Attach the manufacturer's standard valance to the headrail by metal or plastic holders which grip the top and bottom edge of the valance and accept an insert of the same material as the slats. Provide sufficient clearance behind the valance to permit the louvers to tilt without interference. Extend the headrail cover the full width of the blind.[ Provide returns].

2.1.3.5 Controls

**************************************************************************
NOTE: Typically, a tilting control baton is used because it is unobtrusive. Control mechanisms generally are on the right side, but window placement may require the controls to be placed on the left side for ease of operation.

Select which direction the vertical blind will traverse in the Placement Schedule, considering there must be adequate space for the width of the stack without concealing any electrical or mechanical components.
**************************************************************************

Provide tilting and traversing controls that hang compactly at the side of the blinds and reach within 1500 mm 5 feet of the floor. Provide [tilt/traverse control][bead chain tilting control] that tilts all vanes simultaneously to any desired angle and hold them at that angle. Provide louvers that traverse [one way to the right] [one way to the left] [two-way split]. [ The traversing control cord will be minimum 1.78 mm 0.070 inch in diameter with a minimum breaking strength of 556 N 125 pounds. Anchor the
Provide louvers that traverse along the headrail by pulling one side of the looped cord [fastened to a cord tension pulley] [or] [a fiberglass wand that tilts the louvers by turning the wand and traverses the louvers by using the wand as a control]. Sliding glass doors will have a one way draw with stackback occurring opposite door openings.

2.1.3.6 Connectors and Spacers

The connector must be flexible, smooth and flat to slide unhindered when carriers move independently of each other, and to nest compactly when carriers are stacking. Relate the length of the links to the louver width in order to equally space the traversing louvers, to maintain uniform and adequate overlap of louvers, and to fully cover the width of the opening.

2.1.3.7 Intermediate Brackets

Provide intermediate installation brackets for blinds over 1575 mm 62 inches wide.

2.2 COLOR

**************************************************************************
NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawings are used when the project is designed by an Architect or Interior designer. Color must be selected from manufacturer's standard colors or identified as a manufacturer's color in this specification only when the project has minimal finishes.

When the government directs that color be located in the drawings, a note will be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

When more than one type, pattern or color is specified, identify location.

When a manufacturer's name, stock number, pattern, and color is specified for color, be certain that the product conforms to the specification, as edited.
**************************************************************************

Provide color, pattern and texture [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [as indicated] [selected from manufacturer's standard colors] [______]. Color listed is not intended to limit the selection of equal colors from other manufacturers.]
PART 3    EXECUTION

3.1    EXAMINATION

After becoming familiar with details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2    WINDOW TREATMENT PLACEMENT SCHEDULE

**************************************************************************
NOTE: The Window Treatment Placement Schedule will be provided at the designer's option to clarify placement of the treatments. When all exterior windows are to receive a window treatment, a note can be made to this effect instead of filling out the schedule. The location of the window treatment should be clearly defined within this specification.
**************************************************************************

[All exterior windows include [_____] ] [Provide window covering as follows:

<table>
<thead>
<tr>
<th>Room Number/Name</th>
<th>Window Covering Type</th>
<th>Vertical Blind Draw Direction</th>
<th>Window Type</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

3.3    INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

Submit drawings showing fabrication and Installation details. Show layout and locations of track, direction of draw, mounting heights, and details. Provide Manufacturer's Instructions and Operation and Maintenance Data. Perform installation of window blinds in accordance with the approved detail drawings and manufacturer's installation instructions. Install units level, plumb, secure, and at proper height and location relative to window units. Provide and install supplementary or miscellaneous items in total, including clips, brackets, or anchorages incidental to or necessary for a sound, secure, and complete installation. Do not start installation until completion of room painting and finishing operations.

3.4    CLEAN-UP

Upon completion of the installation, inspect window treatments for soiling, damage or blemishes; and adjust them for form and appearance and proper operating condition. Repair or replace damaged units as directed by the Contracting Officer. Isolate metal parts from direct contact with concrete, mortar, or dissimilar metals. Ensure blinds installed in recessed pockets can be removable without disturbing the pocket. The entire blind, when retracted, must be contained behind the pocket. For blinds installed outside the jambs and mullions, overlap each jamb and mullion 20 mm 0.75 inch or more when the jamb and mullion sizes permit. Include all hardware, brackets, anchors, fasteners, and accessories necessary for a complete, finished installation.

NOTE: This guide specification covers the requirements for draperies, drapery hardware, and installation.

Note: Use Section 12 21 00 for WINDOW BLINDS

Note: Use Section 12 24 13 for ROLLER WINDOW SHADES

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

This guide specification includes tailoring options for Motorized Drapery Rods. Selection or deselection of a tailoring option (select view-tailoring options) will include or exclude that option in the section. Specific project editing is still required for the resulting section.

Motorized drapery systems must be coordinated with electrical and HVAC systems (energy conservation measures), as well as the drapery manufacturer to verify weight and related carrying hardware.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
NOTE: On the drawings, show:

1. Windows and other locations requiring drapery. Indicate whether drapery extends to ceiling or to specific height above windows.

2. Location of each different drapery fabric when more than one type, pattern or color is to be provided.

3. Width of window and width of drapery extension if bay window.

4. Location of sample window installation, if appropriate.

5. Indicate draw direction when one-way draw traverse rods or tracks are to be provided.

6. Indicate motor location and any integrated components or accessories.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

**Drawings; G[, [_____]]**

**SD-03 Product Data**

**Drapery System**

**SD-04 Samples**

**Drapery Fabric; G[, [_____]]**

Submit a range of three samples, 900 by 900 mm 36 by 36 inches or larger, to match the fabric quality, weight, pattern, and color shown or specified. Once selected, label approved samples to identify locations for their use in the project. Maintain identification and approval markings until final acceptance of the work.

**Motor and Controller; G[, [_____]]**

**NOTE:** Coordinate with the drapery hardware specified for the project. Should the designer choose to indicate the location for the sample window installation, clearly indicate the location on the project drawings and edit the paragraph accordingly.

**Finished Drapery**

Provide one full size window sample installation including hardware. Install the finished drapery on a [stationary] [traverse] [rod] [or] [track] [at the location indicated].

**SD-06 Test Reports**

**Flame Resistance**

**SD-07 Certificates**

**Indoor Air Quality for Fabrics; S**

**SD-08 Manufacturer's Instructions**

**Drapery Hardware**

**Motor and Controller**
Special Fabrication

Before fabrication, submit the manufacturer's printed instructions for fabrics requiring special fabrication methods.

SD-10 Operation and Maintenance Data

Drapery System, Data Package 1; G[, [_____]]

Motor and Controller

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

**************************************************************************

NOTE: The Government's preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, it must be verified there is a certified product available that is both cost effective and appropriate for the project. Retain the bracketed sentences when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness. In addition, when these sentences are retained requiring Greenguard or SCS products, also include the Indoor Air Quality Certificates in SD-07 submittals of this section.

**************************************************************************

[1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality Certifications

1.3.1.1 Fabrics

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

]1.4 DRAWINGS

Submit drawings indicating the following:

Windows and other locations requiring drapery extent of drapery, to ceiling or to specific height above windows; location of each different drapery fabric when more than one type, pattern or color is to be provided; width of window and width of drapery extension if bay window. Motor and Controller location and any integrated components or accessories.

1.5 SYSTEM REQUIREMENTS

Submit data for completed drapery system in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Include laundering and dry cleaning instructions for fabrics requiring special care. Furnish separate
instruction sheet for each material (one for fiberglass, one for Verel). For fabrics which are not permanently or inherently flame resistant, furnish instruction to include frequency and process required for retreating the fabric to renew the effectiveness of the flame resistant treatment. Head each sheet with name and number of room or rooms in which each material is hung. In lieu of instruction sheets, provide instructions on small, permanent labels (either iron-on type or sewn-on) affixed to back of the heading of each panel.

1.6 DELIVERY, STORAGE, AND HANDLING

Deliver draperies and hardware to the site in sealed containers clearly labeled with manufacturer's name and contents. Store in a safe, dry, clean, and well ventilated area. Do not open containers until needed for installation, unless verification inspection is required.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Fabrics

Provide fabrics meeting the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification or validation of indoor air quality for fabrics.

2.1.1.1 Drapery Fabric

**************************************************************************
NOTE: Generic descriptions are preferred in order to promote competition. However, due to variety of fabrics available, manufacturer's names and designations may be the more practical method of describing desired fabrics. When a manufacturer's name and designation are used, add the following note to text: "Manufacturer's name and fabric designation are provided to identify the fabric weight, pattern, weave, texture, and color desired. Other manufacturers' products meeting the requirements specified and having similar fabric weight, pattern, weave, texture, and color will be acceptable."

When project requires matching a standard sample, include last sentence. Make fabric sample available at location stated for inspection by prospective bidders when special fabrics are required.

If more than one fabric is required, repeat the listing as necessary.
**************************************************************************

ASTM D3691/D3691M. Provide fabric manufactured from [man-made] [or] [natural] fibers. Fabric physical characteristics must be as [indicated.] [follows:]  

a. Finished fabric weight: [_____] to [_____] kilograms per square meter ounces per square yard
b. Pattern: [Printed] [Woven] [______]

c. Weave: [Open (25.1 to 50 percent)] [Semi-open (7.1 to 25 percent)]
[Closed (0 to 7 percent)]

d. Texture: [Burlap] [Smooth] [Twill] [______]

e. Color: [______]

f. Shading coefficient (single glass with drapery): [______]

[A sample of each drapery fabric to be matched is on display at [______].

2.1.1.2 Drapery Lining

********************************************************************************
NOTE: Delete this paragraph if unlined draperies are specified. Other lining fabrics may be specified in the blank space provided. Specify lining color.
********************************************************************************

[Insulated], [soft blackout,] [______], color [______] [as indicated].

2.1.1.3 Flame Resistance

********************************************************************************
NOTE: NFPA 701 includes small and large scale test procedures. The large scale test is more severe than the small scale test. NFPA 701 provides for optional use at the discretion of the authority having jurisdiction. National Fire Protection Association 101, "Code for Safety to Life from Fire in Buildings and Structures", requires both tests for fabrics used in assembly, educational, health care, detention and correctional, and residential occupancies.

For other occupancies, the large scale test should be specified only when stringent flame resistance requirements are necessary, or when the nature of the fabric specified is such that excessive melting or shrinkage will render the small scale test ineffective. Otherwise, the small scale test requirements are adequate in most cases.

A variety of flame-retardant treatments are available. Generally, they fall into two broad categories: (1) permanent type, and (2) the less expensive, renewable type. Permanent treatments retain their effectiveness through a number of cleanings without reapplication. Renewable treatments, however, must be reapplied periodically, frequently after each cleaning, which imposes a continuing maintenance burden. Permanent treatments can be successfully applied to most fabrics. Only a few fibers or fabrics are limited to renewable treatments. Specify permanent treatment except
where the fiber type or other fabric characteristics prohibit use of this type.

NFPA 701. Drapery fabric and lining must pass the [small] [and] [large] scale test. Treatment to enhance flame resistance must be [permanent] [renewable] type. If treated, fabric must pass the [small] [and] [large] scale test after being subjected to the accelerated dry cleaning or laundering cycles specified in NFPA 701.

2.1.2 Sewing Thread

Pre-shrunk mercerized cotton (50/3) or monofilament in equivalent size, except do not use monofilament in the heading.

2.1.3 Heading

2.1.3.1 Heading Hooks

Slip-in-type, [bright zinc-plated][chromium-plated,][nickel-plated steel,] and of a size adequate to hold the heading upright. Provide one hook for each pleat. Provide 10 percent [_____] surplus hooks for possible lost or damaged hooks.

2.1.3.2 Snap-Tape System (Ripplefold)

Heavy vinyl or nylon tape with locking fasteners attached to tape to form desired pleat spaces and fullness. Cut tapes to size and sew to drapery fabric to form the heading.

2.1.4 Drapery Hardware

**************************************************************************

NOTE: Unless both stationary and traverse rods or tracks are required, delete the type not to be used.
When traverse, indicate whether two or one-way draw; when one-way, select whether left-to-right or right-to-left.

**************************************************************************

**************************************************************************

NOTE: Permit Contractor's option of steel or aluminum rods and tracks unless the desired finish cannot be provided with both materials or the installation dictates the use of one particular material.

**************************************************************************

[Stationary] [and] [traverse] [wall-mounted rods] [and] [ceiling mounted tracks] of heavy-duty type. [Traverse rods or tracks must be [manually operated][motorized], [center close two-way] [one-way draw] [left-to-right] [right-to-left]. Rods and tracks must be cold-rolled, commercial quality steel minimum 0.75 mm 0.030 inch thick or extruded aluminum minimum 1.27 mm 0.050 inch thick. Rod and track cross section width and depth must be sufficient to carry the drapery without sagging. Track configuration (number of channels) must be such so as to permit drapery operation as specified or indicated. Finish steel components with a [white] [_____] baked enamel, vinyl, or epoxy coating as standard with the manufacturer. Finish aluminum components with [an anodic [clear (natural)] [bronze]
[_____] coating] [a baked enamel, vinyl, or epoxy coating] as standard with
the manufacturer. Provide smooth and non-sticking sliding surfaces.
Provide one-piece rod and track up to 4875 mm 16 feet long. Provide steel
brackets and intermediate supports. Provide one manufacturer's design
throughout.

2.1.4.1 Track Sets

Include ceiling track, sliding or rolling carriers, and caps for stationary
deraperies; ceiling track, sliding or rolling carriers, master sliding or
rolling carriers, ball bearing end pulleys, and traverse cord with cord
[tassels] [tension pulleys] for traverse draperies.

2.1.4.2 Rod Sets

Include wall-hung rod, sliding or rolling carriers, brackets, and
intermediate supports with 65 to 90 mm 2-1/2 to 3-1/2 inch projection for
stationary draperies; wall-hung rod, sliding or rolling carriers, master
sliding or rolling carriers, ball bearing end pulleys, brackets,
intermediate supports with 65 to 90 mm 2-1/2 to 3-1/2 inch projection, and
traverse cord with cord [tassels] [tension pulleys] for traverse draperies.

2.1.4.3 Traverse Cord

**************************************************************************
NOTE: When traverse draperies are required, select
cord tassels or tension pulleys.
**************************************************************************

Size No. 4 with fiberglass center. Provide cord [tassel with lead weight
center and plastic coating] [tension pulley, metal tube type, with mounting
bracelet, helical spring, and ball bearing pulley wheel]. Finish color,
white or off-white.

2.1.4.4 Hand Traverse Cordless Track System

Extra heavy duty track assembly with baton on roomside of draperies where
it is readily visible and easily used. [Ceiling mounted] [side-wall
mounted] in extruded aluminum track anodized in [clear (natural)] [bronze]
[_____] finish.

2.1.4.5 Motor and Controller

Provide motor[s] for [single][double] track system, complete with remote
controller and manufacturer's instructions for installation and operation.
Verify motor size is adequate for drapery system to be installed.
Coordinate with [existing][new] electrical system for power supply and
location of motor mounting. [ Coordinate thermostatic setting instructions
for automated systems.]

2.1.4.6 Snap-Tape System Track

Dovetail slots in clear folding linkage. Provide one-piece molded plastic
snap tab type carriers with snap-on components sewn to drapery heading.

2.1.5 Fasteners

Provide [zinc][cadmium][_____] plated.
2.2 FABRICATION

Prior to cutting and fabrication, field measure each drapery location paying particular attention to field conditions affecting the work.

2.2.1 Drapery Fabrication

2.2.1.1 Panels

**************************************************************************
NOTE: Select fullness required, enter percentage and edit fullness definition to suit (i.e. 200 percent fullness is defined as 2 times the rod width plus overlaps and returns.) Select appropriate length.
**************************************************************************

Make from full or half widths of fabric to give a minimum of [200] [250] [300] [_____] percent fullness. [_____] percent fullness is defined as [2] [2 1/2] [3] [_____] times the rod width plus overlaps and returns. Provide [conventional french pleats] [ripplefold]. Draperies must be [floor] [sill] [apron] length. [Floor length draperies must hang 25 mm 1 inch above finish floors.] [Sill length draperies must hang 13 mm 1/2 inch above window sills and heating-air conditioning units.] [Apron length draperies must hang 25 mm 1 inch below bottom of window aprons.] Provide table-sized drapery panels with a plus or minus tolerance of 6 mm 1/4 inch accurately laid-out before cutting. Cut fabric to allow for pleats and for outside ends to return to the walls. For traverse draperies, allow for a minimum overlap of 75 mm 3 inches at the center. Accurately match patterned fabrics to provide identical designs horizontally and vertically on each window within each room. Where variations in length or placement of windows occur in a room, match patterns horizontally. When fabricating panels from fabrics which require special methods or instructions, conform to the workroom instructions provided by the fabric manufacturer. Sew seams and hems using a firm interlocking stitch at a stitch rate per millimeter inch appropriate to fabric being sewn. Sew with enough slack present so that thread shrinkage due to laundering and dry cleaning will not pucker seams and hems. Do not expose seam and hem raw edges.

2.2.1.2 Headings

**************************************************************************
NOTE: This specification covers conventional triple french pleat and ripplefold construction and heavy-duty rodding. Special "architectural" type patented pleating systems are not included. Where special heading treatment is required, appropriate requirements should be incorporated into the project specification.
**************************************************************************

Pleat evenly to required widths. Make headings 100 mm 4 inches high with triple french pleats, and double fold. Include permanent finish stiffener of buckram, crinoline, or pellon across entire heading. Paper stiffening is not acceptable. Machine stitch pleats for a depth of at least 95 millimeters 3-3/4 inches. Do not use horizontal stitching across the width of the heading.
2.2.1.3  Seams

Join widths by serging, overlock, and safety stitch. Retain selvage when practical.

2.2.1.4  Hems

**************************************************************************
NOTE: When sheer fabrics are used, suitable cotton covered beaded tape should be specified in lieu of standard covered weights for better appearance.
**************************************************************************

Double fold hems (top and bottom) and blind stitch so as not to show on the panel face. Make side seams 38 mm (1-1/2 inches) wide and bottom seams 100 mm (4 inches) deep with weights sewn 13 mm (1/2 inch) above hem bottom. Provide weights at corners and each vertical seam. When lining is attached to the drapery fabric, single fold heading is acceptable, however, double fold the bottom hem.

[2.2.2  Lining Fabrication

**************************************************************************
NOTE: Delete this paragraph if unlined draperies are specified.
**************************************************************************

Lock stitch lining to the back of the fabric panel. Hem fabric panel and lining panel separately at the bottom.

[2.2.3  Tie-Backs

**************************************************************************
NOTE: Delete this paragraph if drapery tie-backs are not required. Specify tie-back materials, if other than same as draperies. Specify tie-back width and length, if other than specified.
**************************************************************************

Make from [same material as draperies] [______], [75] [______] millimeters wide by [750] [______] millimeters [3] [______] inches wide by [30] [______] inches long. Fabricate from a double thickness of fabric, press flat to provide specified width, and locate seam at the bottom fold so as to permit the tie-back to be reversible. Provide bone or plastic ring end fastenings to loop over tie-back hooks.

[2.2.4  Valances

**************************************************************************
NOTE: Delete paragraph if valances not required.
**************************************************************************

[Rod-hung, fabricated in the same manner as draperies and of [same material] [______].] [Box-type, with sides and top constructed of 25 mm (1 inch thick) [softwood pine] [______], and 10 mm (3/8 inch thick) plywood front. Cover front, sides and bottom edges of valance with batting, stretch fabric [and trim] evenly and neatly over valance exterior, and fasten to the inside. Provide [same fabric as draperies] [______]. Paint interior of valance. Shape valance bottom front edge [straight] [______].]
Make valance of required width to span the window, and [_____] millimeters inches high. Make depth of valance adequate to ensure proper appearance and to permit proper operation of traverse draperies.

3.1 EXAMINATION

Ensure that work of other trades and cleaning operations are completed. Test completed installation to ensure smooth and continuous operation of all draperies, hardware and accessories.

3.2 INSTALLATION

Install draperies in rooms and areas [indicated] [as scheduled herein]. Include all material indicated, specified, or necessary for a complete finished drapery installation. Contractor is responsible for the required quantities of draperies and hardware.

Do not install building construction materials that show visual evidence of biological growth.

3.2.1 Hardware

Install in accordance with the manufacturer's printed instructions and as specified herein. Install ceiling tracks parallel to walls and windows, fasten at each end, at 400 mm 16 inches from each end and with additional intermediate fasteners spaced not more than 1200 mm 48 inches apart.

Install wall rods with end brackets and provide intermediate support brackets 600 mm 24 inches from each end with additional intermediate support brackets spaced not more than 1200 mm 48 inches apart. Provide fasteners for installation as follows:

<table>
<thead>
<tr>
<th>Fastener</th>
<th>Structural Material</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wood or sheet metal screw</td>
<td>Wood</td>
</tr>
<tr>
<td>Self tapping screw</td>
<td>Metal</td>
</tr>
<tr>
<td>Case hardened, self-tapping sheet metal screw</td>
<td>Sheet metal</td>
</tr>
<tr>
<td>Screw or bolt in expansion shield</td>
<td>Solid masonry</td>
</tr>
<tr>
<td>Toggle or molly bolt</td>
<td>Hollow masonry, wallboard, plaster</td>
</tr>
</tbody>
</table>

3.2.2 Draperies

Install with a minimum clearance of 6 mm 1/4 inch between the ceiling and top of drapery heading. Floor length draperies must hang 25 mm 1 inch above finished floors; sill length, 13 mm 1/2 inch above window sills and heating-air conditioning units; and apron length, 25 mm 1 inch below bottom of window aprons. Insert heading hooks at rear of each pleat, placed to obtain the clearance specified. Press well before hanging, except fiberglass. Dress-down and adjust hung draperies to provide best form and appearance. Traverse draperies must operate smoothly and easily over the full range of travel. Remove incorrectly sized drapery and remake to correct size. Remove damaged, spotted, or otherwise defective fabric and repair to original state or replace with new material.
3.2.3 Valances

Install with top edge parallel to ceiling.

3.3 DRAPERY SCHEDULE

**************************************************************************
NOTE: Some projects require several drapery treatments. Where such variations exist, a drapery schedule made as a part of this section or should be included in the drawings. The schedule and any necessary detailed drawings should be cross-referenced. Schedule and drawing data should include all necessary information, such as: areas and rooms to receive draperies; size and placement of each; type and location of rods or tracks, (ceiling-hung, stationary, center close two-way, etc.); drapery length, (floor, sill, or apron); whether lined or unlined; fabric type, color, and pattern unless covered in paragraph FABRICS.
**************************************************************************

[ All exterior windows include [____].

][Provide window covering as follows:

<table>
<thead>
<tr>
<th>Room Number/Name</th>
<th>Window Covering Type</th>
<th>Drapery Draw Type/Direction</th>
<th>Window Type</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>[{____}]</td>
<td>[{____}]</td>
<td>[{____}]</td>
<td>[{____}]</td>
<td>[{____}]</td>
</tr>
</tbody>
</table>

]3.3.1 IDENTIFICATION

**************************************************************************
NOTE: Projects requiring large quantities of window treatments or a variety of window treatment types may need a numbering plan.
**************************************************************************

In accordance with the numbering plan, mark each opening and the corresponding window treatment with identical numbers. For multiple windows separated by mullions, the space required by each blind must be numbered separately. Use brass, aluminum, plastic, durable paper plates, or stamp to place corresponding numbers on unexposed surfaces of openings and inside or on top of the headrail track.

NOTE: This guide specification covers the requirements for roller window shades and hardware.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Use Section 12 21 00 for WINDOW BLINDS. Use Section 12 22 00 for CURTAINS AND DRAPES

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature
when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

AMERICAN NATIONAL STANDARDS INSTITUTE (ANSI)

ASTM INTERNATIONAL (ASTM)

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

NEMA ICS 6 (1993; R 2016) Industrial Control and Systems: Enclosures

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

SCIENTIFIC CERTIFICATION SYSTEMS (SCS)

SCS SCS Global Services (SCS) Indoor Advantage

UNDERWRITERS LABORATORIES (UL)

UL 325 (2017; Reprint Feb 2020) UL Standard for Safety Door, Drapery, Gate, Louver, and Window Operators and Systems

UL 2818 (2013) GREENGUARD Certification Program For Chemical Emissions For Building Materials, Finishes And Furnishings

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification
technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES

SD-02 Shop Drawings

Detailed Drawings; G[, [____]]
Location Schedule; G[, [____]]

SD-03 Product Data

Window Shades; G[, [____]]
[ Recycled Content for various fiber components; S ]

SD-04 Samples

SD-11 Closeout Submittals

Submit Data Package 1 for roller window shades, and Data Package 2 for electrical operators, in accordance with Section 01 78 23 OPERATIONS AND MAINTENANCE DATA.

1.3 CERTIFICATES

1.3.1 Indoor Air Quality Certifications

1.3.1.1 Roller Window Shades

**********************************************************************
NOTE: The Government's preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, verify there is a certified product available that is both cost effective and appropriate for the project.
**********************************************************************

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) [Gold], SCS Global Services Indoor Advantage Gold or provide validation by other third-party program that products meet the requirements of this paragraph. Provide current product certification documentation from certification body.

1.4 QUALITY ASSURANCE

1.4.1 Qualifications

1.4.1.1 Installer's Qualifications

Installer trained and certified by the manufacturer with a minimum of ten years of experience in installing products comparable to those specified in this section.

1.4.2 Flammability Requirements

Passes in accordance with NFPA 701 small and large-scale vertical burn. Materials tested are identical to products proposed for use.

1.4.3 Electrical Requirements

NFPA Article 100 listed and labeled in accordance with UL 325 or other testing agency acceptable to authorities having jurisdiction, marked for intended use, and tested as a system. Individual testing of components is not acceptable in lieu of system testing.
1.4.4 Anti-Microbial Requirements

'No Growth' per ASTM G21 results for fungi ATCC9642, ATCC 9644, ATCC9645.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver components to the jobsite in the manufacturer's original packaging with the brand or company name, item identification, and project reference clearly marked. Store components in a dry location that is adequately ventilated and free from dust, water, or other contaminants and has easy access for inspection and handling. Store materials flat in a clean dry area with temperature maintained above 10 degrees C 50 degrees F. Do not open containers until needed for installation unless verification inspection is required. Handle and store shades in accordance with manufacturer's recommendations.

1.6 WARRANTY

Provide manufacturer's warranty to repair or replace defective materials and workmanship for a period of [10] [_____] years from date of final acceptance of the work.

PART 2 PRODUCTS

**********************************************************************************************
NOTE: Coordinate with the drapery hardware specified for the project.
**********************************************************************************************

2.1 WINDOW SHADES

**********************************************************************************************
NOTE: Window shade options will include manual single or dual shade and motor-operated single or dual shade. Light filtering shade cloth is translucent in varying shades of opacity. Room darkening shades are opaque and block out light completely.

The designer should specify a complete room darkening system only if total light block is necessary, as in an audio visual application. A room darkening shade is typically made of a vinyl coated fiberglass cloth. Do not specify cotton cambric fabric for room darkening shades since it cannot provide total light block. Coordinate maximum unit sizes available with the window sizes.

Attachment of fabric to roller tube with double sided adhesive is not recommended.

Recycled content is affected by openness factor. Projects need to balance the desired openness factor with all other requirements including recycled content, aesthetics, color and energy efficiency.

**********************************************************************************************

Submit drawings showing plans, elevations, sections, product details, installation details, operational clearances, wiring diagrams and
relationship to work. Submit a location schedule showing location, size and quantity of shades. Include the use of same room designations as indicated on the drawings.

Provide product data composed of catalog cuts, brochures, and operating and maintenance instructions on each product to be used. Include styles, profiles and features.

Furnish samples of each type and color of roller shade fabric and roller shade channel. Provide shade material minimum 150 by 150 mm 6 by 6 inches in size. Mark face of material to indicate interior faces.

Mock up: Install shade in area designated by Contracting Officer. Do not proceed with remaining work until the Contracting Officer approves workmanship and operation. Rework mock up as required to produce acceptable work. The approved shade can be used in the installation.

Submit fire resistance data, flame spread and smoke contribution data.

Provide roller tube that operates smoothly and of sufficient diameter and thickness to prevent excessive deflection. Provide brackets that are appropriate for [inside][outside][ceiling] mount. Provide shade cloth meeting the performance described in NFPA 701, small scale test. Treat steel features for corrosion resistance.

Provide Various Fiber Components with a minimum of 60 percent recycled content. Provide data identifying percentage of recycled content for various fiber components.

**************************************************************************
NOTE: Included bracketed sentence below requiring products with indoor air quality certifications when product will be located in offices or classrooms.
**************************************************************************

[Provide certification of indoor air quality for roller window shades.]

2.1.1 Manufacturer's Qualifications

Obtain motor-controlled roller shades through one source from a single manufacturer with a minimum of twenty years of experience and minimum of three projects of similar scope and size in manufacturing products comparable to those specified in this section. Furnish manual and motorized shades produced by the same manufacturer to provide matching appearance.

2.1.2 Manually Operated Shades with Single Rollers

2.1.2.1 Chain-and-Clutch Operating Mechanisms

Provide continuous-loop bead chain and clutch that stops shade movement when bead chain is released; shade to be permanently adjusted and lubricated.

2.1.2.2 Bead Chains

Provide bead chain from #10 stainless steel rated to 400N 90 lb. minimum breaking strength with pull chain tensioning device complying with ANSI/WCMA A100.1
a. Loop Length:  [Full length of roller shade][As indicated].

b. Limit Stops:  Allows shade to stop when chain is released.  Provide limit stops to prevent shade from being raised or lowered too far.

c. Chain-Retainer Type:  [Clip, jamb mount][Chain tensioner, jamb mounted][Chain tensioner, sill mounted].

[2.1.2.3] Crank-and-Gear Operating Mechanisms

Sealed gearbox drive system controlled by crank handle, [detachable][permanently mounted].

a. Crank-Handle Length:  [Manufacturer's standard for height of shade][As indicated on drawings].

b. Coupling system:  Provide system to operate shades from single crank by coupling shade rollers together.  System to consist of endcaps, plus couplings to connect rollers.

[2.1.2.4] Rollers

Provide corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shade bands indicated without deflection.  Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shade cloth for service.

a. Roller Drive-End Location:  [Right side of interior face of shade][Left side of interior face of shade][As indicated].

b. Direction of Shade Cloth Roll:  [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].

c. Shade Cloth-to-Roller Attachment:  [Manufacturer's standard method][Removable spline fitting into integral channel in tube].  Adhesive attachment is not acceptable.

[2.1.2.5] Mounting Hardware

Provide corrosion resistant brackets or endcaps compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated.  Provide hardware that allows for field adjustment or removal of shade roller tube and other operable hardware component without removal of brackets and end or center supports.

[2.1.2.6] Shade Cloth

a. Shade Material:  [Light-filtering fabric:  Openness [1 percent][3 percent][5 percent][_____]][Light-blocking fabric].

b. Shade Cloth Bottom (Hem) Bar:  Steel or extruded aluminum.  Provide shade bar [enclosed in sealed pocket of shade band material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

[2.1.2.7] Installation Accessories

a. Front Fascia:  L-shaped aluminum extrusion to conceal shade roller
and hardware that snaps onto end caps without requiring exposed fasteners of any kind. Fascia can be mounted continuously across two or more shade bands. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

b. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

c. Endcaps: Extruded aluminum with universal design suitable for mounting to window mullions. Provide size compatible with roller size. Provide end cap covers matching fascia/headbox finish.

d. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open. Provide pocket with lip at lower edge to support acoustical ceiling panel.

e. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.

2.1.2.8 Room Darkening Shades

Provide room darkening (black-out) window shades designed to eliminate all visible light gaps when shades are fully closed and conform with the following:

a. Provide roller tube made of aluminum. Provide shop fabricated light traps consisting of a head box to house the roller shade, and U-shaped channels to serve as guides for the shade along the sides and to receive the bottom edge of the shade along the sill.

b. Provide light trap made of sheet steel having a minimum thickness of 0.64 mm 22 gauge or anodized, extruded, aluminum. Provide legs of the channels not less than 44 mm 1-3/4 inches long and separated by the minimum distance that permits free operation of the shade. Edges of light trap coming into contact with the shade cloth are smooth pile light seal. The exposed face of the head box is hinged or removable for access to the shade roller. The interior or unexposed surfaces of the light trap have a finish coat of flat black enamel. The exposed portions of the light trap have a factory-applied priming coat of gray paint.

c. Provide type of cloth for blackout purposes. Provide shade from a single piece of [PVC polyester][PVC fiberglass][PVC free material][______].

d. Fit the bottom edge of the shade with a steel operating bar. Shades to engage positively with bottom rail through operating bar or chain pull. Paint bars with flat black enamel. Make pull cords of No. 4 braided nylon or beaded chain having not less than 778 N 175 pounds breaking strength.
2.1.3 Manually Operated Shades with Dual Rollers

2.1.3.1 Chain-and-Clutch Operating Mechanisms

Provide continuous-loop bead chain and clutch that stops shade movement when bead chain is released; shade to be permanently adjusted and lubricated.

2.1.3.2 Bead Chains

Provide bead chain from #10 stainless steel rated to 400 N 90 lb. minimum breaking strength with pull chain tensioning device complying with ANSI/WCMA A100.1. Provide positive mechanical engagement of drive mechanism to shade roller tube. Center bead chain placement for right or left-hand operation.

a. Loop Length: [Full length of roller shade][As indicated].

b. Limit Stops: Allows shade to stop when chain is released. Provide limit stops to prevent shade from being raised or lowered too far.

c. Chain-Retainer Type: [Clip, jamb mount][Chain tensioner, jamb mounted][Chain tensioner, sill mounted].

2.1.3.3 Crank-and-Gear Operating Mechanisms

Sealed gearbox drive system controlled by crank handle, [detachable][permanently mounted].

a. Crank-Handle Length: [Manufacturer's standard for height of shade][As indicated].

b. Coupling system: Provide system to operate shades from single crank by coupling shade rollers together. System to consist of endcaps, plus couplings to connect rollers.

2.1.3.4 Rollers

Provide corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shade bands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shade bands for service.

a. Dual Shade-Roller Mounting Configuration: [Side by Side][Offset][___].

b. Inside Roller: Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated on drawings]. Direction of Shade cloth Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].

c. Outside Roller: Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated]. Direction of Shade cloth Roll: [Regular, from back (exterior face) of roller] [Reverse, from front (interior face) of roller].

d. Shade cloth-to-Roller Attachment: [Manufacturer's standard]
method][Removable spline fitting into integral channel in tube].
Adhesive attachment is not acceptable.

2.1.3.5 Mounting Hardware

Provide corrosion resistant brackets or endcaps compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated. Provide hardware that allows for field adjustment or removal of shade roller tube and other operable hardware component without removal of brackets and end or center supports.

2.1.3.6 Inside Shade Cloth

a. Shade Material: [Light-filtering fabric: Openness [1 percent][3 percent][5 percent][_____]][Light-blocking fabric].

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

2.1.3.7 Outside Shade Cloth

a. Shade Material: [Light-filtering fabric: Openness [1 percent][3 percent][5 percent][_____]][Light-blocking fabric].

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

2.1.3.8 Installation Accessories

a. Front Fascia: L-shaped aluminum extrusion to conceal shade roller and hardware that snaps onto end caps without requiring exposed fasteners of any kind. Fascia can be mounted continuously across two or more shade bands. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

[ b. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

[ d. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open. Provide pocket with lip at lower edge to support acoustical ceiling panel.

][e. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.
2.1.3.9 Room Darkening Shades

Provide room darkening (black-out) window shades designed to eliminate all visible light gaps when shades are fully closed, and conform with the following:

a. Provide roller tube made of aluminum. Provide shop fabricated light traps, consisting of a head box to house the shade roller, and U-shaped channels to serve as guides for the shade along the sides and to receive the bottom edge of the shade along the sill.

b. Provide light trap made of sheet steel having a minimum thickness of 0.64 mm 22 gauge or anodized, extruded, aluminum. Provide legs of the channels not less than 44 mm 1-3/4 inches long and separated by the minimum distance that permits free operation of the shade. Edges of light trap coming into contact with the shade cloth are smooth pile light seal. The exposed face of the head box is hinged or removable for access to the shade roller. The interior or unexposed surfaces of the light trap have a finish coat of flat black enamel. The exposed portions of the light trap have a factory-applied priming coat of gray paint.

c. Provide type of cloth for blackout purposes. Provide shade from a single piece of [PVC polyester][PVC fiberglass][PVC free material][______].

d. Fit the bottom edge of the shade with a steel operating bar. Shades to engage positively with bottom rail through operating bar or chain pull. Paint bars with flat black enamel. Make pull cords of No. 4 braided nylon or beaded chain having not less than 778 N 175 pounds breaking strength.

2.1.4 Motor-Operated Shades with Single Rollers

Provide factory-assembled, shade-operator system of size and capacity and with features, characteristics, and accessories suitable for conditions indicated, complete with electric motor and factory-prewired motor controls, power disconnect switch, enclosures protecting controls and operating parts, and accessories required for reliable operation without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.

2.1.4.1 Motors

Provide motors that are [hardwired, wired into the building electrical system and][plug-in to standard AC electrical outlets and] concealed from interior view. The position of the motor and electrical connection is [left][right] side of roller, based on the hand of the user facing the shade from inside, unless otherwise indicated [on drawing][in the ROLLER WINDOW SHADE PLACEMENT SCHEDULE]. Provide motors capable of operating at or below 44 dBA measured 914 mm 3 feet from the center of the shade depending on the electronic drive unit selected; no audible clicks when motor starts and stop. Motors are [120V, 60 Hz][low voltage with Class 2 power supply].

2.1.4.2 Controls

Provide electric controls with NEMA ICS 6 Type 1 enclosure for
UFGS

(surface) [recessed or flush] mounting. Controls are able to electronically set and reconfigure shade open and close limits, shade preset positions, system groups and system subgroups at the control without rewiring and without access to the Electronic Drive Unit. Provide wall control engraved with button, group, or scene description as indicated on the drawings.

[ a. Key Pad: Three-position, switch-operated control station with open, close, and off functions. Provide two keys per station. Battery operated key pads are not allowed.

[ b. Switches: Wall-switch-operated control station with open, close, and center off functions. Switch Positions: [Three][Five]. Switch Style: [Toggle][Rocker].

[ c. Group Control Station: Three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for single-switch group control.

[ d. Individual/Group Control Station: Three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for individual and group control.

[ e. Sun Sensor Control: Provide solar adaptive shading software that automatically adjusts motorized shades throughout the day in response to the changing position and intensity of the sun. Customized shade schedules are developed combining information about building location and facade orientation. Wireless mullion sensors to be provided for cloudy-day override.

[ f. Low Voltage Controls: Provide a digital system that includes a low-voltage interface to communicate with both wired and wireless inputs. Wireless controls to utilize radio frequency in FCC governed frequency spectrum for periodic operation; continuous transmission spectrum is not permitted.

[ g. Provide a whole building shade control system that can be preprogrammed and reprogrammed to accomplish different operations for management flexibility.

[2.1.4.3 Timer Controls

Clock timer, [24-hour][seven-day][_____] programmable for regular events.

[ a. Provide switches that are adjustable and interlocked with motor controls and set to automatically stop the shade at fully raised and fully lowered positions. [ Low voltage switching is required.]

[ b. Operating Function: [Stop and hold shade at any position][Stop and hold shade at open, midpoint, and closed positions][Stop and hold shade at 3 pre-determined positions including open, closed and user-programmed position][Stop and hold shade at 5 pre-determined position including open, closed, and 3 user-programmed positions][_____].

[ c. Provide the following options: [Low voltage system][Group switching with integrating switch control][ Low voltage switching is required.][ Capable of interface with [audiovisual][multi-room][_____] control system][ Capable of accepting input from building automation control system][Override switch][Power failure memory for the life of the systems which protects
2.1.4.4 Rollers

Provide corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shade bands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shade cloth for service.

a. Roller Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated on drawings].

b. Direction of Shade Cloth Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].

c. Shade Cloth-to-Roller Attachment: [Manufacturer's standard method][Removable spline fitting into integral channel in tube]. Adhesive attachment is not acceptable.

2.1.4.5 Mounting Hardware

Provide corrosion resistant brackets or endcaps compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated. Provide hardware that allows for field adjustment or removal of shade roller tube and other operable hardware component without removal of brackets and end or center supports.

2.1.4.6 Shade Cloth

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

2.1.4.7 Installation Accessories

a. Front Fascia: L-shaped aluminum extrusion to conceal shade roller and hardware that snaps onto end caps without requiring exposed fasteners of any kind. Fascia can be mounted continuously across two or more shade bands. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

[ b. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

[ d. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel. Provide manufacturers standard height fascia as required to conceal...
roller and shade band assembly when shade is fully open. Provide pocket with lip at lower edge to support acoustical ceiling panel.

][e. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.

][2.1.4.8 Room Darkening Shades

Provide room darkening (black-out) window shades designed to eliminate all visible light gaps when shades are fully closed, and conform with the following:

a. Provide roller tube made of aluminum. Provide shop fabricated light traps consisting of a head box to house the roller shade, and U-shaped channels to serve as guides for the shade along the sides and to receive the bottom edge of the shade along the sill.

b. Provide light trap made of sheet steel having a minimum thickness of 0.64 mm 22 gauge or anodized, extruded, aluminum. Provide legs of the channels not less than 44 mm 1-3/4 inches long and separated by the minimum distance that permits free operation of the shade. Edges of light trap coming into contact with the shade cloth are smooth pile light seal. The exposed face of the head box is hinged or removable for access to the shade roller. The interior or unexposed surfaces of the light trap have a finish coat of flat black enamel. The exposed portions of the light trap have a factory-applied priming coat of gray paint.

c. Provide type of cloth for blackout purposes. Provide shade from a single piece of [PVC polyester][PVC fiberglass][PVC free material][______].

d. Fit the bottom edge of the shade with a steel operating bar. Shades to engage positively with bottom rail through operating bar or chain pull. Paint bars with flat black enamel. Make pull cords of No. 4 braided nylon or beaded chain having not less than 778 N 175 pounds breaking strength.

][2.1.5 Motor-Operated, with Dual Rollers

Provide factory-assembled, shade-operator system of size and capacity and with features, characteristics, and accessories suitable for conditions indicated, complete with electric motor and factory-prewired motor controls, power disconnect switch, enclosures protecting controls and operating parts, and accessories required for reliable operation without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.

2.1.5.1 Motors

Provide motors that are [hardwired, wired into the building electrical system and][plug-in to standard AC electrical outlets and] concealed from interior view. The position of the motor and electrical connection is [left][right] side of roller, based on the hand of the user facing the shade from inside, unless otherwise indicated [on drawing][in the ROLLER WINDOW SHADE PLACEMENT SCHEDULE]. Provide motors capable of operating at or below 44 dBA measured 914 mm 3 feet from the center of the shade.
depending on the electronic drive unit selected; no audible clicks when motor starts and stops. Motors are [120V, 60 Hz] [low voltage with Class 2 power supply].

2.1.5.2 controls

Provide electric controls with NEMA ICS 6, Type 1 enclosure for [surface][recessed or flush] mounting. Controls are able to electronically set and reconfigure shade open and close limits, shade preset positions, system groups and system subgroups at the control without rewiring and without access to the Electronic Drive Unit. Provide wall control engraved with button, group, or scene description as indicated on the drawings.

[a] Key Pad: Three-position, switch-operated control station with open, close, and off functions. Provide two keys per station. Battery operated key pads are not allowed.

[b] Switches: Wall-switch-operated control station with open, close, and center off functions. Switch Positions: [Three][Five]. Switch Style: [Toggle][Rocker].

c] Group Control Station: Three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for single-switch group control.

d] Individual/Group Control Station: Three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for individual and group control.

e] Sun Sensor Control: Provide solar adaptive shading software that automatically adjusts motorized shades throughout the day in response to the changing position and intensity of the sun. Customized shade schedules are developed combining information about building location and facade orientation. Wireless mullion sensors to be provided for cloudy-day override.

f] Low Voltage Controls: Provide a digital system that includes a low-voltage interface to communicate with both wired and wireless inputs. Wireless controls to utilize radio frequency in FCC governed frequency spectrum for periodic operation; continuous transmission spectrum is not permitted.

g] Provide a whole building shade control system that can be preprogrammed and reprogrammed to accomplish different operations for management flexibility.

2.1.5.3 Timer Controls

Clock timer, [24-hour][seven-day][_____] programmable for regular events.

[a] Provide switches that are adjustable and interlocked with motor controls and set to automatically stop the shade at fully raised and fully lowered positions.[ Low voltage switching is required.]

[b] Operating Function: [Stop and hold shade at any position][Stop and hold shade at open, midpoint, and closed positions][Stop and hold shade at 3 pre-determined positions including open, closed and user-programmed position][Stop and hold shade at 5 pre-determined position including open, closed, and 3 user-programmed positions]
c. Provide the following options: [Low voltage system][Group switching with integrating switch control]. [Capable of interface with [audiovisual][multi-room][_____] control system][Capable of accepting input from building automation control system][Override switch][Power failure memory for the life of the systems which protects presets][______].

2.1.5.4 Rollers

Provide corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shade bands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shade cloth for service.

a. Dual Shade Mounting Configuration: [Side by Side][Offset][______].

b. Inside Roller: Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated on drawings]. Direction of Shade Cloth Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].

c. Outside Roller: Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated on drawings]. Direction of Shade Band Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].

d. Shade Cloth-to-Roller Attachment: [Manufacturer's standard method][Removable spline fitting into integral channel in tube]. Adhesive attachment is not acceptable.

2.1.5.5 Sub Title

Provide corrosion resistant brackets or endcaps compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated. Provide hardware that allows for field adjustment or removal of shade roller tube and other operable hardware component without removal of brackets and end or center supports.

2.1.5.6 Inside Shade Cloth

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

2.1.5.7 Outside Shade Cloth

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].
where it meets the sill].

2.1.5.8  Installation Accessories

a. Front Fascia: L-shaped aluminum extrusion to conceal shade roller and hardware that snaps onto end caps without requiring exposed fasteners of any kind. Fascia can be mounted continuously across two or more shade bands. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

b. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

c. Endcaps: Extruded aluminum with universal design suitable for mounting to window mullions. Provide size compatible with roller size. Provide end cap covers matching fascia/headbox finish.

d. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open. Provide pocket with lip at lower edge to support acoustical ceiling panel.

e. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.

2.1.5.9  Room Darkening Shades

Provide room darkening (black-out) window shades designed to eliminate all visible light gaps when shades are fully closed, and conform with the following:

a. Provide roller tube made of aluminum. Provide shop fabricated light traps consisting of a head box to house the roller shade, and U-shaped channels to serve as guides for the shade along the sides and to receive the bottom edge of the shade along the sill.

b. Provide light trap made of sheet steel having a minimum thickness of 0.64 mm 22 gauge or anodized, extruded, aluminum. Provide legs of the channels not less than 44 mm 1-3/4 inches long and separated by the minimum distance that permits free operation of the shade. Edges of light trap coming into contact with the shade cloth are smooth pile light seal. The exposed face of the head box is hinged or removable for access to the shade roller. The interior or unexposed surfaces of the light trap have a finish coat of flat black enamel. The exposed portions of the light trap have a factory-applied priming coat of gray paint.

c. Provide type of cloth for blackout purposes. Provide shade from a single piece of [PVC polyester][PVC fiberglass][PVC free material][______].

d. Fit the bottom edge of the shade with a steel operating bar. Shades to engage positively with bottom rail through operating bar or chain pull. Paint bars with flat black enamel. Make pull cords of No. 4
braided nylon or beaded chain having not less than 778 N 175 pounds breaking strength.

\[ \] 2.2 COLOR

**************************************************************************
NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawings are used to indicate color references. Color must be selected from manufacturer's standard colors or identified as a manufacturer's color in this specification only when the project has minimal finishes.

When the government directs that color be located in the drawings, a note must be added to the drawings that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Considerations of fabric selection include: glare control, view maintenance, privacy and heat build-up. Identify if solar reflective property is required on the backside of the fabric and specify a dual-sided fabric if applicable.

When more than one type, pattern or color is specified identify location.

When a manufacturer's name, stock number, pattern, and color is specified for color, verify that the product conforms to the specification, as edited and is not a proprietary product.

**************************************************************************
Provide color, pattern and texture for metal trim and shade fabric [as specified in Section 09 06 00 SCHEDULES FOR FINISHES.] [as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.]

PART 3 EXECUTION

3.1 FIELD MEASUREMENTS

After becoming familiar with details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 ROLLER WINDOW SHADE PLACEMENT SCHEDULE

**************************************************************************
NOTE: The Roller Window Shade Placement Schedule will be provided at the designer's option when it will clarify placement of the window treatments.
When all exterior windows are to receive a window treatment, a note can be added to this effect instead of filling out the schedule completely. The location of window treatment placement should be clearly defined within this specification. The Placement Schedule will be completely filled out with the room number/name, window covering type, window type and quantity.

**************************************************************************

[All exterior windows include [____].] [Provide window covering as follows:

<table>
<thead>
<tr>
<th>Room Number/Name</th>
<th>Roller Window Shade Covering Type</th>
<th>Window Type/Size</th>
<th>Window Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>[____]</td>
<td>[____]</td>
<td>[____]</td>
<td>[____]</td>
</tr>
</tbody>
</table>

3.3 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

Provide roller window shades, complete with necessary brackets, fittings, and hardware [in accordance with paragraph ROLLER WINDOW SHADE PLACEMENT SCHEDULE] [as indicated].

Perform installation in accordance with the approved detailed drawings and manufacturer's installation instructions. Install units level, plumb, secure, and at proper height and location relative to window units. Provide and install supplementary or miscellaneous items in total, including clips, brackets, or anchorages incidental to or necessary for a sound, secure, and complete installation. Do not start installation until completion of room painting and finishing operations.

3.4 CLEAN-UP

Upon completion of the installation, clean window treatments and exposed components as recommended by manufacturer. Adjust window treatment for form and appearance and proper operating condition. Repair or replace damaged units as directed by the Contracting Officer. Isolate metal parts from direct contact with concrete, mortar, or dissimilar metals. Ensure shades installed in recessed pockets can be removed without disturbing the pocket. The entire shade, when retracted, is contained inside the pocket. For shades installed outside the jambs and mullions, overlap each jamb and mullion 19 mm 0.75 inch or more when the jamb and mullion sizes permit. Include all hardware, brackets, anchors, fasteners, and accessories necessary for a complete, finished installation.

NOTE: This guide specification covers the requirements for metal casework.

Coordinate the use of this section in conjunction with and coordinated with the referenced sections.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Pre-Installation Meeting

Within [30] [_____] calendar days after [date of award] [date of receipt by
him of notice of award], submit for the approval of the Contracting Officer six (6) copies of outline drawings of all casework to be furnished under this contract, together with weights and overall dimensions, and required samples. Ensure drawings show the general arrangement and overall dimensions of the casework, details of any casework supports[, and provisions for electrical outlets[, special provisions for external cables and cords. Submit the following for review and approval:

a. Fabrication Drawings

b. Installation Drawings

Submit installation drawings for metal cabinets. Include in drawings the location of cabinets, details of cabinet relationship and dimensional positions, and locations for roughing in plumbing, including sinks, faucets, strainers and cocks[, special electrical lines or conduits] [cables][].

Submit manufacturer's catalog data and certificates for the following items showing conformance with the referenced standards contained in this section:

a. Cabinets

b. Corrosion-Resistant Steel
c. Glass

d. Adhesives
e. Filler Material
f. Fasteners

g. Steel Sinks

[h. Service Fixtures

[i. Accessories and Hardware

j. Plastic Laminate

k. Countertops

Submit manufacturer's instructions for metal cabinet systems including special provisions required to install equipment components and system packages. Include special notices detailing impedances, hazards and safety precautions.

Submit manufacturer's standard color charts for metal cabinets showing the manufacturer's recommended color and finish selections.

1.3 SUBMITTALS

******************************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals
required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4  DELIVERY, STORAGE, AND HANDLING

Deliver, store, and handle metal casework in a manner that prevents damage or disfigurement.

Provide temporary skids under units weighing more than [____] kilogram pounds.

PART 2   PRODUCTS

2.1  SYSTEM DESCRIPTION

2.1.1  Design Requirements

Provide metal casework, factory-fabricated and finished in the manufacturer's standard sizes and finishes of the type, design, and configuration indicated. Construct casework as specified and meet the requirements of KCMA A161.1. Provide wall and base cabinet assemblies consisting of individual units joined into continuous sections. Accomplish fastenings to permit removal and replacement of individual units without affecting the remainder of the installation. Provide counters with
watertight sink rim when indicated. Provide removable doors equipped with position stops to avoid accidental complete withdrawals. Fix or adjust shelves as indicated.

2.2 MATERIALS

Provide corrosion-resistant steel conforming to ASTM A1008/A1008M, and ASTM A167, Type [302] [304] [316] Finish 4.

Provide glass conforming to ASTM C1036, Type I, Class 1, Quality q3, 6 millimeter 1/4 inch thick, for unframed sliding glass doors; other glass is to conform to ASTM C1036, Type II, Class 1, Quality q8, 5 millimeter 7/32 inch thick.

Use thermosetting urea-resin Type II Adhesives for application of plastic laminate conforming to ASTM D4690 as recommended by the manufacturer of the laminate. Use adhesive conforming to ASTM D4689 for wood members.

Provide filler material conforming to FS TT-F-336.

******************************************************************************
*************************NOTE: Review ANSI/NEMA LD 3 and insert style, type, grade, class, and finish as required.******************************************************************************

Provide plastic laminate conforming to ANSI/NEMA LD 3, Style [____], Type [____], Grade [____], Class [____], Finish [____].

Provide accessories and hardware conforming to the following requirements, as applicable:

   Extension drawer slides: ANSI/BHMA A156.9, Type B85071

[ Semiconcealed hinges: ANSI/BHMA A156.9, Type B81201, 40 millimeter 1-1/2 inches]

[ Full surface hinges: ANSI/BHMA A156.9, Type B81131, 40 millimeter 1-1/2 inches]

[ Knob pulls: ANSI/BHMA A156.9, 25 millimeter 1-inch diameter, Type B12132]

[ Bar type pulls: ANSI/BHMA A156.9, 100 millimeter 4-inch overall length, Type B12012]

Locks, keying, and keys: As directed

Catches: Magnetic, 22 Newton 5-pound pull

Sliding door set:

   Impregnated fiberboard track

   Nylon glides

Provide Fasteners conforming to the following:

   Screws: Complying with ANSI Standards, Group, Type and Class as applicable
Anchoring Devices:  FS FF-S-325, Group, Type, and Class as applicable
Toggle bolts:  FS FF-B-588, Type I, Class A, Style 2
Nuts:  ASTM F594, corrosion-resistant steel
Bolts:  ASTM A325, heavy, hexagon head bolts corrosion-resistant steel
Nuts:  ASTM F836M, corrosion-resistant steel
Bolts:  ASTM A325M, heavy, hexagon head bolts corrosion-resistant steel

**************************************************************************
NOTE:  Sink for inset-type installation is as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE.
**************************************************************************

Corrosion-resistant Steel Sinks:

[ 18-gauge corrosion-resistant steel, integral with corrosion-resistant steel countertop
]
[ 1.3 millimeter 18-gauge corrosion-resistant steel, nonintegral, self-rimming
]

Drain holes in center of bowl
Underside coated with 3 millimeter 1/8-inch thick sound deadener
Die-form, seamless, raised edges at front and ends
Cove corners to 13 millimeter 1/2-inch radius
Equip with strainers and tail pieces

Provide Service Fixtures conforming to the following requirements:

a.  Provide fixtures in accordance with the water conservation policy as stated in the ICC IPC.

b.  Faucets:
(1)  Splashback mounted, cast brass, chrome plated, FS WW-P-541
(2)  Deck mounted, cast brass, chrome plated, FS WW-P-541

c.  Gas, air, and vacuum, distilled water, steam, and de-ionized water cocks: cast brass, chrome plated, ground key type

d.  Drains, strainers, and taps: brass, chrome plated, FS WW-P-541

e.  Index buttons: plastic, color codes in accordance with SEFA 7

f.  Special items: provide nipples and locknuts with each fixture.

**************************************************************************
NOTE:  Delete any of the following types that are

SECTION 12 31 00  Page 10
not applicable:

Type I, zinc phosphate
Type II, iron phosphate
Type III, organic-paint, varnish, lacquer

[ ] Metal pretreatment coatings: FS TT-C-490, Type I
][ Metal pretreatment coatings: FS TT-C-490, Type II
][ Metal pretreatment coatings: FS TT-C-490, Type III
][ Enamel: FS TT-E-491, Class 2

2.3 STEEL CABINET FABRICATION

2.3.1 General

Provide wall and base cabinets fabricated from 0.85 millimeter 22-gauge, cold-rolled furniture steel, except for backs of cabinets and backs of doors provide 0.70 millimeter 24-gauge steel. Construct cabinets with no raw edges or exposed flanges, with welds being flush and ground smooth on all exposed surfaces. Provide concealed fasteners at all exposed exterior surfaces. Provide doors and drawer fronts with panelized double-wall construction, not less than 15 millimeter 1/2-inch thick, with a sound-absorbing material adhered between the walls. Equip doors and drawers with rubber or plastic silencers and bumpers. Provide drawers with removable fronts, mounted on [metal guides] [renewable fiber guides] [plastic guides] and equipped with position stops for complete drawer withdrawal. Provide [fixed] [adjustable] shelving as indicated.

2.3.2 Workmanship

Align end panels, top rails, bottoms and vertical posts at intersections in same plane, without overlap. Grind exposed welds flush and smooth. Welding is to conform to AWS D1.1/D1.1M and AWS D1.3/D1.3M.

Additional casework construction requirements:

- a. Welded assembly.
- b. Fabricate with enclosed uprights or posts full height or width at front, include sides, backs, bottoms, soffits, ceilings under sloping tops, headers and rail, assembled to form an integral unit.
- c. Form sides to make rabbeted stile 19 to 28 mm 3/4 to 1-1/8 inch wide, closed by channel containing shelf adjustment slots.
- d. Make bottom of wall units flush, double panel construction.
- e. Make top and cross rails of "U" shaped channel.
- f. Enclose all backs and bottoms in cabinets, including drawer units.
- g. Provide finish panel on exposed cabinet backs.
- h. Do not use screws and bolts in construction or assembly of casework, except to secure hardware, applied door stops, accessories, removable
panels and where casework is required to fastened end to end or back to back.

i. Fabricate casework, except benches, and desks with finished end panels.

j. Close flush exposed soffits of wall hung shelving, knee spaces in counters, and toe spaces at bases.

k. In base units with sinks provide on piece, lowered backs.

l. In base units with doors provide removable backs.

m. Provide built-in raceways or tubular or channel shaped members of casework for installation of wiring and electric work. Mount junction boxes on rear of cabinets. Electric work is specified in electrical sections of specifications.

n. Provide reinforcing for hardware.

o. Size Dimensions:

(1) Used dimensions shown or specified within tolerances specified.

(2) Tolerance:

(a) Depth: 325 mm 13-inches in lieu of 300 mm 12 -inches, 450 mm 18 inches in lieu of 400 mm 16 -inches, except wall hung units above counter 525 mm 21 inches to 600 mm 24 inches in lieu of 550 mm 22-inches.

(b) Width: Minus 25 mm one inch.

(c) Height: 25 mm 1-inch plus or minus for wall hung cabinets and counter mounted cabinets, excluding sloping tops. 25 mm 1-inch plus for floor standing cabinets, excluding base and sloping tops. Full height cabinets shown back to back same height.

(d) Manufacturer's tolerance for the length, depth or height: Not to exceed 1.58 mm 0.0625-inches

2.3.4 Cabinets

Provide cabinets with sheet steel fronts, backs, sides, tops, and bottoms.

Form sides with rabbeted stiles 28 millimeter 1-1/8-inches wide, closed by welded channel containing embossed louvers spaced 40 millimeter 1-1/2-inches on center, for adjustable shelves.

Provide cabinets that have a steel channel-shaped top rail, 1.3 millimeter 18-gauge steel cross rails, and Z-shaped rear rail to engage 1.6 millimeter 16-gauge steel hanging bracket.

At base cabinets, provide 40 millimeter 1-1/2-inch long leveling screws for adjusting to floor variations that are accessible through plugged openings in bottom; install 1.9 millimeter 14-gauge gussets to support the screws.

At base cabinets, provide removable backs, knee space panels, or access doors where piping occurs.

2.3.5 Doors

Provide doors that are double-pan construction with 16 millimeter 5/8-inch thick telescoped inner pan into outer pan with exposed vertical edge formed into channel shape having returned lip over inner pan and offset to receive lip.

Coat panels with 3 millimeter 1/8-inch thick asphaltic sound deadener.

Fasten reinforcement for hardware attachment to inner pan and conceal.

Fit hinged doors with pairs of hinges, knob pulls, locks, and bumpers.

Bevel inside edge of cutout in front panel of glass door.

Set glass in continuous rubber gasket between panels.

 Equip sliding doors with tracks, guides, bumpers, and bar pulls.

Additional considerations for doors:

a. Hollow metal type, flush and glazed doors not less than 16 mm 5/8 inch thick.

b. Fabricate flush metal doors of two panels formed into pans with corners welded and ground smooth. Provide flush doors with a sound deadening core.

c. Fabricate glazed metal doors with reinforced frame and construct either from one piece of steel, or have separate stiles and rails mitered and welded at corners, and welds ground smooth.

  (1) Secure removable glazing members with screws to back of doors.

  (2) Install glass in rubber or plastic glazing channels.

d. Provide sheet steel hinge reinforcement inside doors.

e. Sliding doors: Provide stops to prevent bypass.
f. Doors removable without use of tools except where equipped with locks.

2.3.6 Drawers

Provide drawer fronts that are double-pan construction with 16 millimeter 5/8-inch thick telescoped inner pan into outer pan with exposed vertical edge formed into channel shape having return lip over inner pan and offset to receive lip. Weld drawer bodies to front through flanges on sides and bottom, and to back through flanges at rear.

Extend flanges outward or downward, top of side, and backrolled.

Cove corners to 15 millimeter 1/2-inch radius.

**************************************************************************

NOTE: Delete locks when not applicable. When width of drawer exceeds 610 millimeter 24 inches, two pulls are required.

**************************************************************************

Provide drawer accessories including slides, bar pulls, lock and stop devices.

Additional considerations for drawers:

a. Drawer fronts flush hollow metal type not less than 16 mm 5/8-inch thick with sound deadening core. Fabricate of two panels formed into pans. Weld and grind smooth corners of drawer fronts.

b. Form bodies from one piece of steel, weld to drawer front.

c. Provide reinforcement for locks and provide rubber bumpers at both sides of drawer head to cushion closing.

d. Equip with roller suspension guides.

2.3.7 Shelves

**************************************************************************

NOTE: Specify stainless steel when sanitation is critical.

**************************************************************************

Fabricate shelves from sheet steel with front and rear edges flanged down 20 millimeter 3/4-inch and hemmed back at 30 degrees to underside of shelf.

Fabricate shelves from corrosion-resistant steel sheet with front and rear edges flanged down 20 millimeter 3/4-inch and hemmed back at 30 degrees to underside of shelf.

Support shelves with 1.6 millimeter 16-gauge shelf clips inserted in slots in front stile and in form channel in back.

Notch flanges at sides to match and engage with embossments on side panels.

Additional considerations for shelves:

a. Capable of supporting an evenly distributed minimum load of 122 kg/m² (twenty-five pounds per square foot) without visible distortion.
b. Flange shelves down 19 mm 3/4-inch on edges, with front and bearing edges flanged back 13 mm 1/2 inch.

c. For shelves over 1050 mm 42-inches in length and over 300 mm 12 inches in depth install 38 mm by 13 mm by 0.9 mm 1-1/2 x 1/2 x 0.0359 inch thick sheet steel hat channel reinforcement welded to underside midway between front and back and extending full length of shelf.

d. Weld shelves to metal back and ends unless shown adjustable.

e. Provide means of positive locking shelf in position, and to permit adjustment without use of tools.

f. On pharmacy on sloping shelf provide 13 mm 1/2-inch wide clear acrylic plastic raised edge, 3 mm 1/8-inch thick, secured to front edge of shelf.

2.3.8 Dustcover Tops

Provide front face height of 25 millimeter 1-inch.

Slope dustcover tops upward 30 degrees from front to back of cabinet. Equip dustcover tops for attaching from inside of cabinet.

Additional considerations for sloping tops:

a. Provide sloping tops for casework where shown.

b. Where ceilings interfere with installation of sloping tops. Provide filler plates as specified.

c. Omit sloping tops or filler plates whenever ceiling material is turned down and furred-in at face of casework.

d. Provide exposed ends of sloping tops with flush closures.

e. Fasten sloping tops with sheet metal screws inserted from cabinet interior; space fastener as recommended by manufacturer.

2.3.9 Finish

Prime and factory finish steel cabinets with two coats of synthetic enamel, baking quality, conforming to FS TT-E-489, Class B. Provide colors as selected.

2.3.10 Welded Cabinets

Conform to KCMA A161.1, all welded construction.

***********************************************************************************************************************************************
NOTE: Delete when not applicable.
***********************************************************************************************************************************************

[2.3.11 Doors and Drawer Fronts

Doors and Drawer Fronts may be as specified for wood cabinets in lieu of metal pan construction.
2.3.12 Undercounter Table and Bench Frames

Requirements for undercounter table and bench frames:

a. Using welded construction.

b. Open frame type with aprons and legs when required.

c. Aprons:

   (1) Channels shaped welded at corners, with leg sockets and reinforcing triangular corner gussets welded in corners; 05-03M12301-9.

   (2) Pierce sockets to receive leg bolts and notch gussets to receive legs.

   (3) Upper flange perforated or slotted to receive screws at 200 mm 8-inch centers, and back channels when installed against wall. Sizes lots for 6 mm 1/4-inch anchor bolts.

   (4) Pierce aprons to receive drawer formation, rail at top of drawer opening. Install channel shaped apron division welded at ends, 762 mm 30-inches apart to front and back aprons, or at each side of drawer.

   (5) Fabricate metal components from sheet steel.

   (6) Use 1.5 mm 0.0598-inch thick sheet for gussets and channel aprons.

   (7) Use 1.2 mm 0.0478-inch thick sheet for other items.

   (8) At knee space, provide exposed metal sides and metal closure plate for soffit. Where shown at knee space, provide exposed metal back secured with continuous angle closures at both side.

d. Legs:

   (1) Cold rolled tubing or 1.5 mm 0.0598-inch formed steel.

   (2) Leveling-anchoring device at floor.

   (3) Stud bolt at top for attachment to leg socket.

e. Leg Braces:

   (1) Tables and benches not anchored to walls.

   (2) Brace back against front legs near bottom with steel angle channel or tubular braces.

   (3) Fasten braces together with steel straps.

f. Leg Shoes:

   (1) Fit laboratory casework legs at bottom with either stainless steel, aluminum, or chromium plated brass shoes, not less than 25 mm one inch in height.
(2) Fit other legs with a movable molded vinyl shoe 100 mm 4 inches high and coved at bottom.

2.3.13 Closures and Filler Strips at Pipe Spaces

Requirements for closures and filler strips at pipe spaces:

a. Flat steel strips or plates.

b. Openings less than 200 mm 8-inches wide: 1.2 mm 0.047-inch thick.

c. Openings more than 200 mm 8-inches wide 0.9 mm 0.359-inches wide.

[2.4 MISCELLANEOUS CABINETS

**************************************************************************

NOTE: Delete inapplicable paragraphs, or state appropriate options.
**************************************************************************

[2.4.1 Combination Sink-and-Base Cabinet

A combination sink-and-base cabinet unit may be furnished in lieu of the base cabinet and inset sink indicated provided the combination unit affords facilities and space equal to those indicated and provided the combination unit matches the adjacent units in materials and construction. Provide sink, with matching drainboards, made of [corrosion-resistant steel] [porcelain-enamel steel] and equipped with a chromium-plated [swinging-spout faucet, chromium-plated water-control valves,] [automatic faucet] and chromium-plated cup strainer. Make joints between sink and drainboard and between drainboard and counter top watertight.

[2.4.2 Special Purpose Cabinets

Provide special-purpose cabinets, such as cabinets for eye-level oven units, countertop range units, and built-in refrigerators as indicated[ on the drawings,] and of the same materials and construction as adjacent cabinets. Provide space adjacent to sink for a dishwasher, as indicated.

[2.5 ACCESSORIES AND HARDWARE

Furnish accessories such as utility shelves and racks for extracts, condiments, and towels; bins for sugar and flour; breadboxes; and trays for cutlery and flatware as indicated.

Provide corrosion resistant hardware. Provide exposed hardware with a chromium-plated finish or a corrosion-resistant finish as approved. Paint semi-concealed hinges on cabinets where paint finish is required to match the cabinets. Equip doors with [bullet-type catches] [spring hinges] [magnetic-type catches]. Provide door and drawer pulls as indicated.

[2.6 CABINETS

The work includes providing new factory-finished kitchen wall and base cabinets with:

[ a. High pressure decorative laminate (HPDL)
][b. Granite countertops
][c. Marble countertops
][d. Synthetic resins countertops
][e. ffrp countertops
][f. Stainless steel countertops
][g. Tile countertops
][h. [_____] custom countertops

] Bathroom vanity cabinets [with HPDL countertops] [to receive combination lavatory-countertops as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE].

Provide cabinets conforming to KCMA A161.1, and bear the "KCMA Certified Cabinet" seal of the Kitchen Cabinet Manufacturers Association. Provide Countertops that conform to NEMA LD 3.1 and requirements specified herein.

2.6.1 Cabinet Locks

Requirements for cabinet locks:

a. Where locks are shown.

b. Locked pair of hinged door over 900 mm 36 inches high:

   (1) ANSI/BHMA A156.5, similar to E0261, key one side.

   (2) On active leaf use three-point locking device, consisting of two steel rods and lever controlled cam at lock, to operate by lever having lock cylinder housed therein.

   (3) On inactive leaf use dummy lever of same design.

   (4) Provide keeper holes for locking device rods and cam.

   (5) Use two point locking device both doors of cabinet 6D similar to ANSI/BHMA A156.5, E0251, key one side.

c. Door and Drawer: ANSI/BHMA A156.11 cam locks.

   (1) Drawer and Hinged Door up to 900 mm 36-inches high: E07261. 05-03M 12301-11

   (2) Pin-tumbler, cylinder type lock with not less than four pins. Disc tumbler lock "duo A" with brass working parts and case, as manufactured by Illinois Lock Company are acceptable.

   (3) Sliding Door: E07161.

d. Key locks differently for each type casework and master key for each service, such as Nursing Units, Psychiatric, Administrative, Pharmacy.

   (1) Key drug locker inner door different from outer door.
(2) Provide two keys per lock.

(3) Provide six master keys per service or Nursing Unit.

e. Marking of Locks and Keys:

(1) Name of manufacturer, or trademark which can readily be identified legibly marked on each lock and key change number marked on exposed face of lock.

(2) Key change numbers stamped on keys.

(3) Key change numbers to provide sufficient information for manufacturer to replace key.

2.6.2 Cabinet Hardware

Comply with ANSI/BHMA A156.9.

Requirements for cabinet hardware:

a. Door/Drawer Pulls: B02011.

(1) One for drawers up to 575 mm 23-inches wide.

(2) Two for drawers over 575 mm 23-inches wide.

(3) Sliding door flush pull, each door: B02201.

b. Door in seismic zones: B03352.

(1) Do not provide thumb latch on doors equipped with three point locking device.

(2) Use lever operated two point latching device on paired doors over 900 mm 36-inches high if three point locking or latching device is not used.

c. Cabinet Door Catch:

(1) Install at bottom of wall cabinets, top of base cabinets and top and bottom of full height cabinet doors over 1200 mm 48-inches.

(2) Omit on doors with locks.

d. Drawer Slides:

(1) Use B05051 for drawers over 150 mm 6-inches deep.

(2) Use B05052 for drawers 75 to 150 mm 3 to 6-inches deep.

(3) Use B05053 for drawers less than 75 mm 3-inches deep.

2.7 FINISH

2.7.1 Cabinet Finish

Provide cabinets with a factory-applied durable finish in accordance with KCMA A161.1 requirements and of a type standard with the manufacturer.
2.8  COLOR, TEXTURE, AND PATTERN

**************************************************************************
NOTE:  Coordinate editing of color reference sentence(s) with the Government.  Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an Architect or Interior designer.  Select color from manufacturers standard colors or identified as a manufacturers color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings add a note that states:  "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval.  Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers.  The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible.  There is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.
**************************************************************************

Provide color [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES.] [as indicated on the drawings.] [as selected from manufacturers standard colors.] [{______} Color listed is not intended to limit the selection of equal colors from other manufacturers.]

[2.9  DISPENSING TRAYS AND BINS

Requirements for dispensing trays and bins:

a.  Design trays and bins to fit cabinets where shown.

b.  Fabricate of steel, polypropylene, fiberglass reinforced polyester resin, or other suitable material.

c.  Lock securely in place without the use of tools.

d.  Fit at angle to provide gravity feed where shown.

e.  Dispensing Trays:

   (1) Equip trays with two longitudinal dividers adjustable to three position.

   (2) Approximate dimensions: 150 mm 6-inches in width 75 mm 3-inches (in depth, and length to suit cabinets depth furnished.
f. Dispensing Bins:
   (1) Open front, except for retaining rim. 05-03M 12301-14
   (2) Approximate dimensions: 150 mm 6-inches in width, 125 mm 5-inches in depth, and length to suit cabinets furnished.

][2.10 ELECTRICAL FIXTURES

Requirements for dispensing electrical fixtures:

a. Comply with requirements of DIVISION 26 ELECTRICAL specifications for fixtures, receptacles, wiring and junction boxes required for fixtures and receptacles, included with casework.

b. Suitable for use with electrical system specified and shown.

c. Factory install in casework.

][2.11 SUSPENSION SYSTEM FOR INTERCHANGEABLE CASEWORK

Requirements for dispensing suspension systems for interchangeable casework:

a. Provide a suspension system for independent suspension of interchangeable under-counter cabinets and of countertops. Provide for removal or exchange of under counter cabinets of various heights, widths and types, and for vertical adjustment of countertops to heights indicated on drawings.

b. Suspension Frames: Fabricate from 32 mm 1-1/4-inch square or 25 mm 1 inch x 38 mm 1-1/2-inch rectangular, 2.6 mm 0.104-inch 12 gauge steel tubing welded to form full rectangle. Provide integral, adjustable leveling device in steel leg with non marring foot cap.

c. Provide mounting channels and support frames which allow for pipe chases and service channels when required.

d. Provide cabinets with a 1.49 mm .059-inch steel shaped form welded across the entire width of back to engage a continuous slot in a wall mounting channel. Provide final positive location and locking of case in position with two fastening devices through case stile at front.

e. Paint all construction materials that are exposed.

][2.12 WHEELED CARRIER

Provide a wheeled carrier to facilitate installation, removal, and transport of interchangeable cases as part of the interchangeable [laboratory] furniture system.

]PART 3 EXECUTION

3.1 INSTALLATION

**************************************************************************
NOTE: Installation of sinks is per the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE.
**************************************************************************
Install casework as described in manufacturers installation drawings in accordance with design intent.

a. Level base cabinets by adjusting leveling screws.

b. Secure cases permanently to floor and wall construction, where applicable.

c. Secure wall cases in position with screws to blocking, where applicable.

d. Bolt adjoining cases together.

e. Align doors, adjust hardware, and clean surfaces.

3.1.1 Coordination

Before installing casework, verify wall and floor surfaces covered by casework have been finished.

Verify location and size of mechanical and electrical services as required.

Verify reinforcement of walls and partitions for support and anchorage of casework.

3.1.2 Fastenings and Anchorage

Do not anchor to wood ground strips.

Provide hat shape metal spacers where fasteners span gaps or spaces 05-03M 12301-16.

Use 6 mm 1/4-inch diameter toggle or expansion bolts, or other appropriate size and type fastening device for securing casework to walls or floor.

Use expansion bolts shields having holding power beyond tensile and shear strength of bolt and breaking strength of bolt head.

Use 6 mm 1/4-inch diameter hex bolts for securing cabinets together.

Use 6 mm 1/4-inch by minimum 38 mm 1-1/2-inch length lag bolt anchorage to wood blocking for concealed fasteners.

Use not less than No. 12 or 14 wood screws with not less than 38 mm 1-1/2-inch penetration into wood blocking.

Space fastening devices 300 mm 12-inches on center with minimum of three fasteners in 900 or 1200 mm 3 or 4-foot unit width.

Anchor floor mounted cabinets with a minimum of four bolts through corner gussets. Anchor bolts may be combined with or separate from leveling device.

Secure cabinets in alignment with hex bolts or other internal fastener devices removable from interior of cabinets without special tools. Do not use fastener devices which require removal of tops for access.

Where units abut end to end anchor together at top and bottom of sides at front and back. Where units are back to back anchor backs together at corners with hex bolts placed inconspicuously inside casework.
Where type, size, or spacing of fastenings is not shown or specified, show on shop drawings proposed fastenings and method of installation.

3.1.3 Closures and Filler Plates

Close openings larger than 6 mm 1/4-inch wide between cabinets and adjacent walls with flat, steel closure strips, scribed to required contours, or machined formed steel fillers with returns, and secured with sheet metal screws to tubular or channel members of units, or bolts where exposed on inside.

Where ceilings interfere with installation of sloping tops, omit sloping tops and provide flat steel filler plates.

a. Secure filler plates to casework top members, unless shown otherwise.

b. Secure filler plates more than 150 mm 6-inches in width top edge to a continuous 25 by 25 mm one by one inch 0.889 mm .035-inches thick steel formed steel angle with screws.

c. Anchor angle to ceiling with toggle bolts, 05-03M 12301-17

Install closure strips at exposed ends of pipe space and offset opening into concealed space. Paint closure strips and fillers with same finishes as cabinets. Caulk and seal laboratory furniture as specified in Section 07 92 00 JOINT SEALANTS

3.1.4 Cabinets

Install in available space; arranged for safe and convenient operation and maintenance. Align cabinets for flush joints except where shown otherwise.

Install cabinets level with bottom of wall cabinets in alignment and tops of base cabinets aligned. Install corner cabinets with hinges on corner side with filler or spacers sufficient to allow opening of drawers.

Plug Buttons:

a. Install plug buttons in predrilled or prepunched perforations not used.

b. Use chromium plate plug buttons or buttons finish to match adjacent surfaces.

Cabinets 6D: Ground to nearest cold water pipe in accordance with NFPA, Underwriters Laboratories, Inc., or other nationally recognized laboratory approved ground specified system.

Cabinets PH77:

a. Install undercounter unit, PH77U, on base to bring cabinet to same height as adjacent cabinets.

b. Install wall hung units, PH77N, as for wall cabinets, bolt together with security type bolts.

c. Install stacked units, PH77D, bolted together and to base with security type bolts.
3.2 CLEANING

Remove crating and packing materials from premises. Wipe down surfaces to remove fingerprints and markings and leave in clean condition.

3.3 FIELD QUALITY CONTROL

3.3.1 Inspection

Examine casework grounds and supports for adequate anchorage, foreign material, moisture, and unevenness that could prevent quality casework installation. Ensure that electrical and plumbing rough-ins for casework are complete. Do not proceed with installation until defects are corrected.

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

Use the "S" Classification only in SD-11 Closeout Submittals. The "S" classification indicates
submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

1.3 QUALITY CONTROL

Submit manufacturer's standard color charts for wood and metal cabinets showing the manufacturer's recommended color and finish selections.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver, handle, and store cabinets in a manner that prevents damage or deformity. Provide temporary skids under units weighing more than [_____] kilogram pounds.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide wood cabinets, factory-fabricated and finished in the manufacturer's standard sizes and finishes of the type, design, and configuration indicated on drawings. Construct cabinets as specified meeting the requirements of KCMA A161.1. Provide wall and base cabinet assemblies consisting of individual units joined into continuous sections. Use fastenings that permit removal and replacement of individual units.
without affecting the remainder of the installation. Provide counters with watertight sink rim when indicated, and removable drawers equipped with position stops to avoid accidental complete withdrawals. Fix or adjust shelves as indicated.

2.2 FABRICATION

2.2.1 Wood Cabinet Fabrication

**************************************************************************
NOTE: Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in high humidity areas of facilities.
**************************************************************************

Construct wall and base cabinets with frame fronts and solid ends, or frame construction throughout. Provide 20 by 40 millimeter 3/4 by 1-1/2 inch kiln-dried hardwood framing members, using mortise and tenon, dovetailed, groove and lapped, biscuit and dado, or doveled, with glue assembly. Brace top and bottom corners with hardwood blocks that are glued with water-resistant glue and nailed in place. Provide base cabinets with an integral toe space at least 65 millimeter 2-1/2 inches deep and 100 millimeter 4 inches high. Mount drawers on [metal guides] [hardwood guides] [renewable plastic] [fiber guides]. Provide [fixed] [removable] [and] [adjustable] shelving, as indicated.

Provide minimum thicknesses of materials for frame-front, solid-end cabinet construction as follows:

a. Backs and bottoms of base cabinets and tops of wall cabinets: 3 millimeter 1/8 inch tempered hardboard. Brace bottoms with wood members glued in place.

b. Cabinet ends: 15 millimeter 1/2 inch hardwood-veneer plywood

c. Doors: 20 millimeter 3/4 inch [hardwood] [softwood] plywood, [solid] [hollow] core doors

d. Drawer fronts: 20 millimeter 3/4 inch hardwood

e. Drawer bottoms: 4.76 millimeter 3/16 inch plywood or tempered hardboard. Brace drawer bottoms over 380 millimeter 15 inches wide with wood members glued in place.

f. Drawer sides and backs: 15 millimeter 1/2 inch hardwood

g. Interior partitions or dividers: 15 millimeter 1/2 inch [fir plywood, Grade A-A] [hardwood]

h. Shelves: Grade A-B plywood, supported on ends and 600 millimeter 24 inches on centers

i. Adjustable shelves: 20 millimeter 3/4 inch plywood
j. Base cabinet shelves: 16 millimeter 5/8 inch plywood

k. Wall cabinet shelves: [15 millimeter 1/2 inch [plywood] [glued-up solid wood]] [6 millimeter 1/4 inch plywood with a solid-wood frame]

Provide minimum thicknesses of materials for frame-type cabinet construction as follows:

a. Cabinet ends: 6 millimeter 1/4 inch hardwood plywood

b. Backs, bottoms, partitions, and dividers: 4 millimeter 3/16 inch tempered hardboard in a frame

Provide materials for other components as specified.

2.2.1.1 High-Pressure Decorative Laminate (HPDL)

ANSI/NEMA LD 3, satin finish, unless otherwise indicated.

a. Countertops: PF 42, satin finish

b. Vertical Surfaces: GP 28 or PF 30, satin finish

c. Backing Sheet: BK 20

d. Cabinet Liner: CL 20

2.2.1.2 Hardwood Plywood

HPVA HP-1, Type II (Interior), [three-] [five-]ply, with face veneer of good grade (1) or better. Cover all exposed edges.

2.2.1.3 Hardwood

******************************************************************************
NOTE: Manufacturers use a variety of wood species in the production of kitchen cabinets. To specify a single species would be cost prohibitive and/or restrict competition. When indicating finishes, such as "light oak," "medium walnut," etc., a wood species should be included in the finish designation for use as a guide to the wood grain character and appearance.
******************************************************************************

Provide hardwood for use in cabinet work, thoroughly seasoned or kiln-dried to 12-15 percent mc; without defects in any exposed parts or surfaces.

2.2.1.4 Softwood Plywood

Comply with DOC/NIST PS1.

a. Countertops: Exterior type, A-C Grade

b. Elsewhere: Interior type, A-B Grade, may be used in lieu of hardwood plywood where HPDL finish is provided.
2.2.1.5 Hardboard

**************************************************************************
NOTE: Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in high humidity areas of facilities.
**************************************************************************

In accordance with AHA A135.4, tempered

2.2.1.6 Steel for Cabinets

ASTM A1008/A1008M, cold rolled, commercial quality carbon steel sheet

2.2.1.7 Sinks [, Lavatories] and Fittings

As specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE.

[2.2.2 Particle Board Cabinet Fabrication

**************************************************************************
NOTE: Delete inapplicable paragraphs, or state appropriate options.

Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in high humidity areas of facilities.
**************************************************************************

[ Construct frameless wall and base cabinets with solid particleboard panels throughout, using mortise and tenon, grooved and lapped, [with biscuit and dado] [doweled] and glue assembly. Brace top and bottom corners with hardwood blocks that are glued with water-resistant glue and nailed in place. Provide base cabinets with an integral toe space at least 65 millimeter 2-1/2-inches deep and 100 millimeter 4 inches high. Mount drawers on [metal guides] [hardwood guides] [renewable plastic or fiber guides]. Provide [fixed] [removable] [and] [adjustable] shelving, as indicated on drawings.

][Provide minimum thicknesses of materials for cabinet construction as follows:

a. Backs and bottoms of base cabinets and tops of wall cabinets: 16 millimeter 5/8 inch Grade [M-2] [M-2 exterior glue]

b. Exposed cabinet ends: 16 millimeter 5/8 inch particle board with a plastic laminate covering

c. Doors: 20 millimeter 3/4 inch particle board laminated on [front
surface] [rear surface] [all edges]

d. Drawer fronts: 20 millimeter 3/4 inch particle board laminated on all edges

e. Drawer bottoms: 3 millimeter 1/8 inch plywood or tempered hardboard. Brace drawer bottoms over 380 millimeter 15 inches wide with wood members glued in place.

f. Drawer sides and backs: 15 millimeter 1/2 inch particle board

g. Interior partitions or dividers: 15 millimeter 1/2 inch particle board

h. Shelves: Supported on ends and 600 millimeter 24 inches on centers

i. Adjustable shelves: 20 millimeter 3/4 inch particle board

j. Base cabinet shelves: 16 millimeter 5/8 inch particle board

k. Wall cabinet shelves: 13 millimeter 1/2 inch particle board

)[2.2.3 Plywood Cabinet Fabrication

**************************************************************************

NOTE: Delete inapplicable paragraphs, or state appropriate options.

Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in high humidity areas of facilities.

**************************************************************************

[Construct frameless wall and base cabinets with solid plywood panels throughout using mortise and tenon, grooved and lapped, [with biscuit and dado] [doweled], with glue assembly. Brace top and bottom corners with hardwood blocks that are glued with water-resistant glue and nailed in place. Provide base cabinets with an integral toe space at least 65 millimeter 2-1/2 inches deep and 100 millimeter 4 inches high. Mount drawers on [metal guides] [hardwood guides] [renewable plastic or fiber guides]. Provide [fixed] [removable] [and] [adjustable] shelving, as indicated on drawings.

][Provide minimum thicknesses of materials for cabinet construction as follows:

b. Cabinet ends: 20 millimeter 3/4 inch standard veneer-core plywood with a plastic laminate covering

c. Doors: 20 millimeter 3/4 inch standard veneer-core plywood laminated on [front surface] [rear surface] [all edges]
d. Drawer fronts: **20 millimeter 3/4 inch** standard veneer-core plywood laminated on all edges

e. Drawer bottoms: **3 millimeter 1/8 inch** plywood or tempered hardboard. Brace drawer bottoms over **380 millimeter 15 inches** wide with wood members glued in place.

f. Drawer sides and backs: **20 millimeter 3/4 inch** standard veneer-core plywood

g. Interior partitions or dividers: **20 millimeter 34 inch** standard veneer-core plywood

h. Shelves: Supported on ends and **600 millimeter 24 inches** on centers

i. Adjustable shelves: **20 millimeter 3/4 inch** standard veneer-core plywood

j. Base cabinet shelves: **20 millimeter 3/4 inch** standard veneer-core plywood

k. Wall cabinet shelves: **20 millimeter 3/4 inch** standard veneer-core plywood

][2.2.4 Melamine Cabinet Fabrication

************************************************************************************

NOTE: Delete inapplicable paragraphs, or state appropriate options.

Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in high humidity areas of facilities.

************************************************************************************

[ Construct cabinets with frame fronts and solid ends throughout. Frame members must be **20 by 40 millimeter 3/4 by 1-1/2 inch** kiln-dried hardwood, using mortise and tenon, dovetailed or doweled, and glued together. Brace top and bottom corners with hardwood blocks that are glued with water-resistant glue and nailed in place. Provide base cabinets with an integral toe space at least **65 millimeter 2-1/2 inches** deep and **100 millimeter 4 inches** high. Mount drawers on [metal guides] [hardwood guides] [renewable plastic or fiber guides]. Provide [fixed] [removable] [and] [adjustable] shelving, as indicated on drawings.

][Provide minimum thicknesses of materials for cabinet construction as follows:

  b. Cabinet ends: **20 millimeter 3/4 inch** melamine particle board with a plastic laminate covering

SECTION 12 32 00 Page 13
c. Doors: 20 millimeter 3/4 inch melamine particle board laminated on [front surface] [rear surface] [all edges]

d. Drawer fronts: 20 millimeter 3/4 inch melamine particle board laminated on all edges

e. Drawer bottoms: 3 millimeter 1/8 inch plywood or tempered hardboard. Brace drawer bottoms over 380 millimeter 15 inches wide with wood members glued in place.

f. Drawer sides and backs: 16 millimeter 5/8 inch melamine particle board

g. Interior partitions or dividers: 16 millimeter 5/8 inch melamine particle board

h. Shelves: Supported on ends and 600 millimeter 24 inches on centers

i. Adjustable shelves: 20 millimeter 3/4 inch melamine particle board

j. Base cabinet shelves: 16 millimeter 5/8 inch melamine particle board

k. Wall cabinet shelves: 16 millimeter 5/8 inch melamine particle board

][2.2.5 Laminate Cabinet Fabrication

**************************************************************************

NOTE: Delete inapplicable paragraphs, or state appropriate options.

Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in highhumidity areas of facilities.

**************************************************************************

[ Construct cabinets with frame fronts and solid ends throughout. Frame members must be 20 by 40 millimeter 3/4 by 1-1/2 inch kiln-dried hardwood, using mortise and tenon, dovetailed or doweled, and glued together. Brace top and bottom corners with hardwood blocks that are glued with water-resistant glue and nailed in place. j. Base cabinet shelves: 20 millimeter 3/4 inch standard veneer-core plywood

k. Wall cabinet shelves: 20 millimeter 3/4 inch standard veneer-core plywood

]2.2.6 Miscellaneous Cabinets

**************************************************************************
NOTE: Delete inapplicable paragraphs, or state appropriate options.

Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in high humidity areas of facilities.
**************************************************************************

[2.2.6.1 Combination Sink-and-Base Cabinet

A combination sink-and-base cabinet unit may be furnished in lieu of the base cabinet and inset sink indicated provided the combination unit affords facilities and space equal to those indicated and provided the combination unit matches the adjacent units in materials and construction. Provide a sink with matching drainboards, of [corrosion-resistant steel] [porcelain-enamel steel], equipped with a chromium-plated [swinging-spout faucet, chromium-plated water-control valves,] [automatic faucet] and chromium-plated cup strainer. Ensure joints are watertight between sink and drainboard and between drainboard and counter top.

][2.2.6.2 Special Purpose Cabinets

[Provide special-purpose cabinets, such as cabinets for eye-level oven units, countertop range units, and built-in refrigerators and desks, as indicated on drawings, of the same materials and construction as adjacent cabinets.] [Provide space adjacent to sink for a dishwasher, as indicated.]
2.3 MANUFACTURED UNITS

******************************************************************************
NOTE: Delete inapplicable paragraphs, or state appropriate options.

Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in high humidity areas of facilities.

******************************************************************************

2.3.1 Cabinets

Provide new factory-finished kitchen wall and base cabinets with high pressure decorative laminate (HPDL) countertops [and bathroom vanity cabinets [with HPDL countertops] [to receive combination lavatory-countertops as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE]]. Provide cabinets conforming to KCMA A161.1, requirements specified herein, bearing the "KCMA Certified Cabinet" seal of the Kitchen Cabinet Manufacturers Association, or submit manufacturer's test reports from an approval laboratory that cabinets meet requirements of KCMA A161.1. Provide countertops conforming to requirements specified herein.

2.3.1.1 Frame Type Cabinets

Provide cabinets with [frame fronts and solid ends] [frame construction throughout]. Provide 19 mm 3/4 inch thick by 38 mm 1-1/2 inch wide frame members; kiln-dried hardwood, glued together, either mortised and tenoned, dovetailed or doweled, nailed, stapled or screwed. Brace top and bottom corners with either hardwood blocks that are glued together with water resistant glue and nailed in place, or metal or plastic corner braces. Use 3 mm 1/8 inch thick plywood for backs of cabinets, with tempered hardboard or 9 mm 3/8 inch thick, 20 kg 44 pound density particle board. [Provide 9 mm 3/8 inch thick hardwood or 9 mm 3/8-inch thick, 20 kg 44 pound density particle board] [plywood] [melamine] [laminate] for backs of cabinets. [Provide minimum 9 mm 3/8 inch thick plywood 20 kg 44 pound density particle board or [good grade] [sound grade] plywood for bottoms of cabinets, braced with wood members glued in place.] Provide cabinet ends made with [16 mm 5/8 inch thick hardwood plywood] [16 mm 5/8 inch thick, 20 kg 44 pound density particle board core] [9 mm 3/8 inch thick, 20 kg 44 pound density particle board].

2.3.1.2 Frameless Type Cabinets

******************************************************************************
NOTE: Frameless cabinetry may be slightly oversized. When considering a frameless design, incorporate trimmable fillers to allow for any excess. This becomes increasingly important when the design requires cabinetry to fit snugly between two walls or other confined areas.

******************************************************************************
 PROVIDE CABINETS OF FRAMELESS DESIGN AND CONSTRUCTION. CONSTRUCT CABINETS OF MINIMUM 16 MM 5/8 INCH THICK, 20 KG 44 POUND [DENSITY PARTICLE BOARD] [Plywood] [MELAMINE] [LAMINATE] END AND FLOOR PANELS. CONSTRUCT CABINET BACK OF MINIMUM 5 MM 3/16 INCH THICK, 20 KG 44 POUND [DENSITY PARTICLE BOARD] [Plywood] [MELAMINE] [LAMINATE]. DOWEL AND GLUE HANGING RAILS TO END PANELS, THEN FASTENED AND HOT MELT GLUED TO CABINET BACK. PROVIDE TOE KICK PLATES THAT ARE RECESSED, DOWELED AND GLUED TO THE END PANELS. BRACE TOP AND BOTTOM CORNERS WITH EITHER HARDWOOD BLOCKS GLUED TOGETHER WITH WATER RESISTANT GLUE AND NAILED IN PLACE, OR FASTENED WITH METAL OR PLASTIC CORNER BRACES.

2.3.2 Finish

2.3.2.1 Cabinet Finish

Provide cabinets with a factory-applied durable finish in accordance with KCMA A161.1 requirements and of a type standard with the manufacturer. Fabricate natural finish wood doors, drawer fronts, cabinet fronts, and exposed cabinet sides of wood, free of extreme color variations within each panel or between adjacent panels. For exposed exterior surfaces, provide [hardwood or grade A-A hardwood veneer with natural stain and sprayed on factory applied finish.] [MELAMINE PLASTIC FINISH.] [PAINT-FINISHED WOOD DOORS, DRAWER FRONTS, CABINET FRONTS, AND EXPOSED CABINET SIDES FABRICATED OF HARDWOOD OR GRADE C HARDWOOD VENEER.][ 0.051 MM 2 MIL VINYL WRAP.]

2.3.2.2 Melamine Laminated Interior Cabinet Finish

Finish plywood, particle board or tempered hardboard cabinet backs with a melamine laminate on the exposed side. Cover particle board shelves on both sides with a laminated melamine finish. Provide Melamine laminate that conforms to the requirements of ANSI/NEMA LD 3 and laminate adhesive that is contact type applied to both surfaces.

2.3.2.3 Backer Sheets

Provide backer sheets of high pressure plastic laminate, conforming to ANSI/NEMA LD 3, Grade BK20, applied to the underside of all core material.

2.3.3 Color, Texture, And Pattern

**************************************************************************
NOTE: Coordinate editing of color reference sentence(s) with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an Architect or Interior designer. Select color from manufacturers standard colors or identified as a manufacturers color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings add a note that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

SECTION 12 32 00 Page 17
Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

Provide color [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES.] [as indicated on the drawings.] [selected from manufacturers standard colors.] [_____.] Color listed is not intended to limit the selection of equal colors from other manufacturers.

2.4 MATERIALS

******************************************************************************

NOTE: Delete any of the following materials that are not applicable.
******************************************************************************

[ Provide steel for cabinet construction conforming to ASTM A1008/A1008M. ]

[ Provide corrosion-resistant steel conforming to ASTM A240/A240M, Type [302] [304] [316] Finish 4. ]

[ Provide douglas-fir plywood conforming to APA E30,APA EWCG, and APA PS 1 exterior type, fully waterproof bond. ]

[ Provide Medium Density Fiberboard (MDF) for interior applications, fully waterproof bond conforming to CPA A208.1 and CPA A208.2. ]

[ Provide glass conforming to ASTM C1036, Type I, Class 1, Quality q3, 6 millimeter 1/4 inch thick, for unframed sliding glass doors; other glass to conform to ASTM C1036, Type II, Class 1, Quality q8, 5 millimeter 7/32 inch thick. ]

[ Provide adhesives for application of plastic laminate consisting of a thermosetting urea-resin Type II conforming to ASTM D4690 as recommended by the manufacturer of the laminate. Provide adhesive for wood members conforming to ASTM D4689. ]

[ Provide filler material conforming to MPI 91. ]

[ Provide hardwood conforming to PS MM-L-736, standard hardwood lumber, S2S. ]

[ Provide hardwood plywood conforming to HPVA HP-1. ]

[ Provide particle board conforming to CPA A208.1, Type 1, Grade M or medium density. ]

******************************************************************************

NOTE: Review ANSI/NEMA LD 3 and insert style, type, grade, class, and finish as required.
******************************************************************************
Provide **plastic laminate** conforming to ANSI/NEMA LD 3, Style [____], Type [____], Grade [____], Class [____], Finish [____].

[ Provide **softwoods** conforming to DOC/NIST PS20, factory and shop grade.

][Provide **varnish** conforming to MPI 28.

][Provide accessories and hardware conforming to the following requirements, as applicable:

a. Extension drawer slides: ANSI/BHMA A156.9, Type B85071
b. Semconcealed hinges: ANSI/BHMA A156.9, Type B81201, 1-1/2 inches
c. Full surface hinges: ANSI/BHMA A156.9, Type B81131, 1-1/2 inches
d. Knob pulls: ANSI/BHMA A156.9, 1-inch diameter, Type B12132
e. Bar type pulls: ANSI/BHMA A156.9, 4-inch overall length, Type B12012
f. Semconcealed hinges: ANSI/BHMA A156.9, Type B81201, 40 millimeter
g. Full surface hinges: ANSI/BHMA A156.9, Type B81131, 40 millimeter
h. Knob pulls: ANSI/BHMA A156.9, 25 millimeter diameter, Type B12132
i. Bar type pulls: ANSI/BHMA A156.9, 100 millimeter overall length, Type B12012
j. Locks, keying, and keys: As directed
k. Catches: Magnetic, 22 newton 5 pound pull
l. Sliding door set: Impregnated fiberboard track, Nylon glides

Provide **fasteners** conforming to the following:

a. Screws: ASME B18.6.1, Group, Type and Class as applicable
b. Anchoring Devices: FS FF-S-325, Group, Type, and Class as applicable
c. Toggle bolts: FS FF-B-588, Type I, Class A, Style 2
d. Nuts: ASTM F594, corrosion-resistant steel
e. Bolts: ASTM A325, heavy, hexagon head bolts corrosion-resistant steel
f. Nuts: ASTM F836M, corrosion-resistant steel
g. Bolts: ASTM A325M, heavy, hexagon head bolts corrosion-resistant steel

**************************************************************************
**NOTE:** Provide for sink inset-type installation as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE.
**************************************************************************

[ Provide corrosion-resistant **steel sinks** conforming to the following requirements:
[ a. 1.3 millimeter 18-gage corrosion-resistant steel, integral with corrosion-resistant steel countertop

] [b. 1.3 millimeter 18-gage corrosion-resistant steel, nonintegral, self-rimming

] c. Drain holes in center of bowl

d. Underside coated with 3 millimeter 1/8 inch thick sound deadener

e. Die-form, seamless, raised edges at front and ends

f. Cove corners to 13 millimeter 1/2 inch radius

g. Equip with strainers and tail pieces

] [Provide service fixtures conforming to the following requirements:

a. Provide fixtures in accordance with the water conservation policy as stated in the Standard Plumbing Codes, Appendix J.

b. Faucets: splashback mounted, cast brass, chrome plated, FS WW-P-541

c. Faucets: deck mounted, cast brass, chrome plated, FS WW-P-541

d. Gas, air, and vacuum, distilled water, steam, and de-ionized water cocks: cast brass, chrome plated, ground key type

e. Drains, strainers, and taps: brass, chrome plated, FS WW-P-541

f. Index buttons: plastic, color codes in accordance with SEFA 7

g. Special items: provide nipples and locknuts with each fixture as directed.

] Provide the following coating:

**************************************************************************
NOTE: Delete any of the following types that are not applicable.
**************************************************************************

Type I, zinc phosphate

Type II, iron phosphate

Type III, organic-paint, varnish, lacquer

**************************************************************************

[ a. Metal pretreatment coatings: FS TT-C-490, Type I

][b. Metal pretreatment coatings: FS TT-C-490, Type II

][c. Metal pretreatment coatings: FS TT-C-490, Type III

][d. Enamel: [MPI 10][MPI 11][MPI 119]
2.5 ACCESSORIES AND HARDWARE

Provide accessories such as utility shelves and racks [for extracts, condiments,] [and towels;][ bins for sugar and flour;][ breadboxes;] and trays for cutlery and flatware as indicated.

Provide corrosion resistant hardware, and all exposed hardware with a chromium-plated finish or a corrosion-resistant finish as approved. Paint semiconcealed hinges on cabinets where paint finish is required to match the cabinets. Equip doors with [bullet-type catches] [spring hinges] [magnetic-type catches]. Provide door and drawer pulls as indicated.

PART 3 EXECUTION

Submit manufacturer's instructions for wood and metal cabinet systems including special provisions required to install equipment components and system packages. Submit special notices to detail impedances, hazards and safety precautions.

3.1 INSTALLATION

3.1.1 Field Finishing of Wood Cabinets

[ For painted finish, apply a prime coat and two coats of synthetic enamel of air-drying quality, conforming to [MPI 9][MPI 94], Class A. Provide colors as selected. ]

[For natural finish, use the applicable procedure for the type of wood selected as follows:

a. For open-grain woods: Apply one coat of paste wood filler, and remove excess filler. Then apply one coat of pale varnish thinned with turpentine, followed by one coat of pale varnish and then by one coat of satin-finish varnish, plus an additional coat of satin-finish varnish on cabinet doors and drawer fronts. Lightly sand surfaces between coats.

b. For close-grain woods: Apply one coat of pale varnish thinned with turpentine, followed by one coat of pale varnish and then by one coat of satin-finish varnish, plus an additional coat of satin-finish varnish on cabinet doors and drawer fronts. Lightly sand surfaces between coats.

] At the Contractor's option, wood cabinets with a factory finish standard set by the cabinet manufacturer may be provided.

3.1.2 Cabinet Installation

******************************************************************************
NOTE: Installation of sinks is per the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE.
******************************************************************************

Install casework plumb with countertops level to within 1 millimeter in 3000 millimeter 1/16 inch in 10 feet. Level base cabinets by adjusting leveling screws. Scribe and fit scribe strips to irregularities of adjacent surfaces. Gap opening is not to exceed 0.63 millimeter 0.025-inch [______].
Secure cases permanently to floor and wall construction using 6 millimeter 1/4 inch diameter masonry anchors, spaced 760 millimeter 30 inches maximum on center, with a minimum of two for each case.

Support wall cases on continuous 1.3 millimeter 18-gage galvanized steel hanging brackets. Secure wall cases in position with screws to blocking. Bolt adjoining cases together. Ensure width of joints does not exceed 0.79 millimeter 1/32 inch. Provide closer strips, filler strips, and finish moldings as required. Align doors, adjust hardware, clean and wax surfaces.

Submit installation drawings for cabinets. Include in drawings location of cabinets, details of cabinets related and dimensional positions, and locations for roughing in plumbing, including sinks, faucets, strainers and cocks.

3.2 ADJUSTING AND CLEANING

3.2.1 Inspection

Examine casework grounds and supports for adequate anchorage, foreign material, moisture, and unevenness that could prevent quality casework installation. Ensure that electrical and plumbing rough-ins for casework are complete. Do not proceed with installation until defects are corrected.

3.2.2 Cleaning

On completion of cabinet installation, touch up marred or abraded finished surfaces. Remove crating and packing materials from premises. Wipe down surfaces to remove fingerprints and markings and leave in clean condition.

1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Pre-Installation Meeting

Within [30] [_____] calendar days after [date of award] [date of receipt of notice of award], submit for the approval of the Contracting Officer [6] [_____] copies of outline drawings of all casework to be furnished under this contract, together with weights, overall dimensions, and required samples. Ensure that drawings show the general arrangement and overall dimensions of the casework, details of any casework supports[, and provisions for electrical outlets[, and special provisions for external cables and cords.]] Submit the following for review and approval:

a. Fabrication Drawings

b. Installation Drawings
c. Casework Samples

d. Manufacturer's Standard Color Charts

e. Accessories and Hardware Samples

f. Certificates of Conformance

Submit installation drawings for manufactured plastic casework. Include in drawings location of cabinets, details of cabinets related and their dimensional positions,[, and locations for roughing in plumbing, including sinks, faucets, strainers and cocks.]

Submit casework samples in accordance with ASTM D4000, and include accessories and hardware, one each.

Submit manufacturer's standard color charts for plastic cabinets, showing the manufacturer's recommended color and finish selections.

1.3 SUBMITTALS

**********************************************************************************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**********************************************************************************************************************************************

Government approval is required for submittals with a "G" or "S"
classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

- Fabrication Drawings; G[, [____]]
- Installation Drawings; G[, [____]]

**SD-03 Product Data**

- Catalog Data; G[, [____]]

**SD-04 Samples**

- Casework Samples; G[, [____]]
- Accessories and Hardware; G[, [____]]
- Manufacturer's Standard Color Charts; G[, [____]]

**SD-07 Certificates**

- Certificates of Conformance

**SD-08 Manufacturer's Instructions**

- Manufacturer's Instructions

1.4 QUALITY CONTROL

Submit certificates of conformance for the following items, showing conformance with the standards cited in this section:

a. Corrosion-resistant steel

b. Glass
c. Adhesives
d. Filler material
e. Fasteners

f. Service fixtures
g. Accessories and hardware

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver, handle, and store cabinets in a manner that will prevent damage or deformity. [Provide temporary skids under units weighing more than [_____] kilogram pounds.]
PART 2   PRODUCTS

2.1  SYSTEM DESCRIPTION

Furnish plastic laminate cabinets, factory-fabricated and finished in the manufacturer's standard sizes and finishes, of the type, design, and configuration indicated. Construct cabinets as specified and meet the requirements of KCMA A161.1. [Submit fabrication drawings for review and approval before commencement of fabrication.] Provide wall and base cabinet assemblies consisting of individual units joined into continuous sections. Provide counters with a watertight sink rim when indicated. Provide removable drawers equipped with position stops to prevent accidental complete withdrawals. Fix or adjust shelves as indicated.

2.2  COMPONENTS

Submit manufacturer's catalog data for the following items:

a. Cabinets
b. Glass
c. Adhesives
d. Filler material
e. Fasteners
f. Service fixtures
g. Accessories and hardware
h. Plastic laminate
i. Steel sinks
j. Countertops

Submit the manufacturer's instructions for plastic cabinet systems, including special provisions required to install equipment components and system packages, and any special notices detailing impedances, hazards and safety precautions, and casework maintenance.

Provide the manufacturer's cabinets with the standard sizes, type, and design indicated. For both wall and base cabinets, join individual units into continuous sections as indicated.

2.2.1  Cabinets

Provide new factory-finished kitchen wall and base cabinets with high-pressure decorative laminate (HPDL) countertops [and bathroom vanity cabinets [with HPDL countertops] [to receive combination lavatory-countertops as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE]]. Provide cabinets that conform to KCMA A161.1 and requirements specified herein, and that bear the "KCMA Certified Cabinet" seal of the Kitchen Cabinet Manufacturers Association. Provide countertops that conform to ANSI/NEMA LD 3 and requirements specified herein.
2.2.2 Miscellaneous Cabinets

******************************************************************************
NOTE: Delete inapplicable paragraphs, or state appropriate options.
******************************************************************************

[2.2.2.1 Combination Sink-and-Base Cabinet

Provide a sink with matching drainboards, made of [corrosion-resistant steel] [porcelain-enamel steel] [plastic laminate] [solid surface] [fiberglass composites]; equipped with a chromium-plated [swinging-spout faucet, chromium-plated water-control valves,] [automatic faucet] and chromium-plated cup strainer. Make joints between sink and drainboard and between drainboard and countertop watertight.

][2.2.2.2 Special-Purpose Cabinets

Provide special-purpose cabinets, such as cabinets for eye-level oven units, countertop range units, and built-in refrigerators, as indicated on the drawings, with the same materials and construction as adjacent cabinets.

]2.3 MATERIALS

******************************************************************************
NOTE: Delete any of the following materials that are not applicable.
******************************************************************************

[ Provide corrosion-resistant steel conforming to ASTM A240/A240M, Type [302] [304] [316].

][Provide glass conforming to ASTM C1036, Type I, Class 1, Quality q3, 6 millimeter 1/4 inch thick, for unframed sliding glass doors; and other glass conforming to ASTM C1036, Type II, Class 1, Quality q8, 5 millimeter 7/32 inch thick.

Provide thermosetting urea-resin Type II adhesives for application of plastic laminate, conforming to ASTM D4690 as recommended by the manufacturer of the laminate. Provide adhesive for wood members, conforming to ASTM D4689.

][Provide filler material conforming to FS TT-F-336.

]

******************************************************************************
NOTE: Review ANSI/NEMA LD 3 and insert style, type, grade, class, and finish as required.
******************************************************************************

Provide plastic laminates conforming to ANSI/NEMA LD 3, Style [____], Type [____], Grade [____], Class [____], Finish [____].

Provide accessories and hardware conforming to the following requirements, as applicable:

a. Extension drawer slides: ANSI/BHMA A156.9, Type B85071

b. Semiconcealed hinges: ANSI/BHMA A156.9, Type B81201, 40 millimeter 1 1/2 inches
c. Full surface hinges: ANSI/BHMA A156.9, Type B81131, 40 millimeter 1 1/2 inches

d. Knob pulls: ANSI/BHMA A156.9, Type B12132 25 millimeter 1-inch diameter

e. Bar pulls: ANSI/BHMA A156.9, Type B12012 100 millimeter 4-inch overall length

f. Locks, keying, and keys: As directed
g. Catches: Magnetic, 22 Newton 5-pound pull

h. Sliding door set: Nylon glides, [_____]  

Provide fasteners conforming to the following:

a. Screws: ASME B18.6.1, Group, Type and Class as applicable

b. Anchoring devices: FS FF-S-325, Group, Type, and Class as applicable

c. Toggle bolts: FS FF-B-588, Type I, Class A, Style 2

d. Nuts: ASTM F836M ASTM F594, corrosion-resistant steel

e. Bolts: ASTM F3125/F3125M heavy, hexagon head bolts, corrosion-resistant steel

**************************************************************************

NOTE: Sink for inset-type installation is as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE.

**************************************************************************

[ Provide integral corrosion-resistant steel sinks with the following characteristics:

[ a. 1.3 millimeter 18-gauge corrosion-resistant steel, integral with corrosion-resistant steel countertop

]b. 1.3 millimeter 18-gauge corrosion-resistant steel, nonintegral, self-rimming

] c. Drain holes in center of bowl

d. Underside coated with 3 millimeter 1/8-inch thick sound deadener

e. Die-form, seamless, raised edges at front and ends

f. Cove the corners to 13 millimeter 1/2-inch radius

g. Strainers and tail pieces

][Provide sound deadening conforming to CID A-A-59295.

][Provide service fixtures conforming to the following requirements:

a. Fixtures conforming to the water conservation policy as stated in the specified Standard Plumbing Codes, Appendix J.
b. Faucets: Splashback-mounted, cast brass, chrome plated, FS WW-P-541

c. Faucets: Deck-mounted, cast brass, chrome plated, FS WW-P-541

d. Cocks for gas, air, vacuum, distilled water, steam, and deionized water cocks: Cast brass, chrome-plated, ground key

e. Drains, strainers, and taps: Brass, chrome-plated, FS WW-P-541

f. Index buttons: Plastic, color codes in accordance with SEFA 7

g. Special items: Nipples and locknuts with each fixture as directed.

**************************************************************************
NOTE: Delete any of the following types that are not applicable.

Type I, zinc phosphate

Type II, iron phosphate

Type III, organic-paint, varnish, lacquer

**************************************************************************

h. Metal pretreatment coatings: [FS TT-C-490, Type I][FS TT-C-490, Type II][FS TT-C-490, Type III]

i. Enamel: [MPI 10] [MPI 11] [MPI 119], Class 2

2.3.1 Finish

2.3.1.1 Cabinet Finish

Provide cabinets of a type standard with the manufacturer, with a durable factory-applied finish and in accordance with KCMA A161.1.

2.3.1.2 Backer Sheets

Provide backer sheets of high pressure plastic laminate conforming to ANSI/NEMA LD 3, with Grade BK20 applied to the underside of all core material.

2.3.2 Color, Texture, and Pattern

**************************************************************************
NOTE: Coordinate editing of color reference sentence(s) with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an architect or interior designer. Select a color from the manufacturer's standard colors or from those identified as a manufacturer's color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be indicated in the drawings, add a note that states: "Where color is shown as being specific to one
manufacturer, an equivalent color by another
manufacturer may be submitted for approval.
Manufacturers and materials specified are not
intended to limit the selection of equal colors from
other manufacturers. The word "color" as used
herein includes surface color and pattern."

Before specifying a custom color finish, research to
determine if the additional cost and lead time is
feasible. Note that a minimum order is often
required; this requirement will also affect future
orders.

When a manufacturer's name, stock number, pattern,
and color are indicated, be certain that the product
conforms to this specification, as edited.

**************************************************************************

Provide color [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES.]
[as indicated on the drawings.] [as selected from manufacturer's standard
colors.] [[____]. The color listed is not intended to limit the selection
of equal colors from other manufacturers.]

2.4 ACCESSORIES

Furnish accessories such as utility shelves and racks for [specialized lab
equipment][extracts, condiments, and towels; bins for sugar and flour;
breadboxes; and trays for cutlery and flatware as indicated.]

Provide corrosion-resistant hardware. Provide a chromium-plated finish or
a corrosion-resistant finish as approved. Paint semiconcealed hinges on
cabinets where paint finish is required to match the cabinets. Equip doors
with [bullet catches] [spring hinges] [magnetic catches]. Provide door and
drawer pulls as indicated.

PART 3 EXECUTION

3.1 INSTALLATION

**************************************************************************

NOTE: Install sinks in accordance with the
requirements of Section 22 00 00 PLUMBING, GENERAL
PURPOSE.
**************************************************************************

Install the casework plumb with countertops level to within 1 millimeter in
3000 millimeter 1/16 inch in 10 feet. Level base cabinets by adjusting
leveling screws. Scribe and fit scribe strips to irregularities of
adjacent surfaces. Ensure the gap openings do not to exceed 0.63 millimeter
0.025 inch [____].

[ Secure cases permanently to floor and wall construction using 6 millimeter
1/4-inch-diameter masonry anchors, spaced 760 millimeter 30 inches maximum
on center, with a minimum of two anchors for each case, where indicated.
]

Install fastenings to permit removal and replacement of individual units
without affecting the remainder of the installation.

Support wall cases on continuous 1.3 millimeter 18-gauge galvanized-steel
hanging brackets. [Secure wall cases in position with screws to blocking, where indicated.] [Bolt adjoining cases together. Ensure that joint widths do not exceed 0.79 millimeter 1/32 inch, where indicated.] [Provide closer strips, filler strips, and finish moldings as required.] Align doors, adjust hardware, and clean and wax surfaces.

3.2 FIELD QUALITY CONTROL

Examine casework grounds and supports for adequate anchorage, foreign material, moisture, and unevenness that could prevent casework installation from meeting the requirements specified.

Ensure that [electrical and plumbing] rough-ins for casework are complete. Do not proceed with installation until defects are corrected.

3.3 ADJUSTING AND CLEANING

On completion of cabinet installation, clean surfaces and surrounding area. Remove crating and packing materials from premises. Wipe down surfaces to remove fingerprints and markings and leave in clean condition.

NOTE: This guide specification covers the requirements for vanities for Bachelor Enlisted Quarters (BEQ).

Adhere to [UFC 1-300-02](https://www.fas.dla.mil/ufc/) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://www.fas.dla.mil/ufc/).

NOTE: Lavatories and wall base, if desired, must be specified in other sections. If the project requires custom wood millwork such as required in locations like the Marine Corps Air Station, Cherry Point and Marine Corps Base, Camp Lejeune, North Carolina, do not use this section. Custom wood vanities require the designer to show elevations, sections, and details which clarify materials, thicknesses, size, finishes, and support framing on the contract drawings and use Section 06 20 00 [FINISH CARPENTRY](https://www.fas.dla.mil/ufc/) to specify the product.
PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

APA - THE ENGINEERED WOOD ASSOCIATION (APA)

APA L870 (2010) Voluntary Product Standard, PS 1-09, Structural Plywood

SOCIETY OF AUTOMOTIVE ENGINEERS INTERNATIONAL (SAE)

U.S. GENERAL SERVICES ADMINISTRATION (GSA)

CID A-A-50565 (Basic; CANC Notice 1) Cabinet, Storage; Wardrobe, Three Drawer

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.
**************************************************************************
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Vanities; G[, [______]]

Show configuration, materials, thicknesses, hardware, finishes, and colors of vanities for the project.

1.3 DELIVERY, STORAGE, AND HANDLING

Deliver vanities undamaged and store in a safe, dry, and clean location. Handle so as to prevent damage.

PART 2 PRODUCTS

2.1 VANITIES

**************************************************************************

NOTE: Insert type and size required. Sizes listed should be used unless otherwise approved by the Engineering Field Division Code 04 in writing. If other sizes are required, determine whether modification of door/intermediate panel configuration is required to maintain proper door size and structural support.

**************************************************************************

Provide, [single lavatory type with double doors, Size [(750 mm30 inches wide)] [(900 mm36 inches wide)] [(1050 mm42 inches wide)] [(1200 mm48 inches wide)]]
[double lavatory type with two sets of double doors, Size (1500 mm  
60 inches wide)] [The type and size shall be [as indicated] [(_____] mm  
inches wide)], and except as specified herein. Wood construction shall be  
used. Particleboard shall not be used. Countertop, doors, and all wood  
panels shall be 20 mm 3/4 inch plywood, APA L870, Exterior Type, Grade  
A-A. Chromium-plated brass pulls or aluminum pulls and chromium-plated,  
spring-loaded, self-closing, adjustable, European type hinges may be used  
in lieu of pulls, hinges, and magnetic catches.

2.1.1 Quantity  
[_____] [As indicated].

2.2 FINISHES

**************************************************************************  
NOTE: Since a wood or steel constructed vanity is  
the Contractor's option, specify finish, pattern,  
and color for laminated plastic for both and a paint  
color for steel.  
**************************************************************************

Five-digit designations refer to SAE AMS-STD-595A.

2.2.1 Exposed Surfaces

Exterior of doors and exposed surfaces of cabinet body shall be decorative  
laminated plastic of color and pattern [indicated] [specified].

2.2.2 Concealed Surfaces

Interior of doors and cabinet body, and concealed exterior surfaces of  
cabinet body, shall be nondecorative laminated plastic.

2.3 END CURBS

**************************************************************************  
NOTE: Delete this paragraph if end curbs are not  
required.  
**************************************************************************

Provide end curbs to match back splash where end of countertop abuts a wall.

2.4 DRAWERS

**************************************************************************  
NOTE: Delete this paragraph if drawers are not  
required.  
**************************************************************************

Where drawers are indicated in vanities, comply with CID A-A-50565 for  
drawers, drawer slides, and slide supports.
PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Final Assembly

Distribute vanities to rooms [as indicated] [as directed]. Uncrate, assemble, adjust as necessary, and place as specified or indicated, complete with accessories and hardware. Position vanities [as indicated] [as directed].

3.1.2 Fastening

**************************************************************************
NOTE: Ensure that work referred to is actually specified in the referenced sections.
**************************************************************************

Fasten wood vanities as indicated on the drawings and as specified. Fasten steel vanities through the holes in vanity back flanges. Fasteners shall be appropriate for use with the wall construction. Seal joint between back splash and wall and between end curb and wall as specified in Section 07 92 00 JOINT SEALANTS.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NSF INTERNATIONAL (NSF)

NSP/ANSI 2 (2019) Food Equipment
NSP/ANSI 35 (2020) High Pressure Decorative Laminates for Surfacing Food Service Equipment

U.S. DEPARTMENT OF DEFENSE (DOD)

1.2 DEFINITIONS

Refer to Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE.

1.3 SUMMARY

******************************************************************************

NOTE: Indicate the configuration and layout for all casework, countertops, slide rails, sneeze guards, and other accessories, with casework and counter details, and each equipment item identified by number. Show "FoodService Equipment Schedule" on the drawings using the same identification numbers as indicated in Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE[, as indicated on the current US Army Quartersmaster Center and School equipment schedule]. Ensure that all Contractor built-to-order items, per equipment schedule, are shown and coordinated with the specifications.

Coordinate with other sections for final connection of equipment.

Details of particular equipment and installations
are provided on Naval Food Service Division drawings. Use these NAVFSD drawings as a basis for the project details. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

General requirements, including all mechanical, electrical, health and safety, are specified in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT. Provide detailed equipment Schedule conforming to DOD 4000.25-1-M.

1.3.1 General Requirements

The work includes [furnishing] [and] [installing] [and modifying existing] [casework] [countertops] [slide rails] [_____] for foodservice and related work. Verify all existing dimensions, contract drawings, product data and all related conditions prior to commencing rough-in work. Include coordination of delivery through existing finished opening and vertical handling limitations within the building. Advise the Contracting Officer of all discrepancies prior to ordering equipment. Submit Field Verification Data prior to the preconstruction meeting. Provide rough-in and connect utilities to equipment in accordance with requirements specified in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT and with the physical dimensions, capacities and other requirements of the equipment furnished. Submit Detail Drawings for foodservice casework, countertops, and rails in the same format as the equipment schedule on the drawings.

1.3.2 Foodservice Configuration

NOTE: Details of particular equipment and installations are provided on Naval Food Service Division drawings. Use these NAVFSD drawings as a basis for the project details. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

<table>

On the drawings, show:

1. A 1:50 1/4 inch scale floor plan with layout of all foodservice equipment, casework, counters and rails using Naval Equipment Symbols.

2. A food Service Equipment Schedule laid out in accordance with current CNIC's Galleys Department or
US Army Quartermaster Center and School equipment schedules, and specified design requirements.

3. Wall and ceiling penetrations.

4. Raised bases, retainer curbs, or depressions.

5. Recessed, grated floor drains required for equipment.

6. Utility connections to building water, sanitary, electrical, and other utility systems coordinated with all casework. Convenience outlets at point of use for plug-in equipment.

7. All Contractor built-to-order items, per equipment schedule, shown and coordinated with the specifications.

8. Electrical chases and raceways and plumbing chases.

**************************************************************************
Submit coordinated detail drawings for [casework] [countertops] [slide rails] [______]. On layout drawing, use Naval Equipment Symbols designated herein. Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for complete detail drawing requirements. Follow all the applicable NSF International standards for equipment. Submit within [60] [_____] days of award of contract. Drawings scale: 1:50 (1/4 inch) minimum.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.
The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
    Field Verification Data; G[, [____]]

SD-02 Shop Drawings
    Foodservice Configuration; G[, [____]]
    Food Service Equipment Schedule; G[, [____]]

SD-03 Product Data
    Recycled Content for steel components; S

SD-04 Samples
    Closure Panels; G[, [____]]

1.5 PRE-INSTALLATION MEETINGS

Thirty [____] days prior to the commencement of work, notify the Contracting Officer that the submittal items listed above are prepared and ready for review.

1.6 DELIVERY, STORAGE AND HANDLING

Submit and comply with manufacturer's instructions for shipping, handling, storage, installation and start-up.

PART 2 PRODUCTS

2.1 STEEL COMPONENTS

Provide Steel Components with a minimum of 60 percent recycled content. Provide data identifying percentage of recycled content for steel components.
2.2 CAFETERIA; BUFFET; HOT AND COLD COUNTERS

2.2.1 Counter Edges and Backsplashes

2.2.1.1 Counter Edges

Provide counter edges, as required by design, of the following types:

2.2.1.1.1 Turned Down

50 mm 2 inch at 90 degrees with 19 mm 3/4 inch tight hem at bottom. Round free corners with 19 mm 3/4 inch radius.

2.2.1.1.2 Marine Edge

Turned up [13 mm 1/2 inch] [and] [38 mm 1-1/2 inch] at 45-degree angle and turned down 50 mm 2 inch at 135 degree angle with 19 mm 3/4 inch tight hem at bottom.

2.2.1.1.3 Rolled Rim

Coved up 75 mm 3 inch with 38 mm 1-1/2 inch wide rim rolled 180 degrees and turned down to table top; hem edges, and bullnose corners.

2.2.1.2 Counter Backsplash

Provide counter backsplash of the following types:

2.2.1.2.1 Coved Up

Coved up [250] [_____] mm [10] [_____] inch and sloped back 38 mm 1-1/2 inch at the top on a 45-degree angle; 63 mm 2-1/2 inch slope where piping occurs. Turned down 25 mm 1 inch at 135 degrees at the rear of the splash with the ends closed to the bottom of the top turn down. Secure splash turn down to wall with 100 mm 4 inch long, 1.9 mm 14 gauge stainless steel "zee" clips anchored to wall, 900 mm 36 inches on center.

2.2.1.2.2 Turned Up

Turned up [150] [_____] mm [6] [_____] inch at 90 degrees on a 16 mm 5/8 inch radius with edge turned back [25 mm 1 inch] [50 mm 2 inch] at 90-degree angle with 25 mm 1 inch turn down at 90 degrees at rear of splash with the ends closed to the bottom of the top turn down. Secure splash turn down to wall with 100 mm 4 inch long, 1.9 mm 14 gauge stainless steel "zee" clips anchored to wall, 900 mm 36 inch on center.

2.2.2 Counter Bases

**************************************************************************

NOTE: Indicate the type desired for the individual pieces of equipment or specify which is to be used. Alternatively, both types may be specified as a Contractor's option.

**************************************************************************

2.2.2.1 Closed Counter Bases

Fabricate with 38 by 38 by 3 mm 1.5 by 1.5 by 0.125 inch galvanized steel angles with all corners mitered, welded and ground smooth. Provide
horizontal and vertical angles at 600 mm 2 feet on-center. Fabricate closure panels of 1.2 mm 18 gage thick stainless steel or 1.2 mm 18 gage thick galvanized steel with laminated plastic material in accordance with NSF/ANSI 35. Fabricate joint trim of 50 mm 2 inch wide, 1.8 mm 14 gage thick stainless steel; attach with concealed bolts or screws. For enclosed bases provide double-wall at ends and partitions. Weld support legs to body support angles. [Use closed-type bases on [_____].]

2.2.2.2 Open Counter Bases

Fabricate and crossbrace with 40 mm 1.625 inch outside diameter, 1.5 mm 16 gage thick stainless steel tubing. Weld crossbraces to legs to reinforce each leg. Weld legs to gussets. Make gussets of stainless steel, fully enclosed, a minimum of 75 mm 3 inches in diameter at top, reinforced with bushing, and continuously welded to support channels located under the counter top. [Use open-type bases on [_____].]

2.2.3 Legs

Fabricate of 1.5 mm 16 gage thick, 40 mm 1.625 inch outside diameter stainless steel tubing. Continuously weld to angles on closed bases and gussets on open bases. Finish bottom of legs smoothly. Overlap stem of feet to provide a sanitary fitting.

2.2.4 Pedestal Bases

Fabricate of 2.5 mm 12 gage thick stainless steel for serving line counters. Make pedestal 200 mm high, 250 mm wide, and 600 mm long 8 inches high, 10 inches wide, and 24 inches long with top and bottom edges flanged 38 mm 1.5 inch to the inside at 90 degrees. Provide holes in both flanges for 13 mm 0.5 inch lag screws. Locate utility stub-ups inside pedestal and run to designated equipment.

2.2.5 Feet

Die-stamped stainless steel, bullet shaped, fully enclosed, with slightly rounded bottom. Fit top of feet with male threaded stem to mate with end of legs and provide for a 25 mm 1 inch adjustment without threads being exposed.

2.2.6 Casters

Provide heavy-duty, ball bearing disc wheel, with replaceable grease-proof rubber or neoprene tires and brakes. Provide tires with minimum 125 mm 5 inch diameter and minimum 25 mm one inch width of tread and 90 kilograms 200 pounds capacity per caster. Provide pressure-type grease fittings, threaded guards, and plated finish.

2.2.7 Open Base Shelves

Fabricate of 1.5 mm 16 gage thick stainless steel with all edges turned down 50 mm 2 inches at 90 degrees on a 6 mm 0.25 inch radius with bottom edges turned back 13 mm 0.5 inch at 45 degrees. Notch corners 90 degrees, and intersections 180 degrees. Weld to legs at corners and intersections. Locate legs maximum 1200 mm 48 inches apart. Shelving to be removable without use of tools.
2.2.8 Closed Base Interior Shelves

Fabricate of 1.5 mm 16 gage thick stainless steel. Turn back and side edges up 50 mm 2 inches at 90 degrees on a 6 mm 0.25 inch radius. Turn front edge down 50 mm 2 inches at 90 degrees on a 6 mm 0.25 inch radius and back 6 mm 0.25 inch at 45 degrees. Reinforce shelves longer than 750 mm 30 inches with 38 by 38 by 3 mm 1.5 by 1.5 by 0.125 inch galvanized steel angles under front edge and horizontal center of the shelf. Shelving to be removable without use of tools.

2.2.9 Shelf Pan Slides

Provide 1.8 mm 14 gage thick stainless steel 38 by 38 by 3 mm 1.5 by 1.5 by 0.125 inch angles, with front and back corners rounded and finished smooth. Set angles at 50 mm 2 inches on-center for 450 by 660 mm 18 by 26 inch bun pans and 300 by 500 mm 12 by 20 inch serving pans.

2.2.10 Drawers

Provide die-stamped 1.2 mm 18 gage thick stainless steel, 500 by 500 by 125 mm 20 by 20 by 5 inch deep. Ensure drawer body can be easily removed for cleaning with top edges flanged out 13 mm 0.5 inch. Round interior horizontal corners on a 25 mm one inch radius and interior vertical corners on a 50 mm 2 inch radius. Fabricate supporting frame of 1.8 mm 14 gage thick stainless steel channel. Weld drawer face to frame. Die-stamp drawer face with raised border for rigidity. Die-form an integral open sanitary handle into face. Mount drawer slides with ball bearing nylon or stainless steel rollers on channel frame. Provide with slides and frame which allow for full opening of drawer, and are reinforced to support a weight of 22.5 kg 50 pounds when fully extended. Provide stops for each drawer at fully open position. Enclose drawers on open-base tables in 1.2 mm 18 gage thick stainless steel housing.

2.2.11 Doors

Provide stainless steel double-cased doors, 1.2 mm 18 gage thick outer pan with corners welded, ground smooth and polished; 0.9 mm 20 gage thick inner pan fitted tightly into outer pan with core of sound deadening material. Tack-weld outer and inner pans together with solder-filled seam. Provide doors approximately 20 mm 0.75 inch thick and fitted with flush-recessed, stainless steel door pulls. Mount doors on stainless steel piano or concealed hinges.

2.3 TRAY SLIDE

**************************************************************************
NOTE: Install tray slides for Enlisted General Messes as an integral fabrication of serving line counterfront; NAVFSSO drawing 11103-857 and as specified in the applicable Standard for other equipment.
**************************************************************************

[Solid] [Tube] type, 300 mm 12 inch wide; mounted 865 mm 34 inches above floor. Extend to full length of supporting counter.

2.3.1 Solid Type

Provide solid type constructed with 1.8 mm 14 gage thick stainless steel
with front and back edges rolled 45 mm 1.75 inch at 180 degrees. Ensure top edge of roll is 10 mm 0.375 inch above flat surface of slide. Provide three inverted "V" forms, approximately 10 mm 0.375 inch high, in flat surface of slide as running surface for trays. Close ends of slide.

2.3.2 Tube Type

Provide four 25 mm one inch diameter 1.5 mm 16 gage thick stainless steel tubes with supporting hardware. Close both ends of each tube.

2.3.3 Support Brackets

Stainless steel or chromium plated. Secure to counter with stainless steel bolts. Space 1200 mm 4 feet on-center. Provide [stationary] [fold-down] type extending under full width of tray slide.

2.3.4 Protector Shelf

Install and locate protector shelf as indicated on the drawings. Fabricate top of 1.8 mm 14 gage thick stainless steel with all edges rolled down 180 degrees for 38 mm 1.5 inches with bullnosed corners. Shelf to be minimum 250 mm 10 inches wide.

2.3.5 Shelf Frame

Provide 25 by 25 mm one by one inch, 1.5 mm 16 gage thick stainless steel square tubing under all edges of shelf at 750 mm 30 inches on center.

2.3.6 Shelf Frame Support

Form front uprights of 30 by 30 mm 1.25 by 1.25 inch, 1.5 mm 16 gage thick stainless steel tubing. Form back uprights of 25 by 25 mm one by one inch, 1.5 mm 16 gage thick stainless steel square tubing. Provide a horizontal brace, 25 mm one inch above bottom of front uprights. Space front uprights 750 mm 30 inches apart or less, fit with die-formed flanges to be attached to counter top from underside with bolts, and slope 10 degrees to rear.

2.4 PROTECTOR GLASS

6 mm0.25 inch thick, transparent [clear tempered plate glass] [heat and mar resistant clear acrylic]. Frame edges with 13 mm 0.5 inch, 0.09 mm 20 gage thick stainless steel channel. [Glass] [Acrylic] to be easily replaced in the event of [breakage] [damage]. Provide matching [glass] [acrylic] end panels. Round all free corner on 19 mm 3/4 inch radius.

2.5 FOOD SHIELD

Provide self-serve food shield conforming to NSF/ANSI 2 constructed of 1.6 mm (16 gauge) 16 gauge stainless steel, with a minimum width of at least 300 mm 12 inch with a full 25 mm 1 inch skirt with 19 mm 3/4 inch tight hem on all sides. Support on stainless steel uprights [at front] [as indicated on drawings]. Round all free corners with 19 mm 3/4 inch radius.

a. Provide adjustable louver brackets below the top fitted with 6 mm 1/4 inch polished, [tempered plate glass][heat and mar-resistant clear acrylic] framed in an all welded stainless steel channel and installed with a 175 mm 7 inch clearance above counter top.

b. Install fluorescent light fixtures the full length of the non-heated
undershelf displays, with translucent protection guard. Conceal display light wiring in a corner post. Prewire fixtures to a single recess-mounted master switch per serving shelf.

2.6 DRIP GUTTER

Provide drip gutter as integral part of counter tops, where indicated. Provide a 25 mm one inch brass drain tube centered in bottom of gutter with bottom pitched to drain. Make drip gutter 100 mm wide, 25 mm deep 4 inches wide, one inch deep, and length indicated. Provide removable, stainless steel, die-stamped, anti-splash strainer with finger hole.

[2.7 COLORS

[Refer to Section 09 06 00 - SCHEDULES FOR FINISHES.][ As indicated on drawings.]

PART 3 EXECUTION

3.1 INSTALLATION,

Install as specified in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT.

3.2 MANUFACTURER'S FIELD SERVICES

As specified in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT.

NOTE: This guide specification covers the requirements for metal and wood casework for medical and dental facilities.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com).

---

**PART 1   GENERAL**

NOTE: This specification covers metal and wood casework, normally preassembled, for installation as fixed or built-in elements in medical and dental facilities. The "casework" includes: Cabinets, singularly or in assemblies; treatment room units wardrobes; deck units; reagent racks; countertops and sink; plus their components; hardware and service fixture trim. All casework must be shown on the drawings.

A schedule of casework, shown in alpha-numerical order, will be included on the drawings. Schedules will include the Joint Schedule Number (JSN).
designator, and dimensions. The schedule or elevations should indicate the number of shelves required. Joint Schedule Numbers (JSN) or the National Stock Numbers are specified in MIL-STD-1691. Any additional specially required casework items which are not covered by MIL-STD-1691 should be described herein and identified on the drawings and schedule.

On the drawings, show:

1. Sizes and spacing of casework units, plumbing fixtures and utility outlets.

2. Schedule of casework including all component parts and accessories.

3. Details of connections and anchorage where special conditions exist. Size and spacing of anchors.

1.1 REFERENCES

****************************************************************************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****************************************************************************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN FOREST FOUNDATION (AFF)

ASTM INTERNATIONAL (ASTM)

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office.
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATIONS

1.3.1 Certified Sustainably Harvested Wood

**************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective.
Sustainably Harvested Wood is a product which comes from a third-party Forestry Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration (e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.

Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications - if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certifications other than FSC; for all other projects pursuing third-party certification allow the entire list of third party certifications.

**************************************************************************
Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SPI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.
[1.3.2 Indoor Air Quality Certification]

**************************************************************************

NOTE: Include this subparagraph when composite wood or agrifiber products are included in project.
**************************************************************************

For purposes of this specification, composite wood and agrifiber products include particleboard, medium density fiberboard (MDF), wheatboard, strawboard, panel substrates, and door cores. Provide products certified to meet requirements of both 40 CFR 770 and CARB 93120. Provide current product certification documentation from certification body.

[1.4 DELIVERY, STORAGE, AND HANDLING]

Deliver casework to the jobsite in the original individual containers, complete with screws, keys, and instructions. Mark each container with the manufacturer's name and catalog number. Store casework in an adequately ventilated, dry location that is free of dust, water, or other contaminates and in a manner to permit access for inspection and handling. Handle casework carefully to prevent damage to the surfaces. Replace damaged items that cannot be restored to like-new condition.

PART 2 PRODUCTS

2.1 CASEWORK

**************************************************************************

NOTE: Joint schedule numbers used in MIL-STD-1691 provide the Military Medical Services a uniform basis for identifying casework items in medical and dental facilities. Any items required which are not covered by MIL-STD-1691 should be described appropriately and identified on the drawings with a new assigned number.

Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in high humidity areas of facilities.
**************************************************************************

Submit for approval Drawings showing layout of casework at 1:20 3/4 inch equals one foot scale. Indicate details of construction and rough-in requirements. Indicate whether cabinets are metal or wood, whether countertop is corrosion-resisting steel or plastic laminate, and whether sink is coated with [modified epoxy resin] [polypropylene] [polyethylene] or corrosion-resisting steel. All wood products must be formaldehyde free. Verify job condition affecting the work and obtain accurate field measurements for incorporation into drawings. Locate structural members, required utilities and services provided by other sections of this specification. Submit details and information necessary for fabrication and installation, manufacturer's printed data, catalog cuts, and instructions for installation and cleaning. Provide casework as scheduled...
on the **detail drawings**. Factory fabrication of manufacturer's standard sizes and finishes and conform to MIL-STD-1691, and the requirements specified below. Supplementary ordering data are as follows: [____]. Casework items are identified on drawings with numbers preceded by the letters "C" and "D". These numbers are Joint Schedule Numbers in MIL-STD-1691. [Material finish and color shall be [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [____].]

2.1.1 Medical Casework

**************************************************************************

**NOTE:** Plastic laminated casework may be used in non corrosive areas such as hospital rooms and nursing stations. Corrosion resisting steel should be specified for areas, such as laboratories, where highly corrosive chemicals are handled. Enameled carbon steel casework should be utilized to the maximum practicable extent in lieu of corrosion-resistant steel.

**************************************************************************

Provide medical casework of [baked enamel carbon steel] [corrosion resisting steel] [wood core or carbon steel covered with laminated plastic sheets]. Color of finish [____] [in accordance with color schedule as indicated] [selected by the Contracting Officer from the manufacturer's standard colors].

2.1.1.1 Recycled Content

**************************************************************************

**NOTE:** Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.

**************************************************************************

[Baked enamel carbon steel must contain a minimum of [40][____] percent recycled content. Provide data identifying percentage of **recycled content for baked enamel carbon steel medical casework.**] [Corrosion resisting steel must contain a minimum of [40][____] percent recycled content. Provide data identifying percentage of **recycled content for corrosion resisting steel medical casework.**] [Wood core must contain a minimum of [50][____] percent recycled content. Provide data identifying percentage of **recycled content for wood core medical casework.**] [Carbon steel covered with laminated plastic sheets must contain a minimum of [40][____] percent recycled content. Provide data identifying percentage of **recycled content for carbon steel medical casework.**]
2.1.1.2 Sustainably Harvested Wood

******************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.
******************************************************************************

Wood materials must contain a minimum of [50][_____] percent wood that is certified sustainably harvested. Provide documentation that certified sustainably harvested wood for medical casework is used and identify percentage.

2.1.2 Dental Casework

******************************************************************************
NOTE: When selection is to be made from manufacturer's standard samples, specify whether solids or woodgrains are required.
******************************************************************************

Provide dental operator casework of [wood core] [carbon steel] covered with laminated plastic sheets. Pattern, color and finish of decorative laminated plastic for exteriors of casework [_____] [in accordance with color schedule as indicated] [selected by the Contracting Officer from the manufacturer's standard [color] [woodgrain] samples].

******************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.
******************************************************************************

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.

******************************************************************************
Wood core covered laminated plastic sheets must contain a minimum of [50][_____] percent recycled wood content. Provide data identifying percentage of recycled content for wood core dental casework. [Carbon steel covered laminated plastic sheets must contain a minimum of [40][_____] percent recycled steel content. Provide data identifying percentage of recycled content for carbon steel dental casework.]
******************************************************************************

2.1.3 Dental Prosthetics Casework

Provide dental prosthetics casework of [baked enamel carbon steel] [corrosion resisting steel]. Color of finish [_____] [in accordance with color schedule as indicated] [selected by the Contracting Officer from the manufacturer's standard colors].
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.

Baked enamel carbon steel must contain a minimum of \[40\] percent recycled steel content. Provide data identifying percentage of recycled content for baked enamel carbon steel dental prosthetics casework.

Corrosion resisting steel must contain a minimum of \[40\] percent recycled steel content. Provide data identifying percentage of recycled content for corrosion resisting steel dental prosthetics casework.

2.1.4 Countertops

NOTE: Do not specify countertops constructed of particle board for high humidity locations or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. See UFC 1-200-01 for determination of ESC for project locations.

Provide countertops of [corrosion-resisting steel] [plastic laminate covered plywood] [plastic laminate covered particleboard] [modified epoxy resin] [or] [resin coated laminated pressed wood fiber]. In lieu of individual samples, complete minimum size casework may be submitted as samples. Mock-up units are not acceptable. Samples shall be of sufficient size to show color, pattern, and method of assembly. Some requirements are:

<table>
<thead>
<tr>
<th>Countertop and backsplash</th>
<th>One section, containing both</th>
</tr>
</thead>
<tbody>
<tr>
<td>Door and drawer front</td>
<td>One of each, with hardware mounted</td>
</tr>
<tr>

[2.1.4.1 Recycled Content]

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.
specification) before specifying product recycled content requirements.

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.

**************************************************************************

[Corrosion-resisting steel must have a minimum of [40] [_____] percent recycled steel content. Provide data identifying percentage of recycled content for corrosion resisting steel countertops.] [Plastic Laminate (plywood or particleboard) must have a minimum of [50] [_____] percent recycled wood content. Provide data identifying percentage of recycled wood content for plastic laminate countertops.]

2.1.4.2 Sustainably Harvested Wood

Wood materials must contain a minimum of [50][_____] percent wood that is certified sustainably harvested. Provide documentation that certified sustainably harvested wood for countertops is used and identify percentage.

2.1.4.3 Indoor Air Quality Requirements

Provide certification of indoor air quality for composite wood and agrifiber products used in countertops.

2.2 PLUMBING FIXTURES

Provide faucet, trap and drain fittings, gas, air and vacuum cocks as required. Provide connection conforming to the requirements specified in Section 22 00 70 PLUMBING, HEALTHCARE FACILITIES.

PART 3 EXECUTION

3.1 INSTALLATION

Install casework in a manner that does not damage the work of other trades. Secure the casework in place in true alignment, level, and plumb. Secure units with screws through backs to cleats that have been anchored to building structure with toggle or expansion bolts.

Do not install building construction materials that show visual evidence of biological growth.

3.1.1 Wall Hung Cabinets

Install wall-hung cabinets to support the weight of the cabinets plus the normally expected weight of the contents of the cabinets. Space fasteners 300 mm 12 inch on center using at least three bolts in each 900 or 1200 mm 3 or 4 foot unit width. Join adjacent cabinets in an assembly together at top and bottom with inconspicuous bolts or clips. Seal joints between the casework and wall surfaces which are not larger than the joints between casework sections with sealant conforming to ASTM C920, Type M, Grade NS, Class 25, Use NT. Close larger joints with filler strips of the same material and finish as adjacent casework. Cut filler strips to the contour of the wall surface and secure to the casework with concealed nails or screws. Use filler strips no wider than 150 mm 6 inch.

SECTION 12 35 70 Page 11
3.1.2 Floor Mounted Cabinets

Set floor-mounted metal cabinets on a common metal base or integral base, in assemblies up to 1800 mm 6 feet in length in rooms having concrete or resilient flooring. Bolt cabinets to bases at cabinet corners. Face metal bases with resilient material to match wall base in space where the cabinets are located. Fasten together adjoining cabinets at top and bottom of front and back with bolts placed inconspicuously inside cabinets. Set metal cabinets in rooms having terrazzo or ceramic-tile floors on concrete or masonry bases with exposed faces finished the same as other bases in the room. Seal flush openings between cabinet and wall surfaces, due to irregularity of surfaces, with Type S or M, Grade NS, Class 12.5, use NT, conforming to ASTM C920. Close exposed-to-view openings larger than joints in tile work with filler or scribing strip of the same material and finish as adjacent casework. Cut filler to contour of wall surface and secure to casework with concealed sheet-metal screws. Use minimum width and number of fillers consistent with need and in no case shall filler exceed 150 mm 6 inch in width.

3.1.3 Countertops

Height of counter tops as indicated. Where required, toe space at front of cabinets shall be provided by installing front face of cabinets 75 mm 3 inch in front of face of base. Where toe space is not required, face of base and cabinets shall be flush. Bases must have a height of approximately 100 mm 4 inch. Install all items as required for proper operation in accordance with the manufacturer's directions.

3.2 INSPECTION AND CLEANING

Inspect placed items for proper location, fastening, connection to utilities, operation, and for damage which may have occurred during installation. Put each item into service to prove proper operation. Correct defects disclosed during inspection. Clean cabinets and countertops in accordance with manufacturer's instructions.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATIONS

**************************************************************************
NOTE: Use certified sustainably harvested wood
where suitable for application and cost effective.
Sustainably Harvested Wood is a product which comes
from a third-party Forestry Certification Program
and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and
wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration
(e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited
certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder
involvement in a standards development process; 5) Complaints and appeals process.

Verify suitability, availability within the region, cost effectiveness and adequate competition before
specifying these sustainably harvested wood certifications - if these conditions are verified
for the project locale, include the following section. For projects pursuing LEED, delete
certifications other than FSC; for all other projects pursuing third-party certification allow
the entire list of third party certifications.
**************************************************************************

[1.3.1 Certified Sustainably Harvested Wood]

Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SFI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.

[1.3.2 Indoor Air Quality Certification]

Submit required indoor air quality certifications in one submittal package.

**************************************************************************

NOTE: The Government's preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, it must
be verified there is a certified product available that is both cost effective and appropriate for the project. Retain the Section below when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness.

**************************************************************************

[1.3.2.1 Countertop Products]

Provide countertop products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

[1.3.2.2 Composite Wood, Wood Structural Panel and Agrifiber Products]

**************************************************************************

NOTE: Include this section when particleboard is included in project.

**************************************************************************

For purposes of this specification, composite wood and agrifiber products include particleboard, medium density fiberboard (MDP), wheatboard, strawboard, panel substrates, and door cores. Provide products certified to meet emissions requirements of both 40 CFR 770 and CARB 93120. Provide current product certification documentation from certification body.

[1.4 DELIVERY, STORAGE, AND HANDLING]

Deliver, store, and handle countertops [and backsplash] in a manner that will prevent damage and disfigurement.

Provide temporary skids under units weighing more than [_____] kilogram pounds.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide the manufacturer's standard type countertops or as indicated on the drawings. Accomplish fastenings to permit removal and replacement of individual countertops without affecting the remainder of the installation.

Submit manufacturer's instructions for countertops including special provisions required to install equipment components and system packages. Include all special notices detailing impedances, hazards and safety precautions.

Submit manufacturer's standard color charts for countertops showing the manufacturer's recommended color and finish selections.

Provide countertop products certified to meet the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification or validation of indoor air quality for countertop products.
2.1.1 Design

Provide factory fabricated, prefinished [wood] [marble] [stainless steel] [_____] countertops in the manufacturer's standard sizes and finishes of the type, design, and configuration indicated. Provide countertops as specified and meet the requirements of KCMA A161.1. Accomplish fastenings to permit removal and replacement of individual units without affecting the remainder of the installation. Provide counters with watertight sink rim when indicated. Include removable drawers equipped with position stops to avoid accidental complete withdrawals.

2.2 FABRICATION

2.2.1 Countertop And Backsplash

Provide countertops and backsplash of [plywood] [wood] [particle board] [Granite] [Marble] [Synthetic resin] [Stainless steel] [Tile] [FRP] [_____] covered with a [shop-applied plastic laminate] [stainless steel] [an integral stainless steel top without backing][ according to ANSI A161.2].

Provide a water-resistant type plywood, Grade B-D Douglas fir plywood, with a minimum thickness of 20 mm 3/4-inch. Provide [plywood] [hardwood] [Granite] [Marble] [Synthetic resin] [Stainless steel] [Tile] [FRP] [_____] backsplash 20 mm 3/4-inch thick by the height indicated[ according to ANSI A161.2].

Provide particle board with a minimum thickness of 20 mm 3/4-inch. Build up edges and opening around sink rim with hardwood strips. Provide backsplash of similar construction, a minimum of 20 mm 3/4-inch[_____] thick by the height indicated.

Provide steel no lighter than 0.85 millimeter 22-gage stainless steel for backed construction and not lighter than 1.3 millimeter 18-gage stainless steel for integral construction. Reinforce steel tops on edges and around sink-rim opening. Provide counters of one-piece construction; where stainless steel sink bowls are provided, weld and polish smooth all joints. Make joints between sink, countertop, and backsplash watertight. Provide backsplash of the same material as countertop and form with square edges, and height as indicated.

Provide continuous sheet laminate of the longest length practicable and of the design and color selected. Provide joints in the surface sheeting that are tight and flush, and held to a practical minimum number.

Edging and trim:

a. For plastic-laminate-covered countertops and backsplash, provide edging and trim consisting of:

(1) Strips of laminate cut and fitted to exposed edges with contact adhesive

(2) Stainless steel molding applied to exposed edges and at the intersection of the top and backsplash with a concealed fastening system

(3) For stainless steel countertops and backsplash, form the edging and trim as an integral part of the top.
Provide sink rims which are the standard products of a manufacturer regularly producing this type of equipment, fabricated from stainless steel of the size necessary to receive the sinks.

**************************************************************************
NOTE: Select the appropriate statement from the following paragraph for the type of chopping block desired.
**************************************************************************

[ Include chopping block of the size and in the location indicated on the drawings, [portable type, of solid edge-grain clear [maple] [______], minimum 20 mm 3/4-inch thick, sized to fit on a suitable rack for storage] [stationery type or built-up, edge-grain clear [maple] [______], minimum 40 millimeter 1-1/2-inches thick, installed in a countertop].

