Standard center-to-center spacing of crossties shall be [50][53] mm [19.5][21] inch. Switch ties and bridge ties shall be spaced as indicated on the drawings. Ties shall be laid perpendicular to the center line of the track with the grain up (heartwood side down) for wood ties. The best ties shall be used at the rail joints. The ends of ties on one side of the track shall be parallel to the rail and the center of the tie shall be on the approximate center line of the track. The ends shall be aligned on the inside of curves and shall continue on that side until reaching a curve in the opposite direction. On double tracks, the ties shall be aligned on the outside ends. The top surface of ties shall provide full bearing for the tie plates. Adzing of wood ties shall be restricted to that necessary to provide a sound true bearing for the tie plate. Adzing in excess of 5 mm 0.2 inch will not be permitted. Where adzing is necessary, the cut surface of the wood tie shall be completely saturated with creosote or other approved preservatives.

### 3.3.5 Tie Plates

*NOTE:* For track rehabilitation where the track does not currently have tie plates, plates should be installed on each new tie installed. As defective ties are replaced, tie plates are installed with the new ties and with time the entire track has plates.

Tracks shall be fully tie-plated. Tie plates shall be free of dirt and other foreign material when installed. Tie plates shall be placed so that the rails will have full bearing on the plate, and the plate will have full bearing on the tie. Tie plates shall be set at right angles to the rail with the outside shoulder against the base of the rail, and centered on the tie. Canted tie plates shall be installed to cant the rail inward.

### 3.3.6 Rail

The base of the rail and the surface of the tie and tie plate shall be free
of dirt and other foreign materials prior to laying rail.

3.3.6.1 Laying Rail

Rail shall be laid without bumping or striking, to standard gage (1.435 m 4 ft 8-1/2 inch between points 16 mm 5/8 inch below the top of the rail) on tangents and on curves up to 12 degrees. For curves 12 degrees and greater, the gage shall be widened 3.2 mm 1/8 in for each increment of 2 degrees to a maximum of 1.448 m 4 ft 9 inch, in accordance with TABLE V. The track shall be gaged at every third tie as spikes are being driven.

</tbody>
</table>

a. Lay jointed rails, one at a time, with space allowance for expansion being provided between rail ends in accordance with TABLE VI.

b. Gaps between rail ends in insulated joints shall only be sufficient to permit insertion of standard end posts.

c. Use a standard rail thermometer to determine the rail temperature. The thermometer shall be laid close to the web on the side of the rail base which is shaded from the sun's rays in advance of the laying operation and left there long enough to accurately record the temperature. The Contractor quality control representative shall see that rail temperature is checked frequently and that proper rail expansion shims are used. All thermometers shall be calibrated against the Contracting Officer's rail thermometer which will have been accurately calibrated and will be considered as the standard.

d. Except through turnouts and at insulated joints, the staggering of the joints on one side shall not vary more than 460 [500] mm [18] [20] inch in either direction from the center of the opposite rail.

e. Rails less than 10 m 33 ft in length shall not be used in out-of-face rail relay. However, rails not less than 4 m 13 ft long may be used for final connections to existing rails to prevent joints from occurring at prohibited locations or to provide the specified joint stagger in curves.

f. Rail joints shall not occur in or within 6 m 20 ft of a road crossing, alongside of or within 1.5 m 5 ft of the end of any switch or turnout guard rail, or the end of any open deck bridge.
3.3.6.2 Joints

The joints in opposite rails shall be staggered one-half the rail length but not less than 3.5 m 12 ft apart, except closer joints may be required at turnouts and insulated joints. Rail less than 4 m 13 ft in length shall not be installed in track. No joint shall be less than 2 m 6 ft from the ends of open-deck bridges, or less than 1 m 3 ft from switch points. No joint shall be installed within 6 m 20 ft of a road crossing, outer perimeter of any structure, or any location which restricts access to the joint. Where joints are required in these areas, the joints shall be welded.

3.3.6.3 Expansion Allowance

Allowance for expansion shall be provided at rail joints by using rail-expansion metal shims. Shims shall be removed to within 12 rails of the laying. Shims shall be of the thickness shown in TABLE VI. The temperature of the rail shall be determined by use of a thermometer placed on the rail base on the side away from the sun. Typical rail gap gages are as shown.

3.3.6.4 Cutting Rail

Only rail saws or track chisels shall be used to cut rail. New holes shall be drilled using a standard template. Holes shall not be burned in rail. Holes cut with a torch will not be accepted. When drilling of rail is necessary, all chips and burrs shall be removed before applying joints.

3.3.6.5 Matching Rails

NOTE: Remove this paragraph when relay rail is not used.

Where relay rail is used, matching adjacent rails shall not cause lipped or
uneven joints. Any mismatched rail ends shall be welded to provide proper match. Rail end mismatch shall not exceed 3 mm 1/8 in on gage or tread portions of rail.

3.3.6.6 Rail Replacement

The following procedures apply to rail replacement work:

a. Spot rail replacement is defined as replacement of 30 m 100 ft or less of contiguous rails, usually with rails of the same section. Installation of relief rail in place of defective rail is considered spot rail replacement. Replacement of more than 30 m 100 ft of contiguous rails shall be considered to be out-of-face rail relay.

b. If spikes are withdrawn, the holes shall be plugged with treated tie plugs of proper size to fit the hole, prior to replacement of rail. If spikes are withdrawn and spikes are to be redriven in existing spike holes, the holes shall be plugged with treated tie plugs prior to redriving the spike. Tie plugs shall not be installed in prebored holes unless spikes have been driven and withdrawn.

c. All ties shall be spiked with new spikes in accordance with paragraph Spot Tie Replacement.

d. Ensure that rail ends at joints are not lipped or uneven. Tread portion (vertical) or gage side (horizontal) rail end mismatch shall be no greater than 2 mm 1/16 inch. Rail end mismatch greater than 2 mm 1/16 inch shall be corrected by welding and grinding on the smaller rail. Grinding the larger rail is not permitted unless approved by the Contracting Officer. Welded transitions shall be made at a rate of 1 to 80.

e. Rails removed from track will be designated by the Contracting Officer as relay (for use on project), reclaimer (to be salvaged and stockpiled), or scrap. Joint bars removed from track will be designated as relay, reclaimer, or scrap. Mark scrap materials as scrap using bright red paint, transport them off the military installation or to the military installation temporary scrapyard. Relay materials required to complete other repair work of this contract shall be transported to the location of need. Reclaimer materials shall be classified and inventoried and stacked at the military installation storage site, all as indicated for salvage materials in paragraph Removal, Salvage, and Disposition of Materials.

f. Metal rail expansion shims shall be used when laying rail. Wood sticks or other material shall not be used as shims. Provide a sufficient supply of each shim available to permit rail laying to progress without delay.

3.3.6.7 Out-of-Face Rail Relay

Replace existing rail with the designated new or used rail between designated limits in a continuous operation. It is expected that replacement of one rail of a given track will be completed prior to replacement of the opposite rail. Used rail shall be laid [with previous gage side wear facing out, unless required to match existing wear patterns] [as directed by the Contracting Officer].
3.3.6.8 Spot Rail Replacement

Spot rail replacements shall be made where necessary to replace existing defective rails or to compensate for rail joint gap adjustments.

3.3.6.8.1 Replacement Rail

Replacement rail shall be of equal length or longer than the rail it replaces. The minimum length of rail used shall be 4 m 13 ft.

3.3.6.8.2 Spot Rail Replacement Resulting in Joint Staggers

Unless otherwise approved by the Contracting Officer on a case by case basis, spot rail replacement shall not result in joint staggers less than 1.33 m 4 ft.

3.3.7 Joint Bars

**************************************************************************
NOTE: The location of compromise joints will be shown on the drawings. Where compromise joints are required, the portion of this paragraph in brackets will be retained. If compromise joints are not required, the portion of this paragraph in brackets will be deleted.

AREMA Manual recommends an initial bolt tension of between 89,000 and 133,000 N 20,000 and 30,000 lbs per bolt in order to overcome the surface roughness and provide proper seating for the joint bars. After application of traffic, tension in the bolt is lost relatively rapidly and may lose from 22,000 to 44,000 N 5,000 to 10,000 lbs per bolt in the first month. Therefore, retightening of all track bolts after some period of time is necessary. Bolt tension recommended for subsequent tightening is within the range of 67,000 to 111,000 N 15,000 to 25,000 lbs per bolt. The torque required to develop the specified tension in a bolt is approximately as follows:

<table>
<thead>
<tr>
<th>BOLT DIAMETER</th>

</tr>
</tbody>
</table>

*For well oiled bolts with clean threads.

**************************************************************************

Joint bars shall be clean. Rail joints shall be installed so that bars are
not cocked between the base and head of the rail. Bars shall be properly seated in the rail and the full number of correct-size bolts, nuts, and spring washers installed. Bolts shall be placed with nuts alternately on inside and outside of rail. A corrosion resistant lubricant shall be applied to the bolt threads prior to application of nuts. Bolts shall be tightened to torque of approximately [_____] N·m ft-lbs, beginning at the center of the joint and working both ways to the ends of the joint. After the track has been in service [but before acceptance of the work,] all bolts shall be checked and retightened to a torque of approximately [_____] N-m ft-lbs. [Rail of different sections shall be connected by properly fitting compromise joint bars. The mismatch for compromise joints for either tread surface or on the gage side shall not exceed 3 mm 1/8 inch]. Defective joint bars designated on the contract drawings, discovered by the Contractor during track repair operations, or as identified by the Contracting Officer shall be replaced with acceptable joint bars.

3.3.8 Spiking

3.3.8.1 Spiking Procedures

Rail shall be spiked promptly after being laid. Spikes shall be started and driven vertically and square with the rail. Engineered polymer composite ties shall be pre-drilled in accordance with manufacturer's recommendations for size and depth. Spikes shall be driven to allow approximately 3 to 5 mm 1/8 to 3/16 inch space between the underside of the spike and the top of the rail base. Spikes shall not be overdriven, or straightened while being driven. Spikes shall not be installed through the slots in skirted-type, slotted joint bars (angle bars). Spikes shall not be driven against the ends of joint bars.

3.3.8.2 Number of Spikes

Four rail-holding spikes shall be used on each tie on tangents and curves less than 4 degrees. Spikes on the gage side of the running rail shall be placed directly across from each other and the spikes on the field side of the running rail shall be placed directly across from each other. Spikes on the gage side shall be offset longitudinally from the field spike and all four spikes shall be rail-holding spikes next to the base of the rail. This pattern shall be held consistent. On curves 4 degrees or greater, but not more than 36 degrees, six spikes shall be used on each tie with the spikes located as follows: One rail-holding spike on the field side and two rail-holding spikes on the gage side for both rails. [Curves 36 degrees and greater shall be spiked with eight spikes per tie, located as follows: One rail-holding spike and one plate-holding spike on the field side and two rail-holding spikes on the gage side for both rails.] Eight rail-holding spikes shall be used on each tie through road crossings.

3.3.9 Tie Plugs

If spikes are withdrawn from wood ties, the holes shall be swabbed with creosote and plugged with creosoted tie plugs of proper size to fit the hole. If spikes are withdrawn and spikes are to be reinserted in existing spike holes, the holes shall be swabbed with creosote and plugged with creosoted tie plugs prior to redriving the spike. Tie plugs shall not be installed in prebored holes unless spikes have been driven and withdrawn.

3.3.10 Rail Anchor Placement

**************************************************************************

SECTION 34 11 00 Page 70
NOTES: Coordinate this paragraph with paragraph Rail Anchors in PART 2.

Rail anchors shall be located as indicated on the project plans. Where the use of rail anchors is indicated, apply a minimum of [_____] anchors per 11.9 m 39 ft of rail in the pattern indicated on the project drawings. The rail anchors shall be spaced approximately uniformly along the rail length. Rail anchors shall be installed to the gage side of the rail against the same tie face on opposite rails. Rail anchors shall grip the base of the rail firmly and shall have full bearing against the face of the tie. Rail anchors shall not be moved by driving them along the rail. Rail anchors shall not be applied to track on an open-deck bridge. Where anchors are used on track approaching an open deck bridge, every third tie shall be box anchored for at least four rail lengths, off each end of the bridge. Rail shall be anchored immediately after spiking and before rail has experienced a large temperature change.

3.3.11 Inner Guard Rails

Guard rails shall be installed on bridges and trestles as indicated. Guard rails shall be approximately 280 mm 11 inch from the gage side of track rails and shall extend a minimum of 15 m 50 ft beyond the structure. The ends shall be curved inward and beveled. Guard rails shall be fully bolted. Guard rails shall not be higher than the running rail and shall not be more than 25 mm 1 inch lower than the running rail. Each guard rail shall be spiked with two spikes to each tie but shall not be tie-plated. Unfit track rail in short lengths may be used for guardrails.

3.3.12 Derails

Derails shall be properly installed where indicated. Derailed equipment shall not foul other tracks. Installation shall be in accordance with the manufacturer's instructions. Where no specific installation instructions are available for salvaged derails, reinstallation shall be in accordance with good track construction practice to ensure proper performance of their intended function.

3.3.13 Superelevation

NOTE: Superelevation on military railroad track should not exceed 100 mm 4 inches. Superelevation for each curve will be shown on the drawings.

Curves shall be superelevated as shown on the drawings unless otherwise directed by the Contracting Officer. Superelevation shall be obtained by raising the outside rail of the curve. The inside rail shall be maintained at grade. The maximum superelevation will be [_____] mm inch. Full superelevation shall be carried throughout each curve, unless otherwise directed or shown on the drawings. Superelevation runoff shall be at a uniform rate, and shall extend at least the full length of the spirals. The normal rate of superelevation runoff will be 13 mm per 9.4 m 1/2 inch per 31 ft; however, this may be increased to 25 mm in 9.4 m 1 inch in 31 ft with the prior approval of the Contracting Officer.
3.3.14 Preliminary Surfacing

The preliminary alignment and surfacing gangs shall follow the unloading of the ballast. Rail renewal, tie renewal, bolt tightening, and ballast placement shall be complete prior to commencement of surfacing and alignment work.

3.3.14.1 Lifts

a. The track, after being aligned, shall be brought to grade and surface in lifts not exceeding 100 mm 4 in each. After each lift, the ballast shall be tamped. When using jacks, they shall be placed close enough together to prevent undue bending of rail or stress of rail and joint. Both rails shall be raised at one time and as uniformly as possible, except where superelevation is required. The track shall be so lifted that after a period of not less than 5 train operations (70 metric ton ballast car) after the last lift, it will be necessary to give the track a final lift of between 25 and 50 mm 1 and 2 inch to bring it to grade.

b. In areas where major track resurfacing is not required, perform a "skin lift" tamping operation to ensure that the ties are adequately tamped, the ballast section is adequately compacted and dressed, and to correct minor deficiencies in surface and alignment. The rise in skin lift areas shall be 25 mm 1 in or less and usually will not require that additional ballast be placed.

c. A 50 mm 2 inch rise shall provide an average 50 mm 2 inch raise in the track being surfaced.

d. A 100 mm 4 inch rise shall provide an average 100 mm 4 inch raise in the track being surfaced, and shall be made in at least two lifts not to exceed 50 mm 2 inches per lift.

e. A 150 mm 6 inch raise shall provide an average 150 mm 6 inch raise in the track being surfaced, and shall be made in at least 2 lifts. The initial lift shall not exceed 100 mm 4 inch with the final lift not to exceed 70 mm 2-1/2 inch.

3.3.14.2 Tamping

Raising and tamping of track shall be performed with an automatic, vibratory, squeeze type power tamper with 16 tamping heads, capable of raising both rails simultaneously and maintaining cross-level. The equipment to be used for surfacing operations is subject to approval by the Contracting Officer. Every tie in the track shall receive two or more full insertions of the tamping heads. Ballast shall be power-tamped under both sides of ties from each end to a point [300 mm 12 inches inside each rail for 2.4 m 8-ft ties,] [380 mm 15 inches inside each rail for 2.6 m 8 feet-6 inch ties,] [and] [460 mm 18 inches inside each rail for 2.7 m 9 ft ties]. The center shall be filled with ballast, but tamping will not be permitted in the center of the tie between the above stated limits. Both ends of the ties shall be tamped simultaneously and tamping inside and outside of the rail shall be done at the same time. Tamping tools shall not be used with more than 35 percent wear and shall be worked opposite each other on the same tie. Ballast under switch ties and road crossing ties shall be tamped the entire length of each tie. All ties shall be tamped to provide solid bearing against the base of the rail after the track or turnout is raised to grade at final surfacing. All down ties shall be brought up to the base.
of rail and shall be machine tamped. The resultant track surface and alignment shall be uniform and smooth. Tamping of track in snow or frozen ballast conditions will not be permitted.

3.3.14.3 Replacement of Ties

After tamping has been completed and the jacks removed, all ties pulled loose shall be replaced to their proper position, respiked and retamped to provide full bearing against the rail.

3.3.14.4 Track Off The Ends of Open Deck Bridges

Track off the ends of open deck bridges shall maintain the same grade as the track on the bridge for a minimum of \(8 \text{ m} \ 25 \text{ ft}\) beyond the bridge abutment and then transition smoothly to meet established track grades.

3.3.14.5 Runoff of Track Raises

The runoff at the end of a rise shall not exceed \(13 \text{ mm in 9.4 m 0.5 inches in 31 ft}\) of track unless otherwise approved by the Contracting Officer.

3.3.14.6 Horizontal Realignment

Horizontal realignment of curved track shall be established using manual or mechanical means as described in the AREMA Eng Man Chapter 5, Part 3 Section 3.2, "String Lining of Curves by the Chord Method".

3.3.15 Final Surfacing

After preliminary surfacing has been completed, grade and line stakes shall be checked and the track brought to grade and alignment.

3.3.15.1 Final Tamping

Track shall be brought to grade and the ballast retamped in the manner described for preliminary surfacing, except that the tamping distance inside the rail shall be decreased from \(300 \text{ to } 250 \text{ mm for 2.4 m ties, 380 to 330 mm for 2.6 ties, and 460 to 410 mm for 2.7 12 to 10 inch for 8 ft. ties, 15 to 13 inch for 8 ft 6 inch ties, and 18 to 16 inch for 9 ft ties.}\)

3.3.15.2 Final Alignment

The track shall be given a final aligning conforming to the established track centers.

3.3.15.3 Final Dressing

After the final alignment the ballast shall be dressed to the section indicated. After final dressing ballast shall not cover the tops of the ties. The portion of the subgrade outside the ballast line shall be left with a full, even surface and the shoulder of the subgrade shall be properly dressed to the indicated section to provide proper drainage away from the track.

3.3.15.4 Surplus Ballast

Surplus ballast remaining after final surfacing and dressing of the ballast section shall be distributed or otherwise disposed of as directed by the Contracting Officer.
3.3.16 Cleanup

Upon completion of the work, [remove all rubbish, waste, and discarded materials generated by the work from the project area] [dispose of rubbish, waste, and discarded materials in an approved manner as directed by the Contracting Officer]. Areas where the Contractor has worked, including but not limited to, project areas, material storage sites, and borrow or disposal areas shall be left in a clean, well-graded, and well-drained condition.

3.3.16.1 Shoulder Removal and Reconstruction

Where track construction or rehabilitation operations result in deposition of materials along the track shoulders that would impede the free drainage of the geotextile and track structure, remove the material. Where [undercutting] [ploughing] operations leave fouled shoulder materials that impede free drainage of the geotextile and the track structure, the shoulder material shall be removed, and the ballast shoulders shall be reconstructed using the materials and dimensions as indicated. Areas where shoulder removal and reconstruction are required [are] [are not] indicated on the drawings.

3.3.16.2 Spoil Materials

Spoil materials removed from the track shall be disposed of [as indicated] [off site at the Contractor's expense]. Spoil materials shall not be placed on the shoulders, in ditches, in drains, or in other areas where they would impede the flow of water away from the track.

3.3.17 Final Adjustments

Sixty calendar days after the track has been accepted and put into operation, perform, at no cost to the Government, necessary resurfacing adjustments to leave the track in alignment and on grade.

3.3.18 Tolerances for Finished Track

Completed track shall meet the following tolerances. Track not meeting the tolerances specified below shall be repaired to meet these requirements, at no additional cost to the Government.

3.3.18.1 Gage

Track gage shall be within plus 6 mm 1/4 inch or minus 3 mm 1/8 inch of standard gage.

3.3.18.2 Alignment

**************************************************************************

NOTE: The alignment and track surface tolerances for out-of-face surfacing of secondary track (less than 16 km/hour 10 MPH) may be doubled from the values given below if alignment is not critical. Horizontal alignment and profile drawings are recommended.

**************************************************************************

Alignment shall be measured as the deviation of the mid-offset of a 18.9 m
62 ft line, with the ends of the line at points on the gage side of the line rail, 16 mm 5/8 inch below the top of the railhead. Either rail may be used as the line rail on tangent track; however, the same rail shall be used for the entire length of the tangent. The outside rail in a curve is always the line rail. Alignment on tangents shall not deviate from uniformity more than 13 mm 1/2 inch. Alignment on curves shall not deviate from uniformity more than 10 mm 3/8 inch.

3.3.18.3 Track Surface

Track surface shall meet the following requirements:

a. The runoff at the end of a raise shall not exceed 13 mm 1/2 inch in any 9.4 m 31 ft of rail.

b. The deviation from design profile on either rail at the mid-ordinate of a 18.9 m 62 ft chord shall not exceed 13 mm 1/2 in.

c. Deviation from design elevations on spirals shall not exceed 13 mm 1/2 inch.

d. Deviation from zero cross level at any point on tangent or from designated superelevation on curves or spirals shall not exceed 13 mm 1/2 in.

e. The difference in cross level between any two points less than 18.9 m 62 ft apart on tangents, and on curves between spirals shall not exceed 13 mm 1/2 in.

3.3.18.4 Guard Face Gage

Guard face gage is the distance between the guard lines measured across the track at right angles to the gage line, and is measured at the point of frog on both sides of the turnout. The design value for guard face gage is 1340 mm 52-3/4 inch. Guard face gage shall be within plus or minus 3 mm 1/8 inch of the design value.

3.3.18.5 Guard Check Gage

Guard check gage is the distance between the gage line of a frog and the guard line of its guard rail, or guarding face, measured across the track at right angles to the gage line. The design value for guard check gage is 1388 mm 54-5/8 inch. Guard check gage shall be within plus or minus 3 mm 1/8 inch of the design value.

3.4 TURNOUTS AND TRACK CROSSINGS

Turnouts and crossovers shall be located as indicated on the drawings. Switch, frog and guardrail assemblies shall be complete. Stock rails shall be accurately bent. Changes in rail weight or section will not be permitted within the limits of the switch ties. Headblocks shall be at right angles to the main track and shall be securely spiked in place. Except where directed otherwise, switch stands shall be installed so that when the switch is set for the normal position, the connecting rod keeps the points closed with a pulling force. Switches shall be properly adjusted. Switch components and slide plates shall be lubricated.
3.4.1 Turnout Reconstruction

**************************************************************************
NOTE: List the turnout identification numbers and/or other identifying information, such as location or milepost on the drawings. Indicate the appropriate work required on each turnout.
**************************************************************************

3.4.1.1 Install Salvaged Turnouts

Turnouts shall be reconstructed using Government materials, except switch ties which are furnished and installed. This work includes transporting the turnout from the Government stockpile to the installation site and reconstruction of the turnout.

3.4.1.2 Salvage and Install Turnouts

Turnouts shall be salvaged (removed) and installed. This work consists of removal of the turnout, transporting to the installation site all turnout materials except the switch ties, and reconstructing the turnout using new switch ties.

3.4.1.3 Turnout Removal and Salvaged or Scrapped

Materials from turnouts that are removed from the track and that are not to be reinstalled, shall be either salvaged or scrapped as indicated on the drawings.

3.4.1.4 Trackbed

The trackbed shall be prepared by excavating and wasting existing ballast or subgrade materials and establishing a firm top of subgrade as indicated on the contract drawings. Subballast shall be placed as indicated and compacted. Geotextile shall be placed to the limits indicated.

3.4.1.5 Replacement Turnout

The replacement turnout shall be constructed at the location indicated on the contract drawings. Replacement turnouts shall be located so that the point of frog remains at the same location as the original turnout point of frog. Dimensions, details, and configuration of each turnout shall be as indicated on AREMA Eng Man, Plans Nos. 910 and 911. Switch ties shall be placed as indicated on AREMA Eng Man, Plans Nos. 112 and 912, except that even meter foot increments in length of switch ties may at Contractor's option be substituted for 150 mm 6 inch increments in length of switch ties. The end of a switch tie shall not be within 355 mm 14 inch of a spike. Connecting tracks shall be shifted to their new alignments as shown on the contract drawings and all tracks connected to the replacement turnout. Tracks shall be placed within 30 mm 0.1 ft of design alignment prior to ballasting work.

3.4.1.6 Matching

**************************************************************************
NOTE: Allow at least 50 mm 2 in. of clearance between moving parts of the switch and the top of the ballast. One hundred mm Four inches is the minimum clearance in Northern climates, where snow
and ice accumulation and heaving occur. Select the appropriate clearance for the project location.

Switch points/stock rails, rail joints, frog castings, and other parts of the turnout that must fit together shall fit properly and be of the proper match. Both rail ends at all rail joints throughout the turnout and at the joints at the frog shall be matched on both the top (tread portion) and on the gage side of the rail. Rail end welding and grinding [are][are not] acceptable methods to achieve a good match.

3.4.1.7 Placing of Ballast

Ballast shall be placed as required and the turnout brought to proper grade in a minimum of three lifts. The initial lift shall not exceed 100 mm 4 inch. The final lift shall not exceed 50 mm 2 inch and all tracks shall be brought into final alignment at that time. Tamping, ballast dressing requirements, and alignment tolerances shall be as indicated in paragraph TRACK CONSTRUCTION AND OUT-OF-FACE RELAY. Ballast level in cribs beneath the connecting rod, switch point rails, and switch rods shall be at least 100 mm 4 inch below any steel.

3.4.1.8 Existing Switch Stand

The existing switch stand, or a replacement stand if specified, shall be installed and the switch operating mechanisms adjusted so that the switch operates smoothly and without excessive force being required. All switch plates and connection points in the switch rod shall be lubricated with a switch lubricant, which does not allow sand or debris to adhere to the lubricant.

3.4.1.9 Rail Anchors

All switch ties shall be box-anchored to the extent possible. Ties shall be anchored only when box-anchors can be applied to every rail on the tie.

3.4.2 Turnout Repair

NOTE: Designer will list the turnout identification numbers and/or other identifying information, such as location or milepost, along with the requirements in a schedule on the drawings.

Turnouts which will remain in their existing location but require repairs shall be indicated in the "Schedule of Turnout Repairs" on the contract drawings and repaired as specified below.

3.4.2.1 Switch Ties

Defective switch ties shall be removed and replaced. Existing nondefective switch ties shall remain in place. Replacement switch ties shall be installed at a uniform spacing, but not greater than 530 mm 21 inch center to center. The end of a switch tie shall not be within 36 mm 14 inch of a spike. Switch ties shall not be interlaced, where one tie penetrates the crib area of another tie.
3.4.2.2 Bolt Tightening

All bolts in all turnouts within the project area shall be tightened. Any bolt that cannot be tightened shall be replaced with a bolt assembly of the proper diameter and length.

3.4.2.3 Rebuild Switch Points and Protectors, Frogs, and Guard Rails

Switchpoints, frogs, guard rails, or switch point protectors shall be rebuilt as specified in paragraph ELECTRIC ARC WELDING.

3.4.2.4 Regage Closure Rails

Track shall be regaged from heel of switch to the toe of frog. Regaging shall be performed as specified in paragraph TRACK CONSTRUCTION AND OUT-OF-FACE RELAY.

3.5 HIGHWAY CROSSINGS

**************************************************************************
NOTE: Subdrains are recommended on all highway crossings. Drawings should show location of outfall pipe. Density requirements can be deleted if a separate specification section is provided for subgrade preparation.
**************************************************************************

Highway and other grade crossings within the project shall be constructed as indicated on the contract drawings.

3.5.1 Subgrade

[For new construction, the subgrade in the crossing area and for 6 m 20 ft beyond each end of the crossing shall be bladed to a level surface and compacted to at least 90 percent CE55 maximum dry density for cohesive materials or 95 percent CE55 maximum dry density for cohesionless materials.][For track rehabilitation, old contaminated ballast and subballast shall be excavated a minimum 300 mm 12 inch below the design elevation of the bottom of the tie, 300 mm 12 inch beyond the ends of the ties, and for at least 6 m 20 ft beyond each end of the crossing. The subgrade shall be bladed to a level surface.] Drainage areas shall be cleaned and sloped away from the crossing in both directions along the track and the roadway. [Surface ditches][Subdrains] shall be installed as indicated.

3.5.2 Geotextile Installation

**************************************************************************
NOTE: Coordinate these paragraphs with paragraph GEOTEXTILE. Delete these paragraphs if geotextile is not required.
**************************************************************************

The width of the geotextile should cover the entire width of the roadbed with no longitudinal seams or overlaps. Where mechanized geotextile laying equipment will be used to place the geotextile, the maximum diameter of the geotextile rolls should not exceed the capability of the equipment to be used on the project.
Prior to the placement of the cover material (ballast or subballast), the geotextile may be anchored in several ways, i.e., pins, small ballast piles, ballast bags, etc. If fixing of the geotextile is critical and adverse conditions exist, e.g., steep slopes or high winds, the specification can detail anchoring requirements, e.g., pin length and spacing. Care should be taken to prevent or quickly release any tension caused by anchoring and placement of the geotextile cover materials. Excessive tension can cause bridging of irregularities beneath the geotextile and increase the potential for puncture.

If there is reason to suspect movement which will reduce overlap, provision should be made in the specification to remove cover materials at selected areas in order to determine if required overlap is being maintained after cover placement.

Geotextile shall be placed between the subgrade and the ballast section in the crossing area and for 6 m 20 ft beyond each end of the crossing.

3.5.2.1 Preparation

Surfaces on which geotextiles will be placed shall be prepared in accordance with the applicable portions of this specification and shall be free of irregularities such as sags, cavings, erosion, or vegetation. Any irregularities shall be corrected to ensure continuous, intimate contact of the geotextile with the whole surface. Any loose material or debris shall be removed prior to geotextile placement.

3.5.2.2 Placement

NOTE: Delete paragraph "b." if a protective sand layer is not specified.

a. When geotextile is to be installed in an existing track following removal of the ballast by undercutting or ploughing, special care shall be taken to remove as many of the large ballast particles that remain on the roadbed surface as possible.

b. A protective sand layer 50 mm 2 inch thick [or subballast] shall be placed on top of the geotextile after it has been installed.

c. The geotextile shall be carefully placed on the prepared surface with the long dimension parallel to the prepared surface. The geotextile shall be placed free of wrinkles, folds, creases, and tension. The geotextile shall be held in place by pins, small aggregate piles or ballast bags, until it is completely covered. The geotextile shall be covered immediately after placement in track. The maximum exposure time for the geotextile, from removal of the protective shipping cover to placement of the ballast/subballast cover materials which prevent exposure to sunlight, shall be 2 consecutive days.
d. The minimum overlap of geotextile splicing seams shall be 900 mm 36 inch. If several geotextile units are placed with the required overlap prior to the placement of the [ballast][subballast], the overlap distance of each overlap shall be checked as placement of [ballast][subballast] approaches the overlap. Ensure that the required overlap exists when the geotextile is covered.

e. The geotextile shall remain free of any contamination such as mud, dust, sediment, debris, etc., that will impair its function. Contamination shall be removed without damage to the geotextile or to the prepared surface at the Contractor's expense. If the geotextile is damaged, its function impaired by the cleaning efforts, or if it cannot be properly cleaned, repair the prepared surface, if necessary, and replace the damaged or impaired geotextile with geotextile meeting requirements of this specification. Equipment shall not operate in direct contact with the geotextile. Surface drainage, as much as possible, shall be directed away from the geotextile installation area to prevent accumulation of mud, debris, and sediment.

3.5.2.3 Placement of Cover Material

Placement of [ballast][subballast] cover material in contact with the geotextile shall be performed ensuring intimate contact of the geotextile with the prepared surface and with the cover material. The placement shall be performed without damage to the geotextile including tears, punctures, or abrasion.

3.5.2.4 Equipment Operations on the Cover Material

A minimum depth of 200 mm 8 inch of cover material shall be placed over the geotextile before equipment is allowed to operate on the covered geotextile. Equipment operations on the covered geotextile shall be limited to those necessary for track construction and equipment turning will not be allowed on the covered geotextile.

3.5.2.5 Minimum Ballast Depth

The minimum depth of ballast between the bottom of the tie and the top of the geotextile shall be 300 mm 12 inch.

3.5.2.6 Tamping Operations

Tamping of ballast materials shall be performed by setting the tamping force and insertion depth to the minimum necessary to adequately tamp the track. The tamper operator shall monitor the depth of tamping and limit the depth to prevent detrimental effects of the tamper feet on the geotextile.

3.5.2.7 Double Layers

Double layers of geotextile will not be allowed, except for splicing overlaps at seams.

3.5.3 Ballast Placement and Surfacing

Ballast shall be placed and tamped as specified in paragraph TRACK CONSTRUCTION AND OUT-OF-FACE RELAY except that in crossings, the ballast between the ties shall be thoroughly compacted with a vibratory compactor, or other approved means, after each raise. The ballast shall be tamped for
the entire length of the crossties for highway crossings. The track shall receive final alignment and surfacing prior to placement of the crossing surface. Final surfacing shall bring the track to the final grade and alignment as indicated on the contract drawings. Where the crossing involves two or more tracks, the top of the rail for all tracks shall form a plane with the adjacent roadway surface. The top of rail elevation shall be 50 to 100 mm 2 to 4 inches above surrounding pavement elevation, with a smooth transition of pavement. The ballast in the cribs and on the shoulders shall be compacted using a vibratory plate compactor or other approved means.

3.5.4 Ties

[Hardwood][Concrete][Polymer Composite] ties shall be used. Spacing shall be a minimum of 500 mm 20 inches center to center. For premanufactured grade crossings, ties shall conform to the manufacturer's recommendations for the type of grade crossing surface materials being used.

3.5.5 Tie Plates, Spikes, and Anchors

All ties within the crossing and for 6 m 20 ft beyond each end of the crossing shall be fully tie plated, and spiked with 4 rail-holding spikes per tie plate. [Each tie within the crossing shall be fully box anchored.] [Rubber tie pads shall be installed between the tie and tie plate on all ties within the crossing area and for 6 m 20 ft beyond each end of the crossing.]

3.5.6 Rail

Rail within the crossing area and for 6 m 20 ft beyond each end of the crossing shall be, at a minimum, [57][_____] kg/m [115][_____] lbs/yd. Rail [shall] [shall not] be protected from corrosion by application of an approved rust inhibitor. Bolted joints will not be permitted in any Type 2, Type 3, Type 4, or Type 5 crossing or within 6 m 20 ft of either edge of the crossing surface. Bolted joints will be eliminated by either field welding the joints to form continuous rail throughout this area or by using 24.4 m 78 ft rail lengths.

3.5.7 Lining and Surfacing

Rail shall be spiked to line and the track mechanically tamped and surfaced to the grade and alignment of the existing track and roadway. Where the crossing involves two or more tracks, the top of rails for all tracks shall be brought to the same plane.

3.5.8 Crossing Surface

**************************************************************************
NOTE: Provide Typical Railroad Crossing cross section and details on the drawings.
**************************************************************************

The surface of the highway shall be [in the same plane as][not greater than 6 mm 1/4 inch higher than] the top of the rails for a distance of 600 mm 2 ft outside of the rails for either single or multiple-track crossings. A smooth transition shall be made between the crossing surface and the adjoining pavement.
3.5.8.1 Type 1 Aggregate Crossings

Type 1 crossings shall be constructed by placing the aggregate material between the rails and outside of the rails to form an approach ramp as indicated in the contract drawings.

3.5.8.2 Type 1A Aggregate with Timber Flangeway Guards Crossings

The bond timber headers shall be installed with the edge of the timber solid against the edges of the tie plates prior to placement of the aggregate. Headers shall fasten to the ties as indicated using the appropriate size and length fasteners. After installation of the bond timber, the aggregate shall be placed in the track and on the outside approaches and compacted.

3.5.8.3 Type 2 Timber Plank Crossings

Type 2 crossings shall be installed as shown or in accordance with the manufacturer's instructions for prefabricated timber crossing units. The surface of the crossing timbers shall form a smooth plane with the top of the rails and the adjacent roadway surface. Crossing timbers shall be attached to the ties as indicated in the contract drawings using the appropriate size and length fasteners, unless otherwise specified by the manufacturer's instructions.

3.5.8.4 Type 3a Asphalt Crossings

Type 3a crossings are full-depth asphalt crossings as shown in the contract drawings. The asphalt shall be placed in lifts not to exceed 50 mm 2 inch thick and shall be compacted with approved compaction equipment. General requirements for asphalt placement are specified in [_____] State Highway Specifications.

3.5.8.5 Type 3b Asphalt With Timber Flangeway Header Crossings

Type 3b crossings are full-depth asphalt crossings as shown in the contract drawings. The asphalt shall be placed in lifts not to exceed 50 mm 2 inch thick and shall be compacted with approved compaction equipment. General requirements for asphalt placement are specified in [_____] State Highway Specifications. The flangeway timbers shall be installed prior to the placement of the asphalt pavement. The timbers shall be installed with the dappled edge of the timber solid against the ends of the tie plates. Flangeway timbers shall fasten to the ties as indicated in the contract drawings using the appropriate size and length fasteners.

3.5.8.6 Type 4a Cast-in-place Concrete Crossings

Type 4 crossings shall be constructed as shown in the contract drawings using the materials specified herein. Concrete forming, reinforcement, and placement shall conform to the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.5.8.7 Type 4b Prefabricated Concrete Panel Crossings

Type 4A crossings and crossing materials shall be installed in accordance with the crossing manufacturer's instructions. Tie spacings and track materials used in the crossing shall be in accordance with the installation instructions and manufacturer's recommendations.
3.5.8.8 Type 5 Full Depth Rubber Crossings

Type 5 crossings and crossing materials shall be installed in accordance with the crossing manufacturer's printed instructions. Tie spacings and track materials used in the crossing shall be in accordance with the installation instructions and manufacturer's recommendations.

3.5.9 Signs and Signals

The type and location of railroad-highway crossing warning signs and signals shall conform to the requirements of MUTCD, Part VIII.

3.5.9.1 Location and Positioning of Signs

Signs for both highway and railroad track installation shall be located and erected as shown. Unless otherwise shown, signs shall be erected so that sign face is vertical and at a deflection angle of 87 degrees from the center of the highway lane or track which the sign serves and facing the direction of travel. Where lanes or tracks are on curves, sign faces shall be on a deflection angle of 87 degrees to the tangent to the curve. Signs shall be erected so that specular reflection is minimized or eliminated. After installation is completed, the signs will be inspected during the day and at night by the Contracting Officer. If specular reflection is apparent on any sign, its positioning shall be adjusted to eliminate or minimize this condition. This adjustment and any subsequent adjustments shall be at no additional cost to the Government.

3.5.9.2 Traffic Control

During installation of highway signs, provide for the safe and expeditious movement of traffic through the work area. Provide schedule of lane closures, work zone safety and traffic control, and related items.

3.5.10 Crossing Flangeways

Upon completion of the grade crossing installation, the flangeways through the crossing shall be a minimum of 50 mm 2 inch deep and between 65 and 75 mm 2-1/2 and 3 inches wide. Ensure that adequate flangeways are provided prior to installation of the final crossing surface.

3.5.10.1 Flangeway Filler

Except for Type I crossings all open crossing flangeways shall be filled with asphaltic concrete and compacted as indicated on the drawings][preformed rubber filler].

3.5.10.2 Clean Grade Crossing Flangeways

Where grade crossing flangeways are obstructed (filled in), remove foreign material to provide a minimum 50 mm 2 inch depth and 65 mm 2-1/2 inch width flangeways on the gage side of the rails.

3.5.11 As-Built Drawings

Submit one set of reproducible originals of the final as-built drawings for each automatic crossing protection installation prior to final acceptance by the Contracting Officer. The materials and methods used to produce these drawings shall meet the requirements of this specification and shall result in drawings which are easy to revise without damage to the drawing.
3.6 BONDING AND GROUNDING TRACK

**************************************************************************
NOTE: Whenever rail facilities are required for unloading fuel, ammunition, other flammable or explosive materials, or if the track is located adjacent to electrical equipment, the rails and related track materials capable of conducting electrical current must be bonded, grounded and insulated from the remaining track. See UFC 4-860-01FA for details on which track must be bonded and grounded.
**************************************************************************

Track shall be bonded and grounded as indicated. Where track is designated for bonding and grounding, the rails shall be bonded electrically continuous and effectively grounded. Connections shall be made by exothermite welds in accordance with the manufacturer's instructions.

3.6.1 Rail Joint Bond

Rail joints on both rails of designated track shall be bonded using an exothermic type bond. The bond shall be applied to the field side of the rail [head] [web] unless otherwise approved by the Contracting Officer. Track to be bonded and grounded shall be electrically insulated from the remaining track using one of the specified insulated joints.

3.6.2 Rail Cross-Bond and Ground

Rail cross-bond and ground shall be installed using an exothermic type bond. The cross-bond shall be applied to the [rail head] [rail web]. One cross-bond and ground shall be installed at 30.5 m 100 ft intervals along the designated tracks.[provided for each section of bonded and grounded track.] Connections between grounding system or ground rods and rails shall be made with bare stranded copper cable, installed at least 300 mm 12 inch below the bottom of the ties. Ground rods shall be driven vertically full-length. The top of the ground rod shall be located at the toe of the ballast slope and shall be a minimum of 300 mm 12 inch below the top of the subgrade. Maximum resistance to ground from any grounded rail or structure shall not exceed 25 ohms. Make any corrections needed to reduce the resistance to below 25 ohms at no cost to the Government.

3.6.3 Inspection of Rail Bond and Ground

Loose, damaged, or missing rail bond wires, cross bond wires, ground connections, and ground rods shall be visually inspected. If there is a signal failure, bonding can be tested for current loss in the joints using a volt meter. Defective items shall be marked for repair.

3.6.4 Rail Bonds At Signalized Grade Crossings

Bolted rail joints within the approach circuits to signalized highway grade crossings shall be double-bonded using both a rail head bond and a web bond. Rail head and web bonds shall be installed in the locations indicated where the existing rail bonds are missing, broken, or otherwise ineffective.
3.6.5 Existing Bonds

Protect existing rail bonds[, cross-bonds][, ground connections, and grounding rods] from damage. Except for bonds attached to rails which are designated to be replaced in this contract, replacement of bonds damaged or destroyed by the Contractor's operation shall be replaced at no cost to the Government.

3.6.6 Removal of Defective Bonds

Rail head pin-type and welded-type bonds shall be removed by shear cutting old cables immediately adjacent to the weld or pin. Rail web type pin bonds shall be removed by knocking the old pin out with a drift. Flames or torches shall not be used to remove defective bonds.

3.7 INSTALLATION OF MISCELLANEOUS TRACK MATERIALS

3.7.1 Tie Plates

Tie plates shall be furnished to the work sites as required. Excess tie plates, remaining at the conclusion of the contract, shall be delivered to the military installation storage site and stacked where directed by the Contracting Officer.

3.7.2 Insulated Joints

Insulated joints shall be installed where indicated and in accordance with the manufacturer's installation instructions.

3.7.3 Bumping Posts, Cushion Head, and Wheelstops

Bumping posts, cushion head, and wheelstops shall be [removed,][installed,][ or ][reinstalled][____]. Installation shall be in accordance with the manufacturer's instructions. Where no specific installation instructions are available for salvaged bumping posts and wheelstops, reinstallation shall be in accordance with good track construction practice to ensure proper performance.

3.7.4 Inner Guard Rails

Inner guard rails shall be installed as detailed in the contract drawings. Each rail shall be spiked to alternate crossties throughout the full length using two spikes per rail per tie; tie plates are not required. Guard rails shall be installed using acceptable joint bars of the proper size to fit the rails being joined. Each joint shall be bolted with at least two bolts and one fully tightened bolt per rail.

3.7.5 Gage Rods

One gage rod shall be installed in the crib immediately ahead of the switch point of all turnouts. Two gage rods shall be installed on the curved closure rail, one ahead of the joint, and one ahead of the toe of the frog in all turnouts.

3.7.6 Installation of Joint Bars

**************************************************************************

NOTE: For low traffic volume tracks that are equipped with six hole angle bars, the bars may be
Joint bars shall be installed with their full number of bolt assemblies unless otherwise noted. Bars shall be properly seated on the rail and the bolts tightened beginning at the center of the joint and working toward the ends of the bars, alternating between rails. Bolts used shall be of the proper diameter and length for the rail and joint bars at the joint. The use of extra washers to shim out track bolt nuts is prohibited. Bolts with nuts shall be placed alternately on inside and outside of rail.

3.8 *BRIDGE REPAIR*

Submit shop drawings necessary for the construction and erection of the railroad bridge work. Provide shop drawings made from measurements taken at the site wherever possible or from established measurements, when actual measurements are not available. The Contractor is responsible for the accuracy of the established measurements, the information furnished to the subcontractors for the preparation of their Shop Drawings, and the checking of all Shop Drawings. Drawings shall bear the stamp of a Professional Engineer. Bridge repair shall be as follows:

3.8.1 State and Local Government Permits

Obtain necessary permits from state and local governments for work over public roads. Prepare *traffic maintenance and detour plans*; submit them for approval to the appropriate authorities; erect and maintain signs, barricades, lighting, and other traffic control devices in accordance with MUTCD; pay for police details; and stage the work to provide for the continued safe public use of the roadways beneath the bridges.

3.8.2 Work Hours

The Contractor may be required by local or state authorities to work at night or on split shifts to avoid peak traffic hours at bridges [____]. No additional compensation will be made for any costs associated with meeting such requirements.

3.8.3 Schedule of Bridge Repair Work

The work of this project shall be scheduled to minimize the duration of interruptions to rail service. Bridge repair work shall be scheduled so that to the maximum practical extent, bridges on the same line are taken out of service and repaired simultaneously.

3.8.4 Timber Pile Repair

A timber pile can be spliced or shimmed to repair areas of deterioration or to compensate for settlement of the pile. Any spliced pile shall achieve a bearing adequate for its design loading. No more than 50 percent of the piles in a single bent shall be spliced, and no more than 25 percent of the piles in the entire substructure shall be spliced or shimmed.

3.8.5 Timber Pile Replacement

Any pile shall be replaced when it does not achieve adequate bearing, the pile has greater than 50 percent deterioration, or replacement is more
economical. [Replacement pile shall be driven along side existing piles] [A two pile support pier shall be constructed under the bridge cap to carry the load of the deteriorated pile].

3.8.6 Bridge Tie Replacement Open-Deck Bridges

Where spot replacement of bridge ties is required, the existing tie shall be removed without permanently disturbing the track surface. New bridge ties shall be of the proper wood species, structural grade, and size for the intended application. Shimming of bridge ties will not be permitted.

3.8.7 Rivet Replacement

Where replacement is required, rivets shall be replaced with high-strength bolts as specified in Section 05 12 00 STRUCTURAL STEEL.

3.9 ELECTRIC ARC WELDING

**************************************************************************
NOTE: An electric flash butt mobile rail welder should be used on large projects.
**************************************************************************

Welding to repair or rebuild frogs, switch point, guard rails, switch point protectors and rails (engine burns, battered ends, etc.) shall be done in accordance with AREMA Eng Man, Chapter 5, Part 5, Section 5.10 and AWS D1.1/D1.1M. Submit a detailed specification covering the step-by-step procedures to be employed in making the electric arc welds. A complete description of each of the following items as applicable and any other essential characteristics shall be included in the procedure specifications.

- a. Type, size, and capacity of electric welding machine (250 amp minimum), grinder and other equipment. Also, type and size of material (welding rod or wire).

- b. The method to be used to remove defective and excess metal prior to welding (arcair or grinding).

- c. The method to be used to prevent warping.

- d. The method used for preheating, including time and temperature.

- e. The method of applying metal buildup and slag removal.

- f. The method of securing original contour of items welded.

- g. Quality control procedures to be followed.

- h. Welding materials (rod or wire), name and manufacturer of materials (low carbon steel) for welding rail, rail frogs, guard rails, switch point protectors, and switch points without manganese inserts and materials (manganese alloy) for welding manganese frogs, RBM frogs, manganese switch point inserts and manganese railroad crossing inserts or castings.

3.9.1 Welding Supervision

Electric arc welding shall be performed under the direct supervision of an experienced welding supervisor or foreman and by a certified welder.
3.9.2 Weather Conditions

Welding shall not be performed in rain, snow, or other inclement weather without adequate protection of the welding from the elements.

3.9.3 Welding Manganese Frogs and Crossings

**************************************************************************
NOTE: Edit these paragraphs as needed to match the project requirements.
**************************************************************************

Bolts shall be tightened, spikes driven down and ties tamped under crossing and frogs for level surface, when welding manganese frogs and crossings. Chips and cracks shall be ground out with grinding machine or gouged out with arcair gouging device even if crack goes through the entire casting. When gouging device is used, no finished grinding of cracks or chips is required. If cracks are gouged out to bottom of casting, reinforcement strap shall be [placed underneath the hole.][welded to the bottom of the hole in casting with the wire feed machine, allowing the frog or crossing to be welded back to level surface using the skip method.]

3.9.3.1 Manganese Overheating

Welder shall ensure that manganese is not overheated in this process. If manganese shows signs of overheating, casting shall be air cooled and then welding process continued, repeating the process as many times as necessary to prevent manganese from overheating. Flange carbons [shall][shall not] be used to keep welding metal out of flangeways. Welded surface shall be built slightly higher than normal surface of casting so when ground, it will have sufficient weld metal to grind to a level surface. A 600 mm 24 inch straightedge shall be used to check this work. Edges of flangeways and sides of points shall be ground in a roll manner, using a frog and crossing flangeway gage as a guide.

3.9.3.2 Slotting

Manganese frogs and crossings shall be slotted with a 5 mm 3/16 inch slotting wheel. Connecting rail joints to frog shall also be welded, ground, and slotted in like manner. The grinding and slotting process shall be repeated approximately 6 weeks from the time the frog is put back in service and thereafter when overflow appears on points and flangeways.

3.9.4 Welding Switch Points

**************************************************************************
NOTE: Field welding of switch points is not recommended. Qualifications of welder are very important for this type of work.
**************************************************************************

Overflow of stock rail shall be ground off of ball of rail on both sides and switch point ground to where cracks and chips are ground out. All grease and rust shall be ground off of point as far back as point is to be welded. Switch point shall be adjusted tight against stock rail and check gage. If gage just ahead of switch point is tight, it shall be opened to where gage reads 6 mm 1/4 inch open. The following shall be done before starting to weld: 1) Open switch point and place rail flange carbon...
between switch point and stock rail. 2) Pull switch tight against carbon and hold with spike; another rail carbon can be placed just on top of reinforcement binding strap on point to use as guide for first welding pass; carbon can then be removed or left in place. 3) Grind switch point with surface grinder or utility grinder. 4) Apply graphite or oil to switch points and plates to prevent rusting and to make switch throw easier. 5) Check with proper authority to ensure ample time to complete welding, grinding and cooling before traffic is due. Switch point shall be ground welded complete without chipping weld slag.

3.9.5  Welding Switch Point Protectors

3.9.5.1  In Track

The following operations shall be performed: 1) Check with proper authority to ensure ample time to complete welding, grinding and cooling before traffic is due. 2) Use a steel ruler to determine the amount of weld needed on manganese switch point protectors; measure the top of the protector any place where there is no wear. 3) Grind out the work hardened surface and any cracks or chips. 4) Weld the protector with the semi-automatic wire feed machine slightly wider than the width of a new switch point protector; run a string bead along the bottom of the wear surface on the protector guard; leaving flux on this bead continue with string bead until protector is built back to size without overheating the protector. If signs of overheating appear, use intermittent welding procedure. 5) Grind back the protector to the correct width. 6) Use roll method on top inside corner of protector.

3.9.5.2  Out of Track

The following operations shall be performed: 1) Use a steel tape to determine the amount of weld needed on manganese switch point protectors; measure the top of the protector any place where there is no wear. 2) Ground out the work hardened surface and any cracks or chips. 3) Weld the protector with the semi-automatic wire feed machine to just a little wider than the width of a new switch point protector; the protector can be laid on its side and three flat beads run on wear surface of the protector guard; ground back to the size of a new protector. 4) Use intermittent method and skip welding to keep protector from overheating. 5) Use the roll method on inside corner of running wear surface of guard.

3.9.6  Welding Engine Burns

The damaged steel of the rail shall be removed by grinding or arcair to get below the burn area into sound metal. Sufficient amount of metal shall be removed to eliminate all shatter cracks.

3.9.6.1  Depth and Length Limitations

Engine burns requiring welds greater than 10 mm 3/8 inch in depth below the top of the rail head shall not be repaired by welding and grinding. While grinding out the damaged metal, the operation shall be stopped when it is discovered that the necessary weld will go too deep into the rail head. The ground out portion shall be welded and joint bars shall be applied at the weld location with the rail undrilled at the middle bolt holes, centering the joint bars under the engine burn. The supervisor of maintenance shall be immediately notified so that the rail can be removed from track. These failed rails shall be disposed of in accordance with current instructions. Engine burns which would require a weld longer than
200 mm 8 inch shall not be welded.

3.9.6.2 Ambient Limitations

Welding and grinding engine burns shall be avoided when the air temperature is below 0 degrees C 32 degrees F. When welding is necessary below 0 degrees C 32 degrees F, the heated area shall be protected by covering with insulating material to retard cooling. Engine burns shall not be welded during rain or heavy snow.

3.9.6.3 Number of Welds

Determine the maximum number of burns in a 12 m 39 ft rail, or equivalent, that can be economically welded. Unless otherwise directed, when a rail has more than 8 burns needing repair, the rail shall be replaced.

3.9.6.4 Welding Procedure

The burn shall be welded with semi-automatic wire feed machine. The skip method shall be used in this process because no preheating or post heating is needed. If engine burns are found in groups close together, ten to fifteen burns shall be ground out at a time, welding one pass at a time on each of the burns. The process shall be repeated until all of the burns are completed to a surface just higher than the normal ball of the rail. The burn shall then be cooled until hand can be placed on it. Welds shall be ground to a level surface with cup wheel attachment grinder.

3.9.7 Welding Rail Joints

**************************************************************************
NOTE: Remove this paragraph when not required.
**************************************************************************

Bolts in the joint bars shall be tightened and the joint pulled to a level surface. Joint bars shall be checked for wear and replaced if they are badly worn. Six hole bars shall be used if available. A straightedge shall be placed across the joint to determine the amount of batter. The straightedge shall be a minimum of 450 mm 18 inch in length. A rail joint with less than 3 mm 0.012 inch of batter shall not be welded. If batter is 3 mm 0.012 inch or more, the rail joint shall be built up. If rail cracks or chipped out places are present in rail ends, they shall be melted out with acetylene torch, gouged out with arcair or ground out with grinder. If cracks or chips extend below ball, rail shall be replaced. If horizontal crack in ball of rail extends more than 200 mm 8 inch rail shall be replaced. Rail ends shall be preheated to approximately 93 degrees C 200 degrees F before welding. Starting 40 mm 1-1/2 inches from the end, the rail shall be built back as follows: A strip shall be welded 25 mm 1 inch into bead; the rail ends shall be ground to a level surface with surface grinder or cup wheel attachment; and rail joint shall be cross slotted with 5 mm 3/16 inch grinding stone to keep rail ends from overlapping and chipping out.

3.10 THERMITE WELDING PROCEDURES

Submit a detailed statement covering the step-by-step procedures to be employed in making the welds, including a complete description of each of the following items, as applicable, and any other essential characteristics included in the welding procedures:

SECTION 34 11 00 Page 90
a. The manufacturer's trade name for the welding process.

b. The method used for cutting and cleaning the rail ends. Flame cutting of rail ends will not be allowed.

c. The minimum and maximum spacing between rail ends.

d. The method used for maintaining the rails in alignment during welding.

e. The method used for preheating, including time and temperature.

f. The tapping procedure, including the minimum time required to cool the weld under the mold insulation.

g. The method used, including a description of special tools and equipment, for removing the upset metal and finishing the weld to the final contour.

h. Quality control procedures to be followed.

i. The contractual agreements with any subcontractor employed by the Contractor in doing the work.

Thermite welding procedures shall be performed by a technician certified to meet ANSI/ASNT CP-189, level II or III qualifications and comply with the following paragraphs:

3.10.1 End Preparation

Rails to be welded shall meet the requirements Section 2.2, "Specifications for Fabrication of Continuous Welded Rail" given in Chapter 4, Part 2 of AREMA Eng Man. The rail ends shall be aligned in accordance with paragraph GAP AND ALIGNMENT. Rail ends shall show no steel defects, dents, or porosity before welding. Bolt holes shall not be made in, or permitted to remain in, the ends of the rail to be welded. One handling hole may be made in each end of welded string. Rail ends containing such holes shall be cut off during track construction. Rail which must be cut for any reason shall be cut square and clean by means of approved rail saws or abrasive cutting wheels in accordance with Chapter 5 of AREMA Eng Man, Section 10.3, "Recommended Practice For Use of Abrasive Wheels".

3.10.1.1 Cleaning

The rails to be welded shall be cleaned of grease, oil, dirt, loose scale, and moisture to a minimum of 150 mm 6 inch back from the rail ends, including the railhead surface. Cleaning shall be accomplished by use of a wire brush, to completely remove dirt and loose oxide and by use of oxygen-acetylene torch to remove grease, oil and moisture. A power grinder with an abrasive wheel shall be used to remove scale rust, burrs, lipped metal and mill brands which would interfere with the fit of the mold, for 50 mm 2 inch on each side of the ends.

3.10.1.2 Gap and Alignment

The minimum and maximum spacing between rail ends shall be as specified by the rail welding kit manufacturer and the approved welding procedures.

a. The ends of the rails to be welded shall be properly gapped and aligned to produce a weld which shall conform to the alignment tolerances.
below. Alignment of rail shall be done on the head of the rail. The rail gap and alignment shall be held without change during the complete welding cycle.

b. Vertical alignment shall provide for a flat running surface. Any difference of height of the rails shall be in the base.

c. Horizontal alignment shall be done so that any difference in the width of heads of rails shall occur on the field side. Horizontal offsets shall not exceed 1 mm 0.04 in in the head and/or 3 mm 0.12 inch in the base.

3.10.2 Surface Misalignment Tolerance

Combined vertical offset and crown camber shall not exceed 3 mm/m 0.04 inch/feet at 315 degrees C 600 degrees F or less. Combined vertical offset and dip camber shall not exceed 1 mm/m 0.01 inch/feet at 315 degrees C 600 degrees F or less.

3.10.3 Gage Misalignment Tolerance

Combined horizontal offset and horizontal kink camber shall not exceed 3 mm/m 0.04 inch/feet at 315 degrees C 600 degrees F or less.

3.10.4 Thermite Welding

Welding shall be done in accordance with Chapter 4, Part 2, Section 2.5 of AREMA Eng Man, articles "Thermite Welding - Rail Joints" and Section 2.2 "Specification for Fabrication of Continuous Welded Rail", except as modified by these specifications. All welds shall be visually inspected at the time of welding.

3.10.4.1 Thermite Weld Preheating

The rail ends shall be preheated prior to welding to a sufficient temperature and for sufficient time as indicated in the approved welding procedures to ensure full fusion of the weld metal to the rail ends without cracking of the rail or weld.

3.10.4.2 Thermite Weld Cooling

The molds shall be left in place after tapping for sufficient time to permit complete solidification of the molten metal and proper slow cooling to prevent cracking and provide a complete weld with proper hardness and ductility.

3.10.5 Weld Finishing and Tolerances

Welded joints in the finished track shall be brought to a true surface and alignment by means of a proper grinding or planing machine (shear). Finish grinding shall be performed with an approved grinder operated by a skilled workman grinding evenly and leaving the joints in a smooth and satisfactory condition. Finishing shall eliminate all cracks. The completed weld shall be finished by mechanically controlled grinding in conformance with the following requirements:

a. A finishing deviation of not more than plus or minus 1 mm 0.01 in of the parent section of the rail head surface will be allowed. The gage side of the rail head shall be finished to plus or minus 1 mm 0.01 in
of the parent section.

b. Welds produced by welding kits which are specially designed to produce reinforced welds need not be ground in the finishing area except as necessary to remove fins, burrs, cracks, etc.

3.10.6 Weld Quality

Each completed weld shall have full penetration and complete fusion and be entirely free of cracks or fissures. Welds shall meet the acceptance criteria given in **AWS D1.1/D1.1M**.

3.10.7 Weld Numbering

Semi-permanently mark a sequential weld number on the rail immediately adjacent to the weld, using a quality lead paint marker at the time the weld is made. Welds shall be numbered sequentially in the order in which they are made. The Contracting Officer will provide the initial weld number. Defective welds which are replaced shall be assigned a new sequential number by adding a letter to the defective weld number (e.g., defective weld 347 would be replaced by 347A).

3.11 TRACK REPAIR

3.11.1 Cutting and Drilling of Rail

Use only rail saws and abrasive cutting wheels for this operation. Other methods for cutting rail will not be acceptable. Cuts shall be square and clean. When given the option of cutting existing rail or new rail being installed, the existing rail shall be cut. When new holes are necessary, they shall be drilled. Holes shall not be punched, slotted, or burned with a torch. Holes shall be of the size and located as shown on the contract drawings. Drilled bolt holes shall be peened or ground to remove sharp edges.

3.11.2 Rail Joints

In areas which do not require out-of-face rail replacement, tighten all track bolts. Defective track bolts, nuts and lock washers ("bolt assemblies"), and those that cannot be tightened shall be replaced. This work shall include both spot replacement of assemblies at locations to be determined by the Contracting Officer ("Spot Bolt Assembly Replacement") and out-of-face replacement of all bolt assemblies within a rail joint ("Joint Repair").

3.11.2.1 Used Bolt Assemblies

Used bolt assemblies removed from rail joints shall become the Contractor's property and shall not be reincorporated in the work. Existing bolt assemblies designated to be replaced shall be removed by methods which shall not damage joint bars or rails.

3.11.2.2 Joint Repair

**************************************************************************

NOTE: List locations where out-of-face joint repairs are required on the drawings.

**************************************************************************
Replacement of defective joint bars and correction of rail-end mismatch, as designated or directed by the Contracting Officer, shall be defined as joint repair work. At designated joint repair locations, both joint bars shall be removed from the rails and the rail ends inspected for damage or defects.

3.11.2.3 Cleaning of Finishing Area

The finishing area shall be cleaned of mill scale, rust, and dirt by wire brushing, compressed air, solvents, or a combination of these or other methods.

3.11.2.4 Rail Ends

The clean rail ends shall be jointly examined by the Contractor and the Contracting Officer for the presence of any rail defects that would make the rail unsuitable for further use at the location. If a rail is determined to have an end defect, either crop or replace the rail.

3.11.2.5 Joint Gap

Where pull-aparts have occurred, whether currently gapped or not, or where the rail joint gap exceeds 19 mm 3/4 inch, the joint gap shall be adjusted to the rail joint gap specified in TABLE VI. Rail joint gap adjustment work shall be performed in conjunction with spot rail replacement work and bolt renewal work.

3.11.3 Spiking

The proper gage, as indicated in this section, shall be verified immediately prior to spiking.

3.11.4 Spot Tie Replacement

Replace defective ties as marked in the field and as directed by the Contracting Officer.

3.11.4.1 Paint Markings and Tie Inspection

Paint markings may exist on the existing rails and crossties. Such markings do not necessarily indicate work within the scope of the contract. Participate in a walk-through tie inspection with the Contracting Officer prior to commencement of tie replacement work. The scope of the tie replacement work will be determined at that time and relevant paint markings made or touched up as required.

3.11.4.2 Additional Tie Work

In areas where existing ballast inhibits tie inspection, additional ties may be required beyond those marked. The scope of such additional tie work will be identified by the Contracting Officer as adjacent work progresses.

3.11.4.3 Old Spikes, Rail Anchors, tags and Tie Plates

Old spikes shall be pulled and scrapped. Rail anchors shall be removed, sorted, and salvaged. Tie plates shall be removed, inspected and classified as either relay or scrap. Scrap tie plates shall be marked scrap and shall not be reinstalled in the track. Acceptable relay tie plates may be reused at that location or at other locations as required.
Old stationing tags will be removed and replace on the new tie.

3.11.4.4 Humped Track

Where the track will not be surfaced, in order to prevent permanent distortion ("Humping") of the line and surface of the track when performing spot tie replacement, the tie cribs and ends shall be excavated, the old ties removed, and the new ties installed without jacking the rails. Humped track shall be resurfaced at the Contractor's expense.

3.11.4.5 Minimal Humping

For spot or out-of-face tie replacement, where the track will be surfaced and aligned under this Contract, a minimal amount of humping will be allowed, provided the surfacing tolerances can be met.

3.11.4.6 Fouled or Muddy Ballast

Fouled or muddy ballast, as identified by the Contracting Officer, shall be excavated and wasted outside of the track area where it will not interfere with drainage of the track.

3.11.4.7 Insertion of New Ties

New wood ties shall be inserted in track with the heartwood down, square to the line of the rails. Engineered polymer composite ties shall be inserted with the flat (tie plate) surface up, square to the line of the rails.

a. Ties shall be inserted so that the average tie spacing in any one rail length does not exceed \(530 \text{ mm} \ 21 \text{ in}\) and so that the maximum spacing between any two ties does not exceed \(610 \text{ mm} \ 24 \text{ in}\) and the maximum spacing is not less than \(460 \text{ mm} \ 18 \text{ in}\).

b. Crosstie position at joints shall result in a "suspended joint" arrangement unless otherwise directed by the Contracting Officer.

3.11.4.8 Positioning of Tie Plates

Tie plates shall be positioned on the tie so that the shoulder has full bearing against the base of the rail. The plate shall be centered on the tie width, except that the plate shall be positioned up to \(13 \text{ mm} \ 1/2 \text{ in}\) off-center if necessary to avoid spiking into an existing tie split. Ensure that all tie plates in a given stretch of track are either canted or flat. Canted and flat tie plates shall not be mixed within a given stretch of track.

3.11.4.9 Re-spacing of existing ties

Re-spacing of ties is required to straighten slewed ties or to correct uneven tie spacing. Crib and shoulder ballast shall be removed as required to facilitate sliding crossties to their final position or to insert new ties. Spike mauls or sledges shall not be used to slide ties. Rail anchors and ballast shall be installed immediately after ties are re-spaced.

3.11.4.10 Track Gage

Track gage shall be set at the time of spiking.
3.11.4.10.1  Tangent Track

For track rehabilitation or spot rail replacement on tangent, the track shall be regaged if the existing gage is less than 1420 mm 56 in or is equal to or greater than 1460 mm 57-1/2 in. These sections of track shall be regaged to conform with the gage of the adjacent track, but the gage after regaging shall be between 1430 and 1450 mm 56-1/4 and 57 in.

3.11.4.10.2  Curved Track

Curved track shall be gaged as shown in TABLE V.

3.11.5  Joint Respiking

Many joints in track will be found with nonstandard spiking patterns and other deficiencies. These include joints with no tie plates, plates which are positioned so that it is not possible to spike through the plate on both sides of the joint, spikes driven against the ends of skirted joint bars, and similar deficiencies. Respike such joints in accordance with the following.

3.11.5.1  Substitution of Tie Plates

When tie plates are available which will permit spiking through the tie plate at the edge of the joint bar skirts on both sides of the rail, they shall be substituted for existing plates.

3.11.5.2  Respiked Joints

All joints which are respiked shall have existing spike holes plugged.

3.11.6  Regaging

Where the existing track gage is less than 1420 mm 56 in or is equal to or greater than 1460 mm 57-1/2 in, or as designated by the Contracting Officer, the track shall be regaged. These sections of track shall be regaged to conform with the gage of the adjacent track; the track gage after regaging shall be between 1430 and 1450 mm 56-1/4 and 57 in.

3.12  SAMPLING AND TESTING

Sampling and testing is the responsibility of the Contractor. Submit one certified copy of Test Reports for each test performed on the ballast [and subballast] within 2 working days of the test completion. Sampling and testing shall be performed by an approved commercial testing laboratory, or by the Contractor, subject to approval. If the Contractor elects to establish testing facilities, approval of such facilities shall be based on compliance with ASTM D3740. Work requiring testing will not be permitted until the Contractor's facilities have been inspected and approved. The first inspection of the facilities will be at the expense of the Government and any subsequent inspections required because of failure of the first inspection shall be at the expense of the Contractor. Such costs will be deducted from the total amount due the Contractor.

3.12.1  Ballast [and Subballast] Samples

Periodic sampling and testing of ballast [and subballast] material shall be performed to ensure continued compliance with this specification. During construction, one representative sample of the ballast [and subballast]
material shall be taken from each 1818 metric tons 2,000 tons of ballast [and subballast] delivered to determine the material gradation. For each 9090 metric tons 10,000 tons or a fraction thereof of ballast delivered, an additional amount of material shall be obtained in order to perform the quality and soundness tests specified. Samples for material gradation, quality, and soundness tests shall be taken in conformance with ASTM D75/D75M. Test samples shall be reduced from field samples in conformance with ASTM C702/C702M. Sample sizes shall be sufficient to provide the minimum sample sizes required by the designated test procedures. If any individual sample fails to meet the gradation requirement, placement shall be halted and immediate corrective action shall be taken to restore the specified gradation. If any individual sample fails to meet the specified quality and soundness requirements, placement shall be halted and immediate corrective action shall be taken to restore the specified quality.

3.12.2 Ballast [and Subballast] Tests

3.12.2.1 Sieve Analyses

Sieve analyses shall be made in conformance with ASTM C117 and ASTM C136/C136M. Sieves shall conform to ASTM E11.

3.12.2.2 Bulk Specific Gravity and Absorption

Bulk specific gravity and absorption tests shall be made in conformance with ASTM C127.

3.12.2.3 Percentage of Clay Lumps and Friable Particles

The percentage of clay lumps and friable particles shall be determined in conformance with ASTM C142/C142M.

3.12.2.4 Degradation Resistance

Resistance to degradation of materials shall be determined in conformance with ASTM C131/C131M and ASTM C535. Materials with gradations having 100 percent passing the 25 mm 1 in sieve, shall be tested in conformance with ASTM C131/C131M. Materials having gradations with particles larger than 25 mm 1 in shall be tested in conformance with ASTM C535.

3.12.2.5 Soundness Test

Soundness tests shall be made in conformance with ASTM C88.

3.12.2.6 Percentage of Flat or Elongated Particles

The percentage of flat or elongated particles shall be determined in conformance with ASTM D4791.

3.12.3 Tie Inspection

The Contractor is responsible for the quality of the treated ties. Each tie shall be permanently marked or branded by the producer in accordance with AWPA M6. Each treated wood tie shall be inspected, in accordance with AWPA M2, for conformance with the specified AWPA standards. The 100 percent inspection shall be performed by an independent inspection agency approved by the Contracting Officer. Inspection shall be made at the wood treatment site. The agency's report of inspection shall accompany delivery.
of the ties. Core and check preservative treatment once per 1000 ties delivered to the construction site.

3.12.4 Examination of Geotextile

**************************************************************************
NOTE: The amount of geotextile being installed and the criticalness of the installation determine the size and scope of the geotextile testing and quality control/quality assurance program. Small jobs with minor importance may not warrant extensive preconstruction testing of the geotextile, and the manufacturer's Certificate of Compliance may be adequate for assuring that the physical properties are met. However, for large projects and critical installations, regardless of size, a complete regimen of preconstruction and quality control testing should be specified.
**************************************************************************

[Sample the geotextile upon delivery to the project site. Sampling procedures used shall be those detailed in ASTM D4759 and ASTM D4354 with the number of sample units selected from TABLE II of ASTM D4354. An independent testing laboratory shall perform the index property tests specified in TABLE II on each of the sample units and determine conformance with the minimum requirements of TABLE II. Conformance shall be determined in accordance with ASTM D4759.] [Geotextile seams expected to perform a reinforcement function shall be tested in accordance with ASTM D4595.] The Contracting Officer may examine any geotextiles for defects, damage, or nonconformance prior to installation. Any geotextile not meeting the minimum property requirements of paragraph GEOTEXTILE, or geotextile that is determined to be damaged or defective shall be removed from the site and shall be replaced with additional geotextile meeting the requirements of this specification at no additional cost to the Government.

3.13 INSPECTION AND FIELD TESTING

Perform quality control inspection and field testing.

3.13.1 Track

Inspection shall be performed to ensure that all the requirements of these specifications are met. Bolted joints shall be inspected for loose bolts and for smooth transitions between rails of different sections. Rail, tie plates, and ties shall be checked to ensure that the rail is properly seated and has full bearing on the tie plate and tie. Upon completion of construction, measurements of track gage, cross level, and alignment shall be taken and recorded at least once every [30] [60] [_____] m [100] [200] [_____] feet of track centerline length. A copy of these measurements shall be provided to the Contracting Officer.

3.13.2 Welded Joints - Visual Inspection

Quality control inspection and field testing shall be performed by a technician certified to meet ANSI/ASNT CP-189 level II or III qualifications with a minimum of one year experience in testing rail for defects. Each welded joint shall be inspected in the presence of the Contracting Officer after removal of the mold and grinding of excess metal. Pay particular attention to surface cracking, slag inclusion, gas
pockets, and lack of fusion. Correct or replace, at no extra cost to the Government, any weld found defective. The method of correction shall be as approved by the Contracting Officer.

3.13.3 Electric Arc Welding Inspection

Electric arc welds shall be inspected to determine that the item welded conforms to the desired contour and contains no visible cracks or voids.

3.13.4 Thermite Weld Joints Testing

Each thermite weld joint shall be [ultrasonically tested] [dye tested] following the visual inspection. The method of inspection and acceptance shall be in accordance with AWS D1.1/D1.1M. Correct or replace defective welds, at no additional cost to the Government. The method of correction shall be as approved by the Contracting Officer. Ultrasonic testing [shall] [will] be performed by the [Contractor] [Government] after the rail has been installed in track. The testing will determine whether or not each weld meets the criteria of paragraphs Gap and Alignment, Weld Finishing and Tolerances, and Weld Quality. Welds made in the track which the Contracting Officer determines to be unacceptable shall be cut out of the rail and replaced by a section of new rail and two new welds. Saw cuts shall be made at least 150 mm 6 in from the centerline of the faulty weld. Replacement welds and replacement rails shall be at the sole expense of the Contractor. Replacement welds shall be renumbered as indicated. Replacement welds made in track [shall] [will] be ultrasonically tested.

3.13.5 Electric Arc Weld Testing

The welds shall be visually inspected and the contours checked after completion and later tested by the ultrasonic method. The [Government will] [Contractor shall] have the welds tested by the ultrasonic method. The testing will determine whether or not each weld meets the quality criteria. Defective welds will be removed and the item rewelded at the Contractors expense.

3.13.6 Inspection of Geotextile

At the direction of the Contracting Officer, remove the cover material from the geotextile at 3 locations per km mile so that the geotextile may be inspected for damage. At each location, the cover material shall be removed to expose a 1.2 by 1.2 m 4 by 4 feet section of the geotextile. If punctures, tears, improper installation, other impairment or damage are found within this section, additional sections shall be excavated to determine the extent of the damage. Damaged geotextile shall be repaired or replaced and recovered with ballast/subballast at the Contractor's expense.

3.13.7 Testing Relay Rail

3.13.7.1 Testing for Wear

Each relay rail shall be checked for wear by the Contractor's quality control representative in the presence of the Contracting Officer after the material is delivered to the construction site. Monitor the installation of track for defects in rail and joint bars being installed. Rail and joint bars that are found to be defective shall not be installed in track.
3.13.7.2 Testing for Defects

Upon completion of the track construction, have the rail tested by ultrasonic methods. **Ultrasonic testing** shall be done by a Contractor normally engaged in this type of testing with a minimum of 5 years of experience. Submit results of the ultrasonic rail testing. Results shall list defects and rail stationing. Schedule a rail testing machine and notify the Contracting Officer of the type of machine and schedule. Contractor furnished rails which are found to have any detectable defect at that time shall be removed and replaced at no additional cost to the Government. Contractor furnished joint bars and compromise joint bars that are found to be cracked or broken shall be removed and replaced at no additional cost to the Government. Submit Data package 1 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

NOTE: This guide specification covers the requirements for welding of crane rail and railroad rail by a thermite process.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Show the following information on the project drawings:

1. Location of welds.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date,
and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

```
SD-01 Preconstruction Submittals
   Welding Procedure
   Cold Weather Welding Procedures
   Wet Weather Welding Procedures

SD-06 Test Reports
   Ultrasonic Tests
   Hardness Tests
   Weld Correction Method

SD-07 Certificates
   Operator Qualification

SD-08 Manufacturer's Instructions
   Thermite Kit

SD-11 Closeout Submittals
   Joint Records
```

1.3 QUALITY ASSURANCE

**************************************************************************

NOTE: Thermite welding processes and kits have been developed by the following companies. There may be other processes available. This Guide Specification has been prepared with the processes of these
manufacturers in mind. If another manufacturer's product is available in the vicinity of the activity at which the work is to be performed, modify this Guide Specification as necessary.

1. Orgo-Thermit Inc., 3500 Colonial Drive North, Manchester, NJ 08759, Telephone: (732) 657-5781

2. Railtech Boutet, Inc., 25 Interstate Drive, P.O. Box 69, Napoleon, OH 43545, Telephone: (419) 592-5050

3. ESCO Equipment Service Co., 117 Garlisch Dr., Elk Grove Village, IL 60007, Telephone: (847) 758-9860

**************************************************************************

Use only qualified procedures and personnel. Procedures and personnel previously qualified in accordance with this specification are not required to be requalified, provided qualifications have not lapsed and qualification records are available.

1.3.1 Operator Qualification

Notify the Contracting Officer in writing one week prior to making qualification welds. Qualify operators by welding one acceptable rail joint in accordance with a qualified procedure. This qualification may be accomplished either prior to production welding or on the first joints to be welded at the work site. If welding operator qualification is conducted at the work site, perform no further welding until the qualification weldments have been accepted by visual inspection and ultrasonic tests. Obtain written approval of the acceptability of the welded joint from the Contracting Officer prior to continuing with welding. Welding operator's qualifications are effective from the test date and will remain in effect for a period of one year.

1.3.2 Acceptable Welds

Welds that meet the visual inspection and ultrasonic test requirements of MIL-STD-1699 are considered acceptable. Welds selected for testing for Brinell Hardness must meet the requirements of ASTM E10 and paragraph HARDNESS TESTS.

1.3.3 Procedure Qualification

1.3.3.1 Written Procedure

Prepare for the welding process to be used. The procedure must include any particulars of the process deemed pertinent to the successful completion of the welds.

1.3.3.2 Manufacturer's Procedure

No separate qualification is necessary for various rail weights, although in order to be qualified for a specific rail weight or cross section, the procedure must include fit-up requirements and other features unique to the rail weight or cross section of the rails to be welded.
1.3.3.3 Welding Procedure Qualification

a. Submit welding procedure qualification records acceptable to the Contracting Officer as proof of previous qualification under this specification.

b. Welding procedure not previously qualified under this specification may be qualified by providing four consecutive acceptable welded rail joints. An acceptable weld is defined as a weld which has been visually inspected and ultrasonically tested and has been found acceptable in accordance with MIL-STD-1699 and ASTM E10. This qualification may be accomplished either by shop fabrication of the joints or on the first four joints welded at the work site. If procedure qualification is accomplished at the work site, perform no further welding until the qualification weldments have been accepted by visual inspection and ultrasonic tests. Obtain written approval of the acceptability of the four welded joints from the Contracting Officer prior to continuing with welding.

c. Ambient temperature: Welding procedures are considered qualified for use at an ambient temperature of 10 degrees C 50 degrees F and above regardless of ambient temperature during welding of qualification assemblies. Do not conduct welding below 10 degrees C 50 degrees F without a specifically qualified procedure. Procedures qualified for use at ambient temperatures less than 10 degrees C 50 degrees F must be qualified by welding test assemblies in accordance with the procedure qualification requirements of this specification at the desired minimum ambient temperature plus or minus one degree C 5 degrees F. Procedures thus qualified are considered acceptable for use at the minimum qualified ambient temperature and above. Submit cold weather welding procedures.

d. Wet weather welding: Perform welding only during dry weather. No welding will normally be permitted on wet, showery and inclement days. However, if means are provided to protect the work and work area, welding may be performed during other than dry weather, if approved by the Contracting Officer. Submit wet weather welding procedures.

e. Confined space welding: Welding in confined spaces must comply with AWS D1.1/D1.1M to assure adequate ventilation for personnel safety.

1.3.4 Required Data

Submit thermit kit manufacturer's instructions and recommendations covering rail end preheat treatment, thermite ignition, mold removal, and finishing.

1.3.5 Welding Procedure

Submit a report of the following information:

a. Thermit kit manufacturer's name and kit size or designation

b. Thermit kit batch numbers and manufacturing date

c. Welding procedure designation (name, number)

d. Size of rail section being joined and type of rail
e. Test assembly identification number
f. Results of nondestructive testing of qualifications assemblies
g. Date of qualification (test date)

1.3.6 Required Qualification Welds

Submit operator qualification welding results in accordance with paragraph OPERATOR QUALIFICATION. Submit procedure qualification welding results in accordance with paragraph WELDING PROCEDURE QUALIFICATIONS. Include results of ultrasonic test and hardness tests. Welders certification or procedure qualification may be substituted, pursuant to paragraph QUALITY ASSURANCE.

1.4 DELIVERY AND STORAGE

Deliver materials in the manufacturer's original unbroken packages or containers plainly labeled with the manufacturer's name and brand.

1.4.1 Receipt Inspection of All Thermite Weld Kits

Perform visual inspection of the weld kit package for freedom from damage and record the thermite weld mix batch number and manufacturing date. Do not use kits which have been manufactured more than 2 years before the date of use or show signs of having been wet.

1.4.2 Material Control

Store materials in the original package and keep dry at all times until used.

PART 2 PRODUCTS

2.1 MATERIALS

Provide in kit form including preformed mold, thermite powder, wicking cord, luting material, and all necessary materials and accessories needed to provide one welded rail joint per kit. Molds must be factory-made, moisture free, and of nonhygroscopic material.

PART 3 EXECUTION

3.1 SEQUENCE OF OPERATION

Perform work in strict accordance with the qualified procedure.

3.1.1 Rail Preparation

Cut rails which are battered, cracked or notched, or which contain bolt holes so that these irregularities are removed. Rail surface must be free of grease, dirt, loose oxide, and moisture on the face of and for approximately 125 mm 5 inches from the joint to be welded. Clean rail ends by grinding or wire brushing. Use a torch to remove grease, oil, or moisture in accordance with procedures in thermite manufacturer's instructions. Rail cutting, when necessary, must be by the saw-cut method. Remove all burrs, rolled-over edges, and loose oxide before applying the mold. No flame cutting of rails is permitted. If the space between the mold and the rail is unusually large on used or relayer rails,
fill this gap with a piece of wicking cord before luting or packing.

3.1.2 Rail Alignment

Separate rail ends as recommended by the welding process manufacturer. Align rails as to both surface and gage, and raise the rails at the joint to compensate for the greater thermal contraction that occurs in the rail head during cooling relative to the web and base regions. Measure the amount of joint elevation with a 900 mm 36 inch long straightedge centered at the joint. The correct elevation is obtained when 2 mm 1/16 inch separates the top of the rail head and bottom surface of the straightedge at both ends.

3.1.3 Placing of Molds

Attach the molds to the rails, centered over the joint, and seal the molds to the rail with luting material according to the welding kit manufacturer's instructions. Handle the luting material, a mixture of clay and sand, so that none is introduced into the weld chamber. Align so that the centerline of the mold coincides with the centerline of the gap. Install the tapping plug or discs in the crucible and pour in the prescribed amount of thermite mixture.

3.1.4 Preheating Rail Ends

Preheat the rail ends in accordance with the manufacturer's instructions and recommendations.

3.1.5 Ignition of Thermite

Follow manufacturer's instructions and recommendations regarding the ignition of the thermite.

3.1.6 Mold Removal

Follow manufacturer's instructions regarding mold removal.

3.1.7 Finishing

Follow manufacturer's instructions and recommendations. No finishing is required on the web and base of rail. Perform final grinding when the weld and rail have cooled to ambient temperature. Do not use a cutting torch to remove excess weld metal.

3.1.8 Joint Records

Submit a record of the date and location of each weld made. The record must also include the rail type, size, thermite kit manufacturer's name, and thermite weld portion batch number. Also, provide a record of the nondestructive test date and acceptance date.

3.2 INSPECTION AND TESTING

3.2.1 Visual Inspection

Inspect each welded joint after removal of the mold and grinding or removal of excess metal. Pay particular attention to surface cracking, lack of fusion and other surface irregularities. Correct or replace all defective welds at no additional cost to the Government. Submit the weld correction
method for approval by the Contracting Officer.

3.2.2 Nondestructive Inspection

Inspect each welded joint by ultrasonic tests using the method of inspection and acceptance as prescribed in MIL-STD-1699. Correct or replace all defective welds at no additional cost to the Government. The method of correction must be approved by the Contracting Officer. Inspect all repairs to defective welds using the method of inspection and acceptance as prescribed in MIL-STD-1699. Submit test reports showing compliance with MIL-STD-1699.

3.2.3 Hardness Tests

Perform Brinell hardness test in accordance with ASTM E10 and ASTM E110. The Brinell Hardness Number (BHN) of the weld and for the rail for a distance of 150 mm 6 inches on each side of the joint must be greater than 250. In the heat-affected zone (a distance not greater than 25 mm one inch to each side of the joint) the BHN may be up to 20 points lower except for the top of the rail, which must not be less than 250. Check hardness on at least 10 percent of all welds. Perform tests on randomly selected welds or as directed by the Contracting Officer. Submit test reports showing welds meet hardness requirements of this paragraph.

NOTE: This guide specification covers the requirements for roadside barriers.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard’s Check Reference feature when you add a Reference Identifier (RID) outside of the Section’s Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard’s Check Reference feature.
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

ASTM INTERNATIONAL (ASTM)

Tensile Strength, General Use

ASTM A615/A615M (2020) Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement

ASTM A706/A706M (2016) Standard Specification for Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.
**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
FHWA Acceptance Letter
SD-08 Manufacturer's Instructions
End Anchorage
Submit at least 14 days prior to installation.

Crash Cushion
Submit at least 14 days prior to installation.

PART 2 PRODUCTS

2.1 GUARDRAIL POSTS

Guardrail posts must be either wood or steel and of the dimensions indicated. Unless otherwise indicated, use only one type of post throughout the project.

2.1.1 Sawn Wood Posts and Offset Blocks

**************************************************************************
NOTE: Include reference to applicable State DOT specification for wood posts and offset blocks.
**************************************************************************

Except as otherwise specified herein, provide wood posts and offset blocks as specified in [______]. Posts and offset blocks must be of stress grade and capable of resisting a working stress of 11 MPa 1600 psi on the extreme fibers when subjected to bending. Posts and blocks must be double end trimmed with the mounting bolt hole in each being drilled 2 mm 1/16 inch oversize and within 13 mm 1/2 inch of the specified location on either side of the post or block. All wood posts and offset blocks must be rough, free of wane, squarecut, and fully sawn to the dimensions indicated. Drill post bolt holes before preservative treatment is applied. Unless otherwise approved, use only one preservative on the project.

2.1.2 Steel Posts

Fabricate "H" beam sections from steel conforming to either ASTM A36/A36M, ASTM A588/A588M or ASTM A242/A242M and conforming to the size, weight and dimensions indicated. Use bolts must be of the diameters indicated. Bolts used with galvanized ASTM A36/A36M steel must conform to ASTM A307. ASTM F3125/F3125M, Type 3 bolts may be used with ASTM A588/A588M or ASTM A242/A242M steel without galvanizing. Galvanize bolts, posts, and all necessary hardware fabricated from ASTM A36/A36M steel in accordance with ASTM A123/A123M.

2.1.3 Polymer and Polymer Composite Offset Blocks

Provide polymer and polymer composite offset blocks certified by the Federal Highway Administration (FHWA) to meet the requirements of either NCHRP 350 or AASHTO MASH. Submit a copy of the FHWA Acceptance Letter.

2.2 W-BEAM GUARDRAIL

Provide galvanized steel beam guard rail elements and fittings of the indicated design and details. The finished steel beam elements must be Class A (base metal nominal thickness 2.67 mm 0.105 inch and conform to the requirements of AASHTO M 180. Galvanizing of steel beam elements must be Type 1 (zinc coated 550 grams per square meter 1.80 ounces per square foot, minimum single spot) and must conform to the requirements of AASHTO M 180.
2.3 "W' BEAM END SECTION

Provide "W" beam end sections of the same or greater thickness of metal and the same type as the beam to which it is attached.

2.4 GUARDRAIL HARDWARE

All fittings (bolts, nuts, washers, etc.) for guardrail must conform to the requirements of AASHTO M 180.

2.5 TERMINAL FOR W-BEAM GUARDRAIL

**************************************************************************

NOTE: Guardrail terminals must meet the crashworthiness criteria of NCHRP 350 or the Manual for Assessing Safety of Hardware (MASH). FHWA acceptance letters for various end treatments are available on the FHWA Safety Program webpage.

TL-1, TL-2 and TL-3 are conducted at speeds of 50 km/h, 70 km/h, and 100 km/h respectively. The tests conducted depend on whether the terminal is a gating or nongating device. A gating device is one designed to allow controlled penetration of the vehicle when impacted between the end and the beginning of the length of need of the device. A nongating device is designed to contain and redirect a vehicle when impacted downstream from the end of the device.

**************************************************************************

Provide a [flared] [Eccentric Loader Terminal (ELT)] [Modified Eccentric Loader Terminal (SRT)] [Flared Energy-Absorbing Terminal (PLEAT)] [Slotted Rail Terminal (SRT-350)] [tangent] [Extruder Terminal (ET-Plus)] [Sequential Kinking Terminal (SKT-350)] terminal for w-beam guardrail. Provide terminal certified by the Federal Highway Administration (FHWA) to meet the requirements for Test Level [2] [3] of NCHRP 350 or AASHTO MASH. Submit a copy of the FHWA Acceptance Letter.
2.6 CABLE BARRIER

******************************************************************************
NOTE: See the AASHTO "Roadside Design Guide" and NCHRP Report 711 "Guidance for the Selection, Use, and Maintenance of Cable Barrier Systems" for information on cable barrier systems.
******************************************************************************

2.6.1 Cable

Provide 19 mm 3/4 inch, Type I, Class A coating in accordance with AASHTO M 30.

2.6.2 Cable Splices, Ends, Fittings

Design cable splices and ends capable of developing the full breaking strength of the cable (110 kN) (25,000 lbs). Cable ends must be cast steel or malleable iron. Cable wedges must be malleable iron and not be galvanized. Conform cast steel fittings to ASTM A27/A27M, grade 485-250 70-36. Conform malleable iron fittings to ASTM A47/A47M. Galvanize cable splices, ends, and fittings in accordance with ASTM A123/A123M.

2.6.3 Compensating Device

Provide compensating devices with a spring rate of 78.8 newtons 450 lbs plus or minus 8.8 newtons 50 lbs per millimeter inch and a minimum total available travel of 150 mm 6 inches. Galvanize all parts in accordance with ASTM A153/A153M.

2.6.4 Hook Bolts

Provide hook bolts conforming to ASTM A307 Grade A with a tensile strength of 400 MPa 60 ksi and a yield strength of 240 MPa 36 ksi. Provide corrosion-resistant bolts manufactured from ASTM F3125/F3125M Type 3 material, with a tensile strength of 660 MPa 92 ksi and a yield strength of 560 MPa 80 ksi. Hook bolts must develop an ultimate pull open strength, applied in a direction normal to the longitudinal axis of the post, from 2 to 4.5 kN 500 to 1000 pounds. Use galvanized nuts conforming to ASTM A563M Class 5 ASTM A563 Grade A. Use corrosion-resistant nuts conforming to ASTM A563M Grade 8S3 ASTM A563 Grade C3. Finish galvanized bolts and nuts according to ASTM A153/A153M for Class C or ASTM B695 for Class 50. If galvanized, overlap the threads as specified in ASTM A563MASTM A563.

2.6.5 Steel Posts

******************************************************************************
NOTE: Cable guardrail designs typically include either structural steel I beam posts or flanged channel steel posts.
******************************************************************************

2.6.5.1 Structural Steel Posts

Provide structural steel posts and anchor plates conforming to ASTM A36/A36M. Galvanize in accordance with ASTM A123/A123M.
2.6.5.2 Flanged Channel Posts

Fabricate flanged channel posts from rerolled rail steel bars conforming to ASTM A499, Grade 415 60 except that the minimum yield strength must be 480 Mpa 70,000 psi. The post must meet the chemical properties of ASTM A1 for rails 44.56 kg/m 30 pounds per foot and heavier.

2.6.6 Anchor Assembly

**************************************************************************
NOTE: Cable is typically anchored to a concrete foundation with steel rods or hook or J bolts.
**************************************************************************

Provide steel cable anchor brackets conforming to ASTM A709/A709M Grade 250 36 or ASTM A36/A36M. Provide anchor posts and anchor post plates conforming to ASTM A36/A36M. Galvanize cable anchor brackets[, anchor posts, and anchor post plates] after fabrication in accordance with ASTM A123/A123M. Provide steel [rods] [hook or J bolts] conforming to ASTM A449 or ASTM A568/A568M and galvanize the top 150 mm 6 inches in accordance with ASTM A123/A123M. Provide hex nuts conforming to ASTM A563.

2.6.7 Concrete

ASTM C94/C94M, using 19 mm 3/4 inch maximum aggregate, and having minimum compressive strength of 28 Mpa 4000 psi at 28 days. Reinforcing steel must be deformed bars conforming to ASTM A615/A615M, ASTM A706/A706M, or ASTM A1035/A1035M grade 280 40.

2.7 CRASH CUSHION

Provide redirective, non-gating, bi-directional type crash cushion as indicated. Crash cushion must be certified by the Federal Highway Administration (FHWA) to meet the requirements for Test Level [2] [3] of NCHRP 350 or AASHTO MASH. Submit a copy of the FHWA Acceptance Letter.

2.8 RETROREFLECTIVE SHEETING

Provide retroreflective sheeting conforming to ASTM D4956, Type III, IV, V, VII, VIII, IX or XI. All retroreflective sheeting must have a precoated adhesive which will permanently adhere to the metal surface.

PART 3 EXECUTION

3.1 POSTS

Posts may be placed by driving or by setting in excavated holes. Post holes for guardrail posts must be round and at least 100 mm 4 inches larger, in diameter, than the greater dimensions (not the diagonal) of the posts, and must be backfilled around the posts with material removed or other suitable soil, placed in lifts not exceeding 100 mm 4 inches, each lift thoroughly tamped. When placed by driving, drive the posts plumb, to the depth and in the position indicated. Remove posts which are broomed, split or damaged in any other way and replace with a sound post. Carry on driving operations in such manner that nearby structures, shoulders, or pavements are not damaged. Cuts and abrasions in preservative-treated posts and blocks must have the newly exposed surfaces treated with at least three applications of the same type of preservative with which the material
was originally treated. Each application must be reasonably dry before the succeeding coat is applied. At the time a timber post is installed, any seasoning check which extends the full length of the piece cannot exceed 6 mm 1/4 inch in width. Adjust posts used for vertical transition in length so that a minimum of 1550 mm 60 inches will be buried. Where guardrail cross buried structures and 1550 mm 60 inches of bury is not obtainable, install the guardrail post as deep as possible and with a 610 mm 24 inch diameter concrete encasement for the full depth of bury.

3.2 GUARDRAIL BEAM ELEMENTS

Place and fasten the beam elements, fittings, and other parts of the guardrail as indicated. Erect the elements to produce a smooth, even rail, closely conforming to a line and grade parallel to the pavement. Bolt the beam elements to each post, and make splices by lapping in the direction of traffic. Splice only at posts. Where the rail is on a curve, the beams at the splice must make contact throughout the area of the splice, forming a continuous beam before erection. On curves of 45 m 150 foot radius or less, install shop bent beam elements, bent to the radius indicated. Tighten all bolts in the finished rail.

3.3 GUARDRAIL DELINEATOR REFLECTOR TABS

**************************************************************************
NOTE: This paragraph is applicable for metal guardrail delineator tabs with retroreflective sheeting. Delete paragraph if other types of delineators are used.
**************************************************************************

Clean, degrease and etch the face of metal tabs using methods recommended by the retroreflective sheeting manufacturer. After cleaning and degreasing, apply retroreflective sheeting material to the metal tabs as recommended by the manufacturer. Perform shearing, cutting and punching prior to preparing the blanks for application of reflective material.

3.4 GUARDRAIL END ANCHORAGE

Install flared and non-flared end anchorages in accordance with the manufacturer's instructions. Submit a copy of the manufacturer's end anchorage installation instructions prior to installation.

3.5 THREE CABLE GUARDRAIL

3.5.1 Posts

Set all posts plumb and firm and spaced as indicated. Posts may be power driven or set by hand. Protect the top of steel posts by a suitable driving cap if power driven.

3.5.2 Cable Splices, Compensating Devices and Turnbuckle Cable End Assemblies

Stagger cable splices. Provide a minimum of 6 m 20 feet between any pair. Provide a minimum of 30 m 100 feet between cable splices on the same cable. For length of cable runs up to 305 m 1000 feet, use a compensating device on one end and a turnbuckle on the other end of each individual cable. For length of cable runs from 305 m 1000 feet to 610 m 2000 feet, use a compensating device on the ends of each individual cable. For length
of cable runs over 610 m 2000 feet, start a new stretch by interlacing at the last parallel post.

3.5.3 Pretension of Cable

Install and tension the cable barrier as follows:

a. Properly seat the spring in the compensator device and permanently mark the unloaded spring position on the compensator rod.

b. Install spring end assemblies at one end of the barrier and secure to the anchor.

c. With cable strung through the hook bolts, introduce tension into the cable at the opposite end of the barrier to compress the installed springs approximately 90 mm 3.5 inches.

d. Clamp this tension in the cable while the end assemblies are installed at the second anchor.

e. Remove the slack between the clamp point and the second anchor by taking up the turnbuckle. If springs are also used at this end, compress them approximately 90 mm 3.5 inches.

**************************************************************************
NOTE: The cable barrier detail drawing should include a table indicating the required spring compression from the unloaded position for various temperatures.
**************************************************************************

f. After two weeks at this setting, reset the spring compression as indicated based on the temperature at the time of adjustment.

3.6 CRASH CUSHION

Assemble and install crash cushions as indicated and in accordance with the manufacturer's instructions. Submit a copy of crash cushion manufacturer's installation instructions.

-- End of Section --

Appendix A  

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the design of a crash rated active vehicle barrier system where the crash rated active vehicle barriers can consist of a portable, semi-permanent, permanent, power-assisted or manually deployed crash rated active vehicle barriers, covers the active vehicle barrier control system, and non-crash rated actuated traffic arms. Designer should consult UFC 4-022-01 Entry Control Facilities Access Control Points at UFC 4-022-01 and for Army projects consult the Access Control Point Standard and Standard Design Criteria. This specification supercedes previous versions of 34 71 13.19 Active Vehicle Barriers and replaces 34 41 26.00 10 Access Control Point Control System.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard UFC 1-300-02 when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable items(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The design of an access control point/entry
control facility (ACP/ECF) must be fully engineered to ensure compliance with the appropriate Army, Navy or Air Force Standards for ACPs/ECFs. Using these standards and criteria, the designer must prepare an ACP/ECF project specific design including the drawings as indicated herein. The project specific drawings along with this edited performance specification must be included in the procurement documents for the ACP/ECF crash rated active vehicle barrier (AVB) control system.

Drawings must identify the following: active and passive vehicle barrier locations, overspeed and wrong way detection zones, Closed Circuit Television (CCTV) camera coverage areas, Intrusion Detection Sensor and tamper switch locations, duress alarm locations, traffic signal and warning beacon locations, actuated traffic arm locations, and incidental construction. Provide active barrier control panels locations and layouts and sequence of operation.

Army Project: ACP Standard Design Drawings can be used in the development of the requirements herein. However, if changes to the control panels from the drawings are made, the designer is responsible for ensuring the changes are reflected.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 ABBREVIATIONS & DEFINITIONS

1.2.1 Abbreviations

a. ACP - Access Control Point
b. AIE - Automated Installation Entry
c. AVB - Active Vehicle Barrier
d. AVBCS - Active Vehicle Barrier Control System
e. BMS - Balanced Magnetic Switch
f. CCTV - Closed Circuit Television System
g. CPU - Central Processing Unit (Computer)
h. CSMS - Central Security Monitoring Station (e.g., Installation Police Station)
i. CVT - Contractor Verification Test
j. DTS - Data Transmission System
1.2.2 Definitions

Command & Control. Command & Control function refers to location the main guard will be located to oversee the activity at the ECF/ACP. This is typically the Gatehouse, but not in all cases.

Crash-rated active vehicle barrier. Crash-rated active vehicle barrier and active vehicle barrier in this specification refer to a vehicle barrier that has been tested to impede or stop a vehicle of a specific weight and speed. The barrier is operable either manually or through electrical controls.

1.3 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification.
and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 INSTALLATION PACKAGE

Submit Installation package [120][150] days after receipt of the Notice to Proceed. The installation package consists of the overall system drawings, major components and data package.

1.4.1 Overall System Drawings

Include the following in overall system drawing package:

a. Functional System Block Diagram, identifying all major equipment including interconnection between components specified herein and those furnished under other sections and communications protocols.

(1) Indicate control/signal and data communication paths and identify PLCs, control interface devices, and media to be used

(2) Describe characteristics of network and other data communication lines.
(3) Describe methods used to protect against power outages and transient voltages including types and ratings of isolation and surge suppression devices used in data, communication, signal, control, and ac and dc power circuits.

b. Block and Wiring Diagrams of each subsystem.

c. Drawing showing equipment layout in the Command & Control including the Master control panel, UPS, and other hardware intended to be located in the Command & Control.

d. Drawing showing equipment layout around the crash rated active vehicle barriers including the crash rated active vehicle barriers, active vehicle barrier control box(es), vehicle presence detectors, stop lines, traffic signals, warning beacons (wig-wag warning signals) (if applicable), and actuated traffic arms (if applicable).

e. A signing and pavement marking plan.

f. Drawing showing layout and dimensions of the each individual active vehicle barrier operating panels.

g. Touchscreen Audible Tones and Visual Indications if used. Include the following material for use at touchscreen video control panels:

(1) Audible indication, notification, and alarm tones.

(2) Visual materials for touchscreen video control panel display screens, complete with proposed shapes, colors, scale, and textual content. Provide the following: graphics, including maps; icons; dialog boxes; and help messages, prompts and instructions. Provide material in color.

h. Tamper switch locations for AVBCS related cabinets and operating panels.

i. Vehicle presence[, overspeed,] [and wrong-way] detector locations, set-points, and sensor detection patterns. Include descriptions of the security strategy for detecting potential threat vehicles, the coverage and operation of the sensors, and the human machine interfaces for overspeed and wrong way alarms.

j. Details of connections to power sources, including power supplies and grounding.

k. Preliminary point-to-point wiring database. Preliminary submittals is to provide sufficient detail to ensure the final database has all the appropriate information. Provide details such as the legend to be used for the different wiring types, alphanumeric numbering scheme, abbreviations to be used, and the layout of the database. Provide an example of a small section of the system showing the point-to-point wiring.

1.4.2 Point to Point Wiring Information

Final point-to-point wiring diagram of complete interconnected system including database listing of wire numbers, to and from designations, and wire characteristics.
1.4.3  **Major Components**

**************************************************************************
NOTE: Delete items not in the project.
**************************************************************************

Submit the following for approval:

a. Active Vehicle Barrier Controls to include pushbuttons, indicating lights, switches and panels.

b. Programmable Logic Controller.

c. Traffic Signs: powered and unpowered.

d. Traffic signals and traffic signal supports.

e. Warning Beacons (wig-wags).

f. In-pavement lights.

g. Alarm display panels.

h. Sequence of Events Recorder.

i. Cable and wiring used for the data transmission.

j. Surge protection device.

k. Cabinets and other main components needed to make a complete system.

l. Tamper switches.

m. Actuated traffic arms.

n. Touch screens, if allowed.

o. Equipment used for presence detection.

p. Wrong-way detection.

q. Overspeed detection.

1.4.4  **Data Package**

**************************************************************************
NOTE: The acquisition of all technical data, data bases and computer software items that are identified herein will be accomplished strictly in accordance with the Federal Acquisition Regulation (FAR) and the Department of Defense Acquisition Regulation Supplement (DOD FARS). Those regulations, as well as the Air Force, Navy, Army and Corps of Engineers implementations thereof, should also be consulted to ensure that a delivery of critical items of technical data is not inadvertently lost. Specifically, the Rights in Technical Data and Computer Software Clause, DOD FAR 52.227-7013, and the Data Requirements Clause, DOD FAR 52.227-7031, as well as any requisite software licensing agreements will be made a part of the
CONTRACT CLAUSES or SPECIAL CONTRACT REQUIREMENTS.  In addition, the appropriate DD Form 1423 Contract Data Requirements List, will be filled out for each distinct deliverable data item and made a part of the contract. Where necessary, a DD Form 1664, Data Item Description, will be used to explain and more fully identify the data items listed on the DD Form 1423. It is to be noted that all of these clauses and forms are required to ensure the delivery of the data in question and that such data is obtained with the requisite rights to use by the Government.

Include with the request for proposals a completed DD Form 1423, Contract Data Requirements List. This form is essential to obtain delivery of all documentation. Each deliverable will be clearly specified, both description and quantity being required.

**************************************************************************

1.4.4.1 Delivery

Deliver all items of computer software and technical data (including technical data which relates to computer software), which is specifically identified in this specification in accordance with the CONTRACT CLAUSES, SPECIAL CONTRACT REQUIREMENTS, and in accordance with the Contract Data Requirements List (CDRL), DD FORM 1423, which is attached to and thereby made a part of this contract. Identify all data delivered by reference to the particular specification paragraph against which it is furnished.

1.4.4.2 Technical Data and Software

Include the following in the data package:

   a. Communications speeds and protocol descriptions.
   b. Operator commands.
   c. Alarm and system messages and printing formats.
   d. Start-up and shut-down operations including system and database backup operations.
   e. Expansion capability and method of implementation.
   f. Sample copy of sequence of events report.
   g. Color print of the graphical user interface (GUI) screens (when used) on 216 x 292 mm 8-1/2 by 11 inch paper.
   h. System data entry requirements.
   i. User enrollment.
   j. System and application software descriptions.
   k. Recovery and restart procedures.
   l. Use of report generator and generation of reports.
1.4.4.3 Active Vehicle Barrier Controls

Describe operation of the different barrier control operating modes to include normal and emergency operation, barrier control switches, actuated traffic arms, [overspeed,] [wrong-way,] traffic signals, warning beacons, and vehicle presence detectors. Include description of security strategy for defeating a threat vehicle and the SDDC approved barrier safety scheme for protecting innocent vehicles from barrier operations.

1.5 TRAFFIC CONTROL PLANS

1.5.1 Traffic Control Plan for the maintenance of traffic during construction

**************************************************************************
NOTE: Army Projects choose the bracketed option.
**************************************************************************

Provide a Traffic Control Plan for maintenance of traffic during construction[ per Section 08C of EM 385-1-1].

1.5.2 Traffic Control Plan During Crash Rated Active Vehicle Barrier Maintenance

Describe plans for taking one or more active barriers out of service for maintenance or testing purposes, while other barriers at the ACP/ECF remain in service. As a minimum, include requirements for traffic signal indications, for bagging signal heads, and for temporary passive barriers and signage, e.g., Type 3 passive barriers, per MUTCD. Include both short term (less than an hour) and long term plans.

1.6 COMPONENT CERTIFICATION

Provide certifications from the manufacturers of the following equipment as part of the data package: crash rated active vehicle Barrier, programmable logic controller (PLC), traffic arm, warning signal, annunciator, sequence of events recorder, and all sensors including [overspeed,] [wrong-way,] and vehicle presence.

1.7 CYBERSECURITY EQUIPMENT CERTIFICATION

**************************************************************************
NOTE: Coordinate equipment certification with Government's cybersecurity requirements and interpretations. Verify that the system includes remote control or remote access capability.
**************************************************************************

Furnish a certification that control systems are designed and tested in accordance with DOD 8500.01, DOD 8510.01, Section 25 05 11 CYBERSECURITY OF FACILITY RELATED CONTROL SYSTEMS, and as required by individual Service Implementation Policy.

1.8 OPERATION AND MAINTENANCE MANUALS

Submit finalized manuals bound in hardback, loose-leaf binders within 30 days after completing the Endurance test. Update the draft copy used during site testing with any changes required prior to final delivery of the manuals. Identify each manual's contents on the cover. Include in each manual the names, addresses, and telephone numbers of each
subcontractor installing equipment and systems, and the nearest service representative for each item of equipment. Provide each manual with a table of contents and tab sheets. Place tab sheets at the beginning of each chapter or section and at the beginning of each appendix. Include modifications made during installation, checkout, and acceptance in the final copies delivered after completion of the endurance test. Provide the number of copies of each manual to be delivered per DD FORM 1423.

1.8.1 Software Manual

In the software manual describe the functions of all software and include all other information necessary to enable proper loading, testing, and operation. As a minimum, include in the manual the following:

a. Definition of terms and functions.

b. Use of system and application software.

c. Procedures for system initialization, start-up and shutdown.

d. Alarm reports.

e. Reports generation.

f. Database format and date entry requirements.

g. Directory of all disk files.

h. Description of all communication protocols, including data formats, command characters, and a sample of each type of data transfer.

1.8.2 Hardware Manual

As a minimum, describe all equipment furnished in the hardware manual and include the following:

a. General description and specifications.

b. Installation and checkout procedures.

c. Equipment electrical schematics and layout drawings.

d. System schematics and layout drawings.

e. Alignment and calibration procedures.

f. Manufacturer's repair parts list indicating sources of supply.

1.8.3 Functional Design Manual

Identify the operational requirements for the system and explain the theory of operation, design philosophy, and specific functions within the functional design manual. Include a description of hardware and software functions, interfaces, and requirements for all system operating modes.

1.8.4 Maintenance Manual

Include descriptions of maintenance for all equipment including inspection, periodic prevention maintenance (include specific time intervals for each
recommended preventative maintenance tasks), fault diagnosis, and repair or replacement of defective components in the maintenance manual.

1.8.5 Application Software

**************************************************************************
NOTE: Army projects. Choose the option USACE Protective Design Center.
**************************************************************************

Provide a copy of the software installation package on optical disk that runs the control program. Provide on optical disk, separate from the operating system software, the complete program or image of the installed software, with all custom changes and configuration data specific for the installed system. At the end of project, after the endurance test is complete, provide complete sets of optical discs. [Provide one set of discs to the USACE Protective Design Center. Provide one to be turned over to the User.]

1.8.6 Final System Drawings

Maintain a separate set of drawings (including site, civil, electrical, mechanical, structural, and architectural plans, elevations, and details), elementary diagrams, wiring diagrams, and control diagrams of the system to be used for final system drawings. This set is to be accurately kept up-to-date with all changes and additions to the AVBCS and to be delivered to the Government with the final endurance test report. In addition to being complete and accurate, this set of drawings is to be kept neat and not be used for installation purposes. Furnish final drawings with the endurance test report on optical disk in [Microstation latest Version] [or] [AutoCAD latest version] [_____] format.

1.9 CRASH RESISTANCE: DEMONSTRATION OF COMPLIANCE

**************************************************************************
NOTE: Prior to February 1, 2009 both DOS and DOD certified crash rated active vehicle barriers were based on test reports submitted by a manufacturer. Barriers tested prior to February 1, 2009 and subsequently certified by DOS are included in a final published list for use by others. DOD will continue to certify and publish their own certified list. Both of these lists may be found by pointing your web browser to https://pdc.usace.army.mil/library

DOD requires all crash-rated active vehicle barriers (anti-ram) be on the DOD list.

**************************************************************************

Submit the following as demonstration of compliance with the specified crash resistance requirements for each crash rated active vehicle barrier proposed for this project.

1.9.1 DOD Letter of Certification

Submit a DOD Letter of Certification for crash-rated active vehicle barrier with a configuration identical to the as tested crash rated active vehicle barrier being provided. DOS Letter of Certification is allowed; however,
the crash-rated active vehicle barrier must be on the DOD anti-ram vehicle barrier list.

1.9.2 Crash Test Report

**************************************************************************
NOTE: This paragraph is required for those barriers not on the DOD list.
**************************************************************************

Submit a crash test report for crash-rated active vehicle barrier with a configuration identical to the as tested crash rated active vehicle barrier being provided, from a DOS approved testing laboratory or a testing laboratory accredited by a nationally recognized testing agency in accordance with ISO/IEC 17025. This report is only required for crash-rated active vehicle barriers that are not on the DOD list. The information is to be submitted with the barrier submittal and is to show an approved crash test per ASTM F2656/F2656M.

**************************************************************************
NOTE: Include the following bracketed statement if a fixed length barrier is specified. On Army projects, the Protective Design Center is required to review the submittal. See the following link: https://pdc.usace.army.mil/
**************************************************************************

[1.9.3 Different Length

The only exception to the requirement that the tested crash rated active vehicle barrier be identical to the as tested crash rated active vehicle barrier being provided is the barrier’s length. If a length other than that tested is required, the length of the required crash rated active vehicle barrier must represent an interpolation between the successfully tested lengths of crash rated active vehicle barriers that are identical in all other ways. The tested shorter crash rated active vehicle barrier and the tested longer crash rated active vehicle barrier must be identical in construction and testing conditions before the alternate length can be considered. If the length of the required barrier for this project is different than the length tested, provide Crash Test Reports for identical barriers at the maximum/minimum width conditions as required by ASTM F2656/F2656M section 8.2.5. In addition to the test report, provide a letter written by the manufacturer clearly stating that the alternate length crash rated active vehicle barrier is to be constructed in the same manner as the tested barriers. [The crash test reports are to be submitted to the Protective Design Center, Omaha US Army Corps of Engineers for review.]

]1.9.4 Engineering Analysis

Engineering analysis is not an acceptable form of Demonstration of Compliance.

1.9.5 Retrofitted Barrier Systems

Manufacturer is to provide additional documentation that indicates DOD, DOS or ASTM required ratings have been maintained for any barriers that were originally configured and tested with hydraulic systems, but have been revised or retrofitted to be electric (electromechanical). Provide sufficient information to compare the hydraulic system with the electric
system to ensure the change in actuation does not change the ability of the barrier to maintain its tested rating. Manufacturer is to provide a response on company letterhead stating that the rating is still valid along with the supporting material.

Provide documentation from the manufacturer that ensures the motor and actuator is sized sufficiently for long term use given the weight of the barrier and the response time requirements. In addition, ensure the electrical components are adequate for the environment as covered elsewhere in this specification.

1.10 QUALITY CONTROL

**************************************************************************
NOTE: The prime contractor will have quality control managers and representatives as a part of their contract requirements. This additional level should only be considered on larger projects or on projects with unique control requirements. The main intention of this portion is to have one main person below the Prime contractor that is responsible for coordinating all the systems involved with the work in this specification. Edit or delete paragraphs as required for the project.
**************************************************************************

1.10.1 Project Manager Qualifications

Designate a Project Manager for all work under this specification. The Project Manager is to provide technical and managerial leadership to all contractor personnel and subcontractors during the design, manufacturer, and installation phases of this specification. This person serves as the single point of contact for the General Contractor for all work required in this specification. The Project Manager must have a minimum of 5 years of experience in the design, manufacture, and installation of similar systems.

1.10.2 Installation Superintendent Qualifications

Designate an Installation Superintendent responsible for onsite installation team direction and leadership. First line supervision of tradesmen and subcontractors is provided by the Superintendent. The Superintendent is responsible for job planning and coordination between the work with trades, subcontractors, vendors, and site personnel. The Superintendent is responsible for scheduling materials, equipment, and labor to maintain the flow of work commensurate with the task schedule. The Superintendent administers and executes the provisions of the Accident Prevention Plan. The Superintendent must have a minimum of 5 years of experience in the installation, operation, and testing of similar systems. The Project Manager and the Installation Superintendent can be the same individual.

1.11 TECHNICAL SPECIALISTS QUALIFICATIONS

Provide the services of technical specialists for the crash rated active vehicle Barriers and the related control system. Submit names and qualifications for each of the technical specialists involved. The technical specialists are to have a minimum of 3 years of experience in the installation, operation, and testing of all components, software, and interconnecting wiring of their particular equipment/subsystem. The presence of each technical specialist is required during Factory Tests of
the system, during installation in the field, and serves as the Contractor's Commissioning Specialist for their designated equipment/subsystem for the commissioning tests as specified.

1.12 KEY CONTROL PLAN

Key control plan for all Contractor provided enclosures requiring locks and all keyed control switches. Provide a key control plan that includes the following: 1) Procedures that will be used to log and positively control all keys during installation. 2) A listing of all keys and where they are used. 3) A listing of all persons allowed access to the keys.

1.13 DELIVERY, STORAGE, AND HANDLING

Protect components delivered to site and/or placed in storage from the weather, humidity (and humidity variation), temperature (and temperature variation), dirt and dust, or other contaminants. Store structural materials on sleepers or pallets and protect them from rust and objectionable materials such as dirt, grease, or oil. Handle all components to protect finish and coatings from scuffs, abrasions or other damage. Excessive damage to factory applied finishes and coatings is cause for rejection. Provide all other delivery, storage and handling protections as recommended by the manufacturer.

1.14 PROJECT/SITE CONDITIONS

**************************************************************************
NOTE: Edit with actual site conditions if more stringent then the default values.
**************************************************************************

1.14.1 Environmental Conditions

All materials, equipment and installation techniques must be appropriate for the prevalent environmental conditions at the installation location. Installation is to be in conformance with manufacturer's written environmental requirements. Submit Manufacturer's Environmental Requirements.

1.14.2 Exterior Conditions

House all components mounted in locations exposed to weather in corrosion-resistant enclosures with appropriate environmental protection. Improper housing design is not to cause a degradation in component performance.

Provide components (those installed outside or in an enclosure exposed outside) that meet the following ambient conditions:

a. Temperature: -32 to 60[_____] degrees C[ -25 to 140][_____] degrees F;

b. Pressure: Sea level to 4,573 m 15,000 feet above sea level;

c. Solar radiation: Six hours of solar radiation at dry bulb temperature of 60 degrees C 120 degrees F including 4 hours of solar radiation at 0.00112 watts per square mm 104 watts psf;

d. Sand and dust: Wind driven for up to 9.6[_____] km/hour [6][_____] mph;

e. Rain: 50 mm 2 inches per hour and 125 mm 5 inches per hour cyclic with
wind plus one period of 300 mm 12 inches per hour;

f. Humidity: 5 to 95 percent;

g. Fungus: Warm, humid atmosphere conducive to the growth of heterotrophic plants;

h. Salt fog: Salt atmosphere with 5 percent salinity;

i. Snow: Snow loading of 234 kg/square m 48 pounds psf per hour; blowing snow of 22.5 kg/square m 4.6 psf per hour;

j. Ice accretion: Up to 13 mm 1/2 inch of radial ice;

k. Wind: Up to 80 km/h 50 mph with gusts to 106 km/h 66 mph, except that fence sensors are to detect intrusions up to 56 km/h 35 mph; and

l. Acoustical noise: Components are to suitable for use in high noise areas above 110 dB, such as flight lines, run up pads, and generator sites without adversely affecting their performance.

m. Elevation. [_____] m [_____] feet

1.14.3 Interior Conditions

Provide equipment, which is installed in environmentally protected interior areas, that meet the performance requirements specified for the following ambient conditions:

a. Temperature: 0 to 50 degrees C 32 to 120 degrees F. Components installed in unheated security protected areas must meet performance requirements for temperatures as low as -17 degrees C zero degrees F;

b. Pressure: Sea level to 4,573 m 15,000 feet above sea level;

c. Relative humidity: 5 to 95 percent;

d. Fungus: Provide system components located in fungus growth inductive environments with a treatment to provide fungus resistance. Treatments cannot include mercury, materials increase the flammability of the material or surface being treated or cause skin irritation or other injury to personnel handling it during fabrication, transportation, operation, or maintenance of the equipment, or during use of the finished items when used for the purpose intended; and

e. Acoustical noise: Provide components suitable for use in high noise areas above 100 dB, such as boiler rooms, power plants, and foundries without adversely affecting their performance.

**************************************************************************
NOTE: Barriers control systems that are not normally being used to meter traffic can delete the first sentence.
**************************************************************************

1.14.4 Traffic Flow

[Crash rated active vehicle Barriers are to be able to meet the cycle frequency of [_____] vehicles per [hour][day][week][month]. ]Typical
vehicle speed over the barrier is expected to be [_____] kph[_____] mph.

1.14.5 Site Power Supply

Power supply at the site will be [____V] [ _ phase] and is located] as shown on the drawings.

1.14.6 Current Site Conditions

Prepare and submit a report on "Current Site Conditions", within 75 days of Notice to Proceed, to the Government documenting site conditions that significantly differ from the design drawings and include any conditions on the design documents that would negatively affect performance of the system to be installed. Provide specification sheets, or written functional requirements to support the findings, and a cost estimate to correct those site changes or conditions. Do not perform any field work until the "Current Site Conditions" report is approved by the Government. Do not correct any deficiencies identified in the report without written permission from the Contracting Officer. Review of this package is to be by the designer of record and the local government construction manager.

1.14.7 Generic Design and Contract Revisions

Contract drawings show generic power circuits and voltage configurations for the crash rated active vehicle barriers, sump pumps, heaters, roadway heat tape, and associated. Contractor is responsible for revising the circuit breakers (size and configuration), backup power supplies, conductors and conduit for the specific crash rated active vehicle barrier system the contractor has chosen. Any changes required are the responsibility of the contractor at no cost to the government. Changes required need to be submitted under the paragraph CONTRACT MODIFICATIONS.

1.15 MAINTENANCE AND SERVICE

1.15.1 Description of Work

The adjustment and repair of the system includes all vehicle barriers and systems installed under this specification. Provide and perform all repair, calibration, and other work in accordance with the manufacturer's documentation and instruction. Responsibility is limited to Contractor installed equipment.

1.15.2 Service Personnel

Certify service personnel in the maintenance and repair of the specific type of equipment installed and qualified to accomplish work promptly and satisfactorily. Advice the Government in writing of the name of the designated service representative, and of any change in personnel.

1.15.3 Schedule of Work

Perform two minor inspections at 6 month intervals (or more often if required by the manufacturer), and two major inspections offset equally between the minor inspections to effect quarterly inspection of alternating magnitude.

1.15.3.1 Minor Inspections

Include visual checks and operational tests of crash rated active vehicle
barriers (cleaning pit if necessary), traffic signals, console equipment, peripheral equipment, local processors, sensors, and electrical and mechanical controls as part of the minor inspections.

1.15.3.2 Major Inspections

Major inspections includes work described under paragraph Minor Inspections and the following work:

a. Clean interior and exterior surfaces of all system equipment and local processors, including monitors, keyboards, and console equipment.

b. Perform diagnostics on all equipment.

c. Check, walk test, and calibrate each sensor.

d. Run all system software diagnostics and correct all diagnosed problems.

e. Resolve any previous outstanding problems.

f. Purge and compress data bases.

g. Review network configuration.

1.15.3.3 Scheduled Work

Perform scheduled work during regular working hours, Monday through Friday, excluding federal holidays.

1.15.4 Operation

The applicable portion or portions from the performance verification test procedures are to be used after all scheduled maintenance and repair activities to verify proper component and system operation.

1.15.5 Records and Logs

Maintain records and logs of each performed task and organize cumulative records for each component and for the complete system chronologically resulting in a continuous log to be maintained for all devices. Provide a log that contains all initial settings. Ensure logs are kept and available for inspection onsite, demonstrating that planned and systematic adjustments and repairs have been accomplished for the system.

1.15.6 System Modifications

Make any recommendations for system modification in writing to the Government. Prior approval of the Government is required before any system modifications are made. Updating of the operation and maintenance manuals as well as any other documentation affected is required after any modification is made to the system.

1.15.7 Software

Provide a description of all software updates to the Government, who will then decide whether or not they are appropriate for implementation. After notification by the Government, implement the designated software updates and verify operation in the system. Accomplish updates in a timely manner,
fully coordinated with system operators, and ensure all data is incorporated into the operation and maintenance manuals, and software documentation. Make a system image file prior to implementing any software update so the system can be restored to its original state if the update adversely affects system performance.

1.16 WARRANTY
**************************************************************************
NOTE: The standard warranty period is one year. If desired a two year period can be specified; however, there will need to be a separate line item for bidding and is paid with a separate funding source.
**************************************************************************

Provide all labor, equipment, and materials required to maintain the entire system in an operational state as specified, for a period of [one year][two years] after formal written acceptance of the system to include scheduled and nonscheduled adjustments. Contractor is responsible for ensuring the barriers are properly exercised and maintained per the manufacturer instructions until accepted by the Contracting Officer.

1.16.1 Warranty Service
**************************************************************************
NOTE: In some cases the designer may determine a less rapid response time is acceptable when weighed against the cost of the service. When editing consider the location of the project in relationship to available personnel.
**************************************************************************

The Government initiates service calls to the Contractor when the system is not functioning properly. Qualified personnel must be available to provide service to the complete system. Furnish the Government with a telephone number where the service supervisor can be reached at all times. Warranty service is to comply with 01 78 00 CLOSEOUT SUBMITTALS and the with the following codes:

a. First Priority Code 1. Perform onsite inspection to evaluate situation, and determine course of action within [24][_____] hours, initiate work within [12][24][_____] hours and work continuously to completion or relief.

b. Second Priority Code 2. Perform onsite inspection to evaluate situation, and determine course of action within [2][4][_____] days, initiate work within [24][48][_____] hours and work continuously to completion or relief.

c. Third Priority Code 3. All other work to be initiated within [4][7][_____] work days and work continuously to completion or relief.

d. The "Construction Warranty Service Priority List" is as follows:

   Code 1-crash rated active vehicle barrier system (controls and barrier)
   (1) Mechanical or electrical equipment failure that prevents the crash rated active vehicle barrier from opening or closing through the controls.
   (2) Active vehicle barrier control system is unable to reset.
   (3) Active vehicle barrier control system is unable to operate the crash rated active vehicle barriers properly.
Code 2-Active vehicle barrier system (controls and barrier)
(1) A single traffic signal is not operational.
(2) Problem associated with the vehicle presence detection system (typically safety loops).
(3) Problem associated with sequence event recorder.
(4) Crash rated active vehicle barrier opens and closes, but does not perform the operation in a smooth manner.
(5) Problem associated with wrong-way detection system.
(6) Problem associated with overspeed detection system.

Code 3-Active vehicle barrier system (controls and barrier)
(1) Warning beacon(s) is not operational.
(2) Active vehicle barrier warning light(s) or in-pavement light(s) are not operational.
(3) Any item associated with a control system malfunction (example indicating light or warning buzzer) that does not have a direct impact on operating the crash rated active vehicle barriers.

1.16.2 Service Call Requests

Record separately each service call request, as received. Provide a form that includes the serial number identifying the component involved, its location, date and time the call was received, specific nature of trouble, names of service personnel assigned to the task, instructions describing what has to be done, the amount and nature of the material to be used, the time and date work started, and the time and date of completion. Deliver a record of the work performed within 5 days after work is accomplished.

PART 2 PRODUCTS

**************************************************************************
NOTE: The following sections address the most common types of crash rated active vehicle barriers. While the systems listed cover most installations there may be custom assemblies which will still build on the basic systems presented here. Designers specifying custom systems may select the most appropriate crash rating language and insert aesthetic and other requirements as appropriate.
**************************************************************************

2.1 SYSTEM DESCRIPTION

Furnish and install a complete and functional crash rated active vehicle barrier system for the ACP/ECF including crash rated active vehicle barriers, active vehicle barrier controls, traffic signals, traffic signal controls, traffic warning signals, traffic signs and pavement markings, [actuated traffic arms,] [vehicle overspeed detectors,] [wrong-way detectors,] vehicle presence detectors, tamper switches, alarm displays, sequence of events recorder, data transmission, and all interconnecting conduit and wiring. Crash rated active vehicle barrier types covered by this specification include [retractable bollards,] [retractable barriers,] [crash beams,] [active net barriers] [crash gates,] [portable barriers].

2.2 CRASH RATED ACTIVE VEHICLE BARRIER SAFETY SCHEME

**************************************************************************
NOTE: Select one or more of the following barrier safety schemes as appropriate. Include the
appropriate Appendix, at the end of this specification. If not using one of the designed safety schemes, then revise paragraph as appropriate.

**************************************************************************

Install and program the [Hybrid Beacon Conventional (Signs and Signals)] [Full Containment] [High Efficiency Presence Detection] [Stop Control] safety scheme, as approved by the Surface Development and Distribution Command (SDDC) to ensure the safety of innocent motorists. See Appendix A [and the contract drawings] for the required features and operational sequences of this safety scheme.

2.3 CRASH RATED ACTIVE VEHICLE BARRIER FEATURES

2.3.1 Impact Conditions

**************************************************************************

NOTE: Performance levels are based on the following:

Crash Resistance is defined by a combination of the Impact Condition (size and velocity of the design vehicle) and the allowable Penetration Distance.

This UFGS addresses three crash rating standards:

US Department of State SD-STD-02.01, Specification for Vehicle Crash Test of Perimeter Barriers and Gates, 1985

Barriers tested prior to February 1, 2009 are to comply with to one of the two DOS standards; barriers tested after February 1, 2009 are to comply with ASTM F2656/F2656M.

ASTM Impact Condition:

ASTM F2656/F2656M Impact Conditions are listed in Table 1 of ASTM F2656/F2656M and are defined by a letter designation for the test vehicle (SC = Small Passenger Car (1,100 kg (2,340 lbs)); FS = Full Size Sedan (2,100 kg (4,630 lbs)); PU = Pickup Truck (2,300 kg (5,070 lbs)); M = Standard Test Truck (6,800 kg (15,000 lbs)); and H = Heavy Goods Vehicle (29,500 kg (65,000 lbs))) and the nominal velocity in miles per hour. The ASTM F2656/F2656M Impact Conditions are as follows:

<table>
<thead>
<tr>
<th>Designation</th>
<th>Nominal Test Vehicle</th>
<th>Nominal Velocity</th>
</tr>
</thead>
<tbody>
<tr>
<td>SC30</td>
<td>1,100 kg (2,340 lbs)</td>
<td>30 mph (50 km/h)</td>
</tr>
<tr>
<td>SC40</td>
<td>1,100 kg (2,340 lbs)</td>
<td>40 mph (65 km/h)</td>
</tr>
<tr>
<td>SC50</td>
<td>1,100 kg (2,340 lbs)</td>
<td>50 mph (80 km/h)</td>
</tr>
<tr>
<td>SC60</td>
<td>1,100 kg (2,340 lbs)</td>
<td>60 mph (100 km/h)</td>
</tr>
<tr>
<td>FS30</td>
<td>2,100 kg (4,630 lbs)</td>
<td>30 mph (50 km/h)</td>
</tr>
<tr>
<td>FS40</td>
<td>2,100 kg (4,630 lbs)</td>
<td>40 mph (65 km/h)</td>
</tr>
<tr>
<td>FS50</td>
<td>2,100 kg (4,630 lbs)</td>
<td>50 mph (80 km/h)</td>
</tr>
<tr>
<td>FS60</td>
<td>2,100 kg (4,630 lbs)</td>
<td>60 mph (100 km/h)</td>
</tr>
</tbody>
</table>
The Medium-duty Truck has the same inertial weight as the DOS test vehicle.

**DOS Impact Conditions:**

DOS Impact conditions are listed in Table 1 of DOS SD-STD-02.01, Revision A and in Section 5.0 DOS SD-STD-02.01. The impact conditions are as follows:

<table>
<thead>
<tr>
<th>Designation</th>
<th>Test Vehicle</th>
<th>Nominal Velocity</th>
</tr>
</thead>
<tbody>
<tr>
<td>K4</td>
<td>6,800 kg (15,000 lbs)*</td>
<td>30 mph (50 km/h)</td>
</tr>
<tr>
<td>K8</td>
<td>6,800 kg (15,000 lbs)*</td>
<td>40 mph (65 km/h)</td>
</tr>
<tr>
<td>K12</td>
<td>6,800 kg (15,000 lbs)*</td>
<td>50 mph (80 km/h)</td>
</tr>
</tbody>
</table>

* This is the same inertial weight as the ASTM F 2656 Medium-duty Truck; K4 = M30, K8 = M40 and K12 = M50.

**Penetration Rating**

The crash rated active vehicle barriers are to withstand an impact corresponding to [ASTM F2656/F2656M, Impact Condition OF [M50][M40][M30][SC30][SC40][SC50][SC60][FS30][FS40][FS50][FS60][PU40][PU50][PU60][H30][H40][H50][H60][PU40][PU50][PU60][H30][H40][H50][H60]] where the letter(s) correspond to the test vehicle and the last two digits correspond to the test velocity in mph [or DOS [K12][K8][K4]].

**NOTE:** The Penetration Rating defines the permissible distance that the design vehicle may travel beyond the pre-impact inside edge of the barrier under the specified Impact Conditions.

The most current Penetration Rating system is from ASTM F2656/F2656M (Table 2). The penetration rating is based on the dynamic penetration of the test vehicle as shown in the following table.

<table>
<thead>
<tr>
<th>Designation</th>
<th>Dynamic Penetration Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>P1</td>
<td>&lt;= 1 m (3.3 feet)</td>
</tr>
<tr>
<td>P2</td>
<td>1.01 to 7 m (3.31 to 23 feet)</td>
</tr>
<tr>
<td>P3</td>
<td>7.01 to 30 m (23.1 to 98.4 feet)</td>
</tr>
</tbody>
</table>

The DOS SD-STD-02.01 Revision A standard does not include a variable penetration rating system and passes only barriers that limit penetration of the front edge of the cargo bed to one meter beyond the pre-impact, inside edge of the barrier. This is roughly equivalent to an ASTM F2656/F2656M P1 rating.
Insert one of the "P" ratings from the above chart.

Energy absorbing barriers (net style) will allow a greater penetration the longer the barrier i.e. the more lanes it covers. Be sure to edit accordingly to account for the longer penetration distance.

[When subjected to the specified Impact Condition, vehicle barriers are to respond with Penetration Rating equal to or better than [P1][P2][P3] as defined in ASTM F2656/F2656M.]

NOTE: A previous Penetration Rating system was presented in the 1985 DOS SD-STD-02.01. While this penetration rating system has not been used by DOS since 2003, it is still used by the DOD. Some of the early barrier systems were tested to this standard and the designer may therefore decide to include barriers with penetration ratings certified under 1985 DOS ST-STD-02.01 as an option in the specification. The 1985 DOS ST-STD-02.01 rating system should only be included in addition to the ASTM rating system.

<table>
<thead>
<tr>
<th>Designation</th>
<th>Dynamic Penetration Rating</th>
<th>Meets ASTM Designation</th>
</tr>
</thead>
<tbody>
<tr>

</table>

The 1985 DOS SD-STD-02.01 also includes an L4.0 penetration rating for distances exceeding 50 feet, but barriers with this rating are not included on the DOD list of certified barriers. It is recommended that the following paragraph be included to reduce the potential for confusion with barriers tested prior to 2003. Insert the "L" rating which corresponds with the "P" rating included in the above paragraph. If appropriate, identify each barrier with its own rating.

[For DOD certified barriers, use the Penetration Rating of L3.0][L2.0][L1.0] or better.]

2.3.3 Operators

[Provide manual crash rated active vehicle barriers.] [Provide [electric (electromechanical)] [or] [hydraulic][or] [pneumatic] crash rated active vehicle barriers.]

2.3.4 Vehicle Loads

All roadway components are to be capable of supporting a 14515 kg 32,000 pound axle load or a 7257.5 kg 16,000 pound wheel load. Provide a load design in accordance with AASHTO GDHS-5.
2.3.5 Bicycle Safety

For bicycle safety, do not make grooves greater than 13 mm 1/2-inch wide and 152 mm 6-inches long parallel to the drive path.

2.3.6 Roadway Obstruction

When a barrier is in the "Access Allowed" position, no element in the drive path is to extend above the surrounding grade. Taper all changes in grade.

2.3.7 Dimension Requirements

 **************************************************************************

NOTE: Include dimensional requirements for applicable crash rated active vehicle barriers. Minimum and maximum widths, heights and spacing should be specified to suit site conditions and the threat vehicle characteristics.

**************************************************************************

Provide crash rated active vehicle barrier dimensions with the same dimensions of the barrier tested in the Proof of Performance test(s) and as documented [in the Crash Test Report] [and described in the DOS or DOD Certification Letter]. [Additional requirements are listed below.]

2.3.7.1 Bollard Height

 **************************************************************************

NOTE: The bollard height cannot be less than the as tested condition. Bollard heights vary in range for different manufacturers and associated barriers. The minimum bollard height specified must be sufficient to completely engage the frame rails of the threat vehicle.

**************************************************************************

Minimum height of bollards is not be less than the as tested condition[ or [____ ] m [____] feet].

2.3.7.2 Bollard On Center Spacing

 **************************************************************************

NOTE: The on center spacing of individual bollards ensures that the design-sized vehicle will not gain access between the bollard systems and when approaching perpendicular to the bollard system will impact at least one bollard. Spacing cannot exceed the spacing in the as tested condition, typical on center spacing ranges from [0.91 m][ 3 ft] to [1.5 m] [5 ft]. Consult criteria for spacing limitations.

**************************************************************************

Maximum on center spacing of bollards is not more than the as tested condition[ or [0.9][ ] m [3 feet][__ feet]].

2.3.7.3 Structural Footprint Dimensions

 **************************************************************************

NOTE: On some crash rated active vehicle barriers, the buttress structural footprint can be large and may not fit on all sites. If the site is confined and a buttress will be present then include the
following paragraph; otherwise, delete.

Structural footprint dimensions are not to exceed [_____] mm[_____] inches wide (perpendicular to roadway) x [_____] mm[_____] inches long (parallel to roadway). Test crash rated active vehicle barrier buttress at the same rating specified. Configure barrier so that there is a minimum roadway width of [_____] mm[_____] inches between buttresses structural footprint or roadside support system.

2.3.7.4 Clear Distance

Configure barrier so that there is a clear distance of [_____] m[_____] feet between the buttresses structural footprint or roadside support systems.

2.3.7.5 Crash Rated Active Vehicle Barrier Length

NOTE: If active net crash rated active vehicle barriers are specified and the system length needs to be limited, include that information in the following paragraph.

Ensure system length does not exceed [_____] mm[_____] inches (perpendicular to roadway).

2.3.7.6 Portable Barrier Width

NOTE: Include the following bracketed statement if portable barriers are specified and the overall dimensions are to be limited.

Ensure overall system width, including all supporting structures and operating enclosures, is no more than [_____] mm[_____] inches.

2.3.8 Operation Speeds Excluding Crash Gates

NOTE: The normal time to transition from the "allow access" position to the "deny access" position should take into consideration operational and security plans and barrier configurations. Emergency Fast Operation (EFO) is the rapid deployment of the barrier to deny vehicle access.

Edit paragraph c below appropriately. Projects with hydraulic systems or pneumatic systems may not reverse. Also, those projects with final denial type barriers, as opposed to access control, typically do not need the barrier to be instantly reversible.

Paragraphs 'a', 'b', and 'c' are intended for all types of barriers but crash gates. Crash gates are a distance per time and not a flat time. Speeds for crash gates is covered in the paragraph on Crash Gates and are not suitable for an EFO operation. Crash beams that operate vertically, horizontally or
slide typically do not have a speed association and are not suitable for EFO operation.

a. When in manual mode (normal mode), the time to transition to "deny access" is [3][8][_____] seconds or less and the time to "allow access" is [3][_____] seconds or less.

b. Emergency Fast Operation (EFO) time is to be [2][_____] seconds or less.

c. When the barrier is transitioning from the "deny access" position to the "allow access" position, the barrier is to be reversible when EFO is initiated.

2.3.9 Failure Modes of Operation

NOTE: Include the following bracketed paragraph if powered crash rated active vehicle barriers are specified.

It may also be necessary to manually control the barrier to change the position to either the 'access allowed' or 'access denied' position.

For hydraulic and pneumatic barriers, a system of check valves and accumulator pumps (compressor for pneumatic) may be used for maintaining or changing the position of the barrier. A catastrophic failure of the hydraulic or pneumatic lines, depending on the location in the system where it occurs, may cause the barrier to be in the 'access allowed' position.

Design the system to remain in the last commanded position in the event of [[hydraulic,][ pneumatic,][ electrical,][ or mechanical]] failure.

a. Design the system so that unauthorized personnel cannot manually manipulate the barrier into the "access allowed" position in the event of a power outage. Locks and tamperproof screws and bolts are examples of acceptable means to prevent unauthorized access.

b. Design the system to allow authorized personnel to manually manipulate the barrier into the "access allowed" and "access denied" position in the event of a power outage or operator failure. Barriers are to be capable of being raised and lowered using a recessed handle on the top surface of the barrier or a manual hydraulic pump or other means when the hydraulics or electric motors are not operational. The operation is to require no more than 267 N 60 pounds of force to operate.

c. Provide check valves on [hydraulic][pneumatic] systems if loss of hydraulic pressure can result in the barrier moving to the "access allowed" position.

d. Design the system to maintain the barriers in the raised position, without inspection, for periods of time of up to 1 week. [If a hydraulic system is used, provide pressure relief valves to prevent overpressure. Continuous running of the motor to stay in the raised position, excluding the use of manual pinning to do so is not allowed.]
If a pneumatic system is used, provide pressure relief valves to prevent overpressure. Continuous running of the compressor to stay in the raised position, excluding the use of manual pinning to do so is not allowed.

2.3.10 Manual (Non-Powered) Barrier Operation

NOTE: If specifying a manual barrier, include the following paragraph.

Barriers are to be capable of being raised and lowered using a recessed handle, rope or other means. The force required to open/close needs to be less than 267 N (60 pounds) of force. Provide a lockable mechanism to secure the barrier in both the full "access allowed" and "access denied" positions.

2.3.11 Crash Rated Active Vehicle Barrier Foundations

NOTE: Many of the Crash Rated Active Vehicle Barriers (gates, retractable barriers, crash beams) have variations which include a shallow foundation or are surface mounted, for areas with multiple underground utilities or that have high water tables. If there are specific foundation depth requirements, include this paragraph by selecting the bracketed statement that is applicable to the project. Barriers such as drum or bollards will have deeper foundations.

Foundation systems are to be shallow with required depths no more than [600 mm][_____] [24 inches][_____] [Provide surface mounted crash rated active vehicle barriers.]

2.3.12 Lane Coverage

NOTE: In some instances, single fixed-width barriers are installed to protect more than one lane of traffic or multiple barriers are installed to protect a single lane of traffic. The following paragraph should be included when specifying fixed-width barriers. Designer is to fill in the number of lanes and the number of barriers. Note: ASTM F2656/F2656M section 8.2.5) discusses the impacts of single barriers protecting more than one traffic lane. The ASTM document suggests demonstrating performance for this configuration by performing impact tests at 1/3 points for 3 lanes, ¼ points for 4 lanes, etc. This testing is not included in this specification due lack of feasibility to require that crash rated active vehicle barriers be identical to tested barriers, and also requiring testing based on actual lane configurations. There are too many potential permutations to require testing.

Provide and install a quantity of [_____] fixed-width barrier[s] to protect [_____] roadway lane[s].
2.3.13 SAFETY EQUIPMENT

Provide a safety bar with each retractable or raising crash beam barrier to secure the barrier in the open position during maintenance operations. Provide other equipment recommended for safety when working on the barrier.

2.4 CRASH RATED ACTIVE VEHICLE BARRIER(S)

**************************************************************************
NOTE: This section covers various types of crash rated active vehicle barriers. Delete those types of barriers not in the contract.
**************************************************************************

2.4.1 RETRACTABLE BARRIERS

**************************************************************************
NOTE: Retractable barriers consist of steel plates, rotating steel wedges or steel frames which rise to deny access and retract to allow access. Retractable barriers are generally installed with one barrier protecting a single traffic lane. When in the "access denied" position, retractable barriers provide limited pedestrian control. Retractable barriers are operated by hydraulic, pneumatic, electric, and manual means. Retractable barriers are available with standard depth, shallow depth, and surface mounted foundations.
**************************************************************************

In addition to meeting the design and performance requirements of this SECTION, retractable barrier systems are to conform to the following system-specific requirements.

[Barrier is to be electromechanical with no hydraulic fluid or pneumatics used.] [Barrier is allowed to be electromechanical or hydraulic.][Barrier is allowed to be electromechanical, hydraulic or pneumatics.]

2.4.1.1 Configuration

Retractable barriers are to be made of [steel plate][, rotating steel wedges][, or steel frames].

2.4.1.2 Buttresses

**************************************************************************
NOTE: retractable barriers can be configured with or without side buttresses. If space is limited, or for other reasons, it may be necessary to specify a configuration without buttresses. If so, include the following bracketed paragraph.
**************************************************************************

Do not provide above-grade buttresses with the retractable barriers.

2.4.1.3 Powered Retractable Barrier

**************************************************************************
NOTE: Based on peak hourly volumes, fill in number of cycles per hour that the barrier will be required to function (maximum 300 complete up/down cycles per
Barriers used in a final denial configuration (deployed upon a threat) do not need more than around 60 cycles per hour.

Most applications do not require the barrier to be reversible and some systems such as hydraulic may not be reversible. The standard safety schemes found in Appendix A do not require this feature. The reversible feature is provided on some barriers so that when a barrier is deploying and an event happens, such as a vehicle activates a safety loop, the barrier will stop and then open. Note that this time to stop and reverse to fully open will take time and may not prevent a vehicle impacting the crash rated active vehicle barrier.

Provide a retractable barrier that is capable of [_____] complete up/down cycles per hour. [Provide a retractable barrier where the motion of the barrier can be stopped and reversed prior to it becoming fully open or fully closed.]

2.4.2 ACTIVE NET BARRIERS

NOTE: Energy Absorbing crash rated active vehicle barriers are a type of crash rated active vehicle barrier system. Active vehicle barriers under this category normally have shallow mount foundations and secure more than one lane of traffic with a single barrier.

When specifying this type of barrier, be aware that there are only a few barriers that meet this category so in order to ensure competition one may have to allow more than one type of actuator e.g. allow electric and hydraulic.

Provide active net barrier systems that meet the design and performance requirements of this SECTION. Provide active net barriers that consist of a [cable/net system][,] [cable/post system][,] [or] [rising gate systems]. Energy absorbing barrier systems are to have a minimum testing frequency of one week and not require any specialized equipment or trained personal to return to the "access allowed" position.

2.4.3 RETRACTABLE BOLLARDS

NOTE: Retractable bollard systems consist of steel cylinders which rise out of the ground to deny access and retract to "access allowed" position. Retractable bollards are generally installed in groups of 3 or more, as needed to protect the traffic lane, and are installed to rise and retract together. Retractable bollards do not provide pedestrian control. Retractable bollards come in hydraulic, pneumatic, electric and manual retractable configurations. There are no shallow or surface mounted bollard systems.
A bollard system is to consist of a minimum of 3 bollards spaced no more than 1220 mm 48 inches from centerline to centerline of bollards across a 3.0 m 10 foot roadway. Bollards in the lowered position are to be capable of supporting a 71 kN 16,000 pound wheel load each. Design in accordance with AASHTO GDHS-5 for this load.

2.4.3.1 Number of Bollards

The minimum allowable number of bollards cannot be no less than the number [tested] [described in the [DOS][ or] [DOD] Certification Letter].

2.4.3.2 Bollard Operations

**************************************************************************
NOTE: Indicate if bollards are to operate together or independently. Select appropriate requirements below. Most manufacturers have a set of three bollards for a lane that operate in unison.
**************************************************************************

[a. Provide a bollard system where each bollard is operated independently from the other bollards.

[b. Each bollard is to have its own controls.

[c. Bollards must operate in sets. Each set of bollards contains [_____] bollards. A set of bollards will be provided to protect [_____] [a single lane of traffic].

[d. Each set of bollards has its own controls and operate independently from each other set within the system.

2.4.3.3 Decorative Covers

**************************************************************************
NOTE: Some manufacturers can provide retractable bollards with decorative covers. If required for project, include the following paragraph. The designer should consider possible conflict with marking requirements prior to specifying decorative covers. If cover profiles are not shown in the drawings, designer should provide descriptive information in the paragraph below.
**************************************************************************

Provide decorative covers as shown in the drawings. Provide decorative covers fabricated by the bollard manufacturer, and designed to function with the retractable bollard system without interfering with the operation of the system. Fabricate decorative covers of durable material appropriate for the project’s location and environmental conditions. Submit a sample decorative cover for approval.

2.4.3.4 Powered Retractable Bollards

**************************************************************************
NOTE: Based on peak hourly volumes, fill in number of cycles per hour that the barrier will be required to function (maximum 300 complete up/down cycles per hour).
**************************************************************************
Provide a retractable bollard capable of [_____] complete up/down cycles per hour. Provide bollards capable of being raised or lowered within a 3 to 15-second range during normal use and within 2 seconds for emergency operations.

2.4.4 CRASH GATE

**************************************************************************

NOTE: Crash gates either slide across the traffic lane or swing from a hinge point on one or both sides of the traffic lane. The gate is supported by steel buttresses on either side of the opening. Crash gates are available with shallow or surface mounted foundations. Crash gates that are used for pedestrian and vehicle control need to have the taller dimension.

choose a speed that is suitable for the application. Some manufacturers do not have the high rate of speed indicated. Most manufacturers have a standard range that they can meet. Most can meet the two lower speeds indicated.

**************************************************************************

The crash gate consists of steel buttresses anchored into the ground and an above grade assembly consisting of a heavy steel structure or a combination of heavy steel and structural aluminum capable of being opened and closed. The height of the gate must be at least [0.762] [2.1] [_____] m [30] [84] [_____] inches from the road surface to the top of the gate frame. The length closes and protects a minimum [3.0] [_____] m [120] [_____] inch clear opening. Provide an operator for the crash gate that opens and closes the gate at an operating speed of [9.1] [13.7] [18.3] [36.6] [_____] meters per minute [30] [45] [60] [120] [_____] feet per minute.

2.4.4.1 Configuration

Crash gates consist of [track sliding gate systems,] [cantilever sliding gate system,] [single leaf swing gate system].

[Sliding gates slide to the [left] [right] when facing the gate from the attack side.]

[Single leaf gate systems swing [inward in the direction of the secure side] [outward in the direction of the attack side] and swing to the [left] [right] when facing the gate from the attack side.]

2.4.4.2 Fence Fabric

**************************************************************************

NOTE: Crash gates may be installed with fence fabric so they are part of a fence system. If the crash gate is to be installed with fence fabric, the edit the following paragraphs. If fence fabric is not required, then delete the paragraphs.

**************************************************************************

a. Fence fabric can either be from the same manufacturer as the gate system or the attachments, coordinate dimensions, and fittings between the gate system and fence fabric manufacturer.
b. Fence Fabric consists of [vertical metal pickets] [chain link fence] [ballistic panels] [welded wire mesh] [wire fence] [______].

c. Fence Fabric and gates must meet the requirements of Section[s] [32 31 13 CHAIN LINK FENCES AND GATES] [32 31 13.53 HIGH-SECURITY FENCES (CHAIN LINK AND ORNAMENTAL) AND GATES] [32 31 26 WIRE FENCES AND GATES].

2.4.4.3 Powered Crash Gate

Control gate movement by [an electro-mechanical gate operator] [or] [a hydraulic gate operator] consisting of an operator unit with required control circuits and operator station. Provide a system that utilizes 24 vac (nominal) or, as an option 24 Vdc control and operating voltages. Provide a remote control master station that is capable of driving the gate at [[_____] m per second] [[_____] degrees per second] for a swing gate. Unless otherwise indicated, motors are to have [drip-proof] [totally enclosed] enclosures.

Design the system to prevent opening of the crash gate in the event of electrical or mechanical failure. Provide a disconnect system for the gate drive that allows manual operation of the barrier in the event of a power outage.

2.4.4.4 Manual Crash Gate

Provide a manual crash gate that is capable of being hinged from either side. Provide a hinge point on each buttress that contains a locking pin with padlock acceptance for securing the crash gate in the closed position.

2.4.5 CRASH BEAM

**************************************************************************

NOTE: A crash beam barrier consists of a beam across the traffic lane which is supported on either side of the roadway with concrete or steel buttresses. Generally, a crash beam is a vertical pivot, that operates by raising to allow access and lowering to deny access. The barrier pivots about a hinge point at one of the buttresses and is secured with a locking/pin mechanism on the other buttress. There are, however, several models on the market which allow and deny access with a vertically rising beam which remains parallel with the roadway surface (similar to a lift bridge), or swing horizontally. A crash beam can be hydraulically, electrically or manually actuated and is available in surface mounted configurations.

**************************************************************************

Provide a crash beam that consists of an above-grade assembly that, in the "DOWN" position, presents a visible obstacle to approaching vehicles. Provide a barrier with a minimum height of 750 mm 30 inches as measured from the roadway surface to the centerline of the crash beam. Provide a crash beam that is capable of blocking a minimum road width of [3.0] [_____] m [120][_____] inches. Provide a crash beam end that contains a locking pin with padlock acceptance for securing the crash beam when it is in the "DOWN" position.
2.4.5.1 Vertical Rising/Lifting Crash Beam

NOTE: This barrier is able to have an EFO operating mode and slower modes of operation. Typical maximum opening is around 7.3 meters/24 feet. Most of these tend to be hydraulically operated.

Provide a vertical rising (lifting) crash beam.

2.4.5.2 Vertical Pivot Crash Beam (Drop Arm)

NOTE: The barrier may or may not be suitable for EFO operation. It will depend on the specific model and the length of the beam arm. If the arm is normally in the open position, then take into account prevailing wind speed in the area. Most of these barriers tend to be hydraulic, electric (electro-mechanical), or non-powered.

Provide a vertical pivot crash beam.

2.4.5.3 Horizontal Sliding Crash Beam

NOTE: This barrier is not suitable for EFO operation. Most of these barriers tend to be hydraulic or non-powered. This barrier is available, but not as common.

Provide a horizontal sliding crash beam.

2.4.5.4 Horizontal Swing Crash Beam (Barrier Arm)

NOTE: This barrier is not suitable for EFO operation. The longer the arm, the more time it will take to open and close. Most of these barriers tend to be hydraulic or non-powered.

2.4.5.5 Powered Crash Beam

Provide a [hydraulic power system] [or] [electro-mechanical system] for the crash beam that is capable of being raised or lowered within 8 to 15 second time range. Provide the crash beam with a disconnect system that allows manual operation of the barrier in the event of an electrical or mechanical failure.

2.4.5.6 Manual [Non-Powered] Crash Beam

Counterbalance the crash beam so it can be manually raised and lowered with the aid of a counterbalanced end requiring approximately 267 N 60 pounds of force.
**2.4.6 PORTABLE CRASH RATED RETRACTABLE BARRIER**

NOTE: Portable crash rated active vehicle barriers are able to be transported by using equipment (trucks, forklifts, etc) and are able to be erected in a relatively short amount of time. These systems will not be for permanent use and will therefore be surface mounted. They will also not have all of the wiring and control devices required for the permanent crash rated active vehicle barriers. These barriers can be portable retractable barriers, crash beams and crash gates. They can be manually actuated, powered but self contained, or powered via an external power supply.

Provide a portable crash rated retractable barrier that is transportable. When in the raised position, the total barrier height is to be no less than [750] mm [30] inches above the roadway surface and must be [_____] mm [_____] inches wide. Equip the barrier with entrance/exit ramps when the barrier extends more than 16 mm 5/8 inch above the roadway surface. Retractable barriers in the lowered position must be capable of supporting a 142 kN 32,000 pound axle load or a 71 kN 16,000 pound wheel load. Design for this load is to be accordance with AASHTO GDHS-5. Portable crash rated retractable barriers are to be anchored in accordance with the manufacturer instructions. This may include stakes or other means.

Portable barriers must be able to be moved via [integral wheels and tow package] [or] [and] [forklift] [______].

**2.4.6.1 Powered Portable Crash Rated Retractable Barrier**

NOTE: Based on peak hourly volumes, fill in number of cycles per hour that the barrier will be required to function (maximum 300 complete up/down cycles per hour).

Provide a portable crash rated retractable barrier that is capable of [______] complete up/down cycles per hour. Provide a retractable barrier that is capable of raising the barrier from the lowered position to the raised position within 8 seconds during normal use, and within 2 seconds during an emergency. Also, provide a barrier that is capable of being closed from the raised position to the lowered position in not more than 3 seconds. Equip portable power assisted retractable barriers with on and off ramps for smooth transition between surfaces when the barrier extends more than 16 mm 5/8 inch above the roadway surface. Anchor the barrier in accordance with the manufacturer instructions. Provide a barrier that is [electro-mechanical] [or] [hydraulic].

Provide a portable barrier that is of the [retractable barrier] [or] [crash gate] type.

**2.4.6.1.1 Failure Modes of Operation**

Design the system to prevent lowering of the barrier in the event of hydraulic, electric, or mechanical failure. Include a manual pump for operation of hydraulic and/or mechanical barriers without power.
2.4.6.1.2 System

Design the system to maintain the barriers in the raised position, without inspection, for periods of time of up to 1 week. If a hydraulic system is used, equip it with a pressure relief valves to prevent overpressure.

2.4.6.1.3 Controls

**************************************************************************

NOTE: Portable system can be connected into larger control systems, but typically these are temporary or remote. Coordinate the choices below with the Control Panel Components and Construction. This paragraph is not required if using more than a control station that is part of the crash barrier.

If an umbilical cord set-up is required, then pick the desired length. Going over 6 meters/20 feet is not standard.

**************************************************************************

[Provide an open/close pushbutton station at the crash barrier location. ]
[Provide an open/close pushbutton station on a [3][6][_____] meter [10][20][_____] feet flexible cord. ][Provide EPO Operation.]

2.4.6.2 Manual Crash Rated Retractable Portable Barriers

Provide a manual barrier capable of being raised and lowered by manual means such as levers or hydraulics requiring a maximum 267 N 60 pounds of force. Provide a manual mechanism that contains a locking pin which accepts a padlock for securing the barrier when it is in the "UP" position and is also capable of being locked in the "DOWN" position. Provide a retractable barrier to withstand a [_____] kg pound vehicle at impact speed of [_____] km/hour mph, with maximum barrier deflection or vehicle penetration of [_____] m feet.

2.4.7 PORTABLE PIVOTING OR SWINGING CRASH BEAM

Provide a portable crash beam with an above-grade assembly that, in the "DOWN" position, presents a visible obstacle to approaching vehicles. Provide a barrier with a minimum height of 750 mm 30 inches as measured from the roadway surface to the centerline of the crash beam. Provide a crash beam that is capable of blocking a minimum road width of [3.0] [_____] m [120][_____] inches. Provide the crash beam end with a locking pin with padlock acceptance for securing the crash beam when it is in the "DOWN" position.

2.4.7.1 Controls

**************************************************************************

NOTE: Portable system can be connected into larger control systems, but typically these are temporary or remote. Coordinate the choices below with the Control Panel Components and Construction. This paragraph is not required if using more than a control station that is part of the crash barrier.

If an umbilical cord set-up is required, then pick the desired length. Going over 6 meters/20 feet is
not standard.

EFO operation is not used with this type of barrier.

**************************************************************************

[Provide an open/close pushbutton station at the crash barrier location. ]
[Provide an open/close pushbutton station on a [3][6][_____] meter
[10][20][_____] feet flexible cord. ]

2.4.7.2 Powered Portable Crash Beam

Provide a hydraulic power system for the portable crash beam that is capable of being raised or lowered within 8 to 15 second time range.

Provide a disconnect system for the portable crash beam to allow manual operation of the barrier in the event of an electrical or mechanical failure.

2.4.7.3 Manual Portable Crash Beam

Provide a crash beam that is manually operated by means of a counter balanced system requiring approximately 267 N 60 pounds of force.

2.5 POWER UNIT

2.5.1 HYDRAULIC POWER UNIT ENCLOSURE

**************************************************************************

NOTE: Based on manufacturer's system layout the hydraulic platform unit should be located above ground. The hydraulic oil viscosity must remain within its operating range, even after barrier non-use. If ambient temperature drops below -7 degrees C (20 degrees F) then hydraulic power unit needs to be equipped with proper hydraulic oil, hydraulic oil heater, insulated and heated hydraulic lines, and underground hydraulic oil lines in pipes. If ambient temperature exceeds 38 degrees C (100 degrees F) then the manufacture must supply efficient cooling and proper hydraulic oil for oil viscosity to remain within its operating range, even at constant heaviest use rate. If ambient temperature range requires the oil to be changed, the manufacturer must supply information on type of oil to be used and instructions for changing. Fill in the high and low air temperature of the area where the barrier will be installed.

Hydraulic operated barrier systems will contain synthetic biodegradable hydraulic fluid. Provide fluid that meets International Organization for Standardization (ISO) Grade 32 for cooler climates or ISO Grade 46 for temperate zones. Barriers for tropical or desert areas require a heavier grade, verify grade requirements with local suppliers. Based on barrier cycling and climate data, decide if a hydraulic fluid heater is required.

**************************************************************************

Provide the hydraulic power unit with synthetic biodegradable hydraulic fluid.
fluid. Provide fluid ISO Grade that is appropriate for the temperature ranges listed in the Environmental Conditions Section of this specification. Submit recommended Hydraulic Fluid manufacturer's data for approval. Provide a hydraulic thermostatically controlled fluid heater so that the viscosity remains within its operating range if ambient temperatures below minus 7 degrees C 20 degrees F are expected. Buried hydraulic lines for the connection of the hydraulic power unit to the barrier are to consist of flexible or carbon steel pipe, or a combination of flexible and carbon steel pipe. Flexible and rigid hydraulic line working pressures are to exceed the maximum system relief pressure. Where hydraulic lines are placed underground, provide a casing pipe consisting of PVC pipe and fittings in accordance PVC Type EPC-40 if concrete encased or EPC-80 if not concrete encased in accordance with NEMA TC 2 and UL 651. Provide a HPU cabinet that is capable of containing leakage and slope hoses containing hydraulic hose pipes to drain to containment.

a. Provide flexible hydraulic lines that are in accordance with SAE J517.

b. Provide rigid hydraulic lines that are seamless carbon steel pipe in accordance with ASTM A106/A106M.

Place the unit on a reinforced concrete pad or other approved pad material in a prefabricated weatherproof metal enclosure. Provide a containment area; i.e., depressed floor or catch pan, to ensure capture of the total amount of hydraulic fluid within the hydraulic power unit. Access door or doors are provided to meet the maintenance requirements of the unit. The physical location of the unit is on the protected side of the area.