2.2.1.1 High-Pressure Laminated Plastic Clad Countertops

Provide clad countertop and backsplash of [20 mm 3/4-inch thick plywood] [or] [20 mm 3/4-inch thick, 20 kg 44 pound density particle board core], [post formed cove type] [or] [fully formed type]. [Provide single unit cove type unit with self-edging and plastic laminate coved at the juncture of the countertop and backsplash.] [Provide fully formed type or square edge unit with shaped edges using wood nose molding at counter edge, including a separate backsplash not less than 90 mm 3-1/2-inch high.]

Provide edging and trim that consists of plastic laminate cut and fitted to all exposed edges. Supply end splashes constructed of 20 mm 3/4-inch plywood or 20 mm 3/4-inch thick, 20 kg 44 pound density particle board core. Provide continuous sheets of longest lengths practicable. Make all joints in surface sheeting tight and flush. When the countertop and backsplash are two separate units, use GP50 plastic laminate. When the countertop and backsplash are one unit, use PF42 plastic laminate. Provide plastic laminate conforming to the requirements of ANSI/NEMA LD 3, with contact type plastic laminate adhesive applied to both surfaces. For fully formed and cove type countertops, the post-forming plastic laminate cannot be bent to a radius smaller than the limit recommended by the plastic manufacturer.

2.2.1.2 Solid Polymer Countertops

Provide countertop and backsplash [with integral [sink] [and] [lavatory]] [of sheet material for sink/lavatory cutout]; as shown, with [12.7] [19] [______] mm [1/2] [3/4] [______]-inch material thickness, cast, and filled nonporous solid surfacing composed of acrylic polymer, mineral fillers, and pigments. Repair superficial damage, a depth of no more than 0.25 mm 0.010-inch, by sanding or polishing. Use material conforming to the following performance requirements:

a. Tensile Strength; 18.3 N/mm² 4100 psi, when tested in accordance with ASTM D638.

b. Hardness; Barcol Impressor 50 when tested in accordance with ASTM D2583.

c. Flammability; rated Class I with a flame spread of 25 maximum and a smoke developed of 100 maximum when tested in accordance with ASTM E84.

d. Boiling water resistance; no effect when tested in accordance with ANSI/NEMA LD 3.

e. High temperature; no effect when tested in accordance with ANSI/NEMA LD 3.

f. Liquid absorption; 0.06 percent maximum (24 hours) when tested in accordance with ASTM D570.

g. Sanitation; National Sanitation Foundation approval for food contact in accordance with Standard 51 and approval for food area applications.

h. Impact resistance; no failure for ball drop when tested in accordance with ANSI/NEMA LD 3.

2.2.1.3 Solid Polyester Resin Cultured Marble Countertops

Provide countertop and backsplash [with integral [sink] [and] [lavatory]] [of sheet material for sink/lavatory cutout]; as shown. Use material of [12.7] [19] [_____] mm [1/2] [3/4] [_____]-inch thickness minimum, cast, and filled nonporous solid surfacing composed of polyester resin crushed marble, glass frit, mineral fillers and pigments. Material is to comply with IAPMO Z124.3 and the following performance requirement; Flammability: Class I, flame spread of 25 maximum, smoke developed of 100 maximum when tested in accordance with ASTM E84.

2.2.2 Color, Texture, and Pattern

**************************************************************************
NOTE: Coordinate editing of color reference sentence(s) with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an Architect or Interior designer. Select color from manufacturers standard colors or identified as a manufacturers color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings add a note that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.
**************************************************************************

Select color [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES.] [as indicated on the drawings.] [from manufacturers standard colors.]
[_____] Color listed is not intended to limit the selection of equal colors from other manufacturers.

2.3 MATERIALS

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.
**************************************************************************

[ Provide stainless steel conforming to ASTM A1008/A1008M and ASTM A167, Type [302] [304] [316] Finish 4. [Stainless steel countertops and backsplashes must contain a minimum of [40]_____] percent recycled content. Provide data identifying percentage of recycled content for stainless steel countertops. ]

][Provide [Douglas-fir] ____] plywood conforming to ICC IPC, exterior type, fully waterproof bond.

] Use thermosetting urea-resin Type II Adhesives for application of plastic laminate conforming to ASTM D4690 as recommended by the manufacturer of the laminate. Use adhesive for wood members conforming to ASTM D4689. Provide laminate and wood member adhesives meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for laminate and wood member adhesives.

Use filler material conforming to MPI 91.

[ Provide hardwood conforming to FS MM-L-736, standard hardwood lumber, S2S, and hardwood plywood conforming to ICC IPC.

**************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.
**************************************************************************

[ Wood materials must contain a minimum of [50]_____] percent certified sustainably harvested wood. Provide documentation that certified sustainably harvested wood is used and identify percentage.]

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability,
availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.

[Provide particle board conforming to CPA A208.1, Type 1, Grade M or medium density. Particleboard must contain a minimum of [50][_____] percent recycled content. Provide data identifying percentage of recycled content for particleboard. Particle board products must contain no added urea-formaldehyde resins. Provide certification of indoor air quality for particleboard.]

NOTE: Review ANSI/NEMA LD 3 and insert style, type, grade, class, and finish as required.

Provide plastic laminate conforming to ANSI/NEMA LD 3, Style [____], Type [____], Grade [____], Class [____], Finish [____].

Provide softwoods conforming to Voluntary Product Standard PS-20.

Provide turpentine conforming to ASTM D13.

Provide varnish conforming to MPI 28.

Provide fasteners conforming to the following:

a. Screws: ASME B18.6.1, Group, Type and Class as applicable

b. Anchoring Devices: FS FF-S-325, Group, Type, and Class as applicable

c. Toggle Bolts:

   (1) Wings are two sheet-metal parts of "U" or channel shape. The wings are pivoted either on trunnion nuts or pins and are held normally in open position by a spring or springs placed inside the wing groove.

   (2) Wing pivots are integral with the trunnion nuts used with the machine screw or threaded stud. Ensure the nut engages not less than two full threads of its screw or stud except in toggle bolts where the wing parts close on the bolt and lock it while being tightened, in which case one full thread engagement is permissible. The trunnion nuts are inserted in place with the pivots passed through the eyes in the wings.

d. Nuts: ASTM F594, stainless steel

e. Bolts: ASTM A325, heavy, hexagon head bolts stainless steel
f. Nuts: **ASTM F836M**, stainless steel

g. Bolts: **ASTM A325M**, heavy, hexagon head bolts stainless steel

**************************************************************************
NOTE: Specify sink for inset-type installation in Section 22 00 00 PLUMBING, GENERAL PURPOSE.
**************************************************************************

**Stainless Steel Sinks:**

[a] **1.3 millimeter 18-gage** stainless steel, integral with corrosion-resistant steel countertop

[b] **1.3 millimeter 18-gage** stainless steel, nonintegral, self-rimming

c. Drain holes in center of bowl

d. Underside coated with **3 millimeter 1/8-inch** thick sound deadener

e. Die-form, seamless, raised edges at front and ends

f. Cove corners to **13 millimeter 1/2-inch** radius

g. Equip with strainers and tail pieces

Sound deadening: Conform to **CID A-A-59295**.

Provide service fixtures conforming to the following requirements:

a. Fixtures: In accordance with the water conservation policy as stated in the Standard Plumbing Codes, Appendix J.

b. Faucets: Splashback mounted, cast brass, chrome plated, **FS WW-P-541**

c. Faucets: Deck mounted, cast brass, chrome plated, **FS WW-P-541**

d. Gas, air, and vacuum, distilled water, steam, and de-ionized water cocks: Cast brass, chrome plated, ground key type

e. Drains, strainers, and taps: Brass, chrome plated, **FS WW-P-541**

f. Index buttons: Plastic, color codes in accordance with **SEFA 7**

g. Special items: Nipples and locknuts with each fixture will be as directed.

**************************************************************************
NOTE: Delete any of the following types that are not applicable.
**************************************************************************

Type I, zinc phosphate

Type II, iron phosphate

Type III, organic-paint, varnish, lacquer

**************************************************************************

h. Metal pretreatment coatings: **FS TT-C-490**, Type I
Metal pretreatment coatings: FS TT-C-490, Type II

Metal pretreatment coatings: FS TT-C-490, Type III

Enamel: Baked enamel

### 2.4 MIXES

#### 2.4.1 Adhesives

Provide mounting and stone adhesives meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for mounting and stone adhesives.

1. **Mounting Adhesives**

   Provide structural-grade silicone or epoxy adhesives of type recommended by manufacturer for application and conditions of use.

   Provide spacers, if required, of type recommended by adhesive manufacturer.

2. **Stone Adhesive**

   Provide epoxy or polyester adhesive of type recommend by manufacturer for application and conditions of use.

   If adhesive will be visible in finished work, tint adhesive to match surfacing.

#### 2.4.2 Joint Sealants

Use clear silicone sealant of type recommended by manufacturer for application and conditions of use. Provide joint sealant products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for joint sealants.

Provide anti-bacterial type in [[toilet] [and] [bath] rooms,] [food preparation areas,] [and] [______].

### PART 3 EXECUTION

#### 3.1 INSTALLATION

********************************************************************************

**NOTE:** Include Section 22 00 00 PLUMBING, GENERAL PURPOSE for the installation of sinks requirements.

********************************************************************************

Inspect material for defects prior to installation. Ensure materials throughout bear labels with the same batch number. Visually inspect materials used for adjacent pieces to assure acceptable color match. Inspect in lighting conditions similar to those on the project. Repair or replace damaged materials.
Install countertops plumb with cabinetry level to within 1 millimeter in 3000 millimeter 1/16-inch in 10-feet. Level base cabinets by adjusting leveling screws. Scribe and fit scribe strips to irregularities of adjacent surfaces. Gap openings exceeding 0.63 millimeter 0.025-inch are not acceptable.

Secure countertops to cabinetry and wall construction using 6 millimeter 1/4-inch diameter masonry anchors, spaced 760 millimeter 30-inches maximum on center.

Submit installation drawings for countertops. Ensure drawings include location of cabinets, details of cabinets related and dimensional positions, and locations for roughing in plumbing, including sinks, faucets, strainers and cocks.

3.1.1 Preliminary Installation and Adjustment

Install materials in accordance to manufacturer's recommendations. Lift and place to avoid breakage.

Position materials to verify that materials are correctly sized and prepared. Make necessary adjustments.

If jobsite cutting, grinding, or polishing is required, use water-cooled tools. Protect jobsite and surfaces against dust and water. Perform work away from installation site if possible.

[Gypsum drywall back walls [which are not [fire][or][acoustically] rated] may be routed up to half the thickness of the drywall to allow countertop to fit.

][Shim countertop drainage [adjacent to sinks][and][where drainage is required], slightly to insure positive drainage.

3.1.2 Surfacing

3.1.2.1 Laminated Plastic Surfacing

Laminate plastic sheeting to faces and exposed edges of particle board at 138 kilopascal and 85 degrees C 20 pounds per square inch and 185 degrees F.

Apply backing sheet to concealed faces.

3.1.2.2 Stainless Steel Surfacing

Form counters and work surfaces of 1.6 millimeter 16-gage sheets with exposed edges returned.

Use hat-shaped channels, 1.6 millimeter 16-gage, for reinforcement, spaced 760 millimeter 30-inches on center.

Equip surfaces with wood strips under edges for fastening to cabinets.

Cove internal corners to 15 millimeter 1/2-inch radius.

Coat underside with 3 millimeter 1/8-inch thick sound deadener.

Electrically weld all joints, grind smooth, and polish to match adjacent finish.
[3.1.2.3 Wood Countertop Finish]

Provide factory applied [stained wood] [clear coated natural finish] [or] [HPDL] finish [as indicated] on all internal and external surfaces.

a. Stained Wood Finish

**************************************************************************
NOTE: Manufacturers use a variety of wood species in the production of kitchen cabinets. To specify a single species would be cost prohibitive and/or restrict competition. When indicating finishes, such as "light oak," "medium walnut," etc., a wood species should be included in the finish designation for use as a guide to the wood grain character and appearance.
**************************************************************************

[As selected from manufacturer's standard finishes] [As indicated]. Internal surfaces need to receive at least one coat of finish material.

][b. HPDL Finish

Pattern and color: [As selected from manufacturer's standard finishes][As indicated].

]]3.1.3 Permanent Installation

After verifying fit, remove quartz surfacing from position, clean substrates of dust and contamination, and clean quartz surfacing back side and joints with solvent.

Apply sufficient quantity of mounting adhesive in accordance with adhesive manufacturer's recommendations to provide permanent, secure installation.

Spacing of mounting adhesive will not exceed:

a. Horizontal Surfaces: [_____] mm [_____]-inch on center

b. Vertical Surfaces: [_____] mm [_____]-inch on center; provide temporary shims until adhesive cures.

[Fasteners][Grout][Hardware]: [____]

Install surfacing plumb, level, and square and flat to within 1.6 mm in 3 meters 1/6-inch in 10-feet.

3.1.4 Joints

Ensure joints between adjacent pieces of quartz surfacing are:

a. Flush, tight fitting, level, and neat.

b. Securely joined with stone adhesive. Fill joints level with quartz surfacing.

Clamp or brace quartz surfacing in position until adhesive sets.
Seal joints [between backsplashes and countertops] [and] [around tub] [and] [shower] enclosures with silicone sealer.

3.2 FIELD QUALITY CONTROL

Examine casework grounds and supports for adequate anchorage, foreign material, moisture, and unevenness that could prevent quality casework installation.

Ensure that electrical and plumbing rough-ins for casework are complete. Do not proceed with installation until defects are corrected.

3.3 ADJUSTING AND CLEANING

3.3.1 Solvent

Use a product recommended by adhesive manufacturer to clean surface of quartz surfacing to assure adhesion of adhesives [and sealants].

3.3.2 Cleaning Agents

Use non-abrasive, soft-scrub type kitchen cleaners.

3.3.3 Cleaning

On completion of cabinet installation, touch up marred or abraded finished surfaces. Remove crating and packing materials from premises. Wipe down surfaces to remove fingerprints and markings and leave in clean condition.

3.2 INSTALLATION

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for entrance floor mats and frames.

Indicate on drawings the location, size, and shape of mats.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically...
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

36 CFR 1191 Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Architectural Barriers Act (ABA) Accessibility Guidelines

1.2 SUSTAINABILITY REPORTING

Materials in this technical specification may increase contract compliance with sustainability requirements.

NOTE: The bracketed items are representative of LEED material documentation and requirements that may apply to this project. These items should be edited to reflect the project requirements.

1.2.1 EPA Comprehensive Procurement Guidelines

See Section 01 33 29 SUSTAINABILITY REPORTING for requirements associated with EPA-designated products.
1.2.2 USDA Biobased

See Section 01 33 29 SUSTAINABILITY REPORTING for requirements associated with USDA Biobased products.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Installation Drawings; G[, [____]]

Detail Drawings; G[, [____]]

Custom Graphics Drawings; G[, [____]]
1.4 QUALITY CONTROL

Comply with 36 CFR 1191 Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Architectural Barriers Act (ABA) Accessibility Guidelines for installed entrance floor mats and frames. Ensure that entrance floor mats and frames are slip-resistant in accordance with ASTM D2047, with a minimum 0.60 coefficient of friction, for accessible routes and are structurally capable of withstanding a [uniform floor load of 14 kPa 300 lb/sq ft] [wheel load of 160 kg/wheel 350 lb/wheel]. Ensure that flammability is in accordance with ASTM E648, Class 1, Critical Radiant Flux, minimum 0.45 watts/square meter.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the project site in their original packages or containers bearing labels clearly identifying the manufacturer, brand name, and quality or grade.

Store materials in their original unbroken packages or containers in the area in which they will be installed. Unwrap, inspect, and place mats at indicated locations. Remove all excess packing materials.

PART 2 PRODUCTS

2.1 MANUFACTURED UNITS

2.1.1 Entrance Floor Mats and Frames

Submit the manufacturer's catalog data. Submit samples of assembled sections of floor mats showing corners, intersections, and other details of construction. Submit samples of custom graphics, exposed floor mats, frame
finishes and accessories.

2.1.1.1 Resilient-Link Mats

Provide [rubber][vinyl][rubber-tire] resilient-link mats, [9.5][11] mm [3/8][7/16] inch thick with [galvanized-spring][stainless] steel wire link rods. Ensure that nosing is vulcanized and [beveled for surface installation extending approximately 50 mm 2 inches around the perimeter][square for recess or mats butted one to another]. Provide mats with steel-reinforced end trim that is [close-weave with link openings of 1.6 mm by 12 mm 1/16 inch by 1/2 inch][open-weave with link openings of 38 mm by 12 mm 1 1/2 inches by 1/2 inch].

2.1.1.2 [Rubber][Vinyl] Mats

Provide mats [6.4][9.6][1.6][____] mm [1/4][3/8][1/16][____] inches thick with [square edges for recessed installations][beveled edges for surface applications]. Provide mats with [solid sheet (no perforations) style][perforated style, 6 mm 1/4-inch diameter on standard spacing][perforated style, 5 mm by 19 mm 3/16 inch by 3/4 inch on standard spacing][standard pyramid design with knob back][standard wide-wale corrugated][hi-rib, narrow-wale corrugated] top profile and [low-rib, narrow-wale corrugated][standard knob-base][flat-base] bottom surface. Ensure that mats are made of a nonslip prime-quality compound free of calendaring and curing defects, and resistant to weather aging and ozone in normal concentrations.

2.1.1.3 Coco Mats

******************************************************************************************************************************************
NOTE: Coco (also spelled cocoa) matting makes ideal scraper mats, which effectively remove dirt, debris and moisture from shoes.
******************************************************************************************************************************************

Provide coco brush mats made of high-quality coir yarn from coconut husk fibers. Secure mats with a heavy-duty vinyl backing, woven tightly together and securely bound around the perimeter with matching coir yarn rope. Overall thickness is [16][19][25][32] mm [5/8 inch][3/4 inch][1 inch][1 1/4 inches].

2.1.1.4 Recycled Rubber Tire [Tiles][Mats]

Provide recycled rubber tire [tiles] [mats] that are made from recycled truck, bus and aircraft tires, with sidewall cords and are buffed to a chenille finish. Ensure that the [tiles] [mats] are bonded to a woven flexible backing to form 9.5 to 11.1 mm 3/8- to 7/16- inch-thick[ 300 mm 12-inch -wide tiles][ 300 mm 12-inch-wide rolls up to 7.5 m 25 feet long].

2.1.1.5 Carpet-Type Mats

Provide a [nylon][polypropylene][olefin][polyester][____] carpet bonded to a 3 mm to 6 mm 1/8-inch to 1/4-inch-thick, flexible vinyl backing to form mats that are [9.5][11] mm [3/8][7/16] inch thick with nonraveling edges.

2.1.1.6 Loop Filament Mats

Provide loop filament vinyl material [9.5][13] mm [3/8][1/2] inch thick, with [solid vinyl sheet] [foam sheet] backing. Ensure that chemical agents
are built into the backing to reduce fungus and mildew.

2.1.1.7 Roll-Up Mats

Provide roll-up mats with [mill finish] [[clear][bronze]] [black] [anodized] [_____] aluminum tread rails spaced a maximum 51 mm 2 inches on center and running counter to the traffic flow. Ensure that the mats must allow debris to fall to subfloor. Ensure that tread rails are connected by [aluminum] [vinyl] hinges and include [an aluminum] [a vinyl] edge around the perimeter and a continuous vinyl cushion.

Provide [recessed] [surface] mats mounted with [carpet consisting of nylon or polypropylene carpet fibers fusion-bonded to a rigid two-ply backing to prevent fraying and supplied in continuous splice-free lengths. Carpet has antistatic and antistain treatments] [carpet/bristle filament mix] [vinyl] [abrasive tape] [poured abrasive] [recycled rubber] [serrated aluminum] [_____] inserts.

2.1.1.8 Floor Grids

Provide a floor grid consisting of a series of [aluminum][bronze] tread rails spaced [38] [_____] mm [1 1/2] [_____] inches on center and running counter to the traffic flow. Ensure that floor grids allow debris to fall to the subfloor. Provide a [drain pan] [trench drain] [_____] deep. Rest grid assemblies on a continuous vinyl cushion mounted to each continuous foot at [_____] on center. [Ensure that pits are [_____] deep and rest on a continuous vinyl cushion with additional support members [_____] on center, including adjustable support legs.] [Provide a drain pan to include a drain and a stainless-steel strainer.] For a [stainless-steel grid, provide satin-finished stainless-steel rails [_____] apart, electronically welded joints, and a stainless-steel frame [_____] deep.] Provide all anchors, fasteners, accessories, and other parts required for a complete installation.

2.1.1.9 Frames

[Provide surface-mounted frames that have a tapered flexible vinyl edge at least [50][38] mm [2][1 1/2] inches wide, with welded corners and attached to the mat at all four edges.] [Ensure that surface-mounted frames are tapered, at least [2][1 1/2] inches wide, screwed into an opening in the floor to create an opening for the mat to sit in.] [Provide recessed frames in extruded aluminum Alloy 6061-T6 or Alloy 6063-T5 ASTM B221M ASTM B221. Ensure that the frame depth accommodates the mat and system specified.] Frame color is [mill finish] [clear] [black] [[light] [medium] [dark] bronze] [_____] . Ensure that edge-frame members are fabricated in single lengths or with the fewest pieces possible, with hairline joints equally spaced and pieces spliced together by straight connecting pins. Ensure that any concealed surfaces of aluminum frames that contact cementous material are coated with the manufacturer's standard protective coating. Ensure that frames include accessories and devices required for a complete installation.

2.1.1.10 Tread Insert Options

******************************************************************************
** NOTE: Tread inserts are to be specified with floor grid systems or frames provided in two previous paragraphs.**
******************************************************************************
Provide tread inserts consisting of [carpet composed of solution-dyed nylon or polypropylene carpet fibers fusion-bonded to a rigid two-ply backing to prevent fraying and supplied in continuous splice-free lengths; carpet has antistatic and antistain treatments. Ensure that pile weight is a minimum 30 ounces per square yard] [carpet/bristle filament mix] [vinyl] [abrasive tape] [poured abrasive] [recycled rubber] [serrated aluminum] [______].

2.1.2 Adhesives and Concrete Primers

Provide adhesives and concrete primers, where required, according to the manufacturer's recommendations.

2.1.3 Graphics

Clearly illustrate details in drawing of custom graphic [emblem] [logo][design].

2.1.4 Color and Size

Ensure that color is in accordance with [Section 09 06 00 SCHEDULES FOR FINISHES][the drawings][______]. Ensure that the size of mat is [______][as indicated].

PART 3 EXECUTION

3.1 EXAMINATION

Comply with the manufacturer's requirements for substrates and floor conditions affecting installation of floor mats and frames. Ensure that all unsatisfactory conditions have been corrected before installation.

3.2 INSTALLATION

Submit detail drawings, and custom graphics drawings as required. Provide installation drawings. Provide the manufacturer's protection, maintenance, and repair information.

Install floor mats and frames according to manufacturer's instructions. Set mat tops at the height recommended by the manufacturer for the most effective cleaning action. Provide clearance between bottoms of doors and tops of mats. [Coordinate recess frame installation with concrete construction to ensure that frame anchorage is correct and that the base is level and flat. Install grout and fill around frames and, if required to set mat tops at proper elevations, in recesses under mats. Finish grout and fill smooth and level.]

Furniture, Fixtures and Equipment (FF&E) Package

-- End of Section Table of Contents --
NOTE: Use this specification for new construction and building renovation projects for Army and Air Force projects. This specification is not typically used for Navy projects, but if the Army is administering a project for the Navy this specification can be used but must be coordinated through the Navy representatives and Navy Interior Designers for Navy specific requirements. Use this specification only when it has been determined by the Government that the Contractor will be responsible for the purchase and installation of the furniture. This specification can also be used for furniture purchases that are not associated with building construction. Following are exceptions:
- Do not use this specification for Army projects in which the U.S. Army Corps of Engineers Huntsville Engineering and Support Center (HNC) will be purchasing and installing the furniture.

Furniture is not purchased with building construction funds. O&M funding is typically used; coordinate funding source with Government. Since other than building construction funding is used, a separate line item for the FF&E purchase and installation is required on the project Contract Line Item Number (CLIN) Bidding Schedule in the specifications to track different funding sources. Coordinate funding sources with the Government Project Manager. Coordinate the CLIN Schedule requirements with the Contracting Officer, Government Project Manager and Project Specification Editor. If a project also includes System Furniture, Section 12 59 00, include it as part of the FF&E line item on the CLIN Bidding Schedule.

NOTE: This Guide Specification covers the
requirements for furniture and furniture installation.

NOTE: Adhere to [UFC 1-300-02](https://www.fas.dla.mil/ufc/) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://www.fas.dla.mil/ufc/).

**************************************************************************

PART 1   GENERAL

**************************************************************************

NOTE: The FF&E Package must be attached and be designed in accordance with the Government Scope of Services document. The FF&E Package must comply with the Federal Acquisition Requirements (FAR), Buy American Act (BAA), User Requirements and Government Contracting Office's procurement methodology. Coordination is required with the Government Contracting Office to insure that the FF&E Package is procurable.

The FF&E Package furnishings order form contains ordering information, such as but not limited to description, size, finish and fabric information (see Government Scope of Services for more information). The description must include and identify minimum product requirements, be non-proprietary and contain project specific salient characteristics. This information must be sufficient so the Contractor understands the design and furniture intent and furniture minimum requirements. Dependent on the project Scope of Services this form may have different names, for example: data sheet, furniture data sheet, specification sheet or procurement information.

Do not include a cost estimate or furniture item costs in the FF&E Package included in the construction contract documents. Provide copies of the cost estimate for the project design reviews as required by the Government.

For coordination purposes with the other design disciplines (architectural, electrical, mechanical, etc.) include the furniture drawings in the building construction contract drawing set. Also include the furniture drawings in the FF&E binder for the
project design review submittals as required by the Government.

Provide information on existing furniture to be reused and not reused in the FF&E if required for project. See paragraph titled EXISTING FURNITURE in Part 1 of this specification for more information.

Various provisions of this guide specification may be irrelevant to or in conflict with the requirements of any given project. This spec should be carefully edited to fit the needs of each specific application. Portions must be deleted, if not applicable, and additional material inserted where necessary to adequately delineate requirements. Brackets and blanks identify provisions which involve alternates; the editor must select and/or insert the appropriate requirements.

**************************************************************************

Purchase and install furniture as identified within this specification. This specification section includes a Furniture, Fixtures and Equipment (FF&E) Package attachment. [

The requirements of this specification also apply to systems furniture unless otherwise specified in Section 12 59 00 Systems Furniture.]

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

******************************************************************************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

1.3 SERVICES

***************************************************************
NOTE: These services are for Contractor Furnished/Contractor Installed (CF/CI) furniture and can also be used for Government Furnished/Contractor Installed (GF/CI) furniture. For the purposes of this specification as written, Government furnished furniture includes existing furniture provided by the Government.

Clearly identify in the FF&E Package and on furniture drawings CF/CI and GF/CI furniture, and when required Government Furnished/Government Installed (GF/GI) furniture and equipment. This information clarifies the responsibilities of the Contractor and the Government and aids in space planning and coordination with other design disciplines.

Determine if the Contractor will be responsible for disassembling, packing, storing, moving and reinstalling existing furniture (GF/CI) or if existing furniture will be handled by the User (GF/GI). See EXISTING FURNITURE for more information.

***************************************************************
Provide services to include furniture purchase, field measuring, installation drawings, shipping and delivery coordination, receiving, inspection, submitting and processing freight and warranty claims, unpacking, storing, assembly, installation and other related activities or tasks for a complete and functional installation. Reference Section 01 45 00.00 10 QUALITY CONTROL for inspection requirements. The Contracting Officer must be allowed to participate in inspections.[ In addition provide services for existing furniture as specified, reference paragraph on EXISTING FURNITURE for more information.] Develop project timelines and establish shipping, receiving and installation dates that coordinate with the building construction schedule. Hold at a minimum weekly team meetings to brief the project team, include the Contracting Officer. Notify the Contracting Officer immediately of any scheduling problems, discontinued furniture items including fabrics and finishes, or other conditions which may cause delays, and recommend available substitutes, solutions, and provide updated timeline to coordinate with building construction schedule. Substitutes and solutions must comply with the specification and be approved by the Contracting Officer.
1.4 FURNITURE PURCHASE

**************************************************************************

NOTE: Once the Government determines that the furniture can be purchased by the Contractor, coordinate furniture procurement method (such as GSA Schedules and Open Market) with the Government. (This note applies to new construction and renovation projects.)

FURNITURE FROM THE GSA SCHEDULES: Select this bracketed option if it has been determined that the Government will authorize the Contractor to purchase furniture using the Government Supply Sources. If this option is selected make sure that FAR clause 52.251-1 Government Supply Sources is included in the project FAR requirements. This FAR provides the Government the ability to write a letter to the Contractor authorizing the Contractor to use Government Supply Sources to purchase furniture. Coordinate the inclusion of the FAR clause requirement with the Project Specification Editor.

FURNITURE FROM THE OPEN MARKET: Select this bracketed option if it has been determined that the Government will not authorize the Contractor to purchase furniture using the Government Supply Sources.

If another source for furniture is necessary to meet project requirements, for example Navy or Air Force BPA's, edit specification accordingly and add the requirement. Verify that source and processes are appropriate for use within the framework of this specification. Use of any other sources must receive approval by the Government before proceeding.

Delete bracketed sentence on the quick-ship programs and coordinating factory times if project is not on a tight schedule and not applicable to the project.

**************************************************************************

Purchase furniture, including checking accuracy of all acknowledgements and schedules from manufacturers and making necessary corrections to insure that the manufacturer has a correct understanding of the order and requirement. Provide furniture from the GSA Schedules and provide GSA pricing. Provide furniture from open market only when an item is not available on the GSA Schedules. See FAR clause 52.251-1 Government Supply Sources. Purchase furniture from the open market. The furniture provided needs to be available on the GSA Schedules to assist the User with future purchases. GSA information is provided FOR INFORMATIONAL PURPOSES ONLY. It is encouraged to solicit and provide GSA pricing on furniture. Compete the furniture purchase by obtaining a minimum of (3) separate proposals. Furniture is subject to FAR clause 52.236-5 Materials and Workmanship. If necessary to meet project timeline requirements, furniture may be purchased using manufacturers quick-ship programs or by coordinating factory times.
1.5 ALTERNATE DESIGN

**************************************************************************
NOTE: Minor differences exist among different manufacturer's product. This paragraph pertaining to "alternate design" is included in order to not exclude a manufacturer when an equally acceptable solution is proposed.
**************************************************************************

When a manufacturer's product is unable to provide desk and workstation configurations and filing/storage that conform exactly to the furniture layouts shown in the contract drawings and specifications, alternate designs may be submitted for consideration by the Contracting Officer. Alternate designs must meet or exceed the following criteria. Alternate designs that are submitted but do not meet these criteria will be rejected.

1.5.1 Desk and Workstation Size and Configuration

The alternate design must provide desks and workstations of the same basic size and configuration shown, with only the sizes of the individual components within the desk and workstation changed to meet the standard product of the manufacturer.

1.5.2 Filing and Storage Size and Configuration

The alternate design must provide filing and storage of the same basic size and configuration shown, with only the size changed to meet the standard product of the manufacturer. The storage capacity must not be reduced.

1.5.3 Furniture Requirements

The furniture provided must comply with the drawings, specifications, and the requirements identified in the FF&E Package Attachment.

1.5.4 Layout

The storage capacity, number of desks and workstations, number of persons accommodated, width of aisles, and functionality must be maintained. Layout must comply with NFPA 101 and 36 CFR 1191.

1.6 AUTHORIZED DEALER, CERTIFIED FURNITURE INSTALLERS, LICENSED ELECTRICIAN AND CERTIFIED TELECOMMUNICATIONS INSTALLER

When required by the furniture manufacturer, furniture must be installed by an authorized dealer and a certified furniture installation crew must be used on the project. Services provided to reuse existing furniture must comply with manufactures warranty requirements to maintain warranty. If warranty for existing furniture to be reused has expired, services must be completed by a furniture installation crew with a minimum of 5 years experience.] All furniture requiring hardwiring must be completed by a licensed electrician. Communications installers must be Building Industry Consulting Services International (BICSI) Registered Cabling Installers, Technician Level or have a minimum of [3][_____] years experience in the installation of the specified cables and components. All installers, furniture, electrical and communications, must be on-site if questions arise. Submit copies of authorized dealer, furniture installation crew, licensed electrician and certified telecommunications installer certifications.
1.7 DELIVERY, STORAGE AND HANDLING

1.7.1 Delivery

Deliver furniture to the jobsite in manufacturer's original packaging or blanket wrapping. Original packaging must be marked with the manufacturer name, item identification, and project reference clearly marked.

1.7.2 Furniture Inspection

Inspect furniture and provide notification of damage within the time frame required by the shipping company while carrier is still on-site. Complete claims for concealed damage within the time frame required by the shipping company and furniture manufacturer. A claim file must be maintained that documents each claim. Forward copies of claims to the Contracting Officer on a [daily][_____] basis.

1.7.3 Storage

Storage space is not available on-site and furniture must be stored at an off site location. Provide any storage space required for furniture and transport stored furniture to the project site for installation. **Storage location** must be approved by the Contracting Officer at the time of the furniture order. If storage is required, furniture must be stored in a dry location that is adequately ventilated and free from dirt and dust, water, and other contaminants, in a manner that permits easy access for inspection and handling, and in an environment in accordance with furniture manufacturers instructions.

1.7.4 Furniture Staging Area

Coordinate location of the furniture staging area with the Contracting Officer.

1.8 WARRANTY

**************************************************************************
NOTE: Revise, add and/or delete warranty information as applicable to meet project requirements.
**************************************************************************

Provide manufacturer performance guarantees or warranties for single-shift service and include parts, labor and transportation as follows, unless otherwise noted:

a. Systems Furniture - [see Section12 59 00 Systems Furniture][12 year minimum][lifetime]

b. Desks and Workstations - 12 year minimum

c. Filing and Storage - 12 year minimum

d. Seating
   (1) Seating, unless otherwise noted - 10 year minimum
   (2) 24/7 Seating (multiple shift use) - 10 year minimum
(3) Seating Mechanisms and Pneumatic Cylinders - 10 year minimum
(4) Lounge Seating - 10 year minimum
(5) Stacking Chairs - 10 year minimum
e. Tables
(1) Unless otherwise noted - 10 year minimum
(2) Table Mechanisms - 5 year minimum
(3) Table Ganging Device - 1 year minimum
f. Miscellaneous
(1) Fabric - 3 year minimum
(2) LED Task Lighting - 5 year minimum
(3) Task Lighting - [2][3][_____] year minimum

Provide items not listed with a 1 year minimum. When manufacturers standard performance guarantees or warranties exceed the minimum requirements identified, provide the standard performance guarantee or warranty. Submit manufacturer's warranty information for all furniture items.

PART 2   PRODUCTS

2.1   PRODUCT SUSTAINABILITY CRITERIA

For products in this section, where applicable and to extent allowed by performance criteria, provide and document the following:

2.1.1   Energy Efficient Equipment

Coordinate requirement for energy efficient equipment, such as appliances and lighting, and provide documentation in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING paragraph ENERGY EFFICIENT EQUIPMENT.

2.1.2   Reduced VOC's for Furniture

Coordinate requirement for reduced VOC requirements for furniture and provide documentation in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING paragraph REDUCE VOLATILE ORGANIC COMPOUNDS.

2.1.3   Recycled Content of Furniture

Coordinate requirement for recycled content for furniture and provide documentation in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING paragraph RECYCLED CONTENT.

2.1.4   Bio-Based Content of Furniture

Coordinate requirement for biobased content for furniture and provide documentation in accordance with Section 01 33 29 SUSTAINABILITY
REFERENCE TO MANUFACTURER NAMES AND COLORS

Where product and color is shown as being specific to one manufacturer in the FF&E Package Attachment, an equivalent color or product by another manufacturer may be submitted for approval. Manufacturers, style lines, model numbers, finish, and fabric information are provided to establish design intent and are not intended to limit the selection of equal products and colors from other manufacturers.

FURNITURE REQUIREMENTS

**************************************************************************
NOTE: Coordinate with electrical engineer to comply with LED and task lighting guidance in UFC 3-530-01 Interior and Exterior Lighting Systems and Controls. Add information as appropriate to this specification or the FF&E Package to identify project requirements.

If product data for all furniture items should be submitted at the same time

**************************************************************************

Use the FF&E Package Attachment in conjunction with the drawings and specifications for the furniture requirements. Provide furniture from manufacturer's standard product as shown in the most current published price list or amendment. Furniture provided must be part of current line as indicated with no intent to discontinue within two years. Provide furniture that is intended for commercial use not residential. Submit product data for all furniture items, to include catalog cuts, brochures, product information, and other necessary literature to indicate compliance with specifications. Provide product data for all similar types of items together as a group, such as [desks/workstations], [seating], [storage], [tables], and [____]. Submit each grouping of similar type items in a single submittal. When applicable, include GSA schedule information to confirm that items are available on GSA schedule. Tag product data sheets with applicable furniture item code and name. Submit data for all product style options for selection when options are available. This applies to but is not limited to furniture items that have options such as edge details, hardware options, and grommet colors. Submit manufacturer's certification stating that furniture meets the specifications.

EXISTING FURNITURE (GOVERNMENT FURNISHED/CONTRACTOR INSTALLED-GF/CI)

**************************************************************************
NOTE: Existing furniture typically applies to renovation projects in which the User wants the project to be turnkey and have the Contractor also be responsible for handling existing furniture. Note that adding this requirement increases project cost.

Determine if the Contractor will be responsible for disassembling, packing, storing, moving and reinstalling existing furniture (GF/CI) or if
existing furniture will be handled by the User (GF/GI). If User will be responsible for existing furniture delete this paragraph.

If it is determined existing furniture will be reused (disassembled, moved and re-installed) or excessed, the existing furniture must be inventoried and clearly tagged to be reused or excessed as part of the FF&E design. Inventory must also include identifying condition of existing furniture to be reused. Inventory and tagging can be accomplished by the FF&E interior designer, the User or other method determined during design but must be completed as part of the FF&E Package design.

Verify if certified installers are required to maintain the warranty when existing furniture is disassembled and reinstalled and to insure the furniture is handled properly. If this is the case, it is suggested that the Contractor be involved or at a minimum the User contract with a certified furniture installer for this effort.

Supply sufficient information in the FF&E Package attachment and construction contract drawings for a Contractor to provide a bid on the existing furniture requirement. This information can include current and new locations of existing furniture, item name and code for existing furniture, manufacturer information if available, drawings, photographs, description and size of furniture, and other necessary information to clearly indicate intent. Also provide information and locations for existing building and furniture electrical and communication features.

**************************************************************************
2.3.1.1 Existing Furniture to be Reused

Disassemble, pack, move, store, transport to the project site and install existing furniture identified to be reused. This includes disconnecting and reconnecting furniture electrical connections at the building source. Coordinate with electrician for safe terminations or removal of disconnected building electric system supply circuits.

[2.3.1.2 Existing Furniture that is Not Reused]

**************************************************************************

NOTE: Coordinate with the Government to insure that furniture that will not be reused and requires excessing is handled according to the base or post requirements and modify verbiage accordingly to reflect the requirements.

**************************************************************************

[Disassemble and have ready for excessing and pick up any furniture identified as not to be reused. Furniture will be picked up by Government directed vendors. Coordinate pick-up times with Contracting Officer and User.][Disassemble and relocate any furniture identified as not to be
reused to the [Defense Logistics Agency Disposition Services (DLADS)][_____] facility. This includes disconnecting furniture electrical connections at the building source. Coordinate with electrician for safe terminations or removal of disconnected building electric system supply circuits. Protect all items from damage and provide security and weather protection prior to and during[ pickup][ relocation].

][2.3.1.3 Existing Furniture Communications

Remove existing Information Technology (IT) cables (i.e. SIPRNET, NIPRNET, J-WIC'S, etc.) and telephone wiring from existing furniture systems identified to be reused or requiring excessing.

][2.3.2 Construction

a. Provide furniture that complies with the following testing requirements:

(1) ANSI/BIFMA

(a) Office Seating - ANSI/BIFMA X5.1

(b) Vertical Files - ANSI/BIFMA X5.3

(c) Lounge Seating - ANSI/BIFMA X5.4

(d) Desk Products - ANSI/BIFMA X5.5

(e) Panel Systems - ANSI/BIFMA X5.6

(f) Storage - ANSI/BIFMA X5.9

(2) Flammability

***************************************************************************

NOTE: Comply with NFPA 101. Review occupancy chapter requirements for smoldering ignition of upholstered furniture and mattresses and for upholstered furniture and mattresses requiring limited rates of heat release.

***************************************************************************

(a) Systems furniture and workstation panel components must meet requirements for flame spread and smoke development as specified by NFPA 101 except as follows. Conduct testing in accordance with either ASTM E84 or UL 723 on the entire assembled panel of the worst case (most combustible) combination of fabric and interior construction. In addition, fabric must meet the requirements of NFPA 265. Panel flame spread shall not exceed [25 for Class A] [75 for Class B] [200 for Class C], and panel smoke development shall not exceed 450 for Class A, B, and C.]

(b) Upholstered furniture must comply with[ TB 117-2013 or NFPA 260 ][ TB 133 or ASTM E 1537].

(c) Mattresses must comply with 16 CFR 1632[ and ASTM E 1590].

b. Provide furniture with no rough or sharp edges or exposed connections. Clips, screws, and other construction elements must be concealed wherever possible.
NOTE: Recommend that desks, workstations and systems furniture be designed so they do not require attachment to the walls; this provides the User with more flexibility in reconfiguring the furniture. When they are attached to the wall, the User must patch and repair the walls when furniture is reconfigured or replaced in the future. Prior to specifying wall mounted furniture make sure that User is aware of the ramifications and agrees with design approach.

c. Items such as desks, workstations and systems furniture must include all necessary components to be structurally sound and must not be attached to the wall unless specified to be wall mounted in the contract documents.

d. Desks, workstations, storage, and tables must have leveling devices to compensate for uneven floors.

e. The underside of desks, workstations, and tables must be completely and smoothly finished.

f. The backside of freestanding desks, workstations, [_____] and storage must be finished.

g. Provide chair casters and glides appropriate for the floor material they are located on, such as carpet and resilient flooring.

2.3.3 Locks and Keying

a. All drawers and doors, including but not limited to overhead storage cabinets, storage towers, supply cabinets, storage cabinets, desk and workstation pedestals, and filing cabinets must be lockable.

b. Key each desk and workstation in an office differently and key locks within each desk and workstation alike.

c. Furniture storage components in private offices must be keyed alike. Key each private office differently.

d. Provide field changeable lock cylinders in desks and workstations with a minimum of 100 different key options. Number keys and lock cylinders for ease of replacement or clearly label locks with a key number, except for those manufacturers who have removable format locks.

e. Drawers within a pedestal must be lockable either by a central lock that controls all pedestals under one work surface or an individual keyed lock in each pedestal.

f. Central file and storage units which are grouped together but are not a part of a workstation must be keyed [alike][differently] unless otherwise specified.

g. Provide two keys for each workstation when components are keyed alike. Also provide two keys for each miscellaneous item such as filing cabinets, supply cabinets, storage cabinets, and similar type furniture
items.

h. Provide three copies of each master key to the Contracting Officer.

i. [Leave keys in locks] [Inventory keys, label keys by lock number, room number and furniture item and turn over inventory and keys to the Contracting Officer.]

2.3.4 Receptacle Bodies and Device Cover Plates

**************************************************************************
NOTE: Coordinate isolated ground receptacle requirements with the electrical/telecommunications engineer.
**************************************************************************

Provide furniture panel faceplates and receptacle body types [and color] as specified in [FF&E Package Attachment] [12 59 00 SYSTEMS FURNITURE] [____]. [Provide color as follows:

a. Faceplate: [match panel trim color][____]

b. Receptacle Bodies: [match panel trim color][____]

c. Communication Cable Jackets: [match receptacle device cover plates in color][____]

d. Isolated Ground Receptacles: [orange] [or] [have distinct markings] [be of a different color than other receptacles]

2.3.5 Keyboard Tray

Provide worksurfaces that are capable of accepting an articulating keyboard tray at locations indicated. The keyboard tray must be capable of fully recessing under the work surface and extending to give the user full access to the keyboard. The keyboard tray must have height adjustability and positive and negative tilting capability and have 180-degree swing side travel rotation. The keyboard tray must have a wrist support and include a mouse pad at the same level as the keyboard that can accommodate both right and left handed users.

2.3.6 Fabric and Finish

Submit samples of all furniture fabric and finishes. Samples must be actual samples, not photographic representations, size must be a minimum of 75 by 75 mm 3 by 3 inches. If necessary, provide larger size samples to clearly represent pattern. Label samples with fabric or finish code, furniture item code and name, manufacturer name, and color information. Fabric samples must also be labeled with fiber content and double rub testing information.

2.3.6.1 Fabric

**************************************************************************
NOTE: Recommended minimum requirement for double rubs is typically 55,000 for an office environment. Some areas within a facility may require a higher double rub number where seating is located in heavy use and high traffic areas. Modify information as

SECTION 12 50 00.13 10 Page 18
necessary on double rubs to meet project requirements, information may vary if different types of fabrics are specified.

Verify with Government if use of customer's own material (COM) is acceptable.

When required, identify which seating requires a topical or inherent soil retardant treatment.

Recommend specifying acceptable minimums for pattern size to establish design intent for aesthetics and to help hide soiling. Typically the use of solid colors are not recommended unless furniture is located in a command type area or the fabric is a vinyl, polyurethane, leather, faux leather or other similar type of fabric.

Coordinate pattern size and terminology used in this specification with fabric pattern information included in the FF&E Package Attachment.

**************************************************************************

a. Fabric must be from manufacturer's standard line[ and[,] graded-in textile manufacturer's fabrics[, and customer's own material (COM)].[ Do not provide COM fabrics.]

b. Provide a mid grade fabric[, unless otherwise noted]. Example: manufacturer available grades 1 through 4 (even number of grades), provide grade 3; manufacturer available grades A through D (even number of grades), provide grade C; manufacturer available grades A through E (odd number of grades), provide grade C (middle grade).

c. Provide a topical or inherent soil retardant treatment where indicated.

d. [Comply with double rub testing as specified in the FF&E Package Attachment.] [Fabric for seating must comply with a minimum of [55,000] double rubs unless otherwise noted.] Perform double rub testing in accordance with the ASTM D4157 Wyzenbeek Method.

e. Provide vinyl, polypropylene or similar type fabric for seating only if allowed in FF&E Package Attachment.

f. Pattern:

(1) Provide patterned upholstery fabric to help hide soiling. Pattern is defined as follows:

(a) Solid Color: [textured,] [single color] [or] [pattern smaller in size than the small size pattern][____]

(b) Small Size Pattern: minimum [12 mm/2 inch] [____]

(c) Medium Size Pattern: minimum [50 mm2 inch] [____]

(d) Large Size Pattern: minimum [125 mm5 inch] [____]

(2) Provide patterns [as specified in the FF&E Package Attachment.] [as follows:}
(a) Desk Chairs: [solid color] [small] [_____] size pattern
(b) Side or Guest Chairs: [small] [medium] [_____] size pattern
(c) Lounge Type Chairs: [small] [medium] [large] [_____] size pattern
(d) [_____] : [small] [ medium] [large] [_____] size pattern

g. See FF&E Package Attachment for additional information.

2.3.6.2 Finishes

Provide furniture finishes as listed below unless otherwise noted:

a. Finishes must be able to be cleaned with ordinary household cleaning solutions. Wood finishes must be able to be cleaned with damp cloth as directed by the manufacturer.

b. The finish of steel surfaces must be the manufacturer's most durable finish such as factory powder coat or baked enamel.

c. Grommet colors must be compatible and coordinated with desk, workstation, and table finish colors.

d. Finishes must be neutral in color.

e. Plastic laminate worksurfaces and table tops must be neutral in color and must have a pattern to help hide soiling.

f. See FF&E Package Attachment for additional information.

2.4 FURNITURE LAYOUT

Provide furniture layout as indicated.

PART 3 EXECUTION

3.1 BUILDING EXAMINATION

Become familiar with details of the work, inspect all areas and conditions under which furniture is to be installed, and coordinate scheduling of dedicated elevators and docks. Notify the Contracting Officer in writing of any conditions detrimental to the proper and timely completion of the installation. Work will proceed only when conditions have been corrected.

3.2 BUILDING PROTECTION

Protect building surfaces to prevent soiling and damage during delivery and installation. Any soiling and damage that occurs to the building during the installation of furniture must be cleaned and repaired, or replaced to its original condition and must be approved by the Contracting Officer.

3.3 INSTALLATION

3.3.1 Installation Drawings

Installation drawings must include furniture layout, critical dimensions
and locations of electrical and communications. Furniture layouts shall reflect field verified conditions. Drawings must be at 1:100 1/4 inch = 1 foot scale, unless otherwise specified. Provide typical plans and isometrics/elevations of desks and workstations at a scale of 1:50 1/2 inch = 1 foot. When applicable, provide desk and workstation electrical and communications locations. When applicable include controlled-circuit identification for each furniture receptacle and coordinate with the building electrical system circuits in accordance with ASHRAE 90.1 - SI ASHRAE 90.1 - IP. Critical dimensions include, but are not limited to clearances and aisle widths. Drawings must include layout for furniture systems workstations for coordination purposes. Label furniture with furniture item code identified in this specification. Submit grommet[, power and communication units][, and wire management] locations.

3.3.2 Furniture Installation Procedures

Complete installation in accordance with manufacturer's installation instructions, assembly manuals, warranty requirements and approved installation drawings. Also comply with the following requirements:

a. Use material handling equipment with rubber wheels.

b. Furniture and components must be installed level, plumb, square, and with proper alignment with adjoining furniture.

c. Match keys to locks and check locking mechanisms.

d. Check drawers, doors, lighting, and other operable items and mechanisms for proper operation.

e. Remove all protective wrapping tape, residue, and related type items.

f. Securely interconnect furniture components where required.

g. Securely attach and anchor furniture components to the building when required.

h. Securely anchor furniture such as shelving and storage units to the building when required by the manufacturer.

i. All items with an electrical plug, such as but not limited to task lighting and tables with electrical power, must be fully operational.

j. All hardwired furniture, such as but not limited to furniture systems, must be fully operational. Verify that voltage is present in electrical outlets. Verify controlled-circuit outlets are properly configured in accordance with the installation drawings.

k. Furniture must not block SIPRNET[ and ][____] jacks or the jack enclosures on walls. Report conflicts to Contracting Officer to discuss resolution.

l. Upon completion of installation, all furniture must be completely cleaned, finished, leveled, aligned, operational and functional.[

m. Install artwork with security mount hardware as recommended by the manufacturer.]
3.3.3 Furniture Communications Installation

**************************************************************************
NOTE: Coordinate with the User and electrical/telecommunications engineer if the Contractor or others will be providing all IT cables (i.e. SIPRNET, NIPRNET, J-WIC' S, etc.) and phone wiring up to and including the face plate/box of all furniture as required and the services to install new cables/phone wiring and face plates/boxes in the furniture. Furniture may include, but not be limited to desks and workstations, systems furniture and tables.

If required for a project, the requirement for the Contractor to provide the IT cables (i.e. SIPRNET, NIPRNET, J-WIC'S, etc.) and phone wiring up to and including the face plate/box of the furniture should also be indicated in the applicable project UFGS Communications specifications.

Revise language as necessary to meet project specific requirements.
**************************************************************************

[Provide all Information/Technology (IT) cables (i.e. SIPRNET, NIPRNET, J-WIC'S, etc.) and phone wiring up to and including the face plate/box of all furniture as required and the services to install the cables, wiring and face plates/boxes in the furniture. Coordinate cable type, cable jacket and outlet jack color with Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM. Furniture communication installers must be on site to install communication cables, wiring and other components for furniture during furniture installation. Coordinate the TIA-568.2 pin/pair assignments for communication outlets to match the configuration of the building's non-furniture outlets; coordinate with Contracting Officer. All items with a communication interface must be fully operational.][Installation of Information/Technology (IT) wiring, cables and face plates/boxes in the furniture will be completed by others.]

3.4 CLEANING

Remove all packing materials and other trash from the jobsite. Upon completion of installation, all products must be clean, including inside all drawers and doors, and the area must be free of debris and left in a clean and neat condition. Any defects in or damage to furniture must be repaired or replaced and approved by the Contracting Officer. Damaged products that cannot be satisfactorily repaired must be replaced. Correct any problems with assembly and installation. Prior to any furniture repair, replacement, and/or assembly and installation corrections, protect the building surfaces.

3.5 OPERATION AND MAINTENANCE MANUALS

Submit the Furniture, Data Package 1 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA and include the following:

3.5.1 Assembly Manuals

Describe assembly and re-configuration procedures. Provide three sets of
installation video tapes if available.

3.5.2 Installation Instructions

Provide a copy of the instructions used to install the furniture. Also describe any special procedures or helpful hints learned during the installation process.

3.5.3 Maintenance Manuals

Describe proper cleaning and minor repair procedures, include cleaning instructions for fabrics.

3.5.4 Electrical System Manuals

Describe the functions, configuration, and maintenance of the furniture electrical system (power[, communication][, and data]). This information may be included in the assembly or maintenance manuals.

3.5.5 Special Tools

Provide [three][___] sets of special tools necessary for assembly and disassembly of furniture and components from each manufacturer. Mark tool(s) with manufacturer and product information.

3.5.6 Furniture Drawings

Provide hard copy and electronic, showing installed furniture layout. Include all modifications. Provide electronic copies on a CD-ROM. Coordinate type (such as but not limited to Microstation, AutoCad and Revit) and version required with User. Include critical dimensions, and locations of building and furniture electrical and communications. Provide drawings at 1:100 1/4 inch = 1 foot scale, unless otherwise specified. Provide typical plans and isometrics/elevations of workstations at a scale of 1:50 1/2 inch = 1 foot. Code all furniture with furniture item code identified in this specification.

3.5.7 Furniture Listing

Provide complete listing, hard copy and electronic, of furniture provided. Include all modifications. Provide electronic copies on a CD-ROM. Coordinate type of electronic file required with User (such as but not limited to Word and Excel). Listing must include furniture item code and name used in FF&E Package, part/model numbers, fabrics and finishes for all components furnished. Organize listing by item name and code and provide building totals.

3.5.8 Order Form Documentation

Provide Order Form Documentation with Purchase Order number and project name and location to allow the User to follow up on warranty issues and help with future purchases.

3.5.9 Key Control System

Key Control System. Provide system in excel format; indicate lock number, room number and location of lock within rooms if more than one lock number.

NOTE: This guide specification covers the requirements for detention furniture, and accessories for use in brigs and detention facilities.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The following information shall be shown on the project drawings:

1. Show details on drawings and coordinate with specification.

2. Locations of each piece of furniture and accessory.

PART 1  GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the
publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification.
and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

- Mirrors
- Pass Window
- Grab Bars
- Pistol Locker
- Safety Clothes Hooks
- Key Cabinet
- Bunks
- Dining Table
- Seats

Include details of frames, conditions of openings, details of construction, location and installation requirements of hardware and reinforcements, and details of joints and connections showing sizes and locations of welds. Indicate fabrication, erection, anchorage, and accessories.

1.3 DElIVERY, STORAGE, AND HANDLING

Deliver furniture and accessories in packaging to provide protection during transit and job storage. Leave in unopened original containers, clearly labeled for location of installation.

PART 2 PRODUCTS

2.1 MATERIAL

Steel plate, ASTM A36/A36M.

2.2 MIRRORS

a. Mirror shall be 0.8 mm 0.031 inches thick sheet steel, highly polished and bright chrome plated.

b. Frame shall be 16 gage cold-finished steel with 8 mm 5/16 inch inner
and outer flanges.

c. Mirror size shall be approximately 200 by 250 mm 8 by 10 inches with overall size of approximately 250 by 290 mm 10 by 11 1/2 inches.

d. Provide one framed mirror over lavatory in each prisoner housing area.

2.3 PASS WINDOW

Window shall consist of a pass drawer below a speaker panel with a security glazing panel above. The glazing panel shall be the same type as the adjacent glazing. The pass drawer shall be 100 mm 4 inches deep, 400 mm 16 inches wide, and 300 mm 12 inches long and roll horizontally with an interlocking hinged cover on both sides. The speaker panel shall be constructed of perforated metal (T-304 stainless steel), 16 gage, 5 mm 3/16 inch perforated holes, rectangular in shape the full width of the panel, with 14 gage baffles to prevent direct line of sight from one side to the other. This unit shall be integrated into the hollow metal of the adjacent unit.

2.4 GRAB BARS

Provide as specified in Section 10 28 13 TOILET ACCESSORIES, and in lengths and configurations indicated.

2.5 PISTOL LOCKER UNITS

Outer shell and compartment doors shall be 5 mm 3/16 inch steel with continuous hinges. Hinged tilt-out compartments shall be approximately 350 mm wide by 90 mm deep by 150 mm 14 inches wide by 3 1/2 inches deep by 6 inches high lined with moth-proofed felt and locked with an individually keyed snaplock. Entire unit shall be coated with one shop coat of primer. Unit shall be designed for recessed installation in masonry. Units shall have nine compartments. Locate units as indicated.

2.6 SAFETY CLOTHES HOOKS

Provide 6 mm 1/4 inch steel hook and a 10 gage steel bracket safety clothes hook designed to collapse under a heavy load. Provide an adjustable friction device that permits variation of factory setting with use of a simple spanner tool. Finish shall be cadmium plate. Provide 6 mm, 5 by 25 mm 1/4 inch, 20 by 1 inch flat head spanner machine screws to fit widely spaced holes designed to resist abuse.

2.7 BUNKS

Cell bunks shall consist of a bed frame measuring 1980 mm long by 750 mm 78 inches long by 30 inches wide with front and back composed of an angle measuring 50 by 50 by 6 mm 2 by 2 inches by 1/4 inch and ends of frame formed by wall brackets made of 20 gage steel sheet flanged 50 mm 2 inches at wall and lower edge. Back angle shall be kept 50 mm 2 inches from wall. Bottom of bunk shall be made of not lighter than 16 gage steel sheet with round or square holes with rounded corners, spaced as standard with the manufacturer. Join the entire assembly by electrical welding; welds shall be of deep penetration, continuous, and ground smooth. Prime bunks with one shop coat of primer. Bunks shall be wall and floor mounted.
2.8 SEATS

Seats shall be designed for wall mounting to masonry walls with 6 mm 1/4 inch diameter by 500 mm 20 inch long spanner head screws in lead anchor. Seat size shall be approximately 300 mm 12 inches wide by 450 mm 18 inches deep; made of 5 mm 3/16 inch steel with 40 mm 1 1/2 inch flange for wall mounting. Seat shall have one shop coat of primer paint. Provide in locations and quantity indicated.

2.9 KEY CABINET

**************************************************************************
NOTE: Verify location of duplicate cabinet with the Chief of Naval Personnel, PERS-84.
**************************************************************************

Provide for detention lock keys with a capacity of 1.75 times the number of door locks and a complete dual-tag system. Cabinet shall have concealed-type hinges and rounded sides and panels with individual hook and label pockets formed as an integral part of the panel. Provide tags of two types, one set for permanent holding of at least four keys. Provide indexing to record information concerning locks and keys, alphabetically; hook, numerically; and master key. Furnish permanent loan registry to protect identity of key borrowers. Furnish receipt tabs to protect identity of key borrowers and supply receipt tabs for temporary loan. Provide one cabinet in the main control center, and one duplicate cabinet in the Station Security Office and one duplicate cabinet in the Commanding Officer Office.

2.10 DINING TABLE

Provide table designed for institutional use that permits seating in groups of four. Table top shall be formed of not lighter than 10 gage stainless steel, reinforced with steel plate. Corners shall be cut at a 45 degree angle. Top, seat, and leg supports shall be heavy wall square steel tubing. Seats shall be 300 mm 12 inch diameter made of high strength not lighter than 16 gage stainless steel. Table with seats shall be one piece, welded assembly, with welds neatly finished. Assembly framing shall be painted, except for stainless steel, with one shop coat of primer. Table top shall be not less than 900 mm 36 inches in the least dimension. Provide in locations and quantity indicated.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Mirrors

Mount 1600 mm 64 inches up to center line, and anchor with 6 mm 1/4 inch flat head spanner screw in lead masonry anchors.

3.1.2 Grab Bars

Install with 6 mm, 50 mm 1/4 inch, 2 inch long flat head screws in masonry anchors. Provide a minimum of three fasteners per flange.

3.2 ADJUSTMENT

Adjust items and components of items specified in this section to ensure
proper operation.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for systems furniture which include panels, workstations and components.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Various provisions of this guide specification may be irrelevant to or in conflict with the requirements of any given project. This specification should be carefully edited to fit the needs of each specific application. Portions must be deleted, if not applicable, and additional material inserted where necessary to adequately delineate requirements. Brackets and blanks identify provisions which involve alternates; the editor must select and/or insert the appropriate requirements.
1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

SECTION 12 59 00 Page 8
1.3 CERTIFICATIONS

1.3.1 Certified Sustainably Harvested Wood

Provide wood door panels certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SFI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Provide current product certification documentation from certification body. Submit copies of invoices bearing certification numbers.

1.3.2 Indoor Air Quality Certifications

1.3.2.1 Office Furniture Systems and Seating

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold, ANSI/BIFMA M7.1 Certification or provide certification by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.4 QUALITY ASSURANCE

1.4.1 General Safety

Provide workstation products free of rough or sharp edges. [Provide panel supported components with a positive, integral locking device which secures components without the use of additional screws or clamps to prevent the components from being accidentally pulled or knocked off the panels.] [Provide desk-based workstation components with an option for a positive, integral locking device that secures components to the base units.]
1.4.2 Fire Safety

Components must meet requirements for flame spread and smoke development as specified by NFPA 101 except as follows. Conduct testing in accordance with either ASTM E84 or UL 723 on the entire assembled panel of the worst case (most combustible) combination of fabric and interior construction. In addition, fabric must meet the requirements of NFPA 265. Do not exceed [[25 for Class A] [75 for Class B] [200 for Class C]] for panel flame spread and 450 for Class A, B and C panel smoke development.

1.4.3 Electrical System

Task lights are required to be UL listed and installation of task lighting must meet the requirements of NFPA 70. The electrical system must meet the requirements of UL 1286. Submit three sets of electrical system manuals describing the functions, configuration, and maintenance of the electrical system (power [, communications] [, data]). This material may be included in the Assembly or Maintenance manuals at the Contractor's option.

1.4.4 Detail Drawings

Submit detail drawings showing communications, electronic data processing (EDP) and local area network (LAN); locations may be provided as a separate submittal from remaining workstation drawings. Provide drawing requirements, which are the furniture manufacturer's responsibility, as a single submittal. Provide electronic drawings to the user for future re-configuration in the software package requested by the user. Include in the electronic drawings all modifications made during installation. As a minimum, submit the following:

a. Overall reference drawings: Drawings showing workstation locations and overall plan view within each floor in a scale of [1:400 (1/16 inch = 1 foot) 1/16 inch = 1 foot] [1:200 (1/8 inch = 1 foot) 1/8 inch = 1 foot]. Layouts must reflect field verified conditions and clearly illustrate the overall space planning concept and intent.

b. Installation drawings: Drawings showing workstations, panels, components, and plan view within each floor. Identify workstations by workstation type; submit drawings showing the proposed workstation installation at a scale of 1:100 (1/4 inch = 1 foot) 1/4 inch = 1 foot, unless otherwise specified. Installation drawings must reflect field verified conditions.

c. Workstation elevations: Dimensioned workstation elevations showing each type of workstation with panel frame configurations and all components identified with manufacturer's catalog numbers. Draw elevations at 1:50 (1/2 inch = 1 foot) 1/2 inch = 1 foot scale.

d. Panel drawings: Panel drawings showing locations and critical dimensions from finished face of walls, columns, panels, including clearances and aisle widths. Key assemblies to a legend which includes width, height, configuration and composition of frame covers finishes and fabrics (if different selections exist within a project), power or nonpower, connectors and wall mount hardware. Coordinate panel placement with location of electrical, voice/date LAN,[ SIPRNet,][ NIPERNet,] mechanical and fire protection fixtures. Drawings must reflect field verified conditions.
NOTE: NOTE TO INTERIOR DESIGNER for "e. Electrical Drawings": Coordinate with electrical engineer the furniture wiring configuration, receptacle quantities, and receptacle locations for compliance with ASHRAE 90.1 automatic receptacle control requirements.

NOTE TO ELECTRICAL ENGINEER for "e. Electrical Drawings": Provide a separate set of electrical drawings for furniture coordination identifying switched/unswitched supply circuits, furniture wiring configuration(s), switched/unswitched furniture line voltage conductors, switched/unswitched receptacles (or specifically which furniture line voltage spade to which each receptacle is connected), and receptacle locations. Recommend naming drawing series "EF" for "Electrical Power - Furnishings". Coordinate furniture wiring configurations, receptacle quantities, and receptacle locations with the interior designer and this specification. Consult UFC 3-520-01 for systems furniture power guidance. Where shared neutrals are used, provide oversized neutrals to match the harness configuration and balance loads between circuits and phases. A single circuit must not serve more than four (4) cubicles under any circumstances.

e. Electrical drawings: Drawings showing power provisions including type and location of feeder components (service entry poles, base or ceiling feeds), activated power receptacles and other electrical components. Wiring configuration (circuiting, switching, internal and external connections) identified and a legend provided as applicable. Identify which receptacles in typical furniture configurations will be connected to controlled building power circuits as applicable to meet ASHRAE 90.1 - IP [ASHRAE 90.1 - SI] requirements. Coordinate with electrical drawings.

f. Wire management capacity drawings.

NOTE: NOTE TO INTERIOR DESIGNER for "g/h/i/j. Communications Drawings": Coordinate with communications designer the quantity, types, locations, and minimum separations of communications outlets.

NOTE TO COMMUNICATIONS DESIGNER for "g/h/i/j. Communications Drawings": Provide a separate set of communications drawings for furniture coordination identifying quantity, types, locations, and minimum separations of communications outlets. Recommend naming drawing series "TF" for "Telecommunications - Furnishings". Consult UFC 3-580-01 for furniture communications guidance.
g. Communication drawings showing telephone provisions: Drawings indicating the type and location of feeder components and communications jacks with wiring configuration identified where applicable.

h. Communication drawings showing electronic data processing provisions: Drawings indicating the type and location of feeder components, communications jacks, or accessories with wiring configuration identified where applicable.

i. Communication drawings showing local area network provisions: Drawings indicating the type and location of feeder components and data jacks with extra ports for future expansion with wiring configuration identified where applicable.

j. Communications drawings indicating the TIA-568.2 pin/pair assignment that will be used for communications outlet as coordinated with the COR.

k. Reflected ceiling plan for projects specified with power poles.

l. Drawings indicating cabling is protected at all transition points, and that metallic separation is provided between telecommunication and power wiring in the utility columns and systems furniture track in accordance with TIA-569 and NFPA 70.

1.5 DELIVERY, STORAGE, AND HANDLING

**************************************************************************
NOTE: Materials with high short-term emissions include, but are not limited to: adhesives, sealants and glazing compounds (specifically those with petrochemical vehicles or carriers); paint, wood preservatives, and finishes; control and/or expansion joint fillers; hard finishes requiring adhesive installation; gypsum board (with associated finish processes and products); and composite or engineered wood products with formaldehyde binders. Absorbent systems furniture includes, among others, fabric-covered components.
**************************************************************************

Deliver components to the jobsite in the manufacturer’s original packaging with the brand, item identification, and project reference clearly marked. Remove furniture from packaging and store in an unoccupied, dry location that is ventilated. Storage shall be free from dirt and dust, water, and other contaminants, and in a manner that permits easy access for inspection and handling.

1.6 WARRANTY

Warrant the systems furniture for a minimum period of [12 years][lifetime] with the following exceptions: fabrics and other covering materials, and paper handling products for 3 years, LED drivers/power supplies for 5 years, and electromagnetic ballasts for [2][3] years. Warranties must be signed by the authorized representative of the manufacturer. Present warranties, accompanied by document authenticating the signer as an authorized representative of the guarantor, to the Contracting Officer upon the completion of the project. Guarantee that the workstation products and installation are free from any defects in material and workmanship from the
date of delivery. Submit two copies of the warranty.

1.7 MAINTENANCE AGREEMENTS

******************************************************************************
NOTE: Maintenance agreements are standard practice in the building industry. Under a green lease, when the customer no longer requires the use of the particular product or requires an updated model, the manufacturer is obligated to reclaim it and refurbish it or disassemble it for recycling as appropriate. Coordinate with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.
******************************************************************************

Collect information from the manufacturer about [maintenance agreement] [green lease] [take back program] options, and submit to Contracting Officer. Submit documentation that includes contact information, summary of procedures, and the limitations and conditions applicable to the project. Indicate manufacturer's commitment to reclaim materials for recycling and/or reuse and avoid landfilling and burning reclaimed materials. When such a service is not available through a manufacturer, local recyclers should be sought after to reclaim the materials.

PART 2 PRODUCTS

2.1 MATERIALS

******************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.
******************************************************************************

Provide System Furniture Components with a minimum of 55 percent recycled content. Provide data identifying percentage of recycled content for system furniture components.

Provide certification of indoor air quality for Office Furniture Systems and Seating.

******************************************************************************
NOTE: Adjustments to workstations and workstation componentry such as height adjustable work surfaces and storage design must be made when ADA-ABA conformance within the workstation is required. Consider the use of existing reconditioned systems furniture when appropriate. The aesthetics and function of all componentry within this specification

SECTION 12 59 00 Page 13
must be compatible.

**************************************************************************

2.2 SYSTEM DESCRIPTION

2.2.1 Workstations

This specification establishes the minimum requirements for the acquisition and installation of a complete and usable system of workstations composed of panels, freestanding work surfaces or base units, supporting components, electrical hardware, communications, special electrical features, and accessories. Provide workstation requirements and configurations in accordance with the furniture layout and typical workstation types shown in drawings and specified herein. Provide components and hardware from a single manufacturer that are standard products as shown in the most recent published price lists or amendments. Proposed product must be part of the manufacturer's current line with no intent to discontinue within two years. Submit complete listing of part/model numbers for all components to be provided, including names and codes of components referenced on updated drawings. Provide electrical components from a single manufacturer to the extent practicable (different types of components may be of different manufacturers, but all units of a given component must be from a single source). Conformance with NFPA 70, UL 1286, NFPA 101, and 36 CFR 1191 is required. Coordinate the work of this section with that to be performed under other sections. This specification may include items which are not manufactured by the furniture manufacturer; provide any such items under this section. Submit two complete sets of certificates attesting that the proposed workstation meets specified requirements. Date the certificate after the award of the contract, include the name of the project, and list specific requirements being certified.

2.2.2 Samples

Submit samples as required to obtain final approval. The Government reserves the right to reject any finish samples that do not satisfy the technical or color requirements. Work can not proceed without sample approval in writing from the Contracting Officer. Submit four sets of the finish samples listed below:

a. Panel, tackboard and overhead door fabric. Minimum 150 by 150 mm 6 by 6 inches with label designating the manufacturer, pattern, color, fiber content, fabric width, fabric weight, fire rating, and use (panel and/or tackboard).

b. Workstation component finishes. Minimum 60 by 75 mm 2-1/2 by 3 inches with label designating the manufacturer, material composition, thickness, color, and finish.

c. Personal Task lights (Not overhead task lights).

d. Panel glazing. Glazing samples with label designating the material and safety ratings.

**************************************************************************

NOTE: Limit mock-up requirement to sizeable projects involving at least 10 workstations or as required for individual projects.

**************************************************************************
2.2.3  Mock-up

Submit a Mock-up of an actual workstation reflecting approved finishes and fabrics. Locate the mock-up installation at [the local dealership][approved off-site location][____]. Do not order product for the project until the mock-up has been approved. Submit manufacturer's product and construction specifications which provide technical data for furniture system and components specified, including task lighting and illumination performance information. Include adequate information in the literature to verify that the proposed product meets the specification. Review of the mock-up may result in adjustments to the product, layout and finishes. The approved mock-up can be used in installation.

2.2.4  Alternate Design

**************************************************************************
NOTE: Minor differences exist among different manufacturer's product. This paragraph pertaining to an "alternate design" was written to not exclude a manufacturer when an equally acceptable solution is proposed.
**************************************************************************

Manufacturers who are unable to provide workstations that conform exactly to the furniture layouts and typical workstation types shown in the contract drawings, may submit alternate designs for consideration by the Contracting Officer. Alternate designs must meet or exceed the following criteria. Alternate designs that are submitted but do not meet these criteria will be rejected. In the alternate design provide workstations and components of the same basic size and configuration shown, with only the sizes of the individual components within the workstation changed to meet the standard product of the manufacturer or site conditions.

2.2.4.1  Component Requirements

Provide the types of components or elements as shown on the drawings and as specified in PART 2 PRODUCTS of this specification. Do not reduce the storage capacity, number of workstations accommodated, width of aisles, or workstation configuration.

2.2.4.2  Wiring Configuration

Alternate configurations shall support the circuiting and connection capabilities identified under the provisions pertaining to power distribution of paragraph POWER AND COMMUNICATIONS. Generally any alternate will be acceptable which involves only a variation in size or quantity that exceeds the specified configuration.

2.2.5  Performance Requirements

Panels, frames and frame covers, connection system, work surfaces, pedestals, shelf units, overhead door cabinets, lateral files, locks, accessories, and miscellaneous hardware must meet testing as specified. ISO 9001 certified manufacturers may perform in-house testing. Manufacturers not ISO 9001 qualified will be required to produce testing by an independent testing laboratory. Component specific requirements are listed in appropriate paragraphs.
2.2.5.1 Selected Components

Workstation conformance to ANSI/BIFMA X5.5 and ANSI/BIFMA X5.6 is required with the following exceptions: Panels, or panel supported components conformance to ANSI/BIFMA X5.6 is required. Representative items will be selected for testing based on worst case situations (i.e., the deepest and widest work surface or shelf). Perform the keyboard drawer or shelf test applying a 19 kg 50 lb load to the center of the keyboard shelf for a period of 5 minutes. Any loosening of attachments or damage to the operation of the drawer or shelf will be cause for rejection.

2.2.5.2 Panel Acoustics

**************************************************************************
NOTE: Consider using non-acoustical panels when storage units cover more than half of the panel surface as the acoustical advantage is lost and the non-acoustical unit is less expensive.

Acoustical performance ratings should be based upon the workstation design. While NRC and STC ratings contribute to overall acoustical performance, the acoustical role of panels is relatively minimal in the overall environment when compared to sound absorptive properties of other finish surfaces. Most major manufacturers do not comply with the higher 0.80 NRC and 24 STC without providing their more costly high performance panels. The designer must determine if the additional acoustical performance is worth the added cost to the Government.

Delete paragraph if acoustical panels are not required.
**************************************************************************

Provide acoustical panels with a minimum noise reduction coefficient (NRC) of [0.65] [0.80] [_____] when tested in accordance with ASTM C423 and a minimum sound transfer coefficient (STC) of [14] [20] [24] [26] [_____] when tested in accordance with ASTM E290. Conduct the test on the entire assembled panel, full face area (the complete core, adhesive, decorative fabric, frame and joining components).

2.2.5.3 Panel Glazing

**************************************************************************
NOTE: Curved glazed panels should not be specified since most products utilize an acrylic glazing. Acrylic glazing is not acceptable since it does not meet flame spread and smoke development requirements.
**************************************************************************

Tempered glass must conform to ANSI Z97.1 and ASTM C1048, Kind FT, Condition A, Type I, [Class 1 Transparent] [Class 3 - Light reducing, tinted or translucent].

2.2.6 Pattern and Color

**************************************************************************
NOTE: Include a reference in Section 09 06 00 SCHEDULES FOR FINISHES or drawings for all items requiring a finish color. This includes, but is not limited to, the following items: Work Surfaces, Storage Units, Tackboards, Erasable Marker Boards, Signage, Slat Tile, Panels, Panel Frames, Screens, Connectors, Trim and Accessories. Specify finish of both sides of panels.

Provide pattern and color of finishes and fabrics for panel systems, components, and trim [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [as shown on the drawings] [____].

2.3 SYSTEMS FURNITURE

________________________________________________________________________

NOTE: A term sometimes used for the main run of panels distributing the power and data throughout the system is spine wall. For the purpose of this specification, panel systems comprehensively include un-powered, powered, and spine wall panels.

________________________________________________________________________

2.3.1 Panel System Components

Supply accessories and appurtenances for a completely finished panel assembly with the system. Provide a system capable of structurally supporting cantilevered work surfaces, shelves, files, overhead cabinets, and other components in the configurations shown on the drawings plus more than one fully loaded component per panel per side. Provide panels that are [tackable] [or] [capable of accommodating fabric covered tackboards,] [acoustical,] [stackable with a system capable of lowering or raising the overall panel assembly height at horizontal connections by removing or adding panel-frames on-site without disturbing adjacent panel components,] [segmented as designated on the drawings]. [Segments will be field removable from both sides of the panel]. [Provide capability for worksurfaces to attach to the panels in 25 - 50mm 1 - 2 inch increments.] [Provide a spine wall system where electrical and data management will be easily accessible by removable wall covers that can be removed while workstation components are still attached. [Cables must be laid in the system, not threaded through the frame.]] Provide a panel system that is available in a variety of nominal widths and heights as designated on the drawings. Measure heights from the finished floor to the top of the panel. Supply powered and nonpowered panels that are compatible in height. Coordinate panel heights with the HVAC and electrical designs. [Minimum panel thickness is 76 mm 3 inches thick.] [System to have 100 percent off-modular capability with no defacement of any element caused by components when used in an off-modular application. Unique panel frames must not be required for off modular connections.] Submit three sets of Assembly Manuals describing assembly and reconfiguration procedures.

________________________________________________________________________

NOTE: Specify a finish and fabric for applicable items. Include fabric content, for example: 50 percent Nylon, 50 percent Wool. The designer must verify that fabric content, pattern, and color specified are not proprietary and that several manufacturers can provide a similar product.
2.3.2 Panel Finishes
Provide panels in the following options: [safety glazed,] [open frame,]
[tackable fabric,] [acoustical fabric,] [wood veneer,] [marker surface,]
[paint,] [slat tile,] [perforated metal,] [____]. [Frame covers may have
different options on either side of the frame.] Exposed panel trim to have
a [factory baked enamel or epoxy powder] [wood] finish. [Filler trim will
either match the panel trim or be fabric covered to match the panel
fabric.] [Do not provide filler trim.] Provide each fabric-faced panel
with a seamless width of fabric stretched over the entire face of the
panel. The fabric color throughout the installation must be consistent.
Curved panels may use adhesives on curved sections. Attach the fabric
securely and continuously along the entire perimeter of the panel and allow
for easy removal and replacement in the field (with the exception of curved
panels). Fabric must be factory installed with [     ] panel fabric
content.2.3.3 Raceways

Provide raceways and covers as an integral part of the panel whether
powered or nonpowered. Magnet held base covers will not be accepted.

2.3.4 Leveling Glides

Provide precise alignment of adjacent panels and include leveling glides to
compensate for uneven floors. Provide quantity and location of leveling
glides as recommended by the manufacturer. A minimum 19 mm 3/4 inch
adjustment range is required.

2.3.5 Connection System

Provide connectors which accommodate a variety of configurations as
indicated on the drawings to include: a straight line connection of 2
panels (180 degrees), corner connection of 2 panels (90 degrees), T
connection of 3 panels (90 degrees), cross connection of 4 panels (all 90
degrees),[ angle connection of 2 panels (120 degrees),][ and a connection
of 2 panels for setting the panels at any angle]. Provide tight
connections with continuous visual and acoustical seals. Plastic, painted
metal, fabric or wood finish connections are required to match system.
Provide connector system that allows removal of a single panel within a
typical workstation configuration, without requiring disassembly of the
workstation or removal of adjacent panels. Provide for connection of
similar or dissimilar heights to include trim pieces to finish the exposed
dge. Right angle (90 degree) connections between panels must not
interfere with the capability to hang work surfaces and other components on
any adjacent panel. Provide, as required, the continuation of electrical
and communications wiring within workstations and from workstation to
workstation. Filler posts must be level with the top rail.

2.3.6 Wall Mounted Panels

Use wall-mount components when it is necessary to attach panels or vertical
panel-frame assemblies to the building walls. Provide structural support for wall panels as required. Panels and other systems furniture components are not be wall mounted unless they are included in the original design.

2.3.7 Glazed Panel Inserts

Provide safety glass glazed panel inserts in accordance with ANSI Z97.1 and ASTM C1048. Acrylic glazing will not be accepted.

2.3.8 Door Panels

Provide door panels with a rigid metal frame with rails, a threshold, and a [wood] [laminate] [safety glazed] [_____] clad door adaptable to either hand swing. Allow for a 810 mm minimum 32 inch clear opening. Include connectors, hinges, and [brushed chrome] [epoxy powder] [baked enamel] finished ADA compliant door knob or handle.

2.3.9 Sliding Doors

Attach sliding or rolling doors to the panel as shown on the drawings. Provide doors that the direction in which the door slides can be changed in the field. Supply [translucent][_____] door in same width or wider than the opening to be covered. Provide door pulls for each side of door. Door frame to match the panel frame color.

2.4 DESK-BASED SYSTEM

Supply accessories and appurtenances for a completely finished desk-based assembly within the system. Provide a desk-based system that is free-standing, independent of panel system support and capable of structurally supporting work surfaces, shelves, and other components in the configurations shown on the drawings. Provide a variety of nominal widths and depths as indicated on drawings.

2.5 WORK SURFACES

2.5.1 Construction

Construct work surfaces to prevent warpage. [Fully support work surfaces from the panels or support jointly by the panels and supplemental legs, pedestals, or furniture end panels. Use supplemental end supports only under work surfaces when the work station configuration does not permit full support by the panels. Use metal support brackets to support work surfaces from the panels, provide metal-to-metal fitting to the vertical uprights of the panels, vertically adjustable, to lock the work surfaces in place without panel modifications.] [Support work surfaces with legs, pedestals, or furniture end panels.] Abutting work surfaces must line up closely and be at equal heights when used in side-by-side configurations in order to provide a continuous and level work surface. Provide pre-drilled holes to accommodate storage components, pedestals and additional supports in work surfaces, or drill holes at the job site to accommodate these items. Provide work surfaces in sizes and configurations shown on the drawings. Provide work surfaces in nominal depths of [510 mm 20 inches,][ and ][610 mm 24 inches,][ and ][760 mm 30 inches,] plus or minus 50 mm 2 inches, nominal lengths from 610 to 1830 mm 24 to 72 inches, and a nominal thickness from 25 to 45 mm 1 to 1-3/4 inches. [Provide height adjustable work surfaces from 630 to 1040 mm 25 to 52 inches above the finished floor with a [crank-based][mechanical][electrical] control.] Provide [corner,] [peninsula,] [ and ][counter/transaction] work surfaces as shown on the
2.5.2 Finishes

Provide work surfaces with a finished top surface of [high pressure plastic laminate], [veneer] and a smoothly finished underside. The work surface must not be damaged by ordinary household solvents, acids, alcohols, or salt solutions. Provide metal support brackets that match the color and finish of trim. Provide [PVC] [ABS] [laminate] [solid wood] [wood veneer] [synthetic wood] edges

2.6 PEDESTALS

Provide drawer configurations and pedestal height as shown on the drawings. Provide the deepest possible pedestal for each work surface size specified. [Free standing mobile pedestals to include an attached upholstered seat cushion,] [a handle for moving,] [and] casters. Mobile pedestals must be load bearing and equipped with counterbalance as standard. Provide appropriate height of mobile pedestal so it can be stored under a standard height worksurface.

2.6.1 Construction

Provide pedestals and drawers of steel construction [with the exception of drawer fronts]. Securely attach drawer faces to the drawer front.

2.6.2 Finishes

Provide a factory baked enamel finish or powder coated for steel surfaces. Provide [steel][plastic laminate][molded plastic][veneer] drawer fronts.

2.6.3 Drawer Requirements

Pedestals must be field interchangeable from left to right, and right to left, and must retain the pedestal locking system capability. Design pedestals to protect wires from being damaged by drawer operation. Provide pedestals that are [work surface hung,] [support work surfaces,] [free standing] [mobile]. Drawers must stay securely closed when in the closed position and provide each drawer with a safety catch to prevent accidental removal when fully open. File drawers to be provided with full extension ball bearing drawer slides or rack and pinion suspension. File drawers to be provided with hanging folder frames or rails and capable of hanging side-to-side or front-to-back. [Provide dividers with vertical files.] [Provide box drawers with pencil trays.] [Provide center pencil drawer and mount under the work surface.]

2.7 STORAGE

Provide storage units in the sizes and configurations shown on the drawings. [Provide task lights under overhead cabinets] [and] [shelf units]. Depth to accommodate [a standard three ring binder][_____] [Panel attached storage is required to have 100 percent off-modular compatibility with no defacement of any element caused by components when used in an off-modular application.]
2.7.1 Shelf Unit Construction

Provide metal construction shelf pan with formed edges. Provide shelf supporting end panels of metal, high density particle board, molded phenolic resin, or molded melamine. Provide relocatable shelf dividers with shelf units.

2.7.2 Overhead Cabinet Construction

Provide metal construction overhead cabinets. Provide doors with a suspension system. [Provide overhead cabinet door that retracts over the top of the cabinet[and is curved].][Provide overhead cabinet door that retracts into the cabinet.][Provide upmounted overheads.][Provide sliding doors on overheads.][Overhead cabinet must be ADA accessible.]

2.7.3 Lateral File[, Vertical File][ and Book Case] Construction

Provide units and file fronts, top and end panels of steel construction. File drawers to be provided with full extension ball bearing drawer slides or rack and pinion suspension. File drawers to be provided with hanging folder frames or rails and capable of hanging side-to-side or front-to-back. [Provide dividers with vertical files.]

2.7.4 Personal Storage Tower Construction

Provide personal storage tower and components of steel construction. Height of the unit to be [the same height as the surrounding panels][_____] The personal storage tower will include one full height wardrobe unit with coat rod, two file drawers, bookcase with two adjustable shelves, [_____] and hinged lockable doors.

2.7.5 Finish

Provide a factory baked enamel or epoxy powder coat finish for shelves, dividers and top dust cover. Provide either a factory baked enamel, epoxy powder coat or laminate finish for shelf supporting end panels. Shelf bottom is required to match end panel color. Provide metal doors with an exterior finish of factory baked enamel and an interior finish of factory baked enamel or epoxy powder coat. Provide a factory baked enamel finish or epoxy powder coat on metal drawers. [Provide a wood veneer surface on [overhead cabinets] [pedestals] [book cases] [towers],[ and] [lateral files].]

2.8 ACCESSORIES

2.8.1 Coat Hook

Provide one mounted coat hook per workstation.

2.8.2 Keyboard Tray

Provide work surfaces that are capable of accepting an articulating keyboard in locations as shown on the drawings. The keyboard tray must be capable of fully recessing under the work surface and extending to give the user full access to the keyboard. Provide height adjustability, 180-degree swing side travel rotation and negative tilting capability. Include a wrist support and a mouse pad at the same level as the keyboard tray to accommodate either right or left-handed users.
2.8.3 Tackboards

Fabric must be factory installed. Provide [ ] fabric content of tackboards. Location and size [as shown on the drawings][____].

2.8.4 Erasable Marker Boards

Provide marker boards with a white writing surface that can be easily written on and erased and unaffected by common marker board cleaning/conditioning agents. Include a storage tray and minimum two markers with the markerboard. Size and location [as shown on the drawings][____].

2.8.5 Paper Management Unit

Provide paper management units as indicated [on the drawings] [____]. Construct these units of coated steel or injection molded plastic to accommodate either legal or letter size lengths.

2.8.6 Wall Mounted Components

Provide wall tracks when components are shown attached directly to wall surfaces. Provide tracks of heavy duty extruded metal with finish and color matching the the panel trim. Provide vertically aligned tracks slotted on 25 mm 1 inch centers in heights required that match slot spacing for components.

2.8.7 CPU Holder

Provide a mounting to support the computer hard drive. Desk top and floor locations are not acceptable.

2.8.8 Signage

Provide [panel mounted][____] signage composed, at a minimum, of aluminum frame, back panel, clear plastic cover, and hanging device. Provide signage approximately[ 76 by 203 mm 3 by 8 inches][____] and capable of receiving a replaceable [standard white][____] paper insert. Match [____]text type.[ Include name of occupant on signage for each workstation with names provided by customer prior to installation [____].][ Provide software for creating text in PC computers for owner production of replacement paper inserts after project completion.]

2.8.9 Slat Tile

Provide slat tile with channels to accommodate attachments such as monitor arm, task light and organizer accessories. Provide maximum slat tile height of [____] and a length [as shown on the drawings][____]. Slat tile must be integral to the panel and not attached to the surface of the panel. [Provide slat tile that is able to support the weight of two monitor arms and two flat panels simultaneously.]

2.8.10 Monitor Arm

Provide monitor arm that allows 360 degree monitor rotation for portrait and landscape viewing, and 60 degree range of lateral and vertical monitor tilt for additional viewing adjustability. Provide monitor arm that supports monitors weighing[ 3 to 8 kg 7 to 19 lbs][____]. [Provide [dual
2.9 MISCELLANEOUS HARDWARE

Provide brackets, supports, hangers, clips, panel supported legs, connectors, adjustable feet, cover plates, stabilizers, and other miscellaneous hardware that contribute to a complete and operable furniture system.

2.10 LOCKS AND KEYING

**************************************************************************
NOTE: The quantity of different key operations required is dependent on the size of the project. The number specified should not exceed the total quantity of workstations. The maximum quantity utilized should not exceed 150.
**************************************************************************

Provide [overhead cabinets,] [vertical files,] [personal storage towers,] pedestals and lateral files with keyed locks, unless otherwise noted. Provide field changeable lock cylinders with a minimum of [100] [_____] different key options. Key each workstation individually, and key locks alike within a workstation. Provide lockable drawers within a pedestal either by a central lock that controls all pedestals under one work surface or an individual keyed lock in each pedestal. Key alike central file and storage units which are grouped together but are not a part of a workstation unless otherwise specified. Provide two keys for each lock or two keys per workstation when keyed alike, and provide three master keys per area as indicated. Number keys and lock cylinders for ease of replacement. Clearly label locks with a key number, except for those manufacturers who have removable format locks. [Provide door panels with keyed [door knob][_____] set.]

2.11 POWER AND COMMUNICATIONS

**************************************************************************
NOTE: It is recommended that the type of cabling assembly (wiring, harnesses, or buses) be left as a Contractor selection unless it is necessary to restrict for compatibility with existing equipment.
**************************************************************************

Furniture designer shall coordinate with the building power designer to select a systems furniture power distribution wiring system which aligns with the circuit quantities provided to the furniture and satisfies the ASHRAE 90.1 Automatic Receptacle Control requirements. The quantity of receptacles required to be integral for each furniture type should be determined to allow for consistent automatic control of supply circuits for typical furniture of a given type. See additional designer notes within Paragraph 1.3.4 "Detail Drawings" of this specification.

**************************************************************************
Provide both powered and nonpowered panels with base raceways capable of distributing power circuits, [communication cables] [and] [data lines]. Provide nonpowered bases that are capable of easy field conversion to
powered base without requiring the panel to be dismantled or removed from
the workstation. [Provide panels able to support lay-in cabling and having
a large capacity for power and data. Provide ample space for storing excess wires and fiber optic cables in the interior of the spine wall frame. Provide easy access to power and data systems in the spine wall
without having to move return panels or components. Provide the ability
for the spine wall system to supply power to a wall-attached panel system
and/or an adjacent desk system. A termination center or utility closet may
be utilized in the wall or at the end of a panel run.] Provide copper
[cable assemblies,] [wiring harnesses][ or ][electrified bus] for the
system and meet the requirements of UL 1286 and NFPA 70, Article 605.
Provide conductors with 20 amp [90] [75] degree C, #12 AWG wires (unless indicated otherwise) or the equivalent in the bus configuration. A single circuit must not serve more than four (4) cubicles or workstations under
any circumstances. The label or listing of Underwriter's Laboratories,
Inc. will be accepted as evidence that the material or equipment conforms
to the applicable standards of that agency. In lieu of this label or
listing, submit a statement from a nationally recognized, adequately
equipped testing agency indicating that the items have been tested in
accordance with required procedures of UL and that the materials and
equipment comply with contract requirements. Electrical work not addressed
in this section must conform to the requirements of Section 26 20 00
INTERIOR DISTRIBUTION SYSTEM.

2.11.1 Panel Raceways

******************************************************************************
Coordinate raceway locations with workstation
components such as overhead storage units.
******************************************************************************

Provide panels that have hinged or removable covers that permit easy access
to the raceway when required but are securely mounted and cannot be
accidentally dislodged under normal conditions. Place raceways in
locations such as the base, beltline, and below and above the beltline.
The raceway must not extend past either [panel face] [frame cover] by more
than 13 mm 1/2 inch. Provide metal or plastic covers which attach securely
to the raceway as required and match the finish and color of the panel
trim. Provide a minimum of 2 knockouts (doors) per side for power
receptacles and communications jacks as indicated in raceways [in full size
over 610 mm 24 inches powered panels] [on panel frames]. Provide other
raceways that are flush with [panel face][frame covers].

2.11.2 Power Distribution

******************************************************************************
NOTE: The 8-wire system is currently the most
common system utilized for applications serving
mixed loads including electronic data processing
equipment. This is available in several
configurations from which to choose. Since EDP
equipment generates high levels of harmonics (* see
footnote below), a full size neutral should be
provided for each EDP circuit. Alternately, it is
recommended that the phase conductor not be loaded
to more than 12A or that an oversized neutral be
specified. To minimize interference from electronic
noise to sensitive data processing components, the
EDP equipment should be placed on the dedicated
circuits.

In the absence of other criteria, use of an isolated ground conductor is not recommended for the EDP circuits (See IEEE Std. 1100). If the amount of EDP load is extensive and the conventional load is minimal, a modified 8-wire system should be provided.

Non-linear loads such as computers, copiers, laser printers, electronic lighting ballasts, and uninterruptible power supplies cause harmonic distortion on power distribution systems. The majority of workstation loads are non-linear, harmonic producing loads. Designers must ensure that the building power distribution equipment can support these non-linear loads. IEEE 519 and 1100 provide details concerning the causes, effects, and means of compensation for non-linear, harmonic producing loads on power systems. Harmonic compensation may include, but is not limited to: specifying harmonic-mitigating transformers, derating transformers, oversizing neutrals to 200 percent of the ampacity of the phase conductors or phase bus, using phase conductors and terminals with higher ampacities and/or higher temperature ratings, supplying non-linear loads from dedicated isolation transformers, and installing shunt filters. See UGGS-16415A for further guidance. Refer to UFC 3-501-01 for discussion on non-linear loads.

Surge suppression and power conditioning receptacle modules are available. However power conditioning for specific loads (particularly portable equipment) is normally a User responsibility and is not provided as part of the construction contract. The Air Force has identified specific responsibilities of the user and suppliers of end-use equipment. (See Air Force ETL 89-6 for specific criteria or verify specific requirements for electrical support.)

Provide power distribution as indicated on the drawings. Provide an internal [power][ and ]communications] raceway and the capability of disconnecting and connecting external circuits to the electrified raceway in the panel. Capacity for at least [six][twelve][twenty] 4-pair category 6 cables is required for the communications receiving raceway. Power and communications wiring may share a common wireway if a metal divider is included to ensure electrical isolation. Provide doors or access openings for entry of communications cable. Provide the electrified power raceway for the [10-wire][8-wire][6-wire][ or ][5-wire] configuration indicated. Unless otherwise indicated, allocate conductors of the 8-wire system as follows: the three-phase system will have one equipment ground, one isolated ground, [one neutral] [one oversized (133 percent minimum) neutral], and two each dedicated phase. Unless otherwise indicated, allocate conductors of the 8-wire system as follows (4-2-2 shared neutrals, 2+2): the three-phase system will have one equipment ground, one isolated ground, two oversized (133 percent minimum) neutral, and four phase conductors; each neutral will be used by two phase conductors, no neutral
2.11.2.1 Receptacles

*************

NOTE: 15 AMP receptacles are the current industry standard. If 20 amp receptacles are required, the channel depth for the receptacle may have to be increased. Coordinate with the panel wall thickness.

*************

Provide power receptacles in the powered panels. Place devices at the locations indicated on the plans connected to the designated circuits. [Electrical power receptacles and communications jacks should have the ability to be hung at [200 mm 8 inch] [multiple] [_____] vertical increments throughout the frame via power harnesses.] Unless otherwise indicated, receptacles must be [15 amp (NEMA 5-15R)] [20 amp (NEMA 5-20R)] commercial grade conforming to NEMA WD 1 and NEMA WD 6. Provide 10 percent spare devices of each type shown on these plans if receptacles are not interchangeable or will not permit field adjustment of phase and circuit
selection. [All][General use] receptacles are required to be of the duplex configuration; unless otherwise indicated, special use receptacles are required to be of the simplex configuration with the blade/pin arrangement identified on the plans. Coordinate the color of receptacle bodies with the color of the panel trim. Isolated ground receptacles must [be orange] [or] [have distinct markings] [be of a different color than other receptacles]. Furniture receptacles whose building power supply circuit is controlled by an energy management system, timer, or some other automatic means or are provided with local automatic control, will be identified using the standard symbol shown in NFPA 70 Figure 406.3(E); each outlet on a multi-outlet receptacle shall be identified individually. Provide field applied identification that is permanent; stick-on or non-setting adhesives are not acceptable. Provide [5][_____] percent spare devices for each configuration and type of receptacle. Provide a minimum of [5][_____] receptacle removal tools for systems that require special tools for proper receptacle removal.

2.11.2.2 Power Cabling Variations

The paragraph Power Distribution has identified specific cabling configurations. Since universal conventions have not been established, variant configurations available from various manufacturers will be considered. Alternates shall allow the same circuiting, device connections, neutral and ground separation, and upstream feeder connections as shown on the plans. See paragraph ALTERNATE DESIGN. An example of an acceptable variation includes the use of a manufacturer's configuration which allocates individual conductors differently, but which has the same quantity of conductors and allows devices to be physically connected in the field as shown on the plans. It is not necessary that the manufacturer's labeling codes or terminology match the designations used on project plans or in the specifications; however, neutrals and grounds shall have insulation color coded per standard practice or be provided with tags, colored tape, colored ribbons or similar identification. (The reference to "dedicated" conductors in this specification pertains to circuit connections upstream and load connections downstream of panels; it is not necessary that manufacturer's designations correspond.)

2.11.3 Electrical Connections

**************************************************************************
NOTE: The direct wired configurations should be suitable for most applications. All wiring should be contained within raceways or wireways. The exposed cord/plug arrangement should not be used, unless specifically requested by the user. If used, ensure that the design conforms to the limitations of Article 605-8 of NFPA 70.

Code-enforcing personnel in some areas require separate hard wired junction box interfaces from building services to furniture system installations. If the facility will be under their jurisdiction, the design must conform and the junction box configuration must be provided in lieu of the direct wired. If the facility will not be under local jurisdiction, the direct wired configuration could be provided per User request; however, it is preferred that the Government design be consistent with local practice. If top entry
service poles are used for power interfacing, the
junction box configuration is preferred for all
locations.

**************************************************************************

2.11.3.1 Internal Connections

**************************************************************************

NOTE: Some local codes require hardwired
counters with the panels. If local codes are to
be followed, this item will need to be verified.

**************************************************************************

Utilize [straight or flexible plug/receptacle connector assemblies]
[harded connections] for internal panel-to-panel power connections and
provide the powered configurations shown on the drawings.

2.11.3.2 Connections to Building Services

Supply external [power][communications] services to the panels via
[direct-wired [top][base] entry modules.][hard wired [top][base] entry
junction box assemblies.][ Extend wiring from building services to the
entry modules or panel bases in metal conduit or tubing or in flexible
liquidtight conduit 1830 mm 6 foot maximum.][ Extend
wiring from building services to junction box assemblies in metal conduit
or tubing. Provide wiring from junction boxes that is flexible
liquid-tight conduit 1830 mm 6 foot maximum or in metal conduit or
lunging.][ Provide base feed modules that plug into the end or either side of
the raceway at receptacle doors.][ Top entry [modules][junction box
assemblies] are required to extend the [power][communications]
wire into service entry poles attached to the electrified panels.]
External wiring must conform to Section 26 20 00 INTERIOR DISTRIBUTION
SYSTEM.

2.11.4 Wire Management

Provide wire management capability at all workstations and accommodate all
cable types specified, including the applicable manufacturer required
bending radius at corners. Design raceways and interfaces to the raceways
to accommodate the bend radius as shown in TIA-569 for Category
[6][6A][7][_____] [and ][fiber optic cables] communication wiring
[whichever is greater]. Copper and fiber cabling shall meet the
requirements of Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLEING
SYSTEM. The capability may be accomplished by cable access cutouts (1
minimum per work surface), covered wire management troughs in vertical end
panels, horizontal wiring troughs, internal midpanel (beltline) raceways,
or rear gaps (between the back edge of the work surface and the facing
support panel). Provide grommet kits or another suitable finish
arrangement for all cable cutouts. Provide accessories for an externally
mounted vertical and horizontal wire management and concealment system [as
indicated on the contract drawings] [as recommended by the manufacturer].
Supply horizontal wire managers for mounting under all work surfaces.
Attach the wire managers either to the underside of the work surface or to
the vertical panel without damaging the face. Exposed or loose wiring will
not be acceptable. Wire managers must be prefinished and secure, conceal,
and accommodate outlet cords as well as electrical and communications
wiring. Wire channels are required to match color of panel trim, attach by
means of clip-on attachment, and conceal wires routed vertically. Separate
power wiring from communication wiring by use of separate raceways or by placement of channels in joint use troughs or wireways.

2.11.5 Circuit Layout

Provide the circuit layout for workstations on the drawings. Connect devices to the designated circuits in the neutral, ground, and automatic control configurations indicated. Connections must be made to the building electrical distribution system as shown on the contract drawings and in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.11.6 Service Entry Poles

**************************************************************************
NOTE: Coordinate requirements with paragraph Power Distribution. Power and communications separation is required if the power is not in any metallic conduit when run in the pole or channel.
**************************************************************************

Provide service poles, as indicated on the contract drawings, and capable of minimally accommodating the [8-wire][10-wire][_____] power configuration and the equivalent of [six][twelve][twenty] 4-pair category 6 cables. Poles must have metal barriers or channels to separate power and communications wiring. Pole dimensions can be equal to maximum panel thickness. Designated poles are required to have the capability of being opened along the vertical access to permit the lay-in of wiring. Provide each pole with a wiring interface, an end cap and a ceiling trim plate which extends a minimum of 40 mm 1-1/2 inches from all sides of the pole. Include a junction box either as part of the pole assembly or in a field installed configuration with poles for power service. Service poles must be securely attached to the panels and installed plumb. Provide wiring and interface components as required to connect the building power supply to power poles.

2.11.7 Task Lighting

**************************************************************************
NOTE: Coordinate with electrical engineer to comply with LED and task lighting guidance in UFC 3-530-01 Interior and Exterior Lighting Systems and Controls. The decision to use linear fluorescent or LED task lighting shall be based on a life-cycle cost analysis.
**************************************************************************

Provide task lights with [linear fluorescent lamp][light emitting diode (LED) technology] to include a built-in reflector and shielding device that prevents direct glare into an occupant's eyes when they are in a typical working position. [Provide adjustable arm task lights with adjustable, fully articulated and balanced head and arms, minimum 254 mm 10 inch adjustable arm range, linear, circular, or compact fluorescent lamp technology, cord set for plug in, built in reflector, that is [panel mounted][desk mounted][freestanding][_____] .] Provide task light size and placement on the contract drawings. It is required that lights be a standard component of the manufacturer's workstation products, and the ends of the task light length can not extend beyond the edges of the overhead cabinet. Enclose task light power cords within vertical wire cover or clips. Luminaires shall be UL approved for use in the configurations.
indicated on the drawings. Provide task lighting that is Energy Star labeled. Provide data identifying Energy Star label for task lighting.

2.11.7.1 Luminaire Configuration

**************************************************************************

NOTE: The lamp and ballast/driver types should be indicated on the drawings. Ballast and driver technical requirements are covered in Section 26 51 00 INTERIOR LIGHTING. When used, the electrical design must consider the harmonics and electromagnetic energy generated by these ballasts/drivers. Specific areas which shall not have electronic ballasts/drivers are medical electronic equipment areas and areas equipped with infrared remote control or security devices. It is important to inform Users of the benefits and risks of electronic ballasts/drivers and to involve them in the decision regarding their use.

**************************************************************************

Provide luminaires and lamps as specified in Section 26 51 00 INTERIOR LIGHTING and modified herein. For undershelf or undercabinet lighting, provide luminaires that are [linear fluorescent lamp][light emitting diode (LED)] type and have prismatic lenses, baffles, or other shielding device configured to minimize glare by shielding the lamp from view of the seated user.[ For adjustable arm task lights, provide luminaires that are linear, circular, or compact fluorescent lamp or LED type and have prismatic lenses, baffles, or other shielding device configured to minimize glare by shielding the lamp from view of the seated user.] For fluorescent-type luminaires, provide built-in reflectors. Provide task lights for each workstation with a minimum of [810][650] lx[75][60] footcandles of light (horizontally measured) without veiling reflections, on the work surface directly below and a maximum of [500mm][20 inches] from the luminaire. Easily removable diffusers, grilles, or other coverings are required to allow for cleaning and relamping.[ Use F32T8 lamps in [1220 mm][4 foot] units for fluorescent-type task lighting.][ For LED-type task lighting, power consumption shall not exceed 8 watts per foot.] Correlated Color Temperature (CCT) of task lighting shall match the CCT of the ambient room lighting. Provide an easily accessible on-off switch and one ballast or driver per luminaire. A variable intensity control is acceptable if the low setting is equivalent to "off" with zero energy consumption. Multiple level switching is also acceptable.[ For fluorescent type technology, do not use ganged luminaires or shared ballasts.[ For LED type technology, ganged luminaires or shared drivers are permitted for up to 4 continuous feet in length. A single driver designed for use with an individual LED housing of greater than 4 feet in length is allowed.]

2.11.7.2 Wiring

**************************************************************************

NOTE: If the facility will be under the jurisdiction of a city code, verify requirements. Some locations require hard wired connections.

**************************************************************************

Provide each luminaire with a 1830 mm 6 foot minimum, factory installed, heavy duty electrical cordset with a grounded plug for luminaires that are mounted on the same wall as the receptacle. Provide luminaires mounted on
non-powered wall with a 2743 mm 9 foot minimum, factory installed heavy
duty electrical cordset with a grounded plug. Direct or hard wire
connections are not acceptable. Unless otherwise indicated, conceal cord.
Built-in cord concealment is required within panels or utilize field
installed, manufacturer approved accessories. Cords may be extended
through dedicated channels located at any point within panels or may be
placed in vertical slots or in the space between panels if held in place by
retainers and concealed by a cover plate. Vertical wire managers are
required to be prefinished and cut to size and shall extend from the task
light level down to the top of the work surface below the task light.
Attach each manager to a panel vertical edge or connector strip without
damage to the surfaces.

2.11.7.3 Control Device

**************************************************************************
NOTE: Coordinate with the appropriate version of
ASHRAE 90.1 to comply with the requirements for task
lighting control. For ASHRAE 90.1-2007, the
requirements are found in Paragraph 9.4.1.4.d. For
ASHRAE 90.1-2010, the requirements are found in
Paragraph 9.4.1.6.d. For ASHRAE 90.1-2013, the
requirements are found in Paragraph 9.4.1.3(c).
Coordinate with the electrical engineer.
**************************************************************************

[Provide task lighting with an automatic shutoff control device integral to
the luminaires.][Provide occupancy sensors with "manual ON", "automatic
OFF" controls for luminaire control.][For furniture with
automatically-controlled building supply power circuits, task lighting
shall be connected to an automatically-controlled circuit.][Provide task
lighting with a manual ON/OFF switch.]

2.11.8 Communications

Communications wiring will be extended to, and installed in, the
electrified panels as shown on the plans. Install communications jacks at
designated locations.[ Provide a communication consolidation point at the
dead end of the cubicle. The consolidation point will consist of a [24][48]
port patch panel that is rated for Category [6][6A][7]. The panel that
covers the consolidation panel is required to be lockable with all locks
keyed alike. These locks must not be keyed the same as any other item
associated with the workstations.] Communications work may be performed in
conjunction with the installation of workstations or may be separately
executed at the Contractor's option; however, equipment, materials, and
installation must conform to the requirements of [Section 26 20 00 INTERIOR
DISTRIBUTION SYSTEM] [Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING
SYSTEM][____], and properly coordinate all interfaces.

2.11.9 Special Systems

**************************************************************************
NOTE: Include this paragraph only in projects where
requirements for shielded facilities (TEMPEST,
Red/Black, EMP, etc.) and secure wiring have been
called out in project criteria. Specific
requirements for cable arrangement, separation of
Red/Black lines, etc., need to be verified for each
project. Provide metal raceway, channels, etc.
throughout. Separation distances required for exposed cable or wiring in nonmetallic raceways are much greater than for wiring installed in totally enclosed metal raceway. Site specific details and/or notes should be prepared for each project.

**************************************************************************

Provide management for secure and nonsecure power, computer and telecommunications cabling through designated raceway systems. Separate secure distribution from nonsecure distribution [in accordance with details shown on the plans][by running secure lines along top located raceway and nonsecure along the bottom of the workstation panel].

PART 3 EXECUTION

3.1 INSTALLATION

Install the workstations using certified installers in accordance with manufacturer's recommended installation instructions. A licensed electrician is required to hardwire the workstations. Install workstation components level, plumb, square, and with proper alignment with adjoining furniture. Securely interconnect and attach components to the building where required. Provide three sets of special tools and equipment necessary for the relocation of panels and other components. Verify that equipment is properly installed, connected, and adjusted.

3.2 CLEANING

Provide cleanup as specified in Section 01 78 00 CLOSEOUT SUBMITTALS. Upon completion of installation, clean and polish all products and leave the area in a clean and neat condition. Any defects in material and installation are required to be repaired, and damaged products that cannot be satisfactorily repaired are required to be replaced. Submit three sets of Maintenance Manuals describing proper cleaning and minor repair procedures.

NOTE: This guide specification covers the requirements for upholstered fixed seating.

Adhere to **UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard** when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: On the drawings, show: (1) Seating layout, including row length and locations for wheelchair seating and ADA armrests as required by Architectural & Transportation Barriers Compliance Board, "ADA Title III, Americans with Disabilities Act - Buildings and Facilities"; and (2) Row and seat number identification.

Design must comply with all applicable fire and electrical codes, to include NFPA Life Safety Codes.

Coordinate aisle lighting, communication and electrical requirements with Electrical Engineer. Add requirements as appropriate for the project.
1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATIONS

**************************************************************************

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Sustainably Harvested Wood is a product which comes from a third-party Forestry Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration (e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.
Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications - if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certifications other than FSC; for all other projects allow the entire list of third party certifications.

[1.3.1 Certified Sustainably Harvested Wood

Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SPI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.

1.3.2 Indoor Air Quality Certifications

NOTE: The Government's preference is for use of products that have been certified for indoor air quality by third-party organizations such as Greenguard or SCS Global Services. However, verify there is a certified product available that is both cost effective and appropriate for the project.

Research has shown that manufacturer's that out-source their fabric because of customer's demands cannot obtain a third-party certification for the assembly. When out-sourcing is deemed necessary, consider requiring Indoor Air Quality for fabrics and composite wood separately. Choose paragraph entitled "Seating System Products" if out-sourcing is not identified as a problem. Choose paragraphs entitled "Fabrics" and "Low-Emitting Composite Wood or Agrifiber Products" in lieu of paragraph entitled "Seating System Products" if outsourcing is identified as an issue.

1.3.2.1 Seating System Products

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body.

1.3.2.2 Fabrics

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or
provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body.

[1.3.2.3] Composite Wood or Agrifiber Products

For purposes of this specification, composite wood and agrifiber products include particleboard, medium density fiberboard (MDF), wheatboard, strawboard, panel substrates, and door cores. Provide current product certification documentation from certification body.

[1.3.3] Installer's Qualifications

When recommended by the manufacturer, deliver and install seating by an authorized dealer with a certified installation crew. Complete all hardwiring by a licensed electrician.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver components to the site in unopened containers clearly labeled with the manufacturer's name and container contents. Store materials in a safe, dry, and clean, well ventilated area (100 percent outside air supply, minimum of 1.5 air changes per hour, and no recirculation), protected from damage, soiling, and moisture, and strong contaminant sources and residues, maintained at a temperature above 16 degrees C 60 degrees F for 2 days prior to installation. Do not store materials which have high emissions of volatile organic compounds (VOC's) or other contaminants, including [____]. Do not store seating near materials that may offgas or emit harmful fumes, such as kerosene heaters, fresh paint, or adhesives. Handle the items in a manner that will protect the materials from damage.

1.5 WARRANTY

Provide manufacturer's warranty to repair or replace defective materials and workmanship for specified warranty periods from date of final acceptance of the work as follows:

1.5.1 Warranty Periods

a. Structural: [5 years][10 years][____]
b. Plastic, Wood and Paint Components: [3 years][____]
[c. Electrical Components: [5 years][____]
[d. Operating Mechanism: [5 years][____]
[ e. Fabric: [1 year][3 years][____]

PART 2 PRODUCTS

2.1 MATERIALS

*********************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements. A resource that can be used to identify products with recycled content.
is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Research shows the product is available among US national manufacturers above the minimum recycled content shown.

[Provide Upholstered Audience Seating with a minimum of 20 percent recycled content. Provide data identifying percentage of recycled content for upholstered audience seating.]

NOTE: For manufacturers outsourcing fabrics, delete the bracketed sentence below.

[Provide certification of indoor air quality for Upholstered Audience Seating.]

2.2 PERFORMANCE REQUIREMENTS

2.2.1 Fire Test Response Characteristics

NOTE: Specify "Fabric and Padding" paragraph where required by authorities having jurisdiction.

2.2.1.1 Fabric and Padding

NOTE: Specify "Upholstery Assembly" paragraph where required by authorities having jurisdiction. This test is required in California.

2.2.1.2 Upholstery Assembly

2.3 MATERIALS

2.3.1 Upholstery Fabric

NOTE: Consider the following when selecting
upholstery fabric:
- frequency of use
- length of use
- double rub or performance testing
- pilling
- are food and drink to be allowed

Add information on recycled material or natural fibers as applicable for the project.

Provide fabric meeting specified fire test response characteristics which is a [plain][decorative][_____] weave, fiber content of [100 percent polypropylene][100 percent polyester][100 percent nylon][_____] treated to resist staining and soiling. Provide fabric upholstery for seating with [minimum [55,000][75,000][_____] double rub tests according to ASTM D4157.]

NOTE: Retain the bracketed sentences below when the manufacturer outsources their fabrics due to customer demands.

[Provide fabrics meeting emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification of indoor air quality for fabrics.]

2.3.2 Polyurethane Foam Padding

Provide polyurethane foam padding meeting specified fire test response characteristics which is nonhardening, non-oxidizing and has a high resistance to alkalies, oils, grease, soaps, abrasions, moisture, mildew, and tearing.

2.3.3 Sub Title

Provide plywood conforming to HPVA HP-1, made of hardwood and of crossbanded construction. Provide face veneers for exposed surfaces of Grade A hardwood, vertical grain, [maple][oak][cherry][_____] with manufacturer's standard finish. Provide unexposed veneers of sound grade hardwood or Grade A fir.

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability with the region, cost effectiveness, and adequate competition before specifying these certifications.

[Provide certified sustainably harvested plywood.]

2.3.4 Solid Hardwood and Wood Veneer

Provide solid hardwood and wood veneer of first grade [maple][oak][cherry][_____] . Finish exposed wood with manufacturers standard finish.
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability with the region, cost effectiveness, and adequate competition before specifying these certifications.

[Provide certified sustainably harvested solid hardwood and wood veneer.]

2.3.5 Composite Wood or Agrifiber Products

For purposes of this specification, composite wood and agrifiber products include particleboard, medium density fiberboard (MDF), wheatboard, strawboard, panel substrates, and door cores.

Provide products containing no added urea-formaldehyde resins. Provide current product literature showing no added urea-formaldehyde for composite wood or agrifiber products.

[Provide products certified to meet emissions requirements of either CARB Regulation or CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification of indoor air quality for Composite wood and agrifiber products.]

2.3.6 Plastic Laminate

Plastic laminate conforms to ANSI/NEMA LD 3, Horizontal General Purpose Standard (HGS) Grade, 1.22 mm (plus or minus 0.127 mm) 0.048 inches (plus or minus 0.005 inches) in thickness.

2.3.7 Plastic

Plastic has built-in inhibitors to retard fading and anti-static compounds to retard dirt attraction. Pigment quality eliminates need to paint plastic parts. Component surfaces have a textured finish. Color is integral to the plastic.

2.3.8 Cast Iron

Cast iron complies with ASTM A48/A48M. Finish is [powder coat][____].

2.3.9 Steel

Steel complies with ASTM A513/A513M or ASTM A1011/A1011M. Finish is [powder coat][____].

2.4 SEATING SYSTEM

NOTE: Determine on project by project basis if sample chair is required.

Construct components and assembly free from objectionable projections or irregularities. Make corners and edges smooth and rounded. Unless otherwise noted, bolts, nuts, and other fastenings are concealed where possible. Steel is well-formed to shape and size required. Connections of members are by welding, riveting, or interlocking. Casting is fine textured, sound, and free of pits, blow holes, and fins. Lines are true,
Submit Assembly Manuals, manufacturer’s descriptive data, catalog cuts, installation instructions and the following:

a. Minimum **152 by 150 mm 6 by 6 inches** samples of upholstery, exposed plywood, plastic laminate, wood, identification plate, paint, armrest and plastic finish materials. Furnish fabric samples of sufficient size to show color range, pattern, and finish.

b. Two complete sets of certificates attesting that the proposed seating system meets specified requirements. Date the certificate after the award of contract, include name of the project and a list of specific requirements being certified. Three sets of assembly manuals describing assembly procedures.

c. One complete chair that meets requirements specified. Chair sample may be incorporated into the installation, provided the sample is approved and its location is noted.

### 2.4.1 Backs

**************************************************************************

**NOTE:** The option of an upholstered steel, plywood or polypropylene inner panel should remain since manufacturers use such a variety of materials for the inner panel.

Specification of hard surface backs is recommended for durability and maintenance reasons. Although, fully upholstered backs are available and may be substituted as appropriate to meet project requirements.

To achieve a certain aesthetic, it may be determined that hardware be visible. Edit to meet desired appearance. Example: It may be desired or acceptable that screws and bolts be visible on units composed of seat backs with exposed plywood.

Rocker type mechanism is an option but not available from all manufacturers. If required, research availability.

**************************************************************************

Provide back assembly of the fixed type and consisting of [a hard injection molded surface rear panel with an upholstered inner panel] [an exposed plywood front and rear panel]. Attach back assembly to standards with 14 gauge steel wings/back brackets; wings/back brackets have back pitch adjustability option, back assembly length is between [508] [_____] and [724] [_____] mm [20] [_____] and [28-1/2] [_____] inches for a total height of [762] [_____] to [914] [_____] mm [30] [_____] to [36] [_____] inches above the floor measured parallel to the back. Rear panel extends below the seat unit to completely conceal and protect the seat assembly.

### 2.4.1.1 Plastic Rear Panels

Panels are one-piece injection molded high impact resistant polypropylene or polyethylene with textured outer surface. Panel is formed to enclose and protect the edges of the inner upholstery panel at the top and sides.
2.4.1.2 [Plastic Laminate Finish][Wood] Rear Panels

Panels are fabricated from minimum [5 ply, 8 mm 5/16 inch] [7 ply, 16 mm 5/8 inch] thick plywood. [Exposed back surface is plastic laminate.] Rear panel is formed on the same radius as the upholstered inner panel. Sand smooth exposed wood edges. [Exposed bolts, fasteners or other hardware are not acceptable.]

2.4.1.3 Upholstered Inner Panels

Fabricate upholstered inner panels from 5 ply, 11 mm 7/16 inch minimum thick plywood, compound steel or compound curved 20 percent glass filled polypropylene with deep web reinforcing. Cushion consists of 51 mm 2 inch thick polyurethane foam padding and have an upholstery cover. Padding is cemented to plywood inner panel. Upholstery cover is securely stapled to the inner plywood panel or held in place with draw strings for ease of re-upholstering. Upholstery cover cannot be attached with the use of nails, tacks, or screws.

2.4.1.4 Exposed Plywood Front & Rear Panel [Plastic Laminate Finish]

Back is fabricated from minimum [5-ply, 11 mm 7/16 inch] [7-ply, 19 mm 3/4 inch] thick contour molded plywood. [Exposed back and front surfaces are finished with plastic laminate.] Smoothly sand and finish all exposed edges.

2.4.2 Seats

**************************************************************************
NOTE: To achieve a certain aesthetic it may be determined that hardware be visible. Edit to meet desired appearance. Example: It may be desired or acceptable that screws and bolts be visible on units composed of seats with exposed plywood.

An acoustical or perforated seat bottom is available from some manufacturers. If needed to meet project requirements, research availability and add requirement to specification.
**************************************************************************

Provide foundation for upholstered seats free from visible screws, bolts, open holes, and projections on the bottom, front, and sides. [The front center edge of each seat has an identification plate. The area to receive the plate is recessed to prevent wear and abrasion. Method of attachment is tamper-resistant.] The seat unit is removable without disturbing the standards, and the upholstered seat cover is easily removable without removing the seat unit. The fabric covering is fastened to the frame in a manner that will permit easy reupholstering.

2.4.2.1 Polypropylene Seat Unit

Provide foundation consisting of a one-piece, injection molded polypropylene foundation fabricated with a minimum 25 percent glass-filled polypropylene or an inner structural panel constructed of 20 percent glass-filled polypropylene with deep web reinforcing and a wraparound polypropylene shell outer panel. Polypropylene foundation seat is serpentine spring or ergonomic seat cushion. Serpentine spring cushion
contains at least five serpentine design springs spanning an injection molded plastic frame with molded polyurethane foam padding fitting firmly on springs. Frame and spring assembly are covered with a chafing barrier to protect foam padding from abrasion. Ergonomic seat cushion consists of a 5 mm 3/16 inch thick contoured polypropylene substrate supporting a polyurethane foam pad. Seat unit consisting of an inner structural panel has padding that is a molded polyurethane foam pad and has a minimum thickness of 76 mm 3 inches at the center, 38 mm 1-1/2 inches at the front with an overall thickness of 51 mm 2 inches. Upholstery cover fits the cushion size, is fastened with drawstring closure or staples for ease of re-upholstering, and does not have welts. Upholstery cover cannot be attached with the use of nails, tacks, or screws.

2.4.3 Hinges

******************************************************************************
NOTE: Three quarter fold is recommended for safety reasons; it is easier to open when hands are full and opens to 100 percent when additional pressure is applied to seat.
******************************************************************************

Hinges are a counterweight mechanism using gravity to return to the upright position, compensating type or spring lift mechanism, completely enclosed in the seat assembly, totally independent, free and easy in operation, and capable of compensating for circular installation, variation in installation conditions, and unevenness of floors. Each hinge has a noiseless, self-rising seat device, rises automatically to a uniform safety position of 3/4 fold at all times, and folds 100 percent when additional pressure is applied, to provide additional clearance. Seat hinge mechanism complies with ASTM F851 and requires no adjustment after installation. The compensating type and spring lift mechanism hinge is self-lubricating requiring no maintenance. Cushion both the up and down stops on the seat to reduce noise.

2.4.4 Standards

Provide standards which are minimum 1.9 mm 14 gauge tubular or sheet steel or one integral piece of cast iron. Steel standards are welded. Standards with ADA hinged armrests are provided with a label displaying the handicapped symbol and located and installed as shown on drawings.

2.4.4.1 Floor Standards

******************************************************************************
NOTE: Not all manufacturers produce both steel and cast iron standards; it is recommended that both options be left in the specification.
******************************************************************************

Form floor standards to fit the floor incline so that the standards will be vertical and the hinge point will be at a height that will maintain proper relation of seat to floor. Form the feet to eliminate tripping hazards, with a minimum of two holes for bolt attachment to the floor.

2.4.4.2 Riser Standards

Form riser standards to approach the riser face at an angle to allow maximum clearance, formed to fit the riser so that the standards will be
vertical and the hinge point will be at a height that will maintain proper relation of seat to floor. Projection of the standard is not permitted in order to avoid a stumbling hazard or interfere with sweeping and cleaning. Provide riser attachment through a 6 mm 1/4 inch steel plate welded to the standard or on an integrally cast foundation. Provide securely attached standard to the riser without the use of shims or filler strips and attach at a minimum of 2 points.

2.4.4.3 [Aisle] [and] [End] Standards

[Aisle] [and] [end] standard complies with standard specifications and have a [molded plastic] [plastic laminate] [upholstered] [solid hardwood or wood veneer] [_____] decorator panel. [Shape of decorator panel is [open] [tapered] [rectangular] [radius on lower edge] [_____]_] Decorator panels are not required for standards that have the ADA armrest. Install all decorator panels with concealed hardware.

2.4.5 Armrests

**************************************************************************
NOTE: Specification of hard surface armrests are recommended for durability and maintenance reasons.
**************************************************************************

Armrests are [solid hardwood with [rounded corners] [_____] and manufacturer's standard finish] [with cup holder] [wood with laminated plastic] [plastic] [plastic with cup holder] [_____]_. Provide ADA armrest in locations as shown on drawings. ADA armrest is hinged at rear to allow easy access for limited mobility occupants.

2.4.6 Tablet Arm

**************************************************************************
NOTE: There are varying sizes of tablet arms, but not all manufacturers offer all sizes. Some only have one size. If size other than standard is required, add requirements to paragraph. Note some manufacturer have a size that accommodates a laptop computer.
**************************************************************************

Equip each chair with a fold-away tablet arm assembly. Tablet arm will automatically return to the stored position when raised manually to a vertical position in one motion and fall to the stored position by force of gravity, fold smoothly and quietly, store completely out of the way and be easily accessible when needed by the occupant without bending or reaching. Tablet arm is fabricated using balanced construction and is composed of manufacturer's standard core material faced with plastic laminate on the writing surface and supported by a minimum 3 mm 11 gauge steel bracket. All edges are rounded. When in a writing position, the arm locks firmly in place so that it cannot be accidentally disengaged. [Tablet arm is capable of supporting a laptop computer][ and is a minimum of[ 53548 square mm 83 square inches][ 64516 square mm 100 square inches][ 77419 square mm 120 square inches][ 84516 square mm 131 square inches][ 97419 square mm 151 square inches.]] Provide both left and right handed tablet arms as show.

2.4.7 Sub Title
NOTE: Some manufacturers offer power, data or USB connection. If this option is selected, coordinate electrical requirements. When power and data modules are included as an option, end panels are required on aisle ends.

Provide power [and data] to each seat in a location that is convenient to the occupant. Include a 120 Volt wiring with duplex receptacle [and a telecommunications and data port] per seat. Provide power [and data] from the building power source and insure that all power [and data] components are UL listed and conform to Article No. 604 of the National Electric Code.

Connect all chairs in a row with a formed aluminum raceway with [molded] [or] [extruded] polymer covers to conceal power [and data] wiring [in the arm rest] [on raceway beneath the seating] [in fully enclosed wireways]. Provide 120 Volt, A.C. electrical power throughout the row [by means of a two circuit, 4 wire system to power up to 16 chairs] [three circuit, 5 wire system to power up to 24 chairs] [with a doubled sized neutral]. [Use a separate molded polymer module to accommodate owner supplied ethernet, USB, phone and HDMI wiring.]

2.4.8 Identification Plates

**************************************************************************

NOTE: Identify row and seat numbering system on drawings.

Address placement of identification plates when seat unit is fully upholstered.

Delete paragraph if not required.

**************************************************************************

Provide seating with number and letter plates for seat and row designations. Plates are constructed of manufacturer's standard [brass or bronze][clear anodized aluminum] [_____] finish and have black letters and numbers. Provide [tamper resistant] hardware with finish compatible with plates. Provide text font and seat numbering system [per manufacturer's standard.][as indicated.]

2.4.9 Aisle Lighting

**************************************************************************

NOTE: Determine if aisle lighting is required to meet project requirements. Delete paragraph if not required.

Coordinate design requirements with electrical engineer.

**************************************************************************

Provide [aisle] [and] [end] standard panels with [concealed] [surface mounted] [_____] LED aisle lights. Aisle lights are low voltage, 12 Volt, D.C., system with manufacture's voltage reduction device housed in safety enclosure equipped with fuses, terminal blocks, and safety disconnect. Aisle lighting is prewired, UL approved and wiring is routed through concealed casing into floor. Provide low heat generating lighting fixture components that are easily accessible for replacement. Aisle light wiring
is hardwired to the building electric distribution system. The installation, proper safe mounting, and connection of the voltage reduction device, is the responsibility of a certified electrician.

[2.4.10 Electrical [and Telecommunications] Work]

Provide electrical materials conforming to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM[ and telecommunications materials conforming to the requirements of Section 27 10 00 BUILDING TELECOMMUNICATIONS SYSTEM].

2.5 COLOR

**************************************************************************

NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an Architect or Interior designer. Color must be selected from manufacturers standard colors or identified as a manufacturers color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings, a note must be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

**************************************************************************

Provide colors [as specified in Section 09 06 00 SCHEDULES FOR FINISHES.][as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.]

PART 3 EXECUTION

3.1 EXAMINATION

Examine floor, riser, and other adjacent work and conditions prior to layout and installation. Verify compliance with requirements and other conditions affecting performance of the work. [Verify that electrical connections are properly located.] [Verify HVAC air-distribution locations are correct.] Proceed with installation only after unsatisfactory conditions have been corrected.
3.2 PLACEMENT OF STANDARDS

NOTE: Generally, the width of seat units should be 533 or 559 mm with 508 mm 21 or 22 inches with 20 inch wide units restricted to the exit seat location if needed to meet specific dimension requirements.

The system permits the standards to be installed on radial lines from a common center for which concentric circles are determined with each row of units utilizing common middle standards. Standards in each row are placed laterally so the aisle-end standards will be in alignment as indicated on seating layout drawing. The angle of inclination of backs adjusted for variations in sightlines. Mechanical attachment of components is of sufficient flexibility so that when permanently assembled they will compensate for the changing dimensions laterally between standards caused by convergence toward the center. Seat and back attachments absorb inaccuracies in lateral spacing of standards at point of attachment caused by unevenness of floor. Varying lateral dimensions of backs and seats are in accordance with approved seating layout. Minimum width of seating unit is 508 mm 20 inches and may be used only to complete a specific row dimension.

3.3 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

Installation of the seating system is in accordance with the approved detailed drawings and manufacturer's recommended installation instructions. Submit seating plans dimensioned and showing row spacing, row lengths, the varying lateral spacing at backs and seats, back pitch, and seat widths for the various section lengths, placement of standards, floor pitch, and riser height, where applicable. Submit drawings indicating metal thickness, fastenings, details of hinge mechanism, seat and back dimensions, and proposed finish.

3.4 CLEANING

Clean and polish all products and leave the area in a clean and neat condition upon completion of installation. Repair any defects in material and installation and replace damaged products that cannot be satisfactorily repaired.

NOTE: This guide specification covers the requirements for miscellaneous site and street furniture and furnishings including shelters.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Units of work normally included in this section require specific fabrication to meet the desired project requirements. The Key Word Index of the CSI "Masterformat" should be consulted for the proper location of most items.

The following information will be shown on the drawings:

1. Location and configuration of all furniture and furnishings.

2. All sizes and dimensions.
3. Special fastenings, attachments or anchoring.

4. Location and size of expansion shields larger than 10 mm 3/8 inch in diameter.

5. Location of products to be galvanized.

6. Connection details, other than manufacturer's standard.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE:  Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project.  The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System.  Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATIONS

******************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective.
Sustainably Harvested Wood is a product which comes from a third-party Forestry Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration (e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.

Designer must verify suitability, availability within the region, cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications - if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certifications other than FSC; for all other projects allow the entire list of third party certifications.

******************************************************************************

1.3.1 Certified Sustainably Harvested Wood

Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SPI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Provide current product certification documentation from certification body. Submit copies of invoices bearing certification numbers.

1.4 QUALITY ASSURANCE

Qualify welders in accordance with AWS D1.1/D1.1M using procedures, materials, and equipment of the type required for the work.

1.4.1 Fabrication Drawings

Submit fabrication drawings showing layout(s), connections to structural
system, and anchoring details as specified in AISC 303.

1.4.2 Installation Drawings

Submit templates, erection and installation drawings indicating thickness, type, grade, class of metal, and dimensions. Show construction details, reinforcement, anchorage, and installation.

1.4.3 Assembly Instruction Drawings

Submit assembly instruction drawings showing layout(s), connections, bolting and anchoring details in accordance with manufacturer's standards. Submit drawings showing scaled details of proposed site furnishings, elevations for each type of site furnishing; dimensions, details, and methods of mounting or anchoring; shape and thickness of materials; and details of construction.

1.4.4 Primer Certificate

Submit a certificate from the manufacturer stating that the primer conforms to requirements of SSPC Paint 25.

1.4.5 Powder Coatings Certificate

Submit a certificate from the manufacturer stating that the powder coat conforms to ASTM D3451.

1.5 DELIVERY, STORAGE, AND HANDLING

Ship items knocked-down (KD) ready for site assembly. Packaged components must be complete including all accessories and hardware. Materials must be delivered, handled, and stored in accordance with the manufacturer's recommendations. Site furnishings must be inspected upon arrival at the job site for conformity to specifications and quality in accordance with paragraph MATERIALS. Protect from corrosion, staining, and other types of damage. Store items in designated area free from contact with soil and weather. Remove and replace damaged items with new items.

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials which are the standard products of a manufacturer regularly engaged in the manufacture of such products. The materials provided shall be of a type with proven satisfactory usage for at least 2 years.

2.1.1 Metals

Metallic materials and products must conform to Section 08 31 00 ACCESS DOORS AND PANELS. Furnish metal components with factory drilled holes and free of excess weld and spatter. Metal components with holes that will not be filled by hardware or hidden by other components will be rejected. Structural steel products must conform to ASTM A36/A36M, ASTM A500/A500M and ASTM A501/A501M. Provide Steel Components with a minimum of 70 percent recycled content. Provide data identifying percentage of recycled content for steel components.
2.1.2 Structural Tubing

ASTM A500/A500M

2.1.3 Steel Pipe and Fittings

Steel pipe must conform to ASTM A53/A53M, Type E or S, Grade B; standard malleable iron fittings must conform to ASTM A47/A47M.

2.1.4 Gray Cast Iron

Gray cast iron must conform to ASTM A48/A48M Class 35 or better. Provide castings manufactured true to pattern and component parts that fit together in a satisfactory manner. Castings must be of uniform quality, free from blowholes, porosity, hard spots, shrinkage, distortion, or other defects. Smooth castings must be well-cleaned by sand or shot blasting.

2.1.5 Aluminum Products

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Designer must verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.
**************************************************************************

Provide Aluminum Components with a minimum of 50 percent total recycled content. Provide data identifying percentage of recycled content for aluminum components.

2.1.6 Cast Aluminum

Cast aluminum must conform to ASTM B26/B26M and ASTM B108/B108M. Provide castings manufactured true to pattern and component parts that fit together in a satisfactory manner. Provide castings of uniform quality, free from blowholes, porosity, hard spots, shrinkage, distortion, or other defects. Smooth castings must be well-cleaned by sand or shot blasting.

2.1.7 Aluminum Alloy Products

Conform to ASTM B209M ASTM B209 for sheet plate, ASTM B221M ASTM B221 for extrusions and ASTM B26/B26M or ASTM B108/B108M for castings, as applicable. Provide aluminum extrusions at least 3 mm 1/8 inch thick and aluminum plate or sheet at least 1.3 mm 0.050 inch thick.

2.1.8 Anchors and Hardware

Provide anchors, where necessary, for fastening site furnishings securely in place and in accordance with approved manufacturer's instructions. Anchoring devices that may be used, when no anchors are otherwise specified or indicated, include anchor bolts, slotted inserts, expansion shields for concrete; toggle bolts and through bolts for masonry; machine carriage bolts for steel; and lag bolts and screws for wood. Anchor bolts must conform to ASTM A307. Hardware must be [stainless steel] [brass]
[zinc-plated] [zinc-chromate plated] [or] [galvanized steel] in accordance with ASTM A153/A153M and compatible with the material to which applied. All exposed hardware must match in color and finish. Mounting hardware must be concealed, recessed, and plugged.

2.1.8.1 Threaded Inserts and Expansion Anchors

Provide inserts recessed not less than [65] [_____] mm [2.5] [_____] inches into concrete or masonry. Pullout [90] [_____] kg [198] [_____] pounds in concrete with f'c of 20 MPa 3,000 psi, as tested in accordance with ASTM E488/E488M. Expansion shields must conform to CID A-A-1925, group II, type 4, class 1. Provide embedment required by manufacturer.

2.1.8.2 Lag Screws and Bolts

ASME B18.2.1, type and grade best suited for the purpose.

2.1.8.3 Toggle Bolts

ASME B18.2.1.

2.1.8.4 Bolts, Nuts, Studs and Rivets

ASME B18.2.2 or ASTM A307.

2.1.8.5 Power Driven Fasteners

Follow safety provisions of ASSP A10.3.

2.1.8.6 Screws

ASME B18.2.1, ASME B18.6.2, and ASME B18.6.3.

2.1.8.7 Washers

2.1.9 Ounce Metals

Bronze, copper, and other ounce metals must conform to ASTM B62.

2.1.10 Concrete

Ready-mixed concrete must conform to ASTM C94/C94M, using 19 mm 3/4 inch maximum size aggregate, and having minimum compressive strength of 20 MPa 3000 psi at 28 days. Portland cement must conform to ASTM C150/C150M. Cast-in-place concrete materials and products must conform to Section 03 30 00 CAST-IN-PLACE CONCRETE. Precast concrete material and products must conform to Section 03 45 33 PRECAST[ PRESTRESSED] STRUCTURAL CONCRETE. Reinforcing steel must conform to ASTM A615/A615M. Welded wire fabric must conform to ASTM A1064/A1064M.

2.1.11 Masonry

Masonry material and products must conform to Section 04 20 00 UNIT MASONRY
2.1.12 Tempered Glass

**ASTM C1048**, Kind FT (fully tempered), condition A (uncoated), Type 1 (transparent, Quality q3, [6.35] [_____] mm [1/4] [_____] inch thick, [clear] [bronze] [_____] in color.

2.1.13 Plastics

**************************************************************************

NOTE: It is important for the designer to ensure manufacturers supply quality plastic products made from post-consumer recycled high density polyethylenes. High density polyethylene can be manufactured using post-consumer recycled plastic resins from products such as milk containers. Designer should insist on products utilizing high-density polyethylene. Use materials with recycled content where appropriate for use. Designer must verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements. Research shows the product is available among US national manufacturers above the minimum recycled content stated.

Plastic lumber is susceptible to both creep and deflection; therefore, it cannot be used for structural members of furnishings. To overcome creep and deflection, the product is increased in volume of material and dimension.

**************************************************************************

Provide High Density Polyethylene (HDPE) Components with a minimum of 90 percent total recycled content. Provide data identifying percentage of recycled content for HDPE components. Recycled materials must be constructed or manufactured with a maximum 6 mm 1/4 inch deflection or creep in any member in conformance with **ASTM D2990**. Provide panels and components molded of ultraviolet (UV) and color stabilized polyethylene, with minimum 6 mm 1/4 inch wall thickness; exposed edges must be smoothed, rounded, and free of burrs and points; and the material must be resistant to fading, cracking, fogging, and shattering. The material must be non-toxic and have no discernible contaminates such as paper, foil, or wood. The material must contain no more than 3 percent air voids and be resistant to deformation from solar radiation heat gain. Recycled materials to include plastic lumber will not be used as structural components of site furnishings. Submit a report of site furnishing parts consisting of recycled materials. Product specification data, providing test information for deflection and creep in accordance with **ASTM D2990** for site furnishings which use plastic lumber as a component, must be submitted. Provide data for comparison of deflection and creep measurements to other comparable materials.

2.1.13.1 Extruded Acrylic Sheet

**ASTM D4802** [Type I, regular] [Type II, heat resistant] [6] [_____] mm [1/4] [_____] inch thick, [clear] [_____] in color.
2.1.13.2 Cast Acrylic Sheet

ASTM D4802, Item A, [Type I, heat resistant and ultraviolet light absorbing] [Type II, heat resistant], 6 mm 1/4 inch thick, [clear] [bronze] [_____] in color.

2.1.14 Lumber

Provide premium grade wood free of knots; boards with eased edges and ends; and wood components with factory drilled holes. Components with holes that will not be filled by hardware or hidden by other components will be rejected. Wood products must be selected to withstand the climatic conditions of the region in which the site is located.

**************************************************************************
NOTE: Use certified sustainably harvested wood for all specialty items where suitable for application and cost effective. The Editor may wish to selectively apply this requirement to the specialty items within this specification and delete the general requirement here
**************************************************************************

[ Provide certified sustainably harvested lumber.]

Lumber grades must meet manufacturers standards of the grading rules under which they are manufactured. Where no standards exist the following must be the minimum acceptable grades for species used.

a. WWPA G-5 grading rules, [Douglas Fir] [Western Cedars], [Choice & Btr.,] [Select or A & Btr.] in accordance with special western red cedar rules.

b. WCLIB 17 standard grading rules, [Douglas Fir] [Western Cedars], A & Btr.

c. SPIB 1003 grading rules, Southern Pine, C & Btr.

d. NHLA Rules standard specification, Cypress, C-Select.

e. RIS Grade Use standard specifications, Redwood, [Clear] [Clear All Heart].

f. NHLA Rules rules, [Cypress] [Teak], [B Finish] [Select or Btr.].

2.1.14.1 Moisture Content

Air-dry or kiln-dry lumber. Kiln-dry treated lumber after treatment. Maximum moisture content of wood products at time of delivery must be in accordance with manufacturers standard. If no manufacturer's standard exists, then moisture content must be based on requirements for the product, grade and intended use.

2.1.14.2 Treatment

Wood that is not naturally rot and insect resistant must be treated in accordance with AWPA U1, as applicable, and inspected in accordance with AWPA M2. Provide treatment of wood in accordance with ASTM F1487.
2.1.14.3 Wood Seats and Table Tops

Clear teak, maple, oak, Jarrah, Ipe or other suitable hardwood, not less than 40 mm 1-5/8 inches thick with rounded edges.

**************************************************************************

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective.

**************************************************************************

[ Provide certified sustainably harvested wood for wood seats and table tops.]

2.1.15 Fiberglass

Fiberglass must consist of at least 3 laminations of chopped glass fibers impregnated with polyester resin, with colors and textures molded into all exposed surfaces so that colors resist fading. Fiberglass must be resistant to cleaners, fertilizers, high power spray and salt.

2.2 PRETREATMENT, PRIMING AND PAINTING

**************************************************************************

NOTE: Use manufacturers standard treatment when painting and finishing is required.

**************************************************************************

Apply pretreatment, primer, and paint in accordance with manufacturer's printed instructions. [On surfaces concealed in the finished construction or not accessible for finish painting, apply an additional prime coat to a minimum dry film thickness of 0.03 mm 1.0 mil. Tint additional prime coat with a small amount of tinting pigment.]

2.2.1 Nonferrous Metal Surfaces

Protect by plating, anodic, or organic coatings.

2.2.2 Aluminum Surfaces

Before finishes are applied, remove roll marks, scratches, rolled-in scratches, kinks, stains, pits, orange peel, die marks, structural streaks, and other defects which will affect uniform appearance of finished surfaces.

2.3 COATINGS AND FINISHES

**************************************************************************

NOTE: The content of volatile organic compounds (VOC), and marking, must be in compliance with air quality regulations for the type of application and jurisdiction where used.

**************************************************************************

2.3.1 Galvanizing

**************************************************************************

NOTE: Specify galvanizing for items installed in exterior exposures subject to salt spray or corrosive fumes and interior areas subject to continual wetting or high humidity.

**************************************************************************
Hot-dip galvanize items specified to be zinc-coated, after fabrication where practicable. Galvanizing must conform to ASTM A123/A123M, ASTM A153/A153M or ASTM A653/A653M, as applicable. Tailings and sharp protrusions formed as a result of the hot-dip process must be removed and exposed edges burnished. Galvanize anchor bolts, grating fasteners, washers and parts or devices necessary for proper installation, unless otherwise indicated.

2.3.2 Polyester Powder

Powder-coated surfaces must receive electrostatic zinc coating prior to painting. Powder coating must be electrostatically applied and oven cured. Polyester powder coating must be resistant to ultraviolet (UV) light.

2.3.3 Polyvinyl-Chloride (PVC)

PVC coating must be primed with a clear acrylic thermosetting solution. The primed parts must be preheated prior to dipping. The liquid polyvinyl chloride must be ultraviolet (UV) stabilized and mold-resistant. The coated parts must be cured. The coating must be a minimum 2 mm 2/25 inches thick plus or minus 0.5 mm 0.020 inches and must have an 85 durometer hardness with a slip-resistant finish.

2.3.4 Finish

Finish must be as specified by the manufacturer or as indicated. Exposed surfaces and edges must be rounded, polished, or sanded. Finish must be non-toxic, non-glare, and resistant to corrosion. Exposed surfaces must be smooth and splinter-free exposed surfaces. Submit [two] [_____] sets of color data for each furnishing displaying manufacturer's color selections and finishes, and identifying those colors and finishes proposed for use.

2.3.4.1 Wood Sealants

Exposed wood surfaces must have, as a minimum, two shop coats of paint, varnish, sealer, or other approved preservative. Sealants must seal all applied surfaces from air.

2.3.4.2 Paint

Paint must be factory applied with a minimum of 2 coats. Paint must be weather-resistant and resistant to cracking, peeling and fading.

2.3.4.3 Color

Color of site furnishing components must be in accordance with Section 09 06 00 SCHEDULES FOR FINISHES.

2.4 SITE STANDARDS

Site furnishings must be furnished with the dimensions and requirements indicated. Site furnishings placed in children's outdoor play areas must meet the safety requirements of ASTM F1487 for entrapment; sharp points, edges, and protrusions; entanglement; pinch, crush, and shear points. Site furnishings to be included in children's outdoor play areas must be free from sharp vertical edges and any protruding elements and designed with a minimum radius of 13 mm 1/2 inch on all vertical edges; this includes, but
is not limited to, seat walls, containment curbs and planters. Where practical, horizontal edges exposed to children's activities must be rounded.

2.5 **BENCHES AND CHAIRS**

Furnish benches and chairs with no sharp edges or protruding hardware.

a. **Height:** The height above finished grade or specified surface must be between 450-500 mm **18-20 inches** and level.

b. **Seat:** The seat surface must be pitched or slotted to shed water; the seat depth must be between 300-460 mm **12-18 inches** and pitched down at the back at a 0-5 degree angle. Seat must have a minimum width of 610 mm **24 inches** per person, and must overhang the support base by a minimum of 100 mm **4 inches** for heel space and to facilitate rising from a seating position.

c. **Back Rest:** When back rests are required, the height must be between 380-460 mm **15-18 inches** from the top of the seat and the connection must be at a 90-110 degree angle to the seat.

d. **Arm Rest:** When arm rests are required, a minimum of 150 mm **6 inches** height from the seat and a minimum arm rest width of 38.3 mm **1-1/2 inches** must be provided.

e. **Weight Limit:** Seats must support a minimum 136 kg **300 lbs** for each person they are designed to accommodate.

[2.5.1 Precast Units]

Design precast units in accordance with manufacturer's standards, size as indicated. Finish and color as indicated selected from manufacturer's standards.

[2.5.1.1 Glass Fiber Reinforced Concrete (GFRC) Units]

Provide glass fiber reinforced concrete (GFRC) units at locations indicated on the drawings. Comply with PCI MNL-128 recommended practice for glass fiber reinforced concrete, including Appendix G, Polymer Modified Glass Fiber Reinforced Concrete Panels.

a. Design precast benches to sustain a live load of not less than 10 kPa **200 pounds per square foot**.

b. Provide ASTM C150/C150M cement, use only one brand and type of cement throughout project.

c. Provide alkali resistant (AR) glass fibers produced specifically for use in glass fiber reinforced concrete, minimum three percent glass fiber content.

d. Provide clear silica sand aggregate passing 1.18 mm No. 16 sieve; washed, dried and free from deleterious materials. Provide type with successful history of uses in GFRC fabrication standard with the manufacturer.

e. Provide 20.7 MPa **3000 psi** concrete, 28 day minimum compressive strength with approximately 1921 kg/cubic meter **120 pcf** density; shell thickness
of 10 to 16 mm 3/8 to 5/8 inch.

f. Provide manufacturer's standard acrylic thermoplastic copolymer admixture.

g. Provide factory finished units standard with the manufacturer; texture and color as selected.

   (1) Provide white or grey cement consistent with final finish.

   (2) Provide ASTM C33/C33M (less gradation) facing aggregates, clean, hard, durable, inert and free of staining and deleterious materials; as required to match approved samples.

   (3) Provide color meeting ASTM C979/C979M, pure, non-fading mineral oxides, maximum ten percent cement weight; as required to match approved samples without impairing strength of GFRC.

   (4) Apply finish meeting ASTM D4060 waterborne crosslinked acrylic 49.5 +/- two percent solids by weight providing 1000 cycles per 0.0254 mm 1000 cycles per 0.001 inch resistance to abrasion.

h. Prefabricate units within following maximum fabrication tolerances.

   (1) Dimension: Plus or minus 3 mm 1/8 inch in any direction, noncumulative.

   (2) Material Thickness: Plus 6 mm 1/4 inch and minus 0-inch.

   (3) Total Unit Thickness: Plus 6 mm 1/4 inch and minus 3 mm 1/8 inch.

   (4) Insert Locations: Plus or minus 6 mm 1/4 inch.

][2.5.1.2 Precast Concrete/Cast Stone Units

Provide reinforced precast concrete units consisting of a mixture of cement, aggregates and mineral colors suitable for exterior use, located as indicated. Design benches to sustain a live load of not less than 10 kPa 200 pounds per square foot.

2.5.1.2.1 Portland Cement

   ASTM C150/C150M Type I II or III

2.5.1.2.2 Aggregate

   ASTM C33/C33M, maximum size 19 mm 3/4 inch

2.5.1.2.3 Reinforcing Steel

   ASTM A615/A615M

2.5.1.2.4 Galvanized Wire Mesh

   ASTM A1064/A1064M

2.5.1.2.5 Integral Color

   ASTM C979/C979M, pure mineral oxide, limeproof and non-fading
2.5.1.2.6 Concrete Strength

Provide minimum 35 MPa 5000 psi 28 day compressive strength concrete, maximum five percent absorption.

2.5.1.2.7 Admixture

ASTM C260/C260M for air-entraining

2.5.2 Wood Units

Provide manufacturer's standard wood units with wood, metal, fiberglass or concrete pedestals as indicated. Provide fasteners and accessories required for onsite assembly. Kiln dry and pressure treat wood components to manufacturer's standards. Pre-treat metal components and provide manufacturer's standard primer and powder coat finish complying with ASTM D3451, color as selected. Provide fiberglass non-fading gel coat color as indicated. Provide manufacturer's standard exposed aggregate or sandblasted finish and protection coating on concrete pedestals.

**************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective.
**************************************************************************

[ Provide certified sustainably harvested wood for wood benches and chairs.]

a. Design wood benches to sustain a live load of not less than 10 kPa 200 pounds per square foot.

b. Provide kiln dried, surfaced four sides (S4S), clear all sides wood slats of species and sizes indicated.

(1) Species: [Teakwood] [Marine Teak] [Clear All Heart Redwood] [Red Cedar] [Alaska Yellow Cedar] [Clear Douglas Fir] [Ipe] [Mahogany] [Purple Heart].

(2) Nominal wood slat sizes: 25 by 63 mm 1 by 2-1/2 inch [25 by 75 mm 1 by 3 inch] [50 by 75 mm 2 by 3 inch] [50 by 100 mm 2 by 4 inch]. Top and bottom rail may be larger in size and configuration for comfort of seating.

2.5.2.1 Support Pedestals

Provide [cast iron] [cast aluminum] [steel] [wood] [concrete] [fiberglass] support pedestals in accordance with manufacturer's standard.

2.5.2.1.1 Cast Grey Iron

ASTM A48/A48M Class 30 or recycled cast grey iron ASTM A48/A48M Class 25

2.5.2.1.2 Cast Aluminum

ASTM B26/B26M or ASTM B108/B108M as applicable

2.5.2.1.3 Steel

ASTM A653/A653M
2.5.2.1.4 Wood

Match in species, grade, grain, color and finish of the wood slats.

2.5.2.1.5 Concrete

Concrete must be of the same quality and finish as specified for precast concrete.

2.5.2.1.6 Fiberglass

Design fiberglass pedestals to support the loads imposed in design of bench. Color as approved.

2.5.2.2 Steel Arms

Provide 9 mm 3/8 inch thick by 75 mm 3 inch wide steel bench arms conforming to ASTM A653/A653M.

2.5.3 Fiberglass Benches

Provide reinforced fiberglass benches molded with multiple laminations of glass fiber impregnated with polyester isophthalic thermosetting resins, minimum thickness of 3 mm 1/8 inch and reinforced in accordance with manufacturer's standard practice.

a. Design bench to sustain a live load of not less than 10 kPa 200 pounds per square foot.

b. Provide manufacturer's finish, 12-15 mil color impregnated polyester gel coat, of color as selected from manufacturer's standard colors and finishes, [smooth matte] [orange peel] [polished granite].

2.5.4 Steel Units

2.5.4.1 Perforated Steel

Provide [1.9 mm 14 gage] [1.6 mm 16 gage] perforated steel sheet, electrostatically coated with two component polyester enamel.

a. Design bench to sustain a live load of not less than 10 kPa 200 pounds per square foot.

b. Provide 9 mm 3/8 inch thick by 100 mm 4 inch wide hot rolled steel pedestals conforming to ASTM A653/A653M.

[c. Provide 38.3 mm 1-1/2 inch O.D. ASTM A53/A53M schedule 40 steel pipe pedestals.]

2.5.4.2 All-Welded Wire

Provide all-welded wire construction of 3.8 mm 9 gage, 3.1 mm 11 gage wire with 13 mm 1/2 inch clear spacing and 8 mm 5/16 inch wire with 63 mm 2 1/2 inch spacing.

a. Design benches to sustain a live load of not less than 10 kPa 200 pounds per square foot.
b. Provide 33 mm one inch O.D. by 1.3 mm 18 gage [38.3 mm 1-1/2 inch O.D. by 1.6 mm 16 gage] galvanized tubing for bench frames.

c. Provide 38.2 mm 1-1/2 inch O.D. by 3.1 mm 11 gage galvanized tubing for armrest.

d. Provide cadmium or zinc plated hardware; nuts, bolts, screws, and lock washers with a clean chromate finish.

\[2.5.5\] Aluminum Units

[AA DAP45] [AAMA 611]. Provide [extruded] [formed] aluminum benches in accordance with manufacturers standard, with [dark] [medium] [light] bronze [clear anodized] [black anodized] [acrylic paint] [powder coat] finish, color as selected from manufacturer's standards.

a. Design benches to sustain a live load of not less than 10 kPa 200 pounds per square foot.

b. Provide manufacturer's standard [cast grey iron] [cast aluminum] [steel] [precast concrete] [fiberglass] pedestals.

\[2.5.6\] Accessories

Provide manufacturer's standard materials and accessories as required for assembly of units and as indicated on the assembly drawings. Provide unexposed aluminum, stainless steel or steel plates, angles and supports as required for complete assembly. Separate dissimilar materials to prevent electrolytic action.

\[2.5.7\] Fasteners

Provide concealed fasteners except where specifically approved; types as required for specific usage.

\[2.5.8\] Anchoring Brackets

Provide 6 mm 1/4 inch zinc plated steel angle anchoring brackets, 47 mm 1-7/8 inch wide by 50 mm 2 inches deep by 63 mm 2-1/2 inches high [47 mm 1-7/8 inch wide by 90 mm 3-1/2 inch deep by 150 mm 6 inch high], pre-drilled for bolting benches to substrate.

\[2.6\] BICYCLE RACKS

Design bicycle racks (stanchions) in accordance with manufacturer's standards and to meet design conditions indicated. Locate as shown on the drawings. Provide powder coat finish in color as selected from manufacturer's standards. Racks must accommodate locking devices and secure, as a minimum, one wheel and part of the frame simultaneously. The spacing between racks must be a minimum of 610 mm 24 inches.

[2.6.1] Metal Pipe Bicycle Racks

Provide ASTM A53/A53M schedule 40 steel pipe bicycle racks in configuration and of [114] [_____] mm [4-1/2] [_____] inch pipe size. Type of mounting, bicycle rack capacity and height above the ground as shown on the drawings.
[2.6.2  Precast Concrete Bicycle Rack

Provide one-piece precast concrete bicycle rack base with embedded galvanized metal hitching loops. Design bicycle rack with wheel notches for bike support and wheel locking device.

]2.7  BOLLARDS

**************************************************************************
NOTE: Bollards are often included as a site furnishing but function primarily as a vehicle barrier; for bollard specification, verify cross reference with Section 34 75 13.13 CRASH RATED ACTIVE VEHICLE BARRIERS AND CONTROLS.
**************************************************************************

Provide reinforced concrete bollards [300] [450] mm [12] [18] inch [square] [round], height as indicated, suitable for ground mount installation. Provide exposed aggregate or sandblast finish as indicated; manufacturer's standard clear acrylic sealer. Submit manufacturer's descriptive data and catalog cuts.

2.7.1 Portland Cement

ASTM C150/C150M Type I II or III

2.7.2 Aggregate

ASTM C33/C33M, maximum size 19 mm 3/4 inch

2.7.3 Reinforcing Steel

ASTM A615/A615M

2.7.4 Integral Color

ASTM C979/C979M, pure mineral oxide, limeproof and non-fading

2.7.5 Concrete Strength

35 MPa 5000 psi, 28 day minimum compressive strength

2.7.6 Admixture

ASTM C260/C260M for air-entraining

2.8  PLANTERS [WASTE RECEPTACLES] [ASH RECEPTACLES]

[Provide for waste receptacles [spun aluminum] [reinforced fiberglass] [flat] [domed] tops and removable semi-rigid plastic liner insert.]
[Provide top-mounted ash trays for ash receptacles.] Waste receptacles must be furnished with weather protection, odor containment, and insect/animal-proofing. Container size must be [as directed] [_____].

2.8.1 Height

Trash and litter deposit openings must be between 800-1000 mm 30-40 inches above the ground.
2.8.2 Liners

Trash and litter receptacles must be furnished with [disposable inner-linings] [removable/reusable inner containers]. Self-dumping type designs to include hinged bottom, top or sides will be rejected.

2.8.3 Anchors

Trash and litter receptacles that can be anchored to resist overturning by typical use, high winds, or animals must be furnished and anchored in accordance with the manufacturer's recommendations.

2.8.4 Openings

Openings for trash and litter insertion must be a minimum of 100 mm 4 inches in diameter. Edges of the openings must be crimped, rounded and smoothed.

2.8.5 Ash Receptacles

Provide ash receptacles with a fire-proof metal bowl or screen or sand-filled containers for ash containment. Ash receptacles must have a minimum diameter of 200 mm 8 inches; ash containers must have a fire-proof metal bowl or screen and must be easily removable for cleaning.

2.8.6 Planter Size

The planter size must be determined according to the spacial root requirements at 2/3 maturity size of the designated plant material, in conformance with Section 32 93 00 EXTERIOR PLANTS.

2.8.7 Drainage

Drainage for the planter must be as follows: a minimum of one drainage hole in the base of each planter and a minimum 3 mm 1/8 inch space, in 2 locations, between the base of the planter and the supporting surface.

2.8.8 Base

The planter base must be capable of supporting the weight of the planter filled with both the designated plant material and fully saturated soil. The planter must not crack, overturn, or sink below the existing grade. Planters must allow for relocation.

2.8.9 Glass Fiber Reinforced Concrete (GFRC) Precast

Provide glass fiber reinforced concrete (GFRC) precast [planters] [waste receptacles] [ash receptacles] at locations indicated on the drawings. Comply with PCI MNL-117 and PCI MNL-128.

2.8.9.1 Materials

Provide manufacturer's standard shell thickness of 9 to 16 mm 3/8 to 5/8 inch.

2.8.9.1.1 Cement

ASTM C150/C150M, use only one brand and type of cement throughout the Project.
2.8.9.1.2 Glass Fibers

Alkali resistant (AR) glass fibers produced specifically for use in glass fiber reinforced concrete. Glass content of GFRC unit to be a minimum of three percent.

2.8.9.1.3 Aggregates

Clear silica sand passing 1.18 mm No. 16 sieve; washed, dried, and free from deleterious materials; provide type with successful history of use in GFRC and as standard with the manufacturer.

2.8.9.1.4 Compressive Strength

Minimum 20.7 MPa 3000 psi 28 day strength

2.8.9.1.5 Density

Approximately 1921 kg/cu. m 120 pcf

2.8.9.1.6 Polymer Admixture

Manufacturer's standard acrylic thermoplastic copolymer

2.8.9.2 Finishes

Provide factory finished units with manufacturer's standard texture or sandblasted finish as selected.

2.8.9.2.1 Cement

White or grey as consistent with final finish

2.8.9.2.2 Facing Aggregates

ASTM C33/C33M (less gradation), clean, hard, durable, inert, and free of staining and deleterious materials; as required to match approved samples

2.8.9.2.3 Color

ASTM C979/C979M, pure, non-fading mineral oxides which do not impair strength of GFRC; designed and mixed to provide color matching approved samples; maximum 10 percent cement weight

2.8.9.2.4 Applied Finishes

ASTM D4060 waterborne crosslinked acrylic 49.5 +/-2 percent solids by weight providing 1000 cycles per 0.0254 mm 1000 cycles per 0.001 inch resistance to abrasion

2.8.10 Precast Concrete/Cast Stone Planters

Provide reinforced precast concrete planters [waste receptacles] [ash receptacles] consisting of a mixture of cement, aggregates, and mineral colors suitable for exterior use as located on the drawings. Provide manufacturer's standard exposed aggregate or sandblast finish (with clear acrylic coating) as selected.

SECTION 12 93 00 Page 28
2.8.10.1 Portland Cement
   ASTM C150/C150M, gray, Type I

2.8.10.2 Aggregate
   ASTM C33/C33M, 2.36 mm No. 8 crushed limestone and sand

2.8.10.3 Galvanized Steel Mesh
   ASTM A1064/A1064M

2.8.10.4 Integral Color
   ASTM C979/C979M, pure mineral oxide, limeproof and non-fading

2.8.10.5 Concrete Strength
   30 MPa 4000 psi minimum compressive strength at 28 days

2.8.10.6 Admixture
   ASTM C260/C260M for air-entraining

2.8.11 Wood Containers

Provide manufacturer's standard [wood planter] [waste receptacle] [ash receptacle] fabricated of 19 mm 3/4 inch thick tongue and grooved wood slats permanently bonded with fiberglass interior shell. For top-trim, provide wood for square containers and fiberglass for round containers. Interior shell must be sufficient to protect wood from deterioration due to contact with soil and/or moisture.

**************************************************************************
NOTE: For wood species other than Redwood or Cedar use the next sentence in order to avoid contact with ground or finish grade in order to avoid moisture and insect damage. Redwood and Cedar are naturally rot and insect resistant.
**************************************************************************

[Elevate wood finishes at minimum 13 mm 1/2 inch above finish grade. ]Freestanding wood planters must be structurally sufficient to support saturated soil and designated plant materials at the designated mature size.

**************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective.
**************************************************************************

[ Provide certified sustainably harvested wood for wood containers.]

2.8.11.1 Wood Species

[Marine Teak] [Alaska Yellow Cedar] [Clear All-Heart California Redwood] [Purple Heart] [Ipe] [_____]
2.8.11.2 Fiberglass

Molded with multiple laminations of glass fiber impregnated with polyester isophthalic thermosetting resins with a finish of 0.30-0.38 mm 12-15 mil color impregnated polyester gel coat.

2.8.11.3 Metal Frame

Black color-coated steel frame

[2.8.12 Wood Planters with Metal Frames

Provide manufacturer's standard [wood planter][waste receptacle][ash receptacle] with galvanized steel welded frames, and nominal 50 mm two inch tongue and grooved, beveled or square cut wood staves. Attach wood staves to metal frame from inside with steel plated screws.

2.8.12.1 Wood Species

Kiln dried, maximum 19 percent moisture content, [Clear All Heart California Redwood] [Western Yellow Cedar] [Red Oak] [Phillipine Mahogany] [Purple Heart] [Ipe]

2.8.12.2 Metal Frame

Reinforced with steel bars in accordance with manufacture's standard construction, black color factory finish coated.

2.8.12.3 Bottom

6.25 mm 1/4 inch exterior grade redwood with drain holes

[2.8.12.4 Liners

Removable galvanized steel or manufacturer's standard

][2.8.12.5 Tops

[Hinged top opening] [spun aluminum open top with molded rim] [ash top]

][2.8.13 Fiberglass Planters [Waste Receptacles] [Ash Receptacles]

Provide reinforced fiberglass planters [waste receptacles] [ash receptacles] molded with multiple laminations of glass fiber impregnated with polyester isophthalic thermosetting resins; with 0.30-0.38 mm 12-15 mil color impregnated polyester gel coat finish; minimum thickness of 6.35 mm 1/4 inch; color as selected.

2.8.14 Metal Planters [Waste Receptacle]

Provide metal planters [waste receptacles] as indicated, fabricated from [perforated steel sheet material] [wire or diamond mesh steel sheet] [steel frame with steel staves welded to frame] [cast aluminum] [ cast iron]; powder coat finish, color as selected.

a. Metal thickness, width, and configuration must be manufacturer's standard. Chemically clean and phosphate coat prior to final powdercoat.
b. Provide **5 mm 3/16 inch** thick fiberglass-reinforced polyester resin liner in black for planter liners.

2.9 **SHELTERS**

**************************************************************************

NOTE: It is important that the drawings reflect the type and size of Shelter intended. The specifications are intended to cover everything from small BUS STOP SHELTERS to large PAVILION SHELTERS. Types of structural frames, roofing materials and facias, glazing systems, and foundations must be carefully coordinated with the drawings. These systems are all factory designed and prefabricated ready for site assembly.

**************************************************************************

**AISC 360**. Provide prefabricated shelter systems to meet design conditions indicated. Shelter design must conform to all applicable State and Local Building Codes and must meet manufacturer's standards of construction and materials. Shelter systems must be [preglazed] pre-drilled and pre-cut, shipped with all hardware and accessories necessary for complete field assembly.

2.9.1 Framing Systems

Framing system; columns, rafters, ridge, purlins and other structural framing members must be [aluminum] [steel] [wood] as indicated. Manufacturer must provide shop drawings and calculations prepared by a structural engineer.

<table>
<thead>
<tr>
<th>2.9.1.1 Aluminum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extruded aluminum alloy tubing must conform to ASTM B429/B429M 6063-T5 or 3003-H14, dark [medium] [light] bronze [black] [clear anodized] [powder coat] finish. Framing sizes and configurations must be as required for size of structure indicated meeting manufacturer's standards and applicable building codes.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>2.9.1.2 Steel</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structural steel must conform to ASTM A36/A36M or ASTM A500/A500M, 248 MPa 36,000 psi yield strength and 400 MPa 58,000 psi tensile strength, factory finished with rust inhibited primer and powder coat conforming to ASTM D3451. Framing sizes and configurations must be as required for size of structure indicated meeting manufacturer's standard and applicable building codes.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>2.9.1.3 Wood</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wood framing system must consist of surfaced four sides (S4S), #2 grade southern yellow pine [<em><strong><strong>] solid timber columns with eased edges, pressure treated against decay, fungi and insect infestation, surfaced four sides (S4S), #1 grade, southern pine, [</strong></strong></em>] glue-laminated columns manufactured in accordance with ANSI/AITC A190.1 and AITC certified glue-laminated structural grade southern yellow pine [_____] beams, rafters and purlins, factory sealed and individually wrapped for protection during shipment. Factory stain all wood members prior to shipment.</td>
</tr>
</tbody>
</table>

**************************************************************************

NOTE: Use certified sustainably harvested wood
[ Provide certified sustainably harvested wood for wood shelters.]

2.9.2 Roof Panels [Decking]

Provide manufacturer's standard [molded acrylic translucent roof panel] [standing seam metal roof panel] [wood decking] [V-beam aluminum roof panels] [FRP roof panels] [_____] roof panels as indicated. Materials must be factory finished and shipped with all necessary fasteners and accessories as required for complete site assembly.

2.9.3 Glazing

Factory installed in separate structural window frames, gasketed and glazed in accordance with manufacturer's standard, interchangeable, glazing system. Provide [6.35 mm 1/4 inch acrylic sheet] [6.35 mm 1/4 inch tempered glass] [6.35 mm 1/4 inch polycarbonate plastic sheet] [6.35 mm 1/4 inch mar-resistant polycarbonate plastic sheet], [clear] [_____] color.

2.10 TABLES

Picnic tables must be furnished with attached benches that have no backrests. Table's exposed edges and corners must be rounded, eased or chamfered.

2.10.1 Height

Between 750-1200 mm 29-48 inches from the finished grade to the lowest surface of the top, or as noted.

2.10.2 Clearance

A minimum vertical clearance of 230 mm 9 inches between the seat top and the bottom edge of the table top must be provided. A minimum of 460 mm 18 inches of leg space under tables, measured from the inside edge of the seat top to the nearest table support, must be provided. A minimum of 460 mm 18 inches from the end of the table top to the nearest support leg must be provided.

2.10.3 Top

Table top surfaces must not contain recesses that might hold water or food particles. The table top width must be a minimum of 460 mm 18 inches when utilized from one side only, and a minimum of 900 mm 36 inches when utilized from two sides. The table top length must be a minimum of 610 mm 24 inches per person.

2.10.4 Wheelchair Access

A minimum clear space of 740 mm 29 inches from the finished grade to the underside of the table must be provided for persons with disability to be able to pull a wheelchair beneath the table top at the end of the table; the minimum clear width must be 860 mm 34 inches.
2.10.5 Precast Concrete Tables

Provide reinforced precast concrete tables with smooth tops; minimum 35 MPa 4500 psi concrete, 28 day minimum compressive strength, consisting of a mixture of cement, aggregates, and mineral colors suitable for exterior use as located on the drawings. Provide manufacturer's standard exposed aggregate or sandblast finish with clear acrylic coating.

a. Portland cement: ASTM C150/C150M, gray, Type I.
b. Aggregate: ASTM C33/C33M, washed 2.36 mm No. 8 limestone and sand.
c. Galvanized wire mesh: 1.9 mm 14 gage, 50 by 50 mm 2 by 2 inch.
d. Welded wire fabric: ASTM A1064/A1064M

e. Reinforcing steel: ASTM A615/A615M

f. Integral color: ASTM C979/C979M, pure mineral oxide, limeproof and non-fading

2.10.6 Fiberglass Tables

Provide reinforced fiberglass table tops molded with multiple laminations of glass fiber impregnated with polyester isophthalic thermosetting resins, minimum thickness of 6 mm 1/4 inch with 0.30-0.38 mm 12-15 mil thickness color impregnated polyester gel coat, color as selected.

a. Steel pedestal base: ASTM A53/A53M Schedule 40 steel pipe, [38] [41] [60] mm [1-1/2] [1-5/8] [2-3/8] inch O.D.
b. Mounting: Type as indicated.
c. Metal finish: Powder coating conforming to ASTM D3451 testing.

2.10.7 Perforated Steel Tables

Provide 1.9 mm 14 gage [1.6 mm 16 gage] perforated steel sheet table tops with solid metal edges in accordance with manufacturer's standard. Weld tops to base as required for frame support.

a. Steel pedestal base: ASTM A53/A53M Schedule 40 steel pipe, 60 mm 2-3/8 inch O.D.
b. Mounting: Type as indicated.
c. Hardware: Zinc or cadmium plated nuts, bolts, screws, and lock washers.
d. Metal finish: Powder coating conforming to ASTM D3451 testing.

2.10.8 Wood Tables

Provide manufacturer's standard wood tables with wood [metal] [_____] bases as indicated. Provide fasteners and accessories required for onsite assembly. Kiln dry and pressure treat wood components to manufacturer's standard, maximum 19 percent moisture content. [Pre-treat metal components and provide manufacturer's standard primer and powder coat finish complying
with ASTM D3451, color as selected].

**************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective.
**************************************************************************

[ Provide certified sustainably harvested wood for wood tables.]

a. Design wood tables to sustain a live load of not less than 10 kPa 200 pounds per square foot.

b. Provide kiln dried, surfaced four sides (S4S), clear all sides wood slats of species and sizes indicated.
   (1) Species: [Teakwood] [Marine Teak] [Clear All Heart Redwood] [Red Cedar] [Alaska Yellow Cedar] [Clear Douglas Fir] [Ipe] [Mahogany] [Purple Heart].
   (2) Nominal wood slat sizes: 25 by 63 mm 1 by 2-1/2 inch [25 by 75 mm 1 by 3 inch] [50 by 75 mm 2 by 3 inch] [50 by 100 mm 2 by 4 inch].

c. Design bases of the materials listed below to support the loads imposed in the design of the tables.

d. Wood Support: Match in species, grade, grain, color and finish of the wood slats.

[e. Steel Support: ASTM A653/A653M].

[g. Cast Aluminum Support: ASTM B26/B26M or ASTM B108/B108M as applicable.]

2.11 [TREE GRATES]

Provide [cast aluminum] [cast iron] [cast bronze] [punched steel] [stainless steel] tree grates in [round] [square] model of sizes indicated on the drawings. Furnish complete with angle steel frames with finish to match tree grates.

]PART 3 EXECUTION

3.1 CHILDREN'S PLAY AREAS

Install the site furnishings outside the play structure use zone in accordance with ASTM F1487. Verify and mark the locations of the use zone. These zones are to be free from obstacles and hard surfaces. When child accessibility requirements are to be met, child anthropometric dimensions must be used and not adult anthropometric dimensions.

3.2 INSTALLATION

Verify that finished grades and other operations affecting mounting surfaces have been completed prior to the installation of site furnishings. Site furnishings must be installed plumb and true, at locations indicated, in accordance with the approved manufacturer's
3.2.1 Assembly and Erection of Components

New parts must be acquired from the manufacturer; substitute parts will not be accepted unless approved by the manufacturer. When the inspection of parts has been completed, the site furnishings must be assembled and anchored according to manufacturer's instructions or as indicated. When site furnishings are assembled at the site, assembly must not interfere with other operations or pedestrian and vehicular circulation.

3.2.2 Anchorage, Fastenings, and Connections

Furnish metal work, mounting bolts or hardware in ample time for securing into concrete or masonry as the work progresses. Provide anchorage where necessary for fastening furniture or furnishings securely in place. Provide, for anchorage not otherwise specified or indicated, slotted inserts, expansion shields, and power-driven fasteners, when approved for concrete; toggle bolts and through bolts for masonry; machine and carriage bolts for steel; through bolts, lag bolts, and screws for wood. Do not use wood plugs in any material. Provide non-ferrous attachments for non-ferrous metal. Make exposed fastenings of compatible materials, generally matching in color and finish the fastenings to which they are applied. Conceal fastenings where practicable.

3.3 WELDING

Perform welding, welding inspection, and corrective welding, in accordance with AWS D1.1/D1.1M. Use continuous welds on all exposed connections. Grind visible welds smooth in the finished installation.

3.4 TESTING

Test each site furnishing to ascertain a secure and correct installation. A correct installation must be according to the manufacturer's recommendations and by the following procedure: Measure the physical dimensions and clearance of each installed site furnishing for compliance with manufacturer's recommendations and as indicated. Site furnishings which do not comply must be reinstalled. Fasteners and anchors determined to be non-compliant must be replaced. Submit a written report describing the results of the testing and a report of post-installation test results.

3.5 FINISHES

3.5.1 Field Finishes

Where indicated, field finishes must be applied in accordance with Section 09 90 00 PAINTS AND COATINGS. Where dissimilar metals are in contact, protect surfaces with a coat conforming to SSPC Paint 25 to prevent galvanic or corrosive action. Where aluminum is in contact with concrete, mortar, masonry, wood, or absorptive materials subject to wetting, protect with ASTM D1187/D1187M, asphalt-base emulsion.

3.5.2 Repair of Zinc-Coated Surfaces

**************************************************************************
NOTE: Delete this paragraph when no galvanized items are specified.
**************************************************************************
Repair damaged surfaces with galvanizing repair method and paint conforming to ASTM A780/A780M or by the application of stick or thick paste material specifically designed for repair of galvanizing, as approved by the Contracting Officer. Clean areas to be repaired and remove the slag from the welds. Heat surfaces to which stick or paste material is applied, with a torch to a temperature sufficient to melt the metallics in stick or paste; spread the molten material uniformly over surfaces to be coated and wipe the excess material off.

3.6 BOLLARDS

Install in pipe sleeves embedded in concrete and filled with non-shrink grout or quick setting anchoring cement.

3.7 BICYCLE RACKS

Affix to base structure by flanges anchored to concrete or other existing masonry by expansion shields. Provide Series 300 stainless steel bolts to anchor aluminum alloy flanges, of a size appropriate to the standard product of the manufacturer. Where aluminum or alloy fittings or extrusions are to be in contact with dissimilar metals or concrete, give the contact surface a heavy coating of bituminous paint.

3.8 SHELTERS

Secure to the adjacent construction with the clip angles attached to the concrete. Secure to concrete with not less than two 13 mm 1/2 inch diameter expansion bolts.

3.8.1 Glazing

Factory install windows into separate structural frame. Miter corners and connect internally by extruded aluminum corner keys or screw bosses with tamper-proof stainless steel screws. Provide continuous gasketing around windows set to metal frames. Provide 13 to 19 mm 1/2 to 3/4 inch deep pocket for polycarbonate glazing. Fully gasket and frame in independent interchangeable factory assembled units. Affix to shelter frame with 5 mm 3/16 inch mustow head aluminum rivets at approximately 331 mm13-1/4 inches on centers for full 6.28 rad 360 degrees, rivet from inside of shelter.

3.8.2 Roof

Provide manufacturer's standard roof system including facia [gutter] assembly, ensuring a weather-tight seal and installation.

3.9 RESTORATION AND CLEAN UP

When the installation has been completed, clean up and protect the site. Existing areas that have been damaged from the installation operation must be restored to original condition at Contractor's expense.

3.9.1 Clean Up

The site must be cleaned of all materials associated with the installation. Site furnishing surfaces must be cleaned of dirt, stains, filings, and other blemishes occurring from shipment and installation. Cleaning methods and agents must be according to manufacturer's instructions or as indicated.
3.9.2 Protection

The area must be protected as required or directed by providing barricades and signage. Signage must be in accordance with Section 10 14 00.10 EXTERIOR SIGNAGE.

3.9.3 Disposal of Materials

Excess and waste material must be removed and disposed off Government property [____].

3.10 RE-INSTALLATION

Where re-installation is required, the following must be accomplished:

a. Re-install the product as specified. Material acquisition of replacement parts is the responsibility of the Contractor. Provide replacement materials that are new and supplied by the original manufacturer to match.

b. Damage caused by the failed installation must be repaired.

NOTE: This guide specification covers the requirements for prefabricated hydrotherapy equipment and required accessories.

This Section refers to Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for general requirements; always include Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT when this Section is used.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**PART 1   GENERAL**

1.1 RELATED REQUIREMENTS

The requirements of Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT apply to this Section.

1.2 REFERENCES

**NOTE: This paragraph is used to list the**
publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

NFPA 99 (2021; TIA 20-1) Health Care Facilities Code

UNDERWRITERS LABORATORIES (UL)

1.3 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other
submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Item M8040, Whirlpool, Extremity, Floor Mounted
Item M8050, Whirlpool, Leg, CRS, Floor Mounted
Item M8055, Whirlpool, Leg, Floor Mounted

Submit field tests and inspection reports for each item of equipment listed above signed by authorized official responsible for field tests and inspections.

SD-10 Operation and Maintenance Data

Submit Data Package 3, including training requirements, for each item of equipment listed above in accordance with requirements of Section 01 78 23 OPERATION AND MAINTENANCE DATA. In addition, provide hard copies consisting of two Operator's Manuals and two Service Manuals.

1.4 WARRANTY

Provide warranties as specified in this Section. Refer to Article WARRANTY in Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for [additional] requirements.
PART 2   PRODUCTS

2.1 MATERIALS

2.1.1 Stainless Steel

Class 301, 302, or 304. Satin finish for exposed surfaces and No. 4 finish for interior surfaces.

2.1.2 Aluminum Alloy

ASTM B221 equivalent in ultimate tensile, yield, and shear strengths to Alloy 6063-T5 or 6063-T6, as applicable.

**************************************************************************

NOTE: Select project-specific equipment items from the list below and delete equipment items not used. Additional equipment items may be added as required to suit project-specific conditions.

**************************************************************************

2.2 EQUIPMENT

[2.2.1 Item M8000, Shower Trolley System, Complete

Adjustable height shower trolley with locking castors and shower panel.

Provide shower trolley that is hydraulically height-adjustable from minimum 622 mm 24-1/2 to 1016 mm 40 inches, with a load limit of 149.7 kg 330 lbs. Shower trolley includes mattress, pillow, and protective side rails which can be lowered for ease of patient transfer. Shower trolley includes a combination of directional castors and straight steering castors with a minimum of two braking castors. Provide trolley stretcher that is sloped, tilt-able, have automatic leveling, and drain plug.

Approximate total size of unit is 2108 mm 83 inches long by 686 mm 27 inches wide.

Provide shower trolley complete with wall-mounted Shower Panel with sink and includes patient shower hose, thermostatic mixing valve, hot and cold water supply, temperature gauge and cleaning system. Approximate size of Shower Wall Panel with valve and hoses is 762 mm 30 inches wide by 191 mm 20 inches high by 508 mm 7-1/2 inches deep.

][2.2.2 Item M8002, Shower Cabinet, Complete

Provide freestanding Shower Cabinet with Shower Wall Panel with a max load of 149.7 kg 330 lbs. The unit includes shower hose, safety straps, water temperature gauge, back flow prevention, drain size of at least 40 mm 1-1/2 inches, thermostatic mixing valve, and disinfecting system.

Approximate size of the Cabinet is 762 mm 30 inches wide, 940 mm 37 inches high, 1092 mm 43 inches deep. Electrical Characteristics: 120 Volt / 60 Hz. Approximate Size of Wall Panel: 432 mm 17 inches wide, 483 mm 19 inches high.

Unit includes a mobile lift chair to assist in transferring patient to and from the shower cabinet in a seated position. Mobile lift chair includes hand grips, safety belts to secure the patient, and a weight capacity of
149.7 kg 330 lbs. Unit is battery powered.

Adjustable working height range is 483 mm to 965 mm 19 inches to 38 inches. Approximate dimensions of the mobile lift chair unit is 1143 mm 45 inches long, 737 mm 29 inches wide, 1778 mm 70 inches high. Approximate dimensions of the seat is 483 mm 19 inches wide, 356 mm 14 inches deep.

][2.2.3 Item M8005, Bath, Hydrotherapy, Full Body

Stationary full body whirlpool immersion tank. Construction is seamless welded heavy gauge stainless steel. Tank capacity is 1609 liters 425 gallons. Tank is reinforced stainless steel base, cove bottom, adjustable legs, adjustable head rest, thermometer, thermostatic mixing valve. Tank fittings are two 32 mm 1-1/4 inch overflows and one 32 mm 1-1/4 inch filler spout. Water level and direction are adjustable.

Twin turbine assembly has UL listed 1/2 HP jet pump motor with automatic thermal overload protector and lifetime-sealed bearings. Twin turbine assembly is mounted on carriages with automatic counter balance and function as agitator. All parts of turbine assembly that contact the water are stainless steel, chrome plated brass or bronze.

Unit includes patient lift device and attachment providing means of connecting patient lift device.

Approximate Size: 2692 mm 106 inches long, 1956 mm 77 inches wide, 559 mm 22 inches deep.

][2.2.4 Item M8010, Pool, Hydrotherapy, Tank

Provide unit shell constructed of fiberglass and includes adjustable speed water current and multiple depths. Unit includes treadmill, patient entry and exit stairs, and handrails. Unit includes electric heater, pump, filter, skimmers, water testing and maintenance kit, and accessible steps and handrail.

Length: Up to 6.096 m 20 feet.

Width: Up to 6.096 m 20 feet.

Height: Up to 1.829 m 6 feet.

Separate mechanical pit to house electrical equipment, pumps and filtration system is required.

][2.2.5 Item M8015, Bath, Hydrotherapy, Sitting

Freestanding hydrotherapy sitting bath with freestanding mobile lift.

Provide freestanding hydrotherapy sitting bath constructed of gel coated molded fiberglass plastic. Shape allows for comfort and safety with foot rests and seat.

Approximate Outside Size: 2388 mm 94 inches long by 838 mm 33 inches wide. Approximate Inside Size: 1753 mm 69 inches long by 762 mm 30 inches wide at shoulders and 559 mm 22 inches wide at feet. Adjustable Rim Height: 686 mm 27 inches to 1143 mm 45 inches max

The unit includes a minimum of two whirlpool outlets, maximum of four,
anti-scald thermostatic mixing valve for filling and showering, integrated control console, auto fill and auto shut-off, scalding protection, cleaner/disinfection system, a bath oil/shampoo dispensing system, and hand-held shower spray wand.

Electrical Characteristics: 120 Volt, single phase, 60 Hz.

Freestanding mobile lift includes sitting bath system. Height adjustable lift is battery operated, with molded polyurethane seat and toilet opening, non-slip grip handles, integral resident handles, handset control and operator panel, visual brake indicator, safety belt or strap, emergency up and down, and 158.8 kg 350 lb work load.

Unit includes two interchangeable batteries and wall charger.

][2.2.6 Item M8020, Bath, Hydrotherapy, with Elevating Tub

The bathtub unit is freestanding with adjustable height. The unit includes whirlpool system, handheld shower wand, water temperature display, and a cleaning system. The unit includes thermostatic mixing valve and backflow prevention. Hot / Cold water supply lines are 20 mm 3/4 inch, and the drain is 40 mm 1-1/2 inches. Weight capacity is 149.7 kg 330 lbs. Water capacity is 178 liters 47 gallons minimum.

Approximate Size: 889 mm 35 inches wide, 2286 mm 90 inches long, 610 mm to 991 mm 24 inches to 39 inches high.

][2.2.7 Item M8025, Bath, Hydrotherapy, Burn, with Lift

Provide hydrotherapy treatment bathing system that is height-adjustable. The unit is a chemical-resistant stainless steel tub. Unit includes digital temperature control, treatment hose with wall attachment, thermostatic mixing valve, and cleaning disinfecting system. Weight capacity of the unit is 149.7 kg 330 lbs. Unit has 20 mm 3/4 inch supply lines.

Electric characteristics: 120 V single phase AC, 60 Hz.

Approximate size of unit: 2337 mm 92 inches long, 838 mm 33 inches wide, 584 mm to 991 mm 23 inches to 39 inches high.

Unit includes mobile patient lift with hand grips, safety belts, low-friction castors, and emergency stop button. Mobile lift unit is height-adjustable, with working load of 158.8 kg 350 lbs.

Approximate size of mobile lift unit is 864 mm 34 inches wide, 813 mm 32 inches deep, 1727 mm 68 inches high.

][2.2.8 Item M8035, Whirlpool, Arm, Pedestal Mounted

Mobile whirlpool tank recommended for treatment of extremities. Tank is seamless welded construction, of heavy gauge type 304 stainless steel. Tank rim is reinforced with concealed stainless steel rod. Tank bottom is seamless, coved design to minimize bacteria build-up. Provide unit with thermometer. Tank has a minimum of 57 liters 15 gallon capacity.

Unit has heavy duty swivel casters with locking device on rear pair.

Unit has turbine assembly with raising and lowering device which functions
as agitator and emptying device, permits adjustment of water height, direction of water agitation, and locks in place. Turbine assembly has UL listed 1/2 HP jet pump motor with automatic thermal overload protector and lifetime-sealed bearings. All parts contacting water are stainless steel, chrome plated brass or bronze.

Unit includes lift to raise and lower the mobile whirlpool tank to allow for treatment of upper and lower extremities. Lift frame includes clamp for attaching whirlpool unit and push bar to assist when moving whirlpool unit. Frame, clamp and push bar are steel. Crank handle includes brake lever to lock handle into place.

Approximate Size of Unit: 635 mm 25 inches long, 330 mm 13 inches wide, 381 mm 15 inches deep.

[2.2.9  Item M8040, Whirlpool, Extremity, Floor Mounted]

Stationary whirlpool tank recommended for treatment of extremities. Tank is seamless welded construction, of heavy gauge type 304 stainless steel. Tank rim is reinforced with concealed stainless steel rod. Tank bottom is seamless, coved design to minimize bacteria build-up. Unit has thermostatic mixing valve, and thermometer. Tank has a minimum 136 liter 36 gallon capacity.

Provide unit with a 50 mm 2 inch combination drain and overflow and filler spout.

Unit has turbine assembly with raising and lowering device which functions as agitator and emptying device, permits adjustment of water height, direction of water agitation, is spring balanced and locks in place. Turbine assembly has UL listed 1/2 HP jet pump motor with automatic thermal overload protector and lifetime-sealed bearings. All parts contacting water are stainless steel, chrome plated brass or bronze.

Approximate Size of Unit: 813 mm 32 inches long, 381 mm 15 inches wide, 635 mm 25 inches deep.

[2.2.10  Item M8050, Whirlpool, Leg, CRS, Floor Mounted]

Stationary whirlpool tank recommended for treatment of extremities. Tank is seamless welded construction, of heavy gauge type 304 stainless steel. Tank rim is reinforced with concealed stainless-steel rod. Tank bottom is seamless, coved design to minimize bacteria build-up. Unit has thermostatic mixing valve, and dual scale thermometer with adjustable calibration. Tank has a minimum 227 liter 60 gallon capacity.

Provide unit with a 50 mm 2 inch combination drain and overflow and filler spout.

Unit has turbine assembly with raising and lowering device which functions as agitator and emptying device, permits adjustment of water height, direction of water agitation, is spring balanced and locks in place. Turbine assembly has UL listed 1/2 HP jet pump motor with automatic thermal overload protector and lifetime-sealed bearings. All parts contacting water are stainless steel, chrome plated brass or bronze.

Approximate Size of Unit: 1067 mm 42 inches long, 508 mm 20 inches wide, 711 mm 28 inches deep.
2.2.11 Item M8055, Whirlpool, Leg, Floor Mounted

Stationary whirlpool tank recommended for treatment of extremities, hip and back area. Tank is seamless welded construction, of heavy gauge type 304 stainless steel. Tank rim is reinforced with concealed stainless steel rod. Tank bottom is seamless, coved design to minimize bacteria build-up. Unit has thermostatic mixing valve, and dual scale thermometer with adjustable calibration. Tank has a minimum 341 liter 90 gallon capacity.

Provide unit with a 50 mm 2 inch combination drain and overflow and filler spout.

Unit has turbine assembly with raising and lowering device which functions as agitator and emptying device, permits adjustment of water height, direction of water agitation, is spring balanced and locks in place. Turbine assembly has UL listed 1/2 HP jet pump motor with automatic thermal overload protector and lifetime-sealed bearings. All parts contacting water are stainless steel, chrome plated brass or bronze.

Approximate Size of Unit: 1524 mm 60 inches long, 610 mm 24 inches wide, 457 mm 18 inches deep.

]PART 3   EXECUTION

3.1 WORKMANSHIP

Comply with UL 60601-1. Surfaces to be welded are to be free from grease, oil, dirt or other foreign materials. Grind exposed welds smooth to blend with adjacent surfaces. Welds to be continuous, sound, unbroken, clean, and free from pitting, splatter and discoloration.

Exposed corners and edges to be rounded to eliminate sharp edges. All exposed surfaces, including inside of tank, to be free from pit-marks, weld seams, and scale. Finish to be No. 4 commercial, uniform and free of course grind marks or scratched areas.

3.2 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.3 INSTALLATION

Install equipment at locations indicated in accordance with manufacturer's printed installation instructions, Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT, NFPA 70, NFPA 99 and approved detail drawings. Submit detail drawings specifically prepared to illustrate required work for each item of equipment that interfaces with other items of equipment or construction, including, but not limited to, installation layout, coordination of equipment services, [drain piping connections,] [complete electrical wiring and control diagrams,] and details of construction and rough-in requirements. Furnish and install necessary items such as framing, mounting hardware and trim required for the type of equipment furnished.

3.4 ADJUSTING

Following installation, adjust flows, timers, levelers, and similar
components and operation devices as appropriate. After testing, and before acceptance, examine equipment to ensure that adjustments are correct and that any additional adjustments deemed necessary during product testing have been incorporated.

3.5 UTILITIES

3.5.1 Service Runs

Connect service runs from equipment to building services as indicated.

3.5.2 Dissimilar Metal Connectors

Provide connections between ferrous and nonferrous metallic pipe with dielectric waterways and flanges. Provide dielectric waterways with temperature and pressure rating equal to or greater than that specified for the connecting piping. Provide waterways with metal connections on both ends suited to match connecting piping. Internally line dielectric waterways with an insulator specifically designed to prevent current flow between dissimilar metals. Dielectric flanges must meet the performance requirements described herein for dielectric waterways.

3.6 MANUFACTURER'S FIELD SERVICES

Provide the services of a manufacturer's representative [, in conjunction with][, in addition to] [the Contractor's Equipment Planner,] [and] [the Contractor's Biomedical Equipment Technician,] [the Government's Biomedical Equipment Technician,] who is experienced in the installation, adjustment, and operation of the equipment specified, and responsible for supervising the installation, adjustment, and testing of the equipment.

3.7 FIELD TESTS AND INSPECTIONS

3.7.1 Before Testing

Clean pipes, equipment and components of grease, dirt, stains, and other foreign materials.

3.7.2 Testing

Perform testing in accordance with manufacturer's written instructions. Unless otherwise approved by the Contracting Officer, test all items of equipment to ensure that they are operational and installation conforms to specification requirements. Hydrostatically test piping system at pressure of 1.5 times system operating pressure with water at temperature not exceeding 38 degrees C 100 degrees F. Before test, remove or isolate gage traps and apparatus that may be damaged by that pressure. Install calibrated test gage in system to observe any loss of pressure. Close off system and maintain test pressure for not less than one hour. Inspect joints and equipment connections for leaks. Retest and make repair until no further leaks are observed. Each test report must indicate compliance with specified performance criteria and the final position of controls.

3.7.3 Inspection

Examine each item for visual defects and conformance to specifications.
3.8 CLEANING

3.8.1 For Final Acceptance

Remove labels, fingerprints, and clean all surfaces both inside and out. Tightly cover and protect fixtures and equipment against rust, dirt, water, and chemical or mechanical injury.

3.8.2 Marred Surfaces Exposed-to-View

Refinish marred exposed surfaces that affect appearance, such as interior and exterior cabinet finishes, to match the adjacent finishes, like new; replace components that cannot be refinished in this manner.

3.8.3 Concealed Marred Surfaces

Refinish marred surfaces exposed to atmosphere, where such surfaces do not affect product's appearance but do affect resistance to elements, such as galvanized pipes and insulation, to equal resistance performance as the unmarred surfaces.

3.9 TRAINING

3.9.1 Training Course

Conduct training course for operation staff as designated by the Contracting Officer. Start the training period, for a total of [___] hours of normal working time, after systems are functionally complete but prior to final acceptance. The field instructions must include all of the items contained in the approved operations and maintenance data, as well as demonstrations of routine maintenance operations. Notify Contracting Officer at least 14 days prior to date of the training course.

[3.9.1.1 Government's Biomedical Equipment Technician Training

Include operator's training for one Biomedical Equipment Technician (BMET) for each procured equipment item.

] -- End of Section --
SECTION 13 21 26  Page 1
NOTE: This guide specification covers the requirements for requirements for walk-in refrigerators and freezers.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Lighting and refrigeration equipment are included in this guide specification.

NOTE: Indicate the following information on the project drawings for each cold storage room:

1. Configuration and dimensions (width, length, and height).

2. Schematic design of the cold storage room showing locations of shelves, light fixtures, and equipment. Include depressed pad for tile flooring applications.
3. Sections showing supporting steel for ceiling panels if required for the project.

4. Details of shelves.

5. Details and location of light fixtures.

6. Location of refrigeration equipment.

7. Storage temperature, cooler capacity, evaporator air flow rate, and evaporator temperature.

8. Electrical characteristics for lights, condensing units, and evaporators.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AIR-CONDITIONING, HEATING AND REFRIGERATION INSTITUTE (AHRI)

AHRI 365 (2009) Commercial and Industrial Unitary Air-Conditioning Condensing Units

AHRI 366 (2009) Commercial and Industrial Unitary Air-Conditioning Condensing Units

1.2 SUBMITTALS

***************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other
submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 REFRIGERATION PIPING

**************************************************************************
NOTE: Insert appropriate Section number and title in blank below using format in accordance with UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard.
**************************************************************************

Provide as specified in Section [____].

PART 2 PRODUCTS

2.1 COLD-STORE ROOMS

**************************************************************************
NOTE: Select the appropriate type, size, and style from the latest edition of MIL-R-43900.
**************************************************************************

2.1.1 Requirements

MIL-R-43900, factory fabricated type with the following requirements:

a. Type [____]
b. Size [____]
c. Style [____]
d. Entrance doors must be [swing] [sliding] type with [right-handed] [left-handed] openings.
e. Refrigeration systems must be the [remote] [self-contained] type.
f. Electrical characteristics.
g. Preservation and packing must be commercial grade.
h. Recording thermometer.
i. Temperature alarm system [with connector for remote temperature alarm].
j. Interior lighting.
[k. Outdoor weather cap.]
1. Outdoor condensing unit cover.

m. Strip curtains.

n. Condensing unit outdoor controls for operation down to [_____] degrees C
   [_____] F ambient temperature.

  o. Foam plastic insulation **flame spread and smoke index** limits in
     accordance with requirements in **ICC IBC Chapter 26 Plastic**.

2.2 **SHELVES**

CID A-A-52128, stationary type, slotted shelves, stainless steel
construction, 450 to 500 mm 18 to 20 inches front to rear, by 1200 mm 48
inches long, by 1470 to 1680 mm 58 to 66 inches high, except where
indicated otherwise.

2.3 **REFRIGERATION EQUIPMENT**

******************************************************************************
NOTE: Select the first statement for NAVFAC projects, or the second statement for USACE.
******************************************************************************
Refrigeration system equipment for cold storage to be as specified under
Section 23 63 00.00 10 COLD STORAGE REFRIGERATION SYSTEMS.

[ Provide refrigeration system equipment for cold storage in accordance with
Section 23 63 00.00 10 COLD STORAGE REFRIGERATION SYSTEMS.

] MIL-R-43900, except as modified in this section. Design refrigerant
equipment for [remote][self-contained] installation. Design units for 16
to 18 hour operation at the indicated interior temperature in [_____] degrees C
[_____] F ambient temperature. Provide equipment with
capacities, air delivery, and dimensions indicated. Provide refrigeration
equipment that is **Energy Star** labeled. Provide data identifying **Energy Star**
label for refrigeration equipment.

2.3.1 Remote Condensing Units

Factory fabricated and rated in accordance with **UL 1995** and**AHRI 366 (SI)**
**AHRI 365 (I-P)**. Provide with motor, [air-cooled] [water-cooled] condenser,
receiver, compressors, mounted on a common base. Provide [hermetic]
[accessible hermetic] type compressors.

Provide in accordance with **ANSI/ASHRAE 15 & 34** and **ASHRAE 189.1**. Provide
preassembled remote condensing unit assembly with all necessary components
factory installed and wired including electrical box, time clock, drier,
sight glass,[ winter control and crankcase heater][ enclosed compressor
housing,] and compressor rack.[ Set chiller to operate at [[1][minus
1][minus 18][_____] degrees C[33][30][0][_____] degrees F] [temperature
shown on plans]. Mercury is prohibited for use in thermometers.
Chlorofluorocarbon (CFC) based refrigerants are prohibited.

2.3.2 Evaporators

Factory fabricated and rated in accordance with **UL 412** and **AHRI 420**.
Provide forced convection, unit cooler type, made to be suspended from the
ceiling panels, with forced air discharged parallel to the ceiling. Provide with air circulating motor, multifin tube-type coil and grille assembled within a protective housing. Air circulation motors must be lifetime sealed. The entire unit cooler assembly must be accessible for cleaning. Provide a drip pan and drain connection. When the cold storage room is used for freezing, provide an automatic [hot gas] [electric heat] defrosting system. Provide [timer] [demand] type defrost controllers.

2.3.3 Self-Contained Refrigerant Systems

**************************************************************************
NOTE: Select mounting. Side-mounted units are available in sizes up to 6 kW 7 1/2 horsepower. Top-mounted units are available in sizes up to 4 kW 5 horsepower.
**************************************************************************

Factory fabricated in accordance with UL 427 for [side-wall] [top-wall] mounting. Systems to include a condensing unit mounted on the exterior and a forced air evaporator mounted on the interior directly opposite.

Provide in accordance with ANSI/ASHRAE 15 & 34 and ASHRAE 189.1. Provide condensing unit assembly with all necessary components factory installed and wired including electrical box, time clock, drier, sight glass, [winter control and crankcase heater][ enclosed compressor housing,] and compressor rack. [Set chiller to operate at [[1][minus 1][minus 18][_____] degrees C [33][30][0][_____] degrees F] [temperature shown on plans]] Mercury is prohibited for use in thermometers. Chlorofluorocarbon (CFC) based refrigerants are prohibited.

2.4 HEATING CABLE

**************************************************************************
NOTE: The following paragraph is for units operating at below-freezing temperatures.
**************************************************************************

Provide condensate drain lines and drains below freezer floors with electric heating cable, thermostatically controlled to maintain [_____] degrees C [_____] F at zero flow rate. Provide [_____] cable size and [_____] watts per meter (linear foot).

PART 3 EXECUTION

3.1 INSTALLATION

Provide in accordance with NSF/ANSI 7, ANSI/ASHRAE 15 & 34, ASHRAE 189.1, and with the manufacturer's printed instructions. Submit installation instructions covering both assembly of the rooms and installation of the refrigeration equipment, for approval by the Contracting Officer's Representative prior to starting installation. Include equipment start-up and initial operation as well as evacuation and charging procedures for refrigeration equipment in the installation instructions.

3.2 MANUFACTURER'S FIELD SERVICES

3.2.1 Services

Provide manufacturer's representatives who are trained to perform the
services specified. Representatives to provide training services on the following procedures:

a. Erection, alignment, and testing.

b. Charging equipment with refrigerant and oil.

c. Starting equipment and training government personnel in proper care, operation, and maintenance.

3.3 TESTS

Perform the tests for each room and provide everything required. Notify the Contracting Officer 10 days before performing the tests. Perform tests in the presence of a manufacturer's representative.

3.3.1 Start-Up and Operational Tests

Upon completion of equipment and refrigerant piping installation, start-up and operate systems for a period of not less than 24 hours. Place safety and automatic controls in operation and sequence. Record manufacturer's recommended readings hourly.

3.3.2 Performance Tests

Upon completion of operational tests, performance test systems for not less than 8 hours. Include the following information in the test report with conclusions regarding the adequacy of systems:

a. Time, dates and duration of tests.

b. Inside dry-bulb and wet-bulb temperatures maintained in each room during tests employing recording instruments calibrated before the tests.

c. Outside dry-bulb and wet-bulb temperatures obtained from recording instruments calibrated and checked hourly with a sling psychrometer.

d. Evaporator and condenser entering and leaving temperatures taken hourly with compressors in operation.

e. Make, model and capacity of each evaporator and condensing unit.

f. Voltmeter and ammeter readings for condensing units and evaporators.

3.4 OPERATING INSTRUCTIONS

Provide a framed and glassed control chart indicating layout of refrigeration systems, including piping, valves, wiring, and control mechanisms. Install control chart where directed. Submit printed instructions covering the maintenance and operation of refrigeration equipment. Tag shutoff valves in accordance with printed instructions. Provide special tools necessary for repair and maintenance of the equipment. Submit data package 2 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

3.5 CLEANING

Remove masking protection from stainless steel and other finished
surfaces. Wash and clean floors, walls, shelves, and ceilings inside rooms and on exposed exterior surfaces. Clean glass, fixtures and fittings.

3.6 INSTRUCTING OPERATING PERSONNEL

Upon completion of the work and at a time designated by the Contracting Officer, provide instruction to Government personnel in the operation and maintenance of each refrigeration system. Duration of instruction must be a minimum of one 8-hour working day.

1.2 RELATED REQUIREMENTS

Conform to Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT. Provide the final utility connections and utility service to the equipment in accordance with Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS; and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

1.3 PERFORMANCE REQUIREMENTS

1.3.1 Noise Dampening Performance

a. **Noise reduction**: The noise reduction from the outside to the inside of a properly installed audiometric test chamber, as tested in accordance with ASTM E596 and performed in a recognized, independent and approved laboratory, shall be not less than the values in the following table:

<table>
<thead>
<tr>
<th>Octave-band Center Frequency-Hz</th>
<th>125</th>
<th>250</th>
<th>500</th>
<th>1000</th>
<th>2000</th>
<th>4000</th>
<th>8000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Noise reduction in dB</td>
<td>24</td>
<td>30</td>
<td>40</td>
<td>50</td>
<td>55</td>
<td>55</td>
<td>55</td>
</tr>
</tbody>
</table>

b. **Sound absorption**: The sound absorption of the composite metal and sound-absorbing panel assembly, as tested in accordance with ASTM C423 and performed in a recognized independent and approved laboratory, shall not be less than the values in the following table:

<table>
<thead>
<tr>

C. Interior noise level: The interior ambient noise level measured inside of a properly installed audiometric test chamber, as tested in accordance with ASA S3.1 and performed in a recognized independent and approved laboratory, shall be not greater than the values in the following table (ventilation fan on):

1.4 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will
review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Conform to submittal requirements of Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT.

PART 2   PRODUCTS

2.1 GENERAL CHARACTERISTICS

a. The manufacturer shall certify the audiometric testing [room] [booth] as a quiet environment for the testing of hearing.

b. Construct the audiometric testing [room] [booth] of modular panels to allow expeditious installation and relocation of the booths.

c. Equip the audiometric testing [room] [booth] with a window, an audiometric jack panel underneath the window, an inside light, and a ventilation system.

d. Design the [room] [booth] to allow for installation within 4 inches of walls.

2.2 MATERIALS AND CONSTRUCTION

[Single wall] [Double wall].

2.2.1 Walls and Roof Panels

Construct the walls and roof panels as a multilayered sandwich of acoustical materials. The overall thickness of the panels shall be 100 mm [4 inches]. The outer panels shall be 16 gage, cold-rolled steel. The inner surface shall be 22 gage, cold-rolled steel with 2 mm [3/32 inch] perforations at 5 mm [3/16 inch] staggered-on-centers. Frame the panels using 16 gage channels with continuous arch-welded joints. The average weight of the panels shall be a minimum of 50 kg per square meter [10 pounds per square foot]. The total weight of the panel shall be a maximum of 182 kg [400 pounds].

2.2.2 Floor Panel

Construct the floor panel as a multilayered sandwich of materials to allow for the support of a load of 240 kg per sq m [50 pounds per square foot]. The overall thickness of the floor shall be 100 mm [4 inches]. The walking surface shall consist of a minimum of 11 gage, corrosion-resistant steel; the bottom surface shall consist of a minimum of 16-gage steel,
structurally reinforced. The average weight of the floor panel shall be a minimum of **50 kg per sq m 10 pounds per square foot**. The total weight of the panel shall be a maximum of **182 kg 400 pounds**.

2.2.3 Vibration Isolation

Provide vibration isolation by mounting the audiometric test chamber mounted on vibration isolation rails, consisting of rubber-in-shear isolators mounted to **75 mm 3 inch** structural channels for weight distribution. The vibration isolators shall have a natural resonant frequency of 6 1/4 Hz for maximum elimination of structure-borne vibration.

2.2.4 Door

The door shall be acoustically sealed and provide a minimum clear opening of **810 mm 32 inches**. Unless otherwise indicated, the door shall be hinged on the right (facing outward) and shall swing out of the chamber. The door shall be constructed using materials similar to those used for the wall panels. Equip the door with two magnetic compression seals spaced to provide dead airspace. Equip the bottom of the door with either a gravity-activated seal or a compression seal activated by a cam seating of the door within the frame. Provide either surface mounted or butt-type hinges. If butt-type hinges are used, the magnetic seals shall not be broken by the hinges. The hinges shall contain a cam-lift mechanism to ensure proper seating of the door.

2.2.5 Wall and Corner Joiners

All wall and roof panels shall be acoustically and structurally joined together using a member shaped according to the corner or joint configuration. The member shall be made of 16-gage steel and shall be made to allow for the use of pop rivets or sheet metal screws to fasten it in place. The dead airspace between the panels and the member shall be filled with acoustical material and shall be caulked for air-tight integrity.

2.2.6 Acoustical Fill

Fill all panels, walls, and doors with inert mildew- and vermin-resistant acoustical attenuating and absorbing material. When tested in accordance with ASTM E84, the material shall have maximum fire hazard ratings of 25 for flame spread, zero for fuel contribution, and 50 for smoke density.

2.2.7 Windows

**600 mm wide by 760 mm 24 inches wide by 30 inches** high, double-glazed, using **6 mm 1/4 inch** safety glass. Mount glass with acoustically tight rubber gaskets.

2.3 UTILITY FEATURES

2.3.1 Jack Panel

The jack panel shall be insulated and shall contain six 3 wire, phone-type jacks with covers with one three-pin and one four-pin connector per panel, in accordance with the manufacturers standard. Each phone jack shall be insulated from the booth and from the other jacks. The jack panels shall be designed to preserve the acoustical integrity of the room.
2.3.2 Ventilation System

The ventilation system shall be incorporated into the roof panel, except where a multiposition chamber is specified the vent system shall be incorporated into the wall. The silencer for the ventilation system shall not intrude into the room. The noise from the ventilation system shall be below the threshold of hearing when measured 900 mm 3 feet from the opening. The airflow shall be a minimum of 50 L/s 100 cubic feet per minute, except where a multiposition chamber is specified.

2.3.3 Electrical System

Equip the chamber with a recessed 110 volt light fixture with a 40 watt incandescent lamp, except in multiposition test chambers, where indicated. The chamber shall be prewired and shall include switches mounted 1400 mm 4 feet 8 inches above the floor, opposite the side of the door hinges for the light fixture and the ventilation fan. Electrical components shall be UL approved. Factory installed internal wiring shall be in rigid conduits conforming to UL 6, concealed in the chamber. Wiring shall extend to the outside of the enclosure connecting to a prewired electrical harness terminating in a 4 meter 12 foot powercord with a hospital grade plug. Provide convenience outlets as indicated.

2.3.4 Floor Covering

Cover the floor with a 100-percent, continuous-filament nylon carpet on a pad. The carpet and pad system shall comply with ASTM D2859 and shall have a minimum average critical radiant flux of 0.25 watt per square centimeter when measured in accordance with ASTM E648.

2.3.5 Finish

Exposed sheet metal surfaces shall be cleaned and degreased. Fill and grind welds smooth. Prime metal with a rust-inhibiting chromate modified alkyd primer. The finish coat shall be an acrylic enamel-type paint. The quality standards of the NAAMM AMP 500 National Association of Architectural Metal Manufacturers shall apply. Color shall be selected from the manufacturers color standards.

2.4 MULTIPOSITION TEST CHAMBERS

The following additional requirements shall be provided:

a. The jack panels shall provide two 3-wire phone jacks per position. The wiring for the group system jacks shall be Contractor-furnished but Government-installed.

b. Each position within the test chamber shall be divided by a heavy canvas divider.

c. Provide metal stools with upholstered tops.

d. Vibration isolator rails shall extend the full length of the long dimension of the test chamber.

e. Ventilation systems shall be installed on the exterior walls. The airflow shall be a minimum of 140 L/s 300 cubic feet per minute for 4 position rooms, 210 L/s 450 cubic feet per minute for 6 position rooms, and 240 L/s 500 cubic feet per minute for 10 position rooms.
f. The window shall be mounted in the door.

2.5 ITEMS

Items are listed by joint schedule number (JSN) referenced from MIL-STD-1691.

**************************************************************************
NOTE:  1. All available item specifications applicable to this section have been furnished in joint schedule number (JSN) alpha-numerical order. The JSN is referenced from MIL-STD-1691.
2. Delete any items not used, and add additional items as required.
**************************************************************************

**************************************************************************
NOTE: The first paragraph following is a sample guide to be used in generating an item specification. The item number should correspond with the JSN used on the schedule. If no JSN is available, have the item number correspond with the appropriate identification code used on the contract documents.
**************************************************************************

2.5.1 Item [_____, [______]:

**************************************************************************
NOTE: In paragraph entitled "Item [_____, [______]" insert the item identification number and the item name in the first blank space, respectively. Insert a description of the item in the second blank space to determine the type of product required. Avoid repetition of detailed information which is to appear in the salient features listed thereafter. In paragraphs entitled "Item M-0250, Audiometric Testing Room" and "Item M-0300, Audiometric Examination Booth" use the second bracketed option for double wall construction.
**************************************************************************

The unit shall be [_____]"

2.5.1.1 Include the following:
[a. [_____]"
[b. [_____]"
[c. [_____]"

2.5.2 Item M-0250, Audiometric Testing Room

**************************************************************************
NOTE: In paragraph entitled "Item [_____, [______]" insert the item identification number and the item name in the first blank space, respectively. Insert
a description of the item in the second blank space
to determine the type of product required. Avoid
repetition of detailed information which is to
appear in the salient features listed thereafter. In
paragraphs entitled "Item M-0250, Audiometric
Testing Room" and "Item M-0300, Audiometric
Examination Booth" use the second bracketed option
for double wall construction.

**************************************************************************
The audiometric testing room shall be prefabricated; approximately [1980 mm
high by 2100 mm wide by 2235 mm deep inside, 2235 mm high by 2340 mm wide
by 2440 mm deep outside,] [1980 mm high by 2100 mm wide by 2235 mm deep
inside, 2235 mm high by 2740 mm wide by 2840 mm deep outside,] [78 inches
high by 84 inches wide by 88 inches deep inside, 88 inches high by 92
inches wide by 96 inches deep outside,] [78 inches high by 84 inches wide
by 88 inches deep inside, 96 inches high by 108 inches wide by 112 inches
depth outside,] and shall have a continuous ventilating system and a shelf
mounted on the outer wall beneath the observation window.

2.5.3 Item M-0300, Audiometric Examination Booth

**************************************************************************

NOTE: In paragraph entitled "Item [___], [___]"
insert the item identification number and the item
name in the first blank space, respectively. Insert
a description of the item in the second blank space
to determine the type of product required. Avoid
repetition of detailed information which is to
appear in the salient features listed thereafter. In
paragraphs entitled "Item M-0250, Audiometric
Testing Room" and "Item M-0300, Audiometric
Examination Booth" use the second bracketed option
for double wall construction.

**************************************************************************
The audiometric examination booth shall be prefabricated; approximately
[1980 mm high by 1000 mm wide by 900 mm deep inside, 2235 mm high by 1200
mm wide by 1120 mm deep outside,] [1980 mm high by 1000 mm wide by 900 mm
deep inside, 2440 mm high by 1625 mm wide by 1500 mm deep outside,] [78
inches high by 40 inches wide by 36 inches deep inside, 88 inches high by
48 inches wide by 44 inches deep outside,] [78 inches high by 40 inches
wide by 36 inches deep inside, 96 inches high by 64 inches wide by 60
inches deep outside,] and shall have a continuous ventilation system and a
shelf mounted on the outside wall beneath the observation window.

PART 3 EXECUTION

3.1 INSTALLATION

**************************************************************************

NOTE: Provide a ramp of sufficient size to
facilitate the use of wheeled equipment.

**************************************************************************

Install the items at the locations indicated. Conform to the installation
requirements of Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND
DENTAL EQUIPMENT.
3.1.1  [Audiometric Testing Rooms] [and] [Examination Booths]

Assemble the [audiometric testing rooms] [and] [examination booths] on the site using prefabricated panels, doors, windows, ventilation silencers, and assembly hardware, meeting all the requirements specified in this section.

3.2  FIELD QUALITY CONTROL

3.2.1  Inspection

Examine each item for visual defects, and correct all defects to conform to the specifications.

NOTE: This guide specification covers the requirements for fabricated, pre-engineered metal structures. This specification is not intended to be used for gas station or petroleum/oil/lubricants (POL) facility canopies.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

**************************************************************************

NOTE: All references, including dates, should be verified that they comply with the requirements of UFC 1-200-01.

1.2 GENERAL REQUIREMENTS

1.2.1 Design Parameters

Design and construct pre-engineered metal buildings of size, shape, height, fenestration, siting, and configuration indicated. Coordinate site utility services, accessibility requirements, vehicular and pedestrian access, mechanical, electrical, plumbing and fire protection requirements, interior construction and finishes, and such other items as may be necessary for a complete, functional building.

1.2.2 Structural Performance

Provide metal building systems capable of withstanding the effects of gravity loads and the following loads and stresses within the limits and conditions indicated.

1.2.2.1 Engineering

Design metal building systems conforming to procedures described in MBMA MBSM.

1.2.2.2 Design Loads

Design and construct to the requirements of UFC 3-301-01, Structural Engineering.

[1.2.3 Anti-terrorism Requirements

**************************************************************************
NOTE: Confirm occupancy classification and occupancy load and refer to UFC 4-010-01 DoD Minimum Antiterrorism Standards for Buildings to determine if antiterrorism standards will apply. If they apply include this section.
**************************************************************************

Design metal building systems to comply with the requirements of UFC 4-010-01.
1.2.4  Thermal Performance

Provide insulated metal panel assemblies with the following maximum U-factors when assemblies are tested or calculated according to ASHRAE 90.1 - SI ASHRAE 90.1 - IP Appendix A, and minimum R-values for opaque elements when tested according to ASTM C1363 or ASTM C518.

1.2.4.1  Metal Roof Panel Assemblies

**************************************************************************
NOTE: Insert the required U factors and R values.
**************************************************************************

a. U-Factor: [_____]  
b. R-Value: [_____]  

1.2.4.2  Metal Wall Panel Assemblies

a. U-Factor: [_____]  
b. R-Value: [_____]  

1.2.5  Air Infiltration for Metal Roof Panels

**************************************************************************
NOTE: Select or insert infiltration volume and negative pressure. The default values stated are based on the requirements of ASHRAE 90.1 for assemblies; this represents the maximum leakage rate allowed on DoD projects. These leakage requirements are for lab testing of the roof panel assemblies only; leakage rate requirements for field testing of the whole building's air barrier would be stated in 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM with procedures for this testing outlined in Section 07 05 23 PRESSURE TESTING AN AIR BARRIER SYSTEM FOR AIR TIGHTNESS - include these additional sections for air barrier system field testing when required by UFC 3-101-01.
**************************************************************************

Air leakage through assembly must not exceed [0.2 L/s per sq. m] [_____] [0.04 cfm/sq.ft.] [_____] of roof area when lab tested according to ASTM E1680 at negative test-pressure difference of [75 Pa] [_____] [1.57 lb/sq.ft.] [_____]  

1.2.6  Air Infiltration for Metal Wall Panels

**************************************************************************
NOTE: Select or insert infiltration volume and negative pressure. The default values stated are based on the requirements of ASHRAE 90.1 for assemblies; this represents the maximum leakage rate allowed on DoD projects. These leakage requirements are for lab testing of the wall panel assemblies only; leakage rate requirements for field testing of the whole building's air barrier would be stated in
07 27 10.00 10 BUILDING AIR BARRIER SYSTEM with procedures for this testing outlined in Section 07 05 23 PRESSURE TESTING AN AIR BARRIER SYSTEM FOR AIR TIGHTNESS - include these additional sections for air barrier system field testing when required by UFC 3-101-01.

Air leakage through assembly of not more than [0.2 L/s per sq. m] [_____] [0.04 cfm/sq.ft.] [_____] of wall area when labtested according to ASTM E283 at static-air-pressure difference of [75 Pa] [_____] [1.57 lbf/sq.ft.] [_____]..

1.2.7 Water Penetration for Metal Roof Panels

No water penetration when tested according to ASTM E1646 at test-pressure difference of [137 Pa] [_____] [2.86 lbf/sq.ft.] [_____]..

1.2.8 Water Penetration for Metal Wall Panels

No water penetration when tested according to ASTM E331 at a minimum differential pressure of [20] [_____] percent of inward-acting, wind-load design pressure of not less than [300 Pa] [_____] [6.24 lbf/sq.ft.] [_____] and not more than 575 Pa 12 lbf/sq. ft.

1.2.9 Specular Gloss

NOTE: Specify the first bracketed option for most roof conditions.

For roofs of structures along airfields where glare would be objectionable and may be an operational hazard, the specular gloss value should be limited to 10 or less at an angle of 85 degrees. Limited paint systems can meet this reflectance value. Panel embossing also reduces the gloss, or reflectance value, and may be specified in combination with the paint system specification to meet the necessary requirement.

Finished roof surfaces to have a specular gloss value of [30 plus or minus 5 at an angle of 60 degrees] [10 or less at an angle of 85 degrees] when measured in accordance with ASTM D523.

1.2.10 Wind-Uplift Resistance

Design for wind-uplift resistance in accordance with UFC 3-301-01.

1.2.11 Erection Plan

Provide plans and a written erection/lifting procedure with required plans clearly showing the intended sequence and method of erection in accordance with EM 385-1-1 "Safety - Safety and Health Requirements". Indicate required crane lifting requirements, temporary support structures, member size and locations of braced or guyed temporary supports, and locations of bracing or guys anchor points. Clearly define the required framing sequence and conditions necessary to ensure the structure is maintained in...
a properly braced and stable condition throughout the complete erection process.

1.3 DEFINITIONS

a. Bay: Dimension between main frames measured normal to frame (at centerline of frame) for interior bays, and dimension from centerline of first interior main frame measured normal to end wall (outside face of end-wall girt) for end bays.

b. Clear Span: Distance between supports of beams, girders, or trusses (measured from lowest level of connecting area of a column and a rafter frame or knee).

c. Eave Height: Vertical dimension from finished floor to eave (the line along the sidewall formed by intersection of the planes of the roof and wall).

d. Terminology Standard: Refer to MBMA "Metal Building Systems Manual" for definitions of terms for metal building system construction not otherwise defined in this Section or in referenced standards.

1.4 SYSTEM DESCRIPTION

General: Provide a complete, integrated set of metal building system manufacturer's standard mutually dependent components and assemblies that form a metal building system capable of withstanding structural and other loads, thermally induced movement, and exposure to weather without failure or infiltration of water into building interior. Include primary and secondary framing, metal roof panels, metal wall panels, and accessories complying with requirements indicated.

Provide metal building system of size and with spacing, slopes, and spans indicated.

1.4.1 Primary Frame Type

**************************************************************************
NOTE: Select the appropriate primary frame type from the following.
**************************************************************************

[b. Rigid Modular: Solid-member, structural-framing system with interior columns.

[c. Truss-Frame Clear Span: Truss-member, structural-framing system without interior columns.

[d. Truss-Frame Modular: Truss-member, structural-framing system with interior columns.

[e. Long Bay: Solid- or truss-member, structural-framing system without interior columns.

[f. Lean To: Solid- or truss-member, structural-framing system without interior columns, designed to be partially supported by another
structure.

1.4.2 Fixed End-Wall Framing

**************************************************************************
NOTE: Select desired end wall type from the next two paragraphs and delete the other.
**************************************************************************

Provide manufacturer's standard fixed end wall, for buildings not required to be expandable, consisting of [primary frame, capable of supporting one-half of a bay design load, and end-wall columns] [load-bearing end-wall with corner columns, and rafters].

1.4.3 Expandable End-Wall Framing

Provide engineered end walls to be expandable. Provide primary frame, capable of supporting full-bay design loads, and end-wall columns.

1.4.4 Secondary Frame Type

Provide manufacturer's standard purlins and joists and [flush-framed] [partially inset-framed] [exterior-framed (bypass)] girts.

1.4.5 Eave Height

Eave height must be [4.9 m] [6.1 m] [7.3 m] [8.5 m] [_____] [16 feet] [20 feet] [24 feet] [28 feet] [_____] [Manufacturer's standard height, as indicated by nominal height on Drawings].

1.4.6 Bay Spacing

Bay Spacing must be [6.1 m] [7.6 m] [9.1 m] [_____] [20 feet] [25 feet] [30 feet] [_____] [As determined by manufacturer].

1.4.7 Roof Slope

Roof slope must be [1:24] [1:12] [1:3] [_____] [1/2 inch per 12 inches] [1 inch per 12 inches] [4 inches per 12 inches] [_____] [manufacturer's standard for frame type required].

1.4.8 Roof System

Provide manufacturer's standard [vertical-rib, standing-seam] [trapezoidal-rib standing-seam] [lap-seam] metal roof panels [with insulation].

1.4.9 Exterior Wall System

**************************************************************************
NOTE: Coordinate this Section with information shown on the drawings.
**************************************************************************

Provide [field-assembled, insulated] [field-assembled, un-insulated] [factory-assembled, insulated] metal wall panels [complete with vapor barrier conforming to ASTM E96/E96M] [or, where required, an exterior wall system complying with UFC 4-010-01 and these specifications for the project location and site characteristics].

SECTION 13 34 19 Page 16
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Pre-Erection Conference

After submittals are received and approved but before metal building system work, including associated work, is performed, the Contracting Officer will hold a pre-erection conference to review the following:

a. The detail drawings, specifications, and manufacturer's descriptive and technical literature.

b. Finalize construction schedule and verify availability of materials, erector's personnel, equipment, and facilities needed to make progress and avoid delays.

c. Methods and procedures related to metal building system erection, including, but not limited to: qualification of manufacturer, qualification of erector, manufacturer's catalog data, manufacturer's building design analysis, lateral force calculations, written instructions and test reports. Lateral force calculations must include all analysis and confirmation of system components required to transfer lateral forces to the foundation.

d. Support conditions for compliance with requirements, including alignment between and erection of structural members.

e. Flashing, special roofing and siding details, roof and wall penetrations, openings, and condition of other construction that will affect the metal building system, including coatings and base metals, factory color finish performance requirements, system components, and coil stock certificates.

f. Governing regulations and requirements for, certificates, insurance, tests and inspections if applicable.

g. Temporary protection requirements for metal panel assembly during and after installation.
h. Samples of roof panels, wall panels, aluminized steel repair paint, galvanizing repair paint, and enamel repair paint.

1.6.1.1 Pre-Roofing and Siding Installation Conference

After structural framing system erection and approval but before roofing, siding[, insulation and vapor barrier] work, including associated work, is performed; the Contracting Officer will hold a pre-roofing and siding conference to review the following:

a. Examine purlins, sub-girts and formed shapes conditions for compliance with requirements, including flatness and attachment to structural members.

b. Review structural limitations of purlins, sub-girts and formed shapes during construction and after roofing and siding.

c. Review flashings, special roof and wall details, roof drainage, roof and wall penetrations, roof equipment curbs, and condition of other construction that will affect the metal building system.

d. Review temporary protection requirements for metal roof and wall panels' assembly during and after installation.

e. Review roof and wall observation and repair procedures after metal building system erection.

1.6.2 Manufacturer's Technical Representative

The representative must have authorization from manufacturer to approve field changes and be thoroughly familiar with the products, erection of structural framing and installation of roof and wall panels in the geographical area where construction will take place.

1.6.3 Manufacturer's Qualifications

Metal building system manufacturer must have a minimum of five years experience as a qualified manufacturer and a member of MBMA of metal building systems and accessory products.

Provide engineering services by an authorized currently licensed engineer in the geographical area where construction will take place, having a minimum of four years experience as an engineer knowledgeable in building design analysis, protocols and procedures for the "Metal Building Systems Manual" (MBMA MBSM); ASCE 7-16[, the building code in the geographic area where the construction will take place] and ASTM E1592. Provide certified engineering calculations using the products submitted for:

a. Roof and Wall Wind Loads with basic wind speed, exposure category, co-efficient, importance factor, designate type of facility, negative pressures for each zone, methods and requirements of attachment.

b. Roof Dead and Live Loads

c. Collateral Loads

d. Foundation Loads

e. Roof Snow Load
f. Seismic Loads

1.6.4 Qualification of Erection Contractor

An experienced erector who has specialized in erecting and installing work similar in material, design, and extent to that indicated for this Project and must be approved and certified by the metal building system manufacturer.

1.6.5 Single Source

Obtain primary and secondary components and structural framing members, each type of metal roof, wall and liner panel assemblies, clips, closures and other accessories from the standard products of the single source from a single manufacturer to operate as a complete system for the intended use.

1.6.6 Welding

Qualify procedures and personnel according to AWS A5.1/A5.1M, AWS D1.1/D1.1M, and AWS D1.3/D1.3M.

1.6.7 Structural Steel

Comply with AISC 325, [AISC 341 for seismic impacted designs,] AISC 360, for design requirements and allowable stresses.

1.6.8 Cold-Formed Steel

Comply with AISC/AISI 121 and AISI D100 for design requirements and allowable stresses.

1.6.9 Fire-Resistance Ratings

Where indicated, provide metal panels identical to those of assemblies tested for fire resistance in accordance with ASTM E119, as certified by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

Indicate design designations from UL Bld Mat Dir or from the listings of another qualified testing agency. Combustion Characteristics must conform to ASTM E136.

1.6.10 Surface-Burning Characteristics

Provide metal panels having [field-insulation][insulation core][insulation and vapor barrier] material with the following surface-burning characteristics as determined by testing identical products according to ASTM E84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency showing:

a. Flame-Spread Index: [25] [_____] or less.

b. Smoke-Developed Index: [450] [_____] or less.

1.6.11 Fabrication

Fabricate and finish metal panels and accessories at the factory to greatest extent possible, by manufacturer's standard procedures and
processes and as necessary to fulfill indicated performance requirements. Comply with indicated profiles with dimensional and structural requirements. Provide metal panel profile, including major ribs and intermediate stiffening ribs, if any, for full length of panel. Aluminum and aluminum-alloy sheet and plate must conform to ASTM B209. Fabricate metal panel side laps with factory-installed captive gaskets or separator strips that provide a tight seal and prevent metal-to-metal contact, in a manner that will seal weather-tight and minimize noise from movements within panel assembly.

Sheet Metal Accessories: Fabricate flashing and trim to comply with recommendations in SMACNA 1793 that apply to the design, dimensions, metal, and other characteristics of item indicated:

a. Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.

b. End Seams: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.

c. Sealed Joints: Form non-expansion but movable joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.

d. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.

e. Fabricate cleats and attachment devices of size and metal thickness recommended by SMACNA or by metal building system manufacturer for application, but not less than thickness of metal being secured.

1.6.12 Finishes

Comply with NAAMM AMP 500 for recommendations for applying and designating finishes.

Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

1.7 SHIPPING, HANDLING AND STORAGE

1.7.1 Delivery

Package and deliver components, sheets, metal panels, and other manufactured items so as not to be damaged or deformed and protected during transportation and handling.

1.7.2 Storage

Stack and store metal panels horizontally on platforms or pallets, covered with suitable weather-tight and ventilated covering to ensure dryness, with positive slope for drainage of water. Store in a manner to prevent bending, warping, twisting, and surface damage. Do not store metal wall panels in contact with other materials that might cause staining, denting, or other surface damage. Retain strippable protective covering on metal panel for entire period up to metal panel installation.
1.7.3 Protection of Materials

Protect foam-plastic insulation as follows:

a. Do not expose to sunlight, except to extent necessary for period of installation and concealment.

b. Protect against ignition at all times. Do not deliver foam-plastic insulation materials to project site before installation time.

Complete installation and concealment of plastic materials as rapidly as possible in each area of construction to minimize ultraviolet exposure.

1.8 PROJECT CONDITIONS

1.8.1 Weather Limitations

Proceed with installation preparation only when existing and forecasted weather conditions permit Work to proceed without water entering into existing panel system or building.

1.8.2 Field Measurements

1.8.2.1 Established Dimensions for Foundations

Comply with established dimensions on approved anchor-bolt plans, established foundation dimensions, and proceed with fabricating structural framing. Do not proceed without verifying field measurements. Coordinate anchor-bolt installation to ensure that actual anchorage dimensions correspond to established dimensions.

1.8.2.2 Established Dimensions for Metal Panels

Where field measurements cannot be made without delaying the Work, either establish framing and opening dimensions and proceed with fabricating metal panels without field measurements, or allow for field trimming metal panels. Coordinate construction to ensure that actual building dimensions, locations of structural members, and openings correspond to established dimensions.

1.8.2.3 Verification Record

Verify locations of all framing and opening dimensions by field measurements before metal panel fabrication and indicate measurements on Shop Drawings.

1.9 COORDINATION

Coordinate final design and placement of foundation between structural engineer of record, geotechnical engineer, MBMA and Contractor. Coordinate size and location of concrete foundations and casting of anchor-bolt inserts into foundation walls and footings. Concrete, reinforcement, and formwork requirements are specified in section on CAST-IN-PLACE CONCRETE.

Coordinate installation of [fire suppression system] [equipment supports] [piping and supports] [accessories], which are specified in Division 21 - FIRE SUPPRESSION.

Coordinate installation of [plumbing system] [equipment supports] [piping
and supports] [and] [accessories], which are specified in Division 22 - PLUMBING.

Coordinate installation of [HVAC system] [equipment supports] [ductwork and supports] [piping and supports] [and] [accessories], which are specified in Division 23 - HEATING, VENTILATING AND AIR-CONDITIONING (HVAC).

Coordinate installation of [roof curbs] [equipment supports] [and] [roof penetrations], which are specified in Division 07 - THERMAL AND MOISTURE PROTECTION.

Coordinate metal panel assemblies with rain drainage work, flashing, trim, and construction of supports and other adjoining work to provide a leak-proof, secure, and non-corrosive installation.

1.10 WARRANTY

1.10.1 Building System Warranty

Furnish manufacturer's no-dollar-limit warranty for the metal building system. The warranty period is to be no less than [5] [10] [15] [20] years from the date of acceptance of the work and be issued directly to the Government. The warranty must provide that if within the warranty period, the metal building system shows evidence of deterioration resulting from defective materials or workmanship, correcting of any defects is the responsibility of the metal building system manufacturer. Repairs that become necessary because of defective materials and workmanship while metal building system is under warranty are to be performed within [32] [_____] hours after notification, unless additional time is approved by the Contracting Officer. Failure to perform repairs within [32] [_____] hours of notification will constitute grounds for having emergency repairs performed by others and will not void the warranty.

1.10.2 Roof System Weather-Tightness Warranty

Furnish manufacturer's no-dollar-limit warranty for the metal panel system. The warranty period is to be no less than [10] [20] [_____] years from the date of acceptance of the work and be issued directly to the Government.

The warranty is to provide that if within the warranty period the roof panel system shows evidence of corrosion, perforation, rupture, lost of weather-tightness or excess weathering due to deterioration of the panel system resulting from defective materials and correction of the defective workmanship is to be the responsibility of the metal building system manufacturer.

Repairs that become necessary because of defective materials and workmanship while roof panel system is under warranty are to be performed within [24] [_____] hours after notification, unless additional time is approved by the Contracting Officer. Failure to perform [temporary] repairs within [24] [_____] hours of notification will constitute grounds for having emergency repairs performed by others and not void the warranty. Immediate follow-up and completion of permanent repairs must be performed within [_____] days from date of notification.

1.10.3 Roof and Wall Panel Finish Warranty

Furnish manufacturer's no-dollar-limit warranty for the metal panel
system. The warranty period is to be no less than \[10\] \[20\] [[_____] years from the date of acceptance of the work and be issued directly to the Government.

The warranty is to provide that if within the warranty period the metal panel system shows evidence of checking, delaminating cracking, peeling, chalk in excess of a numerical rating of eight, as determined by ASTM D4214 test procedures; or change colors in excess of five CIE or Hunter units in accordance with ASTM D2244 or excess weathering due to deterioration of the panel system resulting from defective materials and finish or correction of the defective workmanship is to be the responsibility of the metal building system manufacturer.

Liability under this warranty is exclusively limited to replacing the defective coated materials.

Repairs that become necessary because of defective materials and workmanship while roof and wall panel system is under warranty are to be performed within \[32\] [[_____] hours after notification, unless additional time is approved by the Contracting Officer. Failure to perform repairs within \[32\] [[_____] hours of notification will constitute grounds for having emergency repairs performed by others and not void the warranty.

**PART 2   PRODUCTS**

2.1    **STRUCTURAL FRAMING MATERIALS**

******************************************************************************

Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Where minimums are stated, research shows the product is available among US national steel manufacturers above the minimum recycled content of the first bracket. Some manufacturers and regions have higher percentages. If desired, insert higher percentages into the second set of brackets and delete the first set of brackets. AISC 2017 white paper "More than Recycled Content: The Sustainable Characteristics of Structural Steel" indicates that the industry average recycled content is 93 percent.

******************************************************************************

2.1.1    **Steel Shapes and Plates**

Wide flange and WT shapes: ASTM A992/A992M; ASTM A572/A572M or ASTM A529/A529M. Angles, Channels and Plates: ASTM A36/A36M, ASTM A572/A572M or ASTM A529/A529M. Provide structural steel shapes and
plates containing a minimum of [80] [_____] percent recycled content. 
Submit data identifying percentage of recycled content for structural steel shapes and plates.

2.1.2 Steel Pipe

ASTM A36/A36M, ASTM A53/A53M, ASTM A572/A572M or ASTM A529/A529M. Provide steel pipe containing a minimum of [50] [_____] percent recycled content. Submit data identifying percentage of recycled content for steel pipe.

2.1.3 Cold-Formed and Hot Formed Hollow Structural Sections

Cold formed: ASTM A500/A500M or ASTM B221, ASTM B221M. Hot-formed: ASTM A501/A501M.

2.1.4 Structural-Steel Sheet

Hot-rolled, ASTM A1011/A1011M or cold-rolled, ASTM A1008/A1008M.

2.1.5 Metallic-Coated Steel Sheet

ASTM A653/A653M, ASTM A606/A606M.

2.1.6 Metallic-Coated Steel Sheet Pre-painted with Coil Stock Coating

Steel sheet metallic coated by the hot-dip process and pre-painted by the coil-coating process to comply with ASTM A755/A755M.

[ a. Zinc-Coated (Galvanized) Steel Sheet: ASTM A653/A653M, and ASTM A123/A123M.]

[b. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A792/A792M, and ASTM A463/A463M.]

2.1.7 Joist Girders

Refer to Section 05 21 00 STEEL JOIST FRAMING

2.1.8 Steel Joists

Refer to the following sections subject to project design requirements:

Section 05 21 00 STEEL JOIST FRAMING

2.1.9 High-Strength Bolts, Nuts, and Washers

ASTM F3125/F3125M, heavy hex steel structural bolts; ASTM A563M ASTM A563 heavy hex carbon-steel nuts; and ASTM F436/F436M hardened carbon-steel washers.

Finish: [Plain] [Hot-dip zinc coating, ASTM A153/A153M] [Mechanically deposited zinc coating, ASTM B695].

Tension-Control, High-Strength Bolt-Nut-Washer Assemblies: ASTM F1852, heavy-hex-head steel structural bolts with spline.

Finish: [Plain] [Mechanically deposited zinc coating, ASTM B695] [Mechanically deposited zinc coating, ASTM B695 baked epoxy coated].
2.1.10 Non-High-Strength Bolts, Nuts, and Washers

Finish: [Plain] [ASTM A153/A153M] [ASTM B695].

2.1.11 Anchor Rods

[ASTM F1554] [ASTM A572/A572M] [ASTM A36/A36M] [ASTM A307].

e. Finish: [Plain] [Hot-dip zinc coating, ASTM A153/A153M] [Mechanically deposited zinc coating, ASTM B695].

2.1.12 Threaded Rods

[ASTM A193/A193M] [ASTM A572/A572M] [ASTM A36/A36M] [ASTM A307].

c. Finish: [Plain] [Hot-dip zinc coating, ASTM A153/A153M] [Mechanically deposited zinc coating, ASTM B695].

2.1.13 Primer

SSPC-Paint 15, Type I, red oxide.

2.2 FABRICATION

2.2.1 General

Comply with MBMA MBSM - "Metal Building Systems Manual": Chapter IV, Section 9, "Fabrication and Erection Tolerances."

2.3 STRUCTURAL FRAMING

2.3.1 General

Clean all framing members to remove loose rust and mill scale. Provide 1 shop coat of primer to an average dry film thickness of 1 mil according to SSPC SP 2. Balance of painting and coating procedures must conform to SSPC Paint 15 and SSPC Painting Manual.

2.3.2 Primary Framing

Manufacturer's standard structural primary framing system includes transverse and lean-to frames; rafter, rakes, and canopy beams; sidewall, intermediate, end-wall, and corner columns; and wind bracing designed to withstand required loads and specified requirements. Provide frames with attachment plates, bearing plates, and splice members. Provide frame span
and spacing indicated.

Shop fabricate framing components by welding or by using high-strength bolts to the indicated size and section with base-plates, bearing plates, stiffeners, and other items required. Cut, form, punch, drill, and weld framing for bolted field erection.

[a. Rigid Clear-Span Frames: I-shaped frame sections fabricated from shop-welded, built-up steel plates or structural-steel shapes. Interior columns are not permitted.

[b. Rigid Modular Frames: I-shaped frame sections fabricated from shop-welded, built-up steel plates or structural-steel shapes. Provide interior columns fabricated from [steel round pipe] [steel tube] [shop-welded, built-up steel plates.]

[c. Frame Configuration: [Single gable] [One-directional sloped] [Lean to, with high side connected to, and supported by, another structure] [Multiple gables] [Load-bearing-wall type] [Multistory].

d. Exterior Column Type: [Uniform depth] [Tapered].

e. Rafter Type: [Uniform depth] [Tapered].

2.3.3 Secondary Framing

Manufacturer's standard secondary framing members, including purlins, girts, eave struts, flange bracing, base members, gable angles, clips, headers, jambs, and other miscellaneous structural members. Fabricate framing from cold-formed, structural-steel sheet or roll-formed, metallic-coated steel sheet pre-painted with coil coating, unless otherwise indicated.

Shop fabricate framing components by roll-forming or break-forming to the indicated size and section with base-plates, bearing plates, stiffeners, and other plates required for erection. Cut, form, punch, drill, and weld secondary framing for bolted field connections to primary framing.

[a. Purlins: C or Z-shaped sections; fabricated from steel sheet, built-up steel plates, or structural-steel shapes; minimum depth [as indicated] [as required to comply with system performance requirements] [____].

b. Girts: C or Z-shaped sections; fabricated from steel sheet, built-up steel plates, or structural-steel shapes. Form ends of Z-sections with stiffening lips angled 40 to 50 degrees to flange minimum depth[ as indicated][ as required to comply with system performance requirements] [____].

c. Eave Struts: Unequal-flange, C-shaped sections; fabricated from steel sheet, built-up steel plates, or structural-steel shapes; to provide adequate backup for metal panels.

d. Flange Bracing: Structural-steel angles or cold-formed structural tubing to stiffen primary frame flanges.

e. Sag Bracing: Structural-steel angles.

f. Base or Sill Angles: Zinc-coated (galvanized) steel sheet.
g. Purlin and Girt Clips: Steel sheet. Provide galvanized clips where clips are connected to galvanized framing members.

h. Secondary End-Wall Framing: Manufacturer's standard sections fabricated from [zinc-coated (galvanized) steel sheet] [structural-steel sheet].

i. Framing for Openings: Channel shapes; fabricated cold-formed, structural-steel sheet or structural-steel shapes. Frame head and jamb of door openings, and head, jamb, and sill of other openings.

j. Miscellaneous Structural Members: Manufacturer's standard sections fabricated from cold-formed, structural-steel sheet; built-up steel plates; or zinc-coated (galvanized) steel sheet; designed to withstand required loads.

2.3.4 Bracing

Provide adjustable wind bracing as follows:

a. Rods: ASTM A36/A36M; ASTM A572/A572M; or ASTM A529/A529M [threaded full length] [threaded a minimum of [_____] at each end.

b. Cable: ASTM A475, [_____] diameter, extra-high-strength grade, zinc-coated, [_____]-strand steel; with threaded end anchors.

c. Angles: Fabricated from structural-steel shapes to match primary framing, of size required to withstand design loads.

d. Rigid Portal Frames: Fabricate from shop-welded, built-up steel plates or structural-steel shapes to match primary framing; of size required to withstand design loads.

e. Fixed-Base Columns: Fabricate from shop-welded, built-up steel plates or structural-steel shapes to match primary framing; of size required to withstand design loads.

f. Diaphragm Action of Metal Panels: Design metal building to resist wind forces through diaphragm action of metal panels.

g. Bracing: Provide wind bracing using any method specified above, at manufacturer's option.

2.4 PANEL MATERIALS

2.4.1 Aluminum Sheet

Roll-form aluminum [roof] [wall] [liner] panels to the specified profile, with fy = [30] [40] [50] [80] ksi [.032] [.040] [.050] inch thickness and depth as indicated. Aluminum sheets must contain a minimum recycled content of 20 percent. Provide data identifying percentage of recycled content for aluminum sheet materials. Material must be plumb and true, and within the tolerances listed:

b. Individual panels to have continuous length to cover the entire length of any [roof slope] [wall area] with no joints or seams and formed
without warping, waviness, or ripples that are not part of the panel profile and free of damage to the finish coating system.

c. Provide panels with thermal expansion and contraction consistent with the type of system specified.

**************************************************************************
NOTE: Select the desired profile from below and delete remaining items.
**************************************************************************

1. Profile and coverage to be a minimum height and width from manufacturer's standard for the indicated [roof slope] [wall area].

[2] Profile to be a 38 mm 1-1/2 inch high rib at 304.8 mm 12 inches o.c. with small stiffening ribs, 965.2 mm 38 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

[3] Profile to be a 38 mm 1-1/2 inch high rib at 182.9 mm 7.2 inches o.c., 987.4 mm 38-7/8 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

[4] Profile to be a 25.4 mm 1 inch high rib at 101.6 mm 4 inches o.c., 1260.5 mm 49-5/8 inch overall width with [1219.2] [1117.6] mm [48] [44] inch coverage and exposed fasteners.

[5] Profile to be a 25.4 mm 1 inch high rib at 203.2 mm 8 inches o.c., 1057.3 mm 41-5/8 inch overall width with 1016 mm 40 inch coverage and exposed fasteners.

[6] Profile to be a 44.5 mm 1-3/4 inch high V-beam rib at 127 mm 5 inches o.c., 1139.9 mm 44-7/8 inch overall width with 1066.8 mm 42 inch coverage and exposed fasteners.

[7] Profile to be a 22.2 mm 7/8 inch high corrugated rib at 50 mm 2 inches o.c., 987.4 mm 38-7/8 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

[8] Profile to be a 76 mm 3 inch high standing seam, 609.6 mm 24 inch coverage, factory-caulked and mechanical crimping or snap-together seams with concealed clips and fasteners.

[9] Profile to be a [25.4] [44.5] [50.8] [63.5] mm [1] [1-3/4] [2] [2-1/2] inch high standing seam, [304.8] [406.4] [457.2] mm [12] [16] [18] inch coverage, with mechanical crimping or snap-together seams with concealed clips and fasteners.

[10] [Smooth, flat] [Embossed] Surface Texture.

[11] Custom profile to be [_____][as shown on drawings].

2.4.2 Steel Sheet

Roll-form steel [roof] [wall] [liner] panels to the specified profile, with $f_y = [30] [40] [50] [80] ksi [26] [24] [22] [20] [18] gauge and depth as indicated. Steel sheets must contain a minimum recycled content of 25 percent. Provide data identifying percentage of recycled content for steel sheet materials. Material must be plumb and true, and within the tolerances listed:
NOTE: Select subparagraph "a" below for projects with Environmental Severity Classification (ESC) C1 through C3 and subparagraph "b" below for ESC C4 and C5. See UFC 1-200-01 for determination of ESC for project locations.

[ a. Galvanized Steel Sheet conforming to ASTM A653/A653M and AISI D100.

] [b. Aluminum-Zinc Alloy-coated Steel Sheet conforming to ASTM A792/A792M and AISI D100.

] [c. Individual panels to have continuous length to cover the entire length of any unbroken [roof slope] [wall area] with no joints or seams and formed without warping, waviness, or ripples that are not part of the panel profile and free of damage to the finish coating system.

d. Provide panels with thermal expansion and contraction consistent with the type of system specified;

[profile and coverage to be a minimum height and width from manufacturer's standard for the indicated [roof slope] [wall area].

][profile to be a 38 mm 1-1/2 inch high rib at 304.8 mm 12 inches o.c. with small stiffening ribs, 965.2 mm 38 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

][profile to be a 38 mm 1-1/2 inch high rib at 182.9 mm 7.2 inches o.c., 987.4 mm 38-7/8 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

][profile to be a 25.4 mm 1 inch high rib at 101.6 mm 4 inches o.c., 1260.5 mm 49-5/8 inch overall width with [1219.2] [1117.6] mm [48] [44] inch coverage and exposed fasteners.

][profile to be a 25.4 mm 1 inch high rib at 203.2 mm 8 inches o.c., 1057.3 mm 41-5/8 inch overall width with 1016 mm 40 inch coverage and exposed fasteners.

][profile to be a 22.2 mm 7/8 inch high corrugated rib at 50 mm 2 inches o.c., 987.4 mm 38-7/8 inch overall width with 914.4 mm 36 inch coverage and exposed fasteners.

][profile to be a 76 mm 3 inch high standing seam, 609.6 mm 24 inch coverage, factory-caulked and mechanical crimping or snap-together seams with concealed clips and fasteners.

][profile to be a [25.4] [44.5] [50.8] [63.5] mm [1] [1-3/4] [2] [2-1/2] inch high standing seam, [304.8] [406.4] [457.2] mm [12] [16] [18] inch coverage, with mechanical crimping or snap-together seams with concealed clips and fasteners.

][Smooth, flat] [Embossed] Surface Texture.

][profile to be custom as shown on drawings.
2.4.3 Foam-Insulation Core Wall Panel

Provide factory-formed [aluminum] [steel] [roof] [wall] panel assembly fabricated from two sheets of metal with modified polyisocyanurate or polyurethane foam insulation core [foamed-in-place] [board] during fabrication with joints between panels designed to form weather-tight seals. Include accessories required for weather-tight installation.

a. Closed-Cell Content: 90 percent when tested according to ASTM D6226, ASTM C1289.

b. Density: 32 to 42 kg/cu. m 2.0 to 2.6 lb/cu. ft. when tested according to ASTM D1622/D1622M.

c. Compressive Strength: Minimum 140 kPa 20 psi when tested according to ASTM D1621.

d. Shear Strength: 179 kPa 26 psi when tested according to ASTM C273/C273M.

2.4.4 Insulated Panel Construction

Shop fabricate or field assemble insulated panel construction with specified exterior and interior [aluminum] [steel] sheet in accordance with manufacturer's printed instructions.

Insulation to be [glass-fiber-ASTM C991] [slag-wool-fiber] [rock-wool-fiber] conforming to ASTM C553 and ASTM C612 of thickness and density as required for the geographical area where construction will take place.

Insulation fasteners to be adhesively attached, plate welded to projecting spindle anchors; capable of holding insulation of thickness indicated, secured in position with self-locking washer and complying with the following requirements:

a. Plate: Perforated galvanized carbon-steel sheet, 0.762 mm 0.030 inch thick by 50 mm 2 inches square.

b. Spindle: Copper-coated, low carbon steel; fully annealed; 2.67 mm 0.105 inch in diameter; length to suit depth of insulation indicated.

c. Insulation-Retaining Washers: Self-locking washers formed from 0.41-mm-0.016-inch- thick galvanized steel sheet, with beveled edge for increased stiffness, sized as required to hold insulation securely in place, but not less than 38 mm 1-1/2 inches square or in diameter.

d. Anchor adhesive to be a product with demonstrated capability to bond insulation anchors securely to substrates indicated without damaging insulation, fasteners, and substrates.

2.4.5 Finish

All panels are to receive a factory-applied polyvinylidene fluoride of Kynar 500/Hylar 5000 finish consisting of a baked-on top-coat with a manufacturer's recommended prime coat conforming to the following:

a. Metal Preparation: All metal is to have the surfaces carefully prepared for painting on a continuous process coil coating line by alkali cleaning, hot water rinsing, application of chemical conversion
coating, cold water rinsing, sealing with acid rinse, and thorough drying.

b. Prime Coating: A base coat of epoxy paint, specifically formulated to interact with the top-coat, is to be applied to the prepared surfaces by roll coating to a dry film thickness of 0.20 plus 0.05 mils. This prime coat must be oven cured prior to application of finish coat.

c. Exterior Finish Coating: Apply the finish coating over the primer by roll coating to dry film thickness of 0.80 plus 0.05 mils for a total dry film thickness of 1.00 plus 0.10 mils. This finish coat must be oven-cured.

d. Interior Finish Coating: Apply a wash-coat on the reverse side over the primer by roll coating to a dry film thickness of 0.30 plus 0.05 mils for a total dry film thickness of 0.50 plus 0.10 mils. The wash-coat must be oven-cured.

e. Color: The exterior finish chosen from the manufacturer's color charts and chips.

f. Physical Properties: Coating must conform to the industry and manufacturer's standard performance criteria as listed by the following certified test reports:

- Chalking: ASTM DEFONLINE
- Color Change and Conformity: ASTM D2244
- Weatherometer: ASTM G152, ASTM G153 and ASTM D822
- Humidity: ASTM D2247 and ASTM D714
- Salt Spray: ASTM B117
- Chemical Pollution: ASTM D1308
- Gloss at 60 degrees: ASTM D523
- Pencil Hardness: ASTM D3363
- Reverse Impact: ASTM D2794
- Flexibility: ASTM D522/D522M
- Abrasion: ASTM D968
- Flame Spread: ASTM E84

2.4.6 Repair Of Finish Protection

Repair paint for enameled metal panel must be compatible paint of the same formula and color as the specified finish furnished by the metal panel manufacturer, conforming to ASTM A780/A780M.

2.5 MISCELLANEOUS METAL FRAMING

2.5.1 General

Cold-formed metallic-coated steel sheet conforming to ASTM A653/A653M and specified in Section 05 40 00 COLD-FORMED METAL FRAMING unless otherwise indicated.

2.5.2 Fasteners for Miscellaneous Metal Framing

Refer to the following paragraph FASTENERS.
2.6 FASTENERS

2.6.1 General

Type, material, corrosion resistance, size and sufficient length to penetrate the supporting member a minimum of 25.4 mm (1 inch) with other properties required to fasten miscellaneous metal framing members to substrates in accordance with the metal panel manufacturer's and ASCE 7-16 requirements.

2.6.2 Exposed Fasteners

Fasteners for metal panels to be corrosion resistant coated steel, aluminum, stainless steel, or nylon capped steel compatible with the sheet panel or flashing and of a type and size recommended by the manufacturer to meet the performance requirements and design loads. Fasteners for accessories to be the manufacturer's standard. Provide an integral metal washer matching the color of attached material with compressible sealing EPDM gasket approximately 0.09 mm (3/32 inch) thick.

2.6.3 Screws

Screws to be corrosion resistant coated steel, aluminum or stainless steel being the type and size recommended by the manufacturer to meet the performance requirements.

2.6.4 Rivets

Rivets to be closed-end type, corrosion resistant coated steel, aluminum or stainless steel where watertight connections are required.

2.6.5 Attachment Clips

Fabricate clips from steel hot-dipped galvanized in accordance with ASTM A653/A653M or Series 300 stainless steel. Size, shape, thickness and capacity as required meeting the insulation thickness and design load criteria specified.

2.7 FRAMES AND MATERIALS FOR OPENINGS

2.7.1 Doors

Fire-Rated and Non-Fire-Rated Door Assemblies conforming with NFPA 80 and based on testing according to NFPA 252 as specified in Division 08 - OPENINGS unless otherwise indicated.

2.7.2 Windows

[Aluminum ][Steel ]Window Assemblies conforming to [ AAMA/WDMA/CSA 101/I.S.2/A440] [SWI AGSW] as specified in Division 08 - OPENINGS unless otherwise indicated.

2.8 ACCESSORIES

2.8.1 General

All accessories to be compatible with the metal panels; sheet metal flashing, trim, metal closure strips, caps and similar metal accessories must not be less than the minimum thickness specified for the metal
panels. Exposed metal accessories/finishes to match the panels, except as otherwise indicated. Molded foam rib, ridge and other closure strips to be non-absorbent closed-cell or solid-cell synthetic rubber or pre-molded neoprene to match configuration of the panels.

2.8.2 Roof and Wall Accessories and Specialties

[Aluminum ][Galvanized Steel ] roof curbs, equipment supports, roof hatches, dropout-type heat and smoke vents, hatch-type heat and smoke vents, gravity and roof ridge ventilators, wall louvers and other miscellaneous roof and wall equipment or penetrations conforming to AAMA, ASTM, and UL as specified in Division 07 unless otherwise indicated.

2.8.3 Insulation

Faced, Glass-Fiber Blanket Insulation: ASTM C665, Type [I, blankets without membrane coverings][ and ][II, blankets with non-reflecting coverings][ and ][III, blankets with reflective coverings]; Class [A, membrane-faced surface with a flame spread of 25 or less] [B, membrane-faced surface with a flame propagation resistance; critical radiant flux of 0.12 W/m2 0.11 Btu/ft2 or greater], except a flame spread rating of [25] [75] [100] or less [and a smoke developed rating of 150 or less] when tested in accordance with ASTM E84. Provide insulation materials containing the following minimum percentage of recycled content by weight: 20 percent glass cullet complying with ASTM D5359. Provide data identifying percentage of recycled content for insulation materials.

2.8.3.1 Polyethylene Vapor Retarder

Install polyethylene vapor retarder membrane over entire [wall][ and roof]surface. Use fully compatible polyethylene tape to seal the edges of the sheets to provide a vapor tight membrane. Lap sheets not less than 150 mm 6 inch. Provide sufficient material to avoid inducing stresses in sheets due to stretching or binding. All tears or punctures visible in the finished surface, at any time during the construction process, must be sealed with polyethylene tape.

2.8.3.2 Wall Liner

Securely fasten wall liner into place in accordance with the manufacturer's recommendation and in a neatly presented appearance.

2.8.4 Rubber Closure Strips

Closed-cell, expanded cellular rubber conforming to ASTM D1056 and ASTM D1667; extruded or molded to the configuration of the specified metal panel and in lengths supplied by the metal panel manufacturer.

2.8.5 Metal Closure Strips

Factory fabricated closure strips to be the same material, thickness, color, finish and profile of the specified [roof] [wall] panel.

2.8.6 Joint Sealants

2.8.6.1 Sealants

Sealants are to be an approved gun type for use in hand or air-pressure caulking guns at temperatures above 4 degrees C 40 degrees F
application at temperatures above minus 12 degrees C 10 degrees F with minimum solid content of 85 percent of the total volume. Sealant is to dry with a tough, durable surface skin which permits it to remain soft and pliable underneath, providing a weather-tight joint. No migratory staining is permitted on painted or unpainted metal, stone, glass, vinyl, or wood.

Prime all joints to receive sealants with a compatible one-component or two-component primer as recommended by the metal panel manufacturer.

2.8.6.2 Shop-Applied

Sealant for shop-applied caulking must be an approved gun grade, non-sag one component polysulfide or silicone conforming to ASTM C920, Type II, and with a curing time to ensure the sealant's plasticity at the time of field erection.

2.8.6.3 Field-Applied

**************************************************************************
NOTE: Where Section 07 92 00 JOINT SEALANTS is included in the specifications, select the first bracketed option; if this section not included, select second option.
**************************************************************************

[See Section 07 92 00 JOINT SEALANTS for sealant requirements.] [Sealant for field-applied caulking must be an approved gun grade, non-sag one component polysulfide or two-component polyurethane with an initial maximum Shore A durometer hardness of 25, and conforming to ASTM C920, Type II. Color to match panel colors.]

2.8.6.4 Tape Sealant

Pressure sensitive, 100 percent solid with a release paper backing; permanently elastic, non-sagging, non-toxic and non-staining as approved by the metal panel manufacturer.

2.9 SHEET METAL FLASHING AND TRIM

2.9.1 Fabrication

Shop fabricate sheet metal flashing and trim where practicable to comply with recommendations in SMACNA 1793 that apply to design, dimensions, metal, and other characteristics of item indicated. Obtain field measurements for accurate fit before shop fabrication.

Fabricate sheet metal flashing and trim without excessive oil canning, buckling, and tool marks and true to line and levels indicated, with exposed edges folded back to form hems.

2.10 FINISHES

2.10.1 General

Comply with NAAMM AMP 500 for recommendations for applying and designating finishes.
2.10.2 Appearance of Finished Work

Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 EXECUTION

3.1 EXAMINATION

Before erection proceeds, examine with the erector present, the concrete foundation dimensions, concrete and masonry bearing surfaces, anchor bolt size and placement, survey slab elevation, locations of bearing plates, and other embedments to receive structural framing with the metal building manufacturer's templates and drawings before erecting any steel components for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

Examine primary and secondary framing to verify that rafters, purlins, angles, channels, and other structural and metal panel support members and anchorages have been installed within alignment tolerances required by metal building manufacturer, UL, ASTM, ASCE 7-16 and as required by the building code for the geographical area where construction will take place.

Examine roughing-in for components and systems penetrating metal roof or wall panels to verify actual locations of penetrations relative to seam locations of metal panels before metal roof or wall panel installation.

Submit to the Contracting Officer a written report, endorsed by Erector, listing conditions detrimental to performance of the Work.

Proceed with erection only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

Provide temporary shoring, guys, braces, and other supports during erection to keep the structural framing secure, plumb, and in alignment against temporary construction loading or loads equal in intensity of the building design loads. Remove temporary support systems when permanent structural framing, connections, and bracing are in place, unless otherwise indicated.

Clean substrates of substances harmful to insulation, including removing projections capable of interfering with insulation attachment and performance.

Miscellaneous Framing: Install sub-purlins, girts, angles, furring, and other miscellaneous support members or anchorage for the metal roof or wall panels, doors, windows, roof curbs, ventilators and louvers according to metal building manufacturer's written instructions.

3.3 ERECTION OF STRUCTURAL FRAMING

Erect metal building system according to manufacturer's written erection instructions, approved shop drawings and other erection documents in accordance with MBMA MBSM - "Metal Building Systems Manual".
Do not field cut, drill, or alter structural members without written approval from metal building system manufacturer's professional engineer and the Contracting Officer.

Set structural framing accurately in locations and to elevations indicated and according to AISC 325 specifications. Maintain structural stability of frame during erection.

Clean and roughen concrete and masonry bearing surfaces prior to setting plates. Clean bottom surface of plates.

Align and adjust structural framing before permanent bolt-up and connections. Perform necessary adjustments and alignment to compensate for changes or discrepancies in elevations.

Maintain erection tolerances of structural framing in accordance with AISC 360.

3.4 METAL WALL PANEL INSTALLATION

Provide metal wall panels of full length from sill to eave as indicated, unless otherwise indicated or restricted by shipping limitations. Anchor metal wall panels and other components of the Work securely in place, in accordance with MBMA MBSM.

Erect wall panel system in accordance with the approved erection drawings, the printed instructions and safety precautions of the metal building manufacturer.

Sheets are not to be subjected to overloading, abuse, or undue impact. Do not install bent, chipped, or defective sheets.

Sheets must be erected true and plumb and in exact alignment with the horizontal and vertical edges of the building, securely anchored, and with the indicated eave, and sill.

Work is to allow for thermal movement of the wall panel, movement of the building structure, and to provide permanent freedom from noise due to wind pressure.

Field cutting metal wall panels by torch is not permitted.

3.5 ROOF PANEL INSTALLATION

Provide metal roof panels of full length from eave to ridge or eave to wall as indicated, unless otherwise indicated or restricted by shipping limitations. Anchor metal roof panels and other components of the Work securely in place in accordance with NRCA RoofMan and MBMA MBSM.

Erect roofing system in accordance with the approved erection drawings, the printed instructions and safety precautions of the metal building manufacturer.

Sheets are not to be subjected to overloading, abuse, or undue impact. Do not install bent, chipped, or defective sheets.

Sheets must be erected true and plumb and in exact alignment with the horizontal and vertical edges of the building, securely anchored, and with the indicated rake and eave overhang.
Work must allow for thermal movement of the roofing, movement of the building structure, and provide permanent freedom from noise due to wind pressure.

Field cutting metal roof panels by torch is not permitted.

Roofing sheets must be laid with corrugations in the direction of the roof slope. End laps of exterior roofing must not be less than 203.2 mm 8 inches; the side laps of standard exterior corrugated sheets must be not less than 2-1/2 corrugations.

Do not permit storage, walking, wheeling, or trucking directly on applied roofing materials. Provide temporary walkways, runways, and platforms of smooth clean boards or planks as necessary to avoid damage to the installed roofing materials, and to distribute weight to conform to the indicated live load limits of roof construction.

3.6 METAL PANEL FASTENER INSTALLATION

Anchor metal panels and other components of the Work securely in place, using manufacturer's approved fasteners according to manufacturers' written instructions.

3.7 FLASHING, TRIM AND CLOSURE INSTALLATION

a. Comply with performance requirements, manufacturer's written installation instructions, and SMACNA 1793. Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.

b. Sheet metalwork is to be accomplished to form weather-tight construction without waves, warps, buckles, fastening stresses or distortion, and allow for expansion and contraction. Cutting, fitting, drilling, and other operations in connection with sheet metal required to accommodate the work of other trades is to be performed by sheet metal mechanics.

3.8 DOOR AND FRAME INSTALLATION

Install doors and frames plumb, rigid, properly aligned, and securely fastened in place according to manufacturer's written instructions. Coordinate installation with metal panel flashings and other components. Caulk and seal perimeter of each door frame with elastomeric sealant compatible with metal panels. Comply with installation requirements in Division 08 - OPENINGS.

3.9 WINDOW INSTALLATION

Install windows plumb, rigid, properly aligned, without warp or rack of frames or sash, and securely fastened in place according to manufacturer's written instructions. Coordinate installation with metal panel flashings and other components. Caulk and seal perimeter of each window frame with elastomeric sealant compatible with for metal panels. Comply with installation requirements in Division 08 - OPENINGS.
3.10 ACCESSORY INSTALLATION

3.10.1 General

Install accessories with positive anchorage to building and weather-tight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.

3.10.2 Dissimilar Metals

Where dissimilar metals contact one another or corrosive substrates are present, protect against galvanic action by painting dissimilar metal surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each surface, or by other permanent separation techniques as recommended by the metal building manufacturer.

3.10.3 Gutters and Downspouts

Comply with performance requirements, manufacturer's written installation instructions, and install sheet metal roof drainage items to produce complete roof drainage system according to SMACNA 1793 recommendations and as indicated. Coordinate installation of roof perimeter flashing with installation of roof drainage system.

3.10.4 Insulation

Comply with performance requirements and manufacturer's written installation instructions. Install insulation concurrently with metal panel installation, in thickness indicated to cover entire roof and wall area, as specified in Division 07 - THERMAL AND MOISTURE PROTECTION.

3.10.5 Roof and Wall Accessories and Specialties

Install roof and wall accessories and specialties complete with necessary hardware, anchors, dampers, weather guards, rain caps, and equipment supports as specified in Division 07 - THERMAL AND MOISTURE PROTECTION, unless otherwise indicated.

3.11 CLEAN-UP AND PROTECTION

3.11.1 Structural Framing

Clean all exposed structural framing at completion of installation. Remove metal shavings, filings, bolts, and wires from work area. Remove grease and oil films, excess sealants, handling marks, contamination from steel wool, fittings and drilling debris and scrub the work clean. Exposed metal surfaces to be free of dents, creases, waves, scratch marks, solder or weld marks, and damage to the finish coating.

3.11.2 Metal Panels

Clean all exposed sheet metal work at completion of installation. Remove metal shavings, filings, nails, bolts, and wires from work area. Remove protective coverings/films, grease and oil films, excess sealants, handling marks, contamination from steel wool, fittings and drilling debris and scrub the work clean. Exposed metal surfaces to be free of dents, creases, waves, scratch marks, solder or weld marks, and damage to the finish coating.
3.11.3 Touch-Up Painting

After erection, promptly clean, prepare, and prime or re-prime field connections, rust spots, and abraded surfaces of prime-painted structural framing and accessories. Clean and touch-up paint [with manufacturer's touch-up paint] [as specified in Section 09 90 00 PAINTS AND COATINGS, unless otherwise indicated].

3.12 WASTE MANAGEMENT

Dispose of construction waste in accordance with the requirements of Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL.

3.13 SPECIAL INSPECTION AND TESTING FOR SEISMIC-RESISTING SYSTEMS

**************************************************************************
NOTE: When geographically applicable, this paragraph will be applicable to both new buildings and existing building seismic rehabilitation designs done according to UFC 3-301-01, "Structural Engineering".

The designer must indicate on the drawings all locations and all features for which special inspection and testing is required. This includes indicating the locations of all structural components and connections requiring inspections.

Add any additional requirements as necessary
**************************************************************************

Perform special inspections and testing for seismic-resisting systems and components in accordance with Section 01 45 35 SPECIAL INSPECTIONS. When buildings are classified as Risk Category V, perform special inspections and testing in accordance with UFC 3-301-02.

3.14 WARRANTY

3.14.1 Manufacturer's Warranty

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.14.2 Contractor's Warranty For Installation

Submit warranty for installation to the Contracting Officer prior to final commissioning and acceptance.

3.14.3 Contractor's Five Year No Penal Sum Warranty
CONTRACTOR'S FIVE YEAR NO PENAL SUM WARRANTY
FOR
METAL BUILDING SYSTEM

FACILITY DESCRIPTION: ____________________________________________________________

BUILDING NUMBER: ______________________________________________________________

CONTRACTOR'S FIVE YEAR NO PENAL SUM WARRANTY
FOR
METAL BUILDING SYSTEM
(continued)

THE METAL BUILDING SYSTEM INSTALLED ON THE ABOVE NAMED BUILDING IS WARRANTED
BY [_____] FOR A PERIOD OF FIVE [5][10][20][_____] YEARS AGAINST WORKMANSHIP
AND MATERIAL DEFICIENCIES, WIND DAMAGE AND STRUCTURAL FAILURE WITHIN PROJECT
SPECIFIED DESIGN LOADS, AND LEAKAGE. THE METAL BUILDING SYSTEM COVERED UNDER
THIS WARRANTY INCLUDES, BUT IS NOT LIMITED TO, THE FOLLOWING:

FRAMING AND STRUCTURAL MEMBERS, ROOFING AND SIDING PANELS AND SEAMS, INTERIOR
OR EXTERIOR GUTTERS AND DOWNSPOUTS, ACCESSORIES, TRIM, FLASHINGS AND
MISCELLANEOUS BUILDING CLOSURE ITEMS SUCH AS DOORS AND WINDOWS (WHEN
FURNISHED BY THE MANUFACTURER), CONNECTORS, COMPONENTS, AND FASTENERS, AND
OTHER SYSTEM COMPONENTS AND ASSEMBLIES INSTALLED TO PROVIDE A WEATHERTIGHT
SYSTEM; AND ITEMS SPECIFIED IN OTHER SECTIONS OF THESE SPECIFICATIONS THAT
BECOME PART OF THE METAL BUILDING SYSTEM.

ALL MATERIAL AND WORKMANSHIP DEFICIENCIES, SYSTEM DETERIORATION CAUSED BY
EXPOSURE TO THE ELEMENTS OR INADEQUATE RESISTANCE TO SPECIFIED SERVICE DESIGN
LOADS, WATER LEAKS AND WIND UPLIFT DAMAGE MUST BE REPAIRED AS APPROVED BY THE
CONTRACTING OFFICER.

ALL MATERIAL DEFICIENCIES, WIND DAMAGE, STRUCTURAL FAILURE AND LEAKAGE
ASSOCIATED WITH THE METAL BUILDING SYSTEM COVERED UNDER THIS WARRANTY MUST BE
REPAIRED AS APPROVED BY THE CONTRACTING OFFICER.

THIS WARRANTY COVERS THE ENTIRE COST OF REPAIR OR REPLACEMENT, INCLUDING ALL
MATERIAL, LABOR, AND RELATED MARKUPS. THE ABOVE REFERENCED WARRANTY
COMMENCED ON THE DATE OF FINAL ACCEPTANCE ON [_____] AND WILL REMAIN IN
EFFECT FOR STATED DURATION FROM THIS DATE.

SIGNED, DATED, AND NOTARIZED (BY COMPANY PRESIDENT)

(Company President)                                     (Date)
CONTRACTOR’S FIVE YEAR NO PENAL SUM WARRANTY
FOR
METAL BUILDING SYSTEM
(continued)

THE CONTRACTOR HEREBY SUPPLEMENTS THIS WARRANTY WITH WRITTEN WARRANTIES FROM
THE MANUFACTURER AND/OR INSTALLER OF THE METAL BUILDING SYSTEM, WHICH IS
SUBMITTED ALONG WITH THE CONTRACTOR’S WARRANTY. HOWEVER, THE CONTRACTOR IS
ULTIMATELY RESPONSIBLE FOR THIS WARRANTY AS OUTLINED IN THE SPECIFICATIONS
AND AS INDICATED IN THIS WARRANTY.

EXCLUSIONS FROM COVERAGE

1. NATURAL DISASTERS, ACTS OF GOD (LIGHTNING, FIRE, EXPLOSIONS, SUSTAINED
WIND FORCES IN EXCESS OF THE DESIGN CRITERIA, EARTHQUAKES, AND HAIL).

2. ACTS OF NEGLIGENCE OR ABUSE OR MISUSE BY GOVERNMENT OR OTHER
PERSONNEL, INCLUDING ACCIDENTS, VANDALISM, CIVIL DISOBEDIENCE, WAR, OR DAMAGE
CAUSED BY FALLING OBJECTS.

3. DAMAGE BY STRUCTURAL FAILURE, SETTLEMENT, MOVEMENT, DISTORTION, WARPAGE,
OR DISPLACEMENT OF THE BUILDING STRUCTURE OR ALTERATIONS MADE TO THE BUILDING.

4. CORROSION CAUSED BY EXPOSURE TO CORROSIVE CHEMICALS, ASH OR FUMES
GENERATED OR RELEASED INSIDE OR OUTSIDE THE BUILDING FROM CHEMICAL PLANTS,
FOUNDRIES, PLATING WORKS, KILNS, FERTILIZER FACTORIES, PAPER PLANTS, AND THE
LIKE.

5. FAILURE OF ANY PART OF THE BUILDING SYSTEM DUE TO ACTIONS BY THE OWNER
WHICH INHIBIT FREE DRAINAGE FROM THE ROOF, GUTTERS AND DOWNSPOUTS; OR
CONDITIONS WHICH CREATE PONDING WATER ON THE ROOF OR AGAINST THE BUILDING
SIDING.

6. THIS WARRANTY APPLIES TO THE METAL BUILDING SYSTEM. IT DOES NOT INCLUDE
ANY CONSEQUENTIAL DAMAGE TO THE BUILDING INTERIOR OR CONTENTS WHICH IS
COVERED BY THE WARRANTY OF CONSTRUCTION CLAUSE INCLUDED IN THIS CONTRACT.

7. THIS WARRANTY CANNOT BE TRANSFERRED TO ANOTHER OWNER WITHOUT WRITTEN
CONSENT OF THE CONTRACTOR AND THIS WARRANTY AND THE CONTRACT PROVISIONS TAKE
PRECEDENCE OVER ANY CONFLICTS WITH STATE STATUTES. REPORTS OF LEAKS AND
BUILDING SYSTEM DEFICIENCIES MUST BE RESPONDED TO WITHIN 48 HOURS OF RECEIPT
OF NOTICE BY TELEPHONE OR IN WRITING FROM EITHER THE OWNER, OR CONTRACTING
OFFICER. EMERGENCY REPAIRS, TO PREVENT FURTHER ROOF LEAKS, MUST BE INITIATED
IMMEDIATELY; A WRITTEN PLAN MUST BE SUBMITTED FOR APPROVAL TO REPAIR OR
REPLACE THIS SSSMR SYSTEM WITHIN SEVEN CALENDAR DAYS. ACTUAL WORK FOR
PERMANENT REPAIRS OR REPLACEMENT MUST BE STARTED WITHIN 30 DAYS AFTER RECEIPT
OF NOTICE, AND COMPLETED WITHIN A REASONABLE TIME FRAME. IF THE CONTRACTOR
FAILS TO ADEQUATELY RESPOND TO THE WARRANTY PROVISIONS, AS STATED...
CONTRACTOR'S FIVE YEAR NO PENAL SUM WARRANTY
FOR
METAL BUILDING SYSTEM
(Exclusions from Coverage Continued)

POST A FRAMED COPY OF THIS WARRANTY IN THE MECHANICAL ROOM OR OTHER APPROVED LOCATION DURING THE ENTIRE WARRANTY PERIOD.

3.6 SPECIAL TESTING FOR SEISMIC-RESISTING EQUIPMENT
3.7 SPECIAL INSPECTION FOR SEISMIC-RESISTING SYSTEMS AND EQUIPMENT

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for seismic structural elements for protection of miscellaneous equipment.

This guide specification [also] covers all equipment bracing requirements (including mechanical, electrical and architectural) for antiterrorism protection from equipment falling on building occupants in accordance with UFC 4-010-01 DoD Minimum Antiterrorism Standards for Buildings.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Projects only having antiterrorism equipment bracing requirements with no seismic protection requirements will require significant editing to this UFGS because most of the requirements apply to seismic protection. Projects having both antiterrorism equipment bracing and seismic protection requirements will require the specification to be edited such that the most stringent of both requirements is met.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.
NOTE: The intent of this specification is to provide for adequate resistance to lateral forces induced by earthquakes for listed mechanical, electrical and miscellaneous equipment and systems. The design seismic lateral forces are in addition to the "normal" gravity forces (weight) acting on the components of a system. This guide specification will be used in conjunction with Sections 23 05 48.19 10 SEISMIC CONTROLS FOR HVAC, 01 45 35 SPECIAL INSTRUCTIONS, and 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT.

Seismic protection design for anchorage and bracing of all equipment will be based on UFC 3-301-01 Seismic Design for Buildings and UFC 4-010-01 DoD Minimum Antiterrorism Standards for Buildings.

The designer has 3 options to provide seismic protection for a project:

1) Issue a contract requiring the Contractor to hire a registered structural engineer to submit the stamped calculations and drawings in accordance with this section. The contracting Officer will "accept" the design but the registered engineer (Engineer of Record) will have final responsibility for the adequacy of the structural members and their connections.

2) Hire an A-E who will use this section and will submit calculations and drawings stamped by a registered structural engineer. The Contracting Officer will "accept" the design but the registered engineer (Engineer of Record) will have final responsibility for the adequacy of the structural members and their connections. One of the disadvantages of this approach may be that the actual equipment dimensions, weights and mounting details may not be known until the equipment is acquired. The structural engineer should be retained during the construction phase to review seismic bracing shop drawings and perform field inspections as part of the final responsibility.

3) Perform the design in house, in which case the Government designer will have final responsibility for the adequacy of the structural members and their connections. One of the disadvantages of this approach may be that the actual equipment dimensions, weights and mounting details may not be known until the equipment is acquired. The structural engineer should be retained during the construction phase to review seismic bracing shop drawings and perform field inspections as part of the final responsibility.
Regardless of who performs the design, this section, properly edited, must be included in the construction documents to allow the Contractor to install the seismic protection features.

This section can be used for bracing details of medical equipment by editing the specification accordingly.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN CONCRETE INSTITUTE (ACI)

MFMA-4 (2004) Metal Framing Standards Publication
**SYSTEM DESCRIPTION**

1.2.1 General Requirements

**************************************************************************

NOTE: Designer should verify that specified details do not interfere with the performance of the cathodic protection system (when used) or of the vibration isolation systems.

For systems and equipment in RC V buildings that have a performance objective higher than non-mission critical, the designer should show a "G" classification for the items under SD-02 Shop Drawings in the SUBMITTALS paragraph. This will allow the Engineer of Record (EOR) to: 1) Do a QC review on the anchorage and bracing details of these essential systems, and 2) Assess the impact of the bracing and anchorage details on the structural supporting system of the essential building. This also includes Designated Seismic Systems that must remain operational after an earthquake.

Design done by the Contractor must be in accordance with UFC 3-301-01 and UFC 4-010-01. Loadings determined using UFC 3-301-01 are based on strength design; therefore, 2018 IBC, ASCE 7-16-10, and ASCE/SEI 41-13 should be used to design the steel members in the bracing and anchorage systems.

**************************************************************************

Apply the requirements for seismic protection measures, described in this section and on the drawings, of the miscellaneous equipment and systems listed below, in accordance with UFC 3-301-01 and additional data furnished by the Contracting Officer. Provide seismic protection measures in addition to any other requirements called for in other sections of these specifications. Where there is a conflict between the specifications and the drawings, the specifications will take precedence. Accomplish resistance to lateral forces induced by earthquakes without consideration of friction resulting from gravity loads.
1.2.2 Miscellaneous Equipment and Systems

**************************************************************************

NOTE: The designer must ensure that the lists below includes all miscellaneous items to be braced. Delete the items which are not part of the project and add items which are not included in the list. The lists should be broken out as follows: For nonstructural equipment, components and systems in Risk Category V structures, the designer should provide three separate lists of equipment and systems; non-Mission Critical (NMC), Mission Critical Level 1 (MC-1 equipment and components must be fully operational immediately after a seismic event), or Mission Critical Level 2 (MC-2 equipment and components must be repairable and operable within 3 days after a seismic event). For nonstructural equipment/components/systems in Risk Category I, II, III, or IV structures, two separate lists of nonstructural systems/components must be provided; components/systems with Ip = 1.0 and components/systems with Ip = 1.5 (Designated Seismic Systems).

**************************************************************************

Provide bracing and attachment for the following miscellaneous equipment and components developed by the [Contractor] [A-E] in accordance with the requirements of this specification:

[  Equipment/Components with Ip = 1.0
  Storage cabinets
  Ornamentations
  Storage Racks
  Signs and Billboards
  Shelving
  Furnishings
  Partitions
  Stacks
  Pole or frame supported equipment
  Storage tanks for water and oil
  [_____] ]

[Equipment/Components with Ip = 1.5 (Designated Seismic Systems)
Insert edited list here similar to one above for Ip = 1.0]
[Non-Mission Critical (NMC) Equipment/Components in Risk Category V
Insert edited list here similar to one above for Ip = 1.0 ]
[Mission Critical Level 1 (MC-1) Equipment/Components in Risk Category V
Insert edited list here similar to one above for Ip = 1.0 ]
[Mission Critical Level 2 (MC-2) Equipment/Components in Risk Category V
Insert edited list here similar to one above for Ip = 1.0 ]

1.2.3 Contractor Designed Bracing

**************************************************************************

NOTE: Retain this paragraph when the Contractor will design the bracing. The designer will refer and/or modify the listings above or will list below the equipment and systems to receive seismic bracing. Delete this paragraph when all bracing
details and locations are indicated on the drawings and calculations are included in the Design Analysis.

**************************************************************************
Submit copies of the design calculations with the drawings. Calculations must be approved, certified, stamped and signed by a registered Professional Structural Engineer. Calculations must verify the capability of structural members to which bracing is attached for carrying the load from the brace. Design the bracing in accordance with UFC 3-301-01, UFC 4-010-01 and additional data furnished by the Contracting Officer. Resistance to lateral forces induced by earthquakes must be accomplished without consideration of friction resulting from gravity loads. UFC 3-301-01 uses parameters for the building, not for the equipment in the building; therefore, corresponding adjustments to the formulas must be required. Loadings determined using UFC 3-301-01 are based on strength design; therefore, AISC 325 Specifications must be used for the design. The bracing for the equipment designated in paragraph 1.2.2 must be developed by the Contractor. [Provide documentation of an independent design review for mission critical (MC) equipment bracing design. Documentation must be signed by the independent reviewer who must also be a registered structural engineer.]

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project. This includes Designated Seismic Systems and Mission Critical Systems that must remain operational after an earthquake.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

PART 2 PRODUCTS

******************************************************************************
NOTE: Appropriate materials for structural supports must be used in corrosive environments. Dissimilar metals must be isolated.
******************************************************************************

2.1 EQUIPMENT REQUIREMENTS

******************************************************************************
NOTE: Seismic Control Bracing does not guarantee that the equipment itself is rugged enough to survive earthquake shaking. When a piece of
equipment is required to remain operational after an earthquake, include paragraph 3.11 Special Testing for Seismic Resisting Equipment.

Submit detail drawings of bracing along with calculations, catalog cuts, templates, and erection and installation details, as appropriate, for the items listed in Paragraph 1.2.2. Indicate thickness, type, grade, class of metal, and dimensions; and show construction details, reinforcement, anchorage, and installation with relation to the building construction. Provide calculations and drawings that are stamped by a registered structural engineer, and that verify the capability of structural members to which bracing is attached for carrying the load from the brace. Design must be based on actual equipment and system layout. Design must include calculated dead loads, static seismic loads and capacity of materials utilized for the connection of the equipment or system to the structure. Analysis must detail anchoring methods.

Include drawing for [Mission Critical Equipment and] Designated Seismic System Equipment indicating the equipment location in the facility sufficient to be used for the installation. Equipment must be rigidly or flexibly mounted as indicated in the specifications and/or drawings depending on vibration isolation requirements as follows below. Roof mounted equipment both vibration isolated and nonisolated, must have support members designed and anchored to building structural steel or concrete as required for seismic restraint and wind loads.

2.1.1 Rigidly (Base and Suspended) Mounted Equipment

NOTE: List items that may require additional reinforcements (internally) to prevent permanent deformation, dislocations, separation of components, or other damage, which would render the equipment inoperative for significant periods of time following an earthquake and to meet the specified requirements. Coordinate with note in paragraph BRACING.

Equipment furnished under this contract must be [rigidly mounted] [rigidly mounted using cast-in-place anchor bolts to anchor them or post-installed anchors that are qualified for earthquake loading in accordance with ACI 355.2 and ACI 355.4. Anchor bolts must conform to ASTM F1554-07ae1]. For any rigid equipment which is rigidly anchored, provide flexible joints for piping, electrical conduit, etc., that are capable of accommodating displacements equal to the full width of the joint in both orthogonal directions. Suspended equipment bracing attachments should be located just above the center of gravity to minimize swinging. [Mission critical base mounted and suspended equipment for Risk Category (RC) V], and Designated Seismic Systems (DSS) RC IV buildings assigned to Seismic Design Category Coefficient (SDC) C, D, E, or F and Risk Category IV components needed for continued operation after an earthquake must have two nuts provided on each anchor bolt.

2.1.2 Nonrigid or Flexibly-Mounted Equipment

Select vibration isolation devices so that the maximum movement of equipment from the static deflection point is 6 mm 1/4 inch. Equipment
flexibly mounted on vibration isolators must have a bumper restraint or snubber in each horizontal direction and vertical restraints must be provided where required to resist overturning. Isolator housing and restraints must be constructed of ductile materials. A viscoelastic pad or similar material of appropriate thickness must be used between the bumper and components to limit the impact load. Restraints must be designed to resist the calculated horizontal lateral and vertical forces.

Spring vibration isolators must be seismically rated, restrained isolators for equipment subject to load variations and large external forces. The seismically rated housing must be sized to meet or exceed the force requirements applicable to the project and meet the required isolation criteria. Spring vibration isolator manufacturer's will be a member of VISCMA. Design force, \( F_p \), must be doubled for vibration isolators with an air gap greater than 0.25 inches as specified in ASCE 7-16, Chapter 13.

2.2 BOLTS AND NUTS

Hex head bolts, and heavy hexagon nuts must be ASTM A325 or ASTM A490 bolts and ASTM A563 nuts. Provide bolts and nuts galvanized in accordance with ASTM A153/A153M when used underground or exposed to weather.

2.3 SWAY BRACING

Material used for members listed [in this section] [and] [on the drawings], must be structural steel conforming with the following:

a. Plates, rods, and rolled shapes, ASTM A36/A36M.

b. Wire rope, ASTM A603.

c. Tubes, ASTM A500/A500M, Grade B.

d. Pipes, ASTM A53/A53M, Grade B.

e. Angles, ASTM A36/A36M.

f. Channels (Struts) with in-turned lips and associated hardware for fastening to channels at random points conforming to MFMA-4.

PART 3 EXECUTION

3.1 BRACING

******************************************************************************
NOTE: Designs must include complete seismic details showing bracing requirements. The design is for the supports of the equipment, not the equipment itself. Bracing does not guarantee that the equipment is rugged enough to survive earthquake shaking. When a piece of equipment is required to remain operational after an earthquake, the manufacturer should be consulted regarding the capabilities of the equipment to withstand seismic loading.
******************************************************************************

Provide bracing conforming to the arrangements shown. Install cables at a 45-degree slope. Where interference is present, the slope may be minimum.
of 30 degrees or a maximum of 60 degrees per VISCMA 412.

3.2 BUILDING DRIFT

**************************************************************************
NOTE: The designer will be guided by the results of the seismic analysis to determine the expected drift of the building; this information is needed for equipment bracing design.
**************************************************************************

Do not attach sway braces for equipment to two dissimilar structural elements of a building that may respond differentially during an earthquake unless a flexible joint is provided. Bracing must be capable of accommodating building drift due to seismic displacements.

3.3 ANCHOR BOLTS

3.3.1 General

Submit copies of test results to verify the adequacy of the specific anchor and application, as specified.

Ensure housekeeping pads have adequate space to mount equipment and seismic restraint devices allowing adequate edge distance and embedment depth for restraint anchor bolts. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength. Install neoprene grommet washers or till the gap with epoxy on equipment anchor bolts where clearance between anchor and equipment support hole exceeds 0.125 inches.

3.3.2 Cast-In-Place

**************************************************************************
NOTE: The designer will ensure that foundations and anchor bolts for pad-mounted or floor-mounted equipment are detailed and designed in accordance with UFC 3-301-01. When the designer has the necessary size, weight, and other information for a piece of equipment, the anchorage details including sizes, length and number of bolts, thickness and reinforcing of pads and foundations for that piece of equipment will be shown by the designer on the drawings. When this information is not available, it will be the A-E responsibility to design the support and anchorage for the equipment in accordance with the specified requirements.
**************************************************************************

If the calculated seismic forces would cause the equipment to uplift, the anchor bolts should be designed for combined shear and tension.

**************************************************************************
Use templates to locate cast-in-place bolts accurately and securely in formwork. Provide anchor bolts with an embedded straight length equal to at least 12 times nominal diameter of the bolt. Anchor bolts that exceed the normal depth of equipment foundation piers or pads must either extend into concrete floor or the foundation or be increased in depth to
accommodate bolt lengths. Use templates to locate cast-in-place bolts accurately and securely in formwork.

### 3.3.3 Drilled-In Anchor Bolts

**************************************************************************

**NOTE: Verify if restrictions exist on the type of drilling equipment to be used for the project.**

**************************************************************************

Drill holes with rotary impact hammer drills. Drill bits must be of diameters as specified by the anchor manufacturer. Unless otherwise shown on the drawings, all holes must be drilled perpendicular to the concrete surface. Where anchors are permitted to be installed in cored holes, use core bits with matched tolerances as specified by the manufacturer. Properly clean cored hole per manufacturer's instructions. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Exercise care in coring or drilling to avoid damaging existing reinforcing or embedded items. Notify the COR if reinforcing steel or other embedded items are encountered during drilling. Take precautions as necessary to avoid damaging prestressing tendons, electrical and telecommunications conduit, and gas lines. Unless otherwise specified, do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength. Perform anchor installation in accordance with manufacturer instructions. For Wedge Anchors, Heavy-Duty Sleeve Anchors, and Undercut Anchors, protect threads from damage during anchor installation. Heavy-duty sleeve anchors must be installed with sleeve fully engaged in part to be fastened. Set anchors to manufacturer's recommended torque, using a torque wrench. Following attainment of 10 percent of the specified torque, 100 percent of the specified torque must be reached within 7 or fewer complete turns of the nut. If the specified torque is not achieved within the required number of turns, the anchor must be removed and replaced unless otherwise directed by the Engineer.

For Cartridge Injection Adhesive Anchors where approved for seismic application, clean all holes per manufacturer instructions to remove loose material and drilling dust prior to installation of adhesive. Inject adhesive into holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive. Follow manufacturer recommendations to ensure proper mixing of adhesive components. Sufficient adhesive must be injected in the hole to ensure that the annular gap is filled to the surface. Remove excess adhesive from the surface. Shim anchors with suitable device to center the anchor in the hole. Do not disturb or load anchors before manufacturer specified cure time has elapsed. For Capsule Anchors where approved for seismic application, perform drilling and setting operations in accordance with manufacturer instructions. Clean all holes to remove loose material and drilling dust prior to installation of adhesive. Remove water from drilled holes in such a manner as to achieve a surface dry condition. Capsule anchors must be installed with equipment conforming to manufacturer recommendations. Do not disturb or load anchors before manufacturer specified cure time has elapsed. Observe manufacturer recommendations with respect to installation temperatures for cartridge injection adhesive anchors and capsule anchors.

### 3.3.4 Anchor Bolt Testing

**************************************************************************

**NOTE: Expansion and chemically bonded anchors**

**************************************************************************
should be tested after installation. Testing every expansion anchor is not necessary or practical; therefore a reasonable rate of testing should be developed depending on the importance of the job. There are two methods of testing: Torque wrench and pullout testing. The torque test is easier and cheaper and usually gives a good indication of installation quality; the pullout test gives a better indication of the strength of both expansion and chemically bonded anchors. The torque test does not apply to expansion bolts which are anchored by hammering the sleeve over a cone such as self drilling anchors.

Test in place expansion and chemically bonded anchors not more than [24] [_____] hours after installation of the anchor, conducted by an independent testing agency; testing must be performed on random anchor bolts as described below.

3.3.4.1 Torque Wrench Testing

NOTE: Delete this paragraph for expansion anchors which are not anchored by an applied torque, such as self drilling anchors.

Torque wrench testing verifies that a torqued expansion anchor has seated properly. If it has not seated, the applied torque on the nut will cause the bolt to twist in the hole. Torque wrench testing does not load the bolt up to allowable load and therefore does not verify the capacity of the installed bolt.

Perform torque wrench testing on not less than [50] [_____] percent of the total installed expansion anchors and at least [one anchor] [(____)] anchors for every piece of equipment containing more than [two] [_____] anchors. The test torque must equal the minimum required installation torque as required by the bolt manufacturer. Calibrate torque wrenches at the beginning of each day the torque tests are performed. Recalibrate torque wrenches for each bolt diameter whenever tests are run on bolts of various diameters. Apply torque between 20 and 100 percent of wrench capacity. Reach the test torque within one half turn of the nut, except for 9 mm 3/8 inch sleeve anchors which must reach their torque by one quarter turn of the nut. If any anchor fails the test, test similar anchors not previously tested until [20] [_____] consecutive anchors pass. Failed anchors must be retightened and retested to the specified torque; if the anchor still fails the test it must be replaced.

3.3.4.2 Pullout Testing

NOTE: Pullout testing is expensive and labor intensive because of the apparatus needed to pull on the anchor bolt. Pullout testing determines the tension capacity of the anchor bolt. The amount of load to be applied can vary between 0.5 to 2 times
the calculated load, depending on the importance of
the bolt. There is not a significant cost
difference between testing to 0.5 or 2 times the
calculated load; since most anchor bolts have a
factor of safety of 4, testing to twice the
specified load should not cause any distress. The
typical tension failure causes a shear cone to be
pulled out of the concrete, the slope of the cone is
about a 45 degree angle so there should be nothing
on the concrete surface in the vicinity of the bolt
to prevent the cone from pulling out. Shear testing
is usually not needed unless the bolt is heavily
loaded in shear and close to an edge.

Test expansion and chemically bonded anchors by applying a pullout load
using a hydraulic ram attached to the anchor bolt. Testing must be done in
accordance with ASTM E488/E488M or ICC-ES AC23. At least [5] [_____] percent of the anchors, but not less than [3] [_____] per day must be
tested. Apply the load to the anchor without removing the nut; when that
is not possible, the nut must be removed and a threaded coupler must be
installed of the same tightness as the original nut. Check the test setup
to verify that the anchor is not restrained from withdrawing by the
baseplate, the test fixture, or any other fixtures. The support for the
testing apparatus must be at least 1.5 times the embedment length away from
the bolt being tested. Load each tested anchor to [1] [_____] times the
design tension value for the anchor. The anchor must have no observable
movement at the test load. If any anchor fails the test, similar anchors
not previously tested must be tested until [10] [_____] consecutive anchors
pass. Failed anchors must be retightened and retested to the specified
load; if the anchor still fails the test it must be replaced.

3.4 RESILIENT VIBRATION ISOLATION DEVICES

Where the need for these devices is determined, based on the magnitude of
the design seismic forces, select anchor bolts for vibration isolation
devices and/or snubbers for equipment base and foundations that follow the
same procedure as in paragraph ANCHOR BOLTS, except use an equipment weight
equal to [five] [_____] times the actual equipment weight.

3.4.1 Spring-Type Vibration Devices

NOTE: Designer must double design force Fp for
vibration isolators where maximum movement of
equipment from static deflection point is greater
than 0.25 inches as specified in ASCE 7-16, Table
13.6-1, footnote b.

Select vibration isolation devices so that the maximum movement of
equipment from the static deflection point is 13 mm 1/2 inch. Equipment
flexibly mounted on vibration isolators must have a bumper restraint or
snubber in each horizontal direction and vertical restraints must be
provided where required to resist overturning. Isolator housing and
restraints must be constructed of ductile materials. A viscoelastic pad or
similar material of appropriate thickness must be used between the bumper
and components to limit the impact load. Restraints must be designed to
resist the calculated horizontal lateral and vertical forces.
Spring vibration isolators must be seismically rated, restrained isolators for equipment subject to load variations and large external forces. The seismically rated housing must be sized to meet or exceed the force requirements applicable to the project and meet the required isolation criteria. Spring vibration isolator manufacturers will be a member of VISCMA.

3.4.2 Multidirectional Seismic Snubbers

**************************************************************************
NOTE: Details of multidirectional seismic snubbers will be shown in drawings if paragraph is retained.

Designer must double design force Fp for vibration isolators where maximum movement of equipment from static deflection point is greater than 0.25 inches as specified in ASCE 7-16, Table 13.6-1, footnote b.
**************************************************************************

Install multidirectional seismic snubbers employing elastomeric pads on floor- or slab-mounted equipment. Use snubbers that provide 6 mm 1/4 inch free vertical and horizontal movement from the static deflection point. Provide snubber medium consisting of multiple pads of cotton duct and neoprene or other suitable materials arranged around a flanged steel trunnion so both horizontal and vertical forces are resisted by the snubber medium.

3.5 EQUIPMENT SWAY BRACING

3.5.1 Suspended Equipment

**************************************************************************
NOTE: Equipment weighing more than one-fifth of the dead load of slabs above grade at the equipment level or equipment weighing more than one-tenth of the building weight must be checked by structural analysis to conform with building seismic provisions. Such equipment has a pronounced effect on the response of the building. The following items must be checked structurally and specific seismic bracing and/or anchoring requirements must be incorporated on appropriate drawings and in the relevant specifications.

Pole or frame supported equipment.

Storage tanks for water and oil.

Storage racks with upper storage level more than 2.4 m 8 feet in height.

Smoke stacks taller than 15 m 50 feet in height.
**************************************************************************

Provide equipment sway bracing for items supported from floor, overhead floor or roof structural systems. Provide braces that consist of angles,
rods, wire rope, bars, channels (struts) or pipes arranged as shown in bracing submittals and secured at both ends with not less than 13 mm 1/2 inch bolts. Provide sufficient braces for equipment to resist a horizontal force as specified in UFC 3-301-01 without exceeding safe working stress of bracing components. Provide, for approval, specific force calculations in accordance with UFC 3-301-01 for the equipment in the project. Submit details of equipment bracing for acceptance. In lieu of bracing with vertical supports, these items may be supported with hangers inclined at 45 degrees directed up and radially away from equipment and oriented symmetrically in 90-degree intervals on the horizontal plane, bisecting the angles of each corner of the equipment, provided that supporting members are properly sized to support operating weight of equipment when hangers are inclined at a 45-degree angle.

3.5.2 Floor or Pad Mounted Equipment

3.5.2.1 Shear Resistance

Bolt to the floor, floor mounted equipment. Provide the number and installation of bolts to resist shear forces in accordance with paragraph ANCHOR BOLTS.

3.5.2.2 Overturning Resistance

**************************************************************************
NOTE: See UFC 3-301-01 for guidance on design of anchor bolts.
**************************************************************************

Use the ratio of the overturning moment from seismic forces to the resisting moment due to gravity loads to determine if overturning forces need to be considered in the sizing of anchor bolts. Provide calculations to verify the adequacy of the anchor bolts for combined shear and overturning.

3.6 SPECIAL TESTING FOR SEISMIC-RESISTING EQUIPMENT

**************************************************************************
NOTE: Include this paragraph only for special testing for seismic-resisting equipment and components designated as Risk Category V Mission Critical Level 1 (MC-1) by the building owner and specified by the Structural Engineer. MC-1 equipment and components must be fully operable immediately after a seismic event. This paragraph may also apply to Designated Seismic System (DSS)(assigned to SDC C thru F) equipment and components that must remain operational after an earthquake to function for life safety purposes or is needed for continued operation in a Risk Category IV structure.

This paragraph will be applicable to both new buildings designed according to UFC 3-301-01 STRUCTURAL ENGINEERING, UFC 3-301-02 DESIGN OR RISK CATEGORY V STRUCTURES, NATIONAL STRATEGIC MILITARY ASSETS, and to existing building seismic rehabilitation designs.
The designer must indicate on the drawings all locations and all components for which special inspection and testing is required for MC-1 equipment.

Add any additional requirements as necessary.

Equipment and components designated as [MC-1 (Mission Critical Level 1)] Designated Seismic Systems required to remain operational after an earthquake will be seismic qualified by shake table testing conforming to ICC ES AC156 Shake Table Test procedures. The manufacturer is to provide a certification by a fully qualified testing agency for the specific equipment and/or components. Prequalified certifications are acceptable unless noted otherwise.[ Seismic component qualification documentation for each piece of equipment must contain the information required in UFC 3-301-02, Section 2-17.2.5 Component Qualification Documentation.]

Miscellaneous components that are required to be certified must bear permanent marking or nameplates constructed of a durable heat and water resistant material. Nameplates must be mechanically attached to such nonstructural components and placed on each component for clear identification. The nameplate must not be less than 5 inches x 7 inches with red letters 1 inch in height on a white background stating "Certified Equipment." The following statement must be on the nameplate: "This equipment/component is certified. No modifications are allowed unless authorized in advance and documented in the Equipment Certification Documentation file." The nameplate must also contain the component identification number in accordance with the drawings/specifications and the O&M manuals.

3.7 SPECIAL INSPECTION FOR SEISMIC-RESISTING SYSTEMS AND EQUIPMENT

NOTE: Include this paragraph only for special inspection of seismic-resisting systems that serve Risk Category V Structures; designated seismic systems and equipment per IBC 1705.12.4; and storage racks per IBC 1705.12.7. The designer must indicate on the drawings all locations and all features for which special inspection is required. This includes indicating the locations of all structural components and connections requiring inspection. Designated Seismic Systems are required to be operational after a design earthquake. MC-1 equipment and components must be fully operable immediately after a seismic event. MC-2 equipment and components must be repairable and operable within 3 days after a seismic event. This paragraph will be applicable to both new buildings designed according to UFC 3-301-01 SEISMIC DESIGN FOR BUILDINGS, and to existing building seismic rehabilitation designs.

Perform special inspections for seismic-resisting systems, equipment and components [for structures assigned to Risk Category V;] designated seismic systems and equipment per ICC IBC 1705.12.4; and storage racks per ICC IBC 1705.12.7. Periodic special inspections will be conducted on miscellaneous
equipment as required by Section 1705.12 of the International Building Code and paragraph 2-2.4.3 of *UFC 3-301-01*. Provide a Statement of Special Inspections and Final Report in accordance with paragraph 2-2.4.3 of *UFC 3-301-01*.