Unless otherwise indicated, provide electric motors with [drip-proof] [totally enclosed] [totally enclosed fan cooled] enclosures. All couplings, motor shafts, gears, and other moving parts are to be fully guarded in accordance with 29 CFR 1910 Subpart O. Provide guards that are removable without disassembling the guarded unit. For multiple barriers operated from a single hydraulic unit it is highly recommended that the electric motor be 3-phase. This paragraph assumes motors are installed above grade.

2.5.2 ELECTRIC POWER UNIT ENCLOSURE

Provide a NEMA Type 3R enclosure as specified in NEMA 250 to enclose the electric power unit. Design the enclosure for easy removal of the power unit and other accessories without complete removal of the enclosure. Provide an access door with hinges and an inside and outside operable/lockable (exterior) door latch. Place and configure equipment within the enclosure so that all periodic maintenance can be performed through the access door without removal of the equipment. Equip the enclosure with weatherproof louver vents appropriately sized and located to dissipate internal heat generation.

2.5.3 PNEUMATIC POWER UNIT ENCLOSURE

Provide a NEMA Type 3R enclosure as specified in NEMA 250 to enclose the power unit. Design the enclosure for easy removal of the compressor and other accessories without complete removal of the enclosure. Provide an access door with hinges and an inside and outside operable/lockable (exterior) door latch. Place and configure equipment within the enclosure so that all periodic maintenance can be performed through the access door without removal of the equipment. Equip the enclosure with weatherproof louver vents appropriately sized and located to dissipate internal heat.
2.6 HEATER

Provide a waterproof barrier heater with a thermostat control and NEMA 4 junction box connection point for de-icing and snow melting. Provide a heater that ensures proper barrier operation is maintained down to an ambient temperature of minus 40 degrees C minus 40 degrees F. [Provide a [_____] [250]-watt heater for each retractable bollard.]

[Provide heat tape in the drain pipe system that is controlled by the same thermostat for the barrier heater or by a separate thermostat.]

2.7 FINISH AND MARKINGS

Provide signs and markings that meet retroreflectivity requirements as contained in the MUTCD under Part 2 Signs sections on 'Retroreflectivity', 'Maintaining Minimum Retroreflectivity', and 'Shapes' plus ensure all state and local retroreflectivity requirements are satisfied. Paint surfaces in accordance with requirements of Section 09 90 00 PAINTS AND COATINGS.

Use red and white stripe marking on all crash rated active vehicle barriers (and actuated traffic arms) as required for a stop condition by AASHTO RSDG-4. Provide vertical striping and lights (unless otherwise noted in this SECTION) as per MUTCD Part 8B Signs and Markings, Section on 'Crossbuck Assemblies with YIELD or STOP Signs at Passive Grade Crossings'.

a. Provide bollards with full retroreflective markings. Provide bollards that alternate retroreflective colors red and white with the red starting on the side nearest the curb.

b. Paint wedge, frame, beam, and post type barriers with vertical red/white alternating retroreflective striping that is approximately 400 mm 16 inch wide and covers the entire exposed area of the barrier. Since barriers will vary in width, the striping can be adjusted wider or narrower to have it work so each stripe is the same width.

c. For Crash Gates markings will be provided by the installation of retroreflective markings on the both sides of the gate that are visible to the drivers. It will consist of alternating vertical retroreflective red and white stripes. Markings are to provide the same color scheme, retroreflective performance and durability as required in this SECTION.

Provide markings on both the front and back of the crash rated active vehicle barriers. Provide non-skid, durable markings that are part of the roadway (i.e. backside of plate barriers or the top of retractable bollards), and ensure retroreflectivity is maintained based on expected traffic flow (see paragraph PROJECT/SITE CONDITIONS of this SECTION) for a minimum of two years.

Markings on surfaces that are not part of the roadway must meet requirements of ASTM D4956, Type III or better and MUTCD.

Provide signing as shown in the drawings. A minimum sign sheeting of MUTCD Part 6F Temporary Traffic Control Device Zone Devices, Section on Channelizing Devices, Type III sign sheeting is to be used for regulatory and warning signs. Provide all sign posts with a breakaway design as set forth in AASHTO RSDG-4 or as required by the local/State Department of...
Transportation.

Provide a retroreflective white pavement marking envelope consisting of 305 mm 12 inches wide white stripes at 45 degree angle separated by a 610 mm 24 inches clear space at the crash rated active vehicle barriers. Provide an envelope that is full lane width and at least 2.4 meters 8 feet in length.

2.8 SIGNAGE

**************************************************************************
NOTE: Load limit signs based on allowable single axle loads for highways of 80 kN (18,000 pounds) and maximum tandem axle loads of 142 kN (32,000 pounds) are required for subsurface vehicle barriers, except bollards, at entry control points (ECPs). Signage must conform to MUTCD.
**************************************************************************

Provide a sign that conforms to MUTCD sign (R12.2) and reads "Axle Weight Limit 9 Tons 8 metric tons".

2.9 ACTIVE VEHICLE BARRIER CONTROL SYSTEM (AVBCS)

2.9.1 General Requirements

**************************************************************************
NOTE: Delete reference to remote control panel if it is not applicable.
**************************************************************************

The AVBCS provides alarm, status, and control information to the [Master Control Panel], [Remote Control Panel(s), ] [Guard Booth Control(s) (panels and buttons), ] [Search Area Control Panel(s), ] [Search Building Control Panel, ][Overwatch Position Control Panel, ] [Pedestrian Control Panel, ]and the Local Control Panel(s). A full layout showing the location of the controllers is required. A controller that is installed in a facility requires a complete layout of all equipment to be placed in the room/area to ensure all clearances are maintained. This layout is part of the shop drawings submittal. The control system contains all relays, timers, and other devices and an industrial programmable controller programmed as necessary for the barrier operation. The control panel allows direct interface with auxiliary equipment such as card readers, remote switches, loop detectors, infrared sensors, and [sliding][swinging] gate limit switches. Provide logic to coordinate the barricade and the traffic lights.

2.9.2 System Integration

Provide the AVBCS as an integrated system, including all sub systems specified hereafter. AVBCS hardware and software integration is required to function as one integrated system. The Contractor is responsible for all integration and appetencies required for the system to behave as one system. Supply of separate sub systems without integration is not acceptable. The extent and nature of integration must be extensively documented and demonstrated in the Technical Data and Software Package.

The system is configured with industrial programmable logic controllers.

2.9.3 AVBCS Processor

The AVBCS processor consists of a combination of controllers located within the ACP/ECF that work with the various hand machine interface operating
panels that are either hard control panels (discrete switches, buttons and indicating lights) or touchscreen control panel(s) or a combination of both touchscreen and hard control items.

a. A programmable logic controller (PLC) meeting the requirements listed herein. Provide the PLC or PLCs with the latest software version. This is the main overall controller for the AVBCS.

b. Overspeed controllers are to work in unison with the system to provide the appropriate alarms.

c. Wrong-way controllers are to work in unison with the system to provide the appropriate alarms.

**************************************************************************
NOTE: The EFO is required to be pushbutton or switch with a cover. Touchscreen is not allowed for this operation.
**************************************************************************

d. Human Machine Interface: [Hard-control] [Hard-control panel and touchscreen video-control] [Contractor allowed the option to provide either hard control or touchscreen control or a combination of the two systems; however, EFO is to be hard control] panel operator interface.

e. Vehicle Presence Detection: Controller that operate the vehicle presence detection system(s) are to work in unison with the overall system to provide the appropriate response.

f. Computer control. Controller(s) that are computers (not a PLC or traffic control unit) are not allowed at this time.

**************************************************************************
NOTE: Delete if the red/yellow/green traffic signals associated with the crash rated active vehicle system are NOT located at an intersection.
**************************************************************************

g. Traffic Control Unit. A traffic control unit is to be used when the crash rated active vehicle barrier traffic signals are co-located at an intersection. The traffic control unit is, as a minimum, control the intersection traffic signals and is to interface with the crash rated active vehicle barrier control system.

2.9.4 PROGRAMMABLE LOGIC CONTROLLER (PLC)

2.9.4.1 PLC General Requirements

PLCs area digitally operating electronic apparatus that use a programmable memory for internal storage of instructions for implementing specific functions such as logic, sequencing, timing, counting, and arithmetic through digital or analog input/output modules. PLCs are capable of receiving discrete and analog inputs and, through programming, and are able to control discrete and analog output functions, perform data handling operations and communicate with external devices. Provide PLCs that meet the requirements of Class A computing devices, and are labeled as set forth in 47 CFR 15 and are able to withstand conducted susceptibility test as outlined in NEMA ICS 1, NEMA ICS 2, andIEEE C37.90.1. Provide PLCs that function properly at temperatures between 0 and 50 degrees C 32 and 122 degrees F at 5 to 95 percent relative humidity non-condensing and tolerate
storage temperatures between minus 40 and plus 60 degrees C 40 and plus 140 degrees F at 5 to 95 percent relative humidity non-condensing. Provide an intelligent process controller that can perform both data acquisition and process control functions that has the ability to function independently; that is, perform its function without the need for commands from a separate computer.

2.9.4.2 Modular PLC

Provide PLCs that are based on a modular, field expandable design allowing the system to be tailored to the process control application. The system is expandable through the use of additional hardware and/or user software. As a minimum, provide the PLC with a mounting backplane, power supply module, central processing unit (CPU) module, communications module, and input/output (I/O) module. Group modules together in a mounting rack or cabinet. Ensure the mounting rack backplane provides the communications mechanism to fully integrate the individual modules located within the rack. Provide modules that plug directly into the backplane. The use of wire connectors between modules is not be allowed. Provide a rack or cabinet sized as needed to hold the equipment necessary while performing the required control functions. The system configuration allows for the removal and/or installation of modules under power.

2.9.4.2.1 Central Processing Unit (CPU) Module

The CPU module is a self contained, microprocessor based unit that provides time of day, scanning, application (ladder rung logic) program execution, storage of application programs, storage of numerical values related to the application process and logic, I/O bus traffic control, peripheral and external device communications and self diagnostics.

a. Provide a processor with battery backed static RAM to hold application programs. Provide a battery that is serviceable without taking the processor module out of service. Provide a monitoring system that monitors the battery for a low voltage condition. Provide a low voltage status bit for use by the PLC program.

b. Provide the processor with illuminated indicators readable from the front of the processor module for diagnostics. Provide diagnostic status bits for use by the PLC program.

2.9.4.2.2 Communications Module

Provide a communications module that allows peer-to-peer communication with other PLCs and allows the PLC to communicate with the workstation. Provide a communication module that utilizes the manufacturer's standard communication architecture and protocol, Ethernet architecture and protocol or a combination of these. The communication module is to allow programming of the PLC to be done locally through the use of a laptop computer.

2.9.4.2.3 Power Supply Module

Provide one or more power supply modules as necessary to power other modules installed in the same cabinet. Provide power supply modules that plug directly into the backplane. Auxiliary power supplies may be used to supply power to remote cabinets or modules.

a. Provide power supply modules that use [AC] [or] [DC] power with a
nominal voltage of [120 VAC] [or] [220 VAC] [24 VDC] [_____] plus or minus 5 percent. The power supply module is to monitor the incoming line voltage level and provide over current and over voltage protection. If the voltage level is detected as being out of range the power supply module continues to provide power for an adequate amount of time to allow for a safe and orderly shutdown. Power supply modules are capable of withstanding a power loss for a minimum of 20 milliseconds while still remaining in operation and providing adequate power to all connected modules.

b. Provide each power supply module with an on-off switch integral to the module. If the manufacturer's standard power supply module is not provided with an on-off switch, install a miniature toggle type switch near the PLC and clearly labeled the switch as to its function.

c. Provide power supply modules with an indicating light that is lit when the module is operating properly.

2.9.4.2.4 Input/Output (I/O) Modules

I/O Modules are self contained, microprocessor based units that provide an interface to field devices. Locate the I/O modules in the same mounting rack as the other PLC components. The unit is to plug directly into the backplane of the mounting rack. Each module is to contain visual indication to display the on-off status of individual inputs or outputs. All modules are to be mechanically keyed between the I/O module and the terminal strip to ensure the wiring and modules are correctly matched. Extensive diagnostic indicators are to be available on each module including information on the state of the I/O, along with specific module by module special features such as field wiring faults, blown fuses, and over/under voltage range information.

2.9.4.3 Program Storage/Memory Requirements

The CPU utilizes the manufacturer's standard non-volatile memory for the operating system. Provide the controller with electronically erasable, programmable, read only memory (EPROM) for storage of user programs and battery backed RAM for application memory. The EPROM is loaded through the controller keypad or through the use of a laptop computer. The CPU memory capacity is based on the system's control requirements. The memory capacity is sized such that, when the system is completely programmed and functional, no more than 50 percent of the memory allocated for these purposes is used.

2.9.4.4 Input/Output Characteristics

Each controller allows for analog input, analog output, discrete input and discrete output. The number and type of inputs and outputs for the system is as shown on the drawings or described herein and is to comply with the sequence of control. Include in the system capacity a minimum of 20 percent spare input and output points (no less than two points) for each point type provided. During normal operation, a malfunction in any input/output channel is to affect the operation of that channel only and must not affect the operation of the CPU or any other channel. Analog input circuits are available in +/-10V, +/-5V, 0-10V, 0-5V, or 4-20 mA. Discrete input circuits are available in 5 volt TTL, 10-30 VDC, 18-26 VDC, or 79-132 VAC. Provide all input circuits with a minimum optical isolation of 1500 VRMS and be filtered to guard against high voltage transients from the externally connected devices. Analog output circuits are to be
available in +/-10V or 4-20 mA. Discrete output circuits are to be available in 5 volt TTL, 10-30 VDC, 18-26 VDC, or 79-132 VAC. Provide all output circuits with a minimum optical isolation of 1500 VRMS and filter to guard against high voltage transients from the externally connected devices. Provide a PLC that is able to communicate with a computer or other PLC's via fiber optic cable or copper cable. Provide a PLC processor that is able to process data from Remote Input/Output modules via fiber optic cable or copper cable. Ensure remote Input/Output modules do not require individual programming to function.

2.9.4.5 Wiring Connections

Provide wiring connections that are heavy duty, self-lifting, pressure type screw terminals to provide easy wire insertion and secure connections. Provide terminals that accept two #14 AWG wires. Provide a hinged protective cover over the wiring connections. Provide write-on areas for identification of the external circuits on the cover.

2.9.4.6 On-Off Switch

Provide each controller with an integral on-off power switch. If the controller is not provided with a manufacturer's standard on-off switch, then install a miniature toggle type switch in the control panel near the controller and clearly labeled the switch as to its function.

2.9.4.7 Diagnostics

Provide each PLC with diagnostic routines implemented in firmware. The CPU is to continuously perform self-diagnostic routines that will provide information on the configuration and status of the CPU, memory, communications and input/output. The diagnostic routines are to be regularly performed during normal system operation. Provide a portion of the scan time of the controller dedicated to performing these housekeeping functions. In addition, provide a more extensive diagnostic routine that is performed at power up and during normal system shutdown. The CPU is to log input/output and system faults in fault tables which are accessible for display. When a fault affects input/output or communications modules the CPU is to shut down only the hardware affected and continue operation by utilizing the healthy system components. Annunci ate all faults at master control panel and at the PLC.

2.9.4.8 Accuracy

Provide controllers with an accuracy of plus or minus 0.25 percent of input span.

2.9.5 PLC SOFTWARE

Furnish all PLC software described in this specification as part of the complete control system.

2.9.5.1 Operating System

Provide each PLC with the manufacturer's standard operating system software package. Maintain a point database in its memory that includes all parameters, constraints and the latest value or status of all points connected to the PLC. Use the data in memory resident files for the execution of the PLC application programs. The operating system must support a full compliment of process control functions. It is possible to
define these functions using a mix of function blocks, ladder logic diagrams, sequential function charts and text programming. Base programming methods and interactions on IEC 61131-3. A combination of the programming methods is to be possible within a single controller. The operating system allows loading of software locally. The operating system supports data entry and diagnostics using an operator interface panel attached directly to the PLC. Each PLC is be capable of operating in stand alone mode.

2.9.5.1.1 Startup

Provide the PLC with startup software that causes automatic commencement of operation without human intervention, including startup of all connected I/O functions. A PLC restart program based on detection of power failure at the PLC is to be included in the PLC software. The restart program includes start time delays between successive commands to prevent demand surges or overload trips.

2.9.5.1.2 Failure Mode

Upon failure for any reason, each PLC is to perform an orderly shutdown and force all PLC outputs to a predetermined (failure mode) state, consistent with the failure modes shown and the associated control device.

2.9.5.2 Functions

Provide a controller operating system that is able to scan inputs, control outputs, and read and write to its internal memory in order to perform the required control as indicated in the sequence of control on the drawings. The controller periodically perform self diagnostics to verify that it is functioning properly.

2.9.5.2.1 Analog Monitoring

The system measures and transmits all analog values including calculated analog points.

2.9.5.2.2 Logic (Virtual)

Logic (virtual) points are software points entered in the point database which are not directly associated with a physical I/O function. Logic (virtual) points can be analog or digital points created by calculation from any combination of digital and analog points, or other data having all the properties of real points, including alarms, without the associated hardware. Logic (virtual) points are defined or calculated and entered into the database. The calculated analog point has point identification in the same format as any other analog point.

2.9.5.2.3 State Variables

If an analog point represents more than two (up to 8) specific states, each state is to be nameable.

2.9.5.2.4 Analog Totalization

Any analog point is to be operator assignable to the totalization program. Up to eight analog values are to be totalized within a selectable time period.
2.9.5.3 Alarm Processing

Provide each PLC with alarm processing software for analog input, digital input, and pulse accumulator alarms for all real and virtual points connected to that PLC.

2.9.6 AVB Control System Processing and Control Software

2.9.6.1 General

Specific functions to be implemented are defined in individual system control sequences and database tables shown on the drawings and herein. Provide software that provides the communication, programming and control capabilities necessary to support all specified points and functions, [plus a minimum expansion of [20][25][50][____] percent of the current number of points] complete with their point database. Provide a controller that is online at all times and performs all required functions as specified. Provide software that consists of custom-developed code and/or one or more standard software modules. Where multiple modules are used, the modules need to be capable of sharing data and operating together seamlessly. Provide a system that supports multiple user operations with multiple tasks for each user and supports operation and management of all peripheral devices. Provide a system that allows on-line configuration modifications, while the system is operating. Provide a system that allows the possibility of upgrading the software to newer versions using an automatic mechanism provided by the software manufacturer. Provide software with complete user documentation online, including examples of how to operate the various modules within the software. Supply all documentation implemented software, including the custom-developed software codes to [the Contracting Officer][____] after formal system acceptance. [The Contracting Officer][_____] has the right of use for the provided software for future enhancements and additions to the installed system.]

Ensure the AVB control system does not contain proprietary code or passwords that limit work to be done exclusively by a manufacturer of the product. Provide open source code.

2.9.6.2 Resident Application Software

Provide resident applications programs developed in accordance with paragraph Graphical Object Oriented Programming to achieve the sequences of operation, parameters, constraints, and interlocks necessary to provide control of the systems connected to the control system. All application programs are resident in the PLC and are to execute in the PLC, and coordinate with each other, to insure that no conflicts or contentions remain unresolved.

2.9.6.3 Display Information

Provide information necessary to support all requirements specified at the AVBCLS display, including: guard control commands; alarm notification; status point changes; and report generation

2.9.6.4 Graphical Object Oriented Programming

Provide a system that includes a graphical object oriented programming function which is used to create all control sequences utilized in the control panels. The graphical object oriented programming function provides programming elements to be connected together to create a logic diagram. The diagram must be compliable to produce executable code for the
control panel. Provide a graphical object oriented programming function that includes elements necessary to create logic diagrams that represent sequences of operation. Provide program elements that are able to be combined into a custom template which can then be used as a standard function.

2.9.6.5 Command Software

The provide software for defining and selecting I/O, parameters, and all other functions associated with operation. The operator commands must be usable from keyboards with individual operator passwords as specified. Store the database in non-volatile RAM or other approved means. Static database must downloadable to backup devices.

2.9.6.6 Command Input and Errors

Provide command menus that utilize full words and acronyms selected to allow programmers/technicians to use the AVBCS without extensive training or data processing backgrounds. The AVBCS will issue a prompt to the programmer/technician. Insure the AVBCS supervise programmer/technician inputs to ensure they are correct for proper execution. Insure programmer/technician input assistance is provided whenever a command cannot be executed because of input errors.

2.9.6.7 Special Functions

The AVBCS supports the following special functions by using a mouse or touchscreen, in addition to all other commands specified:

a. The Help display will produce a display of all commands available to the operator. The help command, followed by a specific command, produces a context sensitive listing with a short explanation of the purpose, use, and system reaction to that command.

b. Print Report allows the operator to print reports.

2.9.6.8 Alarms

The software alarms is to notify a programmer/technician of the occurrence of an alarm condition. The AVBCS alarm history are to be stored, to be recallable by the programmer/technician using the report generator. Alarm messages take precedence over other functions. A minimum of the most recent 1000 alarms must be directly available at the AVBCS. Within the alarm response time digital alarms are subject to immediate reporting, within the alarm response time.

2.9.6.9 Report Generator

Provide software to generate and format standard and custom reports for displaying and storing on disk. Database values and parameters, values calculated using the real time static database or historical data base; with the reports subsequently stored on removable media to generate reports. Do not interrupt dynamic operation of the system to generate a report. Provide the report with the time and date when the report was printed.

2.9.6.10 Periodic Automatic Report

The system allows for specifying, modifying, or inhibiting the report to
be generated, the time the initial report is to be generated, the time interval between reports, end of period, and the output peripheral. The system (through the Request Report Mode) allows for the operator to request, at any time, an immediate display of any report.

2.9.6.11 Historical Data Storage and Retrieval

Provide a historical data storage and retrieval function used to collect and store dynamic data. This function is in addition to other data storage requirements. The function must have the capability to collect and store alarm status changes, point values, events and operator commands, and system responses. Provide this function with the capability to retain historical data on non-volatile RAM for pre-specified time periods, up to forty-five days using last day roll over, for short-term analysis, and then output the data to the utility software for long-term retention. Insure the operator is able to selectively recall short-term data stored on non-volatile RAM. Using the data retrieval and report generation program, retrieval of the contents of any selected historical data file through utility programs is available. The output of the report generation program must be capable of being viewed on the screen, transferred to removable media, or stored.

2.9.6.12 System Access Control

Provide a minimum of 10 passwords that is usable with the control system software. The AVBCS maintains a log of programmers/technicians logged onto the system. Define each password as to the functions that the programmer/technician can perform. The software must support a user based security system. The security system allows for the creation of users with certain rights and/or privileges, when enabled. When user based security is enabled, an audit trail must be generated in the system which tags every programmer/technician logon with user identification (ID). Support the following functions within the security management application:

a. Define users.

b. Define groups which users may belong to.

c. Define user and/or group rights/privileges.

2.9.6.13 Convenience Outlet

**************************************************************************
NOTE: Coordinate with electrical drawings to provide power for control panel convenience outlet and other required accessories.
**************************************************************************

Provide a 120 volt ac, 15 amp, ground fault interruption (GFI) type duplex convenience outlet inside each cabinet that houses a PLC.

2.9.7 CONTROL PANEL(S)

**************************************************************************
NOTE: The first paragraph is to be used if using typical master, guard booth, overwatch style operating panels that are based on Appendix A with layouts shown on the drawings. The second paragraph is for non-standard applications for these control panels. Choose the desired paragraph and delete the
The guide specification describes control panels here in generic terms of master control panel and types of remote operating panels.

---

[ Provide a master control panel to interface between all barrier control circuits, remote EFO control panels, remote EFO control buttons, wrong-way, overspeed, auxiliary equipment, and the crash rated active vehicle barrier power units. Provide remote control panel(s)/buttons for each guard booth, search area, Overwatch, ____. Provide remote local panel(s) at the barrier location to be used for maintenance purposes. Control circuits contain all relays, timers, and other devices or an industrial programmable controller programmed as necessary for the barrier operation. Provide a control panel that allows direct interface with auxiliary equipment such as card readers, remote switches, loop detectors, infrared sensors, and sliding or swinging gate limit switches. Ensure loop controllers do not allow an automatic barrier raise following power loss or restoration. Run all device interconnect lines to terminal strips. Descriptions are primarily for discrete controls making up a given control panel. If allowing or using touchscreen control instead, see paragraph "Touchscreen" for revised requirements. Provide control panels as shown on the drawings and as described in Appendix A. Provide control panels as described in Appendix A. EFO function is not allowed to be accomplished with a touchscreen.]

[ Provide a master control panel to interface between all barrier control circuits, remote EFO control panels, remote EFO control buttons, wrong-way, overspeed, auxiliary equipment, and the crash rated active vehicle barrier power units. [ Provide a master control panel with all necessary displays and controls to allow the operator to view real-time alarms, discrete point status changes, to control crash rated active vehicle barriers and related equipment. Locate the master control panel as shown on the drawings in a manner to allow the operator to easily use the controls and monitor the displays while, at the same time, oversee entry and exit operations. Permanently

---

[2.9.7.1 Master Control Panel]

******************************************************************************

NOTE: If panel layout is shown on the drawings, then keep the first paragraph and delete the subparagraphs.

******************************************************************************

Provide a master control panel with all necessary displays and controls to allow the operator to view real-time alarms, discrete point status changes, to control crash rated active vehicle barriers and related equipment. Locate the master control panel as shown on the drawings in a manner to allow the operator to easily use the controls and monitor the displays while, at the same time, oversee entry and exit operations. Permanently...
label all control panel indicator lights, push buttons, and switches on the console. [Provide master control panel as shown on the drawings. ] [The master control panel includes the following:]

[a.  Keyed Power On/Off switch with a red indicating light illuminating when power is on.

[b.  Mode Selector Switch. Provide a selector switch for each barrier. The switch is to have ["EFO", "Test", "Local"] ["EFO", "Test"] [_____] modes. [Provide a keyed switch.]

[c.  A pushbutton for "access allowed" and a pushbutton for "access denied" positions for each barrier and corresponding indicating light for each action. Illuminate a red indicating light for "access denied" and a green indicating light for "access allowed".

[d.  A pictograph of the barrier in the "access allowed" position and "access denied" position next to the pushbutton.

[e.  An EFO [pushbutton][switch][pushbutton or switch] with a cover that operates the barrier(s) in EFO mode.

[g.  EFO Reset. [Lockable][Switch or pushbutton][Keyed switch].

[h.  Lamp test button.

[i.  An operating mode switch between EFO and manual modes for [each barrier][the inbound lanes and for the outbound lanes][as indicated].

[j.  A toggle switch that arms or disarms each [remote panel with an EFO] [guard booth] control panel. Provide indicating light - red for arm and green for disarm.

[k.  An audible alarm (buzzer) that has adjustable volume control. Volume control can be by another switch or built into the buzzer.

[l.  Provide a pushbutton that is used to silence the audible alarm. Silence button when pushed just silences the present alarm. If a new alarm comes into the panel, the audible alarm will activate.

[2.9.7.2 Remote EFO Control Panel - Primary

**************************************************************************
NOTE: The first paragraph is intended to be used for an overwatch position that does not have the master control panel. This overwatch is located at ACPs/ECFs. The second main paragraph is for other locations that may have different requirements. Choose the appropriate option for the project. If panel layout is one drawings, then delete all the subparagraphs.

Within each paragraph, the choose the appropriate option.
**************************************************************************

This panel is intended to be installed at each overwatch position. [Provide as shown on the drawings. ]
[Provide Remote Control Panel(s) - Primary as shown on the drawings.
][The Remote Control Panel(s) - Primary includes the following:]

[a. Provide a red indicating light for "access denied" and a green indicating light for "access allowed".

[b. Next to the pushbutton or position indicating lights, provide a pictograph of the barrier in the access allowed position and access denied position.

[c. An EFO [pushbutton][switch][pushbutton or switch] with a cover that operates the barrier(s) in EFO mode.

[d. EFO Activated. Red indicating light. Locate near the EFO.

[e. A lamp test button.]

[f. An audible alarm (buzzer) that has adjustable volume control. Volume control can be by another switch or built into the buzzer.

[g. Provide a pushbutton that is used to silence the audible alarm. Silence button when pushed just silences the present alarm. If a new alarm comes into the panel, the audible alarm will activate.

[h. Provide a red indicating light that shows when the remote panel is Armed from the master control panel.

][2.9.7.3 Remote EFO Control Panel - Secondary

******************************************************************************
NOTE: The first paragraph is to be used for guard booths and search areas that are at ACPs/ECFs. The second main paragraph is for other locations that may have different requirements. Choose the appropriate option for the project. If panel layout is one drawings, then delete all the subparagraphs.

Within each paragraph, the choose the appropriate option.
******************************************************************************

This panel is intended to be installed in each Guard Booth[, at the Pedestrian Booth,] and at each Search Area. [Provide as shown on the drawings. ]

][Provide Remote Control Panel(s) - secondary as shown on the drawings.[The Remote Control Panel(s) - secondary includes the following:]

[a. An EFO [pushbutton][switch][pushbutton or switch] with a cover that operates the barrier(s) in EFO mode.

[b. Provide a red indicating light that shows when the remote panel is Armed from the master control panel.

[c. EFO Activated. Red indicating light. Locate near the EFO.

[d. An audible alarm (buzzer) that has adjustable volume control. Volume control can be by another switch or built into the buzzer.
]
[ e. An red visual indicating light for wrong-way. ]
[ f. An red visual indicating light for overspeed. ]

[2.9.7.4 Remote EFO Control Button

**************************************************************************
NOTE: Army Only. choose the first paragraph for Army projects.
The second main paragraph is for other locations that may have different requirements. choose the appropriate option for the project. If panel layout is one drawings, then delete all the subparagraphs.

Within each paragraph, choose the appropriate option.
**************************************************************************

This EFO control button is intended to be installed at each Guard Booth. [Provide as shown on the drawings. ]

[ Provide EFO control button as shown on the drawings. ][The EFO control button includes the following:]

a. An EFO [pushbutton] [switch] [pushbutton or switch] with a cover that operates the barrier(s) in EFO mode.

b. Provide a red indicating light that shows when the remote EFO button is Armed from the master control panel.

c. EFO Activated. Red indicating light. Locate near the EFO.

[2.9.7.5 Remote - Local Control Panel

**************************************************************************
NOTE: Local Control Panel is a remote control panel that is to be located near the crash rated active vehicle barrier by the maintenance personnel. This panel in most applications does not have an EFO. Edit per the project requirements. If panel layout is one drawings, then delete all the subparagraphs.

NOTE: Include first bracketed choice that references Army projects with an Access Control Point and delete all other material.
**************************************************************************

This Remote Control Panel does not haven an EFO. The panel is to be located within a cabinet located near the crash-rated active vehicle barrier that is lockable. [Provide Local Remote Control Panel(s) as shown on the drawings. ][The Local Remote Control Panel(s) includes the following:]

[ a. A pushbutton for "access allowed" and a pushbutton for "access denied" positions for each barrier and corresponding indicating light for each action. Illuminate a red indicating light for "access denied" and a green indicating light for "access allowed").

[ b. Next to the pushbutton, provide a pictograph of the barrier in the "access denied" position and "access allowed" position.

[ c. Lamp test button.]

SECTION 34 71 13.19  Page 59
d. Mode Selector Switch. Provide a selector switch on the panel for each barrier/direction of travel. The switch is to have ["EFO or Off", "Local"] modes. [Provide a keyed switch.] Provide with a red indicating light illuminating when in the [Local][On] position.

e. Out of service switch. Provide a two-position switch that can be operated in any operating mode. Provide red indicating light for yes/enabled and a green indicating light for no/disabled.

2.9.7.6 Keys for Switches

[Provide keyed switches and keys as shown on the drawings and required in Appendix A. ][Provide keyed switches and keys as shown on the drawings. ][Provide keyed switches and keys as described in Appendix A. ][The Control Panel(s) include keyed switches with keys per the following:]

a. Each master control panel switch operable by a unique key.

b. Master control panel mode switch key removable in [all modes]["EFO", "Test", "Local"] ["EFO", "Test"] [_____] mode(s) only.

c. Local panel mode selector switch with key removable in ([all modes]["Off", "Local"] ["Off"] [_____].

d. Master control panel mode selector switch for a [specific barrier][direction of travel] is to match the corresponding Local Control Panel mode selector switch for the same barrier. The master control panel mode selector switch and the local control panel switch are keyed the same.

e. Key removable only in [off][on][_____] position.

2.9.8 VOLTAGE

[The control circuit operates from a [120] [_____] volt [60][50] Hz supply. ][Provide control circuits that have a voltage rating of [24] [12] [_____] [ac] [or] [dc] for all external control panels.][Contractor to choose the control voltage desired.]

2.9.9 SEQUENCE OF EVENTS RECORDER

All alarms and events listed in Appendix B must be collected by the AVBCS and stored with the following data: identification of the alarm/event, date and time to the nearest second of occurrence, date and time of acknowledgement (alarm points only), date and time of reset (alarm points only), and an alarm/event message. Events may have multiple messages to describe all possible states, e.g., AVB #1 in EFO mode, AVB #1 in Test mode, or AVB #1 in Local mode, EFO Guard booth 1 activated. Provide means and user-initiated procedure to export the stored alarms and events to a removable storage device for printing in a standard Windows application such as a spreadsheet. Receive and store all alarms and status changes in the AVBCS database with the appropriate time tags in no more than 100 milliseconds after the condition occurs (e.g., alarm/status point contact closure).

2.9.10 ALARM DISPLAY PANELS AT THE ID CHECK AREA AND SEARCH AREA(S)

Mount one or more Alarm Display Panels consisting of back-lit or LED
[OVERSPEED and ] [WRONG WAY] messages outside of but near the guard booths at the ID Check Area. Mount so that the guards can see the message boards while looking toward the on-coming traffic. Include an adjustable audible alarm with the each alarm panel. Provide and locate a sufficient number of alarm panels to ensure any ACP/ECF guard either sitting in a guard booth or standing outside the guard booth can see and hear at least one panel. Provide an adjustable audible alarm that is loud enough to be heard over ambient traffic noise. Overspeed and wrong-way alarms clear automatically 3 seconds (adjustable) after the alarm condition ends with no action required by guard. Record overspeed and wrong-way alarms on the Alarm and Events Recorder.

2.9.11 Control Panel Components and Construction

2.9.11.1 Enclosures

Each control panel enclosure is to conform to the requirements of NEMA 250 for the types specified. Provide the manufacturer's standard finish color, unless otherwise indicated. Repair and refinish damaged using original type finish. Provide Type [1][4][12] enclosures for installation in equipment rooms; those for installation in clean, dry indoor occupied space may be Type 1; other locations are as otherwise specified or shown. [Provide Type 4 or as shown, enclosures for equipment installed outdoors.] [Provide Type 4X enclosures for installation in corrosive environment and construct of [stainless steel] [fiberglass] [polymer plastic]. Painted steel is not be allowed for use in a corrosive environment.] Provide enclosure with a single, continuously hinged exterior door with print pocket, 3-point latching mechanism and key lock and a single, continuously hinged interior door. Provide panels that are mounted on flat horizontal surface with a top that is tilted at 45 degrees or 60 degrees (unless a panel is wall mounted) to ensure easy viewing of the controls. Secure the control panel to the surface it is mounted.

2.9.11.2 Controllers

Provide controllers per paragraph programmable logic controller (PLC).

2.9.11.3 Standard Indicator Light

Provide indicator lights that comply with NEMA ICS 1, NEMA ICS 2, and UL 508. Provide lights that are heavy-duty, round and mount in a 22.5 mm 0.875 inch mounting hole for alarm indicator, crash rated active vehicle barrier position indicator and EFO activation. Provide lights of the same size and type indicated for alarm indicator or provide round and mount in a 12.7 mm 0.5 inch mounting hole for all other indicators. Provide long-life LED type indicator lights that operate at 120 VAC or 24 VDC. Provide indicator light with a legend plate labeled as shown on the drawings. Provide the indicated lens color as shown on the drawings or specified herein. Provide panels with an overall "Push to Test" pushbutton or provide lights that are push to test (lamp) type. It is allowed to provide illuminated pushbuttons instead of a separate visual indicator.

2.9.11.4 Selector Switches

******************************************************************************
NOTE: Indicate on the drawings where key operated switches are required.
******************************************************************************
Selector switches must comply with NEMA ICS 1, NEMA ICS 2 and UL 508. Provide selector switches that are heavy duty, round and mount in a 22.5 mm 0.875 inch mounting hole. Provide the number of positions as indicated on the drawings or specified herein. Provide switches as indicated on the drawings or specified herein. Provide switches that are rated for 600 volts, 10 amperes continuous. Provide selector switches with a legend plate labeled as shown on the drawings or specified herein. Where indicated or required, provide dual auxiliary contacts for the automatic position where indicated or required, to provide position sensing at the workstation. Auxiliary contacts that are rated for 120 VAC, 1A as a minimum. Provide key operated switches where indicated on the drawings or specified herein. All keys are to be identical unless indicated on the drawings or specified herein to have different keying.

2.9.11.5 Push Buttons

Push buttons must comply with NEMA ICS 1, NEMA ICS 2 and UL 508. Provide push buttons that are heavy duty, round and mount in a 22.5 mm 0.875 inch mounting hole. Provide the number and type of contacts as indicated on the drawings or required by the Sequence of Control. Provide push buttons that are rated for 600 volts, 10 amperes continuous. Provide push buttons with a legend plate labeled as shown on the drawings.

2.9.11.6 Relays

Relays must comply with IEEE C37.90 and derated for altitude above 1,500 meter 4921 feet. Provide relays that are as required by the Sequence of Control. Provide relay coils that are rated [120 VAC] [or] [24 VDC] that coordinates with the controls and provide with matching mounting socket. Ensure power consumption is not greater than 3 watts.

2.9.11.7 Terminal Blocks

Terminal blocks must comply with NEMA ICS 4 and UL 1059. Provide terminal blocks for conductors exiting control panels that are two-way type with double terminals, one for internal wiring connections and the other for external wiring connections. Provide terminal blocks made of Bakelite or other suitable insulating material with full deep barriers between each pair of terminals. Provide a terminal identification strip that forms part of the terminal block and each terminal must be identified by a number in accordance with the numbering scheme on the approved wiring diagrams.

[2.9.11.8 Alarm Horns

**************************************************************************
NOTE: If using a SDDCTEA Safety Scheme found in Appendix A, some of the systems require an audible warning at the barrier and some it is just an option. Hybrid Beacon (Signs & Signals), HEPD, and Stop Control require a horn. Full Containment is not required to have a horn. The horn is to sound only for EFO operation. SDDCTEA requires horn to go on for 10 seconds.
**************************************************************************

Provide alarm horns where indicated on the drawings[ or where required in Appendix A]. Provide horns that are vibrating type and comply with UL 508. Provide horns with a 100 dB at 3 meters 10 feet rating. Provide horns with a means to adjust the volume level. Exterior horns are to be weather proof.
by design or be mounted in a weather proof enclosure that does not reduce the effectiveness of the horn. Horn is to be set to go off for [10] [4] [6] [_____] seconds after an EFO is activated.

2.9.11.9 Alarm Buzzer

Provide warning alarm piezoelectric buzzer at the master control panel and other panels where indicated on the drawings and specified herein. Provide round buzzer that mounts mount in a 22.5 mm 0.875 inch mounting hole. Provide buzzers with a Maximum 100 dB at 1000 mm 39 inch. Provide buzzer with a means to adjust the volume level and with selectable alarm tones.

2.9.11.10 Touchscreen

**************************************************************************

NOTE: The EFO pushbutton/switch function is not allowed to be done by touchscreen.

NOTE: Touchscreens are being used more and more for more complex control systems. If touchscreen are not allowed, then delete paragraph

NOTE: Touchscreens can show the ACP/ECF layout and equipment with the controls or just show the controls. The preferred choice is the layout. choose the option for this project. The symbology indicated can be revised for each project.

**************************************************************************

EFO function is to be done by a discrete pushbutton/switch and is not allowed to be done on the touchscreen. The Contractor[ has the option][ is] to provide a touchscreen to perform the functions of the master control panel. [The master control panel graphical user interface is to show the layout of the ACP/ECF and have different screens that allow the user to go to specific areas to perform the operation.][The master control panel graphical user interface is to show pushbuttons and lights in graphical format.] The minimum size for the touchscreen is 15 inches 380mm for the master control panel. Screen shots are to be submitted for review and approval as part of the panel layouts. Provide symbology as indicated:

a. Show the crash rated active vehicle barrier graphically.

b. Red circular symbol to "push" for closing. Green circular symbol to "push" to open.

c. Green rectangle with black lettering for changing between operating modes. When going between different operating modes, a different screen is to show. Items that do not function are not shown or can be grayed out on the screen if approved. If going between modes and the system is in the incorrect configuration, an alarm box stating "Incorrect Configuration" is to pop-up.

d. EFO Activation triggers a red square with the wording "Warning Emergency Fast Operate Activated".

e. EFO Reset will be a green square with the wording "Press to Reset EFO". This opens a screen with a keypad to enter the pin to reset the EFO.

f. Control systems that have different operating modes will have the
modes on different screens or some means to clearly show on the screen which mode the panel is currently operating.

g. Local mode, when using discrete components, uses a key to do a lock-out/tag-out type application to ensure the maintenance worker has full control. When using a touch screen, a keyed approach can still be used as well as a password approach. No matter the solution, it is imperative that it require an action done by the guard or maintenance worker at the master control panel and then at the Local control panel to achieve full control. A solution that has only a unique password at the Local control panel is not allowed.

2.9.11.11 Wiring

Wired, with multiconductor cable secured to underside of panel with straps at 1-inch maximum intervals and extra straps and cable sheath reinforcing sleeve where conductors break out for connections. Provide solderless, quick disconnect, plug or sleeve connectors.

2.10 SEQUENCE OF OPERATION

**************************************************************************
NOTE: If Appendix A is used to define the operation or is shown on the drawings, then delete all the listed subparagraphs.
**************************************************************************

[Refer to Appendix A and the drawings for Sequence of Operation requirements.]
[Refer to Appendix A for Sequence of Operation requirements.] [Sequence of Operation is as shown on the drawings.]
[_____ .]
[The system operates in the following manner.]
[a. [The master control panel arms or disarms the control functions at the [local ] [and ] [remote ] control panels and controls the operational mode of all the barriers in the system. The master control panel also controls and monitors the position of each barrier.]

[b. [When enabled by the Master Control Panel, the Local Control Panel[s] control[s] and monitor[s] the position of each barrier under the Local Panels control.]

c. [When enabled by the master control panel, the remote control panel[s] control[s] and monitor[s] the position of each barrier under the remote panel's control.]

d. Power On/Off switch. Provide a green light to indicate the "on" position. With the switch in the "off" position, all indicating lights and switches are off/disabled.

**************************************************************************
NOTE: Edit this for what is interned for this application. The selector switch(es) can be by barrier, by lane, or by direction of travel.
**************************************************************************

e. Selector Switch. Provide a selector switch for each barrier. [Provide a selector switch for each lane.] [Provide a selector switch for each direction of travel.] Provide a switch that has ["EFO", "Test", "Local"] ["EFO", "Test"] [_____ ] modes. "EFO" mode locks out "Test" (manual) and "Local" operation for the barrier via "access allowed" /"
and access denied” push buttons. “Test” mode locks out “EFO” and “Local” operation for the barrier. “Local” mode locks out the “Test” manual “access allowed” and “access denied” push buttons at the master control panel and the “EFO” mode for that barrier.

f. EFO. When the EFO button is pushed, barriers that have their selector switch in EFO position deployed after a [4] second delay. Induction loops must also be clear for the barriers to deploy. [The delay timer allows the yellow light in the traffic signal to illuminate for 3 seconds and then illuminate the red light for [1] second[s] prior to allowing barrier(s) to deploy. When the EFO button is pushed, a red indicating light on the panel(s) illuminated to indicate EFO activation.] A horn located at the barriers is to sound for [4][6] seconds as soon as the EFO button is pushed.

g. EFO Reset. Use of a [pushbutton][or][keyed switch] is required to reset the logic after an EFO has occurred.

h. Active Vehicle Barriers with “Access Allowed” and “Access Denied” Pushbuttons. When the barrier is in the “access denied” position a red indicating light on a control panel will illuminate. When the barrier is in the “access allowed” position a green indicating light on the same panel illuminated. The green indicating light must not illuminate until the barrier is in the “access allowed” position.

i. Lamp Test Button. When pushed this button activated all indicating lamps to verify that all bulbs are functional.

j. Induction Loops at the barrier. Provide [one prior to and one after the barrier][as shown on the drawings][______]. [In “EFO” mode, barrier activation is suppressed until the loops don’t sense the presence of vehicles.] [In other modes, if the loop is activated (i.e. a vehicle is on the loop) barrier operation is prevented. Once cleared, the barrier does not deploy.]

2.11 AVB LIGHTING

Provide all crash rated active vehicle barriers with red warning flashing warning beacons mounted on the crash rated active vehicle barrier itself unless it is not practical as in the case of a net type. Provide LED type luminaires that have a lumen output sufficient to see easily at 61 m feet. These luminaires are located on the face of the barrier that faces toward off-post (nonsecure side). Luminaires are to be on anytime the barrier is not fully open.

Provide the number and spacing of lights to meet the following requirements:

a. Bollard systems must include, as a minimum, one red led light per bollard.

b. Plate, drum or frame barrier systems equal to or greater than 1 m feet in width will include, as a minimum, 3 red lights. One will be mounted within 305 mm 1 foot of each barrier edge and one will be mounted within 305 mm 1 foot of barrier centerline.

c. Plate, drum or frame barrier systems less than 1 m feet in width will include, as a minimum, 1 red light. One light will be mounted within 305 mm 1 foot of the barrier centerline. Frame type barriers are
allowed instead of the configuration described can have a light on each post/finger of the barrier. If the frame type barrier does not have three or more lights visible, then in-pavement lights are required.

d. Crash beam barrier systems will include, as a minimum, 3 red lights. One will be mounted within 305 mm 1 foot of the each edge of the driving surface. One light will be mounted within 305 mm 1 foot of the roadway centerline.

e. Active Net type barriers are not required to have lighting mounted on the barrier. For Energy Absorbing Barriers, markings will be provided by the installation of retroreflective wrap on the netting/cables/posts which provide the same color scheme, retroreflective performance and durability as required in this SECTION. Provide retroreflective tape wrapped on the cables in alternating red and white pattern that is visible in both directions.

[2.12 IN-PAVEMENT LUMINAIRES

**************************************************************************

NOTE: In-pavement lights are required when the barrier does not have lights in the main direction of travel toward the barrier and any path the threat vehicle can take toward the barrier. Also, active net (net/cable type) barriers are unable to have lights mounted on them. The use of the in-pavement lights do add some maintenance since they are installed in the ground/pavement. Normally uni-direction is sufficient, but for net type, it may be beneficial to have bi-directional.

**************************************************************************

[Luminaire technical requirements are as shown on the drawings.
][Luminaire technical requirements are indicated below:]

[a. Provide [unidirectional] [bi-directional] in-pavement luminaires. Utilize red LEDs. Provide the in-pavement luminaire with a light beam spread of 60 degrees. Ensure the housing does not extend more than 6 mm 0.25 inches above the finished pavement. Provide a housing that can withstand a static load of 19958 kg 44,000 lbs without deformation.

[b. Provide a stainless steel luminaire housing when installed in areas with snow. Provide a unit that is rated for snow plow use.

c. Luminaries are to be steady on and operate [whenever the barrier is not fully open] [when the traffic signal for the barrier is red] [whenever an emergency fast operate button is activated].
]

]2.13 WARNING BEACONS

The warning beacon or wig-wag must be [mounted within [_____ ] m[_____] ft of each barrier] [on each barrier] [as shown on the drawings] and is to include two alternately flashing signal sections. Provide each signal section with a standard traffic signal face with a flashing CIRCULAR YELLOW signal indication. Mount signal sections horizontally on the warning beacon. The visible diameter of each signal section is not to be less than 200 mm 8 inch. When illuminated, the beacon must be clearly visible, to all drivers it faces, for a distance of at least 1.6 km 1 mile under normal atmospheric conditions unless otherwise physically obstructed. Provide the yellow lens color to meet the requirements of MUTCD. Provide all flashing
contacts with filters for suppression of radio interference. Provide beacons that flash at a rate of not less than 50 nor more than 60 times per minute. The illuminated period of each flash is 1/2 of the total cycle for each signal section. Provide a beacon this is programmable and in order to permit continuous non-flashing operation through a supervisory signal from the Traffic Controller Unit (CU). Provide day-light sensor and an automatic dimming system to reduce the brilliance of the beacon.

### 2.14 BLANK-OUT SIGNS

**NOTE:** Appendix A safety schemes for HEPD and Stop Control require the use of this type of signs. Hybrid Beacon indicates that this signage is optional.

Provide the blank-out sign with LEDs that have a lifetime of 80,000 hours or better. Automatic dimming is to adjust to ambient light levels. Flashing circuits are to be adjustable. Sign is to be NEMA 4 or 4X. Sign housing is to be constructed of extruded aluminum or stainless steel with gasket seals around the doors and lens. At full intensity, the sign is to be highly visible anywhere within a 15 degree cone centered about the optic axis. LED assemblies are removable and replaceable with simple hand tools. Provide a sign that is rated to operate in a temperature range of -37°C to 74°C -35°F to 165°F.

### 2.15 TRAFFIC SIGNALS/HYBRID BEACON TRAFFIC SIGNALS

**NOTE:** Designer must verify that vehicles using a gate with a barrier will be able to see the barrier position or the traffic lights. Semi-trucks may require a painted stop line or a traffic arm versus a higher mounted traffic light to ensure the lights or barrier can be seen by all vehicles. Manual barriers are not required to have traffic signals.

Provide traffic signals with light emitting diode (LED) signal modules. The term "LED signal module" in this text refers to an array of LEDs and lens that are capable of providing a circular signal indication as specified herein and shown on the drawings. All LED signal modules are to conform to the Equipment Standards of the Institute of Transportation Engineers (ITE), chapter 2a. The arrangement and size of signal indications for each LED signal module are as shown on the drawings and are to conform with MUTCD. Provide visors on each signal. Provide [yellow] [or] [black] housing color.

**NOTE:** Red/yellow/green signals are required for HEPD and full containment safety schemes. Delete if not required.

[ Supply red/yellow/green 305 mm 12 inch traffic lights for each entrance and exit lanes] as shown on the drawings or required by Appendix A] to alert motorists of the barrier position. Supply all necessary brackets to allow the lights to be properly mounted. Use the green light to indicate...
that the barrier is fully open.

**************************************************************************
NOTE: This signal is used only for hybrid beacon safety scheme.
**************************************************************************

Hybrid Beacon. A three light hybrid beacon signal head over each inbound and outbound active barrier and on each post or only, only in special cases, post mounted only. Post mounted only requires two posts with each having a traffic signal. Supply red/yellow 305 mm 12 inch traffic lights for each entrance and exit lanes to alert motorists of the barrier position. Signals are placed such that there are two red signals mounted side by side with a yellow signal centered below. Supply all necessary brackets to allow the lights to be properly mounted.

**************************************************************************
NOTE: This is required on Stop Control safety scheme.
**************************************************************************

Supply red 305 mm 12 inch traffic lights for each entrance and exit lanes as shown on the drawings or required by Appendix A to alert motorists of the barrier position. Supply all necessary brackets to allow the lights to be properly mounted.

2.16 TRAFFIC SIGNAL SUPPORTS

Submit all traffic signal support design calculations as well as shop drawings to the government for review and acceptance prior to installation. Ensure compliance with AASHTO LTS and applicable local and state standard specifications for the design and installation of all traffic control supports. Traffic signal supports consist of tubular members, mast arms, pole shaft, base plates, anchor bolt assemblies, foundations as well as associated connections and appurtenances. Evaluate loading to be consistent with local and state guidelines. Determine ice and wind loads based on the geographic location of the installation in accordance with AASHTO guidelines. Evaluate group loading analysis to be consistent with local and state guidelines and section 1.2.6 of AASHTO LTS. Allowable stress must be consistent with local and state guideline and section 1.4 of AASHTO LTS. Provide fatigue calculations that are consistent with local and state guideline and section 1.9.6 of AASHTO LTS. It is the Contractor's responsibility to conduct soil borings for foundation design; otherwise, conservative soils assumptions are to be used in calculating foundation requirements. If local and state guidelines provide foundations designs for design conditions, these guidelines may be used provided all loading and design conditions fall within guideline parameters. Before forming and placing concrete, inspect and evaluate each foundation excavation for the actual soil conditions encountered. Do not proceed with the work until the excavation is inspected and evaluated. If necessary, revise the foundation design based on the soil conditions encountered. Before submitting the revised design for approval, obtain the signature and seal of a Professional Engineer registered in the State.

2.17 VEHICLE PRESENCE, WRONG-WAY, AND OVERSPEED DETECTORS

**************************************************************************
NOTE: Overspeed detection is recommended to be set at 4.5 m/sec 10 mph or more over the posted speed to limit nuisance alarms. In an area with a posted
Provide sensors that are compatible with the barrier controller and that function as part of a complete barrier control system.

Sensors used to detect overspeed are to have an alarm setpoint of ([____] m/sec [____] mph that covers a distance of ([____] m/sec [____] mph from the ID Check Area or as shows on the drawings.

2.17.1 Photoelectric Type

Provide photoelectric sensors that meet the requirements listed below. Photoelectric sensors are used for vehicle presence detection [and over-height detection] as shown on the drawings.

a. Photoelectric detectors consist of separate transmitter and receiver units. Detector design or arrangement requiring reflector is not acceptable.

b. Light beam: laser or infrared, modulated and synchronized between the transmitter-receiver pair to minimize cross talk with adjacent detectors or other light sources. Where laser is used, provide a light source that is rated laser Class II or lower as per 21 CFR 1040.

c. Provide shield cones for beam path to minimize and isolate interference from other light sources outside the detector aim cone and from other adjacent light sources.

d. Provide a photoelectric detector set, including the mounting post that is of robust design to withstand mechanical abuse such as plowed snow from roadway snow removal operations.

e. Provide surge protective devices (SPD) for the power and sensor wire terminations. Ground the SPD with minimum 10AW insulated ground wire of high strand-count to the closest ground termination point.

f. Provide matching cable connector as required

g. Provide a detector with a minimum range of 1.8 m 6 feet to no less than 19.5 m 65 feet.

h. Provide automatic detector tuning with temperature compensation.

i. Provide a detector with user selectable sensitivity settings.

j. Provide a detector with a response time of 15 milliseconds or less.

k. Provide detector with an output in a dry form C contact set, rated a minimum of 0.25 A at 24 Volts dc.

l. Provide detector enclosure with an enclosure rating NEMA 4X or better.

m. Provide a detector that is capable of operating in a humidity range of 0 to 95 percent and a temperature range of -40 to +77 degrees C -40 to +170 degrees F.
n. Provide a detector that is capable of operating from 120V/60Hz power, or be provided with appropriate power module/assembly and appurtenance, which are suitable for operation with 120V/60Hz.

2.17.2 Induction Loops

Induction loops may be used for vehicle presence detection, wrong-way detection, and point overspeed detection. Induction loops must be capable of detecting passenger vehicles, motorcycles, and high bed trucks. Tests for all three types of vehicles are to be conducted on each installed loop during the Performance Verification Test. Provide a pair of inductive loops per barrier/lane whose outputs are used to prevent barriers raising and lowering when a vehicle has activated the loop. These safety loops are to be in a quadrapole configuration. Provide loops as required by Appendix A and as shown on the drawings. Active vehicle barriers that cross multiple lanes are to have loops that are still sized for each lane. Induction loops used for vehicle detection and not wrong-way or overspeed detection are to be quadrapole. Provide induction loops that meet the following:

a. Tuning: automatic, with temperature compensation.

b. Loop input: to withstand minimum 2000V, both normal and common modes.

c. Loop Sensing frequency: minimum four user selectable frequencies to minimize cross talk with adjacent loops.

d. Sensitivity: user selectable, minimum 8 ranges, 20 to 2500 micro henries with a Q factor of minimum 5.

e. Diagnostic: provide diagnostics and related indication for short and open loop circuit.

f. Detector output: dry form C contact set, rated a minimum of 0.25 A at 24 Volts dc.

g. Operating humidity: 0 to 95 percent.

h. Operating temperature: -40 to 77 degrees C -40 to 170 degrees F.

i. Vibration: NEMA TS-2 -2.1.9 or better.

j. Shock: NEMA TS-2 -2.1.10 or better.

k. User selectable operation modes: presence, pulse on entrance, pulse on exit - factory set on presence mode.

l. User selectable operation: Fail Safe or Fail Secure - factory set at fail safe.

m. User selectable sensitivity boost feature, which boosts sensitivity after a presence detection and holds the increased sensitivity until the detection drops out, at which time sensor sensitivity returns to the original setting.

n. Power requirement: 120V/60Hz, or be provided with appropriate power module/assembly and appurtenance, which is suitable for operation with 120V/60Hz.
o. Loop Wire.

1. Provide number of inductive loops as per manufacturer's recommendations based on loop size and distance between loop and loop amplifier.

2. Ensure that the loop slots in which the loop wire is laid are free from debris, sharp objects, and are completely dry. Clean out slots with compressed air before installing loop wire.

3. Install loop wire in layers. Install backer rods over top wire at a minimum of 300 mm (1 foot) spacing to ensure uniform placement of wire in the slot. Fill the loop slots with sealant per recommendation of the loop wire manufacturer.

4. Use 16AW stranded cable with cross-linked-polyethylene insulation installed in a PVC sleeve. Loop wire extending from the loop to the loop amplifier is to be twisted with a minimum twist pitch of 18 per m (6 per foot).

5. Check conductor resistance to ground with "megger" of 500V or higher. Remove and replace the whole installation if ground resistance of less than 10 mega-Ohms is measured.

6. Provide surge protective device for both loop-wire terminations at or near the loop detector module. Ground the SPD with minimum 10AW insulated ground wire of high strand-count to the closest ground termination point.

7. Provide loops that are capable of detecting motorcycles, passenger vehicles, and high bed trucks with the same sensitivity setting.

8. Provide two complete loops for wrong-way detection. Using a single loops to detect wrong-way is not acceptable.

2.17.3 Radar

**************************************************************************
NOTE: Select either Point or Continuous overspeed detection as required
**************************************************************************

Radar detection sensors may be used for vehicle overspeed and wrong-way detection. [Point overspeed Detection. Provide a detector unit that is capable of detecting the speed of one or more vehicles at a point in the ACP/ECF Approach Zone and closing an alarm contact if the vehicle speed is over a preset value.][Continuous overspeed Detection. The detector unit must be capable of continuously detecting the speed of vehicles within preset zones as they approach the ID Check Area of the ACP/ECF. The Sensor is to close an alarm contact when the speed of any vehicle anywhere within the zone is above a preset value. See drawings for required detection zones and detector speed settings. For radar sensors which sense speed at multiple discrete points in the direction of travel instead of continuously, the distance between discrete points is to be 5 m (15 feet) or less.] Provide radar detection units that meet the following requirements:

a. Provide a detector unit with an operating temperature range of -40 to +77 degrees C (-40 to +170 degrees F) and a relative humidity range of 5 to 95 percent, non-condensing. Equip The detector unit with means for automatic temperature compensation as is necessary to overcome adverse
effects of temperature and humidity swings in the specified range.

b. The detector unit must be resistant to vibration in accordance with NEMA TS-1, IEC 60068-2-30 (test Fc), or approved equivalent. The detector unit must be resistant to shock in accordance with NEMA TS-1, IEC 60068-2-27 (test Ea), or approved equivalent.

c. Provide a detector unit with a withstand voltage surge of minimum 1kV (rise time = 1.2 microsecond, hold = 50 microsecond) applied in differential mode to all lines, power and output, as defined by IEC 61000-4-5 standard.

d. Provide a detector unit that does not emit a noise at levels exceeding 55 dBA when measured at a distance of 1 meter 3 feet away from its surface.

e. Each detector unit is to transmit on a frequency band of 10.525 GHz +/-25 MHz or another approved spectral band. Provide a detector that complies with the limits for a Class A digital device pursuant to Part 15 of the FCC rules or the appropriate Spectrum Management Authority. Provide a detector unit that does not interfere with any known equipment. Ensure transmitter power does not exceed 10 mili-watts.

f. Provide a detector unit that can detect vehicle speed with 95 percent accuracy or greater independent of the vehicle's direction of travel through the detection zone.

g. Provide a detector unit with a field of view that covers an area defined by an oval shaped beam with a beam height and width of 15 degrees minimum and a range of 3 to 70 m 10 to 200 feet minimum.

h. Provide a NEMA 3R enclosure or better for the detector unit. Do not exceed overall nominal envelop dimensions of 200 by 254 by 150 mm 8 by 10 by 6-inch.

i. Provide a detector unit with a power requirement of 120V/60Hz, or be provided with appropriate power module/assembly and appurtenance, which is suitable for operation with 120V/60Hz.

j. Provide the detector unit output upon detection of a vehicle speed over the adjustable preset value with a dry form C contact set, rated a minimum of 0.25 A at 24 Volts dc.

k. Provide a detector unit that has a blind zone of not more than 3 m 10 feet in front of the unit.

l. The detector unit may be applied in either Side-fired or Forward-looking configuration.

m. Detector units may be mounted on existing ACP/ECF structures or utility poles if suitable for this purpose. When existing structures and utility poles are not suitable, provide mounting trusses or poles for mounting detector units. Provide a support structure that deflect less than 13 mm 0.5 inch at exposure to 160 km/h 100 mph winds with a gust factor of 1.3 when a detector unit or units is mounted on it.

n. Set all detector unit parameters and adjust detectors to provide required zone coverage.
2.17.4 Video Detection

Video detectors may be used for vehicle presence, overspeed, and wrong-way detection. Detection is to be derived from video image signals received from a CCTV video camera. The video vehicle detector set includes the camera, hardware, software, and appurtenances required to perform the detection functions required on the drawings. The Video analytics system produced warning annunciation via alarm contacts when the required detection criteria are met. Refer to Section 28 10 05 ELECTRONIC SECURITY SYSTEMS (ESS) for requirement on the related video camera and video signal transmission system. Provide video detectors that meet the requirements listed below.

a. Provide a detector unit with an operating temperature range of -40 to +77 degrees C -40 to +170 degrees F and a relative humidity range of 5 to 95 percent, non-condensing.

b. Provide a detector that is resistant to vibration in accordance with NEMA TS-1, IEC 60068-2-30 (test Fc), or approved equivalent. Provide a detector unit that is resistant to shock in accordance with NEMA TS-1, IEC 60068-2-27 (test Ea), or approved equivalent.

c. Provide a detector unit when used for continuous speed detection that senses speed at multiple discrete points in the direction of travel. In order to adequately simulate continuous speed detection, the distance between discrete points is limited to no more than 5 m 15 feet.

d. The detector unit when used for speed detection must detect vehicle speed with a 95 percent accuracy or greater, independent of the vehicle's direction of travel through the detection zone. The detector unit when used for presence or wrong-way detection is to identify the required condition with a 95 percent accuracy or greater.

e. Provide a NEMA 3R enclosure or better for the detector unit.

f. Provide a detector unit with a power requirement of 120V/60Hz, or be provided with appropriate power module/assembly and appurtenance, which is suitable for operation with 120V/60Hz. Provide the detector unit output upon detection of a vehicle speed over the adjustable preset value with a dry form C contact set, rated a minimum of 0.25 A at 24 Volts dc.

g. The detector unit may be applied in either Side-fired or Forward-looking configuration.

h. Detector units may be mounted on existing ACP/ECF structures or utility poles if suitable for this purpose. [When existing structures and utility poles are not suitable, provide mounting trusses or poles for mounting detector units. Provide a support structure that deflect less than 13 mm 0.5 inch at exposure to 160 km/h 100 mph winds with a gust factor of 1.3 when a detector unit or units is mounted on it.]

i. Set all detector unit parameters and adjust detectors to provide required zone overages.

2.18 WRONG-WAY AND OVERSPEED WARNING ANNUNCIATOR

**************************************************************************

NOTE: The marquee panel may not be required if the

SECTION 34 71 13.19 Page 73
Provide a warning annunciator (audible and visual) as indicated in the following:

1. Provide a visual and audible annunciator that produces a sound whenever a [wrong way] [or overspeed] is detected by a vehicle entering from the exit. Provide the barrier control panels with an audible and visible indicating device as [indicated in Appendix A] [indicated in Appendix A and on the drawings] [indicated on the drawings.]

2. Provide a visual and audible annunciator that produces a sound whenever a [wrong way] [or overspeed] is detected by a vehicle entering from the exit. Provide a marquee style LED sign that shows "WRONG WAY" or "OVERSPEED" with an audible annunciator. Mount marquee on a column in the ID Check area that is visible to the guards when looking toward approaching traffic. Provide a means to adjust the volume on all the audible alarms. [Provide an audible annunciator that sounds until a silence reset button is pressed.] [Provide an audible annunciator that sounds for [3] [____] seconds and then clears itself.]

2.19 NON-CRASH RATED ACTUATED TRAFFIC ARM ASSEMBLY

NOTE: Edit the traffic arm location based on design requirements. Traffic arms may be required for a SDDCTEA safety scheme or may be located at the ID Check area and at Search Areas.

Provide actuated traffic arm capable of 300 duty cycles per hour as a minimum and capable of operating the arm through 90 degrees. Provide gate operators with single phase [120] [208] [240] [277] [_____] volt motors. Provide slab size and anchorage for gate operator in accordance with manufacturer requirements.

1. Cover each traffic arm with 406 mm 16 inch wide reflectorized red and white sheeting. Provide the traffic arm with retroreflective markings, in accordance with MARKINGS, [LIGHTING] AND SIGNS paragraph of this SECTION.

2. Furnish a spare traffic arm for each traffic arm.

3. Construct gate operator cabinets of galvanized steel, or aluminum and paint per manufacturers approved standard color.

4. Provide gates with a hand-crank, or other means, which will allow manual operation during power failures.

5. Construct actuated traffic arms out of wood, steel, fiberglass, or aluminum, as specified by the manufacturer for the given lengths as shown on the drawings.

6. Provide each gate operator with an obstruction detector that automatically reverses the gate motor when an obstruction is detected. Provide an obstruction detector that is one of the following: An induction loop buried in the road, a photocell
electric eye mounted on the gate operator, or a safety strip mounted on the lower edge of the arm. The detector system automatically deactivates when the arm reaches the fully lowered position.

******************************************************************************
NOTE: This option is typically not required.
******************************************************************************

[ (7) Provide a break sensor as part of the traffic arm assembly that detects when a vehicle makes contact with the traffic arm and breaks the arm. When the break sensor is activated provide an audible warning through the vehicle barrier control panel. Provide an audible warning that sounds until an audible warning silence reset button is pressed or for [3][ ] seconds. ]

2.19.1 Traffic Arm at Other Areas

Provide non-crash rated actuated traffic arm (barrier gate arm) assembly with an opening and closing time of less than or equal to [2][3][5] seconds. Provide each entry lane with a vertical traffic arm gate. Each traffic arm is to be capable of being operated from a remote open-close push button station. The guard booth for that lane is to have the means to open and close. [Provide a means to control each traffic arm from the Command and Control].[ Provide actuated traffic arms with three LED flashing lights mounted on the arm.]

2.19.2 Traffic Arm at Active Vehicle Barrier

NOTE: HEPD and Full Containment safety schemes in Appendix A require a traffic arm near the active vehicle barrier. Hybrid Beacon safety scheme has the traffic arm optional. Those associated with a safety scheme, choose the 2 second operating time. If the traffic arm is located over the safety loop for the crash rated active vehicle barrier, then that loop can act as the obstruction detector. Edit the last choice accordingly.

It is optional to have flashing lights on the traffic arm. It is recommended when located at the barrier. However, if in-pavement lights are provided, it is not be necessary.

Provide non-crash rated actuated traffic arm (barrier gate arm) assembly with an opening and closing time of less than or equal to [2][3][5] seconds. Provide a traffic arm, as a separate piece of equipment, with each non-portable crash rated active vehicle barrier as part of the barrier safety operating system. [This traffic arm automatically deploys (close) when the emergency up button is activated and open when the vehicle barrier is reset. ][Provide actuated traffic arms with three (minimum) LED flashing lights mounted on the arm.][ Do not equip this traffic arm with a separate automatic obstruction detector. The safety loop for the barrier or the stop line is to function as the obstruction detector.]

2.20 UNINTERRUPTIBLE POWER SUPPLIES (UPS)

NOTE: Edit the appropriate choice.
NOTE: Army projects require a minimum of 10 minutes for the batteries.

[A panelboard located at the barrier location is powered from main UPS located near or at the Command and Control. This panelboard can be used to power some of the equipment listed below instead of a stand alone units.]

[When the facility UPS provides power to equipment/systems listed, then separate stand alone UPS are not required.]

Provide separate UPS units capable of carrying required loads for a minimum of [10] [2] [5] [15] [_____] minutes for those items not powered from a central UPS based on this list below. Submit UPS Calculations for all proposed UPS systems identifying all connected loads plus 25% spare capacity.

[a. Primary communications system.

[b. All sensors and controllers for [over speed,] [wrong-way,] [tamper,] etc.

[c. Active Vehicle Barrier Control system including all controls for crash rated active vehicle barriers, [traffic warning signals], [actuated traffic arms], and [warning signals]. This includes the crash rated active vehicle barrier, traffic signal lights, in-pavement lights, and wig-wags.

NOTE: For Army Projects the minimum is 1.5 cycles, but not more than 2 cycles.

[d. Active Vehicle Barrier activation systems for [1.5] [2] complete operation cycle ("access allowed" position to "access denied" position or "access denied" position to "access allowed" position).

[e. Lighting. One luminaire for each ID Check Lane located near the ID guard position and one luminaire for each CCTV camera required at the Active Vehicle Barrier.

2.21 SURGE PROTECTION

2.21.1 Power Line Surge Protection

Protect equipment connected to alternating current circuits protected from power line surges. Equipment protection must withstand surge test waveforms described in IEEE C62.41.1 and IEEE C62.41.2. Fuses are not to be used for surge protection.

2.21.2 Sensor Device Wiring and Communication Circuit Surge Protection

Protect inputs against surges induced on device wiring. Protect outputs against surges induced on control and device wiring installed outdoors and as shown. Protect communications equipment against surges induced on any communications circuit. Install surge protection circuits at each end on cables and conductors, except fiber optics, which serve as communications circuits between systems. Furnish protection at equipment, and additional triple electrode gas surge protectors rated for the application on each wireline circuit is to be installed within 1 meter 3 feet of the building cable entrance. Fuses are not to be used for surge protection. Test the inputs and outputs in both normal mode and common mode using the following
two waveforms:

a. A 10 microsecond rise time by 1000 microsecond pulse width waveform with a peak voltage of 1500 Volts and a peak current of 60 amperes.

b. An 8 microsecond rise time by 20 microsecond pulse width waveform with a peak voltage of 1000 Volts and a peak current of 500 amperes.

2.22 INTRUSION DETECTION SYSTEM

NOTE: Edit Section 28 10 05 ELECTRONIC SECURITY SYSTEMS (ESS) to include appropriate project features of the Intrusion Detection System and the duress alarm system.

NOTE: In some cases the IDS/DURESS system equipment is future. Edit the paragraphs accordingly. Edit the appropriate specifications to ensure the conduit system is appropriate for the system.

Install and furnish the IDS and duress alarm system per the requirements of 28 10 05 ELECTRONIC SECURITY SYSTEMS (ESS).

2.23 CCTV SYSTEM

Install and furnish the CCTV system per the requirements of 28 10 05 ELECTRONIC SECURITY SYSTEMS (ESS).

2.23.1 CCTV System

Provide the AVBCS with output contacts for use by the ESS (IDS and CCTV systems) as follows:

a. Pull up all camera views of the crash rated active vehicle barriers during any EFO activation. Provide a dry contact from the AVBCS to be used by the CCTV system.

b. Provide a dry contact from the AVBCS that indicates a tamper switch alarm. This contact is to be used by the IDS system.

c. Provide a spare dry contact from the AVBCS that indicates an EFO activation.
2.24 MATERIALS AND COMPONENTS

2.24.1 Materials and Equipment

Units of equipment that perform identical, specified functions are to be products of a single manufacturer. Provide all material and equipment that is new and currently in production.

2.24.2 Single Manufacturer Active Vehicle Barriers

Provide all parts, components, accessories fittings and fasteners by a single manufacturer as required by manufacturer's written requirements, installation instructions and written warranty, unless otherwise noted in this specification.

2.24.3 Field Enclosures

2.24.3.1 Interior Sensors

Provide sensors used in an interior environment with a housing that provides protection against dust, falling dirt, and dripping non-corrosive liquids.

2.24.3.2 Exterior Sensors

Provide sensors used in an exterior environment with a housing that provides protection against windblown dust, rain and splashing water, and hose directed water. Provide sensors that remain undamaged by the formation of ice on the enclosure.

2.24.3.3 Interior Electronics

Provide systems electronics used in an interior environment with enclosures which meet the requirements of NEMA 250, Type 12.

2.24.3.4 Exterior Electronics

Provide systems electronics used in an exterior environment with enclosures which meet the requirements of NEMA 250, Type 3R, 4, or 4X.

2.24.3.5 Corrosion Resistant

System electronics to be used in a corrosive environment as defined in NEMA 250 are to be housed in non-metallic non-corrosive enclosures which meet the requirements of NEMA 250, Type 4X.

2.24.4 Above Ground Components

All above ground metal components are to be [shop primed and site painted] [or] [hot dipped galvanized] [or] [powder coated] unless otherwise specified.

2.24.5 Below Ground Components

All below ground metal components are to be [shop primed and site painted] [or] [hot dipped galvanized] [or] [powder coated] unless otherwise specified.
2.24.6 Nameplates

2.24.6.1 Components

Provide a nameplate for major components of the system. Nameplates will not be required for devices smaller than 25 by 75 mm1 by 3 inch. Provide corrosion-resistant metal plates that have at least the following data legibly marked:

a. Manufacturer's name.
b. Manufacturer's address.
c. Type, Style or Model number.
d. Serial number.
e. Date of manufacture.
f. Catalog Number.

2.24.6.1.1 AVB Nameplate

Provide nameplate data that is permanently attached to each vehicle barrier. Provide corrosion-resistant metal plates that have at least the following data legibly marked:

a. Manufacturer's name.
b. Model number.
c. Serial number.
d. Date of manufacture.
e. Catalog Number.

2.24.7 Tamper Switches

Provide tamper switches on all equipment enclosures for the AVBCS to include all operating panels and provide on all manhole/handholes that contain spliced control wiring. Provide enclosures with doors larger than 24 inches with two tamper switches or more. Provide corrosion-resistant tamper switches, arranged to initiate an alarm signal when the door or cover is moved. The enclosure and the tamper switch must function together and not allow direct line of sight to any internal components before the switch activates. Tamper switches must be inaccessible until the switch is activated; have mounting hardware concealed so that the location of the switch cannot be observed from the exterior of the enclosure; be connected to circuits which are under electrical supervision at all times, irrespective of the protection mode in which the circuit is operating; must be spring-loaded and held in the closed position by the door or cover; and be wired so that the circuit is broken when the door or cover is disturbed. The crash rated active vehicle barrier control system is to monitor the tamper switches and provide an audible/visual alarm to the Master control panel. The AVBCS is to provide a single dry contact output that indicates a tamper alarm. The alarms are to be zoned at the master control panel in the following manner:
(1) AVBCS operating control panels.

(2) AVBCS cabinets that contain control equipment such as PLCs that are not covered under Zone 1.

(3) Manholes/handholes that contain spliced control wiring associated with the AVBCS. If there are spliced wiring, then provide a visual alarm at the master control panel.

2.24.8 Locks and Key-Lock Switches

**************************************************************************
NOTE: Either round key or conventional key type locks are acceptable for use in the system. Selection should be based on hardware availability at the time of design and the requirements for matching locks currently in use at the site. If the locks do not have to be matched to locks in use, and the designer has no preference, all brackets may be removed.
**************************************************************************

2.24.8.1 Locks

Provide locks on system enclosures for maintenance purposes. Provide UL Listed locks, [round-key type with 3 dual, 1 mushroom, 3 plain pin tumblers] [or ] [conventional key type lock having a combination of 5 cylinder pin and 5-point 3 position side bar]. Stamp keys "U.S. GOVT. DO NOT DUP". Arrange locks so that the key can only be withdrawn when in the locked position. Key locks alike and furnish only 2 keys for all of these locks. Control these keys in accordance with the key control plan as specified in paragraph Key Control Plan.

2.24.8.2 Key-Lock-Operated Switches

Provide UL listed Key-lock-operated switches as required to be installed on system components, [round-key type, with 3 dual, 1 mushroom, and 3 plain pin tumblers] [or ] [conventional key type lock having a combination of 5 cylinder pin and 5-point 3 position side bar]. Stamp keys "U.S. GOVT. DO NOT DUP". Provide 2 or 3 position key -lock-operated switches, with the key removable in specified positions. Key all key-lock-operated switches differently and furnish only 2 keys for each key-lock-operated-switch. Keys must be removable in the positions described in these specifications or as shown on the drawings. Control keys in accordance with the key control plan as specified in paragraph Key Control Plan.

2.24.8.3 Construction Locks

Use a set of temporary locks during installation and construction. The final set of locks installed and delivered to the Government must not include any of the temporary locks.

2.24.9 System Components

Design system components for continuous operation. Provide electronic components that are solid state type, mounted on printed circuit boards conforming to UL 796. Printed circuit board connectors are to be plug-in, quick-disconnect type. Incorporate safety margins of not less than 25 percent with respect to dissipation ratings, maximum voltages, and current.
carrying capacity on power dissipating components. Provide control relays and similar switching devices that are solid state type or sealed electro-mechanical.

2.24.9.1 Modularity

Design equipment for increase of system capability by installation of modular components. Design system components to facilitate maintenance through replacement of modular subassemblies and parts.

2.24.9.2 Maintainability

Design components to be maintained using commercially available tools and equipment. Arrange and assemble components they are accessible to maintenance personnel. Insure there is no degradation in tamper protection, structural integrity, EMI/RFI attenuation, or line supervision after maintenance when it is performed in accordance with manufacturer's instructions.

2.24.9.3 Interchangeability

Construct the system with off-the-shelf components which are physically, electrically and functionally interchangeable with equivalent components as complete items. Replacement of equivalent components must not require modification of either the new component or of other components with which the replacement items are used. Do not provide custom designed or one-of-a-kind items without explicit approval from the Contracting Officer. Ensure interchangeable components or modules do not require trial and error matching in order to meet integrated system requirements, system accuracy, or restore complete system functionality.

2.24.9.4 Product Safety

Conform system components to applicable rules and requirements of NFPA 70. Install system components with instruction plates including warnings and cautions describing physical safety and any special or important procedures to be followed in operating and servicing system equipment.

2.25 LINE SUPERVISION

Supervise all signal and Data Transmission System (DTS) lines. Provide a system that supervises the signal lines by monitoring the circuit for changes or disturbances in the signal and for conditions as described in UL 1076 for line security equipment. The system is to initiate an alarm in response to a current change of [5][10] percent or greater. The system also initiates an alarm in response to opening, closing, shorting, or grounding of the signal and DTS lines.

2.26 ELECTRICAL WORK

Submit detail drawings containing complete wiring and schematic diagrams, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Provide motors, manual or automatic motor control equipment [,except where installed in motor control centers] and protective or signal devices required for the operation specified herein in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide all field wiring for induction loop detectors, communication lines, and power circuits with surge protection. Provide any wiring required for the operation specified herein, but not
shown on the electrical plans, or specified herein, under this section in accordance with Sections 26 20 00 INTERIOR DISTRIBUTION SYSTEM and 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

2.27 WIRE AND CABLE

Provide all wire, cable, and conduit connecting all Contractor furnished and, where indicated on the drawings, Government furnished equipment. Provide wiring in accordance with NFPA 70. Provide wiring that is fiber optic or copper cable in accordance with the manufacturers' requirements. Copper signaling line circuits and initiating device circuit field wiring must be No. [20][18][_____] AWG size conductors at a minimum. Ensure wire size is sufficient to prevent voltage drop problems. Circuits operating at 24 VDC must not operate at less than 21.6 volts. Circuits operating at any other voltage are to ensure the voltage drop does not exceed 5 percent of nominal voltage.

2.27.1 Above Ground Sensor Wiring

Provide sensor wiring that is 20 AWG minimum, twisted and shielded, 2, 3, 4, or 6 pairs to match hardware. Provide multi-conductor wire with an outer jacket of PVC.

2.27.2 Cable Construction

Provide all cable components to withstand the environment in which the cable is installed for a minimum of 20 years.

2.28 DATA TRANSMISSION SYSTEM (DTS)

**************************************************************************
NOTE: Include Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLEING SYSTEM in the project specification for the appropriate Data Transmission required at the project site
**************************************************************************

Provide DTS as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLEING SYSTEM.

2.29 CONCRETE

Provide concrete that conforms to Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.30 WELDING

Welding is to be in accordance with AWS D1.1/D1.1M.

2.31 ACCESSORIES

Supply all accessories as required for a complete and finished system. Provide, at a minimum, all accessories as required by manufacturer's instructions.

2.32 FABRICATION

Shop assembly the vehicle barrier systems to the greatest extent possible.
2.33 TEST, INSPECTIONS AND VERIFICATIONS

Provide manufacturer written verification that vehicle barrier systems provided under this contract are manufactured in the "as-tested" and/or "as-certified" configurations, based on the crash testing.

Submit a Verification of Performance certificate stating that the construction, materials, and methods used will meet performance standards described in this section for this project.

2.34 FACTORY ACCEPTANCE TEST

******************************************************************************

NOTE: Evaluate the need for a factory test. Take into account the size of the system, unusual site conditions, the complexity of the system, the devices that comprise the system, expansion of an existing system as well as other pertinent information. If a factory test is deemed necessary, the factory test requirements below shall be tailored to the control system to be tested. If a factory test is deemed unnecessary, delete it from the following paragraphs.

First paragraph, last choice is for Army projects only.

NOTE: Protective design center and COS-ACP is required on Army projects.

******************************************************************************

2.34.1 General

Provide personnel, equipment, instrumentation, and supplies necessary to perform a factory acceptance test of the complete crash rated active vehicle barrier control system. A factory acceptance test is to demonstrate that the proposed system and related equipment meet the control parameters within the contract documents. The test is to demonstrate how the systems operates if a PLC is damaged or if signals between systems are lost. The system must show that barriers cannot be deployed with anything but a red signal. The test is to demonstrate the required alarm annunciation, CCTV controls, and sequence of events recording. The test set-up must include the PLC(s), the master control panel, alarm panel, control switches, and at least one of each type of remote panel, tamper switches, and limit switches. The duress, overspeed, and wrong-way sensors; the crash rated active vehicle barrier open and close position switches; the VPDs; the traffic signals; and the warning beacons may all be simulated. [ A member of the Protective Design Center and [of the Communities of Standardization for Access Control Points][Designer of Record] are to witness the factory acceptance test unless waived by the Government.]

Upon Test Plan approval by the Contracting Officer, assemble the test system and perform the factory acceptance test. The factory acceptance test is to demonstrate that the subsystems comply with the requirement specified herein. Conduct the factory acceptance test during regular daytime working hours on weekdays. The Contracting Officer reserves the right to witness all or a portion of the factory acceptance test.
2.34.2 Factory Acceptance Test Plan

Submit Test Plan for the factory acceptance test plan, a minimum of [45][30] days before the scheduled start of all factory acceptance tests. Factory test plan includes a schedule, test procedures, equipment catalog cuts, one line diagrams showing interconnections of all subsystem components, and diagrams showing control logic for the barriers, traffic signals, warning beacons, and alarm and status points. See paragraph "TEST PLANS" for list of information required to be tested.

2.34.3 Factory Acceptance Test Report

Submit the factory acceptance test report, which documents the results of the test, no more than 1 week after the successful completion of the factory acceptance test. The test report is to include the results of all test procedures showing all commands, stimuli, and responses to demonstrate compliance with the contract requirements in the test report. Include the certification from technical specialists from the crash rated active vehicle barrier, PLC, and the CCTV subsystems that their subsystem meets the contract requirements in the test report. The Contracting Officer will notify the Contractor within ten (10) days of receipt of the test report whether the test report is approved. If disapproved, the Contracting Officer will note the specific procedures that are disapproved; retest those procedures. Do not ship equipment to the field until the test report is approved by the Contracting Officer.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify that site conditions are in agreement with the contract drawings in accordance with paragraph "Current Site Conditions".

3.2 INSTALLATION

Perform installation in accordance with manufacturers instructions and in the presence of a representative of the manufacturer. Manufacturer's representative must be experienced in the installation, adjustment, and operation of the equipment provided. The representative is to be present during adjustment and testing of the equipment. Show on the drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including foundation and clearances for maintenance and operation.

3.2.1 Oversight

The Contractor designated technical specialist for the crash rated active vehicle barrier control system (AVBCS) must oversee installation.

3.2.1.1 Observation and Inspection

Manufacturer's representative is to [observe and inspect] [inspect] crash rated active vehicle barrier systems installation. Manufacturer's representative must be experienced in the installation, adjustment, and operation of the equipment provided. Manufacturer's representative is to be present during adjustment and testing of the equipment.
3.2.1.2 Installer Training/Certification

Install crash rated active vehicle barriers by the manufacturer's trained or certified installers in accordance with manufacturer's written installation instructions.

3.2.2 Installation Schedule

Before beginning any site work, provide a schedule of all installation and testing activities. Arrange project activities in the proposed schedule in chronological order. Coordinate all installation and testing activities, specifically those requiring ACP/ECF outages, with the Contracting Officer. There must be a Contracting Officer approved schedule before any site work is performed.

3.2.3 Crash Rated Active Vehicle Barrier Installation

Include with the detail installation drawings a copy of the as tested installation drawing. Install crash rated and/or certified crash rated active vehicle barrier in an 'as-tested' condition. Additional site investigation and construction is required in order to accomplish this; except when a site specific crash test was performed where the exact site requirements were utilized in the crash test.

3.2.3.1 Vertical Alignment

Install all vertical elements plumb and in alignment with a tolerance of 6 mm [1/4 inch] or in accordance with manufacturer's installation instructions, whichever is more restrictive.

3.2.3.2 Horizontal Alignment

Install all horizontal elements in the alignment indicated on the approved shop drawings with a tolerance of 12 mm [1/2 inch] in 2 m [6 feet - 6 inches] or in accordance with manufacturer's installation instructions, whichever is more restrictive.

3.2.3.3 Field Welding

Field welding is unacceptable as it will cause significant damage to the galvanizing and powder coat protective finishes.

3.2.3.4 Field Cutting and Drilling

Avoid unnecessary cutting and drilling of pre-finished components. If necessary to cut or drill or otherwise modify product due to field conditions, repair factory finish in accordance with the manufacturer's written instructions.

3.2.4 Hydraulic Lines

Install the hydraulic unit no more than 7.6 m 25 feet from the barriers or no further than the distance provided in the manufacturer's instructions, whichever distance is more restrictive. Place buried hydraulic lines in polyvinyl chloride (PVC) sleeves. Keep sleeves clean of concrete, dirt, or foreign substances during construction. Use proper tools for field cuts requiring tapers. Thoroughly clean sleeves before they are laid. As each run is completed, draw a flexible testing mandrel approximately 305 mm12 inches long with a diameter less than the inside diameter of the sleeve.
through the sleeve. After which, draw a stiff bristle brush through until the sleeve is clear of particles of earth, sand and gravel; then immediately install plugs. Mark hoses for reference ("up", "down", "barrier "). Coordinate project specific markings with the Contracting Officer.

3.2.5 Incidental Infrastructure

Provide all incidental construction as indicated. Design construct, and install incidental construction in accordance with local/state DOT requirements, AASHTO GDHS-5, AASHTO RSDG-4, NCHRP 350, and the MUTCD.

3.2.6 Concrete Placement

Provide concrete test reports per Section 03 30 00 CAST-IN-PLACE CONCRETE. After placement of the crash rated active vehicle barrier(s), replace the pavement sections to match the section and depth of the surrounding pavement unless a thicker pavement section is required for the tested condition of the crash rated active vehicle barrier. Warp pavement to match the elevations of existing pavement.

3.2.7 Reinforcing Steel Inspection

Inspect all by contractor's project manager or manufacturer's representative and the Contracting Officer representative prior to concrete placement. Contractor is required to provide no less than [_____] days notice of concrete placement schedule to required inspection personnel. Coordinate with the requirements found in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.3 CYBERSECURITY INSTALLATION CERTIFICATION

**************************************************************************
NOTE: Coordinate requirements with UFC 4-010-06 CYBERSECURITY OF FACILITY-RELATED CONTROL SYSTEMS at https://www.wbdg.org/ffc/dod/unified-facilities-criteria-ufc/ufc-4-010-06
**************************************************************************

Furnish a certification that control systems are designed and tested in accordance with DOD 8500.01, DOD 8510.01, 25 05 11 CYBERSECURITY OF FACILITY RELATED CONTROL SYSTEMS, and as required by individual Service Implementation Policy.

3.4 DRAINAGE

3.4.1 Pit Drainage

**************************************************************************
NOTE: Edit this paragraph for drainage requirements. If soil characteristic and/or climate dictates another solution, then this should be considered and edited into this paragraph. Provide self-priming sump pump with capacity and power requirements if one is required. Delete this paragraph if pit/vault type construction is not required.

Federal and/or state EPA regulations may require that an oil/water separator be installed in the pit drainage system to ensure capture of any hydraulic fluid that may leak out of the system. If pit/vault type construction is required provisions will be made for drainage and connection to storm drainage.
system, or if no storm drain exists, a self-priming submersible sump pump of adequate capacity will be specified.

Most the barrier manufacturer's have a 76 mm3 inches opening for drainage. This is the minimum acceptable size drain line. In some applications it is prudent to have larger drain line connect to the smaller opening since several barriers may connect to the same line.

Provide a drain connection [and oil/water separator] in each barrier that requires pit/vault type construction. [Provide hookups between the storm drains.] Provide a minimum drainage line of 76 mm3 inches. If there are multiple drain connections that can be made to the crash rated active vehicle barrier ensure the lines drain the low points as a minimum. [Where drain lines connect to a common header drain, provide a minimum header drainage line of [150][_____] mm[6][_____] inches.] [If the drainage line(s) are allowed to daylight into the side of a ditch, then provide a cast iron grate over the opening that is embedded into a concrete foundation. Provide coarse rock around the opening for at least [900][_____] mm[36][_____] inches] and extend down the slope to prevent erosion.

[A self-priming submersible sump pump of adequate capacity is to be installed.] [Provide the self-priming sump pump with the capacity to remove [_____] gallons liters per minute.] [Submit sump pump data sheets and calculations showing adequacy of the pump for its proposed use.]

3.4.2 Surface Drainage

NOTE: This has been a problem for barriers installed in pits/vaults. Areas that have high incident of rainfall over a short period of time can end up with water in the barrier for a period of time. Consider means to intercept and divert water flow around the crash rated active vehicle barrier.

Install crash rated active vehicle barrier per the test conditions for the crash rated active vehicle barrier. Ensure placement of the barrier provides positive drainage away from the barrier.

3.5 ELECTRICAL

Furnish and install all cables and conduits for all wiring interconnecting contractor furnished, and where indicated, Government furnished equipment. Install all wiring per Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

3.5.1 Wiring

Use ring-style terminals for all control power wiring requiring compression terminals. Conform terminals and compression tools to UL 486A-486B. Use roundhead screws and lockwashers to provide vibration-resistant connections. Use screw connections or other locking means to prevent shock or vibration separation of the card from its chassis for connections between any printed circuit cards and the chassis. Ensure the electrical
3.5.2 Grounding

Provide adequate grounding system for the following: Traffic signal supports, warning signal supports, AVBCS enclosure, crash rated active Vehicle Barrier frames, crash rated active vehicle barrier control enclosure, and supports for overspeed and wrong-way detectors. Test installed ground rods as specified in IEEE 142. Provide a #6 AWG ground wire from crash rated active vehicle barrier frame to the crash rated active vehicle barrier control enclosure.

3.5.3 Enclosure Penetrations

Penetrate enclosures through the bottom unless the system design requires penetrations from other directions. Seal penetrations of interior enclosures involving transitions of conduit from interior to exterior, and penetrations on exterior enclosures with rubber silicone sealant to preclude water entry. Terminate the conduit riser in a hot-dipped galvanized metal cable terminator. Fill the terminator with an approved sealant as recommended by the cable manufacturer and in a manner that does not damage the cable.

3.5.4 Exterior Components

Those components installed outside are to be able to function within the environmental conditions indicated previously for the paragraph on Exterior Conditions.

**************************************************************************

NOTE: choose the appropriate IP rating. Both IP ratings protect from total dust ingress. IP66 protects against low pressure water jets from any direction). IP67 protects against temporary immersion up to 1 meter of water. IP68 protects against complete immersion in water for a long period of time. If barrier is installed in areas with high rate of rain per hour, then choose IP67 or IP68. IP68 is not available by all manufacturers, so ensure the type of barrier being considered has this option.

**************************************************************************

Provide motors, actuators, wiring, luminaires, and other components that are installed below grade that are rated to function in a wet environment. Components within the barrier below grade fall in this category. Manufacturers of the crash rated active vehicle barrier and other below grade components are to assume a water saturated environment for the components. The devices and components must be watertight per NFPA 70. Provide motors and actuators with a minimum rating of IP66, IP67, IP68 per NEMA MG 1.

3.5.5 Other Requirements

Install the system in accordance with the standards for safety included in NFPA 70 and the appropriate installation instructions from the manufacturers of the equipment. Configure components within the system with appropriate service points to pinpoint system trouble in less than 30 minutes.
3.6 OPERATING AND MAINTENANCE INSTRUCTIONS

Submit written Operations and Maintenance Instructions. As part of the Operations and Maintenance Instructions, provide:

a. Periodic inspection and testing recommendations for daily, weekly, monthly and yearly intervals.

b. Electronic copy of the control system programming for each AVB control system. Provide a legend for the acronyms used in the program as well a description of each major logic element.

3.7 REPAIR

Repair damage to galvanized, coated, painted finishes in accordance with manufacturers written instructions. Submit Manufacturer Repair of Coatings Instructions. In the case where the manufacturer does not have written instructions, Submit recommended repair instructions (referencing published standards) for approval.

3.8 TEST PLANS

Factory acceptance test plan is to cover items a through o and x through cc or dd as appropriate as a minimum. The contractor verification test plan and performance verification test plan are to include at least all the following:

a. Information on the AVB to include size and rating.

b. Listing of the controllers and description of each controller and the locations of the controllers.

c. PLC restart test (test each one individually) by turning off the PLC for at least 1 minute then back on to verify proper reboot of the system.

d. Battery power test. 10 minutes on battery then do an EFO and lower barrier.

e. Power on/off test.

f. Test (manual) test for each barrier.

g. Local test for each barrier.

h. Test and Local mode loop (VPD) operation. Test each loop at least once with a motorcycle/small cart, SUV, and passenger vehicle.

i. System alarms

j. Panel layout and labeling.

k. Matrix testing of the various combinations of modes that the AVBs can be found in.

l. Tests to verify loss of a PLC ensures safe operation of the system

m. Test traffic signal operation as well as wig-wag and in-ground light operation.
n. Verify loss of signal between controllers triggers a trouble alarm.

o. Other tests deemed necessary to ensure system operates safely.

p. Information on the layout of the barrier to include distance from ID Check.

q. Information on signage to include wording and location

r. Verification of grounding as discussed herein.

s. Information on the cabinet ratings and NEC disconnect locations.

t. Test or verification on any heating system associated with the AVBs

u. Verification that the AVB drains properly (may be a sump pump etc. that needs testing).

v. General appearance of the system to include paint stripe configuration on the barriers, use of reflective tape, etc.

w. Verification of safety equipment necessary for performing maintenance.

**************************************************************************

NOTE: The first bracketed choice are for systems that have an EFO. The second bracketed choice are for systems that do not use an EFO such as Appendix A - Full Containment (Platooning/Normally Deployed) safety scheme.

**************************************************************************

[ x. EFO test for each EFO switch.

y. EFO loop (VPD) operation). Test each loop at least once with a motorcycle/small cart, SUV, and passenger vehicle.

z. EFO loop activation when signal turns yellow

aa. EFO loop deactivation when signal turns yellow

bb. EFO Reset function works properly.

cc. Matrix testing of the various combination of loops for each safety mode: EFO, Test, Local. Note for Test and Local this does include both up (close) and down) open functions.

dd. Arm/Disarm (yes/no) selector switch operation for each remote EFO panel/station.
]

[ x. Auto mode test for normally closed

y. Auto loop (VPD) operation). Test each loop at least once with a motorcycle/small cart, SUV, and passenger vehicle.

z. Loop activation when signal turns yellow

aa. Loop deactivation when signal turns yellow

bb. Matrix testing of the various combination of loops for each safety
mode: Auto, Test, Local. Note for Test and Local this does include both up (close) and down) open functions.

cc. Arm/Disarm (yes/no) selector switch operation for each remote panel/station.

3.9 CONTRACTOR VERIFICATION TEST

Submit test plan for the Contractor Verification Test. Test plans are to include a test schedule, a minimum of [30][45] days before the scheduled start of the Contractor Field Tests. See paragraph "TEST PLANS" for information required in a test plan. Calibrate and test all equipment, verify communications links between all subsystem components and between subsystems, place the integrated system in service, and test the integrated system using the approved test procedures for the contractor verification test. Submit the contractor verification test report no more than 1 week after the completion of each test. Deliver a report certifying that the installed complete system has been calibrated, tested, and is ready to begin performance verification testing. Include certifications from the Technical Specialists of the crash rated active vehicle barrier, PLC, and CCTV equipment/subsystems that the equipment/subsystems have been installed and tested and that they meet the requirements of the specifications in the report.

3.10 FINAL SYSTEM ACCEPTANCE

3.10.1 General

Final system acceptance consists of successfully completing the Performance Verification Test and completion of the commissioning, the training of Installation security and maintenance personnel, and successfully completing an Endurance Test as described below.

3.10.2 Team Leader

Designate a team leader to be responsible for scheduling all tests, coordinating attendance of all required commissioning team members, conducting the tests, and preparing appropriate test reports and the final commissioning report.

3.10.3 Commissioning Team

NOTE: Army. Army projects are required to have the USACE Protective Design Center, Omaha Corps of Engineers present.

The commissioning team consists of the commissioning team leader; the technical specialists from the crash rated active vehicle barrier supplier, and the programmer for the AVBCCS;[ a representative of the design of record;] [a representative of the USACE Protective Design Center; ]a contracting officer's representative; and a representative from the Installation.

3.10.4 Training

3.10.4.1 General Requirements

NOTE: Coordinate the training requirements with the
Conduct training courses for designated personnel in the operation and maintenance of the AVBCS. Orient the training to the specific system being installed. Deliver training manuals for each trainee with 2 additional copies delivered for archiving at the project site. Include an agenda, defined objectives for each lesson, and a detailed description of the subject matter for each lesson in the manuals. Furnish audio-visual equipment and other training materials and supplies. Where the Contractor presents portions of the course by audio-visual material, copies of the audio-visual material is to be delivered to the Government either as a part of the printed training manuals or on the same media as that used during the training sessions. A training day is defined as 8 hours of classroom instruction, including 60-minutes total of breaks and excluding lunchtime, Monday through Friday, during the daytime shift in effect at the training facility. For guidance in planning the operator training for the guards, assume that guards will have a high school education or equivalent and are familiar with ACPs/ECFs operations. For maintenance training, assume mechanical and electrical maintenance personnel typically employed at military installations. Obtain approval of the planned training schedule from the Government at least 30 days prior to the training. Do no provide training until the performance verification test has been successfully completed.

3.10.4.2 Guard's Training

Teach the guard training course at the project site for a period of up to eight hours after the performance verification test, but before commencing the endurance portion. Plan on a maximum of [12] personnel attending the course. Include instruction on the specific hardware configuration of the installed system and specific instructions for operating the installed system in the course. Upon completion of this course, each student is to demonstrate the ability to perform the following when operating the AVBCS:

a. Operate the crash rated active vehicle barriers in Test, Local and EFO/Auto modes.

b. Understand the differences between the normal and EFO/AUTO operation of the barriers.

c. Understand when to use Test, Local and EFO/AUTO modes for each barrier.

d. Understand all requirements for putting a barrier in either the Test or Local modes including required actions in the roadway ahead of the barrier and actions at the barrier.

e. Understand the crash rated active vehicle barrier safety scheme including operation of all vehicle presence detectors, traffic signals, signs, and warning signals.

f. Understand operation of the traffic signal including all signal indications for various operational modes and barrier positions.

r. Reconfigure barriers after an EFO/Auto activation/operation.

h. Monitor, acknowledge, and reset alarms.
[ i. Understand the operation and coverage of all overspeed and wrong-way sensors.
]
[ j. Monitor and control CCTV system
]

3.10.4.3 Maintenance Personnel Training

The Maintenance Personnel Training Course is to be taught at the project site for a period of up to eight hours after the Performance Verification testing. Plan on a maximum of [4][_____] personnel attending the course. Include the following in the course:

a. Instruction on each equipment and its configuration in the installed system.

b. Trouble shooting and diagnostic procedures.

c. Component repair and replacement procedures.

d. Emphasis on the importance of periodic testing and preventative maintenance. Provide a list of periodic preventative maintenance tasks for the crash rated active vehicle barriers and other critical equipment.

e. Calibration procedures.

f. Review of system drawings to identify device locations, communications, topology, and flow.

3.10.4.4 System Manager Training

Train System managers for a minimum of 4 hours in addition to the Guard and Maintenance Personnel described above. Provide system manager training training for trainers, such that, system managers will be able to train new guards and maintenance personnel in the future. Plan on a maximum of [4][_____] personnel attending this training. System manager training is to include the following:

a. Enrollment/deactivation process including the assignment of operator passwords.

b. Change database configuration.

c. Modify graphics, if provided.

d. Print reports, e.g., Sequence of Events reports.

e. Any other functions necessary to manage the system.

3.10.5 Performance Verification Test (PVT)

3.10.5.1 Test Plan

Submit a performance verification test plan. The test plan is to match the test plan used for the Contractor Verification Test plus any changes that came up during the testing. The test plan is to include the test procedures/plan, layouts of each of the operating panels and a site layout showing the location of the crash rated active vehicle barriers, traffic signals, warning beacons, actuated traffic arms, panels and all associated
signs and signals. Submit to the contracting officer 30 days prior to the proposed start date of the performance verification test.

3.10.5.2 Test Equipment and Personnel

Provide the following for all PVT tests:

a. A minimum of 6 hand held radios/walkie-talkies with additional batteries.

b. Safety vests for all participants.

c. Two Stop watches.

d. Flash lights.

e. Multi-meter.

f. Metal of sufficient size and shape to activate vehicle presence detection (VPD) loops. Provide metal that is easily moveable and provide one piece of metal per loop. Metal roadway signs with a rope tied to one end works well.

g. SUV or High bed truck to test each VPD loop.

h. Sedan type car to test each VPD loop.

i. Motorcycle to test each VPD loop. If testing is during the fall/winter, then a small utility vehicle can be substituted.

j. Three copies of the PVT test plan.

k. Camera that can take video of the crash rated active vehicle barrier and traffic signal operation and then allows a person to go back and count frames to get actual "real time". This is more accurate than the stop watch.

l. Sufficient personnel during the matrix testing equivalent to the number of vehicle presence detection (VPD) loops plus three more. This number of personnel can include government representatives; however, it must be verified that they are willing and able to support the matrix testing. Testing that does not include matrix testing requires five personnel to include government personnel.

m. Contractor is to ensure that someone who can make corrections to the software is present.

3.10.5.3 Commissioning

Perform a performance verification test of the installed AVB Control System per approved test procedures and under the direction of the Contractor's Team Leader. The PVT is to demonstrate that the system complies with the requirements specified herein. Conduct the PVT, where possible, during regular daytime working hours on weekdays. At the completion of the PVT, appropriate Commissioning Team Members are to sign identifying what passed and any deficiencies left unresolved.
3.10.5.4 Test Report

Within ten (10) days of successful completion of the PVT, the Contractor's Team Leader submits a performance verification test report to the Contracting Officer documenting the results of the test. Include in the test report the results of all test procedures showing all commands, stimuli, and responses to demonstrate compliance with the contract requirements. The Contracting Officer will notify the Contractor, within ten (10) days of receipt of the test report, whether the Test Report is approved. If disapproved, the Contracting Officer will note the specific procedures that are disapproved; retest those procedures. Do not start the Endurance Test until the PVT test report is approved by the Contracting Officer.

3.10.5.5 Opposite Season Test

NOTE: If the temperature at the site dips to below freezing for sustained duration in the winter time, specify an opposite season test.

Coordinate with the Commissioning Team to conduct an opposite season PVT. If the initial PVT test is performed in the winter, then the opposite season test is to be performed in the summer. If the initial PVT is done in the spring, summer, or fall, then the opposite season test it to be performed in the winter. All PVT tests and test reports submissions are required for the initial PVT are to be performed for the opposite season PVT.

3.10.6 Endurance Test

NOTE: Army Only. This testing is only required by the Army.

3.10.6.1 General

The Contractor's Commissioning Team Leader must submit a test plan including a schedule, test description, list of personnel required to conduct the test, and a list of all data to collect and observances to be made in order to demonstrate system reliability and operability of the completed AVB control system. Conduct the endurance test in phases as specified. The Contractor is to notify the Contracting Officer, in writing, that training as specified has been completed and that the correction of all outstanding deficiencies has been satisfactorily completed prior to performing the endurance test. The Contracting Officer may terminate the testing at any time the system fails to perform as specified. Upon termination of testing by the Contracting Officer or by the Contractor, commence an assessment period as described for Phase II below. Minimum operation times indicated in the O&M manual will indicate the minimum specific intervals the system is to be exercised. Ensure the exercise intervals meet or exceed the O&M requirements. It is important to note that if the endurance testing uncovers a problem that requires a programming change then the PVT is required to be performed again. Intent of the Endurance test:

NOTE: choose the safety scheme(s) used on the project and delete the ones not used. If not using
one of the safety schemes, then will have to develop what is reasonable for the planned operation of the system.

Hybrid Beacon (Signs & Signals) Safety Scheme. This system typically does not have the crash rated active vehicle barrier moving up/down on a regular basis. The system is to be tested both manually and by an EFO operation at least once every 24 hours or its equivalent as agreed upon by the Contracting Officer. Shift change times are a good time for this operation.

High Efficiency Presence Detection Safety Scheme. Normal system operation can include having the AVB moving up/down on normal basis. A cycle needs to be performed at least twelve times per hour or its equivalent over the normal daylight hours the ACP/ECF operates. Contracting Officer can adjust how this testing is accomplished based on the anticipated operation of this ACP/ECF.

Full Containment Safety Scheme. Normal system operation includes the fill/release of vehicles. A fill/release cycle needs to be performed at least twelve times per hour or its equivalent over the normal daylight hours the ACP/ECF operates. Contracting Officer can adjust how this testing is accomplished based on the anticipated operation of the ACP/ECF.

Stop Control Safety Scheme. This system typically does not have the crash rated active vehicle barrier moving up/down on a regular basis. The system is to be tested both manually and by an EFO operation at least once every 12 hours or its equivalent as agreed upon by the Contracting Officer. Shift change times are a good time for this operation.

General Barrier Operation. The system is to be tested manually at least once every 12 hours or its equivalent as agreed upon by the Contracting Officer. Shift change times are a good time for this operation.

3.10.6.2 Phase I Testing

Conduct the test 24 hours per day for 7 consecutive calendar days, including holidays, and the system is to operate as specified. Make no repairs during this phase of testing unless authorized by the Contracting Officer in writing.

3.10.6.3 Phase II Assessment

After the conclusion of Phase I, identify all failures, determine causes of all failures, repair all failures, and deliver a written report to the Contracting Officer. Explain in detail the nature of each failure, corrective action taken, results of tests performed, and recommend the point at which testing should be resumed in the report. After delivering the written report, convene a test review meeting at the jobsite to present the results and recommendations to the Contracting Officer. As a part of this test review meeting, demonstrate that all failures have been corrected by performing appropriate portions of the performance verification test. Based on the Contractor's report and the test review meeting, the Contracting Officer will determine the restart date, or may require that Phase I be repeated. If the original Phase I testing was completed without
any failures the endurance test is deemed completed.

3.10.7 Final Report

Upon successful completion of the Endurance Test, the Contractor's Team Leader must prepare a Final Report documenting that the Contractor has successfully completed the PVT and Endurance Test and training. Include signatures of the Commissioning Team in the Commissioning Report.

3.10.8 Post Commissioning PVT

NOTE: This is an optional test on the system. It is to be performed approximately 6 months after the system was commissioned. On large, more complex systems, this will add another level of assurance on the system. If an opposite season test is already required, then this option is not required.

Perform a performance verification test 6 months after the system was commissioned. All PVT tests and test reports required for the initial PVT are to be performed for the post commissioning PVT.

NOTE: There are 5 possible Appendix A, of which the Designer must choose the appropriate one or ones for this project. The latest version of the Appendices and drawings for panel layouts are found at https://mrsi.erdc.mil/cos/nwo/acp

NOTE: Include a drawing showing the control switches and control logic for this safety scheme. Use drawings from the ACP Standard Design as a base. If the controls are modified from the standard Army COS-ACP drawings, then care must be taken to ensure compliance with the security and safety criteria.

3.10.9 APPENDICES
APPENDIX A - SDDCTEA Approved Safety Schemes

NOTE: The information provided is based on the SDDCTEA safety scheme layout and operation found in the SDDCTEA Pamphlet 55-15 Traffic and Safety Engineering for Better Entry Control Facilities 2019. There were some significant changes from the 2014 version on the sequence of operation. If needed contact the Army COS-ACPs for information on the operation of the earlier safety schemes.

**************************************************************************
Hybrid Beacon (Conventional Signs and Signals) Safety Scheme Features. Provide the following features for the Conventional (Conventional Signs and Signals) Safety Scheme:

[1. General Layout Information

1.1 Active Vehicle Barriers in all inbound and outbound lanes.

1.2 Hybrid Beacon. A three light hybrid beacon signal head over each inbound and outbound active barrier. Special location may require only posts i.e. no masts. Post mounted requires two posts with each having a traffic signal. Provide three head traffic signals with two Red signals adjacent horizontally and a Yellow centered below the two red beacons. Install the hybrid beacon signal at the centerline of the AVB. The beacons are to be Light Emitting Diode (LED) type. Mast arm will have a 'Barrier Signal' sign.

1.3 A 610 mm 2 foot wide stop line placed 26.2M 86 feet in front of the the active vehicle barrier and the traffic signal is 12.8 meters 42 feet from the near edge of the stop line. Provide a 'Stop Here On Red' sign.

1.4 Double solid white lines between inbound lanes approaching the barriers to prohibit lane changes in front of the barriers.

1.5 Diagonal pavement striping. Provide white crosshatching pavement marking that covers the front and back VPDs.

1.6 Vehicle Presence Detectors (VPDs) located immediately before and immediately after each barrier. VPDs can be induction loops, video motion sensors, or other suitable technologies capable of sensing vehicle presence. Induction loops must be diagonal quadrapole loop. A loop crossing multiple lanes is not allowed. The VPD before the AVB starts 610 mm 2 feet from the AVB and is 23.16M 76 ft long.

1.7 Warning Sign and Warning Beacons (wig-wags) (2 Beacons with alternating flashing yellow lights) located 44.2 meters 145 feet in front of the barriers. Beacon lamps will be LED.

[NOTE: Army. First option choose for Army projects. All others, choose the second option.

1.8 One Master Control Panel, [one Guard Booth Control panel plus one Guard Booth EFO button each Guard Booth] [one Guard Booth EFO panel], one Overwatch Position Control Panel, one Search Area Control panel per separate search

SECTION 34 71 13.19 Page 99
area, [Pedestrian panel, ] and a Local Control Panel or panels at each barrier along with all control switches and indicating lights as shown on the Drawings. Locate the Master Control Panel in the Command and Control location for use by the ACP/ECF guards. Locate each Local Control Panel at or near its respective barrier power unit.

1.9 Red steady in-pavement lights. When required are to be located between the stop line and approach VPD.

1.10 Horn located at the crash-rated active vehicle barriers. Provide the horn with a means to adjust the volume.

**************************************************************************
NOTE: LED Blankout sign is optional.
**************************************************************************

[1.11 LED blankout sign that indicates 'Do Not Enter' installed at the barrier. Two per direction of travel by placing one on each side of the roadway.]

**************************************************************************
NOTE: choose the correct option.
**************************************************************************

2 BARRIER OPERATING CONTROL PANELS.

[Operating panel layouts are found in Army Standard Design drawing package.][Operating panel layouts are found in the contract drawings.]

3 TRAFFIC SIGNAL AND BARRIER CONTROLS.

3.1. Hybrid Beacon. EFO MODE OF OPERATION.

3.1.1 EFO Operation. Under normal operations, all barriers' mode selector switches on the Master Control Panel will be in the EFO position with the key removed and with that key being accessible only by the lead ACP/ECF guard. With the barrier's mode selector switch in the EFO position, EFO is enabled for that direction of travel, but the Open and Close switches for that barrier on the Master Control Panel and the Open and Close switches on that barrier's Local Control Panel are disabled.

3.1.2 In the EFO mode of operation with the barrier open, the Traffic Signal is Dark. Upon activation of an EFO command from any armed EFO, delay barrier emergency closure by 2 seconds. Activate the wig-wag (warning beacons) as soon as EFO is pushed. During the 2 seconds, the hybrid beacons signals change from dark (off) to Solid Yellow for 2 seconds and then to Alternating flashing Red (alternate on/off in a wig-wag fashion). Activate the in-pavement lights (steady on) when the traffic signal turns red and stay red as long as the traffic signal light is red. After 2 seconds from EFO activation, energize the barrier's emergency close circuit to close the barrier(s) in emergency fast mode (2 seconds or less) provided that the VPDs immediately in front of and behind the barrier are clear (entry and exit loops). If either or both VPDs detect a vehicle, then the barrier does not close; however, the the emergency close signal is latched only for those barriers that were in EFO mode at the time of activation. Once both VPDs are clear, the barriers (those in EFO mode) deploy (unless EFO Reset had been activated). The warning horn sounds for 10 seconds with the setting adjustable in the program.
3.2 Hybrid Beacon. EFO RESET. After an EFO activation, guards will close all inbound and outbound lanes. Guards will obtain the EFO Reset key and then activate the EFO Reset switch on the Master Control Panel to reset EFO. This turns off the warning beacons (wig-wags) and removes the latch command for the EFO circuit. The person in charge can then place the Master Control Panel mode switches into Test (or go through the sequence to use the Local panel) and use the Open buttons to lower each barrier. Once all the barriers are Open for a given direction of travel and the corresponding mode switches are back in EFO mode, then the traffic signal for that direction of travel turns Dark and the in-pavement lights deactivate. This needs to be done for both directions of travel in order to have Dark traffic signals in all directions.

3.3 Hybrid Beacon. TEST MODE OF OPERATION.

3.3.1 Test Operation. An individual barrier can be test operated by installing the proper lane closure markings and barricades ahead of the active barrier and then placing the mode selector switch for that direction of travel into the Test position. With the mode selector switch in the Test position, the barrier's Open and Close switches on the Master Control Panel for that direction of travel are enabled, but the Open and Close switches on the Local Control Panel for that direction of travel are disabled. In addition all active EFO switches are disabled from operating any barrier for that direction of travel. Where a single barrier spans both inbound and outbound lanes, the test operation switch deactivates all EFO capability.

3.3.2 When a mode switch is placed in Test mode, the traffic signals for that direction of travel cycle to Alternating Flashing RED (the hybrid beacons signals change from dark (off) to Steady Yellow for 2 seconds and then to Alternate flashing Red (alternate on/off in a wig-wag fashion). The barriers for that direction of travel are allowed to operate without any time delay ONCE the signal is alternating flashing Red. The traffic signals for that direction of travel stay Red until all the conditions are met for RETURN TO EFO MODE. The in-pavement lights for that barrier activate when the traffic signal is red and stay red as long as the traffic signals are red. Note the warning beacons do not operate under Test or Local mode, but can be allowed to operate if requested and approved. WARNING: Installation is responsible for proper lane closure procedures (closing off the lane, bagging the traffic signal over the barrier if a long term operation, having guards present, etc) during a Test or Local mode operation.

3.4 Hybrid Beacon. LOCAL MODE OF OPERATION

3.4.1 Local Operation. Local mode is used when maintenance personnel need to perform maintenance on the barrier.

3.4.1.1 Maintenance personnel would obtain the mode selector switch key from the lead ACP/ECF guard and place the key into the Master Control Panel 3-position mode selector switch for the appropriate direction of travel.

3.4.1.2 The person then turns the selector switch to the Local position to enable Local mode and then removes the key.

3.4.1.3 With the mode selector switch on the Master Control Panel in the Local position, Open and Close switches on the Master Control Panel for the barriers for that direction of travel are disabled and all EFO switches are disabled for that direction of travel. If a single barrier spans multiple directions of travel all EFO capability will be deactivated.
3.4.1.4 The maintenance person would then insert the key into the appropriate Off-Local mode selector switch on the barrier's Local Control Panel and turn the key to the "Local" position. This action activates the Open and Close switches at the Local Control Panel for the barriers in that direction of travel.

3.4.1.5 Maintenance personnel would also have to block and mark the lane ahead of the barrier in accordance with standard lane closure procedures/standards and also lock and tag out certain equipment at the barrier per the barrier manufacturer's recommendations for the type of maintenance to be performed.

3.4.2 Hybrid Beacon. LOCAL MODE OF OPERATION (one barrier per direction of travel). When a mode switch is placed in Local mode, the traffic signals for that direction of travel cycle to Alternating Flashing RED (the hybrid beacons signals change from dark (off) to Steady Yellow for 2 seconds and then to Alternate flashing Red (alternate on/off in a wig-wag fashion). The barriers for that direction of travel are allowed to operate without any time delay ONCE the signal is alternating flashing Red and there is full Local control. The traffic signals for that direction of travel stay Red until all the conditions are met for RETURN TO EFO MODE. The in-pavement lights for that barrier activate when the traffic signal is red and stay red as long as the traffic signals are red. Note the warning beacons do not operate under Local, but can be allowed to operate if requested and approved. WARNING: Installation is responsible for proper lane closure procedures (closing off the lane, bagging the traffic signal over the barrier if a long term operation, having guards present, etc) during a Test or Local mode operation.

3.5 If the Master Control panel is in EFO mode and the Local Panel is in Local mode, that is a conflict. Hybrid beacon is dark and EFO DOES NOT function. Local panel does not have any control. The mode indicating lights for Local and EFO are to alternate flashing and an audible alarm is to sound.

3.6 If the Master Control panel is in Test mode and the Local Panel is in Local mode, that is a conflict. Hybrid beacon signal is Red after cycling and all corresponding Test mode functions are INACTIVE. Local panel does not have any control. The mode indicating lights for Test and Local are to alternate flashing and an audible alarm is to sound.

******************************************************************************
NOTE: This is an optional switch function for locations that have only one lane per direction of travel or have one barrier across all the lanes. If there are multiple lanes per direction of travel with each lane having its own AVB and no lane separation, then provide this switch. Keep or delete as required by the project.
******************************************************************************

3.7 Out-of-Service switch. This function is provided for times when a barrier is damaged in a lane and needs to be taken out of service for an extended period of time. The out of service switch is to be located at the AVB location and is allowed to operate in EFO, Test and Local modes. This allows an AVB to be locked out in a lane, but the other lane can operate under EFO. The switch locks out all functions for the AVB when activated. The up and down lights for that AVB will alternate going on and off. WARNING: Installation is responsible for proper lane closure procedures (closing off the lane, bagging the traffic signal over the barrier, having guards present, etc). The Out-Of-Service switch has two positions: Yes and
3.7.1 No Position. All controls operate normally.

3.7.2 Yes Position. The Close/ Open position indicating lights for those barriers will alternate from one to the other approximately every 1 sec. This will happen at the Master Control Panel, Local Control Panel (if on) and at any other panel that has barrier position indicator lights.

3.7.2.1 If Local Panel is in Local Mode, then traffic signal is red and in-pavement lights are on. All controls to operate the barrier(s) are locked out.

3.7.2.2 If system is in Test Mode, then traffic signal is red and in-pavement lights are on. All controls to operate the barrier(s) are locked out.

3.7.2.3 If system is in EFO Mode, then traffic signal is dark. All controls to operate the barrier(s) are locked out.

3.8 Hybrid Beacon. RETURN TO EFO MODE. When the mode switch is placed in the EFO mode and all the barriers for that direction of travel are Open (not deployed), then the barrier's Traffic Signal change from Red to Dark if it was Red. If a mode switch is placed in the EFO mode and any of the barriers for that direction of travel are Closed, then the barrier's Traffic Signal stays Red (if it was red) and an alarm is generated on the ACP/ECF TROUBLE window on the Gatehouse Control Panel. The in-pavement lights turn off when the traffic signal changes to Dark.

3.9 Vehicle Presence Detector consisting of safety loops on either side of a crash rated active vehicle barrier may require additional programming and hardware. If the loops are more than 3 meters (10 feet) apart, then add 0.5-1 sec additional time delay on the "back" loop. The alternative is to provide a latching logic between loops. In the latching logic, the master panel needs a release pushbutton for each barrier.

3.10 AUDIBLE ALARMS. Provide an audible alarm at the Master Control Panel, Overwatch Control Panel, Pedestrian control panel, main Guard Booth Control Panel and Search Area Control panel(s). The volume must be adjustable either through a rheostat or other means. Provide a button that silences the audible alarm at each panel. This silence button does not affect the corresponding visual indicator. Silence button does not prevent an audible alarm if a new condition develops.

3.10.1 When an EFO is pushed an alarm will go off.

3.10.2 Overspeed and Wrong-way will each cause an alarm to go off for 3 seconds and then clear itself.

3.10.3 Duress activation.

3.10.4 AVB Trouble condition.

3.10.5 VPD Trouble condition.

3.10.6 VPD Activation for over the set amount of time period (typically 15 seconds) Light goes on immediately for VPD activation, but audible alarm activates after 15 seconds.

3.10.7 Out of Service activation. AVB indicator lights alternate being on.
3.10.8 Master Panel in EFO mode and Local Panel is in Local Mode. EFO mode and Local mode indicator lights alternate being on.

3.10.9 Master Panel in Test mode and Local Panel is in Local Mode. Test mode and Local mode indicator lights alternate being on.

3.10.10 Return to EFO mode with an AVB or AVBs in the incorrect position (not fully open). EFO mode indicator light and open/down AVB position light(s) flash.

3.10.11 Communication Loss alarm.

3.10.12 Tramper Switch. Any tamper switch activation triggers an alarm.

3.11 LED Blank-Out Sign (when used). The sign is to meet the following:

3.11.1 Symbol conforms to MUTCD or local Host Nation requirements.

3.12 AUDIBLE ALARMS. Provide an audible alarm at the Local Control Panel. The volume must be adjustable either through a rheostat or other means. Provide a button that silences the audible alarm at each panel. This silence button does not affect the corresponding visual indicator. Silence button does not prevent an audible alarm if a new condition develops.

3.12.1 AVB Trouble condition.

3.13 AUXILIARY CONTACTS

Provide auxiliary contacts (dry) to be used by the Intrusion Detection System and the CCTV system as specified herein and indicated on the drawings.
Appendix A2 - High Efficiency Presence Detection (HEPD) Active Barrier Safety Scheme

HIGH EFFICIENCY PRESENCE DETECTION (HEPD) SAFETY SCHEME FEATURES. Provide the following features for the HEPD Safety Scheme:

**************************************************************************
NOTE:  Paragraph 1 can be deleted in its entirety, if the layouts of equipment is shown on the drawings.
**************************************************************************

[1 General equipment layout information.

1.1 One Active Vehicle Barrier at the end of the Response Zone in each inbound and each outbound lane.

1.2 Vehicle presence detectors can be induction loops, video motion sensors, or other suitable technologies capable of sensing vehicle presence. Induction loops must be diagonal quadrapole loop and sized per lane i.e. a loop crossing multiple lanes is not allowed. Provide a vehicle presence detector (VPD) that starts 1220 mm 4 ft ahead of the stop line and goes across the stop line that is 1830 mm6 ft wide by 2.43 meters 8 ft long. Provide entry VPD that is between the stop line and AVB and starts 610 mm2 ft from the AVB that is 10.36 meters 34 ft long and 1830 mm6 ft wide. This second VPD starts 2 ft from the AVB. There is a third VPD is after the AVB and it is 1830 mm6 ft by 1830 mm6 ft and starts 610 mm2 ft the AVB. All VPDs, if loops, are to be quadrapole.

1.3 A 610 mm2 foot wide stop line placed 13.72 meters 45 feet in front of the active vehicle barrier. Provide a 'Stop Here On Red' sign.

1.4 Traffic Signals and associated signage.

1.4.1 Locations with a single inbound lane and a single outbound lane are to be configured as follows. Provide a post on the driver side and passenger side of the lane. As a minimum the post is to have a three-head Traffic Signal and a LED blank-out sign and a sign that indicates which lane the signal is belongs. Provide a traffic signal that is Red-Yellow-Green top to bottom. The Traffic Signal is to be located at the centerline of the crash rated active vehicle barrier. Bottom of the signal must be 2.49 M 8 ft above finished surface. The LED blank-out sign that states "DO NOT ENTER" and is to be mounted below the traffic signal.

1.5 Warning Sign and Warning Beacons (wig-wags) (2 Beacons with alternating flashing yellow lights) located typically between 39.6 meters 130 ft and 45.7 meters 150 ft in front of the AVB. Beacon lamps will be LED.

**************************************************************************
NOTE: Army. First option choose for Army projects. All others, choose the second option.
**************************************************************************

1.6 One Master Control Panel, [one Guard Booth Control panel plus one Guard Booth EFO button each Guard Booth][one Guard Booth EFO panel], one Overwatch Position Control Panel, one Search Area Control panel per separate search area, [Pedestrian panel, ] and a Local Control Panel or panels at each barrier.
along with all control switches and indicating lights as shown on the Drawings. Locate the Master Control Panel in the Command and Control location for use by the ACP/ECF guards. Locate each Local Control Panel at or near its respective barrier power unit.

1.7 Red steady in-pavement lights. Where required are to be located between the stop line VPD and the approach VPD.

1.8 Horn located at the crash-rated active vehicle barriers. Provide the horn with a means to adjust the volume.

1.9 Diagonal pavement striping. Provide white crosshatching pavement marking that covers the front and back VPDs. Do not stripe the stop line VPD.

1.10 LED blankout sign that indicates 'Do Not Enter' installed at the barrier. Two per direction of travel by placing one on each side of the roadway on the traffic signal post.

1.11 Passive barriers on raised islands between each lane. Passive barriers and islands extend at least the same distance as the stop line VPD on the secure side of the AVB. Passive barriers must be placed to ensure that a vehicle cannot do a reverse slip. A reverse slip is where a vehicle passes over the barrier after a vehicle passes (slips in behind going opposite direction). See Drawings.

1.12 Passive barrier on a raised median island between the inner most inbound and outbound lanes. The median is to extend at least 25 ft ahead of the stop line. Passive barriers as a minimum start at 3.66 meters or 12 ft from the the stop line and extend to 3.66 meters or 12 ft past the active vehicle barrier. Island has a passive barrier that is 1830 mm or 6 ft from the leading edge and 4 ft from the other edge.

1.11 Actuated Traffic Arm 609 mm or 2 feet beyond the back edge of the Stop Line

1.12 Actuated Traffic Arm for each inbound lane in the ID Check Area. ATAs are installed near the Guard Booths as shown on the Drawings. An ATA Control Panel with Open and Close control switches for the ATA are provided and mounted on the back wall of the Guard Booth below the back window. If the installation plans on getting Automatic Installation Entry, then just provide infrastructure for the future installation of the ATAs.

**************************************************************************
NOTE: Choose the appropriate option.
**************************************************************************

2 BARRIER OPERATING CONTROL PANELS.

[Operating panel layouts are found in Army Standard Design drawing package.][Operating panel layouts are found in the contract drawings.]

3 TRAFFIC SIGNAL AND BARRIER CONTROLS.

3.1 EFO MODE ACTIVATION. The following descriptions assume that the safety VPDs (those located adjacent to the AVB) are clear. A vehicle on the stop line VPD does not impact AVB movement under EFO. If the VPDs are not clear then the AVB deployment is delayed until all safety VPDs are clear. EFO Operation. Under normal operations, all lane mode selector switches on the Master Control Panel will be in the EFO position with the key removed and accessible only by the lead ACP/ECF guard. With the barrier's mode selector

SECTION 34 71 13.19  Page 106
switch in the EFO position, EFO is enabled for that lane, but the Open and Close switches for that lane on the Master Control Panel and the Open and Close switches on that barrier’s Local Control Panel is disabled.

3.1.1 EFO Mode of Operation with Active Vehicle Barrier (AVB) Up (Closed).

3.1.1.1 Initial State
a. AVB is UP (Closed)
b. VPDs do not have to be clear since the AVB is already in the closed position.
c. Traffic Arm is Down (Closed).
d. Traffic Signals for that lane are Red.
e. Warning beacons (wig-wags) and LED 'Do Not Enter' Blank-out signs area off.

3.1.1.2 EFO is Pushed.
a. Warning beacons (wig-wags) and LED Blank-out signs activate immediately.
b. Horn activates for 10 seconds.
c. AVB remains in the deployed position until EFO Reset is accomplished.

3.1.2 EFO Mode of Operation with Active Vehicle Barrier (AVB) Down (Open).

3.1.2.1 Initial State
a. AVB is Down (Open).
b. Traffic Arm is Down (Closed).
c. Traffic Signals for that lane are Red.
d. Warning beacons (wig-wags) and LED Blank-out signs area off.

3.1.2.2 EFO is Pushed.
a. Warning beacons (wig-wags) and LED Blank-out signs activate immediately.
b. Lane horn(s) is activated for 10 seconds.
c. AVB is deployed. AVB is fully Up (Closed) within 2 seconds (t=2). EFO is not to be interrupted by any position limit switch for the Actuated Traffic Arm.
d. AVB remains in the deployed position until EFO reset is accomplished.

3.1.3 EFO Mode of Operation while Active Vehicle Barrier (AVB) is Down (Open) While Processing Traffic.

3.1.3.1 Initial State
a. AVB is Down (Open).
b. Traffic Arm is Up (Open).
c. Traffic Signals for that lane are green i.e. in Normal Operation.
d. Warning beacons (wig-wags) and LED Blank-out signs area off.

3.1.3.2 EFO is Pushed.
a. Warning beacons (wig-wags) and LED Blank-out signs activate immediately.
b. Lane horn(s) is activated for 10 seconds.
c. Traffic Signal if Green will go to Yellow for 2 seconds (t=2).
d. Traffic Signal will go to Red (t=2).
e. Traffic Arm begins to go Down (Close) as soon as VPD 1a and 1b are clear. Traffic Arm is fully Down (Closed) after 2 seconds. EFO is not to be interrupted by any position limit switch for the Actuated Traffic Arm.
f. Once Traffic Arm is fully Down (Closed), then AVB is deployed. AVB is to be fully Up (Closed) within 2 seconds.
g. AVB remains in the deployed position until EFO reset is accomplished.

3.2 Normal Operations - EFO Mode

3.2.1.1 Initial State
3.2.1.2 Vehicle Stops is detected by stop line VPD.
   a. Once vehicle detected, AVB is to start Down (Open) after a 1 second delay (t=1).
   b. AVB is fully Down (Open) after 2 more seconds (t=3).
   c. Once AVB is Down (Open), Traffic Arm is to start Up (Open).
   d. Traffic Arm is fully Up (Open) after 2 more seconds (t=5).
   e. Traffic signal changes to Green (t=5).
   f. A timer is started once stop line VPD is cleared. The timer is set for 3 seconds.
   (1). If stop line VPD is clear for the 3 seconds then the Traffic Signal is to change to Yellow (t=8).
       a. Traffic Signal is Yellow for 3 seconds (t=11). Once signal changes to Yellow, the system is to complete the following steps prior to processing other vehicles, even if a vehicle is detected by the stop line VPD.
       b. Traffic Signal changes to Red.
       c. Traffic Arm begins Down (Close).
       d. Traffic Arm is fully Down (Closed) after 2 seconds (t=13).
       e. Once Traffic Arm is fully Down (Closed), AVB is to start Up (Close).
       f. AVB is to be fully Up (Closed) within 2 seconds (t=15).
   (2). If the stop line VPD detects a vehicle before 3 seconds elapse, then the Traffic Signal is to stay Green and the Traffic Arm stay Up (Open). The three second timer resets to each time the loop is cleared.

3.3 EFO RESET. After an EFO activation, guards will close all inbound and outbound lanes. Guards will then activate the EFO Reset switch on the Master Control Panel to reset EFO, place each lane's mode switch to the Test or Local position. When in Test position, it will allow the guard to operate the traffic arm and crash rated active vehicle barrier for that lane. Local mode would be used by maintenance personnel.

3.4 TEST MODE OF OPERATION.

3.4.1 When a barrier's mode switch is placed in Test mode the following is to happen. An individual barrier and traffic arm can be test operated by installing the proper lane closure markings and barricades ahead of the active barrier and then placing the mode selector switch for that direction AVB into the Test position. With the mode selector switch in the Test position, the barrier's and traffic arm's Open and Close switches on the Master Control Panel for that AVB is enabled, but the Open and Close switches on the Local Control Panel for that AVB are disabled. In addition all active EFO activations disabled from operating that barrier.

3.4.2 Test Mode Sequence of Operation

3.5.2.1 Initial State
a. Traffic Arm is Down (Closed).
b. Traffic Signals for that lane are Red. Note signals do not cycle through yellow before changing to red.
c. warning beacons (wig-wags) and LED Blank-out signs area off.
d. AVB can either be Up (Closed) or Down (Open).

3.4.2.2 Switch is placed in Test
a. The operator must ensure that the lane that the barrier is in is properly
blocked and marked prior to placing the switch into Test or Local mode. This is to comply with MUTCD or Host Nation Criteria.
b. Switch must be in either Test or Local mode for 1 second.
c. Blocks EFO operation for that lane.
d. Horn sounds for 4 seconds or not at all.
e. LED blankout signs activate.
f. Warning beacons do not activate.

3.4.2.3 Initial State
a. AVB is Down (Open).
b. Traffic Arm is Up (Open).
c. Traffic Signals for that lane is Green.
d. warning beacons (wig-wags) and LED Blank-out signs area off.

3.4.2.4 Switch is placed in Test or Local Mode.
a. The operator must ensure that the lane that the barrier is in is properly blocked and marked prior to placing the switch into Test or Local Mode. This is to comply with MUTCD or Host Nation Criteria.
b. Blocks EFO operation for that lane.
c. Traffic Signal changes from green to yellow for 2 seconds then red.
d. Horn sounds for 4 seconds or not at all.
e. LED blankout signs activate.
f. Warning beacons do not activate.

3.5 LOCAL MODE OF OPERATION.

3.5.1 Local Operation. Local mode is used when maintenance personnel need to perform maintenance on the barrier.

3.5.1.1 Maintenance personnel would obtain the mode selector switch key from the lead ACP/ECF guard and place the key into the Master Control Panel 3-position mode selector switch for the appropriate AVB.

3.5.1.2 The person then turns the selector switch to the Local position and remove the key.

3.5.1.3 With the mode selector switch on the Master Control Panel in the Local position, Open and Close switches on the Master Control Panel for that barrier and actuated traffic arm is disabled and all EFO activations disabled for that AVB. Local mode operation is enabled.

3.5.1.4 The maintenance person would then insert the key into the appropriate Off-Local mode selector switch on the barrier's Local Control Panel and turn the key to the "Local" position. This action activates the Open and Close switches at the Local Control Panel for that barrier and actuated traffic arm.

3.5.1.5 Maintenance personnel would also have to block and mark the lane ahead of the barrier in accordance with standard lane closure procedures/standards and also lock and tag out certain equipment at the barrier per the barrier manufacturer's recommendations for the type of maintenance to be performed.

3.5.2 Local Mode Sequence of Operation.

3.5.2.1 Initial State
a. Traffic Arm is Down (Closed).
b. Traffic Signals for that lane are Red. Note signals do not cycle through yellow before changing to red.
c. warning beacons (wig-wags) and LED Blank-out signs area off.
d. AVB can either be Up (Closed) or Down (Open).

3.5.2.2 Switch is placed in Local Mode
a. The operator must ensure that the lane that the barrier is in is properly blocked and marked prior to placing the switch into Test or Local mode. This is to comply with MUTCD or Host Nation Criteria.
b. Switch must be in either Test or Local mode for 1 second.
c. Blocks EFO operation for that lane.
d. Horn does not sound.
e. LED blankout signs activate.
f. Warning beacons do not activate.

3.5.2.3 Initial State
a. AVB is Down (Open).
b. Traffic Arm is Up (Open).
c. Traffic Signals for that lane is Green.
d. warning beacons (wig-wags) and LED Blank-out signs area off.

3.5.2.4 Switch is placed in Local Mode.
a. The operator must ensure that the lane that the barrier is in is properly blocked and marked prior to placing the switch into Test or Local Mode. This is to comply with MUTCD or Host Nation Criteria.
b. Blocks EFO operation for that lane.
c. Traffic Signal changes from green to yellow for 2 seconds then red.
d. Horn does not sound.
e. LED blankout signs activate.
f. Warning beacons do not activate.

**************************************************************************
NOTE: This switch is optional. Verify with customer if desired.
**************************************************************************

3.6 Out-of-Service switch. Provide one per direction of travel. This function is provided for times when a barrier is damaged in a lane and needs to be taken out of service for an extended period of time. WARNING: Installation is responsible for proper lane closure procedures (closing off the lane, bagging the traffic signal over the barrier, having guards present, etc). The switch is located at the Local panel but can function at anytime. The Out-Of-Service switch has two positions: Yes and No or the wording Enable and Disable is allowed.

3.6.1 No Position. All controls operate normally.

3.6.2 Yes Position. The Close/ Open position indicating lights for those barriers will alternate from one to the other approximately every 1 sec. This will happen at the Master Control Panel, Local Control Panel (if on) and at any other panel that has barrier position indicator lights.

3.6.2.1 If Local Panel is in Local Mode, then traffic signal is red and in-pavement lights are on. All controls to operate the barrier(s) are locked out.
3.6.2.2 If system is in Test Mode, then traffic signal is red and in-pavement lights are on. All controls to operate the barrier(s) are locked out.
3.4.2.2 If system is in EFO Mode, then traffic signal is green. All controls to operate the barrier(s) are locked out.

3.7 RETURN TO AN EFO MODE. The traffic arm is to be down, AVB is up, and
the traffic signal is to be red. When the operator places the mode switch into EFO mode, the system is to wait 1 second and then check the position of the traffic arm and the AVB. If either the traffic arm or the AVB are not in the correct position or both are not in the correct position, then the EFO Mode indicating light is to flash and an audible alarm activates. The audible alarm is on for 1 second and then off for 2 seconds. The audible alarm continues in this manner until the equipment is either put in the correct position or the alarm silence is pushed.

3.8 VPDS.

3.8.1 Stop Line VPD. This vehicle presence detection device is used to notify the system when a vehicle is in position to be processed through the lane.

3.8.2. Safety VPDs. These vehicle presence detection devices are used to notify the system when a vehicle is traversing the AVB and it will suppress the AVB from going Up (Close) or Down (Open).
   These VPDs must be clear before the AVB is allowed to deploy.

3.8.3. When a VPD is activated for 15 seconds or more, an audible/visual alarm indicating light activates for that lane.

3.8.4. Vehicle Presence Detector consisting of safety loops on either side of a crash rated active vehicle barrier may require additional programming and hardware. If the loops are more than 10 ft (3 meters) apart, then add 0.5-1 sec additional time delay on the "back" loop. The alternative is to provide a latching logic between loops. In the latching logic, the master panel needs a release pushbutton for each barrier.

3.9 Lane Horn. The horn activates under EFO. An adjustable timer is to be set at 10 seconds.

3.10 Actuated Traffic Arm. The Traffic Arm is to have an edge sensor or a torque motor sensor to stop it from continuing to close on a vehicle. When the sensor impacts an object it stops motion and reverses to the Up (Open) position. Loops or break beams are not allowed for this operation. The stop line VPD is to prevent the traffic arm from closing until the VPD is cleared.

3.11 AUDIBLE ALARMS. Provide an audible alarm at the Master Control Panel, Overwatch Control Panel, main Guard Booth Control Panel, Pedestrian Booth, and Search Area Control panel(s). The volume must be adjustable either through a rheostat or other means. Provide a button that silences the audible alarm at each panel. This silence button does not affect the corresponding visual indicator. Silence button does not prevent an audible alarm if a new condition develops.

3.11.1. When an EFO is pushed an alarm will go off for 10 seconds unless silenced earlier.

3.11.2. Overspeed and Wrong-way will cause an alarm to go off for 3 seconds and then clear itself.

3.11.3. Duress activation.

3.11.4. AVB Trouble condition.

3.11.5. Loop Trouble condition.
3.11.6. VPD Activation for over the set amount of time period (typically 15 seconds) Light goes on immediately for VPD activation, but audible alarm activates after 15 seconds.

3.11.7. Out of Service activation. AVB indicator lights alternate being on.

3.11.8. Master Panel in EFO mode and Local Panel is in Local Mode. EFO mode and Local mode indicator lights alternate being on.

3.11.9. Master Panel in Test mode and Local Panel is in Local Mode. Test mode and Local mode indicator lights alternate being on.

3.11.10. Return to EFO mode with an AVB or AVBs in the incorrect position (not fully open). EFO mode indicator light and open/down AVB position light(s) flash.

3.11.11 Traffic arm is neither in fully up or fully down for more than 10 seconds. Position indicator lights for that traffic arm alternate flashing.

3.11.12 Communication Loss alarm.

3.11.13 Tramper Switch. Any tamper switch activation triggers an alarm.

3.12 LED Blank-Out Sign. The sign is to meet the following:

3.12.1 Symbol conforms to MUTCD or local Host Nation requirements.

3.13 AUDIBLE ALARMS. Provide an audible alarm at the Local Control Panel. The volume must be adjustable either through a rheostat or other means. Provide a button that silences the audible alarm at each panel. This silence button does not affect the corresponding visual indicator. Silence button does not prevent an audible alarm if a new condition develops.

3.13.1 AVB Trouble condition.

3.14 AUXILIARY CONTACTS
Providing auxiliary contacts (dry) to be used by the Intrusion Detection System and the CCTV system as specified herein and indicated on the drawings.
FULL CONTAINMENT (Sally Port or Platooning) SAFETY SCHEME FEATURES. Provide the following features for the full containment Safety Scheme:

**************************************************************************
NOTE: Paragraph 1 can be deleted in its entirety, if the layouts of equipment is shown on the drawings.
**************************************************************************

[1 General equipment layout information.

1.1 One or more sets of Active Vehicle Barriers in the inbound and outbound lane or lanes. Each set of barriers consists of an initial and final barrier(s) separated by a selected distance to form an entrapment area, in which either the initial barrier(s) or final barrier(s) is always closed.

1.2 Passive barrier on a raised island separating the inbound entrapment area from the outbound entrapment area to prevent vehicle crossover.

1.3 Passive barriers along the ACP/ECF corridor to contain vehicles within the corridor.

1.4 One three-light Traffic Signal located on each side of each crash rated active vehicle barrier (or roadway if there is more than one barrier across the roadway) as shown on the Drawings. Provide three lights in each Traffic Signal with a light configuration of Red-Yellow-Green top to bottom.

1.5 A 610 mm wide stop line placed 4.9 meters in front of each barrier(s) as a driver normally approaches the barrier(s). Provide a 'Stop Here On Red' sign at the stop line on each side of the roadway.

1.6 Vehicle presence detectors located immediately before and immediately after each barrier. Presence detectors can be induction loops, video motion sensors, or other suitable technologies capable of sensing vehicle presence. Induction loops must be diagonal quadrupole loop and sized per lane i.e. a loop crossing multiple lanes is not allowed.

1.7 Vehicle presence detector located at the stop line starts 1200 mm before the stop line then crosses the stop line and extends another 610 mm past the stop line. Presence detectors can be induction loops, video motion sensors, or other suitable technologies capable of sensing vehicle presence.

1.7 One Master Control Panel, one Guard Booth Control panel for each Guard Booth, and one Overwatch Panel along with all control switches and indicating lights as shown on the Drawings. The Master Control Panel is normally located in the Command and Control for use by the lead ACP/ECF guard.

**************************************************************************
NOTE: Army. First option choose for Army projects. All others, choose the second option.
**************************************************************************

1.8 One Master Control Panel, [one Guard Booth Control panel plus one Guard
Booth EFO button each Guard Booth\[one Guard Booth EFO panel], one Overwatch Position Control Panel, one Search Area Control panel per separate search area, [Pedestrian panel, ]and a Local Control Panel or panels at each barrier along with all control switches and indicating lights as shown on the Drawings. Locate the Master Control Panel in the Command and Control location for use by the ACP/ECF guards. Locate each Local Control Panel at or near its respective barrier power unit.

1.9 Diagonal pavement striping. Provide white cross hatching pavement marking that covers the front and back VPDs. Do not stripe the stop line VPD.

**************************************************************************
NOTE: Stop line traffic arm is optional. It is recommended to provide since it help provide another visual indicator.
**************************************************************************

[1.10 Provide an Actuated Traffic Arm for each lane. Install ATAs 610 mm2 ft from the backside of the stop line.
]

1.11 Provide an Actuated Traffic Arm (ATA) for each inbound lane in the ID Check Area. ATAs are to be installed near the Guard Booths as shown on the Drawings. Provide an ATA Control Panel with Open and Close control switches for the ATA and mount in the Guard Booth.

**************************************************************************
NOTE: Choose the appropriate option.
**************************************************************************

2 BARRIER OPERATING CONTROL PANELS.

[Operating panel layouts are found in Army Standard Design drawing package.][Operating panel layouts are found in the contract drawings.]

3 TRAFFIC SIGNAL AND BARRIER CONTROLS.

3.1 BARRIER LAYOUT AND DESIGNATIONS. Arrange each inbound and outbound lane to have two barriers per lane arranged in to entrap a vehicle or vehicles between them. Design the space between barriers to be long enough for the longest vehicle anticipated for the ACP/ECF. The space may be made longer to accommodate multiple vehicles in a platooning type arrangement. The initial barrier from the perspective of innocent motorists is designated 1, and the final barrier is designated 2 for inbound lanes. The initial barrier, again from the perspective of the innocent motorists leaving the installation, is designated 1, and the final barrier is designated 2 for outbound lanes.

3.2 AUTO MODE OF OPERATION.

3.2.1 Auto Operation. In the Auto mode of the Inbound Barriers' mode selector switch, the Close and Open switches on the Control Panel are deactivated for the inbound barriers and the Fill and Release switches on the Master Control panel are activated for the inbound barriers. Guard Booth Panels and Overwatch Panel are activated for the inbound barriers, but only if the arm/disarm switch for the given panel is in the armed position. The above requirements also apply to the control switches and control logic for the outbound barriers.
3.2.2 Initially with no vehicles present in the inbound lanes and the Inbound Barriers' Manual - Auto - Local mode selector switch in the Auto mode, Barrier 1 is open and Barrier 2 is closed. Incoming vehicles are checked at the ID Check point and if cleared are allowed to pass over Barrier 1 and proceed to the Stop Line for Barrier 2. The guard at either the Gatehouse or the Guard Booth then activates the Inbound Release switch. Upon activation of the Inbound Release switch, the Traffic Signal for Barrier 1 goes from Green to Yellow for three seconds and then to Red. After an additional second of Red, Barrier 1's close circuit is energized to close the barrier and traffic arm if present. After Barrier 1 is fully closed, Barrier 2's open circuit is energized to open Barrier 2. When Barrier 2 is fully open, its Traffic Signal changes from Red to Green to allow the vehicle or vehicles to proceed onto the Installation. If traffic arms are provided at the Stop Line, then the traffic arm associated with Barrier 1 will close first followed by closing Barrier 1. The traffic arm associated with Barrier 2 will have the barrier open first and then the traffic arm will open. In both cases, the traffic signal does not change to Green unless both the traffic arm and crash rated active vehicle barrier are fully open.

3.2.3 When the vehicle or vehicles between Barriers 1 and 2 have passed over Barrier 2, the guard activates the Inbound Fill switch. Upon activation of the Inbound Fill switch, the Traffic Signal for Barrier 2 changes from Green to Yellow for 3 seconds and then to Red. After an additional 1 second at Red, Barrier 2's close circuit is energized to close Barrier 2. After Barrier 2 is fully closed, the open circuit for Barrier 1 is energized to open Barrier 1. After Barrier 1 is fully open, its Traffic Signal changes from Red to Green. If there is a traffic arm associated with Barrier 2, the traffic arm closes once the signal is Red, then once fully closed, then Barrier 2 closes. If there is a traffic arm associated with Barrier 1, then Barrier 1 will open first, followed by the traffic arm. Once both are open then the signal changes to Green.

3.2.4 The same controls apply to Barriers 1 and 2 in the outbound lanes and control switches Outbound Release and Outbound Fill.

3.2.5 Supervise the close circuit for all barriers by the Vehicle Presence Detectors (VPD's) in front of and behind the barrier, such that if either VPD detects a vehicle, the barrier close circuit is suppressed. The open circuit is not impacted by a VPD being activated.

3.2.6 A green indicating light adjacent to each Fill switch illuminates when the lane barriers are moving to the Fill position from the barriers being in the Release position. The indicating light is only on while the barriers (and actuated traffic arms) are moving to the proper position. Once in the Fill position the indicating light goes off. Similarly, there is a green indicating light adjacent to each Release switch that lights when the lane barriers are moving to the Release position from the barriers being in the Fill position. The indicating light is only on while the barriers (and actuated traffic arms) are moving to the proper position. Once in the Release position the indicating light goes off.

3.2.7 Red indicating lights are provided to indicate when the barriers (and actuated traffic arms) are in the Fill or Release positions.

3.3 MANUAL MODE OF OPERATION.

3.3.1 In the Manual mode of the Inbound Barriers' mode selector switch, the Close and Open switches on the Master Control Panel are activated for the inbound barriers, but the Fill and Release switches on the Master, Guard
Booth Control Panels, and Overwatch Panel are deactivated for inbound barriers. The above requirements also apply to the control switches and control logic for the outbound barriers. The AVB and traffic arm in manual mode can be operated independently. Warning: In this mode it is possible to have the traffic arms and AVBs all in the option position.

3.3.1 When the Inbound Barriers Manual - Auto - Local mode switch is placed in the Manual mode, the inbound barriers can now be controlled by the individual barrier Open and Close switches on the Master Control Panel. Initiation of a Close command to an open barrier causes that barrier's Traffic Signal to change from Green to Yellow for 3 seconds and then to Red. After an additional one second of Red, the barrier's close circuit is energized through the VPD's immediately in front of and behind the barrier. If the VPD's are clear, the barrier closes. Initiation of an Open command to a closed barrier energizes the open circuit for the barrier and open the barrier. After the barrier is fully open and the mode switch is placed in Auto mode, then the Traffic Signal changes from Red to Green. In the Manual mode, both initial and final barriers in a given entrapment area can be opened. Situations requiring this configuration include passing a vehicle that is longer than the entrapment area. In such situations, guards must provide compensatory security measures to defeat a threat while both barriers are open. If there is a traffic arm associated with a barrier, the traffic arm is to close first and open last when compared to the barrier movement. Manual mode does not allow manual operation of the barrier and the traffic arm separately from each other.

3.3.2 The close circuit for all barriers is supervised by the Vehicle Presence Detectors (VPD's) in front of and behind the barrier, such that if either VPD detects a vehicle, the barrier close circuit is suppressed. The open circuit is not impacted by a VPD being activated.

3.4 LOCAL MODE OF OPERATION.

3.4.1 Local Operation. Local mode is used when maintenance personnel need to perform maintenance on the barrier.

3.4.1.1 Maintenance personnel would obtain the mode selector switch key from the lead ACP/ECF guard and place the key into the Master Control Panel 3-position mode selector switch for the appropriate direction of travel.

3.4.1.2 The person then turns the selector switch to the Local position and remove the key.

3.4.1.3 With the mode selector switch on the Master Control Panel in the Local position, Open and Close switches on the Master Control Panel for the barriers for that direction of travel are disabled and Auto mode is disabled for that barrier set.

3.4.1.4 The maintenance person would then insert the key into the appropriate Off-Local mode selector switch on the barrier's Local Control Panel and turn the key to the "Local" position. This action enables the Open and Close switches at the Local Control Panel for the barriers in that direction of travel.

3.4.1.5 Maintenance personnel would also have to block and mark the lane ahead of the barrier in accordance with standard lane closure procedures/standards and also lock and tag out certain equipment at the barrier per the barrier manufacturer's recommendations for the type of maintenance to be performed.
3.5.2 When the Inbound Barriers Manual - Auto - Local mode switch is placed in the Local mode no change takes place with the traffic signals. This action just locks out the Auto and Manual mode functions. The key is then taken to the Local panel where the Local panel is placed into Local mode. The inbound barriers can now be controlled by the individual barrier Open and Close switches on the Local Control Panel. Initiation of a Close command to an open barrier causes that barrier's Traffic Signal to change from Green to Yellow for 3 seconds and then to Red. After an additional one second of Red, the barrier's close circuit is energized through the VPD's immediately in front of and behind the barrier. If the VPD's are clear, the barrier closes. Initiation of an Open command to a closed barrier energizes the open circuit for the barrier and open the barrier. After the barrier is fully open and the mode switch is placed in Auto mode, then the Traffic Signal changes from Red to Green. In the Local mode, both initial and final barriers in a given entrapment area can be opened. In such situations, guards must provide compensatory security measures to defeat a threat while both barriers are open. The traffic arm associated with a barrier is operated independent from the crash rated active vehicle barrier. Upon completion of maintenance, the traffic arm and corresponding barrier need to be in the same position e.g. either both open or both closed.

3.5.3 The close circuit for all barriers is supervised by the Vehicle Presence Detectors (VPD's) in front of and behind the barrier, such that if either VPD detects a vehicle, the barrier close circuit is suppressed. The open circuit is not impacted by a VPD being activated.

3.6 FINAL BARRIER: A VPD located at the barrier's STOP line detects a vehicle's presence in the entrapment area. If the final barrier is closed, then a signal is sent to the guard in the Gatehouse notifying him/her of the vehicle's presence. The signal causes a short audible noise to alert the guard and turns on a Red indicating light until the final barrier is open. If the barrier is open, then just the indicating light for the loop illuminates.

3.7 FILL OR RELEASE COMMAND WITH VPD.

3.7.1 Vehicle Presence Detector consisting of safety loops on either side of a crash rated active vehicle barrier may require additional programming and hardware. If the loops are more than 3 meters 10 ft apart, then add 0.5-1 sec additional time delay on the "back" loop. The alternative is to provide a latching logic between loops. In the latching logic, the master panel needs a release pushbutton for each barrier.

3.7.2 When in Auto mode and a Fill or Release command is requested, then the system is to function as indicated.

3.7.2.1 When a VPD is activated on a barrier that is to close, then the action (Fill or Release) is suppressed. An audible alarm is to sound and the Fill or Release indicating light is to Flash. The original command is unlatched. Once the VPD(s) is cleared, then the guard must hit the reset button to clear the system and alarm. The Fill or Release command is to be reinitiated then. Once the traffic arm or barrier starts to close, a VPD activation is not to stop the cycle. The VPD must be activated prior to the command to stop the command.

3.7.2.2 A VPD activation on a barrier that is to open does not stop the action of opening (Fill or Release).
3.8 MANUAL OPEN OR CLOSE COMMAND WITH VPD.

3.8.1 Manual operation to Open a barrier or traffic arm is not impacted by a VPD activation associated with that barrier/traffic arm.

3.8.2 Manual operation to Close a barrier or traffic arm is suppressed by a VPD activation associated with that barrier/traffic arm. The VPD activation must take place prior to the Close command to suppress the action. The command is unlatched and must be reinitiated once the VPD(s) is cleared.

3.9 RETURN TO AUTO MODE.

3.9.1 When the mode switch is placed in the Auto mode and all the barriers for that direction of travel are in the appropriate configuration - one is Open (not deployed) and one is Closed (deployed), then the Auto mode indicating light illuminates and the corresponding Fill or Release light is to be illuminated.

3.9.2 If a mode switch is placed in the Auto mode and if both barriers for that direction of travel are either Open or Closed or if the traffic arm and barrier are in an incorrect position, then an alarm is to sound. The visual indicator is to be an alternating flashing of the Fill and Release indicator lights and the Auto indicating light is to turn off. The guard needs to go to manual mode and place the equipment in the correct configuration. Moving the mode switch from Auto to Manual (or local) mode turns off the alarm.

3.10 RESET. Reset button is only located at the Master Control Panel.

3.10.1 The reset button is used to reset after an Auto mode Fill or Release action is stopped by a VPD during a closing action. See RETURN to Auto Mode.

3.10.2 The reset button is also used to correct the unlikely situation that a barrier and traffic arm are prevented from completing a coordinated action. One possible is traffic arm closing on an object and then reversing back to the open position.

******************************************************************************
NOTE: This is an optional switch function for locations that have only one lane per direction of travel or have one barrier across all the lanes. If there are multiple lanes per direction of travel with each lane having its own AVB and no lane separation, then provide this switch. Keep or delete as required by the project.
******************************************************************************

3.11 Out-of-Service switch. This function is provided for times when a barrier is damaged in a lane and needs to be taken out of service for an extended period of time. The out of service switch is to be located at the AVB location and is allowed to operate in EFO, Test and Local modes. This allows an AVB to be locked out in a lane, but the other lane can operate under EFO. The switch locks out all functions for the AVB when activated. The up and down lights for that AVB will alternate going on and off.

WARNING: Installation is responsible for proper lane closure procedures (closing off the lane, bagging the traffic signal over the barrier, having guards present, etc). The Out-Of-Service switch has two positions: Yes and No or Enable and Disable is allowed for the wording.

3.12 AUDIBLE ALARMS. Provide an audible alarm at the Master Control Panel,
Overwatch Control Panel, [Pedestrian control panel,] main Guard Booth Control Panel and Search Area Control panel(s). The volume must be adjustable either through a rheostat or other means. Provide a button that silences the audible alarm at each panel. This silence button does not affect the corresponding visual indicator. Silence button does not prevent an audible alarm if a new condition develops.

3.12.1 Stop line VPD. When the stop line VPD is activated it activates a visual indicator and audible indicator when the barrier is in the Closed position. If the AVB is in the open position, only a visual indicator.

3.12.2 Overspeed and Wrong-way will cause an alarm to go off for 3 seconds and then clear itself.

3.12.3. Duress activation.

3.12.4. AVB Trouble condition.

3.12.5. Loop Trouble condition.

3.12.7 If an actuated traffic arm is provided at the crash rated active vehicle barriers are equipped with a break arm alarm. Upon breakage of the traffic arm, an audible/visual alarm is to happen at the master control panel. The visual indicator consists of a the traffic arm position indicator light flashing.

3.12.8. Master Panel in Auto mode and Local Panel is in Local Mode. Auto mode and Local mode indicator lights alternate being on.

3.12.10. Return to Auto mode with an AVB or AVBs are in the incorrect position (not fully open). Auto mode indicator light and open/down AVB position light(s) flash.

3.12.11 Communication Loss alarm.

3.12.11 Tramper Switch. Any tamper switch activation triggers an alarm.

3.13 AUDIBLE ALARMS. Provide an audible alarm at the Local Control Panel. The volume must be adjustable either through a rheostat or other means. Provide a button that silences the audible alarm at each panel. This silence button does not affect the corresponding visual indicator. Silence button does not prevent an audible alarm if a new condition develops.

3.13.1. AVB Trouble condition.

3.14 AUXILIARY CONTACTS. Provide auxiliary contacts (dry) to be used by the Intrusion Detection System and the CCTV system as specified herein and indicated on the drawings.
Appendix A4 - Stop Control Safety Scheme

STOP CONTROL Provide the following features for the full containment Safety Scheme:

******************************************************************************
NOTE: Paragraph 1 can be deleted in its entirety, if the layouts of equipment is shown on the drawings.
******************************************************************************

1 General equipment layout information.

1.1 Active Vehicle Barriers in all inbound and outbound lanes.

1.2. Do Not Enter LED blankout signs are located at the midpoint of the AVB on each side of the lane.

1.3 A 610 mm2 foot wide stop line placed 4.3 meters14 feet in front of the active vehicle barrier. A Stop sign is located at the front of the stop line.

1.4 Double solid white lines between inbound lanes approaching the barriers to prohibit lane changes in front of the barriers.

1.5 Double solid yellow lines between adjacent inbound and outbound lanes.

1.6 Vehicle Presence Detectors (VPDs) located immediately before and immediately after each barrier. VPDs can be induction loops, video motion sensors, or other suitable technologies capable of sensing vehicle presence. Induction loops must be diagonal quadrupole loop and sized per lane i.e. a loop crossing multiple lanes is not allowed. The VPD before the AVB starts 610 mm2 ft from the AVB and is 1829 mm6 ft long.

1.7 Warning Sign and Warning Beacons (wig-wags) (2 Beacons with alternating flashing yellow lights) located approximately 33.5 meters110 feet in front of the barriers. Beacon lamps will be LED.

******************************************************************************
NOTE: Army. First option choose for Army projects. All others, choose the second option.
******************************************************************************

1.8 One Master Control Panel, [one Guard Booth Control panel plus one smaller panel for each Guard Booth] [one Guard Booth EFO Control Button], one Overwatch Position Control Panel, one Search Area Control panel per separate search area, Pedestrian booth, and a Local Control Panel or panels at each barrier along with all control switches and indicating lights as shown on the Drawings. Locate the Master Control Panel in the Command and Control location for use by the ACP/ECF guards. Locate each Local Control Panel at or near its respective barrier power unit.

1.9 Diagonal pavement stripping. Provide white crosshatching pavement marking that covers the front and back VPDs. Do not stripe the stop line VPD.
NOTE: In-pavement lights are optional. Edit per project requirements.

**************************************************************************

[1.9  Red steady in-pavement lights on both sides of the barrier in each lane where there are inbound and outbound lanes adjacent to each other. If multiple lanes per direction of travel then the lights are only required where the AVB does not have lights facing normal traffic flow. Provide three lights per barrier on each side of the barrier. Locate approximately 610 mm (2 ft) in front of the stop line.]

1.10 Horn located at the crash-rated active vehicle barriers. Provide the horn with a means to adjust the volume.

1.11 Actuated Traffic Arm for each inbound lane in the ID Check Area. Install ATAs near the Guard Booths as shown on the Drawings. Provide an ATA Control Panel with Open and Close control switches for the ATA in the guard booth or as directed.

**************************************************************************

NOTE: choose the appropriate option.

**************************************************************************

2 BARRIER OPERATING CONTROL PANELS.

[Operating panel layouts are found in Army Standard Design drawing package.][Operating panel layouts are found in the contract drawings.]

3 TRAFFIC SIGNAL AND BARRIER CONTROLS.

3.1 EFO MODE. Under normal operations, all barriers' mode selector switches on the Master Control Panel will be in the EFO position with the key removed and with that key being accessible only by the lead ACP/ECF guard. With the barrier's mode selector switch in the EFO position, EFO is enabled for that direction of travel, but the Open and Close switches for that barrier on the Master Control Panel and the Open and Close switches on that barrier's Local Control Panel are disabled.

3.2 EFO OPERATION. In the EFO mode of operation with the barrier open, the LED Do Not Enter signs are off. Activation of an EFO command from any armed EFO deploys the AVB, activates the warning beacons, turns on the in-pavement lights (if present), red signal, and LED Do Not Enter signs as soon as EFO is pushed. The barrier(s) in emergency fast mode is to be fully deployed within 2 seconds provided that the VPDs immediately in front of and behind the barrier are clear. If either or both VPDs detect a vehicle, then the barrier does not close; however, the emergency close signal is latched only for those barriers that were in EFO mode at the time of activation. Once both VPDs are clear, the barriers (those in EFO mode) deploy (unless EFO Reset had been activated). Horn is to sound for 10 seconds.

3.3 EFO RESET. After an EFO activation, guards will close all inbound and outbound lanes. Guards will obtain the EFO Reset key and then activate the EFO Reset switch on the Master Control Panel to reset EFO. This removes the latch command for the EFO circuit. The person in charge can then place the Master Control Panel mode switches into Test (or go through the sequence to use the Local panel) and use the Open buttons to lower each barrier. Once all the barriers are Open for a given direction of travel and the corresponding mode switches are back in EFO mode, then the warning beacons, red signal, and Do Not Enter signs for that direction of travel, and the in-pavement lights deactivate. This needs to be done for both directions of
travel in order to have all signals off.

3.3 Test Operation.

3.3.1 An individual barrier can be test operated by installing the proper lane closure markings and barricades ahead of the active barrier and then placing the mode selector switch for that direction of travel into the Test position. With the mode selector switch in the Test position, the barrier's Open and Close switches on the Master Control Panel for that direction of travel are enabled, but the Open and Close switches on the Local Control Panel for that direction of travel are disabled. In addition all active EFO switches are disabled from operating any barrier for that direction of travel. Where a single barrier spans both inbound and outbound lanes, the test operation switch deactivates all EFO capability.

3.3.2 When a mode switch is placed in Test mode, the warning beacons, red signal, Do Not Enter signs, and in-pavement lights for that direction of travel activate. The barriers for that direction of travel are allowed to operate without any time delay. The traffic signals for that direction of travel stay on until all the conditions are met for RETURN TO EFO MODE. The AVB must be down and back in EFO mode to deactivate the signals. The warning beacons, in pavement lights, Do Not Enter signs, and red signal all deactivate. WARNING: Installation is responsible for proper lane closure procedures (closing off the lane, bagging the traffic signal over the barrier if a long term operation, having guards present, etc) during a Test or Local mode operation.

3.4 LOCAL MODE OF OPERATION

3.4.1 Local Operation. Local mode is used when maintenance personnel need to perform maintenance on the barrier.

3.4.1.1 Maintenance personnel would obtain the mode selector switch key from the lead ACP/ECF guard and place the key into the Master Control Panel 3-position mode selector switch for the appropriate direction of travel.

3.4.1.2 The person then turns the selector switch to the Local position to enable Local mode and then removes the key.

3.4.1.3 With the mode selector switch on the Master Control Panel in the Local position, Open and Close switches on the Master Control Panel for the barriers for that direction of travel are disabled and all EFO switches are disabled for that direction of travel. If a single barrier spans multiple directions of travel all EFO capability will be deactivated.

3.4.1.4 The maintenance person would then insert the key into the appropriate Off-Local mode selector switch on the barrier's Local Control Panel and turn the key to the "Local" position. This action activates the Open and Close switches at the Local Control Panel for the barriers in that direction of travel.

3.4.1.5 Maintenance personnel would also have to block and mark the lane ahead of the barrier in accordance with standard lane closure procedures/standards and also lock and tag out certain equipment at the barrier per the barrier manufacturer's recommendations for the type of maintenance to be performed.

3.4.2 LOCAL MODE OF OPERATION (one barrier per direction of travel). When a mode switch is placed in Local mode, the traffic signals, in-pavement lights
and LED blankout signs for that direction of travel activate. The barriers for that direction of travel are allowed to operate without any time delay. Everything stays activated for that direction of travel until all the conditions are met for RETURN TO EFO MODE. The in-pavement lights for that barrier activate when the traffic signal is red and stay red as long as the traffic signals are red. Note the warning beacons do not operate under Local, but can be allowed to operate if requested and approved. WARNING: Installation is responsible for proper lane closure procedures (closing off the lane, bagging the traffic signal over the barrier if a long term operation, having guards present, etc) during a Test or Local mode operation.

3.5 Vehicle Presence Detector consisting of safety loops on either side of a crash rated active vehicle barrier may require additional programming and hardware. If the loops are more than 3 meters/10 ft apart, then add 0.5-1 sec additional time delay on the "back" loop. The alternative is to provide a latching logic between loops. In the latching logic, the master panel needs a release pushbutton for each barrier.

**************************************************************************
NOTE: This is an optional switch function for locations that have only one lane per direction of travel or have one barrier across all the lanes. If there are multiple lanes per direction of travel with each lane having its own AVB and the lanes are not separated by an island, then provide this switch. Keep or delete as required by the project.
**************************************************************************

3.6 Out-of-Service switch. This function is provided for times when a barrier is damaged in a lane and needs to be taken out of service for an extended period of time. The out of service switch is to be located at the AVB location and is allowed to operate in EFO, Test and Local modes. This allows an AVB to be locked out in a lane, but the other lane can operate under EFO. The switch locks out all functions for the AVB when activated. The up and down lights for that AVB will alternate going on and off. WARNING: Installation is responsible for proper lane closure procedures (closing off the lane, bagging the traffic signal over the barrier, having guards present, etc). The Out-Of-Service switch has two positions: Yes and No or use Enable and Disable.

3.6.1 No Position. All controls operate normally.

3.6.2 Yes Position. The Close/ Open position indicating lights for those barriers will alternate from one to the other approximately every 1 sec. This will happen at the Master Control Panel, Local Control Panel (if on) and at any other panel that has barrier position indicator lights. Controls for that AVB are all locked out.

3.7 RETURN TO EFO MODE. When the mode switch is placed in the EFO mode and all the barriers for that direction of travel are Open (not deployed), then the barrier's signs and warning beacons (wig-wags) deactivate. If a mode switch is placed in the EFO mode and any of the barriers for that direction of travel are Closed, then the barrier's signs stay on and an alarm is generated on the ACP/ECF TROUBLE window on the Gatehouse Control Panel.

3.8 AUDIBLE ALARMS. Provide an audible alarm at the Master Control Panel, Overwatch Control Panel, main Guard Booth Control Panel and Search Area Control panel(s). The volume must be adjustable either through a rheostat or other means. Provide a button that silences the audible alarm at each
panel. This silence button does not affect the corresponding visual indicator. Silence button does not prevent an audible alarm if a new condition develops.

3.8.1. When an EFO is pushed an alarm will go off for 3 seconds unless silenced earlier.

3.8.2. Overspeed and Wrong-way will cause an alarm to go off for 3 seconds and then clear itself.

3.8.3. Duress activation.

3.8.4. AVB Trouble condition.

3.8.5. VPD Trouble condition.

3.8.6. VPD Activation for over the set amount of time period (typically 15 seconds) Light goes on immediately for VPD activation, but audible alarm activates after 15 seconds.

3.8.5. Out of Service activation. AVB indicator lights alternate being on.

3.8.6. Master Panel in EFO mode and Local Panel is in Local Mode. EFO mode and Local mode indicator lights alternate being on.

3.8.7. Master Panel in Test mode and Local Panel is in Local Mode. Test mode and Local mode indicator lights alternate being on.

3.8.8. Return to EFO mode with an AVB or AVBs in the incorrect position (not fully open). EFO mode indicator light and open/down AVB position light(s) flash.

3.8.9 Communication Loss alarm.

3.8.10 Tramper Switch. Any tamper switch activation triggers an alarm.

3.9 AUDIBLE ALARMS. Provide an audible alarm at the Local Control Panel. The volume must be adjustable either through a rheostat or other means. Provide a button that silences the audible alarm at each panel. This silence button does not affect the corresponding visual indicator. Silence button does not prevent an audible alarm if a new condition develops.

3.9.1. AVB Trouble condition.

3.9 AUXILIARY CONTACTS Provide auxiliary contacts (dry) to be used by the Intrusion Detection System and the CCTV system as specified herein and indicated on the drawings.

### NOTES:

1. CSMS - Central Security Monitoring Station
2. SER - Sequence of Events Recorder
3. Monitor on Hybrid Beacon, if used, HEPD, and Stop Control Safety Schemes
4. This command is for any safety scheme that has an EFO.
5. N = number of inbound crash rated active vehicle barriers.
6. X = number of outbound crash rated active vehicle barriers.
7. Y = number of guard booths.
8. Alarm can be by a Remote Generator Alarm/Status Panel.
9. Alarm can be by a Remote UPS Alarm/Status Panel.
10. Alarm can be separate from Master Control Panel.
11. Alarm is to be monitored by the Intrusion Detection System Panel. Alarm signal is sent by the IDS panel.
12. Only used on Full Containment (Platooning/Sally Port) Safety Scheme. Number is number of lanes.
13. HEPD and Full Containment.
15. HEPD and Full Containment.

-- End of Section Table of Contents --
NOTE: This guide specification covers requirements for aircraft tiedowns for Army and Air Force aircraft.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: It is recommended that this specification, and other contract requirements for mooring be coordinated with UFC 3-260-01, Airfield and Heliport Planning and Design.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in
this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**AMERICAN WELDING SOCIETY (AWS)**

AWS D1.4/D1.4M (2011) Structural Welding Code - Reinforcing Steel

**ASTM INTERNATIONAL (ASTM)**

ASTM A615/A615M (2020) Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement

**NATIONAL INSTITUTE FOR OCCUPATIONAL SAFETY AND HEALTH (NIOSH)**

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's
Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   As-Built Drawings; G[, [______]]

SD-06 Test Reports
   Concrete; G[, [______]]

SD-07 Certificates
   Mooring Devices
   Reinforcing Steel

1.3 AS-BUILT DRAWINGS

Submit as-built drawings that provide current factual information, including deviations from and amendments to the drawings and changes in the work, concealed and visible.

PART 2 PRODUCTS

2.1 MATERIALS

Do not use a combination of materials that forms an electrolytic couple,
which accelerates corrosion in the presence of moisture, unless moisture is permanently excluded from the junction of such metals.

2.2 MOORING DEVICES

Cast mooring devices in ductile iron 80-55-06 in accordance with ASTM C536, unless otherwise indicated. Show the device in the contract drawings. Submit certificates of compliance on the devices stating that the mooring devices meet the specified requirements.

2.3 CONCRETE

**************************************************************************

NOTE: High-early-strength (Type III) cement is recommended. If Type III cement is not available, Types I and II cement are acceptable. However, Types I and II will increase the downtime before the mooring eye can be engaged. Allow the concrete to achieve a minimum compressive strength of 35 MPa 5000 psi before subjecting the tie-down to loading conditions. A 40 MPa 6000 psi concrete with Type III cement could be loaded in 48 to 72 hours. Conversely, a 40 MPa 6000 psi mix with Type I or II cement cannot be loaded for 12 to 14 days.

A 28-day 40 MPa 6000 psi compressive strength concrete is required for mooring point installation in drilled piers and in cored existing pavements. New rigid pavement 150 mm 6 inc or greater in thickness with a minimum 90-day flexural strength of 3.5 MPa 500 psi will be adequate for cast-in-place mooring point installation. Remove this paragraph if concrete is not required. If concrete is specified in another section, delete this paragraph.

**************************************************************************

Submit complete concrete mix design including all cement, aggregate, and concrete tests and compliance certificates. Use concrete in accordance with [Section 32 13 14.13 CONCRETE PAVING FOR AIRFIELDS AND OTHER HEAVY DUTY PAVEMENTS] [ASTM C94/C94M]. Use air entrained concrete having a minimum compressive strength of 40 MPa 6000 psi. Use concrete with the following properties: nominal maximum aggregate size of 25 mm 1 in, air content of 6 percent, and a maximum slump of [100 mm 4 in for drilled piers] [and] [50 mm 2 in for all other applications].

2.4 REINFORCING STEEL

Use reinforcing steel in accordance with ASTM A615/A615M Grade 40 or 60 for #4 tie bars and Grade 60 for #6 vertical bars. Weld steel into cages in accordance with AWS D1.4/D1.4M and insert securely in the piers, in position and alignment, as shown in the drawings, prior to concrete placement. Submit certificates of compliance stating that the reinforcing steel meets the specified requirements.

PART 3 EXECUTION

3.1 MOORING POINTS IN NEW RIGID PAVEMENTS OR CONCRETE PADS

Install the mooring device within plus or minus 50 mm 2 in of the location
shown on the contract drawings. Set the top of the mooring device within 6 mm 1/4 in of the plan pavement surface elevation, but not higher than the pavement surface. Install the mooring device prior to placement of the concrete pavement. Place concrete and reinforcement in accordance with Section [03 30 00 CAST-IN-PLACE CONCRETE][03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE]. Keep hand finishing of the concrete around the mooring devices to a minimum.

3.2 MOORING POINTS IN EXISTING RIGID PAVEMENTS

**************************************************************************
NOTE: Existing rigid pavement must be equal to or greater than 150 mm 6 in thick and in good condition, with very few cracked slabs. This is required to provide adequate mass to resist the horizontal component of the mooring point load.
**************************************************************************

Install the mooring points, unless otherwise indicated, in 305 plus or minus 13 mm 12 plus or minus 1/2 in diameter holes cored through the pavement. Drill the core holes within plus or minus 38 mm 1-1/2 in of the location shown in the contract drawings. Install the mooring device and attached grounding rod within plus or minus 13 mm 1/2 in of the center of the core hole. Install the top of the mooring device within 6 mm 1/4 in of the surrounding pavement surfaces, but not higher.

3.2.1 Coring Requirements

Core the holes using rotary, non-percussion drilling techniques. Check that the sides of the core hole are perpendicular to the pavement surface. Once the pavement is cored, excavate base course as shown in the drawings. Clean the sides of the core hole of latence and roughen by sand blasting. Place the concrete around the mooring device in two or more lifts. Place the first lift to within 125 plus or minus 6.5 mm 5 plus or minus 1/4 in of the pavement surface and consolidate by spud vibrators. Place the second lift and consolidate by internal vibration. Finish and texture the surface of the concrete to match the adjacent pavement surface and elevation. Uniformly apply curing compound meeting the requirements of ASTM C309 at a coverage of not more than 4.5 square m/L 200 square ft per gal.

3.2.2 Cleanup

Control all operations to minimize the amount of dust, dirt, debris and latance in the work area. Clean all dirt, dust, debris, or latance from coring or concreting operations, from the pavement surfaces prior to final acceptance.

3.3 MOORING POINTS INSTALLED IN DRILLED PIERS

Coordinate excavation of piers so that reinforcing steel and concrete placement is a continuous operation performed the same day that the excavation is completed. Do not leave excavations open overnight. Place concrete within 3 hours after approval of the completed pier excavation. Use pier drilling equipment having the minimum torque capacity and downward force capacity for the contract site conditions.

3.3.1 Government Inspection

The Contracting Officer will inspect each drilled pier excavation. Do not
place concrete until the excavation has been approved. Make equipment used for drilled pier excavations available to the Contracting Officer for inspection and approval.

3.3.2 Installation Procedures

Excavate piers to the depths and dimensions shown in the drawings. Core drill piers through pavements. Clean bottoms of piers of loose or soft material and leveled. Dispose of excavated material in accordance with Section 31 00 00 EARTHWORK. Perform the following:

a. Adequately and securely protect the surrounding base courses, subgrade, and soil against cave-ins, displacement of the surrounding earth, and retention of ground water by means of temporary steel casings. Use casings with outside diameters not less than the indicated shaft sizes and a minimum thickness of 6 mm 1/4-in. Withdraw steel casings as the concrete is being placed, maintaining sufficient head of concrete within the casing to prevent extraneous material from falling in from the sides and mixing with the concrete. Allow casings to be jerked upward a maximum of 100 mm 4 in to break the bottom seal; but, thereafter, remove with a smooth, continuous motion.

b. Clean and oil the inside of steel casing before reuse.

c. Remove water that flows into the excavations and water from the excavation bottom prior to concrete placement. The maximum permissible depth of water is 50 mm 2 inch. In the event of a severe water condition that makes it impossible or impractical to dewater the excavation, place concrete using underwater tremie after water movement has stabilized.

d. Fill the entire shaft excavation with concrete of the approved mix design. Place concrete continuously as practical while preventing segregation of the wet mix and dislodging of soil within the sidewalls of the excavation. Place concrete by pumping or drop chutes in dry holes and by tremie or pumping in wet holes. Keep the discharge a minimum of 305 mm 1 ft below the fresh concrete surface during placement. Deposit concrete continuously as practical to prevent formation of cold joints within each pier. Immediately consolidate the freshly deposited concrete within the upper 1.5 m 5 ft using spud vibrators.

e. Correct any pier out-of-center or out-of-plumb beyond the specified tolerance for compliance; the Contractor will bear any cost of correction. Do not allow cross sections of shafts to be less than design dimensions as shown in the drawings. Install piers at the locations designated on the approved project plans within 50 mm 2 in of the design centerline locations.

f. Install the mooring device within plus or minus 25 mm 1 in of the center of the drilled pier. Measure that the top of the mooring device is within 6 mm 1/4 in of the top of the pier, but not higher.

g. Replace all piers found to be out-of-tolerance at no additional cost to the government.

h. Provide protection around top of the excavation to prevent debris from being dislodged into the excavation and concrete.
3.4 SAFETY

In addition to Safety Requirements contained in the Contract Clauses; prevent employee respiratory, eye or skin contact with Portland cement. Provide and require employees to use and dispose or clean the following in accordance with the provisions of the National Institute for Occupational Safety and Health NIOSH 81-123:

a. Impervious clothing, boots, and gloves.
b. Splash-proof safety goggles and face shields.
c. Respiratory protection equipment.

-- End of Section Table of Contents --
NOTE: This guide specification covers requirements for airfield grounding points.

Adhere to [UFC 1-300-02](https://www.fortlewis.edu/ufc/) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://www.fortlewis.edu/ufc/).

PART 1 GENERAL

NOTE: Specify the items to provide ground points with a resistance of no more than 10,000 ohms to ground if the resistance of the surrounding soil or rock is less than 2,000,000 ohm-centimeters. In high resistivity soils of over 2,000,000 ohm-centimeters, allow 3 m (10 ft) or sectional rods to be used to obtain the required resistivity to ground; however, where rock is encountered, additional rods, a counterpoise, or ground grid may be necessary. Allow resistance to ground for static electricity dissipation to be as much as 1,000,000 ohms. Static grounds are not designed for aircraft lightning protection or for equipment grounding.
It is recommended that this specification, and other contract requirements for grounding points, be coordinated with UFC 3-260-01, Airfield and Heliport Planning and Design.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

UNDERWRITERS LABORATORIES (UL)

UL 467 (2013; Reprint Jun 2017) UL Standard for Safety Grounding and Bonding Equipment

1.2 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals
required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

As-Built Drawings; G[, [_____]]

SD-06 Test Reports

Tests

SD-07 Certificates

Grounding Rods

Copper Conductors

Grounding Connectors

1.3 AS-BUILT DRAWINGS

Submit as-built drawings that provide current factual information, including deviations from and amendments to the drawings and changes in the work,
concealed and visible.

PART 2  PRODUCTS

2.1  METALS

Do not use a combination of materials that forms an electrolytic couple, which accelerates corrosion in the presence of moisture, unless moisture is permanently excluded from the junction of such metals.

2.2  GROUNDING RODS

Use grounding rods, unless otherwise indicated, in accordance with UL 467 and made of copper-clad steel, copper, galvanized steel, or copper-zinc-silicone alloy. Use rods not less than 19 mm 3/4 in in diameter and not less than 3 m 10 ft long. Use copper cladding in accordance with ASTM B371/B371M, Copper Alloy UNS No's. c 69400, c 69430, c 69440 or c 69450. Use copper cladding not less than 0.25 mm 0.010 in thick at any point and complying with adherence requirements and the banding requirements of UL 467. Submit certificates of compliance stating that the grounding rods meet the specified requirements. Provide rods with a closed eye or shepherd's hook bend having an inside diameter of not less than 38 mm 1-1/2 in. [Use pointed rods unless used for flexible pavement.] [For flexible pavement, use rods having 19 mm 3/4 in American standard rolled threads for attachment of a bottom anchor and equipped with a screw-type bottom having a wing diameter of not less than 127 mm 5 in.]

2.3  COPPER CONDUCTORS

Use copper conductors that bare number 4 AWG copper wire in accordance with ASTM B8. Submit certificates of compliance stating that the copper conductors meet the specified requirements.

2.4  GROUNDING CONNECTORS

Use grounding connectors that comply with UL 467 for the required application. Submit certificates of compliance stating that the grounding connectors meet the specified requirements.

PART 3  EXECUTION

Prior to installing grounding rods, obtain approved digging permits in accordance with Section 01 11 00 SUMMARY OF WORK.

******************************************************************************
NOTE:  Remove types of grounding point installations not needed.
******************************************************************************

3.1  GROUNDING POINTS

Locate the grounding points as shown on the drawings to within plus or minus 50 mm 2 in.

3.1.1  Pavement Recess

Set the top of the grounding rod at or not more than 6 mm 1/4 in below the
pavement surface grade. Provide a recess 75 mm 3 in wide, and not more than 150 mm 6 in long, with a smooth rounded edge in the pavement around the grounding point anchor eye to permit the entrance of lines into the eye and to allow for attachment of the grounding cable. Do not allow the depth of the recess to be deeper than the bottom of the opening of the grounding point eye.

3.1.2 Installation

3.1.2.1 Existing Rigid Pavement

Install grounding rods in holes cored through the rigid pavement using rotary, non-percussion drilling techniques. Check that the core holes have a minimum diameter of 150 mm 6 in. Check that the sides of the core hole are perpendicular to the pavement surface. Install the grounding rod by pushing or driving the rod through the pavement base courses and subgrade. Do not allow the installation technique chosen to damage the grounding rod or the pavement. Complete installation by placing concrete around the grounding rod in lifts not to exceed 150 mm 6 in in depth and consolidate each lift using spud vibrators.

3.1.2.2 New Rigid Pavement

Install the grounding rod by pushing or driving the rod through the pavement base courses and subgrade prior to concrete placement. Do not allow the installation technique chosen to damage the grounding rod. Keep hand finishing around the rod to a minimum.

3.1.2.3 Flexible Pavement

Install grounding rods in Portland cement concrete blockouts measuring 1.2 by 1.2 m 4 by 4 ft in plan dimensions. The thickness and reinforcing details are shown on the drawings. Install the grounding rod by pushing or driving the rod through the pavement base courses and subgrade prior to concrete placement. Do not allow the installation technique chosen to damage the grounding rod. Keep hand finishing around the rod to a minimum.

3.1.3 Interconnection

For grounding rods installed at fueling hydrant outlets, electrically interconnect with the fuel piping with not less than a number 4 AWG bare copper conductor.

3.2 TESTS

Submit an independent testing agency's certified reports of inspections and tests, including analysis and interpretation of test results. Properly identify each report. Describe test methods and standards used. Measure resistance to ground tests as specified in NFPA 407. Submit test results to the Contracting Officer. Report immediately to the Contracting Officer ground rods that have more than 10,000 ohms of resistance.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for mechanical power systems to operate gates, culvert valves, and other mechanisms at navigational locks and dams, flood control dams, and other civil works structures.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification should be used in accordance with EM 1110-2-2610 MECHANICAL AND ELECTRICAL DESIGN FOR LOCK AND DAM OPERATING EQUIPMENT and EM 1110-2-3200 WIRE ROPE SELECTION CRITERIA FOR GATE OPERATING DEVICES. For hydraulic power systems, see UFGS 35 05 40.14 10 HYDRAULIC POWER SYSTEMS FOR CIVIL WORKS STRUCTURES and EM 1110-2-1424 LUBRICANTS AND HYDRAULIC FLUIDS FOR CIVIL WORKS PROJECTS. However, the designer should note that some components of hydraulic driven machinery systems may have applicable sections.
within this guide specification that should be used for various configurations of linkages, pins, shafts, etc. For self-lubricated bearing systems, see UFGS 35 05 40.17 SELF-LUBRICATED BEARING MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY.

Ensure products used in this section comply with Federal procurement preference under Section 9002 of the Farm Security and Rural Investment Act of 2002. See Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING for requirements associated with EPA designated products.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets
following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

1.3 QUALITY ASSURANCE

1.3.1 Manufacturer and Assembler

Manufacturing and assembly of the [miter gate] [dam gate] [and] [tainter] [valve], [_____] machinery units must be performed by a Contractor and fabrication company that has been normally and regularly engaged in assembly, and manufacture of heavy machinery over the preceding [10] [_____] years. Changes to the dimensions shown on the drawings [and in the Bill of Materials] for the Gate and Valve Machinery (including structural supports) requires written approval from the Contracting Officer. Submit Equipment Manufacturer's and Fabricator's Qualifications showing evidence and years of experience for each of the equipment manufacturers and fabricators. Identify any certifications, standards, and/or professional organizations the manufacturers comply with or are members of.

1.3.2 Erecting Engineer Services

**************************************************************************
NOTE: This paragraph covers services of erecting engineers. The designer should incorporate the use of on-site erecting engineers from the equipment manufacturer when a particularly complex equipment is being installed as part of the project and/or on-site training for project personnel is desired.
**************************************************************************

Provide the services of one or more erecting engineers onsite during the installation and startup of each defined major piece of equipment and subassembly. The erecting engineer(s) are responsible to technically supervise and provide instruction for the equipment to be installed and operated. [The major pieces of equipment and subassemblies requiring engineering services is defined as follows:]

[ a. [Miter Gate Machinery]]
[ b. [Dam gate Machinery]]
[ c. [Culvert Valve Machinery]]

Upon completion of the work and at a time designated, provide the services of one or more erecting engineers for training Government personnel in accordance with the requirements of paragraph FIELD TRAINING.
1.4 DELIVERY, STORAGE, AND HANDLING

1.4.1 Delivery Location

Upon completion of fabrication, testing, and at the Contracting Officers direction deliver specified equipment to [Street, City, State, Zip] Attn: [Receiving Persons Name or Division].

1.4.2 Critical Path Components/Systems

**************************************************************************
NOTE: Many custom and catalog selected items require long lead times that may affect the construction schedule. If this is the case, use the following paragraph.
**************************************************************************

Many of the components required for the electrical and mechanical equipment at a [Lock] [and] [Dam] have long delivery times. A large percentage of the electrical and mechanical work must be accomplished only during critical times ([[Lock] [and] [Dam] shutdown period may be required]). To ensure that all work required during this time period is accomplished, present to the Contracting Officer, within [120] [_____] calendar days after receiving notice to proceed, written copies of finalized **purchase agreements** with component manufacturers (NOT SUPPLIERS) for the components and systems noted below.

</table>
Include a confirmed delivery date and point of contact at the particular manufacturer in the purchase agreements. Require the manufacturer to furnish a monthly report (submit to the Contracting Officer on the 10th of each month) of progress on the particular component/system and any delays in the previously specified delivery date. Include both written and photographic updates to track and monitor the current status of the equipment to be furnished in the progress reports. The reporting requirements specified herein are included in the requirements of Section 01 22 01.00 10 PROJECT SCHEDULE.

1.4.3 Delivery, Storage and Handling of Equipment

**************************************************************************
NOTE: This paragraph covers storage of equipment when delivered to the jobsite and storage of spares. Major pieces of equipment and subassemblies that require Government inspection prior to shipment should be identified by the designer.
**************************************************************************

Protect equipment and components from corrosion, deformation, and other types of damage. Store items in enclosed and secured areas free from contact with soil. Provide moisture proof weather protection for all equipment stored in outdoor locations. Transport, handle and store all equipment in accordance with the manufacturer's written instructions. Remove and replace damaged items with new items. [Do not prepare the major pieces of [lock] [and] [dam] operating equipment and subassemblies for shipment until they have been inspected and accepted for shipment at origin by the Contracting Officer, unless inspection has been waived in writing.] Ship each subassembly completely assembled. Submit the shipping bills with the delivery of finished pieces to the site. The major pieces of equipment and subassemblies for this contract are defined to include the following:

[a. [Miter Gate Machinery]]
[b. [Dam Gate Machinery]]
[c. [Culvert Valve Machinery]]

1.4.3.1 Packaging

Provide equipment and subassemblies with adequate protective pads, supports, and blocking. Securely restrain equipment and subassemblies to prevent distortion or damage to the painted surfaces in transit. Any loss or damage during shipment, including damage to the painted surfaces, is the responsibility of the Contractor. Replace or repair lost or damaged items without cost to the Government. Coat all parts with a rust preventative, wrap in heavy-duty plastic, and securely contain in wooden crates. Clearly mark each crate with its contents (including contract number and Corps mark number) on the outside, with a non-ferrous metal tag, engraved with the contents, and secured to the crate with non-ferrous screws. Provide a
means for inspection of the crate's contents without destroying the crate. Pack all accessories and spare parts separately in containers plainly marked "ACCESSORIES ONLY," or "SPARE PARTS ONLY." Package each spare part or spare part assembly in a durable treated wooden crate with metallic, plastic or suitable outer shell for weathertight protection and with provisions for handling and long-term storage (60 months). Provide and deliver the component and assembly spare parts as delineated on the drawings. Place a separate packing list, listing the contents of each crate, in a moisture-proof envelope securely fastened to the outside of the crate. Standard commercial packaging in accordance with ASTM D3951 is acceptable except where a different method or standard of packaging is specified.

1.4.3.2 Shipping, Preservation, and Storage

Provide all packing, crating, e.g., necessary to ensure safe shipment of equipment. The crates become the property of the Government unless specifically waived. Fill or protect the equipment with the necessary fluids, coatings, and/or preservatives to maintain in a stable condition without corrosion, deterioration, or degradation for an extended period of storage of up to [12] [_____] months. Protect stored equipment from the weather, humidity, temperature variation, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 EQUIPMENT

**************************************************************************

NOTE: This guide specification covers operating machinery for lock gates, filling/emptying valves and dam gate operating equipment. It can be revised as needed to accommodate any type of gate or culvert valve.

**************************************************************************

2.1.1 Machinery

Furnish equipment under this specification consisting of [four] [_____] [_____] type gate operating machinery units [and [four] [_____] type filling/emptying valve operating machinery units; [two] [_____] upper gate and valve units and [two] [_____] lower gate and valve units [and spares]]. Furnish complete units including base supports, geared drives, brakes, motors, shafts, bearings, [wire rope,] [chain,] [pocket wheels,] [sprockets,] [engineered chain,] electrical equipment, controls, covers, guards, [portable] filtering unit and other necessary items to provide a complete and operable system.

2.1.2 Electrical Equipment

Conform electrical equipment, including limit switches, motor starters, conduit, conductors, controls, [slack cable safety devices,] to the requirements of [Section 35 20 20 ELECTRICAL EQUIPMENT FOR GATE HOIST] [and ] [Section 40 60 00 PROCESS CONTROL].

2.1.3 Nameplate

Provide an engraved or raised [metallic] [_____] nameplate that is mechanically attached to each piece of equipment. Include the
manufacturer's name, model designation, serial number, unit rating, application factor, reduction ratio's, and any other applicable information on the nameplate.

2.1.4 Equipment Submittal Data

Submit Equipment Data and Detail Drawings for [pocket wheels,] [sprockets,] [gears,] [shafts,] [bushings,] [hoisting chains,] [limit switches,] [supports,] and any other shop fabricated items, equipment dimensional drawings, assembly drawings, catalog cuts, and material data and shop drawings showing arrangement, construction details and ratings for factory built [miter gate] [tainter valve] [miter gate and tainter valve] machinery; test rig assembly details; proposed and final shop test procedures and data sheets; proposed and final field [cable tensioning and] operating test procedures and data sheets, for approval. Provide all details of fabrication and assembly to include shipping and long term storage instructions. Shop drawings lacking this information will be rejected. Approval of the material submitted in no way relieves the Contractor from the responsibility of complying with the requirements of the specifications as to the suitability and quality of materials and workmanship and the adequacy of capacity, operating speed and other essential characteristics of the [gate] [valve] [gate and valve] drives. Submit drawings, catalogs, and design data necessary to clearly show the details of any changes proposed in conformity with the requirements of this specification. Equipment, materials, and articles of construction installed or used without such approval will be at the risk of subsequent rejection.

Submit a materials list for fabricated items at the time as the detail drawings submittal.

Submit copies of all materials orders including purchase orders, mill orders, shop orders and work orders for materials prior to using the materials in the work.

Submit Manufacturer's Literature and Equipment Data for approval. Provide catalog cuts and material data for the proposed equipment that clearly indicates compliance with the requirements of these specifications and the drawings. Submit AGMA ratings for gear quality of all gears and gear reducers. Include the names of the manufacturers of all machinery and other equipment contemplated for incorporation into the work, performance capacities and other pertinent information about the equipment. As a minimum, include the following Manufacturer's Literature and Equipment Data:

2.1.4.1 Brakes

2.2 DESIGN CRITERIA

**************************************************************************
NOTE: Edit all or portions of this paragraph depending upon type of contract documents to be prepared. At a minimum the designer should provide the anticipated operating loads and required operating conditions to be satisfied for equipment manufacturers to best select and size equipment components to match the anticipated operating conditions. Review EM 1110-2-2610 Mechanical and Electrical Design for Lock and Dam Operating Equipment for specific guidance and design criteria related to the type of lock gate and filling/emptying valve configuration to be specified for the project. The designer should be aware that modifications and or deviations away from EM design criteria may require separate documentation, design analysis, and written USACE-HQ approval.
**************************************************************************

Provide equipment and machinery to meet the anticipated operating conditions as specified by the following design criteria.

COMPONENT DESIGN CRITERIA

<table>
<thead>
<tr>
<th>ITEM</th>
<th>MAXIMUM OPERATING TEMP. RANGE Deg C Deg F</th>
<th>MAXIMUM or MINIMUM OPERATING SPEED (RPM) or (FPM)</th>
<th>OPERATING TRAVEL [CW] [CCW] [Reversing]</th>
<th>CYCLES [Per Hr] [Per Day]</th>
<th>[MAX] [MIN] [MAX] [MIN] TRAVEL TIME OPEN (Sec) TRAVEL TIME CLOSE (Sec)</th>
</tr>

**************************************************************************
NOTE: Delete the following paragraph for Corps of Engineers designed projects and include only for non-Corps designed machinery where the AE, Contractor or Equipment Manufacturer are the responsible Designer of Record for calculating the equipment operating loads. The Corps should be made aware in the review of such designs any modifications and or deviations away from EM design criteria that may require separate documentation, design analysis, and written USACE-HQ approval.
**************************************************************************

[Design equipment in strict accordance with the requirements of EM 1110-2-2610 Mechanical and Electrical Design for Lock and Dam Operating Equipment unless otherwise specified within. Design equipment for the normal loads using factors of safety applicable to the type of service and the particular part with a minimum factor of safety of 5 based on the ultimate strength of the material. Include all anticipated loads in the design. Loads include, but are not limited to, the loads imposed by the dead weight, hydraulic forces, buoyancy forces, ice, and seal friction. In addition, design each part or component, including speed reducers (excluding wire rope), for a unit stress not in excess of 75 percent of the yield strength of the material under loads resulting from the locked rotor torque of the electric motor. Design components that might fail in buckling compression for a minimum factor of safety of 3.0, using the Euler or J.B. Johnson formulas. Apply the factor of safety to the maximum load on the member and the critical buckling load. Model the end fixity coefficient for pin-end conditions. [Consider both the normal loads and loads resulting from the locked rotor torque of the electric motor for miter gate machinery.] [Consider both the normal loads and loads resulting from the locked rotor torque of the motor as divided [70/30] between the two drums of a hoist for [tainter valve] machinery.] [Consider both the normal loads and loads resulting from the locked rotor torque of the electric motor for [gate][filling/emptying valve] operating equipment.] [For loads divided between the components of the operating equipment they should be considered for design purposes to have a split in load distribution.] Allowances for shock and impact are not required unless specifically identified. Submit for approval all equipment modification design calculations.]
2.3 OPERATION SEQUENCES

2.3.1 [Lock Gate] [Hoisting Machinery] Operation

**************************************************************************
NOTE: Coordinate with electrical design engineers to develop the required sequence of operation and provide the requirements on the drawings. Specify the necessary control equipment and devices in UFGS Section 40 60 00 PROCESS CONTROL and Section 35 20 20 ELECTRICAL EQUIPMENT FOR GATE HOIST.
**************************************************************************

The equipment sequence of operation, interlocks and electrical controls are as indicated. [Conform equipment and hardware with the requirements of Section 35 20 20 ELECTRICAL EQUIPMENT FOR GATE HOIST and Section 40 60 00 PROCESS CONTROL.]

2.3.1.1 Sequence of Operation

**************************************************************************
NOTE: Include or edit the paragraphs below to describe the anticipated sequence of operation for the equipment specified.
**************************************************************************

2.3.1.1.1 [Lock] Gate Opening

b. Motor and brake are energized (brake is released).

d. Motor [shifts] [ramps] to high speed mode and runs at full speed mode until the [lock] gate is [95] [_____] percent open.

f. Gate position is device proven to be at end of travel.

g. Motor and brake are de-energized (brake is engaged).

2.3.1.1.2 [Lock] Gate Closing

The sequence for closing the gate is identical to that for opening, except the gate moves in the opposite direction to the closed position.

2.3.1.2 Design Considerations

Normal operations of the [lock][dam] [gates][valves] for the purpose of design consist of the [lock][dam] [gates][valves] operating through [3] [_____] complete cycles per hour with [2] [_____] starts and [2] [_____] stops per cycle. A cycle is defined as moving the [lock][dam] [gate][valve] from the fully closed position to the fully opened position
and back to the fully closed position.

2.4 SPEED REDUCERS

2.4.1 [Miter Gate Speed Reducers] [Gate Hoist Speed Reducer] [Tainter Valve Speed Reducer]

2.4.1.1 General

The speed reducer is a [single] [double] [triple] [quadruple] reduction, [right angle,] [parallel shaft,] [spiral bevel/helical gear] [helical gear] [right angle worm gear] type, entirely self contained in an oil tight, steel housing designed to maintain shafts and bearings in accurate alignment. Provide the gear ratio as indicated plus or minus [1.5] [_____] percent. [The [vertical] [horizontal] output shaft must be [single] [double] extended and [be coupled to the pinion shaft] [have the pinion mounted on the output shaft]]. Provide a [vertical up] [horizontal] output shaft for position feedback with the gear reducer. The shaft must be 19 mm 3/4 inches in diameter and extend to provide a [direct coupled][gear reduced coupling][non-contact coupling] to drive a [rotary cam limit switch][angular displacement transducer][non-contact transducer]. [Reducers with dual output working shafts must be designed to accommodate a split percentage torque distribution between the output shafts based upon the loads produced by the motor and in accordance with the design criteria specified in paragraph DESIGN CRITERIA.][ The input shaft must be [_____] mm inches in diameter.] Design, rate and manufacture the speed reducers in accordance with ANSI/AGMA 6113 AGMA 6013 with all components meeting the requirements of ANSI/AGMA 6001. The gearing must be rated in accordance with ANSI/AGMA 2003 and ANSI/AGMA 2001. In all cases where these standards or this specification are in conflict with one another the more conservative design standard takes precedence.

2.4.1.2 Reducer Housing

**************************************************************************
NOTE: Gearboxes exposed to the environment should be fitted with filtering ports or a self-contained filter system so that the oil can be filtered to remove moisture.
**************************************************************************

The reducer housing must be heavy duty cast steel or welded steel construction and have dowel pins at all parting seams for accurate gear and bearing alignment. Split the reducer housing to facilitate disassembly for maintenance and repair.[ The reducer housing must be of the dry well type design for the vertical down output shaft.][ Design the dry well such that the speed reducer can be completely filled with oil while in storage and the oil can be drained out of the dry well when the speed reducer is to be put into service.] Design the base thickness and width with adequate rigidity and stiffness to not contribute additional stress on the mounting bolts. All surfaces must be smooth and flat and easy to clean. Provide the upper and lower housings with large, rugged lifting lugs.[ Provide a machined steel bracket for mounting the [rotary cam limit switch][angular displacement transducer][_____] and mount as indicated.] Provide all required oil drains, fill ports, breathers, heater ports, filtering ports, and inspection covers in the housing. Provide a main oil drain at the lowest point possible on the reducer housing. Fit the main oil drain with a 25 mm 1-inch stainless steel ball valve with a pressure-temperature rating of [ 13.8 MPa 2000 psig at 38 degrees C 100 degrees F]. Plug the valve on
Housing must include 25 mm 1-inch filter ports with 25 mm 1-inch stainless steel ball valve to be connected to the portable filtering unit where specified, otherwise cap the ends. Also provide the lower bearings with drainable deepwell bearing end caps as indicated. Locate drain and fill plugs for speed reducers so as to be readily accessible on the completed units and provide with extension piping where required. Manifold and pipe the drains to a single point with a shutoff valve and threaded cap on the exterior of the housing so that it is easily accessible. The design of the reducer housing should minimize potential for water intrusion as the reducers will be continuously exposed to all weather conditions. This includes raising the upper bearing caps on top of the housing to prevent standing water from seeping into the enclosure. Internally raise lower bearings within the housing to prevent bearings from being the lowest point in the housings. Top side inspection covers are not acceptable. Provide side inspection access covers. All dimensions indicated must remain as shown as a minimum for proper machinery alignment[, as well as interchangeability with other reducers within the [_____] District].

2.4.2 Gearing

**************************************************************************
NOTE: Coordinate with the gearbox manufacturer to determine the heat treatment and hardening method best suited to satisfy the operational conditions for the gearbox.
**************************************************************************

Provide [spur] [helical] gearing made from high strength alloy steel that is hardened by [flame][induction][carburizing] with subsequent quenching and tempering to produce a [through][case] hardened gear. Grind the gears after gear cutting to achieve a minimum ANSI/AGMA Quality [11] [_____] in accordance with AGMA 2015/915-1.[  Integrally cut the [helical] pinions on the pinion shaft.][  Make spiral bevel gears from high strength alloy steel with case hardened teeth, crown lapped for quality and smooth operation.]

2.4.3 Reducer Shafts

Make shafts from high-strength alloy steel in accordance with ASTM A668/A668M and of sufficient size and as indicated to insure rigid alignment. All keyways must have fillet radii. Provide keys for all shafts. Design shafts in accordance with the requirements of ANSI/AGMA 6001. All shafts must have standard keyways and keys in accordance with ASME B17.1, Class II. Submit all fabricated dimensions of the keyways and keys.

2.4.4 Shaft Bearings

The shaft bearings must be high capacity antifriction roller bearings suitable for both radial and thrust loads. All bearings must have a minimum L-10 bearing life of [75,000] [_____] hours based on the largest full load motor kW horsepower provided by the specified motor.

2.4.5 Gearbox Lubrication System

**************************************************************************
NOTE: A pressure or combination system generally is specified for right angle gearboxes that might have gearing above the oil line or a gearbox with slow moving gearing. If a splash type system is used,
delete the requirement for the pump.

The lubrication system must be a [splash] [pressure] [combination pressure/splash] type system using a [synthetic] [petroleum based] hydro-carbon lubricant conforming to the requirements of ANSI/AGMA 9005. The pressure lubricating system consists of an electric motor driven lubricating gear pump and piping assembly which lubricates the upper bearings and gear meshes not submerged in oil. The pump must be a positive displacement [internal][external] gear type, cast iron construction. Equip the pump with an overpressure relief valve. [Internally][Externally] mount the pump on the gear box and provide with the proper seals to operate under the stated conditions. The gear reducer manufacturer must design the lubrication system. Install external and internal piping as required to provide adequate lubrication to the gear meshes and bearings. Define, document and submit the pressure losses, total flow rate, and expected flow rate to each component and/or gear mesh. Mount a flow switch, pressure switch, and pressure gauge on the pump outlet. Design the lubrication system to function properly at both nameplate speed ratings using the specified lubricating oil. All gears and lower bearings [with the exception of the lower bearing of the vertical (down) output shaft] must be oil lubricated. All upper bearings must be oil and/or grease lubricated. Provide all required oil slingers, dams, and passages. House the lower vertical output shaft bearing in the dry well and grease lubricate. Provide grease lines and lubrication fittings for all grease lubricated bearings and mounted on the reducer housing such that the bearings can be easily identified and lubricated from the side of the reducer housing. Equip the reducer with a sight gauge and dipstick in order to observe and measure the oil level. Also, fit the speed reducer with an oil sample valve arrangement. The valve must be a 6 mm [1/4-inch] stainless steel ball valve with a pressure-temperature rating of 13.8 MPa [2000 psig at 38 degrees C 100 degrees F] and be fitted with a plug on the open end. Locate the oil sample port on the reducer housing such that an oil sample can be drawn (through the sample valve) from a point that is approximate 1/2 of the operating oil level in the reducer.

2.4.6 Seals

Provide spring loaded grease-purged dual lip seals for all shaft extensions. Design and size all seals to withstand the pressure head developed when the speed reducer is completely filled with oil (storage condition) without leaking.

2.4.7 Heater

NOTE: Use caution when specifying heaters for use. Give careful consideration to attempt to select a lubricant with the characteristics and viscosity range that is suitable for the anticipated operating conditions vs. randomly specifying heaters for use in the system. Damage and premature degradation of lubricants can result from high temperatures or excessive heating. Consult with the gearbox manufacturer to best access the lubrication requirements and need for auxiliary heating.

[Electric heating elements must have a maximum watt density of [1.5][_____]
W/sq.cm [10][_____] W/sq.in. and have a supply voltage of [240][_____] Volt AC, [1][_____]phase.)

2.4.8 Breather

**************************************************************************
NOTE: Standard breather may be provided. However, to help prevent water contamination, a hygroscopic breather is recommended for gearboxes exposed to the environment.
**************************************************************************

Provide all reducers with a hygroscopic breather with threaded fittings for installation to prevent problems caused by moisture and particulate matter contamination in the reducer when it breathes in and out due to temperature fluctuations. The breather must filter particles down to 3 µm microns in size. The hygroscopic agent must change color signifying when the unit requires replacement, i.e., when the desiccant is saturated with moisture. Air flow stoppage through the breather under freezing conditions is not allowed.

2.4.9 Lubrication

Lubricating oil for speed reducers must have good resistance to foaming under normal operating conditions and be noncorrosive to speed reducer components. Provide the oil in accordance with the gearbox manufacturer's requirements unless otherwise specified herein. Submit lubricant characteristics, physical properties and product data. Provide lubricant in compliance with ANSI/AGMA 9005 and be [AGMA 5EP][______]). Provide lubricant suitable for infrequent intermittent duty operation of the speed reducers with an ambient temperature range from minus 23 degrees C to plus 43 degrees C minus 10 degrees F to plus 110 degrees F. Lubricate couplings and bearings in accordance with the manufacturer's instructions.

2.4.10 Portable Filtering Unit

**************************************************************************
NOTE: Portable oil filtering unit may be desired if the gearbox unit will be exposed to the weather. Moisture can collect in the unit and become suspended in the oil. The liquid water that has separated can be drained off but the oil must be filtered to remove water still in solution. Heaters can be provided to heat the oil. However, they are not energy efficient, can damage the oil, and may not completely prevent moisture intrusion. The designer may also elect to design a heated kidney loop filtration system which is integral to the gearbox for critical applications requiring continuous filtration during gearbox operation.
**************************************************************************

Provide [one][_____] portable filtering unit for use with the specified gear reducers.

a. The portable filtering unit must be [1.1][_____] kW [1.5][_____] horsepower, 110-120 volt, [1,140][_____] RPM high efficiency, positive displacement, rotary internal gear type pump with a mechanical seal. Provide a pump capable of delivering [0.5][_____] L/s [8][_____] gallons
per minute flow rate. The pump must be self-priming and designed to handle liquids of 35 SSu to 1000 SSu viscosity, while able to develop 625 mm 25 inches of mercury vacuum at zero MPa psi. Equip the filtering unit with an ON/OFF switch, High/Low pressure switch, two interchangeable filter housings, one set of hose assemblies on a portable rolling cart frame.

b. Equip the one set of filter element with replaceable [5][_____] µm micron filter cartridges. [The portable filtering unit separates water from the oil by coalescing and gravity separation. The water sinks to the bottom and accumulates until it is periodically bleed off. The coalescing chamber must be able to handle dissimilar liquids with a specific gravity difference of 0.09 and greater, leaving the effluent with less than 10 ppm of the discontinuous phase. The coalescing element has an indefinite life, with replacement required only when it becomes plugged with solid particles.] Provide a multiple element filter with a non-channeling seal. A non-channeling seal has the flow of oil carrying the contaminants into the depths of the filter media with no flow restriction from surface loading. Each element removes water from wet oils. The multiple element filter consists of four or six sections in one housing that all work at the same time. Design the filters so that water and contaminants are absorbed in the filter element. The capacity of the filter element should be approximately 4 L 1 gallon of water. A coalescing chamber is not necessary for the portable filtration system.

c. Provide the portable filtering unit secured on a dolly or wheeled cart with all the necessary fittings, hoses, and pipe to connect the unit to the reducer using standard hand tools.

2.5 BEARINGS

2.5.1 Pillow Block Bearing Assemblies

The pillow block bearing assemblies include the bearings, housings, seals and hardware. Housings must be [one piece][split] type, with [stainless steel] [painted cast iron][painted cast steel][_____] machined base housing with a [through drilled][tapped], [two bolt][four bolt] base. [Split housings must have dowels or steps to provide alignment accuracy.] Except as otherwise specified, shaft bearings must be high capacity antifriction [spherical][tapered] self-aligning roller bearings suitable for both radial and thrust loads with pressure lubrication fittings. Use the manufacturer's ratings for loads and speeds in determining the bearing capacity. Comply with the bearing manufacturer's recommendations for service and installation factors. The bearings must be capable of withstanding the total resultant normal loads and axial loads as specified below.

<table>
<thead>
<tr>
<th>Bearing Mark/ID No</th>
<th>Normal Load (Kg) (Lbs)</th>
<th>Axial Load (Kg) (Lbs)</th>
</tr>
</thead>
<tbody>
<tr>

<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Provide [floating][fixed] type bearing as indicated. Provide end caps on open ended shafts. All cap bolts must be SAE Grade [8] [____].
locking rings, set screws, lock nuts, spacers, and the necessary sleeves to center and secure the bearings within the housing. All bearings must have a minimum L-10 bearing life of [75,000] [_____] hours as defined by ISO 281 or JSA JIS B 1519 based on the largest full load motor kW horsepower provided by the specified motor. Design the bearing and housing for [grease][oil] lubrication and equip with [labyrinth] [_____] type shaft seals made of materials suitable for the working conditions and lubricant to be used to exclude foreign matter and retain lubrication without leakage under both static and dynamic operating conditions.

2.5.2 Sleeve Type Plain Pillow block Bearing Assemblies

[Provide [one piece][split] type bearing pillow block, [stainless steel][painted cast iron][painted cast steel][______] machined base housing with a [through drilled][tapped], [two bolt][four bolt] base. [Split housings must have dowels or steps to provide alignment accuracy.] The sleeve type plain bearings must be a bronze alloy material suitable for the installation and conform to the requirements of ASTM B271/B271M or ASTM B584, Alloy [C93200][______]. [Press-fit][Epoxy][______] the sleeve type plain bearings into the bearing housing bore.[ Use [retaining sets screws][locking pins][keys][machine screws] to secure the plain sleeve bearings.] Provide machined grease and oil grooves in the interior of the bearing unless otherwise shown. Break all edges of the grease grooves to provide a minimum [1.6][_____] mm [1/16][_____] inch fillet radius.

2.5.3 Self-Lubricated Bearings

Conform self-lubricated and composite type bearings to the requirements of Section 35 05 40.17 SELF-LUBRICATED MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY.

2.6 SHAFTS

**************************************************************************
NOTE: For shafts to be designed by the Contractor the designer may select the following paragraph.
**************************************************************************

[Calculate and design shafts to satisfy the requirements of Corps of Engineers' guidance specified in EM 1110-2-2610. Design shafts at minimum to provide a factor of safety of 5 when maximum load condition stresses are compared to the ultimate strength of the material and the stresses produced by the maximum torque of the motor do not exceed 75 percent of the material yield strength. Equations used for design must meet the requirements of the ASME shafting code. Apply a combined shock-and-fatigue factor of 1.25. Limit the maximum shaft bending moment shaft deflection to 0.83 mm/m 0.01 in/ft of length at the maximum rated load. The torsional shaft deflection must not exceed 0.26 deg/m 0.08 deg/ft of shaft length.]

2.7 SHAFT COUPLINGS

Provide [flexible disk] [elastomeric] [chain] [gear][grid][jaw] type of machined [steel][stainless steel] construction capable of transmitting the applied design torques.

2.7.1 General

Provide couplings capable of the [vertical] [or] [horizontal] installation and design for [non-reversing][reversing] loads and a maximum
[3000][_____] RPM operating speed. The couplings must be capable of handling a maximum torque of [_____] Nm inch-pounds. Design couplings to compensate for angular, parallel and axial misalignment. Couplings must have a general service factor of [1.0][_____] applied to their selection and design based upon the anticipated application and expected service. Couplings must be of sufficient capacity to develop the full strength of the shafting which they connect and must be pressed and keyed thereon. All hub bores must meet the dimensional and tolerance specifications in accordance with AGMA 9002 unless otherwise indicated. The key fit must be in accordance with ASME B17.1, Class II. Submit the fabricated dimensions of the key fit and shaft bores. Equip couplings with lube plugs; enclose and seal with an elastomeric O-ring to retain the lubricant. Couplings must be oiltight under both static and dynamic operating conditions. Use SAE grade 8 bolts unless specifically used for shear applications by the manufacturer to achieve published shear strengths. Minimize misalignment for gear couplings by not exceeding the manufacturer's recommendations for installation limits pertaining to gap-hub separation, angular alignment, and parallel offset alignment measurements.

2.7.1.1 Flexible Disk Couplings

Use high strength stainless steel flexible disks to transmit torque and have no moving parts of backlash. Lubrication of the coupling is not required. The coupling must be of the [close coupled] [floating shaft] design. Dynamically balance the coupling in accordance with AGMA standards to achieve a AGMA [7] [_____] balance class.

2.7.1.2 Elastomeric Couplings

Provide [one-piece][two-piece][through bolt inserts] molded [EPDM][Neoprene][Urethane] sleeves to transmit torque with keyed metal flanges secured with set screws. The elastomeric coupling must have a minimum service factor of [1.0][_____]..

2.7.1.3 Chain Couplings

Provide hardened teeth sprocket hubs with a connecting ANSI Standard Double Width Roller Chain to transmit torque. Secure hubs to the shaft by means of keys/keyways. Furnish a sealed coupling cover of [die-cast aluminum] [stamped steel] material to retain lubricant. Provide rounded edge design covers with recessed and threaded lubricant plugs to fill and retain lubricant.

2.7.1.4 Gear Type Couplings

Flanged with exposed bolt, double engagement, made of forged steel. Couplings must transmit torque by means of external gears on hubs engaging in internal gears on the coupling sleeves. Machine gears in accordance with AGMA 9002 and AGMA 908.

2.7.1.5 Grid Type Couplings

Keyed shaft hubs with slotted faces to connect each coupling half through an interlocking tapered high tensile metal alloy grid. The grid must be fully enclosed in a sealed [horizontally] [vertically] split cover to retain the lubricant. Provide rounded edge design covers with recessed and threaded lubricant plugs to fill and retain lubricant.
2.7.1.6 Jaw Type Couplings

Keyed shaft [stainless steel][sintered iron] hubs of the fail-safe spider design. Furnish set screws to secure the hubs. Make coupling insert material of [bronze][Buna-N][Urethane][_____] to transmit torque.

2.7.2 Torque Limiting Couplings

**************************************************************************
NOTE: Torque limiting couplings prevent motor over-torque which could result in damage to the equipment.
**************************************************************************

Install a [mechanical friction ] [ball-detent] [_____] type torque limiting coupling limit applied torque of the electric motor for equipment protection. The torque limiting coupling must slip if the machinery torque exceeds [_____] N-m inch-pounds. The coupling must continue to slip until the torque drops below this level. Provide a flexible type coupling design with bored and keyed steel hubs[ and a steel grid which fits into the periphery of the coupling hubs].[ Provide friction linings of the segmental type design and are easily replaced without removing connected equipment.] [Hardened steel balls that are spring loaded in machined detents control the slip setting of the coupling.] Control the torque slip range by a spring type mechanism which can be adjusted by means of tightening or loosening bolts or adjustment nut. The torque slip must have an adjustment range of plus or minus [20] [_____] percent of the specified load. Equip the spring mechanism with machined spacers of a specific length determined by the required slip setting. Preset the coupling slip setting at the factory. Equip the coupling with self lubricated bearings to permit free rotation when slipping. Provide elastomeric coupling seals that are both water and dust tight and have a fitting that allows grease lubrication. [Break in mechanical friction torque limiting couplings after assembly to the motor shafts. This consists of operating the couplings at a pre-determined number of revolutions at 100 percent slip and then re-setting the spring compression distance as described in the manufacturer's installation instructions.]

2.8 ELECTRIC MOTORS

**************************************************************************
NOTE: Coordinate with the respective electrical or mechanical designers to ensure motors are not being specified elsewhere in the contract documents and that all motor requirements are satisfied.
**************************************************************************

Motor must be Horizontal shaft, squirrel cage induction, high slip, high torque, [dual horsepower rated], [two winding,] [two speed,] [460] [_____] volt, 3 phase, 60 Hertz type motor controlled by [across the line magnetic starter][Variable Frequency Drive]. The motor must be rated for continuous duty and conform to the applicable requirements of NEMA MG 1. The motor must be rated at a minimum of 8 percent and maximum of 13 percent slip for [both high and low speed] windings. The enclosure must be totally enclosed, fan cooled, and weatherproof type. Provide the motors with a removable stainless steel drain. Remove the drain as specified by the motor manufacturer.[ Motor installation is in an exterior location subjected to the weather elements.] Speed/torque characteristics must be as described herein. Provide conduit box for incoming power with two [38]...
[_____] mm [1-1/2] [_____] inch diameter holes for installation of watertight fittings on the power cord. Provide conduit box for heater power with two [19] [_____] mm [3/4] [_____] inch diameter holes for installation of watertight fitting on the heater power cord. Locate conduit boxes on the side of the motor as indicated. Seal the motor shaft with a labyrinth type seal where the shaft penetrates the front and back of the motor.

2.8.1 Ratings

The [gate] [_____] motors must be rated at [ / ] [_____] kW [20/6.25] [_____] horsepower at [745/230] [_____] RPM (high/low speed) based on [900/300] [_____] RPM synchronous speeds. The 100 percent full load speed values proposed for the new motor must not be less than [740] [_____] RPM and not more than [775] [_____] RPM for high speed and not less than [230] [_____] RPM and not more than [260] [_____] RPM for low speed at the specified horsepower values. Locked rotor torque must be in a range from 200 to 300 percent of full load motor torque for high speed and from 250 to 300 percent of full load motor torque for low speed. [The motor must have no breakdown torque.] It is preferred to optimize characteristics at full load conditions and allow locked rotor torque to be in the previously specified range if there are design trade-off's between full load torque and locked rotor torque values.

2.8.2 Construction

Motor frame size must be a minimum of a NEMA [445TS] [_____] for the [gates] [_____] type. Temperature rise must be no greater than [80] [_____] degrees C [176] [_____] degrees F. Provide an internal heater of the strip type as part of the motor. The heater must have a minimum capacity of [90] [_____] W and have separate leads terminating in a separate conduit box. Heater power supply must be 120 volt, 60 Hertz, single phase. Use Class F insulation throughout the motor. Impregnate motor windings with the insulating compound by the vacuum/pressure impregnating method. Repeat the procedure until all voids in the winding are completely filled with the insulating material. Provide antifriction type motor bearings incorporating a suitable method for lubrication. Bearing ratings must meet or exceed a L-10 life of 30,000 hours at full radial load. Provide the motor with a visible nameplate indicating motor horsepower, voltage, phase, hertz, RPM, full load amps, frame size, manufacturer's name and model number, service factor, and serial number. Submit motor performance data at the time the motors are submitted. The data includes: percent efficiency, percent amperes, percent power factor, and percent slip plotted against 0 to maximum allowable motor overload above 100 percent for both high and low speed windings; and torque (N-m) (ft-lb.) and amperes plotted against 0-100 percent synchronous speed for both high and low speed windings.

2.8.3 Electric Motor Factory Tests

Factory test all motors to ensure that they are free from electrical and mechanical defects. Perform tests in compliance with IEEE 112 and NEMA MG 1. Document test results in accordance with the guidance indicated in IEEE 112 and NEMA MG 1. Testing includes the following. Additionally, perform all tests normally conducted by the manufacturer as part of its quality control program, but not specified herein.
2.8.3.1 No Load Test

For each winding (high and low speed); at no load and rated frequency and 100 percent rated voltage; record the current, voltage, frequency, kilowatt input, and RPM.

2.8.3.2 Locked Rotor Test

For each winding (high and low speed); with the motor blocked and at rated test frequency and 50 percent rated voltage; record the voltage, current, frequency, and kilowatt input. Repeat for 100 percent rated voltage.

2.8.3.3 High Potential Test

For each winding (high and low speed): Record voltage and duration.

2.8.3.4 Stator Winding Resistance Test

For each winding (high and low speed): Record resistance in ohms between the stator winding terminals. Record the temperature in degrees C.

2.9 BRAKES

**************************************************************************

*NOTE: Brakes can be either AC or DC type. If electrohydraulic AC Thruster brakes are specified, delete paragraph RELEASE MAGNETS AND RECTIFIER below. If AC solenoid or DC magnet operated brakes are specified, delete paragraph ELECTROHYDRAULIC ACTUATOR.*

**************************************************************************

Provide brakes that are self-adjusting, shoe type, spring set, [released by a sealed electrohydraulic AC thruster actuator] [with DC magnet operated release] [with AC-rectified solenoid release] and are completely enclosed in a water-tight and dust-tight enclosing case arranged for floor mounting. The brake must be [alternating current] [direct current] type rated for [120] [240] [460]-volts, [1] [3]-phase, 60 Hertz. The brake must have an operating torque rating of [271] [_____] N-m [200] [_____] foot-pounds with a [250] [_____] mm [10] [_____] inch wheel bored for mounting on the brake shaft. Base the torque rating on open construction continuous duty. The brake must be self-adjusting such that compensation for shoe wear is automatic. Provide a manually operated hand release, [external][internal] to the brake enclosure. The brake torque field setting cannot be less than [125] [150] [_____] percent of the full load torque of the motor when referred to the shaft on which the brake wheel is mounted.

2.9.1 Electrohydraulic Actuator

Consists of an electric motor that drives an impeller inside a fluid filled, heavy-duty, cast [aluminum][_____] housing. The rotation of the impeller must develop hydraulic pressure to extend a cylinder which releases the brake by overcoming the main spring. Provide an adjustable valve to allow setting the brake timing. Completely enclose the actuator in the housing. The fluid must be suitable for operation in temperatures to [minus] [plus] [4] [_____] degrees C [40] [_____] degrees F.
2.9.2 Release Magnets and Rectifier

Provide releasing magnets of the [AC] or [DC] shunt type and of standard stock design. Supply direct current by means of a self-contained rectifier unit of proper rating and suitable for operation on [120] [240] [460]-volt, [1] [3]-phase, 60-hertz, alternating current electrical power. The complete unit (brake and rectifier) must be suitable for connection to the power circuit of the motor with which the brake is used so that the brake will set or release when the motor is de-energized or energized, respectively. The rating of the rectifier and the brake releasing magnet must be in accordance with the brake rating requirements specified and be sufficient to release and hold the brake in the released position with 85 percent of rated voltage impressed on the incoming terminals of the rectifier. The brake must operate satisfactorily at up to 110 percent of rated voltage. Provide a forcing contactor for operation of the DC operated magnet.

2.9.3 Enclosing Case

Provide a NEMA Type 4 enclosing case with watertight grease pressure lubricated shaft seals of a standard manufacturer. Hold the cover in place by heavy hinge bolts and wing nuts. Provide enclosing case for 115 volt AC space heaters. Space heaters total capacity must be a minimum of [62] [_____] watts. Heaters are provided by the brake manufacturer. Provide a bottom mounted drain and breather unit on the enclosure to allow condensate water to drain, but prevent outside water from entering the enclosure. Provide the enclosure with a shaft seal for each shaft penetration through the enclosure.

2.9.4 Mechanical Construction

Except for brake wheels, shoes, and electrical parts, no cast iron is allowed in brake construction. All pins, fittings and other miscellaneous small metal parts must be of corrosion-resisting metal. Fit bearings with bronze or other approved bushings to prevent any binding of moving parts. Antifriction bearings of corrosion-resisting construction may be used. Provide means for lubrication for all bearings, unless bearings are of a self or pre-lubricated type. Provide and attach a nameplate of corrosion resisting material to a part of the brake which ordinarily will not be replaced. The nameplate must indicate all necessary information required by this specification. Provide a manual release mechanism to allow removal of wheel or permit lining replacement without readjusting torque setting. Magnet coil must be epoxy coated.

2.10 GUARDS AND COVERS

Provide safety guards or covers where necessary to protect the operators from accidental contact with moving parts. Provide openings in guards and covers as necessary to provide access to parts requiring lubrication or regular maintenance.

2.11 STRUCTURAL BASES AND SUPPORTS

For specific requirements for welded structural steel bases, frames, and supports see Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.12 OPEN [SPUR] [HELCAL] GEARS

******************************************************************************

SECTION 35 01 41.00 10 Page 38
NOTE: Coordinate with the gear manufacturer to determine the heat treatment and hardening method best suited to satisfy the operational conditions for the gears.

2.12.1 Gearing

Make all [spur] [helical] gearing from high strength alloy steel that is hardened by [flame] [induction] [carburizing] with subsequent quenching and tempering to produce a [through] [case] hardened gear. Grind the gears after gear cutting to achieve a minimum ANSI/AGMA Quality [11] [_____] in accordance with AGMA 2015/915-1. [Integrally cut the [helical] pinions on the pinion shaft.]{[Make spiral bevel gears from high strength alloy steel with case hardened teeth, crown lapped for quality and smooth operation.]} Make keys of [ASTM A108, UNS G10180 (ASTM A1018/A1018M),] [_______] keystock. Certified material test results for the drive pinion and drive pinion shaft are required.

The overall dimensions and configurations of new [open] [spur] gears and mating shafts must be as indicated. All gears must be manufactured to achieve a AGMA gear quality of [6] [_____] or better and be supplied as match marked sets. Factory test all gears in accordance with the TESTING paragraphs of this specification. [Spur] [Helical] gear teeth must be of the involute form. Cut pinion gears from solid steel and fabricate from [ASTM A148/A148M Grade 80-40 steel] [ASTM A291/A291M forged steel, Grade 7][____], Class [H][____] [______]. The Brinell Hardness must be a minimum 50 (BHN) greater than the Brinell Hardness of the mating gears. Harden the gear teeth as specified to measure at any point on the tooth face within [360] [_____] to [400] [_____] BHN after finishing. The ends of the pinion teeth must be end relieved to prevent end loading. Crown the gear teeth as indicated.

2.12.1.1 Pinion "Drive" Gear

Pinion "drive" gear must have a pitch diameter of [_____] mm inches. Teeth profile must be standard 20-degree full depth involute with a diametral pitch of [0.75] [_____] . Teeth width must be [_____] mm inches. Accurately machine cut teeth to American Gear Manufacturer Association (AGMA) tolerance of No. 6 or better quality. Machine the inside rim of the gear as indicated and drill to match the mounted [shaft] [motor][______]. Verify machining dimensions to assure proper mounting. Manufacture gears from steel meeting the requirements as stated above. Scribe the pitch line, and two indexing lines offset 3 mm 1/8-inch to each side, on the top of the gear teeth of all mated gears to aid in installation alignment.

2.12.1.2 [Sector] [Bull] [Spoked] [_____] Type Gears

Gears have through hardened teeth and are of fabricated or cast construction. The overall dimensions and configurations of the [sector][_____] gear must be as indicated. Make the rim of the [sector][_____] gear of [ASTM A290/A290M forged steel, Grade 3][____], Class E[____][______]. The material of the spokes, hub and other parts of the [sector][_____] gear are determined based on design requirements. Conform cast hubs, spokes and arms to the requirements of [ASTM A148/A148M, Grade 90-60][______]. Submit certified material test results for the gears and shafts. [Overhung gears on shafts and speed reducers are not be acceptable.]
2.12.2 Contractor Designed Gearing

**************************************************************************
NOTE: The designer should consider requiring a contractor with a manufacturing certification when specifying contractor designed gears. E.g. AGMA or ISO certifications.
**************************************************************************

Contractor designed gearing must be engineered, designed, and manufactured by a gear manufacturer who has prior experience in designing and supplying the specified size gearing (and holds a quality certification of [______). Submit the manufacturer's required calculations and shop drawings for the design and fabrication of the identified gearing prior to the start of shop fabrication. Design the [spur] [helical] gears in accordance with ANSI/AGMA 2001 with life factors CL and KL equal to unity and reliability factors CR and KR equal to 1.00 or greater. The reduction set number used in the design calculations cannot be greater than 3. The normal strength kW horsepower rating of the [spur] [helical] gears cannot exceed 1/2 of the peak strength kW horsepower rating as determined by ANSI/AGMA 2001. Durability rating of gears must be as determined by ANSI/AGMA 2001 and based on a service factor of 1. The pinion must have a generated tooth form as indicated.

2.13 PINTLE BUSHING

**************************************************************************
NOTE: The following paragraphs are included if the pintles are not specified with the lock gates. Choose the first paragraph if the pintle bushing is a greased bronze design. Choose the second paragraph if a self-lubricated pintle bushing is to be furnished and designed by the Government or a self-lubricating bearing manufacturer. Self-lubricated pintle bushings must have performance criteria provided to allow the manufacturer to design and fabricate the pintle and bushing. Additional paragraphs may be required for gate and shoe pintle components that are not included in this guide specification due to the wide variance in designs requirements. Recommendations for material selection of pintle bushing sockets, pintle shoes and pintle bases can be found in ERDC/CERL TR-02-7, Advanced Materials Selection Guide for Lock, Dam, and Hydroelectric Plant Components.
**************************************************************************

[ Provide a grease lubricated alloy bronze pintle bushing to the dimensions and tolerances indicated. For the bushing material use either stainless steel conforming to [ASTM A564/A564M, Type 630, UNS S17400][______) or aluminum bronze alloy and conform to the requirements of [ASTM B148][ or ][ASTM B271/B271M], [C95400][______). [Pattern cast and machine the bushing] [Machine the bushing from a solid piece of material] to acquire the shape and surface finishes indicated. [Provide a surface finish of[16][____] µm micro-inches or better on the running bearing surface.] [Press fit][Mechanically secure] the bushing into the gate as indicated without distortion or altering the fit with the mating pintle ball.]
Provide a greaseless self-lubricated pintle bushing [to the dimensions and tolerances indicated] [designed by the self-lubricating bearing manufacturer to meet the requirements provided for bearing performance]. [Conform the self-lubricated bearing composite material and bearing design to the requirements of Section 35 05 40.17 SELF-LUBRICATED BEARING MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY.] Provide [one piece] [two piece] pintle bushings [and hinge ball bushings] from an approved manufacturer listed in 35 05 40.17 SELF-LUBRICATED BEARING MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY. Bushing bearing surfaces for fabric reinforced polymers must have a minimum thickness of 2 mm 1/12 inch (0.083 inch). Sprayed polymer coatings must have a minimum thickness of 0.5 mm 2/100 inch (0.020 inch). The Bushing substrate material must meet the requirements of ASTM B148, Alloy [C95400] [_____].

Provide a debris seal of the dimensions and materials as indicated with the pintle bushing. Mate the bushing bearing surface with the pintle ball through metrology methods and the use of a calibrated scanning probe coordinate measuring machine that meets the requirements of ISO 10360-2, [by [lapping] mating components], via [_____] to achieve the indicated tolerances and [compare] [test] with contact [measurements] [dye] [tape] [_____] to confirm uniform bearing contact. Test the contact area between the mating components, witnessed by the Government, to achieve a bearing contact area of [85][_____] percent or better to be acceptable. Perform nondestructive examination testing of pintle bushings, balls and fabricated pintle components in accordance with the requirements of paragraph NONDESTRUCTIVE EXAMINATION.

The maximum static bearing pressure for the pintle bushing must not exceed [17][_____] MPa [2500][_____] psi when a normal load of [_____] N pounds is applied at an angle of [_____] degrees from horizontal or [34][_____] MPa [5000][_____] psi during dynamic operation. Pintle bushings will operate submerged [and hinge] bushing will normally be dry but may be exposed to rain water.

2.14 PINTLE BALL

Fabricate pintle ball(s) from steel castings conforming to [ASTM A487/A487M, Grade 13 Modified (Nickel 3.25-3.75)] [ASTM A743/A743M, Grade CF8, UNS J92600] [ASTM A744/A744M, Grade CF8, UNS J92600], ASTM A27/A27M, Grade 70-36, Class 2, [_____] or age-hardened stainless steel forgings in accordance with [ASTM A473, Type 303, condition A, UNS S30300] [ASTM A705/A705M, UNS S17400, Type 630, minimum hardness 40 Rc] [_____]. Machine pintle ball(s) to meet the dimensions, surface finish and tolerances as indicated. Any casting patterns developed become property of the Government and must be packaged for long term storage with the pertinent part identification provided on the exterior packaging. [Free float] [Press fit] [Mechanically secure] the pintle ball into the pintle casting as indicated without distortion or altering the fit with the mating pintle bushing. Furnish removable lifting eyes with the pintle ball for lifting. Mate the pintle ball bearing surface with the pintle bushing through metrology methods and the use of a calibrated scanning probe coordinate measuring machine that meets the requirements of ISO 10360-2, [by [lapping] mating components], via [_____] to achieve the indicated tolerances and [compare] [test] with contact [measurements] [dye] [tape] [_____] to confirm uniform bearing contact. Test the contact area between the mating components, witnessed by the Government, to achieve a bearing contact area of [85][_____] percent or better to be acceptable. [The maximum static bearing pressure for the pintle ball must not exceed [17][_____] MPa [2500][_____] psi when a normal load of [_____] N pounds is applied at an]
angle of [___] degrees from horizontal or [34][___] MPa [5000][___] psi during dynamic operation.)

2.15 PINTLE SHOE

Fabricate pintle shoes from steel castings conforming to [ASTM A27/A27M, Grade 70-36, (UNS J03501)] [____]. Machine pintle shoes to meet the dimensions, surface finish and tolerances indicated. Any casting patterns developed become property of the Government and must be packaged for long term storage with the pertinent part identification provided on the exterior packaging.

2.16 PINTLE BASE

Fabricate pintle bases from steel castings conforming to [ASTM A27/A27M, Grade 60-30, (UNS J03000)] [____]. Machine pintle bases to meet the dimensions, surface finish and tolerances indicated. Any casting patterns developed become property of the Government and must be packaged for long term storage with the pertinent part identification provided on the exterior packaging.

2.17 ENGINEERED CHAIN

**************************************************************************
NOTE: This and following five Articles can be retained and edited or deleted as needed depending on the gate hoist equipment specified.
**************************************************************************

2.17.1 Corrosion-Resisting Steel Flats and Rounds

Conform corrosion-resisting steel flats and rounds [ASTM A564/A564M, Type 630][____], minimum charpy-V notch impact value of [20][____] Nm [15 foot-pounds][____] at -18 degrees C 0 degrees F; or [ASTM A564/A564M, Type XM-25, Condition H1050], age-hardened heat treatment condition, hot-finished or cold-finished, Class C, minimum charpy-V notch impact value of [20][____] Nm [15 foot-pounds][____] at -18 degrees C 0 degrees F.[ Furnish ASTM A564/A564M, Type 630 material to provide a minimum yield strength of 1000 MPa 145,000 psi, minimum Brinell Hardness of [331][____] unless otherwise indicated.][ Furnish ASTM A564/A564M, Type XM-25, H1050 material to provide a minimum yield strength of [930][____] MPa [135,000][____] psi, minimum Brinell Hardness of [321][____] unless otherwise indicated.]

2.17.2 Nickel-Aluminum Bronze Flats and Corrosion-Resisting Steel Rounds

Conform Nickel-Aluminum bronze flats to [ASTM B505/B505M, UNS C95500HT][____] to provide a minimum yield strength of [427][____] MPa [62,000][____] psi and rounds to [ASTM A564/A564M, Type 630][____], minimum charpy-V notch impact value of [20][____] Nm [15 foot-pounds][____] at -18 degrees C 0 degrees F.

2.17.3 Pins

Fabricate normal and long pins from [ASTM A564/A564M, Type XM-25, Condition H1050][____] stainless steel. The material must be certified by the steel manufacturer to provide a minimum yield strength of [930][____] MPa [135,000][____] psi in accordance with ASTM A564/A564M. Heat treat at the mill that supplies the alloy in accordance with the relevant ASTM heat
treatment instructions.

2.17.4 Retaining Rings

Provide retaining rings of [multiple-turn][_____] stainless construction. Provide retaining rings with offset permanently set into the design of the ring spiral to provide parallel flat sides that mate parallel against the groove wall. Provide retaining rings similar in design to [Smalley, model WST-400-S02 series][_____] . Provide a minimum of [667][_____] kN [150,000][_____] pounds thrust shear strength capacity with the retaining rings when installed in the recommended groove detail. Size the retaining rings to match the pin groove details as indicated unless otherwise approved.

2.17.5 Hardness

Hardness for material as indicated.

2.18 ROUND LINK CHAIN

2.18.1 Calibrated Hoisting Chain

Furnish [two][four][_____] lengths of calibrated hoisting chain, as indicated, for each [tainter][_____] gate hoist. Chain must be [34 mm x 126 mm][[_____] mm x [_____] mm] [1.3 inches x 5 inches][[_____] inches x [_____] inches] [ASTM A322, UNS G8620, Grade 2 alloy steel][_____] round link type manufactured to DIN 22252. Machine weld the links, and grind the welds to comply with the dimensions indicated. After welding, heat treat the chain to yield a minimum case hardness of [340][_____] BHN. Machine fit the chain to the tolerances set forth in DIN 22252. After heat treating, proof test each link of chain to [1080][_____] kN [242,800][_____] pounds. After proof testing, visually inspect the chain for permanent deformation cracks and deformed links. After proof testing and visual inspection, immersion coat the chain with a corrosion resisting coating of [TECTYL 846, Class I][MIL-PRF-16173E, Grade 4, Class I]. Tensile test a sample of finished chain to destruction to determine its breaking strength. The breaking strength must not be less than [1450][_____] KN [326,000][_____] pounds. [Make one 7.5 m 25-foot long test chain, of the above specification, available to the manufacturer of the pocket wheels specified in the paragraph FINISHED PRODUCT.]

2.18.2 Hoisting Chain/Gate Attachments

Provide each length of hoisting chain with accessory parts to connect the chain to the gate. Manufacture the accessory parts in accordance with requirements indicated.

2.18.3 Hoisting Chain Repair Links

Furnish repair links in conformance with the specification for connecting chain links as set forth in DIN 22258-1, for the hoisting chains, in the quantity listed. Forge the repair links from high-alloy steel and design to permit installation by mechanical means to replace a damaged link in any of the hoisting chains. Dimension the repair links to be compatible with the [pocket wheels][hoisting drum][_____] . The connector links must be capable of developing the full [1450][_____] KN [326,000][_____] pounds minimum breaking strength of the hoisting chain. Inspect each repair link by non-destructive methods during manufacture to ensure freedom from cracks and other flaws which would impair strength and durability. Finish coat
the same as applied to the hoisting chain.

2.19 POCKET WHEEL [SPROCKET]

2.19.1 Ring Forging

Provide the pocket wheel or chain sprocket that is a ring forging of alloy steel conforming to [ASTM A290/A290M, Class K][____], or [ASTM A322] cast steel having the following mechanical properties:

<table>
<thead>
<tr>
<th>Property</th>

2.19.2 Machining and Heat Treatment

Rough machine the forging prior to heat treatment for mechanical properties. Rough machining prior to heat treatment may include definition of the chain pocket recesses, provided that the product form at that stage is not susceptible to cracking during heat treatment, and provided that specified dimensional accuracy requirements can be met thereafter by final machining or grinding.

2.19.3 Testing

Perform nondestructive examination of each pocket wheel in accordance with the requirements of paragraph NONDESTRUCTIVE EXAMINATION.

2.19.4 Finished Product

Finish-machine each pocket wheel [sprocket] within the dimensional tolerances indicated. Dimensionally verify the pocket wheel [sprocket] metrology methods and the use of a calibrated scanning probe coordinate measuring machine that meets the requirements of ISO 10360-2. The machine tools and the machining methods and procedures used by the manufacturer must be such that the specified calibrated hoisting chain functions properly in engagement with each pocket wheel [sprocket]. Use a test length of calibrated chain, as specified in the paragraph HOISTING CHAIN, to test-fit each pocket wheel after its final machining.

2.20 HOIST DRUMS

**************************************************************************
NOTE: If wire rope hoists are specified, use the following section for fabricated drums.
**************************************************************************

[For specific requirements comply with Section 05 50 15 CIVIL WORKS FABRICATIONS.]
[The hoist drum must be a [centrifugally spun steel casting conforming to ASTM A148/A148M, GR90-60 spun cast steel][machined weldment of ASTM A829/A829M, Grade 4140 or 4340 material, condition [_____][____], as indicated. Each drum must have full end diaphragms to transfer the supported load to the operating shaft. Stress relieve the entire drum after welding and before finish machining. Heat treat the drum spool face through [flame hardening][_____] to achieve a surface hardness of [375-400][_____] BHN after final machining. The hoist drums must be of the through shaft type design and [keyed][welded][_____] to the drum shaft.[Fabricate multi drum assemblies to be synchronous right and left drum units.] Size the drum as indicated.[Weld the drum flange to the drum and fabricate of [ASTM A36/A36M steel][_____.] Fabricate the drum shaft from [ASTM A29/A29M, Grade 1045 cold finished steel][ASTM A473, UNS S4140 or S4340 material] with a minimum yield and tensile strength of 345 MPa and 483 MPa 50,000 psi and 70,000 psi, respectively][_____].]

2.21 GROOVED CHAIN DRUM (FOR ROUND LINK CHAIN)

2.21.1 General

Integrally weld the chain drum and shaft together by rib and diaphragm plates. The drum shell must be cast steel, conforming to [ASTM A27/A27M, Grade 60-30, Class 1][_____.] The shaft must be a steel forging conforming to [ASTM A668/A668M, Class D] [____], with carbon content limited to 0.35 percent. Plates must be ASTM A36/A36M material. The chain anchor block must be a steel forging conforming to ASTM A668/A668M, Class B, with carbon content of 0.35 percent maximum.

2.21.2 Machining and Welding

Machine the component parts for welding assembly as indicated. Conform all welding, including preheat and interpass temperature control, with AWS D1.1/D1.1M. Stress relieve the weldment after completion of welding, and prior to final machining of the shaft to suit the bearings and machining the shell for mounting the [drum gear][_____.]

2.21.3 Testing

Nondestructively examine grooved chain drums in accordance with the requirements in paragraph NONDESTRUCTIVE EXAMINATION. Conform all welding acceptance criteria with the requirements of AWS D1.1/D1.1M.

2.21.4 Finished Product

In the finished product the shaft must be concentric with the drum shell and together with all other dimensions must be within the tolerances indicated. The location of the chain anchor block with respect to the [drum gear][_____] machined shoulder, and the handing (R.H. or L.H.) of the chain groove in the drum shell must be in accordance with the requirements indicated.

2.21.5 Dimension Test

The first chain drum manufactured must be dimensionally match tested with the chain to verify the following:

a. Dimensionally verify the grooved chain drum through metrology methods and the use of a calibrated scanning probe coordinate measuring machine
that meets the requirements of ISO 10360-2.

b. Clearance of U-bolt to the bottom of the chain groove when inserted into the chain anchor.

c. Clearance, if any, from first chain link to the chain anchor when first link is positioned so that its center bears on the drum.

d. Number of threads left over the nuts of the U-bolt when the first link is positioned as described in b. above.

e. Number of revolutions of the chain drum to take up [11.6 m] [38 feet-0 inch] of chain. Provide chain tension (approximately 9 kN 2000 lbs) during the wrapping and measurement to keep it wound tightly on the drum. Measure from W.P. beginning of groove as indicated.

f. Verify chain feeds smoothly onto drum.

g. Clearance between adjacent wraps of chain.

h. Clearance from the chain anchor to the adjacent wrap of chain.

i. Minimum shoulder distance from edge of groove to point where chain link bears on chain drum when chain is displaced to one side of the groove.

k. Maximum "off centeredness" of horizontally oriented links. (to nearest 6 mm 1/4 inch) the distance from the center of the link point where it bears on the drum. Link must be at least 2 links into the wrap from where the chain leaves the drum.

2.22 WIRE ROPE AND END TERMINATIONS

Comply with Section 35 01 70.13 WIRE ROPE FOR GATE OPERATING DEVICES for the hoisting wire rope and end terminations.

2.23 SHEAVES

Provide sheaves of heavy duty [cast], [forged], [rolled][, or ][welded] steel construction[ that are a standard product design regularly offered by a sheave manufacturing company].[ The sheave manufacturer must have been regularly engaged in the production of wire rope sheaves and have a minimum of 5 years experience producing sheaves of similar size to those specified.] Provide sheave of a through shaft design and assemble with new bearings onto the shaft as indicated. Fit the interference fit between the sheave(s) and bearings in accordance with the bearing manufacturer's recommendations to prevent slipping between the components. Dimensions the sheaves and material for sheaves as indicated. Accurately machine sheave grooves for the wire rope diameter provided, smoothly finished, and free of surface defects. Flame harden the groove contact area to a minimum [50] Rockwell C for a depth of [1.5] mm [0.060] inch minimum with a minimum contact arc of 150 degrees. Design sheave(s) for a minimum radial design load of [2292] kN [515.2] KIPS. Provide sheaves with [roller] [bronze] bearings as indicated. [If casting is the fabrication method, produce casting pattern for the wire rope sheave that becomes the property of the Government upon completion of the
contract. If heavy duty fabricated steel weldment is selected as the fabrication method, provide all engineering and design of the sheaves to satisfy the requirements specified herein and submit calculations and shop drawings.]

**************************************************************************
NOTE: For sheaves to be designed by the Contractor the designer may select the following paragraph.
**************************************************************************

[ Conform Contractor designed sheaves to the requirements of EM 1110-2-2610 unless otherwise specified herein. Design the sheaves for the normal operating conditions with sufficient safety factors so that the maximum unit stresses do not exceed 75 percent of the yield points of the materials of construction based on the maximum hoisted load. Engineer, design, fabricate, and assemble the sheave units. Design the sheave assembly in accordance with the Crane Manufacturers Association of America (CMAA) standards and in accordance with ANSI standards and OSHA'S interpretation of their regulations for drums/sheaves for mill type cranes. Prepare and submit all required calculations and shop drawings for the design and fabrication of the hoisting sheave assembly to the Contracting Officer for approval prior to the start of shop fabrication.]

2.24 PAINTING

**************************************************************************
NOTE: Consult with the manufacturer if considering painting the interior of any enclosures such as gearboxes, cabinets, etc. to select the most appropriate paint coating system for the environment.
**************************************************************************

Paint all exposed ferrous surfaces in accordance with Section 09 90 00 PAINTS AND COATINGS[ or as noted]. Paint equipment and components not otherwise specified by Section 09 90 00 PAINTS AND COATINGS with the manufacturer's standard coating system. Standards coatings must be compatible with the lubrication and environmental conditions specified or recommended. Touch up all damaged painted surfaces after installation. Paint must at a minimum provide for zinc chromate primer, 2 coats of varnish, and gray enamel to result in a minimum dry film thickness of [0.062] mm [2.5] mils. Painting of nonferrous metals and corrosion resisting steel will not be required unless otherwise specified.

2.25 SHOP ASSEMBLY AND TESTS

**************************************************************************
NOTE: Shop tests are necessary to ensure proper assembly.
**************************************************************************

2.25.1 General

a. Each machinery unit consisting of the [motor,] [brake,] [reducer,] [wire rope drums,] [wire rope,] [chain,] [couplings,] [and bearings] must be completely assembled [on its structural steel base (machinery base as indicated)] [with its respective mating component] in the shop and tested [without the [sector] [bull] gear and pinion assembly,] in the presence the Contracting Officer.[ The [sector] [bull] gear, pinions, shaft, and bearings must be completely assembled, shimmed, and
aligned in the shop on the pinion support base.] Notify the Contracting Officer at least [10] [_____] calendar days before testing of each machinery unit. This notification includes information on how many units will be tested and the estimated time frame involved with each test.

b. The witnessing of a particular test may be waived by the Contracting Officer; however, the approved commissioning shop test procedures, notification, and documentation must still be performed as required by these specifications. Once informed that Government personnel will witness the test(s), notify the Contracting Officer that a particular test is scheduled as planned a minimum of 48 hours prior to the test(s). Perform all necessary preparations and preliminary testing prior to issuing the 48 hour notification.

c. Commence testing upon the arrival of Government personnel at the scheduled location and time. Design and furnish a test rig and facilities (within the continental United States) suitable for performing the tests. Submit details of the test rig and its location. Address in the submittal aspects including adequacy of rig strength, including, but not limited to, foundations; access to the test rig; availability of suitable power and cranes; how the work will be protected; how the test measurements will be made; and how test results can be verified. Clean all bearing surfaces and lubrication lines and lubricate reducer bearings, couplings, and gears before tests are begun. Fill all speed reducers with the specified lubricating oil; transfer of lubricating oil from one unit to another is not allowed. Electrically connect and operate the motors, brakes, and controls at rated voltage. Test and ship the [motor,] [speed reducer,] [and brake machinery] components to the job-site fully assembled on the structural steel base (machinery base as indicated).

d. [The [sector] [bull] gear and pinion assembly must be properly match marked and disassembled prior to shipment. ]Machinery that is not tested or arrives on site without the machinery base installed will be rejected. Reimburse the Government for all travel, lodging and per diem costs incurred for any Government witness tests that fail to meet the contract specifications or performance requirements and result in the factory testing being terminated, postponed or rescheduled to correct the deficiencies.

2.25.2 Alignment

Conform alignment of interconnecting shafts to the installation requirements of the coupling and gear manufacturers in accordance with standard AGMA practices. Accurately align each machinery or structural unit by the use of stainless steel shims or other approved methods so that no binding in any moving parts or distortion of any member occurs before it is fastened in place. The alignment of all parts with respect to each other must be true within the respective manufacturer's tolerances required. Set machines true to the elevations indicated.

2.25.3 Anti-Seize Lubricant

Assemble threaded portions of the assemblies using an anti-seize lubricant that prevents galling of parts and corrosion, allows for easy disassembly of parts, and reduces friction unless otherwise noted or specified. Anti-seize lubricant must be a standard product designed for the intended use.
2.25.4 Acceptance

All readings taken from the equipment, components or assemblies are required to be within the specified limits. Failure of any part to meet these contract requirements is cause for rejection of the entire quantity until action is taken to correct defects and prevent recurrence and such actions have been approved by the Contracting Officer. Retesting is subject to the same random sampling and testing procedures as the original lots.

2.25.5 Gages

Make gages available to the Government at the fabrication site for use in checking critical dimensions. Gages are steel tape, vernier, micrometer, Gar S22 Surface Finish Comparator, etc.

PART 3 EXECUTION

3.1 STRUCTURAL FABRICATION

3.1.1 General

Fabricate components and assemblies in compliance with the requirements of Section 05 50 15, CIVIL WORKS FABRICATIONS unless otherwise specified herein. Where specification requirements are similarly covered in both sections the specification section, apply the more stringent requirements.

3.1.2 Material

Material must be straight before being laid off or worked. If straightening is necessary, straighten by methods that do not impair or alter the metal. Sharp kinks, bends, or overcuts of material are cause for rejection of the material. Material with welds will not be accepted except where welding is specified, indicated, or otherwise approved. Flame cutting of material is not allowed. Shearing must be accurately done and all portions of the work neatly finished. Corners must be square and true unless otherwise indicated.

3.1.3 Dimensional Tolerances for Structural Work

The overall dimensions of an assembled structural unit must be within the tolerances indicated on the drawings or as specified for the item of work. Where tolerances are not specified in other sections of these specifications or shown, a variation of 0.8 mm 1/32 inch is permissible in the overall length of component members with both ends milled and component members without milled ends must not deviate from the dimensions shown by not more than 1.6 mm 1/16 inch for members 9 m 30 feet or less in length and by not more than 3 mm 1/8 inch for members over 9 m 30 feet in length.

3.2 MACHINE WORK

3.2.1 Finished Surfaces

a. Surface finishes indicated or specified herein, must be in accordance with ASME B46.1. Determine compliance with specified surface by sense of feel and by visual inspection of the work compared to Roughness Comparison Specimens in accordance with the provisions of ASME B46.1. Values of roughness width and waviness height are not specified but
must be consistent with the general type of finish specified by roughness height. Flaws such as scratches, ridges, holes, peaks, cracks, or checks which will make the part unsuitable for the intended use are cause for rejection.

b. Where the finish is not indicated or specified, the type of finish is that which is most suitable for the particular surface and provides the class of fit required. Maximum surface roughness of any surface is 3.175 µm 250 micro-inch. Indicate surfaces to be machine finished by symbols which conform to ASME B46.1.

3.2.2 Unfinished Surfaces

In so far as practicable, lay out all work to secure proper matching of adjoining unfinished surfaces. Where there is a large discrepancy between adjoining unfinished surfaces, chip and grind smooth or machine to secure proper alignment. Unfinished surfaces must be true to the lines and dimensions indicated and must be chipped or ground free of all projections and rough spots. Fill depressions or holes not affecting the strength or usefulness of the parts in a manner approved by the Contracting Officer.

3.2.3 Pin Holes

Pin holes must be bored true to gages, smooth, straight, and at right angles to the axis of the member. Perform the boring after the member is securely fastened in position.

3.3 FIELD QUALITY ASSURANCE

Perform all specified quality control inspections and tests. Implement and maintain an inspection log to include copies of all descriptive data for all specified inspections and tests. Make the inspection log available immediately to the Government's inspector upon request. Submit a complete copy of the inspection log to the Government at the end of specified inspections and tests. The Government reserves the right to witness any and all specified quality control (QC) procedures. Provide the Government with one-week advance notice of QC procedure scheduling to allow time for witness coordination. Fully test replacements for all rejected parts as specified herein for the original lots.

3.4 NONDESTRUCTIVE EXAMINATION

3.4.1 NDT Agency Requirements

Conduct NDT examinations [using a testing agency adequately equipped and competent to perform such services][or][using suitable equipment and qualified personnel]. [In either case, provide][Provide] written approval of the examination procedures and perform the examination tests in the presence of the Contracting Officer. Persons performing the NDT examination must be qualified for the specific procedure used in accordance with ASNT SNT-TC-1A. Submit nondestructive examination certification of qualified persons, procedures and equipment performing or used for nondestructive testing.

3.4.2 Nondestructive Testing (NDT) for Flaws

For all components to be furnished ultrasonically scan a quantity representing approximately 5 percent of the total supplied quantity for internal defects as specified. Select components, specified below, require
(100 percent) of the quantities furnished to be NDT examined to satisfy the specific requirements herein. The minimum quantities and requirements for testing are shown in TABLE 2, below. Lots from which examined specimen parts are selected must consist of at least 25 percent of the total quantity of each type part to be furnished. A lot is the completed components of a given type available at the inspection site. The Contracting Officer will select parts to be examined at random. Notify the Government one week prior to when the lots are available for specimen selection. Flawed specimens (excessive inclusion size, out-of-tolerance dimension or hardness, or excessive surface roughness) are subject to rejection.

3.4.3 Quality Assurance Measurements

Conduct inspections to supplement the Quality Control NDT in the presence of the Contracting Officer. This testing is to verify that dimensions, hardness and finish are within required tolerances. Perform this testing of the chain components at the fabrication site.

Quantities subject to this testing are specified in Table 2. Parts to be examined will be selected at random by the Contracting Officer. Lots from which inspected parts are selected consist of at least 25 percent of the total quantity of each type part to be furnished. A lot is the completed components of a given type available at the inspection site. Notify the Government one week prior to when the lots are available for specimen selection and inspection. More than one testing date may be required.

TABLE 2 Notes:

a. OD = Outside Diameter, ID = Inside Diameter, BHN = Brinell Hardness Number, FINISH = Surface Finish, UST = Ultrasonic Scan Test

b. Take two measurements per parameter per specimen.

c. Test specimen quantities shown are at least 5 percent of the total quantity furnished.

d. Measure inside diameters of both bores and take one measurement per bore. Measure pitch tolerance derived from sidebar inside diameter.
edge to edge measurements. Take two hardness readings per specimen. Take two width measurements per specimen.

e. Measure inside and outside diameter of each selected Bearing (three measurements per bore and three measurements per OD).

3.4.4 Pintle Component Nondestructive Testing Examination

All Pintle bushings, balls and fabricated pintle components must have ANSI/ASNT CP-189, ASNT SNT-TC-1A, AIA/NAS NAS410 qualified personnel perform radiographic NDT testing in accordance with the guidelines, practices and applicable testing standards set forth in ASTM E94/E94M, ASTM E1742/E1742M, ASTM E1030/E1030M, and ASTM E1032. Also test the pintle components by magnetic particle NDT methods in accordance with supplementary requirement S3.1 of ASTM A290/A290M. Other NDT methods are subject to Government approval. Radiographic acceptance criteria for [welds][castings] satisfies the minimum severity level requirements for a Grade I condition as defined by ASTM E1955.

**************************************************************************
NOTE: In some situations where castings are specified severity level requirements in accordance with reference radiographs as outlined by ASTM E390 may not be appropriate for defining acceptance criteria. In those situations the designer may consider the use of the following paragraph.
**************************************************************************

Any cracks found are unacceptable and reason for immediate rejection. Evaluate all relevant indications greater than 1.5 mm 1/16 inch in length present on radiographic films against the specified acceptance criteria. Where the length of each indication (li) within an area of interest and along a continuous straight line oriented in the direction of interest are measured. If the distance between two indications is smaller in length than the length of the smaller indication then both indications must be added and treated as a single indication to include the distance of both indications as well as the distance between the indications. The total indication length is obtained as the sum of all indication lengths on a straight line within the area of interest. The maximum total indication length (lim) on any such single straight line is used to assess acceptance of the casting being evaluated.]

**************************************************************************
NOTE: The designer should specify a feature length (Lf) and the maximum indication fraction limit acceptance level, where Level I F=0.1, Level II F=0.2, Level III F=0.3, Level IV F=0.4, Level V F=0.5.
**************************************************************************

This maximum total indication length (lim) is divided by the feature length (Lf), where (Lf) equals [_____] mm inches, to calculate the indication fraction F (F = lim / Lf). The value of indication fraction F must be acceptable for values less than a [Level I F=0.1][_____].[ Provide [7][_____] day advance notice of the NDT testing and perform all testing in the presence of the Contracting Officer.][ If testing and certification is not performed in the presence of the Contracting Officer, the Government reserves the right to perform independent quality verification and the acceptable total indication length (lim) for the acceptable indication

SECTION 35 01 41.00 10 Page 52
fraction Level will be increased by 1.5 mm 1/16 inch for the calculation to account for reproducibility in the evaluation.[ The manufacturer must certify in writing that the inspection was performed in accordance with the requirements specified and found to meet or exceed the requirements of the specified inspection level.]

3.4.5  Gear Nondestructive Testing Examination

Perform magnetic particle and liquid dye penetrant examination after fabrication of all gears. Conduct the testing in accordance with the requirements set forth in ASTM E709 and ASTM E165/E165M, respectively. Gears found to have unacceptable relevant indications are cause for rejection of the gear component.

3.4.5.1  Gear Teeth (Magnetic Particle or Dye Penetrant)

The gear teeth are defined as [all material] [beyond a radius of [_____] mm [_____] feet [_____] inches]. Only indications with major dimensions greater than 1.5 mm 1/16-inch are considered relevant. The following relevant indications are unacceptable:

a. Any linear indications greater than [4.8][_____] mm [3/16][_____] -inch
   (a linear indication is defined as having length three times its width)

b. Rounded indications with dimensions greater than [4.8][_____] mm [3/16][_____] -inch

c. Four or more relevant indications in a line separated by [1.5][_____] mm [1/16][_____] -inch or less, edge to edge

3.4.5.2  Gear Spokes and Hub (Dye Penetrant)

The gear spokes and hub are defined as all material inside a radius of [_____] mm inches. Only indications with major dimensions greater than [6][_____] mm [1/4][_____] -inch are considered relevant. The following relevant indications are unacceptable:

a. Any linear indications greater than [13][_____] mm [1/2][_____] -inch
   (a linear indication is defined as having length three times its width)

b. Rounded indications with dimensions greater than [6][_____] mm [1/4][_____] -inch

c. Four or more relevant indications in a line separated by [3][_____] mm [1/8][_____] -inch or less, edge to edge

3.4.5.2  Gear Spokes and Hub (Dye Penetrant)

The gear spokes and hub are defined as all material inside a radius of [_____] mm inches. Only indications with major dimensions greater than [6][_____] mm [1/4][_____] -inch are considered relevant. The following relevant indications are unacceptable:

a. Any linear indications greater than [13][_____] mm [1/2][_____] -inch
   (a linear indication is defined as having length three times its width)

b. Rounded indications with dimensions greater than [6][_____] mm [1/4][_____] -inch

c. Four or more relevant indications in a line separated by [3][_____] mm [1/8][_____] -inch or less, edge to edge

   a. Any linear indications greater than [4.8][_____] mm [3/16][_____] -inch
      (a linear indication is defined as having length three times its width)

   b. Rounded indications with dimensions greater than [4.8][_____] mm [3/16][_____] -inch

   c. Four or more relevant indications in a line separated by [1.5][_____] mm [1/16][_____] -inch or less, edge to edge

   d. Ten or more relevant indications in any 3870 square mm 6 square inches of surface with the major dimension of this area not to exceed 150 mm 6 inches when taken in the most unfavorable orientation relative to the indications being evaluated
3.4.6 Pocket Wheel Nondestructive Testing Examination

3.4.6.1 Ultrasonic Examination

Perform ultrasonic examination of all pocket wheels in accordance with supplementary requirement [S3.2 of ASTM A290/A290M] [____], after preliminary machining of plain surfaces of the ring prior to heat treatment. In the straight-beam method of examination, use the back-reflection method of tuning in accordance with [ASTM A388/A388M] [____]. In addition to the reportable conditions of ASTM A388/A388M [____], record indications exceeding the resultant back-reflection. Unless all injurious defects are to be completely removed by final machining, a forging is unacceptable when one or more reflections are present producing indications accompanied by a complete loss of back-reflection, not attributable to nor associated with the geometric configuration. For this purpose, a back-reflection of less than 5 percent of full screen height is considered complete loss of back-reflection. In the angle-beam method of examination, cut calibration notches into the inside diameter and outside diameter surfaces in accordance with ASTM A388/A388M [____]. A forging that contains a discontinuity which results in an indication exceeding the amplitude of the reference line is subject to rejection. Report of the ultrasonic test in compliance with ASTM A388/A388M [____]. Additional non-destructive examination or trepanning may be employed to resolve questions of interpretation of ultrasonic indications.

3.4.6.2 Magnetic Particle Examination

Provide test reports for non-destructive tests performed on the gears, pocket wheels, hoisting chains, repair links and all fabricated welded components.

Perform magnetic particle examination on all pocket wheels in accordance with supplementary requirement [S3.1 of ASTM A290/A290M] [____], after heat treatment and after the chain pocket recesses are fully contoured, but not necessarily finally machined. Only indications with major dimensions greater than 1.5 mm 1/16-inch are considered relevant. The following relevant indications are unacceptable:

a. Any linear indications greater than [5] [____] mm [3/16] [____]-inch (a linear indication is defined as having length three times its width)

c. Four or more relevant indications in a line separated by [1.5] [____] mm [1/16] [____]-inch or less, edge to edge

d. Ten or more relevant indications in any 3870 square mm 6 square inches of surface with the major dimension of this area not to exceed 150 mm 6 inches when taken in the most unfavorable orientation relative to the indications being evaluated

3.4.7 Hoisting Drum Nondestructive Testing Examination

Perform nondestructive testing on all chain and wire rope hoisting drums. After stress relief, test the surfaces of all completed welds including adjacent heat-affected zones and face of drum grooves/sockets using a liquid dye penetrant method for the presence of flaws. Alternate methods
of non-destructive testing which would be equal to or more effective than
the liquid dye penetrant method may be used if approved by the Contracting
Officer.

3.4.8 Engineered Chain Nondestructive Testing Examination

3.4.8.1 Sidebar Tests

Test sidebars in the machined and hardened state. Ultrasonically examine
sidebars in accordance with ASTM A578/A578M and ASTM E114. Specimens with
inclusion (defect) size greater than 5 mm 0.20 inch in any direction are
unacceptable.

3.4.8.2 Pin Tests

Test pins in the machined and hardened state. Tested pins must have ends
finished to 3 µm 125 micro-inches or smoother to allow axial direction
ultrasound scans. Ultrasonically examine pins in accordance with
ASTM A578/A578M and ASTM E114. Specimens with inclusion (defect) size
greater than 5 mm 0.20 inch in any direction are unacceptable.

3.5 GEAR CERTIFICATION

Prepare certified profile (involute) charts and certified tooth alignment
(lead) charts for all gears fabricated to meet the American Gear
Manufacturer's Association AGMA gear quality as specified for each gear to
be fabricated. Satisfy a minimum contact ratio of 1.5 or higher. These
charts must be accurate to within +/-0.0125 mm 0.0005 inches and drawn
directly by metrology methods and the use of a calibrated probe coordinate
measuring machine that meets the requirements of ISO 10360-2. Submit these
charts for both faces of all driven gear and drive pinion gear teeth
arrangements. The tooth alignment charts must span the entire face width
of the tooth at the pitch line and indicate the tooth centerline. The
profile charts must indicate the theoretical involute line and span from
base circle to tooth tip at the tooth centerline. Label scales on all
charts. Charts must be traceable to the specific teeth from which they are
measured.

3.6 CHAIN CERTIFICATION

The finished length of chains and assemblies must not vary more than a
[6][_____] mm [1/4][_____] -inch from the length of its respective mate. Measure length with the chains under a nominal load to eliminate slack
between links. Chains must be straight and aligned when under load without
visible twists, kinks, bends or runout. Attach a taut string line at each
end of the chain under nominal load to visually inspect for straightness.
The string line must not deviate away from the chain surface by more than
[13][_____] mm [1/2][_____] inch at any point along the entire length of
chain. Match and match mark chains in pairs with an indelible dye. In
addition, match mark chain pins and link bars with metal stamped
alpha-numeric characters.

3.7 HOISTING DRUM AND SHEAVE CERTIFICATION

All wire rope hoisting drums and sheaves must have the grooves verified for
size and contour with a groove gage (nominal size plus full oversize
percentage). The grooves must meet the contact area and groove dimension
limitations established within the Wire Rope Users Guide. All wire rope
grooves and running surfaces must be unpainted.
Multi-drum assemblies that are connected to the same driven machinery must have drum geometry for synchronous drums certified by metrology methods and the use of a calibrated probe coordinate measuring machine that meets the requirements of ISO 10360-2. Certify the dimensional data for each drum and submit the results. Multi-drum assemblies that are connected to the same driven machinery must be shop tested and measured to demonstrate the ability to reeve equal lengths of wire rope on each commonly driven wire rope drum. The testing measurements must be by direct measurement of wire rope length and wire rope tension when an interconnected tension load is applied to the wire ropes and drums. Continuously monitor the tension in each wire rope during the testing. Wind drums with sufficient length of pre-stretched wire rope to fill all drum grooves or a single layer of wire rope wound on grooveless drums. The drums are considered synchronous and equal when the tension in each wire rope does not deviate more than [5][_____] percent from the initial wire rope tension measured at the initiation of the testing.

3.8 HOISTING MACHINERY AND DRUM SHOP LOAD TEST

The test procedure applies to all units and include raising and lowering a [_____] kg pound test load ([_____] kg pounds on each drum) vertically through a distance of [_____] mm feet. Suspend the load from the actual service hoisting wire ropes. The wire rope drums must make [_____] revolutions to raise and the same to lower the load, done three times in succession at high and low speeds without significant interruption. Inspect the wire rope drums to ensure proper reeving of the wire rope. Demonstrate the brakes to hold the test load statically and upon receiving a stop travel command in each direction of travel. Any brake hand release specified must have its operation demonstrated by gradually allowing the suspended load to begin movement and catching the load upon release of the handle. Submit shop test information to include the proposed shop test procedures, test rig details, final shop test procedures, and test result data sheets.

3.9 POCKET WHEEL [SPROCKET] SHOP LOAD TEST

[ a. Submit shop test information to include the proposed shop test procedures, test rig details, final shop test procedures, and test result data sheets. Conduct a load test for each complete [tainter][_____] gate assembly of [two][_____] pocket wheels [sprockets], [four][_____] chains, gate connection assemblies, sprocket shaft gears, shafts, chain guards, and bearings, prior to installation of any hoist on the [service bridge][_____] Prior to any load tests being performed all submittals for materials and components must have been approved by the Contracting Officer. Perform the assembly and load test. The load test will be witnessed by the Contracting Officer, unless otherwise waived. Provide [7][_____] working days notice before the testing. Design and furnish a test rig and facilities suitable for performing the assembly and testing. Submit Shop Load Test Rig and Location details of the Contractor designed test rig and its location for shop load test evaluation. The evaluation will address aspects including adequacy of rig strength including, but not limited to, foundations; access to the test rig; availability of suitable cranes; how the work will be protected, how the test measurements will be made, and how test results, including test load, can be verified.]

[ a][b]. The load test consists of raising and lowering a test load...
vertically through a distance of \[3\] m \[10\] feet using the actual equipment furnished for this contract. The test rig must, as a minimum, incorporate the use of the pocket wheel, shaft, chain, and gate connection assemblies. Alternate configurations of the test rig that simulates raising and lowering of the test load will be considered. Load one end of the chain and leave one end slack. Ensure that the chain extending from the test load passes over the top of the pocket wheel in the same direction as in the final installation. The total test load on \[four\] chains must be \[965\] kN \[217,000\] pounds. Connect the load to the actual hoisting chains of the hoist that will be installed in the field. During the test, the pocket wheels must make \[1.5\] revolutions to raise and the same to lower the test load, done \[three\] times in succession without significant interruption. The chain must enter, ride in, and exit the pocket wheel without binding or slipping.

[b][c]. Prior to any operation of the assembly, inspect for proper orientation and straight alignment. Prior to disassembly, match marking mating parts of the hoist in accordance with a system of numbering approved by the Contracting Officer.

3.10 WELDING

Unless otherwise specified, conform welding to the provisions of AWS D1.1/D1.1M, Sections 1 through 8 and Section 10. Welders and welding operators must pass the qualification tests as prescribed by AWS D1.1/D1.1M, Section 5 before being assigned to production work. Submit certifications showing qualification of welders and welding operators prior to commencing fabrication.

3.11 MISCELLANEOUS PROVISIONS

3.11.1 Cleaning of Corrosion-Resisting Steel

After fabrication, remove oil, paint, and other foreign substances from corrosion-resisting steel surfaces. Clean by vapor degreasing or by the use of cleaners of the alkaline, emulsion, or solvent type. After the surfaces have been cleaned, final rinse with clean water followed by a 24 hour period during which the surfaces are intermittently wet with clean water and then allowed to dry for the purpose of inspecting the clean surfaces. Visually inspect the surfaces for evidence of paint, oil, grease, welding slag, heat treatment scale, iron rust, or other forms of contamination. If evidence of foreign substance exists, clean the surface in accordance with the applicable provisions of ASTM A380/A380M. Submit the proposed method of treatment. After treatment visually reinspect the surfaces. Brushes used to remove foreign substances must have only stainless steel or nonmetallic bristles. Remove any contamination occurring subsequent to the initial cleaning by one or more of the methods indicated above.

3.11.2 Protection of Finished Work

Submit an equipment protection plan with detailed information on the method [s] proposed to protect the existing equipment from such operations as power washing, abrasive blast cleaning, welding, placement of concrete, and painting. Thoroughly clean machined surfaces of foreign matter. Protect all finished surfaces by suitable means. Unassembled pins and bolts must be oiled and wrapped with moisture-resistant paper or protected by other approved means.
3.11.3 Lubrication

Lubricate all the components of the equipment requiring lubrication using only the lubricants [specified] [which have been provided by the Government]. Provide and lubricate the components and assemblies, in their entirety, after assembly with a [food grade][_____] lubricant which meets the following minimum characteristics:

<table>
<thead>
<tr>
<th>ISO Grade</th>
<th>Four Ball Wear Test (ASTM D4172)</th>
<th>Falex EP (ASTM D3233)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.39 mm</td>
<td>100 pounds force</td>
</tr>
</tbody>
</table>

3.12 FIELD ERECTION AND TESTS

3.12.1 General

Perform field erection and field tests. Install the machinery under supervision of the erecting engineer under the provisions of paragraph ERECTING ENGINEER. Submit the installation and alignment procedure and install in with the approved procedure. In the submittal provide detailed [manufacturer's] [Contractor developed] instructions concerning the installation and alignment procedures for the equipment to be furnished. Items include [gear reducers,] [bearings,] [shafts,] [brakes,] [motors,] [couplings,] [pocket wheels,] [sprockets,] [hoisting chains,] [_____] and [limit switches]. The procedure must include consideration of all the other work that is obligated to be performed at the site [Lock] [and] [Dam]; and also the operating regime for the [Lock] [and ] [Dam] gates which the Government will enforce, as described and specified in the SPECIAL CLAUSES. Base the procedure on a proper sequence of construction that will complete the work with safety, efficiency, and in full accordance with these specifications. Submit for approval any Gate Support Method to be used. Include detailed information on the method proposed to support the [tainter] gate during the work delineated in this section. The support method, engineering computations, and support drawings must be designed and certified by a licensed professional engineer.

3.12.2 General Test Procedure

Submit the commissioning, pre-functional and functional checklist test procedures, with a blank test results data sheet for each, prior to the commencement of any tests. Complete all Pre-Functional checklists prior to performing Functional operational tests. The testing must comply with the requirements herein and as specified below. The test procedure must consist of operating the units with no load at high speed in both directions for [15][_____] minutes and at low speed in both directions for [10][_____] minutes. [VFD controlled equipment must be ramped in speed from low to high and high to low for normal operation sequencing.] Inspect each piece of equipment for smooth operation and proper alignment and check all necessary clearances to ensure vibration, binding, or excessive heat does not occur in any moving part. During the test, provide readings of motor current, RPM, voltage, and bearing temperature. Stop the test immediately if there is any undue noise, vibration, or heat developed in any of the equipment. After correction of alignment and/or all other causes for the interruption of the test, reinspect the unit and resume.
testing when permitted by the Contracting Officer. Submit final operating test results for each unit.

3.12.3 Crane Availability

The Government's existing cranes will not be available for use in installation of the machinery.

3.12.4 Schedule

Schedule and coordinate operations with the Contracting Officer for the Government's installation and removal of the bulkheads for the [tainter] gates.

3.12.5 Wire Rope Tensioning

Submit the [Field Tensioning and] Operating Test Procedure, with a blank test results data sheet, prior to the commencement of any field tests. Shim and level each [sector and pinion] support base prior to final grouting with attention given to maintaining the elevations indicated. Submit details for the measuring tension procedure used to measure wire rope, [chain] tension during installation. Base the wire rope field tensioning procedure on the following steps. Upon connection of the wire rope to the [valves] gates, equalize the tension in the cables by the use of a hydraulic power pack or hydraulic ram to apply an equal horizontal force (perpendicular to the cable axis) on each cable and measuring the cable deflections at the point of force application. Apply the forces to the cables at a common elevation when the cables are under load. Make adjustments to the cables (to equalize cable tensions) at the [valve drum][adjustable cable connection][______]. Equal tensioning will be considered achieved when the deflections of the [two][______] cables are within 5 percent of each other. Measured deflections must be greater than 63 mm 2-1/2 inches at the time they are considered equal. After final tensioning, the [cable end socket][adjustable connection] must be [welded][mechanically secured] to the drum as indicated. After the units have been installed [and the field tensioning tests are complete], operate each complete [gate] [and valve] unit [______] cycles, as indicated, to demonstrate to the satisfaction of the Contracting Officer that the requirements of the specifications have been met and that the performance of the equipment is satisfactory for the purpose intended. During the test, provide readings of motor RPM, current, and voltage to the Contracting Officer as data to enable estimation of the motor kW horsepower developed. Submit final [field tensioning and] operating test results for each unit.

3.12.6 Round Link Chain Tensioning

Submit proposed operating test procedures, final field operating test procedures, data sheets, and the procedure for measuring the chain tensions. Install hoisting chains such to obtain equal tension in the chains when hoisting the gate. With proper precaution observed to restrain uncontrolled movement of the chains, the cross shaft couplings may be disengaged and rotated to perform gross chain tension adjustment. Use the gate connection and turnbuckle for final adjustment. The installation procedure must define the method to be used. Measure chain tensions using a linear dynamometer, strain gauge with instrumentation, or other approved direct load indicating device. Perform chain tensioning with the gate raised above the sill. Each chain assembly at each [pocket wheel] [sprocket] must be tensioned within 5 percent of the mean tension for that
Limit Switch and Position Indication Settings

Immediately prior to commencement of work on each gate, record the gate position settings. Submit the Gate Position Settings on Limit Switches. Refer to the [pre-recorded] limit switch and position indication requirements as specified [in paragraphs above] [Section 35 20 20 ELECTRICAL EQUIPMENT FOR GATE HOIST]. Following a thorough check of alignment, clearances, and readiness to operate, operate the machinery with due care to set the travel limits and confirm control or monitoring functions. The settings of the limit switch and control points must conform to the indicated requirements.

Open Spur Gear Alignment

Install spur gears, shafts and bearings to meet the specified backlash and gear tooth contact area requirements. Measure the gear backlash in unloaded conditions with one of the mating gears secured and the other gear manually rotated to obtain the backlash measurements. Use dial indicators to collect backlash measurements. Align the gears to achieve a backlash of between 0.63 to 0.89 mm 0.025 and 0.035 inch. Check alignment of mating gear sets in both the unloaded and at rated load conditions. Check four teeth at 90 degree intervals on each gear set for each condition. The gears are considered aligned when there is a minimum of at least 75 percent tooth contact across the pinion or driven gear tooth face, whichever is larger, at rated load. The contact pattern is considered the area indicating a consistent length and depth of the tooth pattern (i.e. a rectangle). Edge loaded patterns or irregular and discontinuous patterns are not acceptable. Submit the calculations of the percentage of tooth contact patterns for each condition. Record unloaded contact patterns using a tooth marking grease or compound and transfer to contact tape. Overlay the contact tape with the lifted contact pattern onto paper with the entire gear tooth profile shown. Measure loaded condition contact patterns using machinist’s layout lacquer similar to (DYKEM) or some other similar use “bluing” dye to verify alignment requirements are met. Submit a Final Alignment Test Report which includes the results of the backlash measurements and the tooth contact patterns with calculations of the tooth contact percentages. Clean the driven gear and pinion and coat with [a dry film][the specified] lubricant after alignment and prior to any operational testing of the equipment. [The dry film lubricant must be [Sprayon S000201][_____] heavy duty open gear and wire rope lubricant or similar product.] After performing successful initial no load gear alignment and prior to full load operational testing, secure the bearing supports with [tapered alignment pins] [fitted bolts] [bearing chocks] [shear blocks]. Verify band check final fastener torques before exposed metal surfaces are coated as required by the contract.

ERECTING ENGINEER

Furnish the services of one or more competent erecting engineers from the equipment manufacturer/fabricator to supervise and direct the erection and installation of this equipment.

a. The erecting engineer(s) must be present for all shop erection,
inspections, tests, installation and operation of all equipment at the project site.

b. The erecting engineer has responsibility for the equipment meeting all the requirements of these specifications and fulfilling all the Contractor's guarantees.

c. The erecting engineer must verify the fit and alignment of mating components prior to erecting in the field and be present during final connection and all commissioning and field testing for contract compliance. The erecting engineer must keep records of all measurements taken during installation and testing.

d. Upon completion of the installation, commissioning and startup for each specified major equipment or subassemblies, each erecting engineer must submit a erecting engineer installation and operation certification approving the installation and operation of the equipment.

3.14 FIELD TRAINING

Provide field training conducted by the erecting engineer for operating staff after each system is functionally complete but prior to final acceptance. The training must be given for a period of not less than [8] hours. The training must cover all pieces of equipment and include items contained in the operation and maintenance manuals. Do not conduct training until operation and maintenance manuals have been approved. Provide a one week advance notice of the scheduled training date to the Government. Digitally record all training conducted and provide two DVD copies of the training to the Government. The recording must be compatible with common DVD players in the United States.

3.15 STARTUP AND ACCEPTANCE TEST

Submit the pre-functional checklist for approval that includes checks, recordings, measurements and verifications to be performed prior to startup. Signature by all parties is required for acceptance. Following the completion of installation, checkout, adjustment, and setting the limit switches, controls, interlocks, perform a startup and acceptance test on each machinery unit. Perform the startup and acceptance test in accordance with the approved commissioning functional checklist, record and submit the results on test result forms of the procedure. Signature by all parties is required for acceptance. Include a demonstration of proper functioning of the limit switches, controls, interlocks in the acceptance test. For acceptance, the machinery unit(s) must be successfully operated through a minimum of three complete cycles to satisfy the Contracting Officer that the requirements of the contract have been met and that the performance of the equipment is satisfactory for the purpose intended.

Upon successful completion of the field tests, the [miter gate] [and] [tainter valve] machinery, accessory items and equipment will be examined by the Contracting Officer, Erecting Engineer, Contractor, Project Personnel, and if found to comply with the contract it will be accepted by signature of all parties in a prepared commissioning document. Signatures and Acceptance will not occur until all found deficiencies have been corrected. submit copies of the signed commissioning document to the Contracting Officer.
3.16 **Equipment Warranty**

Submit manufacturer's standard warranty or guarantee for equipment, e.g., speed reducers, or any other equipment. Identify any warranties that extend beyond a 1-year period.

3.17 **OPERATIONS AND MAINTENANCE DATA**

******************************************************************************

NOTE: Collective O&M Manuals are usually compiled from the individual O&M manuals for each piece of equipment. Incorporate UFGS 01 78 23 OPERATION AND MAINTENANCE DATA into the specifications when comprehensive and outlined data packages are to be furnished to the customer. Use the first bracketed paragraph if UFGS 01 78 23 OPERATION AND MAINTENANCE DATA is included in the specifications.

******************************************************************************

[For specifications on the furnishing, installation, operations and maintenance instructions, refer to Section 01 78 23 OPERATION AND MAINTENANCE DATA. Unless otherwise specified, all operation and maintenance manuals must be comprehensive to the electro-mechanical operating system with independent sections for each unique piece of equipment. Operation and Maintenance manuals are to comply with the requirements of Data Package 3 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.]

Unless otherwise specified, all operation and maintenance manuals must be comprehensive to the electro-mechanical operating system with independent sections for each unique piece of equipment. Include six copies of the following bound information.

a. Safety precautions
b. Operator prestart
c. Startup, shutdown, and post-shutdown procedures
d. Normal operations
e. Emergency operations
f. Environmental conditions
g. Lubrication data
h. Preventive maintenance plan and schedule
i. Cleaning recommendations
j. Troubleshooting guides and diagnostic techniques
k. Wiring diagrams and control diagrams
l. Maintenance and repair procedures
m. Removal and replacement instructions
n. Spare parts and supply list
o. Product submittal data
p. O&M submittal data
q. Parts identification
r. Warranty information
s. Testing equipment and special tool information
t. Testing and performance data
u. Contractor information

Submit six copies of the **OPERATIONS AND MAINTENANCE (O&M) MANUAL** [in accordance with paragraph OPERATIONS AND MAINTENANCE MANUALS and in compliance with Data Package 3 in Section 01 78 23 OPERATION AND MAINTENANCE DATA.]

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for supplying and installing wire rope (new or replacement) needed by gate operating devices (i.e. spillway gates, Tainter gates, etc.)

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification is based on the assumption that a single Contractor will be responsible for supply and installation of the wire rope. Please refer to US Army Corps of Engineers Engineer Manual 1110-2-3200 Wire Rope Selection Criteria for Gate-Operating Devices (http://www.publications.usace.army.mil/Portals/76/Publications/EngineerManuals) prior to editing this section. It is recommended that the designer talk with wire rope manufacturers to get their consensus that the proposed wire rope type can be manufactured and used successfully.
If a specification is needed only for supply of wire rope, or for installation of wire rope, there are example specifications included in the appendices of US Army Corps of Engineers Engineer Manual 1110-2-3200 Wire Rope Selection Criteria for Gate-Operating Devices (link above). It is also assumed the wire rope is for replacement for a gate operating device. Paragraphs written in regard to removal of existing wire rope, and cleaning drums and sheaves would need to be deleted if the application is for a new installation.

Ensure products used in this section comply with Federal procurement preference under Section 9002 of the Farm Security and Rural Investment Act of 2002. See Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING for requirements associated with EPA designated products.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-01 Preconstruction Submittals**
- Wire Rope Work Plan; G[, [____]]
- Wire Rope Safety Plan; G[, [____]]
- Contractor Qualifications; G[, [____]]
- Contractor Installation Qualifications; G[, [____]]
- Wire Rope Tensioning Plan; G[, [____]]

**SD-07 Certificates**
- Warranty
1.3 CONTRACTOR INSTALLATION QUALIFICATIONS

Submit the contractor installation qualifications for installation of the wire rope. The Contractors' installer must have performed work similar to that required in this contract on at least three separate occasions. The Contractors' installer must be on site at all times when wire rope is being delivered, stored, un-reeled, during testing, installation, and after installation testing.

1.4 SYSTEM DESCRIPTION

******************************************************************************
NOTE: The wire rope work plan submittal is only applicable if the contract work involves field installation. This is not needed for a supply contract.

If the wire rope work plan is needed, the designer should carefully consider all steps which are likely to accomplish the wire rope replacement. Add items below the wire rope work plan paragraph as needed.
******************************************************************************

1.4.1 Wire Rope Work Plan

Submit a work plan for Government approval indicating how the existing wire rope will be removed and how the new wire rope will be installed prior to field work proceeding. Describe specific details and practices considering the current condition of existing equipment. At a minimum include the following topics in the plan:

a. Schedule for delivery.
b. Removal plan for old wire rope.
c. Un-reeling and installation plans for new wire rope.
d. Plan for tensioning wire ropes.
e. Schedule for delivery.
f. Schedule for installation.
g. Lubrication method.
h. Field tensioning method.

1.4.2 Wire Rope Safety Plan

Submit a safety plan for approval indicating how work will conform to EM 385-1-1. Include details of how the wire rope will be handled and installed to minimize the risk to personnel. [Include the safety provisions of this section in the safety plan required by [Section [_____] ] ]
SPECIAL CONTRACT REQUIREMENTS] [Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS].)

1.4.3 Tools, Equipment and Expertise

******************************************************************************

NOTE: The last sentence may or may not be needed, or consider propane powered equipment.
******************************************************************************

The work may take place [over water] in areas with limited ventilation. [Only electric or air powered tools and equipment will be allowed within those areas (no internal combustion engines will be allowed inside of machinery spaces or indoors).]

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

[The work and storage areas are as indicated on the plans] [or as directed by the Contracting Officer]. Wind the wire ropes on spools in the same direction as they were bent during manufacturing. Cover the [coils] [spools] for protection from rain, snow, and/or road debris during shipping.

1.5.2 Inspection on Delivery

******************************************************************************

NOTE: Consider altering or deleting this paragraph to reduce cost if the wire rope can be inspected completely, while being installed.
******************************************************************************

Upon delivery to the work or storage area, inspect the wire [ropes] [ropes and sockets] in the presence of the Contracting Officer. Inspect the wire rope for dings, kinks or other damage.[ Unreel the wire ropes from spool to spool to allow complete inspection of the wire ropes over their entire length. Perform the unreeling/reeling operation, and furnish extra spools or any other equipment required.] Upon completion of the inspection, furnish the Contracting Officer with a written delivery report of the results.

1.5.3 Storage

Store wire rope on site in a [covered] location stated on the plans. [After delivery, store spooled wire rope in well ventilated enclosures in the storage area and protect from the elements.]

1.6 ENVIRONMENT PRECAUTIONS

Submit lubricant catalog data for environmental applicability review.

1.7 WARRANTY

******************************************************************************

NOTE: Designer should contact wire rope manufacturers to determine the extent of manufacturer's warranties available. Warranties may vary with type of rope and application.
******************************************************************************
Submit signed copies of a [1][_____] year[s] warranty for all materials and services provided under this section.

PART 2 PRODUCTS

2.1 WIRE ROPE[ AND SOCKETS]

Provide wire rope [and sockets] which are the standard product of a Contractor regularly engaged in the manufacture of wire rope, and that essentially duplicate products having been in satisfactory use for at least 5 years prior to [bid opening] [proposal evaluation]. Submit Contractor qualifications statement.

2.1.1 Quantity

Furnish [_____] wire ropes [with end terminations (sockets) [at both ends]]. Each wire rope must be [of the length indicated on Drawing No. [_____], and within the tolerance also indicated on that drawing.] [[_____] meters feet in length.] Wind the wire rope on reels in lengths such that [_____] sections, each with a length of [_____] meters feet available for use, as splicing will not be allowed.

2.1.2 Type of Wire Rope

******************************************************************************
******************************************************************************

Provide wire ropes as follows:

2.1.2.1 Strand Configuration

[6x19 Seale] [7x19 Seale] [6x26 Warrington Seale] [6X37 Warrington Seale] [_______]; [Flattened strand]

2.1.2.2 Lay

******************************************************************************
NOTE: The advantages of Lang lay wire rope are discussed in more detail in EM 1110-2-3200. In many Army Corp of Engineers applications existing regular lay wire rope would best be replaced by Lang lay wire rope.
******************************************************************************

[Right, Lang] [Left, Lang] [Right, regular] [Left, regular]

2.1.2.3 Diameter

[_____] mm inch, with a tolerance of minus and plus 5 percent

2.1.2.4 Finish

[Galvanized] [Plain]
2.1.2.5 Minimum Breaking Strength

[_____] kN [pounds] [tons]

2.1.2.6 Material

**************************************************************************

NOTE: Stainless steel wire rope tends to abrade on itself when wrapped on disk-layered drums. Some manufacturers are questioning the wisdom of making regular lay stainless steel wire rope with flattened strands, as the cold-working tends to be excessive and weaken the rope. Stress relieving to alleviate the cold working can be difficult and inconsistent with the stainless steels. Do not use stainless steel wire rope in saltwater applications because of susceptibility to crevice corrosion. If they are used, they must be inspected regularly and add O&M manual requirement for required duration of wire rope inspection.

Kevelar wire rope has specific needs which must be included if it's desired to be used. Kevelar rope is very susceptible to abrasion damage and must be protected with a jacket. See EM-1110-2-3200.

**************************************************************************

[Extra improved plow steel] [AISI 302 stainless] [AISI 304 stainless] [Kevelar] [_____]}

2.1.2.7 Core Type

**************************************************************************

NOTE: It is not recommended that fiber core be used for a gate lifting device.

**************************************************************************

Independent wire rope core.

2.1.2.8 Pre-Formed

**************************************************************************

NOTE: There is no reason not to preform.

**************************************************************************

[Yes] [No]

2.1.3 Pre-Stretching

**************************************************************************

NOTE: In the following paragraphs the manufacturer is tasked with some testing. This is intentional, as personnel who are familiar with the required procedures should perform these tasks.

Pre-stretching is highly recommended for installations with multi-rope drums, because initial stretch in the wire ropes tends to be uneven. Pre-stretching will likely result a more equal
tension between the ropes. It is also recommended for other wire rope so that final length after use will be closer to length at the time of installation.

**************************************************************************
Submit Pre-Stretching procedure. Pre-stretch the [wire rope] [wire ropes before attaching their end terminations] in accordance with ASTM A1023/A1023M. This is done by subjecting them to three cycles at 40 percent of its nominal strength. Hold the 40 percent loads for 5 minutes with 5 percent loads for 5 minutes between cycles. A method of dynamic pre-stretching may be proposed.

2.1.4 Wire Strength and Ductility

Perform testing in accordance with FS RR-W-410 to verify wire strength and ductility. Submit test results.

2.1.5 Pre-forming

Provide pre-formed wire rope, and perform testing in accordance with FS RR-W-410 to verify pre-forming. Submit test results.

2.1.6 Magnetic Flux Leakage Testing

**************************************************************************
NOTE: Magnetic flux leakage testing is an NDT method to examine wire rope for internal defects. It provides a baseline condition for new wire rope. If a District does not require the baseline condition for future wire rope inspection/maintenance, the NDT testing may be removed from the spec.

Contractors may prefer to perform this inspection during installation of the wire rope, as this is the easiest method to complete 100 percent testing. After the rope is installed, the full length of wire rope cannot be inspected without several setups.

Excerpt from EM 1110-2-3200 (2016) paragraph 8-3.m states: "NDT can be used to determine the internal condition of wire rope. However, there are conditions that cannot or may not be detected, such as breaks in small wires, closely-spaced broken wires, broken wire versus pit corrosion, and possibly other defects. The percentage of outer wires compared to the total cross sectional area of wire rope is 36 percent to 44 percent. Thus, NDT can provide valuable information on the condition of over 50 percent of the wire rope area. The end user should recognize that NDT is a valuable tool that nevertheless does have some limitations. It also does not require opening up the rope and damaging it in the process. The loss of metallic cross-sectional area and local faults, such as broken individual wires and strands can usually, but not always be detected."

**************************************************************************
Perform magnetic flux leakage testing for [25][50][100] percent of the wire
rope to identify defects that are pre-existing in the ropes. Perform the testing prior to the rope being installed. Repeat the testing after the rope has been installed. Perform the testing in accordance with ASTM E1571. Personnel performing the testing must be qualified in accordance with the requirements of ASTM E1571.

Prepare and submit a Wire Rope Flux Leakage Test Plan that details the step-by-step procedure to inspect the ropes. Detail any differences in the testing procedure between the pre-installation testing and post-installed testing. Include in the plan the qualifications of the personnel who will be performing the testing, and the up-to-date calibration certificates of the test instruments.

Prepare and submit Wire Rope Magnetic Flux Leakage Test Results (Pre-Installation) and Wire Rope Magnetic Flux Leakage Test Results (Post-Installation) reports. Reports must contain the results from the Magnetic Flux Leakage Testing. Include the following in each report:

a. Identify which wire rope(s) the report covers. Reports must identify which end of the wire rope that the testing started from and all data must be identified by the corresponding rope.

b. Identify all local flaw (LF) and loss of metallic cross-sectional area (LMA) indications that are detected during testing. Document where the indications are located along the rope. For post-installation reports only; identify which LF and LMA indications are new from the pre-installation testing.

c. Verification from the Contractor that all LF or LMA indications are within acceptable values for that kind of defect.

2.1.7 Stress Relief "(Wrapping Test)"

Stress relieve the wire rope, and perform testing in accordance with FS RR-W-410 to verify stress relief. Submit test results.

2.1.8 Weld Distribution

Wire joints in any strand must not be closer than 450 mm 18 inches in any strand.

2.1.9 Galvanizing

**************************************************************************
NOTE: Wire rope woven from galvanized wires will have much better resistance to corrosion than un-galvanized wire rope woven from bare carbon steel. It will also have better resistance to corrosion than wire rope woven from drawn galvanized wire. However, it will also have a significantly lower strength. If full strength is required, then use wire rope woven from plain carbon steel or from drawn galvanized wire depending on how important corrosion resistance is. If full strength is not required, but high corrosion resistance is required, use wire ropes woven from galvanized wire and perform the zinc coat test to verify the zinc thickness. See FS RR-W-410 for information on the rate of zinc coating. Stainless steel or Kevlar
wire rope would not be galvanized, and this entire paragraph would be deleted.

[Weave the wire rope from drawn galvanized wire. That is, the wires galvanized prior to their last drawing operation. The wire rope must have the same accepted industry standards for nominal strength as it would, had it not been galvanized.] [Weave the wire ropes from galvanized wire. Apply zinc at a rate of [_____] grams per square meter ounces per square foot of wire surface. The Contractor must perform testing in accordance with FS RR-W-410 to verify the zinc coating has been applied at the required rate. Submit test report.] [Apply zinc coating by either the electrolytic plating process or by hot dipping in molten zinc. The weight of the zinc coating on each wire must be as specified in ASTM A1023/A1023M.]

2.1.10 Strand Pitch Length

Must not be less than 4-1/2 times the nominal rope diameter.

2.1.11 Core Strand Wires

The number of wires in the core strand must be equal to or greater than the number of wires in the other strands. Use the same material as the wires in the other strands, or use a material with a lower tensile strength.

2.1.12 End Terminations

NOTE: EM 1110-2-3200 discusses materials and coatings, and attachment methods for sockets. Note that the wire rope industry usually recommends replacing sockets when replacing wire rope. Sockets are usually selected from a catalog, however they can be custom fabricated. Spelter sockets are the Army Corp of Engineers standard for end terminations. Swaged sockets can be specified but are not suitable for Lang lay rope. Both types should develop 100 percent of the wire rope strength. Do not use molten zinc with stainless steel spelter sockets. Do not use molten zinc or epoxy resin spelter sockets with stainless steel wire rope in saltwater applications due to susceptibility to crevice corrosion. Swaged sockets can be used in saltwater applications.

Submit shop [fabrication] drawings, as specified. [The wire rope end terminations must be [an open] [a closed] spelter socket type with poured zinc or epoxy resin. Spelter sockets must be [forged] [cast alloy] [galvanized steel] [stainless steel] [swaged type of carbon steel suitable for cold forming].] [Provide fabricated wire rope end terminations as indicated [on Drawing No. [____]], and cast from [steel conforming to ASTM A148/A148M, Grade 105-85] [stainless steel conforming to ASTM A351/A351M CF8M] [____]. Secure the wire rope in fabricated sockets with poured zinc or epoxy resin.]

2.1.13 Tension Testing

Submit rope tension test report. Perform a tension test to verify the wire
rope meets the accepted industry standards for nominal strength. Test two rope samples to failure to be sure the expected performance level has been met. Perform the test using suitable tension testing equipment and by qualified personnel. Submit certification of rope tension testing device. Cut the rope samples to no less than 1 meter 3 feet of length. The test will not be considered valid if the failure occurs less than 50 mm 2 inches from either socket or holding mechanism and the test must be repeated. Relative speed between the machine heads must not exceed 25 mm 1 inch per minute.

[2.1.14 Attaching and Proof Loading Terminations]

**************************************************************************

NOTE: EM1110-2-3200 suggests that pre-stretching the wire rope and proof loading the terminations might be accomplished simultaneously. However, for multi-rope drums the wire rope would need to be pre-stretched first to be sure they are closer to their final correct length before attaching the terminations. If the sockets must be attached in the field delete this paragraph.

**************************************************************************

The Contractor must attach the end terminations after pre-stretching the wire rope. [The end termination attachment method is indicated on the plans.] After their attachment, proof load the wire ropes at 40 percent of nominal strength of the rope. Measure the length of the wire ropes to the nearest 0.25 mm 0.01 inch at a load of [______]. Submit proof load of terminations test report and measured rope lengths.

]2.2 LUBRICATION

**************************************************************************

NOTE: All frequently used wire rope should be lubricated, however, if operation is infrequent, it may be best to specify that it not be lubricated. Explained in EM 1110-2-3200, some cases where the wire rope is rarely operated, the presence of a heavy lubricant may increase corrosion on wire ropes. Carbon steel wire ropes in saltwater applications should have a durable protective lubricant coating.

If the end user has their own lubrication product, they may provide the lubricant.

**************************************************************************

Submit literature for proposed factory and field lubricant. The field and factory lubricants must be compatible. [Lubricate the wire ropes at the time of manufacture. Apply the lubricant with equipment capable of forcing the lubricant between the rope wires, including the center strand.] [Do not lubricate the wire rope.] [Lubricant will be supplied by the Government.]

PART 3 EXECUTION

3.1 REMOVAL OF EXISTING WIRE ROPE

Existing removed wire rope becomes the Contractors' property after removal. Remove from the site following all federal, state, and local laws.
and regulations.

3.2 EXAMINATION

**************************************************************************
NOTE: Insert dates in this paragraph for supply contracts that primarily involve wire rope and do not have full front end sections.

For multi-section design bid build contracts site visit dates are typically included in the Contracting front end documents. Delete this paragraph and include the dates in the front end.
**************************************************************************

[It is recommended that bidders visit the site before submitting bids. A pre-bid site visit, between the dates of [_____] and [_____] can be arranged by contacting [_____] at telephone number [______]. [See Section [_____] for site visit arrangements.]

]3.2.1 QA Inspections

Provide means for Government witness inspections at the Contractors' manufacturing facility. Up to two representatives of the Contracting Officer will be present to witness the various manufacturing processes for the wire rope. At a minimum, a site visit will be made by the Government to witness the tension test, and the wire rope will be inspected upon delivery. Inspection during removal of the existing wire rope and installation of the new wire rope will be ongoing. Provide means for remote or teleconference inspection upon request.

3.2.2 Verify Dimensions

After becoming familiar with the details of the work, verify dimensions in the field, and immediately advise the Contracting Officer of any discrepancies before performing any work.

3.3 ATTACHING SOCKETS

**************************************************************************
NOTE: Delete this paragraph if the sockets are to be attached at the wire rope factory.
**************************************************************************

Attach the end terminations to the wire rope [as indicated] [in accordance with Drawing No. [______]] and the recommendations of WRTB.

3.4 CLEAN DRUMS AND SHEAVES

Clean all drum and sheave grooves with a power wire brush, and inspect them for wear, abrasion, corrosion or other roughness and verify their dimensions are suitable for the new wire rope. Immediately advise the Contracting Officer of any problems.

3.5 LUBRICATION

Lubricate the wire ropes after they are installed, but before break-in/testing. Submit the proposed method in the work plan.
3.6 UN-REELING AND INSTALLING WIRE ROPE

**************************************************
NOTE: EM 1110-2-3200 suggests at least two and preferably three dead wraps on the rope on the drum.
**************************************************

Attach the wire rope(s) to spools or pulleys as shown on the plans. Wind the wire rope under adequate tension and guide the each end of the rope(s) to its proper location. Wind the wire rope in the same direction it was bent during its manufacture. Ensure that no twists or loops occur. Do not install wire rope damaged during installation by kinking, and remove from the site. Submit the proposed method of un-reeling and installing in the work plan.

3.7 FIELD TENSIONING [SINGLE LINE] [MULTI-LINE] HOISTS

3.7.1 Field Tensioning Plan

Submit a wire rope tensioning plan that includes:

1. Pre-Opening Tension Measurements and Adjustments
2. Initial Tension Measurements and Adjustments
3. Final Tension Measurements and Adjustments.

Adjust the wire rope tension of [single line][multi-line] hoists to ensure that they share load equally. Submit the proposed field tensioning method in the work plan. (For each multi-line hoist rope drum, final tension values for each rope must be no more than plus or minus 5 percent from the average of the individual rope tension values. For two multi-line hoists on a gate, the total wire rope load on each hoist is computed by summing the measured tension values for all wire ropes on a hoist.) The total wire rope load on each hoist must be within a range less than or equal to 0.5 percent of the average of the two total wire rope loads. Measure and adjust wire rope tensions while keeping the gate properly positioned and aligned (in the slot). After "break-in/testing" test the ropes to determine if they share load equally, and if not, re-tension.

3.7.2 Tensioning Instrumentation and Certificates

At every phase of the tensioning process, take tension measurements of the hoist wire rope using a tension meter. Submit Wire Rope Tension Equipment Calibration Certifications, which includes certifications for current calibration and tension measurement accuracy. Operators of the tension measuring equipment must be trained by the Contractor to use the equipment and have experience performing tension measurements using the equipment. Submit tension equipment operator qualifications detailing the training and experience of the operator of the tension equipment.

3.7.3 Pre-Opening Tensioning Measurements

Pre-opening tensioning must achieve a tension value for each rope within a range that is equal to ten (10) percent of the average of the wire ropes initial tension values. For the [two (2)][_____] hoists on a gate][____], the total wire rope load on each [hoist][_____] must be computed by summing the measured tension values for all wire ropes on a [hoist][____]. The total wire rope load on each [hoist][_____] must be
within a range equal to five (5) percent of the average of the two (2) total wire rope loads.

3.7.4 Tensioning Procedure

Observe the stopped times prior to operating the equipment to check rope tension. Adjust rope tension during the pre-opening stops until all hoist ropes for the equipment have approximately equal tensions. The first pre-opening stop must occur when the wire ropes are supporting approximately 10 percent load. The second pre-opening stop must occur when the wire ropes are supporting approximately 75 percent equipment load.

3.7.5 Initial Tensioning Measurements

For each rope drum, initial tensioning of the wire ropes must achieve a tension value for each rope within a range that is equal to five (5) percent of the average of the wire ropes initial tension values. For the two (2) [hoists], the total wire rope load on each must be computed by summing the measured tension values for all wire ropes on a. The total wire rope load on each must be within a range equal to 0.5 percent of the average of the two (2) total wire rope loads. Wire rope tensions must be measured and adjusted while keeping the properly positioned and aligned in the slot.

3.8 BREAK-IN/TESTING

After installation is complete, run the gate-operating device through complete cycles, fully open to fully closed.

3.9 ORDERLY WORK AREA/SITE CLEANUP

Maintain neat and orderly storage and work areas. The Contract will not be considered complete until all the tools, equipment and property have been removed from the site, and the storage and work areas have been restored. Remove all dirt, debris, litter etc. from project and dispose of in a proper manner.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for hydraulic power systems to operate gates and other mechanisms at civil works structures. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com).

**PART 1  GENERAL**

NOTE: Ensure products used in this section comply with Federal procurement preference under Section 9002 of the Farm Security and Rural Investment Act of 2002. Refer to Section **01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING** for requirements associated with EPA designated products.

**1.1  SUMMARY**

The work covered by this section consists of detailed requirements for the [design,] fabrication, shop assembly, testing, delivery, and installation
of the hydraulic power systems for operation of the [intake gates] [slide
gates] [control gates] [Tainter gates] [miter gates] [butterfly valves]
[hoisting equipment] [_____] as specified and as shown.

[1.2 PRODUCTS INSTALLED BUT NOT SUPPLIED]

**************************************************************************
NOTE: List all property which will be furnished to
the Contractor for installation. Delete materials
and equipment which are purchased by supply Contract
by the Government to be furnished to the Contractor
from other portions of this specification.
**************************************************************************

Pursuant to Contract Clause GOVERNMENT-FURNISHED PROPERTY (SHORT FORM), the
Government will furnish to the Contractor the following property, if
required, to be incorporated or installed in the work. Such property will
be furnished at the project site for delivery acceptance. Install or
incorporate all such property into the work. Verify the quantity and
condition of such Government-furnished property when delivered, acknowledge
receipt thereof in writing and in case of damage to or shortage of such
property, report within 24 hours, in writing, such damage or shortage.

[1.3 MEASUREMENT AND PAYMENT]

**************************************************************************
NOTE: If Section 01 20 00 PRICE AND PAYMENT
PROCEDURES is included in the project
specifications, move this paragraph and its
subparagraphs from this section and insert in
Section 01 20 00.
**************************************************************************

1.3.1 Payment

Payment will be made for costs associated with the hydraulic power
system(s) as specified.

1.3.2 Unit of Measure

Unit of measure: Job

1.4 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the
publications cited in the text of the guide
specification. The publications are referred to in
the text by basic designation only and listed in
this paragraph by organization, designation, date,
and title.

Use the Reference Wizard's Check Reference feature
when you add a Reference Identifier (RID) outside of
the Section's Reference Article to automatically
place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature
to update the issue dates.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.5 DESIGN AND PERFORMANCE REQUIREMENTS

**********************************************************************************************************************************************
NOTE: Include this paragraph in the specifications when the Contractor is required to furnish the detailed design of the system.

List all items for which the Contractor must furnish design computations. If Contractor designed, also provide a reference to have the Contractor follow requirements in USACE EM 1110-2-2610 for hydraulic power systems.
**********************************************************************************************************************************************

The Contract drawings indicate the general arrangement of the hydraulic power system for operation of the [intake gates] [slide gates] [control gates] [Tainter gates] [miter gates] [butterfly valves] [hoisting equipment] [____], clearances necessitated by the structure or other equipment, maximum overall dimensions, and other pertinent features. Furnish the detailed design in accordance with the following design criteria. Furnish the detailed design in accordance with ISO 4413, and the following design criteria. Identify design and dimensional changes necessary to satisfy the principal design parameters identified in the paragraph "Design Parameters" as variations in the submittals. Dimensions submitted that differ from those indicated and not otherwise constrained by the Design Parameters and physical limitations of installation are subject to approval. Also submit design computations for all extension of design items.
1.5.1 Design Parameters

**************************************************************************

NOTE: List all design parameters or criteria required by the Contractor to design the hydraulic power system. Possible design criteria to consider are:

a. Maximum system pressure.
b. Working system pressure.
c. Rated raising or retracting force.
d. Rated lowering or extending force.
e. Maximum raising or retracting time.
f. Maximum lowering or extending time.
g. Hoist stroke.
h. Critical or limiting dimensions.
i. Operating temperature range.
j. Duty cycles.
k. Accumulator performance characteristics.
l. Corrosivity category
m. Any other unusual features.
**************************************************************************

The principal design parameters for the hydraulic power system are as follows and were developed at the minimum operating temperature and utilizing the hydraulic fluid as specified:

1.5.2 Allowable Stresses

1.5.2.1 Structural Items

Design structural items associated with the hydraulic power system, such as support beams, to withstand the maximum force exerted by the hydraulic cylinder plus any dead loads with a factor of safety of 2 based on the yield strength of the materials involved.

1.5.2.2 Hydraulic Cylinders

**************************************************************************

NOTE: Use telescopic hydraulic cylinders only for special retrofit applications where regular single or double acting cylinders cannot be used or where the physical constraints of the installation leave no other alternative. Utilize Euler formula or other analytical methods to determine buckling strength of cylinder rod. Designer will need to determine how the cylinder is fixed and connected to determine buckling strength.
**************************************************************************

Design all hydraulic cylinders to withstand a maximum operating pressure of 21[___] MPa 3000[___] psi with a factor of safety of 5 based on the ultimate strength of the material or 2 based on the yield strength of the material. Apply a factor of safety of 3 to the compression load when designing the hydraulic cylinders to resist buckling. End fixity coefficients for determining the effective buckling length for each hydraulic cylinder are [1.0] [___].
1.5.2.3 Stress Concentration Factors

Use stress concentration factors where applicable. Reduction of allowable stresses to compensate for repeated cycles of loading is not required.

1.5.3 Corrosivity Environment Category

Design hydraulic cylinders, cylinder rods and components to meet the corrosivity category [____] in accordance with ISO 9223 to meet anticipated atmospheric environment the cylinders and piston rods will be operating within.

**************************************************************************

NOTE: Select a Corrosivity Category (C1-C5, or CX) to meet the measured corrosion rates of 1 year tests conducted in the actual intended environment for the hydraulic cylinder in accordance with ISO 9223 and ISO 9226 OR to meet the anticipated atmospheric environment in accordance with the Table 1 furnished below. The hydraulic cylinder manufacturer may already have test data which can be requested in a shop drawing submittal. It is important to work with the cylinder manufacturer on the selected corrosivity category. The corrosivity category impacts the selection of the piston rod and the type of rod coating and rod material. Submerged cylinders and piston rods should be selected for CX Extreme category. In environments with expected "CX category" classification, it is recommended that the atmospheric corrosivity classification be verified from one-year or three year corrosion loss analysis such as salt water droplet corrosion test to ensure correct classification if possible or from existing test data. Collection and analysis of water quality data in advance of the installation may also be beneficial for environments subject to immersion. When crossover between categories occurs the designer should select the category with the more severe environment. Additional factors that may influence the selected corrosivity category include salt spray, humidity, airborne pollutants, waterborne pollutants, anticipated cylinder rod retraction operation, frequency of immersion, frequency of movement, time spent extended, presence of sheltering, and inspection/maintenance accessibility.

**************************************************************************

1.5.4 Connections

1.5.4.1 Pinned Connections

Design pinned hydraulic cylinder connections for field assembly [as manufacture designed] [as shown].

1.5.4.2 Shop Connections

Design shop connections for assembly by means of welding or by bolting.

1.5.4.3 Welded Connections

******************************************************
NOTE: If the need exists for more stringent requirements for weldments, delete this first bracketed paragraph and use the second paragraph. The designer should also consider whether a U-Stamp per ASME BPVC SEC VIII code is necessary since custom produced hydraulic cylinders are generally exempt. Note specifically in paragraph below the exemption of the U-stamp requirement. All other requirements of the ASME BPVSC SEC VIII code should
still be enforced.

Design welded connections in accordance with AWS D1.1/D1.1M except that provisions for repeated stress is not required. Weld hydraulic cylinders in accordance with ASME BPVC SEC VIII D1, [ISO 15614-1]. Weld piping in accordance with ASME B31.1. Qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. [U-stamp requirements per ASME BPVC are waived.] Notify the Contracting Officer within 24 hours in advance of tests and perform the tests at the work site if practicable. Apply the welder's or welding operator's assigned symbol near each weld made as a permanent record. Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators.

Welding and nondestructive testing procedures for piping are specified in Section 40 05 13.96 WELDING PROCESS PIPING.

1.5.4.4 Structural Bolted Connections

Make structural bolted connections carrying primary loads with ASTM F3125/F3125M, Grade [A325][A490] bolts [or ISO equivalent standards as approved].

1.6 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.7 SCHEMATIC DRAWINGS AND DATA

1.7.1 Shop Drawings

Include fabrication, shop assembly, delivery, and field installation drawings in the detailed shop drawings. Detail any component part of fabricated items omitted on the shop drawings. If departures from the Contract drawings are deemed necessary by the Contractor, submit details of such departures, including changes in related portions of the project and reasons, with the shop drawings. Provide fabrication and assembly drawings to 1:8 or 1-1/2 inch = 1 foot-0 inch or larger scale.

1.7.2 Fabrication Drawings and Assembly Details

Provide fabrication drawings for all mechanical and structural parts and components, except those of standard design and manufacture. Include in fabrication drawings complete detailing, materials of construction, tolerances, machined surface finishes, connections, and weld details with annotation to differentiate shop welds from field welds. Provide detailed drawings of the manifolds including required drilled passages. Provide details and dimensions of the hydraulic cylinder and piston rod as applicable. Provide details of the cylinder rod measuring system as applicable [magneto resistive system] [magneto re-strictive system]. Provide details of the proposed coating system for the cylinder rod to meet the required corrosivity category and provide data for any coating system.

1.7.3 Hydraulic Power Unit Drawings

Provide drawings for hydraulic power units showing general arrangement of components and outline dimensions of unit. Identify all components on the drawings and provide sufficient information to determine whether the components proposed conform to the specifications.

1.7.4 Manifold Drawings

Provide fabrication drawings for all manifolds showing general arrangements outline dimensions, and drilling dimensions. Identify all components on
the drawings and provide sufficient information to determine whether the components proposed conform to the specifications. Identify all port configurations and connections.

1.7.5 Piping Drawings

Provide piping drawings showing the complete hydraulic system in schematic format identifying all items of equipment incorporated in the system. Include details of all pipe supports including those for manifolds and on the hydraulic power unit.

1.7.6 Electrical Drawings

Provide electrical drawings of all electrical equipment. On electrical drawings include complete schematic diagrams and connection diagrams. On connection diagrams show electrical connections (by lines) for each conductor between terminal points. Identify terminal points.

1.7.7 Shop Assembly Drawings

Provide shop assembly drawings with details for connecting the adjoining fabricated components in the shop to ensure satisfactory field installation.

1.7.8 Hydraulic Schematic

Provide a complete hydraulic schematic in accordance with ISO 1219-1 and ISO 1219-2. Schematic shall include schematic piping, hoses and other component layouts symbolically indicating, using standard system symbols, all system piping, and other components, including their sizes, materials, heights, spacing, and locations. Both new and refurbished components shall be shown on the schematic with any interfaces to existing equipment noted. All set point and size parameters shall be indicated for each component. Component support types and locations, anchor points versus sliding supports, flex joints, and seismic supports shall also be shown. Include proposed pertinent installation details. Required capacities and system pressures as well as direction of system flow or motion shall be indicated. Each drawing shall include a legend of symbols and bill of materials (BOM). BOM to include name of component, component drawing number or reference drawing, and part number. If hydraulic schematic is split between drawings or connect to a sub-contractor supplier drawing the connection points must be clearly outlined on both the schematic and other drawing, utilizing identical nomenclature.

1.7.9 Product Data

Include performance data and curves for pumps, [electric; hydraulic] motors and valves. Provide catalog cuts and outline dimensions for the pumps, [electric; hydraulic] motors, filters, heaters, thermostats, float switches, pressure transducer, switches, breathers, and all valves, valve controls and other accessories.

1.7.10 Delivery Drawings

Provide delivery [drawings][details][sketches]with descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damage.
1.7.11 Field Installation Procedures

Provide field installation [drawings][sketches][manuals] with a detailed description of the field installation procedures. Include the location and method of support of installation and handling equipment, the provisions to be taken to protect concrete and other work during installation, the method of maintaining components in correct alignment, and the methods for installing other appurtenant items. Include dates and schedule of work. Submit methods and procedures to accelerate the sequence of work.

1.7.12 Design and Performance Requirements

Provide design computations for all items which are designed by the Contractor. [Include computerized simulations of the complete and proposed hydraulic system.]

1.7.13 Cleaning and Flushing Procedures and Results

Submit detailed procedure for the cleaning and flushing of hydraulic cylinders, piping, and power unit as outlined in paragraph "CLEANING AND FLUSHING," not less than 30 calendar days before start of operations. Provide test reports of the results of the flushing and of the oil used to fill the system.

1.7.14 Erecting Engineer Qualifications

Provide a resume for the on-site erecting engineer with details on experience and background in similar installations.

1.8 WARRANTY

**************************************************************************
NOTE:

1) Warranty for supply or construction contracts is covered by FAR clauses and is typically set at 1 year. This paragraph should only be used if a warranty longer than 1 year is desired. Any modifications to the standard warranty clauses need to be coordinated with the Contracting Officer and/or Contract Specialist. Additional costs for a longer warranty should be considered against the benefits, probability of failure and consequences of equipment failure.

2) Consider adding minimum warranty claim response times based on the criticality of the system. For example, failures resulting in delays to navigation or the inoperability of systems integral to flood protection equipment should require faster response times.

**************************************************************************

Guarantee all equipment for a period of 2 years from the date of acceptance. Guarantee replacement parts for 2 years from date of replacement. Provide warranty against defective materials, design, and workmanship. In cases where the equipment manufacturer's advertised minimum guarantee is in excess of 2 years, it remains in force for its full period. Upon receipt of notice from the Government of failure of any of
the parts during the warranty period, provide new replacement parts promptly at no additional cost to the Government.

1.9 QUALITY CONTROL

Establish and maintain quality control for operations to assure compliance with Contract requirements and maintain records of quality control for all materials, fabricated parts, equipment, and construction operations. In addition, establish and maintain surveillance for quality control over sub-contractors, suppliers, or manufacturers. Include a minimum of two shop inspections during manufacture and assembly of the hydraulic cylinder assemblies' power units and manifolds. The quality control includes, but is not limited to, the following:

a. Materials and workmanship.

b. Manufacture and installation of the piping, hydraulic cylinder assemblies power units and manifolds, complete.

c. Cleaning and flushing.

d. Shop assembly and tests.

e. Field erection and tests.

f. Damage and defects.

Submit a copy of these records and tests, as well as the records of corrective action taken, to the Government.

PART 2 PRODUCTS

2.1 MATERIALS AND MECHANICAL EQUIPMENT

**************************************************************************
NOTE: The contents of the following paragraphs are dependent on design requirements which may necessitate revision or expansion to cover different conditions and standards.
**************************************************************************

2.1.1 General

Provide materials and mechanical equipment in accordance with the requirements as indicated or specified, and if not specified, furnish materials and mechanical equipment of the best commercial grade quality suited to the intended use and as approved. All electric motors, hydraulic motors, hydraulic pumps, hydraulic cylinders, valves and similar items and/or accessories, of the same type and size, to be the products of the same manufacturer, unless otherwise approved. Permanently display the manufacturer's name, address, and catalog number on a nameplate securely attached to each major item of equipment.

Submit data specifications [product manuals] and assembly drawings showing sizes, ratings, parts and material lists, overall dimensions, and mounting dimensions with the product data.
2.1.2 **Standard Products**

Where items are referred to hereinafter as "similar and equal to" a particular manufacturer's product, such references have been made merely as a convenient method of indicating the type of material or equipment required, with no intention of asserting superiority thereof. The standard product of any reputable manufacturer regularly engaged in the commercial production for at least 2 years prior to this solicitation of the type and quality of material or equipment referred to will not be excluded on the basis of minor differences, provided essential requirements of the specifications relative to materials, capacity, and performance are met. Furnish performance capacities and other pertinent information concerning the manufacturer's "equal to" standard products intended for incorporation in the work. "Equal to" standard products installed or used without such approval are at the risk of subsequent rejection.

2.2 **HYDRAULIC CYLINDERS**

2.2.1 Hydraulic Cylinders (Standard Design)

**************************************************************************

NOTE: Use this Alternate 1 when hydraulic cylinders of standard design and manufacture are required and available as standard catalogue items. These are typically tie rod type cylinders and will generally be available as standard catalogue items. Cylinder parts and components are generally standardized.