3.10 TESTING AND CERTIFICATION

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for x-ray shielding for medical and dental radiological facilities.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**AMERICAN NATIONAL STANDARDS INSTITUTE (ANSI)**

**ASTM INTERNATIONAL (ASTM)**

**HARDWOOD PLYWOOD AND VENEER ASSOCIATION (HPVA)**

**NATIONAL COUNCIL ON RADIATION PROTECTION AND MEASUREMENTS (NCRP)**

NCRP 145 (2003) Radiation Protection in Dentistry

NCRP 147 (2004) Structural Shielding Design for Medical X-Ray Imaging Facilities

NCRP 148 (2004) Radiation Protection in Veterinary Medicines

**STEEL DOOR INSTITUTE (SDI/DOOR)**

SDI/DOOR A250.8 (2017) Specifications for Standard Steel Doors and Frames
1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

SD-06 Test Reports

Testing and Certification

1.3 QUALITY CONTROL

1.3.1 Preinstallation Meeting

Hold a pre-installation meeting with the subcontractors and installers working in, on, or near the X-Ray Shielding. Review requirements and coordination to ensure the integrity of the shielding including sequence, schedule, penetrations, methods of attachment, service installations and unauthorized modifications.

1.3.2 Shielding Delegated Design

********************************************************************************

NOTE: This section is used when the contractor designs the x-ray shielding protection. Typically delete this section.

********************************************************************************

Shielding design in accordance with [NCRP 145][NCRP 147][NCRP 148] by a qualified medical or health physicist. Calculate, design, detail and specify the x-ray shielding system requirements comprising of walls, partitions, floor[s], ceiling, doors, window[s], joints, patches, sleeves, and mazes as necessary to ensure shielding continuity at penetrations as well as embedded items including ducts, pipes, conduits, service boxes and hardware. Include the thickness of lead, concrete, lead glass and any other relevant materials.

Submit complete x-ray shielding system design comprising of calculations, detail drawings, specifications and product data sufficient to validate the
design and for construction, to the Contracting Officer for approval prior to construction.

a. Medical or Health Physicist Qualifications: Regularly engaged in the design of radiation shielding, and certified by American Board of Radiology, American Board of Medical Physics, American Board of Health Physics, or Canadian College of Physicists in Medicine.

1.3.3 Installer Experience

An experienced firm that has been regularly and successfully engaged in the installation of radiation protection systems, similar to the work required, for at least the previous 5 years.

a. Submit a project experience list on projects of similar scope completed during the previous 5 years for approval. Include project completion dates, name and telephone number of the user and/or owner.

1.3.4 Source Responsibility

Procure radiation protection materials, components and accessories as standard products. Obtain each type of product from a single manufacturer.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials and components in original packaging, labeled with the manufacturer/vendor, brand name and part number as appropriate.

Inspect materials and components upon receipt. Remove and replace damaged items. Minor damage may be repaired at the discretion of the Contracting Officer where repair matches new condition.

Comply with manufacturers/vendors instructions and recommendations for storage and handling of all materials and components.

Protect materials and components from deleterious environments including weather, direct sunlight, moisture, contamination, corrosion, and construction traffic.

PART 2 PRODUCTS

2.1 X-RAY SHIELDING SYSTEM

A continuous x-ray shielding system in accordance with NCRP 145, NCRP 147, NCRP 148, comprising of walls, partitions, floor[s], ceiling, doors, joints, patches, sleeves, and mazes as necessary to ensure shielding continuity at penetrations as well as embedded items including ducts, pipes, conduits, service boxes and hardware.

Minimum sheet lead thickness as indicated.

Nominal sheet lead overlap as indicated to achieve a minimum overlap of not less than 0.4 inch in the field including sheet to sheet joints, sheet to shielded element/component joints, and sheet to patches, sleeves, and mazes, unless specified otherwise.

2.2 LEAD SHEET

Sheet Lead: conform to ASTM B749, Grade C, thickness as indicated.
2.3 **LEAD-LINED CONCRETE MASONRY UNITS**

Single thickness of unpierced sheet lead bonded or permanently anchored to concrete masonry units conforming to ASTM C129, Type 1. Nominal sheet lead overlap between blocks [1 inch][1-1/2 inch]. Provide preformed half block lengths to ensure bond and shielding without cutting in the field. 300 by 300 by [100] [150] mm 150 by 300 by [100] [150] mm 100 mm

2.4 **LEAD LINED PLYWOOD**

Single thickness of unpierced sheet lead laminated to plywood, PS 1 Structural grade, Grade C-C or better, sanded; APA span rated to suit application, [5/8 inch] [3/4 inch] thick conforming to HPVA HP-1.

a. Fire-Retardant Treated Plywood: Where indicated, fire-retardant treated plywood complying with performance requirements in ASTM E84, Interior Type A.

2.5 **LEAD-LINED GYPSUM WALLBOARD**

Single thickness of unpierced sheet lead laminated to [13][16] mm [1/2][5/8] inch thick gypsum board conforming to ASTM C1396/C1396M, Type III, Grade R, Class 1, Form a, [Style 1][Style 3].

[2.6 CONCRETE SHIELDING MATERIAL

2355 kg/cubic meter Refer to Section 03 30 00 CAST-IN-PLACE CONCRETE.

]2.7 **INTERLOCKING LEAD BRICKS**

99.9 percent pure lead, free from inclusions, scale, laminations, blisters, cracks, and projections that could affect interlock. Nominal lead overlap between bricks [1 inch].

2.8 **LEAD GLASS**

Clear x-ray protective quality glass in single or multiple thicknesses. Shielding equivalent not less than the adjacent construction. Permanently labeled as "X-Ray Lead Glass" and with the equivalent lead shielding thickness identified.

a. Lead Safety Glass: Laminated clear float glass, permanently labeled as impact resistant in compliance with ANSI Z97.1 and 16 CFR 1201, CAT II.

2.9 **LEAD-LINED WOOD DOORS**

[Hardwood veneer, solid core, lead-lined wood doors to ANSI/WDMA I.S.1A, with manufacturer's standard lead core thickness to achieve shielding equivalent to not less than the adjacent construction.][Add door description.][Refer to Section 08 14 00 WOOD DOORS.]

2.9.1 Door Hardware

Provide sheet lead and lead plugs to maintain shielding at hardware locations not less than the shielding equivalent in the adjacent construction.
2.9.2 Thresholds

**************************************************************************
NOTE: Threshold construction may not be required for installations operating below critical power levels where the primary beam does not strike the door area.
**************************************************************************

Line thresholds with a single thickness of sheet lead to provide not less than the shielding equivalent in the adjacent construction.

2.10 LEAD-LINED STEEL DOORS

[SDI/DOOR A250.8, Level 2 Heavy Duty, Model 1, minimum 0.042 inch faces with vertical steel stiffeners throughout and manufacturer's standard lead core thickness to achieve shielding equivalent to not less than the adjacent construction.][Add door description.][Refer to Section 08 11 13 STEEL DOORS AND FRAMES.]

2.10.1 Door Hardware

Provide sheet lead and lead plugs to maintain shielding at hardware locations not less than the shielding equivalent in the adjacent construction.

2.10.2 Thresholds

**************************************************************************
NOTE: Threshold construction may not be required for installations operating below critical power levels where the primary beam does not strike the door area.
**************************************************************************

Line thresholds with a single thickness of sheet lead to provide not less than the shielding equivalent in the adjacent construction.

2.11 DOOR FRAMES

[SDI/DOOR A250.8, Level 2 welded frame, minimum 0.053 inch frame thickness and manufacturer's standard lead core thickness to achieve shielding equivalent to not less than the adjacent construction.][Add door frame description.][Refer to Section 08 11 13 STEEL DOORS AND FRAMES.]

Continuously lined with a single thickness of factory installed sheet lead to provide the shielding equivalent not less than the adjacent construction. Include sheet lead and lead plugs to maintain shielding at hardware locations and adjoining lead shielding.

2.12 WINDOW FRAMES

[Add window frame description.][Refer to Section 08 51 13 ALUMINUM WINDOWS.][Refer to Section 08 51 23 STEEL WINDOWS.]

Continuously lined with manufacturer's standard lead core thickness to provide the shielding equivalent not less than the adjacent construction. Overlap frames a minimum of 9 mm 3/8 inch at the perimeter of the lead glass or twice the thickness of the sheet lead shielding, whichever is
greater. Lead frames and glazing panel to provide shielding equivalent not less than the adjacent construction. Include sheet lead and lead plugs to maintain shielding to adjoining lead shielding.

2.13  **LOUVERS**

[Add louver description]

One-unit with a maze-type blade to allow [30 percent] free area and continuously lined with a single thickness of factory installed sheet lead to provide the shielding equivalent not less than the adjacent construction.

2.14  **DESIGNATING PLAQUES**

Aluminum, plastic, or other durable material recording the shielding thicknesses for the enclosure types listed below.

2.14.1  **Continuous X-Ray Shielding System**

Provide one sign, [_____] mm inches tall by [_____] mm inches wide, for each shielded room as follows:

"SURFACES OF THIS ROOM HAVE BEEN INSULATED WITH SHEET LEAD OF THE FOLLOWING THICKNESSES:

<table>
<thead>
<tr>
<th></th>
<th>LEAD THICKNESS</th>
<th>TOTAL LEAD EQUIVALENT SHIELDING</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOORS</td>
<td>[_____] inches</td>
<td>[_____] inches</td>
</tr>
<tr>
<td>WALLS TO [7] FEET ABOVE FLOOR SLAB</td>
<td>[_____] inches</td>
<td>[_____] inches</td>
</tr>
<tr>
<td>FLOOR</td>
<td>[_____] inches</td>
<td>[_____] inches</td>
</tr>
</tbody>
</table>

DO NOT REMOVE"

2.14.2  **Shielded Partitions**

Provide one sign, [_____] mm inches tall by [_____] mm inches wide, for each shielded partition as follows:

"THIS PARTITION HAS X-RAY SHIELDING

[FULL HEIGHT] [FROM FLOOR SLAB TO A HEIGHT OF[_____] FEET]
LEAD SHIELDING THICKNESS: [_____] mm INCH
TOTAL LEAD EQUIVALENT SHIELDING: [_____] INCHES

DO NOT REMOVE"

PART 3  **EXECUTION**

3.1  **INSTALLATION**

Perform installation in accordance with drawings, manufacturer's
3.1 Workmanship

Install sheet lead free of waves, lumps, and wrinkles and with a minimum number of joints. Finish joints smooth and neat.

3.1.2 Protection

Provide patches, plugs, sleeves, and mazes to ensure shielding continuity at penetrations and embedded items including ducts, pipes, conduits, service boxes, and hardware. Coordinate service installations.

Nominal sheet lead overlap as indicated to achieve a minimum overlap of not less than 0.4 inch in the field, including sheet to sheet joints, sheet to shielded element/component joints, and sheet to patches, sleeves, and mazes. Use sheet lead not less than the thickness of the sheet lead being jointed. Ensure all joints are robust and close fitting.

3.2 LEAD-LINED CONCRETE FLOORS

3.2.1 Preparation

Ensure concrete surface is clean, dry, and free of projections that could deform, damage or penetrate the sheet lead. When necessary, apply self leveling underlayment over rough or uneven concrete surfaces. Apply a coat of [asphalt][latex] paint to the concrete surface prior to installation of the sheet lead.

3.2.2 Shielding

Apply sheet lead 1/8 inch thick or less in a single layer with a 1-1/2 inch nominal lap at joints. Apply sheet lead more than 1/8 inch thick in two or more layers 1/8 inch or less in thickness with 1-1/2 inch nominal lap at joints, or in a single layer with joints butted and covered with lead strips 2 inches wide, placed centrally over the joint. Strip thickness not less than the thickness specified for the floor.

3.2.3 Protection from Damage

Apply a coat of [asphalt][latex] paint to the top surface of the sheet lead prior to application of [concrete] surfacing. Do not permit traffic or work in the area until protection is applied over the sheet lead.

3.3 LEAD-LINED BLOCKS

Lay lead-lined blocks in running bond courses with staggered vertical joints. Erect blocks with minimum 0.40 inch wide tight sheet lead lap. Use preformed half block lengths to ensure bond and shielding without cutting in the field.

3.3.1 Joints

Fill mortar joints solid with 3/8 inch thick Type N mortar. Do not place mortar between lead laps.

3.3.2 Pipe and Conduit Chases

Remove concrete from one side of the block only as needed to permit
installation. Fill voids with mortar and finish flush. Reinstall continuous sheet lead and overlap the adjoining sheet a minimum of 0.40 inch. Do not install pipe and conduit chases directly opposite each other within the same wall.

3.4 LEAD-LINED PLYWOOD

Provide studs at vertical joint locations[ and blocking at horizontal joint locations]. Secure 2 inch wide sheet lead strips, not less than the shielding thickness, centrally at the location of each panel vertical[ and horizontal] joint. Butt joint lead lined plywood centrally over lead strips, with shielding on inside face and long edges parallel to vertical supports. Use bent 4 inch wide sheet lead strips at corners. Fasten edges at 8 inch on center and 16 inch on center in the field. Finish fasteners flush to the surface without distortion.

3.5 LEAD-LINED GYPSUM WALLBOARD

Provide studs at vertical joint locations[ and blocking at horizontal joint locations]. Secure 2 inch wide sheet lead strips, not less than the shielding thickness, centrally at the location of each panel vertical[ and horizontal] joint. Butt joint lead lined gypsum wallboard centrally over lead strips, with shielding on inside face and long edges parallel to vertical supports. Use bent 4 inch wide sheet lead strips at corners. Fasten edges at 8 inch on center and 12 inch on center in the field. Install and finish lead-lined gypsum wallboard in accordance with ASTM C840.

3.6 INTERLOCKING LEAD BRICKS

Apply a coat of [asphalt][latex] paint to the concrete floor surface prior to installation of lead bricks. Erect bricks with minimum 0.40 inch wide tight lead lap. Use preformed half block lengths to ensure bond and shielding without cutting in the field.

3.7 SUSPENDED LEAD-LINED CEILINGS

Provide suspended lead-lined ceilings consisting of ceiling bars, and hangers. Space continuous bars approximately [315] [415] mm [12-1/2][16-1/2] inch on center and supported by steel hangers from overhead structure. Use bent 4 inch wide sheet lead strips at ceiling to wall junctions.

3.8 LEAD DOOR THRESHOLDS

Install thresholds in accordance with approved detail drawings. Apply a coat of [asphalt][latex] paint to the concrete surface prior to installation of the sheet lead.

3.9 LEAD-LINED DOORS

Install doors with a clearance of 1/16 inch at sides and top and minimum clearance at bottom. Provide 1/8 inch beveled lock edge and adjust hardware as required. Do not exceed a warp or twist of 1/4 inch in any face dimension of door including full diagonal, after doors have been hung and finished. [Seal cuts required for installation with a clear varnish or sealer.]
3.9.1 Door Hardware

Patch cutouts for lock sets and latch cases with sheet lead not less than the thickness of the door shielding. Lap sheet lead lining of the lock set and sheet lead lining of the door to achieve a minimum overlap of not less than 0.4 inch.

3.9.2 View Windows

Provide stops and moldings around glazed view windows where indicated. Install view windows in doors with hardwood stops to match face veneer. Glue stops to corridor side and fasten with countersunk[ oval head screws][ finishing nails].

[a. Install view windows in doors with hardwood stops to match face veneer. Glue stops to corridor side of door(s) and fasten with countersunk[ oval head screws][ finishing nails].]

[b. Install view windows in doors with fixed frame moldings on corridor side of door(s). Provide loose stops and moldings on inside of hollow-metal doors and fasten with countersunk [flat-] [or] [oval-]head machine screws spaced uniformly not more than [9] inches o.c. and not more than [2] inches o.c. from each corner.]

3.9.3 Lead Louvers

Install lead louvers in doors with [cadmium-] [or] [chromium-]plated screws.

3.10 TESTING AND CERTIFICATION

Perform shielding verification, by a qualified medical or health physicist, to determine that the barrier requirements specified in the shielding design were correctly installed. Perform the verification during construction by physically observing and documenting the installation of the barrier materials or after construction by taking transmission measurements. Prior to building occupancy, submit this shielding verification to the Contracting Officer for approval. Correct or replace any part of x-ray shielding work found to be defective.

NOTE: This guide specification covers the requirements for electromagnetic shielded facilities.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The following information must be shown on the project drawings:

1. Assembly details.

2. Typical penetration details.

3. Method of mounting shielded enclosure within building.

4. Shield penetration plan containing wall elevations, floor and ceiling plans showing the locations of all penetrations (to include all mechanical, electrical, fire protection, etc.) to
the HEMP shield.

5. Location of mechanical and electrical equipment within shielded enclosure.

6. Detail equipment mounted or suspended from the shielded ceiling.

7. Shield penetration schedule to include:
   a. Location of the waveguide.
   b. Size of waveguide (dimensions).
   c. No. of penetrations in the waveguide.
   d. Penetration designation of each penetration in the waveguide (if more than one).
   e. Size of pipe for each penetration in the waveguide.
   f. Type of pipe for each waveguide penetration.
   g. Type of penetration.
   h. The detail/sheet no. of the waveguide detail.
   i. Any remarks pertaining to the waveguide.

8. Filter schedule to include:
   a. Location of filter.
   b. Type of filter (power or signal).
   c. No. of filters in the filter enclosure.
   d. Electrical characteristics of the filter (amperage, no. of poles, frequency).
   e. Purpose of the filter.
   f. The detail/sheet no. of the typical filter detail.
   g. Any remarks pertaining to the filter.

10. Hardness critical items (HCI) should be identified using the (HCI) symbol on project drawings.

Refer to MIL-HDBK 419 for special grounding and bonding requirements for EM shielded enclosures. Refer to the U.S. Air Force Handbook for the Design and Construction of HEMP/TEMPEST and Other Shields in Facilities (March 1993). This document can be obtained from HQ AFIC/LEE, San Antonio, Texas 78243-5001. Also refer to AR 380-19. MIL-HDBK 423 should be used for projects requiring HEMP protection. The designer should consult these documents and other appropriate sources before applying this guide specification to large-scale EM shielded enclosures or to HEMP or TEMPEST projects. The requirement for thermal expansion joints inherent to large-scale enclosures is not addressed in this guide specification. The extent and location of the work to be accomplished and wiring, equipment, and accessories necessary for a complete installation should be indicated on the project drawings. The Air Force contracts with an independent testing laboratory to perform their acceptance testing. The test can consist of a SELDS
or equivalent test and H-field and plane wave CW tests per MIL-STD-188-125 and/or IEEE 299. See the U.S. Air Force Handbook for the Design and Construction of HEMP/TEMPEST and Other Shields in Facilities for more details. Methodology and procedures for setting up equipment are contained in MIL-HDBK-423. Full MIL-STD-188-125 acceptance testing (PCI tests as specified in appendix B) should be avoided. (Also see designer notes K and U). Although not addressed in this specification, fiber optic cable has gained acceptance as an effective method of transmitting data across the boundary of shielded enclosures without filtering. If fiber optic cable is used, describe the waveguide penetration of the shield in detail. Fiber optic cable is specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
** NOTE: Review submittal description (SD) definitions ** in Section 01 33 00 ** SUBMITTAL PROCEDURES and edit ** the following list, and corresponding submittal ** items in the text, to reflect only the submittals ** required for the project. The Guide Specification ** technical editors have classified those items that ** require Government approval, due to their complexity ** or criticality, with a "G." Generally, other ** submittal items can be reviewed by the Contractor's ** Quality Control System. Only add a “G” to an item, ** if the submittal is sufficiently important or ** complex in context of the project.

For Army projects, fill in the empty brackets ** following the "G" classification, with a code of up ** to three characters to indicate the approving ** authority. Codes for Army projects using the ** Resident Management System (RMS) are: "AE" for ** Architect-Engineer; "DO" for District Office ** (Engineering Division or other organization in the ** District Office); "AO" for Area Office; "RO" for **

U.S. DEPARTMENT OF DEFENSE (DOD)

1.3 QUALITY ASSURANCE

Work performed under this section shall be supervised and inspected by the shielding specialist. Materials and equipment shall be approved and verified by the shielding specialist before being submitted to the
Contracting Officer for approval. The submittal shall be date stamped and signed by the shielding specialist. The shielding specialist shall be responsible for coordinating the required shielding work with the work of all other trades that will interface or affect the shielding work in any way.

1.3.1 Shielding Specialists, Installers and Testing Specialists

Provide the name and background qualifications of individuals who will be responsible for installation, supervision, and testing of the shielding systems on this project. Shielding and testing specialist credentials shall include a bachelor’s degree in science or engineering and post-degree training and experience with EM shielding.

1.3.1.1 Testing Experience

The testing specialist shall have experience during the previous 5 years in shielded enclosure leak detection system (SELDS), IEEE 299, and other methods of shielded enclosure testing.

1.3.1.2 Work Experience

The EM shielded system shall be provided by an experienced firm or individual that has been regularly and successfully engaged in the installation, supervision, and/or testing of equivalent EM shielded systems for at least the previous 5 years. The principal work of this firm or individual shall be the satisfactory installation and construction of EM shielded protection systems. Such experience shall include achieving specified requirements for shielded system attenuation and maintainability of attenuation levels on work performed.

1.3.1.3 Project Experience

Furnish a project experience list on projects of similar scope which have been completed during the previous 5 years. Include project completion dates and the name and telephone number of the user and/or owner of each project. Project experience for installers shall indicate the installation responsibilities, performance, materials, and methods used. Project experience for the shielding specialist shall indicate the responsibilities performed. Project experience for the testing specialist shall indicate the test methods performed.

1.3.2 Qualifications of Welders

Welding shall be performed by certified welders. Provide the names of the welders to be employed and certification that each welder has passed qualification tests within the last 2 years in the processes specified in AWS D1.1/D1.1M, AWS D9.1/D9.1M, and as required by the Contracting Officer.

1.3.3 Filter and Electrical Work Requirements

Filter and electrical work shall comply with NFPA 70, UL 486A-486B, and UL 1283. The label and listing of the Underwriters Laboratories or other nationally recognized testing laboratory will be acceptable evidence that the material or equipment conforms to the applicable standards of that agency. In lieu of the label or listing, a certificate may be furnished from an acceptable testing organization adequately equipped and competent to perform such services. The certificate shall state that the items have been tested and that they conform to the specified standard.
1.3.4 Field Samples

**************************************************************************
NOTE: Requests for field samples and mock-ups usually add cost to the project. Samples should only be required for special applications and should be limited to scaled-down items. For example, the designer may ask for a welded floor/wall corner section. Do not normally ask for samples of filters and full-size waveguide vents.
**************************************************************************
Provide field samples for the following: [shielding sheet installation,] [shielding fastening,] [doors,] [[30] [100] [_____] ampere power filter,] [communication filter,] [waveguide,] [penetration,] and [______].

1.3.5 Pre-Installation Meeting

Hold a pre-installation meeting with the subcontractors and installers working in, on, or near the EM shield. Discuss coordination requirements and instructions shall be stated to ensure the integrity of the EM shield.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and stored from excessive humidity and temperature variation, dirt, and other contaminants.

1.5 PROJECT/SITE CONDITIONS

Perform welding of EM shielding material and sheet steel at an ambient temperature of 10 degrees C 50 degrees F minimum to 32 degrees C 90 degrees F. Shielding shall not be installed until the building has been weather enclosed. Sheet steel welding shall not be performed in direct sunlight.

1.6 MAINTENANCE

1.6.1 Maintenance Supplies and Procedures

Provide maintenance supplies sufficient for a [3] [_____] year period or [50,000] [_____] open-close cycles, whichever is greater, for each EM shielded door. The maintenance instructions required to maintain the door through the cycle count shall be prominently displayed nearby.

1.6.2 Extra Materials

1.6.2.1 Filters

[One extra EM power filter] [[_____] extra EM power filters] and [one extra communications filter] [[_____] extra communications filters] of each different type furnished on the project shall be furnished as a spare.

1.6.2.2 EM Shielded Doors

Furnish one set of finger stock and EM gaskets (if used) for each hinged EM shielded door provided. In addition, provide one set of manufacturer recommended and Contracting Officer approved spare parts for EM shielded doors of each style installed.
1.6.2.3 Tools

Furnish one full set of tools that are required to maintain the doors and are not typically available from tool vendors. Furnish environmentally safe lubricants, cleaning solvents, or coatings in sufficient quantities to last for [6] [_____] months.

1.6.2.4 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment as follows: [SELDS Test Set][_____

1.6.3 Operating and Maintenance Manuals

Submit manufacturer's written instructions for operation and maintenance of EM Shielding system. The manual shall address all components and aspects of the EM shielding and shall include, but not be limited to, the following:

a. A complete set of assembly drawings to include penetration locations and installation details.

b. The construction specification on EM shielding.

c. Shield penetration schedule.

d. Power/signal filter schedule.

e. Test plan.

f. The prepared preventive maintenance instructions for periodic inspection, testing and servicing, lubrication, alignment, calibration, and adjustment events normally encountered. Complex preventive maintenance events shall be extracted from or shall refer to detailed vendor or manufacturer data. This information shall be derived from an evaluation of engineering data considering local environmental conditions, manufacturer's recommendations, estimated operating life for the specific application and use of the equipment, and types of job skills available at the operating site.

g. Spare parts data approved and verified by the shielding specialist prior to submission. The data shall include a complete list of recommended parts and supplies with current unit prices and source of supply.

h. Provide a list of hardness critical items (HCI) requiring periodic inspection to maintain EM shield integrity. Hardness critical items are those components and/or construction features which singularly and collectively provide specific levels of HEMP protection, such as the EM shield, surge arresters, EM shielded doors, shield welding, electrical filters, honeycomb waveguides, and waveguides-below-cutoff.

PART 2 PRODUCTS

2.1 SYSTEM REQUIREMENTS

**************************************************************************
NOTE: Projects involving military communications equipment must be designed to incorporate the
applicable requirements of MIL-STD-188-124, which will be provided in the ELECTRICAL WORK, INTERIOR specification.

2.1.1 General

The shielded facility shall meet or exceed minimum attenuation decibel (dB) levels specified. The EM shielding system shall include, but is not limited to, the following:

a. The [welded steel] [bolted] EM shield.
b. EM shielded doors for access into the facility.
c. Electrical and electronic penetrations of the shield.
d. EM filter/surge arrester assemblies, including their EM enclosures.
e. EM shielded pull boxes and junction boxes.
f. EM shielded conduit runs.
g. Special protective measures for mission-essential equipment outside the EM shield.
h. Structural penetrations.
i. Mechanical and utility penetrations (such as air ducts, gas, and water).
j. Instrumentation and control.
k. Equipment door/access panels.
l. Sufficient supervisory and/or quality control personnel onsite to supervise the installation crew and to conduct in-progress quality assurance tests.

2.1.2 Factory Tests

Perform factory tests as specified. The Contracting Officer reserves the right to witness the specified factory tests. Notify the Contracting Officer at least 30 days before factory tests are scheduled to be performed. Test data shall include a detailed description of the test instrumentation and equipment, including calibration dates, a detailed description of the test procedure, and the recorded test data.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Support equipment by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.
2.2.2 Nameplates

Each major item of equipment shall have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.2.3 Testability

Equipment and materials of the EM shielding shall be designed and built to facilitate testing and maintenance.

2.3 EM SHIELDING EFFECTIVENESS

**************************************************************************

NOTE: The designer will consider the shield as early in the design as possible while the geometry of the shielded enclosure can be located to utilize components inherent in the structure. Failure to consider the shield configuration first in the design will increase design costs, cause problems in its incorporation into the structure, and lose installation simplicity. The EM shielded enclosure design should be coordinated by the structural, mechanical, and electrical engineers and architect. The structural and shielding systems should drive each other on large projects. Multi-story shielded enclosures require continuous connections of shielding steel interconnected to the structural steel. In these cases, the shielding wall layout should coincide with the structural steel beam layout. The shield within an exterior building concept must employ a design which allows for settling, seismic motion, and differential thermal expansion between the steel and concrete of the building and the steel of the EM shielding.

**************************************************************************

The EM shielded enclosure complete with all filters, doors, and/or waveguides shall have the following minimum EM shielding effectiveness attenuation. Minimum magnetic field attenuation shall be [20 dB] [___] at 14 kHz increasing linearly to [50 dB] [100 dB] at [200 kHz] [1 MHz] [___.] Minimum electric field and plane wave attenuation shall be [50 dB] [100 dB] [___] from 14 kHz to [1 GHz] [10 GHz] [____].

2.4 EM SHIELDING ENCLOSURE REQUIREMENTS (WELDED CONSTRUCTION)

**************************************************************************

NOTE: For the EM shielding enclosure, choose either welded or bolted construction. The unused method should be deleted from the project specification. Welded construction will usually consist of continuous 1.897 mm 14 gauge thick steel plate and angles to form the enclosure. Thicker material may be used if it is more cost-effective or required for structural reasons. Welded construction is used when a shielded facility requires a long maintainable service life of high-level protection, 100 dB attenuation, or HEMP protection, 100 dB. Bolted construction is associated with a lower level
(50 dB) of maintained shielding effectiveness. Bolted construction will usually consist of modular panels bolted together with metal strips or channels. Panels are commonly plywood with steel sheets laminated to one or both sides. Bolted construction is used when a shielded facility's service life is short, 10 years or less, or the system is required to be demountable for change of location. This system requires more maintenance than a welded system and requires access to the panels. The EM shield layout may restrict attenuation testing of the enclosure. It is desirable for large facilities to place the shield at least 1 meter 3.3 feet inside the exterior walls, although cost and construction restrict this consideration. The floor shielding can be tested by SELDS test but not by IEEE 299 if it is on grade. The facility layout must be carefully planned to allow for testing and shield maintenance.

**************************************************************************

2.4.1 Welded Shielding Enclosure

**************************************************************************

NOTE: Shielding steel thickness should not be based solely on the minimum thickness required for HEMP/TEMPEST attenuation. Thicker steel may be necessary because of structural factors and heat deformation or burn-through from seam welding.

**************************************************************************

The intent of this section and the drawings is to provide a complete metal enclosure including floor, walls, ceiling, doors, penetrations, welds, and the embedded structural members to form a continuous EM shielded enclosure. Shielding sheets and closures shall be [3.416] [_____] mm [10] [_____] gauge thick hot-rolled steel conforming to ASTM A568/A568M. Steel plates, channels, or angles of minimum 6 mm 1/4 inch thick shall be used to reinforce shield sheets for attachments of ducts, waveguides, conduit, pipes, and other penetrating items. Furring channels used to attach shielding sheets to walls or floors shall be the minimum gauge of the shielding steel. The shielding sheet steel gauge may be thicker at the Contractor's option to reduce labor and welding effort only if structurally tolerable with the existing design. Steel shall be free of oil, dents, rust, and defects.

2.4.2 Metal Members

Structural steel shapes, plates, and miscellaneous metal shall conform to ASTM A36/A36M.

2.4.3 Steel and Welding Material

Welding materials shall comply with the applicable requirements of AWS D1.1/D1.1M and AWS D9.1/D9.1M. Steel and welding material shall conform to AISC 325. Welding electrodes shall conform to AWS D1.1/D1.1M for metal inert gas (MIG) welding method. Weld filler metal shall conform to AWS A5.18/A5.18M.
2.4.4 Fasteners

Self-tapping screws shall not be used for attachment of shielding. Power-actuated drive pins shall be zinc-coated steel, Type I, pin size No. 4 to secure steel sheets to concrete surfaces and to light gauge furring channels. The drive pins shall conform to ASTM A227/A227M Class 1 for materials and ASTM B633 for plating.

2.4.5 Miscellaneous Materials and Parts

Miscellaneous bolts and anchors, supports, braces, and connections necessary to complete the miscellaneous metal work shall be provided. The necessary lugs, rebars, and brackets to assemble work shall be provided. Holes for bolts and screws shall be drilled or punched. Poor matching of holes will be cause for rejection. Thickness of metal and details of assembly and supports shall provide ample strength and stiffness. The materials shall be galvanically similar.

2.4.6 Penetrations

**************************************************************************
NOTE: Configure the facility to minimize the number of metallic structural elements required to penetrate the barrier.
**************************************************************************

Penetrations of the shield, including bolts or fasteners, shall be sealed with puddle welds or full circumferential EM welds. Structural penetrations including beams, columns, and other metallic structural elements shall be provided with continuously welded or brazed seams and joints between the penetrating element and the shield. Nonmetallic structural elements shall not penetrate the electromagnetic barrier.

2.4.7 Penetration Plates (Welded Construction)

The penetration plate shall be the central location for treatment of penetrations. The panel shall be constructed of 6 mm 1/4 inch thick ASTM A36/A36M steel plate welded to the shield. Waveguide, conduit, and piping penetrations shall be circumferentially welded at the point of penetration to the inner surface of the penetration plate. Penetration plates shall extend at least 150 mm 6 inch beyond all penetrations.

2.4.8 Floor Finish

**************************************************************************
NOTE: Indicate or specify whether other flooring is to be provided or higher floor loads are required. This is most critical when raised floors are specified. Allowances must be made for elevated door thresholds. Specify special requirements for laboratory loads, provide seismic requirements, if a Government designer is the Engineer of Record, and show on the drawings. Delete the inappropriate bracketed phrase. Pertinent portions of UFC 3-310 04 and Sections 13 48 73 and 23 05 48.19 must be enclosed in the contract documents.
**************************************************************************

If concrete floor wearing slabs are specified, they should be thick enough to hold anchor bolts for
equipment, supports, and interior partitions. Concrete wearing slabs may be provided in most applications with a minimum thickness of **100 mm** 4 inches. The Air Force is opposed to placing concrete wearing slabs over shielding steel because of problems with testing and repair. Placing concrete over floor shielding requires a waiver from HQ AFCEC/ENE.

Floor EM shielding shall be covered by a reinforced cast-in-place concrete slab [100] [_____] mm [4] [_____] inch thick. Seismic requirements shall be [in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC and [09 69 13 RIGID GRID ACCESS FLOORING][09 69 19 STRINGERLESS ACCESS FLOORING](if needed).

2.5 EM SHIELDING ENCLOSURE REQUIREMENTS (BOLTED CONSTRUCTION)

NOTE: For the EM shielding enclosure, choose either welded or bolted construction. The unused method should be deleted from the project specification. Welded construction will usually consist of continuous 1.897 mm 14 gauge thick steel plate and angles to form the enclosure. Thicker material may be used if it is more cost-effective or required for structural reasons. Welded construction is used when a shielded facility requires a long maintainable service life of high-level protection, 100 dB attenuation, or HEMP protection, 100 dB. Bolted construction is associated with a lower level (50 dB) of maintained shielding effectiveness.

Bolted construction will usually consist of modular panels bolted together with metal strips or channels. Panels are commonly plywood with steel sheets laminated to one or both sides. Bolted construction is used when a shielded facility's service life is short, 10 years or less, or the system is required to be demountable for change of location. This system requires more maintenance than a welded system and requires access to the panels. The EM shield layout may restrict attenuation testing of the enclosure. It is desirable for large facilities to place the shield at least 1 meter 3.3 feet inside the exterior walls, although cost and construction restrict this consideration. The floor shielding can be tested by SELDS test but not by IEEE 299 if it is on grade. The facility layout must be carefully planned to allow for testing and shield maintenance.

**2.5.1 Panel Construction**

Flat steel sheets shall be laminated to each side of a 19 mm 3/4 inch thick structural core of either plywood or hardboard. Panels shall have a flame spread rating of less than 25 when tested according to ASTM E84. Flat steel shall conform to ASTM A653/A653M with G-60 coating, minimum 0.5512 mm
26 gauge thick, zinc-coated phosphatized. Plywood shall conform to APA L870 for exterior, sound grade hardwood, Type I. Hardboard shall conform to AHA A135.4, Class 4, SIS, for standard type hardboard. Adhesive for laminating steel sheets to structural core shall be a waterproof type which maintains a permanent bond for the lifetime of the enclosure.

2.5.2 Framing

Panels shall be joined and supported by specially designed framing members that clamp the edges of the panels and provide continuous, uniform, and constant pressure for contact to connect the shielding elements of the panels. The walls shall be self-supporting from floor to ceiling with no bracing. Deflection of walls under a static load of 335 N 75 pounds applied normally to the wall surface at any point along the framing members shall not exceed 1/250 of the span between supports. [Ceilings shall be self-supporting from wall to wall.] [Ceilings shall be supported by adjustable, nonconducting, isolated hangers from the structural ceiling above.] Ceilings shall be designed to have a deflection under total weight, including ceiling finish, of not more than 1/270 of the span. A one-piece factory pre-welded corner section or trihedral corner framed with a brass machine cast corner cap assembly consisting of inner and outer parts shall be provided at all corner intersections of walls and floor or ceiling. The modular enclosure shall be designed for ease of erection, disassembly, and reassembly.

2.5.3 Channel

The framing-joining system members shall consist of 3 mm 1/8 inch thick zinc-plated steel channels having a minimum 16 mm 5/8 inch overlap along each side of the contacting surface. Screw fasteners shall be spaced at 75 or 100 mm 3 or 4 inch intervals. Screw fasteners shall be either zinc or cadmium-plated steel, minimum size 6 mm 1/4 inch, with a pan or flat Phillips head. Fasteners shall be heat-treated and hardened with a minimum tensile strength of 931 MPa 135,000 psi.

2.5.4 Sound Transmission Class (STC)

Enclosure panels shall have an STC of [30] [_____] dB minimum when tested according to ASTM E90.

2.5.5 Penetration Plates (Bolted Construction)

Plates shall be a minimum 3 mm 1/8 inch thick ASTM A36/A36M steel plate, sized [450] [_____] by [450] [_____] mm [18] [_____] by [18] [_____] inch and shall have a 6 mm 1/4 inch thick extruded brass frame for mounting to the shielded enclosure wall panel. Penetration plates shall extend at least 150 mm inch beyond all penetrations.

2.6 EM SHIELDED DOORS

**************************************************************************
NOTE: Edit these paragraphs depending on type of door used on project.
**************************************************************************

2.6.1 General

Material in shielded doors and frames shall be steel conforming to ASTM A36/A36M or ASTM A568/A568M and shall be stretcher-leveled and
installed free of mill scale. Metal shall be thicker where indicated or required for its use and purpose. Metal thresholds of the type for proper shielding at the floor shall be provided. Fire rated shielded doors and assemblies shall meet NFPA 80 and NFPA 80A requirements and shall bear the identifying label of a nationally recognized testing agency qualified to perform certification programs. The EM shielded doors shall be provided by a single supplier who has been regularly engaged in the manufacture of these items for at least the previous 5 years. The assemblies shall be supplied complete with a rigid structural frame, hinges, latches, and parts necessary for operation. The products supplied shall duplicate assemblies that have been in satisfactory use for at least 2 years. The door frame shall be steel suitable for [welding] [bolting] to the surrounding structure and shield. The EM filters, EM waveguide penetrations for door systems, and miscellaneous material shall be provided for a complete system. The enclosure door shall be nonsagging and nonwarping. The EM shielded door shall provide a shielding effectiveness of [10 dB] [20 dB] greater than the minimum EM shielding effectiveness requirements. The door shall have a clear opening [as shown on the drawings] [of [915] [_____] mm [36] [_____] inch wide and [2135] [_____] mm [84] [_____] inch] high. The door and frame assembly shall have a sound rating of STC [30] [_____] minimum. Testing shall be performed in accordance with ASTM E90.

2.6.1.1 Door Latch

The door latch shall be lever controlled with roller cam action requiring not more than 67 N 15 pounds of operating force on the lever handle for both opening and closing. The door shall be equipped with a latching mechanism having a minimum of three latching points that provides proper compressive force for the EM seal. The mechanism shall be operable from both sides of the door and shall have permanently lubricated ball or thrust bearings as required at points of pivot and rotation.

2.6.1.2 Hinges

Doors shall be equipped with a minimum of three well-balanced adjustable ball-bearing or adjustable radial thrust bearing hinges suitable for equal weight distribution of the shielded doors. Hinges shall allow adjustment in two directions. Force necessary to move the doors shall not exceed 22 N 5 pounds.

2.6.1.3 Threshold Protectors

Threshold protectors shall be furnished for each EM shielded door. Protectors shall consist of portable ramps that protect the threshold when equipment carts or other wheeled vehicles are used to move heavy items across the threshold. The ramps may be asymmetrical to account for different floor elevations on each side, but the slope of the ramp shall not exceed 4:1 on either side. Ramps shall be designed to support a [227] [_____] kg [500] [_____] pound vertical force applied to a 75 by 13 mm 3 by 1/2 inch area for a personnel door, and a [907] [_____] kg [2,000] [_____] pound vertical force applied to a 75 by 13 mm 3 by 1/2 inch area for an equipment double leaf door. The force shall be applied to the contact area between the threshold and the door. Mounting brackets, convenient to the entry, shall be provided to store the ramp when not in use.

2.6.1.4 Frequency of Operation

With proper maintenance, door assemblies shall function properly through 100,000 cycles and 15-year service life minimum without the shielding
effectiveness decreasing below the overall shield required attenuation.

2.6.1.5 Electric Interlocking Devices

Electric interlocking devices shall be provided for vestibules equipped with shielded doors at each end. Electric interlocking devices shall be provided so that shielded doors at the ends of the vestibule cannot be opened at the same time during normal operation. A manual override shall be provided to allow emergency egress, and an audible alarm shall be provided to indicate that doors at each end of the vestibule are open. The alarm will continue to sound while both doors are open. Provide a low-piezolectric-type alarm, in a tamperproof enclosure, at a location shown on the project drawings or as directed by the Contracting Officer's representative. The sound intensity shall be 45 dBA minimum at 3.05 m 10 feet. Lights shall be provided on the side of each door outside the vestibule to indicate that the other door is open. Interlock systems may be integrated into a cypher lock system. The interlock system shall be powered by an uninterruptible power source and shall be fail-safe in an unlocked condition in the event of a power failure.

2.6.1.6 Electric Connectivity

Electric connectivity for sensors, alarms, and electric interlocking devices shall be installed in accordance with the door manufacturer's instructions, the approved drawings, and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Submit detail drawings showing location, number, and method of penetrating the shielding material. Fabrication details for penetrations of the shielding material and the complete EM shielded enclosure to include doors and filters. Drawings shall show erection details and sequence of erection and shall clearly indicate the methods necessary to ensure shield integrity under all columns and other structural members.

2.6.1.7 Threshold Alarm

A press-at-any-point ribbon switch shall be applied to the threshold. The switch shall enunciate an alarm whenever pressure is applied to the threshold of the EM shielded door.

2.6.1.8 Hold Open and Stop Device

Each EM shielded door leaf shall be provided with a hold open and stop device permanently attached to the door leaf. Shielded doors shall have a fastener plate welded onto the door. The device shall not interfere with the finger stock. Drilling or tapping of the shielded door will not be allowed.

2.6.1.9 Emergency Exit Hardware

Emergency exit EM shielded doors shall be equipped with single motion egress hardware. The force required to latch and unlatch emergency exit hardware on EM shielded doors shall meet life safety code NFPA 101. Field alterations or modifications to panic hardware will not be allowed.

2.6.1.10 Finish

EM shielded doors shall be factory prime painted with zinc chromate primer. Doors may be factory finish painted or galvanized. Touch up any damaged finish.
2.6.1.11 Door Counter

A door operation counter shall be provided on the enclosure interior.

2.6.1.12 Additional Hardware

**************************************************************************
NOTE: Alarms would normally be specified in Section 28 10 05 ELECTRONIC SECURITY SYSTEMS (ESS).
Hardware will be specified in the hardware section.
**************************************************************************

See door schedule on drawings and Section 08 71 00 DOOR HARDWARE, for additional hardware requirements. Fire rating and STC sound ratings shall be as required by the door finish schedule on the drawings or in the specifications.

2.6.2 Latching Type Doors

**************************************************************************
NOTE: The knife edge shall be made of stainless steel 430 series if it will be exposed to moist air containing salt (near the sea coast) or in an uncontrolled or corrosive environment.
**************************************************************************

Doors shall be [steel] [laminated] type. [Steel doors shall be a minimum of 3.416 mm 10 gauge thick steel sheet electrically and mechanically joined by welded steel frames overlapping joints with continuous EM welds.] [Laminated type shall be the same construction as enclosure panels, except the steel faces shall be electrically and mechanically joined by channels or overlapping seams, both of which shall be continuously seam welded or soldered along all joined surfaces.] The closure seal shall utilize an extruded brass channel containing a recess into which [two] [_____] sets of [beryllium copper condition HT in accordance with ASTM B194] [stainless steel 430 (magnetic type) series] contact fingers and a closed cell foam rubber air seal are fitted and can be easily removed and replaced without the use of special tools and without the application of solders. The door shall mate to the frame in a manner that allows the insertion of a brass knife edge between the two rows of the radio frequency finger stock, to obtain optimum conductivity and electromagnetic shielding. High-temperature silver solder shall be used to attach the brass knife edge components to the door panels and the frame. The fingers that form a contact between the door and its frame shall be protected from damage due to physical contact and shall be concealed within the door and frame assembly.

2.6.3 Pneumatic Sealing Doors

Pneumatic sealing mechanisms shall achieve EM shielding by using pressure to force the door panel against the frame surface. Contact areas of door and frame shall be a peripheral strip not less than 75 mm 3 inch wide completely around the door with a tinned or highly conductive noncorrosive surface. After the door is in a closed position, the pneumatic sealing mechanism shall exert pressure in not more than 10 seconds. The sealing mechanism release shall be actuated in not more than 5 seconds. Manual [override] [operation] shall not exceed a maximum of [155] [_____] N [35] [_____] pounds. When the door is sealed, the attenuation around the edges
shall meet the EM shielding effectiveness requirements of this specification. Swinging doors shall have a threshold of zinc-plated steel, not less than 9.5 mm 3/8 inch thick. The door shall be provided with a pneumatic system that maintains a nominal sealing pressure of [240] [_____] kPa [35] [_____] psi. A label shall be attached to pneumatic doors warning against painting of the mating surfaces.

2.6.3.1 Door and Enclosure Design

Doors shall be designed for long life and reliability without the use of EM gaskets, EM finger stock, or other sealing devices other than the direct metal-to-metal contact specified. The EM sealing device shall be fail-safe upon loss of air pressure and shall readily allow manual opening of the door. For either normal or fail-safe operation, the maximum time to reach the open position shall be no more than 7 seconds. The enclosure design shall include provision for removing the door for routine maintenance without disturbing its alignment and EM sealing properties.

2.6.3.2 Control Panel

The inside and outside of the shielded enclosure shall contain a control panel including the necessary opening and closing pneumatic valves. The outside control panel shall also have a pressure regulator and filter. The door air supply shall be capable of quick opening from inside the enclosure to allow escape when opening pneumatic valves fail or malfunction.

2.6.3.3 Air System for Pneumatic Sealing

A complete air system including compressor, filter alarm, tank, lines, air filter, dryer, air control valves, and controls shall be provided. Air tank capacity shall be sized so that the air volume and pressure are sufficient to operate the door through ten complete cycles after the loss of normal power.

2.6.4 Magnetic Sealed Door Type

An EM seal shall be formed by a solid metal-to-metal contact around the periphery of the door frame. The materials at the contact area shall be compatible and corrosion resistant. The contact force for the door EM seal shall be provided by electromagnets. When the electromagnet is energized, the door leaf shall be pulled in to ensure a solid and continuous contact with the door frame. When the electromagnet is de-energized, the door leaf shall be free to swing. The EM shielded doors may use electromagnets or a combination of permanent magnets and electromagnets.

2.6.5 Sliding Type Door

A sliding shielded door shall be of the size and operating direction indicated. Clear openings indicated on the drawings shall not require dismantling of any part of the door. The door shall be manually operable from either side, inside or outside, with a maximum pull (force) of 155 N 35 pounds to set the shielded door in motion. Shielded door face panels and frames shall be constructed of reinforced steel suitable for achieving the specified attenuation. Frames shall be constructed of steel shapes welded together to form a true rectangular opening. In the sealed position, the shielded doors shall provide the minimum shielding effectiveness specified without any derating. The doors shall be designed for long life and reliability and shall not use EM gaskets, EM finger stocks, or other sealing devices other than the specified direct
metal-to-metal contact. A label shall be attached to sliding doors warning against painting of the mating surfaces.

2.6.6 Power Operators

Power operators shall be [pneumatic] [electric] type conforming to NFPA 80 and the requirements specified. Readily adjustable limit switches shall be provided to automatically stop the door in its full open or closed position. All operating devices shall be suitable for the hazardous class, division, and group defined in NFPA 70.

2.6.6.1 Pneumatic Operators

**************************************************************************
NOTE: Designer will coordinate with the drawings to ensure compressed air is available at door locations.
**************************************************************************

Pneumatic operators shall be heavy-duty industrial type designed to operate the door at not less than 0.2 m/s 2/3 fps or more than 0.3 m/s 1 fps with air pressure of [_____] kPa psi. A pressure regulator shall be provided if the operator is not compatible with available air pressure. Dryer, filter, and filter alarm shall be provided. Pneumatic piping shall be provided up to the connection with building compressed air, but not more than 6 m 20 feet from door jambs. Operators shall have provisions for immediate emergency manual operation of the door in case of failure. The operator shall open, close, start, and stop the door smoothly. Control shall be [electrical, conforming to NEMA ICS 2 and NEMA ICS 6; enclosures shall be Type 12 (industrial use), Type 7 or 9 in hazardous locations, or as otherwise indicated] [pneumatic] [with] [pushbutton wall switches] [ceiling pull switches] [rollover floor treadle] [as indicated].

2.6.6.2 Electric Operators

Electric operators shall be heavy-duty industrial type designed to operate the door at not less than 0.2 m/s 2/3 fps or more than 0.3 m/s 1 fps. Electrical controls shall be [pushbutton wall switches] [ceiling pull switches] [rollover floor treadle] [as indicated]. Electric power operators shall be complete with an electric motor, brackets, controls, limit switches, magnetic reversing starter, and other accessories necessary. The operator shall be designed so that the motor may be removed without disturbing the limit switch timing and without affecting the emergency operator. The power operator shall be provided with a slipping clutch coupling to prevent stalling of the motor. Operators shall have provisions for immediate emergency manual operation of the door in case of electrical failure. Where controls differ from motor voltage, a control voltage transformer shall be provided inside as part of the starter. Control voltage shall be 120 volts or less.

2.6.6.2.1 Motors

Drive motors shall conform to NEMA MG 1, shall be high-starting torque reversible type, and shall be of sufficient output to move the door in either direction from any position at the required speed without exceeding the rated capacity. Motors shall be suitable for operation on [120] [208] [277] [480] volts, 60 Hz] [220] [240] [380] volts, 50 Hz], [single] [three] phase, and shall be suitable for across-the-line starting. Motors shall be designed to operate at full capacity over a supply variation of plus or minus 10 percent of the motor voltage rating.
2.6.6.2.2 Controls

Each door motor shall have an enclosed reversing across-the-line type magnetic starter with thermal overload protection, limit switches, and remote control switches. The control equipment shall conform to NEMA ICS 2; enclosures shall conform to NEMA ICS 6, and shall be Type 12 (industrial use), Type 7 or 9 in hazardous locations, or as otherwise indicated. Each wall control station shall be of the three-button type, with the controls marked and color coded: OPEN - white; CLOSE - green; and STOP - red. When the door is in motion and the stop control is pressed, the door shall stop instantly and remain in the stop position. From the stop position, the door shall be operable in either direction by the open or close controls. Controls shall be of the full-guarded type to prevent accidental operation.

2.6.6.3 Leading Edge Safety Shutdown

Leading edges of the door with operators shall have a safety shutdown switch strip the entire length of the leading edge. The safety strip shall be press-at-any-point ribbon switches. Activation of the strip shall shut down the operator and release the door with reset required to continue door operation.

2.6.7 EM Shielded Door Factory Test

******************************************************************************
NOTE: When specifying nonlatching doors, delete door static load and sag tests and cycle test for door latches. Retain cycle test for door hinges.
******************************************************************************

Test data shall be provided on at least one shielded door of each type provided for the facility to verify that the EM shielded doors of the design supplied have been factory tested for compliance with this specification. Test doors shall not be furnished on the project. Test data reports shall be submitted in accordance with paragraph SUBMITTALS.

2.6.7.1 Swinging Door Static Load Test

The door shall be mounted and latched to its frame, then set down in a horizontal position such that it will open downward with only the frame rigidly and continuously supported from the bottom. A load of 195 kg/psm 40 lb/psf shall be applied uniformly over the entire surface of the door for at least 10 minutes. The door will not be acceptable if this load causes breakage, failure, or permanent deformation which causes the clearance between door leaf and stops to vary more than 1.6 mm 1/16 inch from the original dimension.

2.6.7.2 Swinging Door Sag Test

The door and its frame shall be installed normally and opened 90 degrees. Two 45 kg 100 pound weights, one on each side of the door, shall be suspended from the door within 130 mm 5 inch of the outer edge for at least 10 minutes. The door will not be acceptable if this test causes breakage, failure, or permanent deformation which causes the clearance between the door leaf and door frame to vary more than 1.6 mm 1/16 inch from the original dimension.
2.6.7.3 Door Closure Test

Each door design shall be operated 100,000 complete open-close cycles. The door will not be acceptable if the closure test causes any breakage, failure, or permanent deformation which causes the clearance between the door and door frame to vary more than 1.6 mm 1/16 inch from the original dimension.

2.6.7.4 Handle-Pull Test

The door shall be mounted and latched to its frame. The handle shall have a force of 1100 N 250 pounds applied outward (normal to the surface of the door) at a point within 50 mm 2 inch of the end of the handle. The door will not be acceptable if this test causes any breakage, failure, or permanent deformation exceeding 3 mm 1/8 inch.

2.6.7.5 Door Electromagnetic Shielding Test

The EM shielded door shall be factory tested in accordance with the requirements of this specification both before and after the mechanical tests described above.

2.7 ELECTROMAGNETIC FILTERS

**************************************************************************

NOTE: All EM filters for power and signal lines should be scheduled on the drawings.

This guide specification covers electromagnetic filters for 50, 60, and 400 Hz power lines and signal lines for General Use Only. This specification is NOT applicable for filters to be used with a specific individual item of electronic equipment. Filters for use with specific individual items of equipment must be scheduled on the drawings showing voltage, current, insertion loss, passband, frequency, baud rate, and cutoff frequency.

**************************************************************************

A filter shall be provided for each power, data, and signal line penetrating the enclosure. These lines shall include, but are not limited to, power lines, lines to dummy loads, alarm circuits, lighting circuits, and signal lines such as telephone lines, antenna lines, HVAC control, and fire alarm. Filters [and ESAs] shall be enclosed in metallic cases which shall protect the filter elements from moisture and mechanical damage. All external bonding or grounding surfaces shall be free from insulating protective finishes. All exposed metallic surfaces shall be suitably protected against corrosion by plating, lead-alloy coating, or other means. The finish shall provide good electrical contact when used on a terminal or as a conductor, shall have uniform texture and appearance, shall be adherent, and shall be free from blisters, pinholes and other defects. The filter [and ESA] assemblies shall also meet the requirements of UL 1283. Insertion loss in the stop band between the load side of the filter and the power supply side shall be not less than the EM shielding attenuation specified. The filter used for 400 Hz shall be provided with power factor correcting coil to limit the reactive current to 10 percent maximum of the full load current rating. Each filter unit shall be capable of being mounted individually and shall include one filter for each phase conductor of the power line and the neutral conductor. The signal filters
shall include one filter for each conductor.

2.7.1 Enclosure

**************************************************************************

NOTE: The intent of this paragraph is to preserve the integrity of the filter and to shield the input and output circuits from each other. Usually, this is accomplished by mounting the filters in an EM-modified NEMA Type 1 enclosure with separate compartments for the input and the output terminals. If a weatherproof or hazardous area type enclosure is needed, it must be specified.

**************************************************************************

Filter units shall be mounted in an EM modified NEMA Type [1] [_____] enclosure in accordance with NEMA ICS 6 and meet the requirements of UL 1283. Enclosures shall be made of corrosion resistant steel of 1.9837 mm 14 gauge minimum thickness with welded seams and galvanized bulkhead cover plates. The enclosure nonconductive surfaces shall be finished with a corrosion-inhibiting primer and two coats of baked or finish enamel. The input compartment shall house the individual line filters and the input terminals of the filters and mounting for the surge arrester. Live parts shall be spaced in accordance with NFPA 70. Filter leads shall be copper. Filter enclosures shall be shielding effectiveness tested in accordance with IEEE 299 and Table I of this specification. [Test leads and coaxial connectors through the enclosure shall be provided for HEMP testing.] [The imbedded configuration shall be used for filter enclosures as required by MIL-STD-188-125-1.]

2.7.1.1 Filter Unit Mounting

Each filter unit shall be mounted individually in an enclosure containing one filter for each penetrating conductor. One end of the individual filter case shall be attached to the rf barrier plate between the two compartments to provide a rf tight seal between the rf barrier plate and the filter case. The terminals of the filters shall project through openings in the rf barrier plate into the inner terminal compartment. The case of each filter shall be attached to both the enclosure and to the barrier plate to prevent undue stress being applied to the rf seal between the filter case and the rf barrier plate. Individual filters shall be removable from the enclosure. Like filters shall be interchangeable.

2.7.1.2 Conduit Connections to Enclosures

The load terminal and input compartments shall have no knockouts, and each compartment shall have weldable threaded conduit hubs. The hubs shall be circumferentially EM welded in place and shall be sized and located as required for the conduits indicated.

2.7.1.3 Access Openings and Cover Plates

Enclosures shall have separate clear front access cover plates on terminal and power input compartments. Access cover plates shall be hinged with EM gaskets and 75 mm 3 inch maximum bolt spacing. The design shall include thick cover plates and folded enclosure edges to prevent enclosure deformation, bolt spacers to prevent uneven gasket compression, and gasket mounting to facilitate replacement. All gasket contact areas shall be tin-plated using the electrodeposited type I method in accordance with
ASTM B545. Nuts and bolts shall be permanently fastened to the enclosure by welding or captive attachments.

2.7.1.4 Operating Temperature

The filter and ESA assembly shall be rated for continuous operation, with filters at rated voltage and full-load currents, in ambient temperatures from minus 55 to plus 65 degrees C (measured outside the EM filter enclosure). Filter components shall be suitable for continuous full load operation at a temperature from minus 55 to plus 85 degrees C.

2.7.1.5 Short Circuit Withstand

Filters shall be labeled and built to have standard short circuit withstand ratings in accordance with UL 1283. The minimum ratings shall be as follows:

<table>
<thead>
<tr>
<th>FILTER RATED CURRENT, RMS AMPERE</th>
<th>SHORT CIRCUT FULL LOAD AMPERES SYMMETRICAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-100</td>
<td>10,000</td>
</tr>
<tr>
<td>101-400</td>
<td>14,000</td>
</tr>
</tbody>
</table>

2.7.1.6 Filter Connections

Individual filters shall have prewired standoffs and solderless lugs. The lugs shall be of the hexagonal head bolt or screw type and shall conform to UL 486A-486B. Live parts shall be spaced in accordance with NFPA 70.

2.7.2 Internal Encapsulated Filters (Filter Units)

NOTE: There are two kinds of power filters, commonly known as "W" and "X" series. The "W" series filters are designed to achieve rated insertion loss under load when tested in accordance with MIL-STD-220, which only requires testing under load conditions from 100 kHz to 20 MHz. The "X" series device data sheets will contain the phrase "tested using extended range buffer networks" and will satisfy the stated performance under full load at frequencies below 100 kHz. The "X" series filters will also be tested in accordance with MIL-STD-220. The "X" series filters can also be differentiated from "W" devices by the fact that they are usually two to three times greater in weight.

Fire alarm, signal, energy monitoring and control system, telephone, and control lines require filters that pass a specific frequency, voltage, and number of conductors. Fire alarm circuits with ground fault indicators will show a ground fault when connected through a filter and should be avoided. A fiber optic connection through the shield is recommended. Conductors penetrating the shield
perimeter shall be kept to a minimum. Systems
penetrating the shield will have special
requirements in their specifications for
compatibility between system signal and control
circuits and the EM filters.

2.7.2.1 Filter Construction

Individual filters shall be heavy-duty type sealed in a steel case. After
the filter is filled with an impregnating or encapsulating compound, the
seams shall be welded. When a solid potting compound is used to fill the
filter, the filters may be mechanically secured and sealed with solder.
Hermetically sealed impregnated capacitors shall be used, or the complete
filter assembly shall be vacuum impregnated. Individual filter cases shall
be fabricated of not less than 2 mm 14 gauge thick steel and finished with
a corrosion-resistant plating, or one coat of corrosion-resistant primer and
two coats of finish enamel. The filter shall be filled with an
impregnating or potting compound that is chemically inactive with respect
to the filter unit and case. The compound, either in the state of original
application or as a result of having aged, shall have no adverse effect on
the performance of the filter. The same material shall be used for
impregnating as is used for filling. Filter terminals shall be copper that
can withstand the pull requirements specified and measured in accordance
with paragraph ELECTROMAGNETIC FILTERS.

2.7.2.2 Ratings

NOTE: Indicate maximum current, voltage, and pass
band frequency ratings on the drawings. If no
drawings are furnished with the specifications,
specify the ratings here.

Filter current shall be [_____] volts, 60 Hz] [208] [277] [480] volts, 60 Hz]
[208] [277] [480] volts, 50 Hz].] [The pass band frequencies [_____] Hz to [_____] Hz shall
be suitable for use with the [50] [60] [_____] Hz to [400] Hz power
source and signal line filters as indicated.]

2.7.2.3 Voltage Drop

Voltage drop through the filter at operation frequency shall not exceed 2
percent of the rated line voltage when the filter is fully loaded with a
resistive load (unity power factor). Voltage drop measurements shall be in
accordance with paragraph Voltage Drop Measurements.

2.7.2.4 Input Elements

Filters shall be provided with inductive inputs. If inductive input is
used an ESA is required to protect the filter. The inductor shall ensure
firing potential for the preceding ESA and shall limit the current through
the filter capacitor. The input inductor shall be designed to withstand at
least a 10,000-volt transient.
2.7.2.5 Drainage of Stored Charge

Filters shall be provided with bleeder resistors to drain the stored charge from the capacitors when power is shut off. Drainage of stored charge shall be in accordance with NFPA 70.

2.7.2.6 Insertion Loss

**************************************************************************

NOTE: Use 100 dB insertion loss at 14 kHz to 10 GHz for applications such as secure communications installations. For other applications, insert appropriate insertion loss and frequency range for the specific product. Consult filter manufacturer for detailed requirements. Also consult the manufacturer when leakage current is important, such as in life safety areas. There is a tradeoff between leakage current and insertion loss when insertion loss is measured according to MIL-STD-220 because of the test connection and the line-to-ground capacitance. Harmonic loading of EM filters will require alterations to the electrical system design to protect the filters from damage. Large individual loads, such as adjustable speed drive and uninterruptible power supplies, should have shielded isolation transformers on their input line side. Multiple small individual loads, such as computers, should have EM filters derated or shielded isolation transformers between filter output and the harmonic generating loads. EM filters should be derated by 50 percent when serving loads with substantial harmonic components. If a facility is formally required to fully comply with MIL-STD-188-125, filter and ESA characteristics should meet the standard's requirements as applied to the facility. The facility's electrical system should be designed to meet the requirements of MIL-STD-188-125 with commercially available filters and ESA. The commercial electrical power feeder should be arranged in a manner that will meet MIL-STD-188-125 requirements. Voice and data lines should be converted to fiber optics prior to penetration of the EM shield. The requirements of MIL-STD-188-125 should be applied by a shielding specialist experienced in the standard's requirements and applications.

**************************************************************************

Insertion loss shall meet or exceed the levels complying with EM shielding effectiveness attenuation requirements herein when measured in accordance with MIL-STD-220. Insertion loss measurements shall be performed in accordance with MIL-STD-220 and the paragraph ELECTROMAGNETIC FILTERS.

2.7.2.7 Operating Temperature Range

Individual filters mounted in the filter enclosure operating at full load amperage and rated voltage shall not exceed plus 85 degrees C 185 degrees F based on an ambient temperature of 65 degrees C 150 degrees F outside the filter enclosure. Continuous operation from minus 55 to plus 85 degrees C
minus 67 to plus 185 degrees F shall be demonstrated according to paragraph "Filter Life Test (at Elevated Ambient Temperature)". Filters shall also withstand temperature cycling as specified in paragraph ELECTROMAGNETIC FILTERS. The filter shall remain at rated voltage and full-load current until temperature equilibrium is reached or 24 hours, whichever is greater.

2.7.2.8 Current Overload Capability

Filters shall be capable of operating at 140 percent of rated current for 15 minutes, 200 percent of rated current for 1 minute, and 500 percent of rated current for 1 second when tested in accordance with paragraph Overload Test.

2.7.2.9 Reactive Shunt Current

The reactive shunt current drawn by the filter operating at rated voltage shall not exceed 30 percent of the rated full-load current when measured in accordance with paragraph Reactive Shunt Current Measurements.

2.7.2.10 Dielectric Withstand Voltage

Filters shall be provided which conform to the minimum values of dielectric withstanding voltage. Filter dielectric withstand voltage test shall be in accordance with paragraph "Dielectric Withstand Voltage Test". HEMP filters shall be capable of operating continuously at full-rated voltage and of withstanding an overvoltage test of 2.8 times the rated voltage for 1 minute. In addition, each filter shall be capable of withstanding a 20-kV or 4-kA peak transient pulse of approximately 20 ns pulse width at full operating voltage, without damage.

2.7.2.11 Insulation Resistance

The insulation resistance between each filter terminal and ground shall be greater than 1 megohm when tested in accordance with paragraph Insulation Resistance Test.

2.7.2.12 Parallel Filters (Current Sharing)

Where two or more individual filters are electrically tied in parallel to form a larger filter, they shall equally share the current. Equally sharing is defined to be within 5 percent of the average current. The tests shall be in accordance with paragraph ELECTROMAGNETIC FILTERS.

2.7.2.13 Harmonic Distortion

Harmonics generated by the insertion of a filter shall not increase line voltage distortion more than 2.5 percent when measured with a unity power factor in accordance with the paragraph ELECTROMAGNETIC FILTERS.

2.7.3 Marking of Filter Units

Each filter case shall be marked with HCI tags and with the rated current, rated voltage, manufacturer’s name, type of impregnating or potting compound, operating frequency, and model number. In addition, individual filter cases, the filter enclosures, and supply and load panelboards of filtered circuits shall be marked by the manufacturer with the following: "WARNING: Before working on filters, terminals shall be temporarily grounded to ensure discharge of capacitors. Nameplates and warning labels shall be securely attached."
2.7.4 Minimum Life

Filter assemblies shall be designed for a minimum service life of 15 years. Submit filter schedule including voltage, amperage, enclosure type (low, high, band pass), location, cut-off frequency, band pass frequencies, and electrical surge arresters (ESA). Submit data and/or calculations for design of EM door including schedule of EM penetrations.

2.7.5 Power and Signal Line Factory Testing

**************************************************************************
NOTE: In most cases, test results for equal filters are sufficient to determine compliance with specification requirements. Factory tests on individual filters may be required for higher than average temperature applications, special filter configurations, and other special project requirements.

Filters with nonstandard configuration or ratings may require testing by an independent testing organization. These ratings would be for filters above 1,000 amperes.
**************************************************************************

Factory test report data shall be submitted for each filter configuration, voltage, and amperage which shall show the ability of filters to meet the specified requirements. Filter test reports shall be based on prior tests of the same filter assembly design and components. Test data reports shall be submitted in accordance with paragraph SUBMITTALS. Test data shall include the following:

a. Voltage Drop Measurements.

b. Insertion Loss Measurements.

c. Filter Life Test.

d. Thermal Shock Test.

e. Overload Test.

f. Reactive Shunt Current Measurements.

g. Dielectric Withstand Voltage.

h. Insulation Resistance Test.

i. Current Sharing.

j. Harmonic Distortion.

k. Terminals.

2.7.5.1 Voltage Drop Measurements

The voltage drop measurements on both ac and dc filters shall be performed with the components mounted in the filter/ESA assembly enclosure or mounted...
on a metal plate by the same holding method that will be used for mounting in the enclosure. For ac rated filters, measurements shall be made by using expanded scale-type meters. For dc rated filters, measurements shall be made by using a dc meter when the filter is carrying rated current and rated voltage.

2.7.5.2 Insertion Loss Measurements

Insertion loss measurements for power filters shall have the following modifications. The filters shall be installed in the filter/ESA assembly enclosure. The load current power supply shall operate at the rated voltage of the filters and shall be capable of providing any current from no-load through rated full-load current. The rf signal generator shall be a swept continuous wave (cw) source. The buffer networks shall be modified to permit valid measurements over the entire frequency band on which insertion loss requirements are specified (14 kHz-1 Ghz). The receiver or network analyzer shall be capable of operating over the entire frequency band on which insertion loss requirements are specified (14 kHz-1 Ghz). Sensitivity shall be adequate to provide a measurement dynamic range at least 10 dB greater than the insertion loss requirement. The load impedance shall be resistive and shall be capable of dissipating the rated full-load filter current. Insertion loss measurements shall be made at 20 percent, 50 percent, and 100 percent of the filter full-load operating current. Insertion loss measurements for communication/signal line filters shall be performed the same as for power filters except that the insertion loss measurements are required at a load impedance equal to the image impedance of the filter. No load insertion loss measurements shall be performed over the frequencies defined in the EM shielding effectiveness attenuation requirements for both power and communication filters. [Testing shall be load to source for TEMPEST.] [Testing shall be source to load for HEMP.]

2.7.5.3 Filter Life at High Ambient Temperature

This test is conducted for the purpose of determining the effects on electrical and mechanical characteristics of a filter, resulting from exposure of the filter to a high ambient temperature for a specified length of time, while the filter is performing its operational function. Surge current, total resistance, dielectric strength, insulation resistance, and capacitance are types of measurements that would show the deleterious effects due to exposure to elevated ambient temperatures. A suitable test chamber shall be used which will maintain the temperature at the required test temperature and tolerance. Temperature measurements shall be made within a specified number of unobstructed mm inches from any one filter or group of like filters under test. This test shall be made in still air. Specimens shall be mounted by their normal mounting means. When groups of filters are to be tested simultaneously, the mounting distance between filters shall be as specified for the individual groups otherwise the mounting distance shall be sufficient to minimize the temperature on one filter affecting the temperature of another. Filters fabricated of different materials shall not be tested simultaneously. The test temperature shall be 85 + 2 degrees C 184 + 34 degrees F. The length of the test shall be for 5,000 hours. Specified measurements shall be made prior to, during, or after exposure.

2.7.5.4 Thermal Shock Test

This test is conducted for the purpose of determining the resistance of a filter to exposures at extremes of high and low temperatures, and to the
shock of alternate exposures to these extremes. Suitable temperature controlled systems shall be used to meet the temperature requirements and test conditions. Environmental chambers shall be used to meet test requirements and to reach specified temperature conditions. Filters shall be placed so that there is no obstruction to the flow of air across and around the filter. The filter shall be subjected to the specified test condition. The first five cycles shall be run continuously. After five cycles, the test may be interrupted after the completion of any full cycle, and the filter allowed to return to room ambient temperature before testing is resumed. One cycle consists of steps 1 through 4 of the applicable test condition for dual environmental test chambers (one low temperature and one high temperature test chamber) and steps 1 and 3 for single compartment test chambers where both high and low temperatures are achieved without moving the filter. The test conditions are as follows:

1. -55 deg C 0 deg and -3 deg
2. 25 deg C +10 deg and -5 deg
3. 85 deg C +3 deg and -0 deg
4. 25 deg C +10 deg and -5 deg

The effective total transfer time from the specified low temperature to the specified high temperature shall not exceed 5 minutes. The exposure time in air at the extreme temperatures is a function of the weight of the filter. The minimum exposure time per the weight of the filter shall be as follows:

<table>
<thead>
<tr>
<th>Weight Range</th>
<th>Exposure Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 oz. and below</td>
<td>15 minutes</td>
</tr>
<tr>
<td>Above 1 oz. to 4.8 oz.</td>
<td>30 minutes</td>
</tr>
<tr>
<td>Above 4.8 oz. to 3 lb.</td>
<td>1 hour</td>
</tr>
<tr>
<td>Above 3 lb. to 30 lb.</td>
<td>2 hours</td>
</tr>
<tr>
<td>Above 30 lb. to 300 lb.</td>
<td>4 hours</td>
</tr>
<tr>
<td>Above 300 lb.</td>
<td>8 hours</td>
</tr>
</tbody>
</table>

Specified measurements shall be made prior to the first cycle and upon completion of the final cycle, except that failures shall be based on measurements made after the specimen has stabilized at room temperature following the final cycle.

2.7.5.5 Overload Test

Filters shall be mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method that will be used for mounting in the enclosure. A specified current shall then be applied for a specified period of time. After the filter has returned to room temperature, the insulation resistance and voltage drop shall be measured. The insulation resistance shall be measured using the method in paragraph ELECTROMAGNETIC FILTERS. AC voltage drop measurements shall be made by using expanded scale-type meters which will enable voltage differences of less than 1 volt to be read. DC voltage drop measurements shall be made by using a dc reading meter when the filter is carrying rated current and rated voltage. The insulation resistance and the voltage drop will be measured after each separate overload test. Filters will also be visually examined for
2.7.5.6 Reactive Shunt Current Measurements

The reactive shunt current measurements shall be performed with the filters mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method that will be used for mounting in the enclosure. The filter shall be terminated in the inner compartment in an open circuit. Rated ac voltage shall be applied between the filter outer compartment terminal and the enclosure or metal plate. The ac current into the outer compartment terminal shall be monitored. The measured current is equal to the filter reactive shunt current.

2.7.5.7 Dielectric Withstand Voltage Test

The dielectric withstanding voltage test (also called high-potential, over potential, voltage breakdown, or dielectric-strength test) consists of the application of a voltage higher than rated voltage for a specific time between mutually insulated portions of a filter or between insulated portions and ground. Repeated application of the test voltage on the same filter is not recommended as even an overpotential less than the breakdown voltage may injure the insulation. When subsequent application of the test potential is specified in the test routine, succeeding tests shall be made at reduced potential. When an alternating potential (ac) is used, the test voltage shall be 60 Hz. and shall approximate a true sine wave in form. All ac potentials shall be expressed as root-mean-square values. The KVA rating and impedance of the source shall permit operation at all testing loads without serious distortion of the waveform and without serious change in voltage for any setting. When a direct potential (dc) is used, the ripple content shall not exceed 5 percent rms of the test potential. A voltmeter shall be used to measure the applied voltage to an accuracy of 5 percent. When a transformer is used as a high-voltage source of ac, a voltmeter shall be connected across the primary side or across a tertiary winding provided that the actual voltage across the filter will be within the allowable tolerance under any normal load condition. Unless otherwise specified, the test voltage shall be dc and shall be as follows:

<table>
<thead>
<tr>
<th>Description</th>
<th>Voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC rated only</td>
<td>2.5 times rated voltage</td>
</tr>
<tr>
<td>For filters with ac and dc ratings</td>
<td>2.5 times rated dc voltage</td>
</tr>
<tr>
<td>AC rated only</td>
<td>4.2 times rated rms voltage</td>
</tr>
</tbody>
</table>

The duration of the dc test voltages shall be 5 seconds minimum, 1 minute maximum, after the filter has reached thermal stability at maximum operating temperature produced by passage of rated current. The test voltage shall be applied between the case (ground) and all live (not grounded) terminals of the same circuit connected together. The test voltage shall be raised from zero to the specified value as uniformly as possible, at a rate of approximately 500 volts (rms or dc) per second. Upon completion of the test, the test voltage shall be gradually reduced to avoid voltage surges. The changing current shall be 50 mA maximum. During the dielectric withstanding voltage test, the fault indicator shall be monitored for evidence of disruptive discharge and leakage current. The sensitivity of the breakdown test equipment shall be sufficient to indicate breakdown when at least 0.5 mA of leakage current flows through the filter under test. The test shall be performed with the components mounted in the
filter/ESA assembly enclosure. Filters for ac circuits shall be tested with an ac source while filters for dc circuits shall be tested with a dc source. After the test the filter shall be examined and measurements shall be performed to include insulation resistance measurements to determine the effect of the dielectric withstanding voltage test on specific operating characteristics.

2.7.5.8 Insulation Resistance Test

This is a test to measure the resistance offered by the insulating members of a filter to an impressed direct voltage tending to produce a leakage current through or on the surface of these filters. Insulation-resistance measurements shall be made on an apparatus suitable for the characteristics of the filter to be measured such as a megohm bridge, megohm-meter, insulation-resistance test set, or other suitable apparatus. The test shall be performed with the components mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method that will be used for mounting in the enclosure. The bleeder resistor shall be disconnected. The direct potential applied to the specimen shall be the largest test condition voltage (100, 500, or 1,000 volts +10 percent) that does not exceed the rated peak ac voltage or the rated dc voltage. A separate dc power supply may be used to charge the filters to the test voltage. The measurement error at the insulation-resistance value required shall not exceed 10 percent. Proper guarding techniques shall be used to prevent erroneous readings due to leakage along undesired paths. Insulation-resistance measurements shall be made between the mutually insulated points or between insulated points and ground. The insulation resistance value shall be read with a megohmmeter and recorded after the reading has stabilized. When more than one measurement is specified, subsequent measurements of insulation resistance shall be made using the same polarity as the initial measurements.

2.7.5.9 Current Sharing

Testing shall be performed with the filters mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method that will be used for mounting in the enclosure. The filter inner compartment terminals shall be loaded with a resistor equal in value to the rated operating voltage divided by the sum of the current ratings of the devices in parallel. The resistor shall be capable of dissipating the total current. Rated operating voltage shall be applied at the filter outer compartment terminals. The current into each filter outer compartment terminal shall be monitored.

2.7.5.10 Harmonic Distortion Test

Harmonic distortion measurements shall be made using a spectrum analyzer having a dynamic range of [70 dB] [_____] and a frequency range from [10 kHz to 1.7 GHz] [_____. Total harmonic distortion shall be measured at the input and output terminals of the filter when operating at 25, 50, and 100 percent of rated full-load current.

2.7.5.11 Terminals Pull Test

The purpose of this test is to determine whether the design of the filter terminals can withstand the mechanical stresses to which they will be subjected during installation or disassembly in equipment. Testing shall be performed with the components mounted in the filter/ESA assembly enclosure or mounted on a plate by the same holding method that will be
used for mounting in the enclosure. The force applied to the terminal shall be 89 N (20 pounds). The point of application of the force and the force applied shall be in the direction of the axes of the terminations. The force shall be applied gradually to the terminal and then maintained for a period of 5 to 10 seconds. The terminals shall be checked before and after the pull test for poor workmanship, faulty designs, inadequate methods of attaching of the terminals to the body of the part, broken seals, cracking of the materials surrounding the terminals, and the changes in electrical characteristics such as shorted or interrupted circuits. Measurements are to be made before and after the test.

2.8 ELECTRICAL SURGE ARRESTERS (ESA)

**************************************************************************
NOTE: ESA application guidance is found in MIL-HDBK 423.
**************************************************************************

2.8.1 Power and Signal Line ESA

2.8.1.1 ESA General

ESAs shall be metal oxide varistors (MOVs) or spark gaps. When a spark gap is specified, the ESA shall be enclosed within a metal case. Discharges shall be contained within the case; no external corona or arcing will be permitted. ESAs shall be factory installed with minimum lead lengths within the outer compartment. For all power filter/ESA assemblies, the ESAs shall be installed a minimum of 75 mm (3 inch) apart, with terminals at least 75 mm (3 inch) from a grounded surface. For telephone filter/ESA assemblies, the ESAs shall have a minimum clearance spacing of 25 mm (1 inch), and terminals shall be at least 75 mm (3 inch) from a grounded surface. Each phase, neutral and telephone circuit conductor shall be connected through an ESA to the ground bus. The ESA shall be installed [in the power input compartment of the filter] [in a separate EM shielded enclosure]. ESA units within the filter/ESA assembly shall be individually replaceable. Like ESAs shall be interchangeable. ESA terminals shall withstand the 89 N (20 lb) pull test. Live parts shall be spaced in accordance with NFPA 70. ESA leads shall be copper. Individual ESAs shall be marked with HCI tags and shall be marked with the manufacturer's name or trademark and part number. The ESA shall meet the requirements of IEEE C62.11, IEEE C62.41.1, IEEE C62.41.2, and UL 1449.

2.8.1.2 Wiring

**************************************************************************
NOTE: Some designers prefer coiling the wire between the ESA and the filter, because it creates enough inductance to develop the ESA firing potential during transients for HEMP applications. Short leads, as recommended herein, improve the voltage-limiting effectiveness of the ESA. Fusing of the ESA is not recommended because protection may be lost without the operator's knowledge. If fusing is necessary, a light to indicate a blown fuse will be provided on the ESA enclosures.
**************************************************************************

The ESAs shall be located so that leads of minimum length connect the ESA ground terminal to the enclosure. The total lead length connecting the ESA
to the filter and the ESA ground terminal to the enclosure shall be less than 300 mm 12 inch. Power line ESA wiring shall be No. 4 AWG minimum. Communication/signal line ESA wiring shall be of the same or heavier gauge than the communication/signal line conductor.

2.8.1.3 Voltage Characteristics

**************************************************************************
NOTE: Clamping voltage requirement is intended to ensure that the ESA does not have excessive series resistance. The specific value should be chosen after reviewing manufacturer's data.

Specified dc breakdown voltage (or MOV voltage at 1 milliampere dc current) for dc and single phase ac power should be in the range of 150 to 200 percent of the peak (not rms) operating voltage. Use 200 to 250 percent on three-phase circuits, so that a short-circuit fault in one phase will not fire ESA on the other two phases.

The spark gap dc breakdown voltage requirement is intended to ensure that the spark gap is a low-inductance, fast device. The precise values are not critical and should be chosen after reviewing ESA catalog information.
**************************************************************************

Measurements of (MOV) voltage at 1 mA dc current and spark gap dc breakdown voltage shall be made in accordance with the following procedure. Testing shall be performed with the ESAs mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method which will be used for mounting in the enclosure. A variable dc power supply shall be connected between the ESA terminal and the enclosure (or plate). The applied dc voltage shall be increased at a rate not to exceed 10 percent of the rated firing voltage per second. The (MOV) voltage at 1 mA dc current is the power supply output voltage, when the output current is 1 milliampere. The spark gap dc breakdown voltage is the applied voltage just prior to breakdown (indicated by a rapid decrease in the voltage across the device). The power supply shall be de-energize immediately after the value has been recorded. MOV direct current breakdown voltage at 1 milliampere dc current shall be at least [340] [500] [1,000] [_____] volts and less than [425] [1,500] [_____] volts. MOV testing shall be in accordance with IEEE C62.33. Spark gap direct current breakdown (sparkover) voltage shall be at least [500] [1,000] [_____] volts and less than [1,500] [3,000] [_____] volts. Spark gap impulse sparkover voltage of the ESA shall be less than 4,000 volts. This voltage shall be on surges of either polarity having a rate of rise of 1,000 volts/nanosecond. Testing of the ESA impulse sparkover voltage shall be performed with the spark gaps mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method which will be used for mounting in the enclosure. The pulse generator shall be connected between the spark gap terminal and the enclosure (or plate) with a minimum inductance connection. The pulse generator shall be capable of providing a ramp voltage of 1 kV/ns to a peak voltage which is at least twice the open circuit impulse sparkover voltage. Voltage across the spark gap shall be monitored on an oscilloscope or transient digitizing recorder, capable of at least 1 ns resolution. The peak transient voltage during the pulse is the impulse sparkover voltage. Response time shall be less than 4 nanoseconds.
Clamping voltage of the ESA shall be less than [900] volts at a current pulse of 10 kA. ESA clamping voltage measurements shall be performed with the ESAs mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method which will be used for mounting in the enclosure. The pulse generator shall be connected between the ESA terminal and the enclosure (or plate) with a minimum inductance connection. The pulse generator shall be capable of providing a 10 kA current pulse, on an 8- by 20-microsecond waveshape into the ESA. Current through the ESA and voltage across the ESA shall be monitored on oscilloscopes or transient digitizing recorders. The asymptotic voltage during the 10 kA portion of the pulse is the clamping voltage.

2.8.1.4 ESA Extinguishing Characteristics

The ESA shall extinguish and be self-restoring to the normal nonconductive state within one-half cycle at the operating frequency. The ESA extinguishing test shall be performed with the ESA mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method which will be used for mounting in the enclosure. The extinguishing test shall use an ac power source connected between the ESA terminal and ground which shall be at the rated voltage and frequency capable of providing at least 25 amperes into a short-circuit load. A pulse generator capable of providing a short pulse which will fire the ESA shall also be connected across the ESA. Voltage across the ESA shall be monitored on an oscilloscope or transient digitizing recorder. A series of ten pulses shall be injected. Performance of the ESA is satisfactory if the arc extinguishes (indicated by re-occurrence of the sinusoidal waveform) within 8.5 milliseconds after the start of each pulse.

2.8.1.5 ESA Extreme Duty Discharge Current

The ESA shall be rated to survive the extreme duty discharge current of a single 8- x 20-microsecond pulse with a 10 to 90 percent rise time of 8 microseconds and fall time to a value of 36.8 percent of peak in 20 microseconds. The ESA for high voltage power lines (above 600 volts) shall have an extreme duty discharge capability equal to or greater than 70 kA. The ESA for low voltage power lines (below 600 volts) to such things as building interiors, area lighting, and external HVAC equipment shall have an extreme duty discharge capability equal to or greater than 50 kA. The ESAs for control circuits such as interior alarms, indicator lights, door access controllers, HVAC controls, and telephones, shall have an extreme duty discharge capability equal to or greater than 10 kA. The ESA extreme duty discharge test shall be performed with the ESA mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method which will be used for mounting in the enclosure. A pulse generator shall be connected between the ESA terminal and the enclosure (or plate) with a minimum inductance connection. The pulse generator shall be capable of supplying an 8- x 20-microsecond waveshape and a only single pulse is required. Current through the ESA and voltage across the ESA shall be monitored on oscilloscopes or transient digitizing recorders. The ESA shall be visually monitored during the test and after the pulse inspected for charring, cracks, or other signs of degradation or damage. Test shall be on a prototype only. The dc breakdown voltage test shall be repeated.

2.8.1.6 Minimum Operating Life

**************************************************************************

NOTE: Surge life test will be performed only when
required by the user. Coordinate current amplitude with manufacturer.

The ESA operating life tests shall be performed with the ESA mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method which will be used for mounting in the enclosure. A pulse generator shall be connected between the ESA terminal and the enclosure (or plate) with a minimum inductance connection. The pulse generator shall be capable of supplying repetitive 4 kA current pulses, with a 50 ns x 500 ns waveshape, to the ESA. A series of ten pulses is required. Current through the ESA and voltage across the ESA shall be monitored on oscilloscopes or transient digitizing recorders. The ESA shall be visually monitored during the series of pulses for indications of external breakdown. The ESA shall be able to conduct 2,000 pulses at a peak current of 4 kA and 50 nanoseconds x 500 nanoseconds waveform. Post-test shall include inspection for charring, cracks, or signs of degradation. The dc breakdown voltage test shall be repeated.

2.8.1.7 Operating Temperature

The ESA shall be rated for continuous operation in ambient temperatures from minus 25 to plus 125 degrees C minus 12 to plus 255 degrees F.

2.8.2 ESA Testing

ESA factory test data shall be submitted which shall show the ability to meet the requirements herein, based on prior tests of the same ESA assembly components and design. Testing shall be performed with the ESA mounted in the filter/ESA assembly enclosure or mounted on a metal plate by the same holding method which will be used for mounting in the enclosure. The pulse generator shall be connected between the ESA terminal and the enclosure (or plate) with a minimum inductance connection. Current through the ESA and voltage across the ESA shall be monitored on oscilloscopes or transient digitizing recorders. Test data shall include the following:

a. Breakdown Voltage.
b. Impulse Sparkover Voltage.
c. Clamping Voltage.
d. Extinguishing.
e. Extreme Duty Discharge.
f. Surge Life.

2.9 WAVEGUIDE ASSEMBLIES

Waveguide-below-cutoff (WBC) protection shall be provided for all piping, ventilation, fiber optic cable penetrations and microwave communications barrier penetrations of the HEMP electromagnetic barrier. These WBC penetrations shall be protected with cutoff frequencies and attenuation no less than the EM shielding effectiveness values listed herein. The cutoff frequencies shall be no less than 1.5 times the highest frequency of the shielding effectiveness. For 1 GHz, the maximum rectangular linear diagonal dimension shall be 100 mm 4 inch and the maximum circular diameter shall be 100 mm 4 inch. The length-to-cell cross-section dimension ratio
of the waveguide shall be a minimum of [5:1 to attain 100 dB] [3:1 to attain 50 dB]. Penetration locations shall be arranged to facilitate installation and testing by minimizing the number of locations. Waveguides of each assembly type shall be factory tested in accordance with IEEE 299 and Table I of this specification.

2.9.1 Waveguide-Type Air Vents

**************************************************************************
NOTE: Occurrence of dissimilar metals will use corrosion resistant design.
**************************************************************************

Each ventilation WBC array shall be a honeycomb-type air vent with a core fabricated of corrosion resistant steel as shown on the drawings. Waveguide construction shall include heavy frames to dissipate the heat of welding to the shield. A welded WBC array shall be constructed from sheet metal or square tubes. Array cells shall be formed by welding the sheets at intersections or welding adjacent tubes along the entire length of the WBC section. The maximum cell size shall be 100 mm \(4\) inch on a diagonal. The length of the WBC section shall be at least five times the diagonal dimension of the cells. Air vents shall be a permanent part of the shielded enclosure and shall have a shielding effectiveness equal to that of the total enclosure. Static pressure drop through the vents shall not exceed 3.4 \(\text{gpm}\cdot\text{cm} \quad 0.01\) inch of water at an air velocity of 305 m/s \(1000\) fpm. Waveguides for air vents (honeycomb) shall have access doors in duct work for maintenance. The frame of the honeycomb panel shall be [welded] [bolted] into the penetration plate [with continuous circumferential EM welds.] [with bolts 75 mm \(3\) inch on center.] Welds for fabrication and installation of honeycomb waveguide panels are primary shield welds and shall be inspected as indicated. Acceptance testing of all honeycomb panels shall be included with the final acceptance test. Conductors, such as wires and louver operating rods, shall not pass through the waveguide openings.

2.9.2 Piping Penetrations

All piping penetrations of the HEMP barrier to include utility piping, fire mains, vent pipes, and generator and boiler exhausts shall be made with piping WBC sections. The WBC material shall be steel with a composition suitable for welding to the HEMP shield. The minimum wall thickness shall be 3.2 mm \(0.125\) inch. The maximum inside diameter shall be 100 mm \(4\) inch or a metallic honeycomb insert with a maximum cell dimension of 100 mm \(4\) inch shall be installed. The WBC section shall have an unbroken length of at least five diameters to form a minimum cutoff frequency of 1.5 times the highest frequency of the shield effectiveness. The piping WBC section shall be circumferentially welded or brazed to the HEMP shield, pipe sleeve or a penetration plate as shown on the drawings. Generator and boiler exhausts shall be constructed as shown in the drawings and shall be configured as a WBC or WBC array. The circumferential penetration welds are primary shield welds and shall be inspected and tested as indicated.

2.9.3 Waveguide Penetrations

Waveguide penetrations for dielectric fibers or hoses shall be implemented in the same manner as piping penetrations. Dielectric hoses or pipes shall be converted to metal waveguide piping before penetrating the shield. Conductors, such as wires and fiber cable strength members, shall not pass through the waveguide opening.
2.9.4 GROUNDING STUD

**************************************************************************
NOTE: Grounding stud will be provided only for small (under 100 square meters 1,000 square feet of floor area) bolted and welded enclosures.
**************************************************************************

Enclosure shall have 13 mm 1/2 inch diameter stud circumferentially welded to each side of the shielding penetration plate.

2.10 PENETRATION PLATES

Penetration plates shall be minimum 6 mm 1/4 inch thick and sized as shown on the drawings. The penetration plate shall overlap the shield penetration cutout dimension by a minimum of 150 mm 6 inch on each side. The penetration plate shall be [welded] [bolted] to the HEMP shield [with continuous circumferential EM welds.] [with bolts 75 mm 3 inch on center.]

2.11 GALVANIZING

Galvanizing, when practical and not otherwise indicated, shall be hot-dipped processed after fabrication. Galvanizing shall be in accordance with ASTM A123/A123M, or ASTM A653/A653M, as applicable. Exposed fastenings shall be galvanically compatible material. Electrolytic couples and dissimilar metals that tend to seize or gall shall be avoided.

2.12 EM SHIELDED CABINETS AND PULL BOXES

Cabinets and pull boxes shall be modified NEMA [1] [_____] in accordance with NEMA ICS 6 made of corrosion resistant steel of not less than 2 mm 14 gauge thick with welded seams and galvanized bulkhead cover plates. Access cover plates shall be hinged with EM gaskets and 75 mm 3 inch maximum bolt spacing. Design shall include thick cover plates, folded enclosure edges, and bolt spacers to prevent uneven gasket compression and enclosure deformation. Gasket shall be easy to replace. Gasket contact areas shall be tin-plated using the electrodeposited type I method in accordance with ASTM B545. Conduit hub shall be circumferentially EM welded to the enclosure. The cabinets shall be finished with a corrosion-inhibiting primer and two coats of baked or finish enamel. Cabinets shall be provided with mounting brackets for wall mounting or legs for floor mounting. Cabinets and boxes of each type shall be factory tested in accordance with IEEE 299 and Table I of this specification.

2.13 QUALITATIVE MONITORING SYSTEM

A built-in shield monitoring system for SELDS testing shall be provided. The system shall consist of either multiple injection points or a surface loop system. Driving conductors shall be brought to a single lockable EM shielded connection box, located outside the shield in a controlled space.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.
3.2 INSTALLATION

3.2.1 Coordination

The EM shielding installer shall instruct other trades in the presence and with the direction of the Government representative, in advance of the EM shielding system installation, to ensure that all individuals are aware of the critical installation requirements. Submit manufacturer's data, catalog cuts, and printed documentation regarding the work. Cleaners, solvents, coatings, finishes, physical barriers, and door threshold protectors shall be provided as required to protect the shielding system from corrosion, damage, and degradation. The shielding installation plan shall be approved before construction begins.

3.2.2 Verification

Before, during, and after the EM shielding and penetration protection subsystem installation, the shielding specialist shall verify and approve the installation for compliance with the specifications. Materials and methods, shop drawings, and other items for the shielding subsystem shall bear an approval stamp of the shielding specialist. Compliance notification shall be provided to the Contracting Officer before materials are installed or methods performed.

3.2.3 Inspection

During and after EM shielding and penetration protection subsystem installation, including EM filters and waveguides, a qualified shielding specialist shall inspect the installation for compliance with the specifications. Complete the inspection before a finish or concrete topping coat is installed.

3.2.4 Manufacturer's Services

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative shall supervise the installation, adjustment, and testing of the equipment.

3.2.5 Posting Framed Instructions

Post framed instructions containing wiring and control diagrams under glass or in laminated plastic. Condensed operating instructions, prepared in typed form, shall be framed as specified above and posted beside the diagrams before acceptance testing of the system.

3.3 ENCLOSURE INSTALLATION - WELDED STEEL CONSTRUCTION

**************************************************************************

NOTE: Either the welded or bolted construction will be used for the EM shielding enclosure. Choose the appropriate construction and delete the non-applicable paragraphs.

Welded construction will usually consist of continuous 1.897 mm 14 gauge thick steel plate and angles to form the enclosure. Thicker material may be used if it is more cost-effective or required for
structural reasons. Welded construction is used when a shielded facility requires a long maintainable service life of high-level protection, 100 dB attenuation, or HEMP protection, 100 dB. For bolted construction see the NOTE and paragraphs below under the title ENCLOSURE INSTALLATION - BOLTED CONSTRUCTION

Install the EM shielded enclosure in accordance with this specification, the drawings, and the recommendations of the manufacturer and EM shielding specialist. Handle and install shielding steel without damage. Penetrations of the shield, other than those indicated on the drawings, will not be permitted, including fasteners and mounting bolts, without prior written authorization from the Contracting Officer.

3.3.1 Surface Preparation

Clean and buff contacting surfaces to ensure firm contact with shielding steel.

3.3.2 Control of Warping

NOTE: Steel plates exposed to sunlight and changing environmental conditions increase warpage and buckling.

Keep warping of steel shielding plates during installation and welding within 1 mm in 1 meter 1/8 inch in 10 feet. Use embeds, drive pins, and/or anchor bolts or ties to hold plates in place during welding. Other techniques such as skip welding shall also be used to reduce warpage. The system chosen shall be fully coordinated and approved by the Contracting Officer. Fasteners, drive pins, and other shield penetrations shall be sealed with full penetration circumferential EM welds.

3.3.3 Placement of Floor Shield

NOTE: The shingle overlap method is one successful method of floor shield placement. Designers have the option to select other methods.

Placement of the floor shield shall not begin until at least 14 days after the pouring of the floor slab and Contracting Officer approval of all required submittals. [The placement of the floor shield shall utilize [the shingle overlap method] [____].] [Individual floor sheet shall be attached on the top and one side only with air-pressure drive tools to the floor. Floor shielding sheets shall be overlapped 50 mm 2 inch at joints, bent and laid flat on the concrete floor without voids or gaps, and sealed with continuous EM welds at all seams and joints.] The floor shield installation shall start at the center of the space.

3.3.4 Placement of Overslab

Before placement of the overslab over any portion of the floor shield, the Contracting Officer's approval is required. Both visual and SELDS testing
of the shielding within the area to be covered shall be successfully completed, any defects repaired and retested, and full test results supplied to the Contracting Officer prior to placement of the overslab. A vapor barrier shall be placed over the floor shield.

### 3.3.5 Welding

The shielding work shall be provided in accordance with the performance criteria specified. Shielding steel structurally welded to the steel frame shall be welded in accordance with AWS D1.1/D1.1M and AWS D1.3/D1.3M. EM shielding seams shall be sealed EM-tight by the MIG method, using electrodes structurally and electrically compatible with the adjacent steel sheets. Sheet steel shall be welded to support steel by plug or tack welding at 300 mm 12 inch on center, and then sheet seams shall be continuously EM welded to seal the enclosure [____]. Slag inclusions, gas pockets, voids, or incomplete fusion will not be allowed anywhere along welded seams. Weld failures shall be corrected by grinding out such welds and replacing with new welds. A qualified welder shall perform welding, both structural and EM sealing. Weldments critical to shielding effectiveness are shown on the drawings and shall be performed in the manner shown on the drawings. Where both structural integrity and shielding quality are required for a given weldment, both criteria shall be met simultaneously. Brazing shall conform to the documents discussed above, where practical, and shall also conform to requirement of AWS BRH. Structural, mechanical, or electrical systems penetrations shall be sealed by providing a continuous solid perimeter weld, or braze to the shield as specified. All shield joints and seams shall have a minimum 50 mm 2 inch overlap and shall be sealed with a continuous solid weld. After testing, the Contracting Officer will inspect and approve the installation prior to covering by other trades.

### 3.3.6 Wall Shielding Attachment

**************************************************************************
NOTE: The wall attachment method outlined in this paragraph is one successful example. Site-specific methods must be edited at this point in this specification. Note that all attachment penetrations must be welded closed. Metal wall studs or furring strips should be of equal or greater thickness (gauge) than the shield steel when shield steel is welded to supporting metal.
**************************************************************************

Continuous [1.613] [____] mm [16] [____] gauge thick furring channels spaced not more than 600 mm 24 inch on center shall be secured to steel wall studs by using self-tapping sheet metal screws. The steel sheets shall be tack welded to the furring strips every 400 mm 16 inch on center horizontally and 600 mm 24 inch on center vertically. A continuous full penetration EM weld shall be made to join the sheets and form the shield. Welds shall not form dimples or depressions causing fish mouths at the edge of the sheet.

### 3.3.7 Formed Closures

Install formed closures where indicated and/or necessary to completely close all joints, openings, enclosures of pipe chases, and structural penetrations, columns, and beams.
3.3.8 Sequence of Installation

Erection of the steel shall be sequenced to prevent steel sheet warpage. Install shielding components that have passed initial testing (part 1) before construction of any features that would limit access for repairs to the shield.

3.3.9 Door Assemblies

Mount doors to perform as specified. Door framing shall be continuously welded to the EM shield. The structural system supporting the door frame shall provide proper support for doors and frame.

3.4 ENCLOSURE INSTALLATION - BOLTED CONSTRUCTION

******************************************************************************

NOTE: Either welded or bolted construction will be used for the EM shielding enclosure. For welded construction see the NOTE and paragraphs above.

Bolted construction is associated with a lower level (50 dB) of maintained shielding effectiveness. Bolted construction will usually consist of modular panels bolted together with metal strips or channels. Panels are commonly plywood with steel sheets laminated to one or both sides. Bolted construction is used when a shielded facility's service life is short, 10 years or less, or the system is required to be demountable for change of location. This system requires more maintenance than a welded system and requires access to the panels. The EM shield layout may restrict attenuation testing of the enclosure. It is desirable for large facilities to place the shield at least 1 meter 3.3 feet inside the exterior walls, although cost and construction restrict this consideration. The floor shielding can be tested by SELDS test but not by IEEE 299 if it is on grade. The facility layout must be carefully planned to allow for testing and shield maintenance.

******************************************************************************

3.4.1 Enclosure Panel Installation

Install panels, without damage to the shielding steel, in accordance with the shielding manufacturer's recommendations. Exposed surfaces shall be cleaned of dirt, finger marks, and foreign matter resulting from manufacturing processes, handling, and installation. Install electrical conduits as close to the EM shield as possible. Framing-joining system bolts shall not be used to mount material and equipment. Material and equipment which penetrate the shielded enclosure shall be seam welded or soldered to both shielding surfaces.

3.4.2 Surface Preparation

Clean and buff surfaces to ensure good electrical contact with shielding surface. Paint or other coverings on mating surfaces of special boxes such as for fire alarm systems, buzzers, and signal lights, including areas between box and cover, box and wall, and box and conduit, shall be
removed. Remove insulating material to maintain a low-resistance ground system and to ensure firm mating of metal surfaces.

3.4.3 Floor Panel Setting

Place a polyethylene film 0.15 mm 6 mil thick vapor barrier over the structural floor of the parent room before any other work is set thereon. Provide a 3 mm 1/8 inch thick layer of hardboard over this film with joints loosely butted. Over this layer an additional layer of similar filler material of equal thickness as the projection of the framing-joining member from the bottom surface of the floor panel shall be provided leaving no more than 6 mm 1/4 inch of space between the hardboard and the framing-joining member.

3.4.4 Framing-Joining System

Tighten screws with a calibrated adjustable torque wrench with equal torque set for each screw. Proper torque values shall be in accordance with the manufacturer's requirements.

3.4.5 Door Assemblies

Mount the door to perform as specified. The door shall be through-bolted to the EM shield.

3.4.6 Filter Installation

**************************************************************************
NOTE: When the filter unit must be installed inside the shielded enclosure, the input terminal compartment will be EM-tight instead of the load terminal compartment, and the filters will be located in the load terminal compartment. This arrangement is necessary to prevent radiated EM energy within the shielded enclosure from inducing EM energy in the power conductors between the filters and the point where the conductors pass through the shielded enclosure wall. To provide for this arrangement, change the wording as necessary; i.e., change the word "load" to read "input" and change the words "input" to read "output" or "load," as appropriate.
**************************************************************************

Support filters independently of the wall shielding. Conduct inspections on filters provided under this specification, to verify compliance with the specified requirements. Filters shall be shipped after successful testing and shall be examined prior to installation to determine if damage occurred during shipment. Damage, no matter how slight, will be reason for rejection of the filter.

3.5 WAVEGUIDE INSTALLATION

Penetrations of the EM shield shall be treated with the appropriate waveguide method. Waveguides shall be suitable for piping and for fluids or gases contained within, in accordance with specified requirements.
3.6 SHIELDING PENETRATION INSTALLATION

Penetrations shall be installed in accordance with requirements of the penetration schedule and coordinated with system installation.

3.7 FIELD QUALITY CONTROL

Develop a quality control plan to ensure compliance with contract requirements; maintain quality control records for construction operations required under this section; and submit the quality control plan to the Contracting Officer. Furnish a copy of testing records, as well as the records of corrective actions taken. The in-progress and final acceptance testing of EM shielding and penetration protection system work shall be performed as specified. Correct deficiencies at no additional cost to the Government. Legible copies of the daily inspection reports shall be maintained by the shielding specialist at the project site, and the copies of the Construction Quality Control Report shall be delivered to the Contracting Officer on the third workday following the date of the report. The daily inspections shall include the type of work being performed during the report period and locations, type of testing, deficiencies, corrective actions, unsolved problems, and recommendations to assure adequate quality control. Results of inspections and tests performed in accordance with this specification shall be attached to the daily Construction Quality Control Report.

3.8 FIELD TRAINING

Provide a field training course for designated operating and maintenance staff members. Training shall be provided for a total period of [8] [_____] hours of normal working time and shall start after the system is functionally complete but prior to the final acceptance test. Field training shall cover all the items contained in the Operating and Maintenance Manuals.

3.9 SHIELDING QUALITY CONTROL

The Contractor's organizational structure for shielding quality control shall be integrated into the jobsite management. Testing shall be performed by [an independent testing firm] [the shielding installer].

3.9.1 HEMP Hardness Critical Item Schedule

Hardness critical items shall be identified during the detail drawing submittal period. These items are those components and/or construction features which singularly and collectively provide specified levels of HEMP protection, such as the EM shield, surge arresters, EM shielded doors, shield welding, electrical filters, honeycomb waveguides, and waveguides-below-cutoff.

3.9.1.1 Performance Test Plan

Submit a performance test plan for Contracting Officer approval. Testing shall be accomplished in three parts: (1) in-progress; (2) initial shielded enclosure effectiveness; and (3) final acceptance, shield enclosure effectiveness. Include in the test plan equipment listings (including calibration dates and antenna factors) and the proposed test report format. The plan shall also include specific test dates and durations during the overall construction period so that the Contracting Officer may be scheduled to observe the testing and so that repairs may be
made to the shield and retests conducted. This separate testing schedule for the EM enclosure shall show the points, during construction, when it begins and ends as well as a day-by-day test schedule. The test plan shall indicate proposed dates and duration of lowest and highest frequency tests so that the Contracting Officer may be available for these final acceptance tests. A test grid shall be identified and the plan for correlation of that grid to the structure shall be provided.

3.9.1.2 Test Reports

******************************************************************************
NOTE: Specifications and/or quality assurance test results of this paragraph may be classified for some projects. Provide appropriate instructions when this occurs.
******************************************************************************

Test reports shall include the method of testing, equipment used, personnel, location of tests, and test results. Daily reports of results of each test performed on each portion of the shielding system shall be submitted to the Contracting Officer within 3 working days of the test. Location of the area tested shall be clearly identified. Leaks detected during testing shall be identified with sufficient accuracy to permit relocation for testing in accordance with test procedures. Reports of testing shall be submitted to the Contracting Officer with required certification by the testing agency representative or consultant. Three reports (in-progress test report, initial test report, and final acceptance test report) shall be submitted in accordance with the format described below.

Cover Page:
A cover page is required.

Administrative Data:
Test personnel.
Contract number.
Date of test.

Authentication. Contractor personnel responsible for performance of the tests and witnessing organization or representatives.

Contents:
Shielded facility description.
Nomenclature of measurement equipment.

Serial numbers of measurement equipment. Date of last calibration of measurement equipment. Type of test performed. Measured level of reference measurements and ambient level at each frequency and test point. Measured level of attenuation in decibels at each frequency and test point. Dynamic range at each test frequency and test point. Test frequencies. Location on the shielded enclosure of each test point. Actual attenuation level at each test point.

Conclusions: This section shall include results of the tests in brief narrative form.

Number of Copies of the Report:
[Three] [_____] copies.
3.9.2 Field Testing

**************************************************************************

NOTE: If a facility is required to fully comply with MIL-STD-188-125 by the Joint Chiefs of Staff, a military department headquarters, or a major command, coordinate with the using organization to establish test requirements. Quality assurance and the testing required by appendix A of that standard should be performed. However, the using organization may insist on full testing in accordance with appendix B as well. In that case, advise the user that, based on limited testing to date, no existing EM filter/ESA devices have survived the E-2 and E-3 waveforms. Include appropriate cost and scheduling considerations if appendix B testing is required. If MIL-STD-188-125 is not a requirement, avoid its reference.

**************************************************************************

Submit reports of certified test results and results of all field and factory tests as specified and as required by the Contracting Officer. Testing shall be accomplished in the three parts described below.

3.9.2.1 Testing - Part 1

Perform Part 1 as in-progress testing including inspection, visual seam inspection, and seam testing of all EM shielding materials and installation. [In-progress testing of welded shielding shall include testing the structural welds to be embedded prior to concrete placement by dye penetrant and magnetic particle testing and 100 percent testing of wall, ceiling, and floor shielding welds by the SELDS tests.] [In-progress testing of bolted construction shall include 100 percent testing of floor, wall, and ceiling shielding seams by the SELDS testing.] After successful completion of in-progress testing, including defect repairs and retest, and with prior approval of the Contracting Officer, placement of embedments covering may be made to complete the structural systems. Submit an in-progress test report.

3.9.2.2 Testing - Part 2

Part 2 initial testing shall consist of inspection, visual seam inspection, seam testing, and shielded enclosure effectiveness testing after shielding and shielding penetrations are completed, but before the installation of finish materials over the shielding. Access to penetrations is required. All [seams] [welds], including shielding and penetrations not tested in part 1, shall be SELDS tested. The initial shielded enclosure effectiveness acceptance test shall consist of a MIL-STD-188-125-1 test utilizing specified test frequencies for magnetic and plane wave. Testing shall be conducted in accordance with the paragraph EM Shielding Effectiveness Testing. These tests shall be performed with the number of shield penetrations limited to those required to support the test. After successful completion of Part 2 initial testing, including defect repairs and retest, and with prior approval of the Contracting Officer, placement of any covering may be made except in areas where penetrations are located. Submit an initial test report.
3.9.2.3 Testing - Part 3

Perform Part 3 final acceptance testing consisting of a visual inspection and a shielded enclosure effectiveness test of the EM shielding materials and installation. All seams, including shielding and penetrations not tested in parts 1 and 2, shall be SELDS tested. Part 3 testing shall be performed upon completion of construction and when the building is ready for occupancy. Facilities requiring HEMP protection shall be tested for shielding effectiveness in accordance with acceptance test procedures in MIL-STD-188-125-1. Notify the Contracting Officer in writing 14 days prior to tests to permit adequate monitoring by authorized representatives. Corrective work shall be accomplished immediately upon detection that any area has failed to meet the requirements specified. Retesting shall be performed to verify that remedial work done to meet the required attenuation has been properly installed. Submit a final acceptance test report.

3.9.3 Weld Inspection

**************************************************************************

NOTE: Additional welding tests may be specified, such as ultrasonic or radiographic tests, but these tests are costly.

**************************************************************************

The weld seams shall be visually inspected by a qualified welder during the welding operation and after welding is completed. Completed welds shall be inspected after the welds have been thoroughly cleaned by hand or power wire-brush. Welds shall be inspected with magnifiers under bright light for surface cracking, porosity, slag inclusion, excessive roughness, unfilled craters, gas pockets, undercuts, overlaps, size, and insufficient throat and concavity. Defective welds shall be ground out and replaced with sound welds.

3.9.4 Shielded Enclosure Leak Detection System (SELDS) Testing

**************************************************************************

NOTE: SELDS testing the welds in the floor shielding is usually performed on the interior only because it is not possible to "sniff" on both sides (assuming the shield is on the ground level). Dye penetrant may also be used to test the welds where SELDS testing is not possible. The SELDS can be obtained commercially from the following: 1. Carnel Labs Corporation 21434 Osborne Street Canoga Park, CA 91304 Telephone: (818) 882-3977 2. Rayproof Shielding Systems Corporation 50 Keeler Avenue Norwalk, CT 06854 Telephone: (203) 838-4555 3. Retlif Corporation 795 Marconi Avenue Ronkonkoma, NY 11779 Telephone: (516) 737-1500

**************************************************************************

The leak detection system shall use a 95- to 105-kHz oscillator and a battery operated hand-held receiver. The receiver or "sniffer" shall have a ferrite loop probe capable of sensing leaks within 6 mm 1/4 inch of the probe location with a dynamic range of 140 dB. Testing shall be conducted in accordance with test equipment manufacturer’s instructions. Test loops or leads shall be placed under the shield floor or into inaccessible locations prior to installation to assist in the detection of seam leaks in
the floor, ceiling and walls. The loop or lead wires shall be placed between the vapor barrier and the structural slab for the floor shield with the leads brought to an accessible location. The test leads shall be insulated stranded copper conductors 2 to 2.5 mm 5/64 to 3/32 inch diameter and bonded to the shield only at the end. Test leads shall be placed in plastic conduit for protection and shall not exceed 45 m 150 ft in length. The surface area of the shield will determine the number of test leads (drive points) that are required. Drive points shall be installed on the shielding exterior and attached to two sets of diagonally opposing corners during construction. The distance between test lead connections on a shield surface shall not be more than 20 m 66 ft. The maximum testing area shall be 400 sm 4300 sf. If the shield area exceeds this requirement, additional drive points shall be provided. Bonding of the test leads to the shield is accomplished by brazing or high-temperature soldering. Test leads from the drive points shall be run to a lockable test cabinet for connection to the SELDS oscillator. If more than one test cabinet is required for a given area or building, test leads that would be common to different surface areas shall be duplicated at each test cabinet to ensure that test point parings are maintained. Record the location of the permanent test leads and shall provide this information to the Contracting Officer for permanent reference. Welds and seams shall be 100 percent tested. Seams shall be continuously probed with the test receiver set to detect abrupt changes of shielding level greater than 10 dB on the shielding unit scale. Points having a change greater than 10 dB shall be clearly marked and shall have the weld repaired to meet the specified requirement. Each repaired point shall be retested until there are no points on seams which fail the test.

3.9.5 EM Shielding Effectiveness Testing

Services of an EM shielding testing specialist, approved by the Contracting Officer, shall be furnished to test the shielded enclosure. The laboratory shall be equipped and staffed to perform field tests of EM shielded enclosures and shall perform these tests as a normal service. Test equipment used shall have been calibrated within the last 12 months.

3.9.5.1 Test Procedure

Test procedure and equipment shall be similar to that specified in MIL-STD-188-125-1. Test frequencies are specified herein. Test points shall be as indicated in Table I. Corner points of the grid shall occur at the intersection of three planes (two-wall surfaces and ceiling or two wall surfaces and floor). Measurement data at all test points shall be recorded, and a grid map for each surface tested shall be provided. For any test point where required attenuation is not provided, correct the discrepancy and retest. Both the results of the test failure and the successful results shall be provided. Enclosure effectiveness test for magnetic attenuation shall be performed with the antennas located directly opposite each other and separated by a distance of 600 mm 2 ft plus the wall thickness. Plane wave attenuation tests shall be performed with the antennas located directly opposite each other and with the transmitting antenna placed 300 mm 1 ft away from the enclosure wall and with the receiving antenna set 300 mm 1 ft from the wall for stationary measurements and 50 to 600 mm 2 inch to 2 ft from the wall for swept measurements. The magnetic field test and the plane wave test shall be performed using the following sequence. The calibrations shall be performed at the beginning of each test day. Then the test area shall be set up for the 100 to 400 MHz stationary measurement in on to the two required polarizations. With the transmitter off check the receiver sensitivity. Energize the
transmitter, and record the fixed measurement data. Remove the receiving antenna from the test stand and perform the swept measurement at the same frequency and transmitting antenna polarization. Rotate the transmitting antenna, and perform the second 100 to 400 MHz stationary measurement. Perform the swept measurement for the second transmitting antenna polarization. Reconfigure the equipment for the 900 to 1000 MHz test frequency, and repeat the series of four measurements. To perform the swept measurement, remove the receiving antenna from the test stand and hold with a dielectric rod at least 300 mm 12 inch in length. A dielectric spacer shall be attached to the sweeping antenna to assist in maintaining the 50 mm 2 inch distance from the shield. A rapid sweep to locate hot spots shall be made by rotating the polarization and waving the antenna through the specified volume. The final activity of each test day shall be to repeat the calibrations and verify the consistency with the previous calibration results. Test procedures shall include a definition of all test points including but not limited to walls, door frames, accessible joints, and around filters and penetrations. Each EM door shall be tested at the locations indicated in Table I.

</tr>
</tbody>
</table>

**NOTE 1.** Each point shall be swept in space 600 mm 2 feet around the point.

3.9.5.2 Test Points

Additional test points shall be measured in accordance with MIL-STD-188-125-1 for facilities requiring HEMP protection. Test points include the periphery of doors and covers, handles, latches, power filter penetrations, air vent filters, communications line filter penetrations, and points of penetration by pipes, tubes, and bolts.

3.9.5.3 Test Methodology

Antennas shall be oriented for maximum signal pickup. Each test point shall be probed for area of maximum leakage, such as around door frames, accessible joints, filters, pipes, and air ducts. Magnitude and location of maximum signal levels emanating from the enclosure shall be determined for each accessible wall at a minimum of two locations on each wall, around doors, and at penetrations and seams of the enclosure. Measurement of attenuation shall be accomplished in accordance with Table I.

3.9.5.4 Test Frequencies

**************************************************************************
**NOTE: Test frequencies will be in accordance with MIL-STD-188-125 when applicable.**************************************************************************

Testing frequencies for shielded enclosures shall be as follows:

<table>
<thead>
<tr>
<th>Magnetic field</th>
<th>[14 kHz,] [400 kHz,] and [10.1 MHz] [_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electric field</td>
<td>[200 kHz] and [16 MHz] [_____]</td>
</tr>
<tr>
<td>Plane wave</td>
<td>[100 MHz,] [415 MHz], and [1.29] [18] [_____] [GHz]</td>
</tr>
</tbody>
</table>

MIL-STD-188-125-1 frequencies are as follows:

<table>
<thead>
<tr>
<th>Magnetic</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plane wave</td>
<td>[_____]</td>
</tr>
</tbody>
</table>
3.9.6 Weld Testing

Structural welds to be embedded shall be tested in accordance with AWS D1.1/D1.1M using magnetic particle inspection or dye penetrant inspection and 100 percent of the shielding seams by the SELDS testing prior to embedment.

3.10 GROUNDING

**************************************************************************
NOTE: Grounding method will be in accordance with MIL-STD-188-124. An equipotential ground plane is recommended for shielded facilities.
**************************************************************************

The contract drawings indicate the extent and general arrangement of the shielded enclosure grounding system. The grounding methods shall be an equipotential grounding plane method in accordance with UL 1283, NFPA 70, NFPA 77, NFPA 780, IEEE 142, MIL-STD-188-124, and MIL-HDBK-419. For additional facility grounding requirements, see Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

(2017) UL Standard for Safety Electromagnetic Interference Filters

1.2 **SUBMITTALS**

**NOTE:** Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal
items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-01 Preconstruction Submittals**

RF Shielding Vendor Qualifications[; G, [____]]

RF Shielding Supervisor Qualifications[; G, [____]]

Medical Physicist/MR Scientist Qualifications[; G, [____]]

Field Quality Control Plan[; G, [____]]

RF Attenuation Performance Requirements[; G, [____]]

**SD-02 Shop Drawings**

RF Shielding Shop Drawings[; G, [____]]

**SD-03 Product Data**

Materials, Equipment, and Manufactured Units[; G, [____]]
1.3 QUALITY CONTROL

Supervise and inspect all work under this section, approve all materials and equipment, coordinate shielding work with all other work and trades.

Ensure that RF shielding system fully complies with the MRI equipment manufacturer's requirements, is fully compatible with ACR accreditation, and complies with all applicable codes.

1.3.1 Qualifications

Ensure minimum qualifications as indicated.

1.3.1.1 RF Shielding Vendor Qualifications

A firm that has continuously executed the design installation, supervision, and testing of equivalent RF shielding systems for the previous 5 years for all the RF shielding work.

Submit a project experience list of projects of similar scope completed during the previous 5 years for approval. Include project completion dates, name and contact information of the user and/or owner. Include installation materials, construction system, responsibilities, and performance.

1.3.1.2 RF Shielding Supervisor Qualifications

RF Shielding Vendor to provide a supervisor continuously engaged in the design, installation, supervision, and testing of equivalent RF shielded systems for the previous 5 years to supervise all RF shielding installation work.

Submit the name, qualifications and a list of projects of similar scope completed during the previous 5 years for approval. Include project completion dates, name and contact information of the user and/or owner. Include field investigations and measurements, installation materials, construction system, testing method, responsibilities, and performance.

1.3.1.3 Medical Physicist/MR Scientist Qualifications

RF Shielding Vendor to engage a Medical Physicist/MR Scientist, meeting the minimum ACR requirements, who has been continuously engaged in the design,
installation, supervision, and testing of equivalent RF shielded systems for the previous 5 years.

Submit the name, qualifications and a list of projects of similar scope completed during the previous 5 years for approval. Include, project completion dates, name and contact information of the user and/or owner. Include field investigations and measurements, installation materials, construction system, testing method, responsibilities, and performance.

1.3.2 RF Shielding Shop Drawings

Submit shop drawings for the RF shielding system including: the construction method, materials, arrangement and attachment of the RF walls, ceiling and floor, method of RF sealing joints, the connection and method of RF sealing RF shielding system components and any other attachment to the RF shield. Include attachment details for interior elements, including suspended ceiling, wall finish and floor finish systems.

Locate and label all RF shielding system components and equipment locations.

1.3.3 Material and Component Certification

Where certification is required, provide materials and equipment with Underwriters Laboratories or other nationally recognized testing laboratory label and listing. Comply with NFPA 70, UL 486A-486B, and UL 1283 for filter and electrical work.

1.3.4 Field Quality Control Plan

Submit a field quality control plan to demonstrate compliance with contract requirements. Include: schedule, personnel, methodology, inspection and testing stages and procedures, test equipment and the proposed test report format.

1.3.5 Pre-Construction Conference

Hold a pre-construction conference with all contractors and installers associated with the RF shielding construction and fit out. Review requirements and coordination to ensure the integrity of the RF shielding. Include: Sequence and schedule, coordination of trades, penetrations, attachment of other construction and equipment, and modification and notification procedures.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver equipment, components, and materials in original packaging, labeled with the manufacturer/vendor, brand name and part number.

Inspect equipment, components, and materials upon receipt. Remove and replace damaged items. Minor damage may be repaired at the discretion of the Contracting Officer and the repair matches the new condition.

Comply with manufacturers/vendors instructions and recommendations for storage and handling of all equipment, components, and materials.

Protect materials and components from deleterious environments including weather, direct sunlight, moisture, contamination, corrosion, and construction traffic.
1.5 [PROJECT][SITE] CONDITIONS

Construct the RF shield in a weather enclosed building or environmentally controlled building, according to the RF shielding vendor's or MRI manufacturers' requirements, whichever is more stringent.

1.6 MAINTENANCE

1.6.1 Maintenance Materials

1.6.1.1 Filters

Provide one RF power filter and one communications filter of each type used on the project as a spare.

1.6.1.2 RF Shielded Doors

Provide one set of manufacturer recommended spare parts for each type of RF shielded door and 2 sets of knife edge RF door seals.

Provide one full set of tools required to maintain the doors if not typically available from tool vendors.

1.6.2 Operating And Maintenance Manual

Submit an Operation and Maintenance Manual for the RF Shielding system. Address all components and aspects of the RF shielding and including:

a. The system RF attenuation performance requirements.

b. The RF shielding shop drawings.

c. The construction specification for the RF shielding.

d. RF shielding penetration schedule.

e. RF power filter schedule.

f. RF signal filter schedule.

g. RF test plan.

h. Vendor/manufacturer maintenance data.

i. Spare parts data.

1.7 RF SHIELDING ENCLOSURE WARRANTY

Submit an RF shielding system warranty for the RF attenuation performance of the complete RF shielding system, to meet the MRI equipment manufacturer's requirements and be fully compatible with ACR accreditation of [5] [_____] years from date of completion of the final RF test for defective design, materials and/or workmanship.
PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 RF Shielding System Components

The RF shielding system includes, but is not limited to:

a. RF complete metallic enclosure including walls, floor and ceiling.
b. RF shielded doors.
c. RF shielded windows.
d. Over-pressure relief hatch.
e. Magnet delivery access panel.
f. All electrical, mechanical, utility, signal, and cryogen ventilation penetrations, penetration plates and wave guides.
g. Dielectric fittings.
h. Power filters.
i. Signal filters.
j. Access panels.

2.1.2 RF Attenuation Performance Requirements

Submit RF attenuation performance requirements based on Medical Physicist/MR Scientist electromagnetic interference (EMI) field measurements, and evaluation of site conditions, in consultation with the MRI equipment manufacturer. Ensure that RF shielding system fully complies with the MRI equipment manufacturer's requirements and is fully compatible with ACR accreditation.

2.2 MATERIALS

2.2.1 Materials, Equipment, And Manufactured Units

Provide equipment and manufactured units that have been continuously in production and documented for at least 2 years, with a service organization that provides maintenance, parts and support.

Submit product data for all materials, equipment, and manufactured units forming or integrated with the RF shielding including the RF shielding walls, floor and ceiling materials/construction, doors, windows, overpressure relief hatch, power filters, signal filters, and wave guides.

2.2.2 Nameplates

Provide the manufacturers' nameplate including: name, model type, model number, and serial number, on all items of equipment and manufactured units.
2.3 RF SHIELDING ENCLOSURE CONSTRUCTION

2.3.1 Copper Enclosure Construction

Form a continuous RF shielding enclosure including floor, walls, and ceiling, incorporating all RF shielding system components, and conforming to the Medical Physicist/MR Scientist RF attenuation performance requirements. Acceptable enclosure types:

a. Solid copper sheet conforming to ASTM B370 on non-ferrous sub-frame.

b. Annealed copper foil on non-ferrous panel or composite substrate.

c. Other enclosure types pre-approved in writing.

Use soldered connections only on horizontal joints of solid copper sheet. Overlap copper a minimum of 51 mm 2 inches at all joints, and continuously solder.

Use continuously fastened mechanical connections on all vertical or overhead joints. Seal over all mechanical connection fastener penetrations with not less than 51 mm 2 inches wide conductive copper foil tape with conductive adhesive.

Use stainless steel screws to attach RF doors, windows, overpressure relief hatch, and other opening frame assemblies or attachments.

Provide a minimum 51 mm 2 inches deep isolation space between the back of the RF shielding walls and any adjacent building walls or structure.

Provide vapor barrier isolation membrane below RF shielding floor where required/recommended.

Provide isolated support for RF shielding walls and ceiling as required by the Medical Physicist/MR Scientist.

Use copper material free of oil, dents, and defects.

Comply with all applicable codes.

Include seismic bracing as required by code.

2.3.2 Dielectric Decoupling

Provide dielectric decoupling of conductive services including piping and ductwork. Do not penetrate RF shielding with continuously conductive elements.

2.3.3 Grounding

Electrically ground the shielding enclosure at a single point, with a minimum resistance to alternate ground of 1,000 ohms. Coordinate with Medical Physicist/MR Scientist.

2.4 RF SHIELDED DOORS

Provide door[s], frame[s], hardware and threshold[s] as indicated with purpose manufactured MRI door system with a demonstrated life cycle test rating of at least [10,000] operational cycles without loss of specified RF
attenuation, from a single manufacturer with a minimum of 5 years track
record[ and 2 years for the products supplied]. Supply assemblies complete
with a rigid structural frame, hardware, seals and parts necessary for
operation.

Provide door[s] meeting MRI manufacturer's acoustic
requirements/recommendations.

2.5 RF SHIELDED WINDOWS

Provide window[s] as indicated with purpose manufactured high visibility
MRI window system from a single manufacturer with a minimum of 5 years
track record[ and 2 years for the products supplied]. Supply assemblies
complete with frame, glazing, and seals.

2.6 OVERPRESSURE RELIEF HATCH

Provide a clearly visible, easily accessible and instantly operable
overpressure relief hatch for an overpressure emergency. Operate from
inside by pushing the hatch. Operate from outside by pulling the hatch,
with an appropriate device operated by a person located a minimum of four
feet from the hatch. Mitigate the effects of the outflow of super-cooled
gas when locating the hatch to avoid injury or hazardous conditions in
adjacent areas.

Provide permanent signage inside and outside the MRI room stating:
"OVERPRESSURE RELIEF HATCH OPEN IN CASE OF EMERGENCY"

2.7 MAGNET DELIVERY ACCESS PANEL

Provide a magnet delivery access panel for removal and replacement of the
MRI magnet without dismantling the RF shielding enclosure. Coordinate the
location and dimensions with the magnet delivery path, the MRI equipment
manufacturer and clearances for rigging.

2.8 POWER AND COPPER SIGNAL RF FILTERS

Provide a filter for each power, and cable signal line penetrating the
enclosure, including power, lighting, HVAC control, alarms, and
communications to achieve RF attenuation specified. Factory test filters.
Comply with NFPA 70, UL 486A-486B, and UL 1283.

2.9 WAVEGUIDE ASSEMBLIES

Provide waveguide-below-cutoff (WBC) protection for all piping,
ventilation, fiber signal and cable penetrations of the RF shielding to
achieve RF attenuation performance requirements. Use no less than 1.5
times the highest frequency of the RF attenuation performance requirements
for the cutoff frequency.

Provide exterior dielectric collars to maintain a minimum of [1,000] ohms
DC resistance to ground earth.

Provide exhaust cryogenic gas waveguide assemblies of sufficient structural
strength for magnet quench.
PART 3  EXECUTION

3.1 EXAMINATION

Verify site dimensions, conditions, and electromagnetic interference (EMI) measurements before commencing work.

3.2 INSTALLATION

3.2.1 Coordination

Ensure that all relevant construction, testing, and supply organizations, and personnel are aware of RF attenuation critical installation requirements.

Co-ordinate internal services and finishes to MRI equipment manufacturer's requirements, all applicable codes and to be fully compatible with ACR accreditation.

Ensure that the interior suspended ceiling and walls within the RF shielding enclosure are constructed entirely with non-ferrous materials.

Ensure that fluorescent fixtures, magnetic ballasts, magnetic dimmers or similar equipment are not located within the RF shielding enclosure.

Ensure that building elements or equipment that require access, maintenance or servicing are not located in inaccessible spaces including between the RF shielding enclosure and adjacent walls, floors or ceilings.

Ensure that building services that cross the MRI room pass[ in the interstitial space] above the RF shielding enclosure and do not pass through the enclosure.

3.2.2 Process

Verify the installation process for compliance with the contract documentation, shop drawings, equipment and material submissions and specifications, and coordinate the work of all trades.

3.3 FIELD QUALITY CONTROL

3.3.1 Inspection

Inspect installation for compliance with the contract documentation, shop drawings, equipment and material submissions and specifications. Inspect prior, during and following the application of coverings and finishes.

3.3.2 Ground Isolation Monitoring

Continuously monitor alternate ground earth isolation for a minimum of [1,000] ohms DC resistance prior to connection to ground earth.

3.3.3 RF Attenuation Field Testing

Perform systematic field control inspection and testing. Include the method of inspection and testing, equipment used, personnel, location of tests, test results and corrective action taken or to be taken within RF test reports.
3.3.3.1 In Progress RF Testing

Perform in-progress RF enclosure inspection and testing by the RF shielding vendor as construction proceeds to monitor shielding effectiveness and rectify shielding defects as shielding construction progresses. Include visual inspection and where possible, RF shielded enclosure leak detection system (SELDS) testing of all component parts including seams, penetrations and installations as work progresses. [Submit in progress RF test reports within 3 days of inspection/testing.] Conduct testing to IEEE 299, to validate the minimum RF attenuation performance requirements.

3.3.3.2 Preliminary RF Testing

Perform preliminary RF enclosure inspection and testing, by the RF shielding vendor, the Medical Physicist/MR Scientist, and the MRI equipment manufacturer, prior to the application of coverings and finishes to demonstrate completed RF shielding RF attenuation prior to installation of any closure over the RF shield. Include visual inspection and RF SELDS testing of all component parts including seams, corners, penetrations and installations. Conduct testing to IEEE 299 to validate the minimum RF attenuation performance requirements. Submit preliminary RF test report for approval prior to installation of any closure or finish.

3.3.3.3 Final RF Testing

Perform final RF enclosure inspection and testing, by the RF shielding vendor, the Medical Physicist/MR Scientist, and the MRI equipment manufacturer, following the application of all coverings and finishes, when the facility is complete and is ready for occupancy to demonstrate completed construction RF attenuation. Include visual inspection and RF SELDS testing of all component parts including seams, corners, penetrations and installations. Conduct testing to IEEE 299 to validate the minimum RF attenuation performance requirements. [Notify the Contracting Officer in writing 14 days prior to tests and assist monitoring by client representatives.] Submit the final RF test report.

3.4 GROUNDING

Use an equipotential grounding plane method in accordance with IEEE 142, NFPA 70, and UL 1283.

NOTE: This guide specification covers the requirements for electric traction freight elevators.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: All Army and Navy facility designs which include elevators shall comply with the "NAVFAC ITG 2013-01 Elevator Design". This guide is available from the NAVFAC facilitator at http://www.wbdg.org/ftc/navy-navfac/interim-technical-guidance-itg under Interim Technical Guidance.

NOTE: For NAVY projects, any editing of non-bracketed requirements in this specification must be approved through the NAVFAC FEC VTE Program Lead Certifying Official.
PART 1 GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard’s Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF CIVIL ENGINEERS (ASCE)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

AMERICAN WELDING SOCIETY (AWS)

AWS D1.1/D1.1M (2020; Errata 1 2021) Structural Welding Code - Steel

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office.
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

Elevator System; G[, [____]]
Elevator Components; G[, [____]]
Elevator Machine; G[, [____]]
Elevator Controller; G[, [____]]
Wiring Diagrams; G[, [____]]

**SD-03 Product Data**

SD-10 Operation and Maintenance Data
Elevator, Data Package 4; G[, [_____]]
Maintenance Control Program (MCP); G[, [_____]]
Software and Documentation; G[, [_____]]

Submit in accordance with Sections 01 78 23 OPERATION AND MAINTENANCE DATA and 01 78 24.00 20 FACILITY ELECTRONIC OPERATION AND MAINTENANCE SUPPORT INFORMATION (eOMSI).

1.2.1 Shop Drawing Requirements

Provide assembly and arrangement of elevators, accessories, and elevator components. Show location of elevator machine in elevator machine room (MR) or machinery space (MS). Show location of elevator controller in elevator machine room or elevator control room (CR). Provide details for materials and equipment, including but not limited to operating and signal fixtures, doors, door and car frames, car enclosure, controllers, motors, guide rails and brackets, layout of hoistway in plan and elevation, and other layout information and clearance dimensions.

1.2.2 Product Data Requirements

Provide manufacturers' product data for all elevator components, including but not limited to the following: elevator controller, hoist machine and drive motor, design counterbalance, hoist ropes and shackles, overspeed governor, emergency braking system, car and hall fixture buttons and switches, cab, machine room, control room, and machinery space communication devices, door operator, door protection system, and car and counterweight roller guides and buffers. For data sheets, provide document identification number or bulletin number, published or copyrighted prior to the date of contract bid opening. Provide controller manufacturer's published procedures for performance of each and all testing required by ASME A17.1/CSA B44.

1.2.3 Design Data

1.2.3.1 Reaction Loads

Provide calculations by registered professional engineer for reaction loads imposed on building by elevator system. Calculations must comply with ASCE 7-16 and ASME A17.1/CSA B44.
1.2.3.2 Heat Loads

Provide calculations from elevator manufacturer, or by registered professional engineer, for total anticipated heat loads generated by all of the elevator equipment.

1.2.3.3 Emergency Power Systems

Where the facility does have an emergency power system, confirm the elevators that will be connected to the emergency power system. Confirm the complete emergency power system and sequence of operation for all elevators, including operation of the elevator lobby manual selection switch. Provide wiring diagrams for building emergency power interface with elevator controls. For elevators not supplied by an emergency power system, provide manufacturers' product data for auxiliary power systems.

1.2.4 Welders' Requirements

Comply with AWS D1.1/D1.1M, Section 5. Include certified copies of field welders' qualifications. List welders' names with corresponding code marks to identify each welder's welding work.

1.2.5 Maintenance Control Program (MCP)

For each elevator, prepare and provide a written Maintenance Control Program (MCP) that complies with ASME A17.1/CSA B44 Section 8.6, including written documentation that details the test procedures for each and every test that is required to be performed by ASME A17.1/CSA B44. Assemble all MCP documentation, and supporting technical attachments, in a single MCP package and provide in both electronic and hard copy. Assemble entire hard copy MCP in 3-ring binders. For each elevator provided, the MCP must include only documentation and instruction that apply to the elevator specified.

For each elevator, provide an additional, separate binder that includes all maintenance, repair, replacement, call back, and other records required by ASME A17.1/CSA B44. The records binder must be kept in the elevator mechanical room, maintained by elevator maintenance and service personnel, and be available at all times to authorized personnel.

Provide detailed information regarding emergency service procedures and elevator installation company personnel contact information. Provide a listing of all tools to be provided to the Contracting Officer as components of the elevator system.

1.3 QUALITY ASSURANCE

1.3.1 Qualification

Provide a designed and engineered elevator system by an elevator contractor regularly engaged in the installation of elevator systems. Provide elevator components manufactured by companies regularly engaged in the manufacture of elevator components. Utilize only licensed and certified elevator personnel for the installation, adjusting, testing, and servicing of the elevators.

1.3.1.1 Elevator Contractor's Elevator Technicians

For elevator installations in the United States, including United States
tread territories, perform all elevator related work under the direct guidance of a state certified elevator technician with a minimum of three years of experience in the installation of elevator systems of the type and complexity specified in the contract documents. Provide an endorsement letter from the elevator manufacturer, certifying that the elevator specialist is qualified. All elevator technicians must carry a current certification issued by one of the following organizations:

a. National Association of Elevator Contractors (NAEC)
b. National Elevator Industry Education Program (NEIEP)

1.3.2 Manufacturers' Technical Support

Provide elevator components from manufacturers that provide factory training and online and live telephone elevator technical support to any elevator installation, service, and maintenance contractor. Provide elevator components from manufacturers that guarantee accessibility to all replacement and repair parts and components to any elevator installation, service, and maintenance contractor. Use only elevator component manufacturers that provide current published price lists for all elevator parts and components.

1.3.3 Operation and Maintenance Data

Assemble all shop drawing and product data material into O&M Data Packages in accordance with Article SUBMITTALS. Provide two complete O&M Data Packages in hard copy and two complete electronic O&M data packages on separate CDs, in PDF format. Provide all O&M Data Packages to Contracting Officer. Include controller diagnostic documentation and software as required under Article CONTROL EQUIPMENT.

1.3.4 Wiring Diagrams

Provide complete wiring diagrams and sequence of operations, which show electrical connections and functions of elevator systems. Provide one set (279 mm by 432 mm 11 inch by 17 inch minimum size) of wiring diagrams, with individual sheets laminated in plastic and assembled in binder, to be stored in the machine room or control room cabinet. Provide one additional hard copy set and two complete electronic sets on separate CDs, in PDF format. Provide all wiring diagram sets to the Contracting Officer. Coded diagrams are not acceptable unless fully identified.

1.3.5 Machine Room/Control Room Cabinet

For storage of O&M Data Packages and Wiring Diagrams, provide locking metal cabinet with a minimum size of 508 mm W by 305 mm D by 762 mm H 20 inch W by 12 inch D by 30 inch H. Cabinet must be sized large enough to accommodate all O&M Data and hardware required in paragraphs OPERATION AND MAINTENANCE DATA and WIRING DIAGRAMS. Secure cabinet to machine room or control room wall.

1.4 NEW INSTALLATION SERVICE

**************************************************************************
NOTE: Use Bi-weekly option for Hospitals and other high use facilities.
**************************************************************************
Provide elevator warranty service in accordance with the manufacturer's maintenance plan, warranty requirements and applicable safety codes, for a period of 12 months after the date of acceptance by Contracting Officer. Perform this work during regular working hours. Provide supplies and parts to keep elevator system in operation. Perform service only by factory trained personnel. Provide [Monthly][Bi-weekly] services to include repairs, adjustments, greasing, oiling, and cleaning. Provide service log in elevator machine room or control room cabinet and update [Monthly][Bi-weekly], throughout the one-year warranty period.

**************************************************************************
NOTE: One hour emergency service below is standard; only use two hour for remote locations.
**************************************************************************

Provide 24-hour emergency service, with [one hour][two hour] on-site response time, during this period without additional cost to the Government.

1.4.1 Periodic Elevator Certification Inspection and Testing

Provide elevator mechanic to support [NAVFAC ]QEI Certified Elevator Inspector in the periodic six-month and the annual Category 1 elevator certification inspection and testing. Perform Category 1 inspection and testing no greater than 30 days prior to the end of the warranty period. Perform all elevator certification testing in the presence of QEI Certified Elevator Inspector.

In conjunction with the testing noted above, test systems for Emergency Power Operation, Earthquake Emergency Operation, and Hospital Emergency Commandeering Service Operation, as applicable. Schedule so that testing does not interfere with building operations.

1.5 FIRE PROTECTION SYSTEM

**************************************************************************
NOTE: Confirm that sections listed throughout this article are part of project. Add or delete sections as needed for project.
**************************************************************************

Coordinate interface between building fire protection system and elevator controls.

Additional fire protection requirements are located in: [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE;] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE;] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE;] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE;] [Section 28 31 02.00 20 FIRE ALARM REPORTING SYSTEMS - DIGITAL COMMUNICATORS;] [Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION;] [_____] and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

1.5.1 Fire Alarm Initiating Devices

Fire alarm initiating devices are specified in [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] [____], including conduit and
wiring from each detector to fire protection addressable modules in elevator machine room or control room.

1.5.2 Fire Sprinklers

Provide fire sprinklers in accordance with all applicable safety codes and with [Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION]. Provide shutoff valve, check valve, and non-adjustable, zero time-delay flow switch, in each sprinkler line immediately outside of each machine room, control room and hoistway, as applicable. Provide inspectors' test valve for periodic testing of flow switch and shunt trip disconnect.

Pipe sprinkler piping serving these spaces in a series manner with no laterals. Locate inspectors' test connection at the end of pipe runs such that operation of the test connection will purge air from system piping.

1.5.3 Shunt Trip Disconnect

Provide flow switches specified in paragraph FIRE SPRINKLERS to comply with ASME A17.1/CSA B44 and NFPA 72 for shunt trip of the main line power supply. For each elevator, provide control wiring connecting the flow switch to a shunt trip equipped circuit breaker located in the elevator machine room or control room. Upon flow of water, flow switch will instantaneously cause opening of the shunt-trip circuit breaker and remove power from the elevator. Flow switch must also send a signal to fire alarm control panel to indicate water flow condition.

PART 2 PRODUCTS

2.1 ELEVATOR DESCRIPTION

Provide elevator system that complies with ASME A17.1/CSA B44 in its entirety, ASME A17.2 in its entirety, and additional requirements specified herein. Provide elevator system that meets or exceeds the NEII-1 Ride Quality Performance Standards Matrix (RQPSM). For elevator speeds of 500 fpm and higher, comply with the RQPSM "High Performance" criteria. For elevator speeds 350 fpm, up to but not including 500 fpm, comply with the RQPSM "Intermediate Performance" criteria.

Provide and install elevators in accordance with 36 CFR 1191 - ABAAS, ICC IBC, IEEE C62.41, NFPA 70 and NFPA 101 requirements.

2.1.1 Elevator Design Parameters

**************************************************************************

NOTE: Traffic Analysis and Minimum Cab Size

Perform a traffic analysis and conduct interviews with the facility user to determine number, size, and type of elevators necessary to serve the needs of the facility user. For Army and Navy projects, utilize NAVFAC ITG 2013-01 Elevator Design to determine Design Type. For minimum elevator speed, specify 200 fpm for 2-4 story, 350 fpm for 5-9 story, and 500 fpm, gearless for 10-or-more story elevators.

Specify gearless traction elevators for all buildings more than 10 stories tall.

SECTION 14 21 13 Page 12
a. Type: [Geared] [Gearless]
b. Rated load: [_____] lb.
c. Rated Speed: [200][350][500] fpm
d. Car Inside Dimensions: [_____] cm ft. [_____] cm in. wide, [_____] cm ft. [_____] cm in. deep and [_____] cm ft. [_____] cm in. high
e. Hoistway Door Type & Size: [Manual] [Power operated] Vertical [Rising] [Bi-Parting] [_____] cm ft. [_____] cm in. wide and [_____] cm ft. [_____] cm in. high
f. Car Gate Type: [Manual] [Power operated] Vertical Rising

NOTE: Refer to ASME A17.1/CSA B44 for Classes of loading.

NOTE: If retaining first option in sentence below, ensure that finishes are indicated, most likely somewhere on the drawings. In either case, indicate finish colors of elevator materials in finish schedule on drawings.

NOTE: Specify stainless steel doors, side panels and wall trim in hospital cars.

Provide finishes [as indicated.][as listed below:

a. Floor; [mill finish steel diamond plate][painted steel diamond plate][aluminum diamond plate][tongue and groove hardwood][____].

b. Walls; [prefinished steel panels][stainless steel][____].
   Wall trim; [prefinished steel][stainless steel][____].
   Accessories; [handrail][____].

NOTE: Retain bracketed phrase for freight elevators that do not have Front and Rear openings.

Accessories; Provide in-car horizontal buck-board wall protection on full length of side walls [and back wall] of elevator cab.

c. Car doors, car door returns, and wall reveals; [prefinished steel
panels][stainless steel][____].

d. Ceilings; [prefinished steel panels][stainless steel][anodized aluminum][____].

e. Hoistway Entrance Assembly Material and Finishes; [prefinished steel][stainless steel][____].

2.2 ELEVATOR OPERATION

ASME A17.1/CSA B44, Introduction, Section 3, Definitions.

******************************************************************************
NOTE: Choose one of the following four types of elevator operation.
******************************************************************************

[2.2.1] Single, Two-Stop, Automatic Operation

******************************************************************************
NOTE: Choose for single elevator serving two landings.
******************************************************************************

Provide Single Two-Stop Automatic Operation.

[2.2.2] Selective Collective Automatic Operation

******************************************************************************
NOTE: Choose for single elevator serving three or more landings.
******************************************************************************

Provide Selective Collective Automatic Operation.

[2.2.3] Duplex Selective Collective Automatic Operation

******************************************************************************
NOTE: Choose for two adjacent elevators.
******************************************************************************

Provide Duplex Selective Collective Automatic Operation. If a car is taken out of service or fails to respond to a landing call within a predetermined adjustable time limit of approximately 40 to 180 seconds, transfer calls to the other car functioning as a single car Selective Collective elevator until the out-of-service car is returned to the system.

[2.2.4] Group Automatic Operation

******************************************************************************
NOTE: Choose for three or more elevators that serve the same elevator lobby.
******************************************************************************

Provide Group Automatic Operation. If a car is taken out of service, or fails to respond to a landing call within a predetermined adjustable time limit of approximately 40 to 180 seconds, transfer calls to another car until out-of-service car is returned to the system.
2.3 SPECIAL OPERATION AND CONTROL

Provide the following special operations and control systems.

2.3.1 Keys for Elevator Key Switches

Provide a minimum of twelve keys per unique cylinder used on all key switches for a single elevator. If there is more than one elevator, additional keys will not be required unless there are additional unique lock cylinders. Provide keys with brass or fiberglass tags marked "PROPERTY OF THE U.S. GOVERNMENT" on one side with function of key or approved code number on the other side.

2.3.2 Firefighters' Emergency Operation (FEO)

**************************************************************************
NOTE: Coordinate FEO Designated Landing with Fire Protection Designer.
**************************************************************************

Provide FEO equipment and signaling devices. The designated level for the FEO Phase I key operated switch is the [ground] floor. In the FEO Phase I fixture, provide FEO Operating Instructions.

2.3.2.1 Firefighters' Emergency Operation (FEO) Key Box

Provide flush mounted, locking, FEO Key Box of a minimum size of 127 mm W by 229 mm H by 38 mm D. Install at a height of 183 cm above floor level and directly above the FEO Phase I key switch. Provide box equipped with lock that uses the FEO K1 key.

2.3.3 Hoistway Access Operation

Provide hoistway access operation with switches at top and bottom terminal landings. Locate switch 183 cm above floor level, within 305 mm of elevator hoistway entrance frame or with the ferrule exposed when located in the elevator entrance frame.

2.3.4 In-Car Inspection Operation

Provide In-Car Inspection Operation.

2.3.5 Independent Service

Provide exposed key-operated switch in car operating panel to enable independent service and simultaneously disable in-car signals and landing-call responses. Provide indicator lights that automatically illuminate during independent service. For duplex or group operation, if one car is removed from group another car will respond to its hall calls.

2.3.6 Selective Door Operation

For elevator with one or more rear openings at same level as front opening, provide full-selective operation with car and door operating buttons clearly marked for front and rear openings, front and rear car button for each such floor, and front and rear "DOOR OPEN" and "DOOR CLOSE" buttons. Only door for which the button was operated opens or closes.
2.3.7 Elevator Emergency Power Operation

----------------------------------------------------------------------------------------------------------------------------------
NOTE: Electrical design shall identify the elevators to be connected to the building emergency power system. Identify and define the complete emergency power system for all elevators. When using the 2nd bracketed option in either of the next two paragraphs, edit as required for project-specific requirements.

For any elevator that is not included in the building emergency power operation, utilize paragraph ELEVATOR AUXILIARY POWER OPERATING SYSTEM.

----------------------------------------------------------------------------------------------------------------------------------
Provide elevator emergency power operation for [all elevators] [elevator 1,2,3...]. Coordinate power supply and control wiring to accomplish initiation and operation of elevators on emergency power.

2.3.8 Elevator Auxiliary Power Operating System

Provide elevator auxiliary power operating system for [all elevators] [elevator 1,2,3...].

2.4 ELEVATOR DRIVE MACHINE, HOIST MOTOR, AND DRIVE MOTOR

Provide elevator drive machine, hoist motor, and motor drive system that is designed to be installed in an elevator machine room (MR) or in an elevator machinery space. The elevator machine, motor, and drive configuration and installation design must be mechanically and electrically interchangeable with a minimum of two other elevator manufacturer's drive machines that are readily available in the elevator industry. Paint or finish ferrous surfaces with a minimum of one coat of manufacturer applied rust-inhibiting paint.

Design the elevator drive system so that the hoist motor amperage does not exceed the motor data tag full load amperage in any operating condition, exclusive of acceleration and deceleration. Provide elevator hoist motor that is designed with Class F insulation and rated for 120 starts/hr. Design the elevator drive system to limit Total Harmonic Distortion to a maximum of 5 percent. No single harmonic may exceed 3 percent.

Provide an elevator drive machine designed for and provided with stranded steel wire rope for elevator suspension and counterbalance. The minimum acceptable diameter of suspension and counterweight ropes is 9.52 mm 3/8 inches. Aramid fiber ropes, coated steel ropes, and non-circular coated steel belts may not be used for elevator suspension or counterbalance.

The elevator drive machine must be equipped with machine manufacturer's designed and installed standard means for the manual release of the driving-machine brake.

2.4.1 Manufacturer's Factory Training and Technical Support

Provide an elevator drive machine from a manufacturer that provides comprehensive factory training and technical support for installation, adjustment, service, and maintenance of the drive system. The training and support must be identified as available to any licensed elevator
contractor. Provide verification of an established and documented training schedule, with pricing, for factory training classes that have been provided for a minimum period of one year prior to contract award date.

The elevator drive system must be identified as available for purchase and installation by any licensed elevator contractor. All drive system related components, parts, diagnostic tools, and software must be available for purchase, installation, and use by any licensed elevator contractor; "exchange-only" provisions for the purchase of spare parts are not acceptable.

2.4.2 Ascending Car Overspeed and Unintended Car Movement Protection

Provide elevator Ascending Car Overspeed and Unintended Car Movement Protection means that is designed to act directly upon, and apply a retarding force to, the elevator suspension ropes. In addition to the requirements of ASME A17.1/CSA B44, the means must be designed to detect and stop movement of the elevator suspension ropes that occurs as a result of loss of traction between the suspension ropes and the elevator machine drive sheave.

2.5 CONTROL EQUIPMENT

Enclose all elevator control equipment in factory-primed and baked-enamel coated sheet-metal cabinets with ventilation louvers and removable or hinged doors. Mount cabinets at a height of 254 mm 10 inches above machine room or control room finish floor.

2.5.1 Motor Control Equipment

Provide variable voltage with silicon controlled rectifier (SCR) or Variable-Frequency Variable Voltage (VVVF) alternating current (ac) drive control.

2.5.1.1 Electrical Isolation Protection

Provide individual isolation transformers and individual choke reactors for each individual hoist motor. Provide filtering to maintain harmonic distortion below IEEE C62.41 standards as measured at the elevator machine room or control room disconnect.

2.5.2 Elevator Microprocessor Controller

For each individual elevator controller, and for each group controller, provide a microprocessor controller that complies with the following paragraphs. Provide controller(s) package that includes all hardware and software required for the installation, maintenance, and service of the elevator, in its' entirety. Provide verification of technical support service that the controller manufacturer provides to any licensed elevator installation, service, and maintenance company.

Provide an elevator controller from a manufacturer that provides comprehensive factory training to include controller installation, adjustment, service, and maintenance. The training must be identified as available to any licensed elevator contractor. Provide verification of an established and documented training schedule, with pricing, for factory training classes that manufacturer has provided for a minimum period of one year prior to contract award date.
The elevator controller must be identified as available for purchase and installation by any licensed elevator contractor. All components, parts, diagnostic tools, and software must be available for purchase and installation and use by any licensed elevator contractor; "exchange-only" provisions for the purchase of spare parts are not acceptable. The elevator controller manufacturer must publish an industry competitive price listing for all controller parts, diagnostic tools, and software.

Provide verification of telephone and internet based technical support service that the elevator controller manufacturer provides to any licensed elevator installation, service, and maintenance company at an industry competitive price. The service must include live telephone based technical support for installation, adjustment, maintenance, and troubleshooting of the elevator controller and related elevator components. The service must be available during standard working hours.

Provide an elevator controller that is designed to automatically reestablish normal elevator operation following any temporary loss of power, regardless of duration.

2.5.2.1 Elevator Controller Interface Cabinet

For each individual elevator microprocessor controller, provide a separate elevator control cabinet with an integrated human interface system. For group elevator installations, a single cabinet and interface system with full access to each elevator controller may be utilized. The separate controller interface cabinet must be supplied by the elevator controller manufacturer and include a minimum 305 mm 12 inch wide keyboard and a minimum 254 mm 10 inch monitor. The elevator controller interface cabinet must comply with arc-flash protection requirements of NFPA 70E and UFC 3-560-01.

2.5.2.1.1 Elevator Microprocessor Human Interface

The interface system must provide complete elevator controller interface capability and must include the elevator controller manufacturer's comprehensive package of installation and diagnostic software. The microprocessor interface system must provide unrestricted access to all parameters, all levels of adjustment, and all flags necessary for installation, adjustment, maintenance, and troubleshooting of each elevator and for the elevator group. All software programming must be stored in non-volatile memory. The elevator controller fault log must provide non-volatile memory fault log storage of all faults, trouble calls, and fault history for a minimum of one year and the ability to download or print the fault log. The controller interface must also provide the capability to display and diagnose trouble calls, faults, and shutdowns. Expiring software, degrading operation, and "key" access controls are not acceptable.

2.5.2.2 Software and Documentation

Provide three copies of the manufacturer's maintenance and service diagnostic software, with complete software documentation, that will enable the same level of unrestricted access to all controllers of the same make and model, regardless of the installation date or location. Provide signed certification, from the manufacturer's corporate headquarters, that guarantees that the microprocessor software and access system will not terminate the unlimited and unrestricted access at any future date.
2.5.2.3 Elevator Controller Certification

For elevator installations in the United States, including United States territories, provide an elevator microprocessor controller that has a current certificate of safety code compliance issued by the Technical Standards and Safety Authority (TSSA), Toronto, Canada.

2.6 OPERATING PANELS, SIGNAL FIXTURES, AND COMMUNICATIONS CABINETS

For all panels and fixtures, provide identical and uniform fixture design, material, finish, and components for all elevators. For all panels and fixtures, legibly and indelibly identify all buttons and all operating positions for each device. Use engraving and backfilling, or photo etching, for button and switch designations. Do not use attached signs.

Provide elevator manufacturers' standard grade for all key switches unless otherwise specified. All illuminating panels and fixture components must utilize LED lighting for energy efficiency.

2.6.1 Car and Hall Buttons

For all cab and landing fixture buttons, provide industry-standard, vandal resistant push buttons with positive-stop assembly design. Buttons must be minimum 19 mm 3/4 inch diameter, satin-finish stainless steel, with illuminating LED halo.

2.6.1.1 Hall Station Door-Operating Buttons

*******************************************************************************
NOTE: Use the following for freight elevators with power-operated bi-parting doors.
*******************************************************************************

Provide hall station door-operating buttons, identical in size and design to hall call buttons, but not illuminating.

2.6.2 Freight Car-Operating Panel

*******************************************************************************
NOTE: Use two Car Operating Panels for front and rear opening elevators.
*******************************************************************************

Provide each car with [one] [two] car operating panel[s] that contain[s] operation controls and communication devices. Provide exposed, flush mounted buttons for the controls identified in subparagraph OPERATOR CONTROLS. Provide a lockable service cabinet for the controls listed in subparagraph SERVICE CONTROLS. Use engraving and backfilling or photo etching for button and switch designations. Do not use attached signs.

2.6.2.1 Operator Controls

In addition to ASME A17.1/CSA B44 requirements, provide the following operating controls, identified as indicated:

a. LED illuminating car-call buttons identified to correspond to landings served by the elevator.

b. "DOOR OPEN" and "DOOR CLOSE" buttons. For front and rear openings at the same floor, include the identification "F" and "R" for each opening.
c. Red, illuminating "ALARM" button.

d. Key-operated "Independent Service" switch.

e. "Help" communication device to include communication between elevator cab and elevator machine room or control room.

2.6.2.2 Service Controls

In addition to ASME A17.1/CSA B44 requirements, provide the following operating controls, identified as indicated:

a. Provide a key-operated, three-position switch for "In car Inspection Operation" and "Hoistway Access". The center switch position will provide normal, automatic operation.

b. "Car Light" switch.

c. "Car Fan" switch with two speed settings identified.

d. 120-volt ac 60 Hz single-phase duplex electrical outlet of ground-fault-circuit-interrupt (GFCI) design.

2.6.2.3 Certificate Window

Provide a minimum 102 mm wide by 152 mm high certificate window for elevator inspection certificate. Locate window in the Service Controls door of the Car Operating Panel.

2.6.2.4 Emergency Signaling Devices

Provide an audible signaling device, operable from the Car Operating Panel button marked "ALARM". The audible signaling device must have a sound pressure rating between 80 and 90 dBA at 3 meters 10 ft. Provide battery backup power capable of operating the audible signaling device for at least one hour.

2.6.3 Elevator In-Car Position Indicators

For all elevators, provide illuminating LED position indicator in the Car Operating Panel.

2.6.4 Elevator In-Car Direction Indicators

For 2-stop elevator installations, provide visual direction indicators and audible car arrival signal in the elevator car door jamb, in accordance with ABA Standards. Visual indicators must be visible from the hall call fixture.

2.6.5 Hall Call Landing Fixtures

Provide a hall call fixture adjacent to each elevator. Provide a single push-button for terminal landings and dual push-buttons, up and down, at intermediate landings.
2.6.5.1 Designated Landing Hall Call Fixture

2.6.5.1.1 Location of COMMUNICATION MEANS FAILURE (CMF) Visual Signal

When required by ASME A17.1/CSA B44, provide an elevator CMF audible and illuminating signal, and reset switch, in the FEO Designated Landing hall call fixture. Mount the signal and reset switch at a minimum of 178 mm 7 inches above the "UP" hall call button.

2.6.5.1.2 COMMUNICATION MEANS FAILURE (CMF) Visual and Audible Signal Operation

Provide a CMF visual and audible signal system that conforms to ASME A17.1/CSA B44. Provide continuous verification of operability of the telephone line and immediate activation of audible and visual signals when verification means determines that the telephone line is not functioning. Provide illumination of visual signal at one second intervals. Provide a minimum of 65 dBA audible signal at 30 second intervals.

2.6.5.1.3 Firefighters' Emergency Operation Phase I Switch and Visual Signal

When required by ASME A17.1/CSA B44, provide an elevator Firefighters' Emergency Operation Phase I switch and illuminating visual signal in the FEO Designated Landing hall call fixture. Provide FEO Phase I visual signal that is designed with intermittent, flashing, illumination when actuated by the machine room, control room, or hoistway fire alarm initiating device. Locate FEO Phase I key switch above the CMF visual signal with a minimum of 152 mm 6 inches vertical between the centerlines of the CMF signal and the FEO Phase I key switch. Locate FEO Phase I visual signal directly above the Phase I switch. In addition, locate Elevator Corridor Call Station Pictograph at top of hall call fixture.

2.6.6 Elevator Car Position and Direction Indicators and Car Arrival Signal

For elevator installations with three or more stops, provide a separate hall landing fixture that includes the visual elevator position indicator, visual direction indicators, and audible car arrival signal, in accordance with ABA Standards.

2.6.7 Designated Landing Elevator Identification Fixture

For duplex and group elevator installations, provide a separate elevator identification fixture for each elevator, with identification engraved and backfilled with a contrasting color. Number elevators from left to right, as seen during primary approach from building main entrance to elevator lobby. For multiple elevator groups, begin numbering with group that is closest to the building main entrance.

2.6.8 Emergency or Standby Power

When emergency or standby power is provided for elevator operation, provide an elevator emergency power visual indicator that conforms to ASME A17.1/CSA B44. Locate the visual signal in the Firefighters Emergency Operation fixture for each simplex elevator and for each elevator group. When an emergency power selector switch is required, provide switch in a separate, flush mounted fixture located at the designated level, in view of all elevator entrances.
2.7 CAR DOOR EQUIPMENT

2.7.1 Car Door Operator

Provide elevator door operator equipment and circuitry that is designed and installed as discreet communication. Serial communication must not be used for this system.

2.7.2 Infra-red Curtain Unit

Provide Infra-red Curtain Unit (ICU) with multiple infra-red beams that protect to the full height and width of the door opening. Provide door nudging operation.

2.8 FREIGHT ELEVATOR GUIDES, PLATFORM, AND ENCLOSURE

2.8.1 Guides

Provide coil-spring loaded roller guide assemblies in adjustable mountings on each side of car and counterweight frames in accurate alignment at top and bottom of frames. For freight elevators with a rated load greater than 10,000 lbs., slide guides may be used in lieu of roller guides.

2.8.2 Car Shell Return Panels, Doors, Entrance Columns, and Transom

Provide 14 Gauge minimum [prefinished steel][stainless steel] cab wall panels and entrance components. Use same material and finish for all hoistway and car entrance assemblies. Apply sound-deadening material on exterior of all cab wall panels.

2.8.3 Car Enclosure Top

Provide reinforced, 12 gauge minimum steel car enclosure top. Provide hinged emergency exit with lock that complies with the seismic risk zone 2 or greater design requirements of ASME A17.1/CSA B44. Locate emergency exit hinge towards the rear of the elevator cab. Design and configure the elevator cab interior ceiling to provide convenient and unobstructed access to, and use of, emergency exit from inside the elevator cab.

2.8.4 Car Door

Provide [two section ]vertical rising gate with power door operator.

2.8.5 Car Entrance Sill

Provide one piece steel car entrance sill(s). Set sill(s) level and flush with cab finish floor.

2.8.6 In-Car Horizontal Buck-Board Wall Protection

**************************************************************************
NOTE: Retain bracketed phrase for freight elevators that do not have Front and Rear openings.
**************************************************************************

Provide minimum 64 mm thick by 305 mm high 2-1/2 inch thick by 12 inch high #2 Oak protection boards on all side walls [and back wall] of the elevator cab. Position boards at a height to prevent damage from fork lift traffic.
2.8.7 Cab Finish Floor

Provide cab finish floor with top of finish floor flush with the cab sill.

2.8.8 Car Fan

Provide 2-speed fan for car enclosure forced ventilation. Fan must be mounted in the car enclosure top.

2.8.9 Car Lighting

Utilize LED lighting for elevator car interior illumination. Provide a minimum of 10 foot-candles, measured at all areas of the car enclosure floor. Provide automatic car lighting operation that will turn off car lights after 3 minutes of inactivity. Car lights must automatically turn on upon actuation of an elevator car or hall call.

2.9 FREIGHT ELEVATOR HOISTWAY DOORS AND ENTRANCES

Provide hoistway entrance assemblies with a minimum 1-1/2 hour fire rating. Use same material and finish for all hoistway and car entrance assemblies.

2.9.1 Hoistway Entrance Frames

Provide 14 gage minimum [prefinished carbon sheet steel][stainless steel] hoistway entrance frames. Provide door panels with truckable sill. Provide minimum 102mm width by 229 mm height 4 inch width by 9 inch height vision panel in upper door panel.

2.9.2 Hoistway Entrance Sills

Provide one-piece 8 mm thick, 152 mm by 152 mm 5/16 inch thick, 6 inch by 6 inch steel angle iron sill with top of sill flush with hoistway landing finish floor. Steel angle-iron sill must be set into and fully supported by the concrete floor or the steel building structure. Use same material for all hoistway and car entrance sills.

2.10 HOISTWAY EQUIPMENT

2.10.1 Car and Counterweight Guide Rails and Fastenings

Provide T-section type guide rails for car and counterweight. Paint rail shanks with one coat of black enamel.

2.10.2 Pit Equipment

Provide rail-to-rail pit channels to serve as mounting surface for main guide rails and counterweight guide rails. In addition, pit channels will serve as mounting surfaces for car and counterweight buffers. Method of installation of channels, brackets and buffer mounts will be such that pit waterproofing is not punctured.

2.10.3 Pit "STOP" Switch

Provide push-to-stop/pull-to-run type pit "STOP" switch.
2.10.4 Traveling Cables

Suspend traveling cables by means of self-tightening webbed devices or internal suspension members.

2.10.5 Hoistway Pit Ladder

Provide continuous horizontal rungs for the full height of the pit ladder.

PART 3 EXECUTION

3.1 INSTALLATION

Install in accordance with DOD design criteria, contract specifications, manufacturer's instructions, NEII-1 Building Transportation Standards and Guidelines, and all applicable building and safety code requirements.

3.1.1 Structural Members and Finish Materials

Do not cut or alter structural members. Do not alter finish materials from manufacturer's original design. Restore any damaged or defaced work to original condition.

3.1.2 Miscellaneous Requirements

Provide recesses, cutouts, slots, holes, patching, grouting, and refinishing to accommodate elevator installation. Use core drilling to drill all new holes in concrete. Finish work to be straight, level, and plumb. During installation, protect machinery and equipment from dirt, water, or mechanical damage. At completion, clean all work and spot paint.

3.2 FIELD QUALITY CONTROL

The Contractor will provide and utilize a third-party licensed and certified Qualified Elevator Inspector (QEI) to conduct elevator pre-acceptance inspection and testing. The QEI must perform inspections and witness tests to ensure that the installation conforms to all applicable safety codes and contract requirements. The QEI will be directly employed by the Contractor and independent of the elevator contractor.

Upon completion, the QEI must provide written test data for all ASME A17.1/CSA B44 Acceptance Tests and written certification that the elevator is complete and ready for final Acceptance Inspection, Testing, and Commissioning.

3.3 ACCEPTANCE INSPECTION, TESTING AND COMMISSIONING

When elevator system installation is complete and ready for final inspection, notify Contracting Officer that elevator system is ready for Acceptance Inspection, Testing, and Commissioning. Provide QEI certification specified in Article FIELD QUALITY CONTROL.

******************************************************************************

NOTE: Use the first bracketed paragraph for all Navy Facilities and for all projects managed by NAVFAC FEAD. Use the second bracketed paragraph for Air Force, Army, and NASA projects that are not managed by NAVFAC FEAD.
Contracting Officer will obtain services of Naval Facilities Engineering Command (NAVFAC) QEI Certified Elevator Inspector. NAVFAC QEI will utilize the applicable NAVFAC Elevator Acceptance Inspection Form to record the results of inspection and testing and to identify safety code and contract deficiencies. Specific values must be provided for all tests required by ASME A17.1/CSA B44, ASME A17.2, and contract documents. Upon completion of inspection and testing, the NAVFAC QEI will sign a copy of the completed forms and provide the signed copy to the Contracting Officer or representative. Within 2 weeks of the inspection, the QEI will also prepare a formal inspection report, including all test results and deficiencies. Upon successful completion of inspection and testing, NAVFAC Certified Elevator Inspector will complete, sign and post form NAVFACENGCOM 9-11014/23(Rev.9-2009), Elevator Inspection Certificate.

Contracting Officer will obtain the services of a third-party QEI Certified Elevator Inspector. The QEI must utilize an Elevator Acceptance Inspection Form to record the results of inspection and all testing and to identify safety code and contract deficiencies. Specific values must be provided for all tests required by ASME A17.1/CSA B44, ASME A17.2, and contract documents. Upon completion of inspection and testing, the QEI must sign a copy of the completed forms and provide to the Contracting Officer. Within 2 weeks of the inspection, the QEI must also prepare a formal inspection report, including all test results and deficiencies. Upon successful completion of inspection and testing, the QEI will complete, sign, and provide a certificate of compliance with ASME A17.1/CSA B44.

3.3.1 Acceptance Inspection Support

Prime and Elevator Contractors must provide inspection support and perform all required tests, in order to demonstrate proper operation of each elevator system and to prove that each system complies with contract requirements and all applicable building and safety codes. Inspection procedures in ASME A17.2 form a part of this inspection and acceptance testing. All inspection and testing must be conducted in the presence of the Qualified Elevator Inspector (QEI).

If the elevator does not comply with all contract and safety code requirements on the initial Acceptance Inspection and Test, the Contractor is responsible for all costs involved with re-inspection and re-testing required as a result of contractor delays and discrepancies discovered during inspection and testing.

3.3.2 Testing Materials and Instruments

Provide all testing materials and instruments necessary for Acceptance Inspection, Testing and Commissioning. At a minimum, include calibrated test weights, tachometer, accelerometer, hydraulic pressure gauge, 600-volt megohm meter, volt meter and ammeter, infrared temperature gauge, door pressure gage, dynamometer, and 6 meter 20 foot tape measure.

3.3.3 Field Tests

3.3.3.1 Endurance Tests

Test each elevator for a period of one hour continuous, automatic operation, with specified rated load in the elevator cab. During the one hour test, stop car at each floor, in both directions of travel, and allow
automatic door open and close operation. The requirements for Automatic Operation, Rated Speed, Leveling, Temperature Rise and Motor Amperes must be met throughout the duration of the Endurance Test. Restart the one hour test period from the beginning, following any shutdown or failure.

3.3.3.2 Speed Tests

Determine actual speed of each elevator, in both directions of travel, with rated load and with no load in elevator car. Make Speed tests at the beginning and at the end of the Endurance test. Determine speed by tachometer reading or accelerometer, excluding accelerating and slow-down zones. Under all conditions, minimum acceptable elevator speed is the Rated speed specified. Maximum acceptable elevator speed is 110 percent of Rated speed.

3.3.3.3 Leveling Tests

Test elevator car leveling operation and provide a leveling accuracy equal to or less than 3 mm 1/8 inch at each floor with no load in car, balanced load in car, and with rated load in car, in both directions of travel. Determine leveling accuracy at the beginning and at the end of the endurance tests.

3.3.3.4 Temperature Rise Tests

Determine temperature rise of elevator drive machine motor during one-hour full-load test run. Under these conditions, maximum temperature rise must not exceed acceptable temperature rise indicated on manufacturer's data plate. Start test only when equipment is within 5 degrees C of ambient temperature.

3.3.3.5 Balanced Load Test

Place balanced load in the elevator cab, according to the manufacturer's designed counterbalance. Perform electrical and mechanical balanced load tests of car and counterweight.

3.3.3.6 Motor Ampere Tests

At beginning and end of Endurance test, measure and record motor amperage in both directions of travel and in both no-load and rated load conditions.

3.3.3.7 Elevator Performance and Ride Quality Testing

Evaluate elevator performance to ensure compliance with specification requirements related to the NEII-1 Performance Standards Matrix for New Elevator Installations.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for electric traction passenger elevators.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: All Army and Navy facility designs which include elevators shall comply with the "NAVFAC ITG 2013-01 Elevator Design". This guide is available from the NAVFAC facilitator at http://www.wbdg.org/ffc/navy-navfac/interim-technical-guidance-itg under Interim Technical Guidance.

NOTE: For NAVY projects, any editing of non-bracketed requirements in this specification must be approved through the NAVFAC FEC VTE Program Lead Certifying Official.
PART 1   GENERAL

1.1 REFERENCES

******************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

******************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF CIVIL ENGINEERS (ASCE)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

AMERICAN WELDING SOCIETY (AWS)

AWS D1.1/D1.1M (2020; Errata 1 2021) Structural Welding Code - Steel

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office.
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

  Elevator System; G[, [_____]]
  Elevator Components; G[, [_____]]
  Elevator Machine; G[, [_____]]
  Elevator Controller; G[, [_____]]

Submit in accordance with Sections 01 78 23 OPERATION AND MAINTENANCE DATA and 01 78 24.00 20 FACILITY ELECTRONIC OPERATION AND MAINTENANCE SUPPORT INFORMATION (eOMSI).

1.2.1 Shop Drawing Requirements

Provide assembly and arrangement of elevators, accessories, and elevator components. Show location of elevator machine in elevator machine room (MR) or machinery space (MS). Show location of elevator controller in elevator machine room or elevator control room (CR). Provide details for materials and equipment, including but not limited to operating and signal fixtures, doors, door and car frames, car enclosure, controllers, motors, guide rails and brackets, layout of hoistway in plan and elevation, and other layout information and clearance dimensions.

1.2.2 Product Data Requirements

Provide manufacturers' product data for all elevator components, including but not limited to the following: elevator controller, hoist machine and drive motor, design counterbalance, hoist ropes and shackles, overspeed governor, emergency braking system, car and hall fixture buttons and switches, cab, machine room, control room, and machinery space communication devices, door operator, door protection system, and car and counterweight roller guides and buffers. For data sheets, provide document identification number or bulletin number, published or copyrighted prior to the date of contract bid opening. Provide controller manufacturer's published procedures for performance of each and all testing required by ASME A17.1/CSA B44.

1.2.3 Design Data

1.2.3.1 Reaction Loads

Provide calculations by registered professional engineer for reaction loads imposed on building by elevator system. Calculations must comply with ASCE 7-16 and ASME A17.1/CSA B44.
1.2.3.2 Heat Loads

Provide calculations from elevator manufacturer, or by registered professional engineer, for total anticipated heat loads generated by all of the elevator equipment.

1.2.3.3 Emergency Power Systems

Where the facility does have an emergency power system, confirm the elevators that will be connected to the emergency power system. Confirm the complete emergency power system and sequence of operation for all elevators, including elevator sequential operation and operation of the elevator lobby manual selection switch. Provide wiring diagrams for building emergency power interface with elevator controls. For elevators not supplied by an emergency power system, provide manufacturers' product data for auxiliary power systems.

1.2.4 Welders' Requirements

Comply with AWS D1.1/D1.1M, Section 5. Include certified copies of field welders' qualifications. List welders' names with corresponding code marks to identify each welder's welding work.

1.2.5 Maintenance Control Program (MCP)

For each elevator, prepare and provide a written Maintenance Control Program (MCP) that complies with ASME A17.1/CSA B44 Section 8.6, including written documentation that details the test procedures for each and every test that is required to be performed by ASME A17.1/CSA B44. Assemble all MCP documentation, and supporting technical attachments, in a single MCP package and provide in both electronic and hard copy. Assemble entire hard copy MCP in 3-ring binders. For each elevator provided, the MCP must include only documentation and instruction that apply to the elevator specified.

For each elevator, provide an additional, separate binder that includes all maintenance, repair, replacement, call back, and other records required by ASME A17.1/CSA B44. The records binder must be kept in the elevator mechanical room, maintained by elevator maintenance and service personnel, and be available at all times to authorized personnel.

Provide detailed information regarding emergency service procedures and elevator installation company personnel contact information. Provide a listing of all tools to be provided to the Contracting Officer as components of the elevator system.

1.3 QUALITY ASSURANCE

1.3.1 Qualification

Provide a designed and engineered elevator system by an elevator contractor regularly engaged in the installation of elevator systems. Provide elevator components manufactured by companies regularly engaged in the manufacture of elevator components. Utilize only licensed and certified elevator personnel for the installation, adjusting, testing, and servicing of the elevators.
1.3.1.1 Elevator Contractor's Elevator Technicians

For elevator installations in the United States, including United States territories, perform all elevator related work under the direct guidance of a state certified elevator technician with a minimum of three years of experience in the installation of elevator systems of the type and complexity specified in the contract documents. Provide an endorsement letter from the elevator manufacturer, certifying that the elevator specialist is qualified. All elevator technicians must carry a current certification issued by one of the following organizations:

a. National Association of Elevator Contractors (NAEC)

b. National Elevator Industry Education Program (NEIEP)

1.3.2 Manufacturers' Technical Support

Provide elevator components from manufacturers that provide factory training and online and live telephone elevator technical support to any elevator installation, service, and maintenance contractor. Provide elevator components from manufacturers that guarantee accessibility to all replacement and repair parts and components to any elevator installation, service, and maintenance contractor. Use only elevator component manufacturers that provide current published price lists for all elevator parts and components.

1.3.3 Operation and Maintenance Data

Assemble all shop drawing and product data material into O&M Data Packages in accordance with Article SUBMITTALS. Provide two complete O&M Data Packages in hard copy and two complete electronic O&M data packages on separate CDs, in PDF format. Provide all O&M Data Packages to Contracting Officer. Include controller diagnostic documentation and software as required under Article CONTROL EQUIPMENT.

1.3.4 Wiring Diagrams

Provide complete wiring diagrams and sequence of operations, which show electrical connections and functions of elevator systems. Provide one set (279 mm by 432 mm or 11 inch by 17 inch minimum size) of wiring diagrams, with individual sheets laminated in plastic and assembled in binder, to be stored in the machine room or control room cabinet. Provide one additional hard copy set and two complete electronic sets on separate CDs, in PDF format. Provide all wiring diagram sets to the Contracting Officer. Coded diagrams are not acceptable unless fully identified.

1.3.5 Machine Room/Control Room Cabinet

For storage of O&M Data Packages and Wiring Diagrams, provide locking metal cabinet with a minimum size of 508 mm W by 305 mm D by 762 mm H (20 inch W by 12 inch D by 30 inch H). Cabinet must be sized large enough to accommodate all O&M Data and hardware required in paragraphs OPERATION AND MAINTENANCE DATA and WIRING DIAGRAMS. Secure cabinet to machine room or control room wall.

1.4 NEW INSTALLATION SERVICE

**************************************************************************
NOTE: Use Bi-weekly option for Hospitals and other

SECTION 14 21 23 Page 10
Provide elevator warranty service in accordance with the manufacturer's maintenance plan, warranty requirements, and applicable safety codes, for a period of 12 months after the date of acceptance by Contracting Officer. Perform this work during regular working hours. Provide supplies and parts to keep elevator system in operation. Perform service only by factory trained personnel. Provide [Monthly][Bi-weekly] services to include repairs, adjustments, greasing, oiling, and cleaning. Provide service log in elevator machine room or control room cabinet and update [Monthly][Bi-weekly], throughout the one-year warranty period.

NOTE: One hour emergency service below is standard; only use two hour for remote locations.

Provide 24-hour emergency service, with [one hour][two hour] on-site response time, during this period without additional cost to the Government.

1.4.1 Periodic Elevator Certification Inspection and Testing

Provide elevator mechanic to support [NAVFAC ]QEI Certified Elevator Inspector in the periodic six-month and the annual Category 1 elevator certification inspection and testing. Perform Category 1 inspection and testing no greater than 30 days prior to the end of the warranty period. Perform all elevator certification testing in the presence of QEI Certified Elevator Inspector.

In conjunction with the testing noted above, test systems for Emergency Power Operation, Earthquake Emergency Operation, and Hospital Emergency Commandeering Service Operation, as applicable. Schedule so that testing does not interfere with building operations.

1.5 FIRE PROTECTION SYSTEM

Coordinate interface between building fire protection system and elevator controls.

Additional fire protection requirements are located in: [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] [Section 28 31 02.00 20 FIRE ALARM REPORTING SYSTEMS - DIGITAL COMMUNICATORS] [Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION] [_____] and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

1.5.1 Fire Alarm Initiating Devices

Fire alarm initiating devices are specified in [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM
AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] [_____] including conduit and wiring from each detector to fire protection addressable modules in elevator machine room or control room.

1.5.2 Fire Sprinklers

Provide fire sprinklers in accordance with all applicable safety codes and with [Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION][_____] . Provide shutoff valve, check valve, and non-adjustable, zero time-delay flow switch, in each sprinkler line immediately outside of each machine room, control room, and hoistway, as applicable. Provide inspectors' test valve for periodic testing of flow switch and shunt trip disconnect.

Pipe sprinkler piping serving these spaces in a series manner with no laterals. Locate inspectors' test connection at the end of pipe runs such that operation of the test connection will purge air from system piping.

1.5.3 Shunt Trip Disconnect

Provide flow switches specified in paragraph FIRE SPRINKLERS to comply with ASME A17.1/CSA B44 and NFPA 72 for shunt trip of the main line power supply. For each elevator, provide control wiring connecting the flow switch to a shunt trip equipped circuit breaker located in the elevator machine room or control room. Upon flow of water, flow switch will instantaneously cause opening of the shunt-trip circuit breaker and remove power from the elevator. Flow switch must also send a signal to fire alarm control panel to indicate water flow condition.

PART 2 PRODUCTS

2.1 ELEVATOR DESCRIPTION

Provide elevator system that complies with ASME A17.1/CSA B44 in its entirety, ASME A17.2 in its entirety, and additional requirements specified herein. Provide elevator system that meets or exceeds the NEII-1 Ride Quality Performance Standards Matrix (RQPSM). For elevator speeds of 500 fpm and higher, comply with the RQPSM "High Performance" criteria. For elevator speeds 350 fpm, up to but not including 500 fpm, comply with the RQPSM "Intermediate Performance" criteria.

Provide and install elevators in accordance with 36 CFR 1191 - ABAAS, ICC IBC, IEEE C62.41, NFPA 70 and NFPA 101 requirements.

2.1.1 Elevator Design Parameters

**************************************************************************

NOTE: Traffic Analysis and Minimum Cab Size

Perform a traffic analysis and conduct interviews with the facility user to determine number, size, and type of elevators necessary to serve the needs of the facility user. For Army and Navy projects, utilize NAVFAC ITG 2013-01 Elevator Design to determine Design Type. For minimum elevator speed, specify 200 fpm for 2-4 story, 350 fpm for 5-9 story, and 500 fpm, gearless for 10-or-more story elevators.
Specify gearless traction elevators for all buildings more than 10 stories tall.

Size and capacity configurations are limited to three basic configurations as listed in the subparagraphs below. In the rare case that the listed configurations do not meet project requirements, more extensive project-specific editing will be required.

2.1.1.1 Elevator No.[_____] - Emergency Medical Service Accessibility (EMSA)

NOTE: Emergency Medical Service Accessibility (EMSA): For each building of two stories or greater, provide at least one elevator with a minimum size and arrangement to accommodate an ambulance stretcher 24" by 84" (610 mm by 2134 mm), with not less than 5" radius corners, in the open, horizontal, position. For buildings with multiple elevators, an EMSA elevator must be accessible from all locations in the building; otherwise additional elevator(s) shall also be EMSA.

Two size and capacity configurations of elevators will meet this requirement. For standard passenger applications use the 1588 kg 3500 lb capacity, single speed side slide described in this subparagraph. The larger elevator sized to accommodate pallet-size light freight loading described in next subparagraph below will also meet EMSA requirements.

Provide elevator(s) with minimum size and arrangement to accommodate an ambulance stretcher 610 mm by 2134 mm with not less than 127 mm 24-inch by 84-inch with not less than 5-inch radius corners, in the open, horizontal position.

a. Type: [Geared] [Gearless]
b. Rated load: 3500 lb.
c. Rated Speed: [200] [350] [500] fpm
d. Car Door Type: Single-speed side slide.
e. Car Door Opening Width: 107 cm 3 ft.-6 in. minimum, or [____].

2.1.1.2 Elevator No.[_____] - Larger Capacity (Pallet-Sized) Loading

NOTE: Where a larger capacity elevator is required to accommodate light freight, typically pallet-size loading, use this subparagraph. Elevator shall typically be 4000-4500 lb capacity (may be upwards of 6000 lbs. in rare instances), single speed center...
opening, 48 inch door opening width, and will typically be deeper than the 3500 lb. EMSA elevator above.

This larger elevator will also meet the EMSA requirements described above.

**************************************************************************

a. Type:  [Geared] [Gearless]
b. Rated load:  [4000][4500][_____] lb.
c. Rated Speed:  [200][350][500] fpm
d. Car Door Type:  Single-speed, center opening, horizontally sliding.
e. Car Door Opening Width: [122 cm 4 ft.-0 in][137 cm 4 ft.-6 in].

2.1.1.3 Elevator No.[_____] - Non-EMSA Elevator

**************************************************************************

NOTE: For smaller elevators where EMSA is not required (covered by one of the two elevator types above), this subparagraph may be used. Typical application would be an elevator bank where one elevator meets EMSA requirements. Elevator shall be 2500 lb capacity, 42 inch door opening width, and either side slide or center opening, typically to match other elevators in the bank.

This elevator will not meet EMSA requirements.

**************************************************************************

a. Type:  [Geared] [Gearless]
b. Rated load:  2500 lb.
c. Rated Speed:  [200][350][500] fpm
d. Car Door Type:  Single speed [side slide][center opening], horizontally sliding.
e. Car Door Opening Width:  107 cm 3 ft.-6 in. minimum, or [____].

2.1.2 Cab Enclosure and Hoistway Entrance Assemblies

**************************************************************************

NOTE: If retaining 1st option in sentence below, ensure that finishes are indicated, most likely somewhere on the drawings. In either case, indicate finish colors of elevator materials in finish schedule on drawings.

**************************************************************************

NOTE: Specify stainless steel doors, side panels and wall trim in hospital elevator cabs.
Provide finishes [as indicated.][as listed below:

a. Floor; [carpet][vinyl composition tile][vinyl sheet tile][____].

b. Walls; [prefinished steel][laminated plastic] on plywood [stainless steel][____]. Provide each cab wall with equally spaced and equally sized wall panels. All wall panel fasteners must be concealed.

Wall trim; [prefinished steel][stainless steel][____].

Accessories; Provide hand rails on full length of back wall and side walls of elevator cab.

c. Car doors, car door returns, and wall reveals; [prefinished steel panels][stainless steel][____].

d. Ceilings; [supported][prefinished steel panels][anodized aluminum][egg crate][____].

Ceiling frame; [prefinished steel][stainless steel][anodized aluminum][____].

e. Hoistway Entrance Assembly Material and Finishes; [prefinished steel][stainless steel][____].]

2.2 ELEVATOR OPERATION

ASME A17.1/CSA B44, Introduction, Section 3, Definitions.

**************************************************************************

NOTE: Choose one of the following four types of elevator operation.
**************************************************************************

2.2.1 Single, Two-Stop, Automatic Operation

**************************************************************************

NOTE: Choose for single elevator serving two landings.
**************************************************************************

Provide Single Two-Stop Automatic Operation.

2.2.2 Selective Collective Automatic Operation

**************************************************************************

NOTE: Choose for single elevator serving three or more landings.
**************************************************************************

Provide Selective Collective Automatic Operation.

2.2.3 Duplex Selective Collective Automatic Operation

**************************************************************************

NOTE: Choose for two adjacent elevators.
**************************************************************************

Provide Duplex Selective Collective Automatic Operation. If a car is taken
out of service or fails to respond to a landing call within a predetermined adjustable time limit of approximately 40 to 180 seconds, transfer calls to the other car functioning as a single car Selective Collective elevator until the out-of-service car is returned to the system.

2.2.4 Group Automatic Operation

******************************************************************************
NOTE: Choose for three or more elevators that serve the same elevator lobby.
******************************************************************************

Provide Group Automatic Operation. If a car is taken out of service, or fails to respond to a landing call within a predetermined adjustable time limit of approximately 40 to 180 seconds, transfer calls to another car until out-of-service car is returned to the system.

2.3 SPECIAL OPERATION AND CONTROL

Provide the following special operations and control systems.

2.3.1 Keys for Elevator Key Switches

Provide a minimum of twelve keys per unique cylinder used on all key switches for a single elevator. If there is more than one elevator, additional keys will not be required unless there are additional unique lock cylinders. Provide keys with brass or fiberglass tags marked "PROPERTY OF THE U.S. GOVERNMENT" on one side with function of key or approved code number on the other side.

2.3.2 Firefighters' Emergency Operation (FEO)

******************************************************************************
NOTE: Coordinate FEO Designated Landing with Fire Protection Designer.
******************************************************************************

Provide FEO equipment and signaling devices. The designated level for the FEO Phase I key operated switch is the [ground][_____] floor. In the FEO Phase I fixture, provide FEO Operating Instructions.

2.3.2.1 Firefighters' Emergency Operation (FEO) Key Box

Provide flush mounted, locking, FEO Key Box of a minimum size of 127 mm W by 229 mm H by 38 mm D 5 inch W by 9 inch H by 1.5 inch D. Install at a height of 183 cm 6 feet above floor level and directly above the FEO Phase I key switch. Provide box equipped with lock that uses the FEO K1 key.

2.3.3 Hoistway Access Operation

Provide hoistway access operation with switches at top and bottom terminal landings. Locate switch 183 cm 6 feet above floor level, within 305 mm 12 inches of elevator hoistway entrance frame or with the ferrule exposed when located in the elevator entrance frame.

2.3.4 In-Car Inspection Operation

Provide In-Car Inspection Operation.
2.3.5 Independent Service

Provide exposed key-operated switch in car operating panel to enable independent service and simultaneously disable in-car signals and landing-call responses. Provide indicator lights that automatically illuminate during independent service. For duplex or group operation, if one car is removed from group another car will respond to its hall calls.

2.3.6 Selective Door Operation

For elevator with one or more rear openings at same level as front opening, provide full-selective operation with car and door operating buttons clearly marked for front and rear openings, front and rear car button for each such floor, and front and rear "DOOR OPEN" and "DOOR CLOSE" buttons. Only door for which the button was operated opens or closes.

2.3.7 Elevator Emergency Power Operation

**************************************************************************
NOTE: Electrical design shall identify the elevators to be connected to the building emergency power system. Identify and define the complete emergency power system for all elevators. When using the 2nd bracketed option in either of the next two subparagraphs, edit as required for project-specific requirements.

For any elevator that is not included in the building emergency power operation, utilize paragraph ELEVATOR AUXILIARY POWER OPERATING SYSTEM.
**************************************************************************

Provide elevator emergency power operation for [all elevators] [elevator 1,2,3...]. Coordinate power supply and control wiring to accomplish initiation and operation of elevators on emergency power.

[2.3.8] Elevator Auxiliary Power Operating System

Provide elevator auxiliary power operating system for [all elevators] [elevator 1,2,3...].

[2.3.9] Hospital Emergency Commandeering Service (HECS)

**************************************************************************
NOTE: Only keep this HECS paragraph for hospital elevators or for projects in which this operation is specifically requested by the building owner or facility user.
**************************************************************************

Provide Hospital Emergency Commandeering Service.

[2.4] ELEVATOR DRIVE MACHINE, HOIST MOTOR, AND DRIVE MOTOR

Provide elevator drive machine, hoist motor, and motor drive system that is designed to be installed in an elevator machine room (MR) or an elevator machinery space. The elevator machine, motor, and drive configuration and installation design must be mechanically and electrically interchangeable with a minimum of two other elevator manufacturer's drive machines that are
readily available in the elevator industry. Paint or finish ferrous surfaces with a minimum of one coat of manufacturer applied rust-inhibiting paint.

Design the elevator drive system so that the hoist motor amperage does not exceed the motor data tag full load amperage in any operating condition, exclusive of acceleration and deceleration. Provide elevator hoist motor that is designed with Class F insulation and rated for 120 starts/hr. Design the elevator drive system to limit Total Harmonic Distortion to a maximum of 5 percent. No single harmonic may exceed 3 percent.

Provide an elevator drive machine designed for and provided with stranded steel wire rope for elevator suspension and counterbalance. The minimum acceptable diameter of suspension and counterweight ropes is 9.52 mm 3/8 inches. Aramid fiber ropes, coated steel ropes, and non-circular coated steel belts may not be used for elevator suspension or counterbalance.

The elevator drive machine must be equipped with machine manufacturer's designed and installed standard means for the manual release of the driving-machine brake.

2.4.1 Manufacturer's Factory Training and Technical Support

Provide an elevator drive machine from a manufacturer that provides comprehensive factory training and technical support for installation, adjustment, service, and maintenance of the drive system. The training and support must be identified as available to any licensed elevator contractor. Provide verification of an established and documented training schedule, with pricing, for factory training classes that have been provided for a minimum period of one year prior to contract award date.

The elevator drive system must be identified as available for purchase and installation by any licensed elevator contractor. All drive system related components, parts, diagnostic tools, and software must be available for purchase, installation, and use by any licensed elevator contractor; "exchange-only" provisions for the purchase of spare parts are not acceptable.

2.4.2 Ascending Car Overspeed and Unintended Car Movement Protection

Provide elevator Ascending Car Overspeed and Unintended Car Movement Protection means that is designed to act directly upon, and apply a retarding force to, the elevator suspension ropes. In addition to the requirements of ASME A17.1/CSA B44, the means must be designed to detect and stop movement of the elevator suspension ropes that occurs as a result of loss of traction between the suspension ropes and the elevator machine drive sheave.

2.5 CONTROL EQUIPMENT

Enclose all elevator control equipment in factory-primed and baked-enamel coated sheet-metal cabinets with ventilation louvers and removable or hinged doors. Mount cabinets at a height of 254 mm 10 inches above machine room or control room finish floor.

2.5.1 Motor Control Equipment

Provide variable voltage with silicon controlled rectifier (SCR) or Variable-Frequency Variable Voltage (VVVF) alternating current (ac) drive
control.

2.5.1.1 Electrical Isolation Protection

Provide individual isolation transformers and individual choke reactors for each individual hoist motor. Provide filtering to maintain harmonic distortion below IEEE C62.41 standards as measured at the elevator machine room or control room disconnect.

2.5.2 Elevator Microprocessor Controller

For each individual elevator controller, and for each group controller, provide a microprocessor controller that complies with the following paragraphs. Provide controller(s) package that includes all hardware and software required for the installation, maintenance, and service of the elevator, in its' entirety. Provide verification of technical support service that the controller manufacturer provides to any licensed elevator installation, service, and maintenance company.

Provide an elevator controller from a manufacturer that provides comprehensive factory training to include controller installation, adjustment, service, and maintenance. The training must be identified as available to any licensed elevator contractor. Provide verification of an established and documented training schedule, with pricing, for factory training classes that manufacturer has provided for a minimum period of one year prior to contract award date.

The elevator controller must be identified as available for purchase and installation by any licensed elevator contractor. All components, parts, diagnostic tools, and software must be available for purchase and installation and use by any licensed elevator contractor; "exchange-only" provisions for the purchase of spare parts are not acceptable. The elevator controller manufacturer must publish an industry competitive price listing for all controller parts, diagnostic tools, and software.

Provide verification of telephone and internet based technical support service that the elevator controller manufacturer provides to any licensed elevator installation, service, and maintenance company at an industry competitive price. The service must include live telephone based technical support for installation, adjustment, maintenance, and troubleshooting of the elevator controller and related elevator components. The service must be available during standard working hours.

Provide an elevator controller that is designed to automatically reestablish normal elevator operation following any temporary loss of power, regardless of duration.

2.5.2.1 Elevator Controller Interface Cabinet

For each individual elevator microprocessor controller, provide a separate elevator control cabinet with an integrated human interface system. For group elevator installations, a single cabinet and interface system with full access to each elevator controller may be utilized. The separate controller interface cabinet must be supplied by the elevator controller manufacturer and include a minimum 305 mm 12 inch wide keyboard and a minimum 254 mm 10 inch monitor. The elevator controller interface cabinet must comply with arc-flash protection requirements of NFPA 70E and UFC 3-560-01.
2.5.2.1.1 Elevator Microprocessor Human Interface

The interface system must provide complete elevator controller interface capability and must include the elevator controller manufacturer's comprehensive package of installation and diagnostic software. The microprocessor interface system must provide unrestricted access to all parameters, all levels of adjustment, and all flags necessary for installation, adjustment, maintenance, and troubleshooting of each elevator and for the elevator group. All software programming must be stored in non-volatile memory. The elevator controller fault log must provide non-volatile memory fault log storage of all faults, trouble calls, and fault history for a minimum of one year and the ability to download or print the fault log. The controller interface must also provide the capability to display and diagnose trouble calls, faults, and shutdowns. Expiring software, degrading operation, and "key" access controls are not acceptable.

2.5.2.2 Software and Documentation

Provide three copies of the manufacturer's maintenance and service diagnostic software, with complete software documentation, that will enable the same level of unrestricted access to all controllers of the same make and model, regardless of the installation date or location. Provide signed certification, from the manufacturer's corporate headquarters, that guarantees that the microprocessor software and access system will not terminate the unlimited and unrestricted access at any future date.

2.5.2.3 Elevator Controller Certification

For elevator installations in the United States, including United States territories, provide an elevator microprocessor controller that has a current certificate of safety code compliance issued by the Technical Standards and Safety Authority (TSSA), Toronto, Canada.

2.6 OPERATING PANELS, SIGNAL FIXTURES, AND COMMUNICATIONS CABINETS

For all panels and fixtures, provide identical and uniform fixture design, material, finish, and components for all elevators. For all panels and fixtures, legibly and indelibly identify all buttons and all operating positions for each device. Use engraving and backfilling, or photo etching, for button and switch designations. Do not use attached signs. Provide elevator manufacturers' standard grade for all key switches unless otherwise specified. All illuminating panels and fixture components must utilize LED lighting for energy efficiency.

2.6.1 Car and Hall Buttons

For all cab and landing fixture buttons, provide industry-standard, vandal resistant push buttons with positive-stop assembly design. Buttons must be minimum 19 mm 3/4 inch diameter, satin-finish stainless steel, with illuminating LED halo.

2.6.2 Passenger Car-Operating Panel

**************************************************************************
NOTE: Choose "two" Car Operating Panels for high traffic passenger elevators in hospital buildings and office buildings. Choose "one" for elevator system where traffic is moderate such as in

SECTION 14 21 23 Page 20
barracks, warehouses, clinics or shops.

Provide each car with [one] [two] car operating panel[s] that contain[s] operation controls and communication devices. Provide exposed, flush mounted buttons for the controls identified in subparagraph PASSENGER CONTROLS. Provide a lockable service cabinet for the controls listed in subparagraph SERVICE CONTROLS. Use engraving and backfilling or photo etching for button and switch designations. Do not use attached signs.

2.6.2.1 Passenger Controls

In addition to ASME A17.1/CSA B44 requirements, provide the following operating controls, identified as indicated:

a. LED illuminating car-call buttons identified to correspond to landings served by the elevator.

b. "DOOR OPEN" and "DOOR CLOSE" buttons. For front and rear openings at the same floor, include the identification "F" and "R" for each opening.

c. Red, illuminating "ALARM" button.

d. Key-operated "Independent Service" switch.

e. "Help" communication device to include communication between elevator cab and elevator machine room or control room.

[ f. Key-operated "HOSPITAL EMERGENCY COMMANDEERING SERVICE" switch.]

2.6.2.2 Service Controls

In addition to ASME A17.1/CSA B44 requirements, provide the following operating controls, identified as indicated:

a. Provide a key-operated, three-position switch for "In car Inspection Operation" and "Hoistway Access". The center switch position will provide normal, automatic operation.

b. "Car Light" switch.

c. "Car Fan" switch with two speed settings identified.

d. 120-volt ac 60 Hz single-phase duplex electrical outlet of ground-fault-circuit-interrupt (GFCI) design.

2.6.2.3 Certificate Window

Provide a minimum 102 mm wide by 152 mm high 4 inch wide by 6 inch high certificate window for elevator inspection certificate. Locate window in the Service Controls door of the Car Operating Panel.

2.6.2.4 Emergency Signaling Devices

Provide an audible signaling device, operable from the Car Operating Panel button marked "ALARM". The audible signaling device must have a sound pressure rating between 80 and 90 dBA at 3 meters 10 ft. Provide battery backup power capable of operating the audible signaling device for at least one hour.
2.6.3 Elevator In-Car Position Indicators

For all elevators, provide illuminating LED position indicator in the Car Operating Panel.

2.6.4 Elevator In-Car Direction Indicators

For 2-stop elevator installations, provide visual direction indicators and audible car arrival signal in the elevator car door jamb, in accordance with ABA Standards. Visual indicators must be visible from the hall call fixture.

2.6.5 Hall Call Landing Fixtures

Provide a hall call fixture adjacent to each elevator. Provide a single push-button for terminal landings and dual push-buttons, up and down, at intermediate landings.

2.6.5.1 Designated Landing Hall Call Fixture

2.6.5.1.1 Location of COMMUNICATION MEANS FAILURE (CMF) Visual Signal

When required by ASME A17.1/CSA B44, provide an elevator CMF audible and illuminating signal, and reset switch, in the FEO Designated Landing hall call fixture. Mount the signal and reset switch at a minimum of 178 mm 7 inches above the "UP" hall call button.

2.6.5.1.2 COMMUNICATION MEANS FAILURE (CMF) Visual and Audible Signal Operation

Provide a CMF visual and audible signal system that conforms to ASME A17.1/CSA B44. Provide continuous verification of operability of the telephone line and immediate activation of audible and visual signals when verification means determines that the telephone line is not functioning. Provide illumination of visual signal at one second intervals. Provide a minimum of 65 dBA audible signal at 30 second intervals.

2.6.5.1.3 Firefighters' Emergency Operation Phase I Switch and Visual Signal

When required by ASME A17.1/CSA B44, provide an elevator Firefighters' Emergency Operation Phase I switch and illuminating visual signal in the FEO Designated Landing hall call fixture. Provide FEO Phase I visual signal that is designed with intermittent, flashing, illumination when actuated by the machine room, control room, or hoistway fire alarm initiating device. Locate FEO Phase I key switch above the CMF visual signal with a minimum of 152 mm 6 inches vertical between the centerlines of the CMF signal and the FEO Phase I key switch. Locate FEO Phase I visual signal directly above the Phase I switch. In addition, locate Elevator Corridor Call Station Pictograph at top of hall call fixture.

2.6.6 Elevator Car Position and Direction Indicators and Car Arrival Signal

For elevator installations with three or more stops, provide a separate hall landing fixture that includes the visual elevator position indicator, visual direction indicators, and audible car arrival signal, in accordance with ABA Standards.
2.6.7 Designated Landing Elevator Identification Fixture

For duplex and group elevator installations, provide a separate elevator identification fixture for each elevator, with identification engraved and backfilled with a contrasting color. Number elevators from left to right, as seen during primary approach from building main entrance to elevator lobby. For multiple elevator groups, begin numbering with group that is closest to the building main entrance.

2.6.8 Emergency or Standby Power

When emergency or standby power is provided for elevator operation, provide an elevator emergency power visual indicator that conforms to ASME A17.1/CSA B44. Locate the visual signal in the Firefighters Emergency Operation fixture for each simplex elevator and for each elevator group. When an emergency power selector switch is required, provide switch in a separate, flush mounted fixture located at the designated level, in view of all elevator entrances.

2.7 CAR DOOR EQUIPMENT

2.7.1 Car Door Operator

Provide elevator door operator equipment and circuitry that is designed and installed as discreet communication. Serial communication must not be used for this system.

2.7.2 Infra-red Curtain Unit

Provide Infra-red Curtain Unit (ICU) with multiple infra-red beams that protect to the full height and width of the door opening. Provide door nudging operation.

2.8 PASSENGER ELEVATOR GUIDES, PLATFORM, AND ENCLOSURE

2.8.1 Roller Guides

Provide coil-spring loaded roller guide assemblies in adjustable mountings on each side of car and counterweight frames in accurate alignment at top and bottom of frames.

2.8.2 Car Enclosure Wall Panels, Return Panels, Doors, Entrance Columns, and Transom

Provide 14 Gauge minimum [prefinished steel][stainless steel] cab wall panels and entrance components. Use same material and finish for all hoistway and car entrance assemblies. Apply sound-deadening material on exterior of all cab wall panels.

2.8.3 Car Enclosure Top

Provide reinforced, 12 gauge minimum steel car enclosure top. Provide hinged emergency exit with lock that complies with the seismic risk zone 2 or greater design requirements of ASME A17.1/CSA B44. Locate emergency exit hinge towards the rear of the elevator cab. Design and configure the elevator cab interior ceiling to provide convenient and unobstructed access to, and use of, emergency exit from inside the elevator cab.
2.8.4 Car Door

Provide 16 gauge minimum [prefinished steel][stainless steel] car doors of sandwich construction with flush surfaces on car and landing sides. Provide a minimum of 2 door guide assemblies per door panel, one guide at leading and one at trailing door edge with guides in the sill groove their entire length of travel.

2.8.5 Car Entrance Sill

Provide one piece cast nickel silver, stainless steel, or white bronze entrance sill(s). Set sills level and flush with floor finish. Use same material for hoistway and car entrance sills.

2.8.6 Cab Finish Floor

Provide cab finish floor with top of finish floor flush with the cab sill.

2.8.7 Car Fan

Provide 2-speed fan for car enclosure forced ventilation. Fan must be mounted in the car enclosure top.

2.8.8 Car Lighting

Utilize LED lighting for elevator car interior illumination. Provide a minimum of 10 foot-candles, measured at all areas of the car enclosure floor. Provide automatic car lighting operation that will turn off car lights after 3 minutes of inactivity. Car lights must automatically turn on upon actuation of an elevator car or hall call.

2.8.9 Car Protection Pads and Hooks

Provide fire retardant, hanging car protection pads that provide protection for all car interior wall panels. Provide permanently installed studs in car that are designed for hanging the car protection pads in the car.

2.9 PASSENGER ELEVATOR HOISTWAY DOORS AND ENTRANCES

Provide hoistway entrance assemblies with a minimum 1-1/2 hour fire rating. Use same material and finish for all hoistway and car entrance assemblies.

2.9.1 Hoistway Entrance Frames

2.9.2 Hoistway Entrance Sills

Provide one-piece cast nickel silver, stainless steel, or white bronze entrance sills. Set top of landing sill flush with top of finish floor. Solidly grout under full length of sill. Use same material for all hoistway and car entrance sills.

2.9.3 Hoistway Entrance Doors

Provide [hollow metal][stainless steel] non-vision construction hoistway
entrance doors with flush surfaces on car and landing sides. Provide a minimum of 2 door guide assemblies per door panel, one guide at leading edge and one at trailing edge with guides in the sill groove the entire length of door travel. Use same material and finish for all hoistway and car entrance assemblies.

2.9.4 Hoistway Entrance Door Track Dust Covers

Provide sheet metal hoistway door track dust covers at each landing. Dust covers must cover top and hoistway side of door locks and door roller tracks, and extend the full width of the door track and associated hardware. Dust cover sections will not exceed 3 feet in length.

2.10 HOISTWAY EQUIPMENT

2.10.1 Car and Counterweight Guide Rails and Fastenings

Provide T-section type guide rails for car and counterweight. Paint rail shanks with one coat of black enamel.

2.10.2 Pit Equipment and Support Channels

Provide rail-to-rail pit channels to serve as mounting surface for main guide rails and counterweight guide rails. In addition, pit channels will serve as mounting surfaces for car and counterweight buffers. Method of installation of channels, brackets and buffer mounts will be such that pit waterproofing is not punctured.

2.10.3 Pit "STOP" Switch

Provide push-to-stop/pull-to-run type pit "STOP" switch.

2.10.4 Traveling Cables

Suspend traveling cables by means of self-tightening webbed devices or internal suspension members.

2.10.5 Hoistway Pit Ladder

Provide continuous horizontal rungs for the full height of the pit ladder.

PART 3 EXECUTION

3.1 INSTALLATION

Install in accordance with DOD design criteria, contract specifications, manufacturer's instructions, NEII-1 Building Transportation Standards and Guidelines, and all applicable building and safety code requirements.

3.1.1 Structural Members and Finish Materials

Do not cut or alter structural members. Do not alter finish materials from manufacturer's original design. Restore any damaged or defaced work to original condition.

3.1.2 Miscellaneous Requirements

Provide recesses, cutouts, slots, holes, patching, grouting, and refinishing to accommodate elevator installation. Use core drilling to
drill all new holes in concrete. Finish work to be straight, level, and plumb. During installation, protect machinery and equipment from dirt, water, or mechanical damage. At completion, clean all work and spot paint.

3.2 FIELD QUALITY CONTROL

The Contractor will provide and utilize a third-party licensed and certified Qualified Elevator Inspector (QEI) to conduct elevator pre-acceptance inspection and testing. The QEI must perform inspections and witness tests to ensure that the installation conforms to all applicable safety codes and contract requirements. The QEI will be directly employed by the Contractor and independent of the elevator contractor.

Upon completion, the QEI must provide written test data for all ASME A17.1/CWA B44 Acceptance Tests and written certification that the elevator is complete and ready for final Acceptance Inspection, Testing, and Commissioning.

3.3 ACCEPTANCE INSPECTION, TESTING AND COMMISSIONING

When elevator system installation is complete and ready for final inspection, notify Contracting Officer that elevator system is ready for Acceptance Inspection, Testing, and Commissioning. Provide QEI certification specified in Article FIELD QUALITY CONTROL.

**************************************************************************

NOTE: Use the first bracketed paragraph for all Navy Facilities and for all projects managed by NAVFAC FEAD. Use the second bracketed paragraph for Air Force, Army, and NASA projects that are not managed by NAVFAC FEAD.

**************************************************************************

[ Contracting Officer will obtain services of Naval Facilities Engineering Command (NAVFAC) QEI Certified Elevator Inspector. NAVFAC QEI will utilize the applicable NAVFAC Elevator Acceptance Inspection Form to record the results of inspection and testing and to identify safety code and contract deficiencies. Specific values must be provided for all tests required by ASME A17.1/CWA B44, ASME A17.2, and contract documents. Upon completion of inspection and testing, the NAVFAC QEI will sign a copy of the completed forms and provide the signed copy to the Contracting Officer or representative. Within 2 weeks of the inspection, the QEI will also prepare a formal inspection report, including all test results and deficiencies. Upon successful completion of inspection and testing, NAVFAC Certified Elevator Inspector will complete, sign and post form NAVFACENGCOM 9-11014/23(Rev.9-2009), Elevator Inspection Certificate.

][Contracting Officer will obtain the services of a third-party QEI Certified Elevator Inspector. The QEI must utilize an Elevator Acceptance Inspection Form to record the results of inspection and all testing and to identify safety code and contract deficiencies. Specific values must be provided for all tests required by ASME A17.1/CWA B44, ASME A17.2, and contract documents. Upon completion of inspection and testing, the QEI must sign a copy of the completed forms and provide to the Contracting Officer. Within 2 weeks of the inspection, the QEI must also prepare a formal inspection report, including all test results and deficiencies. Upon successful completion of inspection and testing, the QEI will complete, sign, and provide a certificate of compliance with ASME A17.1/CWA B44.
3.3.1 Acceptance Inspection Support

Prime and Elevator Contractors must provide inspection support and perform all required tests, in order to demonstrate proper operation of each elevator system and to prove that each system complies with contract requirements and all applicable building and safety codes. Inspection procedures in ASME A17.2 form a part of this inspection and acceptance testing. All inspection and testing must be conducted in the presence of the Qualified Elevator Inspector (QEI).

If the elevator does not comply with all contract and safety code requirements on the initial Acceptance Inspection and Test, the Contractor is responsible for all costs involved with re-inspection and re-testing required as a result of contractor delays and discrepancies discovered during inspection and testing.

3.3.2 Testing Materials and Instruments

Provide all testing materials and instruments necessary for Acceptance Inspection, Testing and Commissioning. At a minimum, include calibrated test weights, tachometer, accelerometer, hydraulic pressure gauge, 600-volt megohm meter, volt meter and ammeter, infrared temperature gauge, door pressure gage, dynamometer, and 6 meter 20 foot tape measure.

3.3.3 Field Tests

3.3.3.1 Endurance Tests

Test each elevator for a period of one hour continuous, automatic operation, with specified rated load in the elevator cab. During the one hour test, stop car at each floor, in both directions of travel, and allow automatic door open and close operation. The requirements for Automatic Operation, Rated Speed, Leveling, Temperature Rise and Motor Amperes must be met throughout the duration of the Endurance Test. Restart the one hour test period from the beginning, following any shutdown or failure.

3.3.3.2 Speed Tests

Determine actual speed of each elevator, in both directions of travel, with rated load and with no load in elevator car. Make Speed tests at the beginning and at the end of the Endurance test. Determine speed by tachometer reading or accelerometer, excluding accelerating and slow-down zones. Under all conditions, minimum acceptable elevator speed is the Rated speed specified. Maximum acceptable elevator speed is 110 percent of Rated speed.

3.3.3.3 Leveling Tests

Test elevator car leveling operation and provide a leveling accuracy equal to or less than 3 mm 1/8 inch at each floor with no load in car, balanced load in car, and with rated load in car, in both directions of travel. Determine leveling accuracy at the beginning and at the end of the endurance tests.

3.3.3.4 Temperature Rise Tests

Determine temperature rise of elevator drive machine motor during one-hour full-load test run. Under these conditions, maximum temperature rise must
not exceed acceptable temperature rise indicated on manufacturer's data plate. Start test only when equipment is within 5 degrees C of ambient temperature.

3.3.3.5 Balanced Load Test

Place balanced load in the elevator cab, according to the manufacturer's designed counterbalance. Perform electrical and mechanical balanced load tests of car and counterweight.

3.3.3.6 Motor Ampere Tests

At beginning and end of Endurance test, measure and record motor amperage in both directions of travel and in both no-load and rated load conditions.

3.3.3.7 Elevator Performance and Ride Quality Testing

Evaluate elevator performance to ensure compliance with specification requirements related to the NEII-1 Performance Standards Matrix for New Elevator Installations.

2.10.4 Traveling Cables  
2.10.5 Hoistway Pit Ladder  

PART 3 EXECUTION  

3.1 INSTALLATION  
3.1.1 Structural Members and Finish Materials  
3.1.2 Miscellaneous Requirements  

3.2 FIELD QUALITY CONTROL  

3.3 ACCEPTANCE INSPECTION, TESTING AND COMMISSIONING  
3.3.1 Acceptance Inspection Support  
3.3.2 Testing Materials and Instruments  
3.3.3 Field Tests  
3.3.3.1 Endurance Tests  
3.3.3.2 Speed Tests  
3.3.3.3 Leveling Tests  
3.3.3.4 Temperature Rise Tests  
3.3.3.5 Motor Ampere Tests  
3.3.3.6 Elevator Performance and Ride Quality Testing  
3.3.3.7 Hydraulic Safety Valve (Automatic Shutoff Valve) Tests  
3.3.3.8 Hydraulic Pressure Tests  
3.3.3.9 Pressure Test of Liner/Cylinder Assembly  

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for hydraulic freight elevators.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: All Army and Navy facility designs which include elevators shall comply with the "NAVFAC ITG 2013-01 Elevator Design". This guide is available from the NAVFAC facilitator at http://www.wbdg.org/ffc/navy-navfac/interim-technical-guidance-itg under Interim Technical Guidance.

NOTE: For NAVY projects, any editing of non-bracketed requirements in this specification shall be approved through the NAVFAC FEC VTE Program Lead Certifying Official.
1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B16.11 (2016) Forged Fittings, Socket-Welding and Threaded

AMERICAN WELDING SOCIETY (AWS)

AWS D1.1/D1.1M (2020; Errata 1 2021) Structural Welding Code - Steel

ASTM INTERNATIONAL (ASTM)

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item.
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Submit in accordance with Sections 01 78 23 OPERATION AND MAINTENANCE DATA and 01 78 24.00 20 FACILITY ELECTRONIC OPERATION AND MAINTENANCE SUPPORT INFORMATION (eOMSI).

1.2.1 Shop Drawing Requirements

Provide assembly and arrangement of elevators, accessories, and elevator components. Show location of elevator machine in elevator machine room (MR) or in elevator machinery space (MS). Show location of elevator controller in elevator machine room or elevator control room (CR). Provide details for materials and equipment, including but not limited to operating and signal fixtures, doors, door and car frames, car enclosure, controllers, motors, guide rails and brackets, layout of hoistway in plan and elevation, and other layout information and clearance dimensions.

1.2.2 Product Data Requirements

Provide manufacturers' product data for all elevator components, including but not limited to the following: elevator controller, hydraulic pump unit, hydraulic pump and motor, hydraulic cylinder, hydraulic piping and fittings, car and hall fixture buttons and switches, cab and machine room or control room communication devices, door operator, door protection system, car roller guides, and buffers. For data sheets, provide document identification number or bulletin number, published or copyrighted prior to the date of contract bid opening. Provide controller manufacturer's published procedures for performance of each and all testing required by ASME A17.1/CSA B44.
1.2.3 Design Data

1.2.3.1 Reaction Loads

Provide calculations by registered professional engineer for reaction loads imposed on building by elevator system. Demonstrate calculations complying with ASME A17.1/CSA B44.

1.2.3.2 Heat Loads

Provide calculations from elevator manufacturer, or by registered professional engineer, for total anticipated heat loads generated by all of the elevator equipment.

1.2.3.3 Emergency Power Systems

Where the facility does have an emergency power system, confirm the elevators that will be connected to the emergency power system. Confirm the complete emergency power system and sequence of operation for all elevators, including operation of the elevator lobby manual selection switch. Provide wiring diagrams for building emergency power interface with elevator controls. For elevators not supplied by an emergency power system, provide manufacturers' product data for auxiliary power systems.

1.2.4 Welders' Requirements

Comply with AWS D1.1/D1.1M, Section 5. Include certified copies of field welders' qualifications. List welders' names with corresponding code marks to identify each welder's welding work.

1.2.5 Maintenance Control Program (MCP)

For each elevator, prepare and provide a written Maintenance Control Program (MCP) that complies with ASME A17.1/CSA B44 Section 8.6, including written documentation that details the test procedures for each and every test that is required to be performed by ASME A17.1/CSA B44. Assemble all MCP documentation, and supporting technical attachments, in a single MCP package and provide in both electronic and hard copy. Assemble entire hard copy MCP in 3-ring binders. For each elevator provided, the MCP must include only documentation and instruction that apply to the elevator specified.

For each elevator, provide an additional, separate binder that includes all maintenance, repair, replacement, call back, and other records required by ASME A17.1/CSA B44. The records binder must be kept in the elevator mechanical room, maintained by elevator maintenance and service personnel, and be available at all times to authorized personnel.

Provide detailed information regarding emergency service procedures and elevator installation company personnel contact information. Provide a listing of all tools to be provided to the Contracting Officer as components of the elevator system.

1.3 QUALITY ASSURANCE

1.3.1 Qualification

Provide a designed and engineered elevator system by an elevator contractor regularly engaged in the installation of elevator systems. Provide
elevator components manufactured by companies regularly engaged in the
manufacture of elevator components. Utilize only licensed and certified
elevator personnel for the installation, adjusting, testing, and servicing
of the elevators.

1.3.1.1 Elevator Contractor's Elevator Technicians

For elevator installations in the United States, including United States
territories, perform all elevator related work under the direct guidance of
a state certified elevator technician with a minimum of three years of
experience in the installation of elevator systems of the type and
complexity specified in the contract documents. Provide an endorsement
letter from the elevator manufacturer, certifying that the elevator
specialist is qualified. All elevator technicians must carry a current
certification issued by one of the following organizations:

a. National Association of Elevator Contractors (NAEC)
b. National Elevator Industry Education Program (NEIEP)

1.3.2 Manufacturers' Technical Support

Provide elevator components from manufacturers that provide factory
training and online and live telephone elevator technical support to any
elevator installation, service, and maintenance contractor. Provide
elevator components from manufacturers that guarantee accessibility to all
replacement and repair parts and components to any elevator installation,
service, and maintenance contractor. Use only elevator component
manufacturers that provide current published price lists for all elevator
parts and components.

1.3.3 Operation and Maintenance Data

Assemble all shop drawing and product data material into O&M Data Packages
in accordance with Article SUBMITTALS. Provide two complete O&M Data
Packages in hard copy and two complete electronic O&M data packages on
separate CDs, in PDF format. Provide all O&M Data Packages to Contracting
Officer. Include controller diagnostic documentation and software as
required under Article CONTROL EQUIPMENT.

1.3.4 Wiring Diagrams

Provide complete wiring diagrams and sequence of operations, which show
electrical connections and functions of elevator systems. Provide one set (279 mm by 432 mm)
11 inch by 17 inch minimum size) of wiring diagrams, with
individual sheets laminated in plastic and assembled in binder, to be
stored in the machine room or control room cabinet. Provide one additional
hard copy set and two complete electronic sets on separate CDs, in PDF
format. Provide all wiring diagram sets to the Contracting Officer. Coded
diagrams are not acceptable unless fully identified.

1.3.5 Machine Room/Control Room Cabinet

For storage of O&M Data Packages and Wiring Diagrams, provide locking metal
cabinet with a minimum size of 508 mm W by 305 mm D by 762 mm H 20 inch W
by 12 inch D by 30 inch H. Cabinet must be sized large enough to
accommodate all O&M Data and hardware required in paragraphs OPERATION AND
MAINTENANCE DATA and WIRING DIAGRAMS. Secure cabinet to machine room or
control room wall.
1.4 NEW INSTALLATION SERVICE

**************************************************************************
NOTE: Use Bi-weekly option for Hospitals and other high use facilities.
**************************************************************************

Provide elevator warranty service in accordance with the manufacturer's maintenance plan, warranty requirements and applicable safety codes, for a period of 12 months after the date of acceptance by Contracting Officer. Perform this work during regular working hours. Provide supplies and parts to keep elevator system in operation. Perform service only by factory trained personnel. Provide [Monthly][Bi-weekly] services to include repairs, adjustments, greasing, oiling, and cleaning. Provide service log in elevator machine room or control room and update [Monthly][Bi-weekly], throughout the one-year warranty period.

**************************************************************************
NOTE: One hour emergency service below is standard; only use two hour for remote locations.
**************************************************************************

Provide 24-hour emergency service, with [one hour][two hour] on-site response time, during this period without additional cost to the Government.

1.4.1 Periodic Elevator Certification Inspection and Testing

Provide elevator mechanic to support [NAVFAC ]QEI Certified Elevator Inspector in the periodic six-month and the annual Category 1 elevator certification inspection and testing. Perform Category 1 inspection and testing no greater than 30 days prior to the end of the warranty period. Perform all elevator certification testing in the presence of QEI Certified Elevator Inspector.

In conjunction with the testing noted above, test systems for Emergency Power Operation, Earthquake Emergency Operation, and Hospital Emergency Commandeering Service Operation, as applicable. Schedule so that testing does not interfere with building operations.

1.5 FIRE PROTECTION SYSTEM

**************************************************************************
NOTE: Confirm that sections listed throughout this article are part of project. Add or delete sections as needed for project.
**************************************************************************

Coordinate interface between building fire protection system and elevator controls.

Additional fire protection requirements are located in: [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE;] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE;] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE;] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE;] [Section 28 31 02.00 20 FIRE ALARM REPORTING SYSTEMS - DIGITAL COMMUNICATORS;] [Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION;] [_____] and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.
1.5.1 Fire Alarm Initiating Devices

Fire alarm initiating devices are specified in [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] [_____], including conduit and wiring from each detector to fire protection addressable modules in elevator machine room or control room.

1.5.2 Fire Sprinklers

Provide fire sprinklers in accordance with all applicable safety codes and with [Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION][______]. Provide shutoff valve, check valve, and non-adjustable, zero time-delay flow switch, in each sprinkler line immediately outside of each machine room, control room, and hoistway, as applicable. Provide inspectors' test valve for periodic testing of flow switch and shunt trip disconnect.

Pipe sprinkler piping serving these spaces in a series manner with no laterals. Locate inspectors' test connection at the end of pipe runs such that operation of the test connection will purge air from system piping.

1.5.3 Shunt Trip Disconnect

Provide flow switches specified in paragraph FIRE SPRINKLERS to comply with ASME A17.1/CSA B44 and NFPA 72 for shunt trip of the main line power supply. For each elevator, provide control wiring connecting the flow switch to a shunt trip equipped circuit breaker located in the elevator machine room or control room. Upon flow of water, flow switch will instantaneously cause opening of the shunt-trip circuit breaker and remove power from the elevator. Flow switch must also send a signal to fire alarm control panel to indicate water flow condition.

PART 2 PRODUCTS

2.1 ELEVATOR DESCRIPTION

Provide elevator system that complies with ASME A17.1/CSA B44 in its entirety, ASME A17.2 in its entirety, and additional requirements specified herein. Provide elevator system that meets or exceeds the NEII-1 Ride Quality Performance Standards Matrix (RQPSM). Comply with the RQPSM "Intermediate Performance" criteria.

Provide and install elevators in accordance with 36 CFR 1191 - ABAAS, ICC IBC, IEEE C62.41, NFPA 70 and NFPA 101 requirements.

2.1.1 Elevator Design Parameters

**************************************************************************

NOTE: Traffic Analysis and Minimum Cab Size

Perform a traffic analysis and conduct interviews with the facility user to determine number, size, and type of elevators necessary to serve the needs of the facility user. For Army and Navy projects, utilize NAVFAC ITG 2013-01 Elevator Design to determine Design Type. For minimum elevator speed,
specify 0.64 MPs 125 fpm for 2 story and 0.75 MPs 150 fpm for 3 and 4 story elevators.

Use of a holeless type elevator will be limited to a maximum travel distance of 386 cm 12 ft-8 in.

**************************************************************************

a. Type:  [In-Ground Direct Plunger] [Holeless]

b. Rated load:  [_____] kg lb.

c. Rated Speed:  [0.64][0.75] MPs [125][150] fpm

d. Car Inside Dimensions:  [_____] cm ft. [_____] cm in. wide, [_____] cm ft. [_____] cm in. deep and [_____] cm ft. [_____] cm in. high

e. Hoistway Door Type & Size:  [Manual] [Power operated] Vertical [Rising] [Bi-Parting] [_____] cm ft. [_____] cm in. wide and [_____] cm ft. [_____] cm in. high

f. Car Gate Type:  [Manual] [Power operated] Vertical Rising

**************************************************************************

NOTE: Refer to ASME A17.1/CSA B44 for Classes of loading.

**************************************************************************

g. Loading Type:  Class [A][B][C]

2.1.2 Cab Enclosure and Hoistway Entrance Assemblies

**************************************************************************

NOTE: If retaining 1st option in sentence below, ensure that finishes are indicated, most likely somewhere on the drawings. In either case, indicate finish colors of elevator materials in finish schedule on drawings.

**************************************************************************

NOTE: Specify stainless steel doors, side panels and wall trim in hospital cars.

**************************************************************************

Provide finishes [as indicated.][as listed below:

a. Floor; [mill finish steel diamond plate][painted steel diamond plate][aluminum diamond plate][tongue and groove hardwood][____].

b. Walls; [prefinished steel panels][stainless steel][____].

    Wall trim; [prefinished steel][stainless steel][____].

    Accessories; [handrail][____]

**************************************************************************

NOTE: Retain bracketed phrase for freight elevators that do not have Front and Rear openings.

**************************************************************************
Accessories; Provide in-car horizontal buck-board wall protection on full length of side walls [and back wall] of elevator cab.

c. Car doors, car door returns, and wall reveals; [prefinished steel panels][stainless steel][_____].

d. Ceiling; [prefinished steel panels][stainless steel][anodized aluminum][_____.]

e. Hoistway Entrance Assembly Material and Finishes; [prefinished steel][stainless steel][_____.]

2.2 ELEVATOR OPERATION

ASME A17.1/CSA B44, Introduction, Section 3, Definitions.

**************************************************************************
NOTE: Choose one of the following four types of elevator operation.
**************************************************************************

[2.2.1 Single, Two-Stop, Automatic Operation

**************************************************************************
NOTE: Choose for single elevator serving two landings.
**************************************************************************

Provide Single Two-Stop Automatic Operation.

[2.2.2 Selective Collective Automatic Operation

**************************************************************************
NOTE: Choose for single elevator serving three or more landings.
**************************************************************************

Provide Selective Collective Automatic Operation.

[2.2.3 Duplex Selective Collective Automatic Operation

**************************************************************************
NOTE: Choose for two adjacent elevators.
**************************************************************************

Provide Duplex Selective Collective Automatic Operation. If a car is taken out of service or fails to respond to a landing call within a predetermined adjustable time limit of approximately 40 to 180 seconds, transfer calls to the other car functioning as a single car Selective Collective elevator until the out-of-service car is returned to the system.

[2.2.4 Group Automatic Operation

**************************************************************************
NOTE: Choose for three or more elevators that serve the same elevator lobby.
**************************************************************************
Provide Group Automatic Operation. If a car is taken out of service, or fails to respond to a landing call within a predetermined adjustable time limit of approximately 40 to 180 seconds, transfer calls to another car until out-of-service car is returned to the system.

2.3 SPECIAL OPERATION AND CONTROL

Provide the following special operations and control systems.

2.3.1 Keys for Elevator Key Switches

Provide a minimum of twelve keys per unique cylinder used on all key switches for a single elevator. If there is more than one elevator, additional keys will not be required unless there are additional unique lock cylinders. Provide keys with brass or fiberglass tags marked "PROPERTY OF THE U.S. GOVERNMENT" on one side with function of key or approved code number on the other side.

2.3.2 Firefighters' Emergency Operation (FEO)

**************************************************************************
NOTE: Coordinate FEO Designated Landing with Fire Protection Designer.
**************************************************************************

Provide FEO equipment and signaling devices. The designated level for the FEO Phase I key operated switch is the [ground] floor. In the FEO Phase I fixture, provide FEO Operating Instructions.

2.3.2.1 Firefighters' Emergency Operation (FEO) Key Box

Provide flush mounted, locking, FEO Key Box of a minimum size of 127 mm W by 229 mm H by 38 mm D 5 inch W by 9 inch H by 1.5 inch D. Install at a height of 183 cm 6 feet above floor level and directly above the FEO Phase I key switch. Provide box equipped with lock that uses the FEO K1 key.

2.3.3 Hoistway Access Operation

Provide hoistway access operation with switches at top and bottom terminal landings. Locate switch 183 cm 6 feet above floor level, within 305 mm 12 inches of elevator hoistway entrance frame or with the ferrule exposed when located in the elevator entrance frame.

2.3.4 In-Car Inspection Operation

Provide In-Car Inspection Operation.

2.3.5 Independent Service

Provide exposed key-operated switch in car operating panel to enable independent service and simultaneously disable in-car signals and landing-call responses. Provide indicator lights that automatically illuminate during independent service. For duplex or group operation, if one car is removed from group another car will respond to its hall calls.

2.3.6 Selective Door Operation

For elevator with one or more rear openings at same level as front opening, provide full-selective operation with car and door operating buttons.
clearly marked for front and rear openings, front and rear car button for each such floor, and front and rear "DOOR OPEN" and "DOOR CLOSE" buttons. Only door for which the button was operated opens or closes.

[2.3.7 Elevator Emergency Power Operation]

**************************************************************************
NOTE: Electrical design shall identify the elevators to be connected to the building emergency power system. Identify and define the complete emergency power system for all elevators. When using the 2nd bracketed option in either of the next two subparagraphs, edit as required for project-specific requirements.

For any elevator that is not included in the building emergency power operation, utilize paragraph ELEVATOR AUXILIARY POWER OPERATING SYSTEM.
**************************************************************************

Provide elevator emergency power operation for [all elevators] [elevator 1,2,3...]. Coordinate power supply and control wiring to accomplish initiation and operation of elevators on emergency power.

[2.3.8 Elevator Auxiliary Power Operating System]

Provide elevator emergency auxiliary power operating system for [all elevators] [elevator 1,2,3...].

[2.4 ELEVATOR DRIVE SYSTEM]

Provide hydraulic elevator drive system, including pump unit, piping, cylinder/plunger assembly, and associated equipment, which will operate at a maximum working pressure of 3447 kPag 500 psi or less. Provide complete elevator system that meets or exceeds the NEII-1 Ride Quality Standard, including elevator ride quality and noise levels in car and in elevator machine room and machinery space.

2.4.1 Hydraulic Pump Unit

Provide self-contained pump unit, including oil-hydraulic elevator pump, electric motor, suction-line oil strainer, and structural steel outer base with tank supports and isolation pads. Provide oil tank capacity for full plunger displacement plus at least 38 liters 10 gallons. Provide means to maintain oil temperature between 38 and 54 degrees C 100 and 130 degrees F regardless of ambient temperature. Limit acoustic output in elevator machine room and machinery space to 80 dbA.

2.4.1.1 Pump Motor

Provide intermittent-duty pump motor rated at 120 starts/hour. Provide motor that is sized so that the motor amperage does not exceed the motor data tag amperage in any operating condition, exclusive of acceleration and deceleration. Provide minimum of one mega ohm insulation resistance between conductors and motor frame. Provide motor and pump nameplate and data tags permanently mounted on the outside of the pump unit frame, with all data viewable without the use of mirrors or other tools.
2.4.2 Hydraulic Controls and Equipment

Provide control valve, overspeed safety valve, blowout-proof muffler, and hydraulic pump discharge strainer in the hydraulic oil supply line. Provide two 1/4 turn, ball valve type manual shutoff valves. Provide one in the elevator hoistway pit and one in the elevator machine room or machinery space.

2.4.2.1 Hydraulic Control Valve

Provide constant-velocity, down-speed regulated, control valve. Down-speed regulated control valve allows the car to travel at the same speed in the down direction, regardless of the load on the elevator. In addition, the hydraulic control valve must have built-in adjustment capability to operate the elevator at 140 percent of rated speed to facilitate periodic testing of the overspeed safety valve.

2.4.2.2 Hydraulic Overspeed Safety Valve

Provide overspeed safety valve in hydraulic oil supply line, directly adjacent to the hydraulic cylinder. Provide threaded pipe connections between the hydraulic cylinder and the overspeed valve. Provide valve equipped with manufacturer's manual shutoff feature. Overspeed valve must not be equipped with a manual or automatic lowering feature. Provide adjustable valve with means to seal adjustment after inspection and testing by certified elevator inspector.

2.4.3 Hydraulic Piping and Accessories

**************************************************************************
NOTE: Retain bracketed sentence for in-ground direct plunger type elevators.
**************************************************************************

Provide ASTM A53/A53M or ASTM A106/A106M, Schedule 80, black steel piping with ASME B16.9 or ASME B16.11 fittings for supply piping. Extend schedule 80 piping from the pump control valve body, inside the pump unit, to the hydraulic cylinder in the hoistway. Provide welded or threaded forged pipe fittings for all fittings and components of the hydraulic oil supply line. [For in-ground direct plunger cylinders, provide dielectric union or isolation couplings at each end of the hydraulic oil supply line. ]Provide hangers or supports for all piping and components.

2.4.3.1 Containment of Hydraulic Oil Supply Line

Protect all portions of hydraulic oil supply line that are installed below ground, including portions encapsulated in concrete or covered by construction, with continuous, Schedule 80, PVC. Inside diameter of PVC must be 76 mm 3 inches larger than the outside diameter of the hydraulic oil supply line pipe and couplings.

2.4.4 Hydraulic Elevator Type

**************************************************************************
NOTE: Use of a holeless type elevator with a non-telescoping jack will be limited to a maximum travel distance of 12 ft-8 in.
**************************************************************************
Provide a [in-ground direct plunger] [holeless] direct plunger type hydraulic elevator. Elevator with telescopic or inverted cylinder-plungers are not acceptable and may not be used. Rope hydraulic elevator design is not acceptable and may not be used.

### 2.4.4.1 Cylinder-Plunger (Jack) Unit

Provide a single-stage plunger of seamless steel construction. Provide cylinder with self-stabilizing mount that will support and hold cylinder plumb without the need for stabilization means at the bottom of the cylinder. Provide a threaded, 6 mm 1/4 inch bleeder valve at the top of the cylinder, just below packing gland.

### 2.4.5 Cylinder Well System

**************************************************************************
NOTE: Retain this paragraph and associated subparagraphs for in-ground direct plunger type elevators only.
**************************************************************************

For direct plunger, in-ground type hydraulic elevator, provide a dry, sealed cylinder well system.

#### 2.4.5.1 Well Casing

Locate and drill well for the cylinder well system. Line well with steel casing, minimum 6 mm 1/4 inch wall with welded 13 mm 1/2 inch steel bottom. Set casing plumb.

#### 2.4.5.2 PVC or HDPE Liner

Provide Schedule 80 PVC or HDPE liner with bottom cap and couplings; joints sealed watertight using pipe manufacturer's recommended adhesive or heat welding methods. Provide liner inside diameter not less than 76 mm 3 inches larger than elevator cylinder maximum outside diameter. Liner may be provided as a cylinder manufacturer's applied liner or as a separate component. For separate liner, set liner plumb in well casing, located for cylinder installation. Provide dry, salt-free sand below and around liner to top of well casing.

#### 2.4.5.3 Cylinder Installation

Remove all moisture from inside of liner. Install cylinder plumb, inside liner. Provide a 6 mm 1/4 inch copper evacuation tube inside the liner. The bottom of the evacuation tube must be within 152 mm 6 inch of the bottom of the liner. Top of evacuation tube must extend at least 152 mm 6 inch above pit floor. Provide top of test tube with removable cap to exclude foreign matter. Provide air inlet pressure fitting in top of liner and accessible in pit, for performance of air pressure test. Secure Liner/Cylinder Assembly as recommended by cylinder manufacturer.

#### 2.4.5.4 Cylinder Liner Moisture Sensor System

Provide moisture and oil sensors inside the cylinder liner for detection of oil and water at the bottom of the cylinder liner. Provide sensor monitoring system that will actuate audible and visual alarms and identify the presence of water and identify the presence of oil inside the liner.
2.4.5.5 Seal Top of Well Casing

Upon successful test and certification of Liner/Cylinder assembly, seal gap between steel well casing and liner with foam insert strong enough to retain and support final grouting. Provide 21 MPa 3000 psi grout to a minimum of 102 mm 4 inch thickness and level top of final grouting with pit floor.

2.5 CONTROL EQUIPMENT

Enclose all elevator control equipment in factory-primed and baked-enamel coated sheet-metal cabinets with ventilation louvers and removable or hinged doors. Mount cabinets at a height of 254 mm 10 inches above machine room or control room finish floor.

2.5.1 Motor Control Equipment

Provide elevator motor control with electronic, soft-start motor starter.

2.5.2 Elevator Microprocessor Controller

For each individual elevator controller, and for each group controller, provide a microprocessor controller that complies with the following paragraphs. Provide controller(s) package that includes all hardware and software required for the installation, maintenance, and service of the elevator, in its' entirety. Provide verification of technical support service that the controller manufacturer provides to any licensed elevator installation, service, and maintenance company.

Provide an elevator controller from a manufacturer that provides comprehensive factory training to include controller installation, adjustment, service, and maintenance. The training must be identified as available to any licensed elevator contractor. Provide verification of an established and documented training schedule, with pricing, for factory training classes that manufacturer has provided for a minimum period of one year prior to contract award date.

The elevator controller must be identified as available for purchase and installation by any licensed elevator contractor. All components, parts, diagnostic tools, and software must be available for purchase and installation and use by any licensed elevator contractor; "exchange-only" provisions for the purchase of spare parts are not acceptable. The elevator controller manufacturer must publish an industry competitive price listing for all controller parts, diagnostic tools, and software.

Provide verification of telephone and internet based technical support service that the elevator controller manufacturer provides to any licensed elevator installation, service, and maintenance company at an industry competitive price. The service must include live telephone based technical support for installation, adjustment, maintenance, and troubleshooting of the elevator controller and related elevator components. The service must be available during standard working hours.

Provide an elevator controller that is designed to automatically reestablish normal elevator operation following any temporary loss of power, regardless of duration.
2.5.2.1 Elevator Controller Interface Cabinet

For each individual elevator microprocessor controller, provide a separate elevator control cabinet with an integrated human interface system. For group elevator installations, a single cabinet and interface system with full access to each elevator controller may be utilized. The separate controller interface cabinet must be supplied by the elevator controller manufacturer and include a minimum 305 mm 12 inch wide keyboard and a minimum 254 mm 10 inch monitor. The elevator controller interface cabinet must comply with arc-flash protection requirements of NFPA 70E and UFC 3-560-01.

2.5.2.1.1 Elevator Microprocessor Human Interface

The interface system must provide complete elevator controller interface capability and must include the elevator controller manufacturer's comprehensive package of installation and diagnostic software. The microprocessor interface system must provide unrestricted access to all parameters, all levels of adjustment, and all flags necessary for installation, adjustment, maintenance, and troubleshooting of each elevator and for the elevator group. All software programming must be stored in non-volatile memory. The elevator controller fault log must provide non-volatile memory fault log storage of all faults, trouble calls, and fault history for a minimum of one year and the ability to download or print the fault log. The controller interface must also provide the capability to display and diagnose trouble calls, faults, and shutdowns. Expiring software, degrading operation, and "key" access controls are not acceptable.

2.5.2.2 Software and Documentation

Provide three copies of the manufacturer's maintenance and service diagnostic software, with complete software documentation, that will enable the same level of unrestricted access to all controllers of the same make and model, regardless of the installation date or location. Provide signed certification, from the manufacturer's corporate headquarters, that guarantees that the microprocessor software and access system will not terminate the unlimited and unrestricted access at any future date.

2.5.2.3 Elevator Controller Certification

For elevator installations in the United States, including United States territories, provide an elevator microprocessor controller that has a current certificate of safety code compliance issued by the Technical Standards and Safety Authority (TSSA), Toronto, Canada.

2.6 OPERATING PANELS, SIGNAL FIXTURES, AND COMMUNICATIONS CABINETS

For all panels and fixtures, provide identical and uniform panel and fixture design, material, finish, and components for all elevators. For all panels and fixtures, legibly and indelibly identify all buttons, devices, and all operating positions for each device. Use engraving and backfilling, or photo etching, for button and device designations. Do not use attached signs. Provide elevator manufacturers' standard grade for all key switches unless otherwise specified. All illuminating panels and fixture components must utilize LED lighting for energy efficiency.
2.6.1 Car and Hall Buttons

For all cab and landing fixture buttons, provide industry-standard, vandal resistant push buttons with positive-stop assembly design. Buttons must be minimum 19 mm 3/4 inch diameter, satin-finish stainless steel, with illuminating LED halo.

2.6.1.1 Hall Station Door-Operating Buttons

**************************************************************************
NOTE: Use the following for freight elevators with power-operated bi-parting doors.
**************************************************************************

Provide hall station door-operating buttons, identical in size and design to hall call buttons, but not illuminating.

2.6.2 Freight Car-Operating Panel

**************************************************************************
NOTE: Use two Car Operating Panels for front and rear opening elevators.
**************************************************************************

Provide each car with [one] [two] car operating panel[s] that contains operation controls and communication devices. Provide exposed, flush mounted buttons for the controls identified in subparagraph OPERATOR CONTROLS. Provide a lockable service cabinet for the controls listed in subparagraph SERVICE CONTROLS. Use engraving and backfilling or photo etching for button and switch designations. Do not use attached signs.

2.6.2.1 Operator Controls

In addition to ASME A17.1/CSA B44 requirements, provide the following operating controls, identified as indicated:

a. Illuminating car-call buttons identified to correspond to landings served by the elevator.

b. "DOOR OPEN" and "DOOR CLOSE" buttons. For front and rear openings at the same floor, include the identification "F" and "R" for each opening.

c. Red, illuminating "ALARM" button.

d. Key-operated "Independent Service" switch.

e. "Help" communication device to include communication between elevator cab and elevator machine room or control room.

2.6.2.2 Service Controls

In addition to ASME A17.1/CSA B44 requirements, provide the following operating controls, identified as indicated:

a. Provide a key-operated, three-position switch for "In car Inspection Operation" and "Hoistway Access". The center switch position will provide normal, automatic operation.
b. "Car Light" switch.

c. "Car Fan" switch with two speed settings identified.

d. 120-volt ac 60 Hz single-phase duplex electrical outlet of ground-fault-circuit-interrupt (GFCI) design.

2.6.2.3 Certificate Window

Provide a minimum 102 mm wide by 152 mm high 4 inch wide by 6 inch high certificate window for elevator inspection certificate. Locate window in the Service Controls door of the Car Operating Panel.

2.6.2.4 Emergency Signaling Devices

Provide an audible signaling device, operable from the Car Operating Panel button marked "ALARM". The audible signaling device must have a sound pressure rating between 80 and 90 dBA at 3 meters 10 ft. Provide battery backup power capable of operating the audible signaling device for at least 1 hour.

2.6.3 Elevator In-Car Position Indicators

For all elevators, provide illuminating position indicator in the Car Operating Panel.

2.6.4 Elevator In-Car Direction Indicators

For 2-stop elevator installations, provide visual direction indicators and audible car arrival signal in the elevator car door jamb, in accordance with ABA Standards. Visual indicators must be visible from the hall call fixture.

2.6.5 Hall Call Landing Fixtures

Provide a hall call fixture adjacent to each elevator. Provide a single push-button for terminal landings and dual push-buttons, up and down, at intermediate landings.

2.6.5.1 Designated Landing Hall Call Fixture

2.6.5.1.1 Location of COMMUNICATION MEANS FAILURE (CMF) Visual Signal

When required by ASME A17.1/CSA B44, provide an elevator CMF audible and illuminating signal, and reset switch, in the FEO Designated Landing hall call fixture. Mount the signal and reset switch at a minimum of 178 mm 7 inches above the "UP" hall call button.

2.6.5.1.2 COMMUNICATION MEANS FAILURE (CMF) Visual and Audible Signal Operation

Provide a CMF visual and audible signal system that conforms to ASME A17.1/CSA B44. Provide continuous verification of operability of the telephone line and immediate activation of audible and visual signals when verification means determines that the telephone line is not functioning. Provide illumination of visual signal at one second intervals. Provide a minimum of 65 dBA audible signal at 30 second intervals.
2.6.5.1.3 Firefighters' Emergency Operation Phase I Switch and Visual Signal

When required by ASME A17.1/CSA B44, provide an elevator Firefighters' Emergency Operation Phase I switch and illuminating visual signal in the FEO Designated Landing hall call fixture. Provide FEO Phase I visual signal that is designed with intermittent, flashing, illumination when actuated by the machine room, control room or hoistway fire alarm initiating device. Locate FEO Phase I key switch above the CMF visual signal with a minimum of 152 mm (6 inches) vertical between the centerlines of the CMF signal and the FEO Phase I key switch. Locate FEO Phase I visual signal directly above the Phase I switch. In addition, locate Elevator Corridor Call Station Pictograph at top of hall call fixture.

2.6.6 Elevator Car Position and Direction Indicators and Car Arrival Signal

For elevator installations with three or more stops, provide a separate hall landing fixture that includes the visual elevator position indicator, visual direction indicators, and audible car arrival signal, in accordance with ABA Standards.

2.6.7 Designated Landing Elevator Identification Fixture

For duplex and group elevator installations, provide a separate elevator identification fixture for each elevator, with identification engraved and backfilled with a contrasting color. Number elevators from left to right, as seen during primary approach from building main entrance to elevator lobby. For multiple elevator groups, begin numbering with group that is closest to the building main entrance.

2.6.8 Emergency or Standby Power

When emergency or standby power is provided for elevator operation, provide an elevator emergency power visual indicator that conforms to ASME A17.1/CSA B44. Locate the visual signal in the Firefighters Emergency Operation fixture for each simplex elevator and for each elevator group. When an emergency power selector switch is required, provide switch in a separate, flush mounted fixture located at the designated level, in view of all elevator entrances.

2.7 CAR DOOR EQUIPMENT

2.7.1 Car Door Operator

Provide elevator door operator equipment and circuitry that is designed and installed as discreet communication. Serial communication must not be used for this system.

2.7.2 Infra-red Curtain Unit

Provide Infra-red Curtain Unit (ICU) with multiple infra-red beams that protect to the full height and width of the door opening. Provide door nudging operation.

2.8 FREIGHT ELEVATOR GUIDES, PLATFORM, AND ENCLOSURE

2.8.1 Guides

Provide coil-spring loaded roller guide assemblies in adjustable mountings on each side of car and counterweight frames in accurate alignment at top
and bottom of frames. For freight elevators with a rated load greater than 10,000 lbs., slide guides may be used in lieu of roller guides.

2.8.2 Car Shell Return Panels, Doors, Entrance Columns, and Transom

Provide 16 Gauge minimum [prefinished steel][stainless steel] cab wall panels and entrance components. Use same material and finish for all hoistway and car entrance assemblies. Apply sound-deadening material on exterior of all cab wall panels.

2.8.3 Car Enclosure Top

Provide reinforced, 12 gauge minimum steel car enclosure top. Provide hinged emergency exit with lock that complies with the seismic risk zone 2 or greater design requirements of ASME A17.1/CSA B44. Locate emergency exit hinge towards the rear of the elevator cab. Design and configure the elevator cab interior ceiling to provide convenient and unobstructed access to, and use of, emergency exit from inside the elevator cab.

2.8.4 Car Door

Provide [two section ]vertical rising gate with power door operator.

2.8.5 Car Entrance Sill

Provide one piece steel car entrance sill(s). Set sills level and flush with cab finish floor.

2.8.6 In-Car Horizontal Buck-Board Wall Protection

**************************************************************************
NOTE: Retain bracketed phrase for freight elevators that do not have Front and Rear openings.
**************************************************************************

Provide minimum 64 mm thick by 305 mm high 2 1/2 inch thick by 12 inch high #2 Oak protection boards on all side walls [and back wall] of the elevator cab. Position boards at a height to prevent damage from fork lift traffic.

2.8.7 Cab Finish Floor

Provide cab finish floor with top of finish floor flush with the cab sill.

2.8.8 Car Fan

Provide 2-speed fan for car enclosure forced ventilation. Fan must be mounted in the car enclosure top.

2.8.9 Car Lighting

Utilize LED lighting for elevator car interior illumination. Provide a minimum of 10 foot-candles, measured at all areas of the car enclosure floor. Provide automatic car lighting operation that will turn off car lights after 3 minutes of inactivity. Car lights must automatically turn on upon actuation of an elevator car or hall call.

2.9 FREIGHT ELEVATOR HOISTWAY DOORS AND ENTRANCES

Provide hoistway entrance assemblies with a minimum 1-1/2 hour fire
rating. Use same material and finish for all hoistway and car entrance assemblies.

2.9.1 Hoistway Entrance Frames

Provide 14 gage minimum [prefinished carbon sheet steel][stainless steel] hoistway entrance frames. Provide door panels with truckable sill. Provide minimum 102 mm by 229 mm 4 inch by 9 inch height vision panel in upper door panel.

2.9.2 Hoistway Entrance Sills

Provide one-piece 8 mm thick, 152 mm by 152 mm 5/16 inch thick, 6 inch by 6 inch steel angle iron sill with top of sill flush with hoistway landing finish floor. Steel angle-iron sill must be set into and fully supported by the concrete floor or the steel building structure. Use same material for all hoistway and car entrance sills.

2.10 HOISTWAY EQUIPMENT

2.10.1 Car Guide Rails and Fastenings

Provide T-section type guide rails for car. Paint rail shanks with one coat of black enamel.

2.10.2 Pit Equipment

******************************************************************************
NOTE: Delete bracketed phrase for holeless applications.
******************************************************************************

Provide rail-to-rail pit channels to serve as mounting surface for main guide rails [, hydraulic cylinder ] and car buffers. Method of installation of channels, brackets and buffer mounts must be such that pit waterproofing is not punctured.

2.10.3 Pit "STOP" Switch

Provide push-to-stop/pull-to-run type pit "STOP" switch.

2.10.4 Traveling Cables

Suspend traveling cables by means of self-tightening webbed devices or internal suspension members.

2.10.5 Hoistway Pit Ladder

Provide continuous horizontal rungs for the full height of the pit ladder.

PART 3 EXECUTION

3.1 INSTALLATION

Install in accordance with DOD design criteria, contract specifications, manufacturer's instructions, NEII-1 Building Transportation Standards and Guidelines, and all applicable building and safety code requirements.
3.1.1 Structural Members and Finish Materials

Do not cut or alter structural members. Do not alter finish materials from manufacturer's original design. Restore any damaged or defaced work to original condition.

3.1.2 Miscellaneous Requirements

Provide recesses, cutouts, slots, holes, patching, grouting, and refinishing to accommodate elevator installation. Use core drilling to drill all new holes in concrete. Finish work to be straight, level, and plumb. During installation, protect machinery and equipment from dirt, water, or mechanical damage. At completion, clean all work and spot paint.

3.2 FIELD QUALITY CONTROL

The Contractor will provide and utilize a third-party licensed and certified Qualified Elevator Inspector (QEI) to conduct elevator pre-acceptance inspection and testing. The QEI must perform inspections and witness tests to ensure that the installation conforms to all applicable safety codes and contract requirements. The QEI will be directly employed by the Contractor and independent of the elevator contractor.

Upon completion, the QEI must provide written test data for all ASME A17.1/CSA B44 Acceptance Tests and written certification that the elevator is complete and ready for final Acceptance Inspection, Testing, and Commissioning.

3.3 ACCEPTANCE INSPECTION, TESTING AND COMMISSIONING

When elevator system installation is complete and ready for final inspection, notify Contracting Officer that elevator system is ready for Acceptance Inspection, Testing, and Commissioning. Provide QEI certification specified in Article FIELD QUALITY CONTROL.

**************************************************************************

NOTE: Use the first bracketed paragraph for all Navy Facilities and for all projects managed by NAVFAC FEAD. Use the second bracketed paragraph for Air Force, Army, and NASA projects that are not managed by NAVFAC FEAD.

**************************************************************************

[ Contracting Officer will obtain services of Naval Facilities Engineering Command (NAVFAC) QEI Certified Elevator Inspector. NAVFAC QEI will utilize the applicable NAVFAC Elevator Acceptance Inspection Form to record the results of inspection and testing and to identify safety code and contract deficiencies. Specific values must be provided for all tests required by ASME A17.1/CSA B44, ASME A17.2, and contract documents. Upon completion of inspection and testing, the NAVFAC QEI will sign a copy of the completed forms and provide the signed copy to the Contracting Officer or representative. Within two weeks of the inspection, the QEI will also prepare a formal inspection report, including all test results and deficiencies. Upon successful completion of inspection and testing, NAVFAC Certified Elevator Inspector will complete, sign and post form NAVFACENGCOM 9-11014/23(Rev.9-2009), Elevator Inspection Certificate.

][Contracting Officer will obtain the services of a third-party QEI Certified
Elevator Inspector. The QEI must utilize an Elevator Acceptance Inspection Form to record the results of inspection and all testing and to identify safety code and contract deficiencies. Specific values must be provided for all tests required by ASME A17.1/CSA B44, ASME A17.2, and contract documents. Upon completion of inspection and testing, the QEI must sign a copy of the completed forms and provide to the Contracting Officer. Within two weeks of the inspection, the QEI must also prepare a formal inspection report, including all test results and deficiencies. Upon successful completion of inspection and testing, the QEI will complete, sign, and provide a certificate of compliance with ASME A17.1/CSA B44.

3.3.1 Acceptance Inspection Support

Prime and Elevator Contractors must provide inspection support and perform all required tests, in order to demonstrate proper operation of each elevator system and to prove that each system complies with contract requirements and all applicable building and safety codes. Inspection procedures in ASME A17.2 form a part of this inspection and acceptance testing. All inspection and testing must be conducted in the presence of the Qualified Elevator Inspector (QEI).

If the elevator does not comply with all contract and safety code requirements on the initial Acceptance Inspection and Test, the Contractor is responsible for all costs involved with re-inspection and re-testing required as a result of contractor delays and discrepancies discovered during inspection and testing.

3.3.2 Testing Materials and Instruments

Furnish all testing materials and instruments necessary for Acceptance Inspection, Testing and Commissioning. At a minimum, include calibrated test weights, tachometer, accelerometer, hydraulic pressure gauge, 600-volt mega ohm meter, volt meter and ammeter, infrared temperature gauge, door pressure gage, dynamometer, and 6 meter 20 foot tape measure.

3.3.3 Field Tests

3.3.3.1 Endurance Tests

Test each elevator for a period of one hour continuous, automatic operation, with specified rated load in the elevator cab. During the one hour test, stop car at each floor, in both directions of travel, and allow automatic door open and close operation. The requirements for Automatic Operation, Rated Speed, Leveling, Temperature Rise and Motor Amperes must be met throughout the duration of the Endurance Test. Restart the one hour test period from the beginning, following any shutdown or failure.

3.3.3.2 Speed Tests

Determine actual speed of each elevator, in both directions of travel, with rated load and with no load in elevator car. Make Speed tests at the beginning and at the end of the Endurance test. Determine speed by tachometer reading or accelerometer, excluding accelerating and slow-down zones. Under all conditions, minimum acceptable elevator speed is the Rated speed specified. Maximum acceptable elevator speed is 110 percent of Rated speed.
3.3.3.3 Leveling Tests
Test elevator car leveling operation and provide a leveling accuracy equal to or less than \(3 \text{ mm} \ 1/8 \text{ inch}\) at each floor with no load in car, and with rated load in car, in both directions of travel. Determine leveling accuracy at the beginning and at the end of the endurance tests.

3.3.3.4 Temperature Rise Tests
Determine temperature rise of elevator pump motor and hydraulic fluid during one-hour full-load test run. Under these conditions, maximum temperature rise must not exceed acceptable temperature rise indicated on manufacturer's data plate. Start test only when equipment is within 5 degrees C of ambient temperature.

3.3.3.5 Motor Ampere Tests
At beginning and end of Endurance test, measure and record motor amperage in both directions of travel and in both no-load and rated load conditions.

3.3.3.6 Elevator Performance and Ride Quality Testing
Evaluate elevator performance to ensure compliance with specification requirements related to the NEII-1 Performance Standards Matrix for New Elevator Installations.

3.3.3.7 Hydraulic Safety Valve (Automatic Shutoff Valve) Tests
In order to ensure consistent performance, regardless of hydraulic oil temperature, test the Hydraulic Safety Valve twice. Test once before the one-hour endurance test and once immediately after the one-hour test. For elevator certification, safety valve must perform to code in both tests.

3.3.3.8 Hydraulic Pressure Tests
Check the hydraulic static pressure and rated-speed operating pressure at the hydraulic control valve, under both no load and rated load conditions.

3.3.3.9 Pressure Test of Liner/Cylinder Assembly
Perform 138 kPag 20 psig pressure test of the completed and installed liner/cylinder assembly. Test liner/cylinder assembly as a sealed unit. Provide safety relief valve set to relieve at 138 kPag; 114 mm 20 psig; 4.5 inch diameter dial pressure gage scaled for 0 to 175 kPag 0 to 50 psig and calibrated to 0.5 percent accuracy; and an air pressure admission throttle and shutoff valve. For safety, pressure test must only be performed when liner and cylinder are fully inserted and assembled in the well casing. Perform the test from remote location outside of the elevator pit. Perform test in the presence of, and witnessed by, a Certified Elevator Inspector.

NOTE: This guide specification covers the requirements for hydraulic passenger elevators.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: All Army and Navy facility designs which include elevators shall comply with the "NAVFAC ITG 2013-01 Elevator Design". This guide is available from the NAVFAC facilitator at http://www.wbdg.org/ffc/navy-navfac/interim-technical-guidance-itg under Interim Technical Guidance.

NOTE: For NAVY projects, any editing of non-bracketed requirements in this specification must be approved through the NAVFAC FEC VTE Program Lead Certifying Official.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

   Elevator System; G[, [_____]]
   Elevator Components; G[, [_____]]
   Elevator Machine; G[, [_____]]
   Elevator Controller; G[, [_____]]
   Wiring Diagrams; G[, [_____]]

SD-03 Product Data

**************************************************************************
NOTE: For Army projects, delete the bracketed items. For Navy projects, keep the bracketed items.

**************************************************************************

   Elevator and Accessories[; G[, [_____]]]
   Elevator Components[; G[, [_____]]]
   Data Sheets[; G[, [_____]]]
   Elevator Microprocessor Controller; G[, [_____]]
1.2.1 Shop Drawing Requirements

Provide assembly and arrangement of elevators, accessories, and elevator components. Show location of elevator machine in elevator machine room (MR) or machinery space (MS). Show location of elevator controller in elevator machine room or elevator control room (CR). Provide details for materials and equipment, including but not limited to operating and signal fixtures, doors, door and car frames, car enclosure, controllers, motors, guide rails and brackets, layout of hoistway in plan and elevation, and other layout information and clearance dimensions.

1.2.2 Product Data Requirements

Provide manufacturers' product data for all elevator components, including but not limited to the following: elevator controller, hydraulic pump unit, hydraulic pump and motor, hydraulic cylinder, hydraulic piping and fittings, car and hall fixture buttons and switches, cab and machine room or control room communication devices, door operator, door protection system, car roller guides, and buffers. For data sheets, provide document identification number or bulletin number, published or copyrighted prior to the date of contract bid opening. Provide controller manufacturer's published procedures for performance of each and all testing required by ASME A17.1/CSA B44.
1.2.3 Design Data

1.2.3.1 Reaction Loads

Provide calculations by registered professional engineer for reaction loads imposed on building by elevator system. Demonstrate calculations complying with ASME A17.1/CSA B44.

1.2.3.2 Heat Loads

Provide calculations from elevator manufacturer, or by registered professional engineer, for total anticipated heat loads generated by all of the elevator equipment.

1.2.3.3 Emergency Power Systems

Where the facility does have an emergency power system, confirm the elevators that will be connected to the emergency power system. Confirm the complete emergency power system and sequence of operation for all elevators, including operation of the elevator lobby manual selection switch. Provide wiring diagrams for building emergency power interface with elevator controls. For elevators not supplied by an emergency power system, provide manufacturers' product data for auxiliary power systems.

1.2.4 Welders' Requirements

Comply with AWS D1.1/D1.1M, Section 5. Include certified copies of field welders' qualifications. List welders' names with corresponding code marks to identify each welder's welding work.

1.2.5 Maintenance Control Program (MCP)

For each elevator, prepare and provide a written Maintenance Control Program (MCP) that complies with ASME A17.1/CSA B44 Section 8.6, including written documentation that details the test procedures for each and every test that is required to be performed by ASME A17.1/CSA B44. Assemble all MCP documentation, and supporting technical attachments, in a single MCP package and provide in both electronic and hard copy. Assemble entire hard copy MCP in 3-ring binders. For each elevator provided, the MCP must include only documentation and instruction that apply to the elevator specified.

For each elevator, provide an additional, separate binder that includes all maintenance, repair, replacement, call back, and other records required by ASME A17.1/CSA B44. The records binder must be kept in the elevator mechanical room, maintained by elevator maintenance and service personnel, and be available at all times to authorized personnel.

Provide detailed information regarding emergency service procedures and elevator installation company personnel contact information. Provide a listing of all tools to be provided to the Contracting Officer as components of the elevator system.

1.3 QUALITY ASSURANCE

1.3.1 Qualification

Provide a designed and engineered elevator system by an elevator contractor regularly engaged in the installation of elevator systems. Provide
elevator components manufactured by companies regularly engaged in the manufacture of elevator components. Utilize only licensed and certified elevator personnel for the installation, adjusting, testing, and servicing of the elevators.

1.3.1.1 Elevator Contractor's Elevator Technicians

For elevator installations in the United States, including United States territories, perform all elevator related work under the direct guidance of a state certified elevator technician with a minimum of three years of experience in the installation of elevator systems of the type and complexity specified in the contract documents. Provide an endorsement letter from the elevator manufacturer, certifying that the elevator specialist is qualified. All elevator technicians must carry a current certification issued by one of the following organizations:

a. National Association of Elevator Contractors (NAEC)

b. National Elevator Industry Education Program (NEIEP)

1.3.2 Manufacturers' Technical Support

Provide elevator components from manufacturers that provide factory training and online and live telephone elevator technical support to any elevator installation, service, and maintenance contractor. Provide elevator components from manufacturers that guarantee accessibility to all replacement and repair parts and components to any elevator installation, service, and maintenance contractor. Use only elevator component manufacturers that provide current published price lists for all elevator parts and components.

1.3.3 Operation and Maintenance Data

Assemble all shop drawing and product data material into O&M Data Packages in accordance with Article SUBMITTALS. Provide two complete O&M Data Packages in hard copy and two complete electronic O&M data packages on separate CDs, in PDF format. Provide all O&M Data Packages to Contracting Officer. Include controller diagnostic documentation and software as required under Article CONTROL EQUIPMENT.

1.3.4 Wiring Diagrams

Provide complete wiring diagrams and sequence of operations, which show electrical connections and functions of elevator systems. Provide one set (279 mm by 432 mm) 11 inch by 17 inch minimum size) of wiring diagrams, with individual sheets laminated in plastic and assembled in binder, to be stored in the machine room or control room cabinet. Provide one additional hard copy set and two complete electronic sets on separate CDs, in PDF format. Provide all wiring diagram sets to the Contracting Officer. Coded diagrams are not acceptable unless fully identified.

1.3.5 Machine Room/Control Room Cabinet

For storage of O&M Data Packages and Wiring Diagrams, provide locking metal cabinet with a minimum size of 508 mm W by 305 mm D by 762 mm H 20 inch W by 12 inch D by 30 inch H. Cabinet must be sized large enough to accommodate all O&M Data and hardware required in paragraphs OPERATION AND MAINTENANCE DATA and WIRING DIAGRAMS. Secure cabinet to machine room or control room wall.
1.4 NEW INSTALLATION SERVICE

**************************************************************************
NOTE: Use Bi-weekly option for Hospitals and other high use facilities.
**************************************************************************

Provide elevator warranty service in accordance with the manufacturer's maintenance plan, warranty requirements and applicable safety codes, for a period of 12 months after the date of acceptance by Contracting Officer. Perform this work during regular working hours. Provide supplies and parts to keep elevator system in operation. Perform service only by factory trained personnel. Provide [Monthly][Bi-weekly] services to include repairs, adjustments, greasing, oiling, and cleaning. Provide service log in elevator machine room or control room and update [Monthly][Bi-weekly], throughout the one-year warranty period.

**************************************************************************
NOTE: One hour emergency service below is standard; only use two hour for remote locations.
**************************************************************************

Provide 24-hour emergency service, with [one hour][two hour] on-site response time, during this period without additional cost to the Government.

1.4.1 Periodic Elevator Certification Inspection and Testing

Provide elevator mechanic to support [NAVFAC ]QEI Certified Elevator Inspector in the periodic six-month and the annual Category 1 elevator certification inspection and testing. Perform Category 1 inspection and testing no greater than 30 days prior to the end of the warranty period. Perform all elevator certification testing in the presence of QEI Certified Elevator Inspector.

In conjunction with the testing noted above, test systems for Emergency Power Operation, Earthquake Emergency Operation, and Hospital Emergency Commandeering Service Operation, as applicable. Schedule so that testing does not interfere with building operations.

1.5 FIRE PROTECTION SYSTEM

**************************************************************************
NOTE: Confirm that sections listed throughout this article are part of project. Add or delete sections as needed for project.
**************************************************************************

Coordinate interface between building fire protection system and elevator controls.

Additional fire protection requirements are located in: [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE;] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE;] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE;] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE;] [Section 28 31 02.00 20 FIRE ALARM REPORTING SYSTEMS - DIGITAL COMMUNICATORS;] [Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION;] [_____] and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.
1.5.1 Fire Alarm Initiating Devices

Fire alarm initiating devices are specified in [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] [_____], including conduit and wiring from each detector to fire protection addressable modules in elevator machine room or control room.

1.5.2 Fire Sprinklers

Provide fire sprinklers in accordance with all applicable safety codes and with [Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION][______]. Provide shutoff valve, check valve, and non-adjustable, zero time-delay flow switch, in each sprinkler line immediately outside of each machine room, control room, and hoistway, as applicable. Provide inspectors' test valve for periodic testing of flow switch and shunt trip disconnect.

Pipe sprinkler piping serving these spaces in a series manner with no laterals. Locate inspectors' test connection at the end of pipe runs such that operation of the test connection will purge air from system piping.

1.5.3 Shunt Trip Disconnect

Provide flow switches specified in paragraph FIRE SPRINKLERS to comply with ASME A17.1/CSA B44 and NFPA 72 for shunt trip of the main line power supply. For each elevator, provide control wiring connecting the flow switch to a shunt trip equipped circuit breaker located in the elevator machine room or control room. Upon flow of water, flow switch will instantaneously cause opening of the shunt-trip circuit breaker and remove power from the elevator. Flow switch must also send a signal to fire alarm control panel to indicate water flow condition.

PART 2 PRODUCTS

2.1 ELEVATOR DESCRIPTION

Provide elevator system that complies with ASME A17.1/CSA B44 in its entirety, ASME A17.2 in its entirety, and additional requirements specified herein. Provide elevator system that meets or exceeds the NEII-1 Ride Quality Performance Standards Matrix (RQPSM). Comply with the RQPSM "Intermediate Performance" criteria.

Provide and install elevators in accordance with 36 CFR 1191 - ABAAS, ICC IBC, IEEE C62.41, NFPA 70 and NFPA 101 requirements.

2.1.1 Elevator Design Parameters

**************************************************************************
NOTE: Traffic Analysis and Minimum Cab Size
**************************************************************************

Perform a traffic analysis and conduct interviews with the facility user to determine number, size, and type of elevators necessary to serve the needs of the facility user. For Army and Navy projects, utilize NAVFAC ITG 2013-01 Elevator Design to determine Design Type. For minimum elevator speed,
specify 0.64 MPs 125 fpm for 2 story and 0.75 MPs 150 fpm for 3 and 4 story elevators.

Use of a holeless type elevator will be limited to a maximum travel distance of 386 cm 12 ft-8 in.

Size and capacity configurations are limited to three basic configurations as listed in the subparagraphs below. In the rare case that the listed configurations do not meet project requirements, more extensive project-specific editing will be required.

2.1.1.1 Elevator No.____ - Emergency Medical Service Accessibility (EMSA)

NOTE: Emergency Medical Service Accessibility (EMSA): For each building of two stories or greater, provide at least one elevator with a minimum size and arrangement to accommodate an ambulance stretcher 610 mm by 2134 mm 24 inch by 84 inch, with not less than 127 mm 5 inch radius corners, in the open, horizontal, position. For buildings with multiple elevators, an EMSA elevator must be accessible from all locations in the building; otherwise additional elevator(s) shall also be EMSA.

For two size and capacity configurations of elevators will meet this requirement. For standard passenger applications use the 1588 kg 3500 lb. capacity, single speed side slide described in this subparagraph. The larger elevator sized to accommodate pallet-size light freight loading described in next subparagraph below will also meet EMSA requirements.

Provide elevator(s) with minimum size and arrangement to accommodate an ambulance stretcher 610 mm by 2134 mm with not less than 127 mm 24-inch by 84-inch with not less than 5-inch radius corners, in the open, horizontal position.

a. Type: [In-Ground Direct Plunger] [Holeless]

b. Rated load: 1588 kg 3500 lb.

c. Rated Speed: [0.64][0.75] MPs [125][150] fpm

d. Car Door Type: Single-speed side slide.

e. Car Door Opening Width: 107 cm 3 ft.-6 in. minimum, or [____].

2.1.1.2 Elevator No.____ - Larger Capacity (Pallet-Sized) Loading

NOTE: Where a larger capacity elevator is required to accommodate light freight, typically pallet-size loading, use this subparagraph. Elevator shall
typically be 1814-2040 kg 4000-4500 lb. capacity (may be upwards of 2722 kg 6000 lbs. in rare instances), single speed center opening, 48 inch door opening width, and will typically be deeper than the 1588 kg 3500 lb. EMSA elevator above. 

This larger elevator will also meet the EMSA requirements described above.

**************************************************************************

a. Type: [In-Ground Direct Plunger] [Holeless]

b. Rated load: [1814][2040] kg [4000][4500][_____] lb.

c. Rated Speed: [0.64][0.75] MPs [125][150] fpm

d. Car Door Type: Single-speed center opening, horizontally sliding.

e. Car Door Opening Width: [122 cm 4 ft.-0 in.][137 cm 4 ft.-6 in.]

2.1.1.3 Elevator No.[_____] - Non-EMSA Elevator

**************************************************************************

NOTE: For smaller elevators where EMSA is not required (covered by one of the two elevator types above), this subparagraph may be used. Typical application would be an elevator bank where one elevator meets EMSA requirements. Elevator shall be 2500 lb. capacity, 42 inch door opening width, and either side slide or center opening, typically to match other elevators in the bank.

This elevator will not meet EMSA requirements.

**************************************************************************

a. Type: [In-Ground Direct Plunger] [Holeless]

b. Rated load: 1134 kg 2500 lb.

c. Rated Speed: [0.64][0.75] MPs [125][150] fpm

d. Car Door Type: Single speed [side slide][center opening].

e. Car Door Opening Width: 107 cm 3 ft.-6 in. minimum, or [____].

2.1.2 Cab Enclosure and Hoistway Entrance Assemblies

**************************************************************************

NOTE: If retaining 1st option in sentence below, ensure that finishes are indicated, most likely somewhere on the drawings. In either case, indicate finish colors of elevator materials in finish schedule on drawings.

**************************************************************************

**************************************************************************

NOTE: Specify stainless steel doors, side panels and wall trim in hospital elevator cabs.

**************************************************************************
Provide finishes [as indicated.] [as listed below:

a. Floor; [carpet] [vinyl composition tile] [vinyl sheet tile] [____].

b. Walls; [prefinished steel] [laminated plastic on plywood] [stainless steel] [____]. Provide each cab wall with equally spaced and equally sized wall panels. All wall panel fasteners must be concealed.

   Wall trim; [prefinished steel] [stainless steel] [____].

   Accessories; Provide hand rails on full length of back wall and side walls of elevator cab.

c. Car doors, car door returns, and wall reveals; [prefinished steel panels] [stainless steel] [____].

d. Ceilings; [supported] [prefinished steel panels] [anodized aluminum] [eggcrate] [____].

   Ceiling frame; [prefinished steel] [stainless steel] [anodized aluminum] [____].

e. Hoistway Entrance Assembly Material and Finishes; [prefinished steel] [stainless steel] [____].]

2.2 ELEVATOR OPERATION

ASME A17.1/CSA B44, Introduction, Section 3, Definitions.

******************************************************************************

NOTE: Choose one of the following four types of elevator operation.

******************************************************************************

2.2.1 Single, Two-Stop, Automatic Operation

******************************************************************************

NOTE: Choose for single elevator serving two landings.

******************************************************************************

Provide Single Two-Stop Automatic Operation.

]2.2.2 Selective Collective Automatic Operation

******************************************************************************

NOTE: Choose for single elevator serving three or more landings.

******************************************************************************

Provide Selective Collective Automatic Operation.

]2.2.3 Duplex Selective Collective Automatic Operation

******************************************************************************

NOTE: Choose for two adjacent elevators.

******************************************************************************
Provide Duplex Selective Collective Automatic Operation. If a car is taken out of service or fails to respond to a landing call within a predetermined adjustable time limit of approximately 40 to 180 seconds, transfer calls to the other car functioning as a single car Selective Collective elevator until the out-of-service car is returned to the system.

[2.2.4] Group Automatic Operation

**************************************************************************
NOTE: Choose for three or more elevators that serve the same elevator lobby.
**************************************************************************

Provide Group Automatic Operation. If a car is taken out of service, or fails to respond to a landing call within a predetermined adjustable time limit of approximately 40 to 180 seconds, transfer calls to another car until out-of-service car is returned to the system.

[2.3] SPECIAL OPERATION AND CONTROL

Provide the following special operations and control systems.

2.3.1 Keys for Elevator Key Switches

Provide a minimum of twelve keys per unique cylinder used on all key switches for a single elevator. If there is more than one elevator, additional keys will not be required unless there are additional unique lock cylinders. Provide keys with brass or fiberglass tags marked "PROPERTY OF THE U.S. GOVERNMENT" on one side with function of key or approved code number on the other side.

2.3.2 Firefighters' Emergency Operation (FEO)

**************************************************************************
NOTE: Coordinate FEO Designated Landing with Fire Protection Designer.
**************************************************************************

Provide FEO equipment and signaling devices. The designated level for the FEO Phase I key operated switch is the [ground][_____] floor. In the FEO Phase I fixture, provide FEO Operating Instructions.

2.3.2.1 Firefighters' Emergency Operation (FEO) Key Box

Provide flush mounted, locking, FEO Key Box of a minimum size of 127 mm W by 229 mm H by 38 mm D 5 inch W by 9 inch H by 1.5 inch D. Install at a height of 183 cm 6 feet above floor level and directly above the FEO Phase I key switch. Provide box equipped with lock that uses the FEO K1 key.

2.3.3 Hoistway Access Operation

Provide hoistway access operation with switches at top and bottom terminal landings. Locate switch 183 cm 6 feet above floor level, within 305 mm 12 inches of elevator hoistway entrance frame or with the ferrule exposed when located in the elevator entrance frame.

2.3.4 In-Car Inspection Operation

Provide In-Car Inspection Operation.
2.3.5 Independent Service

Provide exposed key-operated switch in car operating panel to enable independent service and simultaneously disable in-car signals and landing-call responses. Provide indicator lights that automatically illuminate during independent service. For duplex or group operation, if one car is removed from group another car will respond to its hall calls.

2.3.6 Selective Door Operation

For elevator with one or more rear openings at same level as front opening, provide full-selective operation with car and door operating buttons clearly marked for front and rear openings, front and rear car button for each such floor, and front and rear "DOOR OPEN" and "DOOR CLOSE" buttons. Only door for which the button was operated opens or closes.

[2.3.7 Elevator Emergency Power Operation

**************************************************************************

NOTE: Electrical design shall identify the elevators to be connected to the building emergency power system. Identify and define the complete emergency power system for all elevators. When using the 2nd bracketed option in either of the next two subparagraphs, edit as required for project-specific requirements.

For any elevator that is not included in the building emergency power operation, utilize paragraph ELEVATOR AUXILIARY POWER OPERATING SYSTEM.

**************************************************************************

Provide elevator emergency power operation for [all elevators] [elevator 1,2,3...]. Coordinate power supply and control wiring to accomplish initiation and operation of elevators on emergency power.

[2.3.8 Elevator Auxiliary Power Operating System

Provide elevator auxiliary power operating system for [all elevators] [elevator 1,2,3...].

[2.3.9 Hospital Emergency Commandeering Service (HECS)

**************************************************************************

NOTE: Only keep this HECS paragraph for hospital elevators or for projects in which this operation is specifically requested by the building owner or facility user.

**************************************************************************

Provide Hospital Emergency Commandeering Service.

[2.4 ELEVATOR DRIVE SYSTEM

Provide hydraulic elevator drive system, including pump unit, piping, cylinder/plunger assembly, and associated equipment, which will operate at a maximum working pressure of 3447 kPag 500 psi or less. Provide complete elevator system that meets or exceeds the NEII-1 Ride Quality Standard,
including elevator ride quality and noise levels in car and in elevator machine room and machinery space.

2.4.1 Hydraulic Pump Unit

Provide self-contained pump unit, including oil-hydraulic elevator pump, electric motor, suction-line oil strainer, and structural steel outer base with tank supports and isolation pads. Provide oil tank capacity for full plunger displacement plus at least 38 liters (10 gallons). Provide means to maintain oil temperature between 38 and 54 degrees C (100 and 130 degrees F) regardless of ambient temperature. Limit acoustic output in elevator machine room and machinery space to 80 dbA.

2.4.1.1 Pump Motor

Provide intermittent-duty pump motor rated at 120 starts/hour. Provide motor that is sized so that the motor amperage does not exceed the motor data tag amperage in any operating condition, exclusive of acceleration and deceleration. Provide minimum of one mega ohm insulation resistance between conductors and motor frame. Provide motor and pump nameplate and data tags permanently mounted on the outside of the pump unit frame, with all data viewable without the use of mirrors or other tools.

2.4.2 Hydraulic Controls and Equipment

Provide control valve, overspeed safety valve, blowout-proof muffler, and hydraulic pump discharge strainer in the hydraulic oil supply line. Provide two 1/4 turn, ball valve type manual shutoff valves. Provide one in the elevator hoistway pit and one in the elevator machine room or machinery space.

2.4.2.1 Hydraulic Control Valve

Provide constant-velocity, down-speed regulated, control valve. Down-speed regulated control valve allows the car to travel at the same speed in the down direction, regardless of the load on the elevator. In addition, the hydraulic control valve must have built-in adjustment capability to operate the elevator at 140 percent of rated speed to facilitate periodic testing of the overspeed safety valve.

2.4.2.2 Hydraulic Overspeed Safety Valve

Provide overspeed safety valve in hydraulic oil supply line, directly adjacent to the hydraulic cylinder. Provide threaded pipe connections between the hydraulic cylinder and the overspeed valve. Provide valve equipped with manufacturer's manual shutoff feature. Overspeed valve must not be equipped with a manual or automatic lowering feature. Provide adjustable valve with means to seal adjustment after inspection and testing by certified elevator inspector.

2.4.3 Hydraulic Piping and Accessories

**************************************************************************
NOTE: Retain bracketed sentence for in-ground direct plunger type elevators.
**************************************************************************

Provide ASTM A53/A53M or ASTM A106/A106M, Schedule 80, black steel piping with ASME B16.9 or ASME B16.11 fittings for supply piping. Extend schedule.
80 piping from the pump control valve body, inside the pump unit, to the hydraulic cylinder in the hoistway. Provide welded or threaded forged pipe fittings for all fittings and components of the hydraulic oil supply line. [For in-ground direct plunger cylinders, provide dielectric union or isolation couplings at each end of the hydraulic oil supply line.] Provide hangers or supports for all piping and components.

2.4.3.1 Containment of Hydraulic Oil Supply Line

Protect all portions of hydraulic oil supply line that are installed below ground, including portions encapsulated in concrete or covered by construction, with continuous, Schedule 80, PVC. Inside diameter of PVC must be 76 mm 3 inches larger than the outside diameter of the hydraulic oil supply line pipe and couplings.

2.4.4 Hydraulic Elevator Type

**************************************************************************
NOTE: Use of a holeless type elevator with a non-telescoping jack will be limited to a maximum travel distance of 12 ft-8 in.
**************************************************************************

Provide a [in-ground direct plunger] [holeless] direct plunger type hydraulic elevator. Elevators with telescopic or inverted cylinder-plungers are not acceptable and may not be used. Rope hydraulic elevator design is not acceptable and may not be used.

2.4.4.1 Cylinder-Plunger (Jack) Unit

Provide a single-stage plunger of seamless steel construction. Provide cylinder with self-stabilizing mount that will support and hold cylinder plumb without the need for stabilization means at the bottom of the cylinder. Provide a threaded, 6 mm 1/4 inch bleeder valve at the top of the cylinder, just below packing gland.

2.4.5 Cylinder Well System

**************************************************************************
NOTE: Retain this paragraph and associated subparagraphs for in-ground direct plunger type elevators only.
**************************************************************************

For direct plunger, in-ground type hydraulic elevator, provide a dry, sealed cylinder well system.

2.4.5.1 Well Casing

Locate and drill well for the cylinder well system. Line well with steel casing, minimum 6 mm 1/4 inch wall with welded 13 mm 1/2 inch steel bottom. Set casing plumb.

2.4.5.2 PVC or HDPE Liner

Provide Schedule 80 PVC or HDPE liner with bottom cap and couplings; joints sealed watertight using pipe manufacturer's recommended adhesive or heat welding methods. Provide liner inside diameter not less than 76 mm 3 inches larger than elevator cylinder maximum outside diameter. Liner may be
provided as a cylinder manufacture's applied liner or as a separate component. For separate liner, set liner plumb in well casing, located for cylinder installation. Provide dry, salt-free sand below and around liner to top of well casing.

2.4.5.3 Cylinder Installation

Remove all moisture from inside of liner. Install cylinder plumb, inside liner. Provide a 6 mm 1/4 inch copper evacuation tube inside the liner. The bottom of the evacuation tube must be within 152 mm 6 inch of the bottom of the liner. Top of evacuation tube must extend at least 152 mm 6 inch above pit floor. Provide top of test tube with removable cap to exclude foreign matter. Provide air inlet pressure fitting in top of liner and accessible in pit, for performance of air pressure test. Secure Liner/Cylinder Assembly as recommended by cylinder manufacturer.

2.4.5.4 Cylinder Liner Moisture Sensor System

Provide moisture and oil sensors inside the cylinder liner for detection of oil and water at the bottom of the cylinder liner. Provide sensor monitoring system that will actuate audible and visual alarms and identify the presence of water and identify the presence of oil inside the liner.

2.4.5.5 Seal Top of Well Casing

Upon successful test and certification of Liner/Cylinder assembly, seal gap between steel well casing and liner with foam insert strong enough to retain and support final grouting. Provide 21 MPa 3000 psi grout to a minimum of 102 mm 4 inch thickness and level top of final grouting with pit floor.

2.5 CONTROL EQUIPMENT

Enclose all elevator control equipment in factory-primed and baked-enamel coated sheet-metal cabinets with ventilation louvers and removable or hinged doors. Mount cabinets at a height of 254 mm 10 inches above machine room or control room finish floor.

2.5.1 Motor Control Equipment

Provide elevator motor control with electronic, soft-start motor starter.

2.5.2 Elevator Microprocessor Controller

For each individual elevator controller, and for each group controller, provide a microprocessor controller that complies with the following paragraphs. Provide controller(s) package that includes all hardware and software required for the installation, maintenance, and service of the elevator, in its' entirety. Provide verification of technical support service that the controller manufacturer provides to any licensed elevator installation, service, and maintenance company.

Provide an elevator controller from a manufacturer that provides comprehensive factory training to include controller installation, adjustment, service, and maintenance. The training must be identified as available to any licensed elevator contractor. Provide verification of an established and documented training schedule, with pricing, for factory training classes that manufacturer has provided for a minimum period of one year prior to contract award date.
The elevator controller must be identified as available for purchase and installation by any licensed elevator contractor. All components, parts, diagnostic tools, and software must be available for purchase and installation and use by any licensed elevator contractor; "exchange-only" provisions for the purchase of spare parts are not acceptable. The elevator controller manufacturer must publish an industry competitive price listing for all controller parts, diagnostic tools, and software.

Provide verification of telephone and internet based technical support service that the elevator controller manufacturer provides to any licensed elevator installation, service, and maintenance company at an industry competitive price. The service must include live telephone based technical support for installation, adjustment, maintenance, and troubleshooting of the elevator controller and related elevator components. The service must be available during standard working hours.

Provide an elevator controller that is designed to automatically reestablish normal elevator operation following any temporary loss of power, regardless of duration.

2.5.2.1 Elevator Controller Interface Cabinet

For each individual elevator microprocessor controller, provide a separate elevator control cabinet with an integrated human interface system. For group elevator installations, a single cabinet and interface system with full access to each elevator controller may be utilized. The separate controller interface cabinet must be supplied by the elevator controller manufacturer and include a minimum 305 mm 12 inch wide keyboard and a minimum 254 mm 10 inch monitor. The elevator controller interface cabinet must comply with arc-flash protection requirements of NFPA 70E and UFC 3-560-01.

2.5.2.1.1 Elevator Microprocessor Human Interface

The interface system must provide complete elevator controller interface capability and must include the elevator controller manufacturer's comprehensive package of installation and diagnostic software. The microprocessor interface system must provide unrestricted access to all parameters, all levels of adjustment, and all flags necessary for installation, adjustment, maintenance, and troubleshooting of each elevator and for the elevator group. All software programming must be stored in non-volatile memory. The elevator controller fault log must provide non-volatile memory fault log storage of all faults, trouble calls, and fault history for a minimum of one year and the ability to download or print the fault log. The controller interface must also provide the capability to display and diagnose trouble calls, faults, and shutdowns. Expiring software, degrading operation, and "key" access controls are not acceptable.

2.5.2.2 Software and Documentation

Provide three copies of the manufacturer's maintenance and service diagnostic software, with complete software documentation, that will enable the same level of unrestricted access to all controllers of the same make and model, regardless of the installation date or location. Provide signed certification, from the manufacturer's corporate headquarters, that guarantees that the microprocessor software and access system will not terminate the unlimited and unrestricted access at any future date.
2.5.2.3 Elevator Controller Certification

For elevator installations in the United States, including United States territories, provide an elevator microprocessor controller that has a current certificate of safety code compliance issued by the Technical Standards and Safety Authority (TSSA), Toronto, Canada.

2.6 OPERATING PANELS, SIGNAL FIXTURES, AND COMMUNICATIONS CABINETS

For all panels and fixtures, provide identical and uniform panel and fixture design, material, finish, and components for all elevators. For all panels and fixtures, legibly and indelibly identify all buttons, devices, and all operating positions for each device. Use engraving and backfilling, or photo etching, for button and device designations. Do not use attached signs. Provide elevator manufacturers’ standard grade for all key switches unless otherwise specified. All illuminating panels and fixture components must utilize LED lighting for energy efficiency.

2.6.1 Car and Hall Buttons

For all cab and landing fixture buttons, provide industry-standard, vandal resistant push buttons with positive-stop assembly design. Buttons must be minimum 19 mm 3/4 inch diameter, satin-finish stainless steel, with illuminating LED halo.

2.6.2 Passenger Car-Operating Panel

**************************************************************************
NOTE: Choose "two" Car Operating Panels for high traffic passenger elevators in hospital buildings and office buildings. Choose "one" for elevator system where traffic is moderate such as in barracks, warehouses, clinics or shops.
**************************************************************************

Provide each car with [one] [two] car operating panel[s] that contains operation controls and communication devices. Provide exposed, flush mounted buttons for the controls identified in subparagraph PASSENGER CONTROLS. Provide a lockable service cabinet for the controls listed in subparagraph SERVICE CONTROLS. Use engraving and backfilling or photo etching for button and switch designations. Do not use attached signs.

2.6.2.1 Passenger Controls

In addition to ASME A17.1/CSA B44 requirements, provide the following operating controls, identified as indicated:

a. Illuminating car-call buttons identified to correspond to landings served by the elevator.

b. "DOOR OPEN" and "DOOR CLOSE" buttons. For front and rear openings at the same floor, include the identification "F" and "R" for each opening.

c. Red, illuminating "ALARM" button.

d. Key-operated "Independent Service" switch.

e. "Help" communication device to include communication between elevator
[ f. Key-operated "HOSPITAL EMERGENCY COMMANDEERING SERVICE" switch.

2.6.2.2 Service Controls

In addition to ASME A17.1/CSA B44 requirements, provide the following operating controls, identified as indicated:

a. Provide a key-operated, three-position switch for "In car Inspection Operation" and "Hoistway Access". The center switch position will provide normal, automatic operation.

b. "Car Light switch.

c. "Car Fan" switch with two speed settings identified.

d. 120-volt ac 60 Hz single-phase duplex electrical outlet of ground-fault-circuit-interrupt (GFCI) design.

2.6.2.3 Certificate Window

Provide a minimum 102 mm wide by 152 mm high certificate window for elevator inspection certificate. Locate window in the Service Controls door of the Car Operating Panel.

2.6.2.4 Emergency Signaling Devices

Provide an audible signaling device, operable from the Car Operating Panel button marked "ALARM". The audible signaling device must have a sound pressure rating between 80 and 90 dBA at 3 meters 10 ft. Provide battery backup power capable of operating the audible signaling device for at least one hour.

2.6.3 Elevator In-Car Position Indicators

For all elevators, provide illuminating position indicator in the Car Operating Panel.

2.6.4 Elevator In-Car Direction Indicators

For 2-stop elevator installations, provide visual direction indicators and audible car arrival signal in the elevator car door jamb, in accordance with ABA Standards. Visual indicators must be visible from the hall call fixture.

2.6.5 Hall Call Landing Fixtures

Provide a hall call fixture adjacent to each elevator. Provide a single push-button for terminal landings and dual push-buttons, up and down, at intermediate landings.

2.6.5.1 Designated Landing Hall Call Fixture

2.6.5.1.1 Location of COMMUNICATION MEANS FAILURE (CMF) Visual Signal

When required by ASME A17.1/CSA B44, provide an elevator CMF audible and illuminating signal, and reset switch, in the FEO Designated Landing hall call fixture. Mount the signal and reset switch at a minimum of 178 mm 7
2.6.5.1.2 COMMUNICATION MEANS FAILURE (CMF) Visual and Audible Signal Operation

Provide a CMF visual and audible signal system that conforms to ASME A17.1/CSA B44. Provide continuous verification of operability of the telephone line and immediate activation of audible and visual signals when verification means determines that the telephone line is not functioning. Provide illumination of visual signal at one second intervals. Provide a minimum of 65 dBA audible signal at 30 second intervals.

2.6.5.1.3 Firefighters' Emergency Operation Phase I Switch and Visual Signal

When required by ASME A17.1/CSA B44, provide an elevator Firefighters' Emergency Operation Phase I switch and illuminating visual signal in the FEO Designated Landing hall call fixture. Provide FEO Phase I visual signal that is designed with intermittent, flashing, illumination when actuated by the machine room, control room, or hoistway fire alarm initiating device. Locate FEO Phase I key switch above the CMF visual signal with a minimum of 152 mm (6 inches) vertical between the centerlines of the CMF signal and the FEO Phase I key switch. Locate FEO Phase I visual signal directly above the Phase I switch. In addition, locate Elevator Corridor Call Station Pictograph at top of hall call fixture.

2.6.6 Elevator Car Position and Direction Indicators and Car Arrival Signal

For elevator installations with three or more stops, provide a separate hall landing fixture that includes the visual elevator position indicator, visual direction indicators, and audible car arrival signal, in accordance with ABA Standards.

2.6.7 Designated Landing Elevator Identification Fixture

For duplex and group elevator installations, provide a separate elevator identification fixture for each elevator, with identification engraved and backfilled with a contrasting color. Number elevators from left to right, as seen during primary approach from building main entrance to elevator lobby. For multiple elevator groups, begin numbering with group that is closest to the building main entrance.

2.6.8 Emergency or Standby Power

When emergency or standby power is provided for elevator operation, provide an elevator emergency power visual indicator that conforms to ASME A17.1/CSA B44. Locate the visual signal in the Firefighters Emergency Operation fixture for each simplex elevator and for each elevator group. When an emergency power selector switch is required, provide switch in a separate, flush mounted fixture located at the designated level, in view of all elevator entrances.

2.7 CAR DOOR EQUIPMENT

2.7.1 Car Door Operator

Provide elevator door operator equipment and circuitry that is designed and installed as discreet communication. Serial communication must not be used for this system.
2.7.2 Infra-red Curtain Unit

Provide Infra-red Curtain Unit (ICU) with multiple infra-red beams that protect to the full height and width of the door opening. Provide door nudging operation.

2.8 PASSENGER ELEVATOR GUIDES, PLATFORM, AND ENCLOSURE

2.8.1 Roller Guides

Provide coil-spring loaded roller guide assemblies in adjustable mountings on each side of car and counterweight frames in accurate alignment at top and bottom of frames.

2.8.2 Car Enclosure Wall Panels, Return Panels, Doors, Entrance Columns, and Transom

Provide 14 Gauge minimum [prefinished steel][stainless steel] cab wall panels and entrance components. Use same material and finish for all hoistway and car entrance assemblies. Apply sound-deadening material on exterior of all cab wall panels.

2.8.3 Car Enclosure Top

Provide reinforced, 12 gauge minimum steel car enclosure top. Provide hinged emergency exit with lock that complies with the seismic risk zone 2 or greater design requirements of ASME A17.1/CSA B44. Locate emergency exit hinge towards the rear of the elevator cab. Design and configure the elevator cab interior ceiling to provide convenient and unobstructed access to, and use of, emergency exit from inside the elevator cab.

2.8.4 Car Door

Provide 16 gauge minimum [prefinished steel][stainless steel] car doors of sandwich construction with flush surfaces on car and landing sides. Provide a minimum of 2 door guide assemblies per door panel, one guide at leading and one at trailing door edge with guides in the sill groove their entire length of travel.

2.8.5 Car Entrance Sill

Provide one piece cast nickel silver, stainless steel, or white bronze entrance sill(s). Set sills level and flush with floor finish. Use same material for hoistway and car entrance sills.

2.8.6 Cab Finish Floor

Provide cab finish floor with top of finish floor flush with the cab sill.

2.8.7 Car Fan

Provide 2-speed fan for car enclosure forced ventilation. Fan must be mounted in the car enclosure top.

2.8.8 Car Lighting

Utilize LED lighting for elevator car interior illumination. Provide a minimum of 10 foot-candles, measured at all areas of the car enclosure floor. Provide automatic car lighting operation that will turn off car...
lights after 3 minutes of inactivity. Car lights must automatically turn on upon actuation of an elevator car or hall call.

2.8.9 Car Protection Pads and Hooks

Provide fire retardant, hanging car protection pads that provide protection for all car interior wall panels. Provide permanently installed studs in car that are designed for hanging the car protection pads in the car.

2.9 PASSENGER ELEVATOR HOISTWAY DOORS AND ENTRANCES

Provide hoistway entrance assemblies with a minimum 1-1/2 hour fire rating. Use same material and finish for all hoistway and car entrance assemblies.

2.9.1 Hoistway Entrance Frames

2.9.2 Hoistway Entrance Sills

Provide one-piece cast nickel silver, stainless steel, or white bronze entrance sills. Set top of landing sill flush with top of finish floor. Solidly grout under full length of sill. Use same material for all hoistway and car entrance sills.

2.9.3 Hoistway Entrance Doors

Provide [hollow metal][stainless steel] non-vision construction hoistway entrance doors with flush surfaces on car and landing sides. Provide a minimum of 2 door guide assemblies per door panel, one guide at leading edge and one at trailing edge with guides in the sill groove the entire length of door travel. Use same material and finish for all hoistway and car entrance assemblies.

2.9.4 Hoistway Entrance Door Track Dust Covers

Provide sheet metal hoistway door track dust covers at each landing. Dust covers must cover top and hoistway side of door locks and door roller tracks, and extend the full width of the door track and associated hardware. Dust cover sections will not exceed 3 feet in length.

2.10 HOISTWAY EQUIPMENT

2.10.1 Car Guide Rails and Fastenings

Provide T-section type guide rails for car. Paint rail shanks with one coat of black enamel.

2.10.2 Pit Equipment and Support Channels

**************************************************************************
NOTE: Delete bracketed phrase for holeless applications.
**************************************************************************

Provide rail-to-rail pit channels to serve as mounting surface for main
guide rails [, hydraulic cylinder ]and car buffers. Method of installation of channels, brackets and buffer mounts must be such that pit waterproofing is not punctured.

2.10.3 Pit "STOP" Switch

Provide push-to-stop/pull-to-run type pit "STOP" switch.

2.10.4 Traveling Cables

Suspend traveling cables by means of self-tightening webbed devices or internal suspension members.

2.10.5 Hoistway Pit Ladder

Provide continuous horizontal rungs for the full height of the pit ladder.

PART 3 EXECUTION

3.1 INSTALLATION

Install in accordance with DOD design criteria, contract specifications, manufacturer's instructions, NEII-1 Building Transportation Standards and Guidelines, and all applicable building and safety code requirements.

3.1.1 Structural Members and Finish Materials

Do not cut or alter structural members. Do not alter finish materials from manufacturer's original design. Restore any damaged or defaced work to original condition.

3.1.2 Miscellaneous Requirements

Provide recesses, cutouts, slots, holes, patching, grouting, and refinishing to accommodate elevator installation. Use core drilling to drill all new holes in concrete. Finish work to be straight, level, and plumb. During installation, protect machinery and equipment from dirt, water, or mechanical damage. At completion, clean all work and spot paint.

3.2 FIELD QUALITY CONTROL

The Contractor will provide and utilize a third-party licensed and certified Qualified Elevator Inspector (QEI) to conduct elevator pre-acceptance inspection and testing. The QEI must perform inspections and witness tests to ensure that the installation conforms to all applicable safety codes and contract requirements. The QEI will be directly employed by the Contractor and independent of the elevator contractor.

Upon completion, the QEI must provide written test data for all ASME A17.1/CSA B44 Acceptance Tests and written certification that the elevator is complete and ready for final Acceptance Inspection, Testing, and Commissioning.

3.3 ACCEPTANCE INSPECTION, TESTING AND COMMISSIONING

When elevator system installation is complete and ready for final inspection, notify Contracting Officer that elevator system is ready for Acceptance Inspection, Testing, and Commissioning. Provide QEI
certification specified in Article FIELD QUALITY CONTROL.

**************************************************************************
**NOTE:** Use the first bracketed paragraph for all Navy Facilities and for all projects managed by NAVFAC FEAD. Use the second bracketed paragraph for Air Force, Army, and NASA projects that are not managed by NAVFAC FEAD.
**************************************************************************

[ Contracting Officer will obtain services of Naval Facilities Engineering Command (NAVFAC) QEI Certified Elevator Inspector. NAVFAC QEI will utilize the applicable NAVFAC Elevator Acceptance Inspection Form to record the results of inspection and testing and to identify safety code and contract deficiencies. Specific values must be provided for all tests required by ASME A17.1/CSA B44, ASME A17.2, and contract documents. Upon completion of inspection and testing, the NAVFAC QEI will sign a copy of the completed forms and provide the signed copy to the Contracting Officer or representative. Within 2 weeks of the inspection, the QEI will also prepare a formal inspection report, including all test results and deficiencies. Upon successful completion of inspection and testing, NAVFAC Certified Elevator Inspector will complete, sign and post form NAVFACENGCOM 9-11014/23(Rev.9-2009), Elevator Inspection Certificate.

][Contracting Officer will obtain the services of a third-party QEI Certified Elevator Inspector. The QEI must utilize an Elevator Acceptance Inspection Form to record the results of inspection and all testing and to identify safety code and contract deficiencies. Specific values must be provided for all tests required by ASME A17.1/CSA B44, ASME A17.2, and contract documents. Upon completion of inspection and testing, the QEI must sign a copy of the completed forms and provide to the Contracting Officer. Within 2 weeks of the inspection, the QEI must also prepare a formal inspection report, including all test results and deficiencies. Upon successful completion of inspection and testing, the QEI will complete, sign, and provide a certificate of compliance with ASME A17.1/CSA B44.

]3.3.1 Acceptance Inspection Support

Prime and Elevator Contractors must provide inspection support and perform all required tests, in order to demonstrate proper operation of each elevator system and to prove that each system complies with contract requirements and all applicable building and safety codes. Inspection procedures in ASME A17.2 form a part of this inspection and acceptance testing. All inspection and testing must be conducted in the presence of the Qualified Elevator Inspector (QEI).

If the elevator does not comply with all contract and safety code requirements on the initial Acceptance Inspection and Test, the Contractor is responsible for all costs involved with re-inspection and re-testing required as a result of contractor delays and discrepancies discovered during inspection and testing.

3.3.2 Testing Materials and Instruments

Furnish all testing materials and instruments necessary for Acceptance Inspection, Testing and Commissioning. At a minimum, include calibrated test weights, tachometer, accelerometer, hydraulic pressure gauge, 600-volt mega ohm meter, volt meter and ammeter, infrared temperature gauge, door pressure gage, dynamometer, and 6 meter 20 foot tape measure.
3.3.3 Field Tests

3.3.3.1 Endurance Tests

Test each elevator for a period of one hour continuous, automatic operation, with specified rated load in the elevator cab. During the one hour test, stop car at each floor, in both directions of travel, and allow automatic door open and close operation. The requirements for Automatic Operation, Rated Speed, Leveling, Temperature Rise and Motor Amperes must be met throughout the duration of the Endurance Test. Restart the one hour test period from the beginning, following any shutdown or failure.