**************************************************************************

Provide [single end][double end] rod hydraulic cylinders that are a standard catalog item. Provide one of the hydraulic cylinder types listed in ISO 5598 as specified or indicated, of tie rod design, [square head standard construction]. Cylinders must meet the following requirements:

a. Select cylinders with the bore, stroke, rod diameter, and mounting style of the cylinder as indicated.

b. The manufacturer specified pressure rating of the cylinder must be less than the maximum system pressure indicated.

c. Equip the cylinder rods with the manufacturers rod coating system.

d. Equip cylinders with dynamic seals are suitable for both frequent and infrequent operation and are capable of not less than [manufacturer defined and rated number of operations] [500,000 cycles of operation] in systems properly maintained.

e. Equip the cylinders with the manufacturer's standard position measuring system.

f. Equip cylinders with [SAE straight thread O-ring][SAE 4 bolt hydraulic flanges] [_____] piping ports.

g. Provide the hydraulic cylinder with [adjustable] [nonadjustable] cushions on [the cap end only] [the rod end only] [both ends]. [Cushions to have free reverse flow check valves.]

h. Provide evidence that each cylinder was hydrostatically tested by the
manufacturer to [ASME BPVC SEC VIII D1 requirements] [200% of working load] [150% working load] for the severest service rating

2.2.1.1 Cylinder Tubes (Standard Design)

Cylinder tubes for standard design cylinders must meet the following requirements:

a. Machine the cylinder tube from [ASTM A519/A519M, Grade 1018] [heavy wall seamless steel tubing] [or materials meeting ISO standard equivalent as approved]

b. Hone the bore to a surface finish compatible with the seals being used so as to result in zero net leakage past the seals.

2.2.1.2 Cylinder Heads and Caps (Standard Design)

Cylinder heads and caps for standard design cylinders must meet the following requirements:

a. Fabricate the cylinder head and cap from [ASTM A576, Grade 1018, steel bar stock] [ASTM A516/A516M, Grade 60 plate] [or materials meeting ISO equivalent standards as approved]

b. Provide a machine finish on all surfaces.

c. Equip the cylinder head with a rod seal and external dirt wiper, [ice scraper,] and a rod bushing piloted into the head to ensure concentricity. [Rod bushings must be removable without the use of special tools and without removing the tie rods or cylinder head.]

d. Attach the cylinder tube to the head and cap by tie rods [bolts] having a minimum yield strength of 690 MPa or 100,000 psi.

e. Removable attachments to have the cylinder tube end seals arranged to seal with pressure and be designed to prevent shearing and extrusion and to provide axial metal backup.

2.2.1.3 Pistons (Standard Design)

Pistons for standard design cylinders must meet the following requirements:

a. Fabricate the piston from [fine-grained cast iron][____].

b. Precision fit the piston to the cylinder body bore.

c. Provide a suitable method for locking piston to the rod.

d. Equip pistons with [zero net leakage cup-type seals][bronze-filled polytetrafluoroethylene seals with phenolic wear rings][contractor furnished design].

e. The design must protect the piston rings from blow-out and over squeezing.

2.2.1.4 Piston Rods (Standard Design)

Piston rods for standard design cylinders must meet the following requirements
a. Fabricate the rods from [medium carbon steel with a yield strength of 620 to 690 MPa or 90,000 to 100,000 psi for rods 16 through 100 mm or 5/8 through 4 inches in diameter] [620 to 760 MPa or 90,000 to 110,000 psi high tensile strength steel using ASTM A108, Type C 1045, for rods 16 to 63 mm or 5/8 to 2 1/2 inches in diameter, and ASTM A108, Type CR 4140, for rods 75 to 250 mm or 3 to 10 inches in diameter] [materials and coatings as recommended by the manufacturer to meet the specified design requirements for operation, strength, durability, corrosivity and operating environment].

b. [Provide the rod case hardened to 50-54 Rockwell C, polished to a 0.25 micrometer 10 microinch Ra surface finish or better, and nickel and hard-chrome plated to 75 micrometer or 0.003 inch minimum thickness.] [Provide rod coating system per manufacturer standard design and standard surface finish to meet required corrosivity rating.]

2.2.2 Hydraulic Cylinders (Custom Design by Manufacturer)

 ************************************************************
NOTES: Use this Alternate 2 when the hydraulic cylinders are to be custom designed by the manufacturer specifically for this project in accordance with the design parameters.

Telescopic hydraulic cylinders may be used only for special retrofit applications where regular single or double acting cylinders cannot be used.

Unless the designer needs to make the choices because of unique criteria situations, the selection of materials and configurations should remain as Contractor's options. Mill type cylinders are preferable over tie rod cylinders and should be specified and utilized. Mill type cylinders generally are rated for the higher pressures than the other designs. The cylinder heads generally are mounted with bolts or cap screws.

**************************************************************************
Utilize mill type cylinders. Provide cylinder of [single][double] acting[, telescopic] type designed and manufactured [to be used under water and] to meet the criteria as stated in paragraph "Design Parameters." [Design cylinders and integrated appurtenances including position sensing systems to be submerged [and operate] under [_____] meters [_____] feet of water for up to [_____] days per year.][ Telescopic cylinders may be either single or double wall as necessary to provide the best operating characteristics.] Provide cylinder measuring systems as approved. Material for the hydraulic cylinder to be a high strength carbon or alloy steel. Stress relief heat treat cylinder tubes which have been welded and [radiograph all welds including those on the end mounts][radiograph designated welds as indicated]. Material for the piston rod to be a high strength [carbon or alloy steel with chrome plating per ASTM B650 ] [stainless steel with chrome plating per ASTM B177/B177M and ASTM B254 ] [manufacturer standard thermal sprayed system with nickel chromium based alloy on stainless steel substrate][laser clad metal alloy on carbon steel or stainless steel substrates][_____] [Nickel plate the exterior of the extending rods and tubes on a telescopic cylinder.] [The nickel plating to be a minimum of 75 micrometers or 0.003 inch thick and a [high][mid]
phosphorous, electroless nickel process designed for corrosion protection.] Fabricate rings, bearings, packing, packing rings, retaining rings, seals, wiper-scrapers, and any other fabricated items from sufficiently qualified materials as recommended and approved to provide net zero leakage. Where a cylinder head is used as a positive-position stop, the stop head to incorporate an adjustable cushion, or an external deceleration control provided to minimize detrimental mechanical impact. [End mounts [for pinned connections] as indicated.] [Provide bronze bushings in accordance with ASTM B505/B505M, Alloy [C92200], in the pin holes. [Fabricate connection pins from ASTM A564/A564M, Type 630, Condition H-1150, stainless steel.] [Mount the hydraulic cylinder as indicated.] Drill, tap, and surface ports to receive [SAE Code 61 flanges][_____] in the positions indicated or as otherwise approved. Locate the manifold and pipe supports, as indicated, to be an integral part of the machinery. Provide both ends of all the cylinders with convenient bleed ports. Tap each cylinder port to receive the 7/16-20-SAE bleed valves. Provide diagnostic connectors rated at least 31 MPa 4500 psi and consisting of a stainless steel body with internal ball check and spring, male SAE O-ring connection and protective cap as bleed valves. Integrated position indication systems mounted to the cylinders to be designed for minimal leakage [leakage free] and equipped with a pressureless leakage monitoring port collection system. [Cylinders to have ports on both sides and provisions for mounting piping in either left or right hand configuration so that the cylinders for both positions are interchangeable.]

2.2.3 Hydraulic Cylinders (USACE Custom Design)

**************************************************************************

NOTE: Use this Alternate 3 when the hydraulic cylinders have been designed or by the Corps of Engineers or have specific and unique requirements and they are detailed on the contract drawings. Mill type cylinders to be utilized in accordance with EM 1110-2-2610. Mill type cylinders generally are rated for the higher pressures than the other designs. The cylinder heads generally are mounted with bolts or cap screws. Most main operating systems to be designed for this type of cylinder.

Position sensing systems are a critical feature and are either integral with the cylinder or external to the cylinder and sense either the cylinder or the gate or valve directly. An advantage of a position sensing system connected to the gate (not the cylinder) is the gate position is known if the actuator becomes disconnected or damaged. Systems integral with the cylinder can be provided by the manufacturer and require no external mechanisms or linkages.

Integral systems include the magneto resistive systems. Notches are etched or machined into the base material of the cylinder rod and a surface coating is applied over this. These systems, however, only work with carbon steel rods and non-magnetic coatings. Located in the rod seal gland housing is a sensor, which is positioned to receive signals from the etched or machined notch embedded below the polished surface. Signal pulses are
counted and computed to provide an output positioning signal.

Magnetoresistive systems require drilling the cylinder rod from the piston end for a sensor rod. This system provides an absolute indication of position but is limited in stroke because of the length of the unsupported rod in the cylinder when extended.

2.2.3.1 General Requirements (USACE Design)

Utilize mill type cylinders. The hydraulic cylinder to be of the [single][double] acting type designed and manufactured [to be used under water and] to meet the criteria stated in paragraph "Design Parameters."[Design cylinders and integrated appurtenances including position sensing systems to be submerged [and operate] under [_____] meters[_____] feet of water for up to [_____] days per year.] [Cylinder design arrangement must allow for field serviceability of cylinders, where rod wiper/scaper seals and static o-rings can be serviced without specialty jig or offsite facility.]

2.2.3.2 Cylinders (USACE Design)

Cylinders for USACE Design hydraulic cylinders must meet the following requirements:

a. Make cylinders out of steel meeting one of the following options:

   1) Option A: Rolled steel plate in accordance with ASTM A516/A516M, Grade 70 or equivalent material as approved, and welded flanges in accordance with ASTM A181/A181M, Class 70 or equivalent material as approved.

   2) Option B: Provide centrifugal cast steel shell in accordance with ASTM A216/A216M, Grade WWC or equivalent material as approved, and welded flanges in accordance with ASTM A181/A181M, Class 70 or equivalent material as approved, or cast from ASTM A216/A216M, Grade WWC steel or equivalent material as approved.

   3) Option C: The shell and flanges a solid trepanned forging in accordance with ASTM A266/A266M, Class 1 or equivalent material as approved.

b. The interior of the finished cylinder must honed to the dimensions, tolerances and surface finish shown.

c. The finished wall thickness must not be less than that shown.

d. Weld flanges to the cylinder parallel with each other and perpendicular to the cylinder center line.

e. Stress relief heat treat the cylinder after completion of all welding.

f. Fabricate cylinder to the tolerances as shown. The assembled cylinder to be of such straightness that the piston and rod move smoothly without any indication of binding or tight spots.

SECTION 35 05 40.14 10 Page 30
g. [Radiograph all welds including those on the end mounts.][ Radiograph designated welds as indicated.]

2.2.3.3 Piston Rods (USACE Design)

**************************************************************************
NOTE: Choose one or more options depending on the unique requirements and life-cycle costs of the project. Carbon steel piston rods with chrome plating is noted but should be avoided if possible due to potential corrosion of the piston rod especially in high corrosivity environments.

The designer needs to reference and select the appropriate corrosivity category in Table 1 for the piston rod.

The designer should be aware that cylinder rod ends specified with carbon steel substrates have an increased likelihood of corrosion between the mating surfaces/threads of the cylinder rod and connected components. The cylinder rod ends are typically machined threads for adjustability and are not protected by the specified rod coating system. Standard o-ring type seal designs may not be enough to withstand environmental conditions. Designers should provide provisions in the design to seal, protect or coat mating surfaces to minimize the chance of seizing and corrosion for future maintenance and serviceability.

**************************************************************************

Piston rods for USACE Design hydraulic cylinders must meet the following requirements:

a. Rod and road coating system must be in accordance with one of the following options. All rod coatings must meet or exceed the minimum test criterion as stated in the following tables (Tables 2,3,4). [Submit Rod Coating Data that includes details on the coating materials, corrosivity testing, application method, and quality inspection methods and metrics.]:

1) Carbon steel rods with [chrome][nickel plus chrome] plating: Fabricate rods from carbon steel that meets the requirements of ASTM A108, Type C 1045 or Type CR 4140 or equivalent material as approved. Case harden to 50-54 Rockwell C. The chrome plating thickness must be a minimum of 76 micrometers or 0.003 inch. Apply plating in accordance with ASTM B177/B177M or ASTM B546.

2) Stainless steel rods with chrome plating: Fabricate rods from stainless steel that meets the requirements ASTM A564/A564M or ASTM A705/A705M, Type 630 or Type XM-12 or equivalent material as approved. The chrome plating thickness must be a minimum of 76 micrometers or 0.003 inch. Apply plating in accordance with ASTM B177/B177M and ASTM B254.

3) Carbon steel rods with welded overlay: Fabricate rods from carbon steel that meets the requirements of ASTM A108, Type C 1045 or
Type CR 4140 or equivalent material as approved. The coating material must be certified and formulated to consist of a metal alloy to meet corrosivity category and designed and applied by the cylinder manufacturer and submitted for approval. The minimum coating thickness must be 600 micrometers or 0.0236 inches [400 micrometers, 300 micrometers].

4) Carbon steel rods with high velocity oxygen fuel (HVOF) coating: Fabricate the rods from carbon steel that meets the requirements of ASTM A108, Type C 1045 or Type CR 4140 or equivalent material as approved. Case harden to 50-54 Rockwell C. Apply thermal sprayed coatings with HVOF method and have the applied material composition certified and submitted for approval. HVOF application per ASTM E1920 and ASTM C633 [manufacturer standard application process] and submitted for approval. Applied coating materials to consist of Nickel-Chromium based alloys as approved applied in multiple layers to achieve a total coating thickness greater or equal to 250 micrometers or 0.0089 inches for the first layer and not less than 440 micrometers or 0.0173 inches for two layers.

b. If rods are made from two or more pieces, joints must be made with full penetration welds. Perform radiograph testing on 100% of welds.

c. [The final rod surface to have a roughness height of not more than 0.20 micrometers [8 microinches] Ra.]

d. Quantify the final rod surface roughness using the Rpk-Rk-Rvk in accordance with ISO 13565. Other parameters such as Ra, Rz or Rmax value can only be used indicative. Roughness to be determined by Cylinder manufacturer and Seal manufacturer for the intended cylinder operating environment as specified.

e. Submit certified test reports for both the rod material and performance requirements as specified.

NOTE: ASTM G48 testing is not a suitable test for porous coatings, e.g. hard chromium, thermal sprayed.

2.2.3.4 Pistons (USACE Design)

Provide pistons for USACE Design that are made from in cast iron that meets the requirements of ASTM A536, Grade 80-55-06 or 10-50-05 or equivalent material as approved.

******************************************************************************

NOTE: The designer may allow the cylinder manufacturer to recommend and provide the seals, o-rings and bearing materials per their recommendations and coordination with the seal, o-ring and bearing suppliers and compatibility requirements for the selected hydraulic fluids or the designer may specify the requirements of the seals, o-rings and bearing materials using the tables below.

******************************************************************************

2.2.3.5 Position Indication

Equip hydraulic cylinders with a position indication system of the [magnetoresistive type] [magnetorestrictive type].

2.2.3.6 Seals, O-rings and Bearing Materials (USACE Design)

Provide seals, o-rings, and bearing materials for USACE design hydraulic cylinders in accordance with the following paragraphs.

Design and provide seals, O-rings, and bearing materials to be compatible with the specified hydraulic fluid. Each material in use with the hydraulic cylinder to be tested to verify the chemical resistance and hydraulic fluid compatibility. Conduct testing in accordance with ISO 1817 to measure changes in hardness, tensile strength, and elongation to satisfy the requirements of [the cylinder and seal manufacturers][Table 5][Table 6]. Submit for Government approval seals, O-rings and bearing materials.

[Table 5: Allowable deviations in seal material properties after ISO 1817 testing.]

2.2.3.6.1 Piston Wear Rings

Provide [composite] [cast iron] piston wear rings with a compressive and tensile strength of not less than 165 MPa or 24,000 psi and an embedability capability to prevent scoring of the cylinder.

2.2.3.6.2 O-Ring Seals

Use O-ring seals made from [Buna N][Viton] and designed for [_____] kPa psi service.

2.2.3.6.3 Rod Wiper/Scraper

**************************************************************************
NOTE: Use option for metal scraper ring for environment subject to ice or other materials adhering to the rod.
**************************************************************************

Provide a [high-strength polyurethane scraper ring][spring reinforced brass scraper ring] which will withstand the impact and the abrasion of materials adhering to the piston rod and have a minimum tear resistance of 120 N/mm or 685.2 pounds per inch. Split and retain the scrapers with split, bolted retainer to facilitate replacement without removal of the rod end clevis.
2.2.3.6.4  [Piston and] Piston Rod Seals

Provide low leakage V-ring, nonadjustable gland type [piston and] piston rod seals, designed for [___] kPa[___] psi service. [Provide bronze-filled polytetrafluoroethylene piston seals.]

2.2.3.7  Rod Seal Gland and Locking Device Flange

Fabricate the rod seal gland and locking device flange from bronze in accordance with ASTM B505/B505M, Alloy No. C95400 or C93200. The ice scraper, attached to the gland, bronze-filled polytetrafluoroethylene in accordance with ASTM B584, Alloy No. C86300.

**************************************************************************
NOTE: The designer should work with the cylinder manufacturer to determine if a mechanical cylinder rod locking device can be provided for gate lifting applications. These are mechanical locking devices as opposed to valves in the hydraulic circuit for holding the load in place. These should be designed by the cylinder manufacturer and submitted for approval.
**************************************************************************

2.2.3.8  Hoist Locking Device

Fabricate the hoist locking device from stainless steel in accordance with ASTM A564/A564M or ASTM A705/A705M, Type 630 or XM-12, Condition H-1150.

2.3  HYDRAULIC POWER UNIT (HPU)

2.3.1  HPU - General

Provide a self-contained hydraulic power unit. Design the packaged unit to operate the hydraulic cylinders in accordance with the criteria stated in paragraph “Design Parameters.” Design the power unit to meet the space limitations shown and configure essentially as indicated. The structure of the unit both internally and externally will be adequate for the unit to be free standing and capable of being lifted or moved without structural damage. Securely attach all components including piping, motors, pumps, and manifolds to the power unit in a manner to be free of damaging vibration during operation. [Design and provide each unit with forklift tubes and lifting eyes to facilitate lifting or moving the unit, including the reservoir when full of oil.]

**************************************************************************
NOTE: If due to install assess limitations the assembly may need to be modular. The HPU must be designed to be modular by having flanged or fitting connection points. Split skids will need to have connection that allows either field sealing or other method for leak proof oil containment.
**************************************************************************

2.3.2  Oil Containment Skid

The entire HPU, including the reservoir, pumps, all piping, valves and routing shall be within an oil containment skid, that is able to hold 1.5 times the total system volume without loss of fluid. Provide threaded SAE fitting with O-ring for drainage with normally closed manual ball valve...
UFGS

with installed. Design and provide the skid with forklift tubes and lifting eyes to facilitate lifting or moving the entire assembly, including the reservoir when full of oil.

2.3.3 Pumps

*****************************************************************************************************************************************

NOTE: Only use the submerged pump option where space is restricted so that the pump cannot be mounted on the exterior of the reservoir with the pump suction flooded.

If the designer elects to select the particular type of pump to be used, consider the following factors: displacement, pressure rating, prime-mover speed, rated pump life, initial cost, mountings available, serviceability, porting connections, availability, compatibility, product history, efficiencies, and size and weight. Fixed displacement pumps are usually lower in cost, on a component basis. However, weigh the lower initial cost of the pump against the cost of the control components needed to make the system work. Variable displacement pumps, conversely, are generally higher in cost, but less control equipment may be needed to achieve the same result. The reduced control costs may more than offset the higher initial pump cost. As a general rule, gear pumps are usually least costly, vane pumps intermediate, and piston pumps most costly. However, on the basis of cost per watt (horsepower), there is no clear-cut rule. Evaluate each application individually.

*****************************************************************************************************************************************

Provide pumps in accordance with the following general requirements below and in the paragraphs that follow:

a. Pumps must be [submersible,] electric motor-driven, [variable] [fixed] displacement, [gear] [vane] [piston] type pump[s].

b. Equip pumps with constant wattage horsepower control to regulate flow rate and pressure.

c. Pumps must be rated to [rated to deliver a nominal [_____] L/s at [_____] kPa [_____] gpm at [_____] psi] while operating with the specified oil in the specified temperature range.

d. The pumps must be rated for continuous operation at a discharge pressure equal to or greater than the system design pressure.

d. Maximum rotating speed must be no greater than 1800 rpm.

e. Equip the pumps with safety guards for all exposed rotation parts.

f. Mount the pumps [in] [on] the reservoir in a manner similar to that indicated so that the pump suction is flooded.

g. Pump ports to be [NPT] [tapped NPTF] [tapped for straight pipe threads]
[drilled and faced for flange connections] [socket weld] [SAE with O-ring]. Use of fitting adapters does not constitute compliance with these fitting requirements.

h. Operate the pumps on [_____] volts, 60 Hz, three phase power.

2.3.3.1 Gear Pumps

Provide [fixed] [variable] [or] [_____] type gear pumps that meet the following requirements:

a. Make Covers and center section from [high strength aluminum alloy die castings] [steel] [cast iron].

b. Make thrust and wear plates from [heavy-duty bronze coated steel] [bronze] [or] [_____] .

c. Use manufacturer's [standard] [or] [_____] shaft seals for rotary pumps.

d. Seals, wear plates and other wearing parts must be replaceable and suitable for the application, duty, and temperatures involved.

2.3.3.2 Vane Pumps

2.3.3.2.1 Fixed Displacement Vane Pumps

Fixed displacement vane pumps must meet the following requirements:

a. Pumps must be of the hydraulically balanced type.

b. Make pump and components from the following materials:

1) Housing - [high tensile strength ductile iron] [cast iron] [_____] 
2) Vanes - [heat treated high-speed tool steel] [_____] 
3) Shaft and rotor - [case hardened steel] [_____] 
4) Cam ring - [high carbon chromium steel] [_____] 
5) Seals - [Buna N] [nitrile rubber] [fluoroelastomer] [_____] 

[ c. Provide double vane pumps when indicated]

2.3.3.2.2 Variable Displacement Vane Pumps

Variable displacement vane pumps must meet the following requirements:

a. Incorporate means for varying the pump displacement from zero to the maximum rated quantity while the pump is operating against the system pressure indicated.

b. Materials as specified for fixed displacement vane pumps.

c. Arrange pumps for adjustment of discharge volume by [mechanical] [electrical] [hydraulic] [pneumatic] means.

d. Control the pump displacement by [integral automatic pressure compensation] [adjustment screw] control.
e. Provide the pump casing with a tapped outlet for connection of an external drain line.

2.3.3.3 Piston Pumps

Piston pumps must meet the following requirements:

a. Provide [cylinder block in-line] [axial fixed] [axial variable] [or] [_____] type piston pumps.

[In-line type must be capable of reversing flow direction and flow rate by means of external valve bank][Axial variable type must be capable of providing reversed flow with constant direction of input shaft rotation.][Axial variable type to be suitable for control of displacement [and direction of flow] by [manual] [mechanical] [hydraulic] [electric] [pneumatic] devices.]

c. [Provide manually adjustable maximum and minimum limits of displacement in each direction of flow.]

2.3.4 Filters

**************************************************************************
NOTE: Use duplex filters only if continuous operation is necessary without shutting down the system for replacement of the filter element.

To ensure maximum reliability of the system and reduce repairs to or replacement of the system components, specify the filtration level for the system by the Beta ratio, the ratio of the number of particles in a certain size range upstream of the filter to the number of particles in that size range downstream of the filter. This will however increase initial costs and filter maintenance.

Filter media type and filtration level should be coordinated with the supplier of the hydraulic fluid to ensure that the fluid is compatible with the chosen filter and that the filter does not inadvertently remove additives.
**************************************************************************

Locate the filter[s] in the return line to the reservoir [and in the pump discharge line] [in the indicated location]. Provide the [spin-on type with a bypass and an indicator to show the condition of the filter element] [duplex type with a differential pressure device to indicate the need for filter element service]. Provide filter housing and cover of steel or cast iron construction. Bolt the cover to the main housing. Locate filters so that they can be changed without removal of hydraulic system components. Shutoff valves to be easily accessible. Equip the filter with a relief valve which protects the filter against excessive pressures. Equip the filter unit with a gauge or gauges indicating the pressure loss or a cartridge replacement indicator. Equip the filter unit with a pressure switch to signal excessive pressure loss across the filter. Each filter to have a minimum capacity of [_____] L/s [_____]gpm at a pressure drop not exceeding 69 kPa or 10 psi when filtering hydraulic fluid having a viscosity of 389 SSU at 38 degrees C or 100 degrees F. The filter

SECTION 35 05 40.14 10 Page 43
cartridges will not remove additives from the hydraulic fluid. [The filter element to have a rating of [[_____] µm absolute] [10 µm absolute unless a smaller mesh is recommended by the manufacturer of the component with the highest cleanliness requirement].] [The filter element to have a minimum silt control rating as approved and Beta rating of 200 [ ] at 400 kPa or 60 psi differential pressure in accordance with [ISO 16889].] The filter to be rated for use with hydraulic oil and the pressure drop not to exceed 40 kPa or 6 psi in the clean condition. [The return filter to be pressure rated for 1400 kPa or 200 psi and a flow rate of [_____] L/s gpm.] [The discharge line filter to be pressure rated for [_____] kPa psi and a flow rate of [_____] L/s gpm.] [Determine the pressure and flow rating of the filters to be compatible with the design of the power units.] [Filters and strainers are not to be located in the reservoir, where drainage of the reservoir is necessary to inspect or service the element.] [Pump suction lines are to have a filter or strainer unless a bypass circuit is provided to prevent starving of the pump and settings confirmed with pump supplier, and the filter or strainer element’s status is clearly displayed and the element is accessible without system drainage.]

2.3.5 HPU Nameplate and Labeling

Provide nameplates for each gauge, port and device of the HPU, and submit for approval. Nameplates to clearly indicate the function of each device and, in the case of manually operated items, indicate the condition established for each position. Machine engrave [print] lettering on nameplates on [steel plate] [plastic laminate with white characters on a black background]. Mount instruction plates on a rigid backing and covered with clear, rigid plastic sheeting. Use metal wire to secure the nameplate when a panel or flat surface is not available.

2.4 OIL RESERVOIRS

******************************************************************************
NOTE: Remove requirement for painting if reservoir is to be stainless steel. The design and sizing of the hydraulic reservoir is a critical feature. The designer should utilize EM 1110-2-2610 for sizing the reservoir or allow the manufacturer to determine the final size.
******************************************************************************

Size the oil reservoir [as indicated] [to meet the space limitations indicated] [in accordance with the manufacturer requirements as approved]. Fabricate the reservoir of [steel] [stainless steel] with welded joints and conform to the requirements as shown. Fabricate the reservoirs in accordance with ISO 4413. Provide a bolt-on mounting base along side of the reservoir which supports the motor-driven hydraulic pumps, associated valves and accessories for design loads and speeds. The bottom of the reservoir to have a minimum clearance from the floor of not less than 0.3 m or 12 inches. Shape and slope the reservoir bottom to facilitate emptying and cleaning. A foot valve or check suction lines to provide flooded inlets to the pumps. Provide each side of the reservoir with a cleanout opening of not less than 0.26 square meters or 400 square inches clearance with a bolted, gasketed cover. Provide each reservoir with a drain with shut-off valve [threaded for an SAE fitting]; a magnetic trap; low oil float level switches; and other appurtenances as indicated and as specified herein. Equip the reservoir with a fluid level indicator and filler with built-in strainer [that can be inspected and cleaned without need to drain.
the reservoir or access to the inside of the reservoir. Provide a baffle between the intake and return lines to facilitate the separation of air and foreign matter from the hydraulic fluid. The connection between the two chambers of the reservoir to connect high enough from the bottom to form a settling chamber. Bring both the intake and return pipes down to a distance of 1-1/2 pipe diameters above the tank bottom. Clean interior surfaces of the reservoir down to bright metal and coated with an epoxy-based urethane finish or an approved alternate that is compatible with oil and water.] Finish the welded joints of the reservoir smooth and free from irregularities. Do not grind welds to an extent that weakens the reservoir. Until final installation of the hydraulic equipment, seal all openings with plastic closures. The capacity of each reservoir not to be less than [_____ liters [_____] gallons] [and include capacity for all accumulators discharged to 0 psig]. Anchor the reservoirs to the concrete by suitable anchor bolts. Furnish all piping, fittings, hose, manifold blocks, fasteners and appurtenances required to connect equipment to the reservoir. [After painting, insulate the exterior of the reservoir with a polystyrene, polyurethane, or foamglass type insulation. The insulation to be compatible with oil and not retain moisture. The insulation thickness to be 50 mm or 2 inches on all surfaces other than the top.]

2.4.1 Reservoir Heater

**************************************************************************

NOTE: Proper selection of the hydraulic fluid may eliminate the need for a reservoir heater.

**************************************************************************

Provide the reservoir with one or more screw plug type immersion heaters with a watt density not to exceed 17 kW/square meter or 11 watts per square inch and a [built-in][remote] thermostat set to maintain the hydraulic oil at 5 degrees C or 40 degrees F. Fabricate the heater sheath and screw plug from stainless steel. Total heating output to be [___] watts] at [_____] volts AC. Supply the heater with a watertight, stainless steel, NEMA 4X terminal housing as a minimum. Provide a weatherproof junction box with a single phase, [120][___] volt, control transformer for the thermostat and high temperature circuit. Install the heater in a location on the reservoir vessel to maintain complete submergence of the heating element during all operating level fluctuations within the reservoir.

2.4.1.1 Heater Switch

Provide a thermostat to sense the oil temperature in the tank and close its contacts when the temperature drops below [10] [_____] degrees C [50] [_____] degrees F as indicated. Provide a bulb and capillary type thermostat and provided with a protective well which extends into the tank. The temperature adjustment range to be 10 degrees to 38 degrees C or 50 degrees to 100 degrees F with plus or minus 1 degree C or 2 degrees F differential switch. Fit the switch with an external calibrated adjustment knob. The thermostat to be rated for 15 amperes at 120 volts. Provide weatherproof junction box.

2.4.1.2 High Temperature Switch

Provide a thermostat to sense the oil temperature in the tank and close its contacts when the temperature exceeds [50][_____] degrees C [122][_____] degrees F as indicated. The thermostat to be of the bulb and capillary type and provided with a protective well which extends into the tank. The
temperature adjustment range to be 10 to 149 degrees C or 50 to 300 degrees F with plus or minus 1 degree C or plus or minus 2 degrees F differential switch. Fit the switch with an external calibrated adjustment knob. The thermostat to be rated for 15 amperes at 120 volts. Provide weatherproof junction box.

2.4.2 Magnetic Separators

Provide the manufacturer's standard magnetic separator in the reservoir. The magnetic separator consists of a high-strength permanent magnet arranged for rigid mounting with the poles of the magnet exposed to the fluid in the reservoir. The magnet to be [combined in the construction of the fill strainer] [mounted on a removable rod assembly installed through the top of the reservoir] [incorporated in the bottom drain plug]. [The drain plug type installation to incorporate an automatic valve arranged to permit removal of the magnetic separator for inspection without loss of fluid from the reservoir.] [The drain plug type installation to include provisions for automatic chip detection without removal of the plug.]

2.4.3 Low Level Float Switches

Provide each power unit with two float switches. Provide flanged switches and install inside a 125 mm or 5-inch nominal diameter pipe to eliminate surge effects. The thermostat mercury type switches to have a narrow differential and be rated for 13 amperes at 120 volts. Set switches to close when oil level rises above or drops below those recommended by the manufacturer and observed during operational tests. Provide a NEMA 4X junction box.

**************************************************************************
NOTE: If a flow meter is necessary, the designer should select an electronic flow meter or visual flow meter. The detailed design should be provided by the hydraulic power system manufacturer and fabricator.
**************************************************************************

2.4.4 Air Breather

**************************************************************************
NOTE: Where space allows, flexible reservoir breathers are the preferred method of preventing or controlling the introduction of outside air into the reservoir. Delete either of two paragraphs which are not needed.
**************************************************************************

Provide the reservoir with an air breather which removes dirt and moisture from the incoming air. The incoming air to first pass through a desiccant bed to remove the moisture, and then pass through a filter to eliminate the solid contaminants before entering the reservoir. Outgoing air to pass directly to the atmosphere through a check valve. The breather to also provide visual indication of the desiccant and filter condition.

2.4.5 Flexible Reservoir Breathers

Provide each hydraulic power unit with flexible reservoir breather units to eliminate the introduction of outside air into the reservoir during normal
operation of the system and to accommodate expansion and contraction of the
air inside the reservoir. The breather units to be of sufficient capacity
to accommodate the differential volume of the reservoir. The flexible
reservoir breathers to have a bladder compatible with the system hydraulic
fluid. Equip the reservoir breathers with pressure vacuum breakers. The
shell to be free standing and of rugged construction made of steel,
fiberglass or other material as approved. Construct and mount the breather
in a manner to facilitate bladder replacement. Provide piping to the
breather with adequate pipe unions and screwed fittings to facilitate
repair or replacement of the vent bladder. Install, securely attach and
support the units as shown on the hydraulic power unit.

2.4.5.1 Pressure Relief and Emergency Venting

Provide a pressure relief system consisting of inline check valves and
breathers in the breather piping, as indicated, to prevent collapse or "oil
canning" of the tank. The check valve in-line with the breather to be
removable to permit venting the reservoir during setup. Direct the air in
the tank to the flexible breather during normal operations. The breathers
to be of the threaded type with steel shell and nylon strainer and guard
and rated for [127][_____] cubic meters per hour [75][_____] cubic foot per
minute. The inline free flow check valves to be the threaded type with a
13.8 kPa or 2 psi cracking pressure.

2.4.6 Oil Level Gauge (Sight Glass)

Provide an [a continuous] oil level gauge with an indicating length of not
less than 300 mm 12 inches on each unit and position to give a visual
indication of the oil level in the tank including the "low level", "add
oil", "nor. min. level", and "max. level" marks. After the system is
operational and all tests complete, permanently mark the levels on the tank
in a manner approved by the Contracting Officer. Gauge material to be
compatible with hydraulic fluid and acceptable for use over full range of
system fluid temperatures without staining or distortion. [Oil level gauge
material to be shatter-proof.] [Oil gauge housing design to provide
protection to the gauge glass.] [Gauge to be located so that it not
susceptible casual damage.]

2.5 ACCUMULATORS

Provide bladder type suitable for charging with nitrogen. [Provide the
indicated number of accumulators with the fluid capacity not less than
[_____] [L] [gallons]]. [Provide a tee with a [_____]L gallon accumulator
in the pressure line at each cylinder.] Design the accumulators in
accordance with ASME BPVC SEC VIII D1 for a rated working pressure of not
less than [_____] kPa psi. [Accumulators should be stamped and certified
per ASME standards.] Equip accumulators with a safety device to release
excessive pressure before the burst pressure is reached. Arrange
accumulators so that pressures can be checked and bladders can be easily
changed without the removal of other components. Provide a ball type
shutoff valve for each accumulator. [Lever (Handle) of shut-off valve to be
located and oriented such that its position and access for use is not
impeded by other components.] [Valve lever to be lockable with a locking
tab eye sized for a common pad lock diameter.]

2.6 PIPE, TUBE, HOSE, AND APPURTENANCES

**************************************************************************

NOTE: Tubing is recommended for indoor and or
protected environments where damage due to flooding, ice, debris, vibration or personnel traffic is not likely to occur. Use caution when specifying tubing applications in larger diameters as the available working pressures of the tubing may be lower than anticipated operating pressures of the hydraulic system.

Recommend providing an Engineering Consideration for In Field Personnel to have QA performed on the installation, assembly and testing of any threaded piping connections specified to ensure a leak free design.

Tube and tube fittings are readily commercially available in sizes up 1 inch nominal size. Tube fittings above 1 inch in size are less common and it is preferred to use pipe at sizes 1 inch and above.

**************************************************************************

2.6.1 Piping

2.6.1.1 Pipe - General

Design piping, tubing, and hose for a working pressure of [_____] kPa psi. [Use pipe when a 25 mm or 1 inch or larger diameter is required. Use tubing when less than 25 mm or 1 inch diameter is required.] [Provide external cylinder piping as indicated.] Weld pipe as indicated. Provide pipe, tube, and fittings in accordance with ASME B31.1 and subsequent addenda unless otherwise specified or indicated.

2.6.1.2 Pipe

Use seamless [steel conforming to in accordance with ASTM A106/A106M, Grade B] [stainless steel in accordance with ASME B36.19M and ASTM A312/A312M, Grade TP304]. Supply carbon steel pipe in the pickled and oiled condition. The piping weight class to be Schedule 80 [___].

2.6.1.3 Pipe Fittings

Use socket welding type pipe fittings in accordance with ASME B16.11 and made of [steel in accordance with ASTM A234/A234M, Grade WPB] [stainless steel in accordance with ASTM A182/A182M, Grade F304]. Provide pressure class [_____] kg pounds. Flanges in accordance with ASTM A182/A182M with the grade suitable for the pipe to which attached. Also conform threaded fittings to the above, but use only where absolutely necessary for the application.

2.6.1.4 Unions

Provide O-ring type unions, made of stainless steel with socket-welding ends. The Contractor may, as an option, substitute four bolt split flanges with [Buna N] [Viton] O-rings for the unions.

2.6.2 Tubing

2.6.2.1 Hydraulic Tubing

Stainless steel tubing used for hydraulic circuits in accordance with
2.6.2.2 Tube Fittings

Provide flareless type with SAE straight threads and [Buna N] [Viton] O-ring seals. Each fitting to hold the tubing with a chucking action and provide a firm flat grip on the tubing without penetration of the tubing wall. Fittings not to twist the tubing during assembly. Provide a leak-proof seal at the rated working pressure of the tubing. Each fitting connection to be capable of no less than 30 connect - disconnect - reconnect cycles without galling, leakage or any other damage. Provide all tube fittings without special adaptors or custom-designed assemblies. Provide Type 304 stainless steel fittings that conform to SAE J514.

2.6.3 Hose

**************************************************************************
NOTE: Carbon steel hose fittings can be evaluated by the designer for use depending on the application. Any applications that are submerged should utilize stainless steel fittings.
**************************************************************************

2.6.3.1 Flexible Hose

All flexible hoses to have an inside diameter to match the line size to which it is to be connected to. A minimum working pressure of the hose to be rated not lower than the system operating pressure indicated with a factor of safety of 4. Provide hose in accordance with SAE J517, 100R9. The hose used for general industrial use in hydraulic systems provided with petroleum base hydraulic fluids. Provide a synthetic rubber tube with four spiral wire reinforcements and a synthetic rubber cover. Each end of the hose to have a straight split stainless steel flange fitting in accordance with SAE J518-1, Code [61][___]. Design fittings specifically for use with the hose selected and as recommended by the hose manufacturer. Install the fittings using the internal skive crimp method. Make fittings of [stainless steel][carbon steel] and of the reusable type. Fit the hose with a nylon sleeve to protect and prevent abrasion of the hose cover. Maintain minimum bending radii. Use hydraulic hose in locations where system pressure fluctuation is subject to occur, such as the hydraulic pump pressure, return and case lines, and system solenoid control valves. Install hoses with uniform and neat routing such that they are not-overlaying one another and are without kinks, sharp bends, binding, or rubbing throughout the entire motion of the hydraulic actuator. Protect the finished surfaces prior to installation of the flanges.

2.6.4 Manifolds

Provide pre-drilled manifold blocks for connection of control valve assemblies. Construct each manifold block of [aluminum per ASTM B209][stainless steel per ASTM A240/A240M][ductile iron per ASTM A536]. Machine ports and passages smooth and free of burrs and sharp edges. Arrange manifold block interconnecting passages and valving so as to provide the system connections and functions as indicated. Manifold block interconnecting passages and valving to be of ample proportions to minimize internal pressure losses. Machine surfaces and recesses where valving and other components are installed to the specifications of the applicable valve or component manufacturer. Make provisions for attaching the hydraulic piping to the manifolds by the use of flanges as specified in
Pipe Fittings" and as indicated. Adapters are not to be used to
make the manifold port comply with the fitting requirements. The manifold
in accordance with the valve manufacturers' recommendations to provide for
installation of valves, flanges, and accessories. Make hydraulic
interconnections between the manifold and piping with 4 bolt flanges.
Design the manifold for a minimum pressure rating of not less than
[kpa] [psi] at 66 degrees C or 150 degrees F except as
specified. Locate components on the manifold in positions as indicated.
All components as specified by their model numbers and mounted to the
manifold in accordance with mounting details indicated and in the
manufacturer's catalogs.) [Supply manifolds with manifold enclosures
rated for submergence to [m] [feet].] [The manifolds and all
attached valves, equipment, and electrical devices to be rated for
submergence to [m] [feet].] [Provide test ports as shown on the
schematics and fitted with diagnostic connectors with stainless steel quick
coupling nipple and accessory stainless steel metal dust cap.] piping and
hose layout is to not cause radial loading of manifold ports.

2.6.5 Valves

Provide a minimum pressure rating of [kPa] [psi] unless stated
otherwise. Where possible, manifold mount valves. Manifold mounted valves
to be either cartridge type or subplate mounted. Provide socket-welded
piping connections on non-manifold mounted valves 25mm or 1-inch or
larger. Provide valves less than 25 mm or 1 inch with SAE straight thread
ends and [Buna N] [Viton] O-rings with tube fittings. Valves to be
specifically designed and rated for hydraulic system applications.[Provide
nameplates for for all valves and submit for approval. Nameplates to
clearly indicate the function of each device and indicate the condition
established for each. Machine engrave [print] lettering on nameplates on
[steel plate] [plastic laminate with white characters on a black
background. Secure to valve with metal wire.]]

2.6.5.1 Shut-Off Valves

Provide in-line mounted, stainless steel, lever operated, ball type.
Shut-off valves at piping manifolds of each cylinder at the upstream and
downstream locations for the main supply and return lines to be [50]
[mm] [inch] line size, rated for a working pressure of
[21] [MPa] [3000] [psi], with socket-welded ends, double acting
ball type. Shut-off valves for all other lines to be ball type, match the
line size, and have a maximum allowable working pressure of [21] [MPa]
[3000] [psi]. The valve ends to have socket-weld pipe connections
drilled to receive SAE Code [61] [flanges. Provide a removable
operating lever for each valve. Valves to be specifically designed and
rated for hydraulic system applications. Provide with stainless steel
valve trim including handles. The valves to have replaceable seats and be
repairable without disturbing the welded connections. [Valves must have a
lever that is lockable with a locking tab eye sized for a common pad lock
diameter.]

2.6.5.2 Needle Valves

Supply needle valves of stainless steel construction and designed for fine
flow regulation. Use [Buna N] [Viton] stem sealing O-rings.
2.6.5.3 Manual Control Valves

2.6.5.3.1 Flow

Flow control valves to be [subplate mounted for socket-welded piping] [line mounted] [manifold mounted cartridge valves]. The valves to be pressure-compensating, free flowing in one direction, and adjustable. The valves to be capable of being locked in position to prevent an unintentional adjustment. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"].[*]

2.6.5.3.2 Manual Four-Way Directional Control Valves

The rotary shear seal type, open or closed center, and detent or spring centered as indicated. The valve to be three position, [subplate mounted with socket-welded piping connections] [line mounted]. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"].[*]

2.6.5.4 Solenoid Operated Control Valves

**************************************************************************
NOTE: Solenoid operated control valves can be configured many ways. Two specific types are specified below as they are commonly used in USACE hydraulic systems. Designers should add additional valve types/configurations as needed.
**************************************************************************

Solenoids to be rated for continuous operation without damage or malfunction. Solenoids to operate the valves within a 10 percent fluctuation range. Totally enclose all moving parts and windings of the solenoids to prevent entrance of dirt and moisture. Pilot fluid supply to be internally supplied and externally drained from the power circuit. Vent both end cap chambers as necessary to achieve spring centering. [Equip the valve with manual [push detent][lever] weather protected overrides.]

2.6.5.4.1 Pilot-Operated, Solenoid-Controlled Four-Way Directional Control

Pilot-operated, solenoid-controlled four-way directional control valves to be [two][three] position and [open][closed] centered as indicated. Provide pilot operated valves with [a single] [two] solenoid[s], subplate mounted with [socket-welded piping] [tubing] connections. The valve's amplifier to be of the same manufacturer as the throttle valve. Provide a power supply for the valve and amplifier with an input of 120 volts AC. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"].

2.6.5.4.2 Solenoid Operated Proportional Throttle Valve

Hydraulically control the rate of oil flow into the manifold by an electrohydraulic proportional throttle valve with electrical feedback setting. The throttle valve's amplifier to be of the same manufacturer as the throttle valve. Provide a power supply for the throttle valve and
amplifier with an input of 120 volts AC. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters].

2.6.5.5 Pressure Relief Valves

Provide adjustable pressure relief valves with a body designed for a set pressure of [_____] kPa psi. Relief pressure to be adjustable between [_____] kPa psi and [_____] kPa psi. [The valve to have the capacity to pass [_____] L/s gpm.][Determine the flow capacity in accordance with the design criteria stated in paragraph "Design Parameters]. Provide balanced piston type relief valves. Valve bodies to be of close grain alloy cast iron, cast steel or forged steel. Valve pistons to be hardened, alloy steel. Finish grind valve pistons to provide an interchangeable fit. Valve springs to be alloy steel or music wire. All relief valves to be field adjustable within the specified relief pressure adjustment range with a [key-lockable][_____] adjustment handle. Final factory settings as indicated, unless otherwise approved in writing by the Contracting Officer. [Provide manifold mounted type valves.]

2.6.5.6 Unloading Valves

**************************************************************************
NOTE: Unloading valves provide free passage through a low pressure area when a signal is applied to a pilot connection. An unloading valve is normally located in the pump discharge line so that the pump can unload to the tank at a preset pressure. In a typical application, unloading valves may be arranged to accept a signal from an accumulator. At a predetermined pressure value, when the accumulator is charged to the preferred level, the pump unloads to the tank.**************************************************************************

Provide adjustable unloading valves designed for [_____] kPa psi service. Set the pressure as shown and determine the flow capacity so that the valve operates without cavitation.

2.6.5.7 Supply Spring Loaded Check Valves

Provide supply spring loaded check valves of stainless steel construction, the ball or poppet type with a body designed for high shock and [_____] kPa psi service.

2.6.5.8 Return Spring Loaded Check Valves

Construct the return spring loaded check valves of stainless steel, the ball or poppet type with a body designed for [_____] kPa psi service. Cracking pressure to be [_____] kPa psi.

2.6.5.9 Bleeder Valves

Provide 6 mm or 1/4 inch, stainless steel construction, wrench operated bleeder valves.

2.6.5.10 Pressure Snubbers

Provide stainless steel pressure snubbers for all pressure gauges and...
pressure switches to protect against shock and provide more stable instrument operation.

2.6.5.11 Counterbalance Valve

**************************************************************************
NOTE: For hydraulic cylinders with attached flexible hoses, a counterbalance valve should be installed directly on the cylinder so that the lower hose is not subjected to a static load.
**************************************************************************

Install in the oil line to the bottom side of the hoist piston as indicated to balance the load being held by the cylinder. The valve to be directly operated, internally drained, and adjustable for operating over a pressure range of [_____] to [_____] kPa psi. Design the valve for a system operating pressure of [_____] kPa psi. Provide the valve capacity rating of not less than [_____] L/s gpm. Permit unrestrained flow to the underside of the hoist piston and retain pressure in the hoist cylinder in the amount of the valve's pressure adjustment. [Each valve to be remote pilot operated with a check valve.] [Each valve to have an adjustable flow control valve in the pilot pressure line.] The counterbalance valve to be factory set in accordance with the settings as indicated.

2.6.6 Pipe and Tube Hangers and Supports

Locate all pipe support devices at intervals no greater than 2 m or 6 feet between centerlines of adjacent supports, except as modified as specified. Install support devices on both sides of a bend within four nominal pipe or tube diameters of the bend location. Furnish all supports, hangers, sleeves and brackets complete with compatible mounting hardware and appurtenances. Conventional pipe hangers and support in accordance with MSS SP-58 type as required. Provide stainless steel pipe supports and hangers. Provide special hangers and anchors as indicated. Construct tube supports of stainless steel hardware with polypropylene support halves. Provide each tube support with all mounting hardware required to connect with the appropriate anchorage system.

2.6.7 Sleeves and Wall Brackets

Fabricate sleeves and wall brackets of stainless steel as indicated.

2.6.8 Pipe Penetration Seals

Provide modular mechanical type pipe penetration seals, consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe and opening. Assemble links to form a continuous rubber belt around the pipe with a pressure plate under each bolthead and nut. Tightening of the bolts to cause the rubber sealing elements to expand and provide a watertight seal.

2.7 INSTRUMENTS AND APPURTEENANCES

2.7.1 Pressure Gauges

**************************************************************************
NOTE: Panel mounted pressure gauges and other sensors and or valves connected to the manifolds are recommended to avoid loose connections or items that

SECTION 35 05 40.14 10 Page 53
can be bumped or disturbed. Avoid stem mountings.

Provide in accordance with ASME B40.100, with a black enameled metal case, a 115 mm or 4-1/2 inch dial, and a stainless steel Bourdon tube. The scale range of the gauge to be approximately 150 percent of the maximum pressure of the line in which installed. Provide safety type gauges with solid fronts and blowout backs. Provide each gauge with a pressure snubber. [Mount gauge as indicated.] [Panel mount the pressure gauges and make them readable from the front of the power unit after opening the doors of the enclosure.] Provide bottom tap gauges and gauge lines in horizontal pressure lines.

2.7.2 Pressure Transducers

Install pressure transducer as indicated to permit measurement and remote reading of the pressure in the system. Provide a transducer of the bonded strain gauge design with a pressure range of 0-21 MPa 0-3000 psi. The electrical output to be 4-20 mA with an accuracy of plus or minus 1 percent. The transducer to have a shielded electrical conductor cable of sufficient length to extend to the terminal strip in the junction box. Provide stainless steel housing construction with SAE hydraulic connections. Equip the pressure transducer with two adjustable setpoint switches that are integral to the unit to provide protection control. Alternatively, provide standard 4-20mA pressure transducers as approved.

2.7.3 Pressure Switches

Provide a minimum pressure rating of [_____] kPa psi with set point operating as shown. Enclose the switches in watertight, [galvanized] [stainless] steel, NEMA 4X housings. Provide the switches with a normally open, normally closed contact having a minimum rating of 5 amps, 125/250 volts AC.

2.7.4 Thermometers

Provide a direct indicating thermometer to indicate fluid temperature in the reservoir. Do not use Mercury in thermometers. [Provide a bimetallic type thermometer [mounted directly on the reservoir] [and panel mounted as for the pressure gauges].] [Provide a remote reading, capillary tube-and-bulb type thermometer, panel mounted.] Provide a minimum 75 mm or 3 inch dial with black markings on a white background, with scale range of minus 5 to plus 115 degrees C or 20 to 240 degrees F. Provide a corrosion resistant case and stem, and stainless steel wetted components. Provide thermometer wells of the separable socket type for each thermometer with a direct type bulb.

2.7.5 Flow Meter

2.7.5.1 Electronic Flow Meter

The flow meter to accurately measure the volumetric flow rate of fluids in the hydraulic system. The unit to be capable of directly measuring flow and constructed to be compatible with the hydraulic operating system. Convert the flow rate into a 4 to 20 mA signal. The mounting to be in-line with threaded connections and the unit capable of measuring flow rates up to [4.7][_____] L/s [75][_____] gpm with an accuracy of less than or equal to 2 percent of the measured value.
2.7.5.2  Visual Flow Meter

Provide an in-line flow meter with a spring loaded variable area annular orifice metering disk for measuring hydraulic fluid flow with a minimum pressure rating of 21 MPa or 3000 psi. Provide visual indication of the flow rate in the range of [0.32 to 3.2 L/s] [_____] [5 to 50 gpm] [_____]. The viewing window to be graduated to the flow range and of sealed glass construction.

2.7.6  Flow Switch

Provide thermal dispersion type flow detection switches with no moving parts and temperature sensors utilized to monitor flow or "no-flow" condition and be field adjustable with SPDT relays to detect flow in the range of [0-3.2][_____] L/s [0-50][_____] gpm. Provide with powder coated steel or aluminum housing, splash-proof construction. Make the sensors of stainless steel construction. Operating temperature to be -29 to 177 degrees C or -20 to 350 degrees F and the operating pressure 0-28 MPa or 0-4,000 psig. Use either threaded or flanged connections. Electrical requirements are 120V, 60Hz, 4 watts. The relay output to be SPDT 3 amps resistive. Electronics associated with the sensor may be either integrally mounted of weather-proof construction or remotely located within NEMA 4 rated junction box at the cylinder manifold or located within the machinery rooms with extended cabling.

2.8  HYDRAULIC MOTORS

Provide [gear; vane; in-line piston; bent-axis piston; and radial piston] [high speed, low torque (HSLT) or low speed, high torque (LSHT)] Hydraulic Motor having a displacement of not less than [_____] cubic inches per revolution and rated for a system pressure of not less than [_____] psi. The maximum rated speed must be not less than [_____] rpm. Transmit the motor torque to [_____] via a [_____] connection. Provide [_____] ports. The case drain leakage rate at rated system pressure must not exceed [_____] gpm. Motor to be mounted [horizontally; vertically; as shown on drawings]. The motors will be used to provide [_____].

**************************************************************************

NOTE: If motor is to operate in a reverse capacity, then the displacement and speed in the reverse direction must also be specified in same manner as primary direction.

NOTE: If motor use is "non-standard", specifier should consider requiring a submittal from motor manufacturer certifying acceptable use of their motor in the prescribed manner.

**************************************************************************

2.9  HYDRAULIC FLUID

**************************************************************************

NOTE: The designer should consult with the fluid supplier to ensure the hydraulic fluid is compatible with the filtration system used and that the filtration does not inadvertently remove portions of
the additive package.
**************************************************************************

2.9.1 Petroleum Based
**************************************************************************

NOTE: Specify the hydraulic fluid by brand name only if it is necessary for the fluid to be compatible with the fluid in an existing hydraulic system.

Mineral oil hydraulic fluids are the most common within USACE and will work for a majority of applications. They are refined with the addition of additives, which range from anti-wear (AW), rust and oxidation inhibitors (RO), anti-foaming, and viscosity index (VI) improvers. These fluids offer a lower cost alternative to synthetics and can be very comparable in performance when certain additive packages are included.

Viscosity should be determined by the pump type. ISO Grade 32 and 46 and 68 are the most common. Not having the correct viscosity for the application will dramatically reduce the average life of the pump and system, thereby directly reducing its reliability and production. When selecting the appropriate viscosity grade, look for the optimum viscosity required by the pump. This can be determined by collecting data from the pump original equipment manufacturer, actual operating temperature of the pump, and the lubricant properties referenced to the ISO grading system at 40 and 100 °C (104 and 212 °F).

NOTE: A minimum requirement of the Kinematic Viscosity at 40°C = 22 mm²/s (1 mm²/s = 1 cSt = 0.01 St). Lower values, for example 15 mm²/s at 40°C, can be allowed but special seals (similar to low friction seals) are advised. Chevron seals or U-cup seals at 15 mm²/s at 40°C can give friction problems and high wear. Of course, this is also depending on the viscosity index. The absolute minimum viscosity at maximum operation temperature should be no lower than 10 mm²/s.

The designer needs to carefully consider any applications of EA hydraulic fluid to insure proper system performance. Types of EA fluids generally considered to have acceptable properties in the variety of conditions found on civil works projects include synthetic esters and polyglycols (PAG’s). Biobased fluids can also be considered, depending on the application, but the designer needs to carefully consider their performance. Some polyalphaolefins (PAOs) can also be considered EA fluids. Grade of filter to introduce hydraulic into the system through depends on the final target cleanliness of...
the system and the cleanliness requirements of individual components.

Use the hydraulic fluid during shop testing, [to fill the cylinders before shipment,] flush the system after installation, and to fill the complete hydraulic system to be [[_____] Petroleum Corporation's [_____] hydraulic oil which has a high viscosity index, low pour point, and antifoam properties,] [an all-weather type hydraulic oil which has a high viscosity index, low pour point, rust and oxidation inhibitors, and antifoam properties]. The oil to have an ISO viscosity grade of [_____] and a pour point of minus [_____] degrees C degrees F. [Formulate the oil to separate quickly from water to prevent formation of emulsions.] [Provide hydraulic fluid certified by the manufacturer as fire resistant in accordance with NFLPA T2.13.1.] Filter fresh hydraulic fluid through a [10 µm] filter before it is added to the system. Introduce clean and fresh hydraulic fluid [5] [_____] µm filter before it is added to the system. Provide letters of assurance from the hose, pump, motor, valve, and cylinder manufacturers that the oil provided is satisfactory for use in their equipment in this application. Supply all oil and furnish two [210][_____] L [55][_____] gallon containers to the Government for a reserve supply.

2.9.2 Environmentally Acceptable

NOTE: The designer should reference EM 1110-2-1424 for further discussion on EA hydraulic fluid. ISO 15380 identifies four categories of biodegradable hydraulic oil: These four categories of EA hydraulic fluids include:

* Synthetic Esters (SE) - ISO Classification HEES
* Polyglycols (particularly Polyalkylene Glycols (PAG)) - ISO Classification HEPG
* Triglycerides (vegetable oils and biobased oils) - ISO Classification HETG
* Polyalphaolefins (PAO) and related hydrocarbon products - ISO Classification HEPR.

USACE has also adopted a two-tiered approach for selecting EA fluids. Tier 1 is more stringent from an environmental perspective but the selection of fluids may be less available. Tier 2 is less stringent environmentally and more fluids may be available to meet Tier 2 requirements. USACE would prefer a Tier 1 fluid if available and it meets the performance requirements of the system.

A Tier 1 USACE EAL is one that conforms to a strict interpretation of the United States Environmental Protection Agency (USEPA) definition and will either:
* Be a product labeled by European Eco-label, and/or Ospar (other product labeling could be considered by an Environmental Officer), or
* Be a product classified as USEPA VGP document Appendix A compliant, or
* Have test data as specified in USEPA 800-R11-002 or in USEPA VGP document Appendix A. Test reports to indicate that it meets all requirements for
bioaccumulation, toxicity, and biodegradability. Such data may be presented as test reports or reported on product specification sheets.

A Tier 2 USACE EAL is a product that does not meet the criteria of a Tier 1 EAL, but:
* It is labeled by one or more of the following: Blue Angel, Nordic Swan, or Swedish Standard and/or,
* It contains a manufacturer's statement that it meets one or more of the test criteria (bioaccumulation, toxicity, and biodegradability) in accordance with USEPA 800-R11-002 definition or USEPA VGP document Appendix A definition, with appropriate test data to confirm the other criteria, and/or
* Its base oil indicates that it meets one or more of the test criteria (see USEPA 800-R11-002, Section 4, Table 3 for biodegradability, Table 5 for toxicity, and Table 6 for bioaccumulation), with test data to support the other criteria.

**************************************************************************

Use nontoxic and biodegradable hydraulic fluid during shop testing, [to fill the cylinders before shipment,] flush the system after installation, and to fill the complete hydraulic system. Biodegradability is defined as 60 percent or more of the fluid carbon is converted to CO2 in 28 days, using test method in accordance with ASTM D5864. Nontoxicity is defined as concentrations greater than 1000 ppm of the fluid are necessary to kill 50 percent of the test organisms in 96 hours using test method EPA 560/6-82-002. Provide [synthetic ester] [poly glycol] type hydraulic fluid. The fluid to have a high viscosity index, low pour point, oxidation inhibitors, and antifoam properties. The oil to have an ISO viscosity grade of [____], a viscosity index of [____], and a pour point of minus [____] degrees C [degrees F]. [Formulate the oil to separate quickly from water to prevent formation of emulsions.] [Provide hydraulic fluid certified by the manufacturer as fire resistant in accordance with NFLPA T2.13.1.] Introduce clean and fresh hydraulic fluid through a [10] [____] µm filter before it is added to the system. Provide letters of assurance from the hose, pump, valve and cylinder manufacturers that the oil provided is satisfactory for use in their equipment in this application.[ Supply all oil plus furnish [two] [____] [210] [____] L [55][____] gallon containers to the Government for a reserve supply.]

2.10 FASTENERS

2.10.1 Carbon Steel Bolts and Nuts

Provide in accordance with ASTM A354, Grade BC, with ASTM A194/A194M, Grade 2H nuts. Make structural bolted connections carrying primary loads with ASTM F3125/F3125M, Grade [325][490] bolts.

2.10.2 Stainless Steel Bolts and Nuts

Provide in accordance with ASTM A193/A193M, Grade B8, with ASTM A194/A194M, Grade 8 nuts.

2.10.3 Flat Washers

Provide in accordance with ASTM F844.
2.11 ELECTRICAL EQUIPMENT

**************************************************************************
NOTE: The contents of the following paragraphs are dependent on design requirements which may necessitate revision or expansion to cover different conditions and standards.
**************************************************************************

Provide electrical equipment for the hydraulic power systems as indicated and as specified. Other electrical materials and equipment required for the installation of the hydraulic power systems is specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Furnish standard catalog item electrical equipment under regular manufacture with preexisting catalog ratings equal to or better than the requirements of the Contract drawings and specifications. Accompany request for approval of equipment other than as specified or as indicated by technical and descriptive data and specifications sufficient for the Contracting Officer to determine its adequacy. Unless otherwise specified or indicated, electrical materials and equipment to meet the standards, specifications, and tests referenced.

Submit data specifications and assembly drawings showing sizes, ratings, parts and material lists, overall dimensions, and mounting dimensions with the product data.

2.11.1 Conduit, Duct, and Accessories

[___] Threads on the following equipment to be American Standard. No metric threads will be accepted.

2.11.1.1 [Plastic Coated] Rigid Metal Conduit

Hot-dip galvanize the conduit, including the threads, in accordance with ANSI C80.1 and UL 6. [The plastic coating to be factory applied by the same manufacturer who produces the hot-dip galvanized conduit. The plastic coating to have a minimum thickness of 1 mm or 0.040 inch for the full length of the pipe except for the threads and a tensile strength of 24.1 MPa or 3500 psi. Furnish a coupling loose with each length of the conduit. The bond between metal and plastic to be equal to or greater than the tensile strength of the plastic coating. The coated conduit in accordance with NEMA RN 1, Type A.]

2.11.1.2 Conduit Fittings

Provide galvanized, high test, gray iron castings. [The fittings to be plastic coated in the same manner as outlined above for the conduit.] Furnish gaskets for all covers.

2.11.1.3 Conduit and Cabinet Supports

Support conduit and cabinets as required by IEEE C57.12.70. The supports to be galvanized [and plastic coated in the same manner as outlined above for the conduit].

**************************************************************************
NOTE: The designer should consider the use of "Subsea" junction boxes, pin connectors and instrumentation components where flooding or
**************************************************************************
submergence is likely to occur. All potential water ingress points of connection must be considered for possible failure risk of the operating system.

2.11.2 Cabinets and Boxes

Provide watertight, [galvanized] [stainless] steel, NEMA 4X housings sized as required. The cabinet and box hubs to be consistent with the NEMA 4X rating of the box. Mount cabinets and boxes such that the NEMA 4X rating is not compromised. Match threads on the hubs with the threads on the conduit [_____] and to be American Standard. Metric threads will not be accepted. The cabinets and boxes in accordance with UL 50.

2.11.3 Pump Motors

NOTE: Where motor starters are provided in motor control centers, delete the reference to motor starters.

Provide in accordance with NEMA MG 1, except as specified, and designed to withstand full voltage starting. Provide a totally enclosed frame, fan cooled construction for the pump. Provide a stainless steel drain-breather similar and equal to Crouse-Hinds type "ECD Universal" and locate so that any water present can be drained from inside the motor. [Encapsulate the motors windings.] [Provide motor starters complete with properly sized thermal overload protection and other appurtenances necessary for the motors specified.] Provide manual or automatic control and protective or signal devices required for the operation, and any control wiring required for controls and devices but not shown on the electrical drawings.

2.11.3.1 Rating

The motors to operate on [_____] volts, 60 Hz, 3 phase power and sized to operate the pumps specified in paragraph "Pumps." Design the motor to operate continuously without exceeding the temperature rise permitted by the applicable NEMA standards for the class of insulation and frame construction used.

2.11.3.2 Winding Insulation

Provide winding insulation of either class F or H [with special moisture, fungus, and oil-proof treatment]. Provide winding insulation of the type designed and constructed to withstand the severe moisture conditions and the wide range in ambient temperature to which the motors will be subjected.

2.11.3.3 Winding Heaters

Install heater[s] in the motor frame or end bells or wrapped around the winding end turns. The heater to automatically turn on when the motor is not running. The heater to be capable of withstanding the same temperature extremes as the motor. Provide heaters that when energized the temperature of the motor winding will be held approximately 10 degrees C or 18 degrees F above ambient. Design them for [_____] volts AC continuous operation. The heaters to withstand 10 percent overvoltage continuously. Terminals of the heaters, including the leads, to be watertight. Terminate the leads in
2.11.3.4 Terminal Leads

Extend the motor leads outside the frame, have insulation equivalent to that of the motor winding, and terminate in a two-piece, four-position, watertight, [galvanized] [stainless] steel, NEMA 4X, terminal box secured rigidly to the motor frame. Position and seal the leads where they pass through the frame with a water-resistant seal of a synthetic rubber material or else with a synthetic rubber gasket. Thread conduit entrances to the terminal box.

2.11.4 Control Components

**************************************************************************

NOTES: Where it is desired to control, coordinate, and program components of a hydraulic fluid power system to achieve synchronization of cylinders or components or to achieve a sequence of operations in several modes, tailor system requirements and specifications for the job.

a. The programmed controller is used in modern fluid power systems where a series of operations is to be performed in a sequential order on each cycle. It can be programmed to cause a number of hydraulic cylinders or motors to follow a sequential order of operations, extending and retracting, starting and stopping, during each cycle.

b. The controller can be programmable, consisting of a console plugged into a Central Processing Unit (CPU), or a specialized microcomputer system that can be custom programmed to control a wide variety of electronic and electrohydraulic systems and components, and has the capability to interface with other controls and transducers.

c. The designer should consider the use of "Subsea" rated components where there is a possible risk of flooding or submergence.

Other types of position measurement and control equipment may be used instead of the electronic limit switch and transducer combination indicated. Many other methods of position measurement are available including some which are entirely mechanical. Select the best type for the application.

**************************************************************************

2.11.4.1 Control Devices and Wiring

Provide manual or automatic control protective or signal devices required for the specified operation and all control wiring for these controls and devices whether indicated or not. Electrical control devices to have a minimum current and voltage ratings in accordance with NEMA ICS 2 contact rating designation A 300, as applicable, unless larger ratings are indicated or are required. Provide control devices with the number and
arrangement of contacts required to perform the specified control functions. Provide devices with or installed in NEMA 4X enclosures.

2.11.4.2 Electronic Limit Switches

Provide solid-state, thumbwheel, programmable limits with a count/revolution range of 0000 to 3599; four decades of limit programming; set point switch function selection; initial power supply that provides four AC power levels (plus 5 V, plus 15 V, plus 24 V) from standard 120 or 240 VAC sources; and outputs for read-outs on two [digital] [analog] displays (one remote digital read-out in the control room and one at the hydraulic power unit). The operating temperature range of the electronic limit switches to be [0] [minus 20] degrees C [32] [minus 4] degrees F to plus 65 degrees C or 150 degrees F. Locate and mount the limit switches as indicated.

2.11.4.3 Transducer (Electromagnetic Position Sensor)

Provide a single turn, heavy duty, and enclosed in a water-resistant NEMA 13 enclosure with an operating range of minus 20 degrees C or 4 degrees F to plus 85 degrees C or 185 degrees F.

2.11.4.4 Remote Read-Out [Digital] [Analog] Display

Provide a remote [digital] [analog] display which is to be connected to the BCD output from the limit switch.

2.11.4.5 Manual Switches

Manually operated switches, including push-button switches, selector switches, and key-operated switches, heavy-duty, oil-tight type in accordance with NEMA ICS 1. Switches to be the [momentary contact type with standard operators] [maintained contact type with [mushroom head] [illuminated button] [latching button]].

2.11.4.6 Relays

Relays used in control circuits to be industrial magnetic control relays in accordance with NEMA ICS 2 contact rating designation A 300, except where other ratings are indicated. Apply relays in control circuits in such a manner that proper control functions is obtained regardless of whether the contacts are overlapping or non-overlapping.

2.11.4.7 Indicating Lights

Indicating light assemblies to be the switchboard type, insulated for 120 volt AC service, with appropriate colored caps as indicated and integrally mounted resistors for 120 volt AC service. Make color caps of a material which will not be softened by the heat from the lamp. Lamps to be replaceable from the front of the panel. Furnish any special tools required for lamp replacement. The indicating light assemblies to be the same product line as compatible push buttons and switches.

2.11.5 Control Consoles and Valve and Gauge Panels

2.11.5.1 Control Console Construction

The control console to include a basic frame with metal panels fully custom fabricated or may consist of custom modules using standardized components.
where available to meet the dimensional and functional characteristics shown and specified. Construct the console of steel in accordance with NEMA ICS 6. Steel sheet in accordance with ASTM A659/A659M. Secure removable panels in place using captive, spring-loaded, self-locking spring nuts and hardened sheet metal screws. Use stainless steel screws and nuts. Secure access panels with spring-loaded, quarter-turn fasteners with studs held captive in the removable panel. Equip the console with adequate louvered panels to ventilate the interior and dissipate the heat generated within the console. Provide special equipment supports and guides as required to support the equipment and other components within the console. [Finish the interior and exterior surfaces with one coat of primer and two coats of the manufacturer's standard baked-on white enamel finish.]

2.11.5.2 Valve and Gauge Panel Construction

Construct valve and gauge panels of stainless steel plate thick enough to provide rigid support for the valves and other components mounted thereon. Terminate all piping with bulkhead type connections in a position convenient for the connection of external lines. [Primer and finish to be the manufacturer's standard coating.]

*********************************************************************
NOTE: For accumulators and other pressure vessels ASME stamps and certification are often necessary.
*********************************************************************

2.11.5.3 Nameplates and Instruction Plates

Provide nameplates for each device on the control console, valve panels, and gauge panels and submit for approval. Nameplates to clearly indicate the function of each device and, in the case of manually operated controls, indicate the condition established for each position of the control. Instruction plates to clearly indicate the proper procedures and sequences of operations to activate the system, to operate the system, and to secure the system after completion of operation. Machine engrave [print] lettering on nameplates on [steel plate] [plastic laminate with white characters on a black background]. Mount instruction plates on a rigid backing and covered with clear, rigid plastic sheeting. Mount instruction plates in a location easily visible to an operator stationed at the console or panel.

2.11.5.4 Security Provisions

Construct and install control consoles to prevent unauthorized or accidental operation of the system. [The main power control switch mounted on the control console to be a key-operated type with provision for removal of the key only when the switch is in the "OFF" position.] [Provide the control console with a hinged cover with a key-operated lock arranged to automatically lock the cover in the closed position.]

2.11.5.5 Weather Protection

Control consoles and valve and gauge panels exposed to the weather or subjected to water or dirt in the atmosphere to be NEMA Type 4 for exterior nonhazardous applications. Enclosures to have hinged and latched covers. Hinges to be the separable type to permit complete removal of the cover for maintenance. Construct hinges and latches of stainless steel.
2.12 SPECIAL TOOLS

**************************************************************************
NOTE: The designer must identify and list all special tool requirements as needed for operation and maintenance of the operating system and any spare equipment requiring periodic cycling. Items to consider may include such items as; filtering carts, portable HPU, diagnostic pressure gauges, cylinder disassembly/tightening tools, spanner wrenches, oil monitoring/analysis or testing
**************************************************************************

Provide all special tools necessary for the proper operation, maintenance, assembly and disassembly of the machinery in a location and in a manner as directed. Special tools include those indicated and the following:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>

PART 3 EXECUTION

3.1 EXAMINATION

After visiting the site and becoming thoroughly familiar with all details of the work and working conditions, verify dimensions in the field, and then advise the Contracting Officer of any discrepancies prior to performing any work. The Contractor is specifically responsible for the coordination and proper relation of the contracted work to the structure and work of all trades.

3.2 SHOP FABRICATION

3.2.1 Painting

Shop prime and coat all exposed exterior surfaces of assemblies and equipment except stainless steel, synthetic rubber, and plastic, as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES unless the equipment is given a standard factory finish as specified. Insofar as is practicable, apply the complete coating system to individual components and items before assembly to ensure complete coverage and maximum protection against corrosion. Paint shop assembled equipment prior to any storage or shipment. Do not paint aluminum, stainless steel, non-ferrous surfaces, or machined surfaces requiring field assembly, except as approved. Paint standard manufactured equipment, such as motors, pumps, hydraulic cylinders, valves, in accordance with the manufacturer's standard practice for high humidity service, subject to approval. Repair chips, scratches, and other damage to shop-applied painted surfaces in the field.
3.3 SHOP ASSEMBLY

3.3.1 General - Shop Assembly

Completely assemble all hydraulic cylinders and the hydraulic power unit in the shop. Upon satisfactory completion and verification of the shop assembly and testing, preliminary acceptance will be made by the Government and parts/components may be shipped to site.

3.3.2 Protection During Assembly

During cylinder and HPU assembly securely cover all openings to avoid the entrance of abrasives, dirt, metal chips, and other foreign materials into the hydraulic system through open ends of piping, tubing, and ports of the components.

3.3.3 Cleaning and Protection During Assembly

During assembly, ensure all components are free of abrasives, dirt, metal chips and other foreign materials. Clean components as needed to remove foreign materials. Securely cover openings to prevent recontamination.

3.3.4 Flushing

After completing assembly, flush each cylinder and HPU. Use the same hydraulic fluid for flushing as approved for the final filling. Filter oil using a [10 µm] filter. Perform flushing until the contamination level is [_____] in accordance with ISO 4406.

[Take three 500 milliliter samples at approved locations in accordance with ISO 4021. Perform particle counting on each sample in accordance with ISO 11500 or ISO 4407 by an approved independent test laboratory. Water content of each sample to be below 200 ppm. Reclean if any sample does not comply with the permissible contamination limits, and reinspect. Submit shop oil testing reports.]

3.4 SHOP TESTING

3.4.1 General - Shop Testing

Perform the shop testing listed in the following paragraphs. Provide all personnel, tools, hydraulic fluid as a well as temporary piping, hoses, oil reservoirs, wiring, and other appurtenances and accessories as needed to complete testing. The designated Government Witness must be present for the entirety of each test unless previously waived in writing.

3.4.2 Notification of Shop Testing

Provide notification to the Government [45] days prior to the planned start of testing. Include in the notification an identification of what equipment is being tested.

[3.4.3 Hydraulic Cylinder Tests

**************************************************************************
NOTE: This paragraph does not apply for cylinders of standard manufacture and design.
**************************************************************************
Perform a shop test on each hydraulic cylinder. [Group the testing of cylinders with a minimum of [5] cylinders being tested as a group.] If at any point there is a cause for rejection or failed test, immediately stop the test, perform any required adjustments or repairs, and repeat the test from the beginning.

The shop test must consist of the following operations and tests:

a. Fill each cylinder with the hydraulic fluid specified in [this SECTION]. Fluid must be filtered through a [10 micron][8 micron] filter. Purge or bleed all air from filled cylinder.

b. Perform a hydrostatic test [per ASME BPVSC code standards] and the following requirements:
   1) Perform the test for a minimum of [1][_____] hour[s].
   2) Use a test pressure of [_____] kPapsi.
   3) Perform the test in each direction.
   4) With the rod and piston fully retracted, and the pressure applied to the lower side of the piston, observe the upper end for leakage past the piston.
   5) With the telescopic cylinder fully retracted and under pressure, check the cylinder for leakage past the seals.
   6) Observe for leakage past the steals. Any leakage past the seals is cause for rejection and a failed test.

c. Perform an operational test by extending and retracting the [cylinder rod and piston] [telescopic cylinder] through its full stroke. Support and orient the cylinder in a manner to avoid any damage to the cylinder or any of its parts. Provide a means of controlling the speed to the maximum allowable speed specified in this SECTION. Any operational problems or leakage to the outside of the cylinder is cause for rejection and a failed test. Perform [one] complete extension-retraction cycles.

d. At the conclusion of a successful test [drain][leave] oil in the cylinder and prepare for shipping in accordance with PARAGRAPH: SHIPPING, HANDLING, DELIVERY, AND STORAGE.

]3.4.4 Hydraulic Power Unit Tests

Perform a shop test on the hydraulic power unit. Provide all temporary oil, piping, hoses, oil reservoirs, wiring, and other appurtenances and accessories as needed. During testing the temperature of oil during test not to be more than [21][_____] degrees C [70] [_____] degrees F.

If at any time during any of the testing a deficiency is found or failure occurs, immediately stop the test, correct the issue, and restart that portion of the test from the start.

The shop test must consist of the following operations and tests:

a. Perform a hydrostatic test of all piping on the HPU. [Use the specified hydraulic fluid as the test fluid.] Use a test pressure of
b. Perform a [hydrostatic][pneumatic] test of the storage tank. [Use the specified hydraulic fluid as the test fluid.] Use a test pressure of [21][_____] kPa [3][_____] psi for [30 minutes]. Check all joints and seals for leakage. Any leakage found is cause for rejection and a failed test.

c. Perform a functionality and controls test. During the test:

1) Verify the correct function of each [switch][, indicating light], [and][, outputs/alarms][, and [____]]

2) Verify the correct function of each measurement instrument and device.

3) Verify the correct function and operation of each valve and valve operator.

4) [____]

c. Perform an operational test of the HPU consisting of the following:

1) Operate each pump individually for [15] minutes at the [specified operating pressure and flow rate][_____] MPa psi and [_____] L/s gpm. Measure pressure, flow rate, motor voltage, and motor amperage using calibrated instrumentation and data collection equipment. Collect a data at a minimum of [10 samples per second].

2) Operate all pumps simultaneously for [15] minutes at the specified operating pressure. Measure pressure, flow rate, motor voltage, and motor amperage using calibrated instrumentation and data collection equipment. Collect a data at a minimum of [10 samples per second].

3) Test the function of each unloader circuit. Record the pressure at which the unloading valve opens and closes. Record flow rate through the unloading circuit with calibrated instrumentation. Collect a data at a minimum of [10 samples per second].

4) Test the function of each pressure relief valve. Record the pressure at which the pressure relief valve opens and closes. Perform the test 3 times.

5) Operate each pump as lead pump and test the lag functionality of the remaining pumps. Manually jumper, actuate, or otherwise trigger the required devices to initiate lag pumps starting.

3.4.5 Draining of Fluid

Upon successful completion of flushing and testing operation, drain the flushing fluid from the equipment.

3.4.6 Shop Testing Plan and Procedures

Prepare and submit a shop testing plan and procedure prior to the start of
testing. Shop testing activities are not allowed until the testing plan is approved. Submit the testing plan a minimum of [45] days prior to the start of testing. Include the following elements, as a minimum, in the testing plan:

a. Address of testing location and contact information for the designated point of contact.

b. A step-by-step, repeatable procedure for each test to be performed, including but not limited the tests detailed above.

c. Diagrams or drawings of test setups showing orientation of equipment during testing and installation of instrumentation.

d. List of instrumentation that will be used to take measurements.

e. Sample data collection sheets, clearly identifying what is to be recorded, to what accuracy, and the planned outcome (such as value range, threshold, or condition).

3.4.7 Shop Testing Report

After completion of each test or group of tests, submit a test report. Include the following elements, as a minimum, in the testing plan:

a. Date(s) testing occurred

b. Identification of which equipment was tested

c. Completed data collection sheets.

d. Provide records of all adjustments and final settings for all hydraulic components in the system. This includes pump flow rates, operating times, relief settings[, counterbalance valve adjustments], operating pressures at both the hydraulic power units and cylinder manifolds, flow level adjustments[, filter differential switch settings], and other parameters.

d. Post-processed output from any data collection equipment

e. Identification of a successful test. If any test stoppages or failures occurred, identify them and the measures taken to correct the deficiencies.

f. Current, non-expired calibration certificates for all instrumentation and measurement devices used during testing.

3.5 SHIPPING, HANDLING, DELIVERY, AND STORAGE

3.5.1 Packaging

Do not prepare the hydraulic power systems for shipment until they have been inspected and accepted for shipment at origin by the Contracting Officer, unless inspection has been waived in writing. Ship each hydraulic power system or subassembly completely assembled as feasible. [Any separate delivery of components must be coordinated by the Contractor and noted in a submittal.] The subassemblies are defined as the following:

a. Hydraulic cylinders. Each hydraulic cylinder subassembly consists of
the hydraulic cylinder, [trunnion,] [cardanic ring,] [pillow block bearings,] [bushings,] [cylinder support platform,] [manifold,] and [piping].

b. Hydraulic power units.

c. Piping assemblies.

d. Control consoles.

Provide all subassemblies and spare equipment and parts with adequate protective pads, supports, and blocking, and securely restrained to prevent distortion or damage to the painted surfaces in transit. Any loss or damage during shipment, including damage to the painted surfaces, will be the Contractor's responsibility; replace or repair without any cost to the Government. Pack all accessories and spare parts separately in containers plainly marked "ACCESSORIES ONLY" or "SPARE PARTS ONLY." Place a packing list, listing the contents of each container, in a moisture-proof envelope and securely fasten to the outside of the container. Standard commercial packaging in accordance with ASTM D3951 will be acceptable except where a different method or standard of packaging is specified.

3.5.2 Shipping, Preservation, and Storage

**************************************************************************
NOTE: For very long cylinders, deflection of the rod during shipment may cause damage to the rod and/or bore of the cylinder. It is best to avoid the use of internal rod support blocks. One solution to this problem is to extend the rod a short distance, provide a bracket so that the rod cannot be retracted, and then pressurize the underside of the piston so that the rod is in tension. Also, shipping the cylinder filled with oil may help dampen the movement of the rod.
**************************************************************************

Packing, crating, cradles, and other packing materials necessary to ensure safe shipment are the responsibility of the Contractor and become the property of the Government upon delivery of the equipment. The hydraulic cylinders to be [filled with the specified hydraulic fluid, and to account for expansion and contraction of the oil during shipping and storage by installation of a bladder type accumulator to the rod end bleed port.] [drained and purged with nitrogen.] Then securely cap remaining ports with blank flanges to prevent the entrance of foreign matter. [Make provisions with external shipping devices to prevent damage to the cylinder and piston rod resulting from the rod flexing up and down in the cylinder during transport. Submit a proposal for controlling movement of the piston rod for approval.] [Provide internal rod supports to prevent the rod from deflecting and damaging the rod and cylinder bore during handling and shipping.] Adequately protect machined surfaces from corrosion and physical damage. Protect equipment delivered and placed in storage from the weather, humidity, temperature variation, dirt and dust, or other contaminants. [Furnish spare cylinders with a portable pump, hose and connections to stroke the cylinder in and out a short distance during storage to lubricate seals and prevent damage.]
3.5.3  Manufacturer Preparation Before Shipment

3.5.3.1  Flushing Hydraulic Cylinders

Clean, flush, and fill hydraulic cylinders with specified oil, filtered through a [10 µm] filter, taking precautions to exclude all air, before leaving the manufacturing facility. Clean and flush per Paragraph "Cleaning and Flushing." Submit oil for use in the system for approval. Make suitable provisions to allow for expansion and contraction of the hydraulic fluid. Accumulators connected to the cylinder ports are acceptable.

3.5.3.2  Flushing Hydraulic Power Unit

After cleaning and prior to shipment, flush each hydraulic power unit and manifold. Manifolds not to be installed until cleaned and flushed. Fill the hydraulic tank with hydraulic fluid as specified and actuate the oil filtration system with a [10 µm] element in the filter. Circulate the fluid and change filters as become clogged. After flushing of the fluid in the tank is complete, install a by-pass loop with filter on the pressure and tank lines of the unit and the run pumps alternately until the returning oil meets the requirement for system cleanliness.

3.6  ON-SITE DEMOLITION

Remove the existing hydraulic power systems equipment specified and as shown, including but not limited to [operators, HPU with reservoir, and all hydraulic tubing and hoses]. All equipment not specified to be salvaged is the property of the Contractor, removed from the Project site, and disposed of in a legal manner. Materials that cannot be removed daily may be temporarily stored on-site at an approved area. Salvaged materials shall not be sold on the project site.

3.6.1  Existing Equipment Removal Plan and Procedures

Submit an Existing Equipment Removal Plan and Procedures detailing the sequence and procedures for all systems and components to be removed or affected by the removal. Procedure is to include but not be limited to a detailing of:

(1) Items to be removed.
(2) Temporary arrangement or storage of items.
(3) Special containment and disposal procedures.
(4) Protection procedures for open routing.
(5) Spill Prevention Measures.
(6) Lifting Plans

3.6.2  Existing Hydraulic Oil Removal

The Contractor is responsible for the extraction, containment, transportation, and disposal of all the existing hydraulic fluid in the [operators, system routing, HPU components, HPU reservoir] involved with on-site demolition and equipment removal activities. Include the details in the submitted Existing Equipment Removal Plan and Procedures.
3.7 ON-SITE INSTALLATION

Install the equipment specified and as shown to complete the hydraulic power systems for operation of the [intake gates][slide gates][control gates][Tainter gates][miter gates][butterfly valves][hoisting equipment][____]. Install hydraulic components in accordance with the manufacturer's written instructions and under the direction of the erection engineer or manufacturer's representative. Install complete units or assemblies without disassembly. Provide necessary supports for all appurtenances, pumps, motors, and other equipment or components as indicated. Anchor floor-mounted equipment to concrete pads by anchor bolts or expansion anchors as shown. Installation in accordance with Section 05 50 14 STRUCTURAL METAL FABRICATIONS and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Submit an installation plan and procedures.

3.7.1 Erection Engineer

Obtain the services of an experienced erection engineer who is regularly employed by the hydraulic cylinder/power unit manufacturer to supervise the installation, start-up, adjustment and operation, and testing of the equipment provided. The erection engineer to furnish a signed statement stating that the final installation and start-up of the hydraulic power system has been inspected, witnessed, and complies fully with the manufacturer's warranty requirements. Following completion of the work the erecting engineer to instruct the Contracting Officer in the operation and maintenance of the system. These field instructions to cover all items contained in the bound instructions. Do not conduct instruction until Operation and Maintenance Manuals are approved.

3.7.2 Filling And Bleeding The System

With all hydraulic equipment installed and all cleaning and flushing complete filling of the system may begin. The cleanliness of the oil used to fill the system in accordance with the requirements for system cleanliness. Open the by-pass ball valves at the cylinders. Fill each hydraulic power unit and pump oil into the system through a [10 µm] filter and keep adding oil as long as the level continues to drop. Cease pumping when the oil level no longer drops. Install by-pass piping and repeat the procedure to fill the drain/siphon line. Take care to expel as much air as possible from the piping and cylinders during the initial filling. Utilize piping vents and drains as much as possible to expel air from the system. Each power circuit pipe for the [Tainter valves] [and] [miter gate] to have this procedure performed to fill the respective piping. Actuate cylinders by shifting spool on the four-way valve back and forth and bleeding air from ports provided on cylinders. Continue procedure for all hydraulic power units until all cylinders have been bled. Ball valves in tank lines may be closed during bleeding to prevent introduction of air into tank lines. After all the cylinders for the machinery have been filled and bled of air, fill the hydraulic power unit tanks with oil. The oil level with the [miter gate] open and all [Tainter valves] closed to be above the "low level" shut-off. The system, once filled, to be bled of air, operated, and periodically bled during the first week of operation to remove any air entrained in the system.

3.7.3 Used Hydraulic Oil

Contractor is responsible for the containment, transfer, removal, and disposal of all used hydraulic oil. Used hydraulic oil includes any oil in existing components being removed or refurbished, and any generated used
oil from flushing, draining, or bleeding activities as identified in this section. Containment, transfer, removal, and disposal procedures for the used oil must be detailed in the applicable removal and installation procedures.

3.7.4 Power Piping and Hoses

The general arrangement of the hydraulic piping and hoses is as indicated. Any changes to the arrangement necessary to facilitate the installation and proper functioning of the system may be made subject to the approval of the Contracting Officer. Arrange the piping such as to close and open the [miter gates, and to raise and lower the Tainter valves,] when the valve spools are positioned as indicated.

3.7.4.1 Piping Installation

Install the system complete including all necessary valves, fittings, and pipe accessories. All joints to be tight and successfully pass the test as specified. Submit details of pipe supports and anchors not indicated. Adequately support all lines at intervals not greater than 3 m or 10 feet or as otherwise indicated. Install hangers and supports using machine bolts and masonry anchors caulked in drilled holes in the masonry or by using machine bolts and expansion shields. Power piping must not be used to support other equipment. Other equipment can use the same standoff or hanger mounting point as one to support the piping, but the pipe itself must not provide the support of the equipment's load. Spacers and guides can be used if no load is transferred. Ream and remove burrs from all cut ends of pipe. Remove metal particles from the reaming operations and thoroughly clean ends of pipe before proceeding with the work. Tightly plug all piping at all times except when work is being performed on a pipe. Clean the pipe sleeves, recesses and trenches of all debris and thoroughly wash with a high pressure stream of water before any piping is installed. Drilling, chipping, or grinding of concrete in close proximity of any piping being installed is not permitted. Repeat washing out of the sleeves, recesses and trenches from time to time as necessary. Store valves in a clean, dry place and protect against moisture. Do not install valves in the system prior to 4 months before the system is to be filled with hydraulic oil. Install pipes passing through masonry in pipe sleeves as indicated. Mitering of joints for elbows and notching of straight runs of pipe for tees is not permitted.

3.7.4.2 Piping Vents and Drains

Install plugged vent connections with high pressure globe or needle valves at all high points of piping. Provide plugged drain connections with valves in accessible locations at all low points of piping. Threads on valves and pipe plugs for vents and drains to be SAE Straight Thread with O-ring seals. Provide pipe plugs and other miscellaneous fittings required for the installation of the vents and drains of the same material as the pipe on which they are installed.

3.7.4.3 Mounting Support for Manifolds

Bolt the manifolds to a mounting base in such a manner that they can be removed by unbolting from flanges and mounting base and can be adapted for a left hand or right hand orientation of the cylinder mounted piping. Locate manifold and cylinder piping supports on the hydraulic power units or hydraulic cylinders as indicted and as recommended by the cylinder manufacturer to facilitate both left hand and right hand installations.
All bolts and hardware used in the supports to be a minimum of 10 mm 3/8-inch. Provide all items in stainless steel [galvanized steel][painted steel].

3.7.4.4 Power Hose Installation

Install power hose with other power system components as above. Install hose such that it follows its natural lie, without being kinked or twisted. No hose is to be clamped. Hose guides and anti-chafe grommets may be used as long as they do not restrict any local expanding of the hose when pressurized. Hose installation is to adhere to the SAE J1273.

3.7.4.5 Support of Valves with Manual Operators

Valves that operate through a manual operator (such as a handwheel or handlever) connecting to hydraulic tubing must have a hanger or support on each side of the valve within 1 inch of the connection. Such valves include block, ball and needle valves. The hangers or supports must translate the load from the use of the manual operator away from the connection of the valve and tubing. Valves used with hydraulic piping larger than 2 inches in diameter may not require this additional support if the manual operator can be used without induction detrimental induction of forces into the assembly.

3.7.4.6 Support of Cartridge Components

Components, such as filters, that require the periodic removal and installation of housings and cartridges, must not be supported by hydraulic tubing. The component's manifold or housing must be directly supported so that the forces used to perform the periodic removal and installation of the the housing or cartridge element is not translated into its connection with the hydraulic tubing or piping.

3.7.4.7 Identification of Piping, Hoses, and Valves

Identify all pipe, tubing, valves, fittings, as required, and hydraulic power equipment, located within the trenches, machine rooms, and machinery recesses. Use No. 20 gauge brass tags for tagging, with the proper identification symbol stamped into the metal. Use piping symbols as indicated and stamp with 19 mm or 3/4-inch high lettering. Attach tags to piping and valving by means of No. 12 gauge copper wire. Install pipe markers at intervals of no greater than 5 m or 15 feet, except as approved.

a. Provide a numerical identification tag on each valve, coded such that no other valve in a connected hydraulic power system has the same number. Provide each power circuit valve with an additional tag, which indicates the valve's function.

b. Provide manifold-mounted valves with port identification markings on a part of the valve body that remains in view after mounting.

c. Identify all other valves at the port location, on the connecting piping.

d. Identify manifold assemblies with a tag indicating the manifold's function and the identity of the machine operated.

e. Identify all ball, bleed, and globe valves with a "normally closed" or "normally open" legend.
f. Identify all gauge mounts and pressure transducer mounts with numerical tags, as well as any working or instruction tags required for safe operation.

g. Provide a warning tag and an instruction tag, or tags as required, at each return filter assembly to indicate the safe, approved procedures for cartridge replacement and by-pass operation.

3.8 CLEANING AND FLUSHING

**************************************************************************
NOTES: The allowable limit of contamination in this paragraph is subject to the specific project design requirements which may necessitate revision or expansion to cover varying standards of acceptance. The amount and sizes of particles which any given component can tolerate is a function of the clearances between moving parts, the frequency and speed of operation, and the materials of construction. Tolerances range from low pressure gear pumps which may give satisfactory performance with dirt levels typically found in new fluid (ISO 4406) to servo control valves which require oil much cleaner (ISO 4406 16/14/11). General guidelines are as follows:

<table>
<thead>
<tr>
<th>SYSTEM TYPE</th>
<th>CODE LEVEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low pressure - manual control</td>
<td>20/18/15 or better</td>
</tr>
<tr>
<td>Low to medium pressure - electrohydraulic controls</td>
<td>19/17/14 or better</td>
</tr>
<tr>
<td>Systems with servo or proportional control valves</td>
<td>17/15/12</td>
</tr>
<tr>
<td>High pressure-servo controlled</td>
<td>16/14/11 or better</td>
</tr>
</tbody>
</table>

Hydraulic fluid power equipment is rated according to maximum pressure. Generally low pressure is 0 to 4.1 MPa (0 to 600 psi), medium pressure to 20.7 MPa (3000 psi), and high pressure to 34.5 MPa (5000 psi).

Results of microscopic automatic particle counter particle count in accordance with ISO 4406 Higher code levels indicate higher particle counts per millimeter.

ISO 4406 is an internationally recognized standard that expresses the level of particulate contamination of a lubricating fluid. This is the preferred standard for particle counting and should be used in testing lubricants. ISO 4406 is a cleanliness rating system that is based on a number of contamination particles in a 1-milliliter (ml) fluid sample. Once the number and size of the particles are determined, the points are plotted on a standardized chart of ISO range numbers to convert the particle counts into an ISO 4406 rating. The ISO
The 4406 rating provides three range numbers that are separated by a slash, such as 16/14/12. All three values for applicable range numbers can be determined through the use of the ISO 4406 standardized chart based on the actual number of particles counted within the 1-ml sample for each size category. The first number in the ISO 4406 standard represents the number of particles present measuring greater than 4 micron, the second represents particles greater than 6 micron and the third represents those greater than 14 micron. As the range number increases by one value, the number of particles in a sample of oil will double. On the range code, each number is double the range below.

For example, an oil with a code of 19/17/14 should contain twice as many particles in each size category as the code of 17/15/12. For critical components, particle counting and testing should be repeated to confirm the ISO rating.

Filter manufacturing firms can be the source of information regarding determination of contamination levels and analysis and have available portable kits for more general detection of contamination.

During assembly, securely cover all openings to avoid the entrance of abrasives, dirt, metal chips, and other foreign materials into the hydraulic system through open ends of piping, tubing, and ports of the components. Use the same hydraulic fluid for flushing as approved for final filling. Include a detailed description of the equipment, materials, hydraulic fluid, temperatures, and duration of each phase of the flushing in the procedures. Clean the system of particles so that the contamination level is below [_____] in accordance with ISO 4406. Take three 500 milliliter samples at approved locations in accordance with ISO 4021. Perform particle counting on each sample in accordance with ISO 11500 or ISO 4407 by an approved independent test laboratory. Water content of each sample to be below 200 ppm. Reclean if any sample does not comply with the permissible contamination limits, and reinspect. When flushing is completed, drain the system and then fill with the specified hydraulic fluid introduced through a 10 micron filter.

3.8.1 Flushing Piping

Flush all hydraulic piping before installation of the hydraulic power unit, cylinders, and manifolds. Install by-pass loops of piping in place of cylinders, manifolds and the power units. Circulate hydraulic fluid through each and every pipe unit until returning oil meets the requirement for system cleanliness. Sequence flushing so that all piping is flushed in both directions. The flow capacity of the flushing system to produce a minimum velocity of 4.6 meters per second or 15 feet per second in all piping. Provide means to verify the flow during the flushing operation.

3.8.2 Flushing Manifolds and Hoses

After cleaning and prior to installation, flush each valve manifold, pipe manifold, and hose by circulating hydraulic fluid through all ports until the returning fluid meets the requirement for system cleanliness.
3.9 FIELD TESTS AND INSPECTIONS

**************************************************************************
NOTE: Each system will have functional and operational testing requirements that are specific to that system and installation. Add/remove paragraphs to address specific areas of the system being tested.

It is recommended that the designer develop pre-functional and functional checklists for the Contractor to perform all testing requirements and have all concerned parties, including the customer, present to witness and sign-off on the completion of the checklists.
**************************************************************************

3.9.1 General Requirements - Field Testing

The following requirements apply to all testing activities:

a. Notify the Contracting Officer at least 14 calendar days before any field testing is to be conducted.

b. Conduct testing in the presence of the Contracting Officer unless waived in writing.

c. Conduct testing under the direction of the erection engineer or manufacturer's representative.

d. Constantly monitor details of all operations for signs of impending trouble or leakage and make corrections as necessary to prevent damage to the equipment.

e. Immediately correct any deficiency or maladjustment disclosed by the tests and repeat the test until satisfactory results are obtained. No subsequent tests will be permitted until all preceding tests have been completed satisfactorily.

f. No subsequent tests will be permitted until all preceding tests have been completed satisfactorily.

3.9.2 Field Pressure Testing

3.9.2.1 Pressure Testing Requirements

Perform a hydrostatic pressure test for all new installed[, rehabilitated] [and/or disturbed] piping and equipment. Pressure testing may be split up into distinct and separate portions as determined by the Contractor. Perform the pressure testing in accordance with the following requirements:

a. Use the hydraulic fluid specified in this SECTION as the test fluid.

b. Use a test pressure of [1.5 times the rated pressure of the system][____ psi].

c. Perform each test for a minimum of [1 hour] and additional time as needed to verify no leakage.
d. Inspect all joints, seals, packing, valves, and other areas that are possible leak points. Carefully examine welded, flanged, flared, and threaded connections and wipe for leakage, also inspect lines for evidence of deflection caused by inadequate anchorage.

e. The criteria for a successful test is zero leaks, zero drop in pressure, and no deflection of piping or equipment.

f. Take means to protect other portions of the system not being tested from becoming inadvertently pressurized during testing.

3.9.2.2 Field Pressure Testing Plan

Prepare and submit a pressure testing plan a minimum of [45] days prior to the start of testing. The plan must be approved prior to the start of testing. Include the following elements, at a minimum, in the plan:

a. A step-by-step, repeatable procedure for performing the pressure testing. [Address how challenging to reach portions of the equipment will be accessed for inspection during the test.] [Address installation details of temporary instruments and measuring devices.]

b. List of equipment and instrumentation to be used during the test.

c. Spill protection, controls and counter measures plan to address plans and response to any leaking oil.

d. Sample data recording sheets.

3.9.2.3 Field Pressure Testing Report

For each pressure test performed, submit a test report. Include the following elements, at a minimum, in the report:

a. Date(s) testing took place

b. Identification of the equipment or systems of equipment tested and covered by the test report.

c. Completed data recording sheets with the results from testing.

d. Short narrative or statement confirming successful completion of the test.

e. If issues were discovered during testing and any testing had to be repeated, provide a narrative describing the issues and the measures taken to correct the issues.

f. Current, non-expired calibration certificates for all instrumentation and measurement devices used during testing.

3.9.3 Field Functional Testing

3.9.3.1 HPU Functional Testing Requirements

Perform the following functional tests and inspections for the HPU:

a. Inspect the hydraulic reservoir to ensure that the fluid is at the
proper level.

b. Start the hydraulic pumps from all control stations.

c. Pumps:

1) Inspect the pumps for proper operation and discharge pressure.

2) Verify proper operation of the pump controls [including lead-lag functions for all pumps.]

3) Read and record the discharge pressure and flow of [the][each] pump [with the pumps running individually and all possible combinations of multiple pumps running].

4) Monitor and record, using data collection equipment, the motor voltage and amperage during all motor operations.

d. Adjust the pressure relief [valve][valves] to limit the system pressure to the specified value. Record the set pressure and valve adjuster setting.

e. Adjust the unloading [valve][valves] to unload the pumps to the reservoir when the [accumulator has been charged] to the specified pressure or if the control valves are not actuated. Measure and record unloader settings, actuating pressure and flow rate during unloader operation.

[f. Inspect and adjust the accumulator precharge pressure to the specified value.]

3.9.3.2 Control Console Functional Testing Requirements

For [the][each] control console:

a. verify the correct operation of each devices on the control console, including but not limited to: [manual shut-off valves][, manual control valves][, manual flow control valves][, solenoid operated valves][, check valves][, pressure gauges][, and ____].

b. Test all automated control systems and devices.

c. [functional testing sequence specific to the system]

3.9.3.3 Field Functional Testing Plan

Prepare and submit a functional testing plan. Submit plan a minimum of [45 days] prior to the start of testing. Plan must be approved by the Government prior to the start of testing. Include the following elements in the plan at a minimum:

a. A step-by-step, repeatable procedure for performing the functional testing. The procedure must individually address testing of the controls and control consoles and the HPU.

b. List of equipment and instrumentation to be used during the test.

c. Spill protection, controls and counter measures plan to address plans and response to any leaking oil.
d. Sample data recording sheets.

3.9.3.4 Field Functional Testing Report

For each functional test performed, submit a test report. Include the following elements, at a minimum, in the report:

a. Date(s) testing took place

b. Identification of the equipment or systems of equipment tested and covered by the test report.

c. Completed data recording sheets with the results from testing.

d. Short narrative or statement confirming successful completion of the test.

e. If issues were discovered during testing and any testing had to be repeated, provide a narrative describing the issues and the measures taken to correct the issues.

f. Current, non-expired calibration certificates for all instrumentation and measurement devices used during testing.

3.9.4 Acceptance Testing

3.9.4.1 General Requirements - Acceptance Testing

Upon completion of all pressure testing and functional testing, perform acceptance testing. Acceptance testing must prove that the complete system, as installed, meets all requirements of the contract. During acceptance testing perform the following:

a. Monitor and record the following during all acceptance testing.
   [Measurements must be recorded using continuous data logging equipment sampling at a minimum of 10 samples per second]:
   1) Hydraulic fluid temperature at HPU discharge[, and ___]
   2) Flow rate [at each cylinder][at HPU discharge][, and ___]
   3) Pressure in supply and return lines [, at HPU discharge][, and ___]
   4) Speed, temperature, voltage, and amperage of each motor
   5) Flow Control Valve Settings
   [5) ___]

b. During each test operation, inspect the hydraulic lines and components for evidence of leakage.

c. Check flow control valves and adjust as required to conform to indicated operating time requirements.

d. Inspect and adjust sequence valves as required to obtain the indicated sequence of operation.
e. Adjust chokes in pilot circuits of pilot-operated valves to obtain smooth, shock-free operation.

f. Adjust relief valves and counterbalance valves to the proper pressures as indicated, unless otherwise directed by the Contracting Officer.

g. Adjust proportional control valves for the proper flows to achieve desired cylinder operating speeds as directed by the Contracting Officer.

h. Inspect response of components to operation of applicable controls to confirm that all connections have been made properly.

g. Observe components and for excessive vibration, alignment and operating clearances.

h. Record observations regarding such events as unusual sounds, malfunctions or difficulties encountered, and adjustments required.

3.9.4.2 Field Acceptance Testing Requirements

Perform the following acceptance tests. Operating tests to cover a period of not less than [4] [__] hours, and conduct all tests at such times as the Contracting Officer may direct. After installation and testing of the hydraulic system has been completed, install a complete set of new and unused filter cartridges:

a. After final assembly and installation of the machinery, equipment and piping, and prior to [flooding the lock] [____], operate each assembly of operating machinery individually as nearly as practicable under its normal operating conditions for a minimum of [5] [____] open/close cycles to demonstrate that each assembly is in proper working order and free from defects of materials, workmanship or alignment.

b. Upon satisfactory completion of the individual tests, and before final acceptance of the work, conduct, in the presence of the Contracting Officer, over-all testing through a minimum of [10] [____] additional [locking operations with the lock flooded] [operating cycles], to demonstrate that all machinery has been properly installed and that [lock] [____] operation can be effected without interruption.

3.9.4.3 Field Acceptance Testing Plan

Prepare and submit an acceptance testing plan. Submit plan a minimum of [45 days] prior to the start of testing. Plan must be approved by the Government prior to the start of testing. Include the following elements in the plan at a minimum:

a. A step-by-step, repeatable procedure for performing the acceptance testing.

b. List of equipment and instrumentation to be used during the test.

c. Spill protection, controls and counter measures plan to address plans and response to any leaking oil.

d. Sample data recording sheets.
3.9.4.4 Field Acceptance Testing Report

For each functional test performed, submit a test report. Include the following elements, at a minimum, in the report:

a. Date(s) testing took place

b. Identification of the equipment or systems of equipment tested and covered by the test report.

c. Completed data recording sheets with the results from testing.

d. Short narrative or statement confirming successful completion of the test.

e. If issues were discovered during testing and any testing had to be repeated, provide a narrative describing the issues and the measures taken to correct the issues.

f. Current, non-expired calibration certificates for all instrumentation and measurement devices used during testing.

g. A written statement that the hydraulic power system has been field tested and meets all operational requirements.

3.9.5 Final Oil Testing

After all field testing is complete, take three 500 milliliter samples at approved locations in accordance with ISO 4021. Perform particle counting on each sample in accordance with ISO 11500 or ISO 4407 by an approved independent test laboratory. Water content of each sample to be below 200 ppm. Reclean if any sample does not comply with the permissible contamination limits, and reinspect. Submit field oil testing reports.

3.10 CLEAN-UP

Keep the work areas clean during installation of the hydraulic system and appurtenances. Upon completion of the installation of the hydraulic system and appurtenances, remove debris and surplus materials resulting from the work.

3.11 OPERATION AND MAINTENANCE

Submit Operation and Maintenance manuals as data packages in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Supplemental requirements are as described in this paragraph. Furnish [_____] complete sets of instructions containing the manufacturer's operation and maintenance instructions for each piece of equipment to the Contracting Officer. Permanently bind each set with a hard cover. Furnish one complete set prior to field testing and furnish the remaining sets before the contract is completed. Inscribe the following identification on the covers: "OPERATING AND MAINTENANCE INSTRUCTIONS," title of the project, location of the project, the name of the Contractor, and the contract number. Place a flysheet before instructions covering each subject. The instruction sheets size to be 210 by 297 mm 8 1/2 by 11 inches, with large sheets of drawings folded in. The instructions include, but are not be limited to, the following:

a. A cross-section drawing of the hydraulic cylinder with parts list.
b. Detailed fabrication drawings for all custom fabricated components of the hydraulic cylinders.

c. A system layout drawing showing the piping, valves, and controls.

d. A system hydraulic schematic.

e. Manifold fabrication drawings with dimensions and locations of pre-drilled passages and cavities.

f. Electrical wiring and control diagrams.

g. Operating and maintenance instructions.

h. Manufacturer's bulletins, catalog cuts, and descriptive data.

i. A written control sequence describing startup, operation, and shutdown. Uniquely identify the control sequence and list the individual components of the hydraulic system. Each component to have a narrative description as to the function, purpose, and limits of adjustment (if any) and method of adjustment for that component.

Provide the Operation and Maintenance (O&M) Manual with all information which may be needed or useful for operation, maintenance, repair, dismantling or assembling, and for identification of parts for ordering replacements. The manual is subject to approval. Provide a recommended spare parts list.

NOTE: This guide specification covers self-lubricated bearing materials for waterway and marine construction. These bearing materials are used for lock and dam applications ranging from critical bearing applications to light duty and electro-galvanic isolating applications. This spec has been developed for USACE Civil Works projects.

In accordance with ER 10-1-53, the USACE Hydroelectric Design Center (HDC) in Portland OR is designated as the Mandatory Center of Expertise (MCX) for hydropower engineering and design. HDC's policy is to use self-lubricating materials in hydroturbine applications. For applications involving turbines, consult HDC (Phone: 503-808-4250).

Sections have also been included on self-lubricated bearings used for product lubricated vertical shaft pumps. Product lubricated pump bearings are used for applications that require minimizing or eliminating the exposure to petroleum lubricants to be in compliance with environmental, biological, or other applicable regulations.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.
Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**********************************************************************
PART 1   GENERAL
**********************************************************************

NOTE: Use this guide specification in conjunction with EM 1110-2-1424 LUBRICANTS AND HYDRAULIC FLUIDS, EM 1110-2-2610 Mechanical and Electrical Design for Lock and Dam Operating Equipment, and EM 1110-2-3105 Mechanical and Electrical Design of Pumping Stations.

Users of this specification should understand that successful performance of self-lubricated materials relies on factors that are not covered under the scope of this specification. These factors include but are not limited to accurate estimation of applied loads, adequate alignment of self-lubricated parts including their housings and running surfaces, and adequate stiffness of housings and running surfaces to match the loading assumptions made.

Designers need to be aware that self-lubricated parts and materials have many differences in properties and behavior from traditional metallic supplied-lubricant bearings. Successful design of self-lubricated bearing systems relies on designers that understand these differences as well as acceptable design practices for self-lubricated materials. Designers unfamiliar with self-lubricated components, at a minimum, should have their designs and assumptions thoroughly checked by qualified individuals familiar with self-lubricated material systems.

It is common for minor design details, such as final tolerances and fits, to be left for the construction contractor to determine (in coordination with the self-lubricated material manufacturer). However, construction contractors typically are not qualified to perform the complete design for self-lubricated bearing systems. As discussed above successful design of self-lubricated bearing systems requires detailed knowledge of both the application and self-lubricated materials. Using construction contractors to perform the design of self-lubricated bearing systems is not recommended.

Designers are responsible to consult self-lubricated material manufacturers to verify that the products being used are appropriate for the application. Self-lubricated material manufacturers should also be consulted to verify the use of other appropriate design details such as bearing wall thicknesses, installation fits, mating materials, surface conditions, running clearance fits, edge chamfers.
Some self-lubricated components are susceptible to damage caused by edge loading. The test procedure outlined in CERL Technical Report 99/104, Greaseless Bushings for Hydropower Applications tests the edge loading properties of materials with a tapered test sleeve. The slope of the tapered test sleeve is 0.229 degrees (0.004"/1.000"). Actual installations should be held to tighter alignment requirements than this procedure tests for. Define required alignment of self-lubricated components on the contract plans in accordance with an applicable code such as ASME Y14.5 - Dimensioning and Tolerancing.

Consider including self-lubricated material fabricator qualifications and self-lubricated material installation plans as evaluation criteria used to select a contractor.

Include in drawings a complete design indicating the character of the work to be performed and giving the dimensions, quantity, location, assembly details, and installation details of each self-lubricated component, housing, and associated running surface.

Information has been included in this specification for product lubricated pump bearings. This information has been included as many of the materials used to construct these bearings are the same as the materials covered in this specification for other lock and dam applications. This specification assumes the pump manufacturer will be responsible to select the appropriate product lubricated bearings. The information in this specification has been limited to the list of parameters that need to be specified to allow the pump manufacturer to select appropriate bearings. Product lubricated information in this specification should be copied to the applicable pump specification for use.

1.1 SUMMARY

This section specifies fabrication, handling, cleaning, and installation requirements for self-lubricated materials and their mating running surfaces.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature
when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Assembly and Installation Plan; G

SD-02 Shop Drawings

Shop Drawings; G

[Field Installation Drawings]; G

SD-03 Product Data

SECTION 35 05 40.17 Page 7
1.4 MANUFACTURER'S QUALIFICATIONS

**************************************************************************
NOTE: This requirement doesn't add much value if only FCB materials are being specified because products are limited to a prequalified list. If only FCB materials are being specified removing this section is recommended.
**************************************************************************

Self-lubricated material manufacturer must have a minimum of 5 years experience in manufacturing self-lubricated materials. Submit a Manufacturer's Experience Record which details the number of years the manufacturer has been fabricating self-lubricated materials and a description of at least [five][three][one][_____] previous, separate, similar installations within the last 5 years.

1.5 HANDLING

Handle self-lubricated components in a manner that does not damage or deform the self-lubricated material. Handle components that are the mating running surfaces of self-lubricated materials in a manner that does not damage or scratch the surface finish of the running surfaces. Do not allow self-lubricated components or their mating running surfaces to come into contact with chains, shackles, hooks, wire ropes, or other rigging that can damage them. Perform lifting, maneuvering, and securing of self-lubricated components and their mating running surfaces with fabric straps or other non-marring rigging. Replace self-lubricated components and components that are the mating running surfaces of self-lubricated components, at no cost to the Government, if they are scratched, nicked, chipped, marred, or otherwise damaged prior to the Government taking possession of the component.
1.6 SHIPPING AND TRANSPORT

Package self-lubricated components and components that are the mating running surfaces of self-lubricated components in a manner that protects them from damage during shipping and transport. Package self-lubricated components in crates or protective boxes with adequate padding prior to shipping or transport. If self-lubricated components are installed in a larger assembly that does not fit within a crate secure protective coverings over the self-lubricated components prior to shipping and transport.

1.7 SHOP DRAWINGS

Prepare and submit Shop Drawings for the self-lubricated components covered under this specification. Within the shop drawings show the complete fabrication dimensions and tolerances, installed dimensions and tolerances, component details, and material types of the self-lubricated components [and seals]. If the contract drawings only show a fit class or require the self-lubricated material manufacturer to determine the fit then detail the specific dimensions and tolerances of the fit in the shop drawings and indicate they are for Government approval. Show the same unit system on the shop drawings that was used in the contract drawings.

1.8 FIELD INSTALLATION DRAWINGS

**************************************************************************
NOTE: Removing this section if field installation drawings covering the self-lubricated components are required in a different specification section.
**************************************************************************

Prepare and submit Field Installation Drawings for the self-lubricated components covered under this specification. In the field installation drawings show the self-lubricated components in their installed configuration and show the post installation dimensions, tolerances, and alignment requirements.

1.9 WARRANTY

**************************************************************************
NOTE: Consider adding minimum warranty claim response times based on the criticality of the system. For example, failures resulting in delays to navigation or the inoperability of systems integral to flood protection equipment should require faster response times. Also consider basing the warranty period on how much time it will take for a system to operate to an extent where you're confident the bearing is working properly.
**************************************************************************

Guarantee self-lubricated components for a period of [2] years from the date of acceptance. Guarantee replacement parts for [2] years from date of replacement. Provide warranty against defective materials, design, and workmanship. In cases where the equipment manufacturer's advertised minimum guarantee is in excess of 2 years, it remains in force for its full period. Upon receipt of notice from the Government of failure of a self-lubricated components during the warranty period, provide new replacement self-lubricated components [promptly][within 4 weeks][_____] at
no additional cost to the Government. Submit the Self-Lubricated Material Manufacturer's Warranty.

1.10 SELF-LUBRICATED COMPONENTS

**************************************************************************
NOTE: This section can be used to identify the self-lubricated materials the Contractor must provide under this contract. Failure Critical Bearings (FCB) should be clearly identified especially where a mix of FCB and non-FCB applications are present. If self-lubricated materials are called out both in the specifications and contract drawings make sure to use verbatim language for the component names in each document.
**************************************************************************

Self-lubricated components covered under this specification are listed below or shown on the contract drawings. In addition, self-lubricated components that the Government has designated as a Failure Critical Bearing (FCB) are listed below or shown on the contract drawings. FCB requirements are outlined in sections below. Self-lubricated components that are not designated as FCB must meet the general self-lubricated material requirements detailed in section 2.1 below. Provide the following self-lubricated components:

<table>
<thead>
<tr>
<th>Self-Lubricated Component Name</th>
<th>Quantity Required</th>
<th>Failure Critical Bearing (FCB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Component 1 name] [Example: Trunnion Bushing]</td>
<td>____</td>
<td>[Yes][No]</td>
</tr>
<tr>
<td>[Component 2 name] [Example: Thrust Washer]</td>
<td>____</td>
<td>[Yes][No]</td>
</tr>
<tr>
<td>[Component 3 name] [Example: Gate Connection Bushing]</td>
<td>____</td>
<td>[Yes][No]</td>
</tr>
</tbody>
</table>

PART 2 PRODUCTS

2.1 GENERAL SELF-LUBRICATED MATERIAL REQUIREMENTS

**************************************************************************
NOTE: The operating temperature range requirement is based on what would likely be seen in a typical lock and dam application. This range is commonly achievable for self-lubricated materials.

A self-lubricated material's water absorption and thermal expansion behavior should be accounted for by following the material manufacturer's recommendations on interference and clearance fits. Use the water absorption requirement if there's a special need for your application to limit the expansion behavior of a material. If the manufacturers recommendations are being followed for fits the water absorption language can be removed.
Dielectric strength is an important property of self-lubricated materials as galvanic corrosion can jeopardize the performance of the bearing. Supplied lubricant metallic bearings rely on the lubricant to prevent galvanic corrosion. Designers should consider the sensitivity of their application to galvanic corrosion and use the dielectric strength requirement below if prevention of galvanic corrosion in needed (a dielectric strength of 50V/mm should prevent galvanic corrosion for civil works applications). Remove the dielectric strength requirement if the self-lubricated material will have bronze surfaces in contact with the mating running surface of the bearing (such as a plugged bronze self-lubricated material).

Graphite is an electrically conductive material and can cause severe galvanic corrosion with other electrically conductive materials such as metals used for bearing running surfaces. However, If a self-lubricated material containing graphite meets the minimum dielectric strength requirement then it should prevent galvanic corrosion in a typical marine environment.

The requirement for self-lubrication to be continuous and without measurable gaps for the full self-lubricated surface in contact with the mating running surface may be needed for applications that regularly only have small ranges of movement. For these applications plugged bronze or other types of materials that don't meet this requirement may not be the best choice for successful performance. If the range of movement is large enough this requirement may not be relevant and can be removed.

Submit Self-Lubricated Material Product Data showing the material[s] selected for use are in compliance with the requirements of this specification. Self-lubricated materials must:

a. Be approved by the material manufacturer for use in [submerged and marine environments][environments exposed to all weather conditions][____].

b. Have an operating temperature range of [-34] [____] to [93] [____] degrees C [-30] [____] to [200] [____] degrees F.

c. Be approved by the material manufacturer for a dynamic bearing pressure of 69 MPa at least 10,000 psi.

[ d. Have a water absorption of less than [0.1][0.2][0.3] percent increase in weight for long term immersion as tested in accordance with ASTM D570.
]

[ e. Have a minimum dielectric strength of 50V/mm, as tested in accordance with ASTM D149, for surfaces of the self-lubricated materials that come into contact with bearing running surfaces.]
[ f. Be continuous and without measurable gaps for the full self-lubricated material surface that contacts the mating running surface.]

2.1.1 Fabric or Fiber Reinforced Polymer Self-Lubricated Materials

In addition to the general self-lubricated material requirements in section 2.1 above fabric or fiber reinforced polymer self-lubricated materials must:

a. Be fabricated with isophthalic polyester, orthophthalic polyester, vinylester, or epoxy resin.

b. Have polyester reinforcement, or a combination of polyester and polytetrafluoroethylene (PTFE) sheet fabric or fiber strand.

c. Have a minimum compressive yield strength of 103 MPa 15,000 psi as tested in accordance with ASTM D695 with the load applied perpendicular to the fabric/fiber layers.

d. Have a minimum in-plane shear strength of 69 MPa 10,000 psi as tested in accordance with ASTM D3846.

2.1.2 Polymer Coating Self-Lubricated Materials

**************************************************************************
NOTE: Coating thickness and backer material selection vary with each application. Consult self-lubricated material manufacturers for appropriate selections for your application.
**************************************************************************

In addition to the general self-lubricated material requirements in section 2.1 above polymer coated self-lubricated materials must:

a. Have a minimum of [0.38][0.51][0.64] mm [0.015][0.020][0.025] inches self-lubricated coating thickness after final machining.

b. Have a minimum compressive strength at failure of 241 MPa at least 20,000 psi as tested by the material manufacturer.

c. Have a coating backer material fabricated from [copper nickel alloy in accordance with ASTM B929, UNS C72900][copper alloy in accordance with ASTM B584] [stainless steel in accordance with ASTM A564/A564M, UNS S17400, Type 630, Condition [H1025] [H1075] [H1100]] [glass fiber reinforced composite].

d. Have an mechanical bond strength developed between the self-lubricated coating and backer material as the primary method of securing the self-lubricated coating. Mechanical fasteners, keys, or other keepers are not acceptable to retain the self-lubricated coating or transfer load between the coating and backer.

2.1.3 Extruded Homogeneous Polymer Self-Lubricated Materials

In addition to the general self-lubricated material requirements in section 2.1 above extruded homogeneous self-lubricated materials must:

b. Have a minimum compressive yield strength of 138 MPa 20,000 psi as
tested in accordance with ASTM D695.

2.1.4 Plugged Bronze Self-Lubricated Materials

**************************************************************************

NOTE: Plugged bronze self-lubricated materials can result in galvanic corrosion in a marine or submerged environment when used against a dissimilar metal such as a stainless steel. Make sure that galvanic corrosion behavior is considered in the design if using a plugged bronze material.

The self-lubricated plugs used in plugged bronze materials are intermittently spaced and may not be ideal for applications with small ranges of movement. Discuss the required plug spacing with self-lubricated material manufacturers and require a plug spacing that accommodates the minimum range of movement for your application.

Optional requirements in section 2.1e (dielectric strength requirement) and 2.1f (requirement for self-lubricated material to be continuous and without measurable gaps for the full self-lubricated material surface) exclude the use of plugged bronze materials. Remove these sections if using a plugged bronze material.

The specific alloy selected for the base material will depend on a variety of factors, such as corrosion resistance, wear, velocity, hardness requirements, machineability. Consult with manufacturers to determine the specific recommended alloys for your application.

**************************************************************************

In addition to the general self-lubricated material requirements in section 2.1 above plugged bronze self-lubricated materials must:

a. Have a base material fabricated from [a copper alloy in accordance with ASTM B584][an aluminum bronze in accordance with ASTM A148/A148M][______].

b. Have self-lubricating plug recesses machined perpendicular to the bearing surface extending at least 0.25 inches deep.

c. Have a self-lubricating plug material appropriate for the application that provides the primary lubrication for the bearing.

d. Utilize a self-lubricating plug material that does not cause galvanic corrosion with the mating running surface material.

e. Have self-lubricating plugs arranged in a uniform overlapping pattern spaced no greater than 69 MPa[[10][15][20] deg][[0.5][0.75][1.0] inches ] apart in the direction of bearing movement and extending no further than 0.25 inches from the edge of the bearing surface.

f. Have a minimum compressive yield strength of 103 MPa20,000 psi, as rated by the self-lubricated material manufacturer.
[2.2 FAILURE CRITICAL BEARINGS (FCB)]

**************************************************************************

NOTE: This section designates additional performance, testing, and QC requirements for critical bearings. These requirements come with additional cost and should be used for applications where the critical nature of the application justifies the additional cost. Remove this section if it does not apply.

Definition of a failure critical bearing can be tailored as necessary for a specific project.

**************************************************************************

Failure critical bearings are bearing or bushing applications where failure could potentially result in damage to critical systems or, applications where repair or replacement of a failed bearing or bushing would result in a loss of service or operation of a critical system. The designation FCB means failure critical bearing. FCB’s are determined by the Government and are identified on the Contract drawings or in the Contract specifications.

2.2.1 FCB Material Qualifications

**************************************************************************

NOTE: CERL TR 99/104 is available through the Defense Technical Information Center (dtic.mil).

**************************************************************************

The following is required for a material to be considered acceptable for FCB applications:

a. The material must have been tested by the procedure defined in CERL TR 99/104.

b. The material must receive a performance score of 350 or above for both wet and dry testing as evaluated by the USACE Hydro Electric Design Center (HDC) in Portland, Oregon, using the bearing rating system in CERL TR 99/104 Appendix F.

c. The material manufacturer must sign a release agreement allowing public distribution of the material's test results.

2.2.2 Approved FCB Materials

**************************************************************************

NOTE: For an updated list of material performance scores contact the USACE Hydroelectric Design Center (HDC) (Phone: 503-808-4250).

**************************************************************************

The following list of materials meet FCB requirements:
TABLE 2:

Submit **FCB Material Certifications** from the material manufacturer stating that the chemical formulations, manufacturing processes and overall structure of the materials supplied are identical to those of the bearings that meet the approved FCB materials above.

2.3 VERIFICATION OF FABRICATION DETAILS

**************************************************************************
NOTE: The surface finish and hardness of the mating component of a self-lubricated material has a large effect on the successful operation of that self-lubricated material. Running surfaces typically need to be fabricated with a Rockwell hardness number between 30 and 40 on the Rockwell C scale (HRC 30 - HRC 40) in accordance with ASTM E18. Self-lubricated materials in applications with infrequent service typically require no rougher than a 0.8 μm 32 micro-inches surface finish. Surface finishes, typically no rougher than 0.4 μm 16 micro-inches are required for application that have frequent service. These requirements can often be
overlooked by contractors and sub-contractors that are not familiar with self-lubricated materials.

Verify that the fabrication and installation details shown meet the self-lubricated material manufacturer's recommendations. Specifically, verify that:

a. Surface finish and hardness requirements shown for self-lubricated material mating running surfaces are in compliance with the self-lubricated material manufacturer's recommendations.

b. Self-lubricated material clearance fits, interference fits, and tolerances shown comply with the self-lubricated material manufacturer's recommendations.

If these fabrication and installation details are outside of the self-lubricated material manufacturer's recommendations [notify the Government by submitting a Request for Information] [notify the Government by submitting a variance request on the shop drawings] [notify the Contracting Officer Representative].

2.4 Seals

NOTE: The use of physical seals for self-lubricated bushings/bearings is an important consideration for designers. Designers should remember that for a traditional greased bronze bearing the grease is not only lubricating but is also helping to seal the bearing. Self-lubricated materials provide their own lubrication but do not provide their own seal.

Adding a physical seal can help keep debris and contaminants out of the bearing which keeps friction low and minimizes the potential for abrasive wear.

In general, it's recommended that physical seals are used for critical bearings. However, other factors that should be considered when making this decision include the potential for debris or contaminants to enter the bushing/bearing, the bushing/bearing's natural tendency to evacuate debris or contaminants, and the abrasion resistance characteristics of the chosen material construction(s).

There are many acceptable materials and configurations that can be used for physical seals. The material choices presented here have been used in self-lubricated material bushing/bearing designs and are provided here as sample seal materials for consideration. Tailor this spec section to the types of seals selected for the design.

Elastomeric o-rings are commonly used for static joint seals. These are designed to be compressed with the assembly of the joint to provide positive contact to exclude debris, and other contaminants. Low friction polymer lip seals are commonly used for
dynamic joint seals. PTFE is a very common selection because of its low friction, ability to run without grease or oil, and chemically resistive properties. A bent metal spring or compressed o-ring is typically used to energize the lip seal (provide positive contact) when the joint is assembled. These types of seals are typically readily available from seal manufacturers as they are commonly used on mechanical shafts and cylinders.

Submit Seal Product Data showing the seals selected for use are in compliance with the requirements of this specification.

2.4.1 Static Seals

Static seals must be synthetic ethylene propylene elastomeric o-rings meeting the following material requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

2.4.2 Dynamic Seals

Dynamic seals must:

a. Be lip seals or face seals designed to exclude [rainwater][silt][heavy splash and mist][debris and contaminants] from the self-lubricated bearing.

b. Be suitable for use in a [submerged][high splash][outdoor]environment.

c. Be energized with springs fabricated from stainless steel or elastomeric o-rings to provide positive contact between the components being sealed.

d. Be molded or extruded from a polytetrafluoroethylene (PTFE) resin with appropriate fillers to achieve the performance requirements appropriate for the self-lubricated material seal application.

e. Be suitable for running without external lubrication.

[2.5 PRODUCT LUBRICATED PUMP BEARINGS]

**************************************************************************
NOTE: If used, this section should be copied into an applicable pump specification. If pump bearings are not being used remove this section.

SECTION 35 05 40.17  Page 17
Submerged pump bearing must be [product lubricated][externally supplied water lubricated] and meet the following requirements:

a. Fabricated from an elastomeric material or polymer composite material and not require petroleum lubricants for operation.

b. Operate in [brackish][fresh] water that may contain [sand] [silt] [vegetative trash].

c. Does not require service or replacement for [50,000] [_____] operating hours.

PART 3 EXECUTION

3.1 FABRICATION

Fabricate self-lubricated components and their mating running surfaces to the materials, dimensions, tolerances, and qualities shown. Fabricate self-lubricated components in accordance with the self-lubricated material manufacturer's recommendations.

3.2 TEST FITTING

Test the fit of self-lubricated components with their mating surfaces [in the presence of the Contracting Officer Representative] prior to transporting components on site.

3.3 INTERFERENCE FITTING OF SELF-LUBRICATED MATERIALS

3.3.1 Preparation of Interference Fit Surfaces

Prior to interference fitting:

a. Remove coatings such as paint, galvanizing, and anodizing from the interference fit surfaces of the bushing/bearing housing.

b. Clean the interference fit surfaces of the bushing/bearing and housing of oil, grease, cutting fluids, or other substances.

c. Prepare the interference fit surfaces of the bushing/bearing in accordance with the self-lubricated material manufacturer's recommendations.

3.3.2 Press-Fitting

Press fit self-lubricated components in accordance with the material manufacturer's recommendations. Do not use hammer blows or other impact type loading to press fit self-lubricated components. Use a method to press fit self-lubricated components that provides a smooth and constant force such as a hydraulic or other style of press. Protect components from damage during the press fitting process.

3.3.3 Shrink-Fitting

Perform shrink fitting by lowering the temperature of the inner component to a point where the outside diameter shrinks adequately to avoid
interference with the outside part. Use a method to lower the temperature of self-lubricated materials that is approved by the self-lubricated material manufacturer and submitted with the Assembly and Installation Plan. Ensure shrink-fit components are fully seated and prevented from moving prior to allowing the parts to return to ambient temperature.

3.4 MECHANICAL FASTENING OF SELF-LUBRICATED COMPONENTS

Install self-lubricated components in accordance with the approved Assembly and Installation Plan. Use [300 series stainless steel fasteners] [_____] to install self-lubricated components unless otherwise noted. Install fasteners [with a thread locker and] to a torque value that does not damage or distort the self-lubricated materials. Determine the self-lubricated material manufacturer's maximum allowable amount of wear for the self-lubricated component. Install fasteners so that no part of the fastener extends beyond the fully worn running surface of the self-lubricated material.

3.5 BONDING INSTALLATION

**************************************************************************
NOTE: Installation of self-lubricated materials using bonding adhesives have had mixed results for previous installations. In general, bonded installations are much more challenging to perform successfully. Previous challenges have included difficulties with working with bonding adhesives, maintaining component alignment during bonding, and performing accelerated temperature curing of bonding adhesives without post-curing the self-lubricated materials. Overall, bonding installations require a high level of skill and craftsmanship to perform successfully and these qualifications are extremely difficult to specify in a contract. In addition, there's typically no advantage to a bonded installation over interference fitting or mechanical fastening. Therefore, bonded installations are not recommended.
**************************************************************************

Installing self-lubricated materials with a bonding adhesive is not permitted.

3.6 INSTALLATION PLAN

Submit an Assembly and Installation Plan showing the proposed method to assemble and install the self-lubricated components. Include pre-assembly fabrication dimensions, a description of the [interference fitting procedure][mechanical fastening procedure including installation torques], post-assembly dimensions, installation procedure,[seal installation procedure including any methods to temporarily support the seals during assembly,] method to measure and confirm the alignment requirements. Government approval of the plan does not relieve the requirement to provide a successful installation.
3.7 VERIFYING DIMENSIONS AFTER INSTALLATION

**************************************************************************
NOTE: The inner and outer diameter of self-lubricated bushings can change significantly after interference fitting. Consult the self-lubricated material manufacturer for pre-interference fit dimensions to achieve the desired post-interference fit dimensions. Manufacturer's can typically accurately predict the pre-interference fit dimensions required. However, sometimes post-interference fit machining is required to meet final dimensions.

Some self-lubricated materials are fabricated with a layer of premium grade material applied only at the running surface of the part. This is a common practice and can be used to significantly reduce material costs. If this practice is used an adequate thickness of premium grade material needs to be provided to allow post-interference fit machining.

**************************************************************************

After [shop assembly] [field installation], measure self-lubricated components to verify contract required dimensions and alignment requirements are met. If assembly dimensions are not met, machine or hone the self-lubricated materials to achieve the required dimensions. Perform machining and honing of self-lubricated components in accordance with the self-lubricated material manufacturer's recommendations. Some self-lubricated materials are fabricated with a layer of premium grade material applied only at the running surface of the part. Provide enough premium grade material at running surfaces to allow for post-assembly machining. After completing the installation photograph the [bearing/bushing][self-lubricated component] showing the installed condition. Submit a Post-Assembly QC Report detailing the measured dimensions and alignment tolerances after assembly and showing compliance with the approved Assembly and Installation Plan. [Include color photographs of the [bearing/bushing][self-lubricated component] showing the installed condition.]

3.8 ASSEMBLY OF MATING COMPONENTS

3.8.1 Cleaning

Prior to final installation, clean self-lubricated materials and their running surfaces of oil, dirt, and debris using a method recommended by the self-lubricated material manufacturer.

3.8.2 Seal Installation

**************************************************************************
NOTE: Delete this section if physical seals are not used.
**************************************************************************

Install seals in accordance with the approved Assembly and Installation Plan. [Temporary support of seals for assembly/installation may be performed with cyanoacrylate adhesive applied in small amounts at several
[3.8.3] Final Installation

Do not force components together in a manner that causes binding of the running surfaces of the components. Do not use lubricants to assemble self-lubricated components unless otherwise specified.

[3.9] ACCEPTANCE TESTING

**************************************************************************
NOTE: Remove if acceptance testing is covered under a different spec section. Tailor the acceptance testing to your specific application. It's recommended that the designer develop a checklists for all testing or verifications need to ensure the bearing system is functioning correctly. It's also recommended that acceptance testing is witnessed and signed off by all concerned parties such as the customer or stakeholders.
**************************************************************************

[Notify the Contracting Officer in writing at least [14] calendar days before performing acceptance testing. Perform acceptance testing in the presence of the Contracting Officer unless waived in writing.] Create an acceptance test report form to document the procedure to perform the test operation and monitoring required in this section. Verify the following requirements have been completed prior to starting acceptance testing:

[ a. Self-lubricated component installation is complete and components of the bearing system have been fully assembled.]

[ b. The self-lubricated component installed dimensions, tolerance, and alignments have been measured and found to comply with the installation requirements shown.]

[ c. The Post-Assembly QC Report has been finalized and approved by the Government.]

[ d. Fasteners and have been installed and torqued to their final values.]

3.9.1 Test Operation and Monitoring

**************************************************************************
NOTE: Use this section to describe the cycling that needs to be performed for the bearing system. Some general examples are provided but this section needs to be tailored to your specific application.
**************************************************************************

[In the presence of the Contracting Officer Representative][operate the [bearing system] through [5][10][_____] rotation cycles][operate the [bearing system] for [1 hour][2 hours][_____]][Perform test operation at [_____] load and [_____] speed]. During test operation monitor the [bearing system] for:

[ a. Evidence of bending, warping, permanent deformation, cracking, or malfunction of components.]
b. Abnormal noise, stick-slip movements, vibration, or overheating of the self-lubricated components.

c. Evidence of bearing movement or deformation.

Stop test operation immediately if any of these deficiencies are observed. Investigate and correct deficiencies prior to proceeding with test operations. After completing test operation the [Contracting Officer Representative] will examine the [bearing system] and, if found to comply with the contract requirements, it will be accepted [by signature by all parties]. [Signatures and acceptance will not occur until deficiencies have been corrected.]

3.9.2 Test Report

Upon successful completion [and signoff] of the acceptance tests submit an Acceptance Test Report documenting the test operations performed, the monitoring checks performed, deficiencies discovered and their resolution, [and showing final signoff by all parties].

3.10 OPERATION AND MAINTENANCE MANUALS

[In addition to the requirements of Section 01 78 00 CLOSEOUT SUBMITTALS,] [Provide][five][three][_____] [printed and bound][PDF format] [legible] copies of the following information in the Operation and Maintenance Manuals. All information must be the most current and approved copy, reflecting any changes made during the construction process:

a. Shop Drawings.

b. Field Installation Drawings.

d. Seal Product Data.

e. Self-Lubricated Material Manufacturer's Warranty.

f. FCB Material Certifications.

g. Post-Assembly QC Report

h. Acceptance Test Report

i. Photographs showing the installed self-lubricated components]

j. Guidance for when self-lubricated components need to be replaced]

3.11 TRAINING

Provide field training conducted by the [self-lubricated material manufacturer] [erecting engineer] for operating staff after each system is functionally complete but prior to final acceptance. The training must be given for a period of not less than [four][_____] hours. Cover [operation], [inspection], and [maintenance] of [the self-lubricated bearing systems] include the items contained in the operation and maintenance manuals. Do not perform training until operation and
maintenance manuals have been approved. Provide [four weeks] [_____] advance notice of the scheduled training. [Record video and audio of training conducted and provide two CD-ROM copies of the training. Provide MPEG-2 or MPEG-1 format to be compatible with common DVD players in the United States.]

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for fabricating, assembling, delivering, and installing stoplogs. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 LUMP SUM PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (LUMP SUM PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.
1.1.1  Stoplogs Payment

Payment shall constitute full compensation for furnishing all plant, labor, materials and equipment and performing all operations necessary for installing the stoplogs as specified.

1.1.2  Unit of Measure

Unit of measure: lump sum.

1.2  REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM A320/A320M (2021a) Standard Specification for Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service

120/105 ksi Minimum Tensile Strength

ASTM A490M (2014a) Standard Specification for High-Strength Steel Bolts, Classes 10.9 and 10.9.3, for Structural Steel Joints (Metric)

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
  Detail Drawings; G[, [_____]]

SD-03 Product Data
  Sequencing and Scheduling; G[, [_____]]
  Welding
  Materials
1.4 QUALIFICATION OF WELDERS AND WELDING OPERATORS

Qualification of welders and welding operators shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.5 DELIVERY, STORAGE, AND HANDLING

Delivery, handling and storage of materials and fabricated items shall conform to the requirements specified [herein and] in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Materials and equipment delivered to the site by the Contracting Officer shall be unloaded by the Contractor. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.5.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Rubber seals shall be kept free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

1.5.2 Identification System

Submit an Identification System which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract.

1.6 SEQUENCING AND SCHEDULING

******************************************************************************
NOTE: The name of the appropriate railroad company or roadway agency should be inserted as indicated.
******************************************************************************

Before the work is commenced, submit the approved sequencing and scheduling plan which illustrates that work affecting [railroads] [roadways] has been coordinated with [____]. The plan shall include schedules, lists of labor or materials to be provided to the affected [company] [agency], and any other aspects of the work that may impact on the operations of these entities. The plan shall clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed.
2.1 MATERIALS

Materials orders, materials lists and materials shipping bills shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel[, structural aluminum,] and other metal materials sections and standard articles shall be as shown and as specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shall conform to [ASTM A36/A36M][ASTM A242/A242M][ASTM A529/A529M][ASTM A572/A572M, Grade [42,] [50,] [60,] [or] [65]] [ASTM A588/A588M].

2.1.1.2 [Structural Aluminum]

Structural aluminum shall conform to [ASTM B221M ASTM B221,] [ASTM B308/B308M,] [Alloy 6061, Temper T6].

2.1.2 Rubber Seals

******************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION and ZINC FILLER.
******************************************************************************

2.1.2.1 General Requirements

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa2,500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.2 MPa900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>
The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees plus/minus 2 degrees C for 22 plus/minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as W1 (W1 is defined in ASTM D471). The immersion temperature shall be 70 degrees plus/minus 1 degree C and the duration of immersion shall be 166 hours.

2.1.2.2 [Fabrication]

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa 2,000 psi (min.)</td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform to the requirements specified and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

[High-strength bolts, nuts, and washers shall conform to [ASTM A325M ASTM A325,] Type [______], [hot-dip galvanized] or [ASTM A490M ASTM A490,] Type [______].] Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [______]] [Austenitic Steel, Grade [______], Class [______]].] Bolts 13 mm 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated.

2.2.3 [Clips and Clip Bolts for [Aluminum] [Steel] Panels

Clips and clip bolts for [aluminum] [steel] panels shall be approved standard manufactured stock items.]
2.3  FABRICATION

2.3.1  Detail Drawings

Detail drawings of stoplogs and appurtenant shop fabricated items, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.1.1  Fabrication Drawings

Show on the fabrication drawings complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.3.1.2  Shop Assembly Drawings

Show on the shop assembly drawings details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.3.1.3  Delivery Drawings

Show on the delivery drawings descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.3.1.4  Field Installation Drawings

Show on the field installation drawings a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; and methods for installing appurtenant items.

2.3.2  Structural Fabrication

Structural fabrication shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.3  Welding

Submit schedules of welding procedures for structural steel [and welding processes for aluminum]. Welding shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.4  Bolted Connections

Bolted connections shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5  Machine Work

Machine work shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6  Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.
specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Zinc coating of hardware items shall conform to ASTM A153/A153M.]

2.3.7 Fabrications

2.3.7.1 Stoplogs [and Posts]

**************************************************************************
NOTE: Stoplogs and posts shall be fabricated of structural steel or aluminum. Where aluminum is specified, include the requirements for aluminum stoplogs and posts to be furnished by the Contractor, or aluminum materials and extrusion dies for fabricating stoplogs and posts to be furnished by the Government to the Contractor for fabricating aluminum stoplogs and posts if such is the practice in the Command.
**************************************************************************

[Stoplogs [and posts] shall be fabricated of [structural steel conforming to [ASTM A36/A36M] [ASTM A242/A242M] [ASTM A529/A529M] [ASTM A572/A572M, Grade [42,] [50,] [60,] [or] [65]] [ASTM A588/A588M]] [extruded aluminum conforming to [ASTM B221M ASTM B221,] [ASTM B308/B308M,] [Alloy 6061, Temper T6]]. [Steel items shall be galvanized where indicated.] [Stoplogs [and posts] shall be fabricated with the aluminum materials and extrusion dies provided to the Contractor by the Contracting Officer. Furnish all other materials and equipment as required for fabrication.]

2.3.7.2 Stoplog Guides [and Post Pockets]

Stoplog guides [and post pockets] shall be fabricated of structural steel conforming to [ASTM A36/A36M] [ASTM A242/A242M] [ASTM A529/A529M] [ASTM A572/A572M, Grade [42,] [50,] [60,] [or] [65]] [ASTM A588/A588M].

2.3.7.3 Miscellaneous Embedded Metals

Corner protection angles, frames, base plates, and other embedded metal items required for complete installation shall conform to the details shown.

2.3.8 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and machine-finished after splicing.
2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

2.4.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Submit certified test reports for material tests, with all materials delivered to the site.

2.4.2 [Testing of Rubber Seals]

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUOROCARBON FILM</th>
<th>MACHINE METHOD AT 50 MM² INCHES PER MINUTE</th>
<th>DEADWEIGHT METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.762 mm 0.030 inch</td>
<td>13.6 kg per 25 mm³ 13.6 kg per 25 mm³</td>
<td>13.6 kg per 25 mm³</td>
</tr>
<tr>
<td>1.524 mm 0.060 inch</td>
<td>13.6 kg per 25 mm³ 13.6 kg per 25 mm³</td>
<td>13.6 kg per 25 mm³</td>
</tr>
</tbody>
</table>

Failure of any specimen to meet the requirements of the test used will be cause for rejection of the piece from which the test specimen was taken.]

PART 3 EXECUTION

3.1 INSTALLATION

Installation shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.1.1 Embedded Metals

Corner protection angles, frames, base plates, and other embedded metal items required for complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour.

3.1.2 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gate[s], a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.1.3 Painting

Exposed parts of stoplogs and appurtenances except machined surfaces,
corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, rubber seals, and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.2 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.3 ACCEPTANCE TRIAL OPERATION

After completion of installation, the Contracting Officer will examine the stoplog installation for final acceptance. The individual components of the stoplog installation will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will be required to place the stoplogs [and posts] in the guides [and post pockets] a sufficient number of times to demonstrate that the stoplogs fit properly and seat uniformly. Required repairs or replacements to correct defects, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected.

SECTION 35 20 15

FRP COMPOSITES FOR LOW-HEAD WATER CONTROL STRUCTURES
08/18, CHG 1: 08/20

NOTE: This guide specification covers design-build gates and stop logs or boards made from fiber reinforced polymer (FRP) composite materials for use in low-head water control structures and weirs. Structures covered by this specification are to have a maximum static hydraulic head of 6.1 meters 20 feet, accounting for overflow, a maximum height of 3.7 meters 12 feet and a maximum width of 3.7 meters 12 feet. This guide specification is not applicable if catastrophic failure of the water control structure would create a life safety risk as per ER 1110-2-1156. This specification covers the performance requirements for composite gates and stop logs or boards as well as appurtenant components such as seals, guide frames, anchors and fasteners.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com).

Units of work normally included should be FRP items which require specific fabrication to meet the desired project requirements.
PART 1   GENERAL

**************************************************************************
NOTE: The scope section may be edited by the User as needed. However, the maximum design head and maximum width must not be increased.
**************************************************************************

1.1 SCOPE

This guide specification covers low-head FRP water control structures, such as gates, valves or stoplogs, and any appurtenant features defined in the Contract Drawings that have a maximum static hydraulic head of 6.1 meters 20 feet, accounting for overflow, a maximum height of 3.7 meters 12 feet and a maximum width of 3.7 meters 12 feet.

1.2 UNIT PRICES

Payment must constitute full compensation for furnishing all plant, labor, materials and equipment and performing all operations necessary for fabricating and installing the [Stoplogs] [Vertical Lift Gate] [_____] as specified.

1.2.1 Unit of Measure

Unit of measure: lump sum.

1.3 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.4 DEFINITIONS

1.4.1 Design Head

The maximum differential head that will actually be applied to the gate (from AWWA C563).

1.4.2 Failure Critical Member

Any member for which failure would cause collapse, partial collapse or loss of functionality of the structure.

1.4.3 Fracture Critical Member

A steel member (or component thereof) that is in tension and whose failure would result in collapse or partial collapse of the structure.

1.4.4 FRP Composites

A Fiber Reinforced Polymer (FRP) member composed of fibers and resin systems, including fillers and additives. These members are manufactured via pultrusion, filament winding, vacuum infusion, hand lay-up or other methods and may contain foam or wooden cores, metal frame members, other previously produced FRP composites or other materials. This includes structural shapes, sandwich panels, boards, or other members made of FRP.

1.4.5 Low-Head Water Control Structure

A gate, valve or stoplog structure with a maximum design head of 6.1 meters 20 feet, a maximum height of 3.7 meters 12 feet, and a maximum width of 3.7 meters 12 feet.

1.4.6 Stoplog

Horizontal members placed on top of each other fitting into a frame, groove or channel on each side channel in the water control structure.
1.4.7 Vertical Lift Gate

A gate that opens upward to allow water to flow under the gate. Vertical lift gates may also be referred to as sluice gates or slide gates.

1.4.8 Weir Dam

A dam to control water level by flowing water over the top of the structure; may include a control mechanism made of stoplogs or movable gates.

1.5 SEQUENCING AND SCHEDULING

Before the work is commenced, submit the approved sequencing and scheduling plan which illustrates that work affecting [railroads] [roadways] [utilities] [appurtenances] has been coordinated with [_____] and any other aspects of the work that may impact on the operations of these entities. The plan must clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] [appurtenances] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed or approved.

1.6 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Additional submittal requirements may be added by
the User as needed.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Contractor, Manufacturer, and Engineer Qualifications; G[, [______]]
Sequencing and Scheduling Plan; G[, [______]]
Quality Control Plan

SD-02 Shop Drawings

Detail Drawings; G[, [______]]

SD-03 Product Data

[Slide Gate][Stop Log] Technical Data Sheet; G[, [______]]

1.7 MAINTENANCE MATERIAL SUBMITTALS

1.7.1 Spare Parts

********************************************************************************
NOTE: Include a list of all spare parts required.
This information should be provided on the contract drawings.
********************************************************************************

[____]

1.8 QUALITY CONTROL

1.8.1 General

The Contractor is responsible for quality control and must establish and maintain an effective quality control system [in accordance with Contract Clauses 52.236-6 SUPERINTENDENCE BY THE CONTRACTOR and 52.236-5 MATERIAL AND WORKMANSHIP and with SECTION H, SPECIAL CONTRACT REQUIREMENTS]. The quality control system must consist of plans, procedures, and organization necessary to produce an end product which complies with the requirements of this contract. The system must cover all design, fabrication, painting, and delivery operations. The Contractor must submit a written Contractor quality control plan for approval.

1.8.2 Regulatory Requirements

********************************************************************************
NOTE: Include all regulatory information.
********************************************************************************

[____]

1.8.3 Contractor, Manufacturer, and Engineer Qualifications

********************************************************************************
NOTE: If an engineer of record is close to the minimum or if the user has concerns about the nature and extent of the engineer's experience, the user may request a record of specific projects performed by the engineer in order to ensure the engineer
possesses adequate qualifications to perform the proposed work.

Provide documentation from manufacturer having a minimum of [five][_____] years' experience in the manufacture of similar products and systems. Additionally, if requested, provide a record of at least [five][_____] previous, separate, similar successful installations in the last [five][_____] years. Submit Manufacturer's catalog data to include two copies of specifications, load tables, dimension diagrams, and anchor details for the following low-head water control structures and components.

Provide documentation from Engineer of Record having a minimum of [five][_____] years' experience in the design of [five] [_____] similar products and systems and copy of current license. Additionally, if requested, provide a record of at least [five][_____] previous, separate, similar successful installations in the last [five][_____] years.

1.9 DELIVERY, STORAGE, AND HANDLING

1.9.1 General

Submit recommendations for shipping, handling, storage, installation procedures, and care and maintenance instructions. Deliver manufactured materials in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer. Ensure all related adhesives, resins and their catalysts and hardeners are crated or boxed separately, and noted as such to facilitate their movement to a dry indoor storage facility under controlled temperature and humidity.

1.9.2 Handling and Storage

Handle all materials to prevent abrasion, cracking, chipping, twisting, other deformations, and other types of damage. Store adhesives, resins and their catalysts in dry indoor storage facilities following MDS requirements.

1.10 PROJECT/SITE CONDITIONS

1.10.1 Design Parameters

**************************************************************************

NOTE: This information is to be provided by the user. The items suggested below are not necessarily all inclusive nor will all be necessary in all situations. User to edit this section as appropriate to include all relevant site conditions for the project and should be included with the scope of work or contract drawing documents.

**************************************************************************

**************************************************************************

NOTE: Provide information on the following items: type of water control structure; height and width of opening; design head (including operating head); bearing conditions (embedded metals condition and layout); type of actuator preferred to operate gate; type of frame (conventional, self-contained thrust reaction) and installation (surface mounted, in-channel wall mounted, embedded in wall, etc.);
frequency of operation; debris and ice loads;  
corrosive, acidic or alkaline water conditions;  
operational limits (lifting, handling, etc.); and  
other items listed in AWWA C563.

**************************************************************************

1.11 WARRANTY

**************************************************************************

NOTE:  Designated appurtenances of the gate assembly  
may be guaranteed for a minimum period of 1 year  
from the date of acceptance thereof, either for  
beneficial use or final acceptance, whichever is  
earlier, against defective materials and  
workmanship.  Such guarantees will require the  
Contractor to furnish and install new replacement  
parts immediately upon receipt of notice from the  
Government of the failure of any part of the  
guaranteed items during the warranty period.  These  
warranty requirements will be covered in the  
CONTRACT CLAUSES and this paragraph should be  
deleted from this section of the specifications.

**************************************************************************

Furnish manufacturer's no-dollar-limit warranty for the FRP composite  
low-head water control structure or components.  The warranty period is to  
be no less than [1] [5] [10] [15] [20] years from the date of acceptance of  
the work and be issued directly to the Government.  The warranty must  
provide that, if within the warranty period, the composite low-head water  
control structure or components show evidence of deterioration resulting  
from defective materials and/or workmanship, correcting of any defects is  
the responsibility of the manufacturer.  Repairs that become necessary  
because of defective materials and workmanship while the composite low-head  
water control structure or components are under warranty are to be  
performed within [32] [_____] hours after notification, unless additional  
time is approved by the Contracting Officer.  Failure to perform repairs  
within [32] [_____] hours of notification will constitute grounds for having  
emergency repairs performed by others and will not void the warranty.

PART 2   PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************

NOTE:  This section should be modified to account  
for the specific type of water control structure.  
The materials listed are suggestions showing most  
commonly used for such structures.  Unsuitable  
materials for a particular application can be  
removed.  Specify similar metals or provide  
dielectric insulators as necessary.

**************************************************************************

Provide [vertical lift gate] [stop logs] [_____] composed of fiber  
reinforced polymer composites [and embedded metal frame] in qualities,  
quantities, properties, arrangements and dimensions as necessary to meet  
the design requirements and dimensions as specified on the contract.
Provide reinforcement in the form of glass or carbon fibers, mats, or fabrics to meet the design requirements and dimensions as specified. Select the reinforcement format for failure critical FRP components according to the mechanical requirements of the application and the geometry/shape of the part. Confirm selected reinforcements are compatible with selected resin matrix system to ensure proper adhesion/load transfer and long-term performance of the component in its intended physical-chemical environment of use. Ensure all surfaces of FRP composite items and fabrications are smooth, resin-rich, free of voids, and without dry spots, cracks, and un-reinforced areas as per quality requirements herein. Ensure all reinforcing fibers are completely covered during manufacturing with resin to a depth of 0.25 to 0.51 mm 0.01 to 0.02 inches to protect against their exposure to wear, water immersion, or weathering. Seal over fasteners that penetrate the FRP skin, end cuts, and penetrations in a way that prevents delamination and water ingress. Use mechanical fasteners or mechanical plus adhesive for built up FRP members connected in tension after manufacturing. Provide documentation showing core materials are resistant to decay and attack by fungus and bacteria.

Embedded frames made of [FRP] [galvanized steel] [T-[_____] stainless steel] [aluminum] may be used to provide added stiffness to meet the specified requirements, but must be submitted to the Contracting Officer or their approved representative for approval and have a minimum of 1/4 inch thick FRP on each side. [Metal frames made of [galvanized steel][T-[_____] stainless steel] [aluminum] must meet ASME/ASTM standards, be fully encapsulated in the FRP structure, and design submittals must account for the potential for the FRP to delaminate from the frame] [Metal frames must be detailed to prevent galvanic corrosion if carbon is used in FRP]. Specification section [_____] must be referenced when embedded metals are used in conjunction with the composite structure. Provide anchored guide frames made of [carbon steel] [T-[_____] stainless steel] [FRP] [aluminum] [or approved material] that attach into the sidewalls of the water control structure. [Galvanize or epoxy coat carbon steel frames as per AWWA C563.] Provide anchors which match the frame material and provide dielectric insulators to secure the guide frame into the surrounding water control structure. As necessary, coat anchors to inhibit corrosion.

2.1.1 Design Requirements

**************************************************************************
NOTE: A factor of safety of 5 is suggested based on the typical response of FRP composites under sustained loads. This can be adjusted based on the site conditions of the structure and the associated risks. The design life is the same as HSS, but it should be noted that FRP composites do not have the performance data needed to calibrate design codes. Thus, the determination of the parameters that affect the design life would be based on the judgment of the designer of record.
**************************************************************************

The water control structure must be designed in accordance with this specification to achieve the objectives of constructability, safety, serviceability, with due regard to issues of inspectability, and economy. The structural system must be proportioned and detailed to ensure the
development of significant and visible inelastic deformations at the
strength and extreme event limit states before failure. Load-path
redundant structures should be used unless there are compelling reasons to
not do so.

Submit design documentation showing the water control structure is capable
of meeting a factor of safety of [5] [_____] defined as the ratio of
ultimate stress to the working or allowable stress using allowable stress
design prior to commencement of work. Maximum sustained stress cannot
exceed one-fifth of failure stress and account for creep and the effects of
water adsorption. Design life should be assumed to be [100] [_____] years
assuming routine inspection and maintenance. All design computations are
to be stamped by a registered professional engineer who will be identified
as the Engineer of Record. All design computations must also be initialed
by an additional registered professional engineer who will be identified in
the design documents as having provided design quality control. See
paragraph 3.5.2 "Data Book" for additional requirements.

2.1.1.1 Mechanical Anchorage

Mechanical anchorage system to be designed to meet the load requirements as
outlined in ASCE 7-16 and paragraph 1.10.1 Design Parameters. Anchorage
calculations are stamped by a Registered Professional Engineer. Expansion
anchors are not permitted.

2.1.2 Performance Requirements

**************************************************************************
NOTE: Delete columns as appropriate based on gate
type. Leakage requirements should only be included
for instances where leakage is considered a critical
issue. Leakage tests can be performed in the shop
or in the field, though testing may not be practical
based on the size and head on the gate.
**************************************************************************

Submit documentation including [Slide Gate][Stop Log] Technical Data Sheet
showing the full gate system is capable of meeting the following
performance requirements prior to commencement of work.

<table>
<thead>
<tr>
<th>Test</th>
<th>Vertical Lift Gates</th>
<th>Stoplogs</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Leakage (AWWA C563)]</td>
<td>[Less than 1.3 lpm/m 0.1 gpm/ft of seating perimeter]</td>
<td>[Less than 0.62 lpm/m 0.05 gpm/ft of seating perimeter]</td>
</tr>
<tr>
<td>Gate Deflection</td>
<td>Less than 1/720 of the gate width at maximum head water</td>
<td>Less than 1/360 of the gate width, max of 6.4 mm 1/4 inch at maximum head water</td>
</tr>
<tr>
<td>Yoke Deflection</td>
<td>Less than 1/360 of the gate width, max 6.4 mm 1/4 inch at maximum head water</td>
<td>[not applicable]</td>
</tr>
</tbody>
</table>

2.2 MANUFACTURED UNITS

Miscellaneous materials and standard articles must conform to the
respective standards or specifications below when that type of material is furnished. Where material requirements are not specified, materials furnished must be suitable for the intended use and are subject to approval. Submit date and type of manufacture including constituent materials. Submit materials variances for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.1 Bolts, Nuts and Washers

Provide bolts, nuts, and washers of the material, grade, type, class, style and finish indicted or best suited for the intended use.

2.2.1.1 Bolts

Where the use of high strength bolts is required, the materials, workmanship, and installation must conform to the applicable provisions of ASTM F3125/F3125M and RCSC A348. Bolts for low-temperature applications must conform to ASTM A320/A320M. Bolts for non-high strength applications must conform to the applicable provisions of ASTM A307, Grade A.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.1.2 Nuts

All nuts to be used with high strength bolts must conform to ASTM A563 and ASME B18.2.2

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.1.3 Washers

All nuts must be equipped with washers. Washers to be used with high strength bolts must conform to ASTM F436/F436M. Plain washers must conform to ASME B18.22M or ASME B18.21.1, Type B as applicable. Lock washers must conform to ASME B18.21.1.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2 Anchorage

**************************************************************************
NOTE: For most jobs, ASTM F1554 248 MPa 36 ksi anchor bolts are used. If high tensile loads are anticipated, the designer should consider the use of 379 MPa 55 ksi or 724 MPa 105 ksi ASTM F1554 anchor bolts. If stainless steel is considered, the designer should select from material in ASTM A193/A193M.
**************************************************************************
2.2.2.1 Anchor Rods

*ASTM F1554* [Stainless steel Gr 36 [55] [105], Class 1A [2A].

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2 Anchor Nuts

*ASTM A563*, Grade A, hex style. [Stainless steel *ASTM A193/A193M*.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.3 Anchor Washers

*ASTM F844*. [Stainless steel [Type 304][Type 316] conforming to *ASTM A276/A276M*.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.4 Anchor Plate Washers

*ASTM A36/A36M* [Stainless steel [Type 304][Type 316] conforming to *ASTM A276/A276M*.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.5 [Sleeve Anchors][Adhesive Anchors]

Provide [_____] mm [_____] inch diameter [sleeve anchors][adhesive anchors]. Minimum concrete embedment must be [_____] mm [_____] in. Design values listed must be as tested according to *ASTM E488/E488M*.

b. Minimum [ultimate][allowable] shear value: [_____] kN [_____] lb.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.3 EQUIPMENT

[Provide [manual] [powered] actuators to lift the gate as per *AWWA C563*]. [Provide lifting beams and storage racks for stop logs.]

2.4 MATERIALS

Miscellaneous materials and standard articles must conform to the respective standards or specifications below when that type of material is furnished. Where material requirements are not specified, materials
furnished must be suitable for the intended use and are subject to approval. Submit materials variances for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.1 FRP Composites

**************************************************************************

NOTE: A wide range of strength properties for FRP composites are possible and depend on the fiber volume fraction, resin type, cross section, and manufacturing method. There is no need to specify a minimum design strength, as the manufacturer must design the low-head water control structure to meet the specified requirement. A manufacturer could use a weak material in bulk, or smaller quantities of a much stronger material. The key for the government is to ensure that the strength of the supplied FRP composite meets or exceeds the design values.

For reference, pultruded FRP composite structural shapes often have tensile, compressive and flexural strength design values at ultimate around 207 Mpa 30 ksi and tensile modulus around 17.2 Kpa 2.5 Msi in the lengthwise direction. Pultruded plates range from one half to two thirds of these values. FRP rods and bars are often two to three times stronger than structural shapes in tension and flexural. Properties of honeycomb members, sandwich panels and other shapes made via process other than pultrusion can vary significantly.

**************************************************************************

Submit documentation showing FRP composites meet the material properties used in the design as per the applicable [ASTM] [_____] test requirements. [Submit samples to permit verification testing for FRP composites made via hand-layup].

Submit documentation showing that FRP composites show no evidence of damage including breaks, cracks, blistering, delamination, exposure of fibers, or combination thereof, after being subjected to ASTM D4329 or ASTM G154 for a minimum of 720 hours.

Allowable visual defects of FRP Composite members must meet conditions as per ASTM D4385 for pultruded members, Level II of ASTM D2563 for laminates or a similar appropriate specification for other types of FRP composites. Dimensional tolerances for pultruded components must meet ASTM D3917.

2.4.2 Structural Steel

**************************************************************************

NOTE: If structural steel is not permitted to be used, omit this section.

**************************************************************************

Use non-fracture critical steel members conforming to ASTM A36/A36M or ASTM A992/A992M.

Use fracture critical steel members conforming to ASTM A709/A709M, Grade 50 (F) for temperature Zone 2 or ASTM A992/A992M, Grade 50 with a minimum
average Charpy V-Notch (CVN) impact test value of 34 N·m 25 ft-lbs when tested at 4.4 degrees Celsius 40 degrees Fahrenheit.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.3 Stainless Steel

**************************************************************************
NOTE: If stainless steel is not permitted to be used, omit this section.
**************************************************************************

Use stainless steel bars and shapes conforming to ASTM A276/A276M, UNS [S20910,] [S30400,] [S40500,] [S31600,] [_____] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S17400,] [S45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.4 Aluminum

**************************************************************************
NOTE: If aluminum is not permitted to be used, omit this section.
**************************************************************************

Use aluminum bars and shapes conforming to [ASTM B209][ASTM B308/B308M ][____] .