3.3.3.2 Speed Tests

Determine actual speed of each elevator, in both directions of travel, with rated load and with no load in elevator car. Make Speed tests at the beginning and at the end of the Endurance test. Determine speed by tachometer reading or accelerometer, excluding accelerating and slow-down zones. Under all conditions, minimum acceptable elevator speed is the Rated speed specified. Maximum acceptable elevator speed is 110 percent of Rated speed.

3.3.3.3 Leveling Tests

Test elevator car leveling operation and provide a leveling accuracy equal to or less than $3 \text{ mm } 1/8 \text{ inch}$ at each floor with no load in car, and with rated load in car, in both directions of travel. Determine leveling accuracy at the beginning and at the end of the endurance tests.

3.3.3.4 Temperature Rise Tests

Determine temperature rise of elevator pump motor and hydraulic fluid during one-hour full-load test run. Under these conditions, maximum temperature rise must not exceed acceptable temperature rise indicated on manufacturer's data plate. Start test only when equipment is within 5 degrees C of ambient temperature.

3.3.3.5 Motor Ampere Tests

At beginning and end of Endurance test, measure and record motor amperage in both directions of travel and in both no-load and rated load conditions.

3.3.3.6 Elevator Performance and Ride Quality Testing

Evaluate elevator performance to ensure compliance with specification requirements related to the NEII-1 Performance Standards Matrix for New Elevator Installations.

3.3.3.7 Hydraulic Safety Valve (Automatic Shutoff Valve) Tests

In order to ensure consistent performance, regardless of hydraulic oil temperature, test the Hydraulic Safety Valve twice. Test once before the one-hour endurance test and once immediately after the one-hour test. For elevator certification, safety valve must perform to code in both tests.

3.3.3.8 Hydraulic Pressure Tests

Check the hydraulic static pressure and rated-speed operating pressure at
the hydraulic control valve, under both no load and rated load conditions.

3.3.3.9 Pressure Test of Liner/Cylinder Assembly

Perform 138 kPag 20 psig pressure test of the completed and installed liner/cylinder assembly. Test liner/cylinder assembly as a sealed unit. Provide safety relief valve set to relieve at 138 kPag; 114 mm 20 psig; 4.5 inch diameter dial pressure gage scaled for 0 to 175 kPag 0 to 50 psig and calibrated to 0.5 percent accuracy; and an air pressure admission throttle and shutoff valve. For safety, pressure test must only be performed when liner and cylinder are fully inserted and assembled in the well casing. Perform the test from remote location outside of the elevator pit. Perform test in the presence of, and witnessed by, a Certified Elevator Inspector.

1.2 SYSTEM DESCRIPTION

1.2.1 General Requirements

Provide a pneumatic-tube system which is computer controlled and designed with not less than [_____] separate zones interconnected to permit automatic unattended transmission of carriers from any station to any other station. System components shall be designed and located in such a manner that in the event of a defect occurring, components may readily be removed and replaced. Carriers shall be the full access type [, capable of handling 1000 ml I.V. bottles or 1000 ml I.V. bags]. Other system characteristics shall be as follows:

a. Future capacity of not less than [_____] stations without the need for modifications to the central control and existing station control.

b. Each zone capable of serving not less than [_____] stations even though a fewer number may be indicated in a given zone at this time.

c. [Stations within a zone connected to the storage lanes via a single line and diverter unit.] The computer shall control spacing, direction, [storage,] and path of the carriers.

d. Destination selection by means of push buttons or rotary dials on the station control panel.
e. Carriers taking the shortest route to their destinations. A central
exchanger shall not be required. [Carrier processing between zones
shall be done through the central storage lanes.]

f. Carriers routed by means of diverters or in-line transfer units.

g. Carrier rejections indicated at the dispatching station for
non-existing, signed-off, or malfunctioning station destinations.
Reject station shall not be used.

h. Failure of one station shall not interfere with the normal functioning
of any other station. Failure of any diverter will shut down that
section of the system. Failure of an in-line sensor except zero-level
sensor shall not shut down that section of the system.

i. Automatic sequencing of sending and receiving carriers.

j. Each zone [and the central storage lanes] act independently with
separate power units as required.

k. Automatic recovery of a carrier will be required only after a
transaction has been initiated and a failure occurs that prevents the
completion. In such a case the carrier in process will be either
returned to its source station or processed to the destination station
after the failure has been repaired and cleared.

l. Selection of the shortest, most direct routing of all carriers to their
destinations.

m. Complete "route proofing" of transaction paths before acceptance of the
carrier to assure all components in the routing are operating.

n. Intra-zone transactions shall take the most direct path within the zone.

o. Self-adjusting priority within the system to load balance according to
traffic.

p. Carriers may be positioned in senders simultaneously and destination
selected on the station control panel.

q. Carriers in transit at the time a power failure occurs shall be
delivered to their selected destinations upon restoration of power.

r. Processing of simultaneous, multiple transactions shall be directed to
assure maximum operational efficiency of the system.

s. Carriers in transit at the time of station sign-off shall be delivered
to their destination.

t. Carriers addressed to any non-existing or signed off station shall be
rejected.

u. Automatic time clock sign off to allow any station to be automatically
signed-off.

v. Preventive overload feature at station receiver. Carriers will not be
dispatched to a station that is overloaded.

w. Automatic redistribution of empty carriers to return empty carriers to
the locations with the greatest need.

x. Automatic purge by zone or system.

y. Each completed transaction, alarm condition that occurs and sign off schedule automatically printed out on printer.

1.2.2 Electrical Work

Provide electrical motor-driven equipment specified herein complete with motors, motor starters and controls complying with NEMA MG 1. Electrical equipment and wiring shall be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Electrical characteristics shall be as indicated. Extension to equipment from junction box and all control wiring shall be under this section and shall comply with NFPA 70. Provide motor starters under this section complete with properly sized thermal-overload protection in each phase and other appurtenances necessary for the motor control specified. Each motor shall be sized to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor when operating at proper electrical system voltage. Provide control and protective or signal devices required for the operation specified and wiring required for controls and devices but not shown on the electrical plans.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Pneumatic-Tube System

SD-03 Product Data
Pneumatic-Tube System
Materials and Equipment
Spare Parts
Pneumatic-Tube System
Tests

SD-06 Test Reports
Tests

SD-07 Certificates
Energy Efficiency

SD-10 Operation and Maintenance Data
Operating and Maintenance Instructions; G[, [____]]

1.4 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

1.5 EXTRA MATTERIALS

Submit spare parts data for each different item of materials and equipment specified, after approval of the detail drawings and not later than [____] months prior to the date of beneficial occupancy. The data shall include a complete list of parts and supplies, with current unit prices and source of supply.

PART 2 PRODUCTS

2.1 STANDARD PRODUCTS

Provide Materials and Equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that
essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Submit a complete list of equipment and material, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions.

2.2 ENERGY EFFICIENCY

******************************************************************************
NOTE: Selected equipment must conform to efficiency requirements as defined in Public Law (PL) 109-58 - "Energy Policy Act of 2005 (EPAct05)" for energy efficiency procurement and as specified by FEMP and ENERGY STAR. Equipment selected will have as a minimum the efficiency rating determined in under "Energy-Efficient Products" at 
http://www1.eere.energy.gov/femp/procurement
Equipment having a lower efficiency may be specified if the designer determines the equipment to be more life-cycle cost effective. 
Indicate the equipment operating characteristics, including rated energy efficiency, on the drawings.
******************************************************************************

Provide products that meet or exceed the specified energy efficiency requirements of FEMP designated or Energy Star qualified products. Submit documentation certifying that product conforms to PL 109-58 by meeting or exceeding Energy Star or FEMP efficiency requirements as defined at "Energy-Efficient Products" at http://www.energystar.gov. Indicate Energy Efficiency Rating.

2.3 CARRIER TUBING

2.3.1 Tubing

Tubing for carrier transmission lines shall be [152.4] [101.6] [1.613] mm OD [6] [4] in. [16 U.S. gauge] OD galvanized electric welded steel with flash removed, conforming to ASTM A123/A123M. Air lines shall be sized as required for proper system operation.

2.3.2 Bends

Bends shall be of the same material as straight tubing, formed on the centerline to a radius of not less than 1200 mm 4 feet, free from wrinkles or distortion. Joints between sections shall be made with sleeve couplings, bolted couplings or bell end tubing. When bends are cut for offsets and small angle turns, the ends shall be squarely cut, filed and straightened by mandreling. Expanded bends shall not be used.

2.3.3 Fittings

Fittings shall be cast iron, cast aluminum or fabricated steel with the inside fitting snugly on the tubing. Box connectors, close elbows, tees, coupling sleeves and other fittings required for proper installation of the system shall be provided.
2.4 POWER UNITS

Provide power units for each zone and for lanes when required. The power units shall be capable of operating all lines simultaneously and producing an average carrier speed of 7.6 m/s 25 fps. Power units shall be designed for floor or ceiling mounting. A timer or similar device shall shut the unit off after a predetermined time without carrier movement. Power units shall be complete with vibration isolators, intake and exhaust mufflers, intake and exhaust piping, screen box, air valves if required, and shall be designed for easy access.

2.5 AUTOMATIC CENTRAL-CONTROL CENTER

2.5.1 Operation of the System

A solid state memory computer shall control the system. The computer shall perform logic, control, supervisory and alarm functions and provide permanent storage for system operating program. Program memory protection shall be provided during power loss. Interface controls shall transmit operating data to and from stations. Keyboard shall request information and shall simulate operation of components throughout entire system. Printer shall print transactions and failures.

2.5.2 Control Program

The control program shall become the property of the user. The control program shall be constructed to allow the user to add, delete, and/or relocate components of the system, onsite, without the need for a new program or programming assistance.

2.5.3 Computer Circuits and Keyboard

The interface circuits, monitor and keyboard shall be modular and shall use solid state components throughout. For ease of maintenance, each circuit module shall be readily removable.

2.5.3.1 Cathode Ray Tube

Video Display Monitor to display in English language data for the following functions:

a. Failure Location - Zone, [central storage lane,] station, power unit or transfer unit.

b. Failure Type - Mechanical, electrical or component position.

c. Present transactions - Station carrier is leaving from and station carrier is going to, backlog per station or zone [and carrier in storage lanes].

d. Carrier Distribution - Number of carriers assigned to each station, number of carriers presently at each station.

e. Station sign-off schedule.

f. Failure Action - Locate where carrier is and corrective action to be taken.

g. System History Display - Show all system traffic for the past 24-hour
period with totals for stations, zones, and the entire system. This display shall be automatically printed.

2.5.3.2 Keyboard

The keyboard shall be interactive with the video monitor to perform the following functions:

a. Request video monitor displays listed above.

b. Simulate components for trouble shooting. Simulation of all components shall be made to determine the malfunctioning unit.

2.5.3.3 Printer

**************************************************************************
NOTE: Selected printers are required to meet performance requirements specified by Energy Star. Information on the requirements can be found at http://www.energystar.gov/ia/partners/product_specs/program_reqs/Imaging_Equip
As of September 6, 2012, the specific performance requirements were as follows:

<table>
<thead>
<tr>
<th>Printer</th>
<th>Standard</th>
<th>High Performance IJ, DT, DS, EP, SI, TT</th>
<th>TEC</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>IJ, Impact</td>

<tr>
<td>Small</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

These are referenced in Energy Star Program Requirements for Residential Air Source Heat Pump (ASHPs) and Central Air Conditioner Equipment, Volume 4.1. These specifications conform to the efficiency requirements as defined in Public Law (PL) 109-58 - "Energy Policy Act of 2005 (EPAct05)" for energy efficiency procurement and as specified by ENERGY STAR. Equipment selected will have as a minimum the efficiency rating determined in under "Energy-Efficient Products" at http://www1.eere.energy.gov/femp/procurement.

Equipment having a lower efficiency may be specified if the designer determines the equipment to be more life-cycle cost effective. Indicate the equipment operating characteristics, including rated energy efficiency, on the drawings. A list of compliant products can be found at http://downloads.energystar.gov/bi/qplist/image_equip_prod_list.xls?be70-acfd

**************************************************************************

Provide [Energy Star compliant ]laser jet printer with at least 128 MB of random access memory, 1200 dots per inch resolution, and support normal and
postscript fonts and drivers. Type face supported shall be True Type fonts. Printer must support HP PCL 6, HP PCL 5e and Post Script emulation. Equip printer with 10/100 Base Ethernet card, a serial and parallel port. Provide all Ethernet connectivity cables, power cables and printer drivers with the printer. Equip printer with at least two paper drawers. Each drawer must have a capacity of at least 600 sheets of standard paper.

2.5.3.4 Alarm Module

Provide an alarm module for remote audio-visual signaling of system alarms. The alarm module shall have a "Press to Silence" button. The alarm shall automatically activate should a system alarm condition occur.

2.6 STORAGE AREAS

**************************************************************************
NOTE: Storage areas will be deleted if a single zone system is specified.
**************************************************************************

Storage Areas shall be designed to initially serve [_____] zones. Storage shall be expandable to a maximum of [_____] storage lanes without the need to replace the initial unit. Storage area shall consist of storage lanes connected directly to every other zone in the system.

2.7 AUTOMATIC SWITCHING EQUIPMENT

Diverters shall be automatically oriented to route carriers to or from intermediate stations. Units shall be air or electro-mechanically operated and designed to accommodate two or more stations or sublevels and enclosed in sheet metal housing with access panels. Diverter shall be designed so that when a carrier does not clear the diverter completely, no other carrier can be routed to that diverter.

2.8 SUBSTATION EQUIPMENT

Substation equipment shall be enclosed in a self-supporting "rough-in" recessed type enclosure. The operating components shall be installed after the adjacent walls have been finished. Exposed sheet metal surfaces shall be factory painted. Bright metal parts shall be stainless steel, brushed aluminum or chrome plated.

2.8.1 Receiving Units

Units shall be down receive, air cushion, soft delivery type. Carrier receiver tray shall be designed to receive and store carriers to the front of the received tray. Full carrier capacity shall cause audible alarm to sound or the reject light to illuminate.

2.8.2 Sending Units

Units shall be up-send in conjunction with the receiving unit.

2.8.3 Carrier Storage Receptacle

Storage receptacle shall store not less than four carriers and shall be integral with the terminal front.
2.8.4  Station Control Panel

2.8.4.1  Operating Controls and Indicators

Panel shall include the following operating controls and indicators:

a.  Carrier destination selectors, "Carrier Accepted" signal, "Send" buttons.

b.  "Carrier Rejected" signal when a carrier cannot be dispatched because of destination sign off, an alarm condition, a nonexisting selection or an overloaded station.

c.  "Carrier in Receiver" to indicate a carrier is in the receiving unit when the carrier is not visible.

d.  "Cancellation Button."

2.8.4.2  Non-operating Requirements

Non-operating requirements of control panel shall include the following:

a.  "Operating Instructions" display.

b.  Independent carrier dispatch and receive functions.

c.  The memory within the programmable microprocessor available to all stations.

d.  Request to dispatch handled immediately on a local or central control basis.

2.8.5  Directory

Each station shall have a framed directory or photo plate on which is neatly and clearly shown the location, name, and number of each station in the system. The framed directory shall be provided with a glass or plastic cover.

2.9  CARRIERS

Furnish four carriers for each station in the system. Carriers shall be not less than [82.6 x 381.0] [114.3 x 381.0] mm [3-1/4 x 15] [4-1/2 x 15] inch inside dimensions and shall be capable of transporting 1000 ml I.V. bottles.

2.9.1  Access

Carriers shall be side opening of full access type, bi-directional.

2.9.2  Carrier Inserts

Foam lining for transporting fragile items shall be furnished for [_____] of the total system carriers [and [_____] of the total system carriers shall be furnished with foam lining for transporting 1000 ml I.V. bottles].

2.10  SYSTEM TESTER

System Tester shall have the ability to test any station, transfer unit, or
blower with onsite verification of malfunctions. A portable test device which supplements the control center may be used.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Install the pneumatic-tube system as indicated and as recommended by the manufacturer. Submit diagrams, instructions, and other sheets proposed for posting.

a. Submit detail drawings containing complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings shall show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearance for maintenance and operation.

b. Submit [six] copies of design manual consisting of manufacturer's standard literature. The design manual shall identify the operational requirements for the system and explain the theory of operation, design philosophy, and specific functions. A description of hardware and software functions, interfaces, and requirements shall be included for all system operating modes. The manual shall describe all equipment provided, including general description and specifications.

3.2.1 Sound Insulation

Horizontal tubing and bends run over patient rooms or offices shall be sound deadened by applying a 38.1 mm 1-1/2 inch thick layer of 24 kg/cubic meter 1-1/2 pcf density fiberglass insulation with a dust cover and taped joints over the tubing. Sound insulation material shall extend not less than 1.5 meters 5 feet outside the patient rooms or offices. Insulation shall conform to EPA requirements in conformance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.

3.2.2 Hangers and Supports

Hangers and supports shall be spaced on 3 meters 10 foot centers for horizontal runs of tubing. Vertical runs shall be supported at every floor. Each horizontal bend and in-line component shall be supported. Hangers for one or two lines of tubing shall be 10 mm 3/8 inch plated and threaded rods attached to row clamps. Hangers for three or more lines shall be formed with row clamps or 38.1 mm 1-1/2 inch channels laid flat against the bottom of the tubing and supported by not less than two rods spaced not more than 900 mm 3 feet apart. Row clamps shall maintain centerlines of horizontal runs of multiple tubes straight and level and spaced apart in a consistent configuration.

3.2.3 Installation of Tubing

Joints shall be made airtight by methods recommended by the manufacturer. Lines shall be installed where indicated and securely held in place and
braced against any motion caused by the passage of carriers. Tubing passing through openings in floors shall be installed in suitable sleeves or slots which shall be stuffed with 25 mm 1 inch fiberglass blanket and sealed on both ends with a continuous bead of nonhardening mastic at least 6.4 mm 1/4 inch deep.

3.2.4 Firewall Penetrations

Where holes are required in fire and smoke walls for the passage of tubing and other accessories, the annular space between pipe and hole shall be filled with a UL approved fireproof material. Sealing of penetrations through fire rated walls shall be as specified in Section 07 84 00 FIRESTOPPING.

3.3 PAINTING AND FINISHING

Field-applied paint shall be as specified in Section 09 90 00 PAINTS AND COATINGS.

3.4 ACCESS PANELS

Access Panels shall be as specified in Section 08 31 00 ACCESS DOORS AND PANELS.

3.5 ACOUSTIC COUPLER

**************************************************************************
NOTE: Delete acoustic coupler if manufacturer has a service organization conveniently located to the site.
**************************************************************************

An acoustic coupler that will permit the facility to have direct communications with the manufacturer shall be provided for one year. The coupler shall provide a communication tie-in to a cathode ray tube (CRT) at the manufacturer's facility through the handset of an ordinary telephone and the acoustic coupler at the facility. The coupler will be used to examine or modify computer memory and may command any system component and determine its status.

3.6 FRAMED INSTRUCTIONS

Framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, shall be posted where directed. Condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system shall be prepared in typed form, framed as specified above and posted beside the diagrams. The framed instructions shall be posted before acceptance testing of the systems.

3.7 MANUFACTURER'S FIELD SERVICES

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative shall supervise the installation, adjustment, and testing of the equipment.
3.8 FIELD TRAINING

Provide a field training course for designated operating and maintenance staff members. Training shall be provided for a total period of [_____] hours of normal working time and shall start after the system is functionally complete but prior to final acceptance tests. Field training shall cover all of the items contained in the Operating and Maintenance Instructions. Submit [six] [_____] complete copies of operation manual outlining the step-by-step procedures required for system startup, operation, and shutdown. The manuals shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Submit [six] [_____] complete copies of maintenance manual listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The manuals shall include piping layout, equipment layout, simplified wiring and control diagrams of the system as installed. Operation and maintenance manuals shall be approved prior to the training course.

3.9 TESTS

**************************************************************************
NOTE: If a single zone system is specified, delete subparagraphs "c," "e," and "f" below.
**************************************************************************

Submit test plan and procedures, not later than [_____] days prior to the start of testing. The test plan and test procedures shall explain in detail, step-by-step, actions and expected results to demonstrate compliance with the requirements of this specification, and the methods for simulating the necessary conditions of operation to demonstrate performance of the system. Tests shall be conducted in accordance with the approved test procedures to determine that the system is functional, operational and installed in accordance with the specifications. Notify the Contracting Officer in writing [_____] days prior to conducting tests. The following test shall be conducted:

a. Computer simulation and interrogation.

b. Consecutive dispatching to random stations within the zone.

c. Consecutive dispatching to random stations outside the zone.

d. Multi-station dispatching within the zone where all dispatchers are loaded with carriers, random stations selected and dispatching begins.

e. Multi-station dispatching outside the zone where all dispatchers are loaded with carriers, random stations selected and dispatching begins.

f. Two stations in each zone will be randomly selected to dispatch carriers into other zones.

Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion of installation and testing of the installed system. Each test report shall indicate the final position of controls.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for dry and wet standpipe and hose systems for fire extinguishing in multi-story and multi-level buildings.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Standpipe system requirements must conform to the current edition of UFC 3-600-01, "Fire Protection Engineering for Facilities" and NFPA 14.

NOTE: Project drawings should indicate the following information:

1. Location and detail of each standpipe supply riser, alarm valve, water motor alarm, fire department inlet connection, pressure/flow switch, fused disconnect switch, and associated electrical connections;
2. Location where each standpipe system begins including connection to water distribution system piping;

3. Location of standpipe system control valves, post indicator valves, or wall indicator valves;

4. Location of fire hose cabinets when required, also indicate when fire extinguishers will be stored within the fire hose cabinet;

5. Details of anchoring piping, including pipe clamps and tie rods, or mechanical retainer glands.

**************************************************************************

AWWA C651 (2014) Standard for Disinfecting Water Mains

ASTM INTERNATIONAL (ASTM)

FM GLOBAL (FM)
1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies to this section with additions and modifications specified herein.

1.3 SYSTEM DESCRIPTION

Design and provide new [manual dry Class I][combination] [automatic] [wet Class I] standpipe [and fire sprinkler] system[s] as shown.

1.4 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Design standpipe systems in accordance with the current edition of MIL-HDBK-1008 and NFPA 14. Provide pipe-sizing calculations to the Division Fire Protection Engineer (FPE) for review. Class I standpipes are for fire department use only and will normally be the type provided. Wet standpipes must be protected from freezing. It is NAVFAC policy not to provide hose on standpipes except in unique situations as approved by the Division FPE. In low and intermediate height buildings (up to 75-ft in height), use of manual-dry standpipes is normally dictated by economics. In high rise buildings, the time required to fill the piping with water and the pressure involved normally dictate automatic standpipes.

The following clarification is provided regarding
the design of standpipe systems. The two primary factors to consider are type of system (manual vs. automatic) and system design pressures. Unless otherwise directed by the Division FPE, standpipe systems shall be designed as follows:

1. For buildings less than 75-ft, standpipe systems shall be designed as “Manual Standpipe Systems” as defined in NFPA 14. The system piping shall be hydraulically designed to provide the required flow rate at a minimum residual pressure of 65 psi at the hydraulically most remote 2½-inch hose connection. In combination sprinkler-standpipe systems, necessary fire booster pumps shall be sized to support the sprinkler demand only. The fire department shall supplement the standpipe system via the fire department connections to provide the necessary flow and pressure. The water supply must be evaluated to ensure the available capacity will support the minimum standpipe system flow rates.

2. For buildings 75-ft up to 150-ft in height, standpipe systems shall be designed as “Automatic Standpipe Systems” as defined in NFPA 14. Fire pumps shall be sized to consider the standpipe demand as specified in NFPA 14. The system piping shall be hydraulically designed to provide the required flow rate at a minimum residual pressure of 65 psi at the hydraulically most remote 2½-inch hose connection.

3. In buildings 150-ft in height and greater, standpipe systems shall be designed as “Automatic Standpipe Systems” as defined in NFPA 14. Fire pumps shall be sized to consider the standpipe demand as specified in NFPA 14. The system piping shall be hydraulically designed to provide the required flow rate at a minimum residual pressure of 100-psi at the hydraulically most remote 2½-inch hose connection.

System design and manufacturer’s products shall be in accordance with the required and advisory provisions of NFPA 14 except as modified herein. [Standpipe system shall be designed by hydraulic calculations.] [Provide sprinkler portion of system under Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION.] Each system [shall include materials, accessories, and equipment inside and outside the building necessary to provide each system complete and ready for use. Devices and equipment shall be UL Fire Prot Dir listed or FM APP GUIDE approved for fire protection service. In the publications referred to herein, the advisory provisions shall be considered to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears; reference to the "authority having jurisdiction" shall be interpreted to mean the [[_____] Division] [Engineering Field Activity [_____]], Naval Facilities Engineering Command, Fire Protection Engineer. [The work shall begin at [the points indicated][_____] .]
1.4.1 Residual Pressure

The minimum residual pressure at the outlet of the most remote 64 mm hose connection shall be 448.2 kPa 65 psig [689.5 kPa 100 psig] while the system is discharging at the required design flow rates.

1.4.2 Friction Losses

Calculate losses in piping in accordance with the Hazen-Williams formula with 'C' value of 120 for steel piping, 150 for copper tubing, and 140 for cement-lined ductile-iron piping.

[1.4.3 Water Supply

Base hydraulic calculations on a static pressure of [_____] kPa psi (gage with [_____] L/m gpm available at a residual pressure of [_____] kPa psi (gage) at the [junction with the existing water distribution piping system.] [Base hydraulic calculations on operation of fire pump[s] provided in Section 21 30 00 FIRE PUMPS.]

1.4.4 Standpipe System Drawings

Prepare in accordance with the requirements for "Plans and Specifications" as specified in NFPA 14. Each drawing shall be 81 A1 841 by 594 mm 34 by 22 inches. Plans shall be drawn to a scale not less than 1 mm equals 100 mm 1/8 inch scale. Do not commence work until the design of each system and the various components have been approved. Show data essential for proper installation of each system. Show details, plan view, elevations, and sections of the systems supply and piping. Show piping schematic of systems supply, devices, valves, pipe, and fittings. [Submit drawings signed by a registered fire protection engineer.] Show:

a. Room, space or area layout and include pipe supports and hangers.

b. Field wiring diagrams showing locations of devices and points of connection and terminals used for all electrical field connections in the system, with wiring color code scheme.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

The fire protection engineer, [_____] Division [Engineering Field Activity [_____]], Naval Facilities Engineering Command will review any approve all submittals in this section requiring Government approval.

SECTION 21 12 00  Page 8

Data which describes more than one type of item shall be clearly marked to indicate which type the Contractor intends to provide. Submit one original for each item and clear, legible, first-generation photocopies for the remainder of the specified copies. Incomplete or illegible photocopies will not be accepted. Partial submittals will not be accepted.

**SD-06 Test Reports**

*Preliminary Tests; G[*][____]*

*Acceptance Tests; G[*][____]*

Submit for all inspections and tests specified under paragraph entitled "Field Quality Control."

**SD-07 Certificates**

*Qualifications of Installer; G[*][____]*

Submit installers qualifications as required under paragraph entitled "Qualifications of Installer."

**SD-10 Operation and Maintenance Data**

*Alarm Valves, Data Package 3; G[*][____]*

*Backflow Preventer, Data Package 3; G[*][____]*

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Furnish one complete package prior to the time that final acceptance tests are performed, and furnish the remaining before the contract is completed. Inscribe the following identification on the cover: the words OPERATION AND MAINTENANCE MANUAL, the location of the building, the name of the Contractor, system manufacturer and the contract number. The instructions shall be legible and easily read, with large sheets of drawings folded in. The package shall include: schematic drawings showing piping; circuit drawings; installation instructions; maintenance instructions; safety precautions, diagrams, and illustrations; test procedures; performance data; and parts list.

**SD-11 Closeout Submittals**

*System As-Built Drawings; G[*][____]*

1.6 QUALITY ASSURANCE

1.6.1 Qualifications of Installer

**************************************************************************

**NOTE:** The experience clause in this guide specification has been approved by a Level I, Contracting Officer in accordance with the requirements of Naval Facilities Acquisition Supplement (NFAS). NFAS can be found at the
Prior to commencing work, submit data showing that the Contractor has successfully installed fire extinguishing standpipe systems of the same type and design as specified herein, or that he has a firm contractual agreement with a subcontractor having the required experience. Include the names and locations of at least two installations where the Contractor, or the subcontractor referred to above, has installed such systems. Indicate the type and design of each system, and certify that the system has performed satisfactorily for a period of at least 18 months.

Qualifications of System Technician: Installation drawings, shop drawing and as-built drawings shall be prepared, by or under the supervision of, an individual who is experienced with the types of works specified herein, and is currently certified by the National Institute for Certification in Engineering Technologies (NICET) as an engineering technician with minimum Level-III certification in Automatic Sprinkler System program. Contractor shall submit data for approval showing the name and certification of all involved individuals with such qualifications at or prior to submittal of drawings.

1.6.2 System As-Built Drawings

Upon completion, and before final acceptance of the work, submit a complete set of as-built drawings of each system. Submit A1 841 by 594 mm 34 by 22 inch reproducible as-built drawings on mylar film with title block similar to full size contract drawings. Furnish as-built(record) working drawings in addition to the as-built drawings required by Division 1, "General Requirements."

1.7 DELIVERY, STORAGE AND HANDLING

Protect stored equipment from weather, humidity and temperature variations, dirt, dust, and other contaminants.

PART 2 PRODUCTS

2.1 ABOVEGROUND PIPING SYSTEMS

Provide fittings for changes in direction of piping and for connections. Make changes in piping sizes through tapered reducing pipe fittings; bushings will not be permitted. Perform welding in the shop; field welding will not be permitted. [Conceal piping in areas with suspended ceiling.]
high-pressure fittings where applicable. Consult the Division FPE for guidance.

NFPA 14, except as modified herein. Steel piping shall be Schedule 40 for sizes less than 200 mm 8 inches, and Schedule 30 or 40 for sizes 200 mm 8 inches and larger. Fittings shall be welded, threaded, or grooved-end type. Plain-end fittings with mechanical couplings and fittings which use steel gripping devices to bite into the pipe when pressure is applied will not be permitted. Rubber gasketed grooved-end pipe and fittings with mechanical couplings shall be permitted in pipe sizes 40 mm 1.5 inches and larger. Fittings shall be UL Fire Prot Dir listed or FM APP GUIDE approved for use in [dry] [wet] pipe sprinkler systems. Fittings, mechanical couplings, and rubber gaskets shall be supplied by the same manufacturer. Steel piping with wall thickness less than Schedule 30 shall not be threaded.[ Side outlet tees using rubber gasketed fittings shall not be permitted.] Pipe and fittings shall be metal.

2.1.2 Pipe Hangers and Supports

Provide in accordance with NFPA 14.

2.1.3 Valves

NFPA 14. Provide valves of types approved for fire service. Hose and gate valves shall open by counterclockwise rotation. Provide isolation and check valves as required by NFPA 14. Isolation valves shall be OS&Y type. Check valves shall be flanged clear opening swing-check type with flanged inspection and access cover plate for sizes 100 mm 4 inches and larger.

2.1.3.1 Hose Valves

NOTE: Where nozzle pressures may exceed 862 kPa 125 psi for Class I standpipes, specify pressure regulating valves. Specify 690 kPa 100 psi for all Class I standpipes unless otherwise requested by the Division FPE. Indicate on drawings which valves are to be pressure regulating type.

Provide bronze [pressure regulating type] hose valve with 65 mm 2 1/2 inch National Standard male hose threads, and 65 mm 2 1/2 inch NH female by 40 mm 1 1/2 inch IPT male reducer with cap and chain. [Equip valve with a device to regulate pressure at the outlet to a pressure not exceeding [690 [_____] kPa [100] [_____] psi [under both flow and no-flow conditions].]

2.1.4 Identification Signs

NFPA 14. Attach properly lettered and approved metal signs to each valve and alarm device.

[2.1.5 Waterflow Test Connection

NOTE: Include for wet pipe systems only.

Provide test connections approximately 1.83 m 6 feet above the floor for
each standpipe system or portion of each standpipe system equipped with an alarm device; locate downstream and adjacent to each alarm actuating device. Provide test connection piping to a location where the discharge will be readily visible and where water may be discharged without property damage. Discharge to janitor sinks or similar fixtures shall not be permitted. Provide discharge orifice equivalent to \(15 \text{ mm} \) \(1/2\) inch sprinkler orifice. [The penetration of the exterior wall shall be no greater than \(2 \text{ feet} \ 0.61 \text{ meter}\) \(\[\____\]\) above finished grade.]

]2.1.6 Main Drains

******************************************************************************

NOTE: Include for wet pipe systems only.
******************************************************************************

Provide separate drain piping to discharge at safe points outside each building or to sight cones attached to drains of adequate size to readily receive the full flow from each drain under maximum pressure. Provide auxiliary drains as required by NFPA 13 and NFPA 14.

]2.1.7 Pipe Sleeves

Provide where piping passes entirely through walls, floors, roofs and partitions. Secure sleeves in position and location during construction. Provide sleeves of sufficient length to pass through entire thickness of walls, floors, roofs and partitions. Provide one inch minimum clearance between exterior of piping and interior of sleeve or core-drilled hole. Firmly pack space with mineral wool insulation. Seal space at both ends of the sleeve or core-drilled hole with plastic waterproof cement which will dry to a firm but pliable mass, or provide a mechanically adjustable segmented elastomeric seal. In fire walls and fire floors, seal both ends of pipe sleeves or core-drilled holes with UL listed fill, void, or cavity material.

2.1.7.1 Sleeves in Masonry and Concrete Walls, Floors, and Roofs

Provide hot-dip galvanized steel, ductile-iron, or cast-iron sleeves. Core drilling of masonry and concrete may be provided in lieu of pipe sleeves when cavities in the core-drilled hole are completely grouted smooth. Extend sleeves in floor slabs \(76 \text{ mm} \ 3 \text{ inches}\) above finished floors.

2.1.7.2 Sleeves in Partitions

Provide 26 gage galvanized steel sheet.

2.1.8 Escutcheon Plates

Provide one piece or split hinge type metal plates for piping passing through walls, floors, and ceilings in both exposed and concealed spaces. Provide polished stainless steel plates or chromium-plated finish on copper alloy plates in finished spaces. Provide paint finish on metal plates in unfinished spaces. Securely anchor plates in place.

2.1.9 Fire Department Connections

******************************************************************************

NOTE: Consult Division FPE for diameter and thread type for fire department hose connections in use.
******************************************************************************
Provide connections approximately one meter 3 feet above finish grade, of the approved two-way type with [65] [_____] mm[2.5] [_____] inch National Standard female hose threads with plug, chain, and identifying fire department connection escutcheon plate.

[2.1.10]  Alarm Valves

**************************************************************************
NOTE: Include for wet pipe systems only.
**************************************************************************

Provide variable pressure type alarm valve complete with retarding chamber, alarm test valve, alarm shutoff valve, drain valve, pressure gages, accessories, and appurtenances for the proper operation of the system. The alarm shut-off valve in the piping between the alarm valve and the alarm pressure switch shall be a UL listed electrically supervised quarter-turn valve. Connection of switch shall be under Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE.] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE.] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE.] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE.]

[2.1.11]  Water Motor Alarms

**************************************************************************
NOTE: Include for wet pipe systems only.
**************************************************************************

Provide alarms of the approved weatherproof and guarded type, to sound locally on the flow of water in each corresponding standpipe. Mount alarms on the outside of the outer walls of each building. Provide separate drain piping directly to exterior of building.

[2.1.12]  Pressure Switch

**************************************************************************
NOTE: Include for wet pipe systems only.
**************************************************************************

Provide switch with circuit opener or closer [SPDT contacts] for the automatic transmittal of an alarm over the facility fire alarm system. Connect into the building fire alarm system. Alarm actuating device shall have mechanical diaphragm controlled retard device adjustable from 10 to 60 seconds and shall instantly recycle.

[2.1.13]  Waterflow Detector

**************************************************************************
NOTE: Include for wet pipe systems only.
**************************************************************************

Provide vane-type waterflow detector. Provide detector with adjustable retard feature to prevent false alarms caused by momentary water surges. Connect into the building fire alarm system. [Alarm actuating device shall have mechanical diaphragm controlled retard device adjustable from 10 to 60 seconds and shall instantly recycle.] Provide detector [at the base of each standpipe riser above main check valve] [where indicated] in accordance with manufacturers instructions.
2.1.14 Fire Hose Cabinets

Provide [recessed] [semi recessed] [surface]-mounted cabinets where indicated. Cabinets shall be prime grade, cold-rolled, reannealed, process-leveled, furniture steel. Fabricate cabinet from 20 gage steel and door and trim from 18 gage steel. Provide fully welded joints ground smooth. On each jamb, provide at least two anchors or reinforcements spaced approximately 610 mm (24 inches) apart for building in or attaching the cabinets to adjacent construction. Doors shall be flush hollow metal type with fully welded joints ground smooth and full glazed opening. Provide door with continuous hinge, latch and pull. Hinge door for 180 degree opening. Glass shall conform to ASTM C1036 and shall be Type II (flat wired glass), Class 1 (clear), Form 1 (wired, polished both sides), Quality q 8 (glazing quality), diamond or square wire mesh, 6.35 mm (1/4 inch) thick. Factory finish cabinet inside and out with one coat of enamel applied over a primer. Interior finish color shall be white. Exterior finish color shall be [____]. [Fabricate cabinet with sufficient interior space to store one fire extinguisher.]

2.1.15 Valve Tamper Switch

**************************************************************************
NOTE: Include for wet pipe systems only.
**************************************************************************

Provide valve tamper switch(es) to monitor the open position of valve(s) controlling water supply to the standpipe system. Switch contacts shall transfer from the normal (valve open) position to the off-normal (valve closed) position during the first two revolutions of the hand wheel or when the stem of the valve has moved not more than one-fifth of the distance from its normal position. Switch shall be tamper resistant. Removal of the cover shall cause switch to operate into the off-normal position.

2.1.16 Fire Pumps

Provide as specified in Section 21 30 00 FIRE PUMPS.

2.1.17 Backflow Preventer

Provide [reduced pressure principle] [double check] valve assembly backflow preventer with OS&Y gate valve on both ends. Each check valve shall have a drain. Backflow prevention assemblies shall have current "Certificate of Approval from the Foundation for Cross-Connection Control and Hydraulic Research, FCCCHR List. Listing of the specific make, model, design, and size in the FCCCHR List shall be acceptable as the required documentation."

2.2 BURIED PIPING SYSTEMS

2.2.1 Buried Pipe and Fittings

**************************************************************************
NOTE: For pipe sizes larger than 305 mm (12 inches), method for pipe anchorage including pipe clamps and rods shall be shown on the drawings.
**************************************************************************

**************************************************************************
NOTE: Requirements for buried piping systems 1.52 m
5 feet beyond the building walls shall be specified in Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING. Careful coordination is required to insure that materials rated for fire service are specified.

NFPA 24, outside coated, cement lined, ductile iron pipe and fittings for piping under the building and to a point 1.52 m 5 feet outside the building walls. Anchor the joints in accordance with NFPA 24 using pipe clamps and steel rods. Minimum pipe size shall be 150 mm 6 inches. Minimum depth of cover shall be [_____] [one meter] [3] feet. Piping more than 1.52 m 5 feet outside the building walls shall be provided under Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

2.2.2 Buried Utility Warning and Identification Tape

Provide detectable tape in accordance with Section 31 00 00 EARTHWORK.

2.3 ELECTRICAL WORK

**************************************************************************

NOTE: Edit Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and include as part of the project specification.
**************************************************************************

**************************************************************************

NOTE: When project includes requirement for a building fire alarm system, include Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE, Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE, Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE, or Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE in the project specification. When project requires only tying into an existing building fire alarm system, fire alarm wiring should be specified in this section. Edit this paragraph to suit project requirements.
**************************************************************************

Provide electrical work associated with this section under Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, except for fire alarm wiring. Provide fire alarm wiring and connection to fire alarm systems under Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] [this section in accordance with NFPA 70 and NFPA 72].

[2.3.1 Wiring

**************************************************************************

NOTE: Delete this paragraph if [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS
NOTIFICATION SYSTEM, ADDRESSABLE] is included in the project specification.

Provide fire alarm wiring and connections to fire alarm systems, under this section and conforming to NFPA 70, and NFPA 72. Wire for 120 volt circuits shall be No. 12 AWG minimum solid conductor. Wire for low voltage DC circuits shall be No. [14] [16] AWG minimum solid conductor. All wiring shall be color coded. Wiring, conduit and devices exposed to water or weather shall be weatherproof. Wiring, conduit and devices located in hazardous atmospheres, as defined by NFPA 70 [and as shown], shall be explosion proof. All conduit shall be minimum 20 mm 3/4 inch size. Identify circuit conductors within each enclosure where a tap, splice or termination is made. Identify conductors by plastic coated self sticking printed markers or by heat-shrink type sleeves. Attach the markers in a manner that will not permit accidental detachment.

PART 3 EXECUTION

3.1 EXCAVATION, BACKFILLING, AND COMPACTING

NOTE: Edit Section 31 00 00 EARTHWORK and include as part of the project specification.

Provide under this section as specified in Section 31 00 00 EARTHWORK.

3.2 CONNECTIONS TO EXISTING WATER SUPPLY SYSTEMS

NOTE: Coordinate with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING for this work.

Connections to existing water supply system are specified in Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

3.3 STANDPIPE SYSTEM INSTALLATION

NOTE: Include bracketed text for wet pipe systems only.

Equipment, materials, installation, workmanship, fabrication, assembly, erection, examination, inspection, and testing shall be in accordance with the NFPA standards referenced herein. Install piping straight and true to bear evenly on hangers and supports. [Conceal piping to the maximum extent possible. Piping shall be inspected, tested and approved before being concealed.] Provide fittings for changes in direction of piping and for all connections Make changes in piping sizes through standard reducing pipe fittings; do not use bushings. Cut pipe accurately and work into place without springing or forcing. Ream pipe ends and free pipe and fittings from burrs. Clean with solvent to remove all varnish and cutting oil prior to assemble. Make screw joints with PTFE tape applied to male thread only.
3.4 DISINFECTION

**************************************************************************
NOTE: Delete this paragraph for dry pipe systems
and when the water supply for a wet pipe system is non-potable water.
**************************************************************************

Disinfect new water piping from the point of connection at the water main and existing water piping affected by the Contractor's operation in accordance with AWWA C651. Exercise caution when mixing chlorine disinfectant solutions. Fill piping systems with solution containing minimum of 50 parts per million of free available chlorine and allow solution to stand for a minimum of 24 hours. Flush solution from systems with clean water until maximum residual chlorine content is not greater than 0.2 parts per million. Obtain at least two consecutive satisfactory bacteriological samples from new water piping, analyze by a certified laboratory, and submit results prior to new water piping being placed into service.

3.5 FIELD PAINTING

Field painting of fire extinguishing standpipe system shall be specified in Section 09 90 00 PAINTS AND COATINGS. Field painting requirements for "Fire Extinguishing Sprinkler Systems" shall apply.

3.5.1 Piping Labels

Provide permanent labels in mechanical rooms, spaced at 6 meters 20 foot maximum intervals along pipe, indicating "STANDPIPE."

3.6 ELECTRICAL WORK

**************************************************************************
NOTE: Edit Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and include as part of the project specification
**************************************************************************

**************************************************************************
NOTE: When project includes requirement for a building fire alarm system, include Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE, Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE, Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE, or Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE in the project specification. When project requires only tying into an existing building fire alarm system, fire alarm wiring should be specified in this section. Edit this paragraph to suit project requirements.
**************************************************************************

Provide electrical work associated with this section under Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, except for fire alarm wiring. Provide fire alarm wiring and connection to fire alarm systems under Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE
3.6.1 Wiring

Provide fire alarm wiring and connections to fire alarm systems, under this section in accordance with NFPA 70, and NFPA 72. Provide wiring in rigid metal conduit or intermediate metal conduit, except electrical metallic tubing may be used in dry locations not enclosed in concrete or where not subject to mechanical damage. Do not run low voltage DC circuits in the same conduit with AC circuits.

3.7 FLUSHING

Flush the piping system with potable water in accordance with NFPA 14. Continue flushing operation until water is clear, but for not less than 10 minutes.

3.8 FIELD QUALITY CONTROL

Prior to initial operation, inspect equipment and piping systems for compliance with drawings, specifications, and manufacturer's submittals. Perform tests in the presence of the Contracting Officer to determine conformance with the specified requirements.

3.8.1 Preliminary Tests

Each piping system shall be hydrostatically tested at [1379] [_____] kPa (gage) [200] [_____] psig in accordance with NFPA 14 and NFPA 24 and shall show no leakage or reduction in gauge pressure after 2 hours. The Contractor shall conduct complete preliminary tests, which shall encompass all aspects of system operation. [Individually test alarms, and all other components and accessories to demonstrate proper functioning. Test water flow alarms by flowing water.] When tests have been completed and all necessary corrections made, submit to the Contracting Officer a signed and dated certificate, similar to that specified in NFPA 13, attesting to the satisfactory completion of all testing and stating that the system is in operating condition. Also include a written request for a formal inspection and test.
3.8.2 Formal Inspection and Tests (Acceptance Tests)

The [[_____] Division] [Engineering Field Activity [_____]], Naval Facilities Engineering Command, Fire Protection Engineer, will witness formal tests and approve all systems before they are accepted. The system shall be considered ready for such testing only after all necessary preliminary tests have been made and all deficiencies found have been corrected to the satisfaction of the Contracting Officer and written certification to this effect is received by the Division Fire Protection Engineer. Submit the request for formal inspection at least 15 working days prior to the date the inspection is to take place. Experienced technicians regularly employed by the Contractor in the installation of both the mechanical and electrical portions of such systems shall be present during the inspection and shall conduct the testing. All instruments, personnel, appliances and equipment for testing shall be furnished by the Contractor. [The Government will furnish water for the tests.] All necessary tests encompassing all aspects of system operation shall be made including the following, and any deficiency found shall be corrected and the system retested at no cost to the Government.

3.8.2.1 Flow Test

******************************************************************************
NOTE: Include bracketed text for dry pipe systems only.
******************************************************************************

Perform flow tests of each standpipe riser in accordance with NFPA 14. Affix [0-1379] kPa [0-2068] psi pressure gauges to lowest hose valve and next-to-highest hose valve. Connect lined, 65 mm 2 1/2 inch diameter fire hose with underwriter's playpipe to highest hose valve and flow at least 946 L/m 250 gpm for 5 minutes from standpipe to a safe location outside the building. [For dry pipe system, supply system through 65 mm 2 1/2 inch fire hose connected to the nearest fire hydrant which is approximately [_____] meters feet away.] Furnish hose, nozzles and fittings required for this test.

[3.8.2.2 Alarm Testing

******************************************************************************
NOTE: Include for wet pipe systems only.
******************************************************************************

a. Each pressure switch, waterflow detector, and water motor gong shall be activated by flow of water.

b. Each valve tamper switch shall be activated by partially closing the associated control valve.

c. Alarm annunciation at the fire alarm control panel shall be verified.

d. Circuit supervision shall be demonstrated.

]3.8.3 Additional Tests

When deficiencies, defects or malfunctions develop during the tests required, all further testing of the system shall be suspended until proper adjustments, corrections or revisions have been made to assure proper
performance of the system. If these revisions require more than a nominal delay, the Contracting Officer shall be notified when the additional work has been completed, to arrange a new inspection and test of the system. All tests required shall be repeated prior to final acceptance, unless directed otherwise.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for wet and dry fire protection sprinkler systems, hydrants, standpipe equipment, and firehose stations.

Drawings should include the following:

Data on subsurface soil conditions

Location and invert elevations of existing obstructions on the ground surface and existing underground structures and utilities that are to be avoided during construction or are required to be plugged and abandoned or demolished and removed

Invert elevations of all work to be connected to size, type, and extent of selected conduit

Typical cross-section for each nonspecified trench, bedding, and backfill condition, indicating conduit, bedding, and backfill material

Location of soil storage areas and spoil areas on government property where disposal of excess and waste material is permitted

Typical riser details

Areas to be sprinkled, hazard by class, temperature setting of heads, ceiling type, height, and any other special design criteria

Existing alarm-system connections

Proper utilization and coordination of symbols, legends, or codes for various materials and classed conditions as provided in the specifications

Adhere to [UFC 1-300-02](https://example.com) Unified Facilities Guide
Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: If Section 23 30 00 HVAC AIR DISTRIBUTION is not included in the project specification, applicable requirements therefrom should be inserted and the following paragraph deleted.

Section 23 30 00 HVAC AIR DISTRIBUTION applies to work specified in this section.

1.1   REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 ADMINISTRATIVE REQUIREMENTS

Conduct a survey of the work area. Submit a record of existing conditions showing the results of the survey of work area conditions and features of existing structures and facilities within and adjacent to the jobsite. Commencement of work constitutes acceptance of existing conditions.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S"
classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval,] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 PREDICTIVE TESTING AND INSPECTION TECHNOLOGY REQUIREMENTS

**************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I) tests prescribed in Section 01 86 12.07 40 RELIABILITY CENTERED ACCEPTANCE FOR MECHANICAL SYSTEMS are MANDATORY for all [NASA] [_____] assets and systems identified as Critical, Configured, or Mission Essential. If the system is non-critical, non-configured, and not mission essential, use sound engineering discretion to assess the value of adding these additional test and acceptance requirements. See Section 01 86 12.07 40 RELIABILITY CENTERED ACCEPTANCE FOR MECHANICAL SYSTEMS for additional information regarding cost feasibility of PT&I.
**************************************************************************

This section contains systems and/or equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program. This program requires the use of Predictive Testing and Inspection (PT&I) technologies in conformance with RCBEA GUIDE to ensure building equipment and systems installed by the Contractor have been installed properly and contain no identifiable defects that shorten the design life of a system and/or its components. Satisfactory completion of all acceptance requirements is required to obtain Government approval and acceptance of the work.

Perform PT&I tests and provide submittals as specified in Section 01 86 12.07 40 RELIABILITY CENTERED ACCEPTANCE FOR MECHANICAL SYSTEMS.

PART 2 PRODUCTS

Provide design analysis and calculations in accordance with NFPA 13.

Submit connection diagrams indicating the relations and connections of the following items. Indicate on drawings, the general physical layout of all controls, and internal tubing and wiring details.

2.1 SYSTEM DESCRIPTION

Ensure fire-protection system materials and equipment provided under this section conform to the requirements of Underwriters Laboratories (UL) or the Factory Mutual (FM APP GUIDE).

Products with UL label or seal or listing in UL 6, and products with FM label or listed in the FM APP GUIDE are acceptable fire-protection system materials and equipment. Furnish materials and equipment compatible with existing system.

Submit equipment and performance data for fire protection sprinkler systems consisting of information on use life, system functional flows, safety features, and mechanical automated details.
2.2 EQUIPMENT

2.2.1 Underground Piping Materials

Provide ells, tees, reducing tees, wyes, couplings, increasers, crosses, transitions, and end caps of the same type and class of material as the pipe or have equal or superior physical and chemical properties.

2.2.1.1 Type Cast Iron Water Pipe

Provide mechanical joint or push-on cast-iron waterpipe, centrifugally cast, UL listed and labeled, conforming to FS WW-P-421 and, as applicable, to AWWA C151/A21.51, AWWA C110/A21.10, AWWA C111/A21.11. Use Class 150 piping. Ensure bell-and-spigot fittings conform to AWWA C110/A21.10.

For FS WW-P-421 wall-thickness criteria only, depth of cover is 1500 millimeter 5 feet unless drawings indicate less, in which case, drawing requirements apply. Field-laying conditions are B (flat-bottom trench, without blocks, tamped backfill).

Flanged cast-iron pipe fittings are Class 125 conforming to ASME B16.1.

Coat pipe and fittings on the [inside] and [outside] with a bituminous sealer in accordance with AWWA C104/A21.4.

Restraining joints against endwise separation due to internal pressure may be accomplished by a NFPA-recommended metal harness consisting of clamping devices and bolting or by hardened-metal retainers molded into a push-on gasket and engaged by a groove in the spigot end.

Where electrical continuity is indicated, supply the pipe with factory-brazed heavy cross section copper connectors to be joined with copper fasteners upon joint assembly. Connectors, as a minimum, are equal to No. 1/0.

2.2.1.2 Type Ductile Iron Water Pipe

Provide mechanical-joint or push-on type ductile-iron water pipe, centrifugally cast, UL listed and labeled, conforming to applicable provisions of AWWA C111/A21.11, and AWWA C151/A21.51. Wall-thickness criteria is 1380 kilopascal 200-pounds per square inch (psi) working pressure plus 690 kilopascal 100-psi surge allowance, AASHTO H-20 loading with specified trench conditions. Ensure the gasket elastomer is chloroprene.

Coat pipe on the [inside] and [outside] with a bituminous sealer in accordance with AWWA C104/A21.4.

Restraining joints against endwise separation due to internal pressure may be accomplished by using a metal harness consisting of clamping devices and bolting or by hardened-metal retainers molded into a push-on gasket and engaged by a groove in the spigot end.
Where electrical continuity is indicated, supply the pipe with factory-brazed heavy cross section copper connectors to be joined with copper fasteners upon joint assembly. Connectors, at a minimum, are equal to No. 1/0.

2.2.2 Aboveground Piping Materials

2.2.2.1 Type BCS - Black Carbon Steel

Pipe DN6 through DN40 1/8 through 1-1/2 inches: Schedule 40 furnace butt weld black-carbon steel conforming to ASTM A53/A53M, or ASTM A135/A135M, Type F furnace butt welded; Schedule 10 conforming to ASTM A135/A135M, Grade B.

Pipe DN50 through DN2062 through 8 inches, where indicated: Schedule 40 seamless or electric-resistance welded black carbon steel, conforming to ASTM A53/A53M or ASTM A135/A135M, Type E (electric-resistance welded), Grade B, or Type S (seamless), Grade B; Schedule 10 conforming to ASTM A135/A135M, Grade B.

Pipe DN250 10 inches and over: Schedule 30 black carbon steel conforming to ASTM A53/A53M, Type E (electric-resistance welded) or Type S (seamless).

Unions DN50 2 inches and under): 2068 kilopascal 300-pound per square inch gage (psig) working steam pressure (wsp) female, screwed, black malleable iron, with ground joint and brass-to-iron seat conforming to ASME B16.39.

Standard pipe couplings: Extra-heavy screwed black steel.

Grooved pipe couplings (all sizes): 1207 kilopascal 175-psig minimum working pressure with a housing fabricated in two or more parts of black malleable-iron castings. Provide coupling gasket molded of synthetic rubber, conforming to requirements of ASTM D2000. Provide coupling bolts that are oval-neck, track-head type with heavy hexagonal nuts, conforming to ASTM A183.

Fittings DN100 4 inches and under: 1207 kilopascal 175-psig working pressure, cast iron, screwed, conforming to ASTM A126, Class A, and ASME B16.4.

Fittings DN150 6 inches and larger: 1207 kilopascal 175-psig working pressure, cast iron, conforming to ASTM A126, Class A, screwed, conforming to ASME B16.4, or flanged, conforming to ASME B16.1.

Fittings DN200 8 inches and under): Provide rolled-groove or mechanical locking (push-on) couplings. Provide rolled only grooves for rolled-groove type; cut grooving is not allowed. Ensure rolled grooves are dimensionally compatible with the couplings.

Grooved fittings (all sizes): 1207 kilopascal ensure 175-psig working pressure fittings used with grooved couplings are fabricated of black malleable-iron castings. If a manufacturer's standard-size malleable-iron fitting pattern is not available, use fabricated fittings. Fabricate fittings from Grade B seamless-steel pipe and long-radius seamless welding fittings, with wall thickness to match pipe, conforming to ASTM A234/A234M and ASME B16.9.
2.2.2 Type GCS - Galvanized Carbon Steel

Pipe DN15 through DN250 (1/2 through 10 inches and where indicated): Schedule 40 seamless or electric resistant welded galvanized steel conforming to ASTM A53/A53M, Type E (electric-resistance welded) or Type S (seamless). Type F (furnace butt welded continuous welded) is acceptable for sizes less than DN50 2 inches.

Fittings (all sizes): 1034 kilopascal 150-psig working pressure banded, galvanized, malleable, screwed, conforming to ASTM A197/A197M and ASME B16.3.

Fittings DN65 2-1/2 inches and over): 862 kilopascal 125-psig working pressure cast-iron flanges and flanged fittings conforming to ASTM A126, Class A and to ASME B16.1.

Grooved pipe couplings (all sizes): 1207 kilopascal 175-psig minimum working pressure with a housing fabricated in two or more parts of galvanized malleable-iron castings. Provide coupling gasket molded of synthetic rubber, conforming to requirements of ASTM D2000. Ensure coupling bolts are oval-neck, track-head type with heavy hexagonal nuts, conforming to ASTM A183.

Grooved fittings (all sizes): 1207 kilopascal ensure 175-psig working pressure fittings used with grooved couplings are fabricated of galvanized malleable-iron castings. If a manufacturer's standard-size malleable-iron fitting pattern is not available, use fabricated fittings. Fabricate fittings from Grade B seamless steel pipe and long-radius seamless welding fittings, with wall thickness to match pipe, conforming to ASTM A234/A234M and ASME B16.9.

Unions DN50 2 inches and under): 2070 kilopascal 300-psig working pressure female, screwed, galvanized malleable iron, with brass-to-seat and ground joint.

2.2.3 Supporting Elements

Provide piping system components and miscellaneous supporting elements, including, but not limited to, building-structure attachments; supplementary steel; hanger rods, stanchions, and fixtures; vertical-pipe attachments; horizontal-pipe attachments; restraining anchors; and guides. Ensure supporting elements are suitable for stresses imposed by systems pressures and temperatures, natural, and other external forces.

**************************************************************************
NOTE: Refer to Section 23 05 48.00 40 VIBRATION AND SEISMIC CONTROLS FOR HVAC PIPING AND EQUIPMENT if design may induce vibration considerations.
**************************************************************************

Provide FM approved or UL listed supporting elements conforming to ASME B31.1, MSS SP-58, and ASME B16.34.

2.2.3.1 Building-Structure Attachments

For cast-in floor-mounted equipment-anchor devices, ensure adjustable positions are available.

Do not use powder-actuated anchoring devices to support mechanical-systems components.
a. Anchor Devices, Concrete and Masonry

(1) Ensure anchor devices conform to **FS FF-S-325**:

(2) Group I: Shield, expansion (lead, bolt, and stud anchors)

(3) Group II: Shield, expansion (bolt anchors), Type 2, Class 2, Style 1 or 2

(4) Group III: Shield, expansion (self drilling tubular expansion shell bolt anchors)

b. Beam Clamps

(1) Provide center-loading beam clamps, Types 21, 28, 29, and 30, UL listed, cataloged, and load-rated commercially manufactured products.

(2) Use Type 20 beam clamps for pipe **DN50 2 inches** and under.

(3) Use two Type 25 beam clamps per point of pipe support.

c. C-Clamps

******************************************************************************

**NOTE:** C-clamps, as a means of attaching hangers to structural steel, should be avoided. Where used, consider vibration forces and single or accumulated load and resultant moment on structural steel.

******************************************************************************

(1) Ensure C-clamps are [not used.] [used to support piping sizes **DN40 1-1/2 inches** and smaller.] Use FM approved and UL listed C-clamps, with hardened cup-tip setscrew, locknut, and retaining strap. Retaining-strap section cannot be less than **6 by 25 millimeter 1/8 by 1 inch**. Beam-flange thickness to which clamps are attached cannot exceed **15 millimeter 0.60 inch**.

d. Concrete Inserts

(1) Construct concrete inserts in accordance with the requirements of **MSS SP-58** for Type 18 and **ASME B16.34**. When applied to piping in sizes **DN50 2-inch** iron pipe size (ips) and larger, and where otherwise required by imposed loads, insert and wire a **300 millimeter length of 15 millimeter 1-foot length of 1/2-inch reinforcing rod through wing slots**.

2.2.3.2 Horizontal-Pipe Attachments

a. Single Pipes

(1) Support piping in sizes up to and including **DN50 2-inch** ips by using Type 1, 5, 6, 7, 9, 10, 11, or 12 solid, split-ring, or band type attachments.

(2) Support piping in sizes **DN65 2-1/2 inches** and larger by using Type 1, 2, 3, or 4 attachments or with Type 41 or Type 49 pipe rolls.
b. Parallel Fire-Protection Pipes

(1) Use trapeze hangers fabricated from approved structural steel shapes, with U-bolts, when so specified. Ensure structural-steel shapes conform to supplementary steel requirements or the support is commercially available, approved proprietary-design rolled steel.

2.2.3.3 Vertical-Pipe Attachments

Provide Type B single vertical-pipe attachments.

2.2.3.4 Hanger Rods and Fixtures

Use only circular solid cross section rod hangers to connect building structure attachments to pipe-support devices. Use pipe, straps, or bars of equivalent strength for hangers.

Provide turnbuckles, swing eyes, and clevises as required by support system to accommodate temperature changes, pipe accessibility, and adjustment for load and pitch.

2.2.3.5 Supplementary Steel

Where it is necessary to frame structural members between existing members or where structural members are used in lieu of commercially rated supports, design such supplementary steel and fabricate in accordance with AISC/AISI 121.

2.2.4 Fire-Department Connections

Ensure hose connections have National Firehose standard-thread form and rocker lugs in accordance with NFPA 1963. Ensure hose-connection sizes and threads are compatible with the equipment used by the fire department serving the facility.

2.2.4.1 Wall Siamese

Provide cast brass or bronze flush-mounted escutcheon-plate units, with two DN65 2-1/2-inch, fire-department, swivel, female inlets; double-clapper valves; rocker-lug caps and chains; and cast-in function-identifying lettering. Provide a unit with a chrome-plated or polished surface finish. Ensure chrome plate is in accordance with ASME A112.18.1/CSA B125.1.

2.2.4.2 Sidewalk Siamese

Provide cast brass or bronze unit, with two DN65 2-1/2-inch, fire-department, swivel, female inlets; double-clapper valves; rocker-lug caps and chains; and cast-in function-identifying lettering. Provide a unit with a chrome-plated or polished surface finish. Ensure chrome plate is in accordance with ASME A112.18.1/CSA B125.1.

Mount unit on a Schedule 40 ASTM A53/A53M galvanized carbon-steel pipe with red-enameled finish on prime-coated surface. Protect all surfaces embedded in concrete or below grade with a 0.508 millimeter 20-mil thick bituminous coating.
2.2.4.3  Wall Hydrant

Provide a cast brass or bronze flush-mounted escutcheon-plate unit with two DN65 2-1/2-inch, fire-department, male outlets; rocker lug caps and chains; and cast-in function-identifying lettering. Provide a unit with a chrome-plated or polished surface finish. Ensure chrome plate is in accordance with ASME A112.18.1/CSA B125.1.

2.2.4.4  Roof Manifold

Provide a cast brass or bronze, horizontal unit, with two DN65, 1200 kilopascal 2-1/2-inch, 175-pound rated hose valves fitted with rocker-lug caps and chains. Finish is rough body with polished trim.

2.2.4.5  Fire Hydrants

Provide dry-barrel type hydrants, with low-profile and modern appearance. Design hydrants to remain closed if hydrant barrel is sheared or damaged. Select hydrants that have two DN65 2-1/2-inch, hose outlets and one DN115 4-1/2-inch hose outlet complete with non-binding caps and cap chains. Ensure hydrant direction of opening is counterclockwise. Ensure surface is filled, primed, and finished with a multiple-coat high-gloss weather-resistant enamel. All surfaces below grade receive a coating of bitumen not less than 0.508 millimeter 20 mils thick. Exercise care not to plug barrel drainage provisions. Ensure hydrant color is standard for the project site.

2.2.5  Riser Alarm Equipment

Ensure riser alarm equipment is UL listed or FM approved for fire-protection use.

2.2.5.1  Wet-Pipe Alarm Check Valve

Provide wet-pipe alarm check valve, complete with standard accessories and trim necessary to give an alarm and includes pressure gages, retard chamber, testing provisions, and all necessary intercomponent piping, fittings, and valves. Ensure pilot valve and clapper have individual elastomer seats.

2.2.5.2  Standard Check Valve

Provide FM-approved or UL-listed standard swing-check valves with elastomer-disc seat. Provide pressure gages on both sides of the clapper. Water-flow alarm is a vane type.

2.2.5.3  Dry-Pipe Alarm Check Valve

Provide a dry-pipe alarm check valve, complete with standard accessories and trim necessary to give an alarm. Ensure the valve includes pressure gages, accelerator, priming provisions, testing provisions, and all necessary intercomponent compressed-air and water piping, fittings, and valves.

Ensure the system includes a trouble alarm indicating a loss of air pressure.
2.2.5.4 Water-Flow Alarm Device

Ensure water-flow alarm devices are UL listed for the particular type of system.

a. Water Motor Gong Local Alarm

(1) Assembly includes a gong with an aluminum or chrome-plated brass hood with nonstaining weather-resistant mounting. Water motor shaft has tetrafluoroethylene bearings and an inlet strainer. Ensure the waste water drains as indicated.

(2) Ensure weather-exposed units are weatherproof and provided with a weather hood. Construct assembly of nonstaining materials.

b. Pressure Switch Remote Alarm

(1) Wire the pressure switch to make or break a circuit depending on rise or fall of water pressure.

c. Vane-Type Flow Alarm

(1) Ensure the vane-type flow alarm makes or breaks an alarm circuit upon deflection by a volume of flowing water that equals or exceeds the capacity of a single sprinkler. Ensure alarm has an instant-recycle pneumatic-retard time delay.

d. Electric Motor Gong

**************************************************************************

NOTE: Rewrite following for dc systems.
**************************************************************************

(1) Provide an electric motor gong with a 150 millimeter 6-inch diameter bell, synchronous-motor type.

2.2.6 Dry-Pipe Maintenance Air

2.2.6.1 Independent Source

Maintain the dry-pipe system air pressure by an independent air compressor mounted on the riser. Ensure compressor is: spring and elastomer vibration-isolated from the riser, of oil-free construction, complete with adjustable set point low-differential pressure switch, check valve, and necessary unloader and intercomponent piping and wiring. Provide spare inlet-air filter media.

2.2.6.2 Continuous Source

Maintain the dry-pipe system air pressure by an adjustable set point low-differential-diaphragm pressure-reducing valve connected to 690 kilopascal 100 psig facility compressed-air system to maintain air side of dry-pipe valve. Construct unit entirely of nonferrous-metal with a replaceable cartridge inlet-air filter. Provide a complete air-maintenance device with intercomponent piping, fittings, and valves. Provide spare inlet-air filter media.
2.2.6.3 Retard Orifice

Provide an air-supply line near each dry-pipe valve with an orifice union with a 3 millimeter 1/8-inch orifice corrosion-resistant steel plate, externally identified, and a DN15 1/2-inch three-valve bypass around the orifice union.

2.2.7 Standpipe Equipment and Fire Hose Cabinet Stations

2.2.7.1 Fire Hose Cabinet Stations

Furnish fire hose cabinet stations with cabinet, firehose rack, DN40 1-1/2-inch hose, valve, and spanner wrench.

2.2.7.2 Firehose Racks and Hoses

Provide rack-and-hose assemblies, nipple mounted, swinging, semiautomatic, and red enameled. Fit racks with spring-friction retainer clip.

Ensure hoses are DN40 1-1/2-inch diameter, 20 meter 75-feet long, cotton-polyester jacketed, rubber lined, mildew-proof, conforming to NFPA 1961, and UL approved for rack service. Use rocker-lug type couplings. Provide a spanner, mounted in clips, at each rack.

Provide polished brass rack valves, 1200 kilopascal 175-psi rated, DN65 2-1/2-inch angle valve with 65 millimeter 2-1/2-inch female to 40 millimeter 1-1/2-inch male reducer, and fitted with automatic drain-vent device.

Provide hose nozzles that are DN40 1-1/2-inch chemical hose thread, polished brass, adjustable fog, off-and-on solid-stream type.

2.2.7.3 Standpipe-Mounted Hose Racks and Hoses

Select hose racks suitable for specified hose length. Provide red enameled racks and accessories, designed for standpipe mounting at an elevation high enough to avoid damage. Provide suitable clips or spring-loaded retainers to prevent hoses from unwinding and hoses and nozzles from swinging from their mounted position until placed into service.

Provide rack hoses that are DN40 1-1/2-inch diameter, 30 meter 100-foot long, cotton-polyester jacketed, rubber lined and mildew-proof, conforming to NFPA 1961. Use rocker-lug type couplings. Provide a spanner, mounted in clips, at each rack.

Provide a polished brass rack valve, 1200 kilopascal 175-psi rated, DN65 2-1/2-inch angle valve with 65 millimeter 2-1/2-inch female to 40 millimeter 1-1/2-inch male reducer, and fitted with automatic drain-vent device.

Provide a hose nozzle that is DN40 1-1/2-inch chemical hose thread, polished brass, adjustable fog, off-and-on solid-stream type.

2.2.7.4 Hose Reels and Hoses

Provide red enameled hose reels, frames, and accessories, suitable for specified hose diameter and length. Fit reels with a swivel and piping to allow continuous flow through hoses. Provide friction brakes to prevent hoses from accidentally unwinding.

Provide hoses with an 40 millimeter 1-1/2-inch inside diameter, 45
millimeter 1-3/4-inch outside diameter, 3-braid, single-jacket, 2070 kilopascal 300-psi working pressure, 30 meter 100 feet long, hard rubber or heavy duty synthetic cover, non-collapsible, and fitted with couplings. Hoses are red covered, flexible, nonkinking, and weigh not over 35 kilogram per 30 meter 75 pounds per 100 feet.

Provide hole type couplings, one female swivel and one male, both with chemical hose thread (M44 - 3.175 male) (1-3/4-inch outside diameter - 8 NH male threads per inch).

Ensure the reel control valve is 1200 kilopascal 175-psi rated, quarter-turn, ball- or butterfly-valve, for quick-opening operation.

Provide a hose nozzle that is DN40 1-1/2-inch chemical hose thread, polished brass, adjustable fog, off-and-on solid-stream type.

2.2.7.5 Standpipe Valve

Provide a DN65 2-1/2-inch angle hose valve, 1200 kilopascal 175-psi rated, with 65 millimeter 2-1/2-inch female to 40 millimeter 1-1/2-inch male reducer, 40 millimeter 1-1/2-inch cap and chain, and chrome-plated polished brass.

In multistory buildings with fire pumps, include a valve orifice plate to restrict discharge pressure to 450 kilopascal 65 psig.

2.2.7.6 Fire-Hose Cabinet

Provide a recessed heavy-gage steel cabinet body with primed surfaces and baked white enamel interior.

Cabinet door and trim is 32 millimeter 1-1/4-inch projecting type, of AISI Type 302 corrosion-resistant steel, with No. 4 finish on all surfaces, including faces and edges exposed to view. Remove weld burns and smooth radii developed. Control warping of edges, especially those which mate to wall, to prevent gaps. Provide continuous corrosion-resistant steel hinges, and door pulls that are 115 millimeter 4-1/2-inch satin finish, chrome-plated brass or corrosion-resistant steel, enclosed, file-cabinet type.

Fit the door with full size 6 millimeter 1/4-inch thick safety or tempered glass and dual friction latches.

Size cabinet to accommodate the valve, rack, hose, and either one 9.5 liter 2-1/2-gallon air-pressurized water fire extinguisher or one 7 kilogram 15-pound carbon-dioxide extinguisher. Extinguisher will be furnished by the Government.

2.2.8 Sprinkler Heads

2.2.8.1 Head Types

Use standard 13 millimeter 1/2-inch orifice sprinkler heads. Heads are
automatic on-off type. Install on-off type heads only in wet-pipe systems.

Ensure heads in finished areas below suspended ceilings are flush chrome-plated brass. Provide escutcheon plate of baked enamel finished to match ceiling.

Furnish flush or pendant heads in finished areas below suspended ceiling. Ensure heads and escutcheon plates are chrome-plated brass.

Ensure heads in unfinished areas below suspended ceilings are pendant type. Heads in all other locations are [upright] [pendant] [sidewall] type.

Ensure corrosion-resistant heads are lead-coated.

2.2.8.2 Temperature Rating

Fusible links are for ordinary hazard, except where otherwise indicated.

2.2.8.3 Spares

Furnish spares for each type of sprinkler head, complete with appropriate storage cabinet and wrench.

2.2.8.4 Head Protection

Protect heads with paper or plastic bags during painting operations. Remove protection immediately upon finishing painting operations.

Provide head guards wherever mechanical damage could occur. Guard finish is red enamel.

2.2.9 Valves

2.2.9.1 Post Indicator Valve Assembly (PIV)

Assembly consists of a standard FM-approved or UL-listed inside-screw gate valve with an above-grade post indicator or a completely factory-assembled FM-approved quarter-turn valve and above-grade post indicator-operator. Direction to open is counterclockwise.

Quarter-turn valve is a wafer-type butterfly valve, rated at 1200 kilopascal 175 psi, elastomer-lined and sealed. Ensure the liner acts as a gasket between ASME B16.1, Class 125 or Class 250 flanges. Ensure post has a fail-safe feature to keep valve intact in case of breaking off above grade. Provide a worm-gear operator with permanently oil-lubricated watertight gear case complete with handle.

Apply a coating of bitumen not less than 0.508 millimeter 20 mils thick on surfaces below grade. Fill, prime and finish above grade surfaces with a multiple coat of high-gloss, weather-resistant, red enamel.

Fit post indicator valves to accommodate electrical supervisory switches.

Provide electrical supervisory switches for interconnection to the building fire alarm system. Ensure switches and connections meet the requirements of Section 28 31 13.00 40 FIRE DETECTION AND ALARM CONTROL, GUI, AND LOGIC SYSTEMS.
2.2.9.2 Fire-Hydrant Service Valves

Provide fire-hydrant service valves that are standard FM-approved or UL-listed inside-screw gate valve, with valve box connection flange.

2.2.9.3 Valve Boxes

Install valve boxes with not less than 5 millimeter 3/16-inch thick cast-iron construction with locking cover that has a cast-in identification legend. Select adjustable extension type boxes with screw- or slide-type adjustment. Fit the base flange to the valve flange. Ensure the full extended length of box is greater than required by depth of cover by not less than 100 millimeter 4 inches. Supply one valve-operating wrench for each size valve nut. Provide guide rings where operating rods are longer than 2 meter 6 feet.

2.2.9.4 Aboveground Valves

Ensure gate, globe, and check valves (all sizes) are FM approved or UL listed.

Ensure ball valves, DN50 2 inches and under, are FM approved, rated 2070 kilopascal 300 psi, with provisions to wire or lock handle in place where critical alarm function may be isolated.

Ensure butterfly valves, DN150, DN200, and DN250 6-, 8-, and 10-inch are FM approved, rated 1200 kilopascal 175 psi, cast-iron bodied wafer type, with elastomer liners and seals. Ensure liners act as a gasket between standard piping-system flanges. Provide a worm-gear operator, with permanently lubricated gears, and oiltight and watertight case, complete with handle and automatic position indication.

2.2.10 Painting

Furnish equipment of the manufacturer's standard product with the manufacturer's standard finish coat.

Furnish other mechanical equipment with a shop-applied prime paint.

2.3 MATERIALS

2.3.1 Bituminous Coating

Bituminous coating is a solvent cutback, heavy-bodied material to produce not less than a 0.305 millimeter 12-mil dry-film thickness in one coat and is as recommended by the conduit manufacturer for compatibility with factory coating and rubber joints.

For previously coal-tar-coated and for uncoated ferrous surfaces underground, ensure the bituminous coating is a solvent cutback coal-tar type, conforming to MIL-C-18480.

2.3.2 Bolting

Ensure flange and general-purpose bolting is hex-head and conforms to ISO 898-1 ASTM A307, Grade B. Ensure heavy hex-nuts conform to ASTM A563M, ASTM A563. Square-head bolts and nuts are not acceptable.
2.3.3 Elastomer Caulk

Use two component polysulfide- or polyurethane-base elastomer-caulking material, conforming to ASTM C920.

2.3.4 Escutcheons

Manufacture escutcheons from nonferrous metals. Use chrome-plated escutcheons, except when AISI 300 series corrosion-resistant steel is provided. Ensure metals and finish conform to ASME A112.18.1/CSA B125.1.

Provide one piece escutcheons where mounted on chrome-plated pipe or tubing and one-piece or split-pattern type elsewhere. Provide escutcheons consisting of internal spring tension devices or setscrews to maintain a fixed position against a surface.

2.3.5 Flashing

2.3.5.1 Lead

Ensure sheet lead conforms to ASTM B749, and weighs not less than 20 kilogram per square meter 4 pounds per square foot.

2.3.5.2 Copper

Ensure sheet copper conforms to ASTM B370 and weighs not less than 4.88 kilogram per square meter 16 ounces per square foot.

2.3.6 Flange Gaskets

Ensure gaskets are suitable for the intended use and contain no asbestos.

2.3.7 Pipe-Thread Compounds

Use tetrafluoroethylene tape or other suitable compounds.

PART 3 EXECUTION

**************************************************************************
NOTE: Rewrite following paragraph if no NFPA 13, NFPA 13E, NFPA 14, or NFPA 24 work is included in project.
**************************************************************************

3.1 PREPARATION

3.1.1 Painting

If manufacturer's standard-finish equipment surfaces are damaged during construction, bring to as-new condition by touchup or repainting to the satisfaction of the Contracting Officer, or replaced with new undamaged equipment at no additional cost to the Government.

Thoroughly clean and paint hangers, supports, and other iron work in concealed spaces with one coat of primer paint.

Apply two coats of enamel paint to all firex piping, valves, and appurtenances, including hose racks and reels, but excluding hoses, hose nozzles and siamese connections. Use paint color No. 11105 (red) in

SECTION 21 13 00.00 40  Page 23
accordance with MIL-STD-101 and SAE AMS-STD-595A.

3.2 INSTALLATION

Ensure installation of system materials and equipment is in accordance with the recommendations and provisions of NFPA 13, NFPA 13E, NFPA 14, and NFPA 24. Perform work in the presence of the Contracting Officer. Notify the Contracting Officer 48 hours in advance of the start of work.

Perform all installation work by licensed fire protection sprinkler contractors, licensed for such work in the state where the work is to be performed.

3.2.1 Underground Piping Installation

Ensure installation of piping materials conforms to the written or published instructions of the manufacturer.

For pipes passing through walls below grade and ground-floor slab, insert the pipe through pipe sleeves one size larger than pipe. Caulk the pipe sleeve watertight with lead and oakum or mechanically expandable chloroprene inserts with bitumen sealed metal components.

In fill areas, ensure the pipe passing under or through building grade beams has a minimum clearance of 100 millimeter 4 inches in all directions.

For rubber- or elastomer-jointed piping embedded in concrete walls, install a joint within 150 millimeter 6 inches of the face of the wall capable of absorbing movement without leakage.

Use extended-joint or flange-bolt pipe when penetrating earth or concrete grade to a height 150 millimeter 6 inches above the grade.

Support underground piping below supported or suspended slabs from the slab with a minimum of two supports per length of pipe. Protect supports with a coating of bitumen.

On excavations near and below building footings, use the backfilling material consisting of 13.8 Megapascal 2,000-psi cured-strength concrete, poured or pressure-grouted up to the level of the footing.

After piping has been inspected, and not less than 48 hours prior to being lowered into a trench, coat external surfaces of the piping, valves, valve operators, and valve boxes with a compatible bituminous coating suitable for protection against brackish ground water. Apply coating in accordance with the manufacturer's instructions to a dry-film thickness of not less than 0.305 millimeter 12 mils.

3.2.1.1 Cast Iron and Ductile Iron Pipe Construction Tolerances

Ensure maximum deviation from design elevation at any point along piping does not exceed 65 millimeter 2-1/2 inches for all sizes of piping.

Maximum deviation from line at the end of an 5.5 meter 18-foot length of piping is 65 millimeter 2-1/2 inches and cumulatively does not exceed 150 millimeter 6 inches. Make corrections from line within preceding tolerances at a rate not to exceed 65 millimeter 2-1/2 inches for any one length of piping.
Ensure maximum deflection for curves for 5.5 meter 18-foot lengths of cast ferrous pipe is in accordance with NFPA 24.

When the alignment requires deflections in excess of the above limitations, furnish special bends or a sufficient number of shorter lengths of pipe to provide angular deflections within established limits, as approved.

3.2.1.2 Fire Hydrants

Set hydrant outlet elevations between 600 millimeter 24 inches, minimum, to 900 millimeter, 36 inches, maximum, above grade. Face the DN115 4-1/2-inch outlet toward the road or area of access.

3.2.1.3 Valve Boxes

Set valve and valve boxes plumb. Center valve boxes on the valves. Where feasible, locate valves outside traffic areas. Carefully tamp soil around each valve box to a distance of 1.2 meter 4 feet on all sides of the box or to the undisturbed trench face when less than 1.2 meter 4 feet.

[ Install Class 3000A concrete slabs 600 millimeter square by 100 millimeter 2 feet square by 4 inches thick to protect valve boxes, unless other protection is indicated. ]

3.2.1.4 Thrust Blocks

Construct 20 Megapascal 3,000-psi cured-strength thrust blocks to absorb hydraulic thrust at caps, plugs, and at system change-of-direction fittings. Place concrete against undisturbed soil, with an area sufficient to provide load transmittal.

3.2.2 Aboveground Piping-Systems Installation

Run piping parallel with the lines of the building. Space and install piping and components so that a threaded pipe fitting may be removed between adjacent pipes and so that there is not less than 13 millimeter 1/2 inch of clear space between the finished surface and other work and between the finished surface of parallel adjacent piping. Arrange hangers on different adjacent service lines running parallel to be in line with each other and parallel to the lines of the building.

Base the load rating for pipe-hanger supports on all lines filled with water. Deflection per span cannot not exceed slope gradient of pipe. Ensure Schedule 40 and heavier ferrous pipe supports are in accordance with the following minimum rod size and maximum allowable hanger spacing. For concentrated loads such as valves, reduce the allowable span proportionately.

</tbody>
</table>

Support vertical risers at the base where possible and at intervals specified. Guide piping for lateral stability as necessary. Place clamps under fittings wherever possible. Support carbon-steel pipe at each floor at not more than 4.5 meter 15-foot intervals for pipe DN50 2 inches and smaller, and at not more than 6.1 meter 20-foot intervals for pipe DN65 2-1/2 inches and larger.

Securely support pipe with allowance for thrust forces, thermal expansion and contraction, and not be subject to mechanical, chemical, vibrational, or other damage, in conformance with ASME B31.1.

#### 3.2.3 Sound Stopping

Provide effective sound stopping and adequate operating clearance to prevent structure contact where piping penetrates walls, floors, or ceilings; into occupied spaces adjacent to equipment rooms; where similar penetrations occur between occupied spaces; and where penetrations occur from pipe chases into occupied spaces. Occupied spaces include space above ceiling where no special acoustic treatment of ceiling is provided. Construct penetrations with finishes compatible with surface being penetrated.

Sound stopping and vapor-barrier sealing of pipe shafts, and large floor and wall openings may be accomplished by packing with properly supported mineral fiber insulation or by foaming-in-place with self-extinguishing, 0.9 kilogram 2-pound density polyurethane foam to a depth not less than 150 millimeter 6 inches. Finish foam with a rasp. Ensure vapor barrier is not
3.2.4 Sleeves

Provide sleeves where piping passes through roofs, masonry or concrete walls, or floors.

Continuously weld or braze sleeves to the deck when passing through steel decks.

Install sleeves that are continuous when extending through floors, roofs, or load-bearing walls, and sleeves through fire barriers. Fabricate sleeves from Schedule 40 steel pipe with welded anchor lugs. Form other sleeves by molded linear polyethylene liners or similar materials that are removable. Ensure diameter of sleeves is large enough to accommodate pipe, insulation, and jacketing without touching the sleeve, and additionally provides a minimum 10 millimeter 3/8-inch clearance. Install sleeve to accommodate mechanical and thermal motion of pipe and to preclude transmission of vibration to walls and generation of noise.

Pack solid the space between a pipe and the inside of a pipe sleeve or a construction surface penetration or wherever the piping passes through firewalls, equipment-room walls, floors, and ceilings connected to occupied spaces, and other locations where sleeves or construction-surface penetrations occur between occupied spaces. Use a mineral fiber conforming to ASTM C592. Where sleeves or construction-surface penetrations occur between conditioned and unconditioned spaces, fill the space between a pipe, bare or insulated, and the inside of a pipe sleeve or construction-surface penetration with an elastomer caulk to a depth of 15 millimeter 1/2 inch. Ensure surfaces are oil- and grease-free before caulking.

Caulk exterior wall sleeves watertight with lead and oakum or mechanically expandable chloroprene inserts with mastic-sealed components.

3.2.5 Escutcheons

Install escutcheons at penetrations of piping into finished areas. Where finished areas are separated by partitions through which piping passes, provide escutcheons on both sides of the partition. Where suspended ceilings are installed, attach plates at the underside only of such ceilings. Use chrome plated escutcheons in occupied spaces and conceal openings in building construction. Ensure escutcheons are firmly attached.

3.2.6 Flashings

Install flashings at systems penetrations of building boundaries as indicated.

3.2.7 Electrical Work

Electrical work is specified in DIVISION 26 ELECTRICAL except for control and fire alarm wiring which is provided under this section in accordance with NFPA 70. Use rigid metal conduit or intermediate metal conduit, except that electrical metallic tubing may be used in dry locations not enclosed in concrete or where not subject to mechanical damage.
Furnish motors, controllers, contactors, and disconnects with their respective pieces of equipment, except that controllers indicated as part of the motor control centers are provided under Section 26 24 19.00 40 MOTOR CONTROL CENTERS. Ensure motors, controllers, contactors, and disconnects conform to and have electrical connections provided under Section 26 05 00.00 40 COMMON WORK RESULTS FOR ELECTRICAL. Ensure controllers and contactors have maximum 120-volt control circuits, and auxiliary contacts for use with the controls furnished.

3.3 FIELD QUALITY CONTROL

3.3.1 Fire-Protection System Identification

Create a coordinated system of piping and equipment identification which includes the following:

a. Framed and plastic-protected diagrammatic layout of all piping systems, identifying and locating piping, equipment, and valves. Where existing systems are being modified, bring existing layouts up to date.

b. Metal-tag-identified major valves, piping-system components, and equipment.

c. Metal identification plate at controlling alarm valve identifying system and area protected.

d. Service-labeled piping.

e. Use color coding for flow-capacity identification of fire hydrants only. Ensure color coding is accordance with NFPA 291. Number post-indicator valves, hydrants, and other components as an extension of existing systems.

3.3.1.1 Diagrams

Chart listing of equipment is by designation number and shows pertinent data. Mount mechanical drawings in extruded aluminum frames with 3 millimeter 1/8-inch thick acrylic plastic protection. Location is as directed by the Contracting Officer. Provide a minimum of one mounted chart and diagram, plus one extra copy of each, for each fire-protection system.

3.3.1.2 Metal Tags

Install identification tags made of brass or aluminum and indicating function of valve or similar component, on such system devices. furnish tags not less than 50 millimeter 2 inches in diameter with a stamped marking.

Install equipment with metal identification tags that bear an equipment designation number matching the drawing or diagram designations.

Secure tags to valve or equipment items with 2.7 millimeter 12-gage galvanized wire.

3.3.1.3 Service Labeling

Label piping, including that concealed in accessible spaces, to designate
service. Include on each label, an arrow or arrows to indicate flow direction. Labels or tag designations are as follows:

<table>
<thead>
<tr>
<th>SERVICE</th>
<th>LABEL OR TAG DESIGNATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main sprinkler supply</td>
<td>MAIN SPRINKLER SUPPLY</td>
</tr>
<tr>
<td>Sprinkler riser number</td>
<td>SPRINKLER RISER NO.</td>
</tr>
<tr>
<td>Sprinkler branch</td>
<td>SPRINKLER BRANCH</td>
</tr>
<tr>
<td>Standpipe piping</td>
<td>STANDPIPE</td>
</tr>
</tbody>
</table>

Label piping and arrow in accordance with the following:

a. Each point of entry and exit through walls.

b. Each change in direction.

c. In congested or hidden areas, at each point required to clarify service or indicate hazard.

d. In long straight runs, locate labels at a distance visible to each other, but in no case have the distance between labels exceed 12.2 meter 40 feet.

e. Ensure lettering is 2 inches high. Where the size of pipes is 65 millimeter 2-1/2-inch outside diameter and smaller, attach labels to 1.6 millimeter 16-gage aluminum sheet and attach to the pipe with 2.7 millimeter 12-gage galvanized wire. Ensure labels are legible from the primary service and operating area.

f. Make labels of self-sticking plastic film designed for permanent installation. Provide labels with red letters on white background.

g. The label and valve tag schedule above is not construed as defining or limiting the work. Label all piping.

3.3.2 Branch-Line Testers

Ensure branch-line testers permit testing and flushing lines without shutdown of system or loss of fire-protection capability. Fit line testers with chain-attached caps.

Install line testers where indicated and on most remote branch lines being served by cross mains, so that testing may be accomplished at the dead corners of each sprinkler system.

3.3.3 System Testing

**************************************************************************
NOTE: If the specified system is identified as critical, configured, or mission essential, use Section 01 86 12.07 40 RELIABILITY CENTERED ACCEPTANCE FOR MECHANICAL SYSTEMS to establish predictive and acceptance testing criteria, above and beyond that listed below.
**************************************************************************
Perform PT&I tests and provide submittals as specified in Section 01 86 12.07 40 RELIABILITY CENTERED ACCEPTANCE FOR MECHANICAL SYSTEMS.

Government will supply testing water at a location determined by the Contracting Officer. The Contractor is responsible for approved disposal of contaminated water.

Prior to acceptance of the work, test completed systems in the presence of the Contracting Officer. Upon approval, provide certificates of testing.

Conduct a hydrostatic test, unless otherwise specified. Use only potable water for testing.

Perform air tests, valve-operating tests, and drainage tests for dry-pipe systems.

Perform full-flow system operating tests for standpipe systems.

Prepare and maintain test records of piping-system tests. Ensure records show personnel responsibilities, dates, test-gage identification numbers, ambient and test-water temperatures, pressure ranges, rates of pressure drops, and leakage rates. Each test acceptance requires the signature of the Contracting Officer.

3.3.4 Test Gages

Acceptable test gages have 115 millimeter 4-1/2-inch dials or larger with accuracy of plus or minus 1/2 of 1 percent of full-scale range and dial graduations and pointer width compatible with readability to within one-half of the accuracy extremes. Maximum permissible scale range for a given test is such that the pointer during a test has a starting position at midpoint of the dial or within the middle third of the scale range. Ensure the Certification of accuracy and correction table has: a date within 90 calendar days prior to the test, the test gage number, and the project number.

3.3.5 Pneumatic Testing

Perform pneumatic Pressure Tests when freezing conditions may occur and upon prior approval by the Contracting Officer. Use oil-free compressed air used for testing. Pneumatic testing includes swabbing all joints under a test pressure of 34 kilopascal 5 psig with a standard high film strength soap solution and observing for bubbles.

Duration of the test will be determined by the Contracting Officer and will be for 2 hours, minimum, to 24 hours, maximum. Test may be terminated by direction of the Contracting Officer at any point during this period after it has been determined that the permissible leakage rate has not been exceeded.

3.3.6 Test and Acceptable Criteria

Perform above ground systems pressure tests at 1380 kilopascal 200 psi and maintain the applied pressure without further addition of test media for not less than 2 hours. No pressure drop is allowed.

Test underground rubber-jointed ferrous-pipe water systems at 1380 kilopascal 200 psi, and maintain the applied test pressure for not less
than 2 hours. Maximum allowable pressure drop is 14 kilopascal 2 psi.
After satisfactory hydrostatic testing, test piping for leakage as follows:

a. Duration of each leakage test is not less than 2 hours; during the test, subject the main to 1380 kilopascal 200 psi pressure based on the elevation of the lowest section under test and corrected to the elevation of the test gage.

b. Leakage is defined as the quantity of water supplied into the laid pipe, or any valved section thereof, necessary to maintain the specified leakage test pressure after the pipe has been filled with water and the air expelled.

c. No piping installation will be accepted if the leakage in gallons per hour exceeds 2.04 0.00054 times the number of joints in the length of the pipe line tested times the nominal diameter of the pipe in inches times the square root of the average test pressure expressed as psig. Amount of leakage at the joints cannot exceed 1.89 liter 2 quarts per 100 joints regardless of pipe diameter.

d. Apply hydrostatic tests to piping with concrete thrust blocking only after the concrete has cured for more than 7 calendar days.

[ Test backflow prevention into connected potable-water systems and system devices for proper functioning under conditions normal to their application.
]

] Repair dripping or weeping joints.

3.4 ADJUSTING AND CLEANING

At the completion of the work, clean all parts of the installation. Clean equipment, pipes, valves, and fittings of grease, metal cuttings, and sludge that may have accumulated from the installation and testing of the system. Adjust automatic control devices for proper operation.

3.5 PROTECTION

3.5.1 Disinfection

Disinfect water piping, including valves, fittings, and other devices, with a solution of chlorine and water. Use a solution containing not less than 50 parts per million (ppm) of available chlorine. Hold solution for a period of not less than 8 hours, at which time the solution contains a minimum residue of 2 ppm of available chlorine or repeat disinfection of the system. After successful disinfection the piping, thoroughly flush the system before placing into service. Water for both disinfection and flushing will be furnished by the Government.

NOTE: This guide specification covers the requirements for wet pipe fire protection sprinkler systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information. The designer is permitted to edit all of this section for the project. If the designer is modifying/deleting non-bracketed items and text, the Designated Fire Protection Engineer (DFPE) should be consulted prior to incorporating final changes.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

SECTION 21 13 13
WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION
08/20

NOTE: For OCONUS projects, this specification section should be edited for specific Host Nation requirements. Coordinate compliance with Host Nation requirements with the DFPE.

NOTE: This specification section includes requirements from UFC 3-600-01 (change 4, 7 February 2020)
NOTE:
The Designer must edit this specification section for either a performance-designed system or a fully designed system as applicable.

This section is primarily intended for performance designed systems, e.g. systems where the size, layout, and support of branch lines and cross mains, and the layout of sprinklers will be designed by the Contractor.

This section is not intended to be used for NFPA 13D systems.

The Designer must provide the following information in the contract documents for performance designed systems. This information must be in accordance with UFC 3-600-01.

(1) Show the layout and size of all piping and equipment from the point of connection to the water supply, to the sprinkler riser. The contract drawings must include a detailed sprinkler riser diagram.

(2) Show location and size of service laterals, sprinkler risers, control valves, drain lines, sectional valves, and inspector's test valves and switches on the drawings.

(3) Specify waterflow data including hydrant flow test results, including the location where the hydrant flow test was conducted, the location and size of existing mains and new water supply lines that will serve the sprinkler system.

(4) Highlight or clearly indicate the area(s) to be protected by sprinklers on the drawings.

(5) Specify waterflow requirements including the design density, design area, the hose stream demand (including location of the hose stream demand), the duration of supply, and sprinkler spacing and area of coverage in this section.

(6) Show the location of the backflow preventer (including provisions for a drain and access for maintenance) on the drawings.

(7) Show all provisions necessary for forward flow testing of the backflow preventer at system demand as required by NFPA 13 on the drawings.
(8) Highlight all concealed spaces on the drawings that require sprinkler protection, such as spaces above suspended ceilings that are built of combustible material or that can contain combustible materials, such as storage, and communication cabling that is not fire-rated.

(9) Provide details on the drawings of pipe restraints for underground piping. This includes details of pipe clamps, tie rods, mechanical retainer glands, and thrust blocks.

1.2 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Residential Occupancies: NFPA 13R is applicable for residential occupancies up to and including four stories in height. This standard should be referenced and followed only for such occupancies. NFPA 13R differs from NFPA 13 relative to type of sprinkler, design criteria, sprinkler coverage, and other requirements; therefore, care must be taken when using this specification for
residential occupancies to assure that the final project specification clearly indicates design requirements.

NOTE: Residential Occupancies: Allowable area and height (not story) increases noted in UFC 3-600-01 Chapter 5 are not permitted when using a sprinkler system designed in accordance with NFPA 13R or NFPA 13D.

NOTE: Seismic protection/bracing is to be provided for seismic design categories C or greater only, unless specifically requested by the DFPE. Consideration should also be giving to utilizing seismic protection/bracing to limit pipe movement.

Provide wet pipe [sprinkler][water spray] system(s) in [all areas of the building][areas indicated on the drawings] [______]. Except as modified herein, the system must meet the requirements of NFPA 13[ NFPA 13R][ and ][ NFPA 15]. Pipe sizes which are not indicated on the Contract drawings must be determined by hydraulic calculations.

1.2.1 Hydraulic Design

**************************************************************************

NOTE: Applications requiring multiple densities/design areas must be referred to and shown on the drawings.

For sprinkler systems in residential occupancies, which are designed to NFPA 13R standards, paragraphs which address hydraulic design and sprinkler spacing must be edited according to NFPA 13R requirements.

Discharge density for non-storage occupancies must be in accordance with UFC 3-600-01. Specific densities must be listed on the drawings or noted in the specification when drawings are not provided. Stating "comply with UFC 3-600-01 is not acceptable.

Hazard classification of miscellaneous storage must comply with NFPA 13. Discharge density for the hazard classification must comply with UFC 3-600-01.

The paragraph below must be listed on the drawings. If this information is not listed on the drawings, provide the information in paragraph 1.1.1.3 (with brackets completed).

Hydraulically design the system to discharge a minimum density [of [_____] L/min per square meter gpm/square foot over the hydraulically most demanding [280] [_____] square meters[_____] square feet of floor area][as indicated on the drawings]. The minimum pipe size for branch lines in gridded systems must be 32 mm 1/4-inch. Hydraulic calculations must be in accordance with the Area/Density Method of NFPA 13.
NOTE: The addition, modification or relocation of no more than twenty sprinklers to an existing system or modifications to existing sprinkler systems fed from domestic supplies are permitted to be designed using the pipe schedule method in NFPA 13 based on the layout of the existing system.

1.2.1.1 Basis for Calculations

NOTE: The design must include an adequate water supply to meet the sprinkler water demand. The designer must provide waterflow test results and hydraulic calculations to ensure that the system demand will be met.

Design Calculations: The designer must provide detailed hydraulic calculations that clearly demonstrate that the water supply will meet the demand of the sprinkler system and hose streams. Calculations must be submitted with the concept design submission.

A waterflow test was performed on [DATE] at [LOCATION] and resulted in a static pressure of [____ kPa] with a residual pressure of [____ kPa] while flowing [____ L/min] or [____ gpm]. Perform a fire hydrant flow test prior to shop drawing submittal in accordance with NFPA 291. Results must include hydrant elevations relative to the building and hydrant number/identifiers for the tested hydrants, including which were flowed, which had a gauge. This information must be presented in a tabular form if multiple hydrants were flowed. The results must be included with the hydraulic calculations. Hydraulic calculations must be based on flow test noted in this paragraph, unless [verified by the NAVFAC[____] Fire Protection Engineer and] approved by Contracting Officer. Hydraulic calculations must be based upon the Hazen-Williams formula with a "C" value noted in NFPA 13 for piping, [and [____] for existing underground piping]. [Hydraulic calculations must be based on operation of the fire pump(s) provided in Section 21 30 00 FIRE PUMPS.] [The minimum residual pressure in a service lateral (lead-in) at the [design flow rate][150 percent of the fire pump rated flow] must be 138 kPa/20 psi at [the inlet to the backflow preventer][the suction side of the fire pump]].

1.2.1.2 Hydraulic Calculations

a. Water supply curves and system requirements must be plotted on semi-logarithmic graph (N^1.85) paper so as to present a summary of the complete hydraulic calculation.

b. Provide a summary sheet listing sprinklers in the design area and their respective hydraulic reference points, elevations, minimum discharge pressures and minimum flows. Elevations of hydraulic reference points (nodes) must be indicated.

c. Documentation must identify each pipe individually and the nodes
connected thereto. Indicate the diameter, length, flow, velocity, friction loss, number and type fittings, total friction loss in the pipe, equivalent pipe length and Hazen-Williams coefficient for each pipe.

d. Where the sprinkler system is supplied by interconnected risers, the sprinkler system must be hydraulically calculated using the hydraulically most demanding single riser. The calculations must not assume the simultaneous use of more than one riser.

e. All calculations must include the backflow preventer manufacturer's stated friction loss at the design flow or [83 kPa 12 psi for reduced pressure][55 kPa 8 psi for double check] backflow preventer, whichever is greater.

f. All calculations must be performed back to the actual location of the flow test, taking into account the direction of flow in the service main at the test location.

g. For gridded systems, calculations must show peaking of demand area friction loss to verify that the hydraulically most demanding area is being used. A flow diagram indicating the quantity and direction of flows must be included.

1.2.1.3 Design Criteria

Hydraulically design the system to discharge a minimum density [of [___] L/min per square meter gpm/square foot] over the hydraulically most demanding [___] square metersquare feet of floor area] [as indicated on the drawings]. Hydraulic calculations must be in accordance with the Area/Density Method of NFPA 13. Add an allowance for exterior hose streams of [___] L/min gpm to the sprinkler system demand [at the fire hydrant shown on the drawings closest to the point where the water service enters the building] [at the point of connection to the existing water system]. [An allowance for interior hose stations of [___] L/min gpm must be added to the sprinkler system demand.]

1.2.2 Sprinkler Coverage

******************************************************************************
NOTE: The exception in NFPA 13 to eliminate sprinklers in electrical rooms is not applicable per UFC 3-600-01.
******************************************************************************

Sprinklers must be uniformly spaced on branch lines. Provide coverage throughout 100 percent of the [building][area noted on the Contract drawings]. This includes, but is not limited to, telephone rooms, electrical equipment rooms (regardless of the fire resistance rating of the enclosure), boiler rooms, switchgear rooms, transformer rooms, attached electrical vaults and other electrical and mechanical spaces. Coverage per sprinkler must be in accordance with NFPA 13. Provide sprinklers below all obstructions in accordance with NFPA 13. Exceptions are as follows:

a. Sprinklers may be omitted from small rooms which are exempted for specific occupancies in accordance with NFPA 101.

b. Facilities that are designed in accordance with NFPA 13R.
1.2.3 Qualified Fire Protection Engineer (QFPE)

NOTE: UFC 3-600-01 requires that shop drawings must bear the Review Stamp and professional engineering stamp of the QFPE prior to submission to the Government for approval.

NOTE: The term Qualified Fire Protection Engineer (QFPE) should be considered interchangeable with the terms "Fire Protection Designer of Record (FPDOR)" and/or "Fire Protection QC Specialist" where referred to in other applicable contract documents. The intent of defining the QFPE roles and responsibilities here is NOT to require personnel in addition to the QFPE, FPDOR, and/or FPQC specialist referenced elsewhere in the applicable contract documents.

An individual who is a licensed professional engineer (P.E.) who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience. Services of the QFPE must include:

a. Reviewing SD-02, SD-03, and SD-05 submittal packages for completeness and compliance with the provisions of this specification. Working (shop) drawings and calculations must be prepared by, or prepared under the immediate supervision of, the QFPE. The QFPE must affix their professional engineering stamp with signature to the shop drawings, calculations, and material data sheets, indicating approval prior to submitting the shop drawings to the DFPE.

b. Provide a letter documenting that the SD-02, SD-03, and SD-05 submittal package has been reviewed and noting all outstanding comments.

c. Performing in-progress construction surveillance prior to installation of ceilings (rough-in inspection).

e. Signing applicable certificates under SD-07.

1.3 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's
Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

NOTE: When 20 or less sprinklers are added, modified or relocated, shop drawings, hydraulic calculations and product data are not required to be submitted. Edit this section accordingly.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Partial submittals and submittals not fully complying with NFPA 13 and this specification section must be returned disapproved without review. SD-02, SD-03 and SD-05 must be submitted simultaneously.

Shop drawings (SD-02), product data (SD-03) and calculations (SD-05) must be prepared by the designer and combined and submitted as one complete package. The QFPE must review the SD-02/SD-03/SD-05 submittal package for completeness and compliance with the Contract provisions prior to submission to the Government. The QFPE must provide a Letter of Confirmation that they have reviewed the submittal package for compliance with the contract provisions. This letter must include their professional engineer stamp and signature. Partial submittals and submittals not reviewed by the QFPE must be returned disapproved without review.

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Qualified Fire Protection Engineer (QFPE); G[, [____]]

Sprinkler System Designer; G[, [____]]
Sprinkler System Installer; G[, [____]]

SD-02 Shop Drawings

Shop Drawing; G[, [____]]

SD-03 Product Data

Pipe; G[, [____]]
Fittings; G[, [____]]
Valves, including gate, check, butterfly, and globe; G[, [____]]
Alarm Valves; G[, [____]]
Relief Valves; G[, [____]]
Sprinklers; G[, [____]]
Pipe Hangers and Supports; G[, [____]]
Sprinkler Alarm Switch; G[, [____]]

Request for Government Final Test; G[, [____]]

SD-10 Operation and Maintenance Data
1.4 QUALITY ASSURANCE

1.4.1 Preconstruction Submittals

Within 36 days of contract award but no less than [14 days][_____] prior to commencing work on site, the prime Contractor must submit the following for review and approval. SD-02, SD-03 and SD-05 submittals received prior to the review and approval of the qualifications will be returned Disapproved Without Review.

1.4.1.1 Shop Drawing

[_____] copies of the shop drawings, no later than 28 days prior to the start of system installation. Working drawings conforming to the requirements prescribed in NFPA 13 and must be no smaller than [ISO A1][ANSI D][the Contract Drawings]. Each set of drawings must include the following:

a. A descriptive index with drawings listed in sequence by number. A legend sheet identifying device symbols, nomenclature, and conventions used in the package.

b. Floor plans drawn to a scale not less than 1:100 1/8-inch equals 1-foot clearly showing locations of devices, equipment, risers, and other details required to clearly describe the proposed arrangement.

c. Actual center-to-center dimensions between sprinklers on branch lines and between branch lines; from end sprinklers to adjacent walls; from walls to branch lines; from sprinkler feed mains, cross mains and branch lines to finished floor and roof or ceiling. A detail must show the dimension from the sprinkler and sprinkler deflector to the ceiling in finished areas.

d. Longitudinal and transverse building sections showing typical branch line and cross main pipe routing, elevation of each typical sprinkler above finished floor and elevation of "cloud" or false ceilings in relation to the building ceilings.

e. Plan and elevation views which establish that the equipment will fit the allotted spaces with clearance for installation and maintenance.

f. Riser layout drawings drawn to a scale of not less than 1:25 1/2-inch equals 1-foot to show details of each system component, clearances between each other and from other equipment and construction in the room.

g. Details of each type of riser assembly, pipe hanger, [sway bracing for earthquake protection, ]and restraint of underground water main at point-of-entry into the building, and electrical devices and interconnecting wiring. The dimension from the edge of vertical piping to the nearest adjacent wall(s) must be indicated on the drawings when
vertical piping is located in stairs or other portions of the means of egress.

h. Details of each type of pipe hanger[, seismic bracing/restraint] and related components.

[ i. Include fire pump curve with shop drawings and hydraulic calculations.

1.4.1.2 Product Data

[_____] copies of annotated catalog data to show the specific model, type, and size of each item. Catalog cuts must also indicate the NRTL listing. The data must be highlighted to show model, size, options, and other pertinent information, that are intended for consideration. Data must be adequate to demonstrate compliance with all contract requirements. Product data for all equipment must be combined into a single submittal.

1.4.1.3 Hydraulic Calculations

******************************************************************************
NOTE: Include the first bracketed item for Army Corps projects.
******************************************************************************

Calculations must be as outlined in NFPA 13 except that calculations must be performed by computer using software intended specifically for fire protection system design using the design data shown on the drawings.[ Calculations must include isometric diagram indicating hydraulic nodes and pipe segments.][ Include fire pump curve with submittal.]

1.4.1.4 Operating and Maintenance (O&M) Instructions

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA as supplemented and modified by this specification section.

Provide [six][_____] manuals[ and one pdf version on electronic media]. The manuals must include the manufacturer's name, model number, parts list, list of parts and tools that should be kept in stock by the owner for routine maintenance, troubleshooting guide, and recommended service organization (including address and telephone number) for each item of equipment.[ Each service organization submitted must be capable of providing [4][_____] -hour on-site response to a service call on an emergency basis.]

Submit spare parts data for each different item of material and equipment specified. The data must include a complete list of parts and supplies, and a list of parts recommended by the manufacturer to be replaced after 1-year and 3 years of service. Include a list of special tools and test equipment required for maintenance and testing of the products supplied.

1.4.2 Qualifications

******************************************************************************
NOTE: NICET (National Institute for Certification in Engineering Technologies) establishes the qualifications of an individual as an Engineering Technologist with verification of experience by having a current NICET certification.
******************************************************************************
1.4.2.1 Sprinkler System Designer

The sprinkler system designer must be certified as a Level [III][IV] Technician by National Institute for Certification in Engineering Technologies (NICET) in the Water-Based Systems Layout subfield of Fire Protection Engineering Technology in accordance with NICET 1014-7.

1.4.2.2 Sprinkler System Installer

The sprinkler system installer must be regularly engaged in the installation of the type and complexity of system specified in the contract documents, and must have served in a similar capacity for at least three systems that have performed in the manner intended for a period of not less than 6 months.

1.4.3 Regulatory Requirements

Equipment and material must be listed or approved. Listed or approved, as used in this Section, means listed, labeled or approved by a Nationally Recognized Testing Laboratory (NRTL) such as UL Fire Prot Dir or FM APP GUIDE. The omission of these terms under the description of an item or equipment described must not be construed as waiving this requirement. All listings or approvals by testing laboratories must be from an existing ANSI or UL published standard. The recommended practices stated in the manufacturer's literature or documentation are mandatory requirements.

1.5 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, excessive humidity and temperature variations, dirt and dust, or other contaminants. All pipes must be either capped or plugged until installed.

1.6 EXTRA MATERIALS

Spare sprinklers and wrench(es) must be provided as spare parts in accordance with NFPA 13.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials, equipment, and devices listed for fire protection service when so required by NFPA 13 or this specification. Select material from one manufacturer, where possible, and not a combination of manufacturers, for a classification of material. Material and equipment must be standard products of a manufacturer regularly engaged in the manufacture of the products for at least [2][_____] years prior to bid.

2.1.2 Nameplates

Major components of equipment must have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new name plate permanently affixed to the item or equipment. Nameplates must be etched metal or plastic, permanently attached by screws to control units, panels or adjacent walls.
2.1.3 Identification and Marking

Pipe and fitting markings must include name or identifying symbol of manufacturer and nominal size. Pipe must be marked with ASTM designation. Valves and equipment markings must have name or identifying symbol of manufacturer, specific model number, nominal size, name of device, arrow indicating direction of flow, and position of installation (horizontal or vertical), except if valve can be installed in either position. Markings must be included on the body casting or on an etched or stamped metal nameplate permanently on the valve or cover plate.

2.1.4 Pressure Ratings

Valves, fittings, couplings, alarm switches, and similar devices must be rated for the maximum working pressures that can be experienced in the system, but in no case less than $1207 \text{ kPa} \ [1724 \text{ psi}]$.

2.2 UNDERGROUND PIPING COMPONENTS

**************************************************************************
NOTE: The design drawings must show the service connection details and the underground service lateral for the sprinkler system. The drawings must show details of the water service point-of-entry into the building and through the floor slab, and underground piping restraints, including number and size of restraining rods and thrust blocks. 4-inch piping is the minimum permitted for service laterals serving NFPA 13R systems. 6-inch piping is the minimum permitted for NFPA 13 systems.
**************************************************************************

2.2.1 Pipe

Pipe must comply with NFPA 24. Minimum pipe size is $100 \text{ mm} [4 \text{ inches}] [150 \text{ mm} \ [6 \text{ inches}]]$. Piping more than 1.50 meters [5 feet] outside the building walls must comply with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING. A continuous section of welded stainless steel fire water service piping from a point outside the building perimeter to a flanged fitting at least 304 mm [1-foot] above the finished floor within the building is acceptable.

2.2.2 Fittings and Gaskets

Fittings must be ductile-iron conforming to AWWA C110/A21.10 with cement mortar lining conforming to AWWA C104/A21.4. Gaskets must be suitable in design and size for the pipe with which such gaskets are to be used. Gaskets for ductile-iron pipe joints must conform to AWWA C111/A21.11.

2.2.3 Gate Valve[ and Indicator Posts]

**************************************************************************
NOTE: This paragraph will be deleted if underground valves are either not required or are specified elsewhere.
**************************************************************************

Installation must comply with NFPA 24. Gate valves for use with indicator post must conform to UL 262. [ Indicator posts must conform to UL 789.]
Provide each indicator post with one coat of primer and two coats of red enamel paint.]

[2.2.4 Valve Boxes

Except where indicator posts are provided, for each buried valve, provide a cast-iron, ductile-iron, or plastic valve box of a suitable size. Plastic boxes must be constructed of acrylonitrile-butadiene-styrene (ABS) or inorganic fiber-reinforced black polyolefin. Provide cast-iron, ductile-iron, or plastic cover for valve box with the word "WATER" cast on the cover. The minimum box shaft diameter must be 133 mm or 5.25 inches. Coat cast-iron and ductile-iron boxes with bituminous paint applied to a minimum dry-film thickness of 0.254 mm or 10 mils.

]2.2.5 Buried Utility Warning and Identification Tape

Provide detectable aluminum foil plastic backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape must be detectable by an electronic detection instrument. Provide tape, 80 mm or 3 inches minimum width, color coded for the utility involved with warning and identification imprinted in bold block letters continuously and repeatedly over the entire tape length. Warning and identification must read "CAUTION BURIED WATER PIPING BELOW" or similar wording. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material.

2.3 ABOVEGROUND PIPING COMPONENTS

**************************************************************************
NOTE: Specify steel piping exposed to the weather or corrosive atmospheres to properly protect against corrosive effects.

NOTE: GALVANIZED PIPING IS ONLY PERMITTED FOR DELUGE SYSTEMS, VALVE TRIM PIPING AND DRAIN PIPING WHEN EXPOSED TO THE EXTERIOR.

NOTE: The following are basic restrictions on the use of CPVC pipe and fittings:

a. Will be used only in residential occupancies.

b. Will not be used in combustible concealed spaces that are required to be sprinklered.

c. Will not be used in spaces where ambient temperature exceed 65 degrees C or 150 degrees F.

d. Must be protected, as a minimum, by either (1) one layer of 9.525 mm or 3/8-inch thick gypsum board, or (2) a suspended membrane ceiling with lay-in ceiling panels or tiles having a weight of not less than 1.7 kg per square meter or 0.35 psf installed on metallic support grids, or by other method approved by UL. Method or protection of piping must be indicated and detailed in the contract documents.

e. Will not be used where water pressure surges could exceed 1207 kPa or 175 psi.

SECTION 21 13 13 Page 20
f. Will not be used in areas where the system could be subject to impact or physical stress or abuse.

g. Can be used only in wet pipe sprinkler systems.

h. Quick-response sprinklers will be used with plastic piping.

i. CPVC is permitted to be used in accordance with its listing.

**************************************************************************

2.3.1 Steel Piping Components

2.3.1.1 Steel Pipe

**************************************************************************

NOTE: For DLA, use Schedule 40 steel pipe only.

NOTE: Grooved pipe must be cut grooved for WHS projects.

**************************************************************************

Except as modified herein, steel pipe must be black as permitted by NFPA 13 and conform to the applicable provisions of ASTM A53/A53M, ASTM A135/A135M or ASTM A153/A153M.

[Steel pipe must be minimum Schedule 40 for sizes 50 mm2 inches and less; and minimum Schedule 10 for sizes larger than 50 mm2 inches.][Steel pipe must be Schedule 40 only.] Steel piping with wall thickness less than Schedule 40 must not be threaded. [Grooved pipe must be cut-grooved.]

2.3.1.2 Fittings

Fittings must be welded, threaded, or grooved-end type. Threaded fittings must be cast-iron conforming to ASME B16.4, malleable-iron conforming to ASME B16.3 or ductile-iron conforming to ASTM A536. Plain-end fittings with mechanical couplings, fittings that use steel gripping devices to bite into the pipe, steel press fittings and field welded fittings are not permitted. Fittings, mechanical couplings, and rubber gaskets must be supplied by the same manufacturer. Threaded fittings must use Teflon tape or manufacturer's approved joint compound.[Saddle tees using rubber gasketed fittings are permitted only when connecting to existing piping for additions or modifications. Saddle tees must use a connection method that completely wraps around the pipe.] Reducing couplings are not permitted except as allowed by NFPA 13.

2.3.1.3 Grooved Mechanical Joints and Fittings

Joints and fittings must be designed for not less than 1200 kPa175 psi service and the product of the same manufacturer. Field welded fittings must not be used. Fitting and coupling housing must be malleable-iron conforming to ASTM A47/A47M, Grade 32510; ductile-iron conforming to ASTM A536, Grade 65-45-12. Rubber gasketed grooved-end pipe and fittings with mechanical couplings are permitted in pipe sizes 50 mm2 inches and larger. Gasket must be the flush type that fills the entire cavity between the fitting and the pipe. Nuts and bolts must be heat-treated steel conforming to ASTM A183 and must be cadmium-plated or zinc-electroplated.
2.3.1.4 Flanges

Flanges must conform to NFPA 13 and ASME B16.1. Gaskets must be non-asbestos compressed material in accordance with ASME B16.21, 1.6 mm 1/16-inch thick, and full face or self-centering flat ring type.

2.3.2 Copper Tube Components

2.3.2.1 Copper Tube

Copper tube must conform to ASTM B88/ASTM B88M, Types L and M.

2.3.2.2 Copper Fittings and Joints

Cast copper alloy solder-joint pressure fittings must conform to ASME B16.18 and wrought copper and bronze solder-joint pressure fittings must conform to ASME B16.22 and ASTM B75/B75M. Cast copper alloy fittings for flared copper tube must conform to ASME B16.26 and ASTM B62. Brass or bronze adapters for brazed tubing may be used for connecting tubing to flanges and to threaded ends of valves and equipment.

2.3.3 Plastic Piping Components

**************************************************************************
NOTE: See Note in Paragraph "Aboveground Piping Components" for restrictions on use of plastic piping. When plastic pipe is not permitted, delete this paragraph.
**************************************************************************

2.3.3.1 Plastic Pipe

Plastic pipe must be chlorinated polyvinyl chloride (CPVC) conforming to ASTM F442/F442M, 1207 kPa 175 psi rating and listed for use in wet pipe sprinkler systems.

2.3.3.2 Plastic Fittings

Plastic fittings must be chlorinated polyvinyl chloride (CPVC) and listed for use in wet pipe sprinkler systems.

2.3.4 Flexible Sprinkler Hose

**************************************************************************
NOTE: The use of flexible sprinkler hose must be approved by the AHJ per UFC 3-600-01.
**************************************************************************

[ The use of flexible hose is [not ]permitted.][ Flexible sprinkler hose must comply with UL 2443 and FM 1637.]

2.3.5 Pipe Hangers and Supports

**************************************************************************
NOTE: Seismic parameters must follow UFC 3-301-01 Structural Engineering. The writer of this section must coordinate with the Structural Engineer or Government to determine the proper seismic design
**************************************************************************
category for the project, in accordance with the IBC or ASCE guidelines. See UFC 3-310-04 for more information.

Provide galvanized pipe hangers[, supports and seismic bracing][and supports] in accordance with NFPA 13. Design and install seismic protection in accordance with the requirements of NFPA 13 section titled "Protection of Piping Against Damage Where Subject to Earthquakes for Seismic Design Category ['D']"["____"].

2.3.6 Valves

Provide valves of types approved for fire service. Valves must open by counterclockwise rotation.

2.3.6.1 Control Valve

Manually operated sprinkler control/gate valve must be[ outside stem and yoke (OS&Y) type][ or][ butterfly type][ as indicated on the drawings] and must be listed.

2.3.6.2 Check Valves

Check valves must comply with UL 312. Check valves 100 mm 4 inches and larger must be of the swing type, have a clear waterway and meet the requirements of MSS SP-71, for Type 3 or 4. Inspection plate must be provided on valves larger than 150 mm 6 inches.

2.3.6.3 Hose Valve

NOTE: Hose valves are required as part of the backflow prevention test header.

Valve must comply with UL 668.

2.3.7 [Alarm][Riser Check] Valves

NOTE: Alarm valves should only be used when the preference of the Installation due to the additional maintenance requirements.

[Provide riser check valve, pressure gauges and main drain. ][Provide variable pressure type alarm check valve, standard trim piping, pressure gauges, bypass, retarding chamber, testing valves, and main drain, and other components as required for a fully operational system. Alarm valves must comply with UL 193.]

2.4 ALARM INITIATING AND SUPERVISORY DEVICES

NOTE: Water motor alarms and pressure alarm switches can be used only with an alarm check valve.
2.4.1 **Sprinkler Alarm Switch**

Vane or pressure-type flow switch(es). [Connection of switch must be by the fire alarm installer]. [Vane type alarm actuating devices must have mechanical diaphragm controlled retard device adjustable from 10 to 60 seconds and must instantly recycle. ][Flow switches for elevator power shunt must not have a retard feature.]

2.4.2 **Valve Supervisory (Tamper) Switch**

Switch must be integral to the control valve or suitable for mounting to the type of control valve to be supervised open. The switch must be tamper resistant and contain SPDT (Form C) contacts arranged to transfer upon removal of the housing cover or closure of the valve of more than two rotations of the valve stem.

2.5 **BACKFLOW PREVENTION ASSEMBLY**

**************************************************************************

NOTE: Indicate piping, type of connection and equipment, such as a test header with hose valves, required for flow testing of the backflow preventer at full system demand as required by NFPA 13.

Arrangement of test assembly should be coordinated with the installation.

**************************************************************************

[Reduced-pressure principle][Double-check] valve assembly backflow preventer complying with ASSE 1013, ASSE 1015 and AWWA M14. Each check valve must have a drain. Backflow prevention assemblies must have current "Certificate of Approval from the Foundation for Cross-Connection Control and Hydraulic Research, FCCCHR List" and be listed for fire protection use. Listing of the specific make, model, design, and size in the FCCCHR List is acceptable as the required documentation.

2.5.1 **Backflow Preventer Test Connection**

**************************************************************************

NOTE: Delete the backflow preventer test connection when approved by the DFPE.

**************************************************************************

Test connection must consist of a series of listed hose valves with 65-mm 1/2-inch National Standard male hose threads with cap and chain.

2.6 **FIRE DEPARTMENT CONNECTION**

**************************************************************************

NOTE: The designer will coordinate the desired location and thread type for the fire department connection with the responding fire department.

**************************************************************************

Fire department connection must be [freestanding][projecting][flush] type with cast-brass body, matching [wall] escutcheon lettered "Auto Spkr" with a [polished-brass][chromium-plated] finish. [The connection must have individual self-closing clappers, caps with drip drains and chains.]

Female inlets must have [65-mm2 1/2-inch][100 mm4-inch][125 mm5-inch] diameter [American National Fire Hose Connection Screw Threads]
(NH) per NFPA 1963 [Storz][____]. Comply with UL 405.

2.7 SPRINKLERS

**************************************************************************
NOTE: The designer will indicate on the contract drawings the type of sprinklers for each area if more than one type of sprinkler is to be provided. Delete sprinkler types from this paragraph that are not intended for use in the system(s) used in the Contract.

Areas that are classified as light hazard will be equipped with quick-response sprinklers.
Residential areas will be equipped with residential sprinklers.
**************************************************************************

Sprinklers must comply with UL 199 and NFPA 13. Sprinklers with internal O-rings are not acceptable. Sprinklers in high heat areas including attic spaces or in close proximity to unit heaters must have temperature classification in accordance with NFPA 13. Extended coverage sprinklers are permitted for loading docks, residential occupancies and high-piled storage applications only.

2.7.1 Pendent Sprinkler

Pendent sprinkler must be [recessed][quick-response][dry pendant] type with nominal K-factor of [80][115][160][____][5.6][8.0][11.2][____].
Pendent sprinklers must have a [polished chrome][stainless steel][white polyester][____] finish. Assembly must include an integral escutcheon.

2.7.2 Upright Sprinkler

Upright sprinkler must be [brass][chrome-plated][stainless steel][white polyester][quick-response type][____] and have a nominal K-factor of [80][115][160][____][5.6][8.0][11.2][____].

2.7.3 Sidewall Sprinkler

Sidewall sprinkler must be the [quick-response][standard-response][recessed][dry sidewall] type. Sidewall sprinkler must have a nominal K-factor of [80][115][160][____][5.6][8.0][11.2][____]. Sidewall sprinkler must have a [brass][polished-chrome][stainless steel][white polyester][____] finish.

2.7.4 Concealed Sprinkler

Concealed sprinkler must be [chrome-plated][stainless steel][white polyester][quick-response type][____] and have a nominal K-factor of [80][115][160][____][5.6][8.0][11.2][____]. Coverplate must be [chrome][white][____].

2.7.5 Residential Sprinkler

Residential sprinkler must be [recessed pendent][pendent][sidewall] type with nominal K-factor of [60][80][4.2][5.6]. Residential sprinkler must have a [polished-chrome][white polyester][____] finish. Sprinkler must comply with UL 1626.
[2.7.6 Corrosion-Resistant Sprinkler]

**************************************************************************
NOTE: The use of corrosion-resistant sprinklers is generally limited to industrial type occupancies such as electroplating, steam rooms, salt storage, and piers and wharves.
**************************************************************************

Corrosion-resistant sprinkler must be the [upright][pendent] type installed in locations as indicated. Corrosion-resistant coatings must be factory-applied by the sprinkler manufacturer.

[2.7.7 Dry Sprinkler Assembly]

Dry sprinkler assembly must be of the [pendent][sidewall][45-degree] type as indicated. Assembly must include an integral escutcheon. Maximum length must not exceed maximum indicated in its listing. Sprinkler must have a [polished chrome][polyester coating][white enamel] finish.

[2.7.8 Control Mode Specific Application Sprinkler]

Control mode specific application sprinkler must be of the [pendent][upright][dry sidewall] type as indicated. Sprinkler must be specifically listed for high-piled storage only. Sprinkler must have a [polished chrome][rough brass] finish.

[2.7.9 ESFR Sprinkler]

ESFR sprinkler must be [pendent][upright] and comply with UL 1767. Nominal K-factor must be [______].

[2.7.10 Intermediate Level Rack Sprinkler]

Intermediate level rack sprinkler must be of the [upright][pendent] type with nominal K-factor of [80][115][5.6][8.0]. The sprinkler must be equipped with a deflector plate to shield the fusible element from water discharged above it.

[2.8 ACCESSORIES]

2.8.1 Sprinkler Cabinet

Provide spare sprinklers in accordance with NFPA 13 and must be placed in a suitable metal or plastic cabinet of sufficient size to accommodate all the spare sprinklers and wrenches in designated locations. Spare sprinklers must be representative of, and in proportion to, the number of each type and temperature rating of the sprinklers installed as required by NFPA 13. At least one wrench of each type required must be provided.

2.8.2 Pendent Sprinkler Escutcheon

Escutcheon must be one-piece metallic type with a depth of less than 19 mm 3/4-inch and suitable for installation on pendent sprinklers. The escutcheon must have a factory finish that matches the pendent sprinkler.
2.8.3 Pipe Escutcheon

Provide split hinge metal plates for piping entering walls, floors, and ceilings in exposed spaces. Provide polished stainless steel plates or chromium-plated finish on copper alloy plates in finished spaces. Provide paint finish on metal plates in unfinished spaces.

2.8.4 Sprinkler Guard

Listed guard must be a steel wire cage designed to encase the sprinkler and protect it from mechanical damage. Guards must be provided on sprinklers located [_____] [within 2.1 meters 7 feet of the floor] [as indicated].

2.8.5 Relief Valve

Relief valves must be listed and installed at the riser in accordance with NFPA 13.

2.8.6 Air Vent

Air vents must be of the automatic type and piped to drain to the building exterior.

2.8.7 Identification Sign

Valve identification sign must be minimum 150 mm wide by 50 mm high 6 inches wide by 2 inches high with enamel baked finish on minimum 1.214-mm 18 gage steel or 0.6-mm 0.024-inch aluminum with red letters on a white background or white letters on red background. Wording of sign must include, but not be limited to "main drain", "auxiliary drain", "inspector's test", "alarm test", "alarm line", and similar wording as required to identify operational components. Where there is more than one sprinkler system, signage must include specific details as to the respective system.

PART 3 EXECUTION

3.1 VERIFYING ACTUAL FIELD CONDITIONS

Before commencing work, examine all adjoining work on which the contractor's work that is dependent for perfect workmanship according to the intent of this specification section, and report to the Contracting Officer's Representative a condition that prevents performance of first class work. No "waiver of responsibility" for incomplete, inadequate or defective adjoining work will be considered unless notice has been filed before submittal of a proposal.

3.2 INSTALLATION

The installation must be in accordance with the applicable provisions of NFPA 13, NFPA 24 and publications referenced therein.[ Installation of in-rack sprinklers must comply with applicable provisions of NFPA 13.]

Locate sprinklers in a consistent pattern with ceiling grid, lights, and air supply diffusers. Install sprinkler system over and under ducts, piping and platforms when such equipment can negatively affect or disrupt the sprinkler discharge pattern and coverage.

a. Piping offsets, fittings, and other accessories required must be furnished to provide a complete installation and to eliminate interference with other construction.
b. Wherever the contractor's work interconnects with work of other trades the Contractor must coordinate with other Contractors to insure all Contractors have the information necessary so that they may properly install all necessary connections and equipment. Identify all work items needing access (dampers and similar equipment) that are concealed above hung ceilings by permanent color coded pins/tabs in the ceiling directly below the item.

c. Provide required supports and hangers for piping, conduit, and equipment so that loading will not exceed allowable loadings of structure. Submittal of a bid must be a deemed representation that the contractor submitting such bid has ascertained allowable loadings and has included in his estimates the costs associated in furnishing required supports.

3.2.1 Waste Removal

At the conclusion of each day's work, clean up and stockpile on site all waste, debris, and trash which may have accumulated during the day as a result of work by the contractor and of his presence on the job. Sidewalks and streets adjoining the property must be kept broom clean and free of waste, debris, trash and obstructions caused by work of the contractor, which will affect the condition and safety of streets, walks, utilities, and property.

3.3 UNDERGROUND PIPING INSTALLATION

**************************************************************************
NOTE: Restraint of the underground piping must be detailed on the contract drawings.
**************************************************************************

The fire protection water main must be laid, and joints anchored, in accordance with NFPA 24. Minimum depth of cover must be \[900][_____] mm [3][_____] feet or the frost line, whichever is deeper. The supply line must terminate inside the building with a flanged piece, the bottom of which must be set not less than \(304 \text{ mm}1\)-foot above the finished floor. A blind flange must be installed temporarily on top of the flanged piece to prevent the entrance of foreign matter into the supply line. A concrete thrust block must be provided at the elbow where the pipe turns up toward the floor. In addition, joints must be anchored in accordance with NFPA 24. Buried steel components must be provided with a corrosion protective coating in accordance with AWWA C203. Piping more than 1500 mm5 feet outside the building walls must meet the requirements of Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

3.4 ABOVEGROUND PIPING INSTALLATION

The methods of fabrication and installation of the aboveground piping must fully comply with the requirements and recommended practices of NFPA 13 and this specification section.

3.4.1 Protection of Piping Against Earthquake Damage

**************************************************************************
NOTE: The writer of this section must coordinate with the Structural Engineer or Government to determine the proper seismic design category for the
3.4.2 Piping in Exposed Areas

Install exposed piping without diminishing exit access widths, corridors or equipment access. Exposed horizontal piping, including drain piping, must be installed to provide maximum headroom.

3.4.3 Piping in Finished Areas

In areas with suspended or dropped ceilings and in areas with concealed spaces above the ceiling, piping must be concealed above ceilings. Piping must be inspected, hydrostatically tested and approved before being concealed. Risers and similar vertical runs of piping in finished areas must be concealed.

3.4.4 Pendent Sprinklers

NOTE: Where the maximum static or flowing pressure, whichever is greater at the sprinkler, applied other than through the fire department connection, exceeds 6.9 bar 100 psi and a branch line above the ceiling supplies sprinklers in a pendent position below the ceiling, the cumulative horizontal length of an unsupported armovery to a sprinkler or sprinkler drop must not exceed 300 mm 12 inches for steel pipe and 1500 mm 6 inches for copper tube.

a. Drop nipples to pendent sprinklers must consist of minimum 25-mm 1-inch pipe with a reducing coupling into which the sprinkler must be threaded.

b. Where sprinklers are installed below suspended or dropped ceilings, drop nipples must be cut such that sprinkler ceiling plates or escutcheons are of a uniform depth throughout the finished space. The outlet of the reducing coupling must not extend below the underside of the ceiling.

c. Recessed pendent sprinklers must be installed such that the distance from the sprinkler deflector to the underside of the ceiling must not exceed the manufacturer's listed range and must be of uniform depth throughout the finished area.

d. Pendent sprinklers in suspended ceilings must be located in the center of the tile (plus or minus 2 inches).

e. Dry pendent sprinkler assemblies must be such that sprinkler ceiling plates or escutcheons are of the uniform depth throughout the finished space.

f. Dry pendent sprinklers must be of the required length to permit the sprinkler to be threaded directly into a branch line tee.

g. Where the maximum static or flowing pressure, whichever is greater at
the sprinkler, applied other than through the fire department connection, exceeds 6.9 bar100 psi and a branch line above the ceiling supplies sprinklers in a pendent position below the ceiling, the cumulative horizontal length of an unsupported armover to a sprinkler or sprinkler drop must not exceed 300 mm12 inches for steel pipe and 1500 mm6 inches for copper tube.]

3.4.5 Upright Sprinklers

Riser nipples or "sprigs" to upright sprinklers must contain no fittings between the branch line tee and the reducing coupling at the sprinkler.

3.4.6 Pipe Joints

Pipe joints must conform to NFPA 13, except as modified herein. Not more than four threads must show after joint is made up. Welded joints will be permitted, only if welding operations are performed as required by NFPA 13 at the Contractor's fabrication shop, not at the project construction site. Flanged joints must be provided where indicated or required by NFPA 13. Grooved pipe and fittings must be prepared in accordance with the manufacturer's latest published specification according to pipe material, wall thickness and size. Grooved couplings, fittings and grooving tools must be products of the same manufacturer. For copper tubing, pipe and groove dimensions must comply with the tolerances specified by the coupling manufacturer. The diameter of grooves made in the field must be measured using a "go/no-go" gauge, vernier or dial caliper, narrow-land micrometer, or other method specifically approved by the coupling manufacturer for the intended application. Groove width and dimension of groove from end of pipe must be measured and recorded for each change in grooving tool setup to verify compliance with coupling manufacturer's tolerances.

3.4.7 Reducers

Reductions in pipe sizes must be made with one-piece tapered reducing fittings. When standard fittings of the required size are not manufactured, single bushings of the face or hex type will be permitted. Where used, face bushings must be installed with the outer face flush with the face of the fitting opening being reduced. Bushings cannot be used in elbow fittings, in more than one outlet of a tee, in more than two outlets of a cross, or where the reduction in size is less than 13 mm1/2-inch.

3.4.8 Pipe Penetrations

a. Cutting structural members for passage of pipes or for pipe-hanger fastenings will not be permitted. Pipes that must penetrate concrete or masonry walls or concrete floors must be core-drilled and provided with pipe sleeves. Each sleeve must be Schedule 40 galvanized steel, ductile-iron or cast-iron pipe and extend through its respective wall or floor and be cut flush with each wall surface. Sleeves must provide required clearance between the pipe and the sleeve per NFPA 13. The space between the sleeve and the pipe must be firmly packed with mineral wool insulation.

b. Where pipes and sleeves penetrate fire walls, fire partitions, or floors, pipes/sleeves must be firestopped in accordance with Section 07 84 00 FIRESTOPPING.

c. In penetrations that are not fire-rated or not a floor penetration, the space between the sleeve and the pipe must be sealed at both ends with
plastic waterproof cement that will dry to a firm but pliable mass or with a mechanically adjustable segmented elastomer seal.

d. All penetrations through the boundary of rooms/areas identified as secure space area must meet ICS 705-1.

3.4.9 Escutcheons

Escutcheons must be provided for pipe penetration in finished areas of ceilings, floors and walls. Escutcheons must be securely fastened to the pipe at surfaces through which piping passes.

3.4.10 Inspector's Test Connection

***********************************************************************
NOTE: Designer will indicate location of the inspector's test connections and all associated valves on the contract drawings, and will provide details of drain piping.
***********************************************************************

Unless otherwise indicated, the test connection must consist of 25-mm 1-inch pipe connected [to the remote branch line][at the riser as a combination test and drain valve]; a test valve located approximately 2 meters 7 feet above the floor; a smooth bore brass outlet equivalent to the smallest orifice sprinkler used in the system; and a painted metal identification sign affixed to the valve with the words "Inspector's Test". All test connection piping must be inside of the building and penetrate the exterior wall at the location of the discharge orifice only. The discharge orifice must be located outside the building wall no more than 0.6 meters 2 feet above finished grade, directed so as not to cause damage to adjacent construction or landscaping during full flow discharge, or to the sanitary sewer. Discharge to the exterior must not interfere with exiting from the facility. Water discharge or runoff must not cross the path of egress from the building. Do not discharge to the roof. Discharge to floor drains, janitor sinks or similar fixtures is not permitted.

Provide concrete splash blocks at all drain and inspector's test connection discharge locations if not discharging to a concrete surface. Splash blocks must be large enough to mitigate erosion and not become dislodged during a full flow of the drain. Ensure all discharged water drains away from the facility and does not cause property damage.

3.4.11 Backflow Preventer

Locate within the building or in a heated enclosure in locations subject to freezing. For heated enclosures, provide a low temperature supervisory alarm connected to the facility fire alarm system. Heat trace is not permitted to be used.

Install backflow preventers so that the bottom of the assembly is a minimum of 150 mm 6 inches above the finished floor/grade. Install horizontal backflow preventers so that the bottom of the assembly is no greater than [_____] 610 mm 24 inches above the finished floor/grade. Install vertical backflow preventers so that the upper operating handwheel is no more than [_____] 1.8 meters 6 feet above the finished floor/grade. Clearance around control valve handles must be minimum 150 mm 6 inches above grade/finished floor and away from walls.
3.4.11.1 Test Connection

Provide downstream of the backflow prevention assembly UL 668 hose valves with 65-mm2.5-inch National Standard male hose threads with cap and chain. Provide one valve for each 946 L/min 250 gpm of system demand or fraction thereof. Provide a permanent sign in accordance with paragraph entitled "Identification Signs" which reads, "Test Valve". Indicate location of test header. If an exterior connection, provide a control valve inside a heated mechanical room to prevent freezing.

3.4.12 Drains

a. Main drain piping must be provided to discharge [at a safe point outside the building, no more than 0.6 meters 2 feet above finished grade] [at the location indicated] [to the sanitary sewer]. Provide a concrete splash block at drain outlet. Discharge to the exterior must not interfere with exiting from the facility. Water discharge or runoff must not cross the path of egress from the building.

b. Auxiliary drains must be provided as required by NFPA 13. Auxiliary drains are permitted to discharge to a floor drain if the drain is sized to accommodate full flow (min 151 L/min 40 gpm). Discharge to service sinks or similar plumbing fixtures is not permitted.

3.4.13 Installation of Fire Department Connection

Connection must be mounted [on the exterior wall approximately 900 mm 3 feet above finished grade] [adjacent to and on the sprinkler system side of the backflow preventer]. The piping between the connection and the check valve must be provided with an automatic drip in accordance with NFPA 13 and piped to drain to the outside or a floor drain within the same room.

3.4.14 Identification Signs

Signs must be affixed to each control valve, inspector test valve, main drain, auxiliary drain, test valve, and similar valves as appropriate or as required by NFPA 13. Main drain test results must be etched into main drain identification sign. Hydraulic design data must be etched into the nameplates and permanently affixed to each sprinkler riser as specified in NFPA 13. Provide labeling on the surfaces of all feed and cross mains to show the pipe function (e.g., "Sprinkler System", "Fire Department Connection", "Standpipe") and normal valve position (e.g. "Normally Open", "Normally Closed"). For pipe sizes 100 mm 4-inch and larger provide white painted stenciled letters and arrows, a minimum of 50 mm 2 inches in height and visible from at least two sides when viewed from the floor. For pipe sizes less than 100 mm 4-inch, provide white painted stenciled letters and arrows, a minimum of 18 mm 0.75-inch in height and visible from the floor. [Provide properly lettered and approved metal sign to elevator flow switch stating the circuits' voltage, and identify the switch as an "Elevator Power Shunt Flow Switch".]

3.5 ELECTRICAL

**************************************************************************
NOTE: Coordinate power and alarm requirements with the contract drawings and other specification sections.
**************************************************************************
Except as modified herein, electric equipment and wiring must be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.[ Alarm signal wiring connected to the building fire alarm control system must be by the fire alarm installer.]

3.6 PAINTING

**************************************************************************
NOTE: Designer will coordinate color code marking with Section 09 90 00 PAINTS AND COATINGS. Color code marking for piping which are not listed in Table I of Paragraph 3.5 Pipe Color Code Marking of UFGS Section 09 90 00 will be added to the table.
**************************************************************************

Color code mark piping [red][as specified in Section 09 90 00 PAINTS AND COATINGS].

3.7 FIELD QUALITY CONTROL

3.7.1 Test Procedures

Submit detailed test procedures, prepared and signed by the NICET Level (III) or (IV) Fire Sprinkler Technician, and the representative of the installing company, and reviewed by the QFPE, days prior to performing system tests. Detailed test procedures must list all components of the installed system. Test procedures must include sequence of testing, time estimate for each test, and sample test data forms. The test data forms must be in a check-off format (pass/fail with space to add applicable test data; similar to the forms in NFPA 13). The test procedures and accompanying test data forms must be used for the pre-Government testing and the Government final testing.

a. Provide space to identify the date and time of each test. Provide space to identify the names and signatures of the individuals conducting and witnessing each test.

3.7.2 Pre-Government Testing

3.7.2.1 Verification of Compliant Installation

Conduct inspections and tests to ensure that equipment is functioning properly. Tests must meet the requirements of paragraph entitled "Minimum System Tests" and "System Acceptance" as noted in NFPA 13. The Contractor [and QFPE] must be in attendance at the pre-Government testing to make necessary adjustments. After inspection and testing is complete, provide a signed Verification of Compliant Installation letter by the QFPE that the installation is complete, compliant with the specification and fully operable. The letter must include the names and titles of the witnesses to the pre-Government tests. Provide all completion documentation as required by NFPA 13 and the test reports noted below.

a. NFPA 13 Aboveground Material and Test Certificate
b. NFPA 13 Underground Material and Test Certificate

3.7.2.2 Request for Government Final Test

When the verification of compliant installation has been completed, submit
a formal request for Government final test to the [_____] [Designated Fire Protection Engineer (DPFE)] [Contracting Officers Designated Representative (COR)]. Government final testing will not be scheduled until the DFPE has received copies of the request for Government final testing and Verification of Compliant Installation letter with all required reports. Government final testing will not be performed until after the connections to the [building fire alarm system][installation fire alarm reporting system] have been completed and tested to confirm communications are fully functional. Submit request for test at least [15][_____] calendar days prior to the requested test date.

3.7.3 Correction of Deficiencies

If equipment was found to be defective or non-compliant with contract requirements, perform corrective actions and repeat the tests. Tests must be conducted and repeated if necessary until the system has been demonstrated to comply with all contract requirements.

3.7.4 Government Final Tests

The tests must be performed in accordance with the approved test procedures in the presence of the DFPE. Furnish instruments and personnel required for the tests. The following must be provided at the job site for Government Final Testing:

a. The manufacturer's technical representative.

[b. The contractor's Qualified Fire Protection Engineer (QFPE).]

c. Marked-up red line drawings of the system as actually installed.

Government Final Tests will be witnessed by the [____], [Designated Fire Protection Engineer][Contracting Officer][, Qualified Fire Protection Engineer (QFPE)]. At this time, all required tests noted in the paragraph "Minimum System Tests" must be repeated at their discretion.

3.8 MINIMUM SYSTEM TESTS

The system, including the underground water mains, and the aboveground piping and system components, must be tested to ensure that equipment and components function as intended. The underground and aboveground interior piping systems and attached appurtenances subjected to system working pressure must be tested in accordance with NFPA 13 and NFPA 24.

3.8.1 Underground Piping

3.8.1.1 Flushing

**************************************************************************

NOTE: Designer should check the site water section for inconsistencies and to verify flushing of all underground pipe will be performed prior to connection to the sprinkler system.

**************************************************************************

Underground piping must be flushed at a minimum of 3 mps10 fps in accordance with NFPA 24.
3.8.1.2 Hydrostatic Test

New underground piping must be hydrostatically tested in accordance with NFPA 24.

3.8.2 Aboveground Piping

3.8.2.1 Hydrostatic Test

Aboveground piping must be hydrostatically tested in accordance with NFPA 13. There must be no drop in gauge pressure or visible leakage when the system is subjected to the hydrostatic test. The test pressure must be read from a gauge located at the low elevation point of the system or portion being tested.

3.8.2.2 Backflow Prevention Assembly Forward Flow Test

Each backflow prevention assembly must be tested at system flow demand, including all applicable hose streams, as specified in NFPA 13. The Contractor must provide all equipment and instruments necessary to conduct a complete forward flow test, including 65-mm 2.5-inch diameter hoses, playpipe nozzles or flow diffusers, calibrated pressure gauges, and pitot tube gauge. The Contractor must provide all necessary supports to safely secure hoses and nozzles during the test. At the system demand flow, the pressure readings and pressure drop (friction loss) across the assembly must be recorded. A metal placard must be provided on the backflow prevention assembly that lists the pressure readings both upstream and downstream of the assembly, total pressure drop, and the system test flow rate determined during the preliminary testing. The pressure drop must be compared to the manufacturer's data and the readings observed during the final inspections and tests.

3.8.3 Main Drain Flow Test

Following flushing of the underground piping, a main drain test must be made to verify the adequacy of the water supply. Static and residual pressures must be recorded on the certificate specified in paragraph SUBMITTALS.

3.9 SYSTEM ACCEPTANCE

Following acceptance of the system, as-built drawings and O&M manuals must be delivered to the Contracting Officer for review and acceptance. Submit six sets of detailed as-built drawings. The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final acceptance test of the system. At least one set of as-built (marked-up) drawings must be provided at the time of, or prior to the final acceptance test.

[ a. Provide one set of full size paper as-built drawings and schematics. The drawings must be prepared electronically and sized no less than the contract drawings.] [Furnish one set of CDs or DVDs containing software back-up and CAD based drawings in latest version of [MicroStation][AutoCAD, ]DXF and portable document formats of as-built drawings and schematics.]

b. Provide operating and maintenance (O&M) instructions.
3.10 ONSITE TRAINING

**************************************************************************
NOTE: The number of hours of instruction should be
determined based on the number and complexity of the
systems specified.
**************************************************************************

Conduct a training course for the responding fire department and operating
and maintenance personnel as designated by the Contracting Officer.
Training must be performed on two separate days (to accommodate different
shifts of Fire Department personnel) for a period of [____][4] hours of
normal working time and must start after the system is functionally
complete and after the final acceptance test. The on-site training must
cover all of the items contained in the approved Operating and Maintenance
Instructions.

  3.8.2 Aboveground Piping
    3.8.2.1 Hydrostatic Test
    3.8.2.2 Air Pressure Test
    3.8.2.3 Backflow Prevention Assembly Forward Flow Test
  3.8.3 Dry Pipe Valve Trip Test
  3.8.4 Main Drain Flow Test
  3.8.5 Supervisory Nitrogen System Test

3.9 SYSTEM ACCEPTANCE

3.10 ONSITE TRAINING

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for dry pipe fire protection sprinkler systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information. The designer is permitted to edit any and all of this section for the project. If the designer is modifying/deleting non-bracketed items and text, the Designated Fire Protection Engineer (DFPE) should be consulted prior to incorporating final changes.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: For OCONUS projects, this specification section should be edited for specific Host Nation requirements. Coordinate compliance with Host Nation requirements with the DFPE.

NOTE: This specification section includes requirements from UFC 3-600-01 (change 4, 7 February
PART 1   GENERAL

**************************************************************************

NOTE:

The Designer must edit this specification section for either a performance-designed system or a fully designed system as applicable.

This section is primarily intended for performance designed systems, e.g. systems where the size, layout, and support of branch lines and cross mains, and the layout of sprinklers will be designed by the Contractor.

This section is not intended to be used for NFPA 13D systems.

The Designer must provide the following information in the contract documents for performance designed systems. This information must be in accordance with UFC 3-600-01.

(1) Show the layout and size of all piping and equipment from the point of connection to the water supply, to the sprinkler riser. The contract drawings must include a detailed sprinkler riser diagram.

(2) Show location and size of service laterals, sprinkler risers, control valves, drain lines, sectional valves, and inspector's test valves and switches on the drawings.

(3) Specify waterflow data including hydrant flow test results, including the location where the hydrant flow test was conducted, the location and size of existing mains and new water supply lines that will serve the sprinkler system.

(4) Highlight or clearly indicate the area(s) to be protected by sprinklers on the drawings.

(5) Specify waterflow requirements including the design density, design area, the hose stream demand (including location of the hose stream demand), the duration of supply, and sprinkler spacing and area of coverage in this section.

(6) Show the location of the backflow preventer (including provisions for a drain and access for maintenance) on the drawings.

(7) Show all provisions necessary for forward flow testing of the backflow preventer at system demand as required by NFPA 13 on the drawings.
(8) Highlight all concealed spaces on the drawings that require sprinkler protection, such as spaces above suspended ceilings that are built of combustible material or that can contain combustible materials, such as storage, and communication cabling that is not fire-rated.

(9) Provide details on the drawings of pipe restraints for underground piping. This includes details of pipe clamps, tie rods, mechanical retainer glands, and thrust blocks.

(10) Nitrogen generators, including controls and complete installation details, including piping, control valves, mounting base.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Seismic protection/bracing is to be provided for seismic design categories C or greater only, unless specifically requested by the DFPE. Consideration should also be giving to utilizing seismic protection/bracing to limit pipe movement.
**************************************************************************

Provide dry pipe [sprinkler] system(s) in [areas indicated on the drawings] [______]. Except as modified herein, the system must meet the requirements of NFPA 13 [and ]. Dry pipe systems must utilize nitrogen. Pipe sizes which are not indicated on the Contract drawings must be determined by hydraulic calculations.

1.2.1 Hydraulic Design

**************************************************************************
NOTE: Applications requiring multiple densities/design areas must be referred to and shown on the drawings.
**************************************************************************

Discharge density for non-storage occupancies must be in accordance with UFC 3-600-01. Specific densities must be listed on the drawings or noted in the specification when drawings are not provided. Stating "comply with UFC 3-600-01 is not acceptable.

Hazard classification of miscellaneous storage must be per NFPA 13. Discharge density for the hazard classification must be per UFC 3-600-01.

The paragraph below must be listed on the drawings. If this information is not listed on the drawings, provide the information in paragraph 1.1.1.3 (with brackets completed).
Hydraulically design the system to discharge a minimum density [of [_____] L/min per square meter gpm/square foot over the hydraulically most demanding [280] [_____] square meters[_____] square feet of floor area] as indicated on the drawings. Hydraulic calculations must be in accordance with the Area/Density Method of NFPA 13.

**************************************************************************

NOTE: The addition, modification or relocation of no more than twenty sprinklers to an existing system or modifications to existing sprinkler systems fed from domestic supplies are permitted to be designed using the pipe schedule method in NFPA 13 based on the layout of the existing system.

**************************************************************************

1.2.1.1 Basis for Calculations

**************************************************************************

NOTE: The design must include an adequate water supply to meet the sprinkler water demand. The designer must provide waterflow test results and hydraulic calculations to ensure that the system demand will be met.

Design Calculations: The designer must provide detailed hydraulic calculations that clearly demonstrate that the water supply will meet the demand of the sprinkler system and hose streams. Calculations must be submitted with the concept design submission.