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.5 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION OF RUBBER SEALS AND TESTING OF RUBBER SEALS.
**************************************************************************

Use [fluorocarbon (Teflon) clad rubber seals of the mold type only] [compounded of natural rubber, synthetic polyisoprene, or a blend of both, and must contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers]. Submit documentation showing the seals meet the following requirements prior to commencing work:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa 2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
</tbody>
</table>
PHYSICAL TEST | TEST VALUE | TEST METHOD
--- | --- | ---
300 percent | 6.2 MPa 900 psi (min.) | ASTM D412
Durometer Hardness (Shore Type A) | 60 to 70 | ASTM D2240
Water Absorption | 5 percent by weight (max.) | ASTM D471
Compression Set | 30 percent (max.) | ASTM D395
Tensile Strength (after aging 48 hrs) | 80 percent of tensile strength (min.) | ASTM D572

The "Water Absorption" test must be performed with distilled water. The washed specimen must be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees 158 degrees F plus or minus 4 degrees F for 22 hours plus or minus 1/4 hour. The specimen must then be removed, allowed to cool to room temperature in air, and weighed. The weight must be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature must be 70 degrees C plus or minus 1 degree 158 degrees F plus or minus 2 degrees F and the duration of immersion is to be 166 hours.

Rubber seals must have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film must be [0.726 mm] [1.524 mm] [0.030 inch] [0.060 inch] thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and must have the following physical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa 2,000 psi (min.)</td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film must be flush with the surface of the rubber seal and be free of adhering or bonded rubber. Strips and corner seals must be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film must be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

Submit variances of these suggested materials and test methods for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.6 Ultrahigh Molecular Weight Polyethylene (UHMWPE)

******************************************************************************
NOTE: If UHMWPE is not permitted to be used, omit this section.
******************************************************************************

If used, ultrahigh molecular weight polyethylene (UHMWPE) must conform to the following physical properties:
<table>
<thead>

If the UHMWPE material is to be exposed to sunlight, the material must be stabilized for ultraviolet radiation via 2.5 percent carbon black or other equivalent stabilizer. The fabricated form must be from virgin resin. The virgin resin must be a homopolymer of ethylene and have an intrinsic viscosity (IV) between 22.0 and 28.0 dl/g per ASTM D4020.

2.5 FABRICATION

Follow the ACMA Code for pultruded FRP composites.

2.5.1 Drawings and Specifications

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the specified requirements [_____] days prior to starting fabrication. The structure design is communicated to the Government through the required submittals designated in these specifications. All information necessary to fabricate the structure as intended in the design is depicted in these documents. Denote failure critical members on all drawings with the abbreviation FC. Denote fracture critical members on all drawings with the abbreviation FCM. The notation of FC and FCM on the drawings provides critical information to the Government for the structural response of the structure. Drawings must not be reproductions of the Government furnished contract drawings.

2.5.2 Fabrication Drawings

Fabrication drawings must show complete details of materials, dimensions, tolerances, connections.

2.5.3 Fabrication Tolerances

Measure dimensions by an approved measuring system. Submit the measuring system for approval with the work plan (i.e. calibrated steel tape of approximately the same temperature as the material being measured). The overall dimensions of an assembled structural unit must be within the tolerances indicated on the drawings or as specified for the item of work. Where tolerances are not specified in other section of these specifications or shown, a variation of 0.8 mm 1/32-inch is permissible in the overall length of component members with both ends milled and component members without milled ends must not deviate from the dimensions shown by not more than 1.6 mm 1/16-inch for members 3.7 meters 12 feet or less in length.

2.5.4 Delivery Drawings

Delivery drawings must provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.
2.6 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified material test reports with all material delivered to the site. Tests, inspections, and verifications for materials and fabricated items must conform to the requirements specified.

2.6.1 General

Tests, inspections, and verifications for materials must conform to the specified requirements. Submit certified test reports for material tests, with all materials delivered to the site.

2.6.2 Inspection

**************************************************************************
NOTE: This paragraph must be edited to fit the project.
**************************************************************************

Inspect shop assembled components for accurate fit and compliance with dimensional tolerances. Sealing, guiding, and connecting surfaces must be inspected to determine if their planes are true, parallel, and in uniform contact with opposing surfaces.

2.6.3 Operation Tests Prior to Installation

**************************************************************************
NOTE: This paragraph is only applicable to slide gates.
**************************************************************************

[The operation of the shop-assembled gate assembly must be tested by opening and closing the gate several times by use of the operating machinery. The force used to operate the gate must be the minimum required to open and close the gate. Since the sill of the unembedded gate frame is not fully supported during the operation tests, special precaution must be taken to prevent the application of excessive force on the gate leaf and frame when the gate is closed. The operation of the lifting beam must be tested by engaging and disengaging the lifting beam several times. Adjustments must be made as required until operations are satisfactory as determined by the Contracting Officer or their approved representative.]

**************************************************************************
NOTE: The shop hydrostatic leakage test outlined below may not be practical due to the size or head requirements of the gate. This test should only be required if gate leakage is considered a critical issue.
**************************************************************************

[The gate assembly must be tested hydrostatically prior to installation by applying a hydrostatic pressure of [_____] Mpa [_____] psi, measured at the sill of the gate frame, to the upstream side of the gate leaf in the closed position. Under hydrostatic testing, the gate seals must prevent water leakage meeting paragraph 2.1.2.]
PART 3   EXECUTION

3.1   EXAMINATION

Gate will be inspected when delivered to site. When Government inspections result in product rejection, promptly segregate and remove rejected material from the premises. The Government may also charge an additional cost of inspection or testing when prior rejection makes re-inspection or retesting necessary.

3.2   PREPARATION

3.2.1   Protection

Protect the surrounding water control structure to prevent damage during the installation of the gate. Install temporary water control structures if replacing an existing gate to ensure water control is maintained.

3.3   INSTALLATION

Installation must conform to the requirements specified. Gate and appurtenant items must be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication must be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Submit certification of installation. Submit Certification of State Product Approval.

3.4   FIELD QUALITY CONTROL

3.4.1   Tests

**************************************************************************
NOTE: The field leakage test outlined below may not be practical due to the size or head requirements of the gate. This test should only be required if gate leakage is a critical issue. Consideration should be given to the ability to apply head to the gate in the field.
**************************************************************************

[Conduct a field leakage test including [operating the gate][removing and replacing stoplogs] to ensure the as-built gate meets the requirements of paragraph 2.1.2.]

3.5   CLOSEOUT ACTIVITIES

3.5.1   Demonstration and Training

Demonstrate gate operation and provide training for [USACE] [owner] [_____] employees for a maximum [8] [_____] hours.

Provide an operation and maintenance manual to [USACE] [owner] [_____]..

3.5.2   Data Book

Compile and maintain a "Data Book" throughout the duration of the contract. The "Data Book" consists of copies of all Requests for Information (RFI's) with Government responses, Material Orders, Mill
Certification Reports and Certification Letter's. Use tabs to separate each specific item identified above and a Table of Contents to identify which tab corresponds to which item. The in-progress "Data Book" must be available to the Government to review during shop inspections of the project.

When final revisions have been completed, prepare a "Certificate of Conformance" on their company letterhead certifying that: 1) all materials and workmanship included in the project were detailed, designed, manufactured, tested, inspected and documented as specified in the contract requirements; and 2) the requirements of applicable codes, standards, specifications and drawings have been complied with and that all required quality assurance documentation verify conformance to the contract documents have been submitted, signed by the Contractor's Quality Control System Manager and Engineer of Record.

Submit a draft copy of Final "Data Book" for review and approval within fifteen (15) calendar days following the completion of fabrication activities. Within thirty (30) calendar days of receipt of the Final "Data Book", the Government will return one copy annotated with any necessary corrections. Within fourteen (14) calendar days the Contractor must revise the "Data Book" accordingly at no extra cost and submit the Final Copy of the Final "Data Book" including the "Certificate of Conformance" to the Government. Approval and acceptance of the Final "Data Book" is required before final payment to the Contractor.

3.6  WARRANTY

**************************************************************************
NOTE: For USACE projects, delete the first two subparagraphs and utilize the tailored option.
**************************************************************************

3.6.1 Manufacturer's Warranty

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.6.2 Contractor's Warranty for Installation

Submit contractor's warranty for installation to the Contracting Officer prior to final commissioning and acceptance.

3.6.3 Contractor's Five (5) Year No Penal Sum Warranty

The composite low head water control structure or component installed on the above named structure is warranted by [_____] for a period of [5][10][20] [_____] years against workmanship and material deficiencies, wind damage and structural failure within project specified design loads[, and leakage exceeding paragraph 2.1.2]. The composite low-head water control structure and components covered under this warranty includes, but is not limited to, the following:

Framing and structural members, opening mechanisms including motors, storage racks, accessories, trim, miscellaneous closure items, connectors, components, and fasteners, and other system components and assemblies installed to enable operation of the composite low-head water control structure; and items specified in other sections of these specifications that become part of the composite low-head water control structure.

All material and workmanship deficiencies, system deterioration caused by exposure to the elements and/or inadequate resistance to specified service design loads and water leaks must be repaired as approved by the contracting officer.

All material deficiencies, structural failure, and leakage associated with the composite low-head water control structure covered under this warranty must be repaired as approved by the contracting officer.

This warranty covers the entire cost of repair or replacement, including all material, labor, and related markups. The above referenced warranty commenced on the date of final acceptance on [_____] and will remain in effect for stated duration from this date.

Signed, dated, and notarized (by company president)

(Company President)                                     (Date)

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of miter gates and appurtenant items as specified and shown. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 UNIT PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.

Select Alternate 1 (one pay item) or Alternate 2
1.1.1 Furnishing and Installing Miter Gates

NOTE: Alternate 1.

1.1.1.1 Payment

Payment will be made for costs associated with furnishing and installing miter gates and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of miter gates and appurtenant items including gate leaves, diagonals, strut connections, miter guides, miter latches, recess latch strikes, quoin and miter contact blocks, gudgeon top anchorages, pintle assemblies, [walkways,] [bridgeways,] gudgeon embedded anchorages, wall quoins, sill assemblies, seal assemblies, recess latches, bumpers, fenders, and all other items necessary for complete installation.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Furnishing Miter Gates

NOTE: Alternate 2.

1.1.2.1 Payment

Payment will be made for costs associated with furnishing miter gates and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of miter gates and appurtenant items including gate leaves, diagonals, strut connections, miter guides, miter latches, recess latch strikes, quoin and miter contact blocks, gudgeon top anchorages, pintle assemblies, [walkways,] [bridgeways,] gudgeon embedded anchorages, wall quoins, sill assemblies, seal assemblies, recess latches, bumpers, fenders, and other items necessary for complete installation.

1.1.2.2 Unit of Measure

Unit of Measure: lump sum.

1.1.3 Installing Miter Gates

NOTE: Alternate 2.

1.1.3.1 Payment

Payment will be made for costs associated with the installation of miter gates and appurtenant items, which includes full compensation for the complete installation and testing of miter gates and appurtenant items.
1.1.3.2 Unit of Measure

Unit of measure: lump sum.

**1.3 SUBMITTALS**

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required
as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders

Provide qualification of welders and welding operators conforming to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.2 [Safety Provisions for Zinc Filler

The following special safety provisions are required for heating and placing zinc filler:
a. Workers shall wear protective clothing including hard hats with fine wire mesh screen, goggles, leather sleeves, chaps, apron, and leather gloves.

b. Workers shall wear air-line respirators certified by National Institute for Occupational Safety and Health (NIOSH) or Mine Safety and Health Administration (MSHA). In enclosed spaces, both local exhaust ventilation and air-line respirators are required. Local exhaust ventilation shall consist of movable hoods placed close to the work to remove fumes at the source.

c. Ladles, equipment, and material shall be pre-heated before being used so that they will be moisture-free.

d. Heating devices and ladles shall be placed on a level, firm foundation, and protected against traffic, accidental tipping, or similar hazard.

e. Hot zinc shall not be carried up or down ladders.

f. Buckets or vessels used for handling and transporting hot zinc shall be substantially constructed and shall not be filled higher than 100 mm 4 inches from the top.]

1.4.3 Detail Drawings

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.3.1 Fabrication Drawings

Show on the fabrication drawings complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

1.4.3.2 Shop Assembly Drawings

Show on the shop assembly drawings details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

1.4.3.3 Delivery Drawings

Show on the delivery drawings descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

1.4.3.4 Field Installation Drawings

Show on the field installation drawings a detailed description of the field installation procedures. Include in the description the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler; [procedures and
equipment used for heating and placing of the zinc filler; and methods for installing other appurtenant items.

1.5 DELIVERY, STORAGE, AND HANDLING

Perform delivery, handling, and storage of materials and fabricated items in accordance with the requirements specified [herein and] in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Materials and equipment delivered to the site by the Contracting Officer shall be unloaded by the Contractor. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.5.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Do not distort rubber seals during handling.

1.5.2 [Epoxy Filler]

Deliver epoxy filler from the manufacturer just prior to use in the work to insure receipt of recently manufactured material and store under cover, out of direct sunlight, at a temperature between 20 to 30 degrees C 65 to 85 degrees F.]

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract. Materials orders, materials lists and materials shipping bills shall conform with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Submit approved samples prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, aluminum bronze and other metal materials used for fabrication shall conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shall conform to ASTM A36/A36M.

2.1.1.2 Structural Steel Plates

Structural steel plates shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade 50].
2.1.1.3 Steel Pipe

Steel pipe shall conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.1.1.4 Stainless Steel Bars and Shapes

Stainless steel bars and shapes shall conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.5 Stainless Steel Plate, Sheet, and Strip

Stainless steel plate, sheet, and strip shall conform to ASTM A167, UNS S 30400; and ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION and ZINC FILLER.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers.

2.1.2.1 Physical Characteristics

Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa 2,500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.2 MPa 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a
temperature of 70 degrees C plus or minus 2 degrees for 22 plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree and the duration of immersion shall be 166 hours.

2.1.2.2 [Fabrication

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa 2,000 psi (min.)</td>
</tr>

</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.]

[2.1.3 Epoxy Filler

Epoxy filler shall be an approved epoxy resin formulation equal to "Nordback," a product of Nordberg Mfg. Co., or an approved equal, with a specific gravity of 1.70 to 1.75, minimum compressive strength after 72 hours at 20 degrees C 70 degrees F of 114 MPa 16,500 psi, and maximum shrinkage of 0.15 percent. Submit Manufacturer's certificate for epoxy filler stating that it meets or exceeds the specified physical properties; material shall be delivered to the site.]

[2.1.4 Zinc Filler

ASTM B6.

2.1.5 Bumpers and Fenders

[Bumpers and fenders shall be "Rubbump," a product of Missouri Dry Dock & Repair Co., or an approved equal.] [Timber bumpers and fenders shall conform to [west coast fir] [or] [southern yellow pine], structural grade, dressed surfacing, pressure treated with creosote conforming to AWPA P3 in accordance with AWPA U1. Bumpers and fenders shall be cut, beveled, or bored as required before being pressure treated.]

2.1.6 Asphalt Saturated Preformed Filler Strips

ASTM D1751.

2.1.7 Asphalt Cement

ASTM D3019.
2.1.8  Asphalt Mastic

SSPC PS 9.01.

2.2  MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1  Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [_____] [hot-dip galvanized] or ASTM A490M ASTM A490, Type [_____] 

Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [_____] [Austenitic Steel, Grade [_____] ], Class [_____] ].

Bolts M16 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2  Screws

Screws shall be of the type indicated on the drawings.

2.3  FABRICATION

2.3.1  Structural Fabrication

Structural fabrication shall conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown on the drawings. Splices shall occur only where shown or approved. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of [cathodic protection system devices and other] appurtenances as required.

2.3.2  Welding

******************************************************************************
NOTE: List applicable welds requiring radiographic examination.
******************************************************************************

Welding shall conform with the requirements of AWS D1.1/D1.1M, AWS D1.2/D1.2M, the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [_____] . Welds which have been designated to receive radiographic examination and are found to be
inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests. [Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]

2.3.3 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.4 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6 Fabrications

2.3.6.1 Gate Leaf

Gate leaf shall be of welded structural steel fabrication consisting of horizontal girders, [vertical beams,] [vertical girders,] intercostals, diaphragms, quoin post, gudgeon pin hood, operating strut connections, skin plate, and adjustable diagonals. Gate leaf shall be shop-fabricated. Contractor proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved by the Contracting Officer and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of the gate leaf shall not vary from the nominal dimension or differ from the mating gate leaf by more than 6 mm 1/4 inch. The surfaces of framing elements to which skin plates are to be welded shall not vary from a true plane by more than 5 mm 3/16 inch. The outside surfaces of skin plates welded to framing members shall not vary from a true plane by more than 5 mm. 3/16 inch. Splices in skin plates shall be located only where shown or approved. [In addition to welds specifically indicated on the drawings for nondestructive testing, [_____] percent of the welds in the girders, gudgeon pin hood, verticals and skin plate of the gate leaf shall receive nondestructive testing. The location of these additional welds for testing shall be as directed by the Contracting Officer.] Gate leaf shall be provided complete with quoin and miter contact [blocks] [posts], miter guide assembly, pintle assembly, gudgeon anchorage, seal assembly, and other appurtenant components as required for complete installation, specified herein and shown.

2.3.6.2 Wall Quoin

Wall quoin shall consist of a welded structural steel frame with adjustable stainless steel base anchors and adjustable stainless steel quoin contact [block] [post].
2.3.6.3 Quoin and Miter Contact [Blocks] [Posts]

Quoin and miter contact [blocks] [posts] shall be of stainless steel bars conforming to ASTM A276/A276M or ASTM A564/A564M. Splices in contact [blocks] [posts] shall be made by an offset method so that there will not be a continuous joint across the [block] [post]. [Splices in gate leaf contact [block] [post] shall occur only at the centerlines of horizontal girders.] Splice locations shall match those of the opposing [block] [post]. Contact faces of contact [blocks] [posts] shall be milled at splices to assure watertight joints. Contact [blocks] [posts] shall be provided with adjusting bolts as shown.

2.3.6.4 Pintle Assembly

Pintle assembly shall consist of pintle socket, pintle, and pintle base as shown. Pintle socket shall be of cast nickel-alloy steel. Pintle socket shall be press-fitted with an aluminum bronze bushing with bearing surfaces finished truly hemispherical. Pintle shall be of [cast alloy] [forged alloy] steel with bearing surfaces of corrosion-resisting steel. Pintle ball shall receive a 0.4 micrometer 16 microinch finish and shall be fitted into the bushing by scraping until uniform contact is attained over the entire bearing surface as determined by testing with carbon paper or other approved coloring. The pintle ball shall be match-marked with the bushing when fitted and so erected in the field. Pintle base shall be of cast steel. Bolt holes for attaching pintle socket to gate leaf shall be drilled and reamed after the pintle socket is assembled with gate leaf. Pintle socket shall be connected to the bottom of the lower girder web of the gate leaf with stainless steel bolts.

2.3.6.5 Gudgeon Anchorage

Gudgeon anchorage shall consist of gudgeon pin barrel, gudgeon anchorage links, gudgeon pin, and gudgeon embedded anchorage. Gudgeon pin barrel shall be of welded [structural steel plates] [forged alloy steel plates conforming to ASTM A668/A668M] and shall be fitted with a bronze bushing. Gudgeon anchorage links and gudgeon pin shall be of forged alloy steel conforming to ASTM A668/A668M. Gudgeon anchorage links shall be pin connected to the gudgeon embedded anchorage and shall have a threaded section for adjustment of the gate leaf. The threaded section shall have right and left threads, a hexagonal sleeve nut with 13 mm 1/2 inch threads, and a jam nut with standard threads at each end of the sleeve nut. The gudgeon embedded anchorage shall consist of a structural steel frame with end-restrained anchor bolts conforming to [ASTM A325M. ASTM A325.] [ASTM A490M. ASTM A490M.]

2.3.6.6 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be
field-spliced only where shown and machine-finished after splicing.

2.3.6.7 Appurtenant Items

Sill assemblies, latches, bumpers fenders, seal plates and shapes, and other appurtenant items shall conform to details specified and shown.

2.3.7 Shop Assembly

Shop assembly requirements for miter gates and appurtenant items shall be as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Miter gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved by the Contracting Officer, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to facilitate field connections. The matchmarking of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless otherwise approved by the Contracting Officer. The presence of the Contracting Officer will not relieve the Contractor of any responsibility under this contract.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.4.1 General

Tests, Inspections, and Verifications for materials shall conform to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.2 Testing of Rubber Seals

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUOROCARBON FILM</th>
<th>MACHINE METHOD AT 50 MM2 INCHES PER MINUTE</th>
<th>DEADWEIGHT METHOD</th>

</tbody>
</table>
PART 3   EXECUTION

3.1 INSTALLATION

Installation shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Miter gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Sill assemblies, seal plates, frames, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 Pintle Assembly

Base anchors for the pintle assembly shall be embedded in first-pour concrete. The pintle assembly base plate shall be attached to base anchors, adjusted to the exact elevation and center-to-center distance shown, leveled, blocked rigidly to prevent displacement, and embedded in second-pour concrete. The concrete shall be allowed to set 72 hours and must reach a minimum compressive strength of [_____] MPa psi before loading is applied. [The space in the floating pintle base not occupied by the pintle shoe shall be filled completely with sponge rubber before the gate leaf is set in place.]

3.1.3 Gudgeon Embedded Anchorage

Submit approved gudgeon embedded anchorage prestressing plan prior to initiating the anchorage operations. Gudgeon embedded anchorage prestressing record prior to completion of the contract. The gudgeon embedded anchorage, except for anchor bolts and horizontal anchor arms, shall be covered with asphalt saturated preformed strips applied with asphalt cement prior to being embedded in concrete. Anchor bolts shall be coated with asphalt mastic. The gudgeon embedded anchorage shall be aligned, leveled, and blocked rigidly in place to prevent displacement before concrete is placed. Concrete shall be placed in a manner not to damage the preformed strips. Anchor bolts shall be prestressed after the concrete has attained the specified strength in accordance with contract drawings and approved field installation drawings. A record of the gudgeon embedded anchorage prestressing operations shall be compiled and submitted immediately after completion of the prestressing operations.

3.1.4 Wall Quoin

Base anchors for the wall quoin shall be embedded in first-pour concrete. The wall quoin shall be attached to base anchors prior to setting the gate
leaf in place. After the gate leaf is set in place, the wall quoin shall be plumbed and adjusted in relation to the gate leaf quoin so as to provide for continuous contact between the sealing surfaces of the wall and gate leaf quoin contact [blocks] [posts] over the full height of the gate leaf. This adjustment shall be made almost entirely by moving the wall quoin so that the gap for the [epoxy] [zinc] filler behind the gate leaf quoin contact [block] [post] remains near the nominal dimension. After final adjustments have been made, the wall quoin shall be anchored firmly and the second-pour concrete shall be placed in the blockout.

3.1.5 Gate Leaf

Gate leaf components not assembled in the shop shall be assembled in the field as required for installation. The pintle ball shall be coated with grease prior to setting the gate leaf in place. Pintle grease pipes shall be tapped into pintle bushing in correct register with bushing grease grooves. Grease pipes shall be flushed prior to connecting to bearings. All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the miter ends of the gate leaf due to compression of blocking or other causes. After the gate leaf has been set in place and the components of gudgeon anchorage are connected to the gate leaf, the gate leaf shall be plumbed and brought into correct position by adjusting the sleeve nuts of the diagonals and the gudgeon anchorage links.

3.1.6 Diagonals

Gate leaf diagonals shall be attached to the gate leaf after the leaf is set in place. Diagonals prestressing shall be performed before the final adjustment of the quoin and miter contact [blocks] [post] are made. Prestressing of diagonals shall be as specified, shown, and as approved on the prestressing plan developed by the Contractor. Submit approved diagonal prestressing plan prior to initiating the prestressing operations. Submit diagonal prestressing records immediately after completion of the prestressing operations. The plan for prestressing the diagonals shall describe the method of prestressing, including the materials, connections, rigging, anchorages, and stress measuring equipment. Compile a record of the prestressing operations consisting of the information indicated in the following table:

<table>
<thead>
<tr>
<th>STRESS DATA TABLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gate Leaf Location:</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>Diagonal Strain Gage Initial Readings Final E (mm)(in.) D (mm)(in.) d (mm)(in.)</td>
</tr>
<tr>
<td>[<em><strong><strong>] [</strong></strong></em>] [<em><strong><strong>] [</strong></strong></em>] [<em><strong><strong>] [</strong></strong></em>]</td>
</tr>
<tr>
<td>[<em><strong><strong>] [</strong></strong></em>] [<em><strong><strong>] [</strong></strong></em>] [<em><strong><strong>] [</strong></strong></em>]</td>
</tr>
<tr>
<td>[<em><strong><strong>] [</strong></strong></em>] [<em><strong><strong>] [</strong></strong></em>] [<em><strong><strong>] [</strong></strong></em>]</td>
</tr>
</tbody>
</table>

1. Initial strain gage readings shall be made after slack is removed.
2. Final strain gage readings shall be made after prestressing is complete.
3. E is the total elongation over the full length of the diagonal, computed from the strain gage readings.

4. D is the prestress deflection of the leaf as shown on the drawings.

5. d is the field deflection of the leaf measured after completion of the prestress operation; it is the deflection when final strain gage readings are taken.

3.1.7 Gate Leaf Quoin and Miter Contact [Blocks] [Posts]

After the wall quoin has been adjusted and concreted in place and final adjustments made to the gudgeon anchorage links, gate leaf quoin and miter contact [blocks] [posts] shall be adjusted to provide continuous contact over the full height of the gate leaf in the mitered position. After the gate leaf diagonals are prestressed and final adjustments of gate leaf quoin and miter contact [blocks] [posts] have been made with the gate leaf in the mitered position, the gate leaf shall be swung out of miter and [epoxy] [zinc] filler poured behind the quoin and miter contact [blocks] [posts]. Prior to pouring of the filler, the surfaces to receive the filler shall be cleaned free of dirt, rust, and other foreign materials. The adjusting and holding bolts shall be coated with grease or other bond breaker to prevent adherence of the filler.

3.1.7.1 Placing [Epoxy] [Zinc] Filler

[A field test to determine the indentation hardness of the epoxy filler compound shall be conducted prior to placement. The field test procedures are as follows:

a. Cast a 50 mm 2 inch cube sample of mixed epoxy filler compound in a mold and cure at room temperature (20 to 25 degrees C 70 to 80 degrees F) for 24 plus or minus 8 hours.

b. Remove from mold and cut sample to expose interior surface.

c. Sand exposed interior surfaces to remove saw marks and provide a smooth surface.

d. Using a Type D Durometer conforming to ASTM D2240, measure the hardness across the exposed interior surface, taking a minimum of three readings on each half of the sample. Care must be taken during the durometer reading to insure the spring loaded pin used to penetrate the surface is not in a depressed surface caused by either residual saw marks or an exposed air bubble. The average reading should be at least 85, with no individual reading below 82. If the durometer readings fall below the required minimum values, the material will be rejected.

The manufacturer's instructions for placing the epoxy filler shall be followed explicitly. Special precautions must be taken to prevent leakage of the filler during placement. The complete masses of the metals whose surface areas are to receive the epoxy filler should have a temperature of 15 to 30 degrees C 60 to 90 degrees F. The epoxy filler shall be kept free from moisture or other foreign materials during mixing and placement and for at least 48 hours after placement.]

[Immediately preceding the pouring of the zinc filler, the adjacent metal components shall be pre-heated to a temperature of 100 to 150 degrees C212 to 300 degrees F by an approved method which does not buckle the metal]
components. The zinc filler shall then be poured at a temperature which will insure that it will completely fill all interstices. Pouring temperature of zinc filler shall be maintained between 430 and 480 degrees C (810 and 900 degrees F) to minimize volatilization and oxidation of the zinc.

3.1.7.2 Adjusting Contact [Blocks] [Posts]

After the [epoxy has set] [zinc has cooled], quoin and miter contact [blocks] [posts] shall be drawn up against the filler by tightening of the adjusting bolts. After the contact [blocks] [posts] are adjusted, the gate leaves shall swing into the mitered position without interference of the quoin contact [blocks] [posts] and the gate leaf quoin contact [block] [post] shall make tight contact with the wall quoin contact [block] [post].

3.1.8 Miter Guide

Miter guide shall be installed after the contact [blocks] [posts] have been properly set. The guide bracket and roller bracket shall be mounted on gate leaves with leaves in the mitered position. The roller shall be centered accurately in the saddle of the contact [blocks] [posts] and shall be in full contact with the [blocks] [posts]. Adjustment of the miter guide shall be accomplished by adjusting the guide bracket and roller bracket so that the gap behind the contact [blocks] [posts] for the [epoxy] [zinc] filler is kept at the nominal dimension. Proper adjustment of the brackets should allow either gate leaf to be mitered or opened without moving the other leaf. After final adjustments have been made, bolt holes shall be drilled in the brackets and gate leaves, brackets shall be bolted securely in place, and [epoxy] [zinc] filler shall be placed behind the contact [blocks] [posts].

3.1.9 Painting

Exposed parts of gates and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.10 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gate(s), a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2 CATHODIC PROTECTION SYSTEM

The cathodic protection system shall conform to Section 26 42 19.10 CATHODIC PROTECTION SYSTEMS FOR LOCK MITER GATES.

3.3 OPERATING MACHINERY

Operating machinery shall conform to Section 35 01 41.00 10 ELECTROMECHANICAL OPERATING MACHINERY FOR LOCKS.
3.4 FIELD TESTS AND INSPECTIONS

3.4.1 [Skin Plate Watertightness Test

**************************************************************************
NOTE: Skin plate watertightness tests should not be required when complete or spot radiographic or ultrasonic examination of the skinplate is required by the specifications.
**************************************************************************

After the gate leaf diagonals are prestressed but prior to painting and mounting of seals, skin plate welds shall be tested for watertightness by applying air pressure with a hose, using a minimum air pressure of 400 kPa 60 psi at the nozzle, to one face of the skin plate with a light coating of soapsuds on the opposite face. Disclosed leaks shall be sealed with light welds.]

3.4.2 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.5 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders

Provide qualification of welders and welding operators conforming to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.
1.4.2 **Detail Drawings**

Provide detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.2.1 Fabrication Drawings

Provide fabrication drawings showing complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

1.4.2.2 Shop Assembly Drawings

Provide shop assembly drawings showing details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

1.4.2.3 Delivery Drawings

Provide delivery drawings showing descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

1.4.2.4 Field Installation Drawings

Provide field installation drawings showing a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for prestressing hinge bracket anchors, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing pintle and hinge assemblies, including checking and maintaining alignments during concreting; and methods for installing other appurtenant items.

1.5 **DELIVERY, STORAGE, AND HANDLING**

Provide delivery, handling, and storage of materials and fabricated items as described below.

1.5.1 Materials and Fabricated Items

Delivery, handling, and storage of materials and fabricated items shall conform to the requirements specified[ and] in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.[ Materials and equipment delivered to the site by the Contracting Officer shall be unloaded by the Contractor. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.5.2 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the
rubber. Rubber seals shall not be distorted during handling.

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract; and materials orders, materials lists, and materials shipping bills in conformance with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, aluminum-bronze, and other metal materials used for fabrication shall conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel Shapes

ASTM A36/A36M.

2.1.1.2 Structural Steel Plates

[ASTM A36/A36M,] [ASTM A572/A572M, Grade 50,] [or] [ASTM A588/A588M, Grade 50].

2.1.1.3 Steel Pipe

[ASTM A53/A53M, Type S, Grade B, seamless, black, normal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.] [ASTM A501/A501M, seamless, outside diameter and nominal wall thickness as shown.]

2.1.1.4 Steel Castings

ASTM A27/A27M, Grade [____], Class [____]; or ASTM A148/A148M, Grade [____].

2.1.1.5 Steel Forgings

ASTM A668/A668M, Class [____], carbon content not exceeding 0.35 percent, and chemical composition which results in satisfactory weldability.

2.1.1.6 High-Strength Steel Bar

ASTM A722/A722M, Type [____], and complying with all supplementary requirements.

2.1.1.7 Stainless Steel Bars and Shapes

ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.
2.1.1.8 Stainless Steel Plate, Sheet, and Strip

ASTM A167, UNS S 30400; and ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.1.9 Bronze Castings

ASTM B22/B22M, Copper Alloy UNS No. C91300.

2.1.1.10 Aluminum-Bronze Castings

ASTM A148/A148M, Copper Alloy UNS No. [______].

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete paragraph FABRICATION.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers.

2.1.2.1 Physical Characteristics

Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.2 MPa900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees for 22 plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus one (1) degree and the duration of immersion shall be 166 hours.
2.1.2.2  [Fabrication

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa, 2,000 psi (min.)</td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.]

2.1.3  Bumpers and Fenders

[Bumpers and fenders shall be "Rubbumper," a product of Missouri Dry Dock & Repair Co., or an approved equal. [Timber bumpers and fenders shall conform to [west coast fir] [or] [southern yellow pine], structural grade, dressed surfacing, pressure treated with creosote conforming to [AWPA P3] in accordance with AWPA U1. Bumpers and fenders shall be cut, beveled, or bored as required before being pressure treated.]

2.1.4  Asphalt Mastic

SSPC PS 9.01.

2.2  MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown and specified and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1  Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490M ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [____]] [Austenitic Steel, Grade [____], Class [____]]. Bolts M16 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2  Screws

Screws shall be of the type indicated on the drawings.
2.3 FABRICATION

2.3.1 Structural Fabrication

Structural fabrication shall conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown. Splices shall occur only where shown or approved. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of appurtenances as required.

2.3.2 Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination.
**************************************************************************

Welding shall conform with [AWS D1.1/D1.1M, AWS D1.2/D1.2M,] the requirements specified, and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [____]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval of the Contracting Officer, by dye penetrant, magnetic particle tests, or ultrasonic tests. [Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]

2.3.3 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.4 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6 Fabrications

Submit approved samples, prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full
size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded. Fabrications shall conform to the following requirements.

2.3.6.1 Gate Leaf

Gate leaf shall be of welded fabrication except for bolted appurtenances. Gate leaf shall consist of a pintle socket, pipe column, and hinge pin housing integrally framed with horizontal and vertical trusses supporting vertical ribs faced with a continuous skin plate. Pintle socket shall be of cast steel conforming to ASTM A27/A27M. Pintle socket shall be press-fitted with bronze bushing conforming ASTM B22/B22M. Bearing surfaces of the bronze bushing shall have a truly hemispherical 0.4 micrometer 16 microinch finish. Pipe column shall conform to [ASTM A53/A53M] [ASTM A501/A501M]. Hinge pin housing shall be of [cast steel conforming to ASTM A27/A27M] [structural steel conforming to ASTM A36/A36M]. Trusses and vertical ribs shall be of structural steel conforming to ASTM A36/A36M. Skin plate shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50,] [ASTM A588/A588M, Grade 50]. Gate leaf shall be shop-fabricated.

Contractor proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of the gate leaf shall not vary from the nominal dimension or differ from the mating gate leaf by more than 6 mm 1/4 inch. The surfaces of the vertical ribs to which skin plates are to be welded shall not vary from a true plane by more than 5 mm 3/16 inch. The outside surfaces of skin plates welded to the vertical ribs shall not vary from a true plane by more than 5 mm 3/16 inch. Splices in skin plates shall be located only where shown or approved. [In addition to welds specifically indicated on the drawings for nondestructive testing, [_____] percent of the welds in the [hinge pin housing] [joints between trusses and pintle socket] [joints between trusses and hinge pin housing] [joints between vertical webs and skin plate] [and] skin plate shall receive nondestructive testing. The location of these additional welds for testing shall be as directed by the Contracting Officer.] Gate leaf shall be provided complete with pintle assembly, hinge assembly, seal assembly, and other appurtenant components as required for complete installation as specified and shown.

2.3.6.2 Hinge Assembly

Hinge assembly shall consist of hinge bracket support anchor frame, hinge bracket support, hinge bracket, and hinge pin. Hinge bracket support anchor frame shall be a welded structural steel frame with high strength anchor bolts conforming to ASTM A722/A722M for prestressed anchorage of the hinge bracket support. Hinge bracket support and hinge bracket shall be of [cast steel conforming to ASTM A27/A27M] [structural steel conforming to ASTM A36/A36M]. The hinge pin barrel section of the hinge bracket shall be fitted with [a stainless steel collar conforming to ASTM A564/A564M and] [a bronze bushing conforming with ASTM B22/B22M] [an aluminum bronze bushing conforming to ASTM B148]. Hinge pin shall be of [forged steel conforming to ASTM A668/A668M] [stainless steel conforming to [ASTM A276/A276M] [ASTM A564/A564M]]. [In addition to welds specifically indicated on the drawings for nondestructive testing, [_____] percent of the welds in the hinge assembly components shall receive nondestructive testing. The location of these additional welds for testing shall be directed by the Contracting Officer.] [Welded hinge assembly components shall be
stress-relieved by heat-treating after all welding is completed. Stress-relieving shall be performed prior to machining.]

2.3.6.3 Pintle Assembly

Pintle assembly shall consist of pintle base anchor frame, pintle base, pintle socket seal retainer ring assembly, pintle, and pintle socket which shall be an integral component of the gate leaf. Pintle base anchor frame shall be a welded structural steel frame [with high strength anchor bolts conforming to ASTM A722/A722M for prestressed anchorage of the pintle base]. Pintle base shall be of [cast steel conforming to ASTM A27/A27M] [structural steel conforming to ASTM A36/A36M]. Pintle shall be of [cast alloy steel] [forged alloy steel with bearing surfaces of corrosion-resisting steel deposited in weld passes to a thickness of not less than 3 mm 1/8 inch and machined the required shape]. The pintle ball shall receive a 0.4 micrometer 16 microinch finish and shall be fitted into the bushing of the pintle socket by scraping the bushing until uniform contact is attained over the entire bearing surface as determined by testing with carbon paper or other approved coloring. The pintle ball shall be match-marked with the bushing when fitted and so erected in the field.

2.3.6.4 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and shall be machine-finished after splicing.

2.3.6.5 Appurtenant Items

Seal plates, seal shapes, pintle socket seal retainer ring assembly, bumpers, fenders, [walkways,] [bridgeways,] and other appurtenant items shall conform to details specified and shown.

2.3.7 Shop Assembly

Shop assembly requirements for sector gates and appurtenant items shall be as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Sector gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to facilitate field connections. The matchmarking of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. Shop assembly and disassembly work shall be performed in the presence of the Contracting
2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests, with all materials delivered to the site.

2.4.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.2 Testing of Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete this paragraph.
**************************************************************************

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUOROCARBON FILM</th>
<th>MACHINE METHOD AT 50 MM2 INCHES PER MINUTE</th>
<th>DEADWEIGHT METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.524 mm 0.030 inch</td>

</tr>
<tr>
<td>0.726 mm 0.060 inch</td>
<td>13.6 kg per 25 mm30 pounds per inch width</td>
<td>13.6 kg per 25 mm30 pounds per inch width</td>
</tr>
</tbody>
</table>

PART 3 EXECUTION

3.1 INSTALLATION

Perform installation in conformance with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Sector gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Seal shapes, seal plates, frames, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded...
anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 Hinge Assembly Embedded Anchorages

Submit record of the prestressing of hinge bracket anchors immediately after completion of the prestressing operations. The hinge assembly embedded anchorages consisting of the hinge bracket support anchor frame and attached hinge bracket support anchor bolts shall be aligned accurately, leveled, and blocked rigidly in place to prevent displacement before concrete is placed. Hinge bracket support anchor bolts shall be coated with asphalt mastic prior to the placement of first-pour concrete. Hinge bracket support shall be connected to anchor bolts and embedded in second-pour concrete. Anchor bolts shall be prestressed as shown on contract drawings and approved field installation drawings after the concrete has attained the specified strength. A record of the prestressing operations shall be compiled and submitted.

3.1.3 Pintle Base Anchor Frame and Pintle Base

******************************************************************************
NOTE: Design options provided in this paragraph consist of the pintle base bearing directly on an anchor frame embedded in second-pour concrete and anchored with bolts embedded in first-pour concrete, the pintle base bearing directly on second-pour concrete and anchored with bolts attached to an anchor frame embedded in first-pour concrete, and the prestressing of pintle base anchor bolts when attached to an anchor frame embedded in first-pour concrete.
******************************************************************************

[Anchor bolts for the pintle base anchor frame shall be embedded in first-pour concrete. Submit record of the prestressing of the pintle base anchors immediately after the prestressing operations are completed. Pintle base anchor frame shall be attached to the anchor bolts, aligned, leveled, blocked rigidly to prevent displacement, and embedded in second-pour concrete. Pintle base shall be bolted to the pintle base anchor frame.] [Pintle base anchor frame shall be embedded in first-pour concrete. Pintle base shall be attached to the pintle base anchor bolts extending from the embedded anchor frame, aligned, leveled, blocked rigidly to prevent displacement, and embedded in second-pour concrete.] Pintle base anchor bolts shall be prestressed as shown on contract drawings and approved field installation drawings. A record of the prestressing operations shall be compiled and submitted. Concrete pours shall be allowed to set for 72 hours and must attain the specified before any loading is applied.

3.1.4 Pintle

Surfaces of the pintle base shall be cleaned thoroughly prior to installing the pintle. The pintle shaft shall be set in the pintle base and secured by lock-bolting.

3.1.5 Gate Leaf

Gate leaf components not assembled in the shop shall be assembled in the
field as required for installation. Pintle socket seal retainer ring assembly shall be attached to the pintle socket and the pintle ball shall be coated with grease prior to setting the gate leaf in place. Pintle grease pipes shall be tapped into pintle bushing in correct register with bushing grease grooves. Grease pipes shall be flushed prior to connecting to bearings. All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the sector gate leaf due to compression of blocking or other causes.

3.1.6 Hinge Bracket and Hinge Pin

Hinge bracket shall be attached to the hinge bracket support after the gate leaf has been set in place. Hinge pin shall be inserted to connect the hinge pin barrel of the hinge bracket to the hinge pin housing of the gate leaf. Hinge bracket shall be adjusted so that the center of the hinge pin is in vertical alignment with the center of the pintle and each gate leaf swings without interference and any point on the moving gate leaf remain in a plane throughout the range of movement.

3.1.7 Painting

Exposed parts of gates and appurtenances, except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.8 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gates, a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2 CATHODIC PROTECTION SYSTEM

The cathodic protection system shall conform to Section 26 42 19.10 CATHODIC PROTECTION FOR LOCK MITER GATE.

3.3 OPERATING MACHINERY

Operating machinery shall conform to Section 35 01 41.00 10 ELECTROMECHANICAL OPERATING MACHINERY FOR LOCKS.

3.4 FIELD TESTS AND INSPECTIONS

3.4.1 [Skinplate Watertightness Test

**************************************************************************

NOTE: Skinplate watertightness tests should be deleted when complete or spot radiographic or ultrasonic examination of the skinplate is required by the specifications.

**************************************************************************

After the gate leaves are installed but prior to painting and mounting of seals, skinplate welds shall be tested for watertightness by applying air pressure with a hose, using a minimum air pressure of 400 kPa 60 psi at the
nozzle, to one face of the skinplate with a light coating of soapsuds on the opposite face. Disclosed leaks shall be sealed with light welds.

3.4.2 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.5 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

NOTE: This guide specification covers the requirements for fabrication, assembly, delivery, and installation of tainter gates, anchorage assemblies, and appurtenant items. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 UNIT PRICES

NOTE: Delete paragraph UNIT PRICES and incorporate appropriately edited paragraphs from below into Section 01 20 00 PRICE AND PAYMENT PROCEDURES.

1.1.1 Alternate 1

a. "Furnishing Tainter Gates and Appurtenant Items"
(1) Payment will be made for costs associated with furnishing tainter gates and appurtenant items, which includes full compensation for materials, fabrication, shop assembly, and delivery of tainter gates, including gates, trunnions, trunnion yokes, trunnion pins, and appurtenant items, including cable attachment brackets, seal assemblies, side seal plates, dogging brackets, sill beams, stop beams, and other items necessary for complete installation.

(2) Unit of measure: lump sum.

b. "Furnishing Tainter Gate Anchorage Assemblies"

(1) Payment will be made for costs associated with furnishing tainter gate anchorage assemblies, which includes full compensation for materials, fabrication, and delivery of tainter gate anchorage assemblies, including tainter gate trunnion girders and prestressing assemblies for anchoring trunnion girders to piers [and trunnion yokes to trunnion girders, and other items necessary for complete installation].

(2) Unit of measure: lump sum

c. "Installing Tainter Gate Anchorage Assemblies"

(1) Payment will be made for cost associated with the complete installation of tainter gates anchorage assemblies.

(2) Unit of measure: lump sum.

1.1.2 Alternate 2

a. "Furnishing and Installing Tainter Gates and Appurtenant Items"

(1) Payment will be made for costs associated with furnishing and installing tainter gates and appurtenant items, which includes full compensation for materials, fabrication, shop assembly, delivery, and installation of tainter gates, including gates, trunnions, trunnion yokes, trunnion pins, and appurtenant items, including cable attachment brackets, seal assemblies, side seal plates, dogging brackets, sill beams, stop beams, and other items necessary for complete installation.

(2) Unit of measure: lump sum.

b. "Furnishing and Installing Tainter Gate Anchorage Assemblies"

(1) Payment will be made for costs associated with furnishing and installing tainter gate anchorage assemblies, which includes full compensation for materials, fabrication, delivery, and installation of tainter gate anchorage assemblies, including tainter gate trunnion girders and prestressing assemblies for anchoring trunnion girders to piers [and trunnion yokes to trunnion girders, and other items necessary for complete installation].

(2) Unit of measure: lump sum.
1.1.3 Alternate 3

"Furnishing and Installing Tainter Gates, Appurtenant Items, and Tainter Gate Anchorage Assemblies"

(1) Payment will be made for costs associated with furnishing and installing tainter gates, appurtenant items, and tainter gate anchorage assemblies, which includes full compensation for materials, fabrication, shop assembly, delivery, and installation of tainter gates, including gates, trunnions, trunnion yokes, trunnion pins; appurtenant items, including cable attachment brackets, seal assemblies, side seal plates, dogging brackets, sill beams, and stop beams; and tainter gate anchorage assemblies, including tainter gate trunnion girders and prestressing assemblies for anchoring trunnion girders to piers [and trunnion yokes to trunnion girders, and other items necessary for complete installation].

(2) Unit of measure: lump sum.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN WELDING SOCIETY (AWS)

AWS D1.1/D1.1M (2020) Structural Welding Code - Steel

AWS D1.2/D1.2M (2014; Errata 1 2014; Errata 2 2020)
Structural Welding Code - Aluminum

ASTM INTERNATIONAL (ASTM)

ASTM A320/A320M (2021a) Standard Specification for Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service

ASTM A668/A668M (2020a) Standard Specification for Steel
Forgings, Carbon and Alloy, for General Industrial Use

ASTM B22/B22M  (2017) Standard Specification for Bronze Castings for Bridges and Turntables

1.3 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that
require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders and Welding Operators

Provide qualification of welders and welding operators conforming to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.2 Certification of Prestressing Technicians

Submit certificates, for prestressing technicians who will use the proposed system in the work, 30 days prior to the start of prestressing operations certifying by name that the technicians are trained and skilled in the use of the proposed system.

1.4.3 Manufactured Units and Fabricated Items

Samples of manufactured units and shop fabricated shall be full-size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is identified and its location recorded.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Perform delivery, handling, and storage of materials and fabricated items in conformance with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Do not allow prestressing steel materials to come in contact with the earth. Protective wrappings and coverings shall not be removed until immediately prior to use in the work. Each prestressing tendon shall be closely inspected prior to use in the work. Tendons with nicks, pits, bends or damaged threaded ends shall not be used in the work.

1.5.2 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 21 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

PART 2 PRODUCTS

2.1 MATERIALS

System of identification which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract. Provide materials orders, materials lists, and materials
shipping bills conforming with the requirements of Section 05 50 14
STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze,
aluminum-bronze, and other metal materials used for fabrication shall
conform to the requirements shown on the drawings and specified herein and
in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel Shapes

ASTM A36/A36M.

2.1.1.2 Structural Steel Plates

[ASTM A36/A36M,] [ASTM A572/A572M, Grade 50,] [or] [ASTM A588/A588M, Grade
50].

2.1.1.3 Steel Pipe

[ASTM A53/A53M, Type S, Grade B, seamless, black, normal size and weight
class or outside diameter and nominal wall thickness as shown on the
drawings, [plain] [threaded] [threaded and coupled] ends.] [ASTM A501/A501M,
seamless, outside diameter and nominal wall thickness as shown on the
drawings.]

2.1.1.4 Steel Castings

ASTM A27/A27M, Grade [____], Class [____]; or ASTM A148/A148M, Grade
[____].

2.1.1.5 Steel Forgings

ASTM A668/A668M, Class [____], carbon content not exceeding 0.35 per cent,
and chemical composition which results in satisfactory weldability.

2.1.1.6 Stainless Steel Bars and Shapes

ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A,
hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,]
[S 45000,] Condition A, age-hardened heat treatment, hot-finished or
cold-finished, Class C.

2.1.1.7 Stainless Steel Plate, Sheet, and Strip

ASTM A167, UNS S 30400; and ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S
40500,]. Plate finish shall be hot-rolled, annealed or heat-treated, and
blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.1.8 Bronze Castings

ASTM B22/B22M, Copper Alloy UNS No. C91300.

2.1.1.9 Aluminum-Bronze Castings

ASTM B148, Copper Alloy UNS No. [____].
2.1.1.10 Prestressing Steel Bar Tendons

**ASTM A722/A722M**, Type [____], including Supplementary Requirements, except the degree of bending for bend tests shall be 180 degrees. Certified manufacturing records and test reports for tendons shall be provided, identified with specific lots, and approved prior to use of tendons in the work. Manufacturing records for tendons shall include mixing casting, cooling, rolling, cold-stressing to 80 percent of the minimum ultimate strength, and stress-relieving. Test reports shall include chemical analyses, mechanical properties testing and stress-strain curves, mechanical coupling demonstration, and product analyses of finished tendons representing each heat.

2.1.1.11 Steel Bars for Concrete Reinforcement

Steel bars for concrete reinforcement other than steel bar prestressing tendons shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.1.1.12 Anchorages and Couplers

Submit certificates for anchorages and couplers 30 days prior to the start of prestressing operations. Anchorages and couplers for prestressing tendons shall be of metal of proven corrosion resistance and compatibility with tendons and shall be tested by an approved method and certified to be capable of developing the minimum ultimate strength of tendons without excessive slip. Anchorages shall be plate, bar, or other positive connecting type which allows complete placement and consolidation of concrete around and within its confines and exerts uniform bearing on the concrete. Couplers shall be provided with housing or enclosures which are long enough to permit the necessary movements and fittings which allow complete grouting of all components.

2.1.1.13 Ducts

Ducts for encasing prestressing tendons shall be of the type [shown on the drawings] [approved by the Contracting Officer]. Ducts shall retain shape under the weight of concrete and shall not permit the entrance of cement paste from concrete.

2.1.2 Concrete

As specified in Section 03 30 00 CAST-IN-PLACE CONCRETE [and Section 03 45 33 PRECAST[ PRESTRESSED] STRUCTURAL CONCRETE].

2.1.3 Asphalt Mastic

Asphalt Mastic shall conform to [____].

2.1.4 Premolded Expansion Joint Sheets

As specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.1.5 Gaskets for Seal Assemblies

Rubber gasket sheets for seal assemblies shall have nominal Shore A durometer value of [40][55][80] with dimensions as shown on the drawings.
2.1.6 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete paragraph FABRICATION below.
**************************************************************************

2.1.6.1 General

Rubber seals shall be compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>1.38 MPa 2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.21 MPa 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees C for 22 hours plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as $W_1$ ($W_1$ is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree C and the duration of immersion shall be 166 hours.

2.1.6.2 [Fabrication]

Rubber seals shall have a fluoro-carbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be 0.762 [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant fluoro-carbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa 2,000 psi (min.)</td>
<td></td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
<td></td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish...
lengths shown on the drawings and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluoro-carbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.]

2.1.7 Cement for Grout

ASTM C150/C150M, Type I or II.

2.1.8 Grout Admixture

Submit manufacturer's description of grout admixture, for approval, 30 days prior to the use of the material in the work. Grout admixture shall be a shrinkage compensating type which produces 2 percent maximum and 10 percent maximum unconfined expansion of the grout when tested in accordance with ASTM C940, shall not contain chlorides, fluorides, or nitrates and may be dispensed in solid or liquid form. Complete manufacturer's description of the grout admixture shall be submitted for approval.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown on the drawings and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, Ferritic Steel, Grade [____] [Austenitic Steel, Grade [____], Class [____].] Bolts 13-mm 1/2-inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated on the drawings.

2.3 GROUT

Grout shall be a mixture of Portland cement specified in paragraph CEMENT FOR GROUT, shrinkage compensating admixture specified in paragraph GROUT ADMIXTURE, and potable water. Final mix proportions shall be based on test results of sample mixtures. The water content of grout shall be the minimum necessary for proper placement but the water-cement ratio shall not exceed 0.50 by weight. The fluidity of grout shall be determined in accordance with ASTM C939/C939M. The efflux time of a grout sample immediately after mixing shall not be less than 11 seconds. The minimum 7-day compressive strength of 50-mm 2-inch grout cubes molded, cured and tested in accordance with ASTM C109/C109M shall be 17.2 MPa 2500 psi.
2.4  FABRICATION

2.4.1  Detail Drawings

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.1.1  Fabrication Drawings

Show on the fabrication drawings complete details of materials, tolerances, connections, machined surface finishes, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.4.1.2  Shop Assembly Drawings

Provide on the shop assembly drawings details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.4.1.3  Delivery Drawings

Provide on the delivery drawings descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.4.1.4  Field Installation Drawings

Provide on the field installation drawings a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for installation of prestressing assemblies, including proposed stressing sequences and stressing calculations for anchorage assemblies.

2.4.2  Structural Fabrication

Structural fabrication shall conform with the requirements shown on the drawings and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown on the drawings. Dimensional tolerances shall be as specified and shown on the drawings. Splices shall occur only where shown on the drawings or approved by the Contracting Officer. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of appurtenances as required.

2.4.3  Welding

******************************************************************************
NOTE: List applicable welds requiring radiographic examination.
******************************************************************************
Welding shall conform with the requirements [of AWS D1.1/D1.1M, AWS D1.2/D1.2M,] specified herein, and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [____]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval of the Contracting Officer, by dye penetrant, magnetic particle tests, or ultrasonic tests. [Components shall be stress-relief heat treated after welding where shown on the drawings. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]

2.4.4 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.5 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.6 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.7 Fabrications

Submit samples for approval prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded.

2.4.7.1 Gates

Gates shall be of welded fabrication except for bolted appurtenances as shown on the drawings. Structural steel framing members shall be of structural steel conforming to ASTM A36/A36M. Skin plate shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50,] [ASTM A588/A588M, Grade 50]. Gates shall be shop-fabricated. Contractor proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved by the Contracting Officer and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of gates shall not vary from the nominal dimension by more than 6 mm 1/4 inch. The surfaces of framing elements which support skin plates shall be in true alignment within 5 mm 3/16 inch so that skin plates will be in full bearing on all contact surfaces before being welded. The outside faces of skin plates after being welded to framing elements shall not vary from the surface established on the drawings by more than 5 mm 3/16 inch. Splices in skin plates shall be located only where shown on the drawings. Trunnions shall be an integral part of the gate framing and shall be stress-relieved by heat treatment.
after welding. The machining of trunnion hubs and bushings shall be performed after welding of the hubs is completed. The classification of fit between trunnion hubs and bushings shall be as shown on the drawings. Dowel holes and grease holes shall be drilled in bushings after installation in trunnion hubs. Gates shall be provided with seal assemblies and other appurtenant items as shown on the drawings.

2.4.7.2 Trunnion Pins

Trunnion pins shall be of (cast steel conforming to [ASTM A27/A27M] alloy steel forging conforming to [ASTM A148/A148M] clad with corrosion resisting steel [weldment] [shrunk-on sleeve] as shown on the drawings. The clad surface shall be machined after completion of all welding. The thickness of the cladding after final machining shall be not less than 25 mm (1 inch) thick] [corrosion resisting steel as shown on the drawing].

2.4.7.3 Trunnion Yokes

Trunnion yokes shall be provided complete with adjusting plates and bolts and thrust washers. Yokes shall be stress-relieved by heat treatment and machined to the class to fit shown on drawings after fabrication welding is completed.

2.4.7.4 Prestressing Anchorage Assemblies

Submit prestressing records immediately after the work is completed. Furnish descriptions of the proposed method for installing the prestressing assemblies, for approval, 30 days prior to the start of prestressing operations. Prestressing assemblies shall consist of prestressing tendons, anchorages, ducts, grout and other appurtenances as required and shown on the drawings.

   a. Prestressing tendons shall be as specified in paragraph PRESTRESSING STEEL BAR TENDONS.

   b. Anchorages shall be as specified in paragraph ANCHORAGES AND COUPLERS.

   c. Ducts shall be as specified in paragraph DUCTS.

   d. Grout shall be as specified in paragraph GROUT.

2.4.7.5 Trunnion Girders

Trunnion girders shall be [cast-in-place] [precast] concrete girders of the 28-day compressive strength shown on the drawings and post-tensioned with prestressing anchorage assemblies. The ducts of the anchorage assemblies shall be cast in the girders in the positions and alignments shown on the drawings. The installation of prestressing assemblies shall be as specified in paragraph PRESTRESSING ANCHORAGE ASSEMBLIES. Reinforcement steel, premolded expansion joint sheets, blockouts and other components of the girders shall be as specified and indicated on the drawings] [structural steel as shown on the drawings].

2.4.7.6 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the
full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown on the drawings. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown on the drawings and shall be machine-finished after splicing.

2.4.7.7 Appurtenant Items

Cable attachment brackets, dogging brackets, side seal plates, sill beams, stop beams and other appurtenant items shall conform to the requirements specified and shown on the drawings. The sealing surfaces of side seal plates and sill beams shall be flush, straight, and free from offsets, warps, twists or other distortions.

2.4.8 Shop Assembly

Shop assembly requirements for tainter gates, anchorage assemblies and appurtenant items shall be as shown on the drawings and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates shall be assembled completely in the shop to assure satisfactory field installation. Adjoining components and appurtenant items shall be fitted and bolted together to facilitate field connections. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions permit. Rubber seals shall be fitted and drilled to match the seal retainers on the gates, match-marked and removed for shipment. Drilled slots for attaching seals shall allow a minimum adjustment of plus/minus 10 mm 3/8 inch. Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless otherwise waived in writing by the Contracting Officer. The presence of the Contracting Officer during assembly or disassembly will not relieve the Contractor of any responsibility under this contract.

2.5 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.5.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.5.2 Testing of Rubber Seals

**************************************************************************
NOTE: If fluoro-carbon (Teflon) clad seals are not used, delete this paragraph.
**************************************************************************

The fluoro-carbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method.
A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluoro-carbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUORO-CARBON FILM</th>
<th>MACHINE METHOD AT 50 mm² INCHES PER MINUTE</th>
<th>DEADWEIGHT METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.762 mm 0.030 in.</td>
<td>5.25 N per mm² 30 lbs per inch width</td>
<td>5.25 N per mm² 30 lbs per inch width</td>
</tr>
<tr>
<td>1.524 mm 0.060 in.</td>
<td>5.25 N per mm² 30 lbs per inch width</td>
<td>5.25 N per mm² 30 lbs per inch width</td>
</tr>
</tbody>
</table>

PART 3 EXECUTION

3.1 INSTALLATION

Perform installation conforming with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Seal shapes, seal plates, frames, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 Trunnion Girders

Trunnion girders shall be anchored to concrete piers as specified and shown on the drawings. [The installation, post-tensioning and grouting of prestressing assemblies for anchoring trunnion girders shall conform to the requirements specified in paragraph PRESTRESSING ASSEMBLIES.]

3.1.3 Trunnion Yokes

Trunnion yokes shall be installed and adjusted in strict accordance with the procedure shown on the drawings. [The final alignment of trunnion yokes shall be performed after the prestressing tendons of the anchoring prestressing assemblies have been post-tensioned partially as specified in paragraph POST-TENSIONING.] Special precautions shall be exercised to align the trunnion yokes so that the center lines of trunnion pins at the opposite ends of each gate are concentrically located on the established horizontal line. The eccentricity of the actual centerline of each trunnion pin with respect to the established horizontal line shall not be more than 0.8 mm 1/32 inch. The horizontal distance between trunnion yokes
shall not vary more than 3 mm 1/8 inch from the established dimension. [Second-pour, high-strength concrete fills shall be placed between the bases of trunnion yokes and trunnion girders [and concrete non-shrink grout fills shall be placed between the yokes of trunnion yokes and the abutting faces of concrete piers] after the successful completion of the trial operation specified in paragraph TRIAL OPERATIONS and the final alignment of trunnion yokes.] [Complete tensioning of the prestressing tendons shall be performed after the concrete fills have attained the minimum [strengths] [strength]. The installation, post tensioning and grouting of prestressing assemblies for anchoring trunnion yokes to trunnion girders shall conform to the requirements specified in paragraph PRESTRESSING ASSEMBLIES.]

3.1.4 Gates

**************************************************************************
** NOTE: The water-tightness tests on the skinplates should be deleted when complete or spot radiographic or ultrasonic examination of the skinplates is required by the specifications. **
**************************************************************************

The trunnion lubrication system lines shall be purged, filled with grease and connected to each trunnion assembly prior to installing gates. The bearing surfaces of trunnion pins and bushings shall be cleaned and coated with grease prior to installing the trunnion pins. Gates shall be assembled in the field in strict conformity with shop match markings. Controlling dimensions and alignments shall be checked and corrected as required before starting field welding. Welding shall be done in a manner such that distortion of gates is prevented. Erection bolts, lugs and ties shall be removed after welding is completed. Holes and depressions shall be filled with weld metal and surface projections shall be removed by grinding. [Skinplate welds shall be tested for water-tightness after the gates are installed but prior to painting and mounting of seals by coating one face of the skinplate with soapsuds and applying air pressure with a hose using a minimum air pressure of 414 kPa 60 psi at the nozzle to the opposite face.] Disclosed leaks shall be sealed with light welds.

3.1.5 Prestressing Assemblies

The proposed method and equipment for installing prestressing anchorage assemblies, including riggings, tensioning jacks, gages, dynamometers and load cells or other devices for measuring stress loads, shall provide for the accurate installation of the assemblies and shall be selected by the Contractor and submitted for approval.

3.1.5.1 Ducts

Ducts shall be accurately placed, aligned and adequately supported at close intervals to limit sag and deviation from established lines when tendons are inserted and concrete is placed. Ducts shall have grout openings at both ends and grout vents as required. Connections and other joints in ducts shall be watertight. Openings shall be adequately protected to prevent the entry of water, concrete or debris. Ducts shall not have blockages, dents or other defects which could cause increased friction between tendons and ducts or restrict grout flow.

3.1.5.2 Steel Bar Prestressing Tendons

Steel bar prestressing tendons shall be inspected before being placed in
ducts to assure that they are not bent, nicked, scored or have damaged threaded ends. Tendons should not be placed in ducts until all welding has been completed on templates, supports or other items near or in contact with the tendons.

3.1.5.3 Anchorages

Anchorages for steel bar prestressing tendons shall be set in a plan normal to the axis of the tendon so that uniform bearing on the concrete is assured and shall be positively connected to tendons. Ends of tendons shall extend beyond anchorages to accommodate testing. End extensions shall be removed after tests are completed and approved.

3.1.5.4 Post-Tensioning

Complete records of the prestressing operation shall be compiled and submitted as required in paragraph GROUT RECORDS. Tensioning of the steel bar prestressing tendons shall be as specified and shown on the drawings. Tendons shall be tensioned a minimum of [_____] days after the casting of concrete piers [and girders]. Tensioning shall not be started until tests on concrete cylinders made and cured under the same conditions as the piers [and girders] indicate that the concrete has attained the required minimum strength. The tensioning operation shall be conducted in a manner so that the load being applied and the elongation of the tendon may be measured at all times. Elongation measurements shall be accurate to 0.25 mm 0.01 inch. Jack gage readings shall be accurate to the nearest 500 kPa 100 psi. If the stress in a tendon determined by gage pressure differ from the stress determined by elongation measurement in excess of 5 percent the cause of the difference shall be determined and corrected before proceeding with the tensioning operation. [Longitudinal tendons in concrete trunnion girders shall be tensioned prior to the placement of the second-pour, high-strength concrete fills for the sections of piers adjacent to the face of trunnion girders.] [The transverse tendons which anchor trunnion girders to piers shall be tensioned after the second-pour concrete fills for the piers have attained the minimum required strength.] [The transverse tendons which anchor trunnion yokes to trunnion girders shall be partially tensioned prior to the trial operation of tainter gates as specified below in paragraph TRIAL OPERATIONS and prior to the final adjustment of trunnion yokes as specified and shown on the drawings. Complete tensioning of these tendons shall not be performed until after the trunnion yokes have been adjusted and the second-pour, high-strength concrete fills between the base of trunnion yokes and the trunnion girders [and the concrete grout fills between the yokes of trunnion yokes and the piers] have attained the required minimum [strength] [strengths].] Exposed ends of prestressing components shall be protected from damage during the tensioning operations; take the safety measures necessary to prevent accidents caused by failure of prestressing components.

3.1.5.5 Verification of Prestressing Forces

Individual prestressing tendons selected by the Contracting Officer shall be tested to verify the sustentation of prestress forces by being subjected to a force equal to the design force between 7 and 14 days after the complete tensioning of all tendons. Tendons which sustain the applied force without being unseated will be considered to be satisfactory. The number of tendons tested shall not exceed 10 percent of all tendons unless a tested tendon is unable to sustain the required test force. If a tested tendon is unable to sustain the required test force all tendons shall be tested and retensioned if required to the initial prestress. Retensioned
3.1.5.6 Grouting

Prestressing assemblies shall be grouted immediately after complete tensioning of prestressing tendons and verification of prestressing forces. Grout shall conform to the requirements specified in paragraph GROUT. Grouting equipment shall provide continuous mechanical mixing and placing of grout, measure grout mix volume and measure volume of grout placed within 2,500 cubic mm 0.1 cubic foot. Grout pump shall be a positive displacement type and have the capacity to develop a pressure of 1.38 MPa 200 psi. Stand-by water flushing equipment shall be provided for flushing out ducts partially grouted and stopped due to blockage or equipment breakdown. Ducts for prestressing tendons shall be flushed free of water, dirt or any other foreign substance and shall be blown out with compressed air until no water comes through just prior to grouting. Ducts shall be pressure grouted at a minimum pressure of 690 kPa 100 psi immediately after post-tensioning has been completed. Grouting shall continue until all air within the duct has been displaced with grout. Once the grouting of a system of prestressing tendons and ducts has been started the grouting operation shall be continuous until that system has been completely grouted. Grout placement records shall be compiled.

3.1.6 Appurtenant Items

Side seal plates, sill beams, stop beams and other items to be embedded in second-pour concrete shall be attached to anchors, aligned, leveled and rigidly blocked to prevent displacement during the placement of concrete. Side seal plates shall be aligned in planes normal to the axis of rotation of the gates and shall be checked before being embedded in concrete to ensure that they do not vary more than 2.5 mm 3/32-inch from the established alignment in an arc length of 3.6 m 12 feet. Welded field splices in exposed metals shall be ground smooth to assure proper sealing. Metal supports for rubber seals shall be continuous and free of waves, winds and distortions. Rubber seals shall be installed after the [skinplate water-tightness test and] gate painting operations have been completed. Seals shall be adjusted after installation so that they are slightly compressed in the closed, unwatered condition to prevent excessive depression and wear in the closed, watered condition. [The heating system for seals shall be installed as shown on the drawings and specified in Section [_____] CREST-GATE-SEAL.]

3.1.7 Trial Operations

Gates shall be trial operated after the complete installation of gates and appurtenant items. Trial operations shall be performed and approved prior to placing the second-pour, high-strength concrete fills around embedded appurtenant items [and between trunnion yokes and trunnion girders and prior to the complete tensioning of the prestressing tendons anchoring the trunnion yokes]. Hoist lifting cables shall be adjusted and trunnion bushings shall be lubricated through the permanent lubrication fittings with an approved, extreme-pressure lubricant before operating the gates. Gates shall move smoothly and without binding or lateral sway when raised and lowered through the complete range of travel. Defects disclosed from trial operations shall be corrected and trial operations repeated by the Contractor at no cost to the Government. Trial operations shall be repeated after complete tensioning and grouting of all prestressing assemblies.
3.1.8 Second-Pour, High-Strength Concrete [and Concrete Grout] Fills

**************************************************************************
NOTE: The zones and strengths of high-strength concrete and concrete grout should be shown on the drawings.
**************************************************************************

The second-pour, high-strength concrete fills for the sections of piers adjacent to the face of trunnion girders [and the space between the base of trunnion yokes and trunnion girders] [and the concrete grout fills between the yokes of trunnion yokes and the piers] shall be as shown on the drawings and as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.1.9 Painting

Exposed parts of gates and appurtenances, except machined surfaces, stainless steel surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.10 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gates, a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2 CATHODIC PROTECTION SYSTEM

The cathodic protection system shall conform to Section [26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM (IMPRESSED CURRENT)] [26 42 19.10 CATHODIC PROTECTION SYSTEMS (IMPRESSED CURRENT) FOR LOCK MITER GATES].

3.3 OPERATING MACHINERY

Operating machinery shall conform to Section 35 01 41.00 10 ELECTROMECHANICAL OPERATING MACHINERY FOR LOCKS.

3.4 FIELD TESTS AND INSPECTIONS

3.4.1 [Skinplate Watertightness Test]

**************************************************************************
NOTE: Skinplate watertightness tests should be deleted when complete or spot radiographic or ultrasonic examination of the skinplate is required by the specifications.
**************************************************************************

After the gate leaves are installed but prior to painting and mounting of seals, skinplate welds shall be tested for watertightness by applying air pressure with a hose, using a minimum air pressure of 414 kPa 60 psi at the nozzle, to one face of the skinplate with a light coating of soapsuds on the opposite face. Disclosed leaks shall be sealed with light welds.]
3.4.2 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.5 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of vertical lift slide gate, vertical lift wheel gate, and vertical lift tractor gate and appurtenant items. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 LUMP SUM PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (LUMP SUM PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.
Select Alternate 1 (one pay item) or Alternate 2 (two pay items). Delete all paragraphs of Alternate not selected.

**************************************************************************

1.1.1 Furnish & Install Gate & Appurtenances

**************************************************************************

NOTE: Alternate 1, Vertical Lift Slide Gate.

**************************************************************************

1.1.1.1 Payment

Payment will be made for costs associated with furnishing and installing vertical lift slide gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift slide gate and appurtenant items including gate leaf, stem, stem guides, leaf nuts, leaf nut wrench, seal collars, frame, [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate] for supporting operating machinery, [lock assembly,] [leaf springs,] [air vent liner,] and other appurtenances necessary for complete installation.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Furnish Gate & Appurtenances

**************************************************************************

NOTE: Alternate 2, Vertical Lift Slide Gate.

**************************************************************************

1.1.2.1 Payment

Payment will be made for costs associated with furnishing vertical lift slide gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery, of vertical lift slide gate and appurtenant items including gate leaf, stem, stem guides, leaf nuts, leaf nut wrench, seal collars, frame, [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate] for supporting operating machinery, [lock assembly,] [leaf springs,] [air vent liner,] and other appurtenances necessary for complete installation.

1.1.2.2 Unit of Measure

Unit of measure: lump sum.

1.3 SUBMITTALS

**************************************************************************

SECTION 35 20 16.53 Page 9
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Tests, Inspections, and Verifications
Acceptance Trial Operation and Test

1.4 QUALIFICATION OF WELDERS AND WELDING OPERATORS

Qualification of welders and welding operators shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Perform delivery, handling, and storage of materials and fabricated items conforming to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Unload materials and equipment delivered to the site by the Contracting Officer. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing. If delivered items are damaged or a shortage is determined, notify of such in writing within 24 hours after delivery.

1.5.2 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

1.6 WARRANTY

**************************************************************************
NOTE: Designated appurtenances of the gate assembly may be guaranteed for a minimum period of 1 year from the date of acceptance thereof, either for beneficial use or final acceptance, whichever is earlier, against defective materials and workmanship. Such guarantees will require the Contractor to furnish and install new replacement parts immediately upon receipt of notice from the Government of the failure of any part of the guaranteed items during the warranty period. These warranty requirements will be covered in the CONTRACT CLAUSES and this paragraph should be deleted from this section of the specifications.
**************************************************************************

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work before completion of the contract. Furnish materials orders, material lists and material shipping bills conforming with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.
2.1.1 Metals

Structural steel, monel, [babbit,] steel forgings, steel castings, stainless steel, bronze, aluminum bronze, brass and other metal materials used for fabrication shall conform to the requirements as shown and as specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shall conform to ASTM A36/A36M.

2.1.1.2 Structural Steel Plates

Structural steel plates shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade [______]].

2.1.1.3 Steel Pipe

Steel pipe shall conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.1.1.4 Stainless Steel Bars and Shapes

Stainless steel bars and shapes shall conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.5 Stainless Steel Plate, Sheet, and Strip

Stainless steel plate, sheet, and strip shall conform to ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,] [S 41008]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION OF RUBBER SEALS AND TESTING OF RUBBER SEALS.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only] [compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers].

2.1.2.1 Physical Characteristics

Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa 2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>PHYSICAL TEST</td>
<td>TEST VALUE</td>
<td>TEST METHOD SPECIFICATION</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------</td>
<td>----------------------------</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent</td>
<td>6.2 MPa900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>(Shore Type A)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after</td>
<td>80 percent of tensile</td>
<td>ASTM D572</td>
</tr>
<tr>
<td>aging 48 hrs)</td>
<td>strength (min.)</td>
<td></td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees for 22 hours plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree and the duration of immersion shall be 166 hours.

2.1.2.2 Fabrication of Rubber Seals

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.726] [1.524] mm[0.030] [0.060] inches thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Tensile strength</th>
<th>13.8 MPa2,000 psi (min.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements as shown and as specified and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

[High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [_____], [hot-dip galvanized] [_____] or ASTM A490M ASTM A490, Type [_____]..] [Bolts, nuts, studs, stud bolts and bolting
materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] [_____] or ASTM A320/A320M, [Ferritic Steel, Grade [_____]] [Austenitic Steel, Grade [_____], Class [_____]]. Bolts 13 mm 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated.

2.2.3 Sheaves

Sheaves shall be of cast steel conforming to ASTM A27/A27M, sized for the wire rope used.

2.2.4 Wire Rope

Wire rope shall conform to FS RR-W-410, Type [_____], Class [_____], Construction [_____], [wire size,] [strand seizing] as indicated.

2.2.5 Wheels

Wheels shall be short hub or long hub, rigid type, heavy duty steel casters fabricated with steel castings conforming to ASTM A148/A148M. Wheels shall be of the size and load capacity shown. Wheel shall be provided with lubrication fittings, roller bearings, and removable axle or shaft. Wheel treads shall be machined-finished as shown. Unless otherwise specified or shown, shafts for wheels shall be stainless steel conforming to ASTM A276/A276M, UNS S 30400.

2.3 FABRICATION

2.3.1 Detail Drawings

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.1.1 Fabrication Drawings

Fabrication drawings shall show complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.3.1.2 Shop Assembly Drawings

Shop assembly drawings shall provide details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.3.1.3 Delivery Drawings

Delivery drawings shall provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.
2.3.1.4 Field Installation Drawings

**************************************************************************
NOTE: If zinc filler is not specified, delete requirements for procedures and equipment for it.
**************************************************************************

Field installation drawings shall provide a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler; procedures and equipment used for heating and placing of the zinc filler; and methods for installing other appurtenant items.

2.3.2 Structural Fabrication

**************************************************************************
NOTE: Delete reference to cathodic protection if not required for project.
**************************************************************************

Structural fabrication shall conform to the requirements as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Dimensional tolerances shall be as specified and as shown. Splices shall occur only where shown. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of cathodic protection system devices and other appurtenances as required.

2.3.2.1 Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination. Delete reference to stress-relieving if not applicable for the project.
**************************************************************************

Submit schedules of welding procedures for structural steel conforming with the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated and as follows: [______]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise situated where radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests. Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.
2.3.2.2 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.2.3 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.2.4 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.3 Slide Gate Leaf

Slide gate leaf shall be of single-component structural fabrication. Slide gate shall be shop fabricated and shall be provided complete with gate stem, stem guides, leaf nut, leaf nut spanner wrench, bar seals, seal collars, [lock assembly,], [leaf springs,], and other appurtenant items as required for installation. Surfaces of leaf framing elements to which skin plates are to be welded shall not vary from a true plane by more than $\frac{2}{16} \text{ inch}$ to provide uniform bearing. The outside surfaces of skin plates welded to framing elements shall not vary from a true plane by more than $2 \text{ mm}$ $1/16 \text{ inch}$. Splices in skin plates shall be located only where shown. The overall width and height of the fabricated gate leaf shall not vary from the respective dimensions shown by more than $2 \text{ mm}\ 1/16 \text{ inch}$. Gate leaf shall be stress-relieved prior to the attachment of bar seals. Surfaces where bar seals are attached shall be accurately machined to provide uniform bearing for the full contact dimensions. Top and side bar seals shall be firmly butted together at the corners. The ends of side bar seals shall be flush with the bottom seating surface of the gate leaf. Final machining of bar seals shall be performed after they are attached to the gate leaf. The bottom seat of the gate leaf shall be machined for a tight fit with the gate frame sill.

2.3.4 Slide Gate Frame and Bonnet

**************************************************************************
NOTE: Edit this paragraph to fit the project.
**************************************************************************

Slide gate frame and bonnet shall be shop fabricated. Guiding and seal surfaces of slide gate frame and bonnet shall be in a true vertical plane and shall be machined finished. Unmachined surfaces exposed to water flow shall match at joints between component parts, shall not depart from true planes shown by more than $2 \text{ mm}\ 1/16 \text{ inch}$ and shall be free of offsets or irregularities greater than $2 \text{ mm}\ 1/16 \text{ inch}$. Allowable offsets or irregularities less than $2 \text{ mm}\ 1/16 \text{ inch}$ shall be ground to a bevel of not greater than one on twenty-four. The bottom seat of the gate leaf shall be machined for a tight fit with the gate frame sill. Gate frame and bonnet shall be stress relieved prior to the attachment of bar seals. Surfaces where bar seals are attached shall be accurately machined to provide uniform bearing for the full contact dimensions. Top, side, and invert bar seals shall be firmly butted together at the corners. Final machining of bar seals shall be performed after they are attached to the gate frame and...
bonnet. Babbit shall be poured in the gate frame sill and peened before machining the frame. When machining the gate frame sill, the tool travel shall be parallel to the long dimension of the babbit.

2.3.5 Slide Gate Bonnet Cover, Pedestal and Base Plate

**************************************************************************
NOTE: Edit this paragraph to fit the project.
**************************************************************************

The flanges of the bonnet cover, pedestal and base plate for the supporting the operating machinery for the slide gate shall be accurately machined and drilled to match mating flanges and provide the required true alignment. Unmachined oil-contacting surfaces of bonnet cover and pedestal shall be coated with alkyd resin as specified for the unmachined oil-contacting surfaces of hydraulic cylinder heads. Base plate dimensions may be altered to fit the operating machinery furnished, provided the basic configuration, plate thickness, and number and sizes of fasteners are equal to that shown and the altered dimensions are approved.

2.3.6 Wheel Gate Leaf

**************************************************************************
NOTE: Delete first sentence if not applicable for the project.
**************************************************************************

Wheel gate leaf shall be of single-component structural fabrication. Wheel gate leaf shall be shop fabricated and shall be provided complete with lifting brackets, wheel assemblies, seal assemblies, [guide shoes,] [plates,] [dogging brackets,] and other appurtenant items as required for installation and proper operation. Check the design center of gravity of the gate leaf prior to fabrication and notify the Contracting Officer if an unreasonable amount of counter-weighting is required to attain the center of gravity as designed. Surfaces of leaf framing elements to which skin plates are to be welded shall not vary from a true plane by more than 2 mm 1/16 inch to provide uniform bearing. The outside surfaces of skin plates welded to framing elements shall not vary from a true plane by more than 2 mm 1/16 inch. Splices in skin plates shall be located only where shown. The overall width and height of the fabricated gate leaf shall not vary from the respective dimensions shown by more than 2 mm 1/16 inch. Gate leaf shall be stress relieved prior to the attachment of seal assemblies and other appurtenant items.

2.3.6.1 Wheel Gate Leaf Lifting Brackets

Fabrication details of wheel gate leaf lifting brackets shall be closely coordinated with the details of the [lifting sling] [lifting hoist] [engaging and disengaging mechanism of the lifting beam assembly] to assure proper operation.

2.3.6.2 Wheel Gate Leaf Wheel Assembly

Wheel assemblies shall be products of a manufacturer regularly engaged in the manufacture of such products. Each wheel assembly shall be provided complete with wheel, shaft, roller bearing, lock washer, lock nut, bearing cover, seal housing, grease seal, seal retainer, shaft lock plate, lubrication fittings, fasteners, and other accessories as required for complete and proper installation. Wheel diameter and thickness shall not
be changed from that shown. The dimensions and tolerances of other components may be changed as required for compatibility with the manufacturer's product.

2.3.6.3 Wheel Gate Leaf Seal Assembly

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and machine finished after splicing.

2.3.7 Wheel Gate Frame and Guides

**************************************************************************
NOTE: Delete last sentence if not applicable to the project.
**************************************************************************

Exposed unmachined surfaces of wheel gate frame and guides shall match at joints between component parts, shall not depart from true planes shown by more than 2 mm 1/16 inch, and shall be free of offsets or irregularities greater than 2 mm 1/16 inch. Allowable offsets or irregularities less than 2 mm 1/16 inch shall be ground to a bevel of not greater than one on twenty-four. Surfaces of frames and guides to receive seal bars and wheel track bars shall be accurately machined to provide uniform bearing for the full contact dimensions. Seal bars shall be firmly butted together at corners. Bearing surfaces of wheel track bars and sealing surfaces of seal bars shall be machined to the tolerances shown to provide uniform bearing and sealing at all points of contact. Final machining of seal bars and wheel track bars shall be performed after they are attached to the gate frame and guides. Anchor bolt holes for gate frame and guides shall be accurately located using Government-furnished templates which provide the installation location of anchor bolts.

2.3.8 Wheel Gate Lifting Sling

Wheel gate lifting sling shall be of wire rope with thimble and socket fittings attached to the wire rope in a manner that develops the full strength of the wire rope.

2.3.9 Wheel Gate Lifting Beam Assembly

Wheel gate lifting beam assembly shall be fabricated as shown for automatic engaging and disengaging with the lifting brackets of the gate leaf. The lifting beam shall be stress relieved prior to final machining and attachment of the roller and counterweight assemblies.

2.3.10 Tractor Gate Leaf

**************************************************************************
Tractor gate leaf shall be of single-component structural fabrication. Tractor gate leaf shall be shop fabricated and shall be provided complete with roller train assemblies, lifting brackets, seal assemblies, guide [shoes,] [plates,] [dogging brackets,] [pier guides,] [pier ties,] and other appurtenant items as required for installation and proper operation. Check the design center of gravity of the gate leaf prior to fabrication and give notification if an unreasonable amount of counterweighting is required to attain the center of gravity as designed. Surfaces of leaf framing elements to which skin plates are to be welded shall not vary from a true plane by more than $2 \text{ mm} \left( \frac{1}{16} \text{ inch} \right)$ to provide uniform bearing. The outside surfaces of skin plates welded to framing elements shall not vary from a true plane by more than $2 \text{ mm}/16$ inch. Splices in skin plates shall be located only where shown. The overall width and height of the fabricated gate leaf shall not vary from the respective dimensions shown by more than $2 \text{ mm} \left( \frac{1}{16} \text{ inch} \right)$. Gate leaf shall be stress relieved prior to the attachment of seal assemblies and other appurtenant items.

2.3.10.1 Tractor Gate Leaf Lifting Brackets

Fabrication details of tractor gate leaf lifting brackets shall be closely coordinated with the details of the [lifting sling] [lifting hoist] [engaging and disengaging mechanism of the lifting beam assembly] to assure proper operation.

2.3.10.2 Tractor Gate Leaf Roller Train Assemblies

Roller train assemblies shall consist of roller guides, track plates, roller train, and roller train cover. Roller guides shall be adjustable and removable without dismantling the roller train. Turned bolts, jack screws, shims for mounting and adjusting roller guides, and cap screws for attaching track plates shall be provided as shown. Track plates shall be attached to the gate leaf so that the side faces of the track plates are parallel to a vertical plane within $2 \text{ mm} \left( \frac{1}{16} \text{ inch} \right)$. The track surfaces of track plates shall be machined finished to a plane parallel to a common plane within $2 \text{ mm} \left( \frac{1}{16} \text{ inch} \right)$ after being attached to the gate leaf. Roller train shall be provided complete with pins, link bars, retaining rings, and other appurtenances as shown and as required for proper installation and operation.

2.3.10.3 Tractor Gate Leaf Guide Shoes

Guide shoes shall be attached to the gate leaf for drilling and reaming for bolting. Guide shoes shall be accurately located on the gate leaf in a true vertical plane with each other in the upstream-downstream direction. Lines passing through face of guide shoes on each side of leaf shall be parallel within $2 \text{ mm} \left( \frac{1}{16} \text{ inch} \right)$.

2.3.10.4 Tractor Gate Leaf Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of
the unspliced seal, and occur only at locations shown. Vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field spliced only where shown and machine finished after splicing.

2.3.11 Tractor Gate Frame and Guides

**************************************************************************
NOTE: Delete last sentence if not applicable for the project.
**************************************************************************

Exposed unmachined surfaces of tractor gate frame and guides shall match at joints between component parts, shall not depart from true plane shown by more than 2 mm 1/16 inch, and shall be free of offsets or irregularities greater than 2 mm 1/16 in. Allowable offsets or irregularities less than 2 mm 1/16 inch shall be ground to a bevel of not greater than one on twenty-four. Surfaces of frames and guides to receive roller track plates and seal plates shall be accurately machined to provide uniform bearing for the full contact dimensions. Seal plates shall be firmly butted together at corners. Roller bearing surfaces of track plates and sealing surfaces of seal plates shall be machined to the tolerances shown to provide uniform bearing and sealing at all points of contact. Final machining of track plates and seal plates shall be performed after they are attached to the gate frame and guides. Anchor bolt holes for gate frame and guides shall be accurately located using Government furnished templates which provide the installation location of anchor bolts.

2.3.12 Tractor Gate Lifting Sling

Tractor gate lifting sling shall be of wire rope with thimble and socket fittings attached to the wire rope in a manner that develops the full strength of the wire rope.

2.3.13 Tractor Gate Lifting Beam Assembly

Tractor gate lifting beam assembly shall be fabricated as shown for automatic engaging and disengaging with the lifting brackets of the gate leaf. The lifting beam shall be stress relieved prior to final machining and attachment of the roller and counterweight assemblies.

2.3.14 Appurtenant Items

The fabrication requirements for [air vents,] [air vent liner,] [conduit liner,] [dogging devices,] [pier tie anchors,] [gate leaf pier guides,] and other appurtenant items shall conform to the details shown.

2.3.15 Shop Assembly

Shop assembly requirements for gate, gate frame and appurtenant items shall be as shown and as specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gate, frame, guides, and appurtenant items shall be assembled completely in the shop to assure satisfactory field installation. The matchmarking of unassembled components shall be carefully preserved until the components are assembled. Adequate support shall be provided during assembly to maintain components within 2 mm 1/16
inch of actual installation planes. Mating surfaces and machined surfaces shall be coated with a rust preventive coating until assembled. Other connecting surfaces which are not required to be disassembled for shipment shall be thinly coated with an approved rust preventive coating before being joined. Adjoining components shall be fitted and bolted together to facilitate field connections. Shop assembled components shall be delivered assembled, if practically permitted by shipping and field installation conditions. Assembled components shall be shop welded in their final positions as much as delivery and field installation conditions allow. Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless otherwise approved. The presence of the Contracting Officer will not relieve the Contractor of any responsibility under this contract.

2.3.15.1 Gate Leaf

**************************************************************************
NOTE: This paragraph must be edited to fit the project.
**************************************************************************

Shop assembly of the gate leaf shall be in the [vertical position] [and] [horizontal position with the skin side of the gate leaf facing down]. Shop assembly shall include the attachment of all accessories to the gate leaf. The [wheel gate leaf] [and] [tractor gate leaf] shall be lifted by the lifting brackets and inspected for balance about the center of gravity after being shop assembled. If the gate leaf is out of plumb by more than 6 mm 1/4 inch in the total length in a vertical plane in the upstream-downstream direction, or by more than 2 mm 1/16 inch in the total width in a vertical plane perpendicular to the vertical plane in the upstream-downstream direction, it shall be balanced by counterweighting or some other method as approved at the Contractor's expense.

2.3.15.2 Wheel Assemblies

The gate leaf shall be supported in the horizontal position for adjusting wheel assemblies so that the wheels of the attached wheel assemblies are free to rotate to allow the proper adjustment. Attached wheel assemblies shall be adjusted so that the wheels remain perpendicular to the gate leaf and the contact surfaces of the wheels on each side of the gate leaf are in a single plane within 0.127 mm 0.005 inch when rotated 360 degrees. The final adjustment of wheel assemblies shall be made after the gate leaf is assembled with the gate frame and guides in the horizontal position. The top of each wheel shall be tapped to insure that the weight of the wheel assembly has caused the shaft to bear firmly on the supporting framing of the gate leaf. Wheel assemblies shall then be adjusted so that the tolerance on the distance between the plane through the downstream faces of the wheels and the plane through the downstream machined surfaces of the side bar supports for the seal assemblies shall not exceed 1 mm 1/32 inch. After wheel assemblies have been adjusted, they shall be locked in position by drilling the lock plate, support plate, and shaft and installing cap screws as shown. Wheel assemblies shall be lubricated after being locked in position with a lubricant that is suitable for underwater operation, equal to the lubricant recommended by the manufacturer of the wheel roller bearings, and as approved. Additional lubricant shall be applied at regular intervals until final acceptance of the work.
2.3.15.3 Roller Train Assemblies

Roller trains shall be mounted on the track plates with the gate leaf in the vertical position. Roller guides shall be adjusted so that the roller trains are in alignment and can traverse freely without binding and with a maximum sag of \( 19 \text{ mm} \) \( 3/4 \) inch at the bottom. After the roller trains are mounted, the gate leaf shall be maintained in a vertical position unless the roller trains are securely restrained from sagging.

2.3.15.4 Guide Shoes

Guide shoes shall be drilled and reamed for bolting to the gate leaf while attached to the gate leaf. Guide shoes shall be accurately located on the gate leaf in a true plane with each other in the upstream-downstream direction and parallel to the plane established by the downstream machined surfaces of the side bar supports for the seal assemblies. Shims shall be provided as required.

2.3.15.5 Seal Assemblies

Seal assemblies shall be attached to the gate leaf during shop assembly and removed for shipment. The rubber seals of the assemblies shall be accurately fitted, drilled to match the seal retainers, match marked, and removed for shipment.

2.3.15.6 Lifting Beam Assembly

The lifting beam assembly shall be completely shop assembled in the sequence and manner shown. The balance of the completed assembly shall be checked by lifting the assembly by the pick-up pin. If the lifting beam is out of true horizontal by more than \( 10 \text{ mm} \) \( 3/8 \) inch, counterweighting or some other method approved shall be used to balance the assembly at the Contractor's expense.

2.3.15.7 Dogging Devices

Dogging devices shall be completely shop assembled. Pin holes shall be drilled in base plates and dogs with these components in assembly.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified material test reports with all material delivered to the site. Tests, inspections, and verifications for materials and fabricated items shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.1 Testing of Rubber Seals

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:
### Table: Thickness of Fluorocarbon Film

<table>
<thead>
<tr>
<th>Thickness of Fluorocarbon Film</th>
<th>Machine Method at 50 mm² Inches per Minute</th>
<th>Deadweight Method</th>
</tr>
</thead>
<tbody>
<tr>

<td>13.6 kg per 25 mm³ 30 lbs per inch width</td>
<td>13.6 kg per 25 mm³ 30 lbs per inch width</td>
</tr>
<tr>
<td>1.524 mm/0.060 in.</td>
<td>13.6 kg per 25 mm³ 30 lbs per inch width</td>
<td>13.6 kg per 25 mm³ 30 lbs per inch width</td>
</tr>
</tbody>
</table>

### 2.4.2 Inspection

Shop assembled components shall be inspected for accurate fit and compliance with dimensional tolerances. Sealing, guiding, and connecting surfaces shall be inspected to determine if their planes are true, parallel, and in uniform contact with opposing surfaces. With the gate leaf closed and uniformly blocked in the sealing position, gate leaf [wheels,] [rollers,] [bar seals,] [and] [rubber seals] shall be inspected to determine if they are in continuous contact with [track] [and] [seal plates]. [Compression of rubber seals shall not vary by more than 1 mm/32 inch.] [It shall not be possible to insert a feeler gauge of greater than 0.076 [0.127 mm] thickness at any point between bar seals and seal plates.]

### 2.4.3 Operation Tests

**NOTE: This paragraph must be edited to fit the project.**

The operation of the shop-assembled gate assembly shall be tested by opening and closing the gate several times by use of the operating machinery. The force used to operate the gate shall be the minimum required to open and close the gate. Since the sill of the unembedded gate frame is not fully supported during the operation tests, special precaution shall be taken to prevent the application of excessive force on the gate leaf and frame when the gate is closed. The operation of the lifting beam shall be tested by engaging and disengaging the lifting beam several times. Adjustments shall be made as required until operations are satisfactory. The gate assembly shall be tested hydrostatically by applying a hydrostatic pressure of [_____] kPa psi, measured at the sill of the gate frame, to the upstream side of the gate leaf in the closed position. For conducting the hydrostatic testing, the gate frame shall be bulkheaded or restrained by some other method as approved. Under hydrostatic testing, the gate seals shall be sufficiently tight to prevent water leakage.

### PART 3 EXECUTION

#### 3.1 INSTALLATION

Installation shall conform with the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gate and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field welded shall be in correct alignment before welding is commenced.
3.1.1 Embedded Metals

Frames, bases, and other embedded metal items shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Shims, jackbolts, or other supports required to align and hold components rigidly in place until embedment concrete has attained the specified strength shall be provided. Anchors shall be installed as shown. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour.

3.1.2 Gate Frame and Guides

NOTE: This paragraph must be edited to fit the project.

Gate frame and guides shall be connected to embedded anchors, aligned, and rigidly blocked in place prior to the placement of second-pour concrete. The sealing surfaces of the slide gate frame seal bars shall serve as the reference plane for the installation alignment. Alignment shall be to two theoretical control planes described as control plane "A" and control plane "B". Control plane "A" is a vertical plane that is normal to the water passageway and is located at the sealing surface of the gate frame seal bars. Control plane "B" is a vertical plane that is parallel to the water passageway and is located at the centerline of the water passageway. The gate frame shall be aligned to within 0.381 mm 0.015 inch of control planes "A" and "B". A taut piano wire and an electric micrometer or some other approved method shall be used to measure the vertical alignment tolerances. The alignment of [wheel gate] [and] [roller gate] frame and guides shall be such that planes through the bearing surfaces of track plates and the sealing surfaces of seal plates shall be within 2 mm 1/16 inch of the alignment shown. Gate frame and guides shall be tested for proper alignment and clearances prior to being embedded in concrete by lowering and raising the gate leaf through the full operating range.

3.1.3 Gate Leaf

NOTE: Delete reference to rubber seals if not applicable for the project.

Gate leaf shall be completely assembled, including the attachment of all components and accessories, prior to being placed in the gate frame. All necessary precautions shall be taken to avoid distortion of the gate leaf and attached components during installation. Rubber seals shall be fastened securely to metal retainers. Before operating the gate, a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.1.4 Operating Machinery

NOTE: This paragraph must be edited to fit the project.
Operating machinery for the gate assembly and supporting components, including [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate], shall be positioned and aligned to the installed location of the gate frame and guides and anchored in place. The location of the slide gate stem shall be projected to and scribed on the sill of the installed gate frame to serve as a reference point for the alignment of operating machinery and supporting components. Operating machinery and components shall be aligned to within 0.762 mm 0.030 inch of the reference point. Prior to being embedded in concrete, an alignment template shall be bolted to the [bonnet,] [bonnet cover,] marked, and drilled to match the exact center point of the gate stem.

3.1.5 Concrete and Concrete Grout Placement

The embedment of the gate frame and other components in concrete shall be performed in an approved manner to fill all voids, secure anchorage, prevent seepage, and provide uniform finish surfaces. After embedment concrete has cured for at least 7 days, any voids around embedded components shall be filled by pumping concrete grout around the components. After the pumped grout has cured for at least 7 days, hammer blows to the components shall be used to detect any remaining voids. Where remaining voids are located, 25 mm 1 inch diameter grout holes shall be drilled in the components and the voids shall be filled by pressure grouting through the grout holes. Grout holes in the components shall be plugged by welding and shall be ground flush.

3.1.6 Painting

Exposed parts of the gate and appurtenance components, except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, and other specified surfaces, shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.2 OPERATING MACHINERY

Operating machinery shall conform to Section [____].

3.3 ACCEPTANCE TRIAL OPERATION AND TEST

After the gate assembly has been installed, including operating machinery, the Contracting Officer will examine the complete system for final acceptance. Operation and test results shall be furnished to the Contracting Officer. The assembly will be examined first to determine whether or not the workmanship conforms to the specification requirements. Operate the gate throughout its full operating range a sufficient number of times to demonstrate proper operation. [The gate shall be operated from the remote control vault and the control panel in the control tower.] [Operation of hydraulic cylinders by use of compressed air will not be permitted.] The initial operation of the gate assembly shall be conducted in the dry. [With the gate leaf in the seated position and uniformly blocked so that the [wheels] [rollers] are in uniform contact with the track plates, the rubber seals shall be checked to ensure that they are
The gate lock assembly shall be tested by destructing one set of lock pins. This shall be accomplished by inserting one set of pins in the lock position, permitting the weight of the gate leaf to rest on the pins, and using the hydraulic pressure system to break the pins by applying pressure to the top of the hydraulic cylinder. The pressure shall be adjusted at the pressure reducing valve to its lowest setting and gradually increased until the pins fail. The pressure reading at failure of the lock pins shall be recorded in the operation and test report. After completion of the test, broken pins shall be replaced by new ones. The second trial operation and testing of the gate assembly shall be conducted with the reservoir normal operating pool hydrostatic pressure. The workmanship in the fabrication and installation of the gate assembly shall be such that the gate leaf shall form a watertight barrier when lowered to the seated position. Adjustments shall be made to the operation and control apparatus until all components function as required. The [lifting beam assembly,] [lifting sling,] [dogging devices,] and other appurtenances will be inspected to assure proper operation. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no additional cost to the Government. The trial operation and testing shall be repeated after defects are corrected.

3.4 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of slide gates and actuators. This section was originally developed for USACE Civil Works projects.

Brackets are used in the text to indicate designer choices or locations where text must be supplied by the designer.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 SCOPE

The work provided for herein consists of furnishing all plant, labor, materials and equipment and designing, manufacturing, factory testing, delivering, storing, installing and field testing [__#___] slide gates and actuators complete with all necessary accessories and appurtenances, all as shown on the contract drawings and specified herein. Cast-Iron slide gates must be constructed and assembled in accordance with AWWA C560. Fabricated
Stainless-Steel slide gates must be constructed and assembled in accordance with AWWA C561. Electric actuators must meet the requirements of AWWA C542. Electrical work is specified in the applicable sections of Division 26 - ELECTRICAL.

1.2 GENERAL REQUIREMENTS

The contract drawings indicate the requirements and general arrangement of the slide gates and actuators. The slide gates and assembly must fit into the allotted space and allow adequate acceptable clearances for installation, replacement, servicing, and maintenance. The following paragraphs may at times describe or refer to only one item, assembly or arrangement, but these requirements apply to all such items, assemblies or arrangements furnished and installed under these specifications.

1.3 MEASUREMENT AND PAYMENT

The slide gates will not be measured for payment. Payment will be made at the contract job price for "Slide Gates." Price and payment shall constitute full compensation for furnishing all plant, labor, material and equipment and designing, manufacturing, assembling, factory testing, preserving, delivering, storing, installing and field testing the gates, [including painting] and all appurtenant work, services and parts required.

1.4 REFERENCES

1.5 DESIGN

The slide gates must be products of a manufacturer who has been regularly engaged during the past five years in the production of similar-sized gates for the design heads specified herein. Based on the heads specified in the paragraph "Description," working stresses shall not exceed the lower value of either one-half of the yield strength or one-fifth of the ultimate strength of the material. The gates accessories and appurtenances shall be designed for installation as shown on the contract drawings.

1.6 ERECTING ENGINEER

The Contractor shall furnish the services of a competent erecting engineer to supervise and direct the installation and testing of the gates furnished under this section. The erecting engineer shall be a full-time employee of, and designated as such by, the gate manufacturer, shall have had at least five years of experience with the type of gate furnished under these specifications and shall be subject to the approval of the Contracting Officer. The services of the engineer shall be furnished at no extra cost to the Government. The installation and testing of the gates under the direction and supervision of the erecting engineer shall in no way relieve the Contractor of sole responsibility for the gates meeting all requirements of the specifications and fulfilling all the Contractor's guarantees.

1.7 WORKMANSHIP

All workmanship, whether in the factory or the field, must be performed in a skillful and workmanlike manner by qualified mechanics under competent supervision and direction and in accordance with the best modern practice for the various trades involved and for the manufacture of high-grade machinery. All parts must have accurately machined mounting and bearing surfaces so that they can be assembled without fitting, chipping or remachining. All parts must conform to the design dimensions and be free of defects in either workmanship or material that will impair their service. All attaching bolt holes must be accurately drilled to the layout indicated on the shop drawings and dimensional outline drawings.

1.8 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other
submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Shop Drawings; G, [_____]

Dimensional Outline Drawings; G, [_____]

The Contractor shall furnish the Contracting Officer for his review and approval dimensional outline drawings, catalog data and other information and calculations for each size unit which will include at least the following:

(1) Name of actuator manufacturer.

(2) Model number and weight.

(3) Dimensional drawing.

(4) Descriptive bulletin, including a breakaway drawing illustrating all operating components, a parts list and materials of construction.

(5) Strength and durability HP ratings per AGMA 6010.

(6) The electric motor's HP rating, the starting, running, and
locked rotor torques, full load and locked rotor amps.

(7) The maximum and operating stem opening and closing load.

(8) Equipment sizing calculations, including all related factors and supporting literature.

(9) The maximum output of the motor operated actuator with the torque limiting switch inoperative.

(10) Calculations showing the required stem size and bracing required under condition (9) above for L/R < 200.

(11) Control wiring diagram.

SD-06 Test Reports

Quality Control Field Test Report; G, [_____]

Within three (3) days of a successful Quality Control Field Test, the Contractor must submit the Quality Control Field Test Report.

SD-10 Operation and Maintenance Data

Provide both electronic (PDF) and hard copies of Operation and Maintenance Manuals. All manuals and parts lists must be bound separately, be approximately 8-1/2 inches by 11 inches, printed on good quality paper and bound between flexible, durable covers. Drawings incorporated in the manual and/or parts lists may be reduced to page size provided they are clear and easily legible, or may be folded into the manual to page size. Photographs and/or catalog cuts of components may be included for identification. The operation and maintenance manual and parts lists shall be submitted at the time of shipment of the gate actuators. Manuals shall be provided for each type of slide gate and gate actuator.

Installation Manual; G, [_____]

Operation And Maintenance Manuals; G, [_____]

1.9 SUBMITTAL DESCRIPTIONS

The following subparagraphs describe in detail the submittals pertaining to the work specified in this section.

1.9.1 Shop Drawings

Submit complete shop drawings of the gate to the Contracting Officer for approval. Drawings of any items made specially or specifically for this project must be true shop drawings, but catalog cuts are sufficient for standard manufactured articles, and outline drawings of such equipment may be used in the assembly drawings. However, for those items for which true shop drawings are not required, sufficient descriptive data and/or other information, in addition to the catalog cuts, must be submitted to demonstrate compliance with the specifications. The embedded items and structural openings and clearances, which are dependent upon the gate design, must be included with the shop drawings.
1.9.2 Installation Manual

A minimum of 30 days prior to shipment of the slide gate and gate actuator, submit three (3) copies of the gate manufacturer's standard manual describing procedures to be followed by the field service representative in installing and adjusting the slide gates, gate actuators and appurtenances not furnished by the Government. The installation manual must be of such a nature that it may be comprehended by an engineer or mechanic without extensive experience in erecting slide gates of this type. The description must be a step by step explanation of operations required, and include, where applicable, such things as gate component alignment procedures, bolt torque values, limit switch setting adjustment, wedge block adjustment and similar details.

1.9.3 Operation and Maintenance Manuals

Submit five (5) hard copies of all operation and maintenance, lubrication, and repair manuals for all equipment not furnished by the Government. Submit also in electronic format (PDF). Furnish operation and maintenance manuals containing complete information in connection with the operation, lubrication, adjustment, routine and/or special maintenance, disassembly, repair and reassembly of the manual and electric motor driven gate actuators and appurtenances furnished under this section. Furnish copies of the manufacturer's spare parts lists and/or bulletins for the gate actuators and appurtenances. These lists and/or bulletins shall clearly show all details and parts, and all parts shall be adequately described and/or have proper identification marks. Submit the operation and maintenance manual and parts lists at the time of shipment of the gate actuators.

1.10 QUALITY CONTROL

1.10.1 General

Establish and maintain quality control for slide gate operations to assure compliance with contract requirements and maintain records of quality control for all construction operations, including but not limited to the following:

(1) Machine work and electrical work.
(2) Shop painting.
(3) Galvanizing.
(4) Use of specified materials and equipment.
(5) Shop assembly and tests.
(6) Preparation for shipment and storage.
(7) Inspection at the worksite for damage to and defects in all material and equipment.
(8) Storage at the worksite.
(9) Field painting.
(10) Installation and tests.

(11) Operation and maintenance after installation.

1.10.2 Reporting

The original and four copies of these records of inspection and tests, as well as the corrective action taken, must be furnished to the Government daily. Format of the report shall be as prescribed in Section 01 45 00.00 10 QUALITY CONTROL.

1.11 PREPARATION FOR SHIPMENT

Prior to shipment from the manufacturer's plant, prepare the gate for shipment as described herein. All large, bulky and/or heavy elements must be mounted on skids or pallets of ample size and strength to facilitate loading and unloading. Pack all small parts in sturdy wood or heavy corrugated paperboard boxes. Provide a packing list, indicating the contents of each such box and enclose in a moisture-proof envelope securely fastened to the outside of the box. The skid and/or pallet mounting and the boxing must be done in a manner which will prevent damage to the gate during loading, shipment, unloading, storage and any associated and/or subsequent handling. Provide Weatherproof covers during shipment to protect all items which the Contracting officer designates as requiring such protection. Any special slings, strong backs, skidding attachments or other devices used in loading the equipment at the manufacturers' and/or fabricators' plants must be furnished for unloading and handling at the destination and become the property of the Government.

1.12 PREPARATION FOR STORAGE

At the conclusion of all shop tests, the gate must be protectively processed for not less than 24-month storage either outdoors or indoors as the case may be, at the destination. Furnish for approval, a complete description of the processing method or methods intended to use, including complete instructions for maintaining the protection during the storage period. Surfaces of items or portions of items which are to be embedded in or rest on concrete, must be cleaned of all dirt, rust, and other foreign coatings, not including closely-adhering mill scale, and then coated with a rust preventative.

1.13 STORAGE

Upon delivery at the worksite, bulky parts of the gates, such as the frames, slides and wall thimbles, which have been coated with a complete paint system in the manufacturer's plant, may be stored outdoors provided these parts are stored on wood blocking not less than 8 inches above a base of washed gravel or crushed stone not less than 2 inches thick. All other parts of the gates such as the gate stem, fasteners, and actuators store in a weathertight building. A framework covered with a plastic film, or any other such expedient or makeshift arrangement, will not be acceptable. Inspect the storage site at least once per day. Submit a detailed description of the proposed storage facilities, and a plan for storage maintenance and inspection, before any storage actually begins.

1.14 SAFETY

The Contractor is responsible for selection of plant operating equipment to ensure safe installation of the equipment specified herein, at the
worksite, based upon the local working conditions, including site-specific restrictions for utilities, access or environmental conditions. Provide all equipment, labor and power, required for ventilation at the worksite in order to ensure a safe working environment in accordance with EM 385-1-1, Safety and Health Requirements Manual, as well as any local, State, or National codes which apply to the work or work environment. The Contractor must test the air quality for toxicity, flammable gas and percentage of oxygen content prior to entering, and continuously during any work in an enclosed area. Use an air quality monitor from a recognized manufacturer to test the air quality.

1.15 WARRANTY

The Contractor must furnish to the Government, under separate cover, the manufacturer's standard commercial warranty for each size sluice gate and gate actuator, but not less than a minimum of 1 year warranty must be provided.

1.16 MAINTENANCE

After completion of the installation, continue to maintain and protect the gate and keep it ready for operation at any time until acceptance thereof. Provide electrical power in accordance with applicable Sections in Division 26 - ELECTRICAL for all operation and testing of the gates until final acceptance by the Government.

PART 2 PRODUCTS

2.1 MATERIALS

All materials must be free from defects and imperfections, of recent manufacture and unused, and of the classifications and grades specified herein unless otherwise approved by the Contracting Officer. Material not specifically described, as far as practicable, conform to the latest specifications of the American Society for Testing and Materials. All materials, supplies and articles not manufactured by the Contractor must be the products of recognized reputable manufacturers. Submit samples of materials for approval when so directed. Equipment, materials and articles installed or used without such approval are at risk of subsequent rejection.

2.1.1 Iron Castings

Material for iron castings must meet the applicable requirements of either ASTM A48/A48M for Class Nos. 30A, 30B or 30C or ASTM A126 for Class B.

2.1.2 Structural Steel

Structural steel used for shop fabricated items such as the gate actuator pedestals must meet the applicable requirements of ASTM A36/A36M. The contractor may submit other gate material for approval.

2.1.3 Bronze

Bronze castings for such items as wedges, thrust nuts, lift nuts and couplings must meet the applicable requirements of ASTM B584 for Copper Alloy No. 865. Bronze extrusions for seat facings in the frame and slide must meet the applicable requirements of ASTM B21/B21M for Copper Alloy No. 464 or No. 482. Bronze for adjusting screws and lock nuts must meet the applicable requirements of ASTM B98/B98M for Copper Alloy No. 651 or No.
2.1.4 Stainless Steel

Stainless steel rods for stems must meet the applicable requirements of ASTM A276/A276M for Type 304 or 316. Stainless steel for fasteners must meet either the above-mentioned specification or the applicable requirements of ASTM F593 alloy group 1 Type 304. Stainless steel for slides and frames must meet the applicable requirements of ASTM A276/A276M for Type 304 or 316 or ASTM A240/A240M for Type 304L or 316L.

2.2 EQUIPMENT

The following equipment, together with all necessary accessories and appurtenances, must be installed. The following paragraphs may at times describe or refer to only one item, assembly, or arrangement, but these requirements apply to all such items, assemblies, or arrangements furnished under these specifications.

2.2.1 Gate

The [_____] gates for control structure [_____] must fit an opening [xx inches] wide X [xx inches] high, be designed for a maximum head of [xx feet] and an operating head of [x feet], and withstand an unseating head of [x feet]. Each gate must be cast-iron, fully bronze mounted, have side wedging devices for seating heads, and be the rising stem type. Each gate must be stainless steel, non self-contained, rising stem, standard bottom closure type. Cast-iron gates must meet the requirements of AWWA C560. Fabricated stainless steel gates must meet the requirements of AWWA C561.

<table>

<th>Type of Invert</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>in x in</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2.2.2 Frame

The frame must be the flat back type and of one piece, cast-iron construction. All contact surfaces of the frame must be machine-finished. The frame must have machined dovetail type grooves on its front face to accommodate the seat facings. The back face of the frame must be drilled and machined to bolt directly to the machined face of the thimble. Drill all bolt holes using templates to match the thimble. The frame must have integrally cast pads with machined surfaces and keyways to receive the side, wedging devices.

Construct the frame assembly of formed stainless steel plate with a minimum thickness of 1/4 inch. The frame must be of the flange back type design for mounting on a concrete wall with the use of embedded adhesive anchor bolts and grout pad. Size and spacing of anchor bolt holes must be suitable for the operating conditions of the gate. Anchor bolt hole spacing must not exceed [12 inches]. The frame must be of the [non self-contained] [self-contained] design. Design the frame sufficiently rigid to transfer hydrostatic loads to the gate anchorage. The frame must
positively retain the polymer guide/seal strip and the neoprene loading pad on studs welded to it. Use non-loosening fasteners on the gate guide assembly.

2.2.3 Guides and Seals

The guides must be of one-piece, cast-iron construction, conservatively designed to withstand the total thrust due to the water pressure and the wedging action. The guides must be machine-finished on all contact surfaces, and a groove shall be machined the full length of the guide to provide sufficient clearance between the slide tongue and the guide groove to permit free movement and ensure proper engagement of the wedging devices. The guides must have machined areas on their front faces for at least one-half the vertical gate opening and be sufficiently long to retain and support at least one-half of the slide when the gate is in the full-open position. Attach the guides to the frame with steel and bronze fasteners and dowel to prevent relative motion between the guides and frame. Provide integrally cast pads with machined surfaces for attachment of the wedging devices.

The length of the guide must retain at least 2/3 of the slide height in the full open position. The guides must be conservatively designed to withstand the total thrust due to the water pressure. The guide seals must be specially milled or molded ASTM D4020 to positively retain the slide, form a tight seal, and restrict leakage. Seals must prevent metal to metal contact between the frame and slide. Sealing must be accomplished by pinching action of the polymer guide seal. Provide gate with a self-adjusting seal system to restrict leakage in accordance with the requirements of this specification. The guide seal assembly must be field adjustable and replaceable. The UHMW sealing system must maintain efficient sealing in any gate position.

2.2.4 Slide

The slide must be either square or rectangular and of one-piece, cast-iron construction with integrally-cast vertical and horizontal ribs and a reinforced section around the perimeter to provide for the seat facings. The slide must have machined areas on its seating face to accommodate the seat facings. Provide a tongue on each side of the slide, which extends its full length and machined on all sides to provide sufficient clearance between the tongue and the guide groove to permit free movement. Integrally cast pads must be provided and machine-finished to receive the wedges. A stem nut pocket must be cast integrally on the vertical centerline and above the horizontal center and be shaped to receive the stem nut.

The slide must be either square or rectangular and formed of welded stainless steel plate with integrally formed reinforcements at the top and bottom with welded interior reinforcements. The slide must have at least one vertical reinforcement on or adjacent to the vertical center line. All edges and corners must be rounded and polished for smooth operation within the guide seal assembly. Incorporate measures for attaching the stem to the gate with a clevis-type connection welded to the slide.

2.2.5 Wedging Devices

The gate must be provided with sufficient side wedging devices to limit leakage to 0.1 gallon per minute per foot of perimeter at the specified maximum seating heads. The wedging devices must be of solid cast bronze,
machine-finished on all contact surfaces and keyed to the cast-iron pads to maintain adjustment. The wedging devices must be attached with either bronze or steel studs and bronze nuts, and the adjustable element be provided with a bronze adjusting screw with either a bronze lock nut or another approved locking device.

The gate must be provided with top wedging devices if recommended by the manufacturer to provide a practical degree of water-tightness. The wedging devices must be stainless steel castings and held onto the slide reinforcing member with two inline welded studs with backing plate. The wedging devices must be adjustable and provided with a positive means of locking. Wedging devices must be one piece and removable and replaceable without disassembly of other gate parts. Material for stainless steel castings must meet the requirements of ASTM A351/A351M-CF8M.

2.2.6 Seat Facings

Seat facings must be of extruded bronze. The facings must be of a special shape which, when impacted into place, will fill and be locked permanently into the dovetail-type grooves in the frame, and gate slide. Other methods of attachment will not be permitted. The width of the facing must be not less than 3/4-inch. After attachment, the facing shall be machined to a plane surface and to at least a 63 micro-inch finish. The seal shall be a specially molded shape designed to produce a wide sealing area on the machined stop bar bolted to the frame. The differential sealing pressure of the seal on the stop bar shall be capable of being varied by adjustment of the side wedging devices. When the gate slide is in the fully closed position and wedged into position against the frame, the maximum clearance between the seating faces must not exceed 0.004 inch.

2.2.7 Wall Thimble

The wall thimble must be of one-piece, square front flange with a square opening made of cast-iron construction ASTM A126 or approved equal. The wall thimble must be of the "F" Type design unless the gate manufacturer requires an "E" type design based on the unseating heads present. Provide the thimbles with an integrally cast ring or water stop. The front flange face must be machine finished to a plane surface and provided with tapped holes, using a template to match the drilling of the frame. The vertical centerline must be clearly shown by permanent marks at the top and bottom of the machined surface and the word "TOP" shall be permanently marked thereon. Provide the thimble with holes in the invert to permit satisfactory concrete placement. Provide a permanent gasket of uniform thickness between the front face of the thimble and the back face of the frame.

2.2.8 Stem, Couplings and Stem Guides

The stem must be of sufficient diameter to withstand, without buckling or permanent distortion, the stresses induced by closing the gate under locked torque conditions. Stem threads must be either machine-cut or cold rolled and of the double-lead ACME type. The stem and nut threads must have sufficient contact area so that the contact pressure will not exceed 5,000 psi when the maximum stem thrust is exerted. The stem thread surfaces in contact with the lift nut must have not rougher than a 63 micro-inch finish if machine cut and not rougher than a 32 micro-inch finish if roll-formed. The exterior corners of the threads, either during or after machining, must be given a slight radius of approximately 0.015-inch in order to prevent them from acting as cutting edges as the stem passes through the lift nut.
The stem must be of corrosion-resisting steel. Fit the stem with a tapped hole in the top end for handling. Make the tapped hole of sufficient diameter and depth for the insertion of an eyebolt of sufficient strength to pick up the entire stem from a horizontal position. Provide the stem at its lower end with a bronze thrust nut which will fit into the pocket provided on the gate slide and which will positively prevent rotation of the stem. Stem guides must be of cast-iron, bronze bushed and mounted on cast iron brackets. Stem guides are to be drilled and slotted so as to be adjustable in two directions and shall be spaced at close enough intervals to support the stem adequately with an L/R ratio of not more than 200. The bronze bushing must be machine-bored 1/16-inch to 1/8-inch larger than the stem diameter. The stem guide, including the bronze bushing, must be the two-piece collar type which can be installed and removed with the stem in place. Attach stem guides with corrosion resistant steel anchor bolts.

2.2.9 Top and Bottom Seal

The top seal must be made of UHMW polyethylene attached to the top horizontal frame member. Provide seals with elastomer loading pads or continuous compression cords in order to ensure contact between the UHMW polyethylene and gate. Corners or intersections of seals and loading pads or compression cords be interlocked and sealed for a leak-proof joint. The bottom seal must be made of resilient neoprene attached to the bottom horizontal frame member and form a tight seal.

2.2.10 Anchor Bolts

New anchor bolts must be installed for the stem guides and actuator pedestal and fabricated slide gate frame if required. The anchor bolts must be adhesive anchors with stainless steel threaded rods provided with bronze nuts. The quantity, size, spacing, minimum pullout strength and required effective embedment depth of the anchors must be determined and provided by the manufacturer.

2.2.11 Fasteners

All fasteners must be of either silicon bronze or stainless steel. The quantity and size of fasteners per recommended by the gate manufacturer. Thread standards must meet the requirements of ASME B1.1

2.2.12 Stem Cover

Provide a stem cover for each slide gate actuator. The stem cover must be of galvanized steel pipe of sufficient diameter and length to permit full travel of the stem without obstruction or binding. The top of the cover is to be closed with a galvanized steel pipe cap. The pipe cap must have a drilled and tapped hole fitted with an eyebolt of sufficient strength for lifting the assembly from a horizontal position. The stem cover must have a grease fitting, which can be used for lubricating the stem, installed above the threads used for mounting the cover to the actuator. The cover is to be threaded into the top of the actuator to prevent rainwater entry. Prior to assembly, threaded portions of the stem cover, cap, and eyebolt are to be coated with pipe compound. After installation of the cover, clean exposed threads and degrease, then apply a heavy coat of an approved zinc-rich protective coating.

**************************************************************************

NOTE: Designer select either section 2.3 MANUALLY

SECTION 35 20 16.54 Page 15
OPERATED GATE ACTUATOR or section 2.4 ELECTRIC MOTOR DRIVEN GATE ACTUATOR based on project requirements.

2.3 MANUALLY OPERATED GATE ACTUATOR

Open and close each slide gate by means of a manual crank-operated actuator having either a single or double gear reduction depending upon the load and mounted as shown on the drawings. The actuator must have cast bronze lift nuts threaded to match and engage with the stem threads. Provide the lift nuts with ball thrust or tapered roller bearings both above and below the flanges on the lift nut to accommodate the opening and closing thrusts. The actuator housing must be cast iron. Provide adjustable stop collars for installation on the stem just above the lift nut and accessibly below the hoist. All gearing must be steel and have accurately machine-cut teeth. Positive mechanical seals to retain lubricant and exclude dirt and moisture are to be provided on the lift nut and pinion shafts where they extend through the housing. Provide lubrication fittings for lubrication of all gears and bearings. A removable cast-iron crank with a rotating brass grip and a maximum radius of 380 mm 15 inches must be provided. Fit the actuator with a 2 inch square nut for operation with a portable electric drill. Design the actuator such that a maximum force of 178 N 40 pounds at a 380 mm 15 inch radius will unseat the slide from its wedging devices at maximum design head. After the slide is unseated from its wedges a maximum force of 111 N 25 pounds at a 380 mm 15 inch radius must operate the gate.

The actuator unit must include a cast-iron pedestal, drilled and machined to accommodate the gear and lift nut housing, arranged to be bolted to the operating platform, and designed to position the input shaft about 900 mm 36 inches above the platform. An arrow or arrows, with the word "OPEN" adjacent thereto, must be either permanently attached to or cast on the housing to indicate the direction of rotation to open the gate. Affix a brass instruction plate to the gate actuator stating manufacture, lubrication cycle and type of lubricant to be used.

2.4 ELECTRIC MOTOR DRIVEN GATE ACTUATOR

2.4.1 General

NOTE: Designer - The process for calculating gate actuation forces are described in AWWA C560 and AWWA C561 and Engineering Manual EM 1110-2-3105. EM 1110-2-3105 provides detailed sketches showing how these forces are applied.

Each slide gate must be opened and closed by means of an individual electric motor actuator unit driven by an electric motor and mounted on the operating platforms as shown on the contract drawings. The unit must consist of complete, compact, rugged assemblies specially designed and manufactured for the required service by a manufacturer regularly engaged for at least 5 years in the production of this type of device, and be delivered completely wired, assembled and ready for installation. All parts of the lift mechanism must be designed to move the gate slide at a rate of approximately 1 foot per minute under the specified operating head condition. The actuator must be designed in conformance with the latest edition of standard practices of AGMA 6010. Gate actuation forces must follow the requirements as shown in Appendix A of AWWA C560 and AWWA C561.
The gate actuator requirements must be computed using the following formula:

(a) \( Fu = 62.4 \times H \times A \times fu + (Wg + Ws) \)

(b) \( Fn = 62.4 \times H \times A \times fn + (Wg + Ws) \)

- \( Fu = \) Minimum required unseating stem force, pounds
- \( Fn = \) Minimum required stem force, pounds, after unseating
- \( H = \) Operating head of water at gate disk centerline, feet
- \( A = \) Area of gate opening, square feet
- \( fu = 0.6 \) unseating friction factor
- \( fn = 0.3 \) friction factor after unseating
- \( Wg = \) Weight of gate disk, pounds
- \( Ws = \) Weight of gate stem, pounds

2.4.2 Electric Gate Actuator Assembly

The electric motor for the gate actuator must have a continuous duty rating, be suitable for operation on a [240] [480] volt, 3 phase, 60 Hz circuit, have sufficient horsepower to operate the actuator unit through the full gate travel in both directions without exceeding the full load ampere rating, and conform to applicable requirements of NEMA MG 1. All bearings shall be the anti friction type.

Actuator limit switches, torque switches and unit wiring must be provided in accordance with applicable section of Division 26 - ELECTRICAL. All components including the motor, reversing contactors and overload relays, pushbuttons, indicating lights, control transformer, reductions gearing, stem lift nuts, bearings and limit switches, must be enclosed in NEMA Type 4 enclosures and mounted on a cast iron pedestal with flanged base plate, complete with stainless steel anchor bolts and silicon bronze or stainless steel nuts. Design the pedestals to position the handwheel approximately 3 feet above the operating room floor on the standard slide gate installation.

a. Reduction gearing must consist of generated helical gears of heat-treated steel. Worms are to be of hardened alloy steel with threads ground and polished. The worm gear must be in one piece of high strength cast bronze. Run all reduction gearing in lubricant. All gears, the stem lift nuts and other working components must be carried on heavy duty ball or tapered roller bearings adequate for all torque and thrust loads imposed by operation of the gate at the specified maximum heads. Provide suitable seals at all points as required to retain the lubricant. Design the motor actuator to permit manual operation of the unit in event of power failure or as necessary during servicing.

b. Provide a handwheel, and an arrow with the word "OPEN" cast on the rim of the wheel, indicating the direction of opening. Effort required to operate the actuator manually with the gate in motion must not exceed 40 pounds at the wheel rim, and 80 pounds at the wheel rim to unseat the gate. The motor actuator must include a built in clutch.
mechanism so that the handwheel will not rotate during motor operation nor shall the motor turn during manual operation. Locate a dial type indicator at the top of the motor actuator to show gate position during both hand and motor operation. The indicator must be graduated to show "FULL OPEN" when the bottom of the gate is at the fully open position. House the indicator in a watertight enclosure. Indicators which are of the 3-position type showing fully open, fully shut or in an intermediate position are not acceptable. The actuator must be able to watch the indicator from the same position one stands in to operate the controls.

c. The operating unit must include a built in, lost motion device which will permit the motor to attain full speed after which a hammer blow shall be imparted to the hoisting mechanism to initiate gate motion in either the opening or closing direction of travel. Supply bronze lift nuts, made in two pieces with accurately machined splines or keys and threads. The two piece nut consists of an outer member, having a flange or flanges on the exterior and splines on the interior, which mates with an inner member having splines on the exterior and threads on the interior. The outer member must be mounted in the unit housing. Secure the inner member shall to the outer member by either a threaded retainer ring or another suitable arrangement.

d. After the gate has been either completely closed or securely supported in the partially open position, this inner member must be capable of being easily removed by disassembling its retaining arrangement and turning the handwheel. Each stem nut must be adequately designed, factory tested and inspected with the stem with which it will operate. Run each nut by hand throughout the length of the stem with which it will operate. Suitable marks must be used to identify the matched sets once they have been established in the shop. The internal thread must have the lower or non working face relieved 1/64 inch to ensure that the threads will bottom out before wedging can occur. Drill the lift nut or otherwise provide with adequate oil recesses and passages to ensure passage of lubricant to all interior threaded surfaces of the nut. The internal arrangement of the motor actuator units must be such that all moving parts run in lubricant, with adequate fittings and seals provided to retain the lubricant. Use lubricant per recommendations by the gate actuator manufacturer.

2.4.3 Limit Switches

The closing and opening travel of each gate must be protected against overload by torque-responsive mechanical switches, one for each direction of travel. Provide geared limit switches for stopping the gate at both the fully closed and the normal fully open positions. The torque switches must be operative during the entire travel of the gate to protect the stem and gate against possible damage in the event an obstruction is met. The torque switches must function without auxiliary relays or other devices and be field-adjustable to ensure (1) stopping the lowering operation of the gate should the stem load for any reason become compressive to a degree greater than the normal seating requirements, and (2) stopping the raising operation should a 100 percent overload develop. Provide position limit switches that are adjustable and of the intermediate gear type, governed by rotation of the motor driving mechanism. Internal motor control wiring for 120 volt operation and motor power wiring for [240] [480] volt, 3 phase, 60 Hz operation must be provided complete to a suitable terminal block in the limit switch compartment, and clearly mark terminal blocks in a suitable manner to facilitate external control and power connections under another
section of these specifications. All internal wiring shall be not smaller than No. 12 stranded copper conductor with not less than 3/64-inch thick "NEOPRENE" or equal insulation and not less than a 1/64-inch thick "NEOPRENE" or equal jacket.

2.4.4 Gate Actuator Controls

2.4.4.1 Controls

Mount all controls on the side of limit switch compartment door with a hinged, padlockable, vandal resistant cover of at least 1/8 inch plate thickness and of NEMA Type 4 construction.

(a) Control Switch: One (1) selector switch with two positions, Open and Close.

(b) Selector Switch: One (1) heavy duty selector switch, five-position type with legend plate. The five positions shall be labeled as LOCAL-STOP-OFF-STOP-REMOTE.

(c) Pilot Lights: Two (2) solid-state indicator LEDs for long life and ease of replacement with legend plates. Green for fully opened and red for the fully closed position.

(d) Legend Plates: Made of corrosion-resistant metal with permanent marking made by machine engraving or machine stamping; hand engraving, such as would be done with an engraving pencil, is not acceptable. Plates shall be screwed or bolted in place.

2.4.4.2 Internal Control Features

In addition to the limit switches specified above, provide the following control features:

(a) A motor overload protective device in each phase.

(b) A terminal block with connectors for all external control signals. All leads from the actuator motor and limit switch assembly shall be routed to terminal connections in the controller for external connections to other station control devices.

(c) A reversing controller which is both mechanically and electrically interlocked and provided with the necessary direct operated auxiliary contacts for required interlocking and control.

PART 3   EXECUTION

3.1 PAINTING

Each cast-iron slide gate and actuator must be painted with a complete coating system in accordance with the manufacturer's standard practice, in which case it will be exempted entirely from the surface preparation and painting requirement specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, provided the coating system is approved by the Contracting Officer, is of acceptable color and is touched up as necessary prior to shipment. Requests for such exemption shall be accompanied by a description of the manufacturer's standard coating system, including the surface preparation, type of primer and finish coat or coats, dry film
3.2 LUBRICATION AND LUBRICANTS

Lubricate each actuator prior to any use or operation, either in the shop or in the field. Lubricate each bearing through its associated lubrication fitting, and pack the gears with lubricant at assembly. After shop testing, and prior to shipment, relubricate the bearings. Prior to testing in the shop, and to initial operation in the field, the gate seat facings and wedging devices must be cleaned of all foreign material and lubricated thoroughly with a light grease. Just prior to field assembly, lubricate the lift nut and stem threads. All lubricants must be as recommended by the gate and actuator manufacturer and be submitted by manufacturer's name and number as part of the shop drawings. Furnish an additional 20 pounds of each different actuator lubricant at no additional expense to the Government.

3.3 SHOP ASSEMBLY AND TESTS

After completion of initial machining, all gates must be completely assembled, in the vertical position, and the wedging devices adjusted to exclude a 0.004-inch thickness gage between the frame and slide seating surfaces. Perform any additional machining needed to achieve this condition, any discrepancies or deficiencies discovered as a result of this procedure must be corrected, and a retest conducted. Open and close the slide in the guides several times to ensure that it operates freely. Disassemble the gate to the extent necessary for shipment. The Contractor must notify the Contracting Officer sufficiently in advance (minimum 72 hours) so that a representative of the Contracting Officer may witness the assembly, testing and disassembly work, unless this requirement is waived in writing by the Contracting Officer. Any malfunctions or discrepancies disclosed as a result of these tests must be promptly remedied by the Contractor at no additional expense to the Government, and retests conducted.

3.4 FIELD INSTALLATION AND TESTS

3.4.1 Installation

Installation of the gates, actuators and appurtenances must be in accordance with the manufacturer's installation instructions and under the supervision and direction of the field service representative specified in paragraph "Erecting Engineer". Clean all elements of the gate of any protective coatings used thereon during shipment and storage, and remove all rust, dirt, grit and other foreign matter. The gate and actuator must then be "touch-up" painted. The actuator and each element of the gate must be carefully and accurately aligned so that after it is fastened in place there will be no binding or excessive pressure or wear in any moving part and no distortion of any member. Where the frame is attached to the structure by use of a wall thimble, apply mastic to the wall thimble contact surface per the manufacturers recommendation. Internally brace the wall thimble during concrete placement. Adjust each wedge assembly to ensure the specified minimum seal clearances without bending of wedge hooks or other damage to the wedges. Tighten fasteners uniformly and firmly, but take care to not overstress either the fastener or the member with which it is associated. Where specific torque values or ranges are cited in the installation instructions, an accurately calibrated torque-wrench, having the proper capacity range, is required. Stilson wrenches, cold chisels, or
other tools likely to cause injury to the surface of any part, are not permitted for use in the work of assembly or tightening. Install all fasteners with an anaerobic locking compound. Cleaning prior to application of the locking compound per the manufacturer's recommendations. All shims must be of either bronze or corrosion-resisting steel. Where grouting is required, either an epoxy grout or a ready-to-use, non-shrinking grouting material conforming to the applicable requirements of ASTM C1107/C1107M, requiring only mixing with water at the worksite, must be used, and use of any grouting as recommended by the manufacturer. All blocking and wedges used for support during initial grouting are to be removed prior to final grouting.

3.4.2 Field Tests

3.4.2.1 Quality Control Tests

The gates and actuators must be operated and tested by and at the expense of the Contractor and under the supervision and direction of the Erecting Engineer to determine if they have been properly manufactured, assembled, and installed and if they meet the requirements of the specifications. No Government representatives will be present during these tests. After all position and torque limit switches have been set, raise and lower the gate slide not less than three times using the electric motor operated gate actuator. The Contractor shall measure and record the operating current each time the gate is raised. Also raise and lower the gate slide approximately 6 inches using the manual handwheel. After completion of these tests the gates are to be fully closed and an inspection made of each of the seals to verify proper clearance between the seals at all points as specified or per the manufacturer's recommendation. Adjust gate wedges and seals as required to achieve necessary clearance for a proper seal. The Contractor must prepare a Quality Control Field Test Report indicating the test date, personnel present, number of times the gate was operated, operating current measured and written verification from the gate manufacturer's Erecting Engineer that all gates have been properly installed and adjusted and tested successfully.

3.4.2.2 Quality Assurance Tests

The gates and actuators must be operated and tested by and at the expense of the Contractor, under the supervision and direction of the Erecting Engineer and in the presence of representatives of the Contracting Officer to determine if they have been properly manufactured, assembled, and installed and if they meet the requirements of the specifications. These tests will be conducted a minimum of ten (10) days after receipt of the Quality Control Field Test Report. Raise and lower the gate a minimum of three times using the electric motor operated gate actuator. The Contractor must measure and record the operating current and motor amperage each time the gate is raised and lowered. Recorded operating current and motor amperage must be within manufacturer specified tolerance. The gate slide must also be raised and lowered approximately 6 inches using the manual handwheel. After the raising and lowering of the gates is completed the gates are to be fully closed and an inspection made of each of the seals to ensure that there is less than 0.004 inch clearance between the seals at all points or per recommended by the gate manufacturer if otherwise approved. If any gate indicates a seal clearance in excess, that gate will be adjusted as required the rechecked. Any malfunctions or discrepancies disclosed as a result of these tests must be promptly remedied by the Contractor at no additional expense to the Government, and retests conducted. [Contractor to develop a gate leakage test and submit for
3.5 MAINTENANCE

After completion of the installation, the Contractor must maintain and protect the gates and gate actuators and keep them ready for operation at any time until acceptance thereof.

NOTE: This guide specification covers the requirements for furnishing all plant, equipment, labor, and materials (except materials specified to be furnished by the government) for fabricating, assembling, delivering, and installing closure gates in accordance with these specifications and applicable drawings. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 UNIT PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.
1.1.1 Closure Gates

1.1.1.1 Payment

Payment will constitute full compensation for furnishing all plant, labor, materials and equipment and performing all operations necessary for the installing of closure gates as specified.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

The following special safety provisions are required for heating and placing zinc filler:

a. Workers shall wear protective clothing including hard hats with fine wire mesh screen, goggles, leather sleeves, chaps, apron, and leather gloves.

b. Workers shall wear air-line respirators certified by NIOSH or MSHA. In enclosed spaces, both local exhaust ventilation and air-line respirators are required. Local exhaust ventilation shall consist of movable hoods placed close to the work to remove fumes at the source.

c. Ladles, equipment, and material shall be pre-heated before being used so that they will be moisture-free.

d. Heating devices and ladles shall be placed on a level, firm foundation, and protected against traffic, accidental tipping, or similar hazard.

e. Hot zinc shall not be carried up or down ladders.

f. Buckets or vessels used for handling and transporting hot zinc shall be substantially constructed and shall not be filled higher than 100 mm 4 inches from the top.

1.5 QUALIFICATION OF WELDERS AND WELDING OPERATORS

Qualification of welders and welding operators shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.6 DELIVERY, STORAGE, AND HANDLING

Perform delivery, handling, and storage of materials and fabricated items conforming to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Unload materials and equipment delivered to the site by the Contracting Officer. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing.
within 24 hours after delivery.}

1.6.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

1.6.2 [Epoxy Filler]

Epoxy filler shall be delivered from the manufacturer just prior to use in the work to insure receipt of recently manufactured material and shall be stored under cover, out of direct sunlight, at a temperature between 20 to 30 degrees C 65 to 85 degrees F].

1.7 [SEQUENCING AND SCHEDULING]

**************************************************************************
NOTE: The name of the appropriate railroad company or roadway agency should be inserted as indicated.
**************************************************************************

Submit a sequencing and scheduling plan, approved before the work is commenced, which illustrates that work affecting [railroads] [roadways] has been coordinated with [______]. Include in the plan schedules, lists of labor or materials to be provided the affected [company] [agency], and any other aspects of the work that may impact on the operations of these entities as specified in Section SPECIAL CONDITIONS. The protection plan shall clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed. Refer to Section SPECIAL CONDITIONS for other requirements such as warning signs, flagmen, permits, and debris removal.]

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work before completion of the contract. Furnish materials orders, materials lists and materials shipping bills conforming with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, [aluminum alloy,] and other metal materials used for fabrication shall conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shapes shall conform to ASTM A36/A36M. Structural steel plates shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade [______]].
2.1.1.2 [Steel Pipe]

Steel pipe shall conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.1.1.3 [Self-Lubricating Bearings]

Self-lubricating bearings shall conform to ASTM B823, Type II. The bearings shall be impregnated with a turbine grade lubricant containing oxidation and rust inhibitors and a polar anti-wear additive.

2.1.1.4 [Bronze Castings]

Bronze castings shall conform to ASTM B22/B22M, Copper Alloy UNS No. C91300 [and ASTM B148].

2.1.1.5 Stainless Steel Bars and Shapes

Stainless steel bars and shapes shall conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.6 Stainless Steel Plate, Sheet, and Strip

Stainless steel plate, sheet, and strip shall conform to ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,] [S 41008]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.1.7 [High-Strength Steel Bar]

High-strength steel bar shall conform to ASTM A722/A722M, Type I or II, and all supplementary requirements.

2.1.2 Rubber Seals

2.1.2.1 General

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete paragraph FABRICATION OF SEALS.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only and shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa2500 psi (min.)</td>

</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs.)</td>
<td>80 percent of tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees C for 22 plus or minus 1/4 hours. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M1 (M1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree C and the duration of immersion shall be 166 hours.

2.1.2.2 [Fabrication of Seals]

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following minimum physical properties:

<table>
<thead>
<tr>
<th>Tensile strength</th>
<th>13.8 MPa2,000 psi</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elongation</td>
<td>250 percent</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.1.3 [Epoxy Filler]

Submit manufacturer's certificate for epoxy filler with the material delivered to the site. Epoxy filler shall be an approved epoxy resin formulation equal to "Nordback Backing For Locks and Dams," a product of Fel-Pro Chemical Products LP, 6120 East 58th Ave., Commerce City, CO 80022, Phone 1-800-992-9799, or an approved equal, with a specific gravity of 1.70 to 1.75, minimum compressive strength after 72 hours at 20 degrees C 70 degrees F of 114 MPa, 16,500 psi, and maximum shrinkage of 0.15 percent. The manufacturer must certify that the material meets or exceeds the specified physical properties.
2.1.4  [Zinc Filler]

Zinc filler shall conform to ASTM B6.

2.2  MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1  Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490M ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [____]] [Austenitic Steel, Grade [____]], Class [____].] Bolts 13 mm 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2  Screws

Screws shall be of the type indicated.

2.2.3  Shackles and Turnbuckles

Shackles and turnbuckles shall be of forged steel conforming to ASTM A668/A668M, zinc coated. Turnbuckles shall be end-threaded right and left hand and shall be of the size shown.

2.2.4  Screw Jacks

Screw jacks shall have a [____] ton (metric) (2000 lb) rated capacity and shall conform to the details shown.

2.2.5  [Hoists]

Hoists shall be of [____] ton (metric) (2000 lb) capacity, with [____] m foot lift, link type chain and safety latch hook. Hoists shall be of light weight design, weighing not over [____] kg lb and requiring not more than [____] kg lb lever pull to lift the full-rated load.

2.2.6  Winches

Winches shall be [____] ton (metric) (2000 lb) marine winches with [____] mminch drum and adjustable handle. Each winch shall be equipped with [____] mm foot of [____] mm inch diameter wire cable suitable for exterior exposure.

2.2.7  Sheaves

Sheaves shall be of cast steel conforming to ASTM A27/A27M, sized for the wire rope used.

2.2.8  [Rails]

Rails shall conform to ASTM A1, [No. 1] [No. 2], weighing [____] kg/m.
lb/yd. Rail stops shall be as recommended by rail manufacturer for [_____] kg/m lb/yd rails and for the wheel diameters indicated.]

2.2.9 Wire Rope

Wire rope shall conform to FS RR-W-410, Type [____], Class [____], Construction [____], [wire size,] [strand seizing] as shown.

2.2.10 [Wheels

Wheels shall be short hub or long hub, rigid type, heavy duty steel casters fabricated from steel castings conforming to ASTM A148/A148M. Wheel shall be of the size and load capacity shown and shall be provided with lubrication fittings, roller bearings and removable axle. Wheel treads shall be machined-finished to conform with the indicated rail. Unless otherwise specified or shown, axles for wheels shall be of stainless steel bars conforming to ASTM A276/A276M, UNS S30400.]

2.2.11 [Bridge Planks

Bridge planks shall be of steel conforming to ASTM A1011/A1011M, Grade 33. Bridge planks shall have a minimum thickness and minimum section modulus as shown.]

2.2.12 Chains and Attachments

Chains and attachments shall conform to FS RR-C-271, Type [____], Grade [____], Class [____], Style [____], Size [____], Finish [____].

2.2.13 Padlocks and Hasps

Padlocks shall conform to CID A-A-1928, Type [I][II]. Padlocks shall be keyed alike and provided with two keys. Hasps shall be of wrought steel and sized to accommodate padlocks.

2.2.14 [Elastomeric Bearing Pads

Elastomeric bearing pads shall conform to the requirements of AASHTO HB-17, Chapter 25, and shall be reinforced with steel plates.]

2.3 FABRICATION

2.3.1 Detail Drawings

Submit detail drawings as specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS, of closure gates and appurtenant items, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings.

2.3.1.1 Fabrication Drawings

Fabrication drawings shall show complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.3.1.2 Shop Assembly Drawings

Shop assembly drawings shall provide details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.
2.3.1.3 Delivery Drawings

Delivery drawings shall provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.3.1.4 Field Installation Drawings

Field installation drawings shall provide a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; [plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment;] [methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler;] [procedures and equipment used for heating and placing of the zinc filler;] [method for installing hinge anchor plates, including checking and maintaining alignments of the plates during concreting and placement of epoxy filler;] and methods for installing other appurtenant items.

2.3.2 Structural Fabrication

Structural fabrication shall conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown. Splices shall occur only where shown. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation.

2.3.3 Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination.
**************************************************************************

Submit schedules of welding procedures for structural steel conforming with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be [in accordance with AWS D1.1/D1.1M[,] and] AWS D1.2/D1.2M[, and] of the type shown and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated and as follows: [_____.] Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests.[Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]
2.3.4 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.7 Fabrications

Submit samples approved prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded. Fabrications shall conform to the following requirements.

2.3.7.1 Gate Leaf

Gate leaf shall be of welded structural steel fabrication. Gate leaf shall be provided complete with [quoin and miter contact [blocks] [posts],] [miter guide assembly] [elastomeric bearing pads,] [hinge assemblies,] [pintle assembly,] [wheel assemblies,] [trolley assembly,] [tie-down assembly,] [gate hooks,] seal assemblies, and other appurtenant components as specified and shown. [Proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded.] The overall height of gate leaf shall not vary from the nominal dimension [or differ from mating gate leaf] by more than 6 mm. 1/4 inch. The surfaces of framing elements to which [skin plates] [bridge planks] are to be welded shall not vary from a true plane by more than 6 mm.1/4 inch. [Splices in [skin plates] [bridge planks] shall be located only where shown.] [In addition to welds specifically indicated for nondestructive testing, [_____] percent of the welds in the girders, verticals and [skin plate] [bridge planks] of the gate leaf shall receive nondestructive testing. The location of these additional welds for testing shall be as directed.]

2.3.7.2 [Wall Quoin

Wall quoin shall consist of a welded structural steel frame with adjustable base anchors and adjustable quoin contact [block] [post].]

2.3.7.3 [Quoin and Miter Contact [Blocks] [Posts]

Quoin and miter contact [blocks] [posts] shall be of stainless steel bars conforming to ASTM A276/A276M or ASTM A564/A564M. Splices in the contact [block] [post] shall be made by an offset method so that there will not be a continuous joint across the [block] [post]. Contact faces of the contact [block] [post] shall be milled at splices to assure watertight joints.
[Splices in the gate leaf contact [block] [post] shall occur only at the centerlines of horizontal girders.] Contact [blocks] [posts] shall be provided with adjusting bolts as shown.

2.3.7.4 [Hinge Assembly]

Outer cylinder of the hinge assembly shall be of steel pipe conforming to ASTM A53/A53M, Type S, Grade B. Cylinder bushing and thrust washer shall be of bronze casting conforming to ASTM B22/B22M, Copper Alloy UNS No. C91300. Hinge pin [and bearing pedestal for the lower hinge assembly] shall be of stainless steel conforming to ASTM A276/A276M, UNS S 21800. The pedestal base plate for the lower hinge assembly shall be of stainless steel conforming to ASTM A240/A240M, UNS S 30400. Hinge assembly gusset, stiffener, and anchor plates shall be of structural steel conforming to ASTM A36/A36M. [In addition to welds specifically indicated for nondestructive testing, [_____] percent of the welds in the hinge assembly and the welds connecting the hinge assembly to the gate framing shall receive nondestructive testing. The location of these additional welds for testing shall be as directed.] After all welding is completed, the hinge assembly shall be stress-relieved by heat-treating. Stress-relieving shall be performed prior to machining.

2.3.7.5 [Pintle Assembly]

Pintle assembly for miter gates shall consist of pintle socket, pintle, and pintle base as shown. Pintle socket shall be of cast nickel-alloy steel and shall be press-fitted with an aluminum bronze bushing with bearing surfaces finished truly hemispherical. Pintle shall be of [cast alloy steel] [forged alloy steel] with bearing surfaces of corrosion-resisting steel. The pintle ball shall receive a 0.4 micrometer 16 microinch finish and shall be fitted into the bushing by scraping until uniform contact is attained over the entire bearing surface as determined by testing with carbon paper or other approved coloring. The pintle ball shall be match-marked with the bushing when fitted and so erected in the field. Pintle base shall be of cast steel. Bolt holes for attaching pintle socket to gate leaf shall be drilled and reamed after the pintle socket is assembled with gate leaf.

2.3.7.6 [Trolley Gate Trolley Assembly]

Trolley gate trolley assembly shall consist of trolley beam, two (2) four-wheeled, push type trolleys, and trolley hangers. Trolleys shall be of steel fabrication, a manufacturer's standard product, rated for a minimum load of [_____] tons (metric) (2000 lb) and suitable for operation on the trolley beam of the type and size shown. Trolley wheels shall be single-flanged with a diameter of [_____] mm inches and the wheel treads shall be machined-finished to conform with the trolley beam. Trolley wheels shall be mounted on weather-protected roller bearings and a removable axle and shall be provided with accessible lubrication fittings. Trolley hangers shall be supported by the wheel axle and shall be provided with a cross pin with machined grooves and retaining rings spaced at intervals of [_____] mm inches to accommodate a [_____] mm inch thick suspension lug. The centerline of the cross pin shall be located [_____] mm inches below the bottom of the trolley beam. For proper clearance, the maximum horizontal dimension from the centerline of the trolley beam to the end of the cross pin shall not exceed [_____] m. [_____] ft [_____] in. Trolleys shall be designed for continuous outdoor service and shall be painted with the manufacturers standard paint system for outdoor operation.]
2.3.7.7  **Trolley Gate Overhead Support Beam**

Trolley gate overhead support beam shall conform to the details shown. Post-tensioned anchorage for support beam shall consist of ASTM A722/A722M, Type [_____] [_____] high-strength steel bars and prestressing system as specified in Section 03 23 00 STRESSED TENDON REINFORCING.]

2.3.7.8  **Rolling Gate Wheel Assembly**

Rolling gate wheel assembly shall be provided complete with cast steel wheels as specified herein and fittings, couplings and hoses for lubrication of wheels. Fittings shall be 6 mm 1/4 inch threaded-pipe fitting. Couplings shall be 6 mm 1/4 inch stainless steel half coupling. Hoses shall be 6 mm 1/4 inch inside diameter, double-braided stainless steel flexible hoses. Couplings and hoses shall have a pressure rating of 21 MPa. 3,000 psi.]

2.3.7.9  **Rolling Gate Stabilizing Trolley Assembly**

Stabilizing support for trolley wheels shall be of structural steel conforming to ASTM A36/A36M. Trolley wheels shall be of steel fabrication and rated for the minimum load shown. Trolley wheels shall be single-flanged and the wheel treads shall be machined-finished to conform with the guiding gate girder. Trolley wheels shall be mounted on weather-protected roller bearings and a removable axle and shall be provided with lubrication fittings.]

2.3.7.10  **Seal Assembly**

Seal assembly shall consist of rubber seals, steel retainer and spacer bars, [retractable support,] and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Steel retainer bars shall be field-spliced only where shown and machine-finished after splicing. [The retractable support shall be provided complete with hinge and operating winch.]

2.3.7.11  **Miscellaneous Embedded Metals**

Wall armor, shear anchors, protection and seal plates and shapes, and other miscellaneous embedded metals shall be of structural steel or corrosion-resisting steel conforming with the details specified herein and shown.

2.3.8  **Shop Assembly**

Shop assembly requirements for gates and appurtenant items shall be as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to
facilitate field connections. The matchmarking of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. [The trolley gate shall be suspended in the shop to verify its center of gravity location. If the trolley gate is more than 3 mm 1/8 inch out-of-plumb in the suspended position, it shall be balanced by means as directed.] Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless waived in writing. The presence of the Contracting Officer will not relieve the Contractor of any responsibility under this contract.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.4.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

[2.4.2 Testing of Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete this paragraph.
**************************************************************************

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>Thickness of Fluorocarbon Film</th>

</tbody>
</table>

]PART 3 EXECUTION

3.1 INSTALLATION

Installation shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Before assembly and installation, all bearing surfaces
requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant. All components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Corner protection angles, sill angles, seal plates, frames, pedestals, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 [Lower Hinge Assembly]

Base anchors for the lower hinge assembly shall be embedded in the first pour concrete. Base plate shall be attached to base anchors, set to the final position, and epoxy fill shall be placed in the void behind the base plates and allowed to reach the strength as shown and the approved field installation drawings. After the gate leaf is set in place, the hinge assembly shall be adjusted to provide for continuous contact between the sealing surfaces over the full height and length of the gate leaf. Allowances shall be made for the seals which shall not be attached until painting operations are completed. Second pour concrete shall be placed after final adjustments are completed.

3.1.3 [Pintle Assembly]

Base anchors for the pintle assembly shall be embedded in first pour concrete. The pintle assembly base plate shall be attached to base anchors, adjusted to the exact elevation and center-to-center distance as shown, leveled, blocked rigidly to prevent displacement, and embedded in second pour concrete. The concrete shall be allowed to set 72 hours and must reach a minimum compressive strength of [_____] MPa psi before loading is applied.

3.1.4 [Wall Quoin]

Base anchors for the wall quoin shall be embedded in first pour concrete. The wall quoin shall be attached to base anchors prior to setting the gate leaf in place. After the gate leaf is set in place, the wall quoin shall be plumbed and adjusted in relation to the gate leaf quoin so as to provide for continuous contact between the sealing surfaces of the wall and gate leaf quoin contact [blocks] [posts] over the full height of the gate leaf. This adjustment shall be made almost entirely by moving the wall quoin so that the gap for the [epoxy] [zinc] filler behind the gate leaf quoin contact [block] [post] remains near the nominal dimension. After final adjustments have been made, the wall quoin shall be anchored firmly and the second pour concrete shall be placed in the blockout.

3.1.5 Gate Leaf

Gate leaf components not assembled in the shop shall be assembled in the field as required for installation. [[Lower hinge assembly bearings]
[Pintle ball] shall be coated with grease prior to setting the gate leaf in place. [Grease pipes shall be flushed prior to connecting to bearing.] All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the ends of the gate leaf due to compression of blocking or other causes. After the gate leaf has been set in place and the top hinge assembly installed, the gate leaf shall be plumbed and brought into correct position.

3.1.6 Diagonals

Gate leaf diagonals shall be attached to the gate leaf after the leaf is set in place. Submit diagonal prestressing records immediately after completion of the prestressing operations. Diagonals shall be prestressed before the final adjustment of the [quoin and miter contact [blocks] [post]] [hinge assemblies] are made. Diagonal prestressing shall be as specified herein and as shown and the prestressing plan developed by the Contractor. The plan for prestressing the diagonals shall describe the method of prestressing including the materials, connections, rigging, anchorages, and stress measuring equipment. Compile a record of the prestressing operations consisting of the information indicated in the following table:

<table>
<thead>
<tr>
<th>STRESS DATA TABLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gate Leaf Location:</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Diagonal Strain Gage</td>
</tr>
</tbody>
</table>

1. Initial strain gage readings shall be made after slack is removed.
2. Final strain gage readings shall be made after prestressing is complete.
3. E is the total elongation over the full length of the diagonal, computed from the strain gage readings.
4. D is the prestress deflection of the leaf as shown.
5. d is the field deflection of the leaf measured after completion of the prestress operation; it is the deflection when final strain gage readings are taken.

3.1.7 [Top Hinge Assembly]

After the gate leaf has been set in place, the top hinge assembly shall be installed and adjusted so that the center of the hinge pin is in vertical alignment with the center of the [pintle] [bottom hinge assembly pin]. When the top hinge pin is inserted, the gate leaf shall swing horizontally throughout its range of movement. [Any required final adjustments to the top hinge assembly shall be made after the gate leaf diagonals have been prestressed.] The second pour concrete shall be made after final adjustments are completed.]
3.1.8 [Gate Leaf Quoin and Miter Contact [Blocks] [Posts]

After the wall quoin has been adjusted and concreted in place and final adjustments made to the top hinge assembly, gate leaf quoin and miter contact [blocks] [posts] shall be adjusted to provide continuous contact over the full height of the gate leaf in the mitered position. After the gate leaf diagonals are prestressed and final adjustments of gate leaf quoin and miter contact [blocks] [posts] have been made with the gate leaf in the mitered position, the gate leaf shall be swung out of miter and [epoxy] [zinc] filler poured behind the quoin and miter contact [blocks] [posts]. Prior to pouring of the filler, the surfaces to receive the filler shall be cleaned free of dirt, rust, and other foreign materials. The adjusting and holding bolts shall be coated with grease or other bond breaker to prevent adherence of the filler.

3.1.8.1 Placing [Epoxy] [Zinc] Filler

[ Epoxy Filler: The manufacturer's instructions for placing the epoxy filler shall be followed explicitly. Special precautions must be taken to prevent leakage of the filler during placement. The complete masses of the metals whose surface areas are to receive the epoxy filler should have a temperature of 15 to 30 degrees C. 60 to 90 degrees F. The epoxy filler shall be kept free from moisture or other foreign materials during mixing and placement and for at least 48 hours after placement. A field test to determine the indentation hardness of the epoxy filler compound shall be conducted prior to placement. The field test procedures are as follows:

a. Cast a 50 mm 2 inch cube sample of mixed epoxy filler compound in a mold and cure at room temperature 20 to 25 degrees C 70 to 80 degrees F for 24 plus or minus 8 hours.

b. Remove from mold and cut sample to expose interior surface.

c. Sand exposed interior surfaces to remove saw marks and provide a smooth surface.

d. Using a Type D Durometer conforming to ASTM D2240, measure the hardness across the exposed interior surface, taking a minimum of three readings on each half of the sample. Care must be taken during the durometer reading to insure the spring loaded pin used to penetrate the surface is not in a depressed surface caused by either residual saw marks or an exposed air bubble. The average reading should be at least 85, with no individual reading below 82. If the durometer readings fall below the required minimum values, the material will be rejected.

[ Zinc Filler: Immediately preceding the pouring of the zinc filler, the adjacent metal components shall be pre-heated to a temperature of 100 to 150 degrees C 212 to 300 degrees F by an approved method which does not buckle the metal components. The zinc filler shall then be poured at a temperature which will insure that it will completely fill all interstices. Pouring temperature of zinc filler shall be maintained between 430 and 480 degrees C 810 and 900 degrees F to minimize volatilization and oxidation of the zinc.]

3.1.8.2 [Adjusting Contact [Blocks] [Posts]

After the [epoxy has set] [zinc has cooled], quoin and miter contact [blocks] [posts] shall be drawn up against the filler by tightening of the adjusting bolts. After the contact [blocks] [posts] are adjusted, the gate
leaves shall swing into the mitered position without interference of the quoin contact [blocks] [posts] and the gate leaf quoin contact [block] [post] shall make tight contact with the wall quoin contact [block] [post].]

3.1.9  [Anchorage of Overhead Support Beam]

Submit record of the post-tensioning operation for the trolley gate overhead beam anchors, immediately after the anchorage is completed, set in place and post-tensioned anchored as shown and as specified in Section 03 23 00 STRESSED TENDON REINFORCING.]

3.1.10  [Rolling Gate Stabilizing Trolley Assemblies]

Rolling gate stabilizing trolley assemblies shall be installed after the gate is set in place and properly adjusted. Assemblies shall be placed on the top girder of the gate leaf, attached to anchors embedded in the top of the supporting concrete wall, shimmed as required, and secured in place.]

3.1.11  Painting

Exposed parts of gates and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.12  Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gate[s], a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2  PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.3  ACCEPTANCE TRIAL OPERATION

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, shall be made at no additional cost to the Government. Repeat the trial operation after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

NOTE: This guide specification covers the technical requirements for hoist applications using a squirrel-type induction motor commonly used for control gates for outlet works; penstock gates, crest gates, spillway tainter gates, and other similar applications. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This specification is to be used as a section of a supply specification for the procurement of hoisting equipment, or, with only minor modification, it may be used as a section in a general contract specification.

The specification is general and covers all types and ratings of hoist applications used by the Corps of Engineers on Civil Works structures where a
squirrel cage induction-type hoist motor is used. The specification must be accompanied by a drawing or drawings showing the schematic wiring diagram of the control system for the particular application, along with a description of the scheme of operation and illustrations showing the several items of electrical equipment.

In adapting this specification to any project, the form and phraseology will be changed as necessary to properly specify the work contemplated. When technical deviations from this specification are considered necessary and the specification is not submitted to Headquarters, US Army Corps of Engineers (HQUSACE), for review, prior approval of (HQUSACE) will be obtained. Instructions for the preparation and submission of specifications for approval are included in ER 1110-2-1200.

The electrical equipment requirements contained herein are based upon experience and information gained from similar equipment now in service and are considered the most suitable for use on hydraulic structures.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B1.1 (2003; R 2018) Unified Inch Screw Threads (UN and UNR Thread Form)
1.2 SYSTEM DESCRIPTION

All equipment furnished under these specifications will be subjected to [severe moisture] [moderately moist] conditions, [shall operate over a temperature range of [_____] to [_____] degrees C F], and shall be designed to render it resistant to corrosion. The general requirements to be followed are specified below; any additional special treatment or requirement considered necessary for any individual item is specified under
1.2.1 Fastenings and Fittings

Where practicable, all screws, bolts, nuts, pins, studs, springs, washers, and such other miscellaneous fastenings and fittings shall be of an approved corrosion-resisting material or shall be treated in an approved manner to render them resistant to corrosion.

1.2.2 Corrosion-Resisting Materials

Corrosion-resisting steel, copper, brass, bronze, copper-nickel, and nickel-copper alloys are acceptable corrosion-resisting materials. However, contact between dissimilar metals should be avoided as much as practicable, except where one of the dissimilar metals is steel or in the case of wiring and connections.

1.2.3 Corrosion-Resisting Treatments

Hot-dip galvanizing shall be in accordance with ASTM A123/A123M or ASTM A153/A153M as applicable. Other corrosion-resisting treatments may be used if approved by the Contracting Officer.

1.2.4 Frames, Enclosing Cases, and Housings

All surfaces of the enclosing cases or housings of controllers, brakes, limit switches, control stations, and other similar equipment, if other than plastic or stainless steel construction, shall be cleaned of rust, grease, mill scale, and dirt and then treated with an approved iron and zinc phosphate solution followed by rinsing with a chromic acid solution, bonderizing, or equivalent process. Immediately after rinsing and drying, the inside and outside surfaces shall be given one coat of a zinc molybdate primer and cured as required. For items of cast construction, the iron and zinc phosphate treatment may be omitted.

1.2.5 Finish Painting

**************************************************************************
NOTE: If severely moist conditions exist, a separate paint system should be specified using Civil Works Guide Specification UFGS Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, system 21, epoxy finish or equivalent. When such painting is specified, care must be taken to specify a paint that will adhere to and not be injurious to the protective painting provided under these specifications.
**************************************************************************

A minimum of two coats of paint shall be applied to all equipment in accordance with the manufacturer's standard process for the conditions specified.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal
**************************************************************************
items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

PART 2 PRODUCTS

2.1 HOIST MOTOR

Submit [6] [_____] copies of motor characteristics, curves or tabulated data (tested or calculated), indicating the speed, power factor, efficiency, current and kilowatt input, all plotted or tabulated against torque or percent of rated motor load.

a. Submit [6] [_____] copies of calculations to determine the required horsepower rating of each motor.