**************************************************************************

A waterflow test was performed on (DATE) at (LOCATION) and resulted in a static pressure of [____ kPapsi] with a residual pressure of [_____ kPapsi] while flowing [____ L/min/gpm]. Perform a fire hydrant flow test prior to shop drawing submittal in accordance with NFPA 291. Results must include hydrant elevations relative to the building and hydrant number/identifiers for the tested hydrants, including which were flowed, which had a gauge. This information must be presented in a tabular form if multiple hydrants were flowed. The results must be included with the hydraulic calculations. Hydraulic calculations must be based on flow test noted in this paragraph, unless [verified by the NAVFAC[____] Fire Protection Engineer and] approved by Contracting Officer. Hydraulic calculations must be based upon the Hazen-Williams formula with a "C" value noted in NFPA 13 for piping, [and [_____] for existing underground piping]. A "C" value of 120 is permitted to be used in hydraulic calculations when nitrogen is utilized. [Hydraulic calculations must be based on operation of the fire pump(s) provided in Section 21 30 00 FIRE PUMPS.] [The minimum residual pressure in a service lateral (lead-in) at the [design flow rate][150% of the fire pump rated flow] must be 138 kPa20 psi at [the inlet to the backflow preventer][the suction side of the fire pump]].

1.2.1.2 Hydraulic Calculations

a. Water supply curves and system requirements must be plotted on
semi-logarithmic graph (N^1.85) paper so as to present a summary of the complete hydraulic calculation.

b. Provide a summary sheet listing sprinklers in the design area and their respective hydraulic reference points, elevations, minimum discharge pressures and minimum flows. Elevations of hydraulic reference points (nodes) must be indicated.

c. Documentation must identify each pipe individually and the nodes connected thereto. Indicate the diameter, length, flow, velocity, friction loss, number and type fittings, total friction loss in the pipe, equivalent pipe length and Hazen-Williams coefficient for each pipe.

d. Where the sprinkler system is supplied by interconnected risers, the sprinkler system must be hydraulically calculated using the hydraulically most demanding single riser. The calculations must not assume the simultaneous use of more than one riser.

e. All calculations must include the backflow preventer manufacturer's stated friction loss at the design flow or [83 kPa12 psi for reduced pressure][55 kPa8 psi for double check] backflow preventer, whichever is greater.

f. All calculations must be performed back to the actual location of the flow test, taking into account the direction of flow in the service main at the test location.

1.2.1.3 Design Criteria

Hydraulically design the system to discharge a minimum density [of [_____] L/min per square metergpm/square foot over the hydraulically most demanding [_____] square metersquare feet of floor area][as indicated on the drawings]. Hydraulic calculations must be in accordance with the Area/Density Method of NFPA 13. Add an allowance for exterior hose streams of [_____] L/min gpm to the sprinkler system demand [at the fire hydrant shown on the drawings closest to the point where the water service enters the building] [at the point of connection to the existing water system]. [An allowance for interior hose stations of [_____] L/min gpm must be added to the sprinkler system demand.]

1.2.2 Sprinkler Coverage

******************************************************************************
NOTE: The exception in NFPA 13 to eliminate sprinklers in electrical rooms is not applicable per UFC 3-600-01.
******************************************************************************

Sprinklers must be uniformly spaced on branch lines. Provide coverage throughout 100 percent of the [building][area noted on the Contract drawings]. This includes, but is not limited to, telephone rooms, electrical equipment rooms (regardless of the fire resistance rating of the enclosure), boiler rooms, switchgear rooms, transformer rooms, attached electrical vaults and other electrical and mechanical spaces. Coverage per sprinkler must be in accordance with NFPA 13. Provide sprinklers below all obstructions in accordance with NFPA 13. Exceptions are as follows:

a. Sprinklers may be omitted from small rooms which are exempted for
specific occupancies in accordance with **NFPA 101**.

[1.2.3] **System Volume Limitations**

Where the volume of an individual system piping exceeds **1890 liters500 gallons**, provide the dry pipe valve with a quick-opening device. The maximum system capacity controlled by one dry pipe valve must not exceed **2800 liters750 gallons**, unless it complies with the dry pipe system water delivery calculations noted in NFPA 13.

[1.2.4] **Qualified Fire Protection Engineer (QFPE)**

**************************************************************************

**NOTE:** UFC 3-600-01 requires that shop drawings must bear the Review Stamp and professional engineering stamp of the QFPE prior to submission to the Government for approval.

**************************************************************************

**NOTE:** The term Qualified Fire Protection Engineer (QFPE) should be considered interchangeable with the terms "Fire Protection Designer of Record (FPDOR)" and/or "Fire Protection QC Specialist" where referred to in other applicable contract documents. The intent of defining the QFPE roles and responsibilities here is NOT to require personnel in addition to the QFPE, FPDOR, and/or FPQC specialist referenced elsewhere in the applicable contract documents.

**************************************************************************

An individual who is a licensed professional engineer (P.E.) who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience. Services of the QFPE must include:

a. Reviewing SD-02, SD-03, and SD-05 submittal packages for completeness and compliance with the provisions of this specification. Working (shop) drawings and calculations must be prepared by, or prepared under the immediate supervision of, the QFPE. The QFPE must affix their professional engineering stamp with signature to the shop drawings, calculations, and material data sheets, indicating approval prior to submitting the shop drawings to the DFPE.

b. Provide a letter documenting that the SD-02, SD-03, and SD-05 submittal package has been reviewed and noting outstanding comments.

c. Performing in-progress construction surveillance prior to installation of ceilings (rough-in inspection).

e. Signing applicable certificates under SD-07.
1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

NOTE: When 20 or less sprinklers are added, modified or relocated, shop drawings, hydraulic calculations and product data are not required to be submitted. Edit this section accordingly.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Partial submittals and submittals not fully complying with NFPA 13 and this specification section must be returned disapproved without review. SD-02, SD-03 and SD-05 must be submitted simultaneously.

Shop drawings (SD-02), product data (SD-03) and calculations (SD-05) must be prepared by the designer and combined and submitted as one complete package. The QFPE must review the SD-02/SD-03/SD-05 submittal package for completeness and compliance with the Contract provisions prior to submission to the Government. The QFPE must provide a Letter of Confirmation that they have reviewed the submittal package for compliance...
with the contract provisions. This letter must include their professional
engineer stamp and signature. Partial submittals and submittals not
reviewed by the QFPE must be returned disapproved without review.

Submit the following in accordance with Section 01 33 00 SUBMITTAL
PROCEDURES:

SD-01 Preconstruction Submittals
  Qualified Fire Protection Engineer (QFPE); G[, [____]]
  Sprinkler System Designer; G[, [____]]
  Sprinkler System Installer; G[, [____]]
  Nitrogen Generation System Commissioning Technician; G[, [____]]

SD-02 Shop Drawings

SD-11 Closeout Submittals
As-built drawings

1.4 QUALITY ASSURANCE

1.4.1 Preconstruction Submittals

Within 36 days of contract award but no less than [14 days][_____] prior to commencing work on site, the prime Contractor must submit the following for review and approval. SD-02, SD-03 and SD-05 submittals received prior to the review and approval of the qualifications must be returned Disapproved Without Review. All resultant delays are the sole responsibility of the prime Contractor.

1.4.1.1 Shop Drawing

[_____] copies of the shop drawings, no later than 28 days prior to the start of system installation. Working drawings conforming to the requirements prescribed in NFPA 13 and must be no smaller than [ISO A1][ANSI D][the Contract Drawings]. Each set of drawings must include the following:

1. A descriptive index with drawings listed in sequence by number. A legend sheet identifying device symbols, nomenclature, and conventions used in the package.

2. Floor plans drawn to a scale not less than 1:100 1/8-inch equals 1-foot clearly showing locations of devices, equipment, risers, electrical power connections and other details required to clearly describe the proposed arrangement.

3. Actual center-to-center dimensions between sprinklers on branch lines and between branch lines; from end sprinklers to adjacent walls; from walls to branch lines; from sprinkler feed mains, cross mains and branch lines to finished floor and roof or ceiling. A detail must show the dimension from the sprinkler and sprinkler deflector to the ceiling in finished areas.

4. Longitudinal and transverse building sections showing typical branch
line and cross main pipe routing, elevation of each typical sprinkler above finished floor and elevation of "cloud" or false ceilings in relation to the building ceilings.

5. Plan and elevation views which establish that the equipment will fit the allotted spaces with clearance for installation and maintenance.

6. Riser layout drawings drawn to a scale of not less than 1:25 1/2-inch equals 1-foot to show details of each system component, clearances between each other and from other equipment and construction in the room.

7. Details of each type of riser assembly, pipe hanger, [sway bracing for earthquake protection, ]and restraint of underground water main at point-of-entry into the building, and electrical devices and interconnecting wiring. The dimension from the edge of vertical piping to the nearest adjacent wall(s) must be indicated on the drawings when vertical piping is located in stairs or other portions of the means of egress.

8. Details of each type of pipe hanger[, seismic bracing/restraint] and related components.

9. Include fire pump curve with shop drawings and hydraulic calculations.

10. The calculated volume of each system.

1.4.1.2 Product Data

[_____] copies of annotated catalog data to show the specific model, type, and size of each item. Catalog cuts must also indicate the NRTL listing. The data must be highlighted to show model, size, options, and other pertinent information, that are intended for consideration. Data must be adequate to demonstrate compliance with all contract requirements. Product data for all equipment must be combined into a single submittal.

1.4.1.3 Hydraulic Calculations

**************************************************************************
NOTE: Include the first bracketed item for Army Corps projects.
**************************************************************************

Calculations must be as outlined in NFPA 13 except that calculations must be performed by computer using software intended specifically for fire protection system design using the design data shown on the drawings.[Calculations must include isometric diagram indicating hydraulic nodes and pipe segments.][Include fire pump curve with submittal.]

1.4.1.4 Operating and Maintenance (O&M) Instructions

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA as supplemented and modified by this specification section.

Provide [six][_____] manuals[ and one pdf version on electronic media]. The manuals must include the manufacturer's name, model number, parts list, list of parts and tools that should be kept in stock by the owner for routine maintenance, simplified wiring and controls diagrams,
troubleshooting guide, and recommended service organization (including address and telephone number) for each item of equipment. [ Each service organization submitted must be capable of providing [4][_____]_hour on-site response to a service call on an emergency basis.]

Submit spare parts data for each different item of material and equipment specified. The data must include a complete list of parts and supplies, and a list of parts recommended by the manufacturer to be replaced after 1-year and 3 years of service. Include a list of special tools and test equipment required for maintenance and testing of the products supplied.

1.4.2 Qualifications

**************************************************************************
NOTE: NICET (National Institute for Certification in Engineering Technologies) establishes the qualifications of an individual as an Engineering Technologist with verification of experience by having a current NICET certification.
**************************************************************************

1.4.2.1 Sprinkler System Designer

The sprinkler system designer must be certified as a Level [III][IV] Technician by National Institute for Certification in Engineering Technologies (NICET) in the Water-Based Systems Layout subfield of Fire Protection Engineering Technology in accordance with NICET 1014-7.

1.4.2.2 Sprinkler System Installer

The sprinkler system installer must be regularly engaged in the installation of the type and complexity of system specified in the contract documents, and must have served in a similar capacity for at least three systems that have performed in the manner intended for a period of not less than 6 months.

1.4.2.3 Nitrogen Generation System Commissioning Technician

Commissioning technician of nitrogen generation system(s) must have one of the following qualifications. Qualifications must be provided prior to preliminary inspection and tests.

a. Commissioning of nitrogen generation system must be carried out by technician employed by and certified by the nitrogen generation system manufacturer.

b. In lieu of manufacturer's commissioning technician, the fire sprinkler contractor must provide proof their commissioning technician has manufacturer's certified training for the equipment being installed and proof of at least five previous installations of manufacturer's equipment where the contractor's commissioning technician has successfully conducted commissioning under the direct supervision of the manufacturer's commissioning representative. Contractor must provide proof the five supervised commissioning occurred AFTER contractor's commissioning agent has obtained the certified training. Commissioning carried out prior to factory training, or without supervision of manufacturer's technician or commissioning of other manufacturer's equipment does not qualify as applicable experience. Conduct preliminary inspections and testing does not qualify as
applicable experience.

1.4.3 Regulatory Requirements

Equipment and material must be listed or approved. Listed or approved, as used in this Section, means listed, labeled or approved by a Nationally Recognized Testing Laboratory (NRTL) such as UL Fire Prot Dir or FM APP GUIDE. The omission of these terms under the description of an item of equipment described must not be construed as waiving this requirement. All listings or approvals by testing laboratories must be from an existing ANSI or UL published standard. The recommended practices stated in the manufacturer's literature or documentation are mandatory requirements.

1.5 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, excessive humidity and temperature variations, dirt and dust, or other contaminants. All pipes must be either capped or plugged until installed.

1.6 EXTRA MATERIALS

Spare sprinklers and wrench(es) must be provided as spare parts in accordance with NFPA 13.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials, equipment, and devices listed for fire protection service when so required by NFPA 13 or this specification. Select material from one manufacturer, where possible, and not a combination of manufacturers, for a particular classification of materials. Material and equipment must be the standard products of a manufacturer regularly engaged in the manufacture of the products for at least [2][_____] years prior to bid.

2.1.2 Nameplates

Major components of equipment must have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new name plate permanently affixed to the item or equipment. Nameplates must be etched metal or plastic, permanently attached by screws to control units, panels or adjacent walls.

2.1.3 Identification and Marking

Pipe and fitting markings must include name or identifying symbol of manufacturer and nominal size. Pipe must be marked with ASTM designation. Valves and equipment markings must have name or identifying symbol of manufacturer, specific model number, nominal size, name of device, arrow indicating direction of flow, and position of installation (horizontal or vertical), except if valve can be installed in either position. Markings must be included on the body casting or on an etched or stamped metal nameplate permanently on the valve or cover plate.
2.1.4 Pressure Ratings

Valves, fittings, couplings, alarm switches, and similar devices must be rated for the maximum working pressures that can be experienced in the system, but in no case less than \[1207\text{ kPa}[1724]\text{ psi}\].

2.2 UNDERGROUND PIPING COMPONENTS

**************************************************************************

NOTE: The design drawings must show the service connection details and the underground service lateral for the sprinkler system. The drawings must show details of the water service point-of-entry into the building and through the floor slab, and underground piping restraints, including number and size of restraining rods and thrust blocks. 4-inch piping is the minimum permitted for service laterals serving NFPA 13R systems. 6-inch piping is the minimum permitted for NFPA 13 systems.

**************************************************************************

2.2.1 Pipe

Pipe must comply with NFPA 24. Minimum pipe size is \[100\text{ mm}4\text{ inches}][150\text{ mm}6\text{ inches}]. Piping more than 1.50 meters5 feet outside the building walls must comply with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING. A continuous section of welded stainless steel fire water service piping from a point outside the building perimeter to a flanged fitting at least 304 mm1-foot above the finished floor within the building is acceptable.

2.2.2 Fittings and Gaskets

Fittings must be ductile-iron conforming to AWWA C110/A21.10 with cement mortar lining conforming to AWWA C104/A21.4. Gaskets must be suitable in design and size for the pipe with which such gaskets are to be used. Gaskets for ductile-iron pipe joints must conform to AWWA C111/A21.11.

2.2.3 Gate Valve[ and Indicator Posts]

**************************************************************************

NOTE: This paragraph will be deleted if underground valves are either not required or are specified elsewhere.

**************************************************************************

Installation must comply with NFPA 24. Gate valves for use with indicator post must conform to UL 262. [ Indicator posts must conform to UL 789. Provide each indicator post with one coat of primer and two coats of red enamel paint.]

[2.2.4 Valve Boxes

Except where indicator posts are provided, for each buried valve, provide a cast-iron, ductile-iron, or plastic valve box of a suitable size. Plastic boxes must be constructed of acrylonitrile-butadiene-styrene (ABS) or inorganic fiber-reinforced black polyolefin. Provide cast-iron, ductile-iron, or plastic cover for valve box with the word "WATER" cast on the cover. The minimum box shaft diameter must be 133 mm5.25 inches. Coat cast-iron and ductile-iron boxes with bituminous paint applied to a minimum
dry-film thickness of **0.254 mm (10 mils)**.

2.2.5 Buried Utility Warning and Identification Tape

Provide detectable aluminum foil plastic backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape must be detectable by an electronic detection instrument. Provide tape, **80 mm (3 inches) minimum width**, color coded for the utility involved with warning and identification imprinted in bold block letters continuously and repeatedly over the entire tape length. Warning and identification must read "CAUTION BURIED WATER PIPING BELOW" or similar wording. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material.

2.3 ABOVEGROUND PIPING COMPONENTS

**************************************************************************

**NOTE:** Specify steel piping exposed to the weather or corrosive atmospheres to properly protect against corrosive effects.

**NOTE:** GALVANIZED PIPING IS ONLY PERMITTED FOR DELUGE SYSTEMS, VALVE TRIM PIPING AND DRAIN PIPING WHEN EXPOSED TO THE EXTERIOR.

**************************************************************************

2.3.1 Steel Piping Components

2.3.1.1 Steel Pipe

**************************************************************************

**NOTE:** For DLA, use Schedule 40 steel pipe only.

**NOTE:** Grooved pipe must be cut grooved for WHS projects.

**************************************************************************

Except as modified herein, steel pipe must be black as permitted by NFPA 13 and conform to the applicable provisions of ASTM A53/A53M, ASTM A135/A135M or ASTM A153/A153M.

[Steel pipe must be minimum Schedule 40 for sizes 50 mm (2 inches) and less; and minimum Schedule 10 for sizes larger than 50 mm (2 inches).] Steel piping with wall thickness less than Schedule 40 must not be threaded. [Grooved pipe must be cut-grooved.]

2.3.1.2 Fittings

**Fittings** must be welded, threaded, or grooved-end type. Threaded fittings must be cast-iron conforming to ASME B16.4, malleable-iron conforming to ASME B16.3 or ductile-iron conforming to ASTM A536. Plain-end fittings with mechanical couplings, fittings that use steel gripping devices to bite into the pipe, steel press fittings and field welded fittings are not permitted. Fittings, mechanical couplings, and rubber gaskets must be supplied by the same manufacturer. Threaded fittings must use Teflon tape or manufacturer's approved joint compound. [Saddle tees using rubber gasketed fittings are permitted only when connecting to existing piping for additions or modifications. Saddle tees must use a connection method that completely wraps around the pipe.] Reducing couplings are not permitted.
except as allowed by NFPA 13.

2.3.1.3 Grooved Mechanical Joints and Fittings

Joints and fittings must be designed for not less than 1200 kPa (175 psi) service and the product of the same manufacturer. Field welded fittings must not be used. Fitting and coupling housing must be malleable-iron conforming to ASTM A47/A47M, Grade 32510; ductile-iron conforming to ASTM A536, Grade 65-45-12. Rubber gasketed grooved-end pipe and fittings with mechanical couplings are permitted in pipe sizes 50 mm (2 inches) and larger. Gasket must be of silicon compound and listed for dry fire protection systems. Gasket must be the flush type that fills the entire cavity between the fitting and the pipe. Nuts and bolts must be heat-treated steel conforming to ASTM A183 and must be cadmium-plated or zinc-electroplated.

2.3.1.4 Flanges

Flanges must conform to NFPA 13 and ASME B16.1. Gaskets must be non-asbestos compressed material in accordance with ASME B16.21, 1.6 mm (1/16-inch) thick, and full face or self-centering flat ring type.

2.3.2 Copper Tube Components

2.3.2.1 Copper Tube

Copper tube must conform to ASTM B88M, Types L and M.

2.3.2.2 Copper Fittings and Joints

Cast copper alloy solder-joint pressure fittings must conform to ASME B16.18 and wrought copper and bronze solder-joint pressure fittings must conform to ASME B16.22 and ASTM B75/B75M. Cast copper alloy fittings for flared copper tube must conform to ASME B16.26 and ASTM B62. Brass or bronze adapters for brazed tubing may be used for connecting tubing to flanges and to threaded ends of valves and equipment.

2.3.3 Pipe Hangers and Supports

******************************************************************************
NOTE: Seismic parameters must follow UFC 3-301-01 Structural Engineering. The writer of this section must coordinate with the Structural Engineer or Government to determine the proper seismic design category for the project, in accordance with the IBC or ASCE guidelines. See UFC 3-310-04 for more information.
******************************************************************************

Provide galvanized pipe hangers[, supports and seismic bracing][and supports] in accordance with NFPA 13.[ Design and install seismic protection in accordance with the requirements of NFPA 13 section titled "Protection of Piping Against Damage Where Subject to Earthquakes for Seismic Design Category ["C"]|["D"]|["_____"]].

2.3.4 Valves

Provide valves of types approved for fire service. Valves must open by counterclockwise rotation.
2.3.4.1 Control Valve

Manually operated sprinkler control/gate valve must be [outside stem and yoke (OS&Y) type] [or] [butterfly type] [as indicated on the drawings] and must be listed.

2.3.4.2 Check Valves

Check valves must comply with UL 312. Check valves 100 mm 4 inches and larger must be of the swing type, have a clear waterway and meet the requirements of MSS SP-71, for Type 3 or 4. Inspection plate must be provided on valves larger than 150 mm 6 inches.

2.3.4.3 Hose Valve

**************************************************************************

NOTE: Hose valves are required as part of the backflow prevention test header.

**************************************************************************

Valve must comply with UL 668.

2.4 DRY PIPE VALVE ASSEMBLY

The dry pipe valve must be a listed, latching differential type be complete with trim piping, valves, fittings, pressure gauges, priming water fill cup, velocity drip check, drip cup, and other ancillary components as required for proper operation. The assembly must include a quick-opening device by the same manufacturer as the dry pipe valve for systems over 1890 liters 500 gallons in capacity and in all cases when needed to achieve the timed test requirements in part 3 of this specification section.

2.5 SUPERVISORY NITROGEN SYSTEM

Provide a nitrogen supply system in accordance with NFPA 13. The connection pipe from the nitrogen generator must not be less than 13 mm 1/2-inch in diameter and must enter the system above the priming water level of the dry pipe valve. Install a check valve in the system supply nitrogen piping from the generator. A shutoff valve of the renewable disc type must be installed upstream of this check valve. The nitrogen supply system must be sized to pressurize the sprinkler system to [275] [_____] kPa [40] [_____] psi within 20 minutes.

2.5.1 Nitrogen Generation System

The nitrogen generation system (NGS) must be installed with a compressor sized appropriately for the application and capable of achieving system pressure within 30 minutes in accordance with the requirements of NFPA 13. The nitrogen generation system must be designed to achieve a nitrogen concentration of 98% or greater and maintain that concentration within the fire sprinkler system continuously. The output nitrogen quality must be confirmed by using a gas stream analyzer. Where multiple dry pipe sprinkler risers are present, provide a manifold adjacent to the dry pipe sprinkler risers. Manifold system must include automatic vent and air maintenance devices for each sprinkler system riser. Nitrogen generation system requires a dedicated, hardwired 120V AC power supply.
Design the system so all equipment is installed within the confines of the riser room with the exception of a connection for a manual or automatic gas analyzer. Provide a system that is capable of delivering a minimum of 98 percent nitrogen composition throughout all of the system piping within 14 days from the commencement of the inerting process. Provide membrane type nitrogen generators that provide "instant on-instant off" nitrogen gas production without the need for nitrogen storage tanks. The complete nitrogen generator system must be self-contained and skid mounted with "drop-in" operability with a simple one step direct connection of the nitrogen gas supply line to each zone/riser. Provide an automatic "fill and purge" breathing process. This must be done while the sprinkler system is fully functional and must not alter the design performance of the sprinkler system. A process that involves continuous venting of the piping network is not permitted. Air maintenance devices used in conjunction with the nitrogen generation system must be listed for use on sprinkler systems. At the riser and at the end of each zone, provide a connection for a [manual][automatic] gas analyzer.

2.5.1.2 Nitrogen Air Compressor

Air compressors to be used in conjunction with the nitrogen generator must be capable of the following:

a. Capable of producing a continuous stream of compressed air at 100+ psig.
b. Capable of automatic cut in and cut out.
c. Equipped with an on-board after-cooler.
d. Equipped with an on-board automatic water blow down system.
e. Equipped with vibration dampening system.
f. Equipped with an air storage tank to provide continuous delivery of compressed air to the nitrogen generator.
g. Rated for continuous duty service.
h. Compressors less than 3.0 hp must be an oil-less design.
i. Oil-less compressors must be such that the manufacturer has designed the oil-less compressor to provide 5000 hours of continuous duty service before requiring a gasket and seal rebuild.

2.5.1.3 Nitrogen Venting Device

The functional component of the nitrogen venting device for use in the "fill and purge" breathing process must:

a. Be NRTL listed for use on sprinkler systems.
b. Not require plumbing to drain.
c. Close automatically at the completion of the nitrogen inerting process without manual intervention.
d. Be installed on each zone in the riser room.
2.5.1.4 Supervision of Nitrogen Generator

Nitrogen generator must be able to provide the following monitoring options:

a. Power supply "on" for nitrogen generators.

b. Power supply "on" for compressor.

c. Amp draw for compressor.

d. Line pressure (psig).

2.5.2 Nitrogen Pressure Maintenance Device

Device must be a pressure regulator that automatically reduces supply air pressure to the minimum pressure required to be maintained in the piping system. The device must have a cast bronze body and valve housing complete with diaphragm assembly, spring, filter, ball check to prevent backflow, 1.6-mm/16-inch restriction to prevent rapid pressurization of the system, and adjustment screw. The device must be capable of reducing maximum inlet pressure of 680 kPa100 psi to a fixed outlet pressure adjustable to [70][_____] kPa[10][_____] psi.

2.6 ALARM INITIATING AND SUPERVISORY DEVICES

2.6.1 Sprinkler Alarm Switch

pressure-type flow switch(es). [Connection of switch must be by the fire alarm installer].

2.6.2 High/Low-Nitrogen Pressure Supervisory Switch

Each dry pipe valve must be provided with a nitrogen pressure switch connected to the control unit. The pressure switch must supervise the nitrogen pressure in the system and set to activate at 70 kPa10 psi above the dry pipe valve trip point pressure (low) and 70 kPa10 psi above normal nitrogen pressure (high). The switch must have an adjustable range between 35 and 500 kPa5 and 80 psi. The switch must have screw terminal connection and capable of being wired for normally open or normally closed circuit.

2.6.3 Valve Supervisory (Tamper) Switch

Switch must be integral to the control valve or suitable for mounting to the type of control valve to be supervised open. The switch must be tamper resistant and contain SPDT (Form C) contacts arranged to transfer upon removal of the housing cover or closure of the valve of more than two rotations of the valve stem.

2.7 BACKFLOW PREVENTION ASSEMBLY

**************************************************************************

NOTE: Indicate piping, type of connection and equipment, such as a test header with hose valves, required for flow testing of the backflow preventer at full system demand as required by NFPA 13.
Arrangement of test assembly should be coordinated with the installation.

[Reduced-pressure principle] [Double-check] valve assembly backflow preventer complying with ASSE 1013, ASSE 1015 and AWWA M14. Each check valve must have a drain. Backflow prevention assemblies must have current "Certificate of Approval from the Foundation for Cross-Connection Control and Hydraulic Research, FCCCHR List" and be listed for fire protection use. Listing of the specific make, model, design, and size in the FCCCHR List is acceptable as the required documentation.

2.7.1 Backflow Preventer Test Connection

Test connection must consist of a series of listed hose valves with 65-mm 1/2-inch National Standard male hose threads with cap and chain.

2.8 FIRE DEPARTMENT CONNECTION

*NOTE: The designer will coordinate the desired location and thread type for the fire department connection with the responding fire department.*

Fire department connection must be [freestanding] [projecting] [flush] type with cast-brass body, matching [wall] escutcheon lettered "Auto Spkr" with a [polished-brass] [chromium-plated] finish. [The connection must have individual self-closing clappers, caps with drip drains and chains.] Female inlets must have [65-mm 2 1/2-inch] [100 mm 4-inch] [125 mm 5-inch] [_____] diameter [American National Fire Hose Connection Screw Threads (NH) per NFPA 1963] [Storz][_____] . Comply with UL 405.

2.9 SPRINKLERS

*NOTE: The designer will indicate on the contract drawings the type of sprinklers for each area if more than one type of sprinkler is to be provided. Delete sprinkler types from this paragraph that are not intended for use in the system(s) used in the Contract.*

Areas that are classified as light hazard will be equipped with quick-response sprinklers.

Sprinklers must comply with UL 199 and NFPA 13. Sprinklers with internal O-rings are not acceptable. Sprinklers in high heat areas including attic spaces or in close proximity to unit heaters must have temperature classification in accordance with NFPA 13. Extended coverage sprinklers are permitted for loading docks, residential occupancies and high-piled storage applications only.

2.9.1 Pendent Sprinkler

Pendent sprinkler must be [recessed] [quick-response] [dry pendent] type with nominal K-factor of [80] [115] [160] [_____] [5.6] [8.0] [11.2] [_____] . Pendent sprinklers must have a [polished chrome] [stainless steel] [white]
polyester][_____] finish. Assembly must include an integral escutcheon.

2.9.2 Upright Sprinkler

Upright sprinkler must be [brass][chrome-plated][stainless steel][white polyester] [quick-response type][_____] with a nominal K-factor of [80][115][160][_____] [5.6][8.0][11.2][_____].

2.9.3 Sidewall Sprinkler

Sidewall sprinkler must be the [quick-response][standard-response] [recessed][dry sidewall] type. Sidewall sprinkler must have a nominal K-factor of [80][115][160][_____] [5.6][8.0][11.2][_____] . Sidewall sprinkler must have a [brass][polished-chrome][stainless steel][white polyester][_____] finish.

2.9.4 Corrosion-Resistant Sprinkler

**************************************************************************
NOTE: The use of corrosion-resistant sprinklers is generally limited to industrial type occupancies such as electroplating, steam rooms, salt storage, and piers and wharves.
**************************************************************************

Corrosion-resistant sprinkler must be the [upright][pendent] type installed in locations as indicated. Corrosion-resistant coatings must be factory-applied by the sprinkler manufacturer.

]2.10 ACCESSORIES

2.10.1 Sprinkler Cabinet

Provide spare sprinklers in accordance with NFPA 13 and must be placed in a suitable metal or plastic cabinet of sufficient size to accommodate all the spare sprinklers and wrenches in designated locations. Spare sprinklers must be representative of, and in proportion to, the number of each type and temperature rating of the sprinklers installed as required by NFPA 13. At least one wrench of each type required must be provided.

2.10.2 Pendent Sprinkler Escutcheon

Escutcheon must be one-piece metallic type with a depth of less than 19 mm 3/4-inch and suitable for installation on pendent sprinklers. The escutcheon must have a factory finish that matches the pendent sprinkler.

2.10.3 Pipe Escutcheon

Provide split hinge metal plates for piping entering walls, floors, and ceilings in exposed spaces. Provide polished stainless steel plates or chromium-plated finish on copper alloy plates in finished spaces. Provide paint finish on metal plates in unfinished spaces.

2.10.4 Sprinkler Guard

Listed guard must be a steel wire cage designed to encase the sprinkler and protect it from mechanical damage. Guards must be provided on sprinklers located [_____] [within 2.1 meters7 feet of the floor][as indicated].
2.10.5 Relief Valve

Relief valves must be listed and installed at there riser in accordance with NFPA 13.

2.10.6 Identification Sign

Valve identification sign must be minimum 150 mm wide by 50 mm high6 inches wide by 2 inches high with enamel baked finish on minimum 1.214-mm18 gage steel or 0.6-mm0.024-inch aluminum with red letters on a white background or white letters on red background. Wording of sign must include, but not be limited to "main drain", "auxiliary drain", "inspector's test", "alarm test", "alarm line", and similar wording as required to identify operational components. Where there is more than one sprinkler system, signage must include specific details as to the respective system.

PART 3 EXECUTION

3.1 VERIFYING ACTUAL FIELD CONDITIONS

Before commencing work, examine all adjoining work on which the contractor's work that is dependent for perfect workmanship according to the intent of this specification section, and report to the Contracting Officer's Representative a condition which prevents performance of first class work. No "waiver of responsibility" for incomplete, inadequate or defective adjoining work will be considered unless notice has been filed before submittal of a proposal.

3.2 INSTALLATION

The installation must be in accordance with the applicable provisions of NFPA 13, NFPA 24 and publications referenced therein. Installation of in-rack sprinklers must comply with applicable provisions of NFPA 13. Locate sprinklers in a consistent pattern with ceiling grid, lights, and air supply diffusers. Install sprinkler system over and under ducts, piping and platforms when such equipment can negatively affect or disrupt the sprinkler discharge pattern and coverage.

a. Piping offsets, fittings, and other accessories required must be furnished to provide a complete installation and to eliminate interference with other construction.

b. Wherever the contractor's work interconnects with work of other trades the Contractor must coordinate with other Contractors to insure all Contractors have the information necessary so that they may properly install all necessary connections and equipment. Identify all work items needing access (dampers and similar equipment) concealed above hung ceilings by permanent color coded pins/tabs in the ceiling directly below the item.

c. Provide required supports and hangers for piping, conduit, and equipment so that loading will not exceed allowable loadings of structure. Submittal of a bid must be a deemed representation that the contractor submitting such bid has ascertained allowable loadings and has included in his estimates the costs associated in furnishing required supports.
3.2.1 Waste Removal

At the conclusion of each day's work, clean up and stockpile on site all waste, debris, and trash which may have accumulated during the day as a result of work by the contractor and of his presence on the job. Sidewalks and streets adjoining the property must be kept broom clean and free of waste, debris, trash and obstructions caused by work of the contractor, which will affect the condition and safety of streets, walks, utilities, and property.

3.3 UNDERGROUND PIPING INSTALLATION

**************************************************************************
NOTE: Restraint of the underground piping must be detailed on the contract drawings.
**************************************************************************

The fire protection water main must be laid, and joints anchored, in accordance with NFPA 24. Minimum depth of cover must be [900] [_____] mm [3] [_____] feet or the frost line, whichever is deeper. The supply line must terminate inside the building with a flanged piece, the bottom of which must be set not less than 304 mm 1-foot above the finished floor. A blind flange must be installed temporarily on top of the flanged piece to prevent the entrance of foreign matter into the supply line. A concrete thrust block must be provided at the elbow where the pipe turns up toward the floor. In addition, joints must be anchored in accordance with NFPA 24. Buried steel components must be provided with a corrosion protective coating in accordance with AWWA C203. Piping more than 1500 mm 5 feet outside the building walls must meet the requirements of Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

3.4 ABOVEGROUND PIPING INSTALLATION

The methods of fabrication and installation of the aboveground piping must fully comply with the requirements and recommended practices of NFPA 13 and this specification section.

3.4.1 Protection of Piping Against Earthquake Damage

**************************************************************************
NOTE: The writer of this section must coordinate with the Structural Engineer or Government to determine the proper seismic design category for the project, in accordance with the IBC or ASCE guidelines. See UFC 3-310-04 for more information.
**************************************************************************

Seismic restraint is [not] required.

3.4.2 Piping in Exposed Areas

Install exposed piping without diminishing exit access widths, corridors or equipment access. Exposed horizontal piping, including drain piping, must be installed to provide maximum headroom.

3.4.3 Piping in Finished Areas

In areas with suspended or dropped ceilings and in areas with concealed spaces above the ceiling, piping must be concealed above ceilings. Piping
must be inspected, hydrostatically tested and approved before being concealed. Risers and similar vertical runs of piping in finished areas must be concealed.

3.4.4 Pendent Sprinklers

NOTE: Where the maximum static or flowing pressure, whichever is greater at the sprinkler, applied other than through the fire department connection, exceeds 6.9 bar100 psi and a branch line above the ceiling supplies sprinklers in a pendent position below the ceiling, the cumulative horizontal length of an unsupported armover to a sprinkler or sprinkler drop must not exceed 300 mm12 inches for steel pipe and 1500 mm6 inches for copper tube.

a. Drop nipples to pendent sprinklers must consist of minimum 25-mm1-inch pipe with a reducing coupling into which the sprinkler must be threaded.

b. Where sprinklers are installed below suspended or dropped ceilings, drop nipples must be cut such that sprinkler ceiling plates or escutcheons are of a uniform depth throughout the finished space. The outlet of the reducing coupling must not extend below the underside of the ceiling.

c. Recessed pendent sprinklers must be installed such that the distance from the sprinkler deflector to the underside of the ceiling must not exceed the manufacturer's listed range and must be of uniform depth throughout the finished area.

d. Pendent sprinklers in suspended ceilings must be located in the center of the tile (+/- 2 inches).

e. Dry pendent sprinkler assemblies must be such that sprinkler ceiling plates or escutcheons are of the uniform depth throughout the finished space.

f. Dry pendent sprinklers must be of the required length to permit the sprinkler to be threaded directly into a branch line tee.

g. Where the maximum static or flowing pressure, whichever is greater at the sprinkler, applied other than through the fire department connection, exceeds 6.9 bar100 psi and a branch line above the ceiling supplies sprinklers in a pendent position below the ceiling, the cumulative horizontal length of an unsupported armover to a sprinkler or sprinkler drop must not exceed 300 mm12 inches for steel pipe and 1500 mm6 inches for copper tube.

h. Sprinklers installed in the pendent position must be of the listed dry pendent type or on return bends, unless otherwise indicated.

3.4.5 Upright Sprinklers

Riser nipples or "sprigs" to upright sprinklers must contain no fittings between the branch line tee and the reducing coupling at the sprinkler.
3.4.6 Pipe Joints

Pipe joints must conform to NFPA 13, except as modified herein. Not more than four threads must show after joint is made up. Welded joints will be permitted, only if welding operations are performed as required by NFPA 13 at the Contractor's fabrication shop, not at the project construction site. Flanged joints must be provided where indicated or required by NFPA 13. Grooved pipe and fittings must be prepared in accordance with the manufacturer's latest published specification according to pipe material, wall thickness and size. Grooved couplings, fittings and grooving tools must be products of the same manufacturer. For copper tubing, pipe and groove dimensions must comply with the tolerances specified by the coupling manufacturer. The diameter of grooves made in the field must be measured using a "go/no-go" gauge, vernier or dial caliper, narrow-land micrometer, or other method specifically approved by the coupling manufacturer for the intended application. Groove width and dimension of groove from end of pipe must be measured and recorded for each change in grooving tool setup to verify compliance with coupling manufacturer's tolerances.

3.4.7 Reducers

Reductions in pipe sizes cannot be made with one-piece tapered reducing fittings. When standard fittings of the required size are not manufactured, single bushings of the face or hex type will be permitted. Where used, face bushings must be installed with the outer face flush with the face of the fitting opening being reduced. Bushings must not be used in elbow fittings, in more than one outlet of a tee, in more than two outlets of a cross, or where the reduction in size is less than $13 \text{ mm}$ 1/2-inch.

3.4.8 Pipe Penetrations

a. Cutting structural members for passage of pipes or for pipe-hanger fastenings will not be permitted. Pipes that must penetrate concrete or masonry walls or concrete floors must be core-drilled and provided with pipe sleeves. Each sleeve must be Schedule 40 galvanized steel, ductile-iron or cast-iron pipe and extend through its respective wall or floor and be cut flush with each wall surface. Sleeves must provide required clearance between the pipe and the sleeve per NFPA 13. The space between the sleeve and the pipe must be firmly packed with mineral wool insulation.

b. Where pipes and sleeves penetrate fire walls, fire partitions, or floors, pipes/sleeves must be firestopped in accordance with Section 07 84 00 FIRESTOPPING.

c. In penetrations that are not fire-rated or not a floor penetration, the space between the sleeve and the pipe must be sealed at both ends with plastic waterproof cement that will dry to a firm but pliable mass or with a mechanically adjustable segmented elastomer seal.

d. All penetrations through the boundary of rooms/areas identified as secure space area must meet ICS 705-1.

3.4.9 Escutcheons

Escutcheons must be provided for pipe penetration in finished areas of ceilings, floors and walls. Escutcheons must be securely fastened to the pipe at surfaces through which piping passes.
3.4.10 Inspector's Test Connection

**************************************************************************
NOTE: Designer will indicate location of the inspector's test connections and all associated valves on the contract drawings, and will provide details of drain piping.
**************************************************************************

Unless otherwise indicated, the test connection must consist of 25-mm1-inch pipe connected to the remote branch line; a test valve located approximately 2 meters7 feet above the floor; a smooth bore brass outlet equivalent to the smallest orifice sprinkler used in the system; and a painted metal identification sign affixed to the valve with the words "Inspector's Test". All test connection piping must be inside of the building and penetrate the exterior wall at the location of the discharge orifice only. The discharge orifice must be located outside the building wall no more than 0.6 meters2 feet above finished grade, directed so as not to cause damage to adjacent construction or landscaping during full flow discharge, or to the sanitary sewer. Discharge to the exterior must not interfere with exiting from the facility. Water discharge or runoff must not cross the path of egress from the building. Do not discharge to the roof. Discharge to floor drains, janitor sinks or similar fixtures is not permitted.

Provide concrete splash blocks at all drain and inspector's test connection discharge locations if not discharging to a concrete surface. Splash blocks must be large enough to mitigate erosion and not become dislodged during a full flow of the drain. Ensure all discharged water drains away from the facility and does not cause property damage.

3.4.11 Backflow Preventer

Locate within the building or in a heated enclosure in locations subject to freezing. For heated enclosures, provide a low temperature supervisory alarm connected to the facility fire alarm system. Heat trace is not permitted to be used.

Install backflow preventers so that the bottom of the assembly is a minimum of 150 mm6 inches above the finished floor/grade. Install horizontal backflow preventers so that the bottom of the assembly is no greater than [_____]610 mm24 inches above the finished floor/grade. Install vertical backflow preventers so that the upper operating handwheel is no more than [_____]1.8 meters6 feet above the finished floor/grade. Clearance around control valve handles must be minimum 150 mm6inches above grade/finished floor and away from walls.

[3.4.11.1 Test Connection]

Provide downstream of the backflow prevention assembly UL 668 hose valves with 65-mm2.5-inch National Standard male hose threads with cap and chain. Provide one valve for each 946 L/min250 gpm of system demand or fraction thereof. Provide a permanent sign in accordance with paragraph entitled "Identification Signs" which reads, "Test Valve". Indicate location of test header. If an exterior connection, provide a control valve inside a heated mechanical room to prevent freezing. The piping between the backflow preventer test header control valve and the exterior test header must be provided with an automatic drip arranged to drain to the outside.
3.4.12 Drains

a. Main drain piping must be provided to discharge [at a safe point outside the building, no more than 0.6 meters 2 feet above finished grade][at the location indicated][to the sanitary sewer]. Provide a concrete splash block at drain outlet. Discharge to the exterior must not interfere with exiting from the facility. Water discharge or runoff must not cross the path of egress from the building.

b. Auxiliary drains must be provided as required by NFPA 13. Auxiliary drains are permitted to discharge to a floor drain if the drain is sized to accommodate full flow (min 151 L/min 40 gpm). Discharge to service sinks or similar plumbing fixtures is not permitted.

3.4.13 Installation of Fire Department Connection

Connection must be mounted [on the exterior wall approximately 900 mm 3 feet above finished grade][adjacent to and on the sprinkler system side of the backflow preventer]. The piping between the connection and the check valve must be provided with an automatic drip in accordance with NFPA 13 and piped to drain to the outside or a floor drain within the same room.

3.4.14 Identification Signs

Signs must be affixed to each control valve, inspector test valve, main drain, auxiliary drain, test valve, and similar valves as appropriate or as required by NFPA 13. Main drain test results must be etched into main drain identification sign. Hydraulic design data must be etched into the nameplates and permanently affixed to each sprinkler riser as specified in NFPA 13. Provide labeling on the surfaces of all feed and cross mains to show the pipe function (e.g., "Sprinkler System", "Fire Department Connection", "Standpipe") and normal valve position (e.g. "Normally Open", "Normally Closed"). For pipe sizes 100 mm 4-inch and larger provide white painted stenciled letters and arrows, a minimum of 50 mm 2 inches in height and visible from at least two sides when viewed from the floor. For pipe sizes less than 100 mm 4-inch, provide white painted stenciled letters and arrows, a minimum of 18 mm 0.75-inch in height and visible from the floor. [Provide properly lettered and approved metal sign to elevator flow switch stating the circuits' voltage, and identify the switch as an "Elevator Power Shunt Flow Switch".]

3.5 ELECTRICAL

**************************************************************************
NOTE: Coordinate power and alarm requirements with the contract drawings and other specification sections.
**************************************************************************

Except as modified herein, electric equipment and wiring must be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. [Alarm signal wiring connected to the building fire alarm control system must be by the fire alarm installer.]

3.6 PAINTING

**************************************************************************
NOTE: Designer will coordinate color code marking
**************************************************************************
with Section 09 90 00 PAINTS AND COATINGS. Color code marking for piping which are not listed in Table I of Paragraph 3.5 Pipe Color Code Marking of UFGS Section 09 90 00 will be added to the table.

Color code mark piping [red][as specified in Section 09 90 00 PAINTS AND COATINGS].

3.7 FIELD QUALITY CONTROL

3.7.1 Test Procedures

Submit detailed test procedures, prepared and signed by the NICET Level [III][ or ][IV] Fire Sprinkler Technician, and the representative of the installing company,[ and reviewed by the QFPE] [60][_____] days prior to performing system tests. Detailed test procedures must list all components of the installed system. Test procedures must include sequence of testing, time estimate for each test, and sample test data forms. The test data forms must be in a check-off format (pass/fail with space to add applicable test data; similar to the forms in NFPA 13.) The test procedures and accompanying test data forms must be used for the pre-Government testing and the Government final testing.

a. Provide space to identify the date and time of each test. Provide space to identify the names and signatures of the individuals conducting and witnessing each test.

3.7.2 Pre-Government Testing

3.7.2.1 Verification of Compliant Installation

Conduct inspections and tests to ensure that equipment is functioning properly. Tests must meet the requirements of paragraph entitled "Minimum System Tests" and "System Acceptance" as noted in NFPA 13. The Contractor [and QFPE] must be in attendance at the pre-Government testing to make necessary adjustments. After inspection and testing is complete, provide a signed Verification of Compliant Installation letter by the QFPE that the installation is complete, compliant with the specification and fully operable. The letter must include the names and titles of the witnesses to the pre-Government tests. Provide all completion documentation as required by NFPA 13 and the test reports noted below.

a. NFPA 13 Aboveground Material and Test Certificate

b. NFPA 13 Underground Material and Test Certificate

3.7.2.2 Request for Government Final Test

When the verification of compliant installation has been completed, submit a formal request for Government final test to the [_____][Designated Fire Protection Engineer (DFPE)][Contracting Officers Designated Representative (COR)]. Government final testing will not be scheduled until the DFPE has received copies of the request for Government final testing and Verification of Compliant Installation letter with all required reports. Government final testing will not be performed until after the connections to the [building fire alarm system][installation fire alarm reporting system] have been completed and tested to confirm communications are fully functional. Submit request for test at least [15][_____] calendar days before the date of inspection.
prior to the requested test date.

3.7.3 Correction of Deficiencies

If equipment was found to be defective or non-compliant with contract requirements, perform corrective actions and repeat the tests. Tests must be conducted and repeated if necessary until the system has been demonstrated to comply with all contract requirements.

3.7.4 Government Final Tests

The tests must be performed in accordance with the approved test procedures in the presence of the DFPE. Furnish instruments and personnel required for the tests. The following must be provided at the job site for Government Final Testing:

a. The manufacturer's technical representative.

[b. The contractor's Qualified Fire Protection Engineer (QFPE).]

c. Marked-up red line drawings of the system as actually installed.

Government Final Tests will be witnessed by the [_____], [Designated Fire Protection Engineer] [Contracting Officer] [Qualified Fire Protection Engineer (QFPE)]. At this time, all required tests noted in the paragraph "Minimum System Tests" must be repeated at their discretion.

3.8 MINIMUM SYSTEM TESTS

The system, including the underground water mains, and the aboveground piping and system components, must be tested to ensure that equipment and components function as intended. The underground and aboveground interior piping systems and attached appurtenances subjected to system working pressure must be tested in accordance with NFPA 13 and NFPA 24.

3.8.1 Underground Piping

3.8.1.1 Flushing

**************************************************************************
NOTE: Designer should check the site water section for inconsistencies and to verify flushing of all underground pipe will be performed prior to connection to the sprinkler system.
**************************************************************************

Underground piping must be flushed in accordance with NFPA 24.

3.8.1.2 Hydrostatic Test

New underground piping must be hydrostatically tested in accordance with NFPA 24.

3.8.2 Aboveground Piping

3.8.2.1 Hydrostatic Test

Aboveground piping must be hydrostatically tested in accordance with NFPA 13. There must be no drop in gauge pressure or visible leakage when the system
is subjected to the hydrostatic test. The test pressure must be read from a gauge located at the low elevation point of the system or portion being tested.

[3.8.2.2 Air Pressure Test]

As specified in NFPA 13, an air pressure leakage test at 350 kPa, 50 psi must be conducted for 24 hours. There must be no drop in gauge pressure in excess of 10 kPa, 1.5 psi for the 24 hours. This air pressure test is in addition to the required hydrostatic test.

[3.8.2.3 Backflow Prevention Assembly Forward Flow Test]

Each backflow prevention assembly must be tested at system flow demand, including all applicable hose streams, as specified in NFPA 13. The Contractor must provide all equipment and instruments necessary to conduct a complete forward flow test, including 65-mm, 2.5-inch diameter hoses, playpipe nozzles or flow diffusers, calibrated pressure gauges, and pitot tube gauge. The Contractor must provide all necessary supports to safely secure hoses and nozzles during the test. At the system demand flow, the pressure readings and pressure drop (friction loss) across the assembly must be recorded. A metal placard must be provided on the backflow prevention assembly that lists the pressure readings both upstream and downstream of the assembly, total pressure drop, and the system test flow rate determined during the preliminary testing. The pressure drop must be compared to the manufacturer's data and the readings observed during the final inspections and tests.

[3.8.3 Dry Pipe Valve Trip Test]

Each dry pipe valve must be trip-tested by reducing normal system nitrogen pressure through operation of the inspector's test connection. Systems equipped with quick-opening devices must first be tested without the operation of the quick-opening device and then with it in operation. Test results will be witnessed and recorded. Test results must include the number of seconds elapsed between the time the test valve is opened and tripping of the dry valve; trip-point nitrogen pressure of the dry pipe valve; water pressure prior to valve tripping; and number of seconds elapsed between time the inspector's test valve is opened and water reaches the orifice. The delivery of water from the dry pipe valve to the system test connection must not exceed 60 seconds, regardless of system size. Water delivery times must be measured starting at the normal nitrogen pressure on the system.

[3.8.4 Main Drain Flow Test]

Following flushing of the underground piping, a main drain test must be made to verify the adequacy of the water supply. Static and residual pressures must be recorded on the certificate specified in paragraph SUBMITTALS.

[3.8.5 Supervisory Nitrogen System Test]

**************************************************************************
NOTE: Delete this paragraph for deluge system applications and preaction systems not requiring supervisory nitrogen.
**************************************************************************
System supervisory nitrogen pressure must be reduced from the normal system pressure to the point at which a low-pressure alarm is sounded. Nitrogen pressure must be restored to verify trouble signal restoration. Automatic start/stop features of nitrogen generator must be tested.

3.9 SYSTEM ACCEPTANCE

Following acceptance of the system, as-built drawings and O&M manuals must be delivered to the Contracting Officer for review and acceptance. Submit six sets of detailed as-built drawings. The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final acceptance test of the system. At least one set of as-built (marked-up) drawings must be provided at the time of, or prior to the final acceptance test.

[ a. Provide one set of full size paper as-built drawings and schematics. The drawings must be prepared electronically and sized no less than the contract drawings.] [Furnish one set of CDs or DVDs containing software back-up and CAD based drawings in latest version of [MicroStation] [AutoCAD, ] DXF and portable document formats of as-built drawings and schematics.]

b. Provide operating and maintenance (O&M) instructions.

3.10 ONSITE TRAINING

******************************************************************************

NOTE: The number of hours of instruction should be determined based of the number and complexity of the systems specified.

******************************************************************************

Conduct a training course for the responding fire department and operating and maintenance personnel as designated by the Contracting Officer. Training must be performed on two separate days (to accommodate different shifts of Fire Department personnel) for a period of [_____] [4] hours of normal working time and must start after the system is functionally complete and after the final acceptance test. The on-site training must cover all of the items contained in the approved Operating and Maintenance Instructions.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for preaction fire protection sprinkler systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information. The designer is permitted to edit any and all of this section for the project. If the designer is modifying/deleting non-bracketed items and text, the Designated Fire Protection Engineer (DFPE) should be consulted prior to incorporating final changes.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: For OCONUS projects, this specification section should be edited for specific Host Nation requirements. Coordinate compliance with Host Nation requirements with the DFPE.

NOTE: This specification section includes requirements from UFC 3-600-01 (change 4, 7 February 2020)
NOTE: Because preaction systems are more costly, less reliable, and require more maintenance than wet pipe systems, they should be used only where justified by occupancy conditions.

The Designer must edit this specification section for either a performance-designed system or a fully designed system as applicable.

This section is primarily intended for performance designed systems, e.g. systems where the size, layout, and support of branch lines and cross mains, and the layout of sprinklers will be designed by the Contractor.

This section is not intended to be used for NFPA 13D systems.

The Designer must provide the following information in the contract documents for performance designed systems. This information must be in accordance with UFC 3-600-01.

(1) Show the layout and size of all piping and equipment from the point of connection to the water supply, to the sprinkler riser. The contract drawings must include a detailed sprinkler riser diagram.

(2) Show location and size of service laterals, sprinkler risers, control valves, drain lines, sectional valves, and inspector's test valves and switches on the drawings.

(3) Specify waterflow data including hydrant flow test results, including the location where the hydrant flow test was conducted, the location and size of existing mains and new water supply lines that will serve the sprinkler system.

(4) Highlight or clearly indicate the area(s) to be protected by sprinklers on the drawings.

(5) Specify waterflow requirements including the design density, design area, the hose stream demand (including location of the hose stream demand), the duration of supply, and sprinkler spacing and area of coverage in this section.

(6) Show the location of the backflow preventer (including provisions for a drain and access for maintenance) on the drawings.

(7) Show all provisions necessary for forward flow
testing of the backflow preventer at system demand as required by NFPA 13 on the drawings.

(8) Highlight all concealed spaces on the drawings that require sprinkler protection, such as spaces above suspended ceilings that are built of combustible material or that can contain combustible materials, such as storage, and communication cabling that is not fire-rated.

(9) Provide details on the drawings of pipe restraints for underground piping. This includes details of pipe clamps, tie rods, mechanical retainer glands, and thrust blocks.

(10) Nitrogen generators, including controls and complete installation details, including piping, control valves, mounting base.

(11) Show location of the control unit, batteries and charger (if remotely mounted), supervising station transmitter, annunciator, primary power supply, remote annunciator, detectors, notification appliances (unless performance requirements are specified), and each alarm initiating device including fire extinguishing system switches.

(12) Show single-line releasing systems riser diagram. Each device on the riser should be identified by type. Indicate connection of equipment.

(13) Show a releasing system operating matrix. Show actions of input devices such as detectors, manual stations, workflow switches, initiating devices, etc. on one axis and output functions such as door releases, smoke control fans, elevator relays, indicating/notification appliances etc. on the other. Entries which require descriptions, explanation of processes, sequences, interfaces, etc. can be flagged by symbols keyed to supplementary notes. Alternately provide a zone-by-zone sequence of operation or a schedule identifying all initiators, outputs, and interfaces.

1.2 SYSTEM DESCRIPTION

**************************************************************************

NOTE: Seismic protection/bracing is to be provided for seismic design categories C or greater only, unless specifically requested by the DFPE. Consideration should also be giving to utilizing

SECTION 21 13 18 Page 11
seismic protection/bracing to limit pipe movement.

Provide [single-interlock][electric-pneumatic double-interlock] preaction[_____] sprinkler system(s) in [areas indicated on the drawings] [_____] except as modified herein, the system must meet the requirements of NFPA 13[ and ] and NFPA 72. Preaction systems must utilize nitrogen in lieu of air. Pipe sizes which are not indicated on the Contract drawings must be determined by hydraulic calculations.

1.2.1 Hydraulic Design

NOTE: Applications requiring multiple densities/design areas must be referred to and shown on the drawings.

Discharge density for non-storage occupancies must be in accordance with UFC 3-600-01. Specific densities must be listed on the drawings or noted in the specification when drawings are not provided. Stating "comply with UFC 3-600-01 is not acceptable.

Hazard classification of miscellaneous storage must be per NFPA 13. Discharge density for the hazard classification must be per UFC 3-600-01. The paragraph below must be listed on the drawings. If this information is not listed on the drawings, provide the information in paragraph 1.1.1.3 (with brackets completed).

Hydraulically design the system to discharge a minimum density [of [_____] L/min per square meter gpm/square foot over the hydraulically most demanding [280] [_____] square meters[_____] square feet of floor area][as indicated on the drawings]. The minimum pipe size for branch lines in gridded systems must be 32 mm 1/4-inch. Hydraulic calculations must be in accordance with the Area/Density Method of NFPA 13.

NOTE: The addition, modification or relocation of no more than twenty sprinklers to an existing system or modifications to existing sprinkler systems fed from domestic supplies are permitted to be designed using the pipe schedule method in NFPA 13 based on the layout of the existing system.

1.2.1.1 Basis for Calculations

NOTE: The design must include an adequate water supply to meet the sprinkler water demand. The designer must provide waterflow test results and hydraulic calculations to ensure that the system
demand will be met.

**Design Calculations:** The designer must provide detailed hydraulic calculations that clearly demonstrate that the water supply will meet the demand of the sprinkler system and hose streams. Calculations must be submitted with the concept design submission.

A waterflow test was performed on (DATE) at (LOCATION) and resulted in a static pressure of [____ kPpsi] with a residual pressure of [____ kPpsi] while flowing [____ L/min] with a [_____ dPpsi]. Perform a fire hydrant flow test prior to shop drawing submittal in accordance with NFPA 291. Results must include hydrant elevations relative to the building and hydrant number/identifiers for the tested hydrants, including which were flowed, which had a gauge. This information must be presented in a tabular form if multiple hydrants were flowed. The results must be included with the hydraulic calculations. Hydraulic calculations must be based on flow test noted in this paragraph, unless [verified by the NAVFAC[_____] Fire Protection Engineer and] approved by Contracting Officer. Hydraulic calculations must be based upon the Hazen-Williams formula with a "C" value noted in NFPA 13 for piping, [and [_____] for existing underground piping]. A "C" value of 120 is permitted to be used in hydraulic calculations when nitrogen is utilized. [Hydraulic calculations must be based on operation of the fire pump(s) provided in Section 21.30.00 FIRE PUMPS.] [The minimum residual pressure in a service lateral (lead-in) at the design flow] at the [inlet to the backflow preventer] must be 138 kPa (20 psi) at [the suction side of the fire pump].

### 1.2.1.2 Hydraulic Calculations

a. Water supply curves and system requirements must be plotted on semi-logarithmic graph (N^1.85) paper so as to present a summary of the complete hydraulic calculation.

b. Provide a summary sheet listing sprinklers in the design area and their respective hydraulic reference points, elevations, minimum discharge pressures and minimum flows. Elevations of hydraulic reference points (nodes) must be indicated.

c. Documentation must identify each pipe individually and the nodes connected thereto. Indicate the diameter, length, flow, velocity, friction loss, number and type fittings, total friction loss in the pipe, equivalent pipe length and Hazen-Williams coefficient for each pipe.

d. Where the sprinkler system is supplied by interconnected risers, the sprinkler system must be hydraulically calculated using the hydraulically most demanding single riser. The calculations must not assume the simultaneous use of more than one riser.

e. All calculations must include the backflow preventer manufacturer's stated friction loss at the design flow or [83 kPa12 psi for reduced pressure] [55 kPa8 psi for double check] backflow preventer, whichever is greater.

f. All calculations must be performed back to the actual location of the
flow test, taking into account the direction of flow in the service main at the test location.

g. For gridded systems, calculations must show peaking of demand area friction loss to verify that the hydraulically most demanding area is being used. A flow diagram indicating the quantity and direction of flows must be included.

1.2.1.3 Design Criteria

Hydraulically design the system to discharge a minimum density [of [_____] L/min per square meter/gpm/square foot] over the hydraulically most demanding [_____] square meters/square feet of floor area [as indicated on the drawings]. Hydraulic calculations must be in accordance with the Area/Density Method of NFPA 13. Add an allowance for exterior hose streams of [_____] L/min gpm to the sprinkler system demand [at the fire hydrant shown on the drawings closest to the point where the water service enters the building] [at the point of connection to the existing water system]. [An allowance for interior hose stations of [_____] L/min gpm must be added to the sprinkler system demand.]

1.2.2 Sprinkler Coverage

**************************************************************************
NOTE: The exception in NFPA 13 to eliminate sprinklers in electrical rooms is not applicable per UFC 3-600-01.
**************************************************************************

Sprinklers must be uniformly spaced on branch lines. Provide coverage throughout 100 percent of the [building][area noted on the Contract drawings]. This includes, but is not limited to, telephone rooms, electrical equipment rooms (regardless of the fire resistance rating of the enclosure), boiler rooms, switchgear rooms, transformer rooms, attached electrical vaults and other electrical and mechanical spaces. Coverage per sprinkler must be in accordance with NFPA 13. Provide sprinklers below all obstructions in accordance with NFPA 13. Exceptions are as follows:

a. Sprinklers may be omitted from small rooms which are exempted for specific occupancies in accordance with NFPA 101.

[1.2.3 System Volume Limitations

Where the volume of an individual system piping exceeds 1890 liters/500 gallons, provide the dry pipe valve with a quick-opening device. The maximum system capacity controlled by one dry pipe valve must not exceed 2800 liters/750 gallons, unless it complies with the dry pipe system water delivery calculations noted in NFPA 13.

]1.2.4 Control System

**************************************************************************
NOTE: All areas to be protected with preaction sprinklers must be equipped with the detectors necessary to activate the sprinkler system.
**************************************************************************

The control system must meet the requirements of NFPA 72. The control unit must be listed for "Releasing Device Service". The control unit and the
solenoid valve that activates the water control valves must be compatible with each other. Compatibility must be in accordance with the specific listing of the control equipment.

1.2.4.1 Circuit Requirements

Connect alarm initiating devices to initiating device circuits (IDC), Class [B][_____] or to signal line circuits (SLC), Class [B][_____], in accordance with NFPA 72. Alarm notification or indicating appliances must be connected to notification appliance circuit (NAC), Class [B][_____] in accordance with NFPA 72. Provide a separate circuit for actuation of each individual automatic water control valve. Fully supervise the circuits that actuate the water control valves so that the occurrence of a single open or a single ground fault condition in the interconnecting conductors will be indicated at the control unit.

1.2.5 System Operational Features

******************************************************************************
NOTE: Delete manual actuation stations when not required.
******************************************************************************

Include in the system a detection system, manual actuation stations, supervisory and alarm switches, alarm notification appliances, control unit and associated equipment. Provide preaction sprinkler system piping with supervisory nitrogen pressure not to exceed 210 kPa 30 psig.

1.2.5.1 System Actuation

Activation of [a single][two][ smoke][ heat] detector[s] [or a single manual actuation station] must actuate alarm zone circuits of the control unit that, in turn, actuate the corresponding automatic water control valve. Actuation of the automatic water control valve must cause water to [fill the discharge piping after loss of nitrogen pressure][fill the discharge piping].

1.2.5.2 Alarm Functions

******************************************************************************
NOTE: Drawings must indicate and detail the connection of the system control unit to the building alarm system and/or to the base-wide fire reporting system.
******************************************************************************

Activation of a [heat detector][smoke detector], sprinkler pressure (waterflow) alarm switch or manual actuation station must cause the illumination of the respective device at the releasing control unit, and [activation of the building fire alarm system][transmission of the alarm to the base-wide fire reporting system].

1.2.5.3 Supervisory Functions

The reduction of supervisory nitrogen pressure within the sprinkler system piping to less than [70][_____] kPa[10][_____] psi or the increase in nitrogen pressure more than [70][_____] kPa[10][_____] psi above normal set pressure must be transmitted to the building fire alarm system via the releasing control unit as a supervisory condition. Valve tamper switches
must be monitored by the releasing control unit and transmitted to the building fire alarm system as a supervisory condition.

1.2.6 Qualified Fire Protection Engineer (QFPE)

**************************************************************************
NOTE: UFC 3-600-01 requires that shop drawings must bear the Review Stamp and professional engineering stamp of the QFPE prior to submission to the Government for approval.
**************************************************************************

**************************************************************************
NOTE: The term Qualified Fire Protection Engineer (QFPE) should be considered interchangeable with the terms "Fire Protection Designer of Record (FPDOR)" and/or "Fire Protection QC Specialist" where referred to in other applicable contract documents. The intent of defining the QFPE roles and responsibilities here is NOT to require personnel in addition to the QFPE, FPDOR, and/or FPQC specialist referenced elsewhere in the applicable contract documents.
**************************************************************************

An individual who is a licensed professional engineer (P.E.) who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience. Services of the QFPE must include:

a. Reviewing SD-02, SD-03, and SD-05 submittal packages for completeness and compliance with the provisions of this specification. Working (shop) drawings and calculations must be prepared by, or prepared under the immediate supervision of, the QFPE. The QFPE must affix their professional engineering stamp with signature to the shop drawings, calculations, and material data sheets, indicating approval prior to submitting the shop drawings to the DFPE.

b. Provide a letter documenting that the SD-02, SD-03, and SD-05 submittal package has been reviewed and noting all outstanding comments.

c. Performing in-progress construction surveillance prior to installation of ceilings (rough-in inspection).

e. Signing applicable certificates under SD-07.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that
require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

NOTE: When 20 or less sprinklers are added, modified or relocated, shop drawings, hydraulic calculations and product data are not required to be submitted. Edit this section accordingly.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Partial submittals and submittals not fully complying with NFPA 13 and this specification section must be returned disapproved without review. SD-02, SD-03 and SD-05 must be submitted simultaneously.

Shop drawings (SD-02), product data (SD-03) and calculations (SD-05) must be prepared by the designer and combined and submitted as one complete package. The QFPE must review the SD-02/SD-03/SD-05 submittal package for completeness and compliance with the Contract provisions prior to submission to the Government. The QFPE must provide a Letter of Confirmation that they have reviewed the submittal package for compliance with the contract provisions. This letter must include their professional engineer stamp and signature. Partial submittals and submittals not reviewed by the QFPE must be returned disapproved without review.

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

As-built drawings

1.4 TECHNICAL DATA AND SITE-SPECIFIC SOFTWARE

Technical data and site-specific software (meaning technical data that relates to computer software) that are specifically identified in this project, and may be required in other specifications, must be delivered, strictly in accordance with the CONTRACT CLAUSES. The releasing system manufacturer must submit written confirmation of this contract provision as "Releasing System Site-Specific Software Acknowledgement". Identify data delivered by reference to the specification paragraph against which it is furnished. Data to be submitted must include complete system, equipment, and software descriptions. Descriptions must show how the equipment will operate as a system to meet the performance requirements of this contract. The site-specific software data package must include the following:

a. Items identified in NFPA 72, titled "Site-Specific Software".

b. Identification of programmable portions of the system equipment and capabilities.

c. Description of system revision and expansion capabilities and methods of implementation detailing both equipment and software requirements.

d. Provision of operational software data on all modes of programmable portions for foam releasing system.

e. Description of releasing system equipment operation.

f. Description of auxiliary and remote equipment operations.

g. Library of application software.

h. Operation and maintenance manuals.

1.5 QUALITY ASSURANCE

1.5.1 Preconstruction Submittals

Within 36 days of contract award but no less than [14 days][_____] prior to commencing work on site, the prime Contractor must submit the following for review and approval. SD-02, SD-03 and SD-05 submittals received prior to the review and approval of the qualifications will be returned Disapproved Without Review.
1.5.1.1 Shop Drawing

[_____] copies of the shop drawings, no later than 28 days prior to the start of system installation. Working drawings conforming to the requirements prescribed in NFPA 13 and must be no smaller than ISO A1 [ANSI D] [the Contract Drawings]. Each set of drawings must include the following:

1. A descriptive index with drawings listed in sequence by number. A legend sheet identifying device symbols, nomenclature, and conventions used in the package.

2. Floor plans drawn to a scale not less than 1:100 1/8-inch equals 1-foot clearly showing locations of devices, equipment, risers, electrical power connections and other details required to clearly describe the proposed arrangement.

3. Actual center-to-center dimensions between sprinklers on branch lines and between branch lines; from end sprinklers to adjacent walls; from walls to branch lines; from sprinkler feed mains, cross mains and branch lines to finished floor and roof or ceiling. A detail must show the dimension from the sprinkler and sprinkler deflector to the ceiling in finished areas.

4. Longitudinal and transverse building sections showing typical branch line and cross main pipe routing, elevation of each typical sprinkler above finished floor and elevation of "cloud" or false ceilings in relation to the building ceilings.

5. Plan and elevation views which establish that the equipment will fit the allotted spaces with clearance for installation and maintenance.

6. Riser layout drawings drawn to a scale of not less than 1:25 1/2-inch equals 1-foot to show details of each system component, clearances between each other and from other equipment and construction in the room.

7. Details of each type of riser assembly, pipe hanger, sway bracing for earthquake protection, restraint of underground water main at point-of-entry into the building, and electrical devices and interconnecting wiring. The dimension from the edge of vertical piping to the nearest adjacent wall(s) must be indicated on the drawings when vertical piping is located in stairs or other portions of the means of egress.

8. Details of each type of pipe hanger, seismic bracing/restraint and related components.

9. Include fire pump curve with shop drawings and hydraulic calculations.

10. The calculated volume of each system.

11. Point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the RCU and remote fire alarm control units, initiating circuits, switches, relays and terminals.

12. Complete riser diagrams indicating the wiring sequence of devices and
their connections to the control equipment. Include a color code schedule for the wiring. Include floor plans showing the locations of devices and equipment.

1.5.1.2 Notification Appliances

Calculations and supporting data on each circuit to indicate that there is at least [25]% percent spare capacity for notification appliances. Annotate data for each circuit on the drawings.

1.5.1.3 Initiating Devices

Calculations and supporting data on each circuit to indicate that there is at least [25]% percent spare capacity for initiating devices. Annotate data for each circuit on the drawings.

1.5.1.4 Battery Power

Provide battery calculations as required in paragraph Battery Power Calculations for alarm, alert, and supervisory power requirements. Calculations including ampere-hour requirements for each system component and each control unit component, and the battery recharging period, must be included on the drawings.

1.5.1.5 Voltage Drop Calculations

Voltage drop calculations for each notification circuit indicating that sufficient voltage is available for proper operation of the system and all components, at a minimum rated voltage of the system operating on batteries. Include the calculations on the system layout drawings.

1.5.1.6 Product Data

[_____] copies of annotated catalog data to show the specific model, type, and size of each item. Catalog cuts must indicate the NRTL listing. The data must be highlighted to show model, size, options, and other pertinent information, that are intended for consideration. Data must be adequate to demonstrate compliance with all contract requirements. Product data for all equipment must be combined into a single submittal.

Provide an equipment list identifying the type, quantity, make, and model number of each piece of equipment to be provided under this submittal. The equipment list must include the type, quantity, make and model of spare equipment. Types and quantities of equipment submitted must coincide with the types and quantities of equipment used in the battery calculations and those shown on the shop drawings.

1.5.1.7 Air Sampling Smoke Detection System Calculations

Submit air sampling detection system design analysis calculations consisting of battery capacity, loading calculations, and fan speed and air flow/transport calculations. Include schematic diagrams showing pipe segments, pipe diameters, lengths of pipe, node numbers, and sample port diameters to verify the requirements are met.

1.5.1.8 Hydraulic Calculations

**************************************************************************
NOTE: Include the first bracketed item for Army
Corps projects.

Calculations must be as outlined in NFPA 13 except that calculations must be performed by computer using software intended specifically for fire protection system design using the design data shown on the drawings. Calculations must include isometric diagram indicating hydraulic nodes and pipe segments. Include fire pump curve with submittal.

1.5.1.9 Voltage Drop Calculations

Voltage drop calculations for each notification circuit indicating that sufficient voltage is available for proper operation of the system and all components, at a minimum rated voltage of the system operating on batteries. Include the calculations on the system layout drawings.

1.5.1.10 Operating and Maintenance (O&M) Instructions

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA as supplemented and modified by this specification section.

Provide six manuals and one pdf version on electronic media. The manuals must include the manufacturer's name, model number, parts list, list of parts and tools that should be kept in stock by the owner for routine maintenance, simplified wiring and controls diagrams, troubleshooting guide, and recommended service organization (including address and telephone number) for each item of equipment. Each service organization submitted must be capable of providing 4-hour on-site response to a service call on an emergency basis.

Submit spare parts data for each different item of material and equipment specified. The data must include a complete list of parts and supplies, and a list of parts recommended by the manufacturer to be replaced after 1-year and 3 years of service. Include a list of special tools and test equipment required for maintenance and testing of the products supplied.

1.5.2 Qualifications

NOTE: NICET (National Institute for Certification in Engineering Technologies) establishes the qualifications of an individual as an Engineering Technologist with verification of experience by having a current NICET certification.

1.5.2.1 Sprinkler System Designer

The sprinkler system designer must be certified as a Level III Technician by National Institute for Certification in Engineering Technologies (NICET) in the Water-Based Systems Layout subfield of Fire Protection Engineering Technology in accordance with NICET 1014-7.

1.5.2.2 Sprinkler System Installer

The sprinkler system installer must be regularly engaged in the installation of the type and complexity of system specified in the contract documents, and must have served in a similar capacity for at least three systems that have performed in the manner intended for a period of not less
than 6 months.

1.5.2.3 Releasing System Designer

The system designer must be certified as a Level [III][IV] (minimum) Technician by National Institute for Certification in Engineering Technologies (NICET) in the Fire Alarm Systems subfield of Fire Protection Engineering Technology in accordance with NICET 1014-7, or meet the qualifications for a QPFE.

1.5.2.4 Releasing System Technician

Fire alarm technicians with a minimum of four years of experience must be utilized to install and terminate devices, cabinets and control units. The fire alarm technicians installing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings[, and must be thoroughly experienced in the design and installation of air sampling detection systems].

1.5.2.5 Releasing System Installer

[Fire alarm installer with a minimum of two years of experience utilized to assist in the installation of devices, cabinets and control units. ][NICET Level II technician to assist in the installation of devices, cabinets and control units. ]A licensed electrician must be allowed to install wire, cable, conduit and backboxes for the system. The fire alarm installer must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.5.2.6 Nitrogen Generation System Commissioning Technician

Commissioning technician of nitrogen generation system(s) must have one of the following qualifications. Qualifications must be provided prior to preliminary inspection and tests.

a. Commissioning of nitrogen generation system must be carried out by technician employed by and certified by the nitrogen generation system manufacturer.

b. In lieu of manufacturer's commissioning technician, the fire sprinkler contractor must provide proof their commissioning technician has manufacturer's certified training for the equipment being installed and proof of at least five previous installations of manufacturer's equipment where the contractor's commissioning technician has successfully conducted commissioning under the direct supervision of the manufacturer's commissioning representative. Contractor must provide proof the five supervised commissioning occurred AFTER contractor's commissioning agent has obtained the certified training. Commissioning carried out prior to factory training, or without supervision of manufacturer's technician or commissioning of other manufacturer's equipment does not qualify as applicable experience. Conduct preliminary inspections and testing does not qualify as applicable experience.

1.5.3 Regulatory Requirements

Equipment and material must be listed or approved. Listed or approved, as used in this Section, means listed, labeled or approved by a Nationally Recognized Testing Laboratory (NRTL) such as UL Fire Prot Dir or
FM APP GUIDE. The omission of these terms under the description of an item of equipment described must not be construed as waiving this requirement. All listings or approvals by testing laboratories must be from an existing ANSI or UL published standard. The recommended practices stated in the manufacturer's literature or documentation are mandatory requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, excessive humidity and temperature variations, dirt and dust, or other contaminants. All pipes must be either capped or plugged until installed.

1.7 EXTRA MATERIALS

Spare sprinklers and wrench(es) must be provided as spare parts in accordance with NFPA 13.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials, equipment, and devices listed for fire protection service when so required by NFPA 13 or this specification. Select material from one manufacturer, where possible, and not a combination of manufacturers, for a classification of materials. Material and equipment must be the standard products of a manufacturer regularly engaged in the manufacture of the products for at least [2][_____] years prior to bid.

2.1.2 Nameplates

Major components of equipment must have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new name plate permanently affixed to the item or equipment. Nameplates must be etched metal or plastic, permanently attached by screws to control units, panels or adjacent walls.

2.1.3 Identification and Marking

Pipe and fitting markings must include name or identifying symbol of manufacturer and nominal size. Pipe must be marked with ASTM designation. Valves and equipment markings must have name or identifying symbol of manufacturer, specific model number, nominal size, name of device, arrow indicating direction of flow, and position of installation (horizontal or vertical), except if valve can be installed in either position. Markings must be included on the body casting or on an etched or stamped metal nameplate permanently on the valve or cover plate.

2.1.4 Keys

Keys and locks for equipment, control units, panels and devices must be identical.[ Master all keys and locks to a single key as required by the Installation Fire Department][____].[ Keys must be CAT [60][____].]

2.1.5 Pressure Ratings

Valves, fittings, couplings, alarm switches, and similar devices must be
rated for the maximum working pressures that can be experienced in the system, but in no case less than \[1207\] kPa \[175\] psi.

2.1.6 Instructions

Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. [Install the instructions on the interior of the RCU.][ Install the frame in a conspicuous location observable from the RCU.] The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions and their mounting location must be approved by the Contracting Officer before being posted.

2.2 UNDERGROUND PIPING COMPONENTS

**************************************************************************
NOTE: The design drawings must show the service connection details and the underground service lateral for the sprinkler system. The drawings must show details of the water service point-of-entry into the building and through the floor slab, and underground piping restraints, including number and size of restraining rods and thrust blocks. 4-inch piping is the minimum permitted for service laterals serving NFPA 13R systems. 6-inch piping is the minimum permitted for NFPA 13 systems.
**************************************************************************

2.2.1 Pipe

Pipe must comply with NFPA 24. Minimum pipe size is \[100 mm\] 4 inches \[150 mm 6 inches\]. Piping more than 1.50 meters 5 feet outside the building walls must comply with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING. A continuous section of welded stainless steel fire water service piping from a point outside the building perimeter to a flanged fitting at least 304 mm 1-foot above the finished floor within the building is acceptable.

2.2.2 Fittings and Gaskets

Fittings must be ductile-iron conforming to AWWA C110/A21.10 with cement mortar lining conforming to AWWA C104/A21.4. Gaskets must be suitable in design and size for the pipe with which such gaskets are to be used. Gaskets for ductile-iron pipe joints must conform to AWWA C111/A21.11.

2.2.3 Gate Valve[ and Indicator Posts]

**************************************************************************
NOTE: This paragraph will be deleted if underground valves are either not required or are specified elsewhere.
**************************************************************************

Installation must comply with NFPA 24. Gate valves for use with indicator post must conform to UL 262. [Indicator posts must conform to UL 789. Provide each indicator post with one coat of primer and two coats of red enamel paint.]
[2.2.4  Valve Boxes

Except where indicator posts are provided, for each buried valve, provide a cast-iron, ductile-iron, or plastic valve box of a suitable size. Plastic boxes must be constructed of acrylonitrile-butadiene-styrene (ABS) or inorganic fiber-reinforced black polyolefin. Provide cast-iron, ductile-iron, or plastic cover for valve box with the word "WATER" cast on the cover. The minimum box shaft diameter must be 133 mm / 5.25 inches. Coat cast-iron and ductile-iron boxes with bituminous paint applied to a minimum dry-film thickness of 0.254 mm / 10 mils.

]2.2.5  Buried Utility Warning and Identification Tape

Provide detectable aluminum foil plastic backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape must be detectable by an electronic detection instrument. Provide tape, 80 mm / 3 inches minimum width, color coded for the utility involved with warning and identification imprinted in bold block letters continuously and repeatedly over the entire tape length. Warning and identification must read "CAUTION BURIED WATER PIPING BELOW" or similar wording. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material.

2.3  ABOVEGROUND PIPING COMPONENTS

**************************************************************************
NOTE: Specify steel piping exposed to the weather or corrosive atmospheres to properly protect against corrosive effects.

NOTE: GALVANIZED PIPING IS ONLY PERMITTED FOR DELUGE SYSTEMS, VALVE TRIM PIPING AND DRAIN PIPING WHEN EXPOSED TO THE EXTERIOR.
**************************************************************************

2.3.1  Steel Piping Components

2.3.1.1  Steel Pipe

**************************************************************************
NOTE: For DLA, use Schedule 40 steel pipe only.

NOTE: Grooved pipe must be cut grooved for WHS projects.
**************************************************************************

Except as modified herein, steel pipe must be black as permitted by NFPA 13 and conform to the applicable provisions of ASTM A53/A53M, ASTM A135/A135M or ASTM A153/A153M.

[Steel pipe must be minimum Schedule 40 for sizes 50 mm / 2 inches and less; and minimum Schedule 10 for sizes larger than 50 mm / 2 inches.][ Steel pipe must be Schedule 40 only.] Steel piping with wall thickness less than Schedule 40 must not be threaded. [Grooved pipe must be cut-grooved.]
2.3.1.2 Fittings

Fittings must be welded, threaded, or grooved-end type. Threaded fittings must be cast-iron conforming to ASME B16.4, malleable-iron conforming to ASME B16.3 or ductile-iron conforming to ASTM A536. Plain-end fittings with mechanical couplings, fittings that use steel gripping devices to bite into the pipe, steel press fittings and field welded fittings are not permitted. Fittings, mechanical couplings, and rubber gaskets must be supplied by the same manufacturer. Threaded fittings must use Teflon tape or manufacturer's approved joint compound. [Saddle tees using rubber gasketed fittings are permitted only when connecting to existing piping for additions or modifications. Saddle tees must use a connection method that completely wraps around the pipe.] Reducing couplings are not permitted except as allowed by NFPA 13.

2.3.1.3 Grooved Mechanical Joints and Fittings

Joints and fittings must be designed for not less than 1200 kPa or 175 psi service and must be the product of the same manufacturer. Field welded fittings must not be used. Fitting and coupling housing must be malleable-iron conforming to ASTM A47/A47M, Grade 32510; ductile-iron conforming to ASTM A536, Grade 65-45-12. Rubber gasketed grooved-end pipe and fittings with mechanical couplings are permitted in pipe sizes 50 mm and larger. Gasket must be of silicon compound and listed for dry fire protection systems. Gasket must be the flush type that fills the entire cavity between the fitting and the pipe. Nuts and bolts must be heat-treated steel conforming to ASTM A183 and must be cadmium-plated or zinc-electroplated.

2.3.1.4 Flanges

Flanges must conform to NFPA 13 and ASME B16.1. Gaskets must be non-asbestos compressed material in accordance with ASME B16.21, 1.6 mm 1/16-inch thick, and full face or self-centering flat ring type.

[2.3.2 Copper Tube Components

2.3.2.1 Copper Tube

Copper tube must conform to ASTM B88 and ASTM B88M, Types L and M.

2.3.2.2 Copper Fittings and Joints

Cast copper alloy solder-joint pressure fittings must conform to ASME B16.18 and wrought copper and bronze solder-joint pressure fittings must conform to ASME B16.22 and ASTM B75/B75M. Cast copper alloy fittings for flared copper tube must conform to ASME B16.26 and ASTM B62. Brass or bronze adapters for brazed tubing may be used for connecting tubing to flanges and to threaded ends of valves and equipment.

]2.3.3 Pipe Hangers and Supports

**************************************************************************

NOTE: Seismic parameters must follow UFC 3-301-01 Structural Engineering. The writer of this section must coordinate with the Structural Engineer or Government to determine the proper seismic design category for the project, in accordance with the IBC or ASCE guidelines. See UFC 3-310-04 for more

SECTION 21 13 18 Page 28
Provide galvanized pipe hangers[, supports and seismic bracing][and supports] in accordance with NFPA 13. Design and install seismic protection in accordance with the requirements of NFPA 13 section titled "Protection of Piping Against Damage Where Subject to Earthquakes for Seismic Design Category ["D"]"[].

2.3.4 Valves

Provide valves of types approved for fire service. Valves must open by counterclockwise rotation.

2.3.4.1 Control Valve

Manually operated sprinkler control/gate valve must be [outside stem and yoke (OS&Y) type] [or] [butterfly type][as indicated on the drawings] and must be listed.

2.3.4.2 Check Valves

Check valves must comply with UL 312. Check valves 100 mm 4 inches and larger must be of the swing type, have a clear waterway and meet the requirements of MSS SP-71, for Type 3 or 4. Inspection plate must be provided on valves larger than 150 mm 6 inches.

2.3.4.3 Hose Valve

**************************************************************************
NOTE: Hose valves are required as part of the backflow prevention test header.
**************************************************************************
Valve must comply with UL 668.

2.4 AUTOMATIC WATER CONTROL VALVE (DELUGE VALVE)

**************************************************************************
NOTE: "Automatic water control valve" is a generic term synonymous with "deluge valve" and is used for both preaction and deluge systems. "Automatic water control valve" is consistent with what is used in the UL Fire Protection Equipment Directory. Delete reset capability when not required.
**************************************************************************

Automatic water control valve (deluge valve) must be [electrically][hydraulically][pneumatically]-actuated and rated for a working pressure of 1207 kPa 175 psi. Valve must be capable of being reset without opening the valve. Electrical solenoid valve used to actuate the water control valve must be an integral component of the valve or must be approved for use by the water control valve manufacturer. Solenoid valve must be rated at 24 volts direct current, and must be normally closed type that operates when energized. Solenoid valves must be rated for a maximum pressure differential of 1207 kPa 175 psi. Water control valve must be equipped with a means to prevent the valve from returning to the closed position until being manually reset. Assembly must be complete with the valve manufacturer's standard trim piping, drain and test valves, pressure...
gauges, and other required appurtenances. Include with each assembly an emergency release device for manually tripping the water control valve in the event of a power or other system failure. Device must be a standard accessory component of the valve manufacturer and labeled as to its function and method of operation. Valves located in hazardous locations must be approved for the hazard classification of the area where located.

2.5 SUPERVISORY NITROGEN SYSTEM

Provide a nitrogen supply system in accordance with NFPA 13. The connection pipe from the nitrogen generator must not be less than 13 mm 1/2-inch in diameter and must enter the system above the priming water level of the dry pipe valve. Install a check valve in the system supply nitrogen piping from the generator. A shutoff valve of the renewable disc type must be installed upstream of this check valve. The nitrogen supply system must be sized to pressurize the sprinkler system to [275][_____] kPa [40][_____] psi within 20 minutes.

2.5.1 Nitrogen Generation System

The nitrogen generation system (NGS) must be installed with a compressor sized appropriately for the application and capable of achieving system pressure within 30 minutes in accordance with the requirements of NFPA 13. The nitrogen generation system must be designed to achieve a nitrogen concentration of 98% or greater and maintain that concentration within the fire sprinkler system continuously. The output nitrogen quality must be confirmed by using a gas stream analyzer. Where multiple preaction sprinkler risers are present, provide a manifold adjacent to the preaction sprinkler risers. Manifold system must include automatic vent and air maintenance devices for each sprinkler system riser. Nitrogen generation system requires a dedicated, hardwired 120V AC power supply.

2.5.1.1 Design of Nitrogen Generation System

Design the system so all equipment is installed within the confines of the riser room with the exception of a connection for a manual or automatic gas analyzer. Provide a system that is capable of delivering a minimum of 98 percent nitrogen composition throughout all of the system piping within 14 days from the commencement of the inerting process. Provide membrane type nitrogen generators that provide "instant on-instant off" nitrogen gas production without the need for nitrogen storage tanks. The complete nitrogen generator system must be self-contained and skid mounted with "drop-in" operability with a simple one step direct connection of the nitrogen gas supply line to each zone/riser. Provide an automatic "fill and purge" breathing process. This must be done while the sprinkler system is fully functional and must not alter the design performance of the sprinkler system. A process that involves continuous venting of the piping network is not permitted. Air maintenance devices used in conjunction with the nitrogen generation system must be listed for use on sprinkler systems. At the riser and at the end of each zone, provide a connection for a [manual][automatic] gas analyzer.

2.5.1.2 Nitrogen Air Compressor

Air compressors to be used in conjunction with the nitrogen generator must be capable of the following:

a. Capable of producing a continuous stream of compressed air at 100+ psig.
b. Capable of automatic cut in and cut out.

c. Equipped with an on-board after-cooler.

d. Equipped with an on-board automatic water blow down system.

e. Equipped with vibration dampening system.

f. Equipped with an air storage tank to provide continuous delivery of compressed air to the nitrogen generator.

g. Rated for continuous duty service.

h. Compressors less than 3.0 hp must be an oil-less design.

i. Oil-less compressors must be such that the manufacturer has designed the oil-less compressor to provide 5000 hours of continuous duty service before requiring a gasket and seal rebuild.

2.5.1.3 Nitrogen Venting Device

The functional component of the nitrogen venting device for use in the "fill and purge" breathing process must:

a. Be NRTL listed for use on sprinkler systems.

b. Not require plumbing to drain.

c. Close automatically at the completion of the nitrogen inerting process without manual intervention.

d. Be installed on each zone in the riser room.

2.5.1.4 Supervision of Nitrogen Generator

Nitrogen generator must be able to provide the following monitoring options:

a. Power supply "on" for nitrogen generators.

b. Power supply "on" for compressor.

c. Amp draw for compressor.

d. Line pressure (psig).

2.5.2 Nitrogen Pressure Maintenance Device

Device must be a pressure regulator that automatically reduces supply air pressure to the minimum pressure required to be maintained in the piping system. The device must have a cast bronze body and valve housing complete with diaphragm assembly, spring, filter, ball check to prevent backflow, 1.6-mm/16-inch restriction to prevent rapid pressurization of the system, and adjustment screw. The device must be capable of reducing maximum inlet pressure of 680 kPa\text{100 psi} to a fixed outlet pressure adjustable to \[
[70]^{[\text{[____]} \text{kPa}[10]^{[\text{[____]} \text{psi}.\]}}\]
2.6 ALARM INITIATING AND SUPERVISORY DEVICES

2.6.1 Sprinkler Alarm Switch

Pressure-type flow switch(es). [Connection of switch must be by the fire alarm installer].

2.6.2 High/Low-Nitrogen Pressure Supervisory Switch

Each automatic water control valve must be provided with a nitrogen pressure switch connected to the control unit. The pressure switch must supervise the nitrogen pressure in the system and must be set to activate at 70 kPa (10 psi) above the automatic water control valve trip point pressure (low) and 70 kPa (10 psi) above normal nitrogen pressure (high). The switch must have an adjustable range between 35 and 500 kPa (5 and 80 psi). The switch must have screw terminal connection and must be capable of being wired for normally open or normally closed circuit.

2.6.3 Valve Supervisory (Tamper) Switch

Switch must be integral to the control valve or suitable for mounting to the type of control valve to be supervised open. The switch must be tamper resistant and contain SPDT (Form C) contacts arranged to transfer upon removal of the housing cover or closure of the valve of more than two rotations of the valve stem.

[2.7 BACKFLOW PREVENTION ASSEMBLY

=================================================================
NOTE: Indicate piping, type of connection and equipment, such as a test header with hose valves, required for flow testing of the backflow preventer at full system demand as required by NFPA 13. Arrangement of test assembly should be coordinated with the installation.
=================================================================

[Reduced-pressure principle][Double-check] valve assembly backflow preventer complying with ASSE 1013, ASSE 1015 and AWWA M14. Each check valve must have a drain. Backflow prevention assemblies must have current "Certificate of Approval from the Foundation for Cross-Connection Control and Hydraulic Research, FCCCHR List" and be listed for fire protection use. Listing of the specific make, model, design, and size in the FCCCHR List is acceptable as the required documentation.

2.7.1 Backflow Preventer Test Connection

Test connection must consist of a series of listed hose valves with 65-mm 1/2-inch National Standard male hose threads with cap and chain.

[2.8 FIRE DEPARTMENT CONNECTION

=================================================================
NOTE: The designer will coordinate the desired location and thread type for the fire department connection with the responding fire department.
=================================================================

Fire department connection must be [freestanding][projecting][flush] type
with cast-brass body, matching [wall] escutcheon lettered "Auto Spkr" with a [polished-brass] [chromium-plated] finish. [The connection must have individual self-closing clappers, caps with drip drains and chains.]
Female inlets must have [65-mm 1/2-inch] [100 mm 4-inch] [125 mm 5-inch] [_____] diameter [American National Fire Hose Connection Screw Threads (NH) per NFPA 1963] [Storz][______]. Comply with UL 405.

2.9 SPRINKLERS

**************************************************************************
NOTE: The designer will indicate on the contract drawings the type of sprinklers for each area if more than one type of sprinkler is to be provided. Delete sprinkler types from this paragraph that are not intended for use in the system(s) used in the Contract.

Areas that are classified as light hazard will be equipped with quick-response sprinklers.
**************************************************************************

Sprinklers must comply with UL 199 and NFPA 13. Sprinklers with internal O-rings are not acceptable. Sprinklers in high heat areas including attic spaces or in close proximity to unit heaters must have temperature classification in accordance with NFPA 13. Extended coverage sprinklers are permitted for loading docks, residential occupancies and high-piled storage applications only. Sprinklers for preaction systems must be automatic, fusible solder or glass bulb type.

2.9.1 Pendent Sprinkler

Pendent sprinkler must be of the dry pendent type, unless otherwise indicated. Pendent sprinkler must be [recessed] [quick-response] [dry pendent] type with nominal K-factor of [80] [115] [160] [_____] [5.6] [8.0] [11.2] [_____]. Pendent sprinklers must have a [polished chrome] [stainless steel] [white polyester] [_____] finish. Assembly must include an integral escutcheon.

2.9.2 Upright Sprinkler

Upright sprinkler must be [brass] [chrome-plated] [stainless steel] [white polyester] [quick-response type] [_____] with a nominal K-factor of [80] [115] [160] [_____] [5.6] [8.0] [11.2] [_____].

2.9.3 Sidewall Sprinkler

Sidewall sprinkler must be the [quick-response] [standard-response] [recessed] [dry sidewall] type. Sidewall sprinkler must have a nominal K-factor of [80] [115] [160] [_____] [5.6] [8.0] [11.2] [_____]. Sidewall sprinkler must have a [brass] [polished-chrome] [stainless steel] [white polyester] [_____] finish.

2.9.4 Corrosion-Resistant Sprinkler

**************************************************************************
NOTE: The use of corrosion-resistant sprinklers is generally limited to industrial type occupancies such as electroplating, steam rooms, salt storage, and piers and wharves.
**************************************************************************
Corrosion-resistant sprinkler must be the [upright][pendent] type installed in locations as indicated. Corrosion-resistant coatings must be factory-applied by the sprinkler manufacturer.

2.10 ACCESSORIES

2.10.1 Sprinkler Cabinet

Spare sprinklers must be provided in accordance with NFPA 13 and must be placed in a suitable metal or plastic cabinet of sufficient size to accommodate all the spare sprinklers and wrenches in designated locations. Spare sprinklers must be representative of, and in proportion to, the number of each type and temperature rating of the sprinklers installed as required by NFPA 13. At least one wrench of each type required must be provided.

2.10.2 Pendent Sprinkler Escutcheon

Escutcheon must be one-piece metallic type with a depth of less than 19 mm 3/4-inch and suitable for installation on pendent sprinklers. The escutcheon must have a factory finish that matches the pendent sprinkler.

2.10.3 Pipe Escutcheon

Provide split hinge metal plates for piping entering walls, floors, and ceilings in exposed spaces. Provide polished stainless steel plates or chromium-plated finish on copper alloy plates in finished spaces. Provide paint finish on metal plates in unfinished spaces.

2.10.4 Sprinkler Guard

Listed guard must be a steel wire cage designed to encase the sprinkler and protect it from mechanical damage. Guards must be provided on sprinklers located [_____] [within 2.1 meters 7 feet of the floor] [as indicated].

2.10.5 Relief Valve

Relief valves must be listed and installed at the riser in accordance with NFPA 13.

2.10.6 Identification Sign

Valve identification sign must be minimum 150 mm wide by 50 mm high 6 inches wide by 2 inches high with enamel baked finish on minimum 1.214-mm18 gage steel or 0.6-mm0.024-inch aluminum with red letters on a white background or white letters on red background. Wording of sign must include, but not be limited to "main drain", "auxiliary drain", "inspector's test", "alarm test", "alarm line", and similar wording as required to identify operational components. Where there is more than one sprinkler system, signage must include specific details as to the respective system.

2.11 RELEASING CONTROL UNIT (RCU)

The RCU must be listed, analog-addressable and compatible with the system, devices and functions specified. Route all supervision of the RCU through the main FACU. The RCU must perform all functions necessary to operate the system detection, actuation, and auxiliary functions independent of the
The control system must be microprocessor-based utilizing distributed processing concept. A single microprocessor failure must not impact operation of additional modules on the system. The control system must be capable of supporting an air aspirating smoke detection system. The control system's initiating circuits must be capable of Class A or Class B operation. The solenoid must be listed for use with the releasing unit and extinguishing equipment. Each circuit must be capable of monitoring contact devices configured for manual release, trouble input or auxiliary (non-fire) input. The RCU must contain release circuits for activation of an extinguishing system[s]. Each release circuit must be capable of Class B operation. The RCU must contain at least two notification appliance circuits for annunciation. Each notification circuit must be capable of Class A or Class B operation. Provide alarm/trouble reset switches to reset a cleared device in alarm or trouble. Alarm or trouble signals are not to be self-restoring without activating the switch.

Annunciator must be integral with the RCU. Annunciation must be by an indicator lamp, alphanumeric display, or other equivalent means in which each indication provides status information about a circuit, condition, or location and visible through the cabinet door. Supervision is not required provided that a fault in the annunciator circuits results only in loss of annunciation and does not affect the normal functional operation of the remainder of the system. Ensure each visible indicator provides specific identification of the [zone][area][device]. Do not use generic nondescript wording such as "Zone 1", or "Zone 2", for the label identification.

An operator at the RCU, having the proper access level must have the capability to manually access the following information for each initiating device:

a. Primary status.

b. Device type.

c. Present average value.

d. Present sensitivity selected.

e. Sensor range (normal, dirty, etc).

2.12 ANNUNCIATOR

2.12.1 Remote Annunciator Panel

**************************************************************************
NOTE: Provide a remote annunciator only for very large spaces with 10 or more smoke detectors.
**************************************************************************

Provide a [semi-recessed][flush] mounted annunciator that includes an LCD display. The display must indicate the device in trouble/alarm or the supervisory device. Display the device name, address[, and actual building location]. The remote annunciator must duplicate functions of the RCU for message display, fire alarm, supervisory alarm, and trouble conditions, visual and audible notification, and system reset functions. Remote annunciator must require the use of a key for accessing the reset, control and other functions.
2.12.2 Graphic Annunciator Panel

**************************************************************************
NOTE: Graphic annunciator panels should be provided only when a large number of concealed devices are installed. Normally, exposed devices will be annunciated by zone only on the fire alarm control unit zone annunciator and remote zone annunciator. Edit accordingly. Locate panel(s) at or near building entrance to allow fire department quick access to panel.
**************************************************************************

Panel must be of the [interior][weatherproof] type, [flush][surface][pedestal]-mounted. Panel must be provided with the [building][room] floor plan, drawn to scale, with alarm lamps mounted to represent the location of [each concealed detector][each initiating device]. Panel graphic must also show the locations of the annunciator panel and control unit, and must have a "you are here" arrow showing its location. Orient building floor plan on graphic to location of person viewing the graphic, i.e. the direction the viewer is facing must be toward the top of the graphic display. Provide a North arrow. [Principal rooms and areas shown must be labeled with room numbers or titles.] Detectors mounted above ceilings[, on ceilings,] and beneath raised floors and different types of initiating devices must have different symbols or lamps of different colors for identification. Lamps must illuminate upon activation of corresponding device and must remain illuminated until the system is reset. Panel must have a lamp test switch.

2.12.2.1 Materials

Construct the graphic annunciator face plate of [smoked Plexiglas][non-glare matte finish][anodized bronze][anodized aluminum]. The face plate must be backlit with LEDs. Control equipment and wiring must be housed in a [recessed][semi-recessed][surface mounted] back box. The exposed portions of the back box must be [chrome plated][anodized bronze][anodized aluminum] without knockouts.

2.12.2.2 Programming

Where programming for the operation of the graphic annunciator is accomplished by a separate software program other than the software for the RCU, the software program must not require reprogramming after loss of power. The software must be reprogrammable in the field.

2.13 SMOKE DETECTORS

2.13.1 Photoelectric Smoke Detectors

Smoke detector must be photoelectric type and listed for use with the RCU.

a. Provide analog/addressable photoelectric smoke detectors utilizing the photoelectric light scattering principle for operation in accordance with UL 268. Smoke detectors must be listed for use with the RCU.

b. Provide self-restoring type detectors that do not require readjustment after actuation at the RCU to restore them to normal operation. Detectors must be listed as smoke-automatic fire detectors.
c. Components must be rust and corrosion resistant. Vibration must have no effect on the detector's operation. Protect the detection chamber with a fine mesh metallic screen that prevents the entrance of insects or airborne materials. The screen must not inhibit the movement of smoke particles into the chamber.

d. Provide twist lock bases for the detectors. The detectors must maintain contact with their bases without the use of springs. Provide companion mounting base with screw terminals for each conductor. Terminate field wiring on the screw terminals. The detector must have a visual indicator to show actuation.

e. The detector address must identify the particular unit, its location within the system, and its sensitivity setting. Detectors must be of the low voltage type rated for use on a 24 VDC system.

f. An operator at the control unit, having a proper access level, must have the capability to manually access the following information for each initiating device.

   (1) Primary status.

   (2) Device type.

   (3) Present average value.

   (4) Present sensitivity selected.

   (5) Sensor range (normal, dirty, and other similar information).

2.13.2 Laser Smoke Detectors

a. Addressable laser smoke detectors must utilize laser diode and patented smoke sensing chamber, designed to amplify signals from smoke but diminish stray internal reflections and must, on command from the RCU, send data to the panel representing the analog level of smoke density.

b. Smoke detector must be listed for use with the RCU. Detector must be able to achieve sensitivities from 0.02 percent-per-foot to 2 percent-per-foot obscuration.

c. Laser smoke detector must provide point identification of the fire location through addressability, must experience no delay in response time due to smoke dilution or smoke transportation time, and must offer complete supervision of wiring and detector.

2.13.3 Air Sampling Smoke Detectors

**************************************************************************
NOTE: Detector selection and spacing should be based on the applicable cooling system in the hazard area. Detection should be listed for the anticipated temperature and airflow in the hazard area.
**************************************************************************
The [addressable] air sampling smoke system must consist of a detector assembly housing an integral aspiration fan, filter, laser-based detection chamber and control, output and supervision circuitry. [ Each sampling point must be capable of being independently addressable.] The system must
consist of a piping or tubing distribution network that runs from the detector assembly(s) to the protected area(s) and is supported by air sampling smoke detection system calculations from a computer-based design modeling tool. The system must include configurable alarm and trouble relay outputs for interface to other systems where required.

a. System must be complete in all ways. It must include all engineering, and electrical installation, all detection and control equipment, auxiliary devices and controls, alarm interface, functional checkout and testing, training and all other operations necessary for a functional system.

b. System base detectors and modules must each accommodate up to [40 addressable] sampling tubes where each tube has a sampling point at the end. Additional modules may be used to provide up to [20 addressable] sampling holes per system.

c. Program alarm thresholds to the following values unless the results of the system acceptance tests indicate a clear need to change them. In the event that such a need is indicated, notify the Contracting Officer and provide complete documentation concerning the need to deviate from these values. Include within the deviation documentation request, information that complies with the paragraph entitled "Sensitivity Verification Test". Ensure initial threshold levels are approved prior to the final acceptance test.

1. Alarm Level 1: set ALERT at [0.0250] percent obscuration/foot.
2. Alarm Level 2: set PRE-ALARM at [0.0500] percent obscuration/foot.
3. Alarm Level 3: set FIRE 1 at [0.1000] percent obscuration/foot.

d. All air sampling smoke detection devices and associated components must be new, standard products or the manufacturer's latest design and suitable to perform the functions intended.

e. The laser detection chamber must be of the mass light scattering type and capable of detecting a wide range of smoke particle types of varying size. A particle counting method must be employed for the purposes of:

1. Preventing large particles from affecting the true smoke reading.
2. Monitoring contamination of the filter, e.g., dust and dirt, to automatically notify when maintenance is required. The particle counting method must not be used for the purpose of smoke density measurement.

f. Detector(s) must be self-monitoring for filter contamination and provide indication through system fault when replacement is necessary. Detectors which allow automatic reset of filter status upon removal and re-insertion are not permitted.
Detector(s) must contain relays for alarm and fault conditions. The relays must be software programmable to the required functions.

Detector(s) must permit configuration by programmers that are either integral to the system, portable or PC based.

Detector(s) must allow programming of:

1. Smoke threshold alarm levels; ALERT, PRE-ALARM, FIRE 1 and FIRE 2.

2. Time delays. Ensure the display control unit contains individual adjustable alarm time delay features for each of the alarm threshold levels. Provide an adjustment range between 0 and 60 seconds. Program the alarm threshold time delays to 30 seconds for alarm levels 1 and 2, and 15 seconds for alarm levels 3 and 4.

3. Faults, including airflow, detector, power, filter and network, as well as an indication of the urgency of the fault.

4. Configuration of relay outputs for remote indication of alarm and fault conditions.

5. General purpose input functionality.

2.14 HEAT DETECTORS

**NOTE:** The location and type of heat detectors and alarm devices must be indicated on project drawings. Delete descriptive paragraphs of detectors types not used. Alarm indicator should be used only if necessary to meet project requirements.

2.14.1 Heat Detectors

Heat detectors must be analog/addressable and designed for detection of fire by [fixed temperature][combination fixed temperature and rate-of-rise principle] [rate-compensating principle] in accordance with UL 521. The alarm condition must be determined by comparing detector value with the stored values. Detectors located in areas subject to moisture, exterior atmospheric conditions, or hazardous locations[ as defined by NFPA 70][ and][as indicated], must be types approved for such locations.

2.14.1.1 Rate Compensating Detectors

Detector back box must be [surface][flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring and hermetically sealed. The detector assembly must be [weatherproof][ and ][explosionproof].

2.14.1.2 Combination Fixed-Temperature and Rate-of-Rise Detectors

Detectors must be [surface][semi-flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-resetting. Detector must operate at [57.2][90] degrees C[135][194] degrees F. Detector must feature rate compensation. [Detectors rated to operate at 57.2 degrees C135 degrees F will not respond to momentary temperature fluctuations less than 16.7 degrees C30 degrees F per minute between 16 and 38 degrees C60 and 100 degrees F.]

SECTION 21 13 18 Page 39
Detectors rated to operate at 90 degrees C (194 degrees F) will not respond to momentary temperature fluctuations less than 27.8 degrees C (50 degrees F) per minute between 16 and 66 degrees C (60 and 150 degrees F). The detector assembly must be [weatherproof][ and ][explosionproof].]

2.14.1.3 Fixed Temperature Detectors

Detectors must be [surface][semi-flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring. The detectors must have a specific temperature setting [of 57.2][_____] degrees C [135][_____] degrees F [as shown]. [The detector assembly must be [weatherproof][ and ][explosionproof].]

2.15 ADDRESSABLE INTERFACE DEVICES

The initiating device being monitored must be configured as a [Class "A"] [Class "B"] initiating device circuit. The module must be listed as compatible with the control unit. The monitor module must provide address setting means compatible with the control unit's SLC supervision and store an internal identifying code. Monitor module must contain an integral LED that flashes each time the monitor module is polled and is visible through the device cover plate. Pull stations with a monitor module in a common backbox are not required to have an LED.[ Existing releasing system initiating device circuits must be connected to a single module to supervise the circuit.] Modules must be listed for the environmental conditions in which they will be installed.

2.16 ADDRESSABLE CONTROL MODULES

The control module must be capable of operating as a relay (dry contact form C) for interfacing the control unit with other systems, and to control door holders. The module must be listed as compatible with the control unit. The indicating device or the external load being controlled must be configured as a Class "B" notification appliance circuits. The system must be capable of supervising, audible, visual and dry contact circuits. The control module must have both an input and output address. The supervision must detect a short on the supervised circuit and prevent power from being applied to the circuit. The control model must provide address setting means compatible with the control unit's SLC supervision and store an internal identifying code. The control module must contain an integral LED that flashes each time the control module is polled and is visible through the device cover plate. Control Modules must be listed for the environmental conditions in which they will be installed.

2.17 ISOLATION MODULES

a. Provide isolation modules to subdivide each signaling line circuit [into groups of not more than [20 addressable devices][_____]][each floor][in accordance with NFPA 72] between adjacent isolation modules.

b. Isolation modules must provide short circuit isolation for signaling line circuit wiring.

c. Power and communications must be supplied by the SLC and report faults to the RCU.

d. After the wiring fault is repaired, the fault isolation modules must test the lines and automatically restore the connection.
[2.18] NOTIFICATION APPLIANCES

**************************************************************************
NOTE: The notification appliances are for providing local notification of a sprinkler system operation. These devices are not intended to provide general building fire alarm evacuation.
**************************************************************************

Notification appliances must be suitable for connection to supervised notification appliance circuits. Appliance must have a separate screw terminal for each conductor. The surface of the appliance must be red in color.

2.18.1 Horns

Horns must conform to the applicable requirements of UL 464. Horns must be [semi-flush mounted][surface mounted], with the matching mounting backbox surface mounted vibrating type suitable for use in an electrically supervised circuit. Horns must produce a sound rating of at least 85 dBA at 3 meters/10 feet. Horns used in exterior locations must be specifically listed or approved for outdoor use and be provided with metal housing and protective grilles.

2.18.2 Visual Notification Appliances

**************************************************************************
NOTE: 1. ABA requires that Visual Notification Appliances be provided in buildings and facilities in each of the following areas: restrooms, and any general usage area (e.g., meeting rooms), hallways, lobbies, and any other area for common use and other areas stated at www.access-board.gov. The Visual Notification Appliance must be mounted as required by ABA that directs compliance with NFPA 72 except that the maximum allowable sound level of audible notification appliances must have a sound level no more than 110 dB at the minimum hearing distance from the audible appliance. In addition, alarms in guest rooms required to provide communication features must comply with sections 18.5.4.6 of NFPA 72. Shop drawings must indicate location, dimensions, content, details, and other required information to indicate extent of complying with ABA requirements.

2. Currently NFPA 72 requires "clear color" strobes for Fire Alarm Notification. NFPA 72 requires the strobe must be marked "Fire" to clearly identify the function.
**************************************************************************

Visual notification appliances must conform to the applicable requirements of UL 1638, UL 1971 and conform to the Architectural Barriers Act (ABA). Visual Notification Appliances must have clear high intensity optic lens, xenon flash tubes, or light emitting diode (LED). The light pattern must be disbursed so that it is visible above and below the strobe and from a 90 degree angle on both sides of the strobe. Strobe flash rate must be 1
2.19 ELECTRICAL

**************************************************************************
NOTE: Coordinate power and alarm requirements with the contract drawings and other specification sections.
**************************************************************************

2.19.1 Wire

Provide wiring materials under this section as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM with the additions and modifications specified herein.

2.19.2 Alarm Wiring

IDC and SLC wiring must be [fiber optic][ or ][solid copper] cable in accordance with the manufacturers requirements. Copper signaling line circuits and initiating device circuit field wiring must be No. [14][16][18][_____] AWG size conductors at a minimum.[ Visual notification appliance circuit conductors, that contain audible alarm appliances, must be copper No. 14 AWG size conductors at a minimum.] Wire size must be sufficient to prevent voltage drop problems. Circuits operating at 24 VDC must not operate at less than the listed voltages for the detectors, appliances, or combination thereof. Power wiring, operating at 120 VAC minimum, must be a minimum No. 12 AWG solid copper having similar insulation. Acceptable power-limited cables are FPL, FPLR or FPLP as appropriate with red colored covering. Nonpower-limited cables must comply with NFPA 70.

2.20 SURGE PROTECTIVE DEVICES

Surge protective devices must be provided to suppress all voltage transients which might damage RCU components. Systems having circuits located outdoors, communications equipment must be protected against surges induced on the signaling line circuits. Cables and conductors, that serve as communications links, must have surge protection circuits installed at each end. The surge protective device must wire in series to the power supply of the protected equipment with screw terminations. Line voltage surge arrester must be installed directly adjacent to the power panel where the releasing control unit breaker is located.

a. Surge protective devices for nominal 120 VAC must be UL 1449 listed with a maximum 500 volt suppression level and have a maximum response time of 5 nanoseconds. The surge protective device must meet IEEE C62.41.1 and IEEE C62.41.2 category B tests for surge capacity. The surge protective device must feature multi-stage construction and be provided with a long-life indicator lamp (either light emitting diode or neon) which extinguishes upon failure of protected components. A unit fusing must be externally accessible.

b. Surge protective devices for nominal 24 VAC, fire alarm telephone dialer, or ethernet connection must be UL 497B listed, meet IEEE C62.41.1 and have a maximum response time of 1-nanosecond. The surge protective device must feature multi-stage construction and be self-resetting. The surge protective device must be a base and plug
style. The base assembly must have screw terminals for releasing system wiring. The base assembly must accept "plug-in" surge protective module.

c. All surge protective devices (SPD) must be the standard product of a single manufacturer and be equal or better than the following:

(1) For 120 VAC nominal line voltage: UL 1449 and UL 1283 listed, series connected 120 VAC, 20A rated, surge protective device in a NEMA 4x enclosure. Minimum 50,000 amp surge current rating with EMI/RFI filtering and a dry contact circuit for remote monitoring of surge protection status.

(2) For 24-volt nominal line voltage: UL 497B listed, series connected low voltage, 24-volt, 5A rated, loop circuit protector, base and replaceable module.

(3) For alarm telephone dialers: UL 497A listed, series connected, 130-volt, 150 mA rated with self-resetting fuse, dialer circuit protector with modular plug and play.

(4) For IP-DACTS: UL 497B listed, series connected, 6.4-volt, 1.5A rated with 20 kA/pair surge current, data network protector with modular plug and play.

2.21 ELECTRIC POWER

2.21.1 Primary Power

Power must be [120][_____] VAC [50][60] Hz service for the RCU from the AC service to the building in accordance with NFPA 72.

2.22 SECONDARY POWER SUPPLY

Provide for system operation in the event of primary power source failure. Transfer from normal to auxiliary (secondary) power or restoration from auxiliary to normal power must be automatic and must not cause transmission of a false alarm.

2.22.1 Batteries

Provide sealed, maintenance-free,[ valve regulated lead acid] batteries as the source for emergency power to the RCU. Batteries must contain suspended electrolyte. The battery system must be maintained in a fully charged condition by means of a solid state battery charger. Provide an automatic transfer switch to transfer the load to the batteries in the event of the failure of primary power.

2.22.1.1 Capacity

Battery size must apply to every control unit and panel associated with this system, including supplemental notification appliance circuit panels, auxiliary power supply panels, and fire alarm transmitters.

a. Sufficient capacity to operate the releasing system under supervisory and trouble conditions, including audible trouble signal devices for 48 hours and audible and visual signal devices under alarm conditions for an additional 15 minutes (or minimum required time for automatic water control valve release).
2.22.1.2 Battery Power Calculations

a. Verify that battery capacity exceeds supervisory and alarm power requirements for the criteria noted in the paragraph "Capacity" above.

(1) Substantiate the battery calculations for alarm and supervisory power requirements. Include ampere-hour requirements for each system component and each control unit or panel component, and compliance with UL 864.

(2) Provide complete battery calculations for both the alarm and supervisory power requirements. Submit ampere-hour requirements for each system component with the calculations.

(3) Provide voltage drop calculations to indicate that sufficient voltage is available for proper operation of the system and all components, at the minimum rated voltage of the system operating on batteries. Calculations must be performed using the minimum rated voltage of each component.

b. For battery calculations assume a starting voltage of 24 VDC for starting the calculations to size the batteries. Calculate the required Amp-Hours for the specified standby time, and then calculate the required Amp-Hours for the specified alarm time. Using 20.4 VDC as starting voltage, perform a voltage drop calculation for circuits containing devices, appliances, or combination of devices and appliances remote from the power sources.

2.22.2 Battery Chargers

Provide a solid state, fully automatic, variable charging rate battery charger. The charger must be capable of providing 120 percent of the connected system load and maintain the batteries at full charge. In the event the batteries are fully discharged (20.4 Volts dc), the charger must recharge the batteries back to 95 percent of full charge within 48 hours after a single discharge cycle as described in paragraph CAPACITY above. Provide pilot light to indicate when batteries are manually placed on a high rate of charge as part of the unit assembly if a high rate switch is provided.

PART 3 EXECUTION

3.1 VERIFYING ACTUAL FIELD CONDITIONS

Before commencing work, examine all adjoining work on which the contractor's work that is dependent for perfect workmanship according to the intent of this specification section, and report to the Contracting Officer's Representative all conditions that prevents performance of first class work. No "waiver of responsibility" for incomplete, inadequate or defective adjoining work will be considered unless notice has been filed before submittal of a proposal.

3.2 INSTALLATION

The installation must be in accordance with the applicable provisions of NFPA 13, NFPA 24, NFPA 72 and publications referenced therein.[Installation of in-rack sprinklers must comply with applicable provisions of NFPA 13.] Locate sprinklers in a consistent pattern with ceiling grid,
lights, and air supply diffusers. Install sprinkler system over and under ducts, piping and platforms when such equipment can negatively affect or disrupt the sprinkler discharge pattern and coverage.

a. Piping offsets, fittings, and other accessories required must be furnished to provide a complete installation and to eliminate interference with other construction.

b. Wherever the contractor's work interconnects with work of other trades the Contractor must coordinate with other Contractors to insure all Contractors have the information necessary so that they may properly install all necessary connections and equipment. Identify all work items needing access (dampers and similar equipment) concealed above hung ceilings by permanent color coded pins/tabs in the ceiling directly below the item.

c. Provide required supports and hangers for piping, conduit, and equipment so that loading will not exceed allowable loadings of structure. Submittal of a bid must be a deemed representation that the contractor submitting such bid has ascertained allowable loadings and has included in his estimates the costs associated in furnishing required supports.

3.2.1 Waste Removal

At the conclusion of each day's work, clean up and stockpile on site all waste, debris, and trash which may have accumulated during the day as a result of work by the contractor and of his presence on the job. Sidewalks and streets adjoining the property must be kept broom clean and free of waste, debris, trash and obstructions caused by work of the contractor, which will affect the condition and safety of streets, walks, utilities, and property.

3.3 UNDERGROUND PIPING INSTALLATION

**************************************************************************

NOTE: Restraint of the underground piping must be detailed on the contract drawings.
**************************************************************************

The fire protection water main must be laid, and joints anchored, in accordance with NFPA 24. Minimum depth of cover must be \[900\] mm [3\] feet or the frost line, whichever is deeper. The supply line must terminate inside the building with a flanged piece, the bottom of which must be set not less than \(304 \text{ mm1-foot}\) above the finished floor. A blind flange must be installed temporarily on top of the flanged piece to prevent the entrance of foreign matter into the supply line. A concrete thrust block must be provided at the elbow where the pipe turns up toward the floor. In addition, joints must be anchored in accordance with NFPA 24. Buried steel components must be provided with a corrosion protective coating in accordance with AWWA C203. Piping more than \(1600 \text{ mm5 feet}\) outside the building walls must meet the requirements of Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING.

3.4 ABOVEGROUND PIPING INSTALLATION

The methods of fabrication and installation of the aboveground piping must fully comply with the requirements and recommended practices of NFPA 13 and this specification section.
3.4.1 Protection of Piping Against Earthquake Damage

**************************************************************************
NOTE: The writer of this section must coordinate with the Structural Engineer or Government to determine the proper seismic design category for the project, in accordance with the IBC or ASCE guidelines. See UFC 3-310-04 for more information.
**************************************************************************

Seismic restraint is [not ]required.

3.4.2 Piping in Exposed Areas

Install exposed piping without diminishing exit access widths, corridors or equipment access. Exposed horizontal piping, including drain piping, must be installed to provide maximum headroom.

3.4.3 Piping in Finished Areas

In areas with suspended or dropped ceilings and in areas with concealed spaces above the ceiling, piping must be concealed above ceilings. Piping must be inspected, hydrostatically tested and approved before being concealed. Risers and similar vertical runs of piping in finished areas must be concealed.

3.4.4 Pendent Sprinklers

**************************************************************************
NOTE: Where the maximum static or flowing pressure, whichever is greater at the sprinkler, applied other than through the fire department connection, exceeds 6.9 bar 100 psi and a branch line above the ceiling supplies sprinklers in a pendent position below the ceiling, the cumulative horizontal length of an unsupported arm of a sprinkler or sprinkler drop must not exceed 300 mm 12 inches for steel pipe and 1500 mm 6 inches for copper tube.
**************************************************************************

a. Drop nipples to pendent sprinklers must consist of minimum 25-mm1-inch pipe with a reducing coupling into which the sprinkler must be threaded.

b. Where sprinklers are installed below suspended or dropped ceilings, drop nipples must be cut such that sprinkler ceiling plates or escutcheons are of a uniform depth throughout the finished space. The outlet of the reducing coupling must not extend below the underside of the ceiling.

c. Recessed pendent sprinklers must be installed such that the distance from the sprinkler deflector to the underside of the ceiling must not exceed the manufacturer's listed range and must be of uniform depth throughout the finished area.

d. Pendent sprinklers in suspended ceilings must be located in the center of the tile (+/- 2 inches).[  

e. Dry pendent sprinkler assemblies must be such that sprinkler ceiling
plates or escutcheons are of the uniform depth throughout the finished space.][

f. Dry pendent sprinklers must be of the required length to permit the sprinkler to be threaded directly into a branch line tee.][

g. Where the maximum static or flowing pressure, whichever is greater at the sprinkler, applied other than through the fire department connection, exceeds 6.9 bar 100 psi and a branch line above the ceiling supplies sprinklers in a pendent position below the ceiling, the cumulative horizontal length of an unsupported armover to a sprinkler or sprinkler drop must not exceed 300 mm 12 inches for steel pipe and 1500 mm 6 inches for copper tube.]

h. Sprinklers installed in the pendent position must be of the listed dry pendent type or on return bends, unless otherwise indicated.

3.4.5 Upright Sprinklers

Riser nipples or "sprigs" to upright sprinklers must contain no fittings between the branch line tee and the reducing coupling at the sprinkler.

3.4.6 Pipe Joints

Pipe joints must conform to NFPA 13, except as modified herein. Not more than four threads must show after joint is made up. Welded joints will be permitted, only if welding operations are performed as required by NFPA 13 at the Contractor's fabrication shop, not at the project construction site. Flanged joints must be provided where indicated or required by NFPA 13. Grooved pipe and fittings must be prepared in accordance with the manufacturer's latest published specification according to pipe material, wall thickness and size. Grooved couplings, fittings and grooving tools must be products of the same manufacturer. For copper tubing, pipe and groove dimensions must comply with the tolerances specified by the coupling manufacturer. The diameter of grooves made in the field must be measured using a "go/no-go" gauge, vernier or dial caliper, narrow-land micrometer, or other method specifically approved by the coupling manufacturer for the intended application. Groove width and dimension of groove from end of pipe must be measured and recorded for each change in grooving tool setup to verify compliance with coupling manufacturer's tolerances.

3.4.7 Reducers

Reductions in pipe sizes must be made with one-piece tapered reducing fittings. When standard fittings of the required size are not manufactured, single bushings of the face or hex type will be permitted. Where used, face bushings must be installed with the outer face flush with the face of the fitting opening being reduced. Bushings cannot be used in elbow fittings, in more than one outlet of a tee, in more than two outlets of a cross, or where the reduction in size is less than 13 mm 1/2-inch.

3.4.8 Pipe Penetrations

a. Cutting structural members for passage of pipes or for pipe-hanger fastenings will not be permitted. Pipes that must penetrate concrete or masonry walls or concrete floors must be core-drilled and provided with pipe sleeves. Each sleeve must be Schedule 40 galvanized steel, ductile-iron or cast-iron pipe and extend through its respective wall or floor and be cut flush with each wall surface. Sleeves must provide
required clearance between the pipe and the sleeve per NFPA 13. The space between the sleeve and the pipe must be firmly packed with mineral wool insulation.

b. Where pipes and sleeves penetrate fire walls, fire partitions, or floors, pipes/sleeves must be firestopped in accordance with Section 07 84 00 FIRESTOPPING.

c. In penetrations that are not fire-rated or not a floor penetration, the space between the sleeve and the pipe must be sealed at both ends with plastic waterproof cement that will dry to a firm but pliable mass or with a mechanically adjustable segmented elastomer seal.

d. All penetrations through the boundary of rooms/areas identified as secure space area must meet ICS 705-1.

3.4.9 Escutcheons

Escutcheons must be provided for pipe penetration in finished areas of ceilings, floors and walls. Escutcheons must be securely fastened to the pipe at surfaces through which piping passes.

3.4.10 Inspector's Test Connection

**************************************************************************
NOTE: Designer will indicate location of the inspector's test connections and all associated valves on the contract drawings, and will provide details of drain piping.
**************************************************************************

Unless otherwise indicated, the test connection must consist of 25-mm1-inch pipe connected to the remote branch line; a test valve located approximately 2 meters7 feet above the floor; a smooth bore brass outlet equivalent to the smallest orifice sprinkler used in the system; and a painted metal identification sign affixed to the valve with the words "Inspector's Test". All test connection piping must be inside of the building and penetrate the exterior wall at the location of the discharge orifice only. The discharge orifice must be located outside the building wall no more than 0.6 meters2 feet above finished grade, directed so as not to cause damage to adjacent construction or landscaping during full flow discharge, or to the sanitary sewer. Discharge to the exterior must not interfere with exiting from the facility. Water discharge or runoff must not cross the path of egress from the building. Do not discharge to the roof. Discharge to floor drains, janitor sinks or similar fixtures is not permitted.

Provide concrete splash blocks at all drain and inspector's test connection discharge locations if not discharging to a concrete surface. Splash blocks must be large enough to mitigate erosion and not become dislodged during a full flow of the drain. Ensure all discharged water drains away from the facility and does not cause property damage.

3.4.11 Backflow Preventer

Locate within the building or in a heated enclosure in locations subject to freezing. For heated enclosures, provide a low temperature supervisory alarm connected to the facility fire alarm system. Heat trace is not permitted to be used.
Install backflow preventers so that the bottom of the assembly is a minimum of 150 mm6 inches above the finished floor/grade. Install horizontal backflow preventers so that the bottom of the assembly is no greater than [_____]610 mm24 inches above the finished floor/grade. Install vertical backflow preventers so that the upper operating handwheel is no more than [_____]1.8 meters6 feet above the finished floor/grade. Clearance around control valve handles must be minimum 150 mm6 inches above grade/finished floor and away from walls.

[3.4.11.1 Test Connection]

Provide downstream of the backflow prevention assembly UL 668 hose valves with 65-mm2.5-inch National Standard male hose threads with cap and chain. Provide one valve for each 946 L/min250 gpm of system demand or fraction thereof. Provide a permanent sign in accordance with paragraph entitled "Identification Signs" which reads, "Test Valve". Indicate location of test header. If an exterior connection, provide a control valve inside a heated mechanical room to prevent freezing. The piping between the backflow preventer test header control valve and the exterior test header must be provided with an automatic drip arranged to drain to the outside.

]3.4.12 Drains

a. Main drain piping must be provided to discharge [at a safe point outside the building, no more than 0.6 meters2 feet above finished grade] [at the location indicated] [to the sanitary sewer]. Provide a concrete splash block at drain outlet. Discharge to the exterior must not interfere with exiting from the facility. Water discharge or runoff must not cross the path of egress from the building.

b. Auxiliary drains must be provided as required by NFPA 13. Auxiliary drains are permitted to discharge to a floor drain if the drain is sized to accommodate full flow (min 151 L/min40 gpm). Discharge to service sinks or similar plumbing fixtures is not permitted.

3.4.13 Installation of Fire Department Connection

Connection must be mounted [on the exterior wall approximately 900 mm3 feet above finished grade] [adjacent to and on the sprinkler system side of the backflow preventer]. The piping between the connection and the check valve must be provided with an automatic drip in accordance with NFPA 13 and piped to drain to the outside or a floor drain within the same room.

3.4.14 Identification Signs

Signs must be affixed to each control valve, inspector test valve, main drain, auxiliary drain, test valve, and similar valves as appropriate or as required by NFPA 13. Main drain test results must be etched into main drain identification sign. Hydraulic design data must be etched into the nameplates and permanently affixed to each sprinkler riser as specified in NFPA 13. Provide labeling on the surfaces of all feed and cross mains to show the pipe function (e.g., "Sprinkler System", "Fire Department Connection", "Standpipe") and normal valve position (e.g. "Normally Open", "Normally Closed"). For pipe sizes 100 mm4-inch and larger provide white painted stenciled letters and arrows, a minimum of 50 mm2 inches in height and visible from at least two sides when viewed from the floor. For pipe sizes less than 100 mm4-inch, provide white painted stenciled letters and arrows, a minimum of 18 mm0.75-inch in height and visible from the floor.

{SEC}
Provide properly lettered and approved metal sign to elevator flow switch stating the circuits' voltage, and identify the switch as an "Elevator Power Shunt Flow Switch".

3.4.15 Isolation Valve

Provide a control valve on the riser assembly, downstream of the backflow preventer test connection and waterflow indicator, to allow isolation of riser when testing (tripping) the automatic water control valve without allowing water to enter the system piping. The control valve must be electrically supervised in the open position.

3.5 ELECTRICAL

*****************************************************************************
NOTE: Coordinate power and alarm requirements with the contract drawings and other specification sections.
*****************************************************************************

Except as modified herein, electric equipment and wiring must be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. [Alarm signal wiring connected to the building fire alarm control system must be by the fire alarm installer.]

3.5.1 Overcurrent and Surge Protection

All equipment connected to alternating current circuits must be protected from surges. Cables and conductors that serve as communications links, except fiber optics, must have surge protection circuits installed at each end. Fuses must not be used for surge protection.

3.5.2 Grounding

Grounding must be provided to building ground.

3.5.3 System Field Wiring

3.5.3.1 Wiring within Cabinets, Enclosures, and Boxes

Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of the box, enclosure, or cabinet. Conductors that are terminated, spliced, or otherwise interrupted in an enclosure, cabinet, mounting, or junction box must be connected to screw-type terminal blocks. Mark each terminal in accordance with the wiring diagrams of the system. The use of wire nuts or similar devices is prohibited. Wiring to conform with NFPA 70.

Indicate the following in the wiring diagrams:

a. Point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the RCU and remote RCU, initiating circuits, switches, relays and terminals.

b. Complete riser diagrams indicating the wiring sequence of devices and their connections to the control equipment. Include a color code
schedule for the wiring. Include floor plans showing the locations of devices and equipment.

3.5.3.2 Terminal Cabinets

**************************************************************************
NOTE: Provide terminal cabinets on each floor where the fire alarm system supply riser is located and where the fire alarm return riser is located.
**************************************************************************

Provide a terminal cabinet at the base of the circuit riser, on each floor at each riser, and where indicated on the drawings. Terminal size must be appropriate for the size of the wiring to be connected. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the terminal cabinet. Minimum size is 200 mm by 200 mm8 inches by 8 inches. Only screw-type terminals are permitted. Provide an identification label, that displays "RELEASING SYSTEM TERMINAL CABINET" with 50-mm2-inch lettering, on the front of the terminal cabinet.

3.5.3.3 Alarm Wiring

**************************************************************************
NOTE: Do not penetrate SCIF perimeters with copper signal line circuits. SCIF penetrations should be either fiber optic cable or IDC. IDC circuits penetrating the SCIF must be filtered.
**************************************************************************

a. Voltages must not be mixed in junction boxes, housing or device, except those containing power supplies and control relays.

b. Utilize shielded wiring where recommended by the manufacturer. For shielded wiring, ground the shield at only one point, in or adjacent to the RCU.

c. [Pigtail or T-tap connections to signal line circuits, initiating device circuits, supervisory alarm circuits, and notification appliance circuits are prohibited.][ T-tapping using screw terminal blocks is allowed for Class "B" initiating device circuitssignaling line circuits.]

d. Color coding is required for circuits and must be maintained throughout the circuit. Conductors used for the same functions must be similarly color coded. Conform wiring to NFPA 70.

e. Pull all conductors splice free. The use of wire nuts, crimped connectors, or twisting of conductors is prohibited. Where splices are unavoidable, the location of the junction box or pull box where they occur must be identified on the as-built drawings. The number and location of splices must be subject to approval by the [_____] Designated Fire Protection Engineer (DFPE).

3.5.3.4 Back Boxes and Conduit

In addition to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, provide all wiring in rigid metal conduit or intermediate metal conduit unless specifically indicated otherwise. Minimum conduit size must be 19 mm3/4-inch in diameter. Do not use electrical non-metallic tubing.
(ENT) or flexible non-metallic tubing and associated fittings.

a. Galvanized rigid steel (GRS) conduit must be utilized where exposed to weather, where subject to physical damage, and where exposed on exterior of buildings. Intermediate metal conduit (IMC) may be used in lieu of GRS as allowed by NFPA 70.

b. Electrical metallic tubing (EMT) is permitted above suspended ceilings or exposed where not subject to physical damage. Do not use EMT underground, encased in concrete, mortar, or grout, in hazardous locations, where exposed to physical damage, outdoors or in fire pump rooms. Use die-cast compression connectors.

c. For rigid metallic conduit (RMC), only threaded type fitting are permitted for wet or damp locations.

d. Flexible metal conduit is permitted for initiating device circuits 2 meters 6 feet in length or less. Flexible metal conduit is prohibited for notification appliance circuits and signaling line circuits. Use liquid tight flexible metal conduit in damp and wet locations.

e. Schedule 40 (minimum) polyvinyl chloride (PVC) is permitted where conduit is routed underground or underground below floor slabs. Convert non-metallic conduit, other than PVC Schedule 40 or 80, to plastic-coated rigid, or IMC, steel conduit before turning up through floor slab.

f. Exterior wall penetrations must be weathertight. Conduit must be sealed to prevent the infiltration of moisture.

[g. For Class "A" or "X" circuits with conductor lengths of 3 meters 10 feet or less, the conductors must be permitted to be installed in the same raceway in accordance with NFPA 72.]

3.5.3.5 Conductor Terminations

Labeling of conductors at terminal blocks in terminal cabinets, and RCU must be provided at each conductor connection. Each conductor or cable must have a shrink-wrap label to provide a unique and specific designation. Each terminal cabinet and RCU must contain a laminated drawing that indicates each conductor, its label, circuit, and terminal. The laminated drawing must be neat, using 12-point lettering minimum size, and mounted within each cabinet, panel, or control unit so that it does not interfere with the wiring or terminals. Maintain existing color code scheme where connecting to existing equipment.

3.6 RELEASING CONTROL SYSTEM

3.6.1 Releasing Control Unit (RCU)

The RCU must be located in a year round environmentally conditioned space and not in the hazard area served but adjacent to it. Locate the RCU [where indicated on the drawings][____]. [Recess][Semi-recess][Surface mount] the enclosure with the top of the cabinet 2 meters 6 feet above the finished floor or center the cabinet at [1.5][____] meters [5][____] feet, whichever is lower. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the RCU.
3.6.2 Smoke Detectors

Locate detectors [as required by NFPA 72 and their listing][as indicated on the drawings] on a 100-mm 4-inch mounting box. Smoke detectors are permitted to be on the wall no lower than 300 mm 12 inches from the ceiling with no minimum distance from the ceiling.[ In raised floor spaces, install the smoke detectors to protect [21 square meters 225 square feet per detector][_____] ] Install smoke detectors no closer than 1-meter 3 feet from air handling supply diffusers. [Detectors mounted in acoustical ceiling tiles must be centered in the tiles +/- 50 mm 2 inches.]

3.6.3 Air Sampling Smoke Detector

Locate air sampling smoke detectors in accordance with the manufacturer's instructions. Air sampling smoke detectors must be installed as follows:

a. Air Sampling Smoke Detector Assembly:

(1) Detector assembly must be mounted to a wall at a height between 1200 to 1800 mm 48 to 60 inches to top of detector measured above the finished floor.

(2) Mounting must be in a fully accessible and visible location.

(3) Mounting or attachment to site equipment, cable trays, movable walls, other equipment or equipment supports is not permitted.

(4) Piping network insertion into the detector inlet must not be glued.

(5) Air sampling smoke detector assembly must be installed in accordance with this specification section and the manufacturer's installation and instruction manuals.

(6) Flexible tubing for termination of the sampling pipe network into detector inlet is not permitted unless allowed by its listing.

(7) Provide red background with white lettering labels that are plastic or phenolic type with a minimum of 6.4 mm 0.25-inch block lettering to indicate detector and zone. For example: "AIR SAMPLING SMOKE DETECTOR No. 1-1 No. 5".

(8) Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. Install the frame in a conspicuous location observable from the ASD panel. The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions must be approved by the Contracting Officer before being posted.

b. Pipe and Sampling Tube Mounting:

(1) The pipe and sampling tubing detection network must be mounted as per the design and manufacturer's specification. The hardware used for mounting will depend upon the design and site requirements.

(2) To minimize flexing, pipes must be secured every 1.5 meters 5 feet.
(3) Pipes must be suspended between 25 and 100 mm and 4 inches below the ceiling. In areas with a suspended ceiling, the pipe network must be installed above the ceiling utilizing the manufacturer's capillary sample port supported by the ceiling.

(4) The sampling tubes must be of the same length or use the manufacturer's guidelines to run tubes of the required lengths.

(5) When installing a pipe network in areas subject to high temperature fluctuations allow for the contraction and expansion of pipes.

(6) Where expansion or contraction of pipes is likely either after installation or on a continuous basis, do not place pipe clips adjacent to couplings and socket unions as these may interfere with the movement of the pipe.

(7) No bends are permitted within the first 450 mm18 inches from the detector inlet.

(8) The routing of the piping and sample tube network must be coordinated with potential obstructions, including cable trays, grounding bars, and HVAC ductwork.

(9) All changes in direction must be made with standard elbows or tees.

(10) All joints must be air-tight and made by using solvent cement, except at the entry to the detector assembly. Refer to ASTM F402.

(11) All pipes must be supported by mechanical hangers attached to the structure of the building. Not more than 300 mm1-foot of pipe must extend beyond the last hanger of each sampling pipe. The final installation must result in no noticeable deflection in the piping network.

(12) Attachment of air sampling pipes to cable trays, "gray iron", and telecommunications equipment is prohibited.

(13) Clearly label pipe network to distinguish the pipe from other facility pipe work or protective cabling enclosures. For example: "SMOKE DETECTION SAMPLING TUBE - DO NOT DISTURB". In open rooms and exposed areas, provide labels at no greater than 6.1-meter 20-foot intervals. Provide labels every 3 meters10 feet where piping is installed above suspended ceilings and every 609 mm2 feet, centered in the floor panels, where piping is installed within the raised floor cavity.

(14) Placement of the sampling tube must take into consideration appropriate sampling point locations and spacing.

c. Air Sampling Points:

(1) Open area ceiling sampling points must be oriented downward and must be within 25 to 100 mm1 to 4 inches below the underside of the ceiling above where the ceiling is smooth.

(2) Label all air sampling points with a round red label, each with a center hole to match the diameter of the drilled sampling point. For example: "AIR SAMPLING POINT DIA 3.2 MM0.125 INCHES".
Indicate fractional dimensions in decimal format with a minimum of three decimal places.

Locate manual stations as required by NFPA 72 and as indicated on the drawings. Mount stations so they are located no farther than \[1.5\] meters \([_____]\) feet from the exit door they serve, measured horizontally. Manual stations must be mounted at \[1067\] mm \([-42\][-44\][_____] inches measured to the operating handle.

[3.6.5] Notification Appliances

**************************************************************************

NOTE: Locate strobes wall mounted in corridors no more than \(4.5\) meters \(15\) feet from the end of a corridor with \(30\) meters \(100\) feet maximum distance between strobes. Where there is an obstruction to the viewing path in the corridors, such as a cross-corridor door or ceiling elevation change, consider the obstruction as defining a new corridor. Provide ceiling mounted strobes in rooms accessible to the public, such as conference rooms, restrooms, courtrooms, cafeterias, and auditoriums in accordance with NFPA 72. In Child Development Centers only chimes must be used as the pre-alert tone prior to voice messages.

**************************************************************************

a. Locate notification appliance devices [as required by NFPA 72][where indicated]. Where more than two appliances are located in the same room or corridor or field of view, provide synchronized operation. Devices must use screw terminals for all field wiring. [Audible and visual notification appliances mounted in acoustical ceiling tiles must be centered in the tiles +/- \(50\) mm \(2\) inches.]

b. Audible and visual notification appliances mounted on the exterior of the building, within unconditioned spaces, or in the vicinity of showers must be listed weatherproof appliances installed on weatherproof backboxes.

[3.6.6] Graphic Annunciator

Locate the graphic annunciator as shown on the drawings. Mount the panel, with the top of the panel \(1830\) mm \(6\) feet above the finished floor or center the panel at \(1525\) mm \([_____]\) feet, whichever is lower. [Locate the graphic annunciator as shown on the drawings. Surface-mount the panel, with the top of the panel \(1830\) mm \(6\) feet AFF or center the panel at \(1525\) mm \([_____]\) feet, whichever is lower.]

[3.6.7] Remote LCD Annunciator

Locate the remote LCD annunciator as shown on the drawings. Mount the panel, with the top of the panel \(2\) meters \(6\) feet above the finished floor or center the panel at \(1.5\) meters \([_____]\) feet, whichever is lower.

3.6.8 Ceiling Bridges

Provide ceiling bridges for ceiling-mounted appliances. Ceiling bridges
must be as recommended/required by the manufacturer of the ceiling-mounted notification appliance.

3.7 PAINTING

**************************************************************************
NOTE: Designer will coordinate color code marking with Section 09 90 00 PAINTS AND COATINGS. Color code marking for piping which are not listed in Table I of Paragraph 3.5 Pipe Color Code Marking of UFGS Section 09 90 00 will be added to the table.
**************************************************************************

Color code mark piping [red][as specified in Section 09 90 00 PAINTS AND COATINGS].

a. In unfinished areas (including areas above drop ceilings), paint all exposed electrical conduit (serving releasing system equipment), releasing system conduit, surface metal raceway, junction boxes and covers red. In lieu of painting conduit, the contractor may utilize red conduit with a factory applied finish.

b. In finished areas, paint exposed electrical conduit (serving releasing system equipment), releasing system conduit, surface metal raceways, junction boxes, and electrical boxes to match adjacent finishes. The inside cover of the junction box must be identified as "Releasing System" and the conduit must have painted red bands 19 mm3/4-inch wide at 3-meter10-foot centers and at each side of a floor, wall, or ceiling penetration.

3.8 FIELD QUALITY CONTROL

3.8.1 Test Procedures

Submit detailed test procedures, prepared and signed by the NICET Level [III][ or ][IV] Fire Sprinkler Technician, and the representative of the installing company,[ and reviewed by the QFPE] [60][_____] days prior to performing system tests. Detailed test procedures must list all components of the installed system such as initiating devices and circuits, [notification appliances and circuits,] signaling line devices and circuits, control devices/equipment, batteries, power sources/supply, annunciators, special hazard equipment, and interface equipment. Test procedures must include sequence of testing, time estimate for each test, and sample test data forms. The test data forms must be in a check-off format (pass/fail with space to add applicable test data; similar to the forms in NFPA 13 and NFPA 4.) The test procedures and accompanying test data forms must be used for the pre-Government testing and the Government final testing.

a. Identify the NFPA Class of all initiating device circuits (IDC),[ notification appliance circuits (NAC),] and signaling line circuits (SLC).

b. Identify each test required by NFPA 72 Test Methods and required test herein to be performed on each component, and describe how these tests must be performed.

c. Identify each component and circuit as to type, location within the facility, and unique identity within the installed system. Provide
necessary floor plan sheets showing each component location, test location, and alphanumeric identity.

d. Identify all test equipment and personnel required to perform each test (including equipment necessary for smoke detector testing. The use of magnets is not permitted.

e. Provide space to identify the date and time of each test. Provide space to identify the names and signatures of the individuals conducting and witnessing each test.

3.8.2 Pre-Government Testing

3.8.2.1 Verification of Compliant Installation

Conduct inspections and tests to ensure that equipment is functioning properly. Tests must meet the requirements of paragraph entitled "Minimum System Tests" and "System Acceptance" as noted in NFPA 13 and NFPA 72. The Contractor [and QFPE] must be in attendance at the pre-Government testing to make necessary adjustments. After inspection and testing is complete, provide a signed Verification of Compliant Installation letter by the QFPE that the installation is complete, compliant with the specification and fully operable. The letter must include the names and titles of the witnesses to the pre-Government tests. Provide all completion documentation as required by NFPA 13 and the test reports noted below.

a. NFPA 13 Aboveground Material and Test Certificate

b. NFPA 13 Underground Material and Test Certificate

c. NFPA 72 Record of Completion

d. NFPA 72 Record of Inspection and Testing

3.8.2.2 Request for Government Final Test

When the verification of compliant installation has been completed, submit a formal request for Government final test to the [_____] [Designated Fire Protection Engineer (DFPE)] [Contracting Officers Designated Representative (COR)]. Government final testing will not be scheduled until the DFPE has received copies of the request for Government final testing and Verification of Compliant Installation letter with all required reports. Government final testing will not be performed until after the connections to the [building fire alarm system] [installation fire alarm reporting system] have been completed and tested to confirm communications are fully functional. Submit request for test at least [15][_____] calendar days prior to the requested test date.

3.8.3 Correction of Deficiencies

If equipment was found to be defective or non-compliant with contract requirements, perform corrective actions and repeat the tests. Tests must be conducted and repeated if necessary until the system has been demonstrated to comply with all contract requirements.

3.8.4 Government Final Tests

The tests must be performed in accordance with the approved test procedures in the presence of the DFPE. Furnish instruments and personnel required
for the tests. The following must be provided at the job site for Government Final Testing:

a. The manufacturer's technical representative.

[b. The contractor's Qualified Fire Protection Engineer (QFPE).]

c. Marked-up red line drawings of the system as actually installed.

d. Loop resistance test results.

e. Complete program printout including input/output addresses.

f. Copy of pre-Government Test Certificate, test procedures and completed test data forms.

Government Final Tests will be witnessed by the [_____], [Designated Fire Protection Engineer][Contracting Officer][, Qualified Fire Protection Engineer (QFPE)]. At this time, all required tests noted in the paragraph "Minimum System Tests" must be repeated at their discretion.

3.9 MINIMUM SYSTEM TESTS

The system, including the underground water mains, and the aboveground piping and system components, must be tested to ensure that equipment and components function as intended. The underground and aboveground interior piping systems and attached appurtenances subjected to system working pressure must be tested in accordance with NFPA 13 and NFPA 24.

3.9.1 Underground Piping

3.9.1.1 Flushing

**************************************************************************

NOTE: Designer should check the site water section for inconsistencies and to verify flushing of all underground pipe will be performed prior to connection to the sprinkler system.

**************************************************************************

Underground piping must be flushed in accordance with NFPA 24.

3.9.1.2 Hydrostatic Test

New underground piping must be hydrostatically tested in accordance with NFPA 24.

3.9.2 Aboveground Piping

3.9.2.1 Hydrostatic Test

Aboveground piping must be hydrostatically tested in accordance with NFPA 13. There must be no drop in gauge pressure or visible leakage when the system is subjected to the hydrostatic test. The test pressure must be read from a gauge located at the low elevation point of the system or portion being tested.
3.9.2.2 Air Pressure Test

As specified in NFPA 13, an air pressure leakage test at 350 kPa/50 psi must be conducted for 24 hours. There must be no drop in gauge pressure in excess of 10 kPa/1.5 psi for the 24 hours. This air pressure test is in addition to the required hydrostatic test.

3.9.2.3 Backflow Prevention Assembly Forward Flow Test

Each backflow prevention assembly must be tested at system flow demand, including all applicable hose streams, as specified in NFPA 13. The Contractor must provide all equipment and instruments necessary to conduct a complete forward flow test, including 65-mm/2.5-inch diameter hoses, playpipe nozzles or flow diffusers, calibrated pressure gauges, and pitot tube gauge. The Contractor must provide all necessary supports to safely secure hoses and nozzles during the test. At the system demand flow, the pressure readings and pressure drop (friction loss) across the assembly must be recorded. A metal placard must be provided on the backflow prevention assembly that lists the pressure readings both upstream and downstream of the assembly, total pressure drop, and the system test flow rate determined during the preliminary testing. The pressure drop must be compared to the manufacturer's data and the readings observed during the final inspections and tests.

3.9.3 System Tests

Test the system in accordance with the procedures outlined in NFPA 72. The required tests are as follows:

a. Loop Resistance Tests: Measure and record the resistance of each circuit with each pair of conductors in the circuit short-circuited at the farthest point from the circuit origin. The tests must be witnessed by the Contracting Officer and test results recorded for use at the final acceptance test.

b. Verify the absence of unwanted voltages between circuit conductors and ground. The tests must be accomplished at the preliminary test with results available at the final system test.

c. Verify that the control unit is in the normal condition as detailed in the manufacturer's O&M manual.

d. Test each initiating device[ and notification appliance] and circuit for proper operation and response at the control unit. Smoke detectors must be tested in accordance with manufacturer's recommended calibrated test method. Use of magnets is prohibited. Testing of duct smoke detectors must comply with the requirements of NFPA 72 except disconnect at least 20 percent of devices. If there is a failure at these devices, then supervision must be tested at each device.

e. Test the system for specified functions in accordance with the contract drawings and specifications and the manufacturer's O&M manual.

f. Test both primary power and secondary power. Verify, by test, the secondary power system is capable of operating the system for the time period and in the manner specified.

g. Determine that the system is operable under trouble conditions as specified.
h. Visually inspect wiring.

i. Test the battery charger and batteries.

j. Verify that software control and data files have been entered or programmed into the releasing control unit. Hard copy records of the software must be provided to the Contracting Officer.

k. Verify that red-line drawings are accurate.

l. Measure the current in circuits to ensure there is the calculated spare capacity for the circuits.

m. Measure voltage readings for circuits to ensure that voltage drop is not excessive.

n. Disconnect the verification feature for smoke detectors during tests to minimize the amount of smoke needed to activate the sensor. Testing of smoke detectors must be conducted using real smoke or the use of canned smoke which is permitted.

o. Measure the voltage drop at the most remote appliance (based on wire length) on each notification appliance circuit.

p. Verify the documentation cabinet is installed and contains all as-built shop drawings, product data sheets, design calculations, site-specific software data package, and all documentation required by paragraph titled "Test Reports".

3.9.4 Alarm Device Test

Each alarm switch/device must be tested by flowing water through the inspector's test connection.

[3.9.5 Audibility Tests]

Sound pressure levels from audible notification appliances must not exceed 110 dBA in occupiable areas. The provisions for audible notification (audibility) must be met with doors, fire shutters, movable partitions, and similar devices closed.

]3.9.6 Main Drain Flow Test

Following flushing of the underground piping, a main drain test must be made to verify the adequacy of the water supply. Static and residual pressures must be recorded on the certificate specified in paragraph SUBMITTALS.

3.9.7 Automatic Water Control Valves Trip Test

Each water control valve must be independently trip-tested in accordance with the manufacturer's published instructions. Each valve must be electrically trip-tested by actuating a respective heat detector, a manual actuation station connected to the system control unit and the manual release which is part of the valve trim. Each valve must be returned to normal condition after each test. Prior to trip testing sprinkler deluge system, precautionary steps must be taken to prevent water damage to the building and equipment from sprinkler discharge. Water delivery times must
be measured starting at the normal nitrogen pressure on the system. Control valves on preaction systems must remain open until piping is filled with water.

3.9.8 Supervisory Nitrogen System Test

**************************************************************************
NOTE: Delete this paragraph for deluge system applications and preaction systems not requiring supervisory nitrogen.
**************************************************************************

System supervisory nitrogen pressure must be reduced from the normal system pressure to the point at which a low-pressure alarm is sounded. Nitrogen pressure must be restored to verify trouble signal restoration. Automatic start/stop features of nitrogen generator must be tested.

3.10 SYSTEM ACCEPTANCE

Following acceptance of the system, as-built drawings and O&M manuals must be delivered to the Contracting Officer for review and acceptance. Submit six sets of detailed as-built drawings. The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final acceptance test of the system. At least one set of as-built (marked-up) drawings must be provided at the time of, or prior to the final acceptance test.