2.1.1 Motor Type

**************************************************************************
NOTE: When a single-speed motor or two single-speed motors in lieu of a two-speed motor is acceptable for the application, the designer will specify NEMA MG 1 standard design letter. The torque requirements listed in paragraph MOTOR LIMITS must be met, and the designer will verify that the design specified is sufficient. Design "C" and "B" have a 5 percent or less slip limit and are used where load inertia is lower. Design "D" has a 5 percent or greater slip and must be used where inertia is high. Designs "B," "C," and "D" provide progressively higher torques and get progressively more expensive. Design "B" will generally apply to motors from 745 to 2240 W 1 to 3 hp, design "C" to motors between 2.24 to 11 kW 3 and 15 hp, and design
"D" for motors larger than 11 kW 15 hp. This a general guide according to NEMA minimum standards and may vary with manufacturer's specific equipment.

At reduced cost, dripproof encapsulated construction may be used in protected locations. Consult manufacturer's data for information on application of this type motor to specific environmental conditions.

Provide a motor of the horizontal-shaft, squirrel-cage induction type [two-speed, two-winding, constant [torque] [horsepower]] [NEMA design [B] [C] [D]], designed for full-voltage starting, [of water-proof, totally enclosed, fan-cooled or nonventilated frame construction],[dripproof, encapsulated frame construction] and shall conform to the applicable requirements of NEMA MG 1.

2.1.2 Motor Rating

NOTE: For a two-speed motor, use single-voltage rating. Specify load conditions when Contractor designed. (Second Option) This specification covers three-phase motors which are suitable for most applications and shall be used whenever possible. When utility three-phase power is unavailable and forces use of single-phase motors, this specification may be modified accordingly. Generally, single-phase motors used for this application should be below19 kW 25 horsepower. The torque limits should be carefully evaluated, and the testing requirements should be changed. Please consult Engineering Manual (EM) 1110-2-2703 for further guidance.

The motor shall be rated [_____] horsepower, [_____] rpm synchronous speed for the machinery design shown on the drawings or, if the design is changed as permitted by [____], shall have a horsepower rating as required by performance requirements specified to [____]. [The motor shall have a horsepower rating as required by the load conditions specified in [____].] The motor shall be rated for continuous full-load operation without exceeding the standard temperature rise for the class of insulation and frame construction used, and it shall be wound for [_____] [230/460] [460] volts, three-phase, 60-Hz.

2.1.3 Motor Torque

NOTE: The torque values are those required by design guidance given in EM-1110-2-2702 and EM-1110-2-2703. The gate design must be coordinated with the requirements of these documents to ensure that torque limits are met. Reducing the upper limit or raising the lower limit will result in significant cost increase and should be avoided where ever possible.
2.1.3.1 Motor Limits

The torque limits for each individual winding shall be as follows:

a. Upper Limit: The upper limit of the torque between locked-rotor and breakdown shall be not more than 280 percent of the rated full-load torque of the motor.

b. Lower Limit: The lower limit of the torque between locked-rotor and breakdown shall be as high as possible consistent with good design but not less than 150 percent of the rated full-load torque of the motor.

c. When the characteristics of a motor or the winding of a motor results in a speed torque curve without a definite value of breakdown torque, the limitations on the minimum value of torque shall apply between locked-rotor and 75 percent of synchronous speed.

2.1.3.2 [Single-Speed Motor Limits]

*************************************************************************
NOTE: Permit the use of two single-speed motors in lieu of a single two-speed motor where space is not a concern, and a two-speed motor cannot meet the specifications requirements.
*************************************************************************

Two single-speed motors may be used in lieu of a two-speed motor, providing the synchronous speed of the high-speed motor is not more than 1,800 rpm's and the low-speed motor will conform to the 50 percent over-speed requirements of the high-speed motor.

2.1.4 Frames and Shafts

*************************************************************************
NOTE: Shafts of stainless steel may be specified in lieu of manufacturer's standard treatment where extremely corrosive atmospheres exist. The use of stainless steel will change the motor design and increase the shaft diameter at a significant cost. Manufacturer's should be consulted before specifying stainless steel in a given application.
*************************************************************************

Size and dimensions of frames shall conform to NEMA MG 1 and shaft extension shall be as required. Eye bolts shall be provided on all motors. Each motor shall be provided with a drain-breather which shall be so located to prevent accumulation of water inside the motor. Frames shall have corrosion prevention in accordance with the requirements of paragraph CORROSION PREVENTION AND FINISH PAINTING. Exposed portions of shafts shall be treated with manufacturer's standard primer and two coats of moisture proof varnish in accordance with the manufacturer's recommendation.

2.1.5 Windings and Insulation

*************************************************************************
NOTE: Select insulation class based on NEMA temperature requirements as follows:
*************************************************************************
<table>
<thead>
<tr>
<th>CLASS</th>
<th>LIMITING TEMPERATURE</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>130</td>
</tr>
<tr>
<td>F</td>
<td>155</td>
</tr>
<tr>
<td>H</td>
<td>180</td>
</tr>
</tbody>
</table>

Selection of insulation class should be left to the Contractor when he is also responsible for motor design, but in no case should it be less than Class B. Class F is typical.

Designer will provide ambient temperature values where possible.

Insulation shall be Class [B] [F] [H] [B or better as required for design conditions] with special moisture, [fungus], and oil proof treatment. Motors shall be designed and constructed to withstand the environmental conditions specified. The following specifications describe the minimum requirements for acceptable insulation and are not intended to restrict or prohibit the use of materials or methods which will give equal or better performance.

2.1.5.1 Insulated Windings

Insulated windings, unless otherwise approved, shall be completely assembled in the motor core before impregnating with the insulating compound. Insulating compound shall be 100 percent solid. Impregnation of the windings with the insulating compound shall be by vacuum impregnation method followed by baking. The procedure shall be repeated as often as necessary to fill in and seal over the interstices of the winding, but in no case shall the number of dips and bakes be less than two dips and bakes when the vacuum method of impregnation is used.

2.1.5.2 Magnet Wire

The magnet wire shall have an insulation or combination of insulations with an insulation thickness not less than that required for the environment specified and the temperature rating as required by the hot-spot temperature of the motor.

2.1.6 Winding Heaters

NOTE: Delete this paragraph and the requirement for "Winding Heaters," if dripproof encapsulated motor is used. Additionally, the designer should consider elimination of winding heaters if possible in other situations, i.e. where the probability of condensation is low. In the past, heaters have been a maintenance problem and have been disconnected by project personnel.

A heater or heaters shall be installed in the motor frame or end bells or
wrapped around the winding end turns. Heaters shall meet the requirements of paragraph HEATERS-GENERAL. Heaters installed around the winding end turns shall consist of the required turns of heating cable wrapped around the end turns and secured in place before the motor windings are impregnated.

2.1.7 Bearings and Lubrication

**************************************************************************
NOTE: The use of sealed bearings should be limited to special applications. Sealed bearings do not require as much maintenance but reduce the overall life of the motor.
**************************************************************************

The motors shall be provided with antifriction bearings, and the design of the housing and method of assembly shall permit ready removal of the end brackets and prevent escape of lubricant and entrance of foreign materials. Bearings shall be fitted with bronze or other approved bushings to prevent any binding of moving parts. Approved antifriction bearings of corrosion resisting construction may be used. Bearings [shall be of an approved prelubricated type requiring no addition or change of lubrication for a period of at least 5 years] [shall have fitted openings located on the top and bottom of the bearing housing. The openings shall be readily accessible for applying and draining the lubricant]. Pressure lubrication fittings may be used provided the housings are properly vented to prevent damage to the seals. When the brake housing or other equipment is to be assembled adjacent to or bolted to the motor end bell, suitable filler and drain pipe extensions, with the ends properly fitted and easily accessible, shall be provided. For those applications where the brake wheel is mounted on a shaft extension on the front end of the motor, the bearing housing, or a suitable flange, shall be furnished to provide a suitable surface and connecting means to allow the fastening of the brake enclosure to the bearing housing (see paragraph BRAKE ENCLOSING CASE).

2.1.8 Terminal Leads

Terminals leads shall extend outside the frame; shall have insulation equivalent to that of the motor winding; shall be terminated in a two-piece, watertight terminal box secured rigidly to the motor frame; and shall be suitably identified. Leads shall be positioned and sealed where they pass through the frame with a water-resistant seal of a synthetic rubber material or a synthetic rubber gasket. Terminal box shall have threaded conduit entrances on a minimum of four sides.

2.1.9 Machine Work

Machine work shall be accurate, of high quality, and in conformity with approved standard practice. Threads shall be in accordance with ASME B1.1. Thread fittings shall be Class 2. Threads on all body-bound bolts shall be chased a sufficient length so that when the nut is tightened there will be approximately one and one-half full threads under the nut. All bolts and cap screws shall be provided with lock washers.

2.1.10 Designation and Markings

Motor nameplates of a suitable corrosion-resisting material shall be attached to the frame of each motor and shall indicate clearly the motor NEMA temperature and insulation class, continuous amperage rating, voltage...
rating, operating frequency, rated RPM, horsepower rating, nominal efficiency, NEMA locked rotor code letter and serial number. In addition, the nameplate shall show a lead connection diagram. Identification or serial numbers shall be die stamped on the frame.

2.2 BRAKE

Submit [6] [_____] copies of detailed descriptive data covering the brake, with necessary cuts, photographs, and drawings to indicate clearly the construction of the brake and the materials used. Releasing device specifications and characteristics, including input current minimum voltage required for brake release.

2.2.1 Brake Type

The brakes shall be of the shoe type, spring set, with AC or DC magnet operated release and shall be completely enclosed in a watertight and dusttight enclosing case arranged for [floor mounting] [motor mounting].

2.2.2 Brake Rating

**************************************************************************
NOTE: Delete paragraph b. if constant torque two-speed motor or a single-speed motor is specified.
**************************************************************************

a. The brake shall have a torque rating not less than 150 percent of the full load torque of the motor when referred to the shaft on which the brake wheel is mounted, efficiency of speed reducer not being considered. The torque rating shall be based on open construction, [1-hour] [continuous] duty.

b. [The brake shall have a torque rating of [_____] pound-feet as shown on the plans, or if the design is changed as permitted by [____], the brake shall have a torque rating not less than 150 percent of the full load torque of the motor when referred to the shaft on which the brake wheel is mounted, efficiency of speed reducer not being considered.] [For a two-speed motor, the rating shall be computed from the full-load torque of the low-speed winding of the motor.]

2.2.3 Adjustment

Means shall be provided for varying torque required for holding. Additionally, the brake shall have means of adjusting the position of the shoes to compensate for wear, unless the design is such that compensation for shoe wear is automatic.

2.2.4 Release

2.2.4.1 Releasing Magnets and Rectifier

**************************************************************************
NOTE: Coordinate voltage requirements with paragraph MOTOR RATING.
**************************************************************************

The releasing magnets shall be of the DC or AC shunt type and of standard stock design, suitable for operation on [_____] [230] [460]-volt, 60-Hz, AC electrical power. Direct current shall be supplied by means of a
self-contained rectifier unit of proper rating. The complete unit shall be suitable for connection to the control circuit or the power circuit of the motor with which the brake is used so that the brake will set or release when the motor is deenergized or energized, respectively. The brake releasing magnet shall be rated in accordance with the brake rating requirements of paragraph MOTOR RATING, and shall be sufficient to release and hold the brake in the released position with 85 percent of rated voltage impressed on the incoming terminals. The rectifier, when required, shall be mounted in the motor controller enclosing case unless otherwise noted.

2.2.4.2 Hand Release

Hand release shall be provided. It shall be operable only when the enclosing case cover is removed and shall be self-resetting.

2.2.5 Terminal Leads

Connecting leads from the releasing magnet shall be extended outside the enclosing case and shall be terminated on a terminal block located in a watertight terminal box, which shall be rigidly bolted or equally secured to and on the outside of the lower or fixed half of the enclosing case. The terminal box shall provide for conduit entrances on four sides. All conduit entrances to the brake terminal box shall be threaded. The leads inside the brake enclosing case shall be suitably protected. Enclosing case space heater leads shall be terminated in the same manner in separate terminal boxes.

2.2.6 Brake Enclosing Case

**************************************************************************
NOTE: Manufacturers do not generally weld enclosures. Welding required only where conditions require substantial construction and costs may be justified.
**************************************************************************

Submit [6] _____ copies of dimensioned outline drawings showing specific relationships and clearances between equipment and their component parts. The outdoor NEMA Type 4-watertight enclosing case shall be [welded type] [in accordance with the manufacturer's standard practice for the conditions indicated]. In order that the brake mechanism will be accessible from above, when the upper half or cover of the enclosing case is removed, the enclosing case shall be constructed to give equal accessibility to all portions of the brake. The joint between the two halves shall be made with a synthetic rubber gasket, not less than 6 mm 1/4 inch in width, and held in place by embedding in a groove or by other equally effective means. For those applications where the brake wheel is mounted on a shaft extension on the front end of the motor, the enclosing case shall be arranged to permit bolting to the bearing housing of the motor, the joint being made watertight with a gasket. For those applications where the brake wheel is mounted on a shaft of the operating machine or on a flange and shaft extension on the front end of the motor, suitable watertight seals shall be provided on each part of the housing. The shaft seals shall be arranged for pressure lubrication and shall be adjustable for alignment relative to the shaft. An automatic drain breather, located in a protected location, shall be provided in the lower part of the enclosing case. If the drain breather cannot be located in a protected location, the tapped hole shall be plugged and the drain furnished separately for installation in the
field. Enclosing case space heaters conforming to the applicable part of paragraph HEATERS-GENERAL, shall be provided. The enclosing case shall be treated to render the steel resistant to corrosion as required by paragraph CORROSION PREVENTION AND FINISH PAINTING.

2.2.7 Mechanical Construction

Except for brake wheels, shoes, and electrical parts, no cast iron shall be used in brake construction. All pins, fittings, and other miscellaneous small metal parts shall be of approved corrosion-resisting metal or shall be treated to render them corrosion-resistant as required by paragraph CORROSION PREVENTION AND FINISH PAINTING. Bearings shall be fitted with bronze or other approved bushings to prevent any binding of moving parts. Approved antifriction bearings of corrosion-resisting construction may be used. Approved means for lubrication shall be provided for all bearings, unless bearings are of an approved self- or prelubricated type. The machine work shall conform to the requirements for the motor with which the brake is used.

2.2.8 Designation and Markings

A nameplate of suitable corrosion-resisting material shall be provided and attached to a part of the brake which ordinarily will not be renewed during its service life. The nameplate shall conform to standard practice and clearly indicate the manufacturer's name, identification symbols, serial number, and salient design features such as type, frame, torque, rating, voltage, phase, and frequency. If adjustment is required, pertinent information for making the adjustments is necessary.

2.3 CONTROL SYSTEM

**************************************************************************
NOTE: The scheme of control shown on the applicable plate at the end of this document should be retained where possible.

The Plates listed below, containing the related control sequences, are attached at the end of this spec.

PLATE NO. SUBJECT
1. Crest Gate, Electrical Control System (With Approximately 300 mm 1.0 Foot Increments)
2. Crest Gate, Electrical Control System (With Approximately 150 mm 0.5 Foot Increments)
3. Crest Gate, Electrical Control System (With Remote Control and Approximately 300 mm 1.0 Foot Increments)
4. Crest Gate, Electrical Control System (With Remote Control and Approximately 150 mm 0.5 Foot Increments)
5. Outlet Control Gate, Electrical Control System (Single-Speed Motor)
6. Outlet Control Gate, Electrical Control System (Multispeed Motor)

7. Intake Gate, Electrical Control System.

In some instances, where control for a penstock intake gate hoist where the emergency lower control switch is to be located in the powerhouse, the length of the connecting circuit may be such that its mutual inductance may render the circuit susceptible to false operation. In such cases, it will be necessary to use direct current and interpose an additional control relay. The direct current can be provided from a rectifier located in the control cabinet or from a circuit on the powerhouse control battery.

The scheme of operation of the [outlet control gate] [tainter gate] [intake gate] hoist motor control system shall be as described and indicated. The control system shall include the controller, limit switch, master control station[s], and such other items as may be required to accomplish the operating features specified. Each item shall be [installed and] tested as specified and shall be complete and ready for operation [, when installed under another contract,] in accordance with the scheme of operation.

2.4 CONTROLLER

NOTE: Separate mounting of the controller is usually the preferred practice. When mounting the controller on the hoist frame is desired, the Contractor will be required to submit a drawing showing the arrangement of the controller and other electrical equipment on the hoist frame. In this case, the electrical equipment should be wired in the shop complete and ready for operation upon bringing the power connection to the line side of the controller disconnect switch.

Submit [6] [_____] copies of a description of the operation scheme, if other than herein specified or shown on the drawings; a dimensioned outline drawings showing specific relationships and clearances between equipment and their component parts, detailed panel layouts, schematic wiring diagrams, and a panel wiring diagram dimensioned outline drawings showing specific relationships and clearances between equipment and their component parts. Submit [6] [_____] copies of detailed descriptive data covering all component parts of the controller.

2.4.1 Controller Type

The hoist motor controller shall be of the full magnetic type initiated by the push-button control station and controlled automatically by a limit switch or limit switches. Limit switch[es] shall be driven by the hoist mechanism or other auxiliary operating devices as indicated or required to provide the sequence of operation specified or indicated on the plans.
2.4.2 Protection

The controller shall provide [under-voltage protection,] inverse-time-limit overload protection, or other protection as indicated or specified. [In addition, the controller shall provide protection from single-phase faults.] The protection shall be accomplished by suitable relays conforming to the requirements of paragraph RELAYS. Overload relays shall provide protection during both the starting and running condition, and approved means shall be provided to manually reset the relays without opening the enclosing case of the controller. All forward and reversing contactors shall be electrically interlocked. Controller disconnecting circuit breaker[s] shall be interlocked with the controller enclosing case access door to permit opening or closing the access door only when the disconnect is in the "OPEN" position.

2.4.3 Enclosure

**************************************************************************
NOTE: When controller is mounted in a dry room or gallery adjacent to the hoist equipment adjacent to the hoist equipment, a NEMA Type 12, industrial-use enclosure should be specified and the drawings and specifications revised accordingly. Hubs shall be specified for all conduit entrances.

Wall mounting is generally the least costly alternative and should be used whenever practical.

Designer shall coordinate padlock requirements with local standards.
**************************************************************************

Enclosing cabinet shall be of the NEMA Type [3R [stainless steel]] [4 watertight [stainless steel] and moisture-resisting] [12 industrial use] construction with interior dead-front panel meeting the requirements of NEMA ICS 6. Enclosing cabinet shall be designed for [floor mounting] [mounting on the hoist frame] [wall mounting]. Suitable padlock eyes shall be provided to allow locking the exterior door in the closed position. Padlocks, conforming to [_____], shall be provided with each controller and chained to the enclosing case. The chain shall be of a nonferrous material resistant to corrosion. Only front-connected devices shall be used, and clearances shall be in accordance with NEMA ICS 1 requirements. Threaded hubs for conduit entrance of the welded-in type shall be provided as indicated on the drawings or as required to make the wiring connections. An automatic breather-drain, not less than 3/8-inch size and located in a protected location and at the lowest point of the enclosure, shall be provided.

2.4.4 Air Circuit Breakers

Air circuit breakers as shown on the drawings or specified shall be provided and assembled in the housing of each controller.

2.4.4.1 Circuit Breakers - General

Each air circuit breaker shall conform to the applicable requirements of UL 489. The circuit breakers shall be manually operated and shall be of the instantaneous trip type, unless otherwise specified or indicated on the drawings. All poles of each breaker shall be operated simultaneously by
means of a common handle and shall be enclosed in a common molded plastic case. The contacts of multipole breakers shall open simultaneously when the breaker is tripped manually or automatically. The operating handles shall clearly indicate whether the breakers are in "ON," "OFF," or "TRIPPED" position. Each circuit breaker shall be externally operated [and interlocked] as specified in paragraph PROTECTION. Approved means shall be provided for padlocking the breaker[s] operating handle in either the "ON" or "OFF" position. A padlock of the same type as specified in paragraph ENCLOSURE, shall be provided for each breaker and shall be chained to the enclosing case. The circuit breakers shall be products of only one manufacturer and shall be interchangeable when of the same frame size.

2.4.4.2 Trip Units

Except as otherwise indicated on the drawings, the circuit breakers shall be provided with combination thermal and instantaneous magnetic trip units. The minimum frame sizes and the trip unit ratings shall also be as required for the equipment controlled. Nonadjustable instantaneous magnetic trip unit shall be set as approximately 10 times the continuous current ratings of the circuit breakers.

2.4.4.3 480-Volt AC Circuits

Air circuit breakers for 480-volt AC circuits shall be rated 600 volts AC and shall have a minimum NEMA interrupting capacity of 14,000 symmetrical amperes at 600 volts AC.

2.4.4.4 120-Volt AC Circuits

Air circuit breakers for 120-volt AC circuits shall be rated not less than 120/240 or 240 volts AC and shall have a minimum NEMA interrupting capacity of 10,000 symmetrical amperes.

2.4.4.5 125-Volt DC Circuits

Air circuit breakers for 125-volt DC circuits shall be two-pole rated 125/250 or 250 volts DC and shall have a minimum NEMA interrupting capacity of 5,000 [10,000] amperes DC.

2.4.5 Assembly of Controller

Furnish all necessary air circuit breakers, contactors, relays, resistors, interlocks, master switches, limit switches, or other devices required by the scheme of operation. The panel for mounting the relays and contactors shall be sheet steel of sufficient thickness to provide rigid support for the equipment mounted thereon. The steel panel shall be given a corrosion resisting treatment in accordance with the requirements of paragraph CORROSION PREVENTION AND FINISH PAINTING.

2.4.5.1 Wiring

Submit [6] [_____] copies of data sufficient to demonstrate that the proposed wire and cable conform to these specifications. Insulated wire shall conform to the requirements of paragraph CONDUCTORS. All wiring shall be securely held in place and arranged in a neat and orderly manner in horizontal and vertical runs. All wiring passing through steel gutters shall be protected by grommets, unless the openings in the steel gutter are formed to protect the wiring from damage. [All controllers shall be wired in like manner as to location of parts and phase sequence.] The wire and
terminal numbers shall be neatly and legibly identified in an approved manner. Terminal blocks shall be used for making all external connections.

2.4.5.2 Terminal Blocks

Submit method of identifying conductors, terminal leads, and terminal blocks. Terminal blocks for control wiring shall be molded type with barriers, rated not less than 600 volts, and they shall be provided with covers. The terminals shall be removable, screw type, or of the stud type with contact and locking nuts. The terminals shall be not less than No. 10 AWG in size and shall have sufficient length and space for connecting at least two indented terminals on No. 10 AWG conductors to each terminal. The terminal arrangement shall be subject to the approval of the Contracting Officer.

a. Not less than 10 percent, but in no case less than 2 percent, spare terminals shall be provided on each block. Terminal blocks for conductors larger than No. 10 AWG or with a capacity of more than 30 amperes shall be adequate for the purpose intended, having length and space for at least two indented terminals of the size required on the conductors to be terminated.

b. For conductors rated more than 50 amperes, all screws shall have hexagonal heads. For conductors rated 50 to 99 amperes, the minimum screw size shall be \(8 \text{ mm} \ 5/16 \text{ inch}\). Conducting parts between connected terminals shall have adequate contact surface and cross section to operate without overheating.

c. White or other light-colored marking strips, fastened by screws to the molded sections at each block, shall be provided for circuit designation. Each connected terminal of each block shall have the circuit designation or wire number placed on the marking strip with permanent marking fluid. One reversible or one spare marking strip shall be furnished with each block.

2.4.6 Magnetic Contactors

2.4.6.1 Contactor Ratings

All heavy-duty magnetic contactors shall be of the voltage rating indicated on the drawings or otherwise required. They shall have a horsepower rating not less than the horsepower rating of the motor with which the controller is to be used, but in no case shall the contactor used be smaller than NEMA, Size 1. The contactors shall meet the requirements of NEMA ICS 2 and have continuous current ratings for the duty indicated. Contactors shall be suitable for at least 200,000 complete operations under rated load without more than routine maintenance. They shall operate successfully on 10 percent over-voltage and 15 percent under-voltage. The interrupting capacity shall conform to NEMA standards. Mechanical interlocking between contactors shall be provided as indicated or required and shall be accomplished without any mechanical attachment between the interlocking mechanism and the moving parts of the contactor, unless otherwise approved by the Contracting Officer.

2.4.6.2 Arcing Protection

For each pole, the interruption arc and flame shall be minimized by suitable arc chutes or other means so that no damage will be done to other portions of the device. The arc chutes, if provided, shall be easily
removed without removing or dismantling other parts.

2.4.6.3 Contactors

All current carrying surfaces shall be of a silver alloy or of copper faced with a silver alloy and shall be easily accessible and removable for replacement. Contactor shall operate without chatter or perceptible noise while energized. Coils shall be suitable for continuous operation on the voltage specified.

2.4.6.4 Construction

Each contactor shall be provided with a minimum of three auxiliary contacts, which may be easily changed from normally open to normally closed. Contactor construction shall be such as to prevent corrosion in accordance with paragraph CORROSION PREVENTION AND FINISH PAINTING.

2.4.7 Relays

2.4.7.1 Control

Control relay devices shall meet applicable requirements of NEMA ICS 2 for Class A600 contacts. All contacts shall be of a silver alloy or of copper faced with a silver alloy.

2.4.7.2 Overload

Submit [6] copies of curves showing the overload relay tripping time versus current characteristics of the overload relays for the controller. Overload relays shall be the adjustable thermal type with normally closed control circuit contacts having a pilot and control circuit contact rating of A600, in accordance with NEMA ICS 2, and shall have combination manual and automatic-type reset. They shall have inverse-time tripping characteristics simulating the heating characteristics of the motor, shall protect the motor with which used against exceeding its specified temperature rise under any overload, stalled rotor, or single-phase condition, and shall be self-protecting under all conditions, except short circuit. A relay consisting of an assembly of individual-phase thermal elements actuating a common tripping bar shall be used. The means of adjustment shall provide a range from 90 percent to 110 percent of the heater rating and shall be sufficiently accurate to allow setting the relay at the full-load current value of the motor with which used. Reset mechanism shall be trip free and arranged for manual reset in accordance with paragraph PROTECTION, unless automatic reset is indicated. Reset mechanism shall be of design that will permit changing from manual to automatic reset or vice versa without the use of special tools.

2.4.8 Control Transformer

The control transformer shall be a standard, single-phase, 60-Hz, dry-type, [_____] 480/120 volts, and with kVA rating sufficient to supply the control [and heater] circuits.

2.4.9 Control Circuit Breakers

The control circuit breakers shall conform to the requirements of paragraph AIR CIRCUIT BREAKERS, except that an external operating mechanism is not required. Breakers shall be two-pole, 100-ampere frame, and 20-ampere continuous current rating.
2.4.10 Indicating Lights

Indicating lights shall be complete with low-voltage lamps, self-contained resistor or transformer units, and lens or color caps. Lens and lamp shall be removable from the front. They shall operate on 120 volts AC and be suitable for flush or semiflush mounting to the exterior cabinet door. Exterior mounting of the indication lights shall meet the requirement for the enclosure NEMA type. Hinge wire shall be used for connections between the indicator lights and the terminal block.

2.4.11 [Plug Receptacle for Inching Pendant Control Switch

**************************************************************************
NOTE: Inching pendant control switch in paragraph INCHING STATION, and receptacle is not required on crest gates. Omit requirement for receptacle on controller enclosure and mount receptacle on wall of gate inspection room if inspection room is above maximum flood.
**************************************************************************

The receptacle body shall be weather resistant with threaded cap and gasket complete with polarized female contact unit, four-wire, five-pole, grounded through shell and extra pole, and rated 30A, 460 volts.]

2.4.12 Equipment and Door Nameplates

Submit schedule of nameplates. Nameplates shall be provided for the front of the cabinet door and for each item of equipment within the enclosure. Anodized aluminum, stainless steel, or a laminated plastic sheet with black surface layer and a white bottom layer not less than 1/16 inch thick shall be used for the nameplate material. Equipment within the enclosure shall be identified by nameplates or other suitable marking on the equipment unit base or on the panel.

2.4.13 Heater

The heater shall be strip type and meet the requirements of paragraph HEATERS-GENERAL.

2.4.14 Grounding

The ground connection for the controller enclosing cabinet shall be made by a threaded post fitting which extends through the enclosure wall and which is provided with fittings to connect No. 6 AWG stranded copper ground wire both inside and outside the enclosure. Inside the enclosure, the ground circuit shall be extended with No. 6 AWG stranded copper wire from the connector to the panel.

2.5 CONTROL STATION[S]

Submit [6] [_____] copies of detailed descriptive data covering the control station[s]. Control station[s] shall be of the rocker handle push-button type and shall provide the number of indicating lights and individual switches of the type or types required by the scheme of operation. Enclosure shall be NEMA-Type [3R] [4 watertight [stainless steel]] [12R industrial use] construction. All contacts shall be of the double-break bridging type and shall have a pilot and control circuit rating designation.
of A600 in accordance with NEMA ICS 2. Switch cases shall be provided with threaded bosses for conduit or cable connection and shall provide ample wiring space for conductors of the size and insulation specified.

2.5.1 Master Station

**************************************************************************
NOTE: Use padlocked stop switch on all hoists except intake gate hoists provided with remote lowering. Intake gate hoists may use either padlock or "substantial metal cover" alternate. If metal cover alternate is used, the emergency lower contact "ELS" in parallel with the stop switch contact should be deleted.
**************************************************************************

The master station shall be arranged with the elements stacked vertically and with [_____]-inch conduit entrance from the bottom. The station shall provide [a red indicating light and] 3 operating rocker handle-type push buttons. The station shall be arranged starting at top with [a red light followed by] the "RAISE," "CONDUIT OPEN," "LOWER," and "STOP" push buttons. The station switch elements shall have nameplates with the above designations. [The "STOP" switch shall be provided with means of padlocking the switch in the stop or in the open position.] [The station shall be provided with a substantial removable or hinged metal cover which can be locked in the closed position to prevent operation of the switch elements.] The padlock shall be chained to the enclosing case with a chain made of nonferrous material.

2.5.2 [Inching Station]

The inching station shall be arranged with the elements stacked vertically and with conduit entrance on the top for a cable clamp. The cable shall be [_____] feet of five-conductor, No. 12 AWG portable cable with extra flexible conductors, heat and moisture resistant insulation, and outer Neoprene jacket. The station shall have two rocker handle-type push buttons. The switch elements shall be designated "INCH UP" and "INCH DOWN" from top to bottom, respectively.

2.6 LIMIT SWITCH

a. Submit [6] [_____] copies of all limit switch computations used to determine the selection of gear ratios and calibration for gate travel.

b. Submit [6] [_____] copies of complete descriptive data covering the limit switch with necessary cuts, photographs, and drawings to indicate clearly the construction, materials used in the parts, rating, accuracy of tripping and reset, method of adjustment, and safeguards.

2.6.1 Normal Operation

The limit switch shall be the linear solid-state programmable type with digital display and shall operate on 120 volts AC. It shall contain all the contacts required for making and breaking all control and interlocking circuits necessary for the proper control and operation in the manner
specified or required.

2.6.2 Construction

The limit switch shall be of compact and rugged construction, totally enclosed in a NEMA Type 13 case, and housed within the controller enclosure. The digital display shall be visible without opening the enclosure door. This viewing port in the door shall have a replaceable gasketed piece of clear plastic mounted to maintain the NEMA rating of the enclosure. The cover shall be provided with cap screws or other approved means for readily breaking the cover free for removal unless the gasket is so designed that it will not stick. All parts shall be of corrosion-resisting metal or treated in an approved manner to render it resistant to corrosion. The switch shall permit final adjustment in the field. Tapped bosses shall be provided for making all conduit connections to the switch. A clamp-type connector bolted to the outside of the case shall be provided for making ground connections.

2.6.3 Switches

Switches shall be solid state with current rating as required and shall be assembled or combined into operating units as indicated on the plans. They shall be provided with suitable terminals for connecting the external conductors and shall provide for one remote digital readout. Each terminal shall be suitably marked or tagged with the wire number shown on the contract drawings. The tripping mechanism shall be designed for fail-safe operation and shall reset the contacts when moving in the reverse direction. The switch shall have an operator lockout feature which permits programming only by authorized personnel.

2.6.4 Transducer

The electromagnetic position sensor shall be single-turn, heavy-duty enclosed in an outdoor NEMA 4 watertight enclosure. A cable [chain] connector used for the enclosure shall be provided and be suitable for No. 16 AWG shield twisted pair.

2.6.5 Accuracy of Trip and Reset

**************************************************************************
NOTE: For installations where water control requires gate travel of over 9 m 30 feet, measurement of gate travel may become nonlinear. This is due to stretching of the wire rope. The attachment point for measurement of travel should be as near the switch as possible and need not be at the top of the gate. The designer shall investigate possible options, including use of chain and additional limit switches.
**************************************************************************

The design of the switch elements and operating mechanism of the limit switch shall provide for uniform and accurate setting. Switch shall be single turn with 1,000 counts per turn and a minimum of 16 set points. The switch shall accurately transmit position within + 75 mm 3 inches and shall reset gate for drift exceeding 150 mm 6 inches.
2.7 WIRE AND CONDUIT

2.7.1 Conductors

Conductors shall be of annealed copper wire. Copper conductors shall be insulated with polyethylene. Conductors shall be Class B or Class C stranding, except for hinge wire which shall be Class D or K stranding. Unless otherwise specified, all wire and cable for power and control shall be single conductor. Insulation thickness shall be that required for a rated circuit voltage of 0 to 600 volts. Insulation shall be a cross-linked thermosetting polyethylene insulation type. Over the insulated conductor there shall be applied a moisture resisting thermoplastic jacket. The method of accomplishment shall be in accordance with the current practice of the industry. Wire for power and motor circuits shall have a current carrying capacity corresponding to the ampere rating of the circuit's air circuit breaker and not less than No. 10 AWG and the full-load current of the motor or the circuit. Wire for control circuits shall not be smaller than No. 12 AWG.

2.7.2 Control Wire

All control wire shall be type SIS switchboard wire meeting the requirements of UL 44.

2.7.3 Conduit

Rigid steel conduit shall conform to ANSI C80.1 and shall, in addition, be zinc-coated (galvanized) both inside and outside by the hot-dip method.

2.7.4 Fittings

Conduit fittings shall conform to the requirements of NEMA FB 1 and CID A-A-50553.

2.7.5 Assembly

**************************************************************************
NOTE: For contracts where all conduit and wiring are furnished and installed by others, use paragraph 'a.'

For contracts where all conduit and wiring are on the hoist and are furnished and installed under this contract, use paragraph 'b.'

For contracts where the conduit and wiring on the hoist are furnished and installed under this contract and the connections to remotely located items are made under a subsequent contract, use paragraph 'c.'
**************************************************************************

The hoist motor, motor brake, controller, limit switch, and master control station shall be installed on the [hoist frame] [as shown on contract drawings].

[a. The conduit and wiring connections external to the items of electrical equipment previously mentioned will not be furnished or installed under this contract.]
[b. The conduit and wiring connections external to these previously mentioned items of electrical equipment shall be furnished, installed, and connected complete and ready for operation. The conduit, wiring, and connections for the incoming power will be made by others under a subsequent contract.]

c. The conduit and wiring connections external to these previously mentioned items of electrical equipment which are installed on the hoist frame shall be furnished, installed, and connected complete and ready for operation. The conduit and wiring connections to the remotely located control equipment and the incoming power connections will be made by others under a subsequent contract.]

d. All wiring shall be installed in rigid hot-dip galvanized metal conduit with threaded-type fittings (Condulets) and zinc-coated watertight outlet and pull boxes. The conduit shall be securely mounted and fastened to the hoist framework and shall be installed in a neat and workmanlike manner. Change of direction of a conduit run shall be made by means of threaded-type fittings (Condulets) or factory fabricated bends, and the conduit shall be installed to fit close to the hoist framework. Conduit unions shall be used whenever it is necessary to join conduits that are to be turned right and left. No running threads will be permitted. Ends of conduits shall be carefully reamed. All threaded connections shall be made up with electrically conductive colloidal copper rust-inhibiting compound or other suitable compound. Separate conduit systems shall be provided for power and control circuits. The entire conduit system shall be grounded and shall be installed so that any moisture will be drained away from terminal boxes and equipment. All conduit connections to equipment enclosures shall be of the watertight threaded type. Suitable "drain-breather" devices shall be provided at all low points of the conduit system to prevent an accumulation of water. All conductors shall be terminated in an approved manner. Indented terminals shall be used on No. 12 AWG and larger conductors and shall be terminated on screw or stud terminals. Toothed lock washers shall be used on all screw terminals and locking nuts or lock washers shall be used on all stud terminals.

2.8 HEATERS - GENERAL

Enclosure heaters shall be strip type constructed with a chrome-nickel heating element embedded in a refractory insulating material and encased in an approved watertight, corrosion-resisting, nonoxidizing metal sheath. The rate of heat dissipation shall be uniform throughout the effective length. Watt density shall not exceed 20 watts per square inch for chrome-nickel type.

2.8.1 Heater Ratings

Heaters shall be of such rating that, when energized, the temperature of the windings or enclosure will be held approximately 10°C above ambient. They shall be designed for 120 volts AC and for continuous operation under the conditions of installation. The rate of heat dissipation shall be uniform throughout their effective length.

2.8.2 Insulation

Insulation for the heating cable (winding wrap around type) heaters shall be suitable for a conductor temperature of 180°C.
2.8.3 Heater Terminals

The terminals of the heater, including the leads, shall be watertight. The leads shall be terminated and sealed in a watertight terminal box located as selected by the motor manufacturer. The method of sealing shall be as specified for the motor winding leads.

2.9 TESTS

**************************************************************************
NOTE: If designer elects to do operational tests of the gate hoist equipment, in conjunction with testing of the hoist itself, the hoist specification number must be included.
**************************************************************************

Each item of equipment furnished, one of each rating and type and selected at random by the Contracting Officer, shall be given a complete test. The remaining items of equipment shall be given a routine test. All complete tests required herein shall be witnessed by the Contracting Officer, unless waived in writing, and no equipment shall be shipped until it has been approved for shipment by the Contracting Officer. Notify the Contracting Officer sufficiently in advance of the date of the tests, so that arrangements can be made for the Contracting Officer to be present at the tests. The test equipment and the test methods used shall conform to the applicable requirements of ANSI, IEEE, and NEMA standards and shall be subject to the approval of the Contracting Officer. Submit [6] certified copies of the reports of all complete and routine tests, including complete test data. Certified copies of the results of a complete test for duplicate equipment will be accepted in lieu of the requirement of the complete test specified. Reports shall include analysis and interpretation of test results and shall be properly identified with the test systems and materials. Provide test reports for "complete tests" on the motor, brake, and controller. Certified copies of "Complete Tests" on duplicate equipment may be accepted with the approval of the Contracting Officer. No substitute will be accepted for the routine test. The cost of performing all tests shall be borne by the Contractor and shall be included in the price bid. [Operational tests shall be made on the equipment in conjunction with the tests specified in [_____] for the assembled hoist.] [Operational tests shall be made on equipment after it is installed.] Performance curves indicating the results of the motor tests shall be furnished as follows:

a. Excitation Tests. Volts or percent of rated voltage as abscissa vs. amperes and watts as ordinates.

b. Impedance Tests. Volts or percent of rated voltage as abscissa vs. amperes and watts as ordinates.

c. Performance Test. Torque or percent of rated horsepower output as abscissa vs. efficiency, power factor, amperes watts, and rpm or percent slip as ordinates.

d. Speed-Torque Test. Torque in foot-pounds as abscissa vs. speed in rpm or percent of synchronous speed as ordinates.

e. Temperature Test. Time in minutes as abscissa vs. temperature rise in degrees C as ordinate.
f. Insulation Resistance Test. Test result values shall be plotted on semilogarithmic graphs, the insulation resistance values as logarithmic ordinates, and the temperature values as uniform abscissa.

g. Routine test reports shall include analysis and interpretation of test results and shall be properly identified with the test systems and materials. No substitute will be accepted for the routine test. Provide test reports for "routine tests" on the motor, brake, controller, limit switch, [interrupter,] and wiring.

h. Submit [6] [_____] copies of description of "Interrupter" drive including copies of dimensioned outline drawing of the interrupter. Show on the Drawings specific relationships and clearances between equipment and their component parts.

2.9.1 Motor Tests

All tests shall be performed in accordance with the requirements of IEEE 112 for three-phase induction motors.

2.9.1.1 Complete Motor Tests

The complete tests shall include the following:

a. Excitation test.

b. Impedance test.

c. Performance and speed-torque test (Prony brake or other approved method).

d. Temperature test.

e. Insulation resistance tests. Measurements shall be taken following temperature test with readings taken at approximately 10°C intervals. Temperature shall be determined by the resistance method.

f. Dielectric test.

g. Cold and hot resistance measurement.

h. Effectiveness of enclosure.

i. Motor winding heater test.
   (1) Successful operation.
   (2) Dielectric.

2.9.1.2 Routine Motor Tests

The routine tests shall include the following:

a. Excitation test: (One point - no load, volts, amperes, and watts.)

b. Impedance test: (One point - half-voltage amperes and watts.)

c. General operation.
d. Insulation resistance - temperature test (one point).

e. Resistance measurements.

f. Dielectric.

g. Motor winding heater test.
   (1) Successful operation.
   (2) Dielectric.

[ h. Interrupter. ]

2.9.2 Brake Tests

2.9.2.1 Complete Brake Tests

The complete tests shall include the following:

a. Check operation of brake release at the specified rated brake torque for rated and 85 percent terminal voltage.

b. Heat run on release magnet at the specified rated brake torque and voltage.

c. Insulation resistance of release magnet including leads and terminal block.

d. Resistance measurements of release.

e. Dielectric test of release magnet including leads and terminal block.

f. Brake space heater test.
   (1) Successful operation.
   (2) Dielectric.

2.9.2.2 Routine Brake Tests

The routine tests of the brake shall be the same as specified in paragraph COMPLETE BRAKE TESTS, except that the heat run tests shall be omitted.

2.9.3 Controller Tests

2.9.3.1 Complete Controller Tests

The complete tests shall include all tests listed in paragraph ROUTINE CONTROLLER TESTS, and the following:

a. Effect of voltage and frequency variation.

b. Temperature Test.

2.9.3.2 Routine Controller Tests

The routine tests shall include the following:
a. Adjustment, fit, and material.
b. Successful operation.
c. Resistance.
d. Dielectric.
e. Insulation Resistance.
f. Enclosure space heater test.
   (1) Successful operation.
   (2) Dielectric.

2.9.4 Limit-Switch Tests

Each drive shall be tested in the manufacturers shop by suitable means, simulating service conditions, to ascertain that it will transmit the correct information for the control sequence specified. In addition, the routine tests shall include the following:

a. Adjustment, fit, and material.
b. Accuracy of trip and reset.
c. Successful operation.
d. Dielectric.
e. Insulation resistance.

2.9.5 Wiring Tests

All wiring shall be given a dielectric test following installation by applying, for 5 minutes, a voltage test of 1,500 volts to each circuit and ground and between each conductor and all other conductors in the same conduit.

PART 3 EXECUTION [(Not Applicable)]

****************************************************************************************************************************
NOTE: Designer should place any requirements for field installation in this section.

[____].
CREST GATE
ELECTRICAL CONTROL SYSTEM
(With Approximately 1.0 Foot Increments)
DESCRIPTION OF CONTROL SYSTEM

1. SCHEME OF OPERATION
   a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.
   b. Control Points. The operation of the hoist motor shall be controlled by:
      (1) A push button station located on the gate hoist with momentary contacts designated "RAISE," "LOWER," and "STOP."
      (2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."
   c. Operating Features
      (1) Actuation of the "RAISE" and "LOWER" contacts shall provide seal-in operation.
      (2) A limit switch geared or directly connected to the hoist machine, shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.
      (3) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION
   a. Raising
      (1) When the gate is between the closed and the intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.
      (2) When the gate is at or above the intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.
   b. Lowering
      (1) When the gate is between the over travel raised position and the intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the intermediate position and stop.
      (2) When the gate is at or below the intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.
c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts shall stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate the gate after an over travel, the appropriate backout switch contact shall be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the master control station.
1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

(1) A push button station located on the gate hoist with momentary contacts designated "RAISE," "LOWER" and "STOP."

(2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

c. Operating Features

(1) Actuation of the "RAISE" and "LOWER" contacts shall provide seal-in operation.

(2) A limit switch geared or directly connect to the hoist machine, shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

(3) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

(1) When the gate is between the closed position and the first intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 0.5 foot and stop.

(2) When the gate is at or above the first intermediate position and is below the second intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.

(3) When the gate is at or above the second intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and the second intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the second intermediate position and stop.
(2) When the gate is at or below the second intermediate position and above the first intermediate position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

(3) When the gate is at or below the first intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 0.5 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts shall stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate gate after an over travel, the appropriate backout switch contact shall be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the master control station.
1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

   1. A push button selector switch station located on the gate hoist with momentary push button contacts designated "RAISE", "LOWER", and "STOP" and selector switch contacts designated "LOCAL" and "REMOTE."

   2. A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

   3. A push button station, located on the spillway gate remote control board with momentary contacts designated "RAISE", "LOWER", and "STOP."

   4. A synchronous type indicator, located on the spillway gate remote control board to show the gate position.

c. Operating Features

   1. Actuation of the "RAISE" and "LOWER" contacts of the remote or local control station shall provide seal-in operation.

   2. The position of the "REMOTE-LOCAL" control switch will determine which station is operative.

   3. The remote control shall utilize direct current interposing relays.

   4. A limit switch geared or directly connected to the hoist machine, shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

   5. Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

   1. When the gate is between the closed position and the intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.
(2) When the gate is at or above the intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and the intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the intermediate position and stop.

(2) When the gate is at or below the intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts shall stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate the gate after an over travel, the appropriate backout switch contact shall be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER"contact on the master control station.
CREST GATE
ELECTRICAL CONTROL SYSTEM
DESCRIPTION OF CONTROL SYSTEM
(With Remote Control and Approximately 0.5 Foot Increments)

1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:
   
   (1) A push button selector switch station located on the gate hoist with momentary push button contacts designated "RAISE", "LOWER", and "STOP" and selector switch contacts designated "LOCAL" and "REMOTE."

   (2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

   (3) A push button station, located on the spillway gate remote control board with momentary contacts designated "RAISE", "LOWER", and "STOP."

   (4) A synchronous type indicator, located on the spillway gate remote control board to show the gate position.

c. Operating Features

   (1) Actuation of the "RAISE" and "LOWER" contacts of the remote or local control station shall provide seal-in operation.

   (2) The position of the "REMOTE-LOCAL" control switch will determine which station is operative.

   (3) The remote control shall utilize direct current interposing relays.

   (4) A limit switch geared or directly connected to the hoist machine, shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

   (5) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

   (1) When the gate is between the closed position and the first intermediate position, each actuation of the "RAISE " contact will cause the gate to raise approximately 0.5 foot and stop.
(2) When the gate is at or above the first intermediate position and is below the second intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.

(3) When the gate is at or above the second intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and the second intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the second intermediate position and stop.

(2) When the gate is at or below the second intermediate position and above the first intermediate position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

(3) When the gate is at or below the first intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 0.5 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts shall stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate the gate after an over travel, the appropriate backout switch contact shall be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the master control station.
OUTLET CONTROL DATE
ELECTRICAL CONTROL SYSTEM
DESCRIPTION OF CONTROL SYSTEM
(Single-speed Motor)

1. SCHEME OF OPERATION

   a. General. The control system for the gate shall be as indicated by schematic control wiring diagram, and as specified below.

   b. Control Points. The operation of the hoist motor shall be controlled by:

      (1) A push button station located on the gate hoist with contacts designated "RAISE," "CONDUIT OPEN," "LOWER," and "STOP."

      (2) A push button station located on the gate hoist with momentary contacts designated "BACKOUT FROM LOWER OVER TRAVEL" and "BACKOUT FROM RAISE OVER TRAVEL."

      (3) A pendant push button station with momentary contacts designated "INCH UP" and "INCH DOWN," provided with a portable cable of suitable length to permit operation from the inspection room. The cable shall terminate in a polarized plug matching receptacle located on motor controller cabinet or other suitable place.

   c. Operating Features

      (1) Actuation of the "RAISE", "CONDUIT OPEN", and "LOWER" contacts of the push button station shall provide seal-in operation.

      (2) Actuation of the "INCH UP" and "INCH DOWN" contacts of the pendant push button station shall not provide seal-in operation.

      (3) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

      (4) A limit switch geared to directly connected to the hoist machine shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

2. SEQUENCE OF OPERATION

   a. Raising

      (1) When the gate is between the closed position and the raised position, actuation of the "RAISE" contact will cause the gate to open continuously to the raised position.

      (2) When the gate is between the closed position and the conduit open position, actuation of the "CONDUIT OPEN" contact will cause the gate to open continuously to the conduit open position.

   b. Lowering. When the gate is between the over travel raised position and the closed position, actuation of the "LOWER" contact will cause the
gate to lower continuously to the closed position.

c. Inching

(1) To raise the gate above the raised position the "INCH UP" contact shall be held closed. The gate will be stopped at upper inch position by the limit switch.

(2) To lower the gate when it is above the raised position the "INCH DOWN" contact shall be held closed. The gate will be stopped at the raised position by the limit switch.

d. Over Travel

(1) Over travel limit switches shall stop the driving motor if it fails to stop at the raised or closed position on the gate.

(2) The "BACKOUT FROM LOWER OVER TRAVEL" or "BACKOUT FROM RAISE OVER TRAVEL" contact shall be held closed to operate the gate from over travel closed and over travel raised, respectively.
Plate No. 6

OUTLET CONTROL GATE
ELECTRICAL CONTROL SYSTEM
DESCRIPTION OF CONTROL SYSTEM
(Multispeed Motor)

1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

   (1) A push button station located on the gate hoist with momentary contacts designated "RAISE", "CONDUIT OPEN", "LOWER", and "STOP."

   (2) A push button station located on the gate hoist with momentary contacts designated "BACKOUT FROM LOWER OVER TRAVEL" and "BACKOUT FROM RAISE OVER TRAVEL."

   (3) A pendant push button station with momentary contacts designated "INCH UP" and "INCH DOWN", provided with a portable cable of suitable length to permit operation from the inspection room. The cable shall terminate in a polarized plug matching receptacle located on motor controller cabinet or other suitable place.

c. Operating Features

   (1) Actuation of the "RAISE", "CONDUIT OPEN", and "LOWER" contacts of the push button station shall provide seal-in operation.

   (2) Actuation of the "INCH UP" and "INCH DOWN" contacts of the pendant push button station shall not provide seal-in operation.

   (3) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

   (4) A limit switch geared to be directly connected to the hoist machine shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

2. SEQUENCE OF OPERATION

a. Raising

   (1) When the gate is between the closed position and the raised position, actuation of the "RAISE" contact will cause the gate to open continuously at low speed to the conduit open position.

   (2) When the gate is between the closed position and the conduit open position, actuation of the "CONDUIT OPEN" contact will cause the gate to open continuously at low speed to the conduit open position where the limit switch shall cause the gate to open continuously at high speed to the raised position. (3) When the gate is between the conduit open position and the raised position, actuation of the "RAISED" contact will cause the gate to open
continuously at high speed to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and conduit open position, actuation of the "LOWER" contact will cause the gate to lower continuously at high speed to the conduit open position where the limit switch shall cause the gate to close continuously at low speed to the closed position.

(2) When the gate is between the conduit open position and the closed position, actuation of the "LOWER" contact will cause the gate to lower continuously at low speed to the closed position.

c. Inching

(1) To raise the gate above the raised position the "INCH UP" contact shall be held closed. The gate will be stopped at upper inch position by the limit switch.

(2) To lower the gate when it is above the raised position the "INCH DOWN" contact shall be held closed.

(3) The gate will be stopped at the raised position by the limit switch.

d. Over Travel

(1) Over travel limit switches shall stop the driving motor if it fails to stop at the raised or closed position or the gate.

(2) The "BACKOUT FROM LOWER OVER TRAVEL" or "BACKOUT FROM RAISE OVER TRAVEL" contact shall be held closed to operate the gate from over travel closed and over travel raised, respectively.
INTAKE GATE
ELECTRICAL CONTROL SYSTEM
DESCRIPTION OF CONTROL SYSTEM

1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

   (1) A push button station located on the gate hoist with momentary contacts designated "RAISE," "LOWER," and "STOP."

   (2) A push button station located on the door of the controller with momentary contacts designated "BACKOUT FROM LOWER OVER TRAVEL" and "BACKOUT FROM RAISE OVER TRAVEL."

   (3) A pendant push button station with momentary contacts designate "INCH UP" and "INCH DOWN," provided with a portable cable of suitable length to permit operation from the inspection room. The cable shall terminate in a polarized plug matching receptacle located on motor controller cabinet or other suitable place.

c. Operating Features

   (1) Actuation of the "RAISE" and "LOWER" contacts of the push button station shall provide seal-in operation.

   (2) Actuation of the "INCH UP" and "INCH DOWN" contacts of the pendant push button station shall not provide seal-in operation.

   (3) Actuation of the "CLOSE" contact of the emergency lower switch shall provide seal-in operation.

   (4) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

   (5) A "balanced-pressure switch" with normally closed contact.

   (6) A limit switch geared or directly connected to the hoist machine shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

   (7) Gate position indicating lights as follows:

      (a) A red light on push button station and with emergency lower switch indicating gate is in normal operating position.

      (b) A green and blue light with emergency lower switch indicating gate is in closed and raised position, respectively.

      (c) Am amber light with emergency lower switch indicating gate is closing.
2. SEQUENCE OF OPERATION

a. Raising. When the gate is between the closed position and the raised position, actuation of the "RAISE" contact will cause the gate to open continuously to the raised position. If there is a pressure difference between the two sides of the gate, the gate will stop at the cracked position. After pressure is balanced actuation of the "RAISE" contact will cause the gate to open to the raised position.

b. Lowering. When the gate is between the over travel raised position and the closed position, actuation of the "LOWER" contact will cause the gate to lower continuously to the closed position.

c. Normal Operating Position
   (1) The gate is placed in the normal operating position by either the raising or lowering operation described above.
   (2) The red light indicates the gate is in normal position.
   (3) Actuation of the "STOP" contact of the push button station stops the gate.

d. Emergency Closing. When the gate is between the normal position and the closed position, actuation of the "CLOSE" contact of the emergency lower switch will cause the gate to lower continuously to the closed position.

e. Inching
   (1) To raise the gate above the raised position the "INCH UP" contact shall be held closed. Gate will be stopped at upper inch position by the limit switch.
   (2) To lower the gate when it is above the raised position the "INCH DOWN" contacts shall be held closed. Gate will be stopped at the raised position by the limit switch.

f. Over Travel
   (1) Over travel limit switches shall stop the driving motor if it fails to stop at the raised or closed position of the gate.
   (2) The "BACKOUT FROM LOWER OVER TRAVEL" or "BACKOUT FROM RAISE OVER TRAVEL" contact shall be held closed to operate the gate from over travel closed and over travel raised, respectively.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for dredging.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The techniques of sounding, sweeping, or a combination thereof are applicable methods in the acceptance examination, depending upon specific requirements of the project. In general, for maintenance dredging or for new dredging on soft bottom, the acceptance examination by soundings will be acceptable; for new dredging on hard coral or rock bed, and also for dredging below existing channel bottom on hard coral or rock bed, sweepings are required. For new dredging on hard bed harbor channel and turning basin for capital ships (such as aircraft carriers), the combination of soundings and sweepings is required. If modification of navigation charts is required after completion of dredging work, the EFD shall coordinate with Naval Facilities Engineering Command Code 04A3 for the proper data transfer procedures to the Defense
Mapping Agency. In the case of inland rivers all navigation chart updates shall be coordinated with Inland Electronic Navigation Chart (IENC) team of the Corps of Engineers.

PART 1   GENERAL

1.1   GENERAL INFORMATION

NOTE: Identify any known site specific information that would impact the contract work. Identification of known subsurface/submerged materials does not relieve the Contractor for doing their own investigations and should be noted in the contract.

This Section covers furnishing suitable dredging plant and performing all work required to remove the specified materials from within the prescribed work area limits as indicated, and placement of the dredge material within the prescribed material placement areas. The Contractor is responsible for making their own investigation of submerged, surface, and overhead structures in the work areas and other locations they find necessary to traverse. The exact location, depths, and heights of various structures including, but not limited to submarine cables, pipes, highlines, docks, piers, bulkheads, and bridges (as applicable), are not known and it will be necessary for the Contractor to ascertain interference problems and notify the respective owners in advance of dredging operations. The Contractor is responsible for making necessary arrangements with the respective owners of the structure(s) to assure satisfactory completion of dredging in the vicinity with a minimum interruption of service, and shall perform their operations in such a manner as will avoid damage to these facilities.

1.2   DEFINITIONS

1.2.1   Maintenance Material

Maintenance material is defined as that comprising shoaling which has occurred since the channel areas were last dredged.

1.2.2   New Work Material

New work material is defined as previously undredged material.

1.2.3   Hard Material

Hard material is defined as material requiring [blasting or] [the use of] special equipment for economical removal, and includes boulders or fragments too large to be removed in one piece by the dredge.

1.3   SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification
technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Submerged Pipelines

Soundings or Sweepings; G[, [_____]]

Indicate pipeline location and installation details. Submit drawings of surveys during progress of work by soundings or sweepings.

SD-07 Certificates

Protection Plan

1.4 METHOD OF COMMUNICATION

**************************************************************************

NOTE: Where appropriate, also require communications between dredging crews, placement area, and the US Coast Guard or Port Services Department of the Naval installation. Section
01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS should be referenced to ensure there is no redundancy or discrepancy.

**************************************************************************
Provide a system of communication between the dredge crew and the crew at the placement area. A portable two-way radio is acceptable.

1.5 OTHER DREDGING OPERATIONS

The Contractor should anticipate the possibility of concurrent dredging operations, adjacent to or nearby the dredge and placement areas in this contract. Delays should be anticipated in transiting to, and through, the placement sites during concurrent dredging and placement operations. As a standard safety precaution, observe all placement site specific restrictions pertaining to the limit of dredges operating within at any given time. Coordination with other dredge plant in the vicinity of the dredge and placement areas is required.

1.6 ENVIRONMENTAL COMPLIANCE AND PROTECTION

**************************************************************************
NOTE: USACE Division 01 specification concerning environmental compliance should be referenced to ensure there is no redundancy or discrepancy.

**************************************************************************
Comply with conditions and requirements of State or Federal permits. The Government will secure the permit for dredging and placement of material as indicated. Coordinate with [_____] for placement of excavated materials.

During the life of the contract, provide and maintain environmental protective measures. Also, environmental protective measures required to correct conditions, such as oil spills or debris, that occur during the dredging operations, must be provided. Comply with Federal, State, and local regulations pertaining to water, air, and noise pollution.

1.7 BASIS FOR BIDS

**************************************************************************
NOTE: USACE shall reference Division 00 and Division 01 to ensure there is no redundancy or discrepancy. Where applicable, choose one of the following options. Choose the first option for lump sum bidding of dredging, in projects where exact quantities can be practically determined prior to the actual work. Choose the second option for unit price bidding of dredging. Specify unit price bid items for dredging for projects where exact quantities cannot be practically determined prior to the actual work.

**************************************************************************
[Base bids on the quantity of dredging indicated. Should the total quantity of dredging vary from that specified as the basis for bidding, the contract price will be adjusted in accordance with FAR 52.243-4 Changes. The dredging conditions specified and indicated describe conditions which are known. However, the Contractor is responsible for other conditions encountered which are not unusual when compared to the conditions]
recognized in the dredging business as usual in dredging activities such as those required under this contract.]

**************************************************************************

NOTE: For NAVFAC PAC projects: Edit applicable attachments from 00 21 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS for inclusion in Standard Form 1442, "Solicitation, Offer and Award" and "Schedule of Bid Items." Select first bracketed text.

**************************************************************************

[For unit price bid, see [SF 1442, "Solicitation, Offer and Award" and "Schedule of Bid Items." ] [paragraph entitled "Basis of Bids, Measurement, and Payment" in Section 01 20 00 PRICE AND PAYMENT PROCEDURES.]]

**************************************************************************

NOTE: For NAVFAC LANT projects, use the following for unit price bidding.

**************************************************************************

[Payment will be at the contract unit price per cubic meter cubic yard, multiplied by total cubic meters cubic yards of acceptable dredging. Base bids on total cubic meters cubic yards of dredging[, as specified in Section 00 22 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS]. Include a bid unit price per cubic meter cubic yard of dredging based on the quantity [as specified or indicated.][stated in Section 00 22 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS.] If the Contracting Officer requires an increase or a decrease in total volume of dredging, the contract price will be adjusted in accordance with the FAR 52.211-18 Variation in Estimated Quantity. Dredging conditions specified and indicated describe conditions which are known. However, the Contractor is responsible for other conditions encountered which are not unusual when compared to conditions recognized in the dredging business as usual in dredging activities such as those required under this contract.]

PART 2 PRODUCTS

2.1 CHARACTER OF MATERIAL

**************************************************************************

NOTE: Include silt, sand and mud if project is for maintenance dredging. Delete new material if area has been previously dredged to design depth. New material is material which has never been dredged. Provide the site specific material description if it is known. For USACE, review any site investigations specifications, as applicable, to ensure consistency as it relates to material characterization.

**************************************************************************

The material to be removed is [silt, sand, and mud] [new material] [maintenance material] [______]. The in situ bulk density of the predominant material to be dredged is as follows:

a. Dredge Area 1 has an in situ bulk density of [______] grams/liter, and consists of [______] percent sand, [______] percent gravel, and [______] percent fines.

b. The Contractor is ultimately responsible for determination of the
characteristics of materials to be dredged.

**************************************************************************

NOTE: When blasting will not be permitted, so state. When blasting is permitted, incorporate the project specification information relative to maximum amount of charge that will be permitted and detailed requirements applicable to the specific project.

**************************************************************************

Remove hard material as needed to achieve the required template. Use of blasting operations will be permitted. Reference Section 31 23 00.00 20 EXCAVATION AND FILL for blasting requirements.

PART 3 EXECUTION

3.1 INSPECTION

**************************************************************************

NOTE: Choose one of the following options. Choose the first option for projects which incorporate Contractor Quality Control. Choose the second option for projects which do not incorporate Contractor Quality Control.

**************************************************************************

[Inspect the work, keep records of work performed, and ensure that gages, targets, ranges, and other markers are in place and usable for the intended purpose. Provide, at the request of the Contracting Officer, boats, boatmen, laborers, and materials necessary for inspecting, supervising, and surveying the work. When required, provide transportation for the Contracting Officer and inspectors to and from the placement area and between the dredging plant and adjacent points on shore.]

[The Government will keep a record of work performed and will require that gages, ranges, and other markers are usable for the intended purpose. Provide, at the request of the Contracting Officer, boats, boatmen, laborers, and materials necessary for inspecting, supervising, and surveying the work. When required, provide transportation for the Contracting Officer and inspectors to and from the placement area and between the dredging plant and adjacent points on shore.]

The dredge plant will be inspected by the Contracting Officer, or their representative, prior to beginning work to ensure total dredging plant is in safe working condition. Before any machinery or mechanized equipment is placed in service, it must be inspected and tested by the Contractor and certified to be in safe operating condition.

3.2 DREDGING

3.2.1 Order of Work

**************************************************************************

NOTE: Special scheduling requirements, restrictions, or other similar features bearing on the Contractor performing the work, should be specified in this paragraph or reference made to "Special Scheduling Requirements" paragraph in
**Section 01 14 00 WORK RESTRICTIONS.**

The Contracting Officer will direct the Contractor on the order of work. The Government reserves the right to change the order of work at any time.

3.2.2 Interference with Navigation

**NOTE:** If known, include types of vessel and volume of traffic expected to be encountered. USACE review Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS for Contractor requirements to ensure there is no redundancy or duplication.

Minimize interference with the use of channels and passages. The Contractor is responsible for shifting or moving of dredges or the interruption of dredging operations to accommodate the movement of vessels and floating equipment, if necessary. Adhere to Coast Guard Regulations for passing vessels.

3.2.3 Lights

Each night, between sunset and sunrise and during periods of restricted visibility, provide lights for floating plants, pipelines, ranges, and markers. Also, provide lights for buoys that could endanger or obstruct navigation. When night work is in progress, maintain lights from sunset to sunrise for the observation of dredging operations. Lighting must conform to United States Coast Guard requirements for visibility and color.

3.2.4 Navigation Warnings

Furnish and maintain navigation warning signs along the pipeline. Provide notice to increase public awareness of potential hazards presented by dredge plant equipment by stating the location, date of construction, equipment mooring, marshaling areas, using local newspapers, radios, television, waterway users associations, or other appropriate area specific communication networks. Ensure that an announcement is made through the same networks at the beginning of the dredging operation. Make periodic update/status announcements at intervals of not more than a month throughout the contract life.

Display a sturdy and prominent warning sign at all public boat marinas within 10 miles of dredging operations or moored equipment. The Contractor is responsible for keeping this sign current with respect to the dredging operations or equipment.

3.2.5 Ranges, Gages, and Lines

Provide, set, and maintain ranges, buoys, and markers needed to define the work and to facilitate inspection. Establish and maintain gages in locations observable from each part of the work so that the depth may be determined. Suspend dredging when the gages or ranges cannot be seen or followed. The Contracting Officer will furnish, upon request by the Contractor, survey lines, points, and elevations necessary for the setting of ranges, gages, and buoys.
3.2.6 Dredge Plant and Equipment

NOTE: Include either (dredge type) or option for (clamshell) (hydraulic cutterhead) (trailing suction hopper) (other) after bracket.

a. A [_____] dredge will be used to perform all dredging work under this contract.

NOTE: Include (number) or (count).

b. [_____] dredge(s) may be in operation under this Contract at a time.

c. Maintain all dredge plant and associated equipment such as, but not limited to, scows, coamings, barges, and pipelines, to meet the requirements of the work. Promptly repair leaks or breaks along pipelines.

3.2.7 Layout of Work

NOTE: Include datum following bracket to identify purpose of bracket.

The Contractor will be provided layout charts for all dredging areas based on the schedule of work, the Contractor's hydrosurvey requests, and/or the results of Government hydrographic survey monitoring. The most current Government hydrosurvey information will be displayed on the dredging layout charts and provided to the Contractor. All depths are measured from [______]. Other pertinent information to be included with each layout package will be: payment method, required and maximum dredging depths, coordinates for the material placement site, distance one-way from dredging location to placement site, specific placement site instructions, supplemental tide gauge information, horizontal control locations, and computed hydrosurvey quantities.

NOTE: For USACE, quantities for project dredging, overdepth dredging, and total in the blanks are included in the Bid Schedule and should be deleted from herein.

The total estimated quantity of material to be removed is computed as that material that is within the specified limits, including side slopes, but excluding unpaid overdepth. The quantities listed are estimates only. All estimated quantities are subject to FAR 52.211-18 Variation in Estimated Quantity.

3.2.7.1 Overdepth Dredging

To cover unavoidable inaccuracies of dredging processes, material actually removed to a depth of [_____] meters feet below the minimum required depth specified and within the dredging limits will be measured and paid for at
full contract price.

The maximum amount of allowable unpaid overdepth dredging is [_____] meters feet below the specified maximum paid dredging depth.

3.2.7.2 Side Slopes

**************************************************************************

NOTE: Use the first bracketed item when the side slope overdredge allowance is specified; use second bracketed item when side slope overdredge allowance is not specified. For first bracketed item, insert allowable depth for dredging of side slopes beyond the indicated or specified side slopes for which payment will be made.

Ensure project requirements consider slope natural angle of repose and potential for sloughing when selecting appropriate language herein. Dredge equipment used will impact the resultant amount of material required to be removed.

**************************************************************************

Side slopes in the dredge areas within this contract will be measured and paid based on a [_____] meter feet horizontal to [_____] meter feet vertical ratio. Dredging on side slopes must follow, as closely as practicable, the dredge area limits indicated on associated layout drawings.

[ A [_____] meter feet allowance will be made for dredging beyond the indicated or specified side slopes, except as provided herein. Material removed from within the allowance area will be unpaid. The allowance will be determined by projecting a line upwards, paralleling the project design side slopes, from the intersection of the overdepth dredging limit (at a point located vertically below the limit of dredging at the top of slope). The amount of material excavated from side slopes will be determined by either cross-sections or computer, or both.

] [No allowance will be made for dredging beyond the dredge area limits as indicated on the associated layout drawings. No dredging can occur outside of the dredge area and side slope limits.

3.2.8 Obstructions and Debris

**************************************************************************

NOTE: Choose one of the following options. Choose the first option where no known obstructions exist and site is not near existing piers. Choose the second option where known obstructions exist or for dredging around existing piers.

**************************************************************************

[ The Government has no knowledge of cables, pipes, or other artificial obstructions or of any wrecks, wreckage, or other material that would necessitate the use of explosives or the employment of additional equipment for economical removal. Contractors should however exercise due diligence in determining the existence of any obstructions within proposed work areas during bid preparation.
The Government has knowledge of debris such as, but not limited to, metal bands, pallets, pieces of broken cable, rope, fire hose, and broken piles. The Contractor is responsible for the disposal of the removed debris. This disposal must occur outside the limits of government property, and done so in accordance with all federal, state, and municipal regulations.

The Government has no knowledge of existing wrecks, wreckage, or other material of such size or character as to require the use of explosives or special or additional plant for its economical removal.

3.2.9 Dredging Requirements

**************************************************************************
NOTE: Include requirements for various dredge areas. The current text is a template for use.
**************************************************************************

Dredge Areas

1) Dredge Area 1

   a) As determined by the results of a hydrographic survey monitoring, the Government will direct the Contractor to dredging areas within [_____] meters feet [ datum ] including paid overdepth, unless otherwise stated in the layout drawing.

   b) Material placement will be [_____] site. See Section [01 20 00 PRICE AND PAYMENT PROCEDURES] for more details.

2) Dredge Area 2

3.2.10 Quality Control

Establish and maintain quality control for operations to assure compliance with contractual requirements and maintain records of this quality control for dredging operations.

While performing all dredging work control the horizontal positioning of the dredge with electronic positioning.

3.2.11 Surveys during Progress of Work

Quality of dredging depth will be determined by soundings or sweepings taken behind the dredge as work progresses. The [Government will][Contractor will] take progress soundings or sweepings.

3.2.12 Skimming of Hoppers

Skimming of hoppers must be performed in compliance with environmental requirements and ABS/USCG load line marks.

3.2.13 Salvaged Material

Anchors, chains, firearms, and other articles of value, which are brought to the surface during dredging operations, must remain or become the property of the Government and will be placed on shore at a convenient location near the site of the work, as directed.
3.2.14 Safety of Structures

The prosecution of work must ensure the stability of piers, bulkheads, and other structures lying on or adjacent to the site of the work, insofar as structures may be jeopardized by dredging operations. Repair damage resulting from dredging operations is the responsibility of the Contractor, insofar as such damage may be caused by variation in locations or depth of dredging, or both, from that indicated or permitted under the contract. The Contractor is responsible for coordinating with the owner of the structure for any necessary repairs.

3.2.15 Protection Plan

Prior to blasting, submit a plan for protection of surrounding structures, equipment, and vessels in accordance with Section 31 23 00.00 20 EXCAVATION AND FILL for blasting requirements.

3.3 Placement Operations

3.3.1 Placement of Excavated Materials

**************************************************************************
NOTE: Delete inapplicable language for placement area; insert other placement area language as appropriate.
**************************************************************************

Provide for safe transportation and placement of dredged materials. Transport and placement of dredged material in the [_____] [placement area] [area designated for placement of dredged material]. [The Contractor may, at his option, place dredge material at [_____] or provide placement at an government approved placement area.] The placement of dredged materials in unauthorized places is forbidden. Comply with rules and regulations of all, federal, state and local authorities.

3.3.2 Method of Placement

**************************************************************************
NOTE: Delete inapplicable method of placement and include only the language appropriate for the method of placement to be used. Details should be specified regarding exact location for discharge into the placement area, maximum allowable elevation of buildup, and any other limitations or special provisions for placement. It is not recommended to pay based on scow measurement.
**************************************************************************

Place all dredged material by [the hydraulic process] [hopper dredge] [self-dumping scow or barge]. [Coordinate completion of load with the Government. Notify the Government when scows or barges are returned to the dredge area.] [Pipeline for hydraulic dredging must discharge into the placement area.]

3.3.3 Placement in Indicated Site(s)

**************************************************************************
NOTE: Include any special requirements for the
construction and maintenance of fill area bulkheads and weirs. Delete when fill areas are not shown on the contract drawings. Require bulkheads and weir submittals for Contracting Officer review.

In placing excavated material for fill, uniformly grade and allow for shrinkage. Provide and maintain necessary bulkheads, dikes, ditches, weirs, spillways, and other construction necessary to confine and retain the fill in the dredge fill area.

### 3.3.4 Charges for Material Placement

**NOTE:** Insert "Department of the Army" in the first blank where placement area is under jurisdiction of the Corps of Engineers. Insert name of placement area in second blank. Delete entire paragraph when not applicable.

The [Government][Contractor] is responsible for payment of charges imposed by the [_____] for placement of material in the [_____] placement area.

### 3.3.5 Operation of Sluiceways

**NOTE:** Insert Corps of Engineers or other controlling agency in the blank provided. Delete when not applicable to the project.

Sluiceways on the placement area levees will be operated and maintained by the [______]. The Government will relieve the Contractor of operations thereof.

### 3.3.6 Misplaced Dredged Material

Any dredged materials deposited at locations other than in areas designated or approved by the Contracting Officer will be considered misplaced material and will not be paid for until the Contractor, at his own expense, removes and deposits such misplaced material where directed. This required removal and redeposit of the misplaced material and any necessary placement site restoration work is not the basis for a time extension or additional compensation under this contract.

### 3.3.7 Submerged Pipelines

If a leak occurs in the discharge pipeline, immediately discontinue using the line until leaks are repaired. Following a leak, the Contractor should conduct, or request the Government to conduct, a hydrosurvey to ensure that any dredged material discharged through the leak did not accumulate or cause mounding. If accumulation did occur, the Contractor must coordinate with the Government to remove the accumulated material, if deemed necessary. The Contractor is responsible for any resulting costs of repair and restoration.
3.4 MEASUREMENT

NOTE: FOR US Army Corps of Engineers Projects, the measurement is discussed in Division 01 Measurement and Payment and should not be included in the specification herein.

The [Government will be] [Contractor is] responsible for taking soundings before and after dredging.

Final quantities will be subject to deductions or correction of deductions previously made because of excessive overdepth, dredging outside or authorized areas, or placement of material in an unauthorized manner.

3.4.1 Method of Measurement

NOTE: The method of survey shall be defined by the Government. Details for the method of measurement, calculations, and time frame for measurements to be made shall all be defined herein.

Quantity of material removed that will be paid for will be measured by cubic meter cubic yard [in place] [by means of volume difference from soundings taken before and after dredging] [by means of topographic surveys of fill sites taken before and after dredging] [_____] . The drawings represent existing conditions based on current available information, but will be verified and corrected, if necessary, by soundings taken before dredging in each locality. Areas sounded within [_____] of completion of work. The Contractor has the option of being present when such soundings are made.

3.4.2 Monthly Estimates

NOTE: The progress payments requirements for US Army Corps of Engineers Contracts are typically included in Division 01 Measurement and Payment, as well as the front end clauses, and if so, shall be deleted from herein.

Monthly estimates of work completed will be based on the result of soundings taken during the progress of the work [or, at the option of the Contracting Officer, on 85 percent of the scow or barge measurement]. Deductions will be made for dredging and placement not in accordance with the specifications.

3.5 FINAL EXAMINATION AND ACCEPTANCE

NOTE: The techniques of sounding, sweeping, or a combination thereof are applicable methods in the acceptance examination, depending upon specific requirements of the project. In general, for maintenance dredging or for new dredging on soft
bottom, the acceptance examination by soundings will be acceptable; for new dredging on hard coral or rock bed, and also for dredging below existing channel bottom on hard coral or rock bed, sweepings are required. For new dredging on hard bed harbor channel and turning basin for capital ships (such as aircraft carriers), the combination of soundings and sweepings is required. If modification of navigation charts is required after completion of dredging work, the EFD shall coordinate with Naval Facilities Engineering Command Code 04A3 for the proper data transfer procedures to the Defense Mapping Agency. In the case of inland rivers all navigation chart updates shall be coordinated with Inland Electronic Navigation Chart (IENC) team of the Corps of Engineers.

For USACE, do not use if removal requirements are included in other specification sections.

**************************************************************************

As soon as practicable after the completion of areas, which in the opinion of the Contracting Officer, will not be affected by further dredging operations, each area will be examined by the Government by sounding or sweeping, or both. Remove shoals and lumps as required by methods approved by the Government. However, if the bottom is soft and the shoal areas form no material obstruction to navigation, removal may be waived at the discretion of the Government. The Contractor will be notified when soundings or sweepings are to be made and will be permitted to accompany the sounding or sweeping party and to inspect the data and methods used in preparing the final quantity for payment. When areas are found to be in a satisfactory condition, the work therein will be accepted as complete.

Re-dredging at the Contract price, within the limit of available funds, may be completed with the consent of both the Government and the Contractor when infill or shoaling beyond the Contractor's control occurs in any area previously accepted.

3.6 PLANT REMOVAL

Upon completion of the work, remove all dredging plant, including ranges, buoys, piles, and other markers or obstructions within [_____] days.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for stone protection, including foundation preparation, bedding layers and filters, for the slopes and bottom of channels, ditches, structures, lock approaches, etc.; constructing trenchfill revetment, bank paving, and outlet drains; stone revetment, stonefill dikes, stoneroots, and junctions; constructing stone capouts and revetment reinforcing along the river; revetment repairs; shoreline/coastal protection. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The EMs and ETLs referenced in this guide specification can be found on the Internet at http://www.usace.army.mil/inet/usace-docs.
To clarify the difference between Stone Protection, Channel Protection, and Shoreline Protection, the following definitions are provided. Stone Protection is defined as a system which includes a layer of bedding material or layers of filter material beneath a layer or layers of riprap. Stone protection is placed around structures in slack water or within a dewatered site. Stone protection may also be used to protect channel banks when it is placed in the dry or in slack water. Riprap is defined as a material having a gradation band similar to those specified in EM 1110-2-1601, Chapter 3. Channel Protection is stone placed in a current as revetment, dikes, or slope paving without the use of a separate layer of bedding or filter material. In this type of environment, bedding sand or geotextiles and materials with gradation bands with a top size of 150 mm 6 inches will not stay where placed. Shoreline Protection is defined as a system of bedding or filter materials and stone used to protect coastlines of lakes and oceans and for harbor protection.

Grouted riprap should only be used when the quantity of larger stone on a project is very small and in a noncritical area. Also, grouted riprap should be considered only when minor settlement is expected in the foundation, potential of undermining is very low, and the density of the fill material is at a minimum of 95 percent Standard Proctor. Additional information provided in ETL 1110-2-334.

EM 1110-2-2302, Construction with Large Stone, presents criteria and gives guidance for selection, evaluation, and use of large-stone materials in construction. This document also references other EM's that have additional related guidance for the protection design. One additional reference not listed is EM 1110-2-1614, Design of Coastal Revetments, Seawalls, and Bulkheads. However, the quality criteria specified in this document was based upon a limited review of criteria being used by Corps. Quality criteria that is specified by a District should be that which has been selected to be used on its projects or criteria specified by a Division to be used by the District to meet the durability requirements for the project being constructed.

"Riprap Quality Criteria in Standard Specification and Engineering and Guidance", Rock for Erosion Control, ASTM STP 1177; and TR-GL-81-8, Evaluation of Quality and Performance of Stone as Riprap or Armor", both support the need to perform freeze-thaw testing by COE CRD-C 144 instead of ASTM procedures. Also, both indicate that soundness tests and L.A. Abrasion tests are of limited use when evaluating Riprap and Armor Stone.

**************************************************************************
1.1 UNIT PRICES

**************************************************************************
NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.
**************************************************************************

1.1.1 [Bedding] [and] [Filter] Layer(s)

1.1.1.1 Payment

Payment for gravel, crushed stone, and sand placed for bedding and/or filter material will be made at the applicable contract unit prices for [Sand "[_____"]], [Gravel "[_____"]], [Filter Stone], [Bedding Stone]. Price(s) and payment(s) shall include all costs of furnishing, hauling, placing and maintaining the bedding and/or filter material until placement of the riprap cover is completed and accepted. Geotextiles used as filters will be paid for in accordance with provisions of Section [01 20 00 PRICE AND PAYMENT PROCEDURES][31 05 19.13 GEOTEXTILES FOR EARTHWORK]. Preparation of the base will not be paid for separately and all costs incidental thereto shall be included in contract prices for other items for which payment will be made. No payment will be made for excess thickness of bedding and/or filter material, nor for material required to replace subgrade material lost by rainwash, wind erosion, overexcavation or otherwise.

1.1.1.2 Measurement

**************************************************************************
NOTE: Alternative 1.
**************************************************************************

[[Gravel,] [crushed stone,] [and sand] placed for bedding and/or filter layers will be measured for payment by the ton (metric) ton. Quantities will be computed to the nearest whole ton. Gravel, crushed stone, and sand will be measured for payment, in the presence of the Contracting Officer, by weighing on approved, accurately calibrated scales furnished by and at the expense of the Contractor.[ The scales shall be capable of printing a weight ticket including time, date, truck number, and weight.] Weight certificates furnished by a public weighmaster will be acceptable.] Submit Weigh Scale Certification and Certified Weight Scale Tickets, by a copy of the certification from the regulation agency, attesting to the scale's accuracy and a copy of each certified weight scale ticket after [_____] working day(s) after weighing.

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

[[Gravel,] [crushed stone,] [and sand] placed for bedding and/or filter layers will be measured for payment as the volume determined by multiplying the area[, as measured in the field,] of the surface on which the gravel, crushed stone, or sand is placed, by the thickness measured perpendicular to the surface of the gravel, crushed stone, or sand as dimensioned on the
contract drawings. Geotextiles used as filters will be measured in accordance with provisions of Section [01 20 00 PRICE AND PAYMENT PROCEDURES] [31 05 19.13 GEOTEXTILES FOR EARTHWORK]. Preparation of the base will not be measured for payment.

1.1.1.3 Unit of Measure

Unit of measure: [ton (metric)][cubic meter] [ton][cubic yard].

1.1.2 [Riprap] [(Manufactured] Derrick Stone] [Capstone] [Graded Stone] [Stone] [Bedding/Mattress Stone] [Splash/Fill Stone] [Armor/Cover Stone] [Core/Underlayer/Scour Stone]

1.1.2.1 Payment

**************************************************************************
NOTE: Select the first optional paragraph for Alternate 1; select the second optional paragraph for Alternate 2a; select the last optional paragraph for Alternate 2b.
**************************************************************************

[Payment for [riprap] [and] [stone] satisfactorily placed will be made at the applicable contract unit price for [M[_____] R[_____] Riprap,] [Grouted M[_____] R[_____] Riprap,] [(Manufactured] Derrick Stone,] [and] [Capstone,] [Stone,] [Bedding/Mattress Stone,] [Splash/Fill Stone,] [Armor/Cover Stone,] [Core/Underlayer/Scour Stone]. Price(s) and payment(s) shall constitute full compensation for furnishing, hauling, handling, placing, and maintaining the [riprap] [stone] until final acceptance by the Government. [No separate payment will be made for the stockpiling of [riprap] [and] [stone], and all cost in connection with stockpiling shall be included in the contract unit price for [riprap] [and] [stone].]

[Payment for [riprap] [and] [stone] satisfactorily placed will be made at the applicable contract unit price for [M[_____] R[_____] Riprap,] [Grouted M[_____] R[_____] Riprap,] [(Manufactured] Derrick Stone,] [Capstone,] [Stone,] [Bedding/Mattress Stone,] [Splash/Fill Stone,] [Armor/Cover Stone,] [Core/Underlayer/Scour Stone]. Price(s) and payment(s) shall constitute full compensation for furnishing all plant, labor, materials and equipment and constructing the stone protection in the work as specified. [No separate payment will be made for the stockpiling of [riprap] [and] [stone], and all cost in connection with stockpiling shall be included in the contract unit price for [riprap] [and] [stone].]

[Payment for stone satisfactorily placed in constructing the [trenchfill revetment,] [stonefill dikes,] [stonefill revetments and junctions,] [excluding trenchfill revetments, wrap-around,] [dike capouts,] [reinforcements,] [bank paving,] and [outlet drains] will be made at the contract unit price for [Graded Stone ["A"] ["B"] [and/or] ["C"],[57][_____]-kg [125][_____]-pound stone]. Price(s) and payment(s) shall constitute full compensation for furnishing all plant, labor, stone, and performing all work necessary in placing the stone in constructing the trenchfill revetment, bank paving, and drainage structures as specified herein or shown on the drawings. Full payment for stone will not be permitted until trenchfill bank paving has been completed in a satisfactory manner. Twenty (20) percent of the payment for stone will be retained until bank paving has been completed in a satisfactory manner.]
1.1.2.2 Measurement

**************************************************************************
NOTE: Alternative 1.
**************************************************************************

[[Riprap] [Stone] will be measured for payment by the ton (metric) ton.
Quantities will be computed to the nearest whole ton.]  [[Riprap] [Stone]
will be measured for payment, in the presence of the Contracting Officer,
by weighing on approved, accurately calibrated scales furnished by and at
the expense of the Contractor.][ The scales shall be capable of printing a
weight ticket including time, date, truck number, and weight.][ Weight
certificates furnished by a public weighmaster will be acceptable.]

**************************************************************************
NOTE: Alternative 2a.
**************************************************************************

[[Riprap] [Stone] will be measured for payment as the volume determined by
multiplying the area [ as measured in the field,] of the surface on which
the [riprap] [stone] is placed, by the thickness of the [riprap] [stone]
measured perpendicular as dimensioned on the contract drawings.]

**************************************************************************
NOTE: Alternative 2b.
**************************************************************************

[[Riprap] [and] [Stone] will be measured for payment by the ton (metric) ton
as determined by [barge] [vessel] displacement, [certified railroad
weights,] where direct placement into structure(s) is practicable, or by
weighing by the truckload on approved scales meeting the requirements of
paragraph TRUCKLOAD.]

a. Truckload. Each truck load will be weighed to the nearest 0.10 ton
(metric) 0.1 ton and the final quantity rounded to the nearest whole
ton. [Riprap] [and] [Stone] will be measured for payment by weighing
on approved scales before being placed in the work. Scales shall be of
sufficient length to permit simultaneous weighing of all axle loads and
shall have an accuracy within 0.2 percent throughout the range of the
scales. The scale's accuracy shall conform to the applicable
requirements of NIST HB 44 and shall be certified [by an acceptable
scales company representative] [by an inspector of the State Inspection
Bureau charged with scales inspection within the state in which the
project is located] prior to weighing any [riprap] [and] [stone].[ The
scales shall be located at the site of work.][ The scales shall be
capable of printing a weight ticket including time, date, truck number,
and weight.][ If commercial scales are readily available in close
proximity (within [_____][16] km [_____][10] miles) of site of work,
documentation shall be submitted certifying that the scales meet the
requirements of the specification.][ Furnish the scales and weigh the
[riprap] [and] [stone] in the presence of the Contracting Officer,[ who
will read and record the weights thereof][ who will certify the
correctness thereof].[ The Contracting Officer may elect to accept
certified [railroad weights or] weight certificates furnished by a
public weighmaster in lieu of scale weights at the jobsite.][ Quarry
weights will not be accepted.][ Scales will be checked and certified
before hauling [riprap] [and] [stone] [and after each [50 000][____]
tons (metric) [50,000][____] tons increment of [riprap][ and ] [stone]
weighed under this contract].
b. [Barge] (or vessel) Load

(1) If delivered by [barge] (or vessel), [riprap] and [stone] will be measured for payment by the Contracting Officer by weight determined by [barge] (vessel) displacement. Furnish the Contracting Officer a [barge] (vessel) displacement table not less than 10 work days prior to unloading the [riprap] and [stone] from any [barge] (vessel). Each table submitted shall show the name and/or number of the [barge] (vessel) owner, the name of the fabricator, and the certification and date of certification of the person or firm preparing the table. Furnish with the [barge] (vessel) displacement tables a drawing or sketch of each [barge] (vessel), dimensioned in sufficient detail to permit checking of the tables. The drawings shall show, as a minimum, the length, width, depth of the [barge] (vessel), and dimensions of the rake or rakes. Each such table shall have its accuracy certified by a person or firm, other than the Contractor, customarily performing this service. Each table submitted shall contain, in parallel columns, the freeboard of the [barge] (vessel) in meters feet and tenths from zero to the full depth of the [barge] (vessel) and the corresponding gross displacement to the nearest ton. Each [barge] (vessel) shall be suitably marked with [two] (three) displacement gaging locations on each side near each end of the [barge] (vessel) and two amidships on opposite sides. Each gaging location shall be marked by a line perpendicular to the edge of the [barge] (vessel), 100 mm 4 inches wide and 300 mm 1 foot long, on both the deck and side of the [barge] (vessel) and two amidship on opposite sides. [Barges] (Vessels) with rakes shall have the displacement gaging lines placed at each corner of the box section between the rakes. If a [barge] (vessel) has a box end or ends, the gaging locations shall be placed approximately 1200 mm 4 feet from the box end(s). The freeboard will be measured at the [four] (six) gaging locations and the displacement determined by the use of "STANDARD [BARGE] [VESSEL] TABLES" from the average of these measurements. The displacement will be determined before and after being unloaded and the difference between these values shall be the quantity delivered. Submit the Gaging Table Data, stone hauling vessel, gaging tables [and a copy of the data and calculations used for the preparation of the tables]. [[Barges] (Vessels) shall be loaded so that the readings taken at the gaging locations do not vary more than 450 mm 1.5 feet port to starboard fore and aft and do not vary more than 150 mm 0.5 feet port to starboard. If such is not the case, trim the carrier by shifting the stone until this limit is reached, before the measurement will be accepted.][The draft shall be determined from the average of all six readings weighting the readings of the middle gage at double those of the end gages. \(G_1 + G_5 + 2xG_3 + 2xG_4 + G_5 + G_6\) divided by 8 = average draft.][All carriers used in transporting stone shall be free of leaks such as would render accurate gauging difficult. Facilities for inspecting the hold of each carrier to determine whether leakage is occurring shall be provided. Each carrier shall also be provided with adequate pumping facilities, and if water is found to be accumulating in the hold, the carrier shall be pumped dry before each gaging, both before and after unloading.][Lightening by pumping or by transfer of crew or supplies will not be permitted while stone is being transferred.][Rejected [riprap] [stone] [_____] and unacceptable material shall
be left aboard the [barge][vessel] until after the final readings have been taken.]  

(2) [If [barge][vessel] tables are furnished for fresh water and if it is believed that [barge][vessel] displacement measurements made within the contract limits of the work are being taken in water that has salinity, the Contractor has the option of obtaining water samples and determining densities or unit weights of these samples. These water samples shall be taken in accordance with ASTM D3370 (Practice A - Grab Samples) at depths of 1200 and 2400 mm 4 and 8 feet in the area where measurements are made. Water sampling shall be performed when the [barges][vessels] are measured for quantities, both when fully loaded and when empty. Take water samples, as witnessed by the Contracting Officer, with the use of "Polypro" 2000 ml water sampler, or equal. Densities shall be determined as specified in ASTM D1429 (Method D-Hydrometer Method). Testing shall be done for the Contractor by a certified testing laboratory, and test results certified by the laboratory. After review and approval of the test results by the Contracting Officer, the average of the densities obtained at 1200 and 2400 mm 4 and 8 feet will be used as the suitable salt water conversion factor. In all calculations, the unit weight of 1000 kN/m³ 62.4 pounds per cubic foot will be used for fresh water.]  

c. Stockpiled [Riprap] [Stone] [______]. If the Contractor elects to stockpile [riprap] [stone] [______] [on the worksite] [or] [offsite], the [riprap] [stone] [______] shall be weighed immediately before placement by [either][the] method described above. [Riprap] [Stone] [______] placed in temporary storage on the worksite as specified in paragraph WORKSITE STOCKPILE will not be required to be re-weighed prior to placement.] [If the [barge][vessel] displacement method is elected, a minimum of [one-third the total maximum displacement of the [barge][vessel]] [______][500] tons (metric) [______][500] tons of [riprap] [stone] [______] is required on each [barge][vessel].]  

(1) Determination of Excess Stone. All stone outside the limits and tolerances of the cross sections of the structure, except variations so minor as not to be measurable, will be deducted from the quantity of new stone for which payment is to be made. Weight of excess stone will be determined from the cross sections obtained by the method provided for in paragraph FINAL SURVEYS, on the basis that the cubic meters feet of volume (including voids) for each type of stone, as listed in the Table in paragraph FACTORS USED FOR CONVERTING IN PLACE VOLUME TO WEIGHT, is equal to one ton (metric) or 1000 kg one ton or 2,000 pounds for the bulk specific gravity and percentage of voids shown. If the bulk specific gravity of the stone furnished or the percentage of voids is other than as listed below, the cubic meters feet of volume equaling 1000 kg 2,000 pounds shall be recomputed as described in paragraph REVISIONS OF BIDDING SCHEDULE QUANTITIES. Should any excess stone be disclosed above the tolerance line as defined in paragraph TOLERANCES, its volume will be computed by the average end area method, based upon the cross section in the following manner. The average end area of excess stone above the tolerance line for two (2) successive cross sections, multiplied by the distance between the cross sections will be accepted as the volume. [The Contractor will not be required to remove such excess stone and deductions for the weights thereof will be made from contract payments for new stone. ]In addition to the above,
stone, which has been delivered to the site and has been lost or wasted or otherwise not properly incorporated into the final required work, shall be deducted from the quantity for which payment is to be made.

(2) Final Surveys. Survey work and measurements required for determination of excess volume computations for stone materials shall be performed in the presence of the Contracting Officer. Notify the Contracting Officer not less than 3 days in advance of each survey. [In the event of unavailability of the Contracting Officer, perform the survey and certify to the Contracting Officer that it complies with the specifications.] Cross section surveys shall be taken perpendicular to the axis of the structures. Elevations and soundings shall be taken on lines \[8\] feet [25] feet apart measuring along the structure reference line, with the readings at 1.5-meter 5-foot intervals and at breaks in the grade along the line. Other survey intervals and readings may be used if deemed appropriate or advisable by the Government's on-site representative. Additional cross sections, elevations, and soundings may be taken if determined necessary by the Government's on-site representative. Determination of quantities will be made by the Government's on-site representative and having once been made, will not reopen, except on evidence of collusion, fraud or obvious error. Prior to performing any work under this Section, coordinate all operations with the Government's on-site representative so that excess volume surveys will be made at the appropriate time. The surveys made under paragraph CHECK SURVEYS may be used when deemed appropriate by the Government's on-site representative, as part of the surveys required herein. Stone quantity computations shall be based entirely upon weights of new stone as determined from carrier displacement or certified scale weight tickets. [Existing stone placed in lieu of new stone from off-site sources is excluded from measurement and payment.]

1.1.2.3 Unit of Measure

Unit of measure: [ton (metric)] [cubic meter] [ton] [cubic yard].

1.1.3 [Concrete Grout for Grouted Stone Protection]

1.1.3.1 Payment

Payment will be made for cost associated with concrete grout for grouted stone protection, which includes full compensation for furnishing all plant, labor, material, equipment and other items necessary and incidental to the completion of the work.

1.1.3.2 Measurement

Concrete grout for grouted stone protection will be measured for payment based upon the volume determined from the calculated batch volume and the number of mixed batches delivered to the site and acceptably placed in the work.

1.1.3.3 Unit of Measure

Unit of Measure: cubic meter cubic yard.
1.1.4 Bedding Sand

1.1.4.1 Payment

Payment for bedding sand will be made at the contract unit price for "Bedding Sand" and shall constitute full compensation for material and placement of bedding sand in constructing drainage structures as specified herein.

1.1.4.2 Measurement

Bedding sand shall be measured for payment by the ton (metric) ton of sand satisfactorily in-place in accordance with the requirements for stone measurement in paragraph STONE.

1.1.4.3 Unit of Measure

Unit of measure: ton (metric) ton.

1.1.5 Revetment Repairs

1.1.5.1 Earthwork, Small Repairs

When less than 8000 cubic meters 10,000 cubic yards of earthwork is specified, the earthwork shall be considered Earthwork, Small Repairs.

a. Payment will be made for costs associated with grading and excavation, which includes furnishing all equipment, labor and materials, and performing all clearing, except range clearing, drift removal and disposal of debris; grading and excavation; disposal of material from grading, whether or not used for fill; dressing; and all other operations incidental thereto.

b. Earthwork, Small Repairs will be measured for payment based upon on-site surveys, taken under the direction of the Government Representative, of the required grading or excavation areas prior to commencement and on-site surveys taken after completion of the work. All quantities removed will be determined from these surveys computed to the nearest cubic meter yard.

c. Unit of measure: cubic meter yard.

1.1.5.2 Earthwork, Large Repairs

When 8000 cubic meters 10,000 cubic yards or more of earthwork is specified, the earthwork shall be considered Earthwork, Large Repairs.

a. Payment will be made for costs associated with grading and excavation, which includes furnishing all equipment, labor and materials, and performing all clearing, except range clearing, drift removal and disposal of debris; grading and excavation; disposal of material from grading, whether or not used for fill; dressing; and all other operations incidental thereto.

b. Earthwork, Large Repairs will be measured for payment based upon on-site surveys, taken under the direction of the Government Representative, of the required grading or excavation areas prior to commencement and after completion of the work. All quantities removed will be determined from these surveys computed to the nearest cubic
c. Unit of measure: cubic meter yard.

1.1.5.3 Breaking Out Pavement

a. Payment will be made for costs associated with breaking out asphalt and/or concrete pavement, which includes furnishing all material, equipment and labor for breaking out pavement, breaking concrete or asphalt into the required sizes, and using the broken pavement as fill where required, disposing of any excess material, and performing all work incidental thereto. No payment will be made for breakout in those areas where only restoration or dressing of subgrade is necessary.

b. Breaking Out Pavement will be measured for payment based upon the number of square meters feet broken out, computed to the nearest 1/10 square meter 1/100 square foot.

c. Unit of measure: square meter feet.

1.1.5.4 Bedding Stone

a. Payment will be made for costs associated with Bedding Stone satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. Bedding Stone will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.5 [[57][_____]-kg [125][_____]-Pound Stone] [[_____] Riprap]

a. Payment will be made for costs associated with [[57][_____]-kg [125][_____]-Pound Stone] [[_____] Riprap] satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. [[57][_____]-kg [125] [_____]-Pound stone] [[_____] Riprap] will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.6 [Graded Stone ["A"] ["B"] ["C"]][[_____] [Stone][Riprap]], Small Repairs

a. Payment will be made for costs associated with [Graded Stone ["A"] ["B"] ["C"]][[_____] [Stone][Riprap]], Small Repairs, satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that
stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. [Graded Stone "A" ["B"] ["C"] ][_____] [Stone][Riprap], Small Repairs, will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.7  [Graded Stone ["A"] ["B"] ["C"] ][_____] [Stone][Riprap], Large Repairs

a. Payment will be made for costs associated with [Graded Stone ["A"] ["B"] ["C"] ][_____] [Stone][Riprap], Large Repairs, satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. [Graded Stone ["A"] ["B"] ["C"] ][_____] [Stone][Riprap], Large Repairs, will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.8  Stone Placement Premium

a. A premium payment will be made for costs associated with [Crushed Stone][[57][_____]]-kg [125][_____]-Pound [Riprap][Stone][Graded Stone A, Small Repairs][Graded Stone A, Large Repairs] satisfactorily placed in overbank paving, overbank stone spur, or stone landward of an obstruction satisfactorily constructed or repaired, which includes furnishing all material, equipment, and labor; preparing the subgrade; hauling or rehandling stone; shaping spurs to the lines and grades specified; and performing other work incidental thereto.

b. Stone Placement Premium will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.6  Reworking and Utilizing Existing Stone Materials

1.1.6.1  Payment

Payment for reworking existing stone materials and utilizing existing stone in lieu of required materials from off-site sources will be paid for separately from construction utilizing materials obtained from off-site sources. Specifications pertaining to construction utilizing materials obtained from off-site sources are included in Section 31 00 00 EARTHWORK for Site Preparation.

1.1.6.2  Measurement

Reworking and Utilizing Existing Stone Materials will be measured for payment based upon [_____][[cubic][square] meters [cubic yards][square feet] of surface area of existing protection].
1.1.6.3 Unit of Measure

Unit of measure: [ton (metric)] [square meter] [ton [square foot]].

SECTION 35 31 19  Page 19
DEFINITIONS

1.3.1  Bank Stabilization

This paragraph explains certain terminology which is common to construction of bank stabilization work on the [_____] and which may not be self explanatory in the subsequent applicable provisions of the technical specifications and on the drawings.

1.3.1.1  Revetments

The term "revetment" applies to various types of stabilization structures that are constructed along the river approximately parallel to the current. The revetments are constructed of stone or piling.

1.3.1.2  Dikes

The term "dike" applies to the types of stabilization structures that are
constructed along the river at an angle to the current. The dikes are constructed of stone or piling.

1.3.2 Standard Drawings

Details of various types of structures in general use on the [_____] are shown on standard drawings forming a part of these specifications.

1.3.3 Stone Protection

Stone Protection is defined as a system which includes a layer of bedding material or layers of filter material beneath a layer or layers of riprap. Stone protection is placed around structures in slack water or within a dewatered site. Stone protection may also be used to protect channel banks when it is placed in the dry or in slack water.

1.3.4 Riprap

Riprap is defined as a material having a gradation band similar to those specified in EM 1110-2-1601, Chapter 3, uniform graded material. Riprap is normally produced by mechanical methods, with a jaw crushe and grizzly after the stone has been mined by blasting in a quarry. Riprap gradations have a maximum top size of 3.5 tons.

1.3.5 Graded Stone

Graded Stone is defined as material with gradations that are produced by the mining technique and minimal additional processing other than the use of a skeleton bucket or a bar grizzly. The gradation band have more fines than riprap and have gradations with top size up to 3.5 tons and could be classified as being well graded.

1.3.6 Channel Protection

Channel protection is stone placed in a current as revetment, dikes, or slope paving without the use of a separate layer of bedding or filter material. In this type of environment, bedding sand or geotextiles and materials with gradation bands with a top size of 150 mm (6 inches) will not stay where placed.

1.3.7 Shoreline Protection

Shoreline Protection is defined as a system of bedding or filter materials and stone used to protect coastlines of lakes and oceans and for harbor protection.

1.4 SYSTEM DESCRIPTION

1.4.1 Factors Used for Converting In-Place Volume to Weights

**************************************************************************
NOTE: Insert values from the design report in the following table.
**************************************************************************

The following factors were used in converting the in-place volume to the quantities shown in the BIDDING SCHEDULE.
1.4.1.1 Revision of Bidding Schedule Quantities

The estimated quantities of stone listed in the BIDDING SCHEDULE were computed on the basis of stone having a percentage of voids and a bulk specific gravity (saturated surface dry (SSD) basis) as shown in the above table based on water having a unit weight of 1000 kg per cubic meter (62.4 pounds per cubic foot). When the bulk specific gravity (SSD) of the stone to be used in the work is other than that shown in the above table, the estimated quantities will be revised by multiplying them by the fraction which results when the bulk specific gravity (SSD) of the stone furnished is divided by the value shown in the above table for each respective stone gradation. Revision for the percentage of voids will likewise be made. The Contracting Officer will issue a modification to the contract in accordance with FAR 52.211-18 Variation in Estimated Quantity, in Section 00 22 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS.

1.4.1.2 Re-revision of Estimated Quantities

If during the progress of the work it is determined that the delivered stone actually placed has a percentage of voids or a bulk specific gravity range different from that on which the BIDDING SCHEDULE is based, the BIDDING SCHEDULE will be further revised in accordance with paragraph REVISION OF BIDDING SCHEDULE QUANTITIES.

1.4.2 Bulk Specific Gravity of Stone and Redesign

If the Contractor, after award of the contract, requests approval of stone from a source(s) which has a range of bulk specific gravity (SSD), whose...
limits are lower or higher than the specified design range of [2.5 to 2.9] [_____] as specified in paragraph MATERIAL QUALITY, consideration will be given to revising the project design through modification of the design range under the following conditions:

a. The modification of the specified design range will result in a savings to the Government. Such savings shall not be subject to FAR 48 Value Engineering of Section 00 22 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS.

b. Only one (1) such proposal for modification will be allowed. In addition, the required completion time shall not be extended more than [thirty (30)] [_____] calendar days as a result of redesign for any reason, including acts of the Government.

c. The modified design range of bulk specific gravity (SSD) to be used shall not have a lower limit of less than [2.30] [_____] nor higher than [3.50] [_____]..

d. The stone sections of the required structure are to be redesigned by the Government. Such redesign will be based upon the Contractor’s proposed modifications to the specified design range of bulk specific gravity (SSD) and will include any required revisions to allowable tolerances. Only one such redesign will be made. A charge of [$5,000] [$_____] will be assessed the Contractor whether the redesign is used or not.

1. The above redesign will be made upon written request from the Contractor. The request shall state the proposed modified design range of bulk specific gravity (SSD). With the request, submit records of laboratory tests performed on the proposed stone source(s) indicating the range of bulk specific gravity (SSD) of the stone source(s). The laboratory tests shall have been performed by a Government validated commercial laboratory.

2. The Government shall be allowed a period of [twenty-one (21)] [_____] calendar days after receipt of the request to make the redesign. The redesign will be made based upon the lower limit of the proposed modified design range of bulk specific gravity (SSD) furnished.

3. Upon completion, redesign will be furnished to the Contractor, including revised estimated quantities for the BIDDING SCHEDULE, based upon the average bulk specific gravity (SSD) of the proposed modified design.

4. Upon receipt of the redesign, make a formal proposal to modify the allowable range and to perform the work in accordance with the redesign, within fifteen (15) calendar days after receipt of the Government’s redesign; if the Contractor proposes to utilize stone having a specific gravity outside of the specific design range, and as a result thereof, the Government provides the Contractor with a redesign. The submittal shall include a statement of the direct savings to the Government and a tabulation in the form of a revised BIDDING SCHEDULE showing unchanged unit prices for the revised quantities.

e. Any proposal to modify the specified design range shall be submitted within fifteen (15) calendar days after receipt of the Government’s
redesign and shall include a statement as to the savings which will result from the modification. If a formal proposal is not submitted within the time limit, the work shall be performed in accordance with the specified design, in which case use of stone having a bulk specific gravity (SSD) less than the specified design range will not be allowed.

f. The statement of savings shall be in the form of a proposed revised BIDDING SCHEDULE showing unchanged unit prices for the revised quantities.

g. If the Contractor elects to perform the work in accordance with the redesign, the estimated quantities to be shown in the BIDDING SCHEDULE will be the quantities derived from the Government's redesign. See the above paragraph REVISION OF BIDDING SCHEDULE QUANTITIES.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in

1.6 QUALITY ASSURANCE

1.6.1 Stone

Submit suitable stone samples prior to delivery of any such material to the worksite if stone is not from one of the stone sources listed at the end of this section.

1.6.1.1 General

All stone shall be durable material as approved by the Contracting Officer. [Selected stone from the required excavation may be used if it satisfies all requirements as to quality and dimensions.] [In case an unlisted source is to be used, show that an adequate quantity of material is available and provide quality test data.] Stone shall be of a suitable quality to ensure permanence in the structure and in the climate in which it is to be used. It shall be free from cracks, blast fractures, bedding, seams and other defects that would tend to increase its deterioration from natural causes. [Inspections for cracks, fractures, seams and defects shall be made by visual examination. If, by visual examination, it is determined that 10% or more of the stone produced contains hairline cracks, then all stone produced by the means and measures which caused the fractures shall be rejected.] A hairline crack that is defined as being detrimental shall have a minimum width of 0.1 mm (4 mil) and shall be continuous for one-third the dimension of at least two sides of the stone. [The stone shall be clean and reasonably free from soil, quarry fines, and shall contain no refuse.] [The stone shall be clean and adequately free from all foreign matter. Any foreign material adhering to or combined with the stone as a result of stockpiling shall be removed prior to placement.]

1.6.1.2 Sources

NOTE: A special test that could be used to evaluate the abrasion resistance of the riprap is COE CRD-C 63, Abrasion-Erosion Resistance of Concrete. Assume that an Abrasion-Erosion Loss, percent by Mass of approximately 4 is equal to an L.A. Abrasion of 20 percent for a chert aggregate, and 8 is equal to an L.A. Abrasion of 20 percent for limestone.

The number of work days specified in this paragraph are based on the assumption that to tentatively approve the use of a source under a single contract requires data for unit weight, absorption, and petrographic analysis of the stone. A minimum of 80 work days would be required to have available data from the freeze and thawing test. Arrangements need
to be made with the testing laboratory when notice is given to evaluate source not after samples are collected.

On the form attached at the end of this section, the Specifier shall insert a listing of acceptable sources, giving at the minimum quarry locations, addresses, and telephone numbers applicable for the contract or a more detailed list as presented in EM 1110-2-2302, Figure 4-2.

[Stone shall be furnished from any of the sources listed at the end of this section[, or at the option of the Contractor may be furnished from any other source designated by the Contractor and accepted by the Contracting Officer, subject to the conditions herein stated]. [Non-listed sources are prohibited.][If the Contractor proposes to furnish stone from a source not currently listed at the end of this section, the Government will conduct a quarry investigation and evaluate the quality test data[ provided by the Contractor] to determine whether acceptable stone can be produced from the proposed source.] Satisfactory service records on other work may be acceptable. In order for stone to be acceptable on the basis of service records, stone of a similar size must have been placed in a similar thickness and exposed to weathering under similar conditions as are anticipated for this contract, and must have satisfactorily withstood such weathering for a minimum of [5][20] years. If no such records are available, the Government will conduct tests to assure the acceptability of the stone. [In addition to an acceptable 5 year service record, the Contracting Officer has the option to elect to have representative samples taken and tested.]

[a. List of Sources. On the basis of information and data available to the Contracting Officer, stone meeting the quality requirements of these specifications has been produced from the sources listed at the end of this section.]

[a. List of Sources]

(1) Category I Sources: Category I sources have been inspected and evaluated within the last five years by the Government and have produced stone materials of acceptable quality from satisfactory geological formations. The Category I sources have previously demonstrated effective quality control programs at the source and the test results of the materials furnished have been verified that some material are of satisfactory quality. In a like manner, the source would be capable of providing the quality[, quantity,][ and] [gradation] of required stone materials. Further evaluation and testing of the source will not be required unless the preparation of the required demonstration stockpile reveals an adverse condition not previously taken into account.

(2) Category II Sources: Category II sources either have not been inspected and evaluated within the past five years or have had a deficiency in the past which may or may not affect its qualifications to provide stone materials for this project. Deficiencies may include, but are not limited to: ineffective quality control program; unsatisfactory production techniques; unacceptable quality of material in the geological formation being quarried; insufficient quantities of required materials; or
unsatisfactory durability of stone materials previously furnished. These factors of this kind do not disqualify the source for this project. A current inspection and evaluation of the source by the Government would be necessary [to determine whether acceptable stone can be produced from the proposed source] [before allowing the source to proceed with preparation of demonstration stockpiles]. [Disapproval of a proposed Category II source based on the inspection and evaluation would necessitate having the Contractor name a replacement source from the Category I list.]

b. Selection of Source. Designate in writing only one source or one combination of sources from which he proposes to furnish stone. [If the Contractor proposes to furnish stone from a source not listed at the end of this section, he may designate only a single unlisted source for stone and he shall notify the Contracting Officer at least 60 workdays before the stone leaves the quarry.] It is the Contractor's responsibility to determine that the stone source or combination of sources selected is capable of providing the [quality,] quantities and gradation needed and at the rate needed to maintain the scheduled progress of the work. [Samples for acceptance testing shall be provided in accordance with paragraph EVALUATION TESTING below. If a source for stone so designated by the Contractor is not accepted for use by the Contracting Officer, the Contractor may not propose other sources but shall furnish the stone from a source listed in Category I at the end of this section with no additional payment.]

c. Acceptance of Materials. [Acceptance of a source of stone is not to be construed as acceptance of all material from that source. The right is reserved to reject materials from certain localized areas, zones, strata, or channels, when such materials are unsuitable for stone as determined by the Contracting Officer. The Contracting Officer also reserves the right to reject individual units of produced specified materials in stockpiles at the quarry, all transfer points, and at the project construction site when such materials are determined to be unsuitable. During the course of the work, the stone may be tested by the Government, if the Contracting Officer determines that testing is necessary. If such tests are determined necessary, the testing will be done in [the Government's testing laboratory] or [commercial laboratory selected by the Government]. Materials produced from a listed or unlisted source shall meet all the requirements herein. The cost of testing will be at the Government's expense.] [During the contract period, both prior to and after materials are delivered to the job site, visual inspections and measurements of the stone materials may be performed by the Contracting Officer. If the Contracting Officer, during the inspections, finds that the stone quality, gradation, or weights of stone being furnished are not as specified or are questionable, re-sampling and re-testing is required. Sampling of the delivered stone for testing and the manner in which the testing is to be performed shall be as directed by the Contracting Officer. This additional sampling and testing shall be performed at the Contractor's expense when test results indicate that the materials do not meet specified requirements. When test results indicate that materials meet specified requirements, an equitable adjustment in the contract price will be made for the sampling and testing. Any material rejected shall be removed or disposed of as specified and at the Contractor's expense.]

1.6.1.3 Evaluation Testing of Stone

**************************************************************************

SECTION 35 31 19 Page 28
NOTE:  Alternate 1 - Use this paragraph if testing is to be performed by the Government at the Material Testing Center at CEWES or at a Government selected commercial laboratory that has been validated to be able to perform the required tests; delete paragraph EVALUATION TESTING OF STONE (Alternate 2) in PART 2 PRODUCTS.

For contracts having a short duration or are awarded for emergency repair, there will be insufficient time to allow a Contractor to propose and unlisted source and have it evaluated; therefore, delete the bracketed sentences in paragraph STONE above; and subparagraphs SOURCES, above, and this paragraph, EVALUATION TESTING OF STONE, should be deleted.

Table 6-1 of EM 1110-2-2302 gives a broad generalization of desired quality criteria for stone. However, the quality criteria specified in this document was based upon a limited review of criteria being used by Corps. Each District or Division should specify the desired quality of stone necessary to meet performance criteria. It is recommended that at a minimum the stone should be evaluated using petrographic analysis, specific gravity, unit weight, freezing and thawing, and resistance of rock to wetting and drying. The freezing and thawing testing should be performed in accordance with COE CRD-C 144 or ASTM D5312/D5312M on the largest sawn sections of stone, between [____] mm² (144-2304 square inches), so that bedding planes or any potential planes of weakness can be evaluated. These size samples require stone samples that range between 70 kg and 3400 kg (150 pounds and 7400 pounds). If ASTM D5313/D5313M are required, the test specimen shall be of the same size range as specified above. LRD has testing and evaluation procedures for shoreline protection that require larger samples for evaluation of material being used on their projects due to the severity of their environment and the larger sizes of stone used for shoreline protection. These procedures should be investigated if the standard procedures specified are not giving you adequate durability for stone placed on past projects.

A special test that could be used to evaluate the abrasion resistance of stone is COE CRD-C 63, Abrasion-Erosion Resistance of Concrete.

The number of work days specified in this paragraph are based on the assumption that to tentatively approve the use of a source under a single contract requires data for unit weight, absorption, and petrographic analysis of the stone. A minimum of 80 work days would be required to have available data from the freeze and thawing test. Arrangements need to be made with the testing laboratory when notice is given to evaluate source not after samples are
collected.

The size of a sample has been reduced to three pieces of stone weighing 70 kg 150 pounds minimum each for stone gradations with a nominal top size less than 1400 kg 3000 pounds. The number of pieces has been reduced by the COR being a geologist or materials engineer and present during the sample collection. Also, the pieces need to be washed to make sure they are similar and only three pieces are required by the Laboratory for evaluation of sample. Larger size stones may be required for evaluating stone used for shoreline protection. Delete this submittal if evaluation testing of stone will be performed by the Government at a Government Laboratory.

**************************************************************************

Submit a copy of the laboratory inspection report along with actions taken to correct deficiencies and a copy of the test reports, prior to delivery of such material to the worksite; since quality test on the stone in accordance with PART 2 paragraph EVALUATION TESTING OF STONE is the responsibility of the Contractor. The tests to which the stone may be subjected will include petrographic analysis, specific gravity, unit weight, absorption, wetting and drying, freezing and thawing and such other tests as may be considered necessary to demonstrate that the stone is of a satisfactory quality which is at least equivalent to stone from the sources listed at the end of this section.

a.  [Unit Weight][Bulk Specific Gravity, saturated surface dry (SSD)] and Absorption. Stone shall [weigh more than [_____] [2500] kN/m$^3$ [_____][155] pounds per cubic foot] [have a bulk specific gravity, saturated surface dry, (SSD), greater than [_____][2.48]]. The stone shall have an absorption less than [2][_____] percent unless other tests and service records show that the stone is satisfactory. The method of test for [unit weight][bulk specific gravity (SSD)] and absorption will be ASTM C127.

b. Samples. Samples of stone from a source not listed at the end of this section shall be taken by a representative of the quarry under the supervision of the Contracting Officer for testing and acceptance prior to delivery of any stone from this source to the site of the work. Samples shall consist of at least three pieces of stone, roughly cubical in shape and weighing not less than [70][_____] kg [150][_____] pounds each from each unit that will be used in the production of the required stone. If the source is an undeveloped quarry[, or if the operation has been dormant for more than one year such that fresh samples are not available,] expose fresh rock for 6 m 20 feet horizontally and for the full height of the face proposed for production, prior to the field evaluation.[ The Contracting Officer may also require documentation of subsurface exploration of an undeveloped quarry in order to determine whether or not sufficient reserves are available.] The samples shall be shipped at the Contractor's expense to [Waterways Experimental Station, Structures Laboratory, 3909 Halls Ferry Road, Vicksburg, MS 39180, (Attn: [Mr. Joe Tom][_____] ), and [Mr.][Ms.][_____] Branch, [_____] District shall be notified to arrange for testing at least [40][60][_____] workdays before the stone leaves the quarry.
c. Tests. The tests will be conducted in accordance with applicable Corps of Engineers methods of tests given in the Handbook for Concrete and Cement or ASTM methods of tests. [The cost of testing one new source will be borne by the Government.]

1.6.1.4 [Random Sampling]

The stone produced by each source will be sampled by the Government for Quality Assurance testing on the basis of a minimum once each year or once during the production of each [____][25 000][50 000] tons (metric) tons of stone produced each year for the Government. The samples will be evaluated based upon petrographic analysis, specific gravity, [unit weight, ] [bulk specific gravity (SSD),] [____], and absorption.

1.6.1.5 [Drop Test]

A drop test provides an immediate evaluation of the durability of very large stone during handling of the stone including placement into a structure. For comparability, the test stone(s) shall be dropped from a bucket or by other means from a height of not less than half the average diameter of the stone onto a rigid surface or second stone of comparable size. Dumping from a truck is not acceptable. The stone shall be examined carefully before as well as after the completion of the test. Failure criteria is the development of new cracks, opening of old cracks, and the loss of piece from the surface of the stone. Each stone shall be dropped a total of [five][____] times for evaluation purposes with examination after each drop. Provide all necessary equipment and operating personnel to help perform the testing.

1.6.2 [Concrete Grout for Stone Protection]

******************************************************************************
NOTE: If the Designer elects to specify grouting requirements for the project under another section, special care should be taken to delete all grouting requirements specified in this section and appropriate references added identifying the section specifying the grouting requirements.
******************************************************************************

1.6.2.1 General

The Government reserves the right to sample and test the aggregates and grout to determine compliance with the specifications. Provide facilities and labor as may be necessary to assist the government in procurement of representative test samples. Samples of aggregates will be obtained at the point of batching in accordance with ASTM D75/D75M. Grout will be sampled in accordance with ASTM C172/C172M. The slump and air content will be determined when cylinders are molded in accordance with ASTM C143/C143M and ASTM C231/C231M, respectively. Compression test specimens will be made, cured and transported in accordance with ASTM C31/C31M. Compression test specimens will be tested in accordance with ASTM C39/C39M. Samples for strength tests will be taken not less than once each shift in which grout is produced. A minimum of three specimens will be made from each sample, two will be tested at 28 days (90 days if pozzolan is used) for acceptance and one will be tested at 7 days for information.
1.6.2.2  Concrete Grout Mixture Proportions

Concrete grout mixture proportions shall be the responsibility of the Contractor. [Submit the mixture proportions that will produce grout of the qualities required, ten days prior to placement.] [Submit grout mixture proportions for grouting manufactured derrick stone.] Mixture proportions shall be submitted for review [_____] [10] days prior to being used under this contract. Mixture proportions shall include the dry weights of cementitious material(s); the specific gravities, absorptions, and saturated surface-dry weights of the fine and coarse aggregates; the quantities, types, and names of admixtures; and quantity of water per cubic meters cubic yards of grout. Also, applicable test reports, such as air content, compressive strength, and unit weight of the grout, shall be submitted to verify the proportions selected will produce grout of the quality specified. The approved grout mixture proportions shall not be changed without approval. The air content shall be between 4.5 and 7.5 percent. The specified compressive strength f'c shall be [1.4][1.8][_____] kg/mm$^2$ [2000][2500][_____] pounds per square inch at 28 days (90 days if pozzolan is used). The maximum water cement ratio shall be [_____] [0.70]. The slump of the grout mix shall be 150 mm 6 inches plus or minus 25 mm 1 inch. For maximum coarse aggregate size see paragraph AGGREGATES FOR CONCRETE GROUT.

1.6.2.3  Evaluation and Acceptance of Grout

The acceptance test results will be the average of the strengths of the two specimens tested at 28 days (90 days if pozzolan is used). The strength of the concrete grout will be considered satisfactory so long as the average of three consecutive acceptance test results equal or exceed the specified compressive strength f'c and no individual acceptance test result falls below the specified strength f'c by more than [350] g/mm$^2$ 500 pounds per square inch.

1.7  REGULATORY REQUIREMENTS

******************************************************************************
NOTE: Insert the appropriate State Highway Department specifications as applicable.
******************************************************************************

The regulatory requirements listed below form a part of this specification to the extent referenced. The regulatory requirements are referred to in the text by basic designation only.

[_____] STATE HIGHWAY AND TRANSPORTATION DEPARTMENT ([____])

[_____]  [(____)] Standard Specifications for Highway Construction

1.8  CONSTRUCTION TOLERANCES

******************************************************************************
NOTE: For tolerances in general, 1/2 of the average stone dimension of gradation range is allowed above the neatline and 1/4 of the same dimension is allowed below the neatline for stone gradation with a maximum size of 300 kg 650 pounds. For large stone the tolerance may be reversed.
******************************************************************************
The finished surface and stone layer thickness shall not deviate from the lines and grades shown by more than the tolerances listed below. Tolerances are measured perpendicular to the indicated neatlines. Extreme limits of the tolerances given shall not be continuous in any direction for more than [_____] [five] times the nominal stone dimension nor for an area greater than [9.3][18.6][93] m² [100][200][1000] square feet of the structure surface.

The intention is that the work shall be built generally to the required elevations, slope and grade and that the outer surfaces shall be even and present a neat appearance. Placed material not meeting these limits shall be removed or reworked as directed by the Contracting Officer. Payment will not be made for excess material which the Contracting Officer permits to remain in place.

PART 2 PRODUCTS

2.1 BEDDING MATERIAL

NOTE: This paragraph presents gradation bands of materials that were developed based upon seepage criteria presented in EM 1110-2-1913. Each bedding material system should be designed to be used with a specific range of riprap gradations, foundation conditions, and channel conditions.
2.1.1 General

Submit the source for materials used in riprap[,] [and] [filter[,] [and] [bedding]. Bedding material shall consist of [a washed ] [gravel or] crushed stone. Submit test reports attesting that the [bedding material] [,] [and] [filter material] meet specified requirements.

2.1.2 Material

**************************************************************************
NOTE: Delete gradation limits that are not required.
**************************************************************************

Bedding material shall be composed of tough, durable particles, adequately free from thin, flat and elongated pieces, and shall contain no organic matter nor soft, friable particles in quantities considered objectionable by the Contracting Officer. The aggregates shall meet the quality requirements of ASTM C33/C33M[ or paragraph REGULATORY REQUIREMENTS]. Gradation shall conform to the following requirements:

<table>

</tbody>
</table>

Provide bedding material well-graded between the limits shown. Perform at
least one test on each [_____] 1000 tons [to be delivered to the project site] [placed] for each specified gradation in accordance with ASTM C136/C136M. [A representative sample weighting not less than 45 kg 100 pounds shall be removed from the bedding layer placed at locations directed by the Contracting Officer.] All points on individual grading curves obtained from representative samples of bedding material shall lie between the boundary limits as defined by smooth curves drawn through the tabulated gradation limits plotted on ENG FORM 2087 or similar form. The individual gradation curves within these limits shall not exhibit abrupt changes in slope denoting either gap grading or scalping of certain sizes or other irregularities which would be detrimental to the proper functioning of the bedding layers.

2.2 FILTER MATERIAL

*******************************************************************************

NOTE: This paragraph presents gradation bands of materials that were developed based upon seepage criteria presented in EM 1110-2-1913. Each filter material system should be designed to be used with a specific range of riprap gradations, foundation conditions, and channel conditions.

The Specifier should use Alternative 1 if there is a concrete section in the specifications and if the gradations therein are satisfactory for filter materials. If there is no concrete section, or if the gradations therein are unsatisfactory for filter materials, the Specifier should use Alternative 2.

NOTE: Alternative 1.
*******************************************************************************

Submit certificates of compliance attesting that the materials meet specification requirements. [Filter material shall consist of [washed] [sand and gravel] [and crushed stone] [filter stone and geotextile]. [Sand and gravel] [and crushed stone] for filter materials shall meet the applicable requirements of Section 03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE, paragraph MATERIALS, subparagraph AGGREGATES.] [Geotextiles shall be as specified in Section 31 05 19.13 GEOTEXTILES FOR EARTHWORK.]

*******************************************************************************

NOTE: Alternative 2.
*******************************************************************************

[Filter material shall consist of [Sand "[____]"," [Gravel "[____]"," [Filter Stone] [Filter Stone and Geotextile]. The [filter material] [filter stone] shall be composed of tough, durable particles, adequately free from thin, flat and elongated pieces, and shall contain no organic matter nor soft, friable particles in quantities considered objectionable by the Contracting Officer. The aggregate shall meet the quality requirements of ASTM C33/C33M [or paragraph REGULATORY REQUIREMENTS]. Grading shall conform to the following requirements:

</tbody>
</table>

The [filter materials] [filter stone] shall be well-graded between the limits shown. [Gravel shall not be crushed stone.] At least one test shall be performed on each 1000 tons [to be delivered to the project site][placed for each specified gradation in accordance with ASTM C136/C136M.}
[A representative sample weighing not less than 45 kg 100 pounds shall be removed from the filter layer placed at locations directed by the Contracting Officer.] All points on individual grading curves obtained from representative samples of [filter material] [filter stone] shall lie between the boundary limits as defined by smooth curves drawn through the tabulated gradation limits plotted on ENG FORM 2087 or similar form. The individual gradation curves within these limits shall not exhibit abrupt changes in slope denoting either gap grading or scalping of certain sizes or other irregularities which would be detrimental to the proper functioning of the filter. Geotextile shall be as specified in Section 31 05 19.13 GEOTEXTILES FOR EARTHWORK.]

2.3 [BEDDING ]SAND [FILL][CUSHION LAYER]

**************************************************************************
NOTE: Sand fill is used to bring areas which are below grade in paragraph BASE PREPARATION to within allowable minus tolerance instead of using filter or bedding materials.
**************************************************************************

[Sand shall be a clean, free draining sand in accordance with classification SP in ASTM D2487, except that no more than 5 percent by weight of the material smaller than a No. 4 sieve, shall pass a No. 200 sieve. If sand meeting this criteria is available on site it may be used.]
[Sand shall meet [paragraph REGULATORY REQUIREMENTS specification][ASTM C33/C33M] gradation requirements for fine aggregate.]

2.4 STONE

2.4.1 General

2.4.1.1 Evaluation Testing of Stone

**************************************************************************
NOTE: Alternate 2 - Use this paragraph if testing is to be performed by the Contractor at a Commercial Laboratory; delete paragraph EVALUATION TESTING OF STONE (Alternate 1) in PART 1 GENERAL.
**************************************************************************

For contracts having a short duration or are awarded for emergency repair, there will be insufficient time to allow a Contractor to propose an unlisted source and have it evaluated; therefore, delete the bracketed sentences in paragraph STONE above, and subparagraphs SOURCES, above, and this paragraph EVALUATION TESTING OF STONE, should be deleted.

Table 6-1 of EM 1110-2-2302 gives a broad generalization of desired quality criteria for stone. However, the quality specified in this document was based on a limited review of criteria being used by the Corps. Each District or Division should specify the desired quality of stone necessary to meet performance criteria. It is recommended that at a minimum the stone should be evaluated using petrographic analysis, specific gravity, unit weight, absorption, freezing and thawing, and resistance of rock to wetting and
drying. The freezing and thawing testing should be performed in accordance with COE CRD-C 144 or ASTM D5312/D5312M on the largest sawn sections of stone, between 0.09-1.49 m² 144-2304 square inches so that bedding planes or any potential planes of weakness can be evaluated. These size samples require stone samples that range between 70 kg and 3400 kg 150 pounds and 7400 pounds. If ASTM D5313/D5313M is required, the test specimen shall be of the same size range as specified above. LRD has testing and evaluation procedures for shoreline protection that require larger samples for evaluation of material being used on their projects due to the severity of their environment and the larger sizes of stone used for shoreline protection. These procedures should be investigated if the standard procedures specified are not giving you adequate durability for stone placed on past projects.

A special test that could be used to evaluate the abrasion resistance of the stone is COE CRD-C 63, Abrasion-Erosion Resistance of Concrete.

The number of work days specified in this paragraph is based on the assumption that to tentatively approve the use of a source under a single contract requires data for unit weight, absorption, and petrographic analysis of the stone. A minimum of 80 work days would be required to have available data from the freeze and thawing test. Arrangements need to be made with the testing laboratory when notice is given to evaluate source not after samples are collected.

The size of a sample has been reduced to three pieces of stone weighing 70 kg 150 pounds minimum each for stone gradations with a nominal size less than 1400 kg 3000 pounds. The number of pieces has been reduced by the COR being a geologist or materials engineer and present during the sample collection. Also, the pieces need to be washed to make sure they are similar and only three pieces are required by the laboratory for evaluation of sample. Larger size stones may be required for evaluating stone used for shoreline protection.

If the Contractor proposes to furnish stone from an unlisted source, have evaluation tests performed on stone samples collected from the proposed source. The quarry investigation shall be performed by a registered geologist or registered engineer. The tests to which the stone shall be subjected include petrographic examination (ASTM C295/C295M), [bulk specific gravity (SSD),] [unit weight,] absorption (ASTM C127), resistance of stone to freezing and thawing ([COE CRD-C 144][ASTM D5312/D5312M]), and if argillaceous limestone and sandstone are used, resistance to wetting and drying (ASTM D5313/D5313M). The laboratory to perform the required testing shall be validated based on relevant paragraphs of ASTM D3740, and no work requiring testing shall be permitted until the laboratory has been inspected and validated. A copy of the documents, provided by the
Materials Testing Center (MTC) at CEWES[ or other governmental agency], that validates that the laboratory can perform the required tests. The individual tests shall be listed for which the validation covers along with the date of the inspection. The first inspection of the facilities shall be at the expense of the Government and any subsequent inspections required because of failure of the first inspection shall be at the expense of the Contractor.

a. Bulk Specific Gravity Range. All stone shall have a minimum bulk specific gravity, saturated surface dry (SSD), of [_____] [2.50] and a maximum bulk specific gravity of not more than [_____] [2.90] based upon water having a unit weight of 9.8 kN/m$^3$ 62.4 pounds per cubic foot. The method of test for bulk specific gravity (SSD) shall be ASTM C127.

b. Unit Weight and Absorption. Stone shall [weigh more than [24][_____] kN/m$^3$ [155][_____] pounds per cubic foot] have a bulk specific gravity, saturated surface dry, greater than [2.48][_____] [2.60]. The stone shall have an absorption less than [1][2][_____] percent unless other tests and service records show that the stone is satisfactory. The method of test for unit weight and absorption shall be ASTM C127.

c. Petrographic Examination. Stone shall be evaluated in accordance with ASTM C295/C295M which shall include information required by ASTM D4992, paragraph 10. COE CRD-C 148 shall be used to perform Ethylene glycol tests required on rocks containing smectite as specified in ASTM D4992 and on samples identified to contain swelling clays.

d. Resistance to Freezing and Thawing. Stone shall have a maximum loss of [_____] [5][10] percent after the number of cycles specified in ASTM D5312/D5312M, Figure 1, when determining the durability of stone when subjected to freezing and thawing in accordance with [COE CRD-C 144][ASTM D5312/D5312M], except the surface area of one side of the sample shall be between [0.09][_____] and [1.49][_____] m$^2$ [144][_____] and [2304][_____] square inches.

e. Resistance of Rock to Wetting and Drying. Stone shall have a maximum loss of [1][_____] percent when determining the durability of stone when subject to wetting and drying in accordance with ASTM D5313/D5313M, except the surface area of one side of the sample shall be between [0.09][_____] and [1.49][_____] mm$^2$ [144][_____] and [2304][_____] square inches.

f. Samples. Samples of stone from a source not listed at the end of this section shall be taken by a representative of the Quarry under the supervision of the Contracting Officer for testing and acceptance prior to delivery of any stone from this source to the site of the work. Information provided with the samples shall include the location within the quarry from which the sample was taken along with a field examination of the quarry. The field examination shall include the information outline in ASTM D4992, paragraph 7. Samples shall consist of at least three pieces of stone, roughly cubical in shape and weighing not less than [70][_____] kg [150][_____] pounds each from each unit that shall be used in the production of the required stone. If the source is an undeveloped quarry, or if the operation has been
dormant for more than one year such that fresh samples are not available, expose fresh rock for 6 m 20 feet horizontally and for the full height of the face proposed for production, prior to the field evaluation. [The Contracting Officer may also require documentation of subsurface exploration of an undeveloped quarry in order to determine whether or not sufficient reserves are available.] The samples shall be shipped at the Contractor's expense to a laboratory validated by the government to perform the required tests.

g. Tests. Conduct the tests in accordance with applicable ASTM and Corps of Engineers methods of tests, given in the Handbook for Concrete and Cement, in a laboratory validated by the government. The cost of testing shall be borne by the Contractor.

2.4.1.2 Quarry Operations

Conduct quarry operations in a manner to produce stone conforming to the requirements specified, this may involve selective quarrying, handling, processing, blending, and loading as necessary, all of which shall be as specified in Section 01 45 00.00 1001 45 00.00 2001 45 00.00 40 QUALITY CONTROL. Control blasting and handling of rock to produce rock of the size ranges and quality specified. Techniques such as the use of proper hole diameter, hole depth, hole angle, burden and spacing distances, types and distribution of explosives, delay intervals and sequence, removal of muck piles between each shot, and special handling techniques are required as necessary to produce the specified materials. All aspects of blasting operations shall be specifically designed so that the end product is not damaged from the blasting technique and that the stone is suitable for the intended purpose.

a. Curing Stone

Conduct curing operations on freshly quarried stone to allow it to release stored energy and moisture and to allow the stone to demonstrate that it will not fracture during the energy release and drying-out phase. Stones of sizes which are individually picked shall be temporarily stockpiled at the quarry site a minimum of [_____] calendar days before being shipped to the project site, unless this requirement is waived by the Contracting Officer. Such waiver will be granted only if the stone has characteristics that make curing unnecessary.

b. Stone Quarrying Exclusion Period

**************************************************************************
NOTE: Exclude the possibility of waiving the quarrying period restrictions unless the District Geologist authorizes inclusion of the language in the specification for the project.
**************************************************************************

Stone quarried between the [_____] [15th of September and the 15th of April] will not be approved for use in the project. [If the stone is not affected by freeze-thaw cycles, and the durability history of the stone demonstrates that quarrying during the exclusion period has not adverse effect on the durability of the stone and the Contracting Officer approves the use of stone quarried during the exclusion period, the stone quarrying period exclusion may be waived by the Contracting Officer.] Stone quarried before the the exclusion period at a time
which will not permit sufficient curing time before being subjected to freezing conditions, and which is subject to fracturing as a result of freeze-thaw cycles, will not be approved for use.

c. Temporary Storage at Quarry

Storage of stone materials subsequent to shipment from the quarry and prior to permanent placement in the required work shall be subject to approval of the Contracting Officer. [Underwater storage of stone materials is prohibited.]

2.4.1.3 Gradation Test

**************************************************************************

NOTE: As a rule of thumb the sample size should be between 20 to 100 times the weight of the maximum size stone within a specified gradation (see ASTM D5519, Note 2). Recommend using either the calculated minimum sample size or the following size samples for the ranges specified.

15 metric ton sample required for riprap with a top size up to 225 kg 500 pounds. 25 metric ton sample required for riprap or stone with top size between 225 kg 500 pounds and 1000 kg 2200 pounds and 50 metric ton sample required for riprap or stone with top size larger than 1000 kg 2200 pounds up to 3400 kg 7500 pounds.

For sources which have riprap or stone as a standard production item: One gradation test minimum, at the quarry, required for each 50 000 metric tons of riprap or stone with a top size of 460 kg 1,000 pounds or larger, or one test required for each 25,000 metric tons of smaller riprap or stone.

To allow the Contractor to perform a gradation test without the Contracting Officer present, the quantity of riprap or stone required for the project shall be less than 10,000 metric tons.

**************************************************************************

Perform a gradation test or tests on the riprap, stone, or [_____] at the quarry in accordance with paragraph GRADATION TEST METHOD FOR RIPRAP, GRADED STONE, AND [______]. Take the sample in the presence of the Contracting Officer. Notify the Contracting Officer not less than 3 days in advance of each test. Submit the gradation tests using the GRADATION TEST DATA SHEET enclosed at end of this section for riprap or stone. [In the event of unavailability of the Contracting Office, perform the tests and certify to the Contracting Officer that the riprap, stone, or [_____] shipped complies with the specifications.] At least [one] [_____] gradation test(s) shall be performed per [50,000] [_____] tons (metric) tons of each size of riprap, stone, or [_____] placed, but not less than one test shall be performed. The gradation tests shall be reported using the forms, GRADATION TEST DATA SHEET and ENG FORM 4794-RM 4794-R, attached at end of this section.[ Designate on the test form that portion in tons (metric) tons of the lot tested which is applicable to this contract. Any deviation from the reported tonnage shall be corrected and recorded on a revised GRADATION TEST DATA SHEET.]}[ The sample shall consist of not less
than [15] [25] [50] [_____] tons (metric) tons of [_____] riprap, stone, or [_____] and shall be collected in a random manner which will provide a sample which accurately reflects the actual gradation arriving at the jobsite. The sample shall consist of between 30 to 35 pieces of armor stone and jetty stone. A minimum of two tests are required for acceptance of armor stone and jetty stone. The weight of the individual pieces of armor stone and jetty stone, representing the minimum, maximum and 50 percent greater than sizes for the specified armor stone and jetty stone gradation, shall be printed on each stone [and be placed at the quarry to provide visual comparison during production at the quarry] and be placed in a location adjacent to the work site in order to provide a basis for visual comparison during placement of the armor stone and jetty units. These stones shall be used as the last order of work. Failure of the test on the initial sample and on an additional sample will be considered cause for rejection of the quarry and/or quarry process, and all riprap, stone, or [_____] represented by the failed tests shall be set aside and not incorporated into the work. Any additional tests required because of the failure of an initial test sample will not be considered as one of the other required tests. If collected by the truckload, each truckload shall be representative of the gradation requirements. The Contracting Officer may direct additional testing of the riprap, stone, or [_____] at the project site if the riprap, stone, or [_____] appears, by visual inspection, to be out of gradation. The Contracting Officer may direct additional testing of the riprap, stone, or [_____] at the project site if the riprap, stone, or [_____] appears, by visual inspection, to be out of gradation. The additional tests shall be performed on in-place materials at the locations directed, or on random loads selected by the Contracting Officer. In-place test areas shall be not less than 3.6 by 3.6 m 12 by 12 feet [_____] and shall include the full thickness of the placed riprap, stone, or [_____] layer, without disturbing or including the underlying material and shall meet the minimum sample size specified above. Each pit excavated for an in-place test sample shall be refilled and reworked to provide a surface void of signs of disturbance. One in-place gradation shall be performed on each [3,800 cubic meters][7,500 tons (metric)] [5,000 cubic yards][7,500 tons] or portion thereof placed. If the gradation test fails, additional gradation tests will be required at the Contractor's expense to delineate the limits of unacceptable stone. The additional gradation tests shall not count as part of the minimum number of gradation tests required. The unacceptable stone shall either be reworked to bring the stone within the specified gradation or the stone shall be removed from the project site as determined by the Contracting Officer. The Contracting Officer may direct this testing under FAR 52.246-12 Inspection of Construction. Provide all necessary screens, scales and other equipment, and operating personnel, to grade the sample. Certification and test results shall represent riprap, stone, or [_____] shipped from the quarry. Certification and tests results must be received by the Contracting Officer at the jobsite before the riprap, stone, or [_____] is used in the work. 2.4.1.4 Proportional Dimension Limitations The maximum aspect ratio (greatest dimension:least dimension) of any piece of stone for size ranges [which are not graded with a screen or grizzly,] shall be not greater than 3:1 when measured across mutually perpendicular axis. Not more than 25 percent (25 percent) of the stones within a gradation range shall have an aspect ratio greater than 2.5:1. A maximum of [5][10][15] percent flat and elongated pieces by weight will be acceptable. A flat and elongated piece of riprap is defined as having a ratio of width to thickness or length to width greater than 3:1. ASTM D4791 shall be used as a guide to perform the test.
2.4.1.5 [Riprap][Stone][_____] Stockpile

Storage of [riprap][stone][_____] at the worksite is not to be confused with off-site stockpiling of riprap, stone, or [_____]. If the Contractor elects to provide off-site stockpiling areas, the Contracting Officer shall be notified of all such areas. The Contractor's stockpile shall be a maximum of 3.6 m 12 feet high and formed by a series of layers of truckload dumps, where the rock essentially remains where it is placed. Subsequent layers shall be started 3 m 10 feet from the edge of the previous layer so that the rock will not roll down the edges of the previous layers. The first layer shall be a maximum of 1.8 m 6 feet high. After being stockpiled, any riprap, stone, or [_____] which has become contaminated with soil or refuse shall not be put into the work unless the contaminating material has been removed from the riprap, stone, or [_____] prior to placement.

a. Worksite Stockpile. [Riprap, stone, or [_____] delivered to the worksites, which requires temporary storage[landward of top of slope], shall be placed in a container suitable for storing the riprap, stone, or [_____] without waste[, or a sand-clay-gravel or crushed stone pad may be constructed for the storage area and removed upon completion of the work. If the sand-clay-gravel or crushed stone pad method is used, the pad shall have a minimum thickness of at least 150 mm 6 inches. The container[or sand-clay-gravel or crushed stone pad method] shall be subject to approval prior to delivery of the riprap, stone, or [_____]]. Upon completion of the work, the storage areas shall be cleaned of all storage residues and returned to their natural condition. The worksite will be allowed, provided the stockpile toe of the riprap, stone, or [_____] be no closer than [18][30] m [60][100] linear feet from the closest edge of the [excavation's][stream's] top slope, and the amount shall not exceed 200 t 200 T[unless otherwise approved]].

b. Off-site Stockpile. In areas where riprap, stone, or [_____] is stockpiled for placement, the area shall have excess rock removed prior to completion of work. All rock and spalls greater than 75 mm 3 inches in diameter shall be removed. Where rocks may have become buried due to soft ground or operation of the equipment, the rock shall be disposed of as directed[put in a disposal area]. After the rock has been removed, the storage area shall be graded, dressed, and filled to return the ground surface as near as practical to the condition that existed prior to construction.

2.4.2 Riprap

**************************************************************************
NOTE: At the end of this section, the Specifier must attach copies (Plates) of ENG FORM 4794-RM RIPRAP GRADATION CURVES for M40, M65, M90, M180, or M300 (ENG FORM 4794-R RIPRAP GRADATION CURVES FOR R90, R140, R200, R400, or R650), etc., as applicable for this contract.

The riprap gradations presented were developed in Lower Mississippi Valley Division in 1981 and were standardized to limit the number of gradation bands that a producer would have to produce. These gradation bands were developed from gradation bands presented in EM 1110-2-1601, Chapter 3. All bands...
were modified slightly after meetings with producers in AR, MO, and IL to reduce production costs. These five of thirteen gradation bands are provided as examples.

The Specifier will not specify riprap by layer thickness. Riprap shall be specified by the weight of the maximum D100 size of the riprap gradation.

Only quarried stone shall be used. Riprap quality shall be as specified in paragraph GOVERNMENT TESTING AND STUDIES, subparagraph STONE. Stone shall be well graded and shall conform to [the table(s) below and to Plate(s) [____], [____], [____] and [____] attached at the end of this section][the gradation requirements for [____], [____], and [____] as specified in [paragraph REGULATORY REQUIREMENTS][____]].

2.4.3 [Riprap][Stone] Paving

The stone for [riprap][stone] paving shall be in pieces approximately rectangular in cross section, each piece having its greatest dimension not more than three times its least dimension and with one dimension not varying more than 50 mm 2 inches from the thickness of the paving as shown.

2.4.4 [Manufactured ]Derrick Stone

**************************************************************************
NOTE: Specifier should insert weight limits, a weight tabulation to define the desired range of sizes (similar to a riprap gradation), or a range of sizes.
**************************************************************************

[Manufactured derrick][Derrick] stone shall be unreinforced concrete shapes weighing not less than 2300 kN/m³ 145 pounds per cubic foot. Concrete shall be as specified in Section [03 30 53 MISCELL ANEOUS CAST-IN-PLACE CONCRETE] [03 70 00 MASS CONCRETE]. Submit the design of the shapes of the manufactured derrick stone prior to commencing their manufacture. Either handling] [Handling] holes shall be formed in the shapes[ or handling hardware shall be embedded in the shapes] at the time they are manufactured. Derrick stone shall consist of [pieces weighing [_____] kg plus or minus [_____] kg pounds plus or minus [_____] pounds] [pieces as tabulated below:] [rectangular pieces [_____] m feet long by [_____] m feet wide by [_____] m feet thick.] [pieces with dimensions as tabulated below:]

[_____]  [_____]  
[_____]  [_____]  
[_____]  [_____]  

[The stone shall be [roughly] graded as to size between the several limits.][ Stone shall be in pieces generally rectangular in cross section, each piece having its greatest dimension not more than three times its

least dimension.]

2.4.4.1 Grout for Manufactured Derrick Stone

The materials required to make the grout shall be as specified in Section [03 70 00 MASS CONCRETE] [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE]. The grout shall be mixed in the proportions of one part cement to [_____] parts sand, [and] sufficient water to produce a workable mixture[, and that amount of admixture which will entrain sufficient air to produce durable grout. The grout mixture proportions shall be submitted in accordance with paragraph SUBMITTALS.]

2.4.4.2 Epoxy Materials

Epoxy material shall meet the requirements of ASTM C881/C881M, [Type IV, when mixed with packaged sand to form a mortar] [Type VII, for a sealer.]

2.4.5 [Capstone][ and ] [Derrick Stone]

[Capstone][ and ] [Derrick stone] shall consist of [pieces weighing [_____] kg plus or minus [_____] kg] [pounds plus or minus [_____] pounds] [pieces as tabulated below:] [rectangular pieces [_____] m feet long by [_____] m feet wide by [_____] m feet thick.] [pieces with dimensions as tabulated below:]

<tr>
<td>0 to 30 6</td>
<td>0 to 15</td>
</tr>
</tbody>
</table>

Note: Not more than 5 percent shall pass a 25 mm 1-inch sieve.

********************************************************************************

NOTE: For any of the following four paragraphs, when the size of the largest stone within a gradation is 115 kg 250 pounds or less, specify the gradation by dimension (mm inches) instead of by weight.

********************************************************************************

2.4.10 [Bedding/Mattress] Stone

The stones furnished for [bedding/mattress] stone shall weigh between [_____] kg pounds and [_____] kg pounds each, and shall be free of fines and well graded within the following limits:

<table>
<thead>
<tr>
<th>STONE WEIGHT IN KG LBS</th>
<th>PERCENT LIGHTER BY WEIGHT OF TOTAL MIXTURE</th>
</tr>
</thead>
<tbody>
<tr>
<td>(____)</td>
<td>(____)</td>

<td>(____)</td>
</tr>
</tbody>
</table>

2.4.11 [Core/Underlayer/Scour] Stone

The stones furnished for [core/underlayer/scour/riprap] stone shall weigh between [_____] kg pounds and [_____] kg pounds each, and shall be free of fines and well graded within the following limits:
2.4.12  [Armor/Cover] Stone

**************************************************************************
NOTE: The design of armor/cover stone should be based upon criteria presented in EM 1110-2-2904.
**************************************************************************

The stones furnished for [armor/cover/riprap] stone shall weigh between [_____] kg pounds and [_____] kg pounds each, and shall be free of fines. Seventy-five percent (75 percent) of the stones shall weigh greater than [_____] kg pounds each.

2.4.13  Splash/Fill Stone

The stones furnished for splash/fill stone behind the steel sheet pile wall shall be well graded from [_____] mm inch to [_____] mm inches, free of fines and shall contain no more than five percent (5 percent) stones larger than [_____] mm inches in any dimension.

2.5  [CONCRETE GROUT]

**************************************************************************
NOTE: If concrete grouting is not required for the project, delete this paragraph and its subparagraphs in their entirety.
**************************************************************************

Requirements are written to match an abridged version of Section 03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE and meet the requirements of ETL 1110-2-334, Design and Construction of Grouted Riprap, dated 21 Aug 92. Grouted riprap shall not be used in areas where frost heave or ice in the sub-base can be expected to cause uplift failure and on the river-side slopes of levees. A system designed for pressure relief and drainage should be provided beneath the area to be grouted along with edge and toe design to prevent undercutting and lateral movement of water beneath the grouted riprap.

**************************************************************************

2.5.1  Cementitious Materials

Cementitious materials will be accepted on the basis of a manufacturer's certificate of compliance, accompanied by mill test reports, that the materials meet the requirements of the specification under which it is furnished.

2.5.1.1  Portland Cement

ASTM C150/C150M, Type [I,] [IA,] [II,] [IIA], low alkali.
2.5.1.2  Pozzolan

ASTM C618, Class C or F, including requirements of Tables 1A and 2A. Pozzolan in amount not to exceed 25 percent, based on absolute volume, may be substituted for an equivalent amount of portland cement in the grout mixture proportions.

2.5.2  Aggregates for Concrete Grout

**************************************************************************
NOTE: Insert the appropriate State Highway Department gradation requirements if applicable.
**************************************************************************

The fine aggregates for grout shall meet the quality and gradation requirements of either ASTM C33/C33M or paragraph REGULATORY REQUIREMENTS. The coarse aggregates shall meet the quality and gradation requirements of ASTM C33/C33M, Class designation 4M, Size No. 67, 7 or 8 [or paragraph REGULATORY REQUIREMENTS], Class designation [____], Size No. [____].

2.5.3  Admixtures

Submit manufacturers' literature for the concrete admixtures and curing materials. Admixtures to be used, when required or approved, shall comply with the following:

b. Water-Reducing or Retarding Admixture: ASTM C494/C494M, Type A, B, or D.

2.5.4  Curing Materials

Curing materials shall be as follows:

a. Impervious Sheet Materials: ASTM C171, type optional, except polyethylene film, if used, shall be white opaque.

b. Membrane-Forming Curing Compound: ASTM C309, Type 1-D or 2, Class [A] [B].

2.5.5  Water

Water for mixing and curing shall be fresh, clean, potable, and free from injurious amounts of oil, acid, salt, alkali, except that nonpotable water may be used if it meets the requirements of COE CRD-C 400.

2.5.6  [Equipment]

Batching and mixing equipment will be accepted on the basis of manufacturer's data which demonstrates compliance with the applicable specifications.

PART 3  EXECUTION

3.1  DEMONSTRATION SECTION

Prior to placement of stone, construct a section of [stone][channel]
protection consisting of [toe stone][riprap][grouted stone][_____] to demonstrate his proposed operations for production placement. The section shall demonstrate procedures and capability of grading, placing [toe] stone and bank protection[, and placing grout, and curing of the grouted stone] within the tolerances specified. The demonstration section shall be [30][_____] m [100][_____] feet in length and shall conform to all applicable specifications.

3.1.1 Methods and Equipment

Methods and equipment employed for placement shall demonstrate the adequacy for use in placement of [toe stone][riprap][grouted stone][_____] and shall conform with the requirements specified. The quantities of all materials placed within the section shall be accurately tabulated and provided immediately to the Contracting Officer for comparison with computed quantities.

3.1.2 Demonstration Section Evaluation

Do not proceed with placing [stone][channel] protection prior to the approval of the demonstration section. Within a period of 7 days after completion of the section, the Contracting Officer shall determine the adequacy of the section to function as part of the permanent construction. The Contractor will be notified as to the acceptability of the section and may be directed to modify methods of construction[, mix design,] and remove the section if necessary.

3.1.3 Removal of Demonstration Section

If removal of the demonstration section is required, it shall be conducted in such a manner as to maintain the integrity of the underlying subgrade. Make arrangements for disposal in areas not located on the site.

3.2 BASE PREPARATION

**************************************************************************

NOTE: Sand fill is specified for the filling of low areas below the waterline around structures in slack water and giving the Contractor the option of using bedding or filter materials. However, if fill material is required where the designer assumes there will be flowing water, the designer will have to determine the minimum size of materials that will stay in place until the stone protection can be completed. This may require the fill material to be specified as bedding/filter material or riprap.

Tolerances plus 50 to 75 mm 2 to 3 inches (Above water placement).

Tolerances plus 300 mm 1 foot and minus 600 mm 2 feet (Below water placement).

**************************************************************************

Areas on which [geotextile and riprap are] [filter layers and riprap are] [bedding material and riprap are] to be placed shall be graded and/or dressed to conform to cross sections shown on the contract drawings within an allowable tolerance of plus 50 mm 2 inches and minus 100 mm 4 inches from the theoretical [slope] lines and grades. The prepared base shall be...
approved by the Contracting Officer. Where such areas are below the allowable minus tolerance limit they shall be brought to grade by fill [with earth similar to the adjacent material] [with sand fill] and then compacted to a density equal to the adjacent in place material. [Subaqueous areas on which [bedding material and riprap] [filter materials and riprap] are to be placed shall be graded and/or dressed to conform to cross sections shown on the contract drawings within an allowable tolerance of plus 300 mm 1 foot and minus 600 mm 2 feet from the specified [slope] line and grades. Where such areas are below the allowable minus tolerance limit they shall be filled with sand fill. As an alternative, these areas may be filled with [bedding material] [filter material]. No payment will be made for any material thus required.] Immediately prior to placing the [geotextile] [bedding layers] [filter layers], the prepared base will be inspected by the Contracting Officer and no material shall be placed thereon until that area has been approved.

3.3 PLACEMENT OF BEDDING LAYERS

3.3.1 General

**************************************************************************
NOTE: The following construction tolerances will be used for bedding layer placement. Tolerances will vary based upon District experience and project conditions.

Plus or minus 50 mm 2 inches

Plus 100 mm 4 inches or minus 50 mm 2 inches

Plus 150 mm 6 inches or minus 50 mm 2 inches (below water) should be possible if water depths are less than 3 m 9 feet. Placement tolerances at greater depths should be deleted and replaced with tons/square as specified for under water placement of stone.
**************************************************************************

A bedding layer, consisting of a [_____] -mm -inch layer of [gravel or] crushed stone, shall be placed on the prepared base as described below, in accordance with the details shown on the contract drawings, and within the limits shown on the contract drawings or staked in the field. A tolerance of plus 50 mm 2 inches and minus 25 mm 1 inch from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the bedding, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet.

3.3.2 Placement of Bedding Material on Prepared Base

Bedding material shall be spread uniformly on the prepared base to the [slope] lines and grades as indicated on the contract drawings and in such manner as to avoid damage to the prepared base. Placing of [gravel or] crushed stone by methods which tend to segregate the particle sizes within the bedding layer [or cause mixing of the separate layers] will not be permitted. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Any damage to the surface of the prepared base during placing of the material shall be repaired before proceeding with the
work. Compaction of material placed on the prepared base will not be required, but [the material surface] [each layer] shall be finished to present an adequately even surface, free from mounds or windrows.

3.4 PLACEMENT OF FILTER LAYERS

3.4.1 General

**************************************************************************

NOTE: The following construction tolerances will be used for filter layer placement. Tolerances will vary based upon District experience and project conditions.

Plus or minus 50 mm 2 inches

Plus 100 mm 4 inches or minus 50 mm 2 inches

Plus 150 mm 6 inches or minus 50 mm 2 inches (below water) should be possible if water depths are less than 3 m 10 feet. Placement tolerances at greater depths should be deleted and replaced with tons/square as specified for under water placement of stone.

**************************************************************************

**************************************************************************

NOTE: Alternative 1.

**************************************************************************

[Filter layers, composed of geotextile [and a [_____] -mm -inch layer of filter stone] [and a [_____] -mm -inch layer of sand (cushion layer)] shall be placed on the prepared base as described below, in accordance with the details shown on the contract drawings, and within the limits either shown on the contract drawings or staked in the field.] [A tolerance of plus 50 mm 2 inches and minus [25][50] mm [1 inch][2 inches] from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the filter layers, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet.]

**************************************************************************

NOTE: Alternative 2.

**************************************************************************

[Filter layers composed of a [_____] -mm -inch lower layer of [Sand "[_____]"], [a [_____] -mm -inch middle layer of Gravel "][_____]"], and a [_____] -mm -inch upper layer of [Gravel "][_____]"] [Filter Stone] shall be placed on the prepared base as described below, in accordance with the details on the contract drawings, and within the limits shown on the contract drawings or staked in the field.] [A tolerance of plus [_____] mm inch(es) and minus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the filter layers, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet].

3.4.2 [Geotextile

**************************************************************************
NOTE: Delete this paragraph if Alternate 2 is used.

Installation of geotextile shall be as specified in Section 31 05 19.13 GEOTEXTILES FOR EARTHWORK.

3.4.3 [Placement of [Filter Material] [Sand Cushion Layer] on Geotextile]

[[Crushed stone][Filter material] shall be spread uniformly on the geotextile to the [slope] lines and grades as indicated on the contract drawings and in such manner as to avoid damage to the geotextile. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Placing of [crushed stone][filter stone][sand cushion layer] by methods which tend to segregate the particle sizes within the filter layer will not be permitted. Any damage to the surface of the geotextile during placement of [crushed stone][filter stone][sand cushion layer] shall be repaired before proceeding with the work. Compaction of material placed on the geotextile will not be required, but shall be finished to present an adequately even surface, free from mounds or windrows.]

3.4.4 Placement of Filter Material on Prepared Base

Filter material shall be spread uniformly on the prepared base to the [slope] lines and grades as indicated on the contract drawings and in such manner as to avoid damage to the prepared base. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Placing of [sand,] [gravel,] and [crushed stone] by methods which tend to segregate the particle sizes within the filter layers or cause mixing of the separate layers will not be permitted. Any damage to the surface of the prepared base during placement of the material shall be repaired before proceeding with the work. Compaction of material placed on the prepared base will not be required, but each layer shall be finished to present an adequately even surface, free from mounds or windrows.

3.5 PLACEMENT OF RIPRAP

NOTE: At the end of this section, the Specifier must attach copies (Plates) of ENG FORM 4794-RM RIPRAP GRADATION CURVES for M40, M____ (ENG FORM 4794-R RIPRAP GRADATION CURVES for R90, R____), etc.

3.5.1 General

NOTE: The Specifier will not specify riprap by layer thickness. Riprap shall be specified by the weight of the maximum D100 size of the riprap gradation.
Riprap shall be placed on the [filter] and [bedding] layers specified in paragraph(s) [BEDDING MATERIAL] and [FILTER MATERIAL] within the limits shown on the contract drawings.

3.5.2 Placement

**************************************************************************

NOTE: Select appropriate Alternative.
**************************************************************************

[Under water placement rates shall be used when the top of the layer to be placed is covered by more than 900 mm 3 feet of water.]

3.5.2.1 [Above Water]

**************************************************************************

NOTE: Alternative 1.

For placement of riprap above water on a bedding layer or filter layer(s).

For tolerances in general, 1/2 of the average stone dimension of gradation range is allowed above the neatline and 1/4 of the same dimension is allowed below the neatline.

Bottom hinged tailgates shall be added to dump trucks used in placing the riprap if larger than M180 R400 riprap is specified.

**************************************************************************

[Riprap shall be placed in a manner which will produce a well-graded mass of rock with the minimum practicable percentage of voids, and shall be constructed, within the specified tolerances, to the lines and grades shown on the contract drawings or staked in the field. A tolerance of plus [_____] mm inch(es) and minus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the riprap, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet. The average tolerance of the entire job shall have no more than 50 percent of the tolerances specified above. [Riprap shall be placed by means of truck, crane operated skip-pan (box), dragline bucket, clamshell, rock-bucket, hydraulic excavator, trackhoe, or other approved equipment. [The use of tractor loaders or other equipment commonly referred to as front end loaders shall not be permitted. [Pneumatic tired front end loaders may be used provided that in the opinion of the Contracting Officer no degradation of the rock occurs.]]] Riprap shall be placed to its full course thickness in one operation and in such manner as to avoid displacing the [bedding] [filter] material. The large stones shall be well distributed and the entire mass of stones in their final position shall be graded to conform to the gradation specified in paragraph RIPRAP, subparagraph GENERAL. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. The finished riprap shall be free from objectionable pockets of small stones and clusters of larger stones. Placing riprap in layers will not be permitted. Placing riprap by dumping it into chutes, or by similar methods likely to cause segregation of the various sizes, shall not be
permitted. Placing riprap by dumping it at the top of the slope and pushing it down the slope shall not be permitted. No equipment shall be operated directly on the completed stone protection system. The desired distribution of the various sizes of stones throughout the mass shall be obtained by selective loading of the material at the quarry or other source; by controlled dumping of successive loads during final placing; or by other methods of placement which will produce the specified results. Each truckload shall be representative of the gradation requirements. [All dump trucks used in placing the riprap shall be equipped with bottom hinged tailgates. The gate releasing mechanism shall be arranged so that it may be operated only from, at, or near the front of the truck.] Rearranging of individual stones shall be required to the extent necessary to obtain a well-graded distribution of stone sizes as specified above. [However, manipulating stone by means of dozers or other blade equipment shall not be permitted.] [Unless otherwise authorized by the Contracting Officer, riprap shall be placed in conjunction with the construction of the embankment and with only sufficient lag in construction of the stone protection as may be necessary to prevent mixing of embankment and stone protection materials.] Maintain the stone protection until accepted by the Contracting Officer; any material displaced prior to acceptance due to the Contractor's negligence shall be replaced with no additional payment and to the lines and grades shown on the contract drawings.]

**************************************************************************

NOTE: Alternative 2.

For placement of riprap on geotextile or geotextile and filter stone.

Tolerance +100 mm and -50 mm +4 inches and -2 inches for riprap with a top size up to 230 kg 500 pounds riprap and a tolerance of +150 mm and -150 mm +6 inches and -6 inches for large riprap.

Bottom hinged tailgates shall be added to dump trucks used in placing the riprap if larger than M180 R400 riprap is specified.

Drop heights of 900 mm 3 feet specified in this paragraph are based on the geotextile having a minimum puncture strength of 0.51 kN 115 pounds and a minimum tensile strength of 1.07 kN (240 pounds) and the riprap has a top size larger than 90 kg 200 pounds. For riprap with a top size larger than 90 kg 200 pounds and less than 225 kg 500 pounds, the drop height is reduced to 600 mm 2 feet without a layer of filter stone or a sand cushion layer is required.

**************************************************************************

[Place riprap to produce a well graded mass of rock with the minimum practicable percentage of voids, and construct within the specified tolerances to the lines and grades indicated. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material to ensure a relatively homogenous mass. A tolerance of plus [_____] mm inch(es) or minus [_____] mm inch(es) from the slope lines and grades indicted will be allowed in the finished surface of the riprap, except that either extreme of such tolerance shall not be continuous over an area greater than 18 m² 200]
square feet. The average tolerance of the entire job shall have no more than 50 percent of the tolerance specified above. Do not drop stone through air from a height greater than 900 mm 3 feet and do not drop stones heavier than 230 kg 500 pounds from a height greater than 600 mm 2 feet. [The drop height of riprap with a top size greater than 225 kg 500 pounds shall be less than 300 mm 1 foot, but can be increased by placing a cushioning layer of sand [or [_____]] on top of the geotextile before placing the riprap, or other methods deemed necessary if demonstrated in the field to not damage the geotextile.] Distribute the larger stones and roughly grade the entire mass of stones in their final position to conform to the gradation specified in paragraph RIPRAP, subparagraph GENERAL. The finished riprap shall be free from objectionable pockets of small stones and clusters of larger stones. Placing riprap in layers will not be permitted. Placing riprap by dumping into chutes or by similar methods likely to cause segregation of the various sizes will not be permitted. Placing riprap by dumping it at the top of the slope and pushing it down the slope will not be permitted. No equipment shall be operated directly on the completed stone protection system. Obtain the desired distribution of the various sizes of stones throughout the mass by selective loading of the material at the quarry or other source, by controlled dumping of successive loads during final placing, or by other methods of placement which will produce the specified results. Equip all dump trucks used in placing the riprap with bottom hinged tailgates. Arrange the gate releasing mechanism so that it may be operated only from, at, or near the front of the truck. Rearranging of individual stones will be required to the extent necessary to obtain a well-graded distribution of stone sizes as specified above. Maintain the stone protection until accepted by the Contracting Officer; replace any material displaced by any cause, with no additional payment, to the lines and grades indicated.]

[3.5.2.2 Under Water

**************************************************************************

NOTE: The equation presented in this paragraph (Alternative 3) was developed to simplify the relationship between required riprap layer thickness and underwater placement rate in slack water. This equation assumes that riprap weighs approximately 1.8 tons metric per cubic meter 1.5 tons per cubic yard and that the underwater placement rate is based upon a required layer thickness 1.5 times the layer thickness required to be constructed in the dry. The quantities are based on a placement to be performed in two passes with the second pass being perpendicular to the first. This equation is provided as an example and should be modified to meet project design criteria.

\[
T_{mm} = \frac{(1.36t)(1.5)}{(25M^2)(304 \text{ mm})} = R_M
\]

\[T_{mm} = \text{Required theoretical thickness if placed in the dry. (Layer thickness given in mm.)}\]

\[R_M = \text{Required placement rate in Tons/sq m/pass}\]

180 kg placement rate is 10 T/sq m/pass (assume required thickness in the dry is 750 mm for high
turbulent flow criteria).

90 kg placement rate is 5 T/sq m/pass (assume required thickness in the dry is 400 mm for low turbulent flow criteria).  

\[
T(0.347) = \frac{1.5 T/yd^3)(100 \text{ ft}^2)(1.5)}{(27 \text{ ft}^3/yd^3)(12 \text{ in./ft}) (2)} = R
\]

\(T = \) Required theoretical thickness if placed in the dry. (Layer thickness given in inches.)

\(R = \) Required placement rate in Tons/sq/pass. Where a square is referring to 100 square feet.

400 pound placement rate is 10 T/sq/pass (assume required thickness in the dry is 30 inches for high turbulent flow criteria).

200 pound placement rate is 5 T/sq/pass (assume required thickness in the dry is 16 inches for low turbulent flow criteria).

Alternative 3:

The depth of water over the geotextile is based on the puncture strength of the geotextile being a minimum of 0.61 kN 140 pounds and the impact energy of 1.74 kN 400 pounds top size riprap being placed without a layer of filter stone or sand cushion layer.

When riprap [with a maximum size of 180 kg 400 pounds] is placed under water onto geotextile it may be dropped from the water surface if the water depth over the geotextile is greater than 1.5 m 5 feet. Riprap placed in the wet shall be placed evenly at a rate of [_____] tons per square (9.3 m²) tons per square (100 square feet) per pass for M[_____] R[_____] riprap and [_____] tons per square (9.3 m²) tons per square (100 square feet) per pass for M[_____] R[_____] riprap. Prior to starting work, submit the proposed method of placing riprap under water. Riprap to be placed in the wet shall be done during periods of low water levels during the months of June through November. The riprap shall be placed in two passes, with the second pass perpendicular to the first pass. The total quantity of M[_____] R[_____] riprap placed in two passes shall be [_____] tons per square and the total quantity of M[_____] R[_____] riprap placed in two passes shall be [_____] tons per square.

3.6 PLACEMENT OF GROUTED RIPRAP

3.6.1 General

Place riprap on the [filter] [and] [bedding] material specified in paragraph(s) [FILTER MATERIAL] [and] [BEDDING MATERIAL] within the limits shown. [Pressure relief holes shall be installed every 3 m 10 feet and formed by 75-mm 3-inch diameter pipe. The end(s) of the pipe shall be installed into the [bedding][filter] layer so that it will not become clogged with grout. The end(s) of the pipe which is buried in the
[bedding][filter] layer shall be capped and shall be perforated with holes or slots. Care shall be taken to prevent grout from entering the weep holes.]

3.6.2 Placement

**************************************************************************

NOTE: Placement of grouted riprap will always be placed in the dry on filter layers or bedding layer.

Tolerances of +150 mm +6 inches for riprap up to 300 kg 650 pounds and a tolerance of +300 mm +12 inches for large riprap.

Bottom hinged tailgates shall be added to dump trucks used in placing the riprap if larger than 180-kg 400-pound riprap is specified.

**************************************************************************

[Riprap shall be placed in a manner which will produce a well-graded mass of rock with the minimum practicable percentage of voids, and shall be constructed, within the specified tolerance, to the lines and grades either shown on the contract drawings or staked in the field. A tolerance of not less than plus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the riprap except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet. The average tolerance of the entire job shall have no more than 50 percent of the tolerances specified above. Riprap shall be placed to its full course thickness in one operation and in such manner as to avoid displacing the [filter] [bedding] material. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. The large stones shall be well distributed and the entire mass of stones in their final position shall be graded to conform to the gradation specified in paragraph RIPRAP, subparagraph GENERAL. The finished riprap shall be free from objectionable pockets of small stones and clusters of larger stones. Placing riprap in layers will not be permitted. Placing riprap by dumping it into chutes, or by similar methods likely to cause segregation of the various sizes, will not be permitted. Placing riprap by dumping it at the top of the slope and pushing it down the slope will not be permitted. No equipment shall be operated directly on the completed stone protection system. The desired distribution of the various sizes of stones throughout the mass shall be obtained by selective loading of the material at the quarry or other source; by controlled dumping of successive loads during final placing; or by other methods of placement which will produce the specified results. Each truckload shall be representative of the gradation requirements. [All dump trucks used in placing the riprap shall be equipped with bottom hinged tailgates. The gate releasing mechanism shall be arranged so that it may be operated only from, at, or near the front of the truck.] Rearranging of individual stones will be required to the extent necessary to obtain a well-graded distribution of stone sizes as specified above. [Unless otherwise authorized by the Contracting Officer, riprap shall be placed in conjunction with the construction of the embankment and with only sufficient lag in construction of the stone protection as may be necessary to prevent mixing of embankment and stone protection materials.] Maintain the stone protection until accepted by the Government; any material displaced prior to acceptance due to the Contractor's negligence shall be
replaced with no additional payment, and to the lines and grades shown on the contract drawings.)

3.6.3 Grouting of Riprap

Placement of grout shall be as specified in paragraph PRODUCING, CONVEYING AND PLACING GROUT.

3.7 [PLACEMENT OF RIPRAP PAVING STONE]

3.7.1 General

Riprap paving shall be placed on the [filter] and [bedding] material specified in paragraph(s) [FILTER MATERIAL] and [BEDDING MATERIAL] within the limits shown.

3.7.2 Placement

Riprap paving stone shall be carefully placed, by hand or machine, in a manner which will produce a compact paving to the lines and grades either shown on the drawings or staked in the field. The stone shall be placed in a single layer with the dimensions of the stones corresponding to the thickness of the paving laid normal to the plane of the slope. Adjacent stones shall be selected for size and shape and laid in such close contact as to produce a reasonable minimum of voids. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. The stones shall be roughly coursed with courses running horizontally and breaking joints with the preceding course as far as practicable. Double-decking of the flat stones to obtain the required depth of paving will not be permitted. Spaces between the stones in the face of the paving shall be filled with tightly driven spalls and the paving tamped if necessary to produce a compact mass and an adequately even surface. A tolerance of plus or minus [_____] mm inch(ies) from the slope lines and grades shown will be allowed in the finished surface of the riprap paving, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet.

3.8 [PLACEMENT OF HAND-PLACED RIPRAP]

3.8.1 General

Hand-placed riprap shall be placed on the [filter] and [bedding] material specified in paragraph(s) [FILTER MATERIAL] and [BEDDING MATERIAL] within the limits shown. Stone shall conform to the requirements of paragraph RIPRAP. Except for spalls for wedging, stone shall be roughly rectangular in shape of which the least dimension shall be not less than one-third the length.

3.8.2 Placement

The riprap shall be carefully placed by hand in such a manner that adjacent stones are in close contact and, in general, have their greatest dimensions across the slope. "Through stones" shall be well-distributed throughout the mass and the sum of their cross sections, parallel to the slope being protected, shall be not less than two-thirds of such area. As used in this specification a "through stone" is defined as a stone whose dimension normal to the surface being riprapped is not less than the full depth of
the riprap. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material placed on the slope shall be immediately adjacent to previously placed material in such a manner to ensure a relatively homogenous mass. The riprap along the lower edge of an area shall consist of the largest stones set in a trench so as to form a band. Except for spalls used to fill voids between larger stone, no stone shall be used in the exposed face of the riprap which will extend less than one-half the thickness of the riprap. Spaces between the larger stones shall be filled with spalls and smaller stones of the largest feasible size to form a compact mass. Spalls and small stone shall not be placed in nests in lieu of larger size stone. A tolerance of plus or minus [_____] mm inch(es) from the slope lines and grades shown will be allowed in the finished surface of the riprap paving, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet.

3.9 [PLACEMENT OF GROUTED HAND-PLACED RIPRAP]

3.9.1 General

Hand-placed riprap shall be placed on the [filter] [and ] [bedding] material specified in paragraph(s) [FILTER MATERIAL] [and ] [BEDDING MATERIAL] within the limits shown. Stone shall conform to the requirements of paragraph RIPRAP. Except for spalls for wedging, stone shall be roughly rectangular in shape of which the least dimension shall be not less than one-third the length.

3.9.2 Placement

The riprap paving shall be carefully placed to form a layer [_____] mm inch(es) in thickness. The riprap shall be placed in conformance with the general requirements of paragraph PLACEMENT OF HAND-PLACED RIPRAP, except that the stone shall be laid with open joints to facilitate grouting and the smaller spaces between stones in the face of the paving shall not be filled with spalls but shall be left open to receive grout readily. [Pressure relief holes shall be installed every 3 m 10 feet and formed by 75-mm 3-inch diameter pipe. The end(s) of the pipe shall be installed into the [bedding] [filter] layer so that it will not become clogged with grout. The end(s) of the pipe which is buried in the [bedding] [filter] layer shall be capped and shall be left open to receive grout readily.]

3.9.3 Grouting of Hand-Placed Riprap

Placement of the grout shall be as specified in paragraph PRODUCING, CONVEYING AND PLACING GROUT.

3.10 [PLACEMENT OF GROUTED RIPRAP PAVING]

3.10.1 General

Riprap paving shall be placed on the [filter] [and ] [bedding] material specified in paragraph [FILTER MATERIAL] [and ] [BEDDING MATERIAL] within the limits shown. Stone shall conform to the requirements of paragraph RIPRAP PAVING.
3.10.2 Placement

The riprap paving shall be carefully placed to form a layer [_____] mm inch(es) in thickness. The riprap shall be placed in conformance with the general requirements of paragraph PLACEMENT OF RIPRAP PAVING except that the stone shall be laid with open joints to facilitate grouting and the smaller spaces between stones in the face of the paving shall not be filled with spalls but shall be left open to receive grout readily. [Pressure relief holes shall be installed every 3 m 10 feet and formed by 75-mm 3-inch diameter pipe. The end(s) of the pipe shall be installed into the [bedding][filter] layer so that it will not become clogged with grout. The end(s) of the pipe which is buried in the [bedding][filter] layer shall be capped and shall be perforated with holes or slots. Care shall be taken to prevent grout from entering the weep holes.]

3.10.3 Grouting of Riprap Paving

Placement of grout shall be as specified in paragraph PRODUCING, CONVEYING AND PLACING GROUT.

3.11 [PLACEMENT OF [DERRICK STONE] [AND] [CAPSTONE]]

******************************************************************************
NOTE: The tolerance for the riprap layer may have to be tightened in paragraph PLACEMENT OF RIPRAP to meet tolerance required for this layer.
******************************************************************************

3.11.1 General

[Derrick Stone] [and] [Capstone] shall be placed carefully with equipment suitable for handling the stone of the size(s) specified on a [_____] mm inch(es) thick layer of [M40] [M____] [R90] [R____] riprap specified in paragraph PLACEMENT OF RIPRAP.

3.11.2 Placement

The various sizes of [derrick stone] [and] [capstone] shall be distributed in such a manner as to produce a compact, uniform, well-graded mass [within the limits shown on the contract drawings.] [to the lines and grades indicated on the contract drawings and staked in the field.] Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Adjacent stone shall be selected with reasonable care as to size and shape and placed in close contact, the smaller stones filling the spaces between the larger ones so as to leave a reasonable minimum of voids. "Through stones" shall be well distributed throughout the mass, and the sum of their cross sections parallel to the surface being protected shall be not less than 70 percent of such area. As used herein, a "through stone" is defined as a stone whose dimension normal to the surface being protected is not less than the full depth of the protection. A tolerance of not less than plus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the stone except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet. The average tolerance of the entire job shall have no more than 50 percent of the tolerances specified above. Maintain the stone until accepted by the Government; any material displaced prior to acceptance due to the Contractor's negligence shall be
replaced with no additional payment and to the lines and grades shown on the contract drawings.

3.12 GROUTING OF STONE PROTECTION

Placement of grout shall be as specified in paragraph PRODUCING, CONVEYING AND PLACING OF GROUT.

3.12.1 Producing, Conveying and Placing of Grout

3.12.1.1 Producing Grout

The batching and mixing equipment shall provide sufficient capacity to prevent cold joints. Materials shall be stockpiled and batched by methods that will prevent segregation or contamination of aggregates and insure accurate proportioning of the ingredients of the mixture. No mixing water in excess of the amount required by the job mix shall be added to the grout mixture during mixing, hauling, or after arrival at the delivery point,[, except as required and approved.]

a. Ready-Mixed Concrete Grout shall conform to ASTM C94/C94M except as otherwise specified.

b. Volumetric Batching and Continuous Mixing shall conform to ASTM C685/C685M.

c. Onsite Batching and Mixing. The Contractor has the option of using an onsite batching and mixing facility. The facility shall provide sufficient capacity to prevent cold joints and be able to batch the cement and aggregate by weight, and the water and admixtures by weight or volume. The method of measuring materials, the batching operation, and the mixer shall be approved in accordance with paragraph SUBMITTALS. On-site plant shall conform to the requirements of either ASTM C94/C94M or ASTM C685/C685M.

3.12.1.2 Preparation for Placing

[Adequate precautions shall be taken to prevent grout from penetrating the upper filter layer. ]The rock shall be flushed with water to remove the fines from the rock prior to placing the grout. The rock shall be kept moist just ahead of the actual placing, but no flowing or standing water shall be present during the grout operation. Snow and ice shall be removed. All equipment needed to place, protect, and cure the grout shall be at the placement site and in good operating condition. The entire preparation shall be accepted by the Contracting Office prior to placing the grout.

3.12.1.3 Conveying and Placing

Grout placement will not be permitted when weather conditions prevent proper placement, except upon approval. Submit the methods and equipment for transporting, handling, depositing, and consolidating the grout prior to first grout placement. The grout mixture shall not be placed until the stone protection has been inspected and approved. Grout shall be in place within 15 minutes after discharge from the mixer. Grout shall not be dropped more than 1.5 m 5 feet vertically unless suitable equipment is used to prevent segregation.

a. Conveying
When the grout is mixed [and] [or] transported by a truck mixer, the grout shall be delivered to the site of the work and discharge shall be completed within 1-1/2 hours after introduction of the cement to the aggregate and water. When the air temperature is 29 degrees C 85 degrees F or greater) or under conditions contributing to quick stiffening of the grout, the time between the introduction of the cement and discharge of the grout shall not exceed 45 minutes. The Contracting Officer may allow a longer time, provided the setting time of the grout is increased a corresponding amount by the addition of an approved set-retarding admixture. Grout shall be deposited as close as possible to its final position by methods that will prevent segregation of the aggregates or loss of mortar.

b. Placing

The riprap shall be kept moist just ahead of the actual grout placement, but the grout shall not be placed in standing or flowing water. Grout placed on inverts or other nearly level areas may be placed in one course. On slopes, the grout shall be placed in two (2) courses in successive lateral strips approximately 3 m 10 feet in width starting at the toe of the slope and progressing to the top. The grout shall be delivered to the place of final deposit and discharged directly on the surface of the riprap, using a splash plate of metal or wood to prevent displacement of the rock directly under the discharge. The flow of grout shall be directed with brooms, spades or baffles to prevent it from flowing excessively along the same path and to assure that all intermittent spaces are filled. Sufficient barring shall be done to loosen tight pockets of riprap and otherwise aid the penetration of grout so that all voids shall be filled and the grout fully penetrates the riprap [as specified][from the base of the riprap layer to at least two-thirds of the thickness of the stone layer]. All brooming on slopes shall be uphill and after the grout has stiffened, the entire surface shall be rebroomed to eliminate runs, to fill voids caused by sloughing, and to remove grout from the top surface and pockets or depressions of the upper stones.

3.12.1.4 Cold-Weather Requirements

No grout placement shall be made when the ambient temperature is below 2 degrees C 35 degrees F, nor if the ambient temperature is below 5 degrees C 40 degrees F and falling. Suitable covering and other means, as approved, shall be provided for maintaining the grout at a temperature of at least 10 degrees C 50 degrees F for not less than 72 hours after placing and at a temperature above freezing for the remainder of the curing period. When freezing conditions prevail, riprap to be grouted must be covered and heated to a range of 5 to 16 degrees C 40 to 60 degrees F for at least 24 hours prior to placing the grout. Salt, chemicals, or other foreign materials shall not be mixed with the grout to prevent freezing. Any grout damaged by freezing shall be removed and replaced at the expense of the Contractor.

3.12.1.5 Hot Weather Requirements

When the rate of evaporation of surface moisture, as determined by use of Figure 2.1.5 of ACI 305R, is expected to exceed 100 g/m² 0.2 pounds per square foot per hour, provisions for windbreaks, shading, fog spraying, or wet covering with a light-colored material shall be made in advance of placement, and such protective measures shall be taken as quickly as
3.12.2 Curing and Protection of Grouted Stone Protection

Beginning immediately after placement and continuing for at least 7 days, all grout shall be cured and protected from premature drying, extremes in temperature, rapid temperature change, freezing, mechanical damage, and exposure to rain or flowing water. All materials and equipment needed for adequate curing and protection shall be available and at the site of the placement prior to the start of grout placement. After completion of any strip or panel, no workman or other load shall be permitted on the grouted surface for a period of twenty-four (24) hours. Exposed surfaces shall be kept continuously moist for the entire period, or until curing compound is applied. Preservation of moisture for grout surfaces shall be accomplished by one of the following methods:

a. Continuous sprinkling and ponding.

b. Application of absorptive mats or fabrics kept continuously wet.

c. Application of sand kept continuously wet.

d. Application of impervious sheet material conforming to ASTM C171.

e. Application of membrane-forming curing compound conforming to ASTM C309. The compound shall be sprayed on the moist surface as soon as free water has disappeared, but shall not be applied to any surface until finishing of that surface is completed. The compound shall be applied at a uniform rate of not less than 300 ml/m² 1 gallon per 150 square feet of surface and shall form a continuous adherent membrane over the entire surface. Curing compound shall not be applied to surfaces requiring bond to subsequently placed grout. If the membrane is damaged during the curing period, the damaged area shall be resprayed at the rate of application specified above.

3.13 TRENCHFILL REVETMENT, BANK PAVING, AND OUTLET DRAINS

3.13.1 Trenchfill Revetment

Stone for the trenchfill shall be Graded Stone "A" "B" "C" [[___] kg] [[___] Pound] Stone and shall be back-dumped from the dump trucks, placed by skip, clamshell, or other approved method directly in the trench excavated at the toe of the graded revetment slope. Stone placement in trench shall not be accomplished more than 300 m 1,000 feet in advance of the completed trenchfill section, including upper bank paving, unless otherwise permitted by the Contracting Officer. The trenchfill shall be constructed to the elevations and cross sections shown on the drawings. A tolerance of [150] mm [6] inches above or below the lines and grades of final excavation will be permitted provided the area of the finished section is not less than the area of the theoretical section. Placement of the trenchfill shall be completed prior to placement of the bank paving. Bulldozing of stone from the upper bank into the excavated trench will not be permitted.

3.13.2 Bank Paving

Stone bank paving shall be Graded Stone "C" [[57] kg] [[125] pound stone] [[____] kg] -Pound riprap. Excess stone placed directly in the trench at the toe of the graded revetment slope may be
dragged up the slope a maximum of 3 m 10 feet vertically above the average lower water plane (ALWP). The remainder of the upper bank paving stone may be placed in continuous stockpiles at 3 m 10 feet intervals above the ALWP by means of back-dumping from dump trucks or by skip, clamshell, or other approved method, and dragged up the slope a maximum of 3 m 10 feet vertically. The remainder of the upper bank paving stone may also be back-dumped from dump trucks; placed by skip, clamshell, or other approved method; and spread by bulldozing except that pushing stone down the slope will not be permitted. The stone shall be placed in such a manner to achieve a minimum of segregation of sizes in the in-place upper bank paving stone, with uniform gradation from the bottom of the slope to the top elevation of the stone as indicated on the drawings. Prior to placing the stone, the graded slopes shall be brought to final grade and dressed to conform to the limits specified in Section 31 00 00 EARTHWORK. A tolerance of 75 mm 3 inches above and below the specified bank paving thickness will be allowed provided the area of the finished section is not less than the area of the theoretical section. To prevent overtopping of the paved portion of the slope by rising river stages, place bank paving in strips parallel to the water's edge when directed by the Contracting Officer. Repair any damage to the graded bank or paving occasioned by such overtopping of the paving because of failure to keep paving operations above the water surface.

3.13.3 Outlet Drains

Where required, standard outlet drains or special drainage ditches shall be constructed. A tolerance of 150 mm 6 inches above or below the lines and grades will be permitted provided the area of the finished section is not less than the area of the theoretical section. Graded Stone "C" [_____] -kg -Pound stone] [_____] -kg -pound riprap] shall be placed for all outlet drain paving to provide a minimum of segregation of sizes in the in-place materials. A layer of 150-mm 6-inch thick bedding stone shall be placed under the Graded Stone "C" [_____] -kg -pound stone] [_____] -kg -pound riprap] in the manner and at the locations shown on the drawings. A thickness tolerance of plus 25 mm 1 inch for the 150-mm 6-inch thick bedding material will be allowed. Where the outlet drains must be constructed in silts or silty sands, a 150-mm 6-inch layer of bedding sand shall be placed beneath the bedding stone. The bedding sand shall meet the quality and gradation requirements as specified in paragraph BEDDING MATERIALS.

3.13.4 Toe Trench Revetment

Toe trench revetment shall be constructed, when so ordered on the construction schedule, at locations where the existing bank or riverbed at the structure azimuth line is 3 m 10 feet or less below [Average Low Water Plane (ALWP)] [______]. It shall consist of stone placed along the toe of the bank excavated as specified in [Section 31 00 00 EARTHWORK] [______] and on the graded slope of the upper bank as applicable. Toe trench revetment shall be of two types as shown on the contract drawings for the following conditions:

a. Type "A" - For conditions where the top of the graded slope is 2700 mm 9 feet or more above [Average Low Water Plane (ALWP)] [______].

b. Type "B" - For conditions where the top of the graded slope is less than 2700 mm 9 feet above [Average Low Water Plane (ALWP)] [______].
3.13.4.1 Trench Fill

A fill consisting of stone shall be placed along the excavated toe of the bank to the elevation and cross section designated on the contract drawings for both types of toe trench revetment. The fill shall consist of not less than 27 tons 9 tons nor more than 41 tons 14 tons of stone per meter linear foot of fill, unless otherwise specified on the construction schedule. The use of a dozer shall not be permitted in moving stone from the upper bank into the trench.

3.13.4.2 Upper Slope Fill

For Type "A" revetment, a fill consisting of stone shall be placed on the graded slope to a minimum depth normal to the slope of 250 mm 10 inches at the top of the slope and increasing uniformly therefrom to a minimum depth of 375 mm 15 inches where it abuts the trench fill. The upper slope fill shall be arranged uniformly with the larger stone at the bottom of the slope and the small stone at the top and shall not exceed 0.7 t/m² 7 T per 100 square foot of upper slope fill. Rearrange the upper slope fill stone as necessary to conform to these specifications. The use of a dozer is not permitted in placing the upper slope fill.

3.13.4.3 Crown Fill

For Type "B" revetment, a fill consisting of stone shall be placed, abutting the trench fill, to the elevation and crown width specified on the construction schedule. The crown fill shall have a riverward side slope of 1V on 3H, a landward side slope of 1V on 2H, and a minimum thickness of 375 mm 15 inches as shown on the contract drawings.

3.13.4.4 Juncture With Other Types of Revetment

Where toe trench revetment joins an existing structure and the alignment and riverward slopes of the stone fills in the structures are not the same, a transition shall be made by gradually adjusting the alignment and slope of the toe trench revetment over a distance of approximately 30 m 100 feet so that it conforms to the alignment and slope of the existing stone fill at the junction of the structures. The transition shall be made in a workmanlike manner and as directed by the Contracting Officer.

3.13.4.5 Intermittent Repair of the Trench Fill and Upper Slope Area of Revetment

Intermittent repair shall consist of stone placed along the trench fill and/or upper slope area of the revetment to the elevation and cross section designated on the drawings for trench fill or upper slope, and is ordered on the construction schedule. When specified by the Contracting Officer, adjustment in the line and grade may be authorized to accomplish necessary repairs to conform to alignment and grade of undamaged sections. Trench fill repair shall not be performed when the river stage exceeds [Average Low Water Plane (ALWP)] [_____] and upper slope repair shall not be performed when the river stage exceeds 1.5 m 5 feet above [Average Low Water Plane (ALWP)] [______], unless otherwise directed by the Contracting Officer.

3.13.5 Stone Fill Revetment

Stone fill revetment shall be constructed when so ordered on the construction schedule, and shall consist of a stone fill placed as
specified in [Section 31 00 00 EARTHWORK] [_____]. If required to obtain proper placement of material, the Contractor has the option of using either mooring piles, anchors, spud barges, or other suitable methods approved by the Contracting Office to obtain the proper configuration and alignment while placing stone.

3.13.5.1 Stone Fill

A fill consisting of stone shall be placed along the structure azimuth line to a cross-section as shown on the contract drawings and to such elevation and crown width as specified on the construction schedule. The riverward slope shall be 1V on 1.5H and shall intersect the structure azimuth line 900 mm 3 feet below [Average Low Water Plane (ALWP)] [_____] unless otherwise specified; minor irregularities will be permitted. The stone shall be placed in lifts of such height and length as the Contracting Officer may consider necessary to prevent or reduce scour ahead of the fill.

3.13.5.2 Juncture With Other Types of Revetment

Where stone fill revetment joins and existing structure and the alignment and riverward slope of the stone fills in the structures are not the same, a transition shall be made by gradually adjusting alignment and slope of the stone fill revetment over a slope of the existing stone fill at the junction of the structures. The transition shall be made in a workmanlike manner and as directed by the Contracting Officer.

3.14 STONE REVETMENT, STONEFILL DIKES, STONEROOTS, AND JUNCTIONS

3.14.1 Excavation and Grading

Where required for bank protection, the existing ground at the proposed structures shall be excavated and graded to provide a foundation for the complete placement of stone. Excavation and grading shall be in accordance with Section 31 00 00 EARTHWORK.

3.14.2 Construction Method

The stonefill revetment and dikes shall be constructed of [Graded Stone "A" "B" "C"] to the lines, grades, and sections shown or as noted on the drawings. Construction of the stonefill revetments and stonefill dikes shall commence at the upstream end and continue progressively to the downstream end. The initial work shall consist of a stone blanket approximately 600 mm 2 feet thick and extending over the full width and length of the revetment or dike. If stone is placed by land based equipment, this stone blanket is not required. The remaining stone required to complete the underwater portion of the revetment or dike shall be placed from the shoreward to the riverward end of the revetment or dike in approximately uniform layers not exceeding 1.5 m 5 feet in thickness and extending over the full width and length of the revetment or dike. The portion of the revetment or dike above the water may be placed in one lift.

3.14.3 Placement

The stone shall be placed in the revetment and dikes by skip or clamshell, cast off barges by hand or machine, or by other methods approved by the Contracting Officer. The larger stone shall be well distributed throughout the mass, and the finished revetment or dike shall be free from pockets of small stone and clusters of larger stone. A tolerance of plus or minus 300 mm 1 foot will be allowed on the prescribed crown elevation and width. The
side slopes shall be determined by the natural angle of repose of the stone, varying from 1V on 1.25H to 1V on 2H.

3.14.4 Stoneroots

The stoneroots shall consist of [Graded Stone "A"]["B"] ["C"] [_____] -kg -pound stone][[_____] -kg -pound riprap] placed in the excavated trench as specified in paragraph PLACEMENT and as shown on the drawings.

3.14.5 Junctions

The junctions shall consist of [Graded Stone "A"] ["B"] ["C"] [_____] -kg -pound stone][[_____] -kg -pound riprap]. The 60 m 200 feet trenchfill revetment wraparound portion of the junction shall consist of Graded Stone "B" and measurement and payment shall be as specified in paragraph UNIT PRICES. Placement of Graded Stone "B" shall be as specified in paragraph PLACEMENT and shown on the drawings.

3.15 CAPOUT AND REINFORCEMENT

The work covered by this section consists of furnishing all plant, labor and stone, and performing all work necessary in placing the stone for the revetments and dikes capouts, and reinforcement, complete, all as specified herein and shown on the drawings. Stone shall be Graded Stone "B" and shall conform to the requirements specified.

3.15.1 Debris Removal

Debris shall be removed from the structures to allow for the placement of the stone in the capout and reinforcement. The Contracting Officer will determine the location and amount of debris to be removed. There will be no measurement and payment for the debris removal and all costs will be considered incidental to the contract. The debris shall be disposed of landward of the existing structures so as not to interfere with placement of capouts and reinforcement.

3.15.2 Construction Method

The capouts and reinforcement shall be constructed of Graded Stone "B" at the lines, grades and sections shown or as noted on the drawings. Construction shall commence at the upstream end of each structure or portion thereof and continue progressively to the downstream end. The stone required to complete the underwater portion of the capouts and reinforcement shall be placed from the upstream to the downstream end of the revetments and landward end to the riverward end of the dikes in approximately uniform layers not exceeding [1.5][_____] m [5][_____] feet in thickness and extending over the full width and length of the revetment. That portion of the revetments or dikes above the water may be placed in one lift. Where reinforcement is required to be placed below the water surface, the stone shall be dropped from barges or placed by other approved methods to provide a close compact paving with a required thickness of [600][_____] mm [2][_____] feet. Ensure that the stone placement methods for placement of stone between Structural Azimuth Line (SAL) stations [_____] to [_____] will not result in damages to the "sensitive historic site." Prior to the start of work submit, for approval, the proposed method or methods for placing stone underwater.
3.15.3 Placement

The stone shall be placed in the capouts and reinforcement by skip, clamshell, cast off barges by hand or machine, or by other methods approved by the Contracting Officer. The larger stone shall be well distributed throughout the mass and the finished revetment shall be free from pockets of small stone and clusters of larger stone. A tolerance of plus or minus [150][_____] mm [6][_____] inches will be allowed for reinforcement and a tolerance of plus or minus [300][_____] mm [1][_____] foot will be allowed for capouts on the prescribed crown elevation and width provided the area of the finished section is not less than the area of the theoretical section. The allowable tolerances from the prescribed theoretical cross section shall not be continuous for more than [60][_____] m [200][_____] linear foot of revetment and/or dike. There shall be no abrupt changes in the revetment and/or dike crown widths and elevations. The side slopes shall be determined by the natural angle of repose of the stone, varying from 1V on 1.25H to 1V on 2H.

3.16 STONE DIKE

3.16.1 Dike Stone Placement

The dikes shall be constructed to the elevations, cross sections, and minimum thicknesses and within the limits shown on the contract drawings. Side slopes shall be determined by the angle of repose of the stone, approximately 1V on 1.25H. The dikes shall be constructed of Graded Stone "A" as specified in paragraph GRADED STONE "A". Stone shall be placed in the dikes in such a manner as to produce a well-graded mass of stone with the minimum practicable percentage of voids. A tolerance of 300 mm 1 foot will be allowed in the specified elevation, and 300 mm 1 foot under and 600 mm 2 feet over in the specified crown width provided these variations are gradual over a minimum distance of 30 m 100 feet measured along the dikes centerlines. The stone may be placed by either backhoe or dragline equipped with rock bucket; by [either bulldozer or ]front-end loader or bulldozer, except when placing the base blanket subaquously; and by trucks and other methods, if approved by the Contracting Officer. Additional stone shall be added if either soundings or sections indicate such to be necessary. The large stones shall be well distributed throughout the mass and the finished dikes shall be free from pockets of small stones and clusters of large stones. Bulldozing stone into excavated trenches will not be permitted. Subaqueous placement of stone will not be permitted at river stage limitations as specified in [Section [_____]][_____], paragraph [RIVER STAGE LIMITATIONS], without prior approval, in writing, by the Contracting Officer or at any river stage when site and current conditions prevail which, in the opinion of the Contracting Officer, make construction operations either impractical or uneconomical.

3.16.2 Placement Control

Furnish, operate, maintain necessary equipment, and furnish all necessary material and supplies while maintaining control of the placement of stone in the dikes. At all times when stone placement from floating plant is underway, the means by which the Contractor positions the plant, equipment, and stone supply barges must function accurately and consistently. The plant and equipment shall have a dragline or backhoe capable of being mobile on the spud barge and the flexibility to perform stone placement by the drag-off method. The kick-off method for stone placement shall not be used unless approved by the Contracting Officer. Whatever the method employed, it must readily permit the Contractor and the Government
inspector to determine the exact position of the stone-placing operation. Do not not place anchors for the purpose of holding floating plant in place over existing or partially completed dikes.

3.16.2.1 Alignment Control

The method of alignment control shall be either a manned transit or laser or either colored or polarized light beams, or any other method demonstrated to be practicable and sufficiently precise and reliable as approved by the Contracting Officer.

3.16.2.2 Distance Control

The method of distance control for floating plant engaged in the subaqueous placement of stone shall be either wire distance wheel or another equally accurate measuring device as approved by the Contracting Officer.

3.16.2.3 Depth Finder

An electronic recording depth finder, approved by the Contracting Officer, in writing, shall be provided during the construction of the dikes. The depth finder shall have a recording scroll not less than 150 mm 6 inches wide with a scale of not more than 3 m of depth to 25 mm 10 feet of depth to the inch. The depth finder shall be capable of obtaining accurate profiles and cross-sections during construction of the dikes and shall be used to monitor anticipated and actual scour and as an aid in the control of stone placement. Furnish and maintain an adequate stock of recording paper for the depth finder.

3.16.2.4 Nonpermitted Devices

The use of buoys and piles of stone placed above the water surface as placement control devices will not be permitted. The use of bank targets for alignment control will not be permitted for work distances of more than 120 m 400 feet without prior approval, in writing, by the Contracting Officer.

3.16.2.5 Skiff or Boat

Furnish an aluminum skiff or boat with a minimum length of 5.5 m 18 feet and equipped with a 38 kW 50 hp outboard motor.

3.16.3 Longitudinal Stone Dike Placement

**************************************************************************

NOTE: For use with stone under 180 kg 400 pounds top size.
**************************************************************************

The stone shall be placed in the longitudinal peaked stone dikes, stone tiebacks and transverse stone dikes by skip, grapple, hand, or other approved method, in such a manner as to produce a well graded mass or stone with the minimum practicable percentage of voids. Stone shall not be dropped from a height greater than 900 mm 3 feet. A variation of 300 mm 1 foot above or 150 mm 6 inches below the specified deviation and 150 mm 6 inches under or 300 mm 1 foot over the specified crown width will be allowed provided these variations are gradual over a minimum distance of 3 m 10 feet measured along the dike's centerline. Bulldozing stone into excavated trenches will not be permitted. Stone delivered on-site shall be
3.17 CORRECTIVE EARTHWORK

3.17.1 Grading

Grading shall consist of the sloping of bluff banks damaged by failures in the bank paving and the preparation of the subgrade for placement of new paving; reshaping of damaged drains and constructing new drains; reshaping of overbank areas; and any incidental work as may be required in the prosecution of the work. Most of the grading will be in areas where mechanical equipment can be used, but some hand grading will be required. Material resulting from grading operations, including broken pavement, if any, shall be used for making fills where required, including the restoration of deficient slopes. All grading and filling shall be done to the lines and grades as staked in the field or as specified. Material used in making fills or restoring the subgrade shall be free from roots, brush or other debris; and shall be placed in layers not to exceed 300 mm 1 foot in thickness. Each layer shall be thoroughly compacted to a density at least equal to that of the adjacent undisturbed earth. Excess material [may be wasted in the river or ]shall be spread on the slope adjacent to the area of repair.

3.17.2 Excavation

Excavation shall be required in some failures where protrusion of stone above adjacent surface is objectionable. Where excavation is specified, the subgrades shall be excavated 250 to 300 mm 10 to 12 inches below the surface of the adjacent paving. Large areas may not require excavating throughout, but excavation to the depths specified above will be required only for a distance of 1.5 m 5 feet inside the perimeter of the failure. Most of the excavation can be accomplished by mechanical means, but some hand work around the edges will be required. All work shall be to the lines and grades as staked in the field or as specified. Material resulting from the operation shall be used for making fills where required as specified in paragraph GRADING. Excess material may be wasted in the river or spread on the adjacent slopes.

3.18 BREAKING OUT PAVEMENT

The work consists of the breaking out of concrete or asphalt pavement in damaged or undermined areas of pavement. The concrete pavement is approximately [100][_____] mm 4 inches in thickness, and the asphalt pavement is approximately [125][_____] mm 5 inches in thickness. The area of pavement to be broken out will be marked by the Contracting Officer prior to the start of work. Any additional areas to be broken out adjacent thereto will be marked as required as the work progresses. Any pavement outside the limits marked to be broken out that is damaged by the Contractor's operations shall be repaired by the Contractor with no additional payment. The breaking out may be done by any method which will accomplish the results desired and will not damage paving outside the limits marked.[ Blasting will not be permitted.]

3.18.1 Concrete Breakout

Damaged or undetermined monolithic,articulated or slab concrete shall be broken into pieces not exceeding 450 mm 18 inches in any dimension. The pieces shall be left on the subgrade where broken. In areas where grading may be required, the concrete shall be broken out to the extent necessary.
3.18.2 Asphalt Breakout

Generally, asphalt breakout will be limited to areas requiring grading of the bank to slopes suitable for paving. The broken asphalt shall be used to the extent possible in making fills adjacent to the breakout. When broken asphalt is used in making fills, the pieces shall not exceed 450 mm (18 inches) in any dimension. The broken asphalt that is not used for fill shall be spread out sufficiently to avoid abrupt humps on the adjacent paving. In areas where asphalt is damaged and grading of bank is not required, stone may be placed on top of the broken or damaged asphalt to the extent necessary to cover the damaged area.

3.18.3 Removal of Drift and Clearing

Accumulations of drift shall be removed from the areas to be repaired. Clearing will not generally be necessary; however, any trees, stumps or brush in the areas where repair work is prescribed shall be cut off flush with the ground or to an elevation 300 mm (1 foot) below the top of the fill, and removed from the area. The debris shall be disposed of as specified in [Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL] and [Section 31 11 00 CLEARING AND GRUBBING].

3.18.4 Preparation of Subgrade

In areas where grading or excavation is required, the subgrade shall be dressed to a uniform surface suitable for paving. In other areas where crushed stone or [riprap][stone] is specified, the subgrade shall be dressed as necessary to provide an even surface for paving or to provide for a suitable tie to the existing paving.

3.19 STONE WORK

Bedding stone, [_____] -kg -pound [riprap][stone][, and/or] [Graded Stone "A" "B" "C"] shall be used to repair failure areas in existing paving or to protect the upstream, downstream, and landward areas adjacent to an existing paved bank; for constructing or repairing drains; for making stone fills, both above and below the water surface; and for constructing overbank spurs. Stone shall be placed on the bank or overbank area by crane or dragline equipped with skip, grapple, clamshell, or rock bucket; by front-end loader[ or bulldozer]; or by trucks or other methods approved by the Contracting Officer. Unless otherwise approved by the Contracting Officer, the maximum capacity of dragline buckets used to place [riprap][stone] paving on the bank will be limited to 2.3 cubic meters (3 cubic yards).

3.19.1 Placement

It is contemplated that the quantities required will be in increments of a barge load of approximately [_____] [1000] tons (metric) [_____] [1,000] tons for placement at a single revetment. When less than [_____] [10,000] tons (metric) [_____] [10,000] tons of [Graded Stone "A" "B" "C"] [_____] is specified at a single revetment, the stone shall be considered "Graded Stone "A", Small Repairs" for payment purposes. When [_____] [10,000] tons (metric) [_____] [10,000] tons or more of Graded Stone "A" is specified at a single revetment, the stone shall be considered "Graded Stone "A" "B" "C" [_____], Large Repairs" for payment purposes.
3.19.1.1 Bedding Material

Bedding stone may be required for use under [riprap] [stone] paving or to fill scoured areas or depressions in the subgrade, or as a blanket in the construction or repair of drains. Bedding stone is normally placed [100] mm [4] inches in thickness above the water surface, [150] mm [6] inches in drains and in the amount of 1.8 t per square (9.3 m^2) [two] T per square (100 square feet) when placed below the water surface. Placement above the water shall be to the lines and grade specified or as staked in the field; below the water surface, in the amount specified or as directed at the time of placing.

3.19.1.2 [Riprap] [Stone] Paving

******************************************************************************
NOTE: For determining the placement rate for under water placement, see notes at paragraph PLACEMENT OF RIPRAP, subparagraph [UNDER WATER].
******************************************************************************

[Riprap] [Stone] of the specified maximum size shall be placed on the dry slope or overbank areas and rearranged by hand as necessary to provide complete coverage of the specified area with an average thickness of [250] mm for [57] [10] inches for [125] tons per square (9.3 m^2) of the graded slope will not be allowed. Spalls and quarry chips may be used as a base but not as a filler. In underwater placement, the stone shall be uniformly distributed at the rate of [_____][7.3] tons per square [_____][8] tons per square unless another rate is shown or specified. [Riprap] [Stone] may be required for use in constructing stone fills and making other repairs to revetments. [It is contemplated that the quantities of _____] -kg -pound required will be in increments of a barge load of approximately 1000 tons for placement at one or more nearby locations.]

3.19.1.3 Overbank Paving

[Riprap] [Stone] paving may be required to repair scour damage behind top bank. Overbank paving will generally consist of a blanket of stone 250 mm 10 inches thick and up to 15 m 50 feet wide placed behind the top bank or landward of the existing paving. Overbank paving shall be placed in accordance with paragraph [RIPRAP] [Stone] PAVING above or as specified.

3.19.1.4 Stone Fills

Stone fills may be required to be constructed of _____ -kg -pound [riprap][stone] or Graded Stone ["A"] ["B"] ["C"] as specified. Stone fills specified above the water surface shall be placed to the lines and grades specified or as staked in the field. Where specified below the water surface, the material may be placed by any method elected by the Contractor, subject to approval by the Contracting Officer. The location of the fill and the quantities to be placed at each underwater location shall be as specified or as directed at the time of placing.

3.19.1.5 Overbank Stone Spurs

In the repair or prevention of overbank scour, [riprap][stone] shall be required to construct or repair spurs landward of the top of bank at some
locations. The spurs shall consist of stone fill with variable crown widths and side slopes, usually tying into the revetment paving and extending landward at varying angles with the top of bank. Extensions of existing overbank spurs may also be required. The height of stone spurs will usually be from 900 to 1800 mm (3 to 6 feet), with maximum heights depending upon the depth of overbank scour. Generally, work will not extend beyond 90 m (300 feet) landward of the top of the bank, but conditions at some locations may require construction beyond this limit. The location, alignment, and dimensions of the overbank spurs shall be as shown or as directed. [Riprap] [Stone] that can be placed entirely by the floating plant will not be considered Overbank Stone Spur.

3.19.1.6 Stone Landward of an Obstruction

Occasionally in the repair of a revetment, stone must be placed on the revetment slope behind or landward of a structure which prevents placement of stone by a barge-mounted dragline or at a revetment location which, in the opinion of the Contracting Officer, is inaccessible by floating plant for other reasons. These repairs may be accomplished by hauling or other means approved by the Contracting Officer.

3.20 SLOPE DRESSING AND [RIPRAP] [STONE] PAVING

3.20.1 Slope Dressing

The work consist of furnishing all plant, labor and materials and performing all work in strict accordance with these specifications, schedules and drawings for construction of [riprap] [stone] paving on the [river banks] [banks of the [_____] River between [_____] and [_____]]. The work shall be performed at several localities which will be selected after the award of the contract and will be designated in the jobsite specifications and "Before Construction" drawings to be issued pursuant to paragraph [_____], Section 01 35 13 [SPECIAL CONTRACT REQUIREMENTS] [______]. Perform the work regardless of the number of localities involved. Work may not be required under these specifications at all localities at which mattress sinking operations will be performed; however, work may be required at locations where articulated concrete mattress is not required. The work to be performed normally includes the final preparation of the slopes and procuring and placing the [riprap] [stone] on the graded bank. At some locations, underwater and/or overbank paving may be required. Such locations will be specified in the jobsite specifications or indicated on the "Before Construction" drawings. The Government reserves the right to accomplish all or any portion of the work at any location by other means.

3.20.1.1 General

The bank will be graded, including finish grading, by others. However, preparatory to placing the paving, dress the slope to eliminate any irregularities, including irregularities in the bedding material placed by others, due to rain or wave wash or operations of the Contractor’s equipment. Irregularities in the ungraveled slope shall be filled with layers of earth not greater than 300 mm (1 foot) in uncompacted thickness and firmly compacted into place. If directed by the Contracting Officer, irregularities in graveled areas shall be filled with stone, and payment will be made at the applicable contract unit price for "[Riprap] [Stone] Paving" for stone so placed. Earth fill material shall be acquired from adjacent areas within the limits of the right-of-way. Redress and/or clean out any landside drainage ditch damaged by the operations.
3.20.1.2 Regrading

Any regrading necessitated by slides in the bank occurring before or during construction of the bank paving will be done by others and will in no way be the responsibility of the Contractor except that evidence of such slides should be reported promptly to the Contracting Officer and no paving shall be placed on such a disturbed area until the slide has been graded out or otherwise corrected.

3.20.1.3 Repairs

Repair, with no additional payment, any damage to the graded bank or strip paving caused by failure to place paving at the rate required by paragraph [_____] of Section 01 35 13 [SPECIAL CONTRACT REQUIREMENTS] [______]. If strip paving is ordered by the Contracting Officer due to reasons beyond the control of the Contractor and the graded bank or strip paving is damaged by rain wash or overtopping, make the repairs as ordered by the Contracting Officer and an adjustment in the contract price and time of performance as appropriate for that portion of the work will be made in accordance with the Contract Clause, CHANGES.

3.20.2 [Riprap] [Stone] Paving

3.20.2.1 General

[Riprap] [Stone] upper bank paving shall consist of a course of stone with an average thickness of 250 mm 10 inches, measured normal to the slope, except where other thickness is specified or indicated on the drawings. The paving shall cover the surface of the bank between the limits of work as shown on the jobsite plans or surface of the bank between the limits of work as shown on the jobsite plans or as determined by the Quality Assurance Representative in the field. The landward limit of [riprap] [stone] paving may include an overbank strip not exceeding a distance of 15 m 50 feet landward of the top of the bank. The bank to be paved will have been graded by others to a slope that will vary from approximately 1V on 3H to 1V on 5H and any overbank area to be paved will have been dressed by others to a surface suitable for paving. In general, the width of the paving will vary between approximately 15 m 50 feet and 60 m 200 feet slope measurement.

3.20.2.2 Strip Paving

When directed by the Contracting Officer, pave the bank in strips parallel to the water's edge. It is anticipated that strip paving will be required whenever there is more than 600 m 2,000 linear feet of unpaved bank available to the Contractor for paving or whenever rising river stages threaten overtopping of the inshore limit of mattress within that area. In areas where an articulated concrete mattress has been placed, strip paving shall consist of placing [riprap] [stone] paving in a strip along and parallel to the inshore edge of mattress. Unless otherwise authorized or directed, the strip paving shall be 9 m 30 feet wide except it shall include complete paving of drains within the area. At locations requiring only stone paving, the underwater paving shall be placed along with a strip 9 m 30 feet wide above and parallel to the water's edge and shall include paving of drains. Once strip paving operations are directed, this method of paving shall continue as long as required by the Contracting officer, and shall be conducted at such locations and in such order of precedence as he requires in order to protect the interest of the Government. If strip
paving operations and moving, as required by the Contracting Officer to be performed the most essential work, prevent the Contractor from maintaining the required production rate, an equitable adjustment in contract time will be allowed upon written request and justification. Additional towing required to move between jobs as prioritized by the Contracting Officer and to return to unfinished jobs to complete them will be paid for as provided in Section 01 35 13 [SPECIAL CONTRACT REQUIREMENTS] [____], paragraph [PAYMENT FOR EXCESS TOWING] [____].

3.20.2.3 Underwater Paving

Where specified in the jobsite specifications or indicated on the "Before Construction" drawings, underwater [riprap] [stone] paving shall be placed on subaqueous areas not covered by articulated concrete mattress. The underwater [riprap] [stone] paving shall be uniformly distributed over the area to be paved in the amount of 7.3 tons per square (9.3 m²) 8 tons per square (100 square feet) or such other amount as indicated in the jobsite specifications.

3.20.2.4 Placement

The stone shall be placed on the graded slopes by crane or dragline equipped with skip, grapple, clamshell, or rock bucket or by other method approved by the Contracting Officer and rearranged by use of a trackhoe or by hand as necessary to provide complete coverage of the banks to the specified average thickness. If the entire upper bank cannot be paved from floating plant and stone is windrowed on the upper slope, the windrowed stone shall be spread to the prescribed thickness by pulling the stone up the slope with a trackhoe or by other approved methods. In no case shall the stone be pulled or bulldozed down the slope. A tolerance of 50 mm 2 inches above and below the specified average thickness will be allowed. Openings between stones exposing more than 2600 mm² 4 square inches of the graded slope or gravel blanket will not be permitted. In underwater placement, the stone shall be uniformly distributed in the amount specified. [Riprap] [Stone] placed underwater shall be controlled to the extent necessary to provide coverage as indicated on the "Before Construction" drawings and/or to assure a connection between articulated concrete mattress and [riprap] [stone] paving placed above water.

3.20.2.5 Connections

Connections between [riprap] [stone] upper bank paving and concrete mattress or paving shall be made as detailed on the drawings. Any stone placed or spilled onto the concrete mattress shall be removed and placed by hand into the paving and mattress connection area. The thickness of stone in the connection shall be not less than 450 mm 18 inches at a point 1200 mm 4 feet from the concrete mattress or paving, and shall taper to an average thickness of 250 mm 10 inches at the edge of the mattress and at a point 1800 mm 6 feet from the mattress or paving, unless other thickness is specified. At the connection between [riprap] [stone] paving and existing asphalt paving, the thickness of the [riprap] [stone] paving shall be increased to 250 mm 18 inches in a strip approximately 1200 mm 4 feet in width along the connection of the [riprap] [stone] and existing asphalt paving.

3.20.2.6 Bedding Material

Bedding material approximately 100 mm 4 inches thick will have been placed by others at most locations from approximately the
contour to the contour. Exercise reasonable care in placing [riprap] [stone] so that the bedding material will not be damaged.

3.20.2.7 Exposed Flanks

When the bank paving ends with a flank or flanks not connected with existing work, the Contracting Officer may direct that the last 18 m 60 linear feet be paved with [riprap] [stone] averaging 500 mm 20 inches in thickness from a point 1200 mm 4 feet landward of the articulated concrete mattress to the landward limit of the paving.

3.20.2.8 Ditch Outlets

The bottom and side slopes of drainage ditches shall be paved for a distance of 3 to 8 m 10 to 25 feet landward of the top bank as specified in [the Supplementary Specifications] or in the jobsite specifications.

3.21 DIKE REPAIRS

The work requires grading and paving areas of damaged dike bankheads, placing stone fill in areas of dikes where damage has occurred, and performing other stone repairs necessary to maintain integrity of the dike field. Except as provided below, work will be required only on portions of dike fields which are accessible by floating plant. Jobsite work orders will be issued for each dike field where work is required, setting forth the details and limits of work. It is anticipated that at some locations where dike field repairs are specified, the site may be inaccessible to floating plant, and hauling of stone may be necessary to restore the integrity of the dike field or to extend a dike landward. In such cases, [except for work at ], the Contractor will be given the option of performing work at the applicable contract unit prices or omitting the work. However, should the Contractor agree to do the work, the entire work specified at that location must be satisfactorily completed. The Contractor will be furnished a jobsite work order with details as necessary to perform the work. After a review of the jobsite work order and an inspection of the site, notify the Contracting Officer, in writing, whether the work will be performed at the contract unit price or omitted from the job. It is anticipated that the length of a landward dike extension will not exceed [150] m [500] feet. Grading and dressing of the bank and excavation may be required. The type of stone required may be [57] [125] pounds [riprap] [stone], or Graded Stone ["A"] ["B"] ["C"]. The placing of any of the above types of stone may include placing fill in a dike, bank paving and the filling of key trench. Where the Contractor agrees to perform stone dike repair work, which is inaccessible by floating plant and must be hauled, additional compensation for the tonnage hauled will be made at the applicable contract unit price for "Stone Placement Premium".

3.21.1 Tolerances

The following tolerances will be allowed in the specified repairs, provided the extremes do not occur adjacent to each other.

a. Surface Elevations

(1) [Upstream ] m feet of dike crown - zero to minus 300 mm 1 foot] [____].
(2) [Downstream 2700 mm 9 feet of crown and apron -plus or minus 150 mm 6 inches] 56.

b. Crown line (each side) -150 mm 6 inches inside to 300 mm 1 foot outside.

c. Slopes - plus or minus 300 mm 1 foot.

3.21.2 Earthwork

3.21.2.1 Grading

The bank shall be graded or filled with material available from grading to the slopes indicated in the jobsite work order and as staked in the field. Slopes shall be not steeper than 1V on 3H except that steeper slopes may be authorized in making connection with existing paving. The grade of the slope shall conform to the prescribed grade within the limits of plus or minus 300 mm 1 foot. When less than 7600 m³ 10,000 cubic yards is specified in the jobsite work order for a single dike field, the grading shall be considered "Earthwork, Small Repairs" for payment purposes. When 7600 m³ 10,000 cubic yards or more of grading is specified in the jobsite work order for a single dike field, the grading shall be considered "Earthwork, Large Repairs" for payment purposes.

3.21.2.2 Key Trench

A key trench may be required along the downstream limit of the [riprap] [stone] paving or at other locations on the bankhead. Unless otherwise specified or directed, the key trench shall extend from top of bank to waters edge, have a bottom width of 3 m 10 feet and side slopes of 1V on 1H. The bottom grade shall be 1.5 m 5 feet below the prescribed grade of [riprap] [stone] paving.

3.21.2.3 Disposal of Material

Material from grading in excess of that used as fill shall be disposed of by depositing riverward of the top of bank upstream or downstream from the limits of the repair work.

3.21.2.4 Stone Work

a. Stone quality and size shall be as specified.

b. Where [riprap] [stone] is required in dike repairs, the size shall be [57][____] -kg [125][____] -pound [riprap][stone], as specified in the jobsite work orders. It is contemplated that the quantities of [riprap] [stone] specified will be in increments of a barge load of approximately 1000 tons for placement at one or more nearby dike and revetment locations.

(1) [Riprap] [Stone] Paving - Unless otherwise specified, [riprap] [stone] paving shall consist of a course of graded stone with an average thickness of 300 mm 12 inches measured normal to the slope. Where paving is placed under water, the amounts required shall be 7.3 tons 8 tons per square unless otherwise shown in the jobsite work order or directed. Placing of stone shall follow grading and excavation as soon as practicable. Preparatory to placing the [riprap] [stone] paving, dress the slope to eliminate any irregularities due to wave or rain wash, or operation of the Contractor's equipment. The stone shall be placed by crane or
dragline equipped with skip, clamshell, or rock bucket; by frontend loader or bulldozer; or by trucks or other methods approved by the Contracting Officer and rearranged by hand as necessary to provide complete coverage of the bank to the specified average thickness. A tolerance of 20 percent above or below the specified average thickness will be allowed. Openings between stones exposing more than $2600 \text{ mm}^2$ 4 square inches of the graded slope will not be permitted. In underwater placement, the stone shall be uniformly distributed in the amount specified.

(2) Stone-Filled Key Trench - The excavated key trench shall be filled to the elevation of adjacent [riprap] [stone] with stone of the specified size to provide a thickness of 1.5 m 5 feet with a tolerance of 300 mm 1 foot. Bulldozing stone into the excavated trenches will not be permitted.

(3) [Riprap] [Stone] Fill - Eroded areas of stone dikes shall be restored and minor gaps filled with [riprap] [stone] of the specified size. The stone fill shall be placed to the elevations and sections of adjacent portions of the dike or in accordance with the jobsite work orders or as directed by the Contracting Officer. The underwater portion of the repairs shall be accomplished in uniform horizontal layers of about 1.5 m 5 feet thickness. Each lift shall be carried the entire length of the dike repairs. Generally a 1800 mm 6 feet crown width with slopes of angle of repose (approximately 1V on 1 1/4 H) will be required. A tolerance of plus or minus 300 mm 1 foot will be allowed in the specified elevation and crown width. The stone shall be placed by a crane or dragline equipped with a skip, grapple, clamshell, or rock bucket; by frontend loader or bulldozer; or by trucks or other equipment approved by the Contracting Officer. Placing of stone along the dike will not be permitted when river stages are above the top of dike without prior approval of the Contracting Officer or at any river stages when site and current conditions prevail which, in the opinion of the Contracting Officer, make operations impracticable or uneconomical.

3.21.2.5 Placement Control

Control placement of stone in the dikes, and furnish, operate, and maintain the necessary equipment, and all necessary material and supplies. At all times, when stone placement from floating plant is underway, the means by which the plant, equipment, and stone supply barges are positioned must function accurately and consistently. Whatever the method employed, it must permit the Contractor and the Government Quality Assurance Representative to readily determine the exact position of the stone-placing operation. Prior approval of the contracting Officer will be required in each instance before placing any stone subaqueously without the aid of any equipment listed below.

a. The method of alignment control may consist of piles or pile clumps. Other acceptable methods of alignment control include the use of a manned transit, laser, colored or polarized light beams, or other method demonstrable to be practicable and sufficiently precise and reliable.

b. Acceptable methods of distance control for floating plant engaged in subaqueous placement of stone may consist of piles or pile clumps at intervals of 90 to 120 m 300 to 400 feet. Piles or pile clumps, if
used, shall be supplemented by a wire distance wheel or other equally accurate measuring device for use in conjunction with the piles. Other acceptable methods include the use of electronic distance surveying instruments or other method demonstrable to be practicable and sufficiently precise and reliable.

c. Suitable recording electronic depth finder shall be provided at each location of work under this contract. The depth finder shall have a recording scroll not less than 100 mm 4 inches wide with a scale of not more than 3 m of depth to 25 mm 10 feet of depth to the inch. The depth finder shall be capable of obtaining accurate soundings and shall be used as an aid in the control of subaqueous stone placement. Ensure that the depth finder is in proper working order at all times and furnish and maintain an adequate stock of recording paper for the depth finder. Submit to the Contracting Officer, for approval, the manufacturer's name, model number, and/or model name of the electronic depth finder proposed for use prior to the unit being placed in service.

d. The use of buoys as placement control devices will not be permitted. The use of bank targets for alignment control will not be permitted for working distance of more than 1200 mm 400 feet without prior approval of the Contracting Officer.

3.22 PLACEMENT OF SHORELINE PROTECTION

3.22.1 Debris

Any timbers, unsatisfactory material and debris within the reaches for construction shall be removed except as otherwise directed by the Contracting Officer, and upon removal shall become the property of the Contractor. All materials shall be properly disposed of in accordance with the requirements of Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, including any applicable local requirements.

3.22.2 Limitations of Placement Procedures

Stone construction in advance of completed permanent protection except as specified herein shall be at the Contractor's risk. Keep the Contracting Officer informed as to any and all situations that may result in a possible interruption of work.

3.22.2.1 Interruptions

If the Government can anticipate that the stone construction will be interrupted for more than [_____] [four (4)] continuous days, including weekends and holidays, the Contractor may be required to complete the placement of [_____] and [_____] stone on both sides of the breakwater and provide protection of the exposed ends prior to the start of the interruption. The above-required protection for the exposed ends of the breakwater shall consist of the same type of stone protection required on the lake side of the breakwater. All material used for protecting the exposed ends of the breakwater shall be removed after the need thereof has ended and shall be appropriately incorporated into the required permanent construction. All materials which are removed and placed in the permanent construction, in accordance with the provisions of this section, will be measured and paid for only once. When temporary protection of exposed ends of construction in progress is ordered or directed by the Contracting Officer, an equitable adjustment will be made for the work of temporarily placing and removing the stone materials. The Government has no obligation.
to order that exposed ends be protected. If the Government takes no action to have exposed ends protected, then the provisions of the paragraph MATERIAL PLACEMENT IN ADVANCE shall apply.

3.22.2.2 Material Placement in Advance

The breakwater shall not be constructed more than [_____] m feet in advance of completed placement of the [_____] and [_____] stone. If at the completion of a day's placement operations the unprotected portion (maximum [_____] m feet) is surveyed to determine the shape and grade of the materials placed, the Government will assume the responsibility for the cost to replace it (maximum [_____] m feet) if it is displaced or lost due to a storm during the nonwork period but not exceeding a continuous [_____] [four (4)] day nonwork period. In the event an unprotected section of any length unsurveyed is left during a nonwork period or is left unprotected for a period longer than four continuous days and is damaged or causes damage to a completed section, the damaged portion(s) shall be replaced or reshaped as approved by the Contracting Officer with no additional payment.

3.22.3 Core/Mattress/Bedding Stone

Place stone to the lines, grades and thickness shown. The method used in placement shall be such that any soft and organic materials on the lake floor will be displaced outward towards the extreme outside toes of the required sections of the structure and in the direction of the construction. Stone placement shall start at the centerline of the stone structure and extend outward to the toes of the structure in a fashion whereby the line of stone advancement takes an inverted "U" shape. [Placement by self-unloading lake carriers is [not] acceptable.] Placement shall be with reasonably systematic care that segregation of particle sizes will not occur. [If the materials are placed by clam shell, dragline, or other similar equipment, the stone shall not be dropped from a height exceeding [_____] [600] mm [_____] [two] feet above the existing lake bottom or previously placed material.] [Placement with bottom dump scows will [not] be allowed.] The finished surface of the stone shall be adequately smooth and shall be free of mounds or windrows. [The finished work shall be free of clusters or small stones and cluster of larger stones.]

3.22.4 Armor/Cover/Riprap Stone

Place stone in the locations and at the thickness shown without deviating from the lines and grade shown, including allowance for tolerances. Final shaping of the slope shall be performed concurrently with the initial placement of the stone. Stones shall be randomly selected and set in contact with each other so that the interstices between adjacent stones shall be as small as the character of the stone will permit. The face of stone having the largest area shall be placed against the surface of the underlying material. Begin placement at the bottom of the slope. The heaviest stones shall be placed as toe stones. Stones shall be placed in a manner to avoid displacing underlying materials or placing undue impact force on underlying material that would cause the breaking of stones. Unless otherwise specified, stone shall not be dropped from a height greater than [_____] [600] mm [_____] [two] feet. The equipment used in placing the stone shall be suitable for handling materials of the sizes required including the ability to place the stone over its final position before release and if necessary pick up and reposition the stone. Dragline buckets and skips shall not be used in placement. Moving stone by drifting or manipulating down the slope will not be permitted. The finished work shall be a well distributed mass, free of pockets of either smaller or
larger stone, having a minimum of voids and with the maximum of interlocking of stones. It should be anticipated that rehandling of individual stones after initial placement will be required to achieve the above requirements. Stones required to be placed over or adjacent to drains and subsurface pipes shall not be dropped, but gently lowered and placed in their final position by material handling equipment.

[3.22.5] Underlayer Stone

Place stone, to a full zone thickness, in one operation in a manner to avoid displacing the underlying material or placing undue impact force on underlying materials and supporting subsoils. The underlayer stone shall be placed in a manner to produce a resultant graded mass of stone with minimum voids. Rearranging of individual stones may be required to achieve this result. Placement by any method which is likely to cause segregation of the various sizes will not be permitted. Unsegregated stone shall be lowered in a bucket or container and placed in a systematic manner directly on the underlying material. Placement shall begin at the bottom of the slope and proceed upward. Casting or dropping of stone over [_____] [600] mm [_____] [2] feet or moving by drifting and manipulating down the slope will not be permitted. Final finish of the slope shall be performed as the material is placed.

[3.22.6] Scour/Riprap Stone

Place stone, to a full zone thickness, in one operation in a manner to avoid displacing the underlying material or placing undue impact force on underlying materials and supporting subsoils. Place the stone in a manner to produce a resultant graded mass of stone with minimum voids. Rearranging of individual stones may be required to achieve this result. Placement by any method which is likely to cause segregation of the various sizes will not be permitted. Unsegregated stone shall be lowered in a bucket or container and placed in a systematic manner directly on the underlying material. Placement shall begin at the bottom of the slope and proceed upward. Casting or dropping of stone over [_____] [300] mm [_____] [one] foot or moving by drifting or manipulating down the slope will not be permitted. Final finish of slope shall be performed as the material is placed.

[3.22.7] Fill Stone

Placement of fill stone within steel sheet pile walls shall not be done until tie-rods, wales, and connections are installed, tightened, and inspected; and the structure aligned within the required tolerances. The fill materials shall be uniformly deposited in maximum [_____] [900]-mm [_____] [3]-foot lifts and in such a manner that there will be no undue later settlement of the materials and that the structure will not be subjected to undue strains, deformations, or other damage. Responsibility for damage to the structure due to filling operations shall rest with the Contractor. The stone shall be distributed and consolidated by use of a vibratory hammer or similar vibrating hammer or similar vibrating equipment affixed to a steel beam which shall be inserted into the fill at intervals not greater than [_____] [1.5] m [_____] [5] feet. The vibratory operations shall be continued until there is no visual continuation of settlement. Other distribution or consolidation methods may be used when approved by the Contracting Officer. Stone above water shall be compacted to [_____] [ninety percent (90 percent) of maximum density obtained at optimum moisture content as determined by the Contractor in accordance with EM 1110-2-1906] [_____]]. Perform at least [_____] [one (1)] compaction

SECTION 35 31 19 Page 82
test for each [_____] metric ton ton of material placed.

][3.22.8 Splash Stone

Place stone to the lines and grades shown and in a manner that will avoid tearing the underlying geotextile.

][3.22.9 Fitted Cap Stone

Place the fitted cap stone upon the geotextile covering the fill stone within the limits of the steel sheet pile structure to the lines and grades shown. The stones used shall be of assorted sizes and shall be placed to tightly fit against each other in the space bounded by the perimeter [_____] [concrete sidewalk]. Individual stones of the maximum size which will fill a given space shall be used to fill spaces between larger stones to minimize the size of spaces to be filled by chinking. The flattest face of each stone shall be the top surface of the placed stone. Following placement of the cap stones, the remaining spaces between individual stones shall be filled with pieces of smaller stone obtained from the required [underlayer] stone gradation materials being supplied for this contract. The spaces between cap stones shall be filled with selected stones of the maximum size which will fit in each remaining space. At the elevation of the upper horizontal surface of the cap stones, the stones used for chinking shall be placed with their elongated dimension in a vertical direction and forced into place in the spaces between cap stone spaces such that they become firmly wedged in place.

3.22.10 Slides

In the event of the sliding or failure of any part of the structure during its construction, or after its completion, but prior to its acceptance, [upon written order of the Contracting Officer,] cut out and remove the slide from the structure and then rebuild that portion of the structure with new materials or reuse the displaced materials for rebuilding if deemed appropriate. The Contracting Officer shall determine the nature and cause of the slide. In case the slide is caused through fault of the Contractor, the foregoing operations shall be performed without cost to the Government.

3.23 TESTS AND INSPECTIONS

3.23.1 Concrete Grout

3.23.1.1 General

**************************************************************************
NOTE: Select the first bracketed option if ACI International references are cited in the project specification; select and verify the correctness of the second bracketed option if ACI International references are not cited in the project specifications.
**************************************************************************

Individuals who sample and test grout as required by this section shall have demonstrated a knowledge and ability to perform the necessary test procedures equivalent to ACI minimum guidelines for certification of Concrete Transportation Construction Inspector or ACI Concrete Construction Inspector Level II, obtainable from [the address and telephone number for
3.23.1.2 Preparations for Placing

Riprap shall be inspected in sufficient time, prior to each grout placement, in order to certify that it is ready to receive the grout.

3.23.1.3 Air Content

Air Content shall be checked at least [once] [twice] during each shift that grout is placed. Samples shall be obtained in accordance with ASTM C172/C172M and tested in accordance with ASTM C231/C231M. Whenever a test result is outside the specification limits, the grout shall not be delivered to the area to be grouted and an adjustment shall be made to the air-entrainment admixture.

3.23.1.4 Slump

Slump shall be checked [once] [twice] during each shift that concrete grout is produced. Samples shall be obtained in accordance with ASTM C172/C172M and tested in accordance with ASTM C143/C143M.

3.23.1.5 Placing

The placing foreman shall not permit placing to begin until he has verified that adequate equipment and workmen are available.

3.23.2 Pre-Production

3.23.2.1 Bulk Specific Gravity

Submit, at least [120] [_____] calendar days in advance of shipment of stone to the work site, a copy of bulk specific gravity test results for each gradation range of stone proposed to be furnished. The information shall be furnished prior to preparation of pre-production demonstration stockpiles. Quantity determinations are contingent upon the range of bulk specific gravity (saturated surface dry (SSD) basis) of stone to be supplied. Therefore, during the process of selecting a source or sources of stone for the project, make an investigation to determine the lowest and highest bulk specific gravity (SSD) of stone available at the source or sources proposed to be utilized for each gradation range of stone. Tests shall be performed at a Government approved testing laboratory in accordance with [_____] . The testing results shall be submitted in accordance with paragraph SUBMITTALS. Test results which display an extraordinarily wide range of values may necessitate additional testing to determine whether the source contains strata with stones of an acceptable range of bulk specific gravity. For Category I sources which have been acceptably tested not more than two years earlier, and the material is of an acceptable quality and bulk specific gravity, the Contracting Officer may waive the requirement for bulk specific gravity testing.

3.23.2.2 Material Quality

Before selecting a source for preparation of a demonstration stockpile, be reasonably certain that the source is capable of meeting the quality and source requirements specified in paragraphs SOURCES and EVALUATION TESTING.
OF STONE, including their respective subparagraphs.

3.23.2.3 Borderline Material Quality

If the COR's evaluation of a demonstration stockpile results in not being able to determine by visual examination whether the material is acceptable or unacceptable, the COR will select at least one but not more than three representative stones from the demonstration stockpile to be prepared for shipment to the Government's laboratory for testing in accordance with paragraph EVALUATION TESTING OF STONE. Where specified sizes are in excess of 900 kg 2,000 pounds, cut or break a representative piece, weighing approximately 900 kg 2,000 pounds each, off of the selected stones. For specified stone sizes of less than 900 kg 2,000 pounds but more than 230 kg 500 pounds, individual samples shall be the size of the largest stone specified for the size range. Samples of stone groupings with a maximum size less than 230 kg 500 pounds shall contain at least two (2) stones representative of the higher limit of the stone weights specified. In addition, the sample shall be representative of the gradation specified and the minimum weight of the total sample shall be not less than 230 kg 500 pounds. The sampling and testing procedures shall be repeated for each strata being quarried. Ship the samples to the laboratory as specified in paragraph EVALUATION TESTING OF STONE. If the laboratory testing reveals the materials are unacceptable, submit a replacement source for approval and proceed with the demonstration stockpile procedures anew.

3.23.2.4 Demonstration Stockpile at Source

Following submittal of the Contractor's Quality Control (CQC) Plan and selection of a source, but prior to the Government's approval of a source and the CQC Plan, make arrangements to provide a pre-production demonstration stockpile for each of the stone size ranges for the project. The stockpiles shall be located at the source of the stone and be shaped in windrow fashion. The stones with a size range greater than [_____] [2.7] tons [_____] [3] tons shall be placed in a single layer with [_____] [300] mm [_____] [1] foot of clear space around each stone. Stones under [_____] [2.7] tons [_____] [3] tons in weight shall not be stacked higher than [_____] [1200] mm [_____] [4] feet. The stones placed in the demonstration stockpiles shall be representative of the overall quality of materials in the source and shall not consist of the best specimens unless it is reasonable to determine that the source will provide the required amount of stone of the applicable size range with a degree of quality no less than that existent in the demonstration stockpile. The quantity of stone in each demonstration stockpile shall be dependent upon the gradation size range to be produced for the project. The following parameters shall apply:

<table>
<thead>
<tr>
<th>SIZE OF INDIVIDUAL STONES WITHIN A RANGE</th>
<th>DEMONSTRATION STOCKPILE QUANTITY BASED ON PROJECT QUANTITY FOR SIZE RANGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

The stones placed in the stockpile shall have been preselected by the
Contractor's Quality Control Plan (CQCP) inspector or supervisor and acceptable stones over 230 kg 500 pounds in size shall have been marked with spray paint on three mutually perpendicular sides with a coded mark to denote acceptability for a certain size range. A stockpile of representative reject stones marked with a red "X" shall also be maintained at the site as examples of unacceptable materials or shapes.

3.23.2.5 Evaluation of Demonstration Stockpile at Source

Notify the Contracting Officer when stockpiles are ready for evaluation. The Contractor's approved Quality Control Plan (QCP) supervisor and all QCP inspectors shall accompany the Contracting Officer's Representative (COR) during the Government's evaluation of the demonstration stockpiles. Arrange to have individual stones turned as necessary to accommodate the COR's evaluation. The COR will mark rejected stones with a red "X" and such stones shall be removed to the reject stockpile or to a crusher if one is available. If more than [_____] [2] unacceptable stones are found within a stockpile, the entire stockpile will be rejected by the Government and a replacement stockpile will be created for re-evaluation. If the replacement stockpile is rejected, revise and resubmit its Quality Control Plan (QCP) and create another replacement demonstration stockpile for evaluation. If the third demonstration stockpile for a particular size range at a single source is found unacceptable, the source will be disapproved for such size range and a new source shall be submitted for approval. In addition, submit the name and qualifications for a person to replace the QCP supervisor. The Contractor may choose a replacement source at the time a first or second demonstration stockpile is found unacceptable. The replacement of demonstration stockpiles or stone sources shall be at no additional cost to the Government and with no change in the time of completion.

3.23.2.6 Approval of Demonstration Stockpile at Source

At the time the COR finds the contents of a demonstration stockpile to be unacceptable, either through visual examination or through laboratory testing, the Contractor will be notified in writing that the source, the QCP plan and QCP staff are approved, whereupon the Contractor may proceed with production of materials for the project provided they are consistent with demonstration stockpiles.

3.23.2.7 Duration of Demonstration Stockpile at Source

Other than for being shipped as the final quantities of materials to be placed in the work, each demonstration stockpile shall remain unchanged at the source until all other required material of the size range represented by the stockpile has been shipped from the source.

3.23.3 Placement Control

3.23.3.1 Quality Control Measures

Establish and maintain quality control for all work performed at the job site under this section to assure compliance with contract requirements. Maintain records of the quality control tests, inspections and corrective actions. Quality control measures shall cover all construction operations including, but not limited to, the placement of all materials to the slope and grade lines shown and in accordance with this section.
Surveys made by the Contractor are required on each material placed for determining that the materials are acceptably placed in the work. Make checks as the work progresses to verify lines, grades and thicknesses established for completed work. At least one (1) check survey as specified below shall be made for each [_____] [twenty-five (25)] foot section as shown as practicable after completion. Following placement of each type of material, the cross section of each step of the work shall be approved by the Contracting Officer before proceeding with the next step of the work. Approval of cross sections based upon check surveys shall not constitute final acceptance of the work. Cross sections shall be taken on lines [_____] [8] m [_____] [25] feet apart, measured along the structure reference line, with readings at [_____] [1.5]-m [_____] [5]-foot intervals and at beaks along the lines. However, other cross section spacing and reading intervals may be used if determined appropriate by the Contracting Officer. Additional elevations and soundings shall be taken as the Contracting Officer may deem necessary or advisable. The surveys shall be conducted in the presence of an authorized representative of the Contracting Officer, unless this requirement is waived by the Contracting Officer.

a. Above Water: The elevation of stone above the water surface shall be determined by the use of a leveling instrument and a rod having a base 300 mm 12 inches in diameter. If approved by the Contracting Officer other means may also be used.

b. Below Water: For portions of the work that are under water, sounding surveys shall be performed either by means of a sounding pole or a sounding basket weighing about 4 kg 8 1/2 pounds, each of which has a base measuring 300 mm 12 inches in diameter.

c. Gage Board: The gage shall be checked prior to any survey. Install a gage board at the project site.

d. Electronic Depth Recorder Method: When using an electronic depth recorder the following procedures shall be used.

(1) The depth recorder shall be calibrated and adjusted for the gage, with check bar, at least [_____] [six (6)] times within a normal eight (8) hour work day.

(2) Normal calibration times shall be at the beginning of the work day, mid-morning, close of morning’s work, start of afternoon’s work, mid-afternoon, and the end of the day.

(3) Further calibrations shall be performed whenever there is any malfunction within the depth recorder or transducer which might affect the soundings, a major gage change, or change in water temperature due to industrial discharge or other causes.

(4) The check bar shall be set at approximately the deepest sounding in the area to be sounded.
(5) The depth recorder shall be calibrated to read at low water datum.

(6) When checking the calibration at mid-morning, end of morning, mid-afternoon and end of work, the same setting used for the previous calibration shall be used.

(7) If the calibration check does not agree with the previous calibration, the depth recorder shall be calibrated to the proper setting.

(8) Under no circumstances shall the setting of the depth recorder be changed between calibrations.

e. Electronic Depth Recorder: The survey depth recorder used must be a standard model acceptable to the Contracting Officer using a sounding chart that can be read directly to the nearest 300 mm foot and estimated to the nearest 30 mm tenth (0.1) of a foot. Accuracy shall be better than 1/2 of 1 percent.

f. Tagline Method of Horizontal Location Along Station: If a tagline is used with a depth recorder, the soundings shall be marked with a fix every [_____] [1.5] m [_____] [5] feet.

g. Predetermined Transit Angle Method or Ranges Method: The interval between predetermined angles or ranges along a sounding line shall not exceed [_____] [60] m [_____] [200] feet along the entire length of the sounding line. No predetermined angle shall form an intersection with the sounding line of less than 45 degrees.

h. Speed of the Sounding Boat: When sounding, the speed of the sounding boat shall be as constant as possible, preferably between 55 and 67 m per minute 180 and 220 feet per minute.

i. Checking Gage: The gage shall be checked prior to each calibration and recorded on the sounding chart or in the field notes.

3.23.4 Bedding Layers, Filter Layers, and Sand Fill

3.23.4.1 General

Perform gradation tests to assure compliance with contract requirements and shall maintain detailed records. The bedding material, filter materials and/or sand fill shall be sampled in accordance with ASTM D75/D75M and tested in accordance with ASTM C136/C136M. Perform the tests before and after surveys of each layer of stone protection material placed.

3.23.4.2 Reporting

Reporting shall be in accordance with paragraph GRADATION TEST.

3.23.5 [Trenchfill Revetment, Bank Paving, and Outlet Drains]

Establish and maintain quality control for stone placement operations to assure compliance with contract specifications and maintain records of his quality control for all construction operations including, but not limited to, the following:

a. Check grades of trenchfill and bank paving for compliance with design sections.
b. Record tonnage of stone placed in each station of trenchfill revetment and check quantity for compliance with design sections.

c. Check for uniform thickness of paving stone and specified elevation of top paving on graded slopes.

d. Check for even distribution of spalls used in paving.

e. Insure that outlet drains conform with design sections.

3.23.6 Stonefill Revetment and Stonefill Dikes

Check grade, slope, and placement of stone for compliance with design sections and specifications.

3.23.7 Stone Dike

Establish and maintain quality control for all stone dike operations to assure compliance with contract requirements and maintain detailed records of this quality control for all construction operations, including, but not limited to, the following:

a. Placement and alignment of stone in the dike.

b. Periodic fathometer surveys as directed by the Contracting Officer.

c. Record of the tonnage of stone placed in each station.

3.23.8 Revetment Repairs

Inspect the revetment repairs for compliance with the contract requirements and record the inspection of all operations including, but not limited to, the following:

a. Bank grading, excavating or reshaping damaged drains through the paving, placing graded material into areas, and disposing of waste material.

b. Breaking out pavement within specified limits.

c. Disposition of cleared material, drift, and other debris.

d. Preparation of subgrade for paving.

3.23.9 Stone Riprap Paving

Establish and maintain quality control for slope dressing and riprap paving to assure compliance with contract requirements, and maintain records of his quality control for all construction operations, including but not limited to the following:

a. Dressing the slope to eliminate any irregularities, including irregularities in the gravel blanket placed by others, due to rain or wave wash or operations of the Contractor's equipment.

b. Grading and dressing necessary to secure a suitable connection with the riprap paving in place.
c. Underwater paving to assure proper connection with concrete mattress and complete coverage.

d. Above-water connection between riprap paving and concrete mattress.

e. Connection between riprap paving and asphalt paving.

f. Placement of riprap on gravel blanket, upper bank slope, and if applicable, overbank areas for thickness and proper coverage.

g. Placement of riprap in ditch outlets.

3.23.10 Dike Repairs

Inspect all dike stone repair operations for compliance with contract requirements and record the inspection of all operations including, but not limited to the following:

a. Grading of slopes to design grade within tolerance.

b. Disposition of material from grading and excavation.

c. Dressing of slope before placement of paving.

d. Placement of slope and underwater paving.

e. Grade and section of stone fill.

Furnish to the Contracting officer a copy of these records and tests, as well as records of corrective action taken.

3.23.11 Gradation Tests for Stone

3.23.11.1 Gradation Test Method for Riprap

Gradation tests shall be performed in accordance with ASTM D5519, Test Method A [______].

3.23.11.2 Standard Test Method for Gradation of Quarry Run Stone or Stone Paving

**************************************************************************

NOTES: Alternative 2. The gradation test method was developed to provide guidance to field personnel and Contractors so that the procedures would be uniform. This test procedure is provided as an example.

This test method should not be used in contract specifications that cover stone, upper bank and stone, overbank, and quarry run stone.
**************************************************************************

a. Select a representative sample (Note No. 1), weigh and dump on hard stand.

b. Select specific sizes (see example) on which to run "individual weight larger than" test. (See Note No. 2). Procedure is similar to the standard aggregate gradation test for "individual weight retained".

SECTION 35 31 19 Page 90
c. Determine the largest size stone in the sample. (100 percent size)

d. Separate by "size larger than" the selected weights, starting with the larger sizes. Use reference stones, with identified weights, for visual comparison in separating the obviously "larger than" stones. Stones that appear close to the specific weight must be individually weighed to determine size grouping. Weigh each size group, either individually or cumulatively.

e. Paragraph d above will result in "individual weight retained" figures. Calculate individual percent retained (heavier than), cumulative percent retained, and cumulative percent passing (lighter than).

NOTE NO. 1: Sample Selection: The most important part of the test and the least precise is the selection of a representative sample. No "standard" can be devised; larger quarry run stone is best sampled at the shot or stockpile by given direction to the loader; small graded stone is best sampled by random selection from the transporting vehicles. If possible, all parties should take part in the sample selection and agree before the sample is run that the sample is representative.

NOTE NO. 2: Selection of Size for Separation: For these types of stone gradations the separation points need to be selected as the smallest size stone at each break in the gradation specified.

3.23.11.3 Standard Test Method for Gradation of Riprap, Graded Stone, and [_____]

**************************************************************************
NOTE: Alternative 2. The STANDARD TEST METHOD FOR GRADATION OF RIPRAP AND GRADED STONE gradation test method was developed to provide guidance to field personnel and Contractors so that the procedures would be uniform. This test procedure is provided as an example.

This test method should be presented in contract specifications that require riprap or graded stone. This test method should not be used in contract specifications that only cover stone, upper bank and stone, overbank.
**************************************************************************

a. Select a representative sample (Note No. 1), weigh and dump on hard stand.

b. Select specific sizes (see example) on which to run "individual weight larger than" test. (See Note No. 2). Procedure is similar to the standard aggregate gradation test for "individual weight retained".

c. Determine the largest size stone in the sample. (100 percent size)

d. Separate by "size larger than" the selected weights, starting with the larger sizes. Use reference stones, with identified weights, for visual comparison in separating the obviously "larger than" stones. Stones that appear close to the specific weight must be individually weighed to determine size grouping. Weigh each size group, either individually or cumulatively.

e. Paragraph d above will result in "individual weight retained" figures. Calculate individual percent retained (heavier than), cumulative percent retained, and cumulative percent passing (lighter than). Plot percent passing, along with the specification curve on ENG Form 4794-RM 4794-R.

NOTE NO. 1: Sample Selection: The most important part of the test and the least precise is the selection of a representative sample. No "standard" can be devised; larger quarry run stone is best sampled at the shot or stockpile by given direction to the loader; small graded stone is best sampled by random selection from the transporting vehicles. If possible, all parties should take part in the sample selection and agree before the sample is
run that the sample is representative.

NOTE NO. 2: Selection of Size for Separation: It is quite possible and accurate to run a gradation using any convenient sizes for the separation, without reference to the specifications. After the test is plotted on a curve, then the gradation limits may be plotted. Overlapping gradations with this method are no problem. However, it is usually more convenient to select points from the gradation limits, such as the minimum 50 percent size, the minimum 15 percent size, and one or two others, as separation points. For these types of stone gradations the separation points need to be selected as the smallest size stone at each break in the gradation specified.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for commercially available concrete block products for revetments.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: PART 2 PRODUCTS is based on commercial items, and does not address field casting of blocks or manufacturing custom blocks.

This guide specifications assumes the ACB is Government designed for issues such as hydraulic stability and geotextile filters. Maximum flexibility is desirable for Contractor product selection, installation sequence, construction equipment, and block orientation.

Notes before paragraphs are provided to present assumptions in preparation of the guide.
specification, make suggestions for conditions that warrant project revisions, and provide background technical information or references for further information. They should be reviewed prior to revising wording for use in project specifications.

The drawings should show appropriate details for toe key-in, anchor trenches, revetment termination, transition to riprap, anchors, etc.

1.1 MEASUREMENT AND PAYMENT

Measurement of ACB revetment for payment will be made on the basis of the face area. The pay lines of ACB revetment will be neat lines taken off the approved shop drawings; and will include embedded blocks and anchor trenches. Work includes incidental grading and preparatory work, furnishing and installing the geotextile and ACB, filling the voids, securing cable fasteners, installing soil anchors, and seeding (where specified). Engineering services and product testing shall be incidental, if required. Placing cast-in-place concrete joints and cutting blocks shall be incidental, if required. Payment will be made at the respective unit price per square meter foot listed on the Bidding Schedule. Payment will be full compensation for all material, labor and equipment to complete the work.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

ASTM INTERNATIONAL (ASTM)

ASTM C42/C42M (2020) Standard Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete

ASTM C140/C140M (2020a) Standard Test Methods for Sampling and Testing Concrete Masonry Units and Related Units

ASTM D4355/D4355M (2014) Deterioration of Geotextiles from Exposure to Light, Moisture and Heat in a Xenon-Arc Type Apparatus

ASTM D4632/D4632M (2015a) Grab Breaking Load and Elongation of Geotextiles

U.S. FEDERAL HIGHWAY ADMINISTRATION (FHWA)

1.3 DEFINITIONS

1.3.1 Articulating Concrete Block (ACB) Revetment System

A matrix of interconnected concrete block units for erosion protection. Units are connected by geometric interlock and/or cables, geotextiles, or geogrids, and typically include a geotextile underlayment for subsoil retention.

1.3.2 Blocks

Articulating concrete block revetment units will be referred to as blocks.
1.3.3 Interlocking Blocks

Each pair of abutting blocks shall have interlocking keys that limit lateral expansion. The key and keyhole shall have an interference fit such that the joint movement has a minimum aperture at closure, and a maximum aperture when pulled apart. The joint freeplay shall allow articulation of each individual block.

1.3.4 Freeplay

Freeplay shall be the maximum lateral joint movement for interlocking blocks (difference between maximum and minimum aperture).

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
SD-02 Shop Drawings

Flume Test

1.5 DELIVERY, STORAGE, AND HANDLING

Check products upon delivery to assure that the proper material has been received and is undamaged. For geosynthetics, the guidelines presented in ASTM D4873/D4873M shall be followed.

1.5.1 Blocks

Provide blocks which are sound and free of defects that would interfere with proper placement or that would impair the strength or longevity of the installation. Discard blocks with the following defects:

a. Broken appendages.
b. Chips larger than 50 mm 2 inches in any dimension.
c. Cracks wider than 0.5 mm 0.02 inches and longer than 33 percent of the nominal height.

Minor cracks, incidental to the usual method of manufacture, or chipping that results from customary methods of handling in shipping, delivery and placement will not be deemed grounds for rejection. Store blocks in a suitable location away from mud, paint, wet cement, and other contamination or disturbance.

1.5.2 Geotextiles

1.5.2.1 Labeling

Label each roll with the manufacturer's name, product identification, roll dimensions, lot number, and date manufactured.

1.5.2.2 Handling

Geosynthetic rolls shall be handled and unloaded by hand, or with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Geosynthetic rolls shall not be dragged, lifted by one end, lifted by cables or chains, or dropped to the ground.
1.5.2.3 Storage

Protect geotextiles from cement, paint, excessive mud, chemicals, sparks and flames, temperatures in excess of 70 degrees C 160 degrees F, and any other environmental condition that may degrade the physical properties. If stored outdoors, the rolls shall be elevated from the ground surface and protected with an opaque waterproof cover. Geotextiles shall be delivered to the site in a dry and undamaged condition.

1.6 SCHEDULING

To limit ultraviolet light exposure of the geotextile, place the blocks within 7 days after placing the geotextile, and the void filler within 14 days after placing the geotextile.

PART 2 PRODUCTS

2.1 ARTICULATING CONCRETE BLOCK

**************************************************************************
NOTE: Hand placed (interlocking) ACB typically provides a neater, more pleasing appearance in parks and public areas. Cabled ACB can have superior hydraulic stability to interlocking products, it is more difficult to remove (such as by vandalism), and it has improved constructibility when placed in water.

The table of ACB requirements is comprehensive, and many of the properties are interrelated. Including all listed properties will be specification overkill for most projects. Renumber notes where properties are deleted.

The critical shear stress is preferred by the industry over critical velocity because the critical shear is relatively constant for a product. Critical velocity varies depending on flow characteristics (such as depth and turbulence); so that the critical velocity in the flume test is not comparable to the required critical velocity in the field.

The surface void area ratio, DCF, and curvature radius can be used to specify products best suited to placement on curved surfaces, and turf establishment. Some blocks are available with open cells or solid cores. Most products marketed specifically for ACB revetments are within reasonable limits for general use.

Modifying the requirements for a performance specification may be considered for small low hazard projects or negotiated contracts, and may be preferred by some manufacturers. However, performance requirements for firm fixed price (low bid) contracts is not recommended for ACB's because of the price level jumps between product sizes, and
because there is no control in how bidders incorporate risk for a low frequency design event.

Interface friction for soil/fabric and fabric/blocks should be considered by the designer. Because typical design values for soil/fabric are available in geosynthetic design guides, and because the Contractor generally has no control over the soil, the soil/fabric interface friction angle is not addressed in the specification (although for certain critical applications, this may need to be added to verify design assumptions). Interface friction for fabric/blocks is addressed in the specification because it is affected by geotextile and block combinations, it can affect installation, and because the interface friction for fabric/block is highly variable dependent on manufacturing characteristics of both products.

**************************************************************************
Submit descriptive technical data on the blocks, cables, cable fittings, soil anchors, and geotextile. Include all material properties specified under paragraph PRODUCTS. Catalog cuts, technical data sheets, or test data shall be submitted showing that the products meet the specifications. The submittal shall also include a copy of any standard manufacturer's warranties for the products. See below under "geotextile" for more requirements. The ACB shall meet the following criteria:

2.1.1 Hydraulic Stability

NOTE: The velocity and shear stress conditions derived from this test are critical state conditions, and do not represent allowable design values. The surface tolerances for block placement are generally better in the test than field conditions.

FHWA RD-89-199 is a research document, not a standard test method. ASTM committee D18.25.04 has a draft standard based on a flume test, similar to FHWA RD-89-199. The flume test is very expensive: testing expenses can be on the order of $30,000.

FHWA RD-89-199 included a 20 mm 3/4 inch Enkamat fabric below the blocks for the purpose of installing instrumentation to research block behavior. The Enkamat provided a very effective drainage layer that is not integral to the test method. A drainage layer provides a very significant improvement in the ACB stability in the flume test. Regardless of the flume test conditions, the designer should consider including a granular drainage layer in areas with high turbulence flow.

2.1.1.1 Flume Test

Submit a report of testing for the ACB in substantial conformance with FHWA RD-89-199, except that a drainage layer is not required, at the same time as the ACB and Geotextile Data submittal. The report shall clearly state if the critical shear stress associated with the stability threshold of the ACB system was derived from laboratory testing that included a...
sub-block drainage layer as a component of the tested system. The ACB product shall have been tested in a flume chamber in substantial conformance with FHWA RD-89-199. If the product was tested with a drainage layer, the installed product shall incorporate a similar drainage layer with adequate filtration design for the site soils. The flume test shall be based on conservative assumptions for field placement of the blocks (such as block orientation, and joint spacing within construction tolerances). The critical shear stress (and critical velocity) shall be indicated in the test report.

2.1.1.2 Extrapolation of Hydraulic Stability

******************************************************************************

NOTE: Preliminary research has indicated that extrapolation is conservative when extrapolating to thicker blocks, and unconservative when extrapolating to thinner blocks.
******************************************************************************

Extrapolation of critical shear stress for untested blocks within a similar family of ACB shall be subject to limitations. Extrapolation shall only be used for blocks having a similar footprint area and interlock mechanism, but with variable thickness or net weight/area. Extrapolation shall only be accepted if the following conditions are met:

a. The extrapolation is in strict accordance with hydraulic similitude methods commonly accepted by the industry, and includes quantitative treatment for a block overturning failure mode.

b. The tested block is the smaller product size in both thickness and net weight/area, and extrapolation does not extend the critical velocity more than 3 meters per second 10 feet per second from the tested product size.

2.1.2 Matrix Assembly - Interlocking Blocks

Interlocking blocks are assumed to function without the use of cables or similar restraints. Void filler shall be placed to inhibit lateral movement and block pullout, cover the geotextile, and increase hydraulic stability.

2.1.3 Matrix Assembly - Cabled Systems

Cable tied concrete block shall be interconnected by flexible cables running through the blocks. Each block shall be penetrated by a cable that allows articulation of the blocks, but restrains removal of individual blocks. Void filler shall be placed to inhibit lateral movement, cover the geotextile, and increase hydraulic stability. [Articulating concrete block, cables, and fittings shall be fabricated into mattresses at the manufacturer's plant.]

2.1.4 Structural requirements

******************************************************************************

NOTE: Freeze-thaw Testing - The specifier should edit this paragraph based on the project's location. The default values correspond to the default values in ASTM C1372, Segmental Concrete Retaining Wall Units. The freeze thaw requirements
for retaining wall blocks are referenced since they are similar products, ACB blocks can be produced by similar manufacturing methods, and retaining walls have been the subject of more freeze thaw durability research. The number of seasonal freeze thaw cycles for typical ACB's is likely less than for retaining walls. Chloride from deicing salts or sea water increases saturation of the concrete, and thus has a very pronounced affect on freeze thaw degradation.

Articulating concrete block shall be wet cast using concrete as specified herein, or dry-cast by a vibratory block forming machine. The blocks shall be manufactured to the following requirements:

2.1.4.1 Compressive Strength

The minimum compressive strength shall be 28 MPa 4000 psi for an average of 3 units, and 24 MPa 3500 psi for an individual unit. Compressive strength shall be determined by ASTM C42/C42M for wet cast blocks, or by ASTM C140/C140M for dry cast blocks.

2.1.4.2 Water Absorption for Dry Cast Units

The maximum water absorption for dry cast units shall be 145 kg/m$^3$ 9 pcf for an average of 3 units, and 195 kg/m$^3$ 12 pcf for an individual unit. Water absorption shall be determined by ASTM C140/C140M.

2.1.4.3 Saturated Surface-Dry Density

The minimum saturated surface-dry density shall be [140] [_____] for average of 3 units, and [140] [_____] for an individual unit.

2.1.4.4 Air Entraining

Wet cast concrete shall be air entrained to contain between 4 and 7 percent total air.

2.1.4.5 Freeze-Thaw Durability

For freeze-thaw durability tested in accordance with ASTM C1262/C1262M, specimens shall comply with either of the following: (1) the weight loss of each of 5 specimens after 100 cycles shall not exceed 1 percent; or (2) the weight loss of each of 5 specimens after 150 cycles shall not exceed 1.5 percent.

2.2 GEOTEXTILE

NOTE: The AASHTO M 288 table provides survivability requirements. Class 1 is recommended for harsh or severe installation conditions where there is a potential for vehicular traffic, or where irregular sections may require removal and replacement of mattresses to achieve proper alignment. Class 2 is allowed where no vehicle traffic will occur on the installation, and where mattress placement is in regular, even reaches. Reference Protection of Work paragraph in Part 3.
Some manufactures require minimum geotextile properties for warranty coverage. Most manufacturers have recommended geotextiles, but these should be verified for compatibility with the subgrade soils.

Filters should not impede seepage. Clogging resistance is critical for uplift stability. Site specific design should be performed if any of the following problematic soil conditions are encountered: highly erodible soils such as non-cohesive silts, gap graded soils, or laminated sand/silt.

Some references for geotextile design include:
2. FHWA, "Geosynthetic Design and Construction Guidelines."

Geosynthetic Selection - The Federal Acquisition Regulations require full and open competition. Usually justification is not necessary if 3 products meet the specifications. In combining various material requirements, it is easy to specify a geosynthetic product that does not exist. Design utilizing geosynthetics should include a listing with the calculations that verify the specified products are commercially available. The Geotechnical Fabrics Report magazine publishes an annual specifiers guide that is ideal for this purpose.

Submit two samples of the proposed block at the same time as the ACB and Geotextile Data submittal. The samples shall be typical of the size, texture, color, and finish. If the Contracting Officer is familiar with the product, this submittal may be waived. Geotextile used as filters below the ACB shall be a [woven] [non-woven] fabric. The geotextile shall meet the material properties specified in AASHTO M 288 for Class [2] strength property requirements and for permanent erosion control. Filter requirements in AASHTO M 288 shall be based on in-situ soil with [less than 15 percent] [15 percent to 50 percent] [greater than 50 percent] passing the 0.075 mm sieve opening. Geotextile used as a filter below the ACB shall be a [woven] [non-woven] fabric, and shall meet the requirements specified in Table 2. The property values (except for AOS) represent minimum average roll values (MARV) in the weakest principal direction.

2.3 CABLE

2.3.1 Installation Requirements for Cable

Cable used for preassembled mattresses shall be sufficiently sized and fastened for the size/weight of the assembled mattresses such that the assembled mattresses can be placed in compliance with OSHA standards. The manufacturer shall be responsible for determining the minimum cable strength compatible with the mattress size for safe handling. Cable strength shall be based on a minimum factor of safety of 5, and include appropriate reduction factors for mechanically crimped cable, and other fasteners. If applicable, loading conditions shall include the use of a spreader bar for placing the mattresses.

2.3.2 Fasteners Other than Cable

Any systems which rely on geotextiles (or other fabric integral with the mattress) to maintain block-to-block interconnection shall meet the applicable portions of this specification for cables. Geosynthetics strength shall include appropriate factors of safety, with particular attention given to the grab points.

2.3.3 Design Requirements for Cable

**************************************************************************
NOTE: The designer may need to research survivability of cables in the environment where the ACB will be placed. The installation requirements for cable strength usually govern, unless anchors are used.
**************************************************************************

ACB's that rely on cables to maintain block to block interconnection shall use ropes manufactured from polyester, stainless steel wire, or galvanized...
steel wire. The cable shall have a minimum breaking strength of [_____] pounds. Polyester rope shall be constructed of high tenacity, low elongating, continuous filament polyester fibers; and shall consist of a core construction comprised of parallel fibers contained within an outer jacket or cover.

2.3.4 Anchors

**************************************************************************

NOTE: Anchors require a cabled system. Anchors should be used with caution. Control of mattress uplift may only be successful for short term, low frequency, overload. ACB mattresses that are locally uplifted, with or without anchors, may show significant subgrade distortion, which could be a precursor to failure. Anchors spaced throughout the revetment also require special details to maintain integrity of the geotextile filter.

Because anchors are not required for typical installations, this paragraph may commonly be deleted. Where anchors are used for specialized applications, add requirements for anchor materials, minimum property requirements, and design characteristics.

Drawings must detail location and spacing of anchors.
**************************************************************************

Submit calculations for the anchor pullout capacity. Tabulated manufacturer's data is acceptable, if the embedment soil conditions are applicable to the project site. Anchors shall be selected with an ultimate vertical pullout resistance for the project site soil conditions of at least [_____] pounds. Anchors shall be capable of being attached directly to the articulating concrete block mat in a manner which will achieve little or no slack in the cable system or gaps in the articulating concrete block mattress. Anchors shall be attached to the mat in such a manner that they will not be affected by tampering or vandalism. Anchors shall have the capability of being load-tested to the specified pull-out capacity.

2.4 VOID FILLER

2.4.1 Aggregate

**************************************************************************

NOTE: Aggregate is used below the normal water level, or where turf can not be established. Department of Transportation specifications for road base aggregate have been used, such as ASTM D1241, Gradation B.
**************************************************************************

Aggregate for filling the voids in the block shall meet the requirements of [_____] .

2.4.2 Topsoil and Seed

Topsoil for filling the voids in the block and seed for turf establishment shall meet the requirements of Section 32 92 19 SEEDING.
PART 3 EXECUTION

3.1 SUBGRADE PREPARATION

Place the ACB revetment on undisturbed native soils, or acceptably placed and compacted fill. Do not place the ACB on surfaces that contain mud, frost, organic soils, embankment that has not met compaction requirements, or where the Contracting Officer determines that unsatisfactory material remains in or under the subgrade.

3.1.1 Clearing

All vegetation shall be completely removed as specified in Section [31 00 00 EARTHWORK] [31 11 00 CLEARING AND GRUBBING]. Remaining roots from trees and brush shall be removed to a depth of 0.3 meters 1 foot below the subgrade surface. Loose roots and twigs, turf clods, stones larger than 13 mm 1/2 inch diameter, and other debris shall be raked and removed from the final surface. Rills and gullies from erosion shall be corrected.

3.1.2 Bank Grading

Grading shall be finished to a smooth surface, typical of that obtainable with a dozer and blade. A rough surface typically obtained with a backhoe or dragline will not be acceptable, except when ACB placement in water is shown on the drawings or approved by the Contracting Officer. [When natural shorelines require grading in preparation for ACB installation, the bank stratification shall be observed and documented in daily Contractor Quality Control reports. Grading practices shall avoid spreading fine grained soils over more pervious soils, particularly near the toe of slopes. If inadequate material is available to comply with this requirement, the Contracting Officer shall be notified.].

3.1.3 Compaction and Subgrade Finishing

[Fill soils shall be compacted to the specified density in Section 31 00 00 EARTHWORK.] Incidental grading (where embankment is not otherwise specified) shall be compacted by heavy equipment or by tamping with a bucket to a density characteristic of the surrounding soils. The final surfaces accessible by compaction equipment shall be compacted with a smooth drum roller or vibratory plate tamper until there is no further evidence of consolidation. Where slopes limit operation of compaction equipment, the final surface shall be back-dragged to a dense smooth surface with bladed equipment. Localized loose or soft zones shall be corrected.

3.1.4 Grade Tolerances

The grading tolerance shall be within 50 mm 2 inches from the prescribed elevations, with no abrupt variations that would cause unacceptable projections of individual blocks.

3.1.5 Subgrade Surface Tolerances

The subgrade shall be maintained in a smooth condition between installation of the geotextile and the blocks. Windrows, stones, clods of cohesive soil, and irregularities shall be raked smooth. Ruts, rills and gullies resulting from traffic, precipitation runoff, groundwater seepage, etc. shall be corrected prior to installation of blocks.
3.2 GEOTEXTILE INSTALLATION

3.2.1 General

See "block installation" paragraph for drawing requirements. The geotextile shall be laid flat and smooth so that it is in direct contact with the subgrade. The geotextile shall be free of tension, folds, and wrinkles. The number of seams and overlaps shall be minimized by selective orientation of geotextile panels, within the limitations of maintaining a consistent pattern. Geotextile shall be placed immediately prior to block installation, if necessary to limit damage to the geotextile from equipment or repeated pedestrian traffic and limit disturbance of the subgrade from precipitation or runoff.

3.2.2 Geotextile Seams

**************************************************************************
NOTE: Sewn, welded or glued seams are desirable for shoreline protection (or where flow reversal occurs). Substitute the following for sewn seams:

Seams shall be continuously sewn at the locations shown on the drawings. The minimum distance from the geotextile edge to the stitch line nearest to that edge shall be \textbf{75 mm 3 inches}. Seam strength shall meet the minimum requirements specified in AASHTO M288 for a class 2 geotextile. Quality assurance samples shall be taken at the request of the Contracting Officer. The thread at the end of each seam run shall be tied off to prevent unraveling. Seams shall be on the top side of the geotextile to allow inspection. Skipped stitches or discontinuities shall be sewn with an extra line of stitching with a minimum of \textbf{450 mm 18 inches} of overlap.

\textbf{Pins/staples may not be desirable where filtration is critical.}
**************************************************************************

Seams shall be overlapped a minimum of \textbf{450 mm 18 inches}. Seams on slopes and butt end seams shall be shingled so that runoff and channel flow passes over the fabric. Geotextile panels shall be secured before block placement by adequate sandbags, spare blocks, or pins/staples.

3.3 BLOCK INSTALLATION

All placement of blocks shall be in accordance with the manufacturer's recommendations and the Contractor's approved shop drawings. Submit drawings showing details of the ACB and Geotextile Installation, including the block layout patterns in relation to the feature alignment, anticipated locations of cast-in-place concrete joints, mattress junction details, soil anchors, and proposed installation methods for void filling materials.

3.3.1 Placement of Pre-Assembled Mattresses

**************************************************************************
NOTE: The spreader bar may be deleted where
**************************************************************************
tolerances are a minor concern. The spreader bar may have associated cost when placing one end of the mattress in water, due to work in disconnecting the rigging on the wet end.

[Placement of pre-assembled mattresses shall be done with mattresses attached to a spreader bar to aid in lifting, aligning and placing the mattresses. ]The mattresses shall be placed directly into position, with a maximum space or gap between mattresses of 75 mm 3 inches in excess of the nominal joint spacing of blocks within the mattress. Mattresses out of alignment shall be lifted and reset. Mattresses shall not be pushed or pulled laterally after they are in contact with the geotextile. No overlapping of mats will be accepted and no blocks shall project vertically more than 25 mm 1 inch beyond the adjacent blocks. [As adjacent mats are placed, they shall be secured to each other by fastening the protruding horizontal and vertical cable connections and end cable loops together along each side of the mats.]

3.3.2 Hand Placement of Interlocking Blocks

Space hand placed blocks to maximize the ACB ability to articulate. Use adequate alignment control, such as string lines, to keep the block pattern in alignment and the joint spacing consistent and uniform. Initially, no more than two working block rows shall progress simultaneously in the direction of placement. Additional working rows may be added after experience shows that true lines are maintained. The starting position for ACB placement shall be a convenient location for control of the block pattern alignment. The Contracting Officer shall approve of the starting position for placement of the ACB.

3.3.2.1 Target Joint Spacing

Interlocking blocks shall be installed with a uniform aperture in the interlocking connections. The target joint spacing shall be neutrally spaced with equal free-play for the joint to open and close.

3.3.2.2 Correction of Joint Spacing

If the block pattern becomes skewed to an extent that blocks bind, joints close, or blocks stickup, then the placed ACB that is determined to be out of tolerance shall be removed and replaced. Where the nonconformance of the joint spacing is due to project features, such as warped slopes or anchor trenches, then cast-in-place concrete joints shall be field located in concurrence with the Contracting Officer.

3.3.2.3 Maintenance of Joint Spacing

If the block pattern becomes skewed to an extent that the joint freeplay is not acceptable to the Contracting Officer, then cast-in-place concrete joints shall be field located as directed by the Contracting Officer.

3.3.2.4 Block Layout Pattern Dependent on Project Features

If the block pattern is shown to be maintained parallel and perpendicular to selected project features, such as the crest/toe of levee/channel slopes, then field location of cast-in-place concrete joints shall be implemented as needed, and as directed by the Contracting Officer.
3.3.3 Tolerances

Maximum acceptable block projections (vertical offset from adjacent blocks) for "installation in the dry" shall not exceed 0.5 inches for interlocking blocks 25 mm 1.0 inch for cabled systems. Typical block projections shall be less than half the maximum projections.

3.4 ANCHORS

Anchors shall be carefully positioned for attachment to the articulating concrete block. Rigid shafts shall align with the ACB cables. Flexible anchors (cables, etc.) shall be linear between the ACB fastener and the restraining device before tensioning. Penetrations in the geotextile to allow for penetration of the anchor shall be sealed [in accordance with the drawing details].

3.5 CONCRETE JOINTS

3.5.1 General Requirements

Use of cast in place concrete joints shall be minimized to the extent practicable. The Contracting Officer shall be informed of all concrete joints not shown on shop drawings prior to field placement. Joints that shall require concrete include:

a. Joints between cable tied mattresses where the joint is 75 mm 3 inches wider than the nominal joint.

b. Joints where block interlock is discontinuous.

c. Abutments where the ACB meets headwalls, pipe penetrations, or sidewalks.

d. Any areas where there are partial blocks (to avoid small blocks with reduced hydraulic stability).

Field placed concrete shall be proportioned for similar strength and durability properties as the ACB concrete[, and shall meet applicable portions of Section [03 30 00 CAST-IN-PLACE CONCRETE] [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE]]. All cable ties and anchoring shall be completed prior to placing concrete.

3.5.2 Abutments

The ACB shall abut pipe outlets, retaining walls, flood walls, head walls, sidewalks, and other abutments in a neat appearance. Unless a specific detail is indicated on the drawings, voids shall be filled with partial blocks and the gap shall be filled with cast-in-place concrete. The concrete shall be installed flush with the surface of the blocks, and shall be float finished.

3.6 VOID FILLER AND SEEDING

******************************************************************************
NOTE: Topsoil will consolidate in the voids.
Overfilling above the top of block is common to increase the topsoil fill level, but may increase sedimentation during turf establishment.

SECTION 35 31 19.20 Page 19
Broadcast seeding of ACB is difficult because it is
difficult to rake the seed in. Hydroseeding of ACB
is difficult because of channelization of runoff and
susceptibility of the void filler to desiccation.
In areas where establishment of quality turf is
important, it has been successful to blend a rich
mixture of seed (about 10 times the normal
application rate, or about 0.5 to 1 kg/cubic m to
2 pounds per cubic yard) into the topsoil prior to
placing. Watering during establishment is more
critical than typical turf due to the heat
absorption of the concrete blocks and capillary
break of the geotextile.

**************************************************************************
The voids of the articulating concrete block mats shall be filled with
topsoil, except that voids below the normal water level shall be filled
with aggregate void filler. All cable ties and anchoring shall be
completed prior to filling voids. Seeding and maintenance shall be
completed in accordance with Section 32 92 19 SEEDING.

3.7 PROTECTION OF WORK

Work shall be protected against damage from subsequent operations.
Displaced or broken blocks shall be removed and replaced to conform to all
requirements of this section. Damaged material shall not be incorporated.
Equipment shall not be allowed on the ACB that could crack, cause abrasion,
or otherwise damage the blocks. Vehicles shall not operate directly on
gotextile, except that rubber tired vehicles may operate directly on short
reaches of geotextile that meets or exceeds AASHTO M 288 survivability
requirements for Class 1 geotextile, if there is no rutting, if the vehicle
access is necessary to accomplish the work, and if the Contracting Officer
observes the operation and approves. Vehicles shall not operate on the ACB
until (during or after) placement of void filler. Vehicle traffic on the
ACB shall be restricted to light weight rubber tired vehicles, and where
intermittent access is necessary to accomplish the work. Routine haul
routes shall not be established on the ACB. These allowances shall not
waive the Contractor's obligation to maintain the installation until
acceptance, and verify that vehicle access does not crack, or in any way
damage, the ACB.

3.8 QUALITY CONTROL TESTING

**************************************************************************
NOTE: The manufacturer should have completed
similar testing for it's own QC. The following
testing is suggested as an acceptance check on a
schedule typical for QA. The suggested frequency is
on the order of 0.5 percent of construction cost.

**************************************************************************
The following testing shall be performed independent of the manufacturing
process, by an agency other than the manufacturer. The ACB blocks shall be
sampled and tested for compressive strength, water absorption and unit
weight. The sample frequency shall be 3 specimens for each 2500 m² 3000 SY.
Test methods shall be consistent with those specified in PART 2 PRODUCTS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for levee construction. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections.

This guide specification includes paragraphs for construction activity that may have their own UFGS Guide Specifications. These include Section 31 00 00 EARTHWORK, Section 31 66 10 ROCK FOUNDATION PREPARATION and Section 31 11 00 CLEARING AND GRUBBING among others. If those Guide Specifications are to be referenced, remove the appropriate paragraphs from this section or those as is appropriate.

Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: This guide specification includes the
installation of settlement gages for the determination of increases in quantities of embankment materials resulting from settlement of the embankment foundation during construction and for payment to the Contractor for such increases in quantities. These provisions should be included in a project specification when it is determined that settlement in the range of 5 percent or more of the planned embankment height is anticipated over a considerable portion of the embankment foundation area. They will also be used when gages are needed for engineering control purposes, required in critical locations or called for if adverse contractual relationships are expected. When settlement gages are to be used the following information will be indicated on the plans:

1. The location of the gages as well as the stations at which zero settlement will be assumed.

2. The detail construction of the foundation settlement gages to be used. Any applicable type of gage may be selected.

The requirements for rock as prescribed herein are intended to be used on embankments involving rock fill sections. Where rock for slope protection is specified, Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES should be used.

Approval of testing laboratory is addressed in ER 1110-1-8100, dated 31 Dec 1997, Laboratory Investigations and Testing.

**************************************************************************
1.1 [LUMP SUM] [UNIT] PRICES
**************************************************************************

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title ([LUMP SUM] [UNIT] PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00 as appropriate.

**************************************************************************
1.1.1 Clearing, Grubbing, and Stripping
**************************************************************************

NOTE: If Section 31 66 10 ROCK FOUNDATION PREPARATION or Section 31 11 00 CLEARING AND GRUBBING is included in the project specifications, this paragraph title Clearing, Grubbing, and Stripping should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 31 66 10 or Section 31 11 00 as appropriate.
1.1.1.1 Payment

Payment will be made for clearing, grubbing and stripping at the contract [lump sum] [unit price] for clearing, grubbing and stripping. This price will constitute full compensation for all equipment, labor, materials and incidentals necessary to complete the work specified herein. Payment for refilling of holes resulting from grubbing will be included in the contract [lump sum] [unit price] for clearing, grubbing and stripping. No separate or direct payment will be made for stockpiling and disposition of stripped materials. All costs in connection therewith will be considered as a subsidiary obligation of the Contractor. If regrowth of vegetation or trees occurs after clearing and grubbing and before placement of embankment, and the Contractor is required to clear and grub again prior to embankment construction, no payment will be made for this additional clearing and grubbing.

1.1.1.2 Measurement

Note: If clearing, grubbing, and stripping is to be paid for with a unit price bid item include the method of measurement. Delete this paragraph if payment is by lump sum.

Clearing, grubbing, stripping, stockpiling and the disposition of the materials from these operations will [not] be measured for payment. Refilling of grubbing holes will not be measured for payment.

1.1.1.3 Unit of Measure

Unit of measure: [lump sum] [unit price].

1.1.2 Demolition and Removal of Existing Structures

1.1.2.1 Payment

Payment will be made for demolition or removal of existing drainage structures, pavements, foundations, superstructure, walls, fences, or any other manmade object at the contract [lump sum] [unit price] for demolition and removal of existing structures. This price will constitute full compensation for all equipment, labor, materials and incidentals necessary to complete the work specified herein. Payment for refilling of holes resulting from removal of structures will be included in the contract [lump sum] [unit price] for demolition and removal of existing structures. No separate or direct payment will be made for stockpiling and disposition of removed materials. All costs in connection therewith will be considered as a subsidiary obligation of the Contractor.

1.1.2.2 Measurement

NOTE: If removal or demolition of existing drainage structures is to be paid for with a unit price bid item include the method of measurement. Delete this paragraph if payment is by lump sum.
Plugging or removal of existing structures required from these operations will [not] be measured for payment.

1.1.2.3 Unit of Measure

Unit of measure: [lump sum] [unit price].

1.1.3 Excavation

**************************************************************************
NOTE: If Section 31 23 00.00 20 EXCAVATION AND FILL is used, this item should be deleted.

If excavation will not be measured or paid for separately, select the following paragraph and delete subparagraphs PAYMENT, MEASUREMENT, and UNIT OF MEASURE. Delete the following paragraph if excavation is to be measured and paid for separately. If significant quantities of rock excavation is anticipated measurement and payment for rock excavation should be addressed separately. A definition of rock excavation should also be included.
**************************************************************************

No separate measurement or payment will be made for Excavation. All costs in connection with excavation will be considered a subsidiary obligation of the Contractor.

1.1.3.1 Payment

Payment will be made for Excavation at the contract unit price which includes full compensation for all equipment, labor, materials, and incidentals necessary to complete the work specified.[ No separate payment will be made for stockpiling.]

1.1.3.2 Measurement

Excavation will be measured for payment by use of the average end area method. The basis of measurement will be a survey of the area prior to the excavation[ and clearing and grubbing] and a second survey of the same area after the completion of the excavation. For areas where lines and grades are shown on the drawings, measurement will be limited to those lines and grades. Slides caused by fault of the Contractor, over excavation, and excavation performed for will not be measured for payment.

1.1.3.3 Unit of Measure

Unit of measure: cubic meters yards.

1.1.4 Fill Material

**************************************************************************
NOTE: There are restrictions in guidance for the use of Hydraulic fill in levee construction. Designer should refer to EM 1110-2-1913 for guidance.
**************************************************************************
1.1.4.1 Payment For Embankment Fill

Payment will be made for material placed as required in embankments, backfills and ramps, and including additional material placed by reason of foundation settlement and by reason of soft material in the foundation being forced outward from the section during construction, for [Embankment Material Type [______],] [Semicompacted Fill] [Uncompacted Fill] [Hydraulic Fill]. Payment will constitute full compensation for furnishing all plant, labor, equipment and material, [except earth material,] and performing all operations necessary for foundation preparation and placing and compacting the material [, materials testing,] [and moisture control]. [This payment is in addition to any payment for excavating and transporting of the material as required in paragraph EXCAVATION.]

1.1.4.2 Measurement of Fill Material

**************************************************************************
NOTE: The last sentence of the following paragraph (in brackets) should be deleted if surveys are taken "after" clearing and grubbing operations. The last sentence should be included if surveys are taken "prior" to clearing and grubbing operations.
**************************************************************************

Submit a copy of the records of each compliance survey the next work day following the survey.

1.1.4.2.1 Fill Materials Specified for Embankment

Fill materials specified for embankment will be measured for payment by the cubic meter yard, and quantities will be determined by the average end area method. The basis for measurement will be cross sections of the areas to be filled taken [prior to] [after] clearing, grubbing, and stripping operations and the [theoretical cross sections] [actual cross sections] of the embankments constructed within the specified tolerance[ plus additional fill placed as the result of displacement or settlement of foundation material as calculated below].[ Cross sections will be performed at significant breaks in grade except that the maximum distance between cross sections will not exceed [_____] meters feet.] Embankments not constructed to design grade and section including allowable tolerance as indicated on the Contractor's compliance survey will not be accepted.[ Volumes occupied by drainage structures will not be included in measurement of embankment for payment.] [Material removed as a result of the clearing, grubbing, and stripping operations will not be included in measurement of embankment for payment.]

1.1.4.2.2 Fill Due to Soft Material in the Foundation

The basis for measurement of fill placed by reason of soft material in the foundation being forced outward from the section will be a survey of the area taken prior to fill placement and a second survey of the same area after completion of fill placement. The cross sections will extend [_____] meters feet beyond the toes of the fills.[ A cross section will be taken at each settlement measurement location.]

1.1.4.2.3 Levee Settlement

**************************************************************************
NOTE: The designer can choose to measure settlement
**************************************************************************
Measurement of additional fill material placed in each settlement measurement range, shown on the drawings by reason of foundation settlement, will be based on measurements [taken on the respective settlement gage] at the respective settlement measurement locations as specified and will be determined as follows:

a. The settlement measured at each settlement measurement location will be considered to apply to the foundation area throughout the length of the settlement ranges shown on the drawings.

b. The foundation settlement under the embankment at each transverse cross section within a settlement range will be considered to vary uniformly between break points in the cross section.

c. At each breakpoint, the settlement allowance will be based upon the proportion that the specified fill height at the break point bears to the specified fill height at the settlement measurement locations, in accordance with the following formula.

\[ S = h \times \frac{sm}{hm}, \]

where

<table>
<thead>
<tr>
<th>S</th>
<th>settlement to be computed at a break point</th>
</tr>
</thead>
<tbody>
<tr>
<td>h</td>
<td>specified gross fill height at S</td>
</tr>
<tr>
<td>sm</td>
<td>measured or adjusted vertical change at settlement measurement location</td>
</tr>
<tr>
<td>hm</td>
<td>specified gross fill height at settlement measurement location</td>
</tr>
</tbody>
</table>

d. Symbols used in the formula and the break points are [shown on a typical settlement cross section on the drawing] [included in these specifications].

1.1.4.2.4 Forfeiture of Payment for Settlement of Foundation

Failure to utilize settlement gages in strict accordance with the specifications and drawings will result in total forfeiture of any payment which will otherwise be due the Contractor for settlement of the foundation. Payment for settlement of the foundation will be totally forfeited for the reach attributable to the each settlement measurement location in each case for the following reasons: embankment over a settlement measurement location is constructed to a height in excess of the specified construction lines plus the tolerance permitted; settlement plates have been set and cannot be found after completion of the embankment; failure to take the settlement measurement within [_____] hours after the final cross sections have been taken over the completed embankment.

1.1.4.3 Unit of Measure

Unit of measure: cubic meters yards.

1.1.5 Mortar and Concrete for Foundation Preparation

**************************************************************************
NOTE: If Section 31 66 10 ROCK FOUNDATION PREPARATION, specifically paragraphs DENTAL CONCRETE or DENTAL MORTAR is a part of the project specifications, this section should be deleted.

1.1.5.1 Payment

Payment will be made for costs associated with mortar and concrete used in foundation and abutment preparation, which includes full compensation for furnishing all labor, equipment, material, and incidentals, and performing all operations necessary for placement of concrete and mortar for foundation and abutment preparation.

1.1.5.2 Measurement

Mortar and concrete used in filling spaces beneath rock overhangs and around protrusions will be measured for payment as the actual volumes of such mortar and concrete in cubic meters yards as determined by field surveys made before and after placement of the mortar and concrete.[ No measurement will be made for the mortar used in filling the open joints and cracks in the rock surface.][ Measurement of mortar or concrete used in filling the open joints and cracks in the rock surface will be made by the square meter yard based on the horizontal projection of the area obtained from a survey performed before application.][ Measurement of mortar or concrete used in filling the open joints and cracks in the rock surface will be the bags of cement used.]

1.1.5.3 Unit of Measure

Unit of measure: cubic meters yards.

1.1.6 Settlement Gages

No separate payment will be made for furnishing, installing, and maintaining settlement gages during embankment construction as specified herein, if used, including measurements required to be made by the Contractor, and will be at the expense of the Contractor. No separate payment will be made for compaction of fill around and over the settlement gages or for interference with the Contractor's operations resulting from the settlement gage installations.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS** (AASHTO)

**ASTM INTERNATIONAL** (ASTM)

ASTM D422 (1963; R 2007; E 2014; E 2014) Particle-Size Analysis of Soils

ASTM D698 (2012; E 2014; E 2015) Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/cu. ft. (600 kN-m/cu. m.))

ASTM D1557 (2012; E 2015) Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³) (2700 kN-m/m³)

ASTM D2487 (2017; E 2020) Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)

ASTM D4253 (2016; E 2019) Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table
1.3 DEFINITIONS

******************************************************************************************************************************************
NOTE: Add applicable definitions.
******************************************************************************************************************************************

1.3.1 Clearing

Clearing consists of the removal and satisfactory disposal of all [above ground and below ground] trees, downed timber, snags, slash, brush, garbage, trash, debris, fencing, and other items occurring in the designated areas to be cleared.

1.3.2 Grubbing

Grubbing consists of the removal and satisfactory disposal of stumps, roots larger than [_____] mm inches in diameter, and matted roots from the designated grubbing areas. Grubbing also includes filling of holes from the grubbing operation.

1.3.3 Stripping

Stripping consists of the removal and satisfactory disposal of crops, weeds, grass, and other vegetative materials to the ground surface[ and topsoil to a depth of [_____] mm inches].

1.3.4 Satisfactory Materials

******************************************************************************************************************************************
NOTE: Use of CH material should be avoided if possible. As a minimum, constraints should be set governing their use.
******************************************************************************************************************************************
Satisfactory materials consists of materials classified in accordance with ASTM D2487 as CL, [CH], CL-ML, ML, SC, SP, SW, [_____] free from: roots and other organic matter; contamination from hazardous, toxic or radiological substances; trash, debris; and frozen materials. Not all satisfactory materials can be used in levee. Only the satisfactory materials stated above, meeting the additional or modified requirements of paragraph TYPES OF FILL MATERIALS, can be used for levee construction.

1.3.5 Unsatisfactory Materials

Do not use unsatisfactory materials in any levee or other required fill. Unsatisfactory materials includes all other materials that are not defined above as satisfactory materials. Materials which do not comply with the requirements for satisfactory materials are unsatisfactory. Unsatisfactory materials also include, man-made fills (unless excavated, sorted/separated/stockpiled, and tested); trash; refuse; backfills from previous construction; and material classified as satisfactory which contains root and other organic matter or frozen material.

1.3.6 Embankment

The term "embankment" as used in these specifications is defined as the earth [and rock] fill portions of the levee structure or other fills related to the levee structure, including [cut-off trench] and includes all types of earth fill [and filter materials] for the levee [and cut-off trench] and all other fills within the limits of the levee as shown on the project drawings. [Stone and other rock materials used for slope protection are described in paragraph [____]].

1.3.7 Backfill

Backfill as used in this section is defined as that fill material which cannot be placed around or adjacent to a structure until the structure is completed or until a specified time interval has elapsed after completion.

1.3.8 Excavation

Excavation consists of removal of material to the lines and grades shown on the drawings, or as otherwise directed or approved by the Contracting Officer and as described in paragraph [____] EXCAVATION in PART 3 EXECUTION.

1.3.8.1 Over-excavation

Excavation performed beyond lines and grades shown on the plans that is made at the convenience of contractor. No separate payment will be made for over-excavation or for additional embankment materials needed to backfill the over-excavation.

1.3.8.2 Additional Excavation

Excavation performed beyond lines and grades shown on the plans that is performed at the direction of the Government, and to be paid at unit prices for excavation and backfill, or as negotiated.

1.3.9 Classification of Soils

Materials used to construct the embankments and for backfills will be
classified in accordance with ASTM D2487 (Unified Soil Classification System). Cohesionless materials include materials classified in ASTM D2487 as GW, GP, SW, and SP. Cohesive materials include materials classified as GC, SC, ML, CL, MH, and CH. Materials classified as GM and SM will be identified as cohesionless only when the fines are nonplastic.

1.3.10 Degree of Compaction

1.3.10.1 Cohesive Material

**************************************************************************
Note: If a higher compactive effort than is attainable by ASTM D698 is desired, ASTM D1557 may be utilized and references to ASTM D698, relative to compactive effort, should be changed to ASTM D1557.
**************************************************************************

Degree of compaction is expressed as a percentage of the maximum density obtained by the test procedure presented in [ASTM D698] [ASTM D1557], abbreviated hereinafter as percent laboratory maximum density.

1.3.10.2 Cohesionless Material

**************************************************************************
Note: Factors such as (but not limited to) site specific materials, availability of testing equipment and local practice may make it more practical to utilize methods other than ASTM D4253 and ASTM D4254 to control the degree of compaction of cohesionless material. If other methods are utilized the appropriate sections of the specifications should be modified to reflect method selected. The other methods used include comparison of in-place density to either the maximum Proctor density or the maximum density obtained by ASTM D4253 (if vibratory table is available).
**************************************************************************

Degree of compaction is expressed as a percentage of the relative density in accordance with ASTM D4253 and ASTM D4254.

1.4 SYSTEM DESCRIPTION

**************************************************************************
NOTE: This section should describe all appropriate activities to be performed to accomplish the completed projects as planned, including any special work items that must be conducted.
**************************************************************************

The work covered by this section consists of furnishing all equipment, labor, materials, and incidentals, and performing all operations necessary for the clearing, grubbing, and stripping of the areas specified herein or indicated on the drawings, and for the removal and disposal of cleared, grubbed, and stripped materials,[ removal or plugging of existing drainage structures[,] and refilling of holes resulting from grubbing; excavation of borrow areas [and existing levees[,] and for all other required excavations or excavations incidental to the construction of levees[, channels] [, ditches] [, structures] [, and ponding areas] as specified and shown;
foundation preparation and the construction of levee embankments, including new levee, enlargement of existing levee, backfill of inspection trenches, cutoff trenches, berms, road crossings, backfill at drainage structures, and other incidental earthwork as may be necessary to complete the levee as specified herein and as shown on the drawings. All work under this section will comply with the requirements of EM 385-1-1.

1.4.1 Embankment and Backfill Materials

**************************************************************************
NOTE: All available sources of materials for embankment and backfill should be designated.
**************************************************************************

At least [30] days prior to delivery of any Contractor-furnished material to the site of the work, submit soil classification test results, moisture-density curves, gradation curves, and laboratory results of the required tests of the proposed material. Materials for embankment and backfill construction will be obtained from [the borrow sources] [sources provided by the Contractor] [required excavation]. Materials obtained from required excavation which meet or which can be processed to meet the requirements for each embankment material, or any other material required for this project, as specified herein, may be utilized [in the appropriate zone of] [in] the embankment or as backfill. Submit to the Contracting Officer the source or sources intended to provide materials for embankment construction. If a source is selected other than a commercial quarry or other commercial entity from which earth or rock material will be directly purchased and where the Contractor or his subcontractor will perform the borrow excavation, a written statement will be provided to the Contracting Officer indicating permission to utilize the area. It is the Contractor's responsibility to obtain Federal, State, and local permits which may be required for excavation and reclamation of the borrow area. A copy of the plan and procedures to be utilized for reclamation will be furnished to the Contracting Officer as required in Section [____], paragraph [____]. The Contracting Officer will require material samples from any proposed borrow source to be submitted as indicated in paragraph FIELD QUALITY CONTROL.

1.4.2 Haul Roads

**************************************************************************
NOTE: Haul roads are highly project specific. Contractor should be given as much latitude as feasible to determine his traffic patterns. Haul roads must be safe, not interfere with public traffic, environmentally friendly and generally must be restored to preconstruction conditions.
**************************************************************************

Locate and construct haul roads [as indicated and] [as] [approved by the Contracting Officer] [within the project boundaries shown on the drawings]. Prior to the commencement of construction submit for approval a site plan detailing the location of all haul roads within the project limits.] Locate haul road[s] between the borrow site[s] and the levee embankment within the limits [shown on the drawings] [approved by the Contracting Officer]. Mark the limits of the borrow haul road in the field using construction fencing or similar methods approved by the Contracting Officer. Areas on each side of the borrow haul road corridor must not be disturbed.] Construct haul roads to maintain the intended traffic, be free draining, and remain in good condition throughout the
contract period.[ Any haul road which crosses any creek or drainage channel must be constructed, and maintained so as to not flood either upstream areas by restricting stream flows or flood downstream areas by the release of any stored water in the event that the crossing fails for any cause.] Remove haul roads constructed during the contract duration after work is completed and the impacted area restored to its preconstruction conditions.[ Plow and/or scarify or otherwise loosen all access and haul roads other than existing roads to a minimum of [_____] mm inches deep and leave the surface in a smooth condition.] All haul roads within the right-of-way that will remain as public thoroughfares after construction must be cleaned daily and maintained in the preconstruction condition. Consider all costs associated with these haul roads as a subsidiary obligation of the Contractor.

1.4.3 Ramps and Crossings

Construct ramps and crossings at the locations shown on the drawings by placement of a fill as specified in paragraph [______]. Construct ramps and crossings by adding material to the levee crown and slopes. Provide ramps that have a [_____] meter foot crown width, a grade not to exceed [_____] percent, and 1V on [_____]H side slopes.

1.4.4 Runways

*********************************************************
NOTE: Runways are temporary haul roads over a levee.
*********************************************************

Where material is hauled over an existing levee for construction, the Contractor, at no extra cost, will be permitted to construct temporary runways over the levee by the addition of material to the levee cross section. For the construction of runways, if the Contractor so desires, the existing levee may be cut, [but not to exceed a depth of [_____] meters feet below the crown] [not to exceed [_____] meters feet below the project flowline] [or 100-year level] [not to excavate below elevation [_____] or one half the height of the levee, whichever is less], and provided that the cut is made with side slopes not steeper than 1V on 1H, and with a minimum width of haul road of [_____] [7.6] m [_____] [25] feet for one-way traffic, and [_____] [18.3] m [_____] [60] feet for two-way traffic. Cutting into the existing levee at intervals of less than [_____] [152] m [_____] [500] linear feet for the [_____] [7.6]-m [_____] [25]-foot bottom widths or less than [_____] [304] m [_____] [1,000] linear feet for the [_____] [18.3]-m [_____] [60]-foot bottom widths will not be allowed, and no more than [_____] runways will be open at one time. Stockpile, as directed by the Contracting Officer, sufficient suitable levee embankment material to construct emergency closure of the cuts.

1.4.5 Closure of Runways

Where runways have been cut through the levee, the Contracting Officer reserves the right to order their closure at no additional cost to the Government at any time that such runways may endanger the security of the levee. Just prior to restoration of the runway, the bottom of any cut made in the levee must be broken to a depth of [_____] [300] mm [_____] [6] inches and the side slopes thoroughly scarified. The restoration must be made with suitable embankment material, placed and compacted as provided in paragraph [______]. Remove material used in the construction of the approach ramps of the runways and use for fill, if satisfactory. If not used for fill, dispose the material by placing it in abandoned portions of
the borrow areas or by any other method specified in paragraph disposal of material. No section of the levee will be degraded or weakened to provide runways nor will existing runways remain open during the nonwork season described in [GENERAL CONTRACT REQUIREMENTS], [paragraph] [Clause] EXCLUSION OF PERIODS IN COMPUTING COMPLETION SCHEDULES, unless otherwise approved in writing by the Contracting Officer.]

1.4.6 Stockpiling

**************************************************************************

NOTE: Cost of stockpiling embankment fill material should be included in the price for placing fill in the levee embankment.
**************************************************************************

Any on-site stockpiling of embankment materials will be in accordance with paragraph [_____] Stockpiles. No payment will be made for such stockpiling nor for the reloading and hauling of these materials to their final position.

1.4.7 Slides and Foundation Failures

When sliding occurs in any part of the embankment and backfills prescribed in this section after they have been placed, but prior to final acceptance of all work under the contract, either cut out and remove the slide from the embankment and then rebuild that portion of the embankment, or construct a stability berm of such dimensions, and place in such manner as prescribed by the Contracting Officer. When the slide is caused through the fault of the Contractor, the repair will be made at no cost to the Government.

1.4.8 Drainage Requirements

**************************************************************************

NOTE: Modify the following paragraph for specific job conditions such as fill placed in/under water.
**************************************************************************

Submit written evidence consisting of an authenticated copy of the [conveyance] [easement] under which the Contractor acquired the property rights and access thereto, prepared and executed in accordance with applicable State and local requirements. Do not block or restrict the flow in a natural drain, existing culvert, ditch or channel at any time without obtaining prior written approval from the Contracting Officer. This approval will not relieve the Contractor from responsibility for any damage caused by the operation. Monitor the [river] [canal] [stream] flow and provide sufficient free discharge areas so that conditions are not worsened upstream or downstream by possible floods during construction. Surface water will be directed away from excavations and construction sites so as to prevent erosion and undermining of foundations. Diversion ditches, dikes, and grading will be provided and maintained as necessary during construction. Protect excavated slopes and backfill surfaces to prevent erosion and sloughing. Perform excavation so that the site and the area immediately surrounding the site and affecting operations at the site will be continually and effectively drained. If private property is to be used for drainage, submit written evidence that the right has been obtained from the property owner for drainage on his property.
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Plan Of Operations; G[, [_____]]

Submit complete and detailed descriptions of proposed earthwork plan. This plan must include, but not be limited to, the Contractor's proposed sequence of construction for all earthwork including backfill and embankment items; methods and types of equipment to be utilized for all earthwork operations, including transporting, placing and compacting; quantity, type and final disposition of stockpiled materials; location and drainage of proposed stockpiles; proposed disposition of all excavated materials, including items which are anticipated to be disposed of.
off-site. Submit the earthwork plan to the Government not less than 30 days prior to initiating any earthwork operation.

**Embankment And Backfill Materials; G[[], [_____]]**

At least 30 days prior to delivery of any Contractor-furnished material to the site of the work, submit soil classification test results, moisture-density curves, gradation curves, and laboratory results of the required tests of the proposed material.

**Excavation; G[[], [_____]]**

Submit complete and detailed descriptions of proposed excavation plan. Obtain approval of the detailed plan from the Contracting Officer prior to starting the work. If necessary, modify the plan as required to meet field conditions, and the modifications must be approved prior to use. This plan must include:

- Proposed methods for preventing interference with, or damage to, existing underground or overhead utility lines, trees designated to remain and other man-made facilities or natural features designated to remain within or adjacent to the construction rights-of-way.

- Provision for coordinating the work with other Contractors working in the construction rights-of-way or on facilities crossing or adjacent to this work.

- The proposed methods for controlling surface and ground water in the borrow areas and required excavations.

- Stockpiling plan for embankment material before it is transported to the project site showing locations, stockpile heights, slopes, limits, and drainage around the stockpile areas.

- A complete listing of equipment used for excavation and to transport the excavated material.

- The proposed sequence of work for excavating the borrow areas with plan and cross sectional views showing starting and final work locations and clearing, grubbing and stripping limits.

- The proposals for conserving arable land and for making optimum use of available borrow, including the Contractor's proposed methods for grading the bottom of the borrow areas after completing use of the borrow areas.

- The proposed haul road and haulage patterns, and plan for implementing dust control measures.

- Proposed disposition of all excavated materials, including items which are anticipated to be disposed of off-site.

**SD-02 Shop Drawings**

**Drainage Requirements**

**SD-03 Product Data**
1.6 PROJECT SITE CONDITIONS

******************************************************************************
NOTE: The following paragraphs are commonly included with Division 02, EXISTING CONDITIONS. If those sections are to be used, the following paragraphs should be deleted.
******************************************************************************

1.6.1 Protection of Man-Made Facilities and Natural Features

Trees within the clearing area will be felled in such a manner as to avoid damage to trees left standing and trees outside the clearing area, existing buildings, man-made facilities and natural features, with due regard to the safety of employees and others, and in compliance with EM 385-1-1. Excavation will follow the same requirements specified above for felling trees and will be in compliance with EM 385-1-1. Existing utility lines that are shown on the drawings or the locations of which are made known to the Contractor prior to excavation and that are to be retained will be protected from damage during excavation. When utility lines that are to be removed are encountered within the area of operations, notify the applicable utility companies in sufficient time for measures to be taken to prevent interruption of the services.

1.6.2 Historical, Archeological, and Cultural Resources

Historical, archeological, and cultural resources within the Contractor's work limits [are known to exist] [may exist]. If, during construction activities, the Contractor observes items that may have historical or archeological value, such observations will be reported immediately to the Contracting Officer so that appropriate authorities may be notified and a determination made as to their significance and what, if any, special disposition of the finds should be made. Cease all activities that may result in the destruction of these resources and prevent the workers from trespassing on or otherwise damaging such resources.

1.6.3 Subsurface Data

Subsurface soil boring logs are [shown on the drawings] [included in these specifications] [found in the Project Geotechnical Report]. Subsurface investigation reports and samples of materials obtained from subsurface investigations may be examined at the [_____] District Office. These data represent subsurface information at the boring locations; however, variations may exist in the subsurface between boring locations. The
Contractor is ultimately responsible for subsurface interpretation across the entire project site. Groundwater levels indicated on the soil boring logs were levels found at the time of exploration. The groundwater table can vary significantly depending on time of year, variation from normal precipitation, and river stage or tide level. Contractor is ultimately responsible for subsurface interpretation across the entire project site.

1.7 MERCHANTABLE TIMBER

******************************************************************************
NOTE: The following paragraphs are commonly included with Division 02, EXISTING CONDITIONS. If those sections are to be used, the following paragraphs should be deleted.
******************************************************************************

Merchantable timber remaining within the areas to be cleared on or after the date of award of this contract may be disposed of as the Contractor sees fit, as long as such merchantable timber is either removed from the rights-of-way or is satisfactorily disposed of in accordance with the paragraph DISPOSITION OF CLEARED, GRUBBED, AND STRIPPED MATERIAL DISPOSITION OF EXCAVATED MATERIAL and the Contractor complies with all applicable State and local regulations and laws.

1.8 SEQUENCING

1.8.1 Clearing and Grubbing

******************************************************************************
NOTE: If the specification for this project includes Section 31 11 00, CLEARING and GRUBBING, the following paragraph should be deleted.
******************************************************************************

Complete all clearing and grubbing work at least [100] [_____] meters [300][_____] feet in advance of embankment construction. [In locations where work on drainage structures is performed prior to embankment construction, complete all clearing and grubbing for the structure at least [_____] meters feet on each side of the structure, measured along the levee centerline and [_____] meters feet perpendicular to the structure.] If regrowth of vegetation or trees occurs after clearing and grubbing and before placement of embankment, the Contractor will be required to clear and grub again prior to embankment construction.

1.8.2 Stripping

After inspection and acceptance of cleared and grubbed areas, stripping may proceed. All stripping work must be completed not more than [_____] meters feet in advance of embankment construction.

PART 2 PRODUCTS

******************************************************************************
NOTE: After "PART 2 PRODUCTS" above, insert the following "(NOT APPLICABLE)", if there are no subparagraphs in PART 2. PART 2 material requirements should be added for contracts in which the Contractor is required to supply materials.
******************************************************************************
2.1 HAUL ROAD MATERIALS

[____].

2.2 TYPES OF FILL MATERIALS

**************************************************************************

NOTE 1: The types of fill materials used for levee construction usually depend on the availability of materials from required construction excavation and the nearby borrow sources. The material types listed below as satisfactory materials are often used in levee construction.

2: Separate paragraphs, such as those below, should be included for EACH material type that is to be placed under a contract. The plans should clearly show, with labels, the location of the fill types. Embankment fills should include, but not be limited to, the levee, berms, inspection trench, cutoff trenches and any other specified fill or backfill. This allows the Designer and Specifications Engineer to use multiple fill types within the same contract and clearly indicate locations of each type. The types of satisfactory materials should be edited for each type of fill. The bid schedule should include a line for each type of fill. Where multiple fills are placed in layers or zoning, the measurement, payment and tolerance paragraphs should be edited to specify the interfaces of the multiple fill types.

Omit the following soil types which are not applicable to the specific project.

**************************************************************************

2.2.1 [Select Fill]

Obtain select fill embankment material from [the borrow site provided by the Government] [sources provided by the Contractor] [required excavation]. Provide select fill material consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].

2.2.2 [Impervious Fill]

**************************************************************************

NOTES: Caution should be exercised regarding the use of high plasticity clay and silt (CH, MH) soils with Plasticity Indices greater than about 40 (30 in dry climates and 50 in humid climates). Spreading and compacting CH or MH materials can also present constructability problems due to difficulty maintaining proper moisture content. These soils are susceptible to shrinkage and cracking upon drying. Seasonal cycles of swelling and shrinkage can also result in loss of shear strength, which may ultimately result in slope instability. Chemical treatment, such as lime, has been used to reduce the PI and potential for cracking.
Compact Impervious Fill material using self-propelled or towed sheeps-foot rollers.

Provide material consisting of satisfactory impervious material classified as lean clay (CL), fat clay (CH), low plasticity silt (ML), high plasticity silt (MH), sand containing more than 30 percent of clay (CL), and borderline clay and silt (CL-ML) in accordance with ASTM D2487.

2.2.3 [Pervious Fill]

NOTE: The designer should define the types of material which are acceptable as Pervious Fill.

Provide material consisting of satisfactory pervious material classified as well graded sand (SW), poorly graded sand (SP), poorly graded gravel (GP) or well graded gravel (GW) in accordance with ASTM D2487.

2.2.4 [Random Fill]

Provide random fill consisting of any satisfactory materials other than those classified in ASTM D2487 as [_____] [and any silt or sand with a uniformity coefficient (Cu) less than 6]. Random fill may consist of select fill, impervious fill, and pervious fill, or a combination of them.

2.2.5 Random Rock

NOTE: Random rock is sometimes used in levee construction to build up an underwater levee toe foundation or to buttress a slope in a constricted area. Due to its high permeability, random rock or pervious fill should not be used alone as levee fill material. The designer should select the types of acceptable rock material and the maximum allowable percent fines.

Provide random rock consisting primarily of [_____] (shale, siltstone, sandstone, granite or limestone) obtained from a source provided by the Contractor. Provide random rock that is free of silt, clay, or other earth material in quantities greater than [_____] [5] percent by weight, and containing no debris or organic material. Random rock must be reasonably well-graded and the largest stones must have a maximum dimension not exceeding [_____] [450] mm [_____] [18] inches. Control rock production at the source such that not more than 20 percent of the material has a maximum dimension between adjacent earth fill choke off with a layer of finer random rock material. Random rock placed within 1 meter 3 feet of any structure must have a maximum size of 125 mm 5 inches.

[2.2.6 Coarse Drainage Gravel]

NOTE: It is important to use appropriate filter criteria in the design of the drainage features. Selection of the gradation for the coarse and fine
drainage materials should be developed with consideration of filter compatibility with native soils and the materials to be obtained for use.

Obtain coarse gravel material for the [rectangular and trapezoidal] toe drains [landsie seepage berms] [road stone] from a source [provided by the Contractor]. Provide coarse drainage gravel that is non-calcareous, composed of tough durable particles, and does not contain any organic material or soft, friable particles in quantities. Blast furnace slag will not be permitted. The gravel material in-place must meet the quality requirements of [AASHTO M 43, Size No. 57][ASTM C33/C33M No. 57].

2.2.7 Fine Drainage Gravel

NOTE: Identify source of materials. It is important to use appropriate filter criteria in the design of the drainage features. Selection of the gradation for the coarse and fine drainage materials should be developed with consideration of filter compatibility with native soils and the materials to be obtained for use.

Obtain fine drainage gravel material for the [rectangular and trapezoidal] toe drains [landsie seepage berms] [road stone] from a source [provided by the Contractor]. Provide fine drainage gravel material that is non-calcareous, composed of tough durable particles, and does not contain organic material. The fine drainage gravel in-place must meet the requirements of [AASHTO M 43, Size No. 8][ASTM C33/C33M].

2.2.8 Filter Sand

NOTE: It is important to use appropriate filter criteria in the design of the drainage features. Selection of the gradation for the coarse and fine drainage materials should be developed with consideration of filter compatibility with native soils and the materials to be obtained for use.

At least [30] [_____] days prior to delivery of any Contractor-furnished material to the worksite, submit soil classification test results and a gradation curve for each of the proposed filter materials to be used. Fine aggregate for the filter sand in-place must meet the quality requirements of ASTM C33/C33M grading for fine aggregate with additional limits on the allowable percentage passing the No. 200 sieve as specified below.

Additionally, the filter sand must not contain any organic matter or soft friable particles.

2.2.9 Bedding

Bedding material, placed as a backing layer must consist of satisfactory pervious fill material satisfying the material requirements presented in [Section 31 36 00 GABIONS] and [Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES].

2.2.10 Topsoil

Provide topsoil consisting of organic soil and place on the levee slopes as shown on the contract drawings and as specified in Section [32 92 23 SODDING] [____].

2.2.11 Semicompacted Fill

**************************************************************************
NOTE: The designer should list the material types that are acceptable for semicompacted fill, which can be defined in terms of previously defined fill types or basic material types.
**************************************************************************

Provide material for semicompacted fill consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].

2.2.12 Uncompacted Fill

**************************************************************************
NOTE: The designer should list the material types that are acceptable for uncompacted fill, which can be defined in terms of previously defined fill types or basic material types.
**************************************************************************

Provide material for uncompacted fill consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].

2.2.13 Hydraulic Fill for Berms and Depressed Areas

**************************************************************************
NOTE: Caution should be used when specifying hydraulic fill. Hydraulic fill is to be used only in stability berms, pit fills, and seepage berms. Hydraulic fill will normally not be used in construction for levee embankment. In addition to

<table>
<thead>
<tr>

</table>
requiring a large levee footprint, the levee embankment constructed by hydraulic fill is susceptible to soil liquefaction, and excessive seepage. Hydraulic fill also erodes quickly in a situation where a levee is overtopped or where an impervious covering is penetrated. See the appropriate Engineering Manuals for further guidance.

Tie this back to Section 01 45 00.00 1001 45 00.00 20 01 45 00.00 40 QUALITY CONTROL requirement for inspection and validation of CQC laboratories by the government.

Place fill shown on the drawings as hydraulic fill by hydraulic methods in accordance with the plan of operations approved by the Contracting Officer. Thirty (30) days prior to commencement of haul road construction or placing embankment and backfill, whichever is earlier, submit for approval a Plan of Operations for accomplishing all embankment and backfill construction and for the location and construction of haul roads. This plan must include, but not be limited to, the proposed sequence of construction for embankment and backfill items, and methods and types of equipment to be utilized for all embankment and backfill operations, including transporting, placing, and compaction. This plan must also include the names and addresses of the [commercial testing labs] [engineering firms] which will perform the soil testing and inspection and describe how all required soils testing will be performed. The dredged material must have, as placed, not less than [_____] percent by weight passing U.S. Standard Sieve No. [_____] and not less than [_____] percent by weight passing a U.S. Standard Sieve No. [_____].

][2.3 MANUFACTURED PRODUCTS

******************************************************************************

NOTE: Add applicable requirements.

******************************************************************************

[_____].

][2.4 GROUTS AND DENTAL CONCRETE

Provide grouts and dental concrete as specified in concrete Section [_____] CONCRETE, except that the slump must be [_____] mm inches for dental concrete.

][2.5 STABILIZERS

******************************************************************************

NOTE: Add applicable requirements.

******************************************************************************

[_____].

][2.6 INSTRUMENTATION

[2.6.1 Piezometers and Observation Wells

Install piezometers and observation wells as shown.
2.6.2 Settlement Markers and Survey Monuments

Install survey monuments and settlement markers as shown.

2.6.3 Settlement Gages

Provide settlement gages as shown.

PART 3  EXECUTION

3.1 CONSTRUCTION

3.1.1 Lines and Grades

Construct embankment and backfill to the lines, grades, and cross sections indicated on the drawings, unless otherwise directed by the Contracting Officer. The Government reserves the right to increase or decrease the foundation widths and embankment slopes or to make such other changes in the embankment or backfill sections as may be deemed necessary to produce a safe structure. Changes in quantities resulting from such revisions will not constitute justification for change in contract unit prices, except as provided for in FAR 52.211-18 Variation in Estimated Quantities Clause. Increases in height of section, made to compensate for settlement or consolidation of the embankment material subsequent to the completion of the embankment, will not exceed [_____] percent of the height above the foundation at the levee centerline indicated. Provide end slopes and side slopes of partial fill sections no steeper than [one vertical on [_____] horizontal] [, unless otherwise shown on the drawings].

3.1.2 Conduct of the Work

Maintain and protect the embankment and backfill in a satisfactory condition at all times until final completion and acceptance of all work under the Contract.[ If, in the opinion of the Contracting Officer, the hauling equipment causes horizontal shear planes or slicken sides, rutting, quaking, heaving, cracking, or excessive deformation of the embankment or backfill, limit the type, load, or travel speed of the hauling equipment on the embankment or backfill.] The Contractor may be required to remove, at no additional payment, any embankment material placed outside of prescribed slope lines. Replace approved embankment or backfill material which is lost in transit or rendered unsuitable after being placed in the embankment or backfill and before final acceptance of the work in a satisfactory manner and no additional payment will be made therefore.

Excavate and remove from the embankment or backfill any material which is unsatisfactory, dispose of such material, and refill the excavated area as directed, all at no cost to the Government.

3.2 CLEARING

Accomplish clearing within the [limits][construction limits shown on the drawings] of existing ground to receive embankment [and structures], together with strips [1.5] [_____] meters [5] [_____] feet wide, beyond and contiguous thereto, existing levees to be degraded, ponding areas, ditches, structures, traverses, channels, riprap, revetment, borrow areas and ramps. Clear trees, downed timber, snags, slash, brush, garbage, trash, debris, fencing and other items [_____] mm inches above] [flush with] the existing ground surface. Protect trees and vegetation designated to be left standing or to remain from damage from construction operations. Limit
clearing of borrow areas to the minimum area required for construction operations.

3.3 GRUBBING

Accomplish grubbing within the [limits] of existing ground to receive embankment [and structures], together with strips [1.5] meters [5] feet wide, beyond and contiguous thereto, existing levees to be degraded, ponding areas, ditches, structures, traverses, channels, riprap, revetment, borrow areas and ramps. Accomplish grubbing to a depth of at least [1] m [3] feet below the existing ground surface. Fill holes caused by grubbing operations and removal of pipes and drains, excluding holes in borrow areas, channels and ditches [above required grade], with satisfactory material as specified in paragraph [_____]\. Place material in [_____] mm inch layers to the elevation of the adjacent ground surface and each layer compacted to a density at least equal to that of the adjoining undisturbed material.

3.4 STRIPPING

The entire area within the [limits] of existing ground to receive embankment and structures, together with strips [1.5] meters [5] feet wide, beyond and contiguous thereto, existing levees to be degraded, ponding areas, and ditches [shown on the drawing must be stripped to remove crops, weeds, grass, and other vegetative materials to the ground surface [and topsoil to a depth of [_____] mm inches]].

3.5 DISPOSITION OF CLEARED, GRUBBED, AND STRIPPED MATERIAL

CUSTOMER NOTE:  Delete undesirable options for Disposition of Cleared, Grubbed, and Stripped Materials.

Except as otherwise specified or indicated on the drawings, dispose all materials resulting from clearing and grubbing operations at the Contractor's option, by windrowing or stockpiling within construction limits, burying within construction limits, burning, chipping, removal from the site, or a combination thereof. Do not bury or place any material resulting from clearing and grubbing operations within the levee foundation or any structural foundation. Make a reasonable effort to channel merchantable material into the commercial market and to make beneficial use of the materials resulting from clearing and grubbing. [Temporarily stockpile the topsoil material resulting from the stripping operations within the rights-of-way.]

3.5.1 Windrows

Place cleared, grubbed and stripped material [as shown on the drawings] in a neat windrow or in piles with tree limbs trimmed sufficiently to make the windrow as small as practicable. Do not extend cleared, grubbed or stripped material beyond the construction limits.

3.5.2 Burning

Subject to applicable Federal, State and local burning restrictions, the Contractor may burn material within the contract rights-of-way. Conduct
burning operations to prevent damage to adjacent man-made facilities and natural features. The Contractor is responsible for any damage to life and property resulting from fires that are started by the Contractor's employees or as a result of the Contractor's operations. Furnish, at the site of burning operations, adequate fire fighting equipment to properly equip personnel for fighting fires. Guard fires at all times and provide constant surveillance until they have been extinguished. Remove all unburned material (material not reduced to ash) from the site or dispose of by [____].

3.5.3 Burying

Subject to applicable Federal, State and local burying restrictions, the Contractor may bury the cleared and grubbed material in the area(s) as shown on the drawings or in [____]. Do not bury material within [____] meters feet of any standing timber. Cover all buried material with a minimum of [____] mm inches of earth.

3.5.4 Chipping

All cut timber, down timber, dead timber, branches, and brush may be chipped. Haul the chips to stockpiles indicated on the drawings or to other locations approved by the Contracting Officer or remove from site of work. Deposit chips in these areas in piles or windrows [above] [below] elevation [____] NGVD.

3.5.5 Removal from Site of Work

The Contractor may elect to remove all or part of the cleared and grubbed materials from the site of the work[ in accordance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS]. The Contractor may opt either to retain any such materials of value or dispose of them by sale or otherwise. The Government is not responsible for the protection and safekeeping of any materials retained by the Contractor. [Materials resulting from the clearing and grubbing operations must be removed from the site [weekly] [monthly].][ Remove such materials from the site of the work before the date of completion of the work.]

3.6 REMOVAL OR PLUGGING OF ABANDONED PIPE AND CONDUITS

**************************************************************************
NOTE: The terms and conditions in any permits and environmental commitments obtained by the Government must be made a part of the contract. The designer must include technical requirements necessary to comply with these terms and commitments.
**************************************************************************

Remove abandoned pipes and conduits to the limits shown on the drawings or abandon in place by grouting or filling with concrete as shown on the plans a minimum distance of [____] meters feet from [____]. Prior to plugging, clean the interior of the pipe to be plugged and place the concrete in such a manner as to insure a dense, well bonded plug.

3.7 SHORING, SHEETING, AND BRACING

**************************************************************************
NOTE: Add applicable minimum requirements for the shoring, sheeting and bracing plan based upon site
**************************************************************************
Submit a detailed shoring, sheeting and bracing plan [_____] days prior to the beginning of any excavation so supported. The plan for shoring, sheeting and bracing will be prepared and certified by licensed professional engineer, registered in [_____.] All shoring must be designed so that it is effective to the bottom of the excavation, and must be based upon calculation of pressures exerted by the earthen materials to be retained, including the condition and nature of those materials as well as any surcharge loads imparted to the excavation by slopes, equipment, traffic, or stored materials. Include in the plan drawings and design computations of the proposed shoring, sheeting, and bracing, and documentation, showing details of the coordination and approval of shoring, sheeting, and bracing by the applicable parties. Obtain approval of the detailed plan from the Contracting Officer prior to starting the work. If necessary, modify the plan as required to meet field conditions, and the modifications must be approved prior to use. Install shoring, sheeting, and bracing where required for the protection of existing natural features and man-made facilities, for the safety of workers and the public, in compliance with EM 385-1-1, and to insure the integrity of the embankment. Design, furnish and install sheet piling, cribbing, bulkheads, bracing, shores or whatever means that may be necessary to support earthen material carrying structures and other improvements, and maintain such piling, cribbing, bulkheads, bracing, shores in position until they are no longer needed. Do not use shoring, sheeting and bracing in lieu of the required excavation slopes. Design and properly install shoring, sheeting, and bracing to withstand anticipated loads. Remove all shoring, sheeting and bracing as embankment and backfill operations progress so that the backfill is placed directly against the undisturbed excavation face. Shoring deemed necessary by the Contracting Officer must remain in place during the backfill operations. Remove shoring in such a manner as not to disturb or damage the completed work or any adjacent property. If any problems are encountered during excavation, stop excavation operation and notify the Contracting Officer.

3.8 DEWATERING AND DIVERSION

Accomplish surface and groundwater control in coordination with the required excavation and embankment construction. Surface and/or groundwater control may necessitate the use of temporary diversion ditches, cofferdams and/or dewatering by the use of pumping. Methods for care of surface water and for controlling the surface and groundwater levels will be subject to approval of the Contracting Officer. Borrow pits must be drained and kept dry during excavation, as excavation will not be permitted in water nor will excavated material be scraped, dragged or otherwise moved through water. Drain borrow areas by ditching, sump pumping, or other approved methods. Drain borrow areas excavated under this contract and flooded from rains or high river stages and allow to dry as quickly as practicable after the high river stage has passed.

Minimize surface runoff from entering the work areas. Complete the necessary ditching or earthwork shaping at the end of each workday or as necessary to prevent surface runoff from entering the work area. Drain excess precipitation that collects in the work areas and allow to dry as quickly as practicable before work resumes.
3.9 EXCAVATION

Excavation will consist of removal of material in preparing the foundations to the lines and grades shown on the drawings, removal of material from ditches and channels to the lines and grades shown on the drawings, removal of objectionable materials and obtaining required fill materials from the borrow areas. [Blasting will [not] be permitted.] Over excavation will be backfilled to grade with satisfactory material and compacted to a density of at least that of the surrounding material. Backfill and compact excavation beyond the lines shown on the plans in accordance with adjacent materials as directed.

3.9.1 Inspection Trench

Excavate an inspection trench and maintain free of standing water to the dimensions and locations shown on the drawings or as indicated by the Contracting Officer. Excavate the trench at least [_____] meters feet in advance of but not more than [_____] meters feet in advance of construction. When the inspection trench excavation is complete, notify the Contracting Officer's representative in order to examine the foundation stratigraphy in the side walls and bottom of the inspection trench.

3.9.2 Structures

Provide excavations for structures conforming to the dimensions and elevations indicated for each structure and footing, except as specified hereinafter, and include trenching for utility and foundation drainage systems to a point [_____] meters feet beyond each structure and all work incidental thereto [except where the concrete for walls and footings is authorized to be deposited directly against excavated surfaces]. Excavation must extend a sufficient distance from walls and footings to allow for placing and removal of forms. Replace satisfactory material removed below the depths indicated without specific direction of the Contracting Officer at no additional cost to the Government and fill in accordance with paragraph OVER EXCAVATION above. [Backfill over excavation below required invert elevations or bottoms of footings with concrete at no additional cost to the Government. Do not construct footings on unsatisfactory material as determined by the Contracting Officer.] [Remove and replace excessively wet and/or soft material in subgrades resulting from water ponding in footing excavations with [lean concrete] [satisfactory material compacted to the density of the surrounding undisturbed material]].

3.9.3 Channels

Excavate channels at the locations and to the lines and grades shown on the drawings and in accordance with paragraph TOLERANCES.

3.9.4 Ditches

Excavate drainage ditches at the locations and to the lines and grades shown on the drawings and in accordance with paragraph TOLERANCES.

3.9.5 Slopes and Surcharges

Temporary excavation slopes for any channel, structure excavation, or other required excavation must not be steeper than the specified finished slope or the specified construction slope. Any field deviations from this provision must be approved by the Contracting Officer. Temporary slopes
must be benched such that the average slope is not steeper than the specified slope. In addition, do not surcharge temporary, permanent, or construction slope with excavated or stockpiled material or with heavy construction equipment which would have the same effect as the surcharge material. Maintain the toe of stockpiled material a minimum distance back from the top of the finished excavation equal to the depth of the excavation. Determine the maximum height of such stockpile without causing instability of the excavation slope and provide justification for such in the Excavation Plan submittal.

3.9.6 Borrow Areas

Submit a written statement to the Government not later than [_____] days after receipt of Notice to Proceed indicating the Contractor's intention to use the specified Government-furnished borrow area(s), Contractor-furnished borrow area(s), dredged borrow areas, or a combination of these borrow areas.

3.9.6.1 Government-Furnished

Excavate borrow areas to the extent necessary to obtain satisfactory material within the lines and grades as shown on the drawings. When the material necessary for the construction of the embankment and berms cannot be obtained from adjacent borrow areas, obtain it from other Government-furnished borrow areas. [The permissible depth(s) in the borrow areas are indicated on the drawings.] Backfill any excavation below the depths and slopes specified herein or shown on the drawings, at the Contractor's expense, to the specified permissible excavation line, with satisfactory [material(s)] [cohesive material] [or] [other material] as specified by the Contracting Officer to a density of at least that of the surrounding material. Drain borrow areas and keep dry during excavation. In so far as is practicable, do not remove unsatisfactory materials in borrow areas unless otherwise directed by the Contracting Officer.

3.9.6.2 Contractor-Furnished

Proposed borrow areas will be subject to approval by the Contracting Officer. Any borrow sources proposed, accepted and approved by the Contracting Officer must meet all applicable Federal, State and local requirements including written evidence to the Contracting Officer that the Contractor has obtained property rights and access to the material therein. [Proposed sources located within [_____] meters feet landward and [_____] meters feet riverward of the levee between Stations [_____] and [_____] will not be permitted.] No payment will be made for Contractor-furnished borrow areas.

3.9.6.3 Dredged

Dredging operations may be conducted to obtain material for the pervious zones or the random zones subject to the requirements and the conditions specified herein. Dredging operations may be conducted at approved locations in the present stream bed of [_____] or as shown on the drawings. Dredging operations will not be permitted within [_____] meters feet of the levee centerline and no material will be obtained within [_____] meters feet of any revetment, stabilized channel line, bridge pier and/or abutment.
3.9.7 Cut-Off Trenches

Excavate and maintain cutoff trench free of standing water to the dimensions and locations shown on the drawings. Excavate the trench at least [_____] meters feet in advance of but not more than [_____] meters feet of construction.

3.9.8 Existing Levees and Spoil Banks

Remove existing levees and spoil banks as shown on the drawings. In areas where the existing levee is located within the random or berm zone of the levee, incorporate it into the embankment. Remove portions of existing embankments which lie within the impervious zone of the levee. Utilize existing levees located within the rights-of-way landward of the levee and berms to be constructed, as borrow material, but only after equal protection has been provided by construction of the new levee. When excavated for borrow material, remove the existing levee to the adjacent ground surface in a uniform manner, and shape to maintain drainage in accordance with the adjacent natural drainage pattern. [When lower levels of flood protection would be caused by levee construction provide the Contracting Officer a plan to maintain existing levels of protection during the construction period.]

3.9.9 Toe Drains

Excavate toe drains to the dimensions and the locations indicated on the drawings.

3.9.10 Utilities

Shape excavations for pipe beds to fit the contour of the pipe over a width of not less than 0.6 of the pipe diameter, or as shown on the drawings.

3.9.11 Rock

Clean rock and other hard foundation materials of loose debris and cut to a firm surface, either level, stepped, or serrated, as shown on the drawings. Remove loose disintegrated rock and thin strata. Rock excavation will not be measured for payment. [Rock excavation will not be paid for as a separate bid item.]

3.9.12 Riprap and Bedding

Perform excavations for riprap and bedding at the locations and to the lines and grades shown.

3.10 TOLERANCES

Allow a tolerance of [_____] mm inches above or below the prescribed grade in the excavation for channels, ditches, inspection trenches, cutoff trenches, excavations for riprap and bedding, and mandatory borrow areas. Allow a tolerance of [_____] mm inches below the prescribed grade in the excavation for all other borrow areas.

Construct all embankments and backfills to the grades, lines, and cross-sections shown on the drawings. At all points a tolerance of [100] [_____] mm [4] [_____] inches above or below the prescribed grade will be permitted in the final dressing, provided that any excess material is so distributed that the crown of the levee drains and that there are no abrupt cuts.
humps or depressions in any surfaces. For topsoil, a tolerance of [_____] mm inches above the thickness as shown on the drawings will be permitted.

3.11 SLIDES

In case sliding or slope failure occurs in any part of the excavations prescribed in this section after they have been excavated, but prior to final acceptance of all work under the contract, repair the slide or slope failure as directed by the Contracting Officer. In case the slide or slope failure is caused through the fault or negligence of the Contractor, repair at no cost to the Government.

3.12 TRAVERSES

Leave traverses unexcavated between borrow areas at the locations [and to the cross sections] shown on the drawings. [ Provide traverses with minimum top widths of [_____] meters feet with side slopes no steeper than 1 on 3 or as shown on the drawings.]

3.13 STOCKPILES

Provisions of paragraph SLOPES AND SURCHARGES are applicable to all stockpiled materials. Upon completion of construction operations, remove and dispose of all remaining stockpiled material by the disposal methods specified in paragraph DISPOSITION OF EXCAVATED MATERIALS.

3.14 SURFACE DRAINAGE OF COMPLETED AREAS

Grade the areas shown on the drawings designated as "GRADE FOR SURFACE DRAINAGE", the borrow areas, and the finished embankment areas to the lines and grades shown on the drawings. Provide surface that is free from sharp ridges, gullies, potholes, sinkholes, and any other surface irregularities. A tolerance of [_____] mm inches above or below the prescribed grade will be allowed provided that the surface drains in the direction as indicated on the drawings.

3.15 MAINTENANCE OF WORK

3.15.1 Debris Removal

Maintain all ditch and channel excavations free from leaves, brush, sticks, trash, and other debris until final acceptance of all work under the contract at no additional cost to the Government.

3.15.2 Sediment Removal

Prior to final acceptance of all work under this contract, remove sediments from ditch or channel excavations to restore design grade and section at no additional cost to the Government.

3.16 DISPOSITION OF EXCAVATED MATERIALS

3.16.1 Satisfactory Materials

Incorporate satisfactory excavated material in the appropriate zones of the embankment. Provide satisfactory material consisting of material as defined in paragraph DEFINITIONS, subparagraph SATISFACTORY MATERIALS. When direct placement is not practicable, satisfactory material from the excavation [may] [must] be stockpiled for subsequent use in parts of the
work for which it is specified herein and/or as indicated on the drawings. Dispose satisfactory materials in excess of the quantity necessary to construct backfills and embankments as specified for unsatisfactory materials.

3.16.2 Unsatisfactory Materials

Unsatisfactory materials will be as defined in paragraph DEFINITIONS, subparagraph UNSATISFACTORY MATERIALS. Permanently dispose unsatisfactory materials from the excavations prescribed in this section by [removal from the site to a Contractor-furnished disposal area] [placing in the disposal area shown on the drawings] [placing in abandoned portions of the borrow areas]. [Shape the material so that its surface is free from abrupt changes in grade and slope to drain.] [No additional payment will be made for Contractor-furnished disposal areas] [placing in abandoned portions of the borrow areas]. [Shape the material so that its surface is free from abrupt changes in grade and slope to drain.] [No additional payment will be made for Contractor-furnished disposal areas.]

3.17 PREPARATION OF FOUNDATION, PARTIAL FILL SURFACES AND ABUTMENTS

**************************************************************************
NOTE: If Section 31 66 10 ROCK FOUNDATION PREPARATION is to be used, the following sections may be deleted or modified as appropriate.
**************************************************************************

3.17.1 Earth

**************************************************************************
NOTE: Modify and or add to this paragraph to be compatible with the embankment construction procedures. If uncompacted or semicompacted fill is being utilized major modifications may be required.
**************************************************************************

After excavation (as described in paragraph EXCAVATION) or stripping (as described in paragraph CLEARING, GRUBBING AND STRIPPING) of the embankment foundation [and excavation of the [cut-off trench] [inspection trench]] to the extent indicated or otherwise required, break down the sides of stump holes, test pits, and other similar cavities or depressions to flatten out the slopes, and scarify the sides of the cut or hole to provide bond between the foundation material and the fill. [Scarify the slopes and bottom of the cut-off trench as directed.] Perform all scarifying and breaking of ground surface parallel to the centerline of the levee. Unless otherwise directed, fill each depression with the same material type that is to be placed immediately above the foundation. Place the fill in layers, moistened, and compacted in accordance with the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION for the specific material type. Compact materials which cannot be compacted by roller equipment because of inadequate clearances with power tampers in accordance with the paragraph COMPACTION for the specific material type.

After filling of depressions [and cut-off trench] and immediately prior to placement of compacted fill in any section of the embankment, thoroughly loosen the foundation of such section by scarifying, plowing, discing or harrowing to a minimum depth of [_____] [150] mm [_____] [6] inches, and adjust the moisture content to the amount specified in paragraph MOISTURE CONTROL for the appropriate type of material. [After removal of roots or
other debris turned up in the process of loosening, compact the entire surface of the embankment foundation area by [____] complete coverages of the compaction equipment as specified for the appropriate type of fill.] Immediately prior to placement of compacted fill on or against the surfaces of any partial fill section, remove all soft or loose material, all material containing cracks or gullies, and all material that does not conform with the specified zoning of the embankment. Loosen the remaining surface of the partial fill by scarifying, plowing, discing or harrowing to a minimum depth of [____] mm [____] inches, and adjust the moisture content as specified in paragraph MOISTURE CONTROL for the appropriate type of material. Compact the surface of the partial fill section upon which fill is to be placed as specified for the appropriate type of fill. No separate payment will be made for loosening and rolling the foundation area, the abutment area, or the surfaces of partial fill sections, but the entire cost thereof will be included in the applicable contract price for fill.

3.17.2  Rock Foundation

Excavate all rock surfaces upon which or against which embankment materials are to be placed (as described in paragraph EXCAVATION) or strip (as described in paragraph CLEARING, GRUBBING AND STRIPPING).

Prior to the placement of embankment material upon or against a rock surface, fill all open joints and cracks in that surface with mortar to the depths cleaned. Fill those portions of such rock surfaces where, in the opinion of the Contracting Officer, the compaction of the embankment materials cannot be accomplished satisfactorily with power tampers or other specified compaction equipment, with mortar or concrete as directed to the extent necessary to permit satisfactory use of the compaction equipment. Do not leave a thin coat of mortar on smooth, intact rock surfaces[ as shown on Drawing No. _____ Foundation Preparation and Treatment]. Remove large rock overhangs and protrusions and lay back rock surfaces to a slope no steeper than 4V on 1H by the use of pre-splitting or line drilling techniques in such a manner as to minimize damage to the underlying rock, or fill the spaces beneath overhangs and around protrusions with tamped concrete so that satisfactory compaction of embankment materials can be accomplished. Rock surfaces must not be more than 0.67 m 2 feet in height, and provide benches of sufficient width as necessary so that the average slope of any rock face is not steeper than [____]V on [____]H. Mortar and concrete, including forming as necessary, must conform with the applicable provisions of Section [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE] [____]..

3.17.3  [Benching

Benching into existing levee embankment and abutments is required in order to place and compact the material in horizontal layers. The vertical face cut into the existing embankment or abutment resulting from the benching operation must be a minimum of [____] mm inches in height but can not exceed [____] mm inches in height.]

3.17.4  [Preloading

*********************************************************************************************
NOTE: Insert applicable language for preloading as required. Identify the extent of the area over which preloading will be required by designating the stationing along the centerline of the levee.

SECTION 35 41 00  Page 38
Indicate the length of time the preload will be left in place or define the settlement conditions which must occur before construction in the preloaded area can proceed. Address whether or not the preload embankment will become part of the permanent levee.

Preloading of the levee foundation will be required between Station [____] and Station [____]. The preload embankment will be constructed to the cross section shown on the drawings for the applicable location. No additional construction is permitted after completion of the construction of the preload embankment in the preloaded areas [for [____] days] [until the required settlement has occurred].

3.17.5 [Settlement of Foundation]

NOTE: Modify the following as necessary for determining foundation settlement, which may be achieved by installing settlement gages.

The Contractor [must] [may elect to] furnish and install settlement gages, at the settlement measurement locations shown on the plans, for determination of settlement of the foundation during construction within the settlement measurement ranges shown on the drawings. [Locate each settlement measurement location on the prepared foundation at a point directly under the crown of the planned levee section prior to placing of fill material. Level gage beds by removing the minimum amount of earth necessary to produce an even foundation and in such manner that the density of gage beds will remain at the same density as the undisturbed adjacent ground. Leveling of gage beds by the addition of fill will not be permitted. Maintain gages and extend, if necessary, during the construction. The type and arrangement of the gages are as shown on the drawings. Make such measurements and determine such elevations on the gages prior to the placing of fill material and again within 72 hours [or longer] after final cross sections have been taken over the completed embankment at the locations of the gages.] [Perform a cross section at the settlement measurement location prior to the placing of fill material to establish the elevation of the foundation/embankment interface.] Settlement measurements will be [verified] [subject to verification] by the Contracting Officer.

3.18 TEST FILL STRIPS

NOTE: Test strips are needed when the volume of the project is large, the compaction requirement will be obtained by specifying the type of compaction equipment and the number of passes on each lift (i.e. a method or procedure specification is being utilized) and there is not sufficient information on the compaction characteristics of the proposed fill materials and equipment to be used for the project. On projects where the levees are small (no greater than 5 meters 15 feet high) and on levee raising projects where fill placement zones are narrow (3.3 meters 10 feet), some of the larger compaction equipment specified herein (such as 50-ton rubber
tired roller and some tamping rollers) are not appropriate. Consistently Contractors propose using smaller equipment with shorter tamping feet. Test fills, therefore, may also be an appropriate means of evaluating performance and setting placement and compaction criteria to assure satisfactory result.

3.18.1 [General]

Before beginning embankment construction, construct test strip(s) for [_____] fill materials to demonstrate that the equipment and compaction procedure will achieve the moisture density relationship as specified. The test strips may be incorporated as part of the final embankment, if the fills meet the requirements of the specifications. Construct the test strips using materials from the borrow sources which have been approved by the Contracting Officer. Perform a test strip for each of the following type of fill materials [______]. Each test strip shall be of sufficient size to allow compaction equipment to achieve normal operating speed over a [_____] meter [_____] foot length. The test strip must be a minimum of two (2) times wider than the compaction equipment. Construct each test strip with a minimum of 4 lifts. Prior to the construction of the test strips, proof roll the foundation (subgrade) as specified in paragraph [_____] and install [a][an] 200 mm 8 inch thick subbase layer. Provide a subbase layer consisting of the same material to be used in the test strip and spread and compact to the same requirements. Construct the test strips in accordance with the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION for the specific material type. Place and spread the fill material in layers in accordance with the applicable provisions of paragraphs PLACEMENT AND SPREADING for the specific material type. Compact each layer of the fill with a minimum of four (4) complete coverages using the specified compaction equipment, and as many additional coverages as may be required to achieve the specified density. Even if the results from the test strips show that the required densities can be obtained with less than four coverages by the compaction equipment, compaction of the impervious and random fills with a minimum of (4) complete coverages is still required. If the use of the proposed compaction equipment causes shearing of the fill, laminations in the fill, or results in inadequate compaction, the Contracting Officer may direct that such roller be removed from the fill and that another appropriate tamping roller be used.]

3.18.2 Testing and Reporting Requirements for Test Strips

Prior to construction of the test strips, perform [_____] laboratory compaction test[s] for each type of material used in test strips. Perform compaction tests in accordance with the requirements specified in paragraph MATERIALS TESTING. Submit test results to the Contracting Officer before construction of the test strips. After placement and spreading of the fill in the test strip, but prior to compaction, obtain five samples from each lift for moisture content determination in accordance with ASTM D2216. Use nuclear density testing equipment in accordance with ASTM D6938. In addition, the following condition applies:

a. Prior to using the nuclear density testing equipment on the site, submit to the Contracting Officer a certification that the operator has completed a training course approved by the nuclear density testing equipment manufacturer[, the most recent data sheet from the manufacturer's calibration, and a copy of the most recent statistical
check of the standard count precision.

b. Provide nuclear density testing equipment capable of extending a probe a minimum of 150 mm 6 inches down into a hole.]

After compaction of the fill, perform a minimum of [_____] [5] in-place nuclear density and moisture content tests (in accordance with ASTM D6938) and one (1) sand cone density test (in accordance with ASTM D1556/D1556M) on each lift. Obtain one sample from each test strip for classification testing as specified in paragraph MATERIALS TESTING. All testing and sampling locations will be determined by the Contracting Officer. The Contractor's QC personnel will monitor and document construction and testing of the test strips. Documentation must include weather conditions, soil type, spreading and compaction equipment type, lift thickness, number of coverages, moisture content, dry density, and a plan showing approximate location of sampling and testing. Provide documentation of the test strip construction procedures and results of all testing to the Contracting Officer. Do not commence full scale embankment construction until the equipment and placement methods are approved by the Contracting Officer.

3.19 PLACEMENT AND SPREADING

3.19.1 General

[Prior to beginning embankment placement on the levee foundation, notify the Government that the foundation is ready to receive fill.] [ Do not place fill on any part of the embankment foundation until such areas have been inspected and given final approval in writing by the Contracting Officer.]

3.19.1.1 Gradation and Distribution

The gradation and distribution of materials throughout each zone of the levee must be such that the embankment will be free from lenses, pockets, streaks, and layers of material differing substantially in texture or gradation from surrounding material of the same class. If lenses, pockets, or layers of materials differing substantially in texture or gradation from surrounding material occur in the spread material, mix the layer by harrowing or any other approved method to blend the materials. During the placing and spreading process, maintain at all times a force of workers adequate to remove all roots, debris, and oversize stone from all embankment materials. Remove all stones and rock fragments larger than [2/3 of the placement lift thickness measured by the greatest dimension] [75 mm 3 inches in any dimension] [at the source prior to hauling to] [from] the fill. Do not place fill upon a frozen surface, nor incorporate snow, ice, or frozen earth in the embankment.

3.19.1.2 Foundations and Partial Embankment Fills

Keep the foundations and all partial embankment receiving fills thoroughly drained. Placing operations will be such as to avoid mixing of materials from adjacent sections as much as practicable.

3.19.1.3 Equipment Traffic

Route equipment traffic on any embankment zone to distribute the compactive effort as much as practicable. Ruts formed in the surface of any layer of spread material will be filled before that material is compacted. If, in the opinion of the Contracting officer, the compacted surface of any layer
of material is too smooth to bond properly with the succeeding layer, loosen the surface by scarifying or other approved methods before material from the succeeding layer is placed.

3.19.2 Placement on Surfaces Containing Frozen Materials

Do not place embankment on a foundation which contains frozen material, [or which has been subjected to freeze-thaw action]. This prohibition encompasses all foundation types, including the natural ground, all prepared subgrades (whether in an excavation or on an embankment, and all layers of previously placed and compacted earth fill which become the foundations for successive layers of earth fill. Remove all material that freezes or has been subjected to freeze-thaw action during the construction work, or during periods of temporary shutdowns, such as, but not limited to nights, holidays, weekends, or winter shutdowns of earthwork operations, to a depth that is acceptable to the Contracting Officer and replace with new material. Alternatively, thaw, dry, rework and recompact the material to the specified criteria before placing additional material. The Contracting Officer will determine when placement of fill must cease due to cold weather. The Contracting Officer may elect to use average daily air temperatures, and/or physical observation of the soils for the determination. Levee embankment material must not contain frozen clumps of soil, snow or ice.

3.19.3 Placement of Embankment and Backfill Against Rock

Clean all rock surfaces upon which or against which embankment materials are to be placed in accordance with paragraph PREPARATION OF FOUNDATION, PARTIAL FILL SURFACES AND ABUTMENTS, subparagraph ROCK. In restricted areas where material can not be placed in large lifts with normal spreading and compaction equipment, spread material in lifts not exceeding [_____] mm inches and compact with mechanical hand tampers, vibrating plates, or other approved methods and equipment.

3.19.4 Placement of Embankment and Backfill Against Structures

Do not place embankment or backfill on or against concrete less than [14][7] days after placement or 70 percent of the design strength, without prior approval of the Contracting Officer. Do not use crawler-type tractors, vibratory equipment and other similar compaction equipment within [_____] [1] meter [_____] [4] feet of any completed or partially completed structure. Accomplish compaction within [_____] [1] meter [_____] [4] feet of completed or partially completed structures by the use of mechanical hand tampers, vibrating plates, or other approved methods and equipment. Ensure that compaction operations do not damage any existing utilities. Any damage caused by the Contractor's operation must be repaired at the Contractor's expense.

3.19.5 Select Fill

**************************************************************************

NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected and the following should be substituted into the appropriate paragraphs below. [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not
more than [_____] mm inches in thickness prior to compaction.]

Place and spread select fill material in layers not more than 200 mm 8 inches in uncompacted thickness, except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [150] [_____] mm [6] [_____] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.6 Coarse Drainage Gravel and Filter Sand

3.19.7 Impervious Fill

NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.

Place and spread the impervious fill material in layers not more than [_____] [200] mm [_____] [8] inches in uncompacted thickness, except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [_____] [150] mm [_____] [6] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.8 Pervious Fill

NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.

[Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.9 Random Fill

*********************************************************************************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.

*********************************************************************************************************************************************

Place and spread random fill material in layers not more than [_____] [200] mm [_____] [8] inches in uncompacted thickness, except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [_____] [150] mm [_____] [6] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.10 Random Rock

Place random rock within the limits indicated on the drawings in such a manner as to produce a reasonably well graded mass of stone with a minimum percentage of voids. Place random rock in layers that will will produce a compacted [_____] [600] mm [_____] [24] inch thick layer as shown on the drawings. [Provide sufficient dewatering of the foundation beneath the random rock zone to allow the random rock material to be placed and compacted as specified herein to produce a firm, dense surface upon which to place select earth fill.] Grade the outside slope of the random rock zone to produce a reasonably even surface, within a tolerance of plus or minus [_____] [300] mm [_____] [12] inches measured [vertical] [normal] to the slope from the lines indicated on the drawings, upon which slope protection layers can be placed.

3.19.11 Fine Drainage Gravel Placed Around Structures

Place fine drainage gravel placed for drainage around [_____] structures in horizontal layers not exceeding [_____] mm inches in loose lift thickness, or within [_____] [1] m [_____] [4] feet when hand operated compactors are used. After placing, uniformly spread, moisten or aerate each layer as necessary to obtain the specified moisture content, thoroughly mix and compact as specified. Do not backfill until construction below finish grade has been approved, forms removed, and the excavation cleaned of trash and debris. Use power driven hand operated compactors along the closure structure for compaction within [_____] [0.7] m [_____] [2] feet of concrete structures. Do not place backfill against concrete prior to 7 days after placement. As far as practicable, bring backfill up evenly on each side of the structure and slope to drain away from the structure.
3.19.12 Semicompacted Fill

**************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.
**************************************************************************

The location and extent of the semicompacted fill are as shown on the drawings. Do not place semicompacted fill in water. Place and spread semicompacted fill material in layers not more than [_____] [300] mm [_____] [12] inches in uncompacted thickness, [except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [_____] [150] mm [_____] [6] inches]. Layers must be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction. Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.

3.19.13 Uncompacted Fill

**************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the second bracketed sentence should be selected.
**************************************************************************

Place uncompacted fill in approximately horizontal layers not exceeding [_____] mm inches in thickness. Uniformly spread, distribute, and manipulate the layers during placement such that individual loads of material deposited on the fill will not remain intact, and large, open voids in the fill will be eliminated. Do not place lifts in a manner which causes shrinkage cracks and open voids from developing in previously placed lifts. Layers shall be started full out to the slope stakes and must be carried in lifts approximately horizontal and parallel to the centerline with sufficient crown or slope to provide satisfactory drainage during construction. Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction. Compaction other than that obtained by the controlled movement of the hauling and spreading equipment over the area will not be required. Where material must be placed in water, dump therein until it reaches an elevation [_____] mm foot above the water surface, or until a stable fill surface is obtained before layer construction will be required. The material deposited under water must be placed in such a manner to ensure that any soft material will be forced progressively outward from the section and not be trapped within the base of the embankment. Do not place material containing more than [_____] [15] percent fines passing the No. 200 sieve below the water surface.

3.19.14 Hydraulic Fill

3.19.14.1 Discharge Pipe

At all times when the dredge discharge pipe is being washed out or when the
discharge consists of a high percentage of water with only a minimum amount of solid material being pumped, close all control plates at the bottom openings along the spill-pipe sections of the discharge pipe lines immediately and remain in a closed position until the pumping operation produces a minimum of [10] [_____] percent solid materials in the discharge.

3.19.14.2 Discharge Pipe Outlets

During placement operations of the fill, provide free outlets to conduct discharge water away from the embankment at intervals of not more than [610] [_____] m [2,000] [_____] feet, for 300-mm 12-inch dredges or smaller; [915] [_____] m [3,000] [_____] feet, for 325 to 400 mm 13- to 16-inch dredges; and [1219] [_____] m [4,000] [_____] feet, for dredges over 400 mm 16 inches. The size of dredges are determined by the minimum inside diameter of the discharge pipe. No obstruction to free flow will be permitted in these outlets or at any point in the fill area, between the end of the discharge pipe and the outlet. Construct a retaining dike, transverse to the fill area center line, immediately beyond each outlet and do not breach until the end of the discharge pipe has approached the retaining dike to within 76 m 250 feet, in the case of 300 mm 12-inch dredges or smaller; 114 m 375 feet, in case of 325 to 400 mm 13- to 16-inch dredges; or 152 m 500 feet, in the case of dredges over 400 mm 16 inches.

3.19.14.3 Control of Materials in Hydraulic Construction

In general, distribute the materials in the fill in a way to produce a section of relatively uniform permeability. In order to maintain uniform permeability of the fill, do not place strata and large pockets of gravel, not containing sufficient fines. Whenever they occur promptly blend with finer materials. Take necessary precautions to prevent damage from discharge water or other causes.

3.19.14.4 Rehandling Hydraulic Material

Rehandling of hydraulic material to bring the fill area to required grade and cross section must conform to paragraph [____]. If, in the opinion of the Contracting Officer, the rehandled material is too dry to permit its placement by compacted fill method, then the soil placement must conform to paragraph [____].

3.20 MOISTURE CONTROL

3.20.1 General

The materials in each layer of the fill must contain the amount of moisture, within the limits specified below or as directed by the Contracting Officer, necessary to obtain the required compaction. Rework material that is not within the specified moisture content limits after compaction to obtain the specified moisture content, regardless of density.

3.20.1.1 Insufficient Moisture for Suitable Bond

If the top or contact surfaces of a partial fill section become too dry to permit suitable bond between these surfaces and the additional fill to be placed thereon, loosen the dried materials by scarifying or discing to such depths as may be directed by the Contracting Officer, dampen the loosened material to an acceptable moisture content, and compact this layer in accordance with the applicable requirements of paragraph COMPACTION.
3.20.1.2 Excessive Moisture for Suitable Bond

If the top or contact surfaces of a partial fill section become too wet to permit suitable bond between these surfaces and the additional fill to be placed thereon, scarify and dry the wet material, assisted by discing or harrowing, if necessary, to such depths as may be directed by the Contracting Officer. Dry the material to an acceptable moisture content, and compact in accordance with the applicable requirements of paragraph COMPACTION.

3.20.1.3 Drying Wet Material

Material that is too wet must be spread on the embankment and permitted to dry, [be dried in the borrow area prior to bringing to the levee embankment] be assisted by discing or harrowing, if necessary, until the moisture content is reduced to an amount within the specified limits.

3.20.1.4 Increasing Moisture in Dry Material

The moisture content of material that is too dry, will be adjusted on the levee embankment, [will be adjusted in the borrow area prior to bringing to the levee embankment]. Add water to the fill material and by harrowing, or other approved methods, work the moisture into the material until a uniform distribution of moisture within the specified limits is obtained. Control the amount of water applied on a layer of fill on the levee embankment so that free water will not appear on the surface during or subsequent to rolling. Should too much water be added to any part of the embankment, delay the rolling on that section of the embankment until the moisture content of the materials is reduced to an amount within the specified limits. If it is impracticable to obtain the specified moisture content by wetting or drying the material on the fill, the Contractor may be required to pre-wet or dry back the material at the source of excavation or in the borrow area.

3.20.2 Select Fill

The moisture content after compaction must be within the limits of [_____] percentage points above optimum to [_____] percentage point below optimum moisture content as determined by ASTM D698.

3.20.3 Impervious Fill

The moisture content after compaction must be within the limits of [2] [_____] percentage points above optimum to [2] [_____] percentage point below optimum moisture content as determined by ASTM D698.

3.20.4 Pervious Fill

*************************************************************************
NOTE: Saturation of the pervious fill may not be appropriate if the fill is placed in a zone or area (trenches, etc.) which can not readily drain.
*************************************************************************

Place, work and compact each layer of material in a saturated condition.

3.20.5 Random Fill

*************************************************************************
NOTE: The moisture control of random earth must be conformed to the requirements of the material type it most closely approximates in behavior.

[The moisture content after compaction must be within the limits of [_____] percentage points above optimum to [_____] percentage point below optimum moisture content as determined by ASTM D698.] [The moisture content must be that which will facilitate obtaining the specified compaction.]

3.20.6 Coarse Drainage Gravel and Filter Sand

Control the moisture content such that hauling, spreading, and compacting equipment can operate with normal procedure without excessive rutting of the fill. If the material is too wet or too dry to facilitate proper compaction, wet or dry the coarse drainage gravel or filter sand as required by the procedures specified in paragraph [______].

3.20.7 Fine Drainage Gravel

Place, work, and compact fine drainage gravel in a saturated condition. The moisture content after compaction must be as uniform as practicable throughout any one layer of fine drainage gravel.

3.20.8 Semicompacted Fill

[Place semicompacted fill within plus or minus [_____] percent of optimum moisture content.] [Semicompacted fill will be placed at their in situ moisture content.] [Control the moisture content of semicompacted fill such that hauling, spreading, and compacting equipment can operate with normal procedure without excessive rutting of the fill.] [The moisture content must be that which will facilitate obtaining the specified compaction.]

3.20.9 Uncompacted Fill

Uncompacted fill will be placed at their in situ water content. [Control the moisture content such that hauling, spreading, and compacting equipment can operate with normal procedure without excessive rutting of the fill.]

3.20.10 Hydraulic Fill

No moisture control is required for Hydraulic Fill.

3.21 COMPACTION

**************************************************************************

NOTE: The designer should edit the following paragraphs to account for the use of either an end product specification (i.e., the Contractor is required to obtain a specified degree of compaction) or a method specification (i.e., when the Contractor is required to compact the embankment by a specified number of coverages of a specified/approved roller and is not responsible for the obtained degree of compaction). If the method specification is used and the required degree of compaction is not achieved within the specified number of passes using the specified compaction equipment, the Contractor.
should be paid for additional rolling for compaction under a separate bid item as specified in paragraph ADDITIONAL ROLLING FOR COMPACTION.

**************************************************************************

3.21.1 Compaction Equipment

**************************************************************************

NOTE: If an end-product (production) specification is to be used, the following paragraphs may not be necessary at the judgment of the designer and specification writer.

With reference to the use of compaction equipment in this paragraph, the following precautions should be noted:

1. Specifications should be written to ensure that the type of compaction equipment will be used is best suited to obtain the desired compaction of the material being used. When the size of the contract can justify the costs a requirement should be included in the specifications for the performance evaluation of each type of compaction equipment conforming with the specifications and intended for use by the Contractor at an early stage of embankment construction. This equipment evaluation should be accomplished through analysis of test fill areas that are carefully constructed under representative working conditions with materials and moisture contents as specified. Test fill areas may either be separate or part of the permanent work, and for clarity to prospective bidders, payment under a separate item is recommended to equitably cover costs of required variations in equipment coverages, possible changes in equipment loading or foot sizes, as well as intensified field soils testing. The following paragraphs are provided to serve as examples of the information that should be included within the specifications.

2. For tamping rollers that are either towed or self-propelled, with drums capable of being ballasted with fluid, the provision for a pressure relief valve and safety head is optional, and should be included at the discretion of the designer based on local experience and practice. Over-pressurization of fluid ballasted compaction drums to the level of a safety hazard has been rare, but has occurred on several occasions at locations of high elevation and temperature.

3. In compacting materials consisting of shales, sandstones, weathered rock and similar random materials, consideration should be given to specifying sheepfoot-type tamping equipment that has been modified by replacing the standard feet with "chisel" point tamper feet generally referred to as "shale breakers". The end areas of these modified
tamp feet range from 650 to 1000 square mm 1 to 1-1/2 square inches and tend to break up weathered rock to prevent the bridging effect sometimes created by large rock particles.

4. For compaction of sand and gravel fills or filter and drainage layers, equipment characteristics for both a large and small vibratory roller have been provided for optional selection by the designer, depending upon location, selected lift thickness, gradation, grain shape, and durability properties of the materials. The smaller roller, which utilizes an upper limit of 40 kN/m 9000 lbs. per foot of drum length applied force, should be specified for materials which exhibit degradation under compaction. Other options, based on construction experience may also be exercised. For example, it has been found that improved trafficability can often be achieved when compacting clean, fine grained, uniform sands by specifying a drum driven self-propelled vibratory roller.

Compaction equipment must conform to the following requirements and be used as prescribed in subsequent paragraphs.

3.21.1.1 Tamping Rollers

[3.21.1.1.1 Towed]

Provide tamping rollers consisting of a heavy duty double drum unit, with a drum diameter not less than 1.5 m 60 inches, and an individual drum length of not less than 1.5 m 60 inches. Provide drums that are capable of being ballasted with water or a combination of sand and water. Each drum must have staggered feet uniformly spaced over the cylindrical surface to provide approximately three tamping feet for each 0.19 square meter 2 square feet of drum surface. Provide tamping feet that are 175 to 225 mm 7 to 9 inches in clear projection from the cylindrical surface of the roller and have a face area of not less than 3226 square mm 5 square inches nor more than 4516 square mm 7 square inches. The roller must be equipped with cleaning fingers, designed and attached to prevent the accumulation of material between the tamping feet. Maintain these cleaning fingers at their full length throughout the periods of use of the roller. The weight of the roller must be a minimum of 5200 kg/m 3500 psf of linear drum length weighted, and no more than 2975 kg/m 2000 psf of drum length empty. Yoke the two drums comprising one roller unit such that they will oscillate when traversing uneven surfaces. The design and operation of the tamping roller will be subject to the approval of the Contracting Officer who has the right at any time during the prosecution of the work to direct such repairs to the tamping feet, minor alterations in the roller and variations in the weight as may be found necessary to secure optimum compaction of the earth fill materials. The Contractor may be required to add ballast to the roller to the maximum capacity specified by the manufacturer of the roller. Draw the roller by a crawler-type or a rubber-tired tractor at a speed not to exceed 5.6 km 3.5 miles per hour. Discontinue the use of the rubber-tired tractor if the tires leave ruts that prevent uniform compaction by the tamping roller. If tamping rollers are used in tandem, not more than two rollers in tandem will be permitted and in such case, one trip of the tandem rollers over any surface will be considered as two
passes. When tamping rollers are used in tandem, the tamper foot spacing must be offset so that the circumferential rows on the rear drums are in line with the mid-point of the circumferential rows on the forward drums.

3.21.1.1.2 Self-Propelled

[Conditioned upon satisfactory performance, self-propelled tamping rollers may be used in lieu of tractor-drawn tamping rollers. Self-propelled rollers exceeding the empty weight requirement may be used provided that by the substitution of tamping feet, having a face area not exceeding [_____] [9030 square mm 14 square inches], the nominal foot pressure on the tamping feet of the self-propelled roller can be adjusted to approximate the nominal foot pressure of the towed roller for the particular working condition required for the towed rollers. The tamping feet must be 175 to 225 mm 7 to 9 inches in clear projection from the cylindrical surface of the roller. For self-propelled rollers, in which steering is accomplished through use of rubber-tired wheels, the tire pressure must not exceed [_____] [276 kPa 40 psi]. [Operate self-propelled rollers at a speed not to exceed 5.6 km 3.5 miles per hour.] [Self-propelled tamping rollers may be used in lieu of tractor drawn tamping rollers provided the foot pressure on the tamping feet of the self-propelled roller are approximately the same as the foot pressure on the towed roller.] For self-propelled rollers steered with rubber-tired wheels, the tire pressure must not exceed [_____] [276 kPa 40 psi]. Operate self-propelled rollers at speeds not exceeding 5.6 km 3.5 miles per hour. The Contracting Officer has the authority to limit or eliminate the use of self-propelled rollers if they are found to cause shearing or laminations of the compacted fill.]

3.21.1.2 Vibratory Rollers

Equip vibratory rollers for compacting rock fills, pervious sand and gravel fills, or filter and transition drainage layers with a smooth steel compaction drum and operate at a frequency of vibration during compaction operations between 1100 and 1500 vpm. Vibratory rollers may be either towed or self-propelled with an unsprung drum weight that is a minimum of 60 percent of the rollers' static weight. Towed rollers must have at least 90 percent of their weight transmitted to the ground through the compaction drum when the roller is standing in a level position hitched to the towing vehicle. Rollers for compacting rockfill, [sand and gravel fills, or filter and drainage layers] must have a minimum static weight of 90 kN 20,000 pounds, a minimum dynamic force of 180 kN 40,000 pounds when operating at 1400 vpm, and an applied force not less than 130 kN/m 9,000 pounds per foot of compaction drum length.[ Rollers for compacting sand and gravel fills or filter and drainage layers must have a minimum static weight of 36 kN 8,000 pounds, a minimum dynamic force of 71 kN 16,000 pounds when operating at 1400 vpm, and an applied force not less than 22 kN 5,000 pounds nor greater than 130 kN/m 9,000 pounds per foot of compaction drum length.] The level of amplitude and vibration frequency during compaction will be maintained uniform throughout the embankment zone within which it is operating. Operate rollers at speeds not to exceed 2.4 km/h 1.5 mph. The equipment manufacturer must furnish sufficient data, drawings, and computation for verification of the above specifications, and the character and efficiency of this equipment will be subject to approval.

3.21.1.3 Rubber-tired Rollers

Provide rubber-tired rollers that have a minimum of four wheels equipped with pneumatic tires. The tires must be of such size and ply as to be capable of being operated at tire pressures between 550 and 690 kPa 80 and
100 psi at an 11,340 kg 25,000 pound wheel load. The roller wheels must be
distributed abreast and designed so that each wheel will carry approximately
equal load in traversing uneven ground. The spacing of the wheels must be
such that the distance between the nearest edges of adjacent tires will not
be greater than 50 percent of the rated tire width of a single tire at the
operating pressure for an 11,340 kg 25,000 pound wheel load. The roller
must have a body suitable for ballast loading such that the load per wheel
may be varied, as directed by the Contracting Officer, from 8,165 to 11,340
kg 18,000 to 25,000 pounds. Tow the roller at a speed not to exceed 8 km 5
miles per hour. The character and efficiency of this equipment will be
subject to the approval of the Contracting Officer.

3.21.1.4 Hand Operated Compactors

Perform compaction of material, in areas where it is impracticable to use a
roller or tractor compaction, using approved hand operated power compactors.

3.21.1.4.1 Power Tampers

Power tampers must be hand operated equipment capable of compacting
material in confined areas. Provide compactors that are either an internal
combustion or pneumatic activated tamper. Tampers must have sufficient
weight and striking power to produce the specified compaction. The
character and efficiency of this equipment will be subject to the approval
of the Contracting Officer.

3.21.1.4.2 Vibratory Plate Compactor

Vibratory compactors operated by hand in confined areas must utilize the
oscillating cam principal and must deliver an impact of not less than 9 kN
2000 lbf at a rate of approximately 2000 impulses per minute. The
character and efficiency of this equipment will be subject to the approval
of the Contracting Officer.

3.21.1.5 Crawler-type Tractors

Crawler-type tractors used for spreading or compaction must have a minimum
weight of [_____] [9,070] kg [_____] [20,000] pounds, exert a minimum unit
tread pressure of [_____] [41.4] kPa [_____] [6] psi, and operate at a
maximum speed of [_____] [5.6] km [_____] [3.5] miles per hour.

3.21.1.6 Sprinkling Equipment

Provide sprinkling equipment consisting of tank trucks, pressure
distributors or other equipment designed to apply water uniformly and in
controlled quantities to variable width of surface.

3.21.1.7 Miscellaneous Equipment

Provide scarifiers, disks, spring-tooth or spike-tooth harrows, spreaders,
and other equipment that is suitable for use in embankment construction and
approved by the Contracting Officer. Equipment used for blending fill
material must be capable of penetrating the full loose lift thickness of
the specific material type.

3.21.2 Compaction of Select Fill

**************************************************************************

NOTE: Experience indicates that by the time the
surface lift has been laid down, sufficient compactive effort has occurred due to hauling and spreading equipment such that one, two, or even three passes of a heavy disk plow is not sufficient for penetrating the full depth of lift. A harrow equipped with closely spaced spikes (teeth) has been found to effectively penetrate the semi-compacted surface lift in one pass, but this type of device has minimal ability to blend and mix the fill material. It was found that a suitably designed spiked-tooth harrow working in combination with a heavy disk plow can reliably produce the desired result. This note applies to all types of fill placement for which moisture and blending are required.

After a layer of material has been dumped and spread, harrow it to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. When the moisture content and the condition of the layer are satisfactory, compact the lift [to a minimum of [95] [_____] percent of the maximum dry density as determined by the Contractor in accordance with ASTM D698] [with not less than [six] [_____] complete coverages of an approved tamping roller or [four] [_____] complete coverages of an approved 45 metric ton 50-ton rubber-tired roller traversing in a direction parallel to the axis of the levee]. In areas which are not accessible by roller, place the fill in layers not more than 100 mm 4 inches in uncompacted depth and compact with an approved hand-operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.

3.21.3 Compaction of Random Fill

NOTE: Random fill must be compacted in accordance with the requirements of the material type it most closely approximates in behavior.

After a layer of material has been dumped and spread, harrow it to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer.[ If one pass of the harrow does not accomplish the breaking up and blending of the materials, additional passes of the harrow are required, but in no case will more than [_____] [three] passes of the harrow on any one layer be required for this purpose.] When the moisture content and the condition of the layer are satisfactory, compact the lift [to a minimum of [95] [_____] percent of the maximum dry density as determined by the Contractor in accordance with ASTM D698] [with not less than [six] [_____] complete coverages of an approved tamping roller or [four] [_____] complete coverages of an approved 45 metric ton 50-ton rubber-tired roller traversing in a direction parallel to the axis of the levee]. In areas which are not accessible by roller, place the fill in
layers not more than 100 mm 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.

3.21.4 Compaction of Impervious Fill

After a layer of material has been dumped and spread, harrow it to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. If one pass of the harrow does not accomplish the breaking up and blending of the materials, additional passes of the harrow are required, but in no case will more than [_____] [three] passes of the harrow on any one layer be required for this purpose. When the moisture content and the condition of the layer are satisfactory, compact the lift [with not less than [six] [_____] complete coverages of an approved tamping roller traversing in a direction parallel to the axis of the levee]. In areas which are not accessible by roller, place the fill in layers not more than 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] meter [_____] [3] feet.

3.21.5 Compaction of Pervious Fill

After a layer of material has been dumped and spread, harrow it as required to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. If one pass of the harrow does not accomplish the breaking up and blending of the materials, additional passes of the harrow are required, but in no case will more than [_____] [three] passes of the harrow on any one layer be required for this purpose. When the moisture content and the condition of the layer are satisfactory, compact the lift to a [minimum] [80] [_____] percent relative density in accordance with ASTM D4253 and ASTM D4254 [with not less than [six] [_____] complete coverages of an approved vibratory roller]. In areas which are not accessible by roller, place the fill in layers not more than 100 mm 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.

3.21.6 Compaction of Random Rock

After the random rock has been placed and spread to the thickness specified herein, and oversized rock has been removed or broken down, compact by not less than [_____] [3-6] complete coverages of the specified [crawler
tractor] [vibratory roller]. [ Each coverage of the tractor must consist of sufficient trips to provide complete coverage of the area by the treads of the tractor. The tractor coverages specified are in addition to spreading operations.] [Operate the vibratory roller such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.]

3.21.7 Compaction of Semicompacted Fill

After a layer of material has been dumped and spread, harrow it as required to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. When the moisture content and the condition of the layer are satisfactory, compact the new layer of fill by the controlled movement of the hauling equipment over the area of the fill. Equipment will be routed so as to prevent excessive rutting of the fill surface. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously.

3.21.8 Compaction of Uncompacted Fill

No compaction other than that obtained by the controlled movement of the hauling equipment over the area of the fill is required. Route equipment to prevent excessive rutting of the fill surface.

3.21.9 Compaction of Hydraulic Fill

Hydraulic fill will be compacted as uncompacted fill. If the rehandled hydraulic fill is too dry to permit its placement by uncompacted full method, then compact the fill material using the method specified in paragraph [_____] [COMPACTION OF SEMICOMPACTED FILL].

3.21.10 Compaction of Random Fill Within the MSE Walls

Place and compact random earth fill within the limits of the Mechanically Stabilized Earth (MSE) walls in accordance with [the vendor's requirements, subject to the approval of the Contracting Officer] [requirements specified in Section [____]].

3.21.11 Compaction of Coarse Drainage Gravel and Filter Sand

Place coarse drainage gravel placed in the drains in maximum [_____] [300] mm [_____] [12] inch loose lifts and compact by not less than four (4) complete coverages with a [static] [vibratory] roller. Compact each lift of gravel within confined spaces which is not accessible to rollers by at least [_____] [3] complete coverages with a vibratory plate compactor [and as many additional coverages as necessary to achieve the same density obtained with full-size compaction equipment]. Compact filter sand placed along the existing rock fill in accordance with the requirements for the adjacent select earth fill material.

3.21.12 Compaction of Fine Drainage Gravel

Place fine drainage gravel placed in the drains in maximum [_____] [300] mm [_____] [12] inch loose lifts and compact by not less than four (4) complete coverages with a [static] [vibratory] roller. Compact each lift of gravel within confined spaces which is not accessible to rollers by at least three [_____] [3] complete coverages with a vibratory plate compactor.
[and as many additional coverages as necessary to achieve the same density obtained with full-size compaction equipment].

3.21.13 Compaction Adjacent to Structures and Utilities

3.21.14 Additional Rolling for Compaction

**************************************************************************
NOTE: Use the following paragraph only when a method specification is utilized. A bid item for "Additional Rolling for Compaction" should be included in the bid form so that payment can be made. Measurement and payment information should also be added to paragraph [UNIT][LUMP SUM] PRICES or Section 01 20 00 PRICE AND PAYMENT PROCEDURES as applicable.
**************************************************************************

If the Contracting Officer determines that the desired compaction of any portion of the embankment is not achieved by the number of coverages specified, additional complete coverages will be made over the surface area as directed by the Contracting Officer. Payment for additional rolling directed by the Contracting officer will be made in accordance with Bid Item No. [_____] ADDITIONAL ROLLING FOR COMPACTION; however, no payment will be made for additional rolling not specifically directed by the Contracting Officer.

3.21.15 Topsoil

Place topsoil on the embankment surfaces as shown on the contract drawings and as specified in SECTION [32 92 23 SODDING] [____].

3.22 FIELD QUALITY CONTROL

**************************************************************************
NOTE: FAR 46.312 Construction Contracts establishes a requirement for Contractor Quality Control (CQC) in construction contracts and ER 1180-1-6 requires that a CQC section based on Section 01 45 00.00 10 01 45 00.00 2001 45 00.00 40 QUALITY CONTROL be included in contracts of $1,000,000 or more. Use of Section 01 45 00.00 1001 45 00.00 2001 45 00.00 40 for contracts of less than $1,000,000 is discretionary. This part of the specifications must be consistent with the CQC section.
**************************************************************************

Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of mica, halloysite, some other chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density. The chemical composition and "non-free" water of the sample may also dramatically (sometimes over 10 percent) affect the measurement.
of moisture content (see the paragraph entitled "Interferences" in ASTM D2922 and D3017. Also see paragraph 5-10.d.(2). (b). entitled "Nuclear Method" in EM 1110-2-1911). When water content can not be accurately measured using nuclear method, a computer controlled microwave oven system for water content measurement combined with nuclear method for wet density has been successfully used by some districts. Sand Cone or similar field density tests should be performed periodically at the same location as Nuclear Tests to assure nuclear testing is providing accurate information.

**************************************************************************

3.22.1 Clearing, Grubbing, and Stripping

Establish and maintain quality control for clearing, grubbing, and stripping operations to assure compliance with contract requirements, and maintain records of the quality control for all construction operations including but not limited to the items indicated below. Furnish these records, as well as the records of corrective actions taken, to the Government in accordance with Section 01 45 00.00 1001 45 00.00 20 01 45 00.00 40 QUALITY CONTROL.

3.22.1.1 Clearing

Station to station limits, transverse clearing limits from applicable centerline; percentage of area complete; types of materials cleared.

3.22.1.2 Grubbing

Station to station limits, transverse grubbing limits from applicable centerline; percentage of area complete; type of material; filling of grubbed holes.

3.22.1.3 Stripping

Station to station limits, transverse stripping limits from applicable centerline; percentage of area complete; type of material; depth of stripping.

3.22.2 Excavation

Establish and maintain quality control for excavation operations to assure compliance with contract requirements, and maintain records of the Contractor's quality control for all construction operations including but not limited to the following:

a. Equipment; type, size, suitability for the work,
b. Lines, grades and tolerances,
c. Segregation/Disposition of materials,
d. Disposal and/or stockpiling of materials,
e. Unsatisfactory materials,
f. Conditions that may induce seepage or weaken the foundation or
UFGS

embankment,

g. Stability of excavations,
h. Quantity surveys.

Furnish records of inspections and tests, as well as the records of corrective actions taken, to the Government in accordance with Section 01 45 00.00 1001 45 00.00 2001 45 00.00 40 QUALITY CONTROL.

3.22.3 Embankment

3.22.3.1 General

As a part of the Contractor Quality Control (CQC) system required by SECTION 01 45 00.00 1001 45 00.00 2001 45 00.00 40 QUALITY CONTROL, establish and maintain field quality control for foundation preparation, embankment and backfill operations to assure compliance with contract requirements and maintain detailed records of field quality control for all operations including but not limited to the following:

3.22.3.1.1 Earthwork Equipment

Type, size, number of units and suitability for construction of the prescribed work.

3.22.3.1.2 Foundation Preparation

Methods of preparing the foundations in advance of embankment and backfill construction and methods for providing drainage of the foundation and partially completed fills.

3.22.3.1.3 Construction

Layout, maintaining existing drainage, moisture control, thickness of layers, spreading and compacting.

3.22.3.1.4 Grade and Cross Section

Crown width, crown slope, side slopes, and grades.

3.22.3.1.5 Roads and Ramps

Location of temporary roads to fields or buildings, location and placement of fills for ramps in accordance with specified dimensions and grades.

3.22.3.1.6 Grade Tolerances

Check fills to determine if placement conforms to prescribed grade and cross section.

3.22.3.1.7 Slides

Location and limits; methods and equipment used where remedial work has been directed.

3.22.3.1.8 Quantity Surveys

Accuracy and timeliness.
3.22.3.2 Materials Testing

**************************************************************************
NOTE: Types of tests and frequency of testing should be detailed below. Types of tests and frequency of testing will be dependent upon the types of materials utilized, configuration of foundation and embankment, placement and compaction procedures required, moisture control requirements etc. Testing requirements are material type specific rather than embankment fill type specific. It is desirable to present the testing frequency and type in tabular form.
**************************************************************************

Perform sufficient testing to insure that the fill is being constructed as specified. Consider the testing program specified below the minimum acceptable frequency of testing. This does not relieve the Contractor from the responsibility of performing additional testing, if required to ensure compliance with these specifications.

[3.22.3.2.1 Soil Classification Tests]

Perform soil classification tests in accordance with ASTM D2487. Perform one initial classification test for each different classification of material to be utilized as embankment fill or backfill. As prescribed in ASTM D2487, perform grain size analyses in accordance with ASTM D422 and Atterberg limits in accordance with ASTM D4318 on each different classification. Submit additional tests for every [_____] cubic m [20,000 cubic yards] of embankment or backfill material. Perform soil classification tests on foundation material as required to determine the acceptability of the in-situ soils. Additional tests will be required if noticeable changes in the material occur.

[3.22.3.2.2 Cohesive Material Testing]

**************************************************************************
NOTE: Edit the following to comply with the method selected to determine the optimum properties (i.e., density and moisture content, LL, PL, PI).
**************************************************************************

3.22.3.2.2.1 Moisture Density Relationships

Determine the moisture-density relations for each different classification of cohesive material utilized in accordance with [_____] [ASTM D698], [Method A] [Method B] [Method C]. Prior to placing any fill material containing cohesive material, perform a minimum of [_____] five-point compaction test on representative samples of the material to be used as fill.) During fill placement perform a minimum of one additional moisture-density test for every [_____] cubic m [20,000 cubic yard] placed. Additional tests will be required each time a new material is encountered. The moisture-density curves will be compiled to form a family of curves which will be utilized to estimate optimum properties (maximum dry density and optimum moisture content) to be used with field density test.]
3.22.3.2.2 Water (Moisture) Content Tests

Perform determination of water content in accordance with ASTM D2216. [ASTM D4643 may be used when rapid moisture content results are needed. Confirm all rapid results obtained by ASTM D4643 by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern.] One water content test will be performed for each [_____] cubic m cubic yards of material placed [or each lift of material whichever is less]. [These test will be in addition to the water content tests performed in conjunction with in-place density tests.] Retest backfill and fills not meeting the required specifications for water content after corrective measures have been applied.

3.22.3.2.3 In-place Density Testing for Cohesive Materials

**************************************************************************
NOTES: The designer should pick the method or methods of In-place density which are acceptable.
If uncompacted fill is specified density control may not be required.
Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of certain chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density.
When water content can not be accurately measured using nuclear method, a microwave oven system for water content measurement may be used.
**************************************************************************

Determine the in-place density of the cohesive materials in accordance with [ASTM D1556/D1556M], [ASTM D2167], [ASTM D6938], [ASTM D2937], or [ASTM D5195]. Perform at least one (1) in-place density test on [(each lift of material)[shift][day] or] every [_____] cubic m cubic yards of completed fill whenever is more frequent with the horizontal locations randomly staggered in the fill. [At each field density test location, obtain soil samples and perform one [one-point] [two-point] compaction test, one moisture content, [one grain size analysis,] [and one Atterberg limits test,] [if applicable,] on the sample. [The results of the [one-point] [two-point] compaction test and the moisture content test will be utilized to obtain the optimum properties to compare to the results of the in-place density test.] [For use with the family of curves to determine the optimum properties of the material, perform a [one-point] [two-point] compaction test in conjunction with each in-place density. Use a portion of the soil from the in-place field density test and soil obtained immediately adjacent to the field density test location for a [one-point] [two-point] compaction test. The minus 19 mm 3/4-inch portion of the soil must be subjected to [_____] compactive effort using a 150 mm 6-inch compaction mold in accordance with the procedures presented in ASTM D [_____] [ASTM D698] [ASTM D1557]]. Retest fill not meeting the required specifications for in-place density after additional compaction has been completed. [When nuclear method is used for in-place density testing according to ASTM D6938, include a sand cone correlation test in accordance with ASTM D1556/D1556M for the first test and every fifth test thereafter for each material type. Perform the sand cone test adjacent to the location of the nuclear test, including a nominal 150 mm 6 inch diameter sand cone, and including a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. Do not
use nuclear density testing equipment during rain. Submit the density correlations with test results. For each transmittal including density test data, include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
   Station.
   Coordinates.
c. Elevation of lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.
l. Pass/Fail.
m. Retest.
n. Comments.

3.22.3.2.3 Cohesionless Material Testing

3.22.3.2.3.1 Compaction Tests

Run not less than one relative density test for every \[3,000\] cubic m \(3,900\) cubic yards of cohesionless fill in accordance with ASTM D4253 and ASTM D4254.

3.22.3.2.3.2 In-Place Density Tests

Determine the in-place density of the cohesionless materials in accordance with \[ASTM D1556/D1556M\] [, ASTM D2167] [, ASTM D6938] [, ASTM D2937] [, or] [ASTM D5195]. Run not less than one (1) field in-place density test on [each lift of material or] every [_____] cubic m cubic yards of completed embankment fill or backfill whichever is less. Randomly stagger horizontal locations in the fill. When nuclear method is used for in-place density testing according to ASTM D6938, include a sand cone correlation test in accordance with ASTM D1556/D1556M for the first test and every tenth test thereafter for each material type. Perform the sand cone test adjacent to the location of the nuclear test, including a nominal 150 mm 6 inch diameter sand cone, and including a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. Submit the density correlations with test results. For each transmittal including density test data, include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
   Station.
   Coordinates.
c. Elevation of lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.}

[3.22.3.2.3 Water (Moisture) Content Tests

Perform determination of water content in accordance with ASTM D2216.[ ASTM D4643 may be used when rapid moisture content results are needed. Confirm all rapid results obtained by ASTM D4643 by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern.] One water content test will be performed for each [_____] cubic m cubic yards of material placed[ or each lift of material whichever is less].[ These tests will be in addition to the water content tests performed in conjunction with in-place density tests.] Retest backfill and fills not meeting the required specifications for water content after corrective measures have been applied.

][3.22.3.2.4 Additional Testing

The Contracting Officer may request additional tests if there is reason to doubt the adequacy of the compaction, or special compaction procedures are being used, or materials change or if the Contracting Officer determines that the Contractor's testing is inadequate or the Contractor is concentrating backfill and fill operations in a relatively small area.

]}3.22.3.3 Materials

Suitability of materials for use in embankment and backfill.

3.22.3.4 Fill Placement

Layout, maintaining existing drainage, moisture control, thickness of layers, removal of oversized material, spreading and compaction for embankment and backfill.

3.22.3.5 Grade and Cross Section

Surveys to verify that the dimensions, slopes, lines and grades conform to those shown on the drawings.[ Surveys to monitor settlement gages to measure foundation settlement.]

3.22.3.6 Testing by the Government

During the life of this contract, the Government [or its Contractors] will perform quality assurance tests. The performance of such tests may temporarily delay the Contractor and must not be the basis for additional compensation and/or time. Make available to the government [or its Contractors] the equipment to perform these test.

3.22.3.7 Reporting

On a daily basis, furnish the inspection records and all material testing results, [the quantity of fill placed,] as well as the records of corrective action taken, in accordance with Section 01 45 00.00 10 01 45 00.00 2001 45 00.00 40 QUALITY CONTROL.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steepened soil slopes using geosynthetic soil reinforcement. It does not include soil reinforcements such as segmented type retaining walls, metal reinforcing strips, soil nails, and combi walls. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

PART 1  GENERAL

NOTE: This guide specification does not address requirements for dewatering, shoring, or earthwork below foundation level. Geometric requirements such as slope height, crest, toe, length, and construction limits should be shown on the drawings.

Notes before paragraphs are provided to present assumptions in preparation of the guide specification, make suggestions for conditions that
1.1 MEASUREMENT AND PAYMENT

1.1.1 Excavation

The unit of measurement for excavation is the cubic meter (CM) yard (CY), computed by the average end area method from cross sections taken before and after the excavation operations. The volume to be paid for will be the material measured in its original position and removed from the excavation areas when the material is acceptably utilized or disposed of as herein specified. The excavation is unclassified and includes material of all types. The measurement will not include material excavated without authorization. Payment will be made at the respective unit price listed on the bidding schedule. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work. Shoring is incidental to excavation.

1.1.2 Fill

Material of all types not otherwise paid for is included under the unit price for fill. The unit of measurement for fill is the cubic meter (CM) yard (CY) computed by the average end area method from cross sections taken of the final slope and after the excavation operations. The volume to be paid for will be the material measured in its final position and placed within the designated areas when the material is acceptably placed and compacted as herein specified. Payment will be made at the respective unit price listed on the bidding schedule. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.1.3 Soil Slope Reinforcement

The unit of measurement for reinforcement is the square meter (SM) yard (SY). The pay lines of the reinforcement will be neat lines taken off the approved shop drawings. Overlaps for splicing (if allowed) and for the Contractors convenience will not be measured for payment. Overlaps in curved sections will be measured assuming the slope is linear. Payment will be made at the respective unit price listed on the bidding schedule. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.1.4 Soil Slope Drainage System

The drainage system, including associated pipe, geotextile, and aggregate will not be measured for payment and will be paid for on a job basis (JB), complete. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.1.5 Soil Slope Facing and Seeding

Facing and seeding of the soil slope will be measured by the square meter (SM) yard (SY) of exposed face, measured in the plane of the slope face. The pay lines will be neat lines taken off the approved shop drawings. The work includes [seed, mulch, turf reinforcement mat, erosion control...
blankets, erosion control netting, and staples]. Payment will be made at the respective unit price listed on the bidding schedule, and will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.3 DEFINITIONS

**************************************************************************

NOTE: Subparagraph "Reinforcement" - This guide specification only applies to geosynthetic (extensible) reinforcement. There are differences in design and construction applicable to steel soil.
(inextensible) reinforcement.

1.3.1 Drainage Aggregate
Granular soil or aggregate which is placed in or around drains.

1.3.2 Fill
Soil or aggregate placed in, behind, or below the embankment or slope will be referred to as fill.

1.3.3 Reinforced Fill
Soil which is placed and compacted within the neat line volume of reinforcement as outlined on the plans.

1.3.4 Retained Fill
Soil which is placed and compacted behind the reinforced fill.

1.3.5 Reinforcement
Reinforcement consisting of a geogrid or a geotextile product manufactured for use as reinforcing. Reinforcement does not include steel products.

1.3.6 Long Term Design Strength
The long term design strength (LTDS) is:

\[ \text{LTDS} = \frac{T_{\text{ult}}}{(RF_D \times RF_{\text{ID}} \times RF_{\text{CR}})} \]

where:

- \( T_{\text{ult}} \) is the ultimate tensile reinforcement strength
- \( RF_D \) is the reduction factor for chemical and biological durability
- \( RF_{\text{ID}} \) is the reduction factor for installation damage
- \( RF_{\text{CR}} \) is the reduction factor for creep

1.4 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 QUALITY ASSURANCE

1.5.1 Manufacturer Representative

Provide a qualified and experienced representative from the reinforcement manufacturer available on an as-needed basis during the construction. Visit the site for consultation [at least once during construction] [as requested by the Contracting Officer].

1.5.2 Detailed Drawings

Submit the fabrication and installation drawings indicating fabrication and erection details for the slope, including sequencing and construction procedures. If approved by the Contracting Officer, shop drawings may consist of marked up contract drawings showing exact dimensions for the reinforcement supplied, and other minor revisions. The design and layout of the internal reinforcement are subject to the following:

a. Incorporate all features indicated in the contract documents in the final design and construction.

b. Run each reinforcement level as continuous as practical throughout the profile. If a geotextile filter is present, lay out the reinforcement so that interference with the geotextile is minimized.

c. Identify any reinforcement not placed with the machine direction as the design reinforcement direction on the shop drawings.

1.5.3 Classification of Soil Materials

Perform classification of soil materials in accordance with ASTM D2488. The Contracting Officer reserves the right to revise the Contractor classifications. In the case of disagreement, the Contracting Officer's classification will govern unless the soils are classified in accordance with ASTM D2487. All testing completed by the Contractor in conjunction with soil material classification is considered incidental to the contract work.

1.6 DELIVERY, STORAGE, AND HANDLING

Check products upon delivery to assure that the proper material has been received and is undamaged. Protect the materials from damage and exposure following the guidelines presented in ASTM D4873/D4873M.

1.6.1 Labeling

Label each roll with the manufacturer's name, product identification, roll dimensions, lot number, and date manufactured.

1.6.2 Handling

Handle and unload geosynthetic rolls by hand, or with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Do not drag, lift by one end, lift by cables or chains, or drop geosynthetic rolls to the ground.

1.6.3 Storage

Protect geosynthetics from cement, paint, excessive mud, chemicals, sparks
and flames, temperatures in excess of 70 degrees C 160 degrees F, and any other environmental condition that can degrade the physical properties. If stored outdoors, elevate the rolls from the ground surface. Protect geosynthetics, except for extruded grids, with an opaque waterproof cover. Deliver geosynthetics to the site in a dry and undamaged condition. Do not expose geotextiles to direct sunlight for more than 7 days.

PART 2  PRODUCTS

2.1  REINFORCEMENT

**************************************************************************
NOTE: Polyester is susceptible to hydrolysis in alkaline conditions. A high molecular weight and low carboxyl end group number limit the hydrolysis. Normally, a mill certificate or certification of these properties is adequate. The molecular weight of polyester geosynthetics is determined from GSI GRI GG6, "Determination of the Number Average Molecular Weight of Polyethylene Terephthalate (PET) yarns Based on a Relative Viscosity Value", and ASTM D4603, "Determining Inherent Viscosity of Poly(Ethylene Terephthalate) (PET) by Glass Capillary Viscometer." The carboxyl end group number is determined from GSI GRI GG7, "Carboxyl End Group Content of Polyethylene Terephthalate (PET) Yarns."

Survivability - The AASHTO M 288 requirements are minimum requirements and will not normally control in the product selection. The AASHTO reference can be avoided by listing the grab, tear, burst, and puncture strengths. These properties are listed in AASHTO M 288. The puncture strength (ASTM D4833/D4833M), the trapezoidal tear strength (ASTM D4533/D4533M/D4533M) and the mullen burst strength (ASTM D3786) are recognized as important geotextile properties. For the intended application, the commonly specified values for puncture, burst and tear seldom control the product selection.

Geosynthetic Selection - The Federal Acquisition Regulations require full and open competition. Usually justification is not necessary if 3 products meet the specifications. In combining various material requirements, it is easy to specify a geosynthetic product that does not exist. Design utilizing geosynthetics should include a listing with the calculations that verify the specified products are commercially available. The Geosynthetics Fabrics Report magazine publishes an annual specifiers guide that is ideal for this purpose.

The geogrid sample is intended to be for visual demonstration prior to product delivery. Quality assurance testing, if performed, should be obtained from material actually delivered to the job. If testing is to be performed for pre qualification,
the minimum sample size should be 1 m 36 inches in length and the full roll width. Although 1 square meter yard will provide enough material for testing, the full roll width should be sampled since it provides a better selection of specimen locations, it clearly shows the machine and cross directions, and the difference in waste and shipping costs is negligible.

**************************************************************************

Submit Certificates of Compliance for the materials; and calculations of the long term design strength for the reinforcement in accordance with the NCMA TR127B or FHWA NHI-00-043. Submit an affidavit certifying that the reinforcement and seams meets the project specifications. Provide the certificates and affidavits a minimum of 30 days prior to delivery of materials. Have the affidavit signed by an official authorized to certify on behalf of the manufacturer and include a mill certificate that verifies physical properties were tested during manufacturing and lists the manufacturer's quality control testing. [If the affidavit is dated after award of the contract and/or is not specific to the project, attach a statement certifying that the affidavit addressed to the wholesale company is representative of the material supplied.] Include a statement confirming that all purchased resin used to produce reinforcement is virgin resin. Include the tensile strength tested in accordance with either ASTM D4595 or ASTM D6637 in the mill certificate. Base the ultimate strength or index strength on the minimum average roll value tensile strength of the product using the wide width strength test in ASTM D4595 or the single rib test in ASTM D6637. Itemize each reduction factor and include backup data to justify each reduction factor in the calculations. Demonstrate splice efficiency from testing, if used. Submit and label samples of each type of reinforcement with a minimum size of 200 by 250 mm 8 by 10 inches. Include at least 2 apertures in each direction for the geogrid.

2.1.1 Geogrid Reinforcement

Provide geogrid, which is a geosynthetic manufactured for reinforcement applications. The geogrid must be a regular network of integrally connected polymer tensile elements with aperture geometry sufficient to permit significant mechanical interlock with the surrounding soil, aggregate, or other fill materials. The geogrid structure must be dimensionally stable and able to retain its geometry under manufacture, transport and installation. Manufacture the geogrid with 100 percent virgin resin consisting of polyethylene, polypropylene, or polyester, and with a maximum of 5 percent in-plant regrind material. Polyester resin must have a minimum molecular weight of 25,000 and a carboxyl end group number less than 30. Stabilize polyethylene and polypropylene with long term antioxidants.

2.1.2 Geotextile Reinforcement

Submit descriptive technical data on the reinforcement and geotextile filter materials. Include all material properties specified under paragraph PRODUCTS. Geotextile must be a pervious sheet of polymeric material consisting of long-chain synthetic polymers composed of at least 95 percent by weight polyethylene, polypropylene, or polyesters. Manufacture the geotextile with 100 percent virgin resin, and with a maximum of 5 percent in-plant regrind material. Form geotextile into a network such that the filaments or yarns retain dimensional stability.
relative to each other, including the selvages. Polyester resin must have a minimum molecular weight of 20,000 and a carboxyl end group number less than 50. Stabilize polyethylene and polypropylene with long term antioxidants. For survivability during installation, and in addition to installation damage used in calculating the long term design strength, the geotextile must meet the minimum requirements in AASHTO M 288 Class 1, and have a minimum mass per unit area of 270 g/m² 8 oz/sq.

2.1.3 Reinforcement Properties

**************************************************************************
NOTE: Permittivity - Reinforcement geotextiles should not puddle or impede infiltration or seepage.
AASHTO M 288 provides some default guidance.
**************************************************************************

2.1.3.1 Primary Reinforcement Properties

Meet the property requirements listed in Table 1 for reinforcement shown on the contract drawings. Reinforcement strength requirements represent minimum average roll values in the machine direction.

2.1.3.3 Long Term Design Strength

Base the long term design strength on reduction factors for installation damage and durability that are applicable to the fill that will be used. Minimum reduction factors for durability include: 1.1 for polyethylene and polypropylene geosynthetics, 1.15 for coated polyester geogrids, and 1.6 for polyester geotextiles. Minimum reduction factors for creep include: 2.5 for polyester, 4 for polypropylene, and 2.6 for high density polyethylene.

Ranges for damage reduction factors in accordance with FHWA NHI-10-024 are listed in Table 3.

*a Minimum weight 270 g/m2 8.0 oz/yd2.

2.1.4 Reinforcement Splices

Provide reinforcement splices consisting of a standard method or device recommended and approved by the manufacturer of the reinforcing. Splices less than 90 percent efficient (width wide tensile strength of splice to mean average roll value tensile strength of reinforcing) are not
acceptable. Demonstrate and submit the splice efficiency. Splicing may consist of overlaps, fusion wedge welding, sewing, or bodkin connections. Splicing methods that are dependent on installer experience and skill level, such as hot air and torch-applied open flame, are not acceptable. Perform sewing by 2 lines of stitching with a Federal 401 double thread lock stitch with a thread of the same polymer type and UV protection as the geotextile. [Perform overlaps as indicated on the drawings.] Overlaps must be a minimum of [300] [600] mm [12] [24] inches for linear runs along the slope face where the primary design strength axes of adjacent reinforcement panels are parallel.) The overlap is to be protected from folding and/or bunching during installation of fill.

2.1.5 Seams

Test seams in accordance with method ASTM D4884/D4884M.

2.2 GEOTEXTILE FILTER

Meet the requirements specified in Table 4. The property values (except for AOS) represent minimum average roll values (MARV) in the weakest principal direction. For survivability during installation, meet the minimum requirements in AASHTO M 288 Class 2, and have a minimum mass per unit area of 270 g/m² 8 oz/sq.

2.3 TURF REINFORCEMENT MAT

Turf Reinforcement Mat (TRM) must consist of nondegradable monofilaments and meet the requirements specified in Table 5. The property values (except for AOS) represent minimum average roll values (MARV) in the weakest principal direction.

2.4 EROSION CONTROL BLANKET

**************************************************************************
**************************************************************************

Erosion control blanket (ECB) must consist of biodegradable open weave blankets used for establishing vegetation and have a minimum mass per unit area of [_____] g/m² oz/SY, determined in accordance with ASTM D5261.

2.5 SOILS AND AGGREGATES

Classify all material placed as fill by ASTM D2487 as GW, GP, GC, GM, SP, SM, SC, CL, ML, or SW and be free of ice; snow; frozen earth; trash; debris; sod; roots; organic matter; contamination from hazardous, toxic or radiological substances; or stones larger than 75 mm 3 inches in any dimension. Obtain each material entirely from one borrow source, unless the Contracting Officer determines that quality control is adequate and the alternate source produces material that is similar in gradation, texture, and interaction with the reinforcement. All materials must be of a character and quality satisfactory for the purpose intended.

a. Reinforced Fill. Soil placed in the reinforced fill zone must consist of [soils with less than 50 percent passing the 75 µm No. 200 sieve, maximum particle size of 1.9 cm 3/4-inch, and Plasticity Index less than or equal to 20] [alternate properties of available fill soils consistent with soil strengths and reinforcement damage assessment utilized in design]. The reinforced fill soils must have a minimum drained friction angle of 28 [_____] degrees.

b. Retained Fill. Soil in the retained fill zone [consists of existing in-situ soils] [meets the material classification and requirements listed above].

c. Drainage Aggregate. Meet the requirements of ASTM D448, size No.7].
2.6 DRAINAGE PIPE

Corrugated polyethylene pipe meeting requirements of AASHTO M 252.

2.7 SEED

Provide state-certified seed of the latest season's crop in original sealed packages bearing the producer's guaranteed analysis for mixture percentage, purity, germination, weed seed content, and inert material. Provide labels that are in conformance with AMS Seed Act and applicable state seed laws. Proportion the seed mix by weight as follows: [____].

PART 3 EXECUTION

3.1 SHORING

Construct shoring in accordance with the safety requirements of EM 385-1-1. Submit drawings and calculations, certified by a registered professional engineer, describing the methods for shoring and sheeting of excavations at least 30 days prior to installation. Also include sequencing and methods of shoring installation and removal that will facilitate verification that the methods will not leave voids, seepage paths, or other deficiencies. The Contractor is responsible for design and maintenance of all shoring to be installed. Do not negatively impact existing and proposed work during installation. Unless otherwise authorized, remove all sheeting and bracing when backfill is completed. Do not negatively impact completed work during removal.

3.2 EARTHWORK

**************************************************************************
NOTE: Notification of the Contracting Officer - It is beyond the scope of a specification to provide remedies to all possible problems. If the specification indicates the Contracting Officer must be notified, it is assumed qualified assistance will be utilized to assess the situation when necessary.
**************************************************************************

Bear the reinforced fill zone on undisturbed native soils, or acceptably placed and compacted fill. In the event that it is necessary to remove material or place fill below the excavation lines shown on the drawings, or not otherwise provided for in the contract, notify the Contracting Officer prior to work and an adjustment in the contract price will be considered in accordance with the contract. It is at the Contractor's expense if additional work not authorized by the Contracting Officer is performed.

3.2.1 Excavation

Excavate to contours, elevation, and dimensions indicated. Reuse excavated materials that meet the specified requirements for the material type required at the intended location. Keep excavations free from water. Excavate soil disturbed or weakened by Contractor's operations, soils softened or made unsuitable for subsequent construction due to exposure to weather. Excavations below indicated depths will not be permitted except to remove unsatisfactory material. [_____][Remove as directed] unsatisfactory material encountered below the grades shown. [ Refill with backfill and fill material][satisfactory material][select material][porous fill] and compact to [95][_____] percent of [ASTM D698][ASTM D1557] maximum.
Unless specified otherwise, refill excavations cut below indicated depth with [backfill and fill material][satisfactory material][select material][porous fill] and compact to [95][_____] percent of [ASTM D698][ASTM D1557] maximum density. Replace satisfactory material removed below the depths indicated, without specific direction of the Contracting Officer, with satisfactory materials to the indicated excavation grade; except as specified for spread footings. Determination of elevations and measurements of approved overdepth excavation of unsatisfactory material below grades indicated will be done under the direction of the Contracting Officer. Perform excavation and fill in a manner and sequence that will provide proper drainage at all times. The Contractor is responsible for disposal of surplus material, waste material, and material that does not meet specifications, including any soil which is disturbed by the work operations or softened due to exposure to the elements and water.

3.2.2 Stockpiles

Stockpile material for backfilling in a neat and orderly manner at a sufficient distance from the banks of the excavation to avoid overloading and to prevent slides or caving. Keep stockpiles of all material to be incorporated into the work in a neat and well drained condition, giving due consideration to drainage at all times. Clear, grub, and seal the ground surface at stockpile locations. Stockpile topsoil separately from suitable backfill material. Protect stockpiles of aggregates and granular soils from contamination which can destroy the quality and fitness of the stockpiled material. If the Contractor fails to protect the stockpiles, and any material becomes frozen, saturated, intermixed with other materials, or otherwise out of specification or unsatisfactory for the use intended, remove such material and replace with new material from approved sources at no additional cost to the Government.

3.3 SUBGRADE PREPARATION

Remove unsatisfactory material in surfaces to receive fill or in excavated areas and replace with satisfactory materials as directed by the Contracting Officer. Scarify the surface to a depth of 150 mm 6 inches before the fill is placed. Plow, step, bench, or break up sloped surfaces steeper than 1 vertical to 4 horizontal so that the fill material will bond with the existing material. When subgrades are less than the specified density, break up the ground surface to a minimum depth of 150 mm 6 inches, pulverized, and compacted to the specified density. When the subgrade is part fill and part excavation or natural ground, scarify the excavated or natural ground portion to a depth of 300 mm 12 inches and compact as specified for the adjacent fill. Do not place material on surfaces that are muddy, frozen, or contain frost. Accomplish compaction by sheepfoot rollers, pneumatic-tired rollers, steel-wheeled rollers, or other approved equipment well suited to the soil being compacted. Moisten material or aerate as necessary [to plus or minus [_____] percent of optimum moisture][to provide the moisture content that will readily facilitate obtaining the specified compaction with the equipment used]. Minimum subgrade density is as specified herein. Smooth the surface to be free of windrows, sheepfoot impressions, and rocks. Do not place reinforcement directly on native soil unless the upper 0.3 meter 1 foot of soil meets specification of fill materials.

3.4 PROOF ROLLING
NOTE: Specify proof rolling when the quality of the existing subgrade is questionable. Proof rolling can be used to verify that no unsatisfactory material is present (no bid quantity required, location shown or specified) or to locate suspected unsatisfactory material (indicate a bid quantity to be removed).

Perform proof rolling on an exposed subgrade free of surface water at near optimum, or at the moisture content that was used to achieve the required compaction. Perform proof-rolling with a 22,680 kg 25 ton pneumatic-tired tandem axle roller with at least three wheels on each axle, a minimum tire pressure of 5.2 kg per square centimeter 75 pounds per square inch, and a minimum rolling width of 1.9 m 75 inches. Operate proof-rolling equipment at a speed between 2.4 to 4.8 km per hour 1.5 to 3 miles per hour. Notify the Contracting Officer a minimum of 3 days prior to proof rolling. Carry out proof-rolling in two directions at right angles to each other with no more than 60 cm 24 inches between tire tracks of adjacent passes. Operate the proof-roller in a pattern that readily allows for the recording of deformation data and complete coverage of the subgrade.

Take the following actions based on the results of the proof-rolling activity in accordance with FHWA NHI-10-025:

1. Rutting less than 6 mm 1/4 inch - The grade is acceptable.
2. Rutting greater than 6 mm 1/4 inch and less than 38 mm 1-1/2 inches - Scarify and re-compact the grade.
3. Rutting greater than 38 mm 1-1/2 inches - Remove and reconstruct the compacted area.
4. Pumping (deformation that rebounds, or materials that are squeezed out of a wheel’s path) greater than 25 mm 1 inch - Remediate the area as directed by the Engineer.

3.5 REINFORCEMENT INSTALLATION

a. Place reinforcement at the elevations and to the extent shown on the construction drawings and the approved shop drawing submittal. Orient the reinforcement with the design strength axis perpendicular to the slope face. Place reinforcement strips as indicated on the drawings to provide 100 percent coverage of the reinforced area. Keep reinforcement from being exposed to direct sunlight after installation. [This can be accomplished by requiring coverage with reinforced fill material during the same work shift.]

b. Install the reinforcement in tension. Pull the reinforcement taut and anchor with pins, staples, or stakes prior to placing the overlying lift of fill. Maintain uniform tension along the length of the slope and consistent between layers.

c. Where the slope bends, place a veneer of fill to a nominal thickness of 75 mm 3 inches to separate overlapping reinforcement. [Overlap a minimum of 150 mm 6 inches along the edges perpendicular to the slope for wrapped face structures.] [With grid reinforcement, clip or tie the
edges together.][When reinforcements are not required for face support, no overlap is required and edges should be butted.]

d. Splicing. Splicing is not allowed unless identified on the shop drawings. Limit splicing to only one splice per reinforcing strip and do not include a splice with two consecutive reinforcing. Place splices randomly without a pattern. Discard individual reinforcing lengths less than 3 meters 10 feet. Place seams facing upward for inspection purposes.

3.6 FILL PLACEMENT

******************************************************************************

NOTE: Subparagraph "b." below - Studies have documented rubber tired heavy equipment traveling on geogrids with minimal or no damage. However, it is regarded as poor practice and usually unnecessary. Problematic conditions include coarse crushed gravel and coated geogrids. The intent of the specification is to minimize equipment on the geogrid so that it occurs only when necessary.

******************************************************************************

a. Place reinforced fill from the slope face back toward the fill area to ensure that the reinforcement remains taut. Place, spread, and compact fill in such manner that minimizes the development of wrinkles in or movement of the reinforcement.

b. A minimum fill thickness of 150 mm 6 inches is required prior to operation of vehicles over the reinforcement. Avoid sudden braking and sharp turning. Do not turn tracked equipment within the reinforced fill zone to prevent tracks from displacing the fill and damaging the reinforcement. Do not operate construction equipment directly upon the reinforcement as part of the planned construction sequence. Rubber tired equipment can operate directly on the reinforcement if the travel is infrequent, equipment travels slow, turning is minimized, and no damage or displacement to the reinforcement is observed.

c. At the end of each day, slope the last lift of fill away from chimney drains in a manner that will allow drainage and direct runoff away from aggregate.

3.7 COMPACTION

Do not place fill on surfaces that contain mud, frost, organic soils, fill soils that have not met compaction requirements, or where the Contracting Officer determines that unsatisfactory material remains in or under the fill. Spread fill and compact in lifts[ not exceeding the height of the face wrapping].

3.7.1 Degree of Compaction

Degree of compaction required is expressed as a percentage of the maximum density obtained by the test procedure presented in ASTM D698 or ASTM D1557. The maximum density is hereafter abbreviated as the "Standard Proctor" or "Modified Proctor" value.
3.7.2 Moisture Control

**********************************************************************************************************
NOTE: Moisture content limits for compaction should be included in these paragraphs when necessary for obtaining strength and stability in embankments and fill, for controlling movement of expansive soils and when, in the opinion of the project geotechnical engineer, moisture control is required for the soils being used. Specify an acceptable variation from the optimum moisture if justified from experience with similar soils or where demonstrated from moisture-density tests for the borrow material during planning.
**********************************************************************************************************

Maintain control of moisture in the fill to provide acceptable compaction. In the stockpile, excavation or borrow areas, a minimum of two tests per day per type of material or source of materials being placed is required during stable weather conditions. During unstable weather, perform tests as dictated by local conditions and test approved moisture content in accordance with ASTM D2216. Include moisture content test results in daily report. Disking and plowing will not be allowed in the reinforced fill zone. Adjust moisture content of cohesive soils at the borrow source before placement. Only conduct adding water directly to the reinforced fill zone under conditions where the soil has sufficient porosity and capillarity to provide uniform moisture throughout the fill during compaction. Ensure that moisture content is within plus or minus [2][_____] percentage points of optimum moisture content as determined in ASTM D698 or ASTM D1557.

3.7.3 Compaction

Compact reinforced and retained fill to 95[_____] percent of the Standard Proctor as determined in ASTM D698.

3.8 SOIL TESTING

3.8.1 General

All testing expenses is the Contractor's responsibility. Prior to sampling and testing the work, inspect testing laboratories and approve in accordance with Section 01 45 00.00 1001 45 00.00 2001 45 00.00 40 QUALITY CONTROL. The Contracting Officer reserves the right to direct the location and select the material for samples to be tested and to direct where and when moisture-density tests are to be performed.

3.8.2 Transmittal

Inform the Contracting Officer of test results daily for direction on corrective action required. Provide draft copies of field testing results to the Contracting Officer on a frequent and regular basis, as directed. Submit testing data specific to the reinforcement to be supplied:

a. Establish the coefficient for direct shear of the reinforcement on a soil similar in gradation and texture to the material that will be used for fill in the reinforced zone in accordance with ASTM D5321/D5321M.
b. Establish the coefficient of interaction for pull-out resistance of the reinforcement in a soil similar in gradation and texture to the material that will be used for fill in the reinforced zone in accordance with ASTM D6706.

3.8.3 Corrective Action

Tests of materials which do not meet the contract requirements (failed test) will not be counted as part of the required testing. If testing indicates material does not meet the contract requirements, do not place the material represented by the failed test in the contract work or recompact or remove. Determine the quantity of material represented by the failed test by the Contracting Officer up to the quantity represented by the testing frequency. The Contractor may increase testing frequency in the vicinity of a failed test in order to reduce removal requirements, as approved by the Contracting Officer. Such increases in testing frequency are at the Contractor's expense and at no additional cost to the Government.

3.8.4 Testing Schedule

a. Moisture-Density Relations (ASTM D698 or ASTM D1557)

One test for each material variation[, not less than ____ tests total].

b. In-Place Densities (ASTM D1556/D1556M or ASTM D6938)

***************************************************************************
NOTE: Density test frequency can vary from one test per 10 square meter 100 square feet for small areas up to one test per 900 square meter 10,000 square feet. The following table will also help establish test frequency for various situations:
***************************************************************************

<table>
<thead>
<tr>
<th>Borrow</th>
<th>Any</th>
<th>One test per lift per 400 cubic m placed.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Material Type</th>
<th>Location of Material</th>
<th>Test Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Undisturbed native soil</td>
<td>Structures</td>
<td>Two random tests in native soil building footings and two tests on subgrade within building line.</td>
</tr>
<tr>
<td>Fills and backfills</td>
<td>Structures (adjacent to)</td>
<td>One test per structure per 2,000 sq. ft taken 12 inches below finished grade.</td>
</tr>
</tbody>
</table>
### Material Test Frequencies

<table>
<thead>
<tr>
<th>Material Type</th>
<th>Location of Material</th>
<th>Test Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subgrades</td>
<td>Site (except airfields)</td>
<td>One test per lift per 2,500 sq. ft</td>
</tr>
<tr>
<td>Embankments or borrow</td>
<td>Any</td>
<td>One test per lift per 500 cubic yds placed.</td>
</tr>
<tr>
<td>Native soil subgrade other than structures and parking</td>
<td>Any</td>
<td>One test or one test per 10,000 sq. ft whichever is greater.</td>
</tr>
<tr>
<td>Borrow</td>
<td>Any</td>
<td>One test per lift per 500 cubic yds placed.</td>
</tr>
</tbody>
</table>

Test each lift at randomly selected locations every 200 square meters, 2000 square feet of existing grade in fills for structures and concrete slabs, and every 250 square meters, 2500 square feet for other fill areas and every 200 square meters, 2000 square feet of subgrade in cut. Test density in accordance with ASTM D1556/D1556M, or ASTM D6938. When ASTM D6938 density tests are used, verify density test results by performing an ASTM D1556/D1556M density test at a location already ASTM D6938 tested as specified herein. Perform an ASTM D1556/D1556M density test at the start of the job, and for every ten ASTM D6938 density tests thereafter. Include density test results in daily report.

c. Sieve Analysis, (ASTM C136/C136M)

Drainage Aggregate, 1 test for each source.

### 3.9 Reinforcement Testing

NOTE: Primary reasons for testing geosynthetics include verification of quality control by the manufacturer, detecting degradation during shipping and storage, and verifying the correct product is supplied. Verification of quality control by the manufacturer and detecting degradation during shipping and storage is not economically justified for small jobs. Unlike reinforcing steel for concrete, geosynthetics are difficult to identify in the field, and even experienced personnel can sometimes mistake the product identity of unlabeled material. Testing after delivery to verify the correct product was supplied may be advisable for critical structures. The strength is usually the most critical property to verify an acceptable product is furnished.

It is the Contractor's responsibility for all testing expenses. Perform testing by a commercial testing laboratory selected by the Contractor and approved by the Contracting Officer or performed by the Contractor if approved by the Contracting Officer. The Contracting Officer reserves the right to direct the location and select the material for samples.
TABLE 6. REINFORCEMENT TESTING

<table>
<thead>
<tr>
<th>PROPERTY</th>
<th>TEST DESIGNATION</th>
<th>FREQUENCY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wide Width Strip Tensile Strength (Geotextiles)</td>
<td>ASTM D4595</td>
<td>[_____]</td>
</tr>
<tr>
<td>Single Rib Tensile Strength (Geogrids)</td>
<td>ASTM D6637</td>
<td>[_____]</td>
</tr>
<tr>
<td>Specific Gravity (HDPE only)</td>
<td>ASTM D1505</td>
<td>[_____]</td>
</tr>
<tr>
<td>Melt Flow Index (PP &amp; HDPE)</td>
<td>ASTM D1238</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Modify ASTM D4595 for geogrids considering recommendations in GSI GRI GG6; and express the tensile strength on a unit length basis by substituting \( n \times a \) for \( W_s \), where:

\[
W_s = \text{specimen width, (mm inches)}
\]
\[
n = \text{number of ribs in the sample (must be a whole number)}
\]
\[
a = \text{nominal rib spacing for the product tested, (mm inches)}
\]

3.10 DRAINAGE PIPE

Place drain pipe as indicated on the drawings. Lay drain lines to true grades and alignment with a continuous fall in the direction of flow. Keep the interior of the pipe clean from soil and debris; and temporarily cap open ends as necessary.

3.11 EROSION CONTROL

Install erosion control in accordance with the manufacturer's recommendations. Clear the ground surface of vegetation, cobbles, rubbish, or debris prior to placement.

3.12 SEEDING

Apply seed at the rate of 18 square m/kg 10 square yards per pound of seed. Evenly distribute the seed by hand or using broadcast seeders. Cover seed to a nominal 13 mm 1/2 inch depth by rakes.

3.13 CONSTRUCTION TOLERANCES

a. Horizontal: Ensure the slope crest and toe are within 150 mm 6 inches of the plan location.

b. Vertical: Ensure the slope crest elevations are within 90 mm 0.3 feet above to 90 mm 0.3 feet below the prescribed elevations shown on the drawings.

3.14 PROTECTION OF WORK

Protect work against damage from subsequent operations.

PART 1 GENERAL

NOTE: Figure 1, System Loss Curve (May be provided by the Designer). The Specifier should insert Figure 2 and Figure 3 at the end of this section as applicable to the design. (See paragraphs BEARING HEAT SENSORS, TEST SETUP, and VALUE OF NPSHR.)
This specification is written to obtain reliable, long-lasting pumps that are suited for the purpose intended at the most economical price. It requires the use of grease-, water- or oil-lubricated bearings and packing glands, and permits the manufacturer to use his standard castings for the suction bell and the bowls.

Alternate specifications for the "FACTORY TEST" have been provided in this specification. Alternate 1 gives the manufacturer the option of testing either the prototype pump or a homologous model of the pump. This alternative should be used for all pumps having a diameter up to and including 1200 mm 48 inches. Alternate 2, which requires a homologous model of the pump be tested for performance and NPSHR characteristics, should be used for pumps having a diameter greater than 1200 mm 48 inches. Alternate 2 can also be used for pumps smaller than 1200 mm 48 inches in diameter if the expected annual operating time is greater than 500 hours per year or for the special case when there is no published NPSHR curve available.

If this guide specification is used for a supply contract, the flexible mechanical couplings and harness bolts should be obtained under the construction contract, except when the pump manufacturer is required to furnish the discharge piping.

With a construction contract, it is the prime Contractor's responsibility to have equipment delivered when ready for installation. Inevitably, delays occur. Some storage will most likely be required. These requirements may be modified as required, but in no case should they be deleted when the storage of equipment is contemplated.

With a supply contract, the delivery of the equipment being furnished should be arranged to coincide with the date of installation, when possible. This will obviate the need for long-term storage of the equipment in Government-furnished space.

This specification has been prepared on the basis that it will be used in construction contracts. If this guide specification is to be used for supply contracts, paragraphs to be included in Part IV - TECHNICAL PROVISIONS should be arranged to follow the format listed below. Section 5 should be deleted when a reduction gear is not to be furnished, and the word "DELETED" should be substituted in lieu thereof. Section 1 should include appropriate provisions of Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, Section 05 50 14 STRUCTURAL METAL FABRICATIONS and Section 05 50 15
1.1 PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below be inserted into Section 01 20 00.

1.1.1 Vertical Pumps, Axial-Flow and Mixed-Flow Impeller-Type

1.1.1.1 Payment

Payment will be made for costs associated with [furnishing][furnishing and installing][installing] the vertical pumps, axial-flow and mixed-flow impeller-type, as specified.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Contractor's Erection Engineer(s)

1.1.2.1 Payment

Payment will be made for costs associated with the services of the Contractor's erection engineer(s) for the period of time that erecting engineers are in service of the Government within the Continental United States, including time required by them to travel. No payment will be made for days the erecting engineers are absent from the jobsite, except for non-work days, National Legal Holidays, and authorized travel time. No additional or overtime payment will be made to the Contractor when the erecting engineers are required to work in excess of 8 hours per calendar day or 40 hours per week. If delays occur during periods of assembly, erection, or testing, wherein services of erecting engineers are not required, the Contracting Officer may direct the engineers to return to their home station, in which case they will not be paid for time they are not at the site of work, except for travel time; or direct engineers to remain at the site of work, in which case they will be paid as provided by contract.

1.1.2.2 Measurement

Services of the Contractor's erection engineer(s) will be measured for payment based upon contract unit price per calendar day for the number of calendar days that their services are required, including Sundays and National Legal Holidays. Time for travel will be measured for payment by
the most direct commercial airline or rail route from their home station or port of entry, or from their duty station when travel time from the duty station is less than that required from home station or port of entry, to site of erection and return. When travel time from the duty station is greater than that required from home station or port of entry, only time from home station or port of entry will be allowed. Travel time will be allowed only from time of the first available transportation after release for return to home station or port of entry.

1.1.2.3 Unit of Measure

Unit of measure: per calendar day.

1.1.3 Transportation Expenses of Contactor's Erecting Engineer(s)

1.1.3.1 Payment

Payment will be made for costs associated with the travel and transportation expenses of the Contractor's erecting engineer(s). No payment will be made for daily commuting expenses or subsistence or other personal expenses while in route or at the jobsite. Also, no payment will be made for fare and transportation expenses outside of continental limits of the United States. Payment may be made for travel by privately owned conveyance if used in lieu of travel by common carrier.

1.1.3.2 Measurement

Travel and other necessary transportation expenses of the Contractor's erecting engineer(s) will be measured for payment based upon the travel fare by scheduled airline using less than first class accommodations, when available, or railroad and sleeping car fare when air travel accommodations are not available. Payment for travel by privately owned conveyance is made at the applicable mileage rate of [_____] cents per km mile, provided that such payment do not exceed the constructive cost of air coach accommodations, including consideration of the cost to the Government for the rate per calendar day bid for the services of the erecting engineer and regardless of whether space would have been available. When air accommodations are not available, the mileage reimbursement will be limited to the constructive cost of first class rail, when the elapsed time of rail travel is more than 4 hours; coach class when the elapsed time of rail travel is 4 hours or less; or when neither air nor rail accommodations are provided, the mileage reimbursement will be limited to the constructive cost of bus transportation.

1.1.3.3 Unit of Measure

per km mile.

1.3 SUBMITTALS

******************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL

SECTION 35 45 01 Page 12
PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
  Contractor Selected Manufacturers; G

SD-02 Shop Drawings
  Detail Drawings; G[, [____]]

SD-03 Product Data
  Humidity-Controlled Storage

Operation and Maintenance Instructions Manual; G[, [___]]

1.4 QUALITY ASSURANCE
Provide one or more competent erecting engineers who is knowledgeable about the installation of vertical pumps and associated drive machinery. Erecting engineers provided by this section include those from the Contractor's suppliers. This Contractor's erecting engineers must be responsible for providing complete and correct direction during initial starting and subsequent operation of equipment until field tests are completed. The Contractor's erecting engineer must initiate instructions for actions necessary for proper receipt, inspection, handling, uncrating, assembly, and testing of equipment. The erecting engineer(s) must keep a record of measurements taken during erection, and submit one copy to the Contracting Officer on request or on completion of installation of the assembly or part. The erecting engineer must instruct the Contracting Officer in operation and maintenance features of work.

1.4.1 Detail Drawings

**************************************************************************
NOTE: Select appropriate alternate paragraph "d".
The first paragraph choice may be used for pump with discharge diameters up to and including 1350 mm 54 inch. The second paragraph choice should be used for pumps with discharge diameters above 1350 mm 54 inch.
Submit drawings of sufficient size to be easily read, within [90] [_____] days of notice of award of contract. Submit information in the English language. Provide with English (IP) dimensions[, or metric with English conversion]. Submit drawings requiring changes as a result of model test within 45 days after approval of model test.] Drawings must consist of complete designs of the pump, pump installation instructions, performance charts, brochures, and other information required to illustrate that the entire pumping system (including the pump, [engine] [motor] [and speed reducer] has been coordinated and will function as a unit.

a. Outline drawings of the pump showing pertinent dimensions and weight of each component of the pump. Prepare drawings to scale.

b. Drawing showing details and dimensions of pump mounting design or layout including any embedded items[ and the FSI].

c. Cross-sectional drawings of the pump showing each component. Show major or complicated sections of the pump in detail. Indicate on each drawing an itemized list of components showing type, grade, and class of material used and make and model number of standard component used.

d. Detail and assembly drawings required for manufacturing showing dimensions, tolerances, and clearances of shafts, [sleeve journals], bearings, including dimensions of grooving, couplings, and packing gland, and diameter and tip clearance of propeller.

e. Drawings covering erection and installation, that are intended to be furnished to the erecting engineer.

f. Drawings of the pump; base plate showing its dimensions.

1.4.2 Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, procedures and welders must be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1. Perform welder qualification tests for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests. Perform the qualification tests at the work site if practical. The welder or welding operator must apply their assigned symbol near each weld made as a permanent record.

The names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, and standards tested to.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Outfit major pump components with lifting lugs or eye bolts to facilitate handling. Design and arrange lugs or bolts to allow safe handling of pump
components singly or collectively as required during shipping, installation, and maintenance. Submit copies of certified shipping bills to the Contracting Officer or memorandums of all shipments of finished pieces or members to designated site, giving designation mark and weight of each piece, number of pieces, total weight, and if shipped by rail in carload lots, car initial and number.

1.5.2 Processing for Storage

Prepare pumps [and spare parts] for storage indoors. Indoor storage consists of a permanent building that has a leak-proof roof, full walls to contain stored equipment, and a concrete floor or temporary trailers. A temporary structure may also be built at the job site for equipment storage that will contain features of the permanent building above except that provision for ventilation must be provided and floor may be crushed rock. Provide a vapor barrier below the crushed rock. Use cribbing below equipment stored on crushed rock so that equipment does not come in contact with crushed rock. Provide a plastic barrier between equipment and wood cribbing. Submit a list of equipment and materials requiring humidity-controlled storage to the Contracting Officer no later than 30 days prior to shipment of pumping units. Store long term (greater than 6 months) in accordance with Contractor selected pump specifications.

1.6 PROJECT/SITE CONDITIONS

1.6.1 Datum

**************************************************************************
NOTE: Datum Selection
NAVD 1988 Datum is required for new projects. NGVD is only appropriate if this contract is for, or relates to, an existing project where National Geodetic Vertical Datum (NGVD) was used originally.
**************************************************************************

Elevations shown or referred to in this contract, are above [plus] or below [minus] [mean sea level] North American Vertical Datum of 1988 (NAVD) [______].

Elevations shown or referred to in this contract, are above [plus] or below [minus] [mean sea level] National Geodetic Vertical Datum (NGVD) [______].

1.6.2 [Static][Pool-To-Pool][Bowl] Head

**************************************************************************
NOTES: Select appropriate alternate paragraph.
Static head (1st alternate) is generally used for pumping stations having discharges over the protection, free discharge or a discharge chamber type pumping station. If this alternate is selected, the Specifier should attach FIGURE 1, SYSTEM LOSS CURVE to the end of this section.
Pool-to-pool heads (2nd alternate) are usually
specified when the discharge and suction systems are complex and total head is found by model test or determined by the Contractor.

Bowl Head (3rd alternate).

[ Static head is the difference, in meters feet, between water surface elevation in the [sump bay] [sump] [immediately inside trash rack] and [top of discharge pipe at highest elevation] [water surface elevation of [river] [lake] [discharge chamber] [centerline of discharge flap gate in discharge chamber] [____]]. Total head includes static head, friction losses outside of equipment being furnished, plus velocity head loss. [A curve showing friction losses plus velocity head for pumped capacities is included at the end of this section.]

[ Pool-to-pool head is the difference in meters feet between the water surface elevation in the [sump bay] [sump] and water surface elevation in [discharge chamber] [discharge channel] [river] [____]. Submit computations of total head and losses. Total head includes losses from the water surface on the suction side of the pump to discharge water surface.]

[ Bowl head is the difference in meters feet between the water surface elevation in the [sump bay] [sump] [immediately inside of trash rack] and the elevation of the diffuser exit plus head of water occurring at the diffuser exit. The Contractor must determine total head. Total head includes losses beyond the pump diffuser plus velocity head loss.]

1.7 MAINTENANCE

1.7.1 Special Tools

NOTE: Add applicable sections for drive units used.

Include one set of special tools required to completely assemble, disassemble, or maintain the pumps. Special tools refer to oversized or specially dimensioned tools, special attachments or fixtures, or any similar items. If required, provide a device for temporarily supporting the pump shaft and impeller during assembly, disassembly, and reassembly of the [motor] [gear reducer] when the thrust bearing is not in place. Provide lifting devices required for use in conjunction with [the overhead] [a truck] crane. [Provide a portable steel cabinet large enough to accommodate all special tools included under this paragraph and as required by Section(s) [26 29 01.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL INDUCTION TYPE] [26 29 02.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL SYNCHRONOUS TYPE], [41 65 10.00 10 DIESEL][NATURAL GAS] FUELED ENGINE PUMP DRIVES] and [35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS]. Mount the cabinet on four rubber-tired casters. Provide drawers to accommodate tools. Fit front of cabinet with doors hinged to swing horizontally. Furnish doors with necessary stops, catches, and hasps for completely securing the cabinet with a padlock. Furnish the padlock complete with three keys. Pack special tools in wooden boxes if the size and weight do not permit storage in the tool cabinet. Provide slings if the box and tools are heavier than 34 kg 75 pounds.]
[1.7.2 Extra Materials]

******************************************************************************
NOTE: Spare parts should be required if estimated station operating hours are greater than 500 hours per year. Spare parts should also be considered for pumps located in remote locations and for pumps with unusual design. Spare parts for pumping stations having more than three pumps of identical construction should be considered, since acquisition of these spares will be more economical when purchased with the pumping units. Decisions on requiring spare parts can also be based on including spare parts for stations in remote areas or having unusually designed pumps where parts could take considerable time to obtain. When spare parts are included as part of the original supply contract, their cost would probably be half of their cost if obtained after original construction. When spare parts are included as part of the original purchase of the pumping units, their cost could be less than one half of the cost when obtained at a later date.

Select appropriate alternate paragraphs for subparagraphs "d" and "f", below.
******************************************************************************

Provide the following spare parts:

a. One complete replacement set of bearings, bearing shells, journal sleeves, shaft coupling, if applicable, and seals for each size pump.

b. One complete replacement set of wearing parts for the packing gland for each size pump, and sufficient packing for all pumps.

c. Fifty percent of each size and length of bolt, nut, and washer used on each size pump assembly.

d. [One lube pump, complete with motor and timer control, for the centralized lubrication system.] [One complete manually operated centralized lubrication system.] [One oil storage container including drip device and solenoid oil valve.]

e. One complete main pump shaft, including keys and thrust collars.

f. [One complete pump impeller for each size pump.] [One complete main pump impeller bowl assembly for each size pump, consisting of the impeller bowl, diffuser bowl, suction bell if so equipped, impeller shaft with sleeves, bearings, impeller, and all fasteners required to make a complete assembly.] All spare parts must be duplicates of the original parts furnished and be interchangeable therewith. Pack spare parts in crates as specified in paragraph PROCESSING FOR STORAGE, subparagraph GENERAL. Provide slings if the crates and parts are heavier than 34 kg 75 pounds.

g. Provide copies of complete parts list showing all parts, spare parts, and bulletins for each size pump. Clearly show all details and parts, and adequately describe parts or have proper identification marks.
[1.8 WARRANTY]

**************************************************************************
NOTE: Consider including an extended warranty for the pumping equipment if there is a likelihood that the pumping equipment will be operated very little during the first years due to a lack of water, ongoing interconnected projects, or permitting issues.
**************************************************************************

Provide a warranty for all equipment included under this section against defective workmanship, materials, design, and performance for a period of [_____] years from the date the equipment is accepted. If the equipment or part does not conform to these warranties, and the Government notifies the Contractor within a reasonable time after its discovery, the Contractor must promptly correct such nonconformity by repair or replacement. Coordinate the down time and repair for the equipment with the Contracting Officer. The Contractor is liable during the warranty period for the direct cost of removal of the equipment from the installed location, transportation for repair, and reinstallation on site. The expense of removing adjacent apparatus, installing spare equipment, costs of supplying temporary service, is not included in this warranty provision.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Design and provide [_____] [identical] vertical [axial-flow] [or] [mixed-flow], single [or two-]stage impeller-type pumps, as indicated. The pumping systems include pumps, [diesel engine pump drives], [electric motor pump drives], [and reduction gears].

2.1.1 Design Requirements

**************************************************************************
NOTE: Delete the reference to the pump operating in the dry if the pump is product-water lubricated. Select appropriate alternate paragraph for subparagraph "d". A discharge line is used for all applications, except for stations that have the discharge system integral with the wall of the pumping station.
**************************************************************************

a. Pumps are for the purpose of pumping [_____] from [_____] into [______]. Water pumped will not exceed [_____] degrees C F, will be relatively turbid, and may contain sand, silt, and vegetative trash capable of passing through the trash rack. Trash racks will have [_____] mm inch clear openings. [Design pumps to operate in the dry.]

b. Drive the pumps with the [vertical] [horizontal] [induction] [synchronous] [motors described in Section [26 29 01.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL INDUCTION TYPE] [26 29 02.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL SYNCHRONOUS TYPE]] [horizontal crankshaft diesel engines described in Section [41 65 10.00 10 [DIESEL] [NATURAL GAS] FUELED ENGINE PUMP DRIVES],] [through right angle, vertical shaft, reducers described in Section [35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS]] as indicated.
c. Design pumps so that no major modifications, alterations, or additions will be required to the pumping station or suction bays to accommodate them. Design pumps so that pump parts will fit within the limiting horizontal and vertical dimensions shown and that installation and maintenance can be accomplished by the [interior; overhead traveling crane,] [truck crane using hatch in roof.] Pumps, [or pump parts assembled at pumping station] must be capable of being lowered through floor openings shown with a minimum of 25 mm 1 inch clearance around each side.

[ d. Each pump must discharge into discharge system shown. System loss curve, which includes friction losses from pump discharge elbow to [end of discharge line], [beginning of down [riverward] leg of discharge line], including bend losses, exit loss, and velocity head, is included as Figure 1 at end of this section to permit determination of total head. Determine losses within the pump.]

[ d. Each pump discharge system downstream of pump [discharge elbow] [diffuser] must be compatible with Contractor selected pumps. It must be of type shown and fit within limiting dimensions and elevations shown. Determine all losses for discharge system and submit for approval.]

[ d. Each pump must discharge into discharge chamber shown. System loss curve(s) furnished includes all losses beyond the discharge elbow. Determine losses within the pump.]

[ e. Accomplish priming of siphon [with] [without] assistance of vacuum equipment.]

[ f. Design the pump and column to be installed and removed using the [_____] kg ton overhead crane indicated. Design the pump and column section lengths with the indicated crane lift as a limiting factor.]

[ g. Design documents must be signed and sealed by a professional engineer.]

2.1.2 Capacities

**************************************************************************

NOTE: Select appropriate alternate paragraphs.
Capacities are those determined from earlier design studies for the station. If hydrology/hydraulic studies indicate that gross over-capacity may cause a problem, as in certain discharge chambers, a maximum capacity should be specified. If a siphon discharge system is to be used, there should be a minimum of two design points listed; one for the priming condition and one for the design operating condition.

**************************************************************************

Each pump must:

[ a. The guarantee point for the pump is [_____] L/s gal/min] with a differential head pressure of [_____] m feet with water surface in sump at Elevation [_____] m feet.]

[ b. Be capable of constant-speed operation from a total head corresponding to a [pool-to-pool][static][bowl] head of [_____] m feet down to total]
head corresponding to a [pool-to-pool][static][bowl] head of [_____] m feet [with water surface in the sump at Elevation [______]].

[2.1.2.1 Primed Condition]

Each pump must discharge more than [_____] m3/scfs [_____] L/sgal/min against a total head corresponding to a [pool-to-pool][static][bowl] head of [_____] m feet. This rated condition is based on an intake canal elevation of [_____] m feet and a discharge pool elevation of [_____] m feet. These pumps must be capable of constant speed operation from a pool-to-pool head of [_____] m feet down to and including a pool-to-pool head of [_____] m feet with water surface in the intake sump ranging from elevation [_____] m feet to elevation [_____] m feet. Once the system is primed, the water level in the discharge impoundment can range from elevation [_____] m feet to elevation [_____] m feet.

[2.1.2.2 Start-Up Condition]

Upon startup, each pump must discharge sufficient water for the pumps to become primed and siphon recovery to begin. Since the head conditions will be higher prior to the pump discharge pipe becoming filled, the pump may be operated at a higher speed for a short period of time. The pump flow must be sufficient to result in a flow velocity in the discharge pipe of no less than 2 m per second 7 feet per second. The pump speeds may be changed during the pump priming period, but after priming is accomplished, the pumps must operate as constant-speed pumps. Siphon breaker valves will be used to help prime the pumps.

[2.1.3 Pump Curves]

Indicate on the pump curves for the submitted pumps that the pumps are capable of operating over the entire total head corresponding to the [full pool-to-pool] [static head range]. [Also provide pump curves for the startup condition for pumps that are operated at a different speed during startup.]

Submit preliminary pump curves with the initial pump submittal. Indicate the pump's expected total head, static heads, brake horsepower, and efficiency, as ordinates. Plot against the pump discharge as the abscissa. The curves must indicate that the pump meets all specified conditions of capacity, head, brake horsepower, and efficiency.

2.2 MATERIALS

**************************************************************************
NOTE: The Designer should discuss materials and design details for specific site application with pump manufacturers; and the Designer should edit Sections 05 50 14, 05 50 15, and 08 31 00 as appropriate.

The use of corrosion resistant materials for pump fabrication such as composite impellers or components may be appropriate on a case by case basis. If a designer believes conventional pump materials are not suitable or reliable. The Designer should specifically consult pump fabricators while developing contract documents when considering the use of composite material. Some

If not specified, materials and fabrication must conform to the requirements of Section [08 31 00 ACCESS DOORS AND PANELS] [05 50 14 STRUCTURAL METAL FABRICATIONS] and Section 05 50 15 CIVIL WORKS FABRICATIONS. Material selection not specified is guided by HI 9.1-9.5 for corrosion, erosion, and abrasion resistance. Submit copies of purchase orders, deviations from the specified materials, mill orders, shop orders for materials, and work orders, including orders placed or extended by each supplier. Furnish a list designating materials to be used for each item at time of submittal of drawings. Within 60 days of notice of award submit names of Contractor selected manufacturers of machinery and other equipment contemplated to be incorporated in the work, together with performance capacities and other relevant information pertaining to the equipment. Submit samples of materials as directed. Equipment, materials, and articles installed or used without the approval of the Contracting Officer are at risk of subsequent rejection.

a. Identify each pump by means of a separate nameplate permanently affixed in a conspicuous location. The plate must bear the manufacturer's name, model designation, serial number if applicable, and other pertinent information e.g. horsepower, speed, capacity, type, direction of rotation. Make the plate of corrosion-resisting metal with raised or depressed lettering and a contrasting background.

b. Equip each pump with suitably located instruction plates, including any warnings and cautions, describing any special and important procedures to be followed in starting, operating, and servicing the equipment. Make the plates of corrosion-resisting metal with raised or depressed lettering and contrasting background.

c. Provide safety guards and/or covers wherever necessary to protect the operators from accidental contact with moving parts. Make guards and covers of sheet steel, expanded metal, or another acceptable material and removable for disassembly of the pump.

2.3 METALWORK FABRICATION

2.3.1 Designated Materials

Designated materials must conform to the following specifications, grades, and classifications.

<table>
<thead>
<tr>

2.3.2 Bolted Connections

2.3.2.1 Bolts, Nuts, and Washers

Bolts, nuts, and washers must conform to requirements of paragraph MATERIALS AND METALWORK FABRICATION, subparagraph DESIGNATED MATERIALS, and paragraph VERTICAL PUMPS, subparagraph PUMP COLUMN AND DISCHARGE ELBOW, subparagraph NUTS AND BOLTS for types required. Use beveled washers where bearing faces have a slope of more than 1:20 with respect to a plane normal to bolt axis.

2.3.2.2 Materials Not Specifically Described

Materials not specifically described must conform to latest ASTM specification or to other listed commercial specifications covering class
2.3.3 Metalwork

2.3.3.1 Flame Cutting of Material

Flame cutting of material other than steel is subject to approval of the Contracting Officer. Shear accurately, and neatly finish all portions of work. Steel may be cut by mechanically guided or hand-guided torches, provided an accurate profile with a smooth surface free from cracks and notches is secured. Prepare surfaces and edges to be welded in accordance with AWS D1.1/D1.1M. Do not chip or grind except where specified and as necessary to remove slag and sharp edges of mechanically guided or hand-guided cuts not exposed to view. Visible or exposed hand-guided cuts must be chipped, ground, or machined to metal free of voids, discontinuities, and foreign materials.

2.3.3.2 Alignment of Wetted Surfaces

Exercise care to assure that correct alignment of wetted surfaces being joined by a flanged joint is being obtained. [Where plates of the water passage change thickness, transition on the outer surface, leaving inner surface properly aligned.] When welding has been completed and welds have been cleaned, but prior to stress relieving, carefully check joining of plates in the presence of the Contracting Officer for misalignment of adjoining parts. Localized misalignment between inside or wetted surfaces of an adjoining flange-connected section of pump or formed suction intake cannot exceed the amount shown in Column 4 of Table 1 for the respective radius or normal distance from the theoretical flow centerline. Correct misalignments greater than the allowable amount by grinding away offending metal, providing the maximum depth to which metal is to be removed does not exceed amount shown in Column 5 of Table 1. Do not remove metal until assuring the Contracting Officer that no excessive stresses will occur in the remaining material and that excessive local vibration will not result from removal of the material. Where required correction is greater than the amount in Column 5 of Table 1, reject pipe for use. Proposed procedure for all corrective work, other than minor grinding, must be approved by the Contracting Officer prior to start of corrective work. Finish corrective work by grinding corrected surface to a smooth taper. Length of the taper along each flow line element must be 10 times the depth of the offset error at the flow line. Wetted surface irregularities that might have existed in an approved model cannot be reason for accepting comparable surface irregularities in the prototype pump.

2.3.3.3 Stress-Relieving Procedure

After all fabrication welding is completed, and prior to any machining, stress-relieve the bell and the impeller (if it is fabricated) by heat treatment. Submit proposed stress-relieving procedure.

2.3.4 Examination of Castings

Clean and carefully examine all castings for surface defects. Examine all discovered defects by nondestructive means. Examination personnel must be qualified/certified in accordance with applicable ASTM requirements. Submit the examination procedure and qualification of the examiner. Conduct examination tests in the presence of the Contracting Officer. Choose the examination procedure best suited for the application.

2.3.4.1 Examination Procedures

2.3.4.1.1 Ultrasonic

Conform inspection to the applicable provisions of ASTM A609/A609M.

2.3.4.1.2 Magnetic Particle

Conform inspection to the applicable provisions of ASTM E709.

2.3.4.1.3 Liquid Penetrant

Conform inspection to the applicable provisions of ASTM E165/E165M.

2.3.4.2 Acceptance and Repair Criteria

Acceptance and repair criteria must be in accordance with Section [08 31 00 ACCESS DOORS AND PANELS] [05 50 14 STRUCTURAL METAL FABRICATIONS].
2.4 VERTICAL PUMPS

2.4.1 Speed

**************************************************************************
NOTE: Select appropriate alternate paragraph.
Alternate 1 is used when cavitation testing is part
of the contract. Alternate 2 is used when the pump
will not be tested to determine the cavitation
characteristics and the designer has determined the
maximum speed to be specified based on the NPSHA.
The following criteria should be used by the
designer in determining the maximum rotative speed:

\[ \frac{(SS) \times (NPSHA)^{3/4}}{Q^{1/2}} \]

where:

\[ N_{ss} = \text{pump rotative speed, in revolutions per minute} \]
\[ SS = \text{suction-specific speed} \]
\[ Q = \text{flow, in gallons per minute} \]
\[ NPSHA = \text{net positive suction head available} \]

Maximum value of SS to be used in the formula:

SS = 8,500

A more conservative value of suction specific speed
may be used when operating for extended periods of
time above or below the optimum efficiency point.
**************************************************************************

[ Rotative speed of pump must be no greater than [_____] r/min rpm. Verify
that rotative speed of pump at which the NPSH is produced is no less than
required, as determined by cavitation tests specified in paragraph FACTORY
TESTS (Alternate 2).]

[ Rotative speed of pump must be no greater than [_____] r/min rpm.]

2.4.2 Reverse [Rotation] [Flow]

**************************************************************************
NOTE: Select appropriate alternate paragraph:
Reverse Rotation (1st alternate) and Reverse Flow
(Alternate 2). 1st alternate (bracketed paragraph)
is used when the pumping unit does not have a
non-reverse device. 2nd alternate (bracketed
paragraph) is used when the pumping unit is equipped
with a non-reverse device.
**************************************************************************

[ Each pump must withstand, with no damage, full rotative speed caused by
subjecting the pump to reverse flow. The head used to determine this
reverse rotative speed is calculated from specified highest discharge side
water elevation and lowest pump intake side water elevation.[ Each pump
and its connected electric motor must be capable of full reverse rotative
speed when acting as a turbine by reverse water flow. Use the highest head

SECTION 35 45 01 Page 26
specified in paragraph [STATIC][POOL-TO-POOL][BOWL] HEAD to determine the reverse speed.][ Provide a non-reverse device for drive systems containing reduction gears or engines with .]]

The pump(s) must withstand, with no damage, the full force exerted on it, with the impeller subjected to reverse flow and the upper end locked in place by a backstop. Calculate the head to determine the force developed by this reverse flow from the specified highest discharge side water elevation and lowest pump intake side water elevation. Reverse rotative speed must be [0.0][_____] with instantaneous activation of the backstop.

2.4.3 Efficiency

**************************************************************************
NOTES: Select appropriate alternate paragraph.

All pump specifications should require some minimum efficiency at the primary or normal operating design point. This minimum efficiency should be based on the pump selections made during pump station layout and design.

Alternate 1 is used when pool-to-pool head is specified in paragraph PROJECT/SITE CONDITIONS, and the pump manufacturer is required to model the discharge system (Alternate 2). Alternate 2 is a measure of pump efficiency as defined in HI ANSI/HI 14.6. The stated efficiency is based on the pump selection made during station layout and design.
**************************************************************************

[ Pool-to-pool efficiency at head-capacity condition(s) specified in paragraph CAPACITIES must not be less than [_____] percent when calculated as follows:

Efficiency = \( \frac{Q \times H}{366 \times BKW} \times 100 \)

Where: 
- \( Q \) = Discharge, cubic meter/hour
- \( H \) = Pool-to-pool total head, meters
- \( BKW \) = Pump brake kilowatt

Efficiency = \( \frac{Q \times H}{3960 \times BHP} \times 100 \)

Where: 
- \( Q \) = Discharge, gallons per minute
- \( H \) = Total head, feet
- \( BHP \) = Pump brake horsepower

Pump efficiency, as defined in HI ANSI/HI 14.6, must include losses from the suction bell to the discharge elbow outlet and must not be less than [_____] percent at the head-capacity condition(s) specified in paragraph CAPACITIES.]

2.4.4 Suction Bell

**************************************************************************
NOTE: The recommended minimum thickness of steel

SECTION 35 45 01 Page 27
pipe to be specified is:

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER</th>
<th>MINIMUM THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mm</td>
<td>inch</td>
</tr>
<tr>
<td>Up to and including 750</td>
<td>103/8</td>
</tr>
<tr>
<td>Above 750 and up to and including 1200</td>
<td>131/2</td>
</tr>
<tr>
<td>Above 1200 and up to and including 2100</td>
<td>165/8</td>
</tr>
</tbody>
</table>

More detailed procedure for computing minimum pipe thickness can be found in AWWA M11 Steel Pipe or ASME B31.3 Process Piping. If a formed suction inlet (FSI) is specified, this paragraph should be deleted.

**********************************************************************

Make each suction bell of [either cast iron, cast steel, or welded steel plate,] [stainless steel plate]. Provide a flanged connection for mating with the impeller bowl with a rabbet fit or four equally spaced dowels installed in the vertical position for initial alignment purposes and to maintain concentric alignment of the pump. [Steel plate, if used,] [Stainless steel plate] must have thickness of not less than [_____] mm inch. Each suction bell must be [made in one piece] [split vertically with bolted flanges joining the two pieces together]. Maintain alignment by use of dowels. Support each suction bell entirely by the pump casing. Supports from sump floor will not be acceptable, [except those that are part of a formed suction intake]. [Support umbrellas, if used, by the suction bowl. Construct the umbrella in two pieces if a single piece umbrella could not be removed using the pump opening in the operating floor. Provide bolted flanges on each half of the umbrella and provide for and easily removable bolted connection to the suction bowl. Provide sufficient lifting lugs on the umbrella to aid in handling.]

2.4.5 Impeller Bowl

**********************************************************************

NOTE: The recommended minimum thickness of steel plate to be specified is:

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER</th>
<th>MINIMUM THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mm</td>
<td>inch</td>
</tr>
<tr>
<td>Up to and including 750</td>
<td>131/2</td>
</tr>
<tr>
<td>Above 750 and up to and including 1200</td>
<td>165/8</td>
</tr>
<tr>
<td>Above 1200 and up to and including 2100</td>
<td>193/4</td>
</tr>
</tbody>
</table>

**********************************************************************

Make each impeller bowl of [either cast iron, cast steel, welded steel plate or a combination of cast steel and steel plate] [stainless steel plate] [cast stainless steel]. [Steel plate, if used,] [Stainless steel
plate] must have thickness of not less than [_____] mm inch after machining is completed. Heat-treat and stress-relieve welds before final machining. Provide flanges for mating with the [suction bell][formed suction intake] and the impeller bowl or two-piece construction of the impeller. Provide flanged connections with the suction bell and the diffuser or split construction with a rabbet fit or four equally spaced dowels installed in the vertical position for initial alignment purposes and to maintain concentric alignment of the pump. Machine finish the impeller-swept area in the impeller bowl to at least 3.2 µm 125 microinch rms and concentric with the impeller axis. For mixed-flow impellers, the angle in the impeller bowl must equal the outside angle of the impeller blade tips. Tolerance for concentricity of the impeller with the impeller axis is not greater than 20 percent of the operating clearance between the impeller and the impeller bowl.

2.4.6 Diffuser Bowl

**************************************************************************
NOTE: Use the same thickness for the steel plate as specified in paragraph IMPELLER BOWL.
**************************************************************************

Make each diffuser bowl of [cast iron, cast steel, welded steel plate, or a combination of cast steel and steel plate][stainless steel plate][cast stainless steel]. [Steel plate, if used,][Stainless steel plate] must have a thickness of not less than [_____] mm inch after machining is completed. The diffuser must contain support for the upper impeller shaft bearing and have vanes to guide the pumped flow. Equip the diffuser bowl with a bypass drain, if required, to outside of the pump from the diffuser cavity located between the enclosing tube connection and the impeller. Furnish throttle bushing located in the cavity immediately above the impeller. Design bypass drain and throttle bushing to reduce water pressure on the lower seal. Impeller back-wear rings can also be used to reduce water pressure on the lower seal.

2.4.7 Pump Column and Discharge Elbow

2.4.7.1 Column and Discharge Elbow

**************************************************************************
NOTE: Use the same thickness for the steel plate as specified in paragraph IMPELLER BOWL, above. For most pumps, space should be provided for using a long radius type elbow. Unless the elbow is made of cast materials, the elbow will be the mitered type. The roundness tolerance should be specified when the flexible coupling is not part of the contract. Turning vanes must be used in pumps having an access door to inspect/remove trash.

The following tolerance should be used for specifying the tolerance for the plain end of the elbow.
<table>
<thead>
<tr>
<th>NOMINAL PIPE SIZE m/minch</th>
<th>TOLERANCE ON ACTUAL O.D. m/minch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than or equal to 400 16</td>
<td>Plus/minus 1.5 0.06</td>
</tr>
<tr>
<td>Above 400 16 and up to and including 600 24</td>
<td>Plus/minus 2.0 0.08</td>
</tr>
<tr>
<td>Above 600 24 and up to and including 1050 42</td>
<td>Plus/minus 2.5 0.10</td>
</tr>
<tr>
<td>Greater than 1050 42</td>
<td>Plus 3.0 0.12/Minus 1.5 0.06</td>
</tr>
</tbody>
</table>

Make each column and discharge elbow of [either cast iron, cast steel, or welded steel plate] [stainless steel plate]. [Steel plate, if used,][Stainless steel plate] must have a thickness of not less than [_____] mm inch after machining is completed. Provide elbow of [short radius type][long radius type][mitered type].[ Do not use turning vanes.][ Space turning vanes, if used, at least twice the space of clear space of the trash rack.] If turning vanes made of welded steel plate are used, provide an access door in the discharge elbow to allow personnel to inspect turning vanes and remove trash if necessary. Design column and discharge elbow to withstand internal pressures and external loadings associated with various conditions of pump operation. Provide flanges for mating individual segments together and for mating the pump column to the diffuser bowl. Flanges must have rabbeted fits or four equally spaced dowels installed in flanges for initial alignment purposes and to maintain concentric alignment. Terminate the elbow in a plain-end circular section. Diameter tolerance of plain end is [_____] mm inch. Provide diameter of discharge end of elbow as indicated and allow standard diameter flexible couplings to be used. Use adjustable thrust rods and thrust lugs to transfer the load by bridging the coupling between the pump discharge elbow and discharge piping. Determine the size and number of thrust rods needed for the expected loading. Use a minimum of four thrust rods. Maintain complete access to the discharge piping until the discharge pipe installation is complete, inspected, and approved.

2.4.7.2 Column and Discharge Elbow Support

NOTE: Select appropriate alternate paragraph. Pump Column and Discharge Elbow (1st alternate) is used for conventional pumps supported from the base-plate. Design Pump Unit (2nd alternate) is used for large stations having pumps over 1800 mm 72 inches in discharge diameter and supported from different floors.

[ Design pump column and discharge elbow for suspension from a baseplate assembly specified in paragraph BASE-PLATE AND SUPPORTS and located at operating floor level.]

[ Design each pumping unit for installation as indicated. Install the baseplate for supporting the [electric motor] [gear reducer] at elevation of operating floor, EL [_____] . Support the pump casing at intermediate]
floor, EL [______]. Provide the [support system] [support system consisting of columns extending from baseplate to intermediate floor]. The support system must transfer the entire load on the baseplate to the intermediate floor. Design the support system to maintain proper alignment of the pumping unit and propeller blade setting. Include the support system in the dynamic analysis.]

2.4.7.3 Pumps Discharge Diameter

**************************************************************************
NOTE: A manhole is used if the pump has a shaft enclosing cover that can be removed without disassembly of the pump.
**************************************************************************

Pumps having a discharge diameter greater than 1500 mm 60 inches must contain a manhole. Provide a structural steel bracket with a platform of raised-pattern floor plate similar to the one(s) indicated as a support for maintenance personnel for access to the pump through a manhole. Provide a manhole 600 by 750 mm 24 by 30 inches, or largest practicable size with a gasketed cover, in the column above the diffuser bowl. Provide jack bolts in the cover together with eye bolts to facilitate removal.

[2.4.7.4 Formed Suction Intake

**************************************************************************
NOTE: Select appropriate alternate paragraph.
**************************************************************************

Alternate 1 should be used when a rectangular sump is designed using criteria established by U.S. Army Engineer Research and Development Center (ERDC).

The use of a Formed Suction Intake (FSI) (Type 10), Alternate 2, is determined during the design phase of the station/pump. The Government will furnish all dimensions and be responsible for the design. The FSI was developed by ERDC and is now included in HI ANSI/HI 9.8.

The sump floor elevations should be determined in the design of the pumps/station. The impeller datum elevation should allow the necessary submergence as determined by the computations in EM 1110-2-3105, and verified with pump manufacturers' data.

The Designer should contact at least 3 pump manufacturers early in the project design phase to verify the Designer's pump size estimate. Normally the eye of the impeller is located at minimum sump elevation, and the geometry of the FSI determines sump floor elevation. The early verification is important for the pump house structural design FSI hydraulics are very sensitive to change, and the pump diameter determines the dimensions of the FSI.

In designs where the FSI is not constructed of concrete, it is recommended that all materials indicated, or combination of these materials, should be specified. A hatch in the operating floor is
generally provided in each pump bay to permit the placement of the FSI sections into the sump. If the station design/size does not have space for a hatch, then the opening for the pump is used for placement and removal of the FSI or is designed so that it can be removed using the sump gates and trash rack. The minimum thickness of fabricated material for the FSI should be:

<table>
<thead>
<tr>
<th>EXIT DIAMETER OF FSI</th>
<th>THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mm/m&quot;</td>
<td>mm/m&quot;</td>
</tr>
<tr>
<td>Up to and including 450 18</td>
<td>103/8</td>
</tr>
<tr>
<td>Above 450 18 and up to and including 900 36</td>
<td>131/2</td>
</tr>
<tr>
<td>Above 900 36 and up to and including 1350 54</td>
<td>165/8</td>
</tr>
<tr>
<td>Above 1350 54 and up to and including 2100 84</td>
<td>193/4</td>
</tr>
</tbody>
</table>

When a FSI is used, paragraphs SUCTION BELL and IMPELLER BOWL should be changed to coordinate with the FSI requirements.

The thickness of the rubber gasket must be as follows:

<table>
<thead>
<tr>
<th>FSI EXIT DIAMETER</th>
<th>THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mm/m&quot;</td>
<td>mm/m&quot;</td>
</tr>
<tr>
<td>Up to and including 1200 48</td>
<td>131/2</td>
</tr>
<tr>
<td>Above 1200 48 and up to and including 2100 84</td>
<td>193/4</td>
</tr>
</tbody>
</table>

**************************************************************************

Sump has been designed using information obtained by sump model testing. Changes to sump layout will not be permitted.

Formed Suction Intake (FSI):

a. Provide the FSI water passage with the pump, sized to fit within the limiting elevations and dimensions indicated. Do not locate bearing below the impeller when an FSI is used.

b. Dimensions of the intake elbow and conical transition section of the FSI are relative to the diameter at the top of the cone, as defined on the drawings. The diameter at top of the cone and related dimensions are determined to accommodate the size of pump, providing limiting values for discharge and submergence are not exceeded, the floor of the FSI remains at elevation [_____] and impeller datum is set no higher than elevation [______]. The rectangular transition section of the FSI upstream of the elbow can be modified in length to match the width of the individual pump bay or sump intake. Any modification must be limited to surfaces and dimensions indicated, and must be approved.
c. Construct each FSI of [fabricated steel,] [cast iron,] [cast steel,] or a combination of these materials embedded in concrete][formed concrete as indicated]. Stiffeners used must be on the outside of the FSI to allow smooth flows in the FSI. Size subassemblies of the FSI, unless constructed of formed concrete, to permit placement and removal through [a hatch in operating floor] [the pump opening in the operating floor] [through the sump gate and trash rack]. Bolts used to connect flanges must be stainless steel with bronze nuts. Minimum thickness of fabricated material must be [10][13][16][19] mm [3/8][1/2][5/8][3/4] inch for fabricated portions. Provide grout holes in floor of the FSI to permit full grouting. [FSIs formed in concrete must meet the surface requirements specified in Section 03 30 00 CAST-IN-PLACE CONCRETE and conform to the construction tolerances given in TABLE 1.] [FSIs constructed of iron or steel must conform to the construction tolerances given in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.]

</tbody>
</table>
Machine flanges and drill bolt holes concentric with pump shaft vertical centerline, having a tolerance of plus or minus one fourth of the clearance between the bolt and bolt hole. When fabricated from steel plate, flanges must not be less than [25] [32] [38] [50] mm [1] [1-1/4] [1-1/2] [2] inch thick after machining. Flange thickness after machining cannot vary more than 10 percent of greatest flange thickness. Provide external stiffeners, if needed. Construct fabricated flanges, as a minimum, to the dimensions of AWWA C207, Class B. Design flanges on major components of pump casing (suction bell, impeller bowl, diffuser bowl, and column and elbow piping) such that blind holes necessitating use of cap screws or stud bolts are not used. Design flanges for connection to column pipe by at least two continuous fillet welds. Connect the inside diameter of the flange to pump column with one weld, and connect the outside diameter of the pump column to the flange with the other weld. Final design of welds rests with the manufacturer, and specified welds are the minimum requirement. Parallel machine, when provided on each end of the same component, and mount parallel to a plane that is normal to pump shaft centerline. Flanges on each end of the same component must have parallel tolerance of 0.051 mm 0.002 inch. Finish machine mating surface on flange to 3.2 µm 125 microinch finish or better. Provide flanges with a minimum of three jacking bolts to aid in disassembly of the pump.

2.4.7.6 Flanged Joints

Design flanged joints to be air-and water-tight, without the use of preformed gaskets, against positive and negative operating pressures that will be experienced, except that permanent gasketing compound will be permitted. Provide mating flanges, unless of the male-female rabbet type, with not less than four tapered dowels equally spaced around each flange. If rabbeted fit is not used, then provide the method used to determine concentricity of connected pieces.

2.4.7.7 Nuts and Bolts

Use 300 series stainless steel for bolts used in assembling the pump and its supporting members, including anchor bolts and dowels. Use only bronze nuts and hexagonal bolts and nuts. Also use 300 series stainless steel washers.

2.4.7.8 Galvanic Protection

**************************************************************************
NOTE: Select appropriate alternate paragraph.
**************************************************************************
Alternate 1 should be used for pumps having discharge diameters of 500 mm 20 inches or less.

Alternate 2 should be used for pumps having a discharge diameter greater than 500 mm 20 inches. This may also be used for pumps with sidecharge diameters of 500 mm 20 inches or less when manufacturers' information indicates that this method will be the least expensive. The total weight of anodes to be used for each pump is:

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER mm inch</th>
<th>MINIMUM NUMBER OF ANODES USED</th>
<th>TOTAL WEIGHT OF ANODES USED kg lbs</th>
</tr>
</thead>
<tbody>
<tr>
<td>From 500 20 up to and including 900 36</td>
<td>2</td>
<td>1840</td>
</tr>
<tr>
<td>Above 900 36 up to and including 1200 48</td>
<td>4</td>
<td>3680</td>

[When dissimilar metals are used, electrically isolate dissimilar parts. Verify isolation by checking joint with an ohmmeter.] [When dissimilar metals are used, use zinc anodes. Provide machined mounting pads and install anodes on carbon steel or cast iron parts. Fasten anodes to bare material on the pump so that continuity is obtained between the anode and the pump. Verify continuity by checking the joint with an ohmmeter. Locate anodes on the exterior of the pump below normal sump level. Total weight of anodes used per pump must be 18 [36] [68] kg 40 [80] [150] pounds. Electrically bond pump joints at the joints.]

2.4.7.9 Harnessed Coupling

NOTE: This alternative is used when the flexible coupling is to be furnished by the pump Contractor. The applicable connection should be stated.

Provide a flexible mechanical coupling or split-sleeve type coupling that either conforms to ASTM F1476, Type II, Class 3, stainless steel or ASTM F1476, Type 1, to connect the pump discharge elbow to the transition section [wall thimble] [discharge piping]. Install a minimum of four harness bolts (sized by the pump manufacturer) at each coupling.

2.4.7.10 Wall Thimble

NOTE: This alternative is used when the discharge piping includes the piece that will be embedded in the wall of the station. The size of vent to be used is determined from information in EM 1110-2-3105.
Provide each wall thimble with one plain end to accommodate the flexible mechanical coupling and one flanged end to mate with the [flap gate] [multiple shutter gate] [discharge piping]. The plain end must match the pump discharge elbow in thickness and diameter and drill the flanged end to match, and be capable of supporting without distortion, the [flap gate] [multiple shutter gate]. Provide the seal ring on the wall thimble located so that it is centered in the wall when embedded. In addition, provide a [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 Standard 125 pound flange and locate where indicated. Fabricate the wall thimble from steel plates.

2.4.7.11 Discharge Piping

******************************************************************************
NOTE: Include applicable discharge pipe description.
******************************************************************************

[ Provide discharge piping consisting of a transition section and a wall thimble. Provide a transition section with one plain end and one flanged end, and have a change in cross section from round to [square] [rectangular]. On the plain end, match the pump discharge elbow in thickness and diameter. Arrange the wall thimble for embedment and with the flanges on each end. Mate one end with the flange on the transition section and mate the other end with the flap gate. Fabricate the discharge flange with a minimum dimension of AWWA C207, Class D, and drill to match. The discharge flange must be capable of supporting without distortion, the multiple shutter gate. Provide a seal ring on the wall thimble and locate it so that it is centered in the wall when embedded. In addition, provide a [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 Standard 125 pound flange and locate where indicated. Fabricate the discharge piping from steel plate.]

[ Install the discharge piping as indicated. Match the plain end of each discharge pipe with the pump discharge elbow in thickness and diameter and be able to allow a flexible mechanical coupling to connect it to the pump discharge elbow. [Terminate the discharge piping in a flanged end to mate with a flap gate. Drill the flanged end to match, and be capable of supporting the flap gate without distortion.] [Terminate the discharge piping in an open end.] Provide the discharge pipe with pipe supports or cradles as recommended by the pump manufacturer. Locate the supports between the flexible coupling and the wall, as indicated. Provide suitably-sized thrust restraints at each flexible coupling as indicated. The supports must provide support for the weight of the pipe, the water that will pass through the pipe, and any dynamic forces that may develop due to water flowing through the pipe. Furnish a minimum [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 standard 125 pound flange and locate where indicated. The discharge pipe must be non-galvanized piping of welded or seamless pipe or welded steel plate. Use steel pipe conforming to AWWA C200 with dimensional requirements as given in ASME B36.10M. Provide fittings in compliance with AWWA C208.]

2.4.7.12 Flap Gate

Design the flap gate for pump discharge service with flange-frame with a resilient seat of neoprene or BUNA-N to prevent closing shock. Make the size of the flap gate the same as the discharge pipe size. [Use cast iron for the body of the valve and the flap in compliance with ASTM A126. Use high-tensile bronze ASTM B584- CA 865 for the hinge arms. Design the hinge pins in double shear and of silicon bronze, ASTM B98/B98M- CA 655.]
[Fabricate the flap gate entirely of stainless steel. Use only stainless steel hardware.] Provide lubrication fittings on the hinge arms. Extend the grease lines to a convenient location for lubricating. Provide an anti-locking bar to prevent excessive rotation about the lower hinge pin. Provide a stainless steel leaf spring with rubber pad to safely limit the travel of the flap gate during pumping.

2.4.8 Impeller

**************************************************************************

NOTE: Cast steel and aluminum bronze are normally used when pumps are less than 2100 mm 84 inch. Fabricated steel impellers are used with pumps having discharge diameters 2100 mm 84 inch or greater. Cast stainless steel is used for pumps where the difference between pump NPSHA and NPSHR is small (less than 600 mm 2 feet) or, when severe corrosion is expected.

**************************************************************************

Make the impeller of [cast steel, ] [cast stainless steel, ] [aluminum bronze] or [fabricated of welded steel plate].

2.4.8.1 Removal and Prior To Finishing

After removal from mold, and prior to finishing of surface imperfections, the Contracting officer will inspect castings. Fill and grind minor surface imperfections as necessary to preserve correct contour and outline of impeller and to restore surface imperfections to the same degree of finish as surrounding surfaces. Correct surface pits, depressions, projections, or overlaps showing greater than 2 mm 1/16 inch variation from the general contour for that section. Method and procedure for accomplishing repair must be as required in Section [08 31 00 ACCESS DOORS AND PANELS] [05 50 14 STRUCTURAL METAL FABRICATIONS]. Castings that exhibit surface imperfections (as defined above) covering an area of more than 10 percent of blade surface will be rejected.

2.4.8.2 Balance

**************************************************************************

NOTE: The maximum operating speed is used for driver/pumps which operate at different speeds. The rated operating speed is used with a single speed driver. The g-mm oz-inch used in this paragraph are determined from ISO 1940-1 for grade G6.3. Impellers for pumps having a discharge diameter greater than 600 mm 24 inch must have the impeller weighted. The amount of allowable unbalance or the level of balance in the acceptable standards must be chosen and included in this guide specification. This includes choosing acceptable standard(s). A suggested standard is balance quality grade G6.3 in accordance with ISO 1940-1.

**************************************************************************

Balance each impeller by the two-plane balancing technique. Balance each impeller at [maximum] [rated] operating speed. Check the balance at 110 percent of balance speed, and make needed corrections. Amount of allowable unbalance is in accordance with grade G6.3 of ISO 1940-1. Securely fasten
weights needed to obtain the required level of balance to the inside cavity of the impeller hub. In no case can portions of the impeller be removed or weights be added to the outside of the hub, vanes, or water passages. Submit balancing procedure at least four weeks prior to the date of balancing. Weigh each finished impeller and weight stamped on the bottom of the hub with weight accurate to 0.5 percent of the total weight of the impeller. Weighing and balancing will be witnessed by the Contracting Officer. Submit all impeller weights and the results of impeller balancing.

2.4.9 Shafting

2.4.9.1 Shaft

**************************************************************************
NOTE: Stainless steel shafting should be used when the potential for corrosion is high such as a pump used in a station where the pump/station sump is not capable of being dewatered. The shaft lengths are limited in length by the headroom available. Shaft sections are usually less than 3000 mm 10 feet in length. Vertical adjustment of the shaft should be performed above the operating floor. The motor and gear reducer are normally specified to be hollow shaft type to allow the pump shaft to pass concentrically through the reducer and motor allowing finite impeller elevation adjustments.
**************************************************************************

Each impeller shaft must be stainless steel and intermediate shaft(s) must be [cold-rolled carbon steel] [same material as the impeller shaft]. Design shafting so that (shaft sections do not exceed [_____] mm feet in length and that) any necessary vertical adjustment of the impeller can be made [from the operating room floor] without interfering with shaft alignment. Also provide for removal of the impeller from below without disassembly of the pump above the impeller bowl. If the pump is multi-staged, design to permit the lower bowls and impeller to be easily removed for in-place inspections of upper propeller and bowl. Design shafts for two different design cases. The first uses a factor of safety of 5 based on ultimate tensile strength of the shaft material and rated wattage horsepower of the [motor] [engine]. The second uses 75 percent of the yield strength of the shaft material and [the locked rotor torque of the motor] [maximum wattage horsepower of the engine].

2.4.9.2 Couplings

**************************************************************************
NOTE: Rigid flange couplings should be specified only for pumps having discharge diameters greater than 1800 mm 72 inch. The rigid flange coupling may be specified as an option for all pumps less than 1800 mm 72 inch. Sleeve type couplings should be used for pumps having discharge diameters from 600 mm 24 inch to 2100 mm 84 inch. Threaded shaft couplings can be used for pumps with discharge diameters less than 600 mm 24 inch.
**************************************************************************

Couple the pump and [motor] [gear reducer] shafts[ and pump shaft sections] together using rigid flanged coupling capable of transmitting the forces
and torques involved. Bolt coupling halves together and maintain concentric with each other, by means of a rabbet fit, to within 500 µm 0.002 inch. Retain a shaft coupling nut, if used, by fitted bolts, and comply with all tolerances specified for the coupling. Finish machine the flange and bore in one setup to insure that the flange of the coupling is true to the bore. Each flange must be perpendicular to the bore, and parallel to the opposite end and mating flanges to within 500 µm 0.002 inch. Each flange must be concentric to the centerline of the shaft to within 0.50 mm 0.002 inch. Join together pump shaft sections with sleeve-type couplings capable of taking rotation in either direction. Threads, except on fasteners, cannot be employed in construction of sleeve-type couplings [threaded couplings in which the threaded shaft ends are threaded into the coupling]. Construct couplings, including keys and fasteners, of stainless steel materials. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The finished shaft assembly must be concentric about the shaft centerline to within 100 µm 0.004 inch. Shop assemble couplings and the pump shaft, and inspect for compliance with contract requirements. After inspection, matchmark parts, including fitted bolts, to their mating pieces.

2.4.9.3 Journals

**************************************************************************
NOTE: Select the appropriate alternate paragraph.
The first alternate is used when plain steel shafting is used for the intermediate shafting. The second alternate is used when all the shafting is stainless steel. If self-lubricated bearings are used ensure to specify those in 35 05 40.17.
**************************************************************************

[Provide replaceable stainless steel one-piece journal sleeves at each guide bearing, packing gland and seal locations. [For self-lubricated bearings see 35 05 40.17 SELF-LUBRICATED MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY]. Finish sleeves at all bearings and packing gland locations to at least 32 rms and finish sleeves at seal locations to 16 rms. Securely fasten sleeves to the shaft to prevent movement. Make keys and fasteners, if used, from corrosion resisting steel; fastening by adhesive or welding is not acceptable. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The surface hardness of the sleeves at the bearing and packing gland locations must be as recommended by the pump manufacturer.

][Finish the shaft journal at all guide bearing and packing gland locations to at least 32 rms and finish the shaft at seal journal locations to 16 rms. The option exists to install replaceable stainless steel one-piece sleeves at each bearing, packing gland, and seal locations with the finishes stated above. Securely fasten sleeves to the shaft to prevent movement. Make keys and fasteners, if used, from corrosion resisting steel; fastening by adhesive or welding is not acceptable. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The surface hardness at the seal locations must be as recommended by the seal manufacturer.

]2.4.9.4 Circumferential Line

**************************************************************************
NOTE: The circumferential line with pointer should be used for pumps having 1200 mm 48 inch and greater
**************************************************************************
discharge diameters. The following information will be used for determining whether the pump driver is specified as using a hollow or solid shaft.

Pump drivers with rating less than 745 kW 1000 horsepower are equipped with hollow shafts permitting vertical shaft adjustment from the top of the driver.

Pumps drivers over 745 kW 1000 horsepower are equipped with hollow shafts whenever possible but as a minimum the pump will have a means of vertical adjustment above the operating floor.

Inscribe or etch a circumferential line on the shaft above the stuffing box and mount an adjustable pointer opposite this line in order to indicate a change in vertical position of shaft and to permit realignment after [motor] [gear reducer] removal.

2.4.10 Shaft Enclosure

NOTE: Shaft enclosure tubes are tensioned for pumps with discharge diameters less than 1350 mm 54 inch. Rigid enclosing tubes are used on pumps having discharge diameters 1350 mm 54 inch and greater. External supports or bracing located in the pump water passage are used for pumps with tensioned enclosing tube of 6000 mm 20 ft in length or greater. Self-supported enclosing tubes 4500 mm 15 feet length or greater should have external supports. The enclosing tube is split when pump size is 1800 mm 72 inch or larger. Select appropriate bracketed statements based on the type of pump lubrication being called for.

Provide a shaft enclosure to cover the intermediate shaft and coupling. It [must be placed in tension or ]must be rigid enough to be self-supporting. [Do not use external supports or bracing located in the pump water passage for support of the enclosing tube unless necessary to support intermediate bearings or indicated to be necessary or advantageous by the dynamic analysis required in paragraph DYNAMIC ANALYSIS. Consider the effect of external supports, including rubber inserts, in the dynamic analysis required in paragraph TEST, INSPECTIONS, AND VERIFICATIONS, subparagraph DYNAMIC ANALYSIS.] Design each enclosure [to be watertight and] for easy assembly and disassembly in the field.[ Split each enclosure longitudinally to permit easy removal without removing or disassembling the pump shaft.] [Perforate each enclosure tube sufficiently to allow a free flow of pump discharge water (i.e., product water) to lubricate the shaft bearings.] Construct enclosing tubes, constructed with screw type joints and using tension in the tube to hold alignment, to prohibit the tension tube from unscrewing when the packing gland adjustments are made. [Provide a shaft enclosure for grease-lubricated pumps with a drain having a shut-off valve located outside of the pump to permit draining the enclosure between operation periods. Locate the drain at the bottom of the shaft enclosure.] [On oil-lubricated pumps, fit the enclosing tube below the lowest bearing and above the oil seals with an oil/water drain line to the
outside of the pump. The drain line must have a check valve outside of the pump to preclude the entrance of sump water.]

2.4.11 Guide Bearings and Seals

******************************************************************************
NOTE: The Clean Water Act requires all in water bearings to meet the standard EAL criteria (Vessel General Permit (VGP), or EPA 800-R-11-002). Confirm submitted EAL product data conforms to EM 1110-2-1424. Grease lubrication can be used with all size pumps. Oil lubrication may be used in pumps having discharge diameters of 900 mm 36 inch or smaller. Select appropriate bracketed statements based on the type of pump lubrication being called for. The first water-lubricated bearing alternative is for product lubricated bearings. The second water-lubricated alternative if for externally-provided water.
******************************************************************************

2.4.11.1 Guide Bearings

All in water bearing lubrication must conform EPA 800-R-11-002 for environmental acceptability. Submit in water bearing lubrication product data to show bearings meet environmental, performance, and comparability requirements for the application.

[Provide each pump with sleeve-type bearings designed for [grease] [oil] lubrication. Each bearing must have a bronze lining in contact with shaft journal and must be replaceable type. Arrange the bearing liner for maximum distribution of [grease] [oil] for lubrication of journal surface. Bearings must have a surface finish of 0.80 µm 32 microinches rms or better to match the journal finish. Since pumped water may contain some fine sand and silt in suspension, give special attention to the design and selection of bearing parts, especially seal rings, to preclude entrance of foreign material between the bearing and journal due to differential water pressure.

][Provide elastomeric polymer alloy bearings, sealed in the shaft enclosure. Support the bearings in threaded bronze sleeves acting as an enclosing tube. Ensure the bearings are submerged in water when the pump is in operation. Accomplish lubrication by pump discharge water (product water) free-flowing through perforations in the shaft enclosure tube.

][Provide each pump with bearings that are grooved and continuous. Machine the bearings to marine clearances for strained canal water lubrication and of sufficient length and diameter to keep bearing pressure to the allowable design. Select bearing thicknesses and marine clearances to allow for material swell from water submergence. Shaft bearings may be located as the design dictates with the following exceptions. Provide no fewer than three bearings in the pump with a maximum bearing spacing of 1.5 m 5 feet. Locate bearings at the top of the diffuser section, above the impeller, and near the baseplate. Bearings in the right angle gear, other than the thrust bearing, are not acceptable for use as pump shaft support. Support the line shaft bearing by the diffuser inner cone fabricated assembly. Secure tubing for bearing lubrication water to and routed on the outside of the casing for each bearing. The tubing must be continuously welded to a diffuser vane or bearing support to cross from the outside of the casing to the bearing mounting assembly.
2.4.11.2 [Oil][Grease] Lubrication Shaft Seals

**************************************************************************
NOTE: Select appropriate alternate paragraph. The designer must select the appropriate seal material which is compatible with the selected oil lubrication.
**************************************************************************

Pumps designed for oil lubrication must have a shaft seal system located below the upper pump shaft bearing. The seal system consists of a seal containing two lip elements. The element facing the bearing must have a stainless steel garter spring back-up and be constructed of [tetrafluoroethylene][fluoropolymer elastomer][Buna N]. The secondary element faces the impeller and is constructed of tetrafluoroethylene. Use a bullet-shaped assembly tool or other special tool over the end of the shaft or grooves in the shaft to preclude damage to the lip element during assembly. Assembly tools used are considered a special tool and must be furnished to the Government as part of special tools specified in paragraph SPECIAL TOOLS. Pumps having two stages must have seals to protect the extra bearings required by two stages of construction.

Pumps designed for grease lubrication must have a shaft seal consisting of lip seals. The seal system consists of a lip-type seal located on each end of the bearing. Each seal must contain a lip element having a stainless steel garter spring back-up and be constructed of [tetrafluoroethylene][fluoropolymer elastomer][Buna N]. Face the lip element out, away from the bearing to keep water from intruding into the bearing chamber. The lowest bearing must have an additional grease seat with the lip facing away from the bearing. Use a bullet-shaped assembly tool or other special tools over the end of the shaft and shaft grooves to preclude damage to the lip element during assembly. The assembly tool used is considered a special tool and must be furnished to the Government as part of special tools specified in paragraph SPECIAL TOOLS.

2.4.11.3 Product Lubricated Pump Bearings

Submerged pump bearing must be [product lubricated][externally supplied water lubricated] and meet the following requirements:

a. Fabricated from an elastomeric material or polymer composite material and not require petroleum lubricants for operation.

b. Operate in [brackish][fresh] water that may contain [sand] [silt] [vegetative trash].

c. Does not require service or replacement for [50,000] [_____] operating hours.

2.4.12 Bearing Heat Sensors

**************************************************************************
NOTE: Bearing heat sensors may be used in pumps having a discharge diameter larger than 600 mm 24 inches. Pumps with large discharge diameters should be furnished with heat sensors for the impeller.
**************************************************************************
bearings only, when the estimated annual operation is less than 100 hours per pump. Pumps with greater operating hours per year may be equipped with bearing heat sensors for all bearings in the pump. Schedule 80 guard pipes must be used when the unsupported length is 450 mm 18 inches or less. Schedule 120 should be used for greater unsupported lengths.

**************************************************************************

Fit [the impeller shaft bearings] [each bearing] with temperature-sensing elements, inserted in the bearings to within 3 mm 1/8 inch of shaft. Provide these temperature-sensing elements with temperature readouts mounted [on the [engine] [motor] instrument board] [at a central location as shown]. Provide a visual and audible alarm system to warn of bearing overheating. Provide temperature indicator with dual outputs that have setpoints that are separately adjustable. Support leads and protect them from water and mechanical damage. Terminate the leads outside of the pump casing in a waterproof connection head and cap until final connections are made in the field. The connection head must be rated watertight to 175 kPa 25 psi. Lead protection consists of pipes fastened to the pump with brackets using bolts and nuts to permit their removal, and constructed with enough unions to be completely disassembled. Leads passing through the pump water passage in the pump must either be contained in a guide vane or be protected by [Schedule 80] [Schedule 120] pipe. Make protection pipe removable if connected to the shaft-enclosing tube. Install bearing heat sensors as [shown in Figure 2 at end of the section] [indicated]. Run leads and wiring to a junction box located on the baseplate. Provide a terminal strip in the junction box for connection of wiring to temperature readouts.

2.4.13 Thrust Bearing

Provide a thrust bearing in the [speed reduction gear][motor] to carry total thrust load[ as specified in [_____]].

2.4.14 Packing Gland

Provide [grease-] [water-]lubricated packing gland split longitudinally to facilitate removal or renewal. Arrange it to permit inspection, repair, removal, or replacement of packing without entering pump from below operating room floor. Provide eye bolts and tapped holes in each half of the split gland if halves weigh over 14 kg 30 pounds each.

[2.4.15 Siphon Breaker Valve

Provide a siphon breaker valve assembly for each of the vertical axial-flow pumps. Provide [mechanical, self-actuating] [electrically-operated] valves. Install each assembly at the top (summit) of the discharge pipe and must vent air from the discharge pipe when the pump is started. The assembly must also permit air to enter the discharge pipe through the siphon breaker valve to prevent reverse siphoning of water when the pump is stopped. Size the valves based on the pumping conditions (e.g. flow, head, discharge pipe diameter) of the specific system. If a mechanically-actuated valve is chosen, size the valve to allow air to relieve at a maximum of 90 m per second 300 feet per second. Provide a means to operate the valve manually to stop back-siphoning through the pump in case the normal operator of the siphon breaker valve fails.
2.5 LUBRICATION SYSTEM

NOTE: Select appropriate alternate paragraph. Oil lubrication may be used for pumps with discharge diameters up to and including 900 mm (36 inch). Grease lubrication may be used for all size pumps. The centralized pressure lubrication system will be used when grease lubrication is selected. Select the water-lubricated bearings bracketed information if this type of lubrication is being used. The Clean Water Act requires all in water bearings to meet the standard EAL criteria (Vessel General Permit (VGP), or EPA 800-R-11-002). Confirm submitted EAL product data conforms to EM 1110-2-1424.

All in water bearing lubrication must conform EPA 800-R-11-002 for environmental acceptability. Submit in water bearing lubrication product data to show bearings meet environmental, performance, and comparability requirements for the application.

Oil lubrication of shaft bearings consists of introducing oil at the top line shaft bearing and allowing oil to run down the shaft for the lubrication of the lower bearings. Oil lubrication consists of an oil reservoir mounted on the pump baseplate or pump driver at such height to permit gravity flow of oil to the highest lubrication point of the pump shaft. Construct the reservoir of transparent material to permit observation of the quantity of oil in the reservoir. The oil reservoir must have a minimum capacity of 1 L (1 quart). The reservoir must have a solenoid valve to permit oil flow whenever the pump driver is in operation. The flow rate from the oil reservoir must be adjustable from five drips per minute to constant flow. The reservoir valve must permit manual flow of oil when the pump driver is not operating for prelubrication of the shaft bearing. Construct the oil line from the oil reservoir to the pump line shaft of stainless steel tubing and support at sufficient locations to preclude vibration of tubing when the pump is operating. If the pump has a bearing located below the impeller, this bearing must be grease-lubricated. Provide a grease line with a grease fitting from this bearing to a location on top of the baseplate. Provide a grease reservoir with this bearing configuration for containing extra grease. Lubricate shaft packing by grease. Run the grease lines to a location outside of the driver pedestal and provide with a fitting for manual lubrication.

Support grease lines to each bearing and protect them from water and mechanical damage. Grease line protection consists of channels fastened to the pump with brackets, using bolts and nuts to permit removal. Grease lines passing through the pump water passage must either be contained in a guide vane or be protected by Schedule [80] [120] pipe. This protection pipe must be removable if connected to the shaft-enclosing tube. Prefill grease lines before connection to bearings. Terminate grease lines above baseplate for connection to the lubricating grease pump.

Provide lubrication for the bearings from the water being pumped (i.e., product water) by means of perforations in the shaft enclosure. Design the perforations such that the shaft tube is constantly filled with water during pump operation, thereby continually covering the contact surfaces of
the bearings. If upper bearings will not receive sufficient pumped water for lubrication, use another means to provide sufficient water to these bearings using either product water or water from the intake canal. Provide a means to indicate visually that the upper bearing(s) and packing gland are obtaining sufficient lubrication water.

2.5.1 Supplemental Lubrication Water