[ a. Provide one set of full size paper as-built drawings and schematics. The drawings must be prepared electronically and sized no less than the contract drawings.] [Furnish one set of CDs or DVDs containing software back-up and CAD based drawings in latest version of [MicroStation][AutoCAD, ]DXF and portable document formats of as-built drawings and schematics.]

b. Include complete wiring diagrams showing connections between devices and equipment, both factory and field wired.

c. Include a riser diagram and drawings showing the as-built location of devices and equipment.

d. Provide operating and maintenance (O&M) instructions.

3.11 ONSITE TRAINING

**************************************************************************
NOTE: The number of hours of instruction should be determined based on the number and complexity of the systems specified.
**************************************************************************

Conduct a training course for the responding fire department and operating and maintenance personnel as designated by the Contracting Officer. Training must be performed on two separate days (to accommodate different shifts of Fire Department personnel) for a period of [_____] [4] hours of normal working time and must start after the system is functionally complete and after the final acceptance test. The on-site training must cover all of the items contained in the approved Operating and Maintenance Instructions.
3.12 EXTRA MATERIALS

3.12.1 Repair Service/Replacement Parts

Repair services and replacement parts for the system must be available for a period of 10 years after the date of final acceptance of this work by the Contracting Officer. During the warranty period, the service technician must be on-site within 24 hours after notification. All repairs must be completed within 24 hours of arrival on-site.

During the warranty period, the installing fire alarm contractor is responsible for conducting all required testing and maintenance in accordance with the requirements and recommended practices of NFPA 72 and the system manufacturer[s]. Installing fire alarm contractor is NOT responsible for damage resulting from abuse, misuse, or neglect of equipment by the end user.

3.12.2 Spare Parts

Spare parts furnished must be directly interchangeable with the corresponding components of the installed system[s]. Spare parts must be suitably packaged and identified by nameplate, tagging, or stamping. Spare parts must be delivered to the Contracting Officer at the time of the final acceptance testing and must be accompanied by an inventory list.

3.12.3 Document Storage Cabinet

Upon completion of the project, but prior to project close-out, place in the document storage cabinet copies of the following record documentation:

a. As-built shop drawings
b. Product data sheets
c. Design calculations
d. Site-specific software data package
e. All documentation required by SD-06

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for deluge fire protection sprinkler systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information. The designer is permitted to edit any and all of this section for the project. If the designer is modifying/deleting non-bracketed items and text, the Designated Fire Protection Engineer (DFPE) should be consulted prior to incorporating final changes.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

For OCONUS projects, this specification section should be edited for specific Host Nation requirements. Coordinate compliance with Host Nation requirements with the DFPE.

NOTE: This specification section includes requirements from UFC 3-600-01 (change 4, 7 February 2020)
NOTE: Deluge systems are "open sprinkler" systems which discharge all sprinklers upon system actuation. The use of deluge systems should be limited to special hazard situations.

The Designer must edit this specification section for either a performance-designed system or a fully designed system as applicable.

This section is primarily intended for performance designed systems, e.g. systems where the size, layout, and support of branch lines and cross mains, and the layout of sprinklers will be designed by the Contractor.

This section is not intended to be used for NFPA 13D systems.

The Designer must provide the following information in the contract documents for performance designed systems. This information must be in accordance with UFC 3-600-01.

(1) Show the layout and size of all piping and equipment from the point of connection to the water supply, to the sprinkler riser. The contract drawings must include a detailed sprinkler riser diagram.

(2) Show location and size of service laterals, sprinkler risers, control valves, drain lines, sectional valves, and inspector's test valves and switches on the drawings.

(3) Specify waterflow data including hydrant flow test results, including the location where the hydrant flow test was conducted, the location and size of existing mains and new water supply lines that will serve the sprinkler system.

(4) Highlight or clearly indicate the area(s) to be protected by sprinklers on the drawings.

(5) Specify waterflow requirements including the design density, design area, the hose stream demand (including location of the hose stream demand), the duration of supply, and sprinkler spacing and area of coverage in this section.

(6) Show the location of the backflow preventer (including provisions for a drain and access for maintenance) on the drawings.

(7) Show all provisions necessary for forward flow
testing of the backflow preventer at system demand as required by NFPA 13 on the drawings.

(8) Highlight all concealed spaces on the drawings that require sprinkler protection, such as spaces above suspended ceilings that are built of combustible material or that can contain combustible materials, such as storage, and communication cabling that is not fire-rated.

(9) Provide details on the drawings of pipe restraints for underground piping. This includes details of pipe clamps, tie rods, mechanical retainer glands, and thrust blocks.

(10) Show location of the control unit, batteries and charger (if remotely mounted), supervising station transmitter, annunciator, primary power supply, remote annunciator, detectors, notification appliances (unless performance requirements are specified), and each alarm initiating device including fire extinguishing system switches.

(11) Show single-line releasing systems riser diagram. Each device on the riser should be identified by type. Indicate connection of equipment.

(12) Show a releasing system operating matrix. Show actions of input devices such as detectors, manual stations, waterflow switches, initiating devices, etc. on one axis and output functions such as door releases, smoke control fans, elevator relays, indicating/notification appliances etc. on the other. Entries which require descriptions, explanation of processes, sequences, interfaces, etc. can be flagged by symbols keyed to supplementary notes. Alternately provide a zone-by-zone sequence of operation or a schedule identifying all initiators, outputs, and interfaces.

SECTION 21 13 19 Page 10
1.2 SYSTEM DESCRIPTION

******************************************************************************
NOTE: Seismic protection/bracing is to be provided
for seismic design categories C or greater only,
unless specifically requested by the DFPE. Consideration should also be giving to utilizing seismic protection/bracing to limit pipe movement.

Provide [single-interlock][electric-pneumatic double-interlock]deluge[_____][sprinkler][water spray] system(s) in [areas indicated on the drawings][_____]. Except as modified herein, the system must meet the requirements of NFPA 13[ and ][NFPA 15] and NFPA 72. Pipe sizes which are not indicated on the Contract drawings must be determined by hydraulic calculations.

1.2.1 Hydraulic Design

**************************************************************************

NOTE: Applications requiring multiple densities/design areas must be referred to and shown on the drawings.

Discharge density for non-storage occupancies must be in accordance with UFC 3-600-01. Specific densities must be listed on the drawings or noted in the specification when drawings are not provided. Stating "comply with UFC 3-600-01 is not acceptable.

Hazard classification of miscellaneous storage must be per NFPA 13. Discharge density for the hazard classification must be per UFC 3-600-01.

The paragraph below must be listed on the drawings. If this information is not listed on the drawings, provide the information in paragraph 1.1.1.3 (with brackets completed).

Hydraulically design the system to discharge a minimum density [of [_____] L/min per square meter gpm/square foot over the hydraulically most demanding [280] [_____] square meters[_____] square feet of floor area][as indicated on the drawings]. Hydraulic calculations must be in accordance with the Area/Density Method of NFPA 13.

**************************************************************************

**************************************************************************

NOTE: The addition, modification or relocation of no more than twenty sprinklers to an existing system or modifications to existing sprinkler systems fed from domestic supplies are permitted to be designed using the pipe schedule method in NFPA 13 based on the layout of the existing system.

**************************************************************************

1.2.1.1 Basis for Calculations

**************************************************************************

NOTE: The design must include an adequate water supply to meet the sprinkler water demand. The designer must provide waterflow test results and hydraulic calculations to ensure that the system
demand will be met.

Design Calculations: The designer must provide detailed hydraulic calculations that clearly demonstrate that the water supply will meet the demand of the sprinkler system and hose streams. Calculations must be submitted with the concept design submission.

A water flow test was performed on (DATE) at (LOCATION) and resulted in a static pressure of [____ kPapsi] with a residual pressure of [____ kPapsi] while flowing [____ L/min] gpm. Perform a fire hydrant flow test prior to shop drawing submittal in accordance with NFPA 291. Results must include hydrant elevations relative to the building and hydrant number/identifiers for the tested hydrants, including which were flowed, which had a gauge. This information must be presented in a tabular form if multiple hydrants were flowed. The results must be included with the hydraulic calculations. Hydraulic calculations must be based on flow test noted in this paragraph, unless verified by the NAVFAC[ ____] Fire Protection Engineer and approved by Contracting Officer. Hydraulic calculations must be based upon the Hazen-Williams formula with a "C" value noted in NFPA 13 for piping, [and [____] for existing underground piping].[ Hydraulic calculations must be based on operation of the fire pump(s) provided in Section 21 30 00 FIRE PUMPS.] [The minimum residual pressure in a service lateral (lead-in) at the [design flow rate] [150% of the fire pump rated flow] must be 138 kPa20 psi at [the inlet to the backflow preventer] [the suction side of the fire pump].]

1.2.1.2 Hydraulic Calculations

a. Water supply curves and system requirements must be plotted on semi-logarithmic graph (N^1.85) paper so as to present a summary of the complete hydraulic calculation.

b. Provide a summary sheet listing sprinklers in the design area and their respective hydraulic reference points, elevations, minimum discharge pressures and minimum flows. Elevations of hydraulic reference points (nodes) must be indicated.

c. Documentation must identify each pipe individually and the nodes connected thereto. Indicate the diameter, length, flow, velocity, friction loss, number and type fittings, total friction loss in the pipe, equivalent pipe length and Hazen-Williams coefficient for each pipe.

d. Where the sprinkler system is supplied by interconnected risers, the sprinkler system must be hydraulically calculated using the hydraulically most demanding single riser. The calculations must not assume the simultaneous use of more than one riser.

e. All calculations must include the backflow preventer manufacturer's stated friction loss at the design flow or [83 kPa12 psi for reduced pressure] [55 kPa8 psi for double check] backflow preventer, whichever is greater.

f. All calculations must be performed back to the actual location of the flow test, taking into account the direction of flow in the service main at the test location.
1.2.1.3 Design Criteria

Hydraulically design the system to discharge a minimum density [of [_____] L/min per square meter/gpm/square foot] over the hydraulically most demanding [_____] square meters/square feet of floor area [as indicated on the drawings]. Hydraulic calculations must be in accordance with the Area/Density Method of NFPA 13. Add an allowance for exterior hose streams of [_____] L/min gpm to the sprinkler system demand [at the fire hydrant shown on the drawings closest to the point where the water service enters the building] [at the point of connection to the existing water system]. [An allowance for interior hose stations of [_____] L/min gpm must also be added to the sprinkler system demand.]

1.2.2 Sprinkler Coverage

*************************************************************************
**NOTE:** The exception in NFPA 13 to eliminate sprinklers in electrical rooms is not applicable per UFC 3-600-01.
*************************************************************************

Sprinklers must be uniformly spaced on branch lines. Provide coverage throughout 100 percent of the [building][area noted on the Contract drawings]. This includes, but is not limited to, telephone rooms, electrical equipment rooms (regardless of the fire resistance rating of the enclosure), boiler rooms, switchgear rooms, transformer rooms, attached electrical vaults and other electrical and mechanical spaces. Coverage per sprinkler must be in accordance with NFPA 13. Provide sprinklers below all obstructions in accordance with NFPA 13. Exceptions are as follows:

a. Sprinklers may be omitted from small rooms which are exempted for specific occupancies in accordance with NFPA 101.

1.2.3 Control System

The control system must meet the requirements of NFPA 72. The control unit must be listed for "Releasing Device Service". The control unit and the solenoid valve that activates the water control valves must be compatible with each other. Compatibility must be in accordance with the specific listing of the control equipment.

1.2.3.1 Circuit Requirements

Connect alarm initiating devices to initiating device circuits (IDC), Class [B][_____] or to signal line circuits (SLC), Class [B][_____] in accordance with NFPA 72. [Alarm notification or indicating appliances must be connected to notification appliance circuit (NAC), Class [B][_____] in accordance with NFPA 72.] Provide a separate circuit for actuation of each individual automatic water control valve. Fully supervise the circuits that actuate the water control valves so that the occurrence of a single open or a single ground fault condition in the interconnecting conductors will be indicated at the control unit.

1.2.4 System Operational Features

*************************************************************************
**NOTE:** Delete manual actuation stations when not required.
*************************************************************************
Include in the system a detection system, manual actuation stations, supervisory and alarm switches, alarm notification appliances, control unit and associated equipment.

1.2.4.1 System Actuation

Activation of [a single][two][ smoke][ heat] detector[s] [or a single manual actuation station] must actuate alarm zone circuits of the control unit that, in turn, must actuate the corresponding automatic water control valve. Actuation of the automatic water control valve must cause water to [fill the discharge piping][discharge from the open sprinklers of the deluge system].

1.2.4.2 Alarm Functions

NOTE: Drawings must indicate and detail the connection of the system control unit to the building alarm system and/or to the base-wide fire reporting system.

Activation of a [heat detector][smoke detector], sprinkler pressure (waterflow) alarm switch or manual actuation station must cause the illumination of the respective device at the releasing control unit, and [activation of the building fire alarm system][transmission of the alarm to the base-wide fire reporting system].

1.2.4.3 Supervisory Functions

Valve tamper switches must be monitored by the releasing control unit and transmitted to the building fire alarm system as a supervisory condition.

1.2.5 Qualified Fire Protection Engineer (QFPE)

NOTE: UFC 3-600-01 requires that shop drawings must bear the Review Stamp and professional engineering stamp of the QFPE prior to submission to the Government for approval.

NOTE: The term Qualified Fire Protection Engineer (QFPE) should be considered interchangeable with the terms "Fire Protection Designer of Record (FPDOR)" and/or "Fire Protection QC Specialist" where referred to in other applicable contract documents. The intent of defining the QFPE roles and responsibilities here is NOT to require personnel in addition to the QFPE, FPDOR, and/or FPQC specialist referenced elsewhere in the applicable contract documents.

An individual who is a licensed professional engineer (P.E.) who has passed the fire protection engineering written examination administered by the
National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience. Services of the QFPE must include:

a. Reviewing SD-02, SD-03, and SD-05 submittal packages for completeness and compliance with the provisions of this specification. Working (shop) drawings and calculations must be prepared by, or prepared under the immediate supervision of, the QFPE. The QFPE must affix their professional engineering stamp with signature to the shop drawings, calculations, and material data sheets, indicating approval prior to submitting the shop drawings to the DFPE.

b. Provide a letter documenting that the SD-02, SD-03, and SD-05 submittal package has been reviewed and noting all outstanding comments.

c. Performing in-progress construction surveillance prior to installation of ceilings (rough-in inspection).

e. Signing applicable certificates under SD-07.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed
item for Army projects.

NOTE: When 20 or less sprinklers are added, modified or relocated, shop drawings, hydraulic calculations and product data are not required to be submitted. Edit this section accordingly.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Partial submittals and submittals not fully complying with NFPA 13 and this specification section must be returned disapproved without review. SD-02, SD-03 and SD-05 must be submitted simultaneously.

Shop drawings (SD-02), product data (SD-03) and calculations (SD-05) must be prepared by the designer and combined and submitted as one complete package. The QFPE must review the SD-02/SD-03/SD-05 submittal package for completeness and compliance with the Contract provisions prior to submission to the Government. The QFPE must provide a Letter of Confirmation that they have reviewed the submittal package for compliance with the contract provisions. This letter must include their professional engineer stamp and signature. Partial submittals and submittals not reviewed by the QFPE must be returned disapproved without review.

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 TECHNICAL DATA AND SITE-SPECIFIC SOFTWARE

Technical data and site-specific software (meaning technical data that relates to computer software) that are specifically identified in this project, and may be required in other specifications, must be delivered, strictly in accordance with the CONTRACT CLAUSES. The releasing system manufacturer must submit written confirmation of this contract provision as "Releasing System Site-Specific Software Acknowledgement". Identify data delivered by reference to the specification paragraph against which it is furnished. Data to be submitted must include complete system, equipment, and software descriptions. Descriptions must show how the equipment will operate as a system to meet the performance requirements of this contract. The site-specific software data package must also include the following:
a. Items identified in NFPA 72, titled "Site-Specific Software".

b. Identification of programmable portions of the system equipment and capabilities.

c. Description of system revision and expansion capabilities and methods of implementation detailing both equipment and software requirements.

d. Provision of operational software data on all modes of programmable portions for foam releasing system.

e. Description of releasing system equipment operation.

f. Description of auxiliary and remote equipment operations.

g. Library of application software.

h. Operation and maintenance manuals.

1.5 QUALITY ASSURANCE

1.5.1 Preconstruction Submittals

Within 36 days of contract award but no less than [14 days] prior to commencing work on site, the prime Contractor must submit the following for review and approval. SD-02, SD-03 and SD-05 submittals received prior to the review and approval of the qualifications will be returned Disapproved Without Review.

1.5.1.1 Shop Drawing

[___] copies of the shop drawings, no later than 28 days prior to the start of system installation. Working drawings conforming to the requirements prescribed in NFPA 13 and must be no smaller than [ISO A1][ANSI D][the Contract Drawings]. Each set of drawings must include the following:

1. A descriptive index with drawings listed in sequence by number. A legend sheet identifying device symbols, nomenclature, and conventions used in the package.

2. Floor plans drawn to a scale not less than 1:100 1/8-inch equals 1-foot clearly showing locations of devices, equipment, risers, electrical power connections and other details required to clearly describe the proposed arrangement.

3. Actual center-to-center dimensions between sprinklers on branch lines and between branch lines; from end sprinklers to adjacent walls; from walls to branch lines; from sprinkler feed mains, cross mains and branch lines to finished floor and roof or ceiling. A detail must show the dimension from the sprinkler and sprinkler deflector to the ceiling in finished areas.

4. Longitudinal and transverse building sections showing typical branch line and cross main pipe routing, elevation of each typical sprinkler above finished floor and elevation of "cloud" or false ceilings in relation to the building ceilings.

5. Plan and elevation views which establish that the equipment will fit the allotted spaces with clearance for installation and maintenance.
6. Riser layout drawings drawn to a scale of not less than 1:25 1/2-inch equals 1-foot to show details of each system component, clearances between each other and from other equipment and construction in the room.

7. Details of each type of riser assembly, pipe hanger, [sway bracing for earthquake protection, ]and restraint of underground water main at point-of-entry into the building, and electrical devices and interconnecting wiring. The dimension from the edge of vertical piping to the nearest adjacent wall(s) must be indicated on the drawings when vertical piping is located in stairs or other portions of the means of egress.

8. Details of each type of pipe hanger[, seismic bracing/restraint] and related components.

[9. Include fire pump curve with shop drawings and hydraulic calculations.]

10. Point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the RCU and remote fire alarm control units, initiating circuits, switches, relays and terminals.

11. Complete riser diagrams indicating the wiring sequence of devices and their connections to the control equipment. Include a color code schedule for the wiring. Include floor plans showing the locations of devices and equipment.

1.5.1.2 Notification Appliances

Calculations and supporting data on each circuit to indicate that there is at least [25][___] percent spare capacity for notification appliances. Annotate data for each circuit on the drawings.

1.5.1.3 Initiating Devices

Calculations and supporting data on each circuit to indicate that there is at least [25][___] percent spare capacity for initiating devices. Annotate data for each circuit on the drawings.

1.5.1.4 Battery Power

Provide battery calculations as required in paragraph Battery Power Calculations for alarm, alert, and supervisory power requirements. Calculations including ampere-hour requirements for each system component and each control unit component, and the battery recharging period, must be included on the drawings.

1.5.1.5 Voltage Drop Calculations

Voltage drop calculations for each notification circuit indicating that sufficient voltage is available for proper operation of the system and all components, at a minimum rated voltage of the system operating on batteries. Include the calculations on the system layout drawings.
1.5.1.6 Product Data

[_____] copies of annotated catalog data to show the specific model, type, and size of each item. Catalog cuts must indicate the NRTL listing. The data must be highlighted to show model, size, options, and other pertinent information, that are intended for consideration. Data must be adequate to demonstrate compliance with all contract requirements. Product data for all equipment must be combined into a single submittal.

1.5.1.7 Air Sampling Smoke Detection System Calculations

Submit air sampling detection system design analysis calculations consisting of battery capacity, loading calculations, and fan speed and air flow/transport calculations. Include schematic diagrams showing pipe segments, pipe diameters, lengths of pipe, node numbers, and sample port diameters to verify the requirements are met.

1.5.1.8 Hydraulic Calculations

**************************************************************************
NOTE: Include the first bracketed item for Army Corps projects.
**************************************************************************

Calculations must be as outlined in NFPA 13 except that calculations must be performed by computer using software intended specifically for fire protection system design using the design data shown on the drawings.[ Calculations must include isometric diagram indicating hydraulic nodes and pipe segments.][ Include fire pump curve with submittal.]

1.5.1.9 Voltage Drop Calculations

Voltage drop calculations for each notification circuit indicating that sufficient voltage is available for proper operation of the system and all components, at a minimum rated voltage of the system operating on batteries. Include the calculations on the system layout drawings.

1.5.1.10 Operating and Maintenance (O&M) Instructions

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA as supplemented and modified by this specification section.

Provide [six][_____] manuals[ and one pdf version on electronic media]. The manuals must include the manufacturer's name, model number, parts list, list of parts and tools that should be kept in stock by the owner for routine maintenance, simplified wiring and controls diagrams, troubleshooting guide, and recommended service organization (including address and telephone number) for each item of equipment.[ Each service organization submitted must be capable of providing [4][_____] -hour on-site response to a service call on an emergency basis.]

Submit spare parts data for each different item of material and equipment specified. The data must include a complete list of parts and supplies, and a list of parts recommended by the manufacturer to be replaced after 1-year and 3 years of service. Include a list of special tools and test equipment required for maintenance and testing of the products supplied.
1.5.2 Qualifications

**************************************************************************
NOTE: NICET (National Institute for Certification in Engineering Technologies) establishes the qualifications of an individual as an Engineering Technologist with verification of experience by having a current NICET certification.
**************************************************************************

1.5.2.1 Sprinkler System Designer

The sprinkler system designer must be certified as a Level [III][IV] Technician by National Institute for Certification in Engineering Technologies (NICET) in the Water-Based Systems Layout subfield of Fire Protection Engineering Technology in accordance with NICET 1014-7.

1.5.2.2 Sprinkler System Installer

The sprinkler system installer must be regularly engaged in the installation of the type and complexity of system specified in the contract documents, and must have served in a similar capacity for at least three systems that have performed in the manner intended for a period of not less than 6 months.

1.5.2.3 Releasing System Designer

The system designer must be certified as a Level [III][IV] (minimum) Technician by National Institute for Certification in Engineering Technologies (NICET) in the Fire Alarm Systems subfield of Fire Protection Engineering Technology in accordance with NICET 1014-7, or meet the qualifications for a QFPE.

1.5.2.4 Releasing System Technician

Fire alarm technicians with a minimum of four years of experience must be utilized to install and terminate devices, cabinets and control units. The fire alarm technicians installing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings[, and must be thoroughly experienced in the design and installation of air sampling detection systems].

1.5.2.5 Releasing System Installer

[Fire alarm installer with a minimum of two years of experience utilized to assist in the installation of devices, cabinets and control units. ][NICET Level II technician to assist in the installation of devices, cabinets and control units. ]A licensed electrician must be allowed to install wire, cable, conduit and backboxes for the system. The fire alarm installer must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.5.3 Regulatory Requirements

Equipment and material must be listed or approved. Listed or approved, as used in this Section, means listed, labeled or approved by a Nationally Recognized Testing Laboratory (NRTL) such as UL Fire Prot Dir or FM APP GUIDE. The omission of these terms under the description of an item of equipment described must not be construed as waiving this requirement.
All listings or approvals by testing laboratories must be from an existing ANSI or UL published standard. The recommended practices stated in the manufacturer's literature or documentation are mandatory requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, excessive humidity and temperature variations, dirt and dust, or other contaminants. All pipes must be either capped or plugged until installed.

1.7 EXTRA MATERIALS

Spare sprinklers and wrench(es) must be provided as spare parts in accordance with NFPA 13.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials, equipment, and devices listed for fire protection service when so required by NFPA 13 or this specification. Select material from one manufacturer, where possible, and not a combination of manufacturers, for a classification of materials. Material and equipment must be the standard products of a manufacturer regularly engaged in the manufacture of the products for at least [2][_____] years prior to bid.

2.1.2 Nameplates

Major components of equipment must have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new name plate permanently affixed to the item or equipment. Nameplates must be etched metal or plastic, permanently attached by screws to control units, panels or adjacent walls.

2.1.3 Identification and Marking

Pipe and fitting markings must include name or identifying symbol of manufacturer and nominal size. Pipe must be marked with ASTM designation. Valves and equipment markings must have name or identifying symbol of manufacturer, specific model number, nominal size, name of device, arrow indicating direction of flow, and position of installation (horizontal or vertical), except if valve can be installed in either position. Markings must be included on the body casting or on an etched or stamped metal nameplate permanently on the valve or cover plate.

2.1.4 Keys

Keys and locks for equipment, control units, panels and devices must be identical.[ Master all keys and locks to a single key as required by the [Installation Fire Department][______].][ Keys must be CAT [60][______].]

2.1.5 Pressure Ratings

Valves, fittings, couplings, alarm switches, and similar devices must be rated for the maximum working pressures that can be experienced in the system, but in no case less than [1207][1724] kPa [175][250] psi.
2.1.6 Instructions

Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. Install the instructions on the interior of the RCU. Install the frame in a conspicuous location observable from the RCU. The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions and their mounting location must be approved by the Contracting Officer before being posted.

2.2 UNDERGROUND PIPING COMPONENTS

**************************************************************************

NOTE: The design drawings must show the service connection details and the underground service lateral for the sprinkler system. The drawings must show details of the water service point-of-entry into the building and through the floor slab, and underground piping restraints, including number and size of restraining rods and thrust blocks. 4-inch piping is the minimum permitted for service laterals serving NFPA 13R systems. 6-inch piping is the minimum permitted for NFPA 13 systems.

**************************************************************************

2.2.1 Pipe

Pipe must comply with NFPA 24. Minimum pipe size is [100 mm 4 inches][150 mm 6 inches]. Piping more than 1.50 meters 5 feet outside the building walls must comply with Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING. A continuous section of welded stainless steel fire water service piping from a point outside the building perimeter to a flanged fitting at least 304 mm 1-foot above the finished floor within the building is acceptable.

2.2.2 Fittings and Gaskets

Fittings must be ductile-iron conforming to AWWA C110/A21.10 with cement mortar lining conforming to AWWA C104/A21.4. Gaskets must be suitable in design and size for the pipe with which such gaskets are to be used. Gaskets for ductile-iron pipe joints must conform to AWWA C111/A21.11.

2.2.3 Gate Valve[ and Indicator Posts]

**************************************************************************

NOTE: This paragraph will be deleted if underground valves are either not required or are specified elsewhere.

**************************************************************************

Installation must comply with NFPA 24. Gate valves for use with indicator post must conform to UL 262. [ Indicator posts must conform to UL 789. Provide each indicator post with one coat of primer and two coats of red enamel paint.]

[2.2.4 Valve Boxes

Except where indicator posts are provided, for each buried valve, provide a
cast-iron, ductile-iron, or plastic valve box of a suitable size. Plastic boxes must be constructed of acrylonitrile-butadiene-styrene (ABS) or inorganic fiber-reinforced black polyolefin. Provide cast-iron, ductile-iron, or plastic cover for valve box with the word "WATER" cast on the cover. The minimum box shaft diameter must be 133 mm5.25 inches. Coat cast-iron and ductile-iron boxes with bituminous paint applied to a minimum dry-film thickness of 0.254 mm10 mils.

2.2.5 Buried Utility Warning and Identification Tape

Provide detectable aluminum foil plastic backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape must be detectable by an electronic detection instrument. Provide tape, 80 mm3 inches minimum width, color coded for the utility involved with warning and identification imprinted in bold block letters continuously and repeatedly over the entire tape length. Warning and identification must read "CAUTION BURIED WATER PIPING BELOW" or similar wording. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material.

2.3 ABOVEGROUND PIPING COMPONENTS

**************************************************************************
NOTE: Specify steel piping exposed to the weather or corrosive atmospheres to properly protect against corrosive effects.

NOTE: GALVANIZED PIPING IS ONLY PERMITTED FOR DELUGE SYSTEMS, VALVE TRIM PIPING AND DRAIN PIPING WHEN EXPOSED TO THE EXTERIOR.
**************************************************************************

2.3.1 Steel Piping Components

2.3.1.1 Steel Pipe

**************************************************************************
NOTE: For DLA, use Schedule 40 steel pipe only.

NOTE: Grooved pipe must be cut grooved for WHS projects.
**************************************************************************

Except as modified herein, steel pipe must be black or galvanized as permitted by NFPA 13 and conform to the applicable provisions of ASTM A53/A53M, ASTM A135/A135M or ASTM A153/A153M.

[Steel pipe must be minimum Schedule 40 for sizes 50 mm2 inches and less; and minimum Schedule 10 for sizes larger than 50 mm2 inches.] Steel piping with wall thickness less than Schedule 40 must not be threaded. [Grooved pipe must be roll-grooved.]

2.3.1.2 Fittings

Fittings must be welded, threaded, or grooved-end type. Threaded fittings must be cast-iron conforming to ASME B16.4, malleable-iron conforming to ASME B16.3 or ductile-iron conforming to ASTM A536. Plain-end fittings with mechanical couplings, fittings that use steel gripping devices to bite into the pipe, steel press fittings and field welded fittings must not be
permitted. Fittings, mechanical couplings, and rubber gaskets must be supplied by the same manufacturer. Threaded fittings must use Teflon tape or manufacturer's approved joint compound. Saddle tees using rubber gasketed fittings are permitted only when connecting to existing piping for additions or modifications. Saddle tees must use a connection method that completely wraps around the pipe. Reducing couplings are not permitted except as allowed by NFPA 13.

2.3.1.3 Grooved Mechanical Joints and Fittings

Joints and fittings must be designed for not less than 1200 kPa (175 psi) service and must be the product of the same manufacturer. Field welded fittings must not be used. Fitting and coupling housing must be malleable-iron conforming to ASTM A47/A47M, Grade 32510; ductile-iron conforming to ASTM A536, Grade 65-45-12. Rubber gasketed grooved-end pipe and fittings with mechanical couplings must be permitted in pipe sizes 50 mm and larger. Gasket must be the flush type that fills the entire cavity between the fitting and the pipe. Nuts and bolts must be heat-treated steel conforming to ASTM A183 and must be cadmium-plated or zinc-electroplated.

2.3.1.4 Flanges

Flanges must conform to NFPA 13 and ASME B16.1. Gaskets must be non-asbestos compressed material in accordance with ASME B16.21, 1.6 mm 1/16-inch thick, and full face or self-centering flat ring type.

[2.3.2 Copper Tube Components

2.3.2.1 Copper Tube

Copper tube must conform to ASTM B88/ASTM B88, Types L and M.

2.3.2.2 Copper Fittings and Joints

Cast copper alloy solder-joint pressure fittings must conform to ASME B16.18 and wrought copper and bronze solder-joint pressure fittings must conform to ASME B16.22 and ASTM B75/B75M. Cast copper alloy fittings for flared copper tube must conform to ASME B16.26 and ASTM B62. Brass or bronze adapters for brazed tubing may be used for connecting tubing to flanges and to threaded ends of valves and equipment.

2.3.3 Pipe Hangers and Supports

**************************************************************************
NOTE: Seismic parameters must follow UFC 3-301-01 Structural Engineering. The writer of this section must coordinate with the Structural Engineer or Government to determine the proper seismic design category for the project, in accordance with the IBC or ASCE guidelines. See UFC 3-310-04 for more information.
**************************************************************************

Provide galvanized pipe hangers[, supports and seismic bracing][and supports] in accordance with NFPA 13.[ Design and install seismic protection in accordance with the requirements of NFPA 13 section titled "Protection of Piping Against Damage Where Subject to Earthquakes for Seismic Design Category ["D"]].
2.3.4 Valves

Provide valves of types approved for fire service. Valves must open by counterclockwise rotation.

2.3.4.1 Control Valve

Manually operated sprinkler control/gate valve must be [outside stem and yoke (OS&Y) type] [or] [butterfly type] [as indicated on the drawings] and must be listed.

2.3.4.2 Check Valves

Check valves must comply with UL 312. Check valves 100 mm 4 inches and larger must be of the swing type, have a clear waterway and meet the requirements of MSS SP-71, for Type 3 or 4. Inspection plate must be provided on valves larger than 150 mm 6 inches.

2.3.4.3 Hose Valve

**************************************************************************
NOTE: Hose valves are required as part of the backflow prevention test header.
**************************************************************************

Valve must comply with UL 668.

2.4 AUTOMATIC WATER CONTROL VALVE (DELUGE VALVE)

**************************************************************************
NOTE: "Automatic water control valve" is a generic term synonymous with "deluge valve" and is used for both preaction and deluge systems. "Automatic water control valve" is consistent with what is used in the UL Fire Protection Equipment Directory. Delete reset capability when not required.
**************************************************************************

Automatic water control valve (deluge valve) must be [electrically] [hydraulically] [pneumatically]-actuated and rated for a working pressure of 1207 kPa 175 psi. Valve must be capable of being reset without opening the valve. Electrical solenoid valve used to actuate the water control valve must be an integral component of the valve or must be approved for use by the water control valve manufacturer. Solenoid valve must be rated at 24 volts direct current, and must be normally closed type that operates when energized. Solenoid valves must be rated for a maximum pressure differential of 1207 kPa 175 psi. Water control valve must be equipped with a means to prevent the valve from returning to the closed position until being manually reset. Assembly must be complete with the valve manufacturer's standard trim piping, drain and test valves, pressure gauges, and other required appurtenances. Include with each assembly an emergency release device for manually tripping the water control valve in the event of a power or other system failure. Device must be a standard accessory component of the valve manufacturer and labeled as to its function and method of operation. Valves located in hazardous locations must be approved for the hazard classification of the area where located.
2.5 ALARM INITIATING AND SUPERVISORY DEVICES

2.5.1 Sprinkler Alarm Switch

pressure-type flow switch(es). [Connection of switch must be by the fire alarm installer].

2.5.2 Valve Supervisory (Tamper) Switch

Switch must be integral to the control valve or suitable for mounting to the type of control valve to be supervised open. The switch must be tamper resistant and contain SPDT (Form C) contacts arranged to transfer upon removal of the housing cover or closure of the valve of more than two rotations of the valve stem.

2.6 BACKFLOW PREVENTION ASSEMBLY

**************************************************************************
NOTE: Indicate piping, type of connection and equipment, such as a test header with hose valves, required for flow testing of the backflow preventer at full system demand as required by NFPA 13. Arrangement of test assembly should be coordinated with the installation.
**************************************************************************

[Reduced-pressure principle][Double-check] valve assembly backflow preventer complying with ASSE 1013, ASSE 1015 and AWWA M14. Each check valve must have a drain. Backflow prevention assemblies must have current "Certificate of Approval from the Foundation for Cross-Connection Control and Hydraulic Research, FCCCHR List" and be listed for fire protection use. Listing of the specific make, model, design, and size in the FCCCHR List must be acceptable as the required documentation.

2.6.1 Backflow Preventer Test Connection

Test connection must consist of a series of listed hose valves with 65-mm 1/2-inch National Standard male hose threads with cap and chain.

2.7 FIRE DEPARTMENT CONNECTION

**************************************************************************
NOTE: The designer will coordinate the desired location and thread type for the fire department connection with the responding fire department.
**************************************************************************

Fire department connection must be [freestanding][projecting][flush] type with cast-brass body, matching [wall] escutcheon lettered "Auto Spkr" with a [polished-brass][chromium-plated] finish. [The connection must have individual self-closing clappers, caps with drip drains and chains.] Female inlets must have [65-mm 1/2-inch][100-mm 4-inch][125-mm 5-inch] [_____] diameter [American National Fire Hose Connection Screw Threads (NH) per NFPA 1963] [Storz][______]. Comply with UL 405.

2.8 SPRINKLERS

**************************************************************************
NOTE: The designer will indicate on the contract
drawings the type of sprinklers for each area if more than one type of sprinkler is to be provided. Delete sprinkler types from this paragraph that are not intended for use in the system(s) used in the Contract.

Areas that are classified as light hazard will be equipped with quick-response sprinklers.

Sprinklers must comply with UL 199 or UL 2351 and NFPA 13. Sprinklers with internal O-rings are not acceptable. Sprinklers in high heat areas including attic spaces or in close proximity to unit heaters must have temperature classification in accordance with NFPA 13. Extended coverage sprinklers are permitted for loading docks, residential occupancies and high-piled storage applications only. Sprinklers for deluge systems must be open type without the fusible element.

2.8.1 Pendent Sprinkler

Pendent sprinkler must be [recessed][quick-response][dry pendent] type with nominal K-factor of [80][115][160][_____] [5.6][8.0][11.2][_____]. Pendent sprinklers must have a [polished chrome][stainless steel][white polyester][_____] finish. Assembly must include an integral escutcheon.

2.8.2 Upright Sprinkler

Upright sprinkler must be [brass][chrome-plated][stainless steel][white polyester][quick-response type][_____] with nominal K-factor of [80][115][160][_____] [5.6][8.0][11.2][_____].

2.8.3 Sidewall Sprinkler

Sidewall sprinkler must be the [quick-response][standard-response][recessed][dry sidewall] type. Sidewall sprinkler must have a nominal K-factor of [80][115][160][_____] [5.6][8.0][11.2][_____] . Sidewall sprinkler must have a [brass][polished-chrome][stainless steel][white polyester][_____] finish.

2.8.4 Corrosion-Resistant Sprinkler

NOTE: The use of corrosion-resistant sprinklers is generally limited to industrial type occupancies such as electroplating, steam rooms, salt storage, and piers and wharves.

Corrosion-resistant sprinkler must be the [upright][pendent] type installed in locations as indicated. Corrosion-resistant coatings must be factory-applied by the sprinkler manufacturer.

2.9 ACCESSORIES

2.9.1 Sprinkler Cabinet

Spare sprinklers must be provided in accordance with NFPA 13 and must be placed in a suitable metal or plastic cabinet of sufficient size to accommodate all the spare sprinklers and wrenches in designated locations.
Spare sprinklers must be representative of, and in proportion to, the number of each type and temperature rating of the sprinklers installed as required by NFPA 13. At least one wrench of each type required must be provided.

2.9.2 Pendent Sprinkler Escutcheon

Escutcheon must be one-piece metallic type with a depth of less than 19 mm 3/4-inch and suitable for installation on pendent sprinklers. The escutcheon must have a factory finish that matches the pendent sprinkler.

2.9.3 Pipe Escutcheon

Provide split hinge metal plates for piping entering walls, floors, and ceilings in exposed spaces. Provide polished stainless steel plates or chromium-plated finish on copper alloy plates in finished spaces. Provide paint finish on metal plates in unfinished spaces.

2.9.4 Sprinkler Guard

Listed guard must be a steel wire cage designed to encase the sprinkler and protect it from mechanical damage. Guards must be provided on sprinklers located [_____] within 2.1 meters 7 feet of the floor as indicated.

2.9.5 Relief Valve

Relief valves must be listed and installed at the riser in accordance with NFPA 13.

2.9.6 Identification Sign

Valve identification sign must be minimum 150 mm wide by 50 mm high 6 inches wide by 2 inches high with enamel baked finish on minimum 1.214-mm 18 gage steel or 0.6-mm 0.024-inch aluminum with red letters on a white background or white letters on red background. Wording of sign must include, but not be limited to "main drain", "auxiliary drain", "inspector's test", "alarm test", "alarm line", and similar wording as required to identify operational components. Where there is more than one sprinkler system, signage must include specific details as to the respective system.

2.10 RELEASING CONTROL UNIT (RCU)

The RCU must be listed, analog-addressable and compatible with the system, devices and functions specified. Route all supervision of the RCU through the main FACU. The RCU must perform all functions necessary to operate the system detection, actuation, and auxiliary functions independent of the FACU. The control system must be microprocessor-based utilizing distributed processing concept. A single microprocessor failure must not impact operation of additional modules on the system. The control system must be capable of supporting an air aspirating smoke detection system. The control system's initiating circuits must be capable of Class A or Class B operation. The solenoid must be listed for use with the releasing unit and extinguishing equipment. Each circuit must be capable of monitoring contact devices configured for manual release, trouble input or auxiliary (non-fire) input. The RCU must contain release circuits for activation of an extinguishing system[s]. Each release circuit must be capable of Class B operation. The RCU must contain at least two notification appliance circuits for annunciation. Each notification circuit must be capable of Class A or Class B operation. Provide
alarm/trouble reset switches to reset a cleared device in alarm or trouble. Alarm or trouble signals are not to be self-restoring without activating the switch.

Annunciator must be integral with the RCU. Annunciation must be by an indicator lamp, alphanumeric display, or other equivalent means in which each indication provides status information about a circuit, condition, or location and visible through the cabinet door. Supervision is not required provided that a fault in the annunciator circuits results only in loss of annunciation and does not affect the normal functional operation of the remainder of the system. Ensure each visible indicator provides specific identification of the [zone][area][device]. Do not use generic nondescript wording such as "Zone 1", or "Zone 2", for the label identification.

An operator at the RCU, having the proper access level must have the capability to manually access the following information for each initiating device:

a. Primary status.
b. Device type.
c. Present average value.
d. Present sensitivity selected.
e. Sensor range (normal, dirty, etc).

2.11 ANNUNCIATOR

[2.11.1 Remote Annunciator Panel

**************************************************************************
NOTE: Provide a remote annunciator only for very large spaces with 10 or more smoke detectors.
**************************************************************************

Provide a [semi-recessed][flush] mounted annunciator that includes an LCD display. The display must indicate the device in trouble/alarm or the supervisory device. Display the device name, address[, and actual building location]. The remote annunciator must duplicate functions of the RCU for message display, fire alarm, supervisory alarm, and trouble conditions, visual and audible notification, and system reset functions. Remote annunciator must require the use of a key for accessing the reset, control and other functions.

][2.11.2 Graphic Annunciator Panel

**************************************************************************
NOTE: Graphic annunciator panels should be provided only when a large number of concealed devices are installed. Normally, exposed devices will be annunciated by zone only on the fire alarm control unit zone annunciator and remote zone annunciator. Edit accordingly. Locate panel(s) at or near building entrance to allow fire department quick access to panel.
**************************************************************************
Panel must be of the [interior][weatherproof] type, [flush][surface][pedestal]-mounted. Panel must be provided with the [building][room] floor plan, drawn to scale, with alarm lamps mounted to represent the location of [each concealed detector][each initiating device]. Panel graphic must also show the locations of the annunciator panel and control unit, and must have a "you are here" arrow showing its location. Orient building floor plan on graphic to location of person viewing the graphic, i.e. the direction the viewer is facing must be toward the top of the graphic display. Provide a North arrow.[ Principal rooms and areas shown must be labeled with room numbers or titles.] Detectors mounted above ceilings[, on ceilings,,] and beneath raised floors and different types of initiating devices must have different symbols or lamps of different colors for identification. Lamps must illuminate upon activation of corresponding device and must remain illuminated until the system is reset. Panel must have a lamp test switch.

2.11.2.1 Materials

Construct the graphic annunciator face plate of [smoked Plexiglas][non-glare matte finish][anodized bronze][anodized aluminum]. The face plate must be backlit with LEDs. Control equipment and wiring must be housed in a [recessed][semi-recessed][surface mounted] back box. The exposed portions of the back box must be [chrome plated][anodized bronze][anodized aluminum] without knockouts.

2.11.2.2 Programming

Where programming for the operation of the graphic annunciator is accomplished by a separate software program other than the software for the RCU, the software program must not require reprogramming after loss of power. The software must be reprogrammable in the field.

2.12 SMOKE DETECTORS

2.12.1 Photoelectric Smoke Detectors

Smoke detector must be photoelectric type and listed for use with the RCU.

a. Provide analog/addressable photoelectric smoke detectors utilizing the photoelectric light scattering principle for operation in accordance with UL 268. Smoke detectors must be listed for use with the RCU.

b. Provide self-restoring type detectors that do not require readjustment after actuation at the RCU to restore them to normal operation. Detectors must be listed as smoke-automatic fire detectors.

c. Components must be rust and corrosion resistant. Vibration must have no effect on the detector's operation. Protect the detection chamber with a fine mesh metallic screen that prevents the entrance of insects or airborne materials. The screen must not inhibit the movement of smoke particles into the chamber.

d. Provide twist lock bases for the detectors. The detectors must maintain contact with their bases without the use of springs. Provide companion mounting base with screw terminals for each conductor. Terminate field wiring on the screw terminals. The detector must have a visual indicator to show actuation.

e. The detector address must identify the particular unit, its location
within the system, and its sensitivity setting. Detectors must be of the low voltage type rated for use on a 24 VDC system.

f. An operator at the control unit, having a proper access level, must have the capability to manually access the following information for each initiating device.

(1) Primary status.
(2) Device type.
(3) Present average value.
(4) Present sensitivity selected.
(5) Sensor range (normal, dirty, and other similar information).

2.12.2 Laser Smoke Detectors

a. Addressable laser smoke detectors must utilize laser diode and patented smoke sensing chamber, designed to amplify signals from smoke but diminish stray internal reflections and must, on command from the RCU, send data to the panel representing the analog level of smoke density.

b. Smoke detector must be listed for use with the RCU. Detector must be able to achieve sensitivities from 0.02 percent-per-foot to 2 percent-per-foot obscuration.

c. Laser smoke detector must provide point identification of the fire location through addressability, must experience no delay in response time due to smoke dilution or smoke transportation time, and must offer complete supervision of wiring and detector.

[2.12.3 Air Sampling Smoke Detectors

**************************************************************************
NOTE: Detector selection and spacing should be based on the applicable cooling system in the hazard area. Detection should be listed for the anticipated temperature and airflow in the hazard area.
**************************************************************************

The [addressable] air sampling smoke system must consist of a detector assembly housing an integral aspiration fan, filter, laser-based detection chamber and control, output and supervision circuitry. Each sampling point must be capable of being independently addressable. The system must consist of a piping or tubing distribution network that runs from the detector assembly(s) to the protected area(s) and is supported by air sampling smoke detection system calculations from a computer-based design modeling tool. The system must include configurable alarm and trouble relay outputs for interface to other systems where required.

a. System must be complete in all ways. It must include all engineering, and electrical installation, all detection and control equipment, auxiliary devices and controls, alarm interface, functional checkout and testing, training and all other operations necessary for a functional system.

b. System base detectors and modules must each accommodate up to [40
c. Program alarm thresholds to the following values unless the results of the system acceptance tests indicate a clear need to change them. In the event that such a need is indicated, notify the Contracting Officer and provide complete documentation concerning the need to deviate from these values. Include within the deviation documentation request, information that complies with the paragraph entitled "Sensitivity Verification Test". Ensure initial threshold levels are approved prior to the final acceptance test.

(1) Alarm Level 1: set ALERT at [_____][0.0250] percent obscuration/foot.

(2) Alarm Level 2: set PRE-ALARM at [_____][0.0500] percent obscuration/foot.

(3) Alarm Level 3: set FIRE 1 at [_____][0.1000] percent obscuration/foot.

d. All air sampling smoke detection devices and associated components must be new, standard products or the manufacturer's latest design and suitable to perform the functions intended.

e. The laser detection chamber must be of the mass light scattering type and capable of detecting a wide range of smoke particle types of varying size. A particle counting method must be employed for the purposes of:

(1) Preventing large particles from affecting the true smoke reading.

(2) Monitoring contamination of the filter, e.g., dust and dirt, to automatically notify when maintenance is required. The particle counting method must not be used for the purpose of smoke density measurement.

f. Detector(s) must be self-monitoring for filter contamination and provide indication through system fault when replacement is necessary. Detectors which allow automatic reset of filter status upon removal and re-insertion are not permitted.

g. Detector(s) must contain relays for alarm and fault conditions. The relays must be software programmable to the required functions.

h. Detector(s) must permit configuration by programmers that are either integral to the system, portable or PC based.

i. Detector(s) must allow programming of:

(1) Smoke threshold alarm levels; ALERT, PRE-ALARM, FIRE 1 and FIRE 2.

(2) Time delays. Ensure the display control unit contains individual adjustable alarm time delay features for each of the alarm threshold levels. Provide an adjustment range between 0 and 60
seconds. Program the alarm threshold time delays to 30 seconds for alarm levels 1 and 2, and 15 seconds for alarm levels 3 and 4.

(3) Faults, including airflow, detector, power, filter and network, as well as an indication of the urgency of the fault.

(4) Configuration of relay outputs for remote indication of alarm and fault conditions.

(5) General purpose input functionality.

2.13 HEAT DETECTORS

NOTE: The location and type of heat detectors and alarm devices must be indicated on project drawings. Delete descriptive paragraphs of detectors types not used. Alarm indicator should be used only if necessary to meet project requirements.

2.13.1 Heat Detectors

Heat detectors must be analog/addressable and designed for detection of fire by [fixed temperature] [combination fixed temperature and rate-of-rise principle] [rate-compensating principle] in accordance with UL 521. The alarm condition must be determined by comparing detector value with the stored values. Detectors located in areas subject to moisture, exterior atmospheric conditions, or hazardous locations [as defined by NFPA 70] [as indicated], must be types approved for such locations.

2.13.1.1 Rate Compensating Detectors

Detector back box must be [surface] [flush] mounted in the [vertical] [horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring and hermetically sealed. The detector assembly must be [weatherproof] [explosionproof].

2.13.1.2 Combination Fixed-Temperature and Rate-of-Rise Detectors

Detectors must be [surface] [semi-flush] mounted in the [vertical] [horizontal] orientation and supported independently of wiring connections. Detectors must be self-resetting. Detector must operate at [57.2] [90] degrees C [135] [194] degrees F. Detector must feature rate compensation. [Detectors rated to operate at 57.2 degrees C 135 degrees F will not respond to momentary temperature fluctuations less than 16.7 degrees C 30 degrees F per minute between 16 and 38 degrees C 60 and 100 degrees F. ] [Detectors rated to operate at 90 degrees C 194 degrees F will not respond to momentary temperature fluctuations less than 27.8 degrees C 50 degrees F per minute between 16 and 66 degrees C 60 and 150 degrees F. ] The detector assembly must be [weatherproof] [explosionproof].

2.13.1.3 Fixed Temperature Detectors

Detectors must be [surface] [semi-flush] mounted in the [vertical] [horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring. The detectors must have a specific temperature setting [of [57.2] [_____] degrees C [135] [_____] degrees F] as shown. The detector assembly must be [weatherproof] [explosionproof].
2.14 MANUAL RELEASE STATION

**************************************************************************
NOTE: Manual actuation stations are needed for deluge systems only. Delete this paragraph for preaction systems.
**************************************************************************

Provide metal or plastic, semi-flush mounted, [single][double]-action, addressable manual stations, that are not subject to operation by jarring or vibration. Stations must be equipped with screw terminals for each conductor. Stations that require the replacement of a portion of the device after activation are not permitted. Stations must be finished in yellow with molded raised lettering operating instructions of contrasting color. The use of a[ key][ wrench] must be required to reset the station. Stations must have a separate screw terminal for each conductor. Manual release stations must be a different color from building fire alarm pull stations. Station must be weatherproof type and must be provided with an engraved label indicating DELUGE SYSTEM.

2.15 ADDRESSABLE INTERFACE DEVICES

The initiating device being monitored must be configured as a [Class "A"] [Class "B"] initiating device circuit. The module must be listed as compatible with the control unit. The monitor module must provide address setting means compatible with the control unit's SLC supervision and store an internal identifying code. Monitor module must contain an integral LED that flashes each time the monitor module is polled and is visible through the device cover plate. Pull stations with a monitor module in a common backbox are not required to have an LED. [Existing releasing system initiating device circuits must be connected to a single module to supervise the circuit.] Modules must be listed for the environmental conditions in which they will be installed.

2.16 ADDRESSABLE CONTROL MODULES

The control module must be capable of operating as a relay (dry contact form C) for interfacing the control unit with other systems, and to control door holders. The module must be listed as compatible with the control unit. The indicating device or the external load being controlled must be configured as a Class "B" notification appliance circuits. The system must be capable of supervising, audible, visual and dry contact circuits. The control module must have both an input and output address. The supervision must detect a short on the supervised circuit and must prevent power from being applied to the circuit. The control model must provide address setting means compatible with the control unit's SLC supervision and store an internal identifying code. The control module must contain an integral LED that flashes each time the control module is polled and is visible through the device cover plate. Control Modules must be listed for the environmental conditions in which they will be installed.

2.17 ISOLATION MODULES

a. Provide isolation modules to subdivide each signaling line circuit [into groups of not more than [20 addressable devices][___]][each floor][in accordance with NFPA 72] between adjacent isolation modules.

b. Isolation modules must provide short circuit isolation for signaling

SECTION 21 13 19 Page 37
line circuit wiring.

c. Power and communications must be supplied by the SLC and must report faults to the RCU.

d. After the wiring fault is repaired, the fault isolation modules must test the lines and automatically restore the connection.

[2.18] NOTIFICATION APPLIANCES

*NOTE: The notification appliances are for providing local notification of a sprinkler system operation. These devices are not intended to provide general building fire alarm evacuation.*

Notification appliances must be suitable for connection to supervised notification appliance circuits. Appliance must have a separate screw terminal for each conductor. The surface of the appliance must be red in color.

2.18.1 Horns

Horns must conform to the applicable requirements of UL 464. Horns must be [semi-flush mounted] [surface mounted], with the matching mounting backbox surface mounted vibrating type suitable for use in an electrically supervised circuit. Horns must produce a sound rating of at least 85 dBA at 3 meters 10 feet. Horns used in exterior locations must be specifically listed or approved for outdoor use and be provided with metal housing and protective grilles.

2.18.2 Visual Notification Appliances

*NOTE: 1. ABA requires that Visual Notification Appliances be provided in buildings and facilities in each of the following areas: restrooms, and any general usage area (e.g., meeting rooms), hallways, lobbies, and any other area for common use and other areas stated at www.access-board.gov. The Visual Notification Appliance must be mounted as required by ABA that directs compliance with NFPA 72 except that the maximum allowable sound level of audible notification appliances must have a sound level no more than 110 dB at the minimum hearing distance from the audible appliance. In addition, alarms in guest rooms required to provide communication features must comply with sections 18.5.4.6 of NFPA 72. Shop drawings must indicate location, dimensions, content, details, and other required information to indicate extent of complying with ABA requirements.

2. Currently NFPA 72 requires "clear color" strobes for Fire Alarm Notification. NFPA 72 requires the strobe must be marked "Fire" to clearly identify the function.*
Visual notification appliances must conform to the applicable requirements of UL 1638, UL 1971 and conform to the Architectural Barriers Act (ABA). Visual Notification Appliances must have clear high intensity optic lens, xenon flash tubes, or light emitting diode (LED). The light pattern must be dispersed so that it is visible above and below the strobe and from a 90 degree angle on both sides of the strobe. Strobe flash rate must be 1 flash per second and a minimum of [15][30][75][_____] candela based on the UL 1971 test. Strobe must be [surface][semi-flush] mounted.

2.19 ELECTRICAL

**************************************************************************
NOTE: Coordinate power and alarm requirements with the contract drawings and other specification sections.
**************************************************************************

2.19.1 Wire

Provide wiring materials under this section as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM with the additions and modifications specified herein.

2.19.2 Alarm Wiring

IDC and SLC wiring must be [fiber optic][ or ][solid copper] cable in accordance with the manufacturers requirements. Copper signaling line circuits and initiating device circuit field wiring must be No. [14][16][18][_____] AWG size conductors at a minimum.[ Visual notification appliance circuit conductors, that contain audible alarm appliances, must be copper No. 14 AWG size conductors at a minimum.] Wire size must be sufficient to prevent voltage drop problems. Circuits operating at 24 VDC must not operate at less than the listed voltages for the detectors, appliances, or combination thereof. Power wiring, operating at 120 VAC minimum, must be a minimum No. 12 AWG solid copper having similar insulation. Acceptable power-limited cables are FPL, FPLR or FPLP as appropriate with red colored covering. Nonpower-limited cables must comply with NFPA 70.

2.20 SURGE PROTECTIVE DEVICES

Surge protective devices must be provided to suppress all voltage transients which might damage RCU components. Systems having circuits located outdoors, communications equipment must be protected against surges induced on a signaling line circuit. Cables and conductors, that serve as communications links, must have surge protection circuits installed at each end. The surge protective device must wire in series to the power supply of the protected equipment with screw terminations. Line voltage surge arrestor must be installed directly adjacent to the power panel where the releasing control unit breaker is located.

a. Surge protective devices for nominal 120 VAC must be UL 1449 listed with a maximum 500 volt suppression level and have a maximum response time of 5 nanoseconds. The surge protective device must also meet IEEE C62.41.1 and IEEE C62.41.2 category B tests for surge capacity. The surge protective device must feature multi-stage construction and be provided with a long-life indicator lamp (either light emitting diode or neon) which extinguishes upon failure of protected
components. A unit fusing must be externally accessible.

b. Surge protective devices for nominal 24 VAC, fire alarm telephone dialer, or ethernet connection must be UL 497B listed, meet IEEE C62.41.1 and have a maximum response time of 1-nanosecond. The surge protective device must feature multi-stage construction and be self-resetting. The surge protective device must be a base and plug style. The base assembly must have screw terminals for releasing system wiring. The base assembly must accept "plug-in" surge protective module.

c. All surge protective devices (SPD) must be the standard product of a single manufacturer and be equal or better than the following:

(1) For 120 VAC nominal line voltage: UL 1449 and UL 1283 listed, series connected 120 VAC, 20A rated, surge protective device in a NEMA 4x enclosure. Minimum 50,000 amp surge current rating with EMI/RFI filtering and a dry contact circuit for remote monitoring of surge protection status.

(2) For 24-volt nominal line voltage: UL 497B listed, series connected low voltage, 24-volt, 5A rated, loop circuit protector, base and replaceable module.

(3) For alarm telephone dialers: UL 497A listed, series connected, 130-volt, 150 mA rated with self-resetting fuse, dialer circuit protector with modular plug and play.

(4) For IP-DACTS: UL 497B listed, series connected, 6.4-volt, 1.5A rated with 20 kA/pair surge current, data network protector with modular plug and play.

2.21 ELECTRIC POWER

2.21.1 Primary Power

Power must be [120] VAC [50][60] Hz service for the RCU from the AC service to the building in accordance with NFPA 72.

2.22 SECONDARY POWER SUPPLY

Provide for system operation in the event of primary power source failure. Transfer from normal to auxiliary (secondary) power or restoration from auxiliary to normal power must be automatic and must not cause transmission of a false alarm.

2.22.1 Batteries

Provide sealed, maintenance-free, [valve regulated lead acid] batteries as the source for emergency power to the RCU. Batteries must contain suspended electrolyte. The battery system must be maintained in a fully charged condition by means of a solid state battery charger. Provide an automatic transfer switch to transfer the load to the batteries in the event of the failure of primary power.

2.22.1.1 Capacity

Battery size must apply to every control unit and panel associated with this system, including supplemental notification appliance circuit panels,
auxiliary power supply panels, and fire alarm transmitters.

a. Sufficient capacity to operate the releasing system under supervisory and trouble conditions, including audible trouble signal devices for 48 hours and audible and visual signal devices under alarm conditions for an additional 15 minutes (or minimum required time for automatic water control valve release).

2.22.1.2 Battery Power Calculations

a. Verify that battery capacity exceeds supervisory and alarm power requirements for the criteria noted in the paragraph "Capacity" above.

(1) Substantiate the battery calculations for alarm and supervisory power requirements. Include ampere-hour requirements for each system component and each control unit or panel component, and compliance with UL 864.

(2) Provide complete battery calculations for both the alarm and supervisory power requirements. Submit ampere-hour requirements for each system component with the calculations.

(3) Provide voltage drop calculations to indicate that sufficient voltage is available for proper operation of the system and all components, at the minimum rated voltage of the system operating on batteries. Calculations must be performed using the minimum rated voltage of each component.

b. For battery calculations assume a starting voltage of 24 VDC for starting the calculations to size the batteries. Calculate the required Amp-Hours for the specified standby time, and then calculate the required Amp-Hours for the specified alarm time. Using 20.4 VDC as starting voltage, perform a voltage drop calculation for circuits containing devices, appliances, or combination of devices and appliances remote from the power sources.

2.22.2 Battery Chargers

Provide a solid state, fully automatic, variable charging rate battery charger. The charger must be capable of providing 120 percent of the connected system load and maintain the batteries at full charge. In the event the batteries are fully discharged (20.4 Volts dc), the charger must recharge the batteries back to 95 percent of full charge within 48 hours after a single discharge cycle as described in paragraph CAPACITY above. Provide pilot light to indicate when batteries are manually placed on a high rate of charge as part of the unit assembly if a high rate switch is provided.

PART 3 EXECUTION

3.1 VERIFYING ACTUAL FIELD CONDITIONS

Before commencing work, examine all adjoining work on which the contractor's work that is dependent for perfect workmanship according to the intent of this specification section, and report to the Contracting Officer's Representative all conditions that prevents performance of first class work. No "waiver of responsibility" for incomplete, inadequate or defective adjoining work will be considered unless notice has been filed before submittal of a proposal.
3.2 INSTALLATION

The installation must be in accordance with the applicable provisions of NFPA 13, NFPA 24, NFPA 72 and publications referenced therein. [Installation of in-rack sprinklers must comply with applicable provisions of NFPA 13.] Locate sprinklers in a consistent pattern with ceiling grid, lights, and air supply diffusers. Install sprinkler system over and under ducts, piping and platforms when such equipment can negatively affect or disrupt the sprinkler discharge pattern and coverage.

a. Piping offsets, fittings, and other accessories required must be furnished to provide a complete installation and to eliminate interference with other construction.

b. Wherever the contractor's work interconnects with work of other trades the Contractor must coordinate with other Contractors to insure all Contractors have the information necessary so that they may properly install all necessary connections and equipment. Identify all work items needing access (dampers and similar equipment) concealed above hung ceilings by permanent color coded pins/tabs in the ceiling directly below the item.

c. Provide required supports and hangers for piping, conduit, and equipment so that loading will not exceed allowable loadings of structure. Submittal of a bid must be a deemed representation that the contractor submitting such bid has ascertained allowable loadings and has included in his estimates the costs associated in furnishing required supports.

3.2.1 Waste Removal

At the conclusion of each day's work, clean up and stockpile on site all waste, debris, and trash which may have accumulated during the day as a result of work by the contractor and of his presence on the job. Sidewalks and streets adjoining the property must be kept broom clean and free of waste, debris, trash and obstructions caused by work of the contractor, which will affect the condition and safety of streets, walks, utilities, and property.

3.3 UNDERGROUND PIPING INSTALLATION

**************************************************************************
NOTE: Restraint of the underground piping must be detailed on the contract drawings.
**************************************************************************

The fire protection water main must be laid, and joints anchored, in accordance with NFPA 24. Minimum depth of cover must be \[900][_____] mm \[
3\][_____] feet or the frost line, whichever is deeper. The supply line must terminate inside the building with a flanged piece, the bottom of which must be set not less than 304 mm1-foot above the finished floor. A blind flange must be installed temporarily on top of the flanged piece to prevent the entrance of foreign matter into the supply line. A concrete thrust block must be provided at the elbow where the pipe turns up toward the floor. In addition, joints must be anchored in accordance with NFPA 24. Buried steel components must be provided with a corrosion protective coating in accordance with AWWA C203. Piping more than 1500 mm5 feet outside the building walls must meet the requirements of Section 33 11 00
WATER UTILITY DISTRIBUTION PIPING.

3.4 ABOVEGROUND PIPING INSTALLATION

The methods of fabrication and installation of the aboveground piping must fully comply with the requirements and recommended practices of NFPA 13 and this specification section.

3.4.1 Protection of Piping Against Earthquake Damage

**************************************************************************
NOTE: The writer of this section must coordinate with the Structural Engineer or Government to determine the proper seismic design category for the project, in accordance with the IBC or ASCE guidelines. See UFC 3-310-04 for more information.
**************************************************************************

Seismic restraint is [not ]required.

3.4.2 Piping in Exposed Areas

Install exposed piping without diminishing exit access widths, corridors or equipment access. Exposed horizontal piping, including drain piping, must be installed to provide maximum headroom.

3.4.3 Piping in Finished Areas

In areas with suspended or dropped ceilings and in areas with concealed spaces above the ceiling, piping must be concealed above ceilings. Piping must be inspected, hydrostatically tested and approved before being concealed. Risers and similar vertical runs of piping in finished areas must be concealed.

3.4.4 Pendent Sprinklers

**************************************************************************
NOTE: Where the maximum static or flowing pressure, whichever is greater at the sprinkler, applied other than through the fire department connection, exceeds 6.9 bar100 psi and a branch line above the ceiling supplies sprinklers in a pendent position below the ceiling, the cumulative horizontal length of an unsupported arm over to a sprinkler or sprinkler drop must not exceed 300 mm12 inches for steel pipe and 1500 mm6 inches for copper tube.
**************************************************************************

a. Drop nipples to pendent sprinklers must consist of minimum 25-mm1-inch pipe with a reducing coupling into which the sprinkler must be threaded.

b. Where sprinklers are installed below suspended or dropped ceilings, drop nipples must be cut such that sprinkler ceiling plates or escutcheons are of a uniform depth throughout the finished space. The outlet of the reducing coupling must not extend below the underside of the ceiling.

c. Recessed pendent sprinklers must be installed such that the distance from the sprinkler deflector to the underside of the ceiling must not
exceed the manufacturer's listed range and must be of uniform depth throughout the finished area.

d. Pendent sprinklers in suspended ceilings must be located in the center of the tile (+/- 2 inches).

e. Dry pendent sprinkler assemblies must be such that sprinkler ceiling plates or escutcheons are of the uniform depth throughout the finished space.

f. Dry pendent sprinklers must be of the required length to permit the sprinkler to be threaded directly into a branch line tee.

g. Where the maximum static or flowing pressure, whichever is greater at the sprinkler, applied other than through the fire department connection, exceeds 6.9 bar (100 psi) and a branch line above the ceiling supplies sprinklers in a pendent position below the ceiling, the cumulative horizontal length of an unsupported arm over to a sprinkler or sprinkler drop must not exceed 300 mm (12 inches) for steel pipe and 1500 mm (6 inches) for copper tube.

3.4.5 Upright Sprinklers

Riser nipples or "sprigs" to upright sprinklers must contain no fittings between the branch line tee and the reducing coupling at the sprinkler.

3.4.6 Pipe Joints

Pipe joints must conform to NFPA 13, except as modified herein. Not more than four threads must show after joint is made up. Welded joints will be permitted, only if welding operations are performed as required by NFPA 13 at the Contractor's fabrication shop, not at the project construction site. Flanged joints must be provided where indicated or required by NFPA 13. Grooved pipe and fittings must be prepared in accordance with the manufacturer's latest published specification according to pipe material, wall thickness and size. Grooved couplings, fittings and grooving tools must be products of the same manufacturer. For copper tubing, pipe and groove dimensions must comply with the tolerances specified by the coupling manufacturer. The diameter of grooves made in the field must be measured using a "go/no-go" gauge, vernier or dial caliper, narrow-land micrometer, or other method specifically approved by the coupling manufacturer for the intended application. Groove width and dimension of groove from end of pipe must be measured and recorded for each change in grooving tool setup to verify compliance with coupling manufacturer's tolerances.

3.4.7 Reducers

Reductions in pipe sizes must be made with one-piece tapered reducing fittings. When standard fittings of the required size are not manufactured, single bushings of the face or hex type will be permitted. Where used, face bushings must be installed with the outer face flush with the face of the fitting opening being reduced. Bushings cannot be used in elbow fittings, in more than one outlet of a tee, in more than two outlets of a cross, or where the reduction in size is less than 13 mm (1/2-inch).

3.4.8 Pipe Penetrations

a. Cutting structural members for passage of pipes or for pipe-hanger fastenings will not be permitted. Pipes that must penetrate concrete
or masonry walls or concrete floors must be core-drilled and provided with pipe sleeves. Each sleeve must be Schedule 40 galvanized steel, ductile-iron or cast-iron pipe and extend through its respective wall or floor and be cut flush with each wall surface. Sleeves must provide required clearance between the pipe and the sleeve per NFPA 13. The space between the sleeve and the pipe must be firmly packed with mineral wool insulation.

b. Where pipes and sleeves penetrate fire walls, fire partitions, or floors, pipes/sleeves must be firestopped in accordance with Section 07 84 00 FIRESTOPPING.

c. In penetrations that are not fire-rated or not a floor penetration, the space between the sleeve and the pipe must be sealed at both ends with plastic waterproof cement that will dry to a firm but pliable mass or with a mechanically adjustable segmented elastomer seal.

d. All penetrations through the boundary of rooms/areas identified as secure space area must meet ICS 705-1.

3.4.9 Escutcheons

Escutcheons must be provided for pipe penetration in finished areas of ceilings, floors and walls. Escutcheons must be securely fastened to the pipe at surfaces through which piping passes.

3.4.10 Inspector's Test Connection

**************************************************************************
NOTE: Designer will indicate location of the inspector's test connections and all associated valves on the contract drawings, and will provide details of drain piping.
**************************************************************************

Unless otherwise indicated, the test connection must consist of 25-mm1-inch pipe connected to the remote branch line; a test valve located approximately 2 meters7 feet above the floor; a smooth bore brass outlet equivalent to the smallest orifice sprinkler used in the system; and a painted metal identification sign affixed to the valve with the words "Inspector's Test". All test connection piping must be inside of the building and penetrate the exterior wall at the location of the discharge orifice only. The discharge orifice must be located outside the building wall no more than 0.6 meters2 feet above finished grade, directed so as not to cause damage to adjacent construction or landscaping during full flow discharge, or to the sanitary sewer. Discharge to the exterior must not interfere with exiting from the facility. Water discharge or runoff must not cross the path of egress from the building. Do not discharge to the roof. Discharge to floor drains, janitor sinks or similar fixtures is not be permitted.

Provide concrete splash blocks at all drain and inspector's test connection discharge locations if not discharging to a concrete surface. Splash blocks must be large enough to mitigate erosion and must not become dislodged during a full flow of the drain. Ensure all discharged water drains away from the facility and does not cause property damage.
3.4.11 Backflow Preventer

Locate within the building or in a heated enclosure in locations subject to freezing. For heated enclosures, provide a low temperature supervisory alarm connected to the facility fire alarm system. Heat trace is not permitted to be used.

Install backflow preventers so that the bottom of the assembly is a minimum of 150 mm6 inches above the finished floor/grade. Install horizontal backflow preventers so that the bottom of the assembly is no greater than [_____]610 mm24 inches above the finished floor/grade. Install vertical backflow preventers so that the upper operating handwheel is no more than [_____]1.8 meters6 feet above the finished floor/grade. Clearance around control valve handles must be minimum 150 mm6 inches above grade/finished floor and away from walls.

[3.4.11.1 Test Connection]

Provide downstream of the backflow prevention assembly UL 668 hose valves with 65-mm2.5-inch National Standard male hose threads with cap and chain. Provide one valve for each 946 L/min250 gpm of system demand or fraction thereof. Provide a permanent sign in accordance with paragraph entitled "Identification Signs" which reads, "Test Valve". Indicate location of test header. If an exterior connection, provide a control valve inside a heated mechanical room to prevent freezing. The piping between the backflow preventer test header control valve and the exterior test header must be provided with an automatic drip arranged to drain to the outside.

3.4.12 Drains

a. Main drain piping must be provided to discharge [at a safe point outside the building, no more than 0.6 meters2 feet above finished grade] [at the location indicated] [to the sanitary sewer]. Provide a concrete splash block at drain outlet. Discharge to the exterior must not interfere with exiting from the facility. Water discharge or runoff must not cross the path of egress from the building.

b. Auxiliary drains must be provided as required by NFPA 13. Auxiliary drains are permitted to discharge to a floor drain if the drain is sized to accommodate full flow (min 151 L/min40 gpm). Discharge to service sinks or similar plumbing fixtures is not permitted.

3.4.13 Installation of Fire Department Connection

Connection must be mounted [on the exterior wall approximately 900 mm3 feet above finished grade] [adjacent to and on the sprinkler system side of the backflow preventer]. The piping between the connection and the check valve must be provided with an automatic drip in accordance with NFPA 13 and piped to drain to the outside or a floor drain within the same room.

3.4.14 Identification Signs

Signs must be affixed to each control valve, inspector test valve, main drain, auxiliary drain, test valve, and similar valves as appropriate or as required by NFPA 13. Main drain test results must be etched into main drain identification sign. Hydraulic design data must be etched into the nameplates and must be permanently affixed to each sprinkler riser as specified in NFPA 13. Provide labeling on the surfaces of all feed and cross mains to show the pipe function (e.g., "Sprinkler System", "Fire
Department Connection", "Standpipe") and normal valve position (e.g. "Normally Open", " Normally Closed"). For pipe sizes $100\, \text{mm4-inch}$ and larger provide white painted stenciled letters and arrows, a minimum of $50\, \text{mm2\, inches}$ in height and visible from at least two sides when viewed from the floor. For pipe sizes less than $100\, \text{mm4-inch}$, provide white painted stenciled letters and arrows, a minimum of $18\, \text{mm0.75-inch}$ in height and visible from the floor. [Provide properly lettered and approved metal sign to elevator flow switch stating the circuits' voltage, and identify the switch as an "Elevator Power Shunt Flow Switch".]

### 3.4.15 Isolation Valve

Provide a control valve on the riser assembly, downstream of the backflow preventer test connection and waterflow indicator, to allow isolation of riser when testing (tripping) the automatic water control valve without allowing water to enter the system piping. The control valve must be electrically supervised in the open position.

### 3.5 ELECTRICAL

**************************************************************************
NOTE: Coordinate power and alarm requirements with the contract drawings and other specification sections.
**************************************************************************

Except as modified herein, electric equipment and wiring must be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. [Alarm signal wiring connected to the building fire alarm control system must be by the fire alarm installer.]

#### 3.5.1 Overcurrent and Surge Protection

All equipment connected to alternating current circuits must be protected from surges. Cables and conductors that serve as communications links, except fiber optics, must have surge protection circuits installed at each end. Fuses must not be used for surge protection.

#### 3.5.2 Grounding

Grounding must be provided to building ground.

#### 3.5.3 System Field Wiring

##### 3.5.3.1 Wiring within Cabinets, Enclosures, and Boxes

Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of the box, enclosure, or cabinet. Conductors that are terminated, spliced, or otherwise interrupted in an enclosure, cabinet, mounting, or junction box must be connected to screw-type terminal blocks. Mark each terminal in accordance with the wiring diagrams of the system. The use of wire nuts or similar devices is prohibited. Wiring to conform with NFPA 70.

Indicate the following in the wiring diagrams:

a. Point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are
supervised or controlled by the system. Diagrams must show connections from field devices to the RCU and remote RCU, initiating circuits, switches, relays and terminals.

b. Complete riser diagrams indicating the wiring sequence of devices and their connections to the control equipment. Include a color code schedule for the wiring. Include floor plans showing the locations of devices and equipment.

3.5.3.2 Terminal Cabinets

**************************************************************************
NOTE: Provide terminal cabinets on each floor where the fire alarm system supply riser is located and where the fire alarm return riser is located.
**************************************************************************

Provide a terminal cabinet at the base of the circuit riser, on each floor at each riser, and where indicated on the drawings. Terminal size must be appropriate for the size of the wiring to be connected. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the terminal cabinet. Minimum size is 200 mm by 200 mm8 inches by 8 inches. Only screw-type terminals are permitted. Provide an identification label, that displays "RELEASING SYSTEM TERMINAL CABINET" with 50-mm2-inch lettering, on the front of the terminal cabinet.

3.5.3.3 Alarm Wiring

**************************************************************************
NOTE: Do not penetrate SCIF perimeters with copper signal line circuits. SCIF penetrations should be either fiber optic cable or IDC. IDC circuits penetrating the SCIF must be filtered.
**************************************************************************

a. Voltages must not be mixed in junction boxes, housing or device, except those containing power supplies and control relays.

b. Utilize shielded wiring where recommended by the manufacturer. For shielded wiring, ground the shield at only one point, in or adjacent to the RCU.

c. [Pigtail or T-tap connections to signal line circuits, initiating device circuits, supervisory alarm circuits, and notification appliance circuits are prohibited.][ T-tapping using screw terminal blocks is allowed for Class "B" initiating device circuitssignaling line circuits.]

d. Color coding is required for circuits and must be maintained throughout the circuit. Conductors used for the same functions must be similarly color coded. Conform wiring to NFPA 70.

e. Pull all conductors splice free. The use of wire nuts, crimped connectors, or twisting of conductors is prohibited. Where splices are unavoidable, the location of the junction box or pull box where they occur must be identified on the as-built drawings. The number and location of splices must be subject to approval by the [_____] Designated Fire Protection Engineer (DFPE).
3.5.3.4 Back Boxes and Conduit

In addition to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, provide all wiring in rigid metal conduit or intermediate metal conduit unless specifically indicated otherwise. Minimum conduit size must be 19 mm3/4-inch in diameter. Do not use electrical non-metallic tubing (ENT) or flexible non-metallic tubing and associated fittings.

a. Galvanized rigid steel (GRS) conduit must be utilized where exposed to weather, where subject to physical damage, and where exposed on exterior of buildings. Intermediate metal conduit (IMC) may be used in lieu of GRS as allowed by NFPA 70.

b. Electrical metallic tubing (EMT) is permitted above suspended ceilings or exposed where not subject to physical damage. Do not use EMT underground, encased in concrete, mortar, or grout, in hazardous locations, where exposed to physical damage, outdoors or in fire pump rooms. Use die-cast compression connectors.

c. For rigid metallic conduit (RMC), only threaded type fitting are permitted for wet or damp locations.

d. Flexible metal conduit is permitted for initiating device circuits 2 meters 6 feet in length or less. Flexible metal conduit is prohibited for notification appliance circuits and signaling line circuits. Use liquid tight flexible metal conduit in damp and wet locations.

e. Schedule 40 (minimum) polyvinyl chloride (PVC) is permitted where conduit is routed underground or underground below floor slabs. Convert non-metallic conduit, other than PVC Schedule 40 or 80, to plastic-coated rigid, or IMC, steel conduit before turning up through floor slab.

f. Exterior wall penetrations must be weathertight. Conduit must be sealed to prevent the infiltration of moisture.

[g. For Class "A" or "X" circuits with conductor lengths of 3 meters 10 feet or less, the conductors must be permitted to be installed in the same raceway in accordance with NFPA 72.]

3.5.3.5 Conductor Terminations

Labeling of conductors at terminal blocks in terminal cabinets, and RCU must be provided at each conductor connection. Each conductor or cable must have a shrink-wrap label to provide a unique and specific designation. Each terminal cabinet and RCU must contain a laminated drawing that indicates each conductor, its label, circuit, and terminal. The laminated drawing must be neat, using 12-point lettering minimum size, and mounted within each cabinet, panel, or control unit so that it does not interfere with the wiring or terminals. Maintain existing color code scheme where connecting to existing equipment.

3.6 RELEASING CONTROL SYSTEM

3.6.1 Releasing Control Unit (RCU)

The RCU must be located in a year round environmentally conditioned space and not in the hazard area served but adjacent to it. Locate the RCU [where indicated on the drawings] [____]. [Recess][Semi-recess][Surface
mount] the enclosure with the top of the cabinet 2 meters 6 feet above the finished floor or center the cabinet at [1.5][_____] meters [5][_____] feet, whichever is lower. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the RCU.

3.6.2 Smoke Detectors

Locate detectors [as required by NFPA 72 and their listing] [as indicated on the drawings] on a 100-mm 4-inch mounting box. Smoke detectors are permitted to be on the wall no lower than 300 mm 12 inches from the ceiling with no minimum distance from the ceiling. [In raised floor spaces, install the smoke detectors to protect [21 square meters 225 square feet per detector][_____]]. Install smoke detectors no closer than 1-meter 3 feet from air handling supply diffusers. [Detectors mounted in acoustical ceiling tiles must be centered in the tiles +/- 50 mm 2 inches.]

3.6.3 Air Sampling Smoke Detector

Locate air sampling smoke detectors in accordance with the manufacturer's instructions. Air sampling smoke detectors must be installed as follows:

a. Air Sampling Smoke Detector Assembly:

(1) Detector assembly must be mounted to a wall at a height between 1200 to 1800 mm 48 to 60 inches to top of detector measured above the finished floor.

(2) Mounting must be in a fully accessible and visible location.

(3) Mounting or attachment to site equipment, cable trays, movable walls, other equipment or equipment supports is not permitted.

(4) Piping network insertion into the detector inlet must not be glued.

(5) Air sampling smoke detector assembly must be installed in accordance with this specification section and the manufacturer's installation and instruction manuals.

(6) Flexible tubing for termination of the sampling pipe network into detector inlet is not permitted unless allowed by its listing.

(7) Provide red background with white lettering labels that are plastic or phenolic type with a minimum of 6.4 mm 0.25-inch block lettering to indicate detector and zone. For example: "AIR SAMPLING SMOKE DETECTOR No. 1-1 No. 5".

(8) Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. Install the frame in a conspicuous location observable from the ASD panel. The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions must be approved by the Contracting Officer before being posted.

b. Pipe and Sampling Tube Mounting:

(1) The pipe and sampling tubing detection network must be mounted as
per the design and manufacturer's specification. The hardware used for mounting will depend upon the design and site requirements.

(2) To minimize flexing, pipes must be secured every 1.5 meters 5 feet.

(3) Pipes must be suspended between 25 and 100 mm 1 and 4 inches below the ceiling. In areas with a suspended ceiling, the pipe network must be installed above the ceiling utilizing the manufacturer's capillary sample port supported by the ceiling.

(4) The sampling tubes must be of the same length or use the manufacturer's guidelines to run tubes of the required lengths.

(5) When installing a pipe network in areas subject to high temperature fluctuations allow for the contraction and expansion of pipes.

(6) Where expansion or contraction of pipes is likely either after installation or on a continuous basis, do not place pipe clips adjacent to couplings and socket unions as these may interfere with the movement of the pipe.

(7) No bends are permitted within the first 450 mm 18 inches from the detector inlet.

(8) The routing of the piping and sample tube network must be coordinated with potential obstructions, including cable trays, grounding bars, and HVAC ductwork.

(9) All changes in direction must be made with standard elbows or tees.

(10) All joints must be air-tight and made by using solvent cement, except at the entry to the detector assembly. Refer to ASTM F402.

(11) All pipes must be supported by mechanical hangers attached to the structure of the building. Not more than 300 mm 1-foot of pipe must extend beyond the last hanger of each sampling pipe. The final installation must result in no noticeable deflection in the piping network.

(12) Attachment of air sampling pipes to cable trays, "gray iron", and telecommunications equipment is prohibited.

(13) Clearly label pipe network to distinguish the pipe from other facility pipe work or protective cabling enclosures. For example: "SMOKE DETECTION SAMPLING TUBE - DO NOT DISTURB". In open rooms and exposed areas, provide labels at no greater than 6.1-meter 20-foot intervals. Provide labels every 3 meters 10 feet where piping is installed above suspended ceilings and every 609 mm 2 feet, centered in the floor panels, where piping is installed within the raised floor cavity.

(14) Placement of the sampling tube must take into consideration appropriate sampling point locations and spacing.

c. Air Sampling Points:

(1) Open area ceiling sampling points must be oriented downward and
must be within *25 to 100 mm1 to 4 inches* below the underside of the ceiling above where the ceiling is smooth.

(2) Label all air sampling points with a round red label, each with a center hole to match the diameter of the drilled sampling point. For example: "AIR SAMPLING POINT DIA 3.2 MM0.125 INCHES". Indicate fractional dimensions in decimal format with a minimum of three decimal places.

### [3.6.4 Manaul Stations]

Locate manual stations as required by NFPA 72[ and as indicated on the drawings]. Mount stations so they are located no farther than $[1.5][_____]$ meters $[5][_____]$ feet from the exit door they serve, measured horizontally. Manual stations must be mounted at $[1067][1117][_____]$ mm $[42][44][_____]$ inches measured to the operating handle.

### [3.6.5 Notification Appliances]

**************************************************************************

NOTE: Locate strobes wall mounted in corridors no more than 4.5 meters 15 feet from the end of a corridor with 30 meters 100 feet maximum distance between strobes. Where there is an obstruction to the viewing path in the corridors, such as a cross-corridor door or ceiling elevation change, consider the obstruction as defining a new corridor. Provide ceiling mounted strobes in rooms accessible to the public, such as conference rooms, restrooms, courtrooms, cafeterias, and auditoriums in accordance with NFPA 72. In Child Development Centers only chimes must be used as the pre-alert tone prior to voice messages.

**************************************************************************

a. Locate notification appliance devices [as required by NFPA 72][where indicated]. Where more than two appliances are located in the same room or corridor or field of view, provide synchronized operation. Devices must use screw terminals for all field wiring.[ Audible and visual notification appliances mounted in acoustical ceiling tiles must be centered in the tiles +/- 50 mm 2 inches.]

b. Audible and visual notification appliances mounted on the exterior of the building, within unconditioned spaces, or in the vicinity of showers must be listed weatherproof appliances installed on weatherproof backboxes.

### [3.6.6 Graphic Annunciator]

Locate the graphic annunciator as shown on the drawings. Mount the panel, with the top of the panel $1830$ mm6 feet above the finished floor or center the panel at $[1525][_____]$ mm $[5][_____]$ feet, whichever is lower. [Locate the graphic annunciator as shown on the drawings. Surface-mount the panel, with the top of the panel $1830$ mm6 feet AFF or center the panel at $[1525][_____]$ mm $[5][_____]$ feet, whichever is lower.]

### [3.6.7 Remote LCD Annunciator]

Locate the remote LCD annunciator as shown on the drawings. Mount the
3.6.8 Ceiling Bridges

Provide ceiling bridges for ceiling-mounted appliances. Ceiling bridges must be as recommended/required by the manufacturer of the ceiling-mounted notification appliance.

3.7 PAINTING

**************************************************************************
NOTE: Designer will coordinate color code marking with Section 09 90 00 PAINTS AND COATINGS. Color code marking for piping which are not listed in Table I of Paragraph 3.5 Pipe Color Code Marking of UFGS Section 09 90 00 will be added to the table.
**************************************************************************

Color code mark piping [red] as specified in Section 09 90 00 PAINTS AND COATINGS.

a. In unfinished areas (including areas above drop ceilings), paint all exposed electrical conduit (serving releasing system equipment), releasing system conduit, surface metal raceway, junction boxes and covers red. In lieu of painting conduit, the contractor may utilize red conduit with a factory applied finish.

b. In finished areas, paint exposed electrical conduit (serving releasing system equipment), releasing system conduit, surface metal raceways, junction boxes, and electrical boxes to match adjacent finishes. The inside cover of the junction box must be identified as "Releasing System" and the conduit must have painted red bands 19 mm 3/4-inch wide at 3-meter 10-foot centers and at each side of a floor, wall, or ceiling penetration.

3.8 FIELD QUALITY CONTROL

3.8.1 Test Procedures

Submit detailed test procedures, prepared and signed by the NICET Level [III] [or ] [IV] Fire Sprinkler Technician, and the representative of the installing company, [and reviewed by the QPPE] [60][_____] days prior to performing system tests. Detailed test procedures must list all components of the installed system such as initiating devices and circuits, notification appliances and circuits, signaling line devices and circuits, control devices/equipment, batteries, power sources/supply, annunciators, special hazard equipment, and interface equipment. Test procedures must include sequence of testing, time estimate for each test, and sample test data forms. The test data forms must be in a check-off format (pass/fail with space to add applicable test data; similar to the forms in NFPA 13 and NFPA 4.) The test procedures and accompanying test data forms must be used for the pre-Government testing and the Government final testing.

a. Identify the NFPA Class of all initiating device circuits (IDC), [ notification appliance circuits (NAC),] and signaling line circuits (SLC).
b. Identify each test required by NFPA 72 Test Methods and required test herein to be performed on each component, and describe how these tests must be performed.

c. Identify each component and circuit as to type, location within the facility, and unique identity within the installed system. Provide necessary floor plan sheets showing each component location, test location, and alphanumeric identity.

d. Identify all test equipment and personnel required to perform each test (including equipment necessary for smoke detector testing. The use of magnets is not permitted.

e. Provide space to identify the date and time of each test. Provide space to identify the names and signatures of the individuals conducting and witnessing each test.

3.8.2 Pre-Government Testing

3.8.2.1 Verification of Compliant Installation

Conduct inspections and tests to ensure that equipment is functioning properly. Tests must meet the requirements of paragraph entitled "Minimum System Tests" and "System Acceptance" as noted in NFPA 13 and NFPA 72. The Contractor [and QFPE] must be in attendance at the pre-Government testing to make necessary adjustments. After inspection and testing is complete, provide a signed Verification of Compliant Installation letter by the QFPE that the installation is complete, compliant with the specification and fully operable. The letter must include the names and titles of the witnesses to the pre-Government tests. Provide all completion documentation as required by NFPA 13 and the test reports noted below.

a. NFPA 13 Aboveground Material and Test Certificate

b. NFPA 13 Underground Material and Test Certificate

c. NFPA 72 Record of Completion

d. NFPA 72 Record of Inspection and Testing

3.8.2.2 Request for Government Final Test

When the verification of compliant installation has been completed, submit a formal request for Government final test to the [_____][Designated Fire Protection Engineer (DFPE)][Contracting Officers Designated Representative (COR)]. Government final testing will not be scheduled until the DFPE has received copies of the request for Government final testing and Verification of Compliant Installation letter with all required reports. Government final testing will not be performed until after the connections to the [building fire alarm system][installation fire alarm reporting system] have been completed and tested to confirm communications are fully functional. Submit request for test at least [15][_____] calendar days prior to the requested test date.

3.8.3 Correction of Deficiencies

If equipment was found to be defective or non-compliant with contract requirements, perform corrective actions and repeat the tests. Tests must be conducted and repeated if necessary until the system has been
demonstrated to comply with all contract requirements.

3.8.4 Government Final Tests

The tests must be performed in accordance with the approved test procedures in the presence of the DFPE. Furnish instruments and personnel required for the tests. The following must be provided at the job site for Government Final Testing:

a. The manufacturer's technical representative.

[b. The contractor's Qualified Fire Protection Engineer (QFPE).]

c. Marked-up red line drawings of the system as actually installed.

d. Loop resistance test results.

e. Complete program printout including input/output addresses.

f. Copy of pre-Government Test Certificate, test procedures and completed test data forms.

Government Final Tests will be witnessed by the [______], [Designated Fire Protection Engineer][Contracting Officer][, Qualified Fire Protection Engineer (QFPE)]. At this time, all required tests noted in the paragraph "Minimum System Tests" must be repeated at their discretion.

3.9 MINIMUM SYSTEM TESTS

The system, including the underground water mains, and the aboveground piping and system components, must be tested to ensure that equipment and components function as intended. The underground and aboveground interior piping systems and attached appurtenances subjected to system working pressure must be tested in accordance with NFPA 13 and NFPA 24.

3.9.1 Underground Piping

3.9.1.1 Flushing

**************************************************************************
NOTE: Designer should check the site water section for inconsistencies and to verify flushing of all underground pipe will be performed prior to connection to the sprinkler system.
**************************************************************************

Underground piping must be flushed in accordance with NFPA 24.

3.9.1.2 Hydrostatic Test

New underground piping must be hydrostatically tested in accordance with NFPA 24.

3.9.2 Aboveground Piping

3.9.2.1 Hydrostatic Test

Aboveground piping must be hydrostatically tested in accordance with NFPA 13. There must be no drop in gauge pressure or visible leakage when the system
is subjected to the hydrostatic test. The test pressure must be read from a gauge located at the low elevation point of the system or portion being tested.

3.9.2.2 Backflow Prevention Assembly Forward Flow Test

Each backflow prevention assembly must be tested at system flow demand, including all applicable hose streams, as specified in NFPA 13. The Contractor must provide all equipment and instruments necessary to conduct a complete forward flow test, including 65-mm 2.5-inch diameter hoses, playpipe nozzles or flow diffusers, calibrated pressure gauges, and pitot tube gauge. The Contractor must provide all necessary supports to safely secure hoses and nozzles during the test. At the system demand flow, the pressure readings and pressure drop (friction loss) across the assembly must be recorded. A metal placard must be provided on the backflow prevention assembly that lists the pressure readings both upstream and downstream of the assembly, total pressure drop, and the system test flow rate determined during the preliminary testing. The pressure drop must be compared to the manufacturer's data and the readings observed during the final inspections and tests.

3.9.3 System Tests

Test the system in accordance with the procedures outlined in NFPA 72. The required tests are as follows:

a. Loop Resistance Tests: Measure and record the resistance of each circuit with each pair of conductors in the circuit short-circuited at the farthest point from the circuit origin. The tests must be witnessed by the Contracting Officer and test results recorded for use at the final acceptance test.

b. Verify the absence of unwanted voltages between circuit conductors and ground. The tests must be accomplished at the preliminary test with results available at the final system test.

c. Verify that the control unit is in the normal condition as detailed in the manufacturer's O&M manual.

d. Test each initiating device[ and notification appliance] and circuit for proper operation and response at the control unit. Smoke detectors must be tested in accordance with manufacturer's recommended calibrated test method. Use of magnets is prohibited. Testing of duct smoke detectors must comply with the requirements of NFPA 72 except disconnect at least 20 percent of devices. If there is a failure at these devices, then supervision must be tested at each device.

e. Test the system for specified functions in accordance with the contract drawings and specifications and the manufacturer's O&M manual.

f. Test both primary power and secondary power. Verify, by test, the secondary power system is capable of operating the system for the time period and in the manner specified.

g. Determine that the system is operable under trouble conditions as specified.

h. Visually inspect wiring.
i. Test the battery charger and batteries.

j. Verify that software control and data files have been entered or programmed into the releasing control unit. Hard copy records of the software must be provided to the Contracting Officer.

k. Verify that red-line drawings are accurate.

l. Measure the current in circuits to ensure there is the calculated spare capacity for the circuits.

m. Measure voltage readings for circuits to ensure that voltage drop is not excessive.

n. Disconnect the verification feature for smoke detectors during tests to minimize the amount of smoke needed to activate the sensor. Testing of smoke detectors must be conducted using real smoke or the use of canned smoke which is permitted.

[ ]

o. Measure the voltage drop at the most remote appliance (based on wire length) on each notification appliance circuit.

p. Verify the documentation cabinet is installed and contains all as-built shop drawings, product data sheets, design calculations, site-specific software data package, and all documentation required by paragraph titled "Test Reports".

3.9.4 Alarm Device Test

Each alarm switch/device must be tested by flowing water through the inspector's test connection.

[3.9.5 Audibility Tests

Sound pressure levels from audible notification appliances must not exceed 110 dBA in occupiable areas. The provisions for audible notification (audibility) must be met with doors, fire shutters, movable partitions, and similar devices closed.

]3.9.6 Main Drain Flow Test

Following flushing of the underground piping, a main drain test must be made to verify the adequacy of the water supply. Static and residual pressures must be recorded on the certificate specified in paragraph SUBMITTALS.

3.9.7 Automatic Water Control Valves Trip Test

Each water control valve must be independently trip-tested in accordance with the manufacturer's published instructions. Each valve must be electrically trip-tested by actuating a respective heat detector, a manual actuation station connected to the system control unit and the manual release which is part of the valve trim. Each valve must be returned to normal condition after each test. Prior to trip testing sprinkler deluge system, precautionary steps must be taken to prevent water damage to the building and equipment from sprinkler discharge. Control valves on deluge systems must[ be shut off immediately after automatic water control valve trips][ remain open until open sprinklers have discharged for a minimum of [10][_____] seconds].
3.10 SYSTEM ACCEPTANCE

Following acceptance of the system, as-built drawings and O&M manuals must be delivered to the Contracting Officer for review and acceptance. Submit six sets of detailed as-built drawings. The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final acceptance test of the system. At least one set of as-built (marked-up) drawings must be provided at the time of, or prior to the final acceptance test.

[ a. Provide one set of full size paper as-built drawings and schematics. The drawings must be prepared electronically and sized no less than the contract drawings.][Furnish one set of CDs or DVDs containing software back-up and CAD based drawings in latest version of [MicroStation][AutoCAD, ]DXF and portable document formats of as-built drawings and schematics.]

b. Include complete wiring diagrams showing connections between devices and equipment, both factory and field wired.

c. Include a riser diagram and drawings showing the as-built location of devices and equipment.

d. Provide operating and maintenance (O&M) instructions.

3.11 ONSITE TRAINING

**************************************************************************

NOTE: The number of hours of instruction should be determined based of the number and complexity of the systems specified.
**************************************************************************

Conduct a training course for the responding fire department and operating and maintenance personnel as designated by the Contracting Officer. Training must be performed on two separate days (to accommodate different shifts of Fire Department personnel) for a period of [_____] [4] hours of normal working time and must start after the system is functionally complete and after the final acceptance test. The on-site training must cover all of the items contained in the approved Operating and Maintenance Instructions.

3.12 EXTRA MATERIALS

3.12.1 Repair Service/Replacement Parts

Repair services and replacement parts for the system must be available for a period of 10 years after the date of final acceptance of this work by the Contracting Officer. During the warranty period, the service technician must be on-site within 24 hours after notification. All repairs must be completed within 24 hours of arrival on-site.

During the warranty period, the installing fire alarm contractor is responsible for conducting all required testing and maintenance in accordance with the requirements and recommended practices of NFPA 72 and the system manufacturer[s]. Installing fire alarm contractor is NOT responsible for damage resulting from abuse, misuse, or neglect of
equipment by the end user.

3.12.2 Spare Parts

Spare parts furnished must be directly interchangeable with the corresponding components of the installed system[s]. Spare parts must be suitably packaged and identified by nameplate, tagging, or stamping. Spare parts must be delivered to the Contracting Officer at the time of the final acceptance testing and must be accompanied by an inventory list.

3.12.3 Document Storage Cabinet

Upon completion of the project, but prior to project close-out, place in the document storage cabinet copies of the following record documentation:

a. As-built shop drawings
b. Product data sheets
c. Design calculations
d. Site-specific software data package
e. All documentation required by SD-06

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for automatic deluge, and pre-action fire extinguishing foam systems for aircraft hangars.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: For fuel tank farm protection use Section 21 13 21.00 20 FOAM FIRE EXTINGUISHING FOR FUEL TANK PROTECTION. For hazardous and flammable handling and storage facilities such as truck or rail loading/unloading racks, hazardous/flammable liquid warehouses, fuel pump houses and laboratories, use Section 21 13 22.00 20 FOAM FIRE EXTINGUISHING FOR HAZ/FLAM MATERIAL FACILITY. Choose the type of system most appropriate for the hazard. Deluge systems are primarily intended for fire protection of aircraft hangar facilities. Pre-action systems may be required for Air Force hangars even though NFPA 409 recommends deluge systems for aircraft hangars. Consult the current edition of AFR 88-15, "Criteria and Standards for Air Force Construction" for Air Force projects. Pre-action systems provide
added safety against accidental discharge by requiring both actuation of a detector and fusing of a sprinkler head before foam discharge will occur. Deluge systems provide the fastest fire extinguishment. Areas larger than 279 sq meters 3,000 square feet and all deluge systems must be hydraulically designed for uniform distribution. Assure that up to date reliable hydraulic data is used in design of the project. Do not show sprinkler piping layout and heads on project drawings. System requirements must conform to the current edition of UFC 3-600-01, "Fire Protection Engineering for Facilities".

**************************************************************************
**************************************************************************
NOTE: If there are questions concerning type of foam systems required, consult the Engineering Field Division, Naval Facilities Engineering Command.
**************************************************************************
**************************************************************************
NOTE: The following information shall be shown on the project drawings:

1. Location and detail of each foam system supply riser, deluge, or pre-action valve, water motor alarm, fire department inlet connection, foam hydrant, hand hose station, monitor nozzle, air compressor(s), and associated electrical connections.

2. Point of connection to the existing water distribution system.

3. Location of foam system control valves and post indicator valves.

4. Area(s) of foam system coverage, with zone designations (if multiple zones). Do not show piping layout.

5. Location and design of draft curtains as required by NFPA 409 for aircraft hangar.

6. For pipe larger than 305 mm 12 inches, detail methods of anchoring pipe including pipe clamps and tie rods.

7. Location of foam proportioning equipment and storage tank.

8. Show locations of control panel, annunciator(s), alarm devices, manual actuation stations, point of connection to the building fire evacuation alarm system, remote trouble device, point of connection to the incoming power supply and fusible safety switch. Do not show conduit sizes or number of conductors for DC circuits. Do not show locations of detectors.
9. Show single line riser diagram for all detection, activation, and alarm circuits. Connection of equipment shall be indicated by circuit runs and not conduit runs. Do not indicate number and size of conductors for interconnection of fire alarm components.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section, with the additions and modifications specified herein.

1.3 SYSTEM DESCRIPTION

1.3.1 Design Requirements

**************************************************************************
NOTE: Identify the rooms, spaces or areas, as appropriate, which are to be protected by each system.
**************************************************************************

**************************************************************************
NOTE: Include only those NFPA codes applicable to the specific project.
**************************************************************************

Design and [provide a new][ and ][modify an existing] automatic aqueous film forming foam (AFFF) [deluge][pre-action] sprinkler system(s)[ and under-wing supplemental protection system] for [____] System shall provide uniform distribution of AFFF solution to provide complete coverage throughout the [building][areas indicated]. The design, equipment, materials, installation, and workmanship shall be in strict accordance with the required and advisory provisions of NFPA 11, NFPA 13, [NFPA 14,] [NFPA 15,] NFPA 16, [NFPA 24,] [NFPA 30,] NFPA 70, NFPA 72, and NFPA 409, except as modified herein. Each system [shall be designed for earthquakes]
and] shall include all materials, accessories and equipment necessary to provide each system complete and ready for use. Design and install each system to give full consideration to blind spaces, piping, electrical equipment, ductwork, and all other construction and equipment to provide complete coverage in accordance with the drawings to be submitted for approval. Devices and equipment for fire protection service shall be of a make and type listed by the Underwriter's Laboratories Inc. in the UL Fire Prot Dir, or approved by the Factory Mutual System and listed in FM APP GUIDE. In the publications referred to herein, the advisory provisions shall be considered to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears; reference to the "authority having jurisdiction" shall be interpreted to mean the [_____] Division, Naval Facilities Engineering Command Fire Protection Engineer] [Corps of Engineers Contracting Officer]. Begin work at the point indicated.

1.3.1.1 Shop Drawings

Prepare shop drawings for fire extinguishing system in accordance with the requirements for "Plans" as specified in NFPA 11 and "Working Plans" as specified in NFPA 13. Each drawing shall be A1 841 by 594 mm 34 by 22 inches. Do not commence work until the design of each system and the various components have been approved. Show:

a. Room, space or area layout and include data essential to the proper installation of each system

b. Sprinkler heads, discharge nozzles and system piping layout annotated with reference points for design calculations

c. Field wiring diagrams showing locations of devices and points of connection and terminals used for all electrical field connections in the system, with wiring color code scheme

[ d. UV-IR detector manufacturer's recommended detector layout (plan view) including horizontal and vertical angles for correct aiming.

]1.3.1.2 Calculations

Submit design calculations for the system.

a. Hydraulic calculations showing basis for design in accordance with NFPA 11 and NFPA 13.

b. Pressure discharge graphs or tables showing pressure discharge relationship for sprinkler heads and discharge nozzles.

**************************************************************************

NOTE: Regarding the text below, consult with the Division Fire Protection Engineer before specifying 2-wire smoke detectors as a Contractor option. 2-wire detectors must be carefully matched to the control panel by the manufacturer, and are not universally interchangeable between systems for maintenance purposes.

**************************************************************************

c. Substantiating battery standby power requirements calculations showing battery capacity, supervisory and alarm power requirements.[ If 2-wire
smoke detectors are proposed for use show comparison of the detector power requirements per zone versus the control panel smoke detector power output per zone in both the standby and alarm modes.

**************************************************************************

NOTE: Include the text below for Air Force Projects only.
**************************************************************************

[ 1.3.1.3 AFFF Containment and Disposal Plan

Submit AFFF containment and disposal plan as required under paragraph ENVIRONMENTAL PROTECTION.

1.3.1.4 As-Built Drawings for the Fire Extinguishing System

Upon completion, and before final acceptance of the work, submit a complete set of as-built drawings for the fire extinguishing system [, including complete as-built circuit diagrams]. Submit A1 841 by 594 mm 34 by 22 inch reproducible as-built drawings on mylar film with 200 by 100 mm 8 by 4 inch title block similar to contract drawings. Submit as-built drawings in addition to the record drawings required by Division 1.

1.3.2 System Operation

Flow of water and AFFF shall be controlled by [deluge] [pre-action] valves. Foam proportioning equipment shall activate automatically upon tripping of the [deluge] [pre-action] valve(s) for the corresponding foam system(s). [Deluge][Pre-action] valves shall be tripped by independent detection systems. No valve will be operated by the building fire evacuation alarm system. Use of motor-operated valves is prohibited. Once activated, system(s) shall operate until shut down manually. Provide separate circuits from the control panel to each zone of initiating devices. Transmission of signals from more than one zone over a common circuit is prohibited.

1.3.2.1 Overhead Systems

Overhead systems shall be controlled by [deluge] [pre-action] valves operated by automatic detection systems and by remote manual release stations.

1.3.2.2 Monitor System

Monitor nozzles shall be controlled by deluge valves operated by[ the automatic detection systems and manual release stations which activate the corresponding overhead system(s)][ independent ultraviolet-infrared (UV-IR) optical detection systems and manual stations][ flow of AFFF solution in the overhead system].

1.3.2.3 Hose System

Hose reels shall be controlled by deluge valves operated by remote manual release stations, separate from those used for overhead systems and monitor nozzles.
1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
NOTE: Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

[ The fire protection engineer, [_____] Division, Naval Facilities Engineering Command will review any approve all submittals in this section requiring Government approval.]

**************************************************************************
NOTE: For projects administered by the Pacific Division, Naval Facilities Engineering Command, use the optional "SUBMITTALS" article immediately below and delete the general "SUBMITTALS" article above.

**************************************************************************
[ The [_____] Division, Naval Facilities Engineering Command, Fire Protection Engineer delegates the authority to the Quality Control (QC)
Representative's U.S. Registered Fire Protection Engineer for review and approval of submittals required by this section. Submit to the [_____] Division, Naval Facilities Engineering Command, Fire Protection Engineer one set of all approved submittals and drawings immediately after approval but no more later than 15 working days prior to final inspection.

Instructions for Operating the Fire Extinguishing System, Data Package 4; G[, [____]]
Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Furnish one complete set of data prior to the time that final acceptance tests are performed, and furnish the remaining sets before the contract is completed.

SD-11 Closeout Submittals

As-built Drawings for the Fire Extinguishing System; G[, [____]]

1.5 QUALITY ASSURANCE

1.5.1 Qualifications of Installer

Prior to commencing work, submit data showing that the Contractor has successfully installed automatic foam fire extinguishing sprinkler systems of the same type and design as specified herein, or that he has a firm contractual agreement with a subcontractor having the required experience. Include the names and locations of at least two installations where the Contractor, or the subcontractor referred to above, has installed such systems. Indicate the type and design of each system, and certify that the system has performed satisfactorily for a period of at least 18 months.

********************************************************************************
NOTE: For projects administered by the Pacific Division, Naval Facilities Engineering Command, include the following optional paragraph requiring the minimum qualification of a NICET Level-III technician for preparation of all fire protection system drawings.
********************************************************************************

Qualifications of System Technician: Installation drawings, shop drawing and as-built drawings shall be prepared, by or under the supervision of, an individual who is experienced with the types of works specified herein, and is currently certified by the National Institute for Certification in Engineering Technologies (NICET) as an engineering technician with minimum Level-III certification in Special Hazard System program. Contractor shall
submit data for approval showing the name and certification of all involved individuals with such qualifications at or prior to submittal of drawings.

1.6 SPARE PARTS

Furnish the following spare parts:

a. Two of each type of detector installed.

b. One of each type of audible and/or visual alarm device installed.

c. Two of each type of fuse required by the system.

d. Five complete sets of system keys.

PART 2 PRODUCTS

2.1 DESIGN OF FOAM SYSTEMS

Design of [deluge] [pre-action] fire extinguishing foam systems shall be by hydraulic calculations for uniform distribution of AFFF solution over the protected area and shall conform to the NFPA standards listed above and to the requirements as specified herein.

2.1.1 Sprinkler Heads

Heads shall have 15[ or 13.50] mm 1/2[ or 17/32] inch orifice. No o-rings will be permitted in sprinkler heads.[ For deluge systems, provide open heads.] [For pre-action systems, the release element of each head shall be of the ["intermediate"] ["high"] temperature rating or higher as suitable for the individual location installed.] Provide chromium plated ceiling plates and pendent sprinklers below suspended ceilings. Provide corrosion resistant sprinkler heads and sprinkler head guards as required by NFPA 13.

2.1.2 Cabinet

**************************************************************************
NOTE: Deluge systems do not require a sprinkler head cabinet.
**************************************************************************

Provide extra sprinkler heads and sprinkler head wrench in a metal cabinet adjacent to the pre-action valve within each building. The number and types of extra sprinkler heads shall be as specified in NFPA 13.

2.1.3 [Deluge] [Pre-Action] Valves

Valves shall be operated by a detection system listed for releasing service and independent of the building fire alarm system.[ [Deluge][Pre-action] valve clappers shall incorporate a latching mechanism that will not be affected by changes of pressure in the water system.] If 150 mm 6 inch valves are used in 200 mm 8 inch risers, provide smoothly tapered connections. In addition to automatic operation, arrange each valve for manual release at the valve. Provide pressure gages and other appurtenances at the [deluge] [pre-action] valves as required by NFPA 13. Provide a detection device at the end of each actuation circuit to test the circuit and mount the device[ adjacent to the valve] between 1.80 and 2.40 meters 6 and 8 feet above the finish floor. Label each testing device to indicate the valve it activates.[ Provide remote manual releases[ at
2.1.4  AFFF Solution Distribution

**************************************************************************
NOTE: Select the first option for pre-action systems. Select the second option for deluge systems.
**************************************************************************

[ Distribution shall be essentially uniform throughout the area in which it is assumed the sprinkler heads will open. Variation in discharge from individual heads in the hydraulically most remote area shall be between 100 and 115 percent of the specified density.]

][Distribution shall be essentially uniform throughout the area. Variation in discharge from individual heads shall be between 100 and 115 percent of the specified density.]

2.1.5  AFFF Solution Application Density

Size system to provide the specified density when the system is discharging the specified total maximum required flow. Application to horizontal surfaces below the ceiling sprinklers shall be 110 mL/sec per sq meter 0.16 gallons per minute (gpm) per square foot with simultaneous operation of [___] operating foam monitor nozzles, [and] [___] operating foam hose lines[, and with outside water hose stream requirements of [_____] mL/sec gpm].

2.1.6  Sprinkler Discharge Area

**************************************************************************
NOTE: Select the first option for pre-action systems only and refer to MIL-HDBK-1008 and the appropriate NFPA standard(s) governing the particular facility to determine the discharge area required. Select the second option for deluge systems only and refer to NFPA 409 to determine the discharge area required for hangars.
**************************************************************************

[ Area shall be the hydraulically most remote [___] square meter foot area as defined by NFPA 13.]

][Area shall be[ that protected by each riser][ based on the [15.25] [22.75] [30.50] meter [50] [75] [100] foot radius rule as determined in accordance with NFPA 409 for Type I aircraft hangars].

2.1.7  Friction Losses

Calculate losses in pipe in accordance with the Hazen-Williams Formula with 'C' value of 100 for steel pipe[ except 120 for steel pipe used in deluge systems], 150 for copper tube, and 140 for cement lined ductile iron pipe.

2.1.8  Location of Sprinkler Heads

Location of heads in relation to the ceiling and spacing of sprinkler heads shall conform to NFPA 13 for extra hazard occupancy. The spacing of sprinklers on the branch lines shall be essentially uniform.
2.1.9 Water Supply

**************************************************************************
NOTE: Select first option if the water supply is provided directly from the base water distribution system and show or specify the point of connection. Select second option if the water supply is provided from fire pumps dedicated to the AFFF system, which are taking suction from a static water source. Select third option if the water supply is provided from booster fire pumps being supplied from the base water distribution system, and show or specify the point of connection to the base system. Edit Section 21 30 00 FIRE PUMPS and include as part of the project specification when using the second or third option.
**************************************************************************

[Base hydraulic calculations on a static pressure of [_____] kPa (gage) with [_____] L/m pounds per square inch gage (psig) with [_____] gpm being available at a residual pressure of [_____] kPa (gage) psig at the point of connection with the base water distribution system].

][Base hydraulic calculations on [_____] fire pump(s) running. Provide fire pumps as specified in Section 21 30 00 FIRE PUMPS.

][Base hydraulic calculations on [_____] fire pump(s) running, with a suction supply having a static pressure of [_____] kPa (gage) psig with [_____] L/m gpm being available at a residual pressure of [_____] kPa (gage) psig at the point of connection with the base water distribution system]. Provide fire pumps as specified in Section 21 30 00 FIRE PUMPS.

2.1.10 Duration of Discharge

**************************************************************************
NOTE: For sprinkler and monitors discharge duration, consult NFPA 409. For hose station discharge duration, consult NFPA 30 and NFPA 409.
**************************************************************************

System shall apply foam solution over the sprinkler discharge area for a minimum of [10] [_____] minutes while simultaneously discharging foam solution through monitors for a minimum of [10] [_____] minutes. Hose station discharge time shall be a minimum of [20] [_____] minutes. Reduction of the discharge duration based on a discharge rate higher than the specified minimum is not permitted.

2.2 ELECTRIC DETECTION DEVICES

**************************************************************************
NOTE: Electric detection system may be used with all detector types specified in this guide specification and are necessary for complex controls.
**************************************************************************

Provide electric [heat detectors,] [and] [smoke detectors,] [and] [combination ultraviolet-infrared detectors]. All wiring shall be supervised and installed in protective metal conduit or tubing.

### 2.2.1 Control Panel

**NOTE:** Select either "Class B" or Class A" supervision ("Style B" or "Style D" as defined by NFPA 72). "Class B" supervision which will normally be used, provides a trouble indication when a failure occurs in a circuit. "Class A" supervision provides a trouble indication when a fault occurs in a circuit and at the same time allows continued operation of that circuit. "Class A" supervision should be used for strategically critical facilities. Select first ("Class B") or second ("Class A") supervisory option accordingly.

**NOTE:** Provide a remote trouble bell or buzzer in a constantly attended area if the control panel is not so located. Provide a trouble bell at the control panel if the panel is located in a high noise area. Coordinate location of remote trouble bell and remote annunciator panel when both are provided.

Modular type panel installed in a [flush] [surface] mounted steel cabinet with hinged door and cylinder lock. Switches and other controls shall not be accessible without the use of a key. The control panel shall be a neat, compact, factory-wired assembly containing all parts and equipment required to provide specified operating and supervisory functions of the system. Panel cabinet shall be finished on the inside and outside with factory-applied enamel finish. Provide main annunciator located on the exterior of the cabinet door or visible through the cabinet door. Provide audible trouble signal. Provide prominent engraved rigid plastic or metal identification plates, or silk-screened labels attached to the rear face of the panel viewing window, for all lamps and switches. System power shall be 120 volts AC service, transformed through a two winding isolation transformer and rectified to 24 volts DC for operation of all system initiating, actuating, signal sounding, trouble signal and fire alarm tripping circuits. System shall be electrically supervised on all circuits. A ground fault condition or a single break in any circuit which prevents the required operation of the system shall result in the operation of the system trouble signal. A single open or ground fault condition in any detection (initiating) or signaling circuit shall not result in any loss of system function, but shall cause the actuation of system trouble signals. A ground fault condition or single break in any other circuit shall result in the activation of the system trouble signals. Loss of AC power, a break in the standby battery power circuits, or abnormal AC power or low battery voltage shall result in the operation of the system trouble signals. The abnormal position of any system switch in the control panel shall result in the operation of the system trouble signals. Trouble signals shall operate continuously until the system has been restored to normal at the control panel. System trouble shall also be annunciated on the appropriate zone of the building fire alarm panel. Provide a [remote system trouble bell] or buzzer, installed in a constantly attended area, arranged to operate in conjunction with the integral trouble signals of the panel. Provide remote bell or buzzer with a rigid plastic or metal identification sign which reads "Foam System..."
Trouble." Lettering on identification sign shall be a minimum of 25 mm one inch high.] Control panel, batteries, and battery charger shall be weatherproof type or located in an area not subject to water damage. System control panel shall be UL listed or FM approved for extinguishing system control (releasing device service). Permanently label all switches. Provide panel with the following switches:

a. Trouble silencing switch which transfers audible trouble signals (including remote trouble devices, if provided) to an indicating lamp. Upon correction of the trouble condition, audible signals will again sound until the switch is returned to its normal position, or the trouble signal circuit shall be automatically restored to normal upon correction of the trouble condition. The silencing switch may be a momentary action, self-resetting type.

b. Alarm silencing switch which when activated will silence all associated alarm devices without resetting the panel, and cause operation of system trouble signals.

c. Individual zone disconnect switches which when operated will disable only their respective initiating circuit and cause operation of the system and zone trouble signals.

d. Reset switch which when activated will restore the system to normal standby status after the cause of the alarm has been corrected, and all activated initiating devices reset.[ Operation of reset switch shall restore activated smoke detectors to normal standby status.]

e. Lamp test switch.

f. City disconnect switch which when activated will disconnect the coded device and cause operation of the system trouble signal.

2.2.1.1 Main Annunciator

Provide integral with the main control panel. Provide separate alarm and trouble lamps for each zone alarm initiating circuit as indicated below, located on the exterior of the cabinet door or visible through the cabinet door. Lamps shall be LED (Light Emitting Diode) type. Supervision will not be required provided a fault in the annunciator circuits results only in loss of annunciation and will not affect the normal functional operation of the remainder of the system. Each lamp shall provide specific identification of the [zone] [area] [device] by means of a permanent label. In no case shall zone identification consist of the words "Zone 1," "Zone 2," etc., but shall consist of the description of the [zone] [area] [device].

2.2.1.2 Initiating Zones

**************************************************************************
NOTE: List zones from 1 to x, with a brief description of each zone; e.g. "Zone 1: Hangar Bay No. 1". Expand this list as necessary to identify all the zones required for the building.
**************************************************************************

Shall be arranged as follows:

Zone 1: [_____]
2.2.1.3 Remote Annunciator Panel

NOTE: Coordinate location of remote trouble bell and remote annunciator panel when both are provided. Locate panel at or near the building entrance to allow fire department quick access to panel.

Locate as shown. Panel shall duplicate all requirements specified for the main control panel annunciator, except that in lieu of individual zone trouble lamps a single common system trouble lamp may be provided. Lamps shall be LED (Light Emitting Diode) type, except lamps used in backlit panels shall be LED or neon type. Panel shall have a lamp test switch. Zone identification shall be by means of [permanently attached rigid plastic or metal plate(s)] [silk-screened labels attached to the reverse face of backlit viewing window(s)]. Panel shall be of the [interior] [weatherproof] type, [flush] [surface] [pedestal]-mounted.

2.2.2 Auxiliary Power Supply

2.2.2.1 Storage Batteries

NOTE: Consult the Public Works Department for battery preference.

Provide [sealed lead calcium,] [or] [sealed lead acid,] [or] [vented wet cell nickel cadmium,] batteries and charger. Drycell batteries are not acceptable. House batteries in the control panel or in a well constructed vented steel cabinet with cylinder lock, non-corrosive base, and louvered vents. Provide batteries of adequate ampere-hour rating to operate the system under supervisory conditions for 60 hours, at the end of which time batteries shall be capable of operating the entire system in a full alarm condition for not less than [30] [15] minutes. Provide calculations substantiating the battery capacity. Provide reliable separation between cells to prevent contact between terminals of adjacent cells and between battery terminals and other metal parts. Provide batteries with post-and-nut, "L"-blade, or similar terminals. Slip-on tab type terminals are not acceptable. When a separate battery cabinet is used, provide a fuse block for battery leads within the cabinets. Finish the cabinet on the inside and outside with enamel paint. Locate the top of the battery cabinet not more than 1.20 meters (4 feet) above floor level.

2.2.2.2 Battery Charger

Provide completely automatic high/low charging rate type charger capable of recovery of the batteries from full discharge to full charge in 24 hours or less. Provide an ammeter for recording rate of charge and a voltmeter to indicate the state of battery charge under load. Meters shall be factory installed, or factory-supplied plug-in modules. Field installation of
meters other than the panel manufacturer's plug-in modules is prohibited. Provide a trouble light to indicate when batteries are manually placed on a high rate of charge as part of the unit assembly if a high-rate switch is provided. House charger in the control panel or battery cabinet.

2.3 PNEUMATIC DETECTION SYSTEM

**************************************************************************
NOTE: Pneumatic detection system may be used only with single acting rate-of-rise heat detectors. Consult with the Division Fire Protection Engineer for guidance on use of pneumatic detection systems.
**************************************************************************

Provide pneumatic single acting rate-of-rise heat detectors. All tubing shall be supervised and installed in protective metal conduit or tubing.

2.3.1 Air Compressor

Shall be automatic, electric motor driven and include piping, pressure switch, regulator, and tank if required. Provide compressor with a minimum capacity capable of charging the pneumatic detection system to normal system pressure in 15 minutes and shall include all controls necessary to maintain the system fully charged.[ Provide at least one compressor for every [_____] detection circuits.]

2.3.2 Piping and Control Panel

Provide copper piping. Provide a control panel or equivalent device(s) to automatically maintain the required pneumatic pressure in the detection system, and limit the quantity of air that enters the detection/release system. Provide supply air and system air pressure gages.

2.4 PIPING SUPERVISION

**************************************************************************
NOTE: Include for projects involving pre-action sprinkler piping systems or pneumatic detection systems only.
**************************************************************************

[Pre-action sprinkler piping][ and ][Pneumatic detection system] shall be supervised. A break in the piping or tubing systems resulting in loss of pneumatic pressure shall result in the activation of a trouble signal. Provide a silencing switch which transfers trouble signals to an indicating lamp and arrange so that correction of the trouble condition will automatically transfer the trouble signal from the indicating lamp back to the trouble signal until the switch is restored to normal position.

2.5 MANUAL RELEASE STATIONS

Provide[ combined] overhead system, and monitor nozzle release stations where shown, and separate hose station release stations at each hose station. Stations shall be of a type not subject to operation by jarring or vibration. Stations shall have a dual action release configuration to prevent accidental system discharge. Break-glass-front stations are not permitted; however a pull lever break-glass-rod type is acceptable. Station color shall be red. Station shall provide positive visible indication of operation. Restoration shall require use of a key or special tool. Place
warning signs at each station indicating that operation of the station will cause immediate AFFF discharge. Where a building fire alarm pull station is also mounted in the vicinity of a foam release station, separate the stations by at least one meter or three feet horizontally. Provided permanent engraved rigid plastic or metal labels to clearly distinguish foam release stations from building fire alarm stations, and to indicate the function of each foam release station. Stations shall be weatherproof type.

2.6 HEAT DETECTORS

**************************************************************************
NOTE: Select the type of heat detector most suited for application or design. Do not use rate-of-rise detectors in areas subject to rapid temperature changes (e.g. near main hangar doors, unit heaters, etc.). Consult the Division Fire Protection Engineer.
**************************************************************************

Designed for detection of fire by [combination fixed temperature rate-of-rise] [rate compensating] principle. Locate detectors in accordance with their listing by UL or FM and the requirements of NFPA 72, except provide at least two detectors in all rooms of 56 square meters or larger in area. Temperature rating of detectors shall be in accordance with NFPA 72. Reduce heat detector spacing in areas with ceiling heights exceeding 3 meters or 10 feet, in accordance with NFPA 72. No detector shall be located closer than 305 mm or 12 inches to any part of any lighting fixture nor closer than 610 mm or 24 inches to any part of an air supply diffuser. Detectors, located in hazardous locations as defined by NFPA 70, shall be types approved for such locations. Provide with terminal screw type connections. Removal of detector head from its base shall cause activation of system trouble signal. Detectors shall be weatherproof type.

2.6.1 Combination Fixed Temperature Rate-of-Rise Detectors

**************************************************************************
NOTE: Only single acting rate-of-rise heat detectors may be specified for use with a pneumatic detection system.
**************************************************************************

Designed for [surface] [semi-flush] outlet box mounting and supported independently of conduit, tubing or wiring connections. Contacts shall be self-resetting after response to rate-of-rise actuation. Operation under fixed temperature actuation shall result in an external indication. Detector units located in areas subject to abnormal temperature changes shall operate on fixed temperature principle only.

2.6.2 Rate Compensating Detector

Designed for [surface] [flush] [vertical unit] outlet box mounting and supported independently of conduit, tubing or wiring connections. Detectors shall be hermetically sealed and automatically resetting type which will operate when ambient air temperature reaches detector setting regardless of rate of temperature rise. Detector operation shall not be subject to thermal time lag.
2.7 OPEN-AREA (SPOT-TYPE) SMOKE DETECTORS

**************************************************************************
NOTE: Consult with the Division Fire Protection Engineer before specifying 2 wire smoke detectors as a Contractor option. 2 wire detectors must be carefully matched to the control panel by the manufacturer, and are not universally interchangeable between systems for maintenance purposes.
**************************************************************************

Designed for detection of abnormal smoke densities by the [ionization] or [photoelectric] principle. Provide necessary control and power modules required for operation integral with the main control panel. Provide detectors and associated modules which are compatible with the main control panel and suitable for use in a supervised circuit. Detector circuits shall be of the 4 wire type whereby the detector operating power is transmitted over conductors separate from the initiating circuit. Provide a separate, fused, power circuit for each smoke detection initiating circuit (zone). Failure of the power circuit shall be indicated as a trouble condition on the corresponding initiating circuit.[ As an alternate, detector circuits of the 2-wire type whereby the detector operating power is transmitted over the initiating circuit are permitted, provided the detectors used are approved by the control panel manufacturer for use with the control panel provided and are UL listed or FM approved as being compatible with the control panel (copies of the UL or FM listings showing compatibility shall be submitted). When 2-wire smoke detectors are used, the total number of detectors on any detection circuit shall not exceed 80 percent of the maximum number of detectors allowed by the control panel manufacturer for that circuit and the standby current draw of the entire system shall not exceed 80 percent of the rated output of the system power supply module(s). Provide additional zones above those specified in the paragraph INITIATING ZONES if required to meet the above requirements. Calculations showing compliance with the power consumption limitation requirements specified above shall be submitted with the calculations required by the paragraph DESIGN DATA. The data submitted under the paragraph TEST REPORTS shall clearly indicate the compatibility of the detectors with the control panel provided and the maximum number of detectors permitted per zone.] Malfunction of the electrical circuits to the detector or its control or power units shall result in the operation of the system trouble signals. Equip each detector with a visible indicator lamp that flashes when the detector is in the normal standby mode and glows continuously when the detector is activated.[ Provide remote indicator lamps for each detector that is concealed from view.] Provide plug-in type detectors with tab-lock or twist-lock, quick disconnect head and separate base in which the detector base contains screw terminals for making all wiring connections. Detector head shall be removable from its base without disconnecting any wires. Removal of detector head from its base shall cause activation of system trouble signals. Provide each detector with an integral screen to prevent entrance of insects into the detection chamber(s).

2.7.1 Ionization Detectors

Multiple chamber type which is responsive to both visible and invisible particles of combustion. Detectors shall not be susceptible to operation by changes in relative humidity.
2.7.2 Photoelectric Detectors

Operate on a multiple cell concept using an infra-red light-emitting diode (LED) light source.

2.7.3 Detector Spacing and Location

NFPA 72, the manufacturer's recommendations and the requirements stated herein, however, in no case shall spacing exceed 9 by 9 meters 30 by 30 feet per detector, and 9 lineal meter 30 lineal feet per detector along corridors. Detectors shall not be placed closer than [1] [1.50] meter [3] [5] feet from any air discharge or return grille, nor closer than 305 mm 12 inches to any part of any lighting fixture.

2.8 COMBINATION ULTRAVIOLET-INFRARED FLAME DETECTORS

Flame detectors shall operate on the dual spectrum ultraviolet-infrared (UV-IR) principle. Detector shall employ a solar-blind UV sensor with a high signal-to-noise ratio, and a narrow band IR sensor. Detector logic shall require UV and IR signals to be present, in the proper ratio or signature as emitted by a hydrocarbon fire, before the detector initiates an alarm.[ Detectors shall respond within 5 seconds to a JP-4 fire 3 meters 10 feet square, 46 meters 150 feet from the detector.] Detector shall not be activated by non-fire sources such as continuous or intermittent direct or reflected solar radiation, arc-welding, lightning, radiant heat, x-rays, artificial lighting, radio transmissions, and normal jet engine functions. Detector shall have an automatic through-the-lens self-testing feature. Malfunction of the detector circuitry, or degradation of the sensors' lens cleanliness to the point where the detector will not detect the design fire signature, shall cause operation of the system trouble signals. Logic circuits necessary for operation of the detector shall be integral to the detector or located in separate flame detector control panel(s) located adjacent to the foam system control panel(s). Each detector in alarm shall be individually annunciated by an LED on the detector or at the detector control panel. Primary and auxiliary power supply shall be taken from the foam system control panel(s). Detectors, and associated control panels if required, shall be compatible with the foam system control panel(s). Detectors and associated control panels shall be weatherproof, or housed in weatherproof enclosure(s) when in an area subject to system discharge and shall also be explosion-proof when located in hazardous areas as defined by NFPA 70. Detector spacing and location shall be in accordance with NFPA 72, their UL listing or FM approval, and the manufacturer's recommendations. The detector manufacturer shall determine or approve the detector layout. Detector layout drawings shall include horizontal and vertical angles for correct aiming. Locate detectors so that every portion of the protected [floor] area is within the field of view of at least [two] [three] detectors, taking into account fixed obstructions. Provide detectors with manufacturer's swivel mounting bracket. Provide a permanent engraved rigid plastic or metal label at each detector location with detector aiming information (degrees horizontal and vertical) for the corresponding detector.

2.9 ELECTRICAL WORK

******************************************************************************
NOTE: Edit Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and include as part of the project specification.
******************************************************************************
NOTE: When project includes requirement for a building fire alarm system, include Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] in the project specification. When project requires only tying into an existing building fire alarm system, fire alarm wiring should be specified in this section. Select the appropriate Section title when using the basic NAVFAC guide specification covering the subject work or select the second title when using the EFD regional guide specification covering the subject work.

Electrical work is specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, except for control [and fire alarm] wiring.[ Fire alarm system is specified in Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] ["Fire Alarm and Fire Detecting Systems (Local)"]

2.9.1 Wiring

Provide control wiring and connections to fire alarm systems, under this section and conforming to NFPA 70 and NFPA 72. Wire for 120 volt circuits shall be No. 12 AWG minimum solid conductor. Wire for low voltage DC circuits shall be No. 14 [16] AWG minimum solid conductor [, except wire to remote annunciators, if provided, may be 18 AWG minimum solid conductor]. All wiring shall be color coded. Wiring, conduit and devices exposed to water or foam discharge shall be weatherproof. Wiring, conduit and devices located in hazardous atmospheres, as defined by NFPA 70[ and as shown], shall be explosion proof. All conduit shall be minimum 20 mm 3/4 inch size.

2.9.2 Operating Power

Power shall be 120 volts AC service, transformed through a two winding isolation type transformer and rectified to 24 volts DC for operation of all signal initiating, signal sounding, trouble signal, and actuating (releasing) circuits. Provide secondary DC power supply for operation of system in the event of failure of the AC supply. Transfer from normal to emergency power or restoration from emergency to normal power shall be fully automatic and shall not cause transmission of a false alarm. Obtain AC operating power for control panel,[ and ]battery charger[, and air compressor] from the line side of the incoming building power source ahead of all building services. Provide independent properly fused safety switch, with provisions for locking the cover and operating handle in the "POWER ON" position for these connections and locate adjacent to the main distribution panel. Paint switch box red and suitably identify by a lettered designation.
2.9.3 Conductor Identification

Identify circuit conductors within each enclosure where a tap, splice or termination is made. Identify conductors by plastic coated self-sticking printed markers or by heat-shrink type sleeves. Attach the markers in a manner that will not permit accidental detachment. Properly identify control circuit terminations.

2.10 SYSTEM ACTIVATION

2.10.1 Overhead System Activation

**************************************************************************
NOTE: Provide one or more risers per hangar bay as required by NFPA 409 based on size of bay. Overhead systems, monitor systems and hose systems shall be served by separate risers.
**************************************************************************

Each zone shall encompass the area[ protected by each riser][ of one hangar bay]. Upon activation of the detection system or overhead system manual release station(s), the corresponding overhead system protecting that area shall activate.

2.10.2 Monitor System Activation

**************************************************************************
NOTE: Overhead systems, monitor systems and hose systems shall be served by separate risers.
**************************************************************************

Each zone shall encompass[ one hangar bay][ the monitors indicated]. Upon activation of [[detectors for] the overhead system] [two UV-IR detectors for more than 5 seconds] or activation of a manual release station, all monitors in that zone shall be activated.

2.10.3 Hose System Activation

**************************************************************************
NOTE: Overhead systems, monitor systems and hose systems shall be served by separate risers.
**************************************************************************

[Each][The] zone shall encompass [all hose stations] [the hose stations indicated]. Hose stations shall be activated upon activation of a hose station manual release station. Provide a manual release station at each hose station.

2.11 ALARMS

2.11.1 Water Motor Alarms

Provide weatherproof and guarded type alarm for each [group of] [deluge] [pre-action] valve(s). Alarms shall sound locally on the flow of foam solution in each system to which it is connected. Mount alarms on the outside of the outer walls of each building, at locations indicated. When more than one alarm gong is provided, provide permanent engraved rigid plastic or metal signs indicating to which system each gong is connected.
2.11.2 Local Alarm

**************************************************************************
NOTE: Delete if a building fire alarm system exists in the building or is being provided under this project.
**************************************************************************

Provide electric [alarm horns] [alarm bells] to sound locally on operation of any system, regardless of whether water flows or not. When more than one alarm is provided, provide permanent engraved rigid plastic or metal signs indicating to which system each alarm is connected.

2.11.3 Fire Alarm

Provide equipment for the automatic transmittal of an alarm over the building fire alarm system. Arrange so that the detection system and the flow of solution in each system will actuate the alarm. [Activation of a single UV-IR detector shall not cause activation of the foam system but shall cause activation of the fire alarm system].

2.11.3.1 Pressure Switch

Provide switch with SPDT contacts to automatically transmit alarms upon flow of water or AFFF. Alarm actuating device shall [have mechanical diaphragm controlled retard device adjustable from 10 to 60 seconds and shall] instantly recycle.

2.11.4 Trouble Alarm

**************************************************************************
NOTE: Delete if a building fire alarm system exists in the building or is being provided under this project.
**************************************************************************

**************************************************************************
NOTE: Pre-action sprinkler piping systems require supervision.
**************************************************************************

Provide local[100 mm 4 inch] electric alarm [bell] [horn] [_____] to indicate trouble [or failure of the [detection system][ or ][pre-action sprinkler piping system]]. Also connect trouble alarm into the building fire alarm control panel to indicate "trouble" on a separate zone labeled "Foam System Trouble".

2.12 TANK MOUNTED AIR COMPRESSOR

**************************************************************************
NOTE: Include for projects involving pre-action sprinkler piping systems only.
**************************************************************************

Provide an approved automatic type electric motor driven air compressor including pressure switch, air piping, and [38 liter] [10 gallon][_____] minimum capacity tank. Compressor shall have a minimum capacity capable of charging the complete sprinkler system to normal system air pressure within 30 minutes. Provide each system with an approved automatic air pressure
regulating device.

2.13  AFFF CONCENTRATE

**************************************************************************

NOTE: Consult the facility fire department and the Division Fire Protection Engineer to determine percentage.

**************************************************************************

2.13.1  Concentrate Fill Pump

Provide one pump to fill foam system tank. Pump shall have a minimum flow rate of 27 L/m 7 gpm. Pump shall be complete with 115 VAC motor, fused switch, power cord with plug and 3 meters 10 foot minimum suction and clear discharge hoses.

2.14  DIAPHRAGM PRESSURE PROPORTIONING EQUIPMENT

**************************************************************************

NOTE: Select the method of proportioning best suited for the project. For hangars, NFPA 409 requires dual pumps (main and reserve) for each system.

Diaphragm pressure proportioning systems operate by water pressure, require no electrical power, and minimal control circuitry for automatic operation. Maintenance requirements are minimal, however refilling the tank is a difficult operation requiring the services of a qualified technician to avoid rupturing the diaphragm.

Balanced pressure proportioning systems require reliable electrical power and more complex control circuitry for automatic operation. In some cases an emergency generator will be required. The primary advantage of the non-diaphragm systems is the ease in refilling the tanks. Tanks may be refilled even while the system is in operation, if necessary.

Skid-mounted balanced pressure proportioning systems perform proportioning at a central location, avoiding long runs of concentrate lines. They are well suited for systems such as deluge sprinklers and monitor nozzles which have a relative narrow range of flow rates.

In-line balanced pressure proportioning is useful when there are multiple hazards with widely varying discharge rates which are to be supplied from the same proportioning system, and any time it is desired to proportion foam remotely at risers or discharge devices instead of at the pump room. Their disadvantage is the need for much more concentrate piping in the field.

**************************************************************************
Foam solution shall be produced by introducing AFFF concentrate into the water stream by the balanced pressure proportioning method using a diaphragm pressure tank and ratio controller. [Provide proportioning system and storage tanks for hose lines independent of main proportioning system and tanks.]

2.14.1 Diaphragm Pressure Proportioning Tanks

**NOTE:** When large quantities of AFFF concentrate are required, consider two or more tanks in parallel vs one large tank. (This is in addition to reserve tanks.) Approved diaphragm tanks larger than 9.50 to 11.40 cu meters 2,500 to 3,000 gallons are not readily available.

**NOTE:** Designer must calculate foam tank capacity based on maximum flow for maximum duration to determine size of tank and space required. Do not label foam tank capacity on drawing. Exact tank size (which may be larger) will be determined by Contractor's hydraulic calculations.

Tanks shall be cylindrical steel ASME pressure vessels with a full Buna-N impregnated nylon inner tank or bladder designed to contain AFFF concentrate and to be used in conjunction with the concentrate ratio controller. Tanks shall be designed for working pressure of [1206 kPa (gage)] [175 psig] [_____] and hydrostatically tested at 1.5 times the working pressure in accordance with ASME standards at the factory. Tanks shall have UL or FM label and ASME stamp affixed to the vessel. Size tank to provide sufficient AFFF concentrate for the time specified when the system is discharging foam solution at total maximum system flow. Also provide connected reserve tanks(s) of equal capacity. Permanently label each tank with its capacity, type and percentage of concentrate, which system(s) it serves, and whether it is a main or reserve tank. Conspicuously post filling instructions near each group of tanks. Provide a gage or unbreakable sight glass to permit visual determination of level of tank contents. Prior to shop painting, abrasive blast clean tank exterior surface in accordance with SSPC SP 6/NACE No.3 to a surface profile not to exceed 0.05 mm 2.0 mils and provide a MIL-DTL-24441 or SSPC coating system to the tank exterior. Prime tank exterior with one coat of MIL-DTL-244411, Formula 150 or SSPC Paint 22 primer applied to a dry film thickness of 0.076 mm 3 mils and topcoat with one coat of MIL-DTL-24441/7 Formula 156 (red) or SSPC Paint 22 topcoat (red) applied to a dry film thickness of 0.076 mm 3 mils.

2.14.2 Concentrate Ratio Controller

Ratio controller shall be a modified venturi device with AFFF concentrate feed line from diaphragm tank(s), and integral concentrate metering orifice. Size for specified flow rate(s).

2.15 BALANCED PRESSURE PROPORTIONING SYSTEM
NOTE: Select the method of proportioning best suited for the project. For hangars, NFPA 409 requires dual pumps (main and reserve) for each system.

Diaphragm pressure proportioning systems operate by water pressure, require no electrical power, and minimal control circuitry for automatic operation. Maintenance requirements are minimal, however refilling the tank is a difficult operation requiring the services of a qualified technician to avoid rupturing the diaphragm.

Balanced pressure proportioning systems require reliable electrical power and more complex control circuitry for automatic operation. In some cases an emergency generator will be required. The primary advantage of the non-diaphragm systems is the ease in refilling the tanks. Tanks may be refilled even while the system is in operation, if necessary.

Skid-mounted balanced pressure proportioning systems perform proportioning at a central location, avoiding long runs of concentrate lines. They are well suited for systems such as deluge sprinklers and monitor nozzles which have a relative narrow range of flow rates.

In-line balanced pressure proportioning is useful when there are multiple hazards with widely varying discharge rates which are to be supplied from the same proportioning system, and any time it is desired to proportion foam remotely at risers or discharge devices instead of at the pump room. Their disadvantage is the need for much more concentrate piping in the field.

Foam solution shall be produced by introducing AFFF concentrate into the water stream by the balanced pressure proportioning method using a pump and proportioner. [Provide proportioning system and storage tanks for hose lines independent of main proportioning system and tanks.]

[2.15.1 Skid-Mounted Balanced Pressure Proportioning System]

Self-contained, skid-mounted system, fully assembled at the factory and delivered complete and ready for use. Field connections shall be limited to water, electrical, and AFFF concentrate inputs, foam solution output, and foam concentrate return line to storage tank. Size system for required flow rate(s). The concentrate pump and all piping, valves, and fittings in contact with foam concentrate shall be of materials resistant to the corrosive effects of the AFFF concentrate. Concentrate pump shall be electric motor driven, drip proof, 240/480 volts, 60 Hz AC. Activation and operation of system shall be fully automatic, with manual over-ride and
manual shut-down. Provide permanent engraved rigid plastic or corrosion resistant metal instruction plate for emergency manual operation, along with a similarly constructed label for each control device.

2.15.2 In-Line Balanced Pressure Proportioning System

Size system for required flow rates. AFFF concentrate pump shall be positive displacement, electric motor driven, drip proof, 240/480 volts, 60 Hz AC. System operation shall be fully automatic, with manual over-ride and manual shut-down. Provide a pressure regulating device in the AFFF concentrate pump return line to maintain constant pressure on the concentrate piping system at all AFFF solution flow rates. Provide an in-line balanced pressure proportioning device at each system riser to automatically balance the AFFF concentrate pressure with the water pressure at the riser to provide correct proportioning over the range of flow rates calculated for that riser. The pump and all piping, valves, and fittings in contact with the foam concentrate shall be of materials resistant to the corrosive effects of the AFFF concentrate. Provide permanent engraved rigid plastic or corrosion-resistant metal instruction plate for emergency manual operation, along with a similarly constructed label for each control device.

2.15.3 AFFF Concentrate Storage Tanks

******************************************************************************
NOTE: Designer must calculate foam tank capacity based on maximum flow for maximum duration to determine size of tank and space required. Do not label foam tank capacity on drawing. Exact tank size (which may be larger) will be determined by Contractor's hydraulic calculations.
******************************************************************************

Tank shall be designed for storage of AFFF concentrate at atmospheric pressure, and shall be [horizontal] or [vertical] cylindrical, fiberglass or polyethylene construction. Tank shall have the following: Drain valve located at the lowest point in the tank, connections for concentrate supply and return lines to the proportioners, top-mounted fill connections and inspection hatch, and a pressure/vacuum relief vent. All openings and tank connections shall be installed at the factory, no holes shall be made in the tank shell in the field. Tank shall include all necessary supports for free-standing installation. Provide a gage or unbreakable sight glass to permit visual determination of level of tank contents, unless liquid level is clearly visible through shell of tank. Size tank to provide sufficient AFFF concentrate for the time specified when the system is discharging foam solution at total maximum system flow. Also provide connected reserve tank(s) of equal capacity. Permanently label each tank with its capacity, type and percentage of concentrate, which system it serves, and whether it is a main or reserve tank.

2.16 OSCILLATING MONITOR NOZZLES

******************************************************************************
NOTE: Refer to MIL-HDBK-1008 and the appropriate NFPA standard(s) governing the particular facility to determine the density required. Consult the activity for the floor area under the wings and fuselage.
******************************************************************************
Fixed, water motor operated, [with] [without] override to allow manual aiming. Oscillation arc shall be adjustable from at least 0 to 2.88 radian 165 degrees. Oscillation speed shall be adjustable from 0 to 0.52 radian 30 degrees per second. Nozzle shall be adjustable while in operation from 0.52 radian 30 degrees below to 1.40 radian 80 degrees above horizontal, with lock or latching mechanism. Nozzle shall be [non aspirating] [air aspirating] type, adjustable while in operation from straight stream to fan-spray. Nozzle shall be capable of retaining the adjusted setting once the desired pattern has been set. Nozzle shall produce a straight stream of 46 meters 150 feet at [1920 L/m] [500 gpm] [_____] and [690 kPa (gage)] [100 psig] [______]. Nozzles shall provide a minimum application rate of [4.2] [_____] L/m per sq meter [0.10] [_____] gpm per square foot over [the entire floor area] [_____] square meter feet of floor area underneath the aircraft wings and fuselage. Provide normally open 0S&Y gate valve in supply line at each monitor location.

2.17 HAND HOSE LINES

Provide each hose station with flow-through reel and [_____] meter of 40 mm feet of 1 1/2 inch hard rubber hose and nozzles. Nozzle shall have pistol-grip ball shutoff valve. Nozzle shall be [non aspirating] [air aspirating] type. Provide normally closed quarter-turn ball valve in supply line at each hose station. Nozzle flow rate shall be [228 L/m] [60 gpm] [_____] minimum.

2.18 WALL FOAM HYDRANTS

******************************************************************************
NOTE: Provide wall foam hydrants for testing of proportioners on pre-action systems or where additional foam hand hose lines are required. Determine number of outlet connections based upon a ratio of one outlet for each 948 L/m 250 gpm of design flow, up to a maximum of 8 outlets.
******************************************************************************

Provide [dual] [triple] [_____] outlet connections with integral gate valves and locate about one meter 3 feet above grade. Provide each outlet with 65 mm 2 1/2 inch male National Standard hose threads with cap and chain. Hydrant shall be controlled by 0S&Y gate valve located inside foam room. Provide wall escutcheon plate with "FOAM HYDRANT" in raised letters cast in plate. Hydrant shall permit testing of each pre-action system riser at full design flow without charging the system supplied by the riser.]

2.19 ABOVEGROUND PIPING SYSTEMS

2.19.1 Pipe, Fittings, and Mechanical Couplings

NFP 13, except steel piping shall be Schedule 40 for sizes smaller than 200 mm 8 inches, and Schedule 30 or 40 for sizes 200 mm 8 inches and larger. Pipe nipples 150 mm 6 inches long and shorter shall be Schedule 80 steel pipe. Water motor alarm piping shall be zinc-coated steel pipe and fittings. Rubber gasketed grooved-end pipe and fittings with mechanical couplings shall only be permitted in pipe sizes 40 mm 1 1/2 inches and larger. Rubber gaskets shall be UL listed for use in dry-pipe sprinkler systems. Use of restriction orifices, reducing flanges, and plain-end fittings with mechanical couplings (which utilize steel gripping devices to
bite into the pipe when pressure is applied) are not permitted. Pipe and fittings in contact with AFFF concentrate shall be [material resistant to the corrosive effects of AFFF concentrate as approved by the manufacturer of the proportioning system] [stainless steel]. [Fittings on concentrate lines shall be flanged or welded only. Screwed or mechanical fittings will not be permitted.]

2.19.2 Jointing Material

**CID A-A-58092, Polytetrafluoroethylene (PTFE) tape. Pipe joint compound (pipe dope) is not acceptable.**

2.19.3 Duplex Basket Strainers

**************************************************************************
NOTE: Include for deluge systems with high volume flow, and for untreated water supply.
**************************************************************************

**FS WW-S-2739, Style Y (Y pattern). Provide duplex basket strainers with removable screens having standard perforations, 3 mm 0.125 inch in diameter in the riser beneath the deluge valves.**

2.19.4 Pipe Hangers and Supports

**NFPA 13.**

2.19.5 Valves

Provide valves as required by **NFPA 13** and of types approved for fire service. Gate valves shall open by counterclockwise rotation. Check valves shall be flanged clear opening swing check type with flanged inspection and access cover plate for sizes 100 mm 4 inches and larger. Provide an OS&Y valve beneath each [deluge] [pre-action] valve in each riser, when more than one valve is supplied from the same water supply pipe. Butterfly valves are not acceptable.

2.19.6 Identification Signs

Attach properly lettered approved metal signs conforming to **NFPA 13** to each valve and alarm device. Permanently affix design data nameplates to the riser of each system.

2.19.7 Inspector's Test Connection

**************************************************************************
NOTE: Include for pre-action systems.
**************************************************************************

Provide test connections about 2 meters 6 feet above the floor for each sprinkler system and locate at the hydraulically most remote part of each system. Provide test connection piping to a location where the discharge will be readily visible and where water may be discharged without damage.

2.19.8 Main Drains

Provide drain piping to discharge at safe points outside each building or to sight cones attached to drains of adequate size to readily receive the full flow from each drain under maximum pressure. Provide auxiliary drains.
as required by NFPA 13.

2.19.9 Pipe Sleeves

Provide where piping passes through walls, floors, roofs, and partitions. Secure sleeves in proper position and location during construction. Provide sleeves of sufficient length to pass through entire thickness of walls, floors, roofs, and partitions. Provide not less than 6 mm 1/4 inch space between exterior of piping and interior of sleeve. Firmly pack space with insulation and caulk at both ends of the sleeve with plastic waterproof cement.

2.19.9.1 Sleeves in Masonry and Concrete Walls, Floors, Roofs

ASTM A53/A53M, schedule 40 or standard weight, zinc-coated steel pipe sleeves. Extend sleeves in floor slabs 80 mm 3 inches above the finished floor.

2.19.9.2 Sleeves in Partitions

Provide zinc-coated steel sheet having a nominal weight of not less than 4.40 kg per sq meter 0.90 pounds per square foot.

2.19.10 Escutcheon Plates

Provide one piece or split hinge type plates for piping passing through floors, walls and ceilings, in both exposed and concealed areas. Provide chromium plated metal plates where pipe passes through finished ceilings. Provide other plates of steel or cast iron with aluminum paint finish. Securely anchor plates in place.

2.19.11 Fire Department Inlet Connections

[Two ] [Three ] way type with 65 mm 2 1/2 inch National Standard female hose threads with plug, chain, and identifying fire department connection escutcheon plate. Provide inlet connections about one meter 3 feet above grade.

2.19.12 Backflow Preventers

**************************************************************************

NOTE: When the water supply for the AFFF system is non-potable water delete this paragraph.
**************************************************************************

Reduced pressure principle type. Proof shall be furnished that each make, model/design, and size of backflow preventer being furnished for the project is approved by and has a current "Certificate of Approval" from the FCCCHR List. Listing of the particular make, model/design, and size in the current FCCCHR List will be acceptable as the required proof.

2.20 BURIED PIPING SYSTEMS

2.20.1 Pipe and Fittings

**************************************************************************

NOTE: For pipe sizes larger than 305 mm 12 inches, method for pipe anchorage including pipe clamps and the rods shall be shown on the drawings. Avoid
velocities greater than 4.60 meters per second 15 feet per second.

**************************************************************************

NOTE: Select first bracketed phrase for connection to an existing water distribution system located a short distance from the building. Select second bracketed phrase when a new water distribution line is being provided as part of this project. For new water distribution system, select and edit Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING and include as part of the project specification.

**************************************************************************

NFPA 24, outside coated cement lined ductile iron pipe and fittings for piping under the building and to a point 1.50 meters 5 feet outside the building walls. Anchor the joints in accordance with NFPA 24 using pipe clamps and steel rods. Minimum pipe size shall be 150 mm 6 inches. Minimum depth of cover shall be [_____] [one meter] [3 feet]. Piping more than 1.50 meters 5 feet outside the building walls shall be [outside coated cement lined ductile iron pipe and fittings conforming to NFPA 24] [provided under Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING].

2.20.2 Valves

**************************************************************************

NOTE: If Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING is included as part of the project specification, requirements for buried gate valves, post indicator valves, and valve boxes may be deleted here and specified in Section 33 11 00. Careful coordination is required to insure that materials rated for fire service are specified.

**************************************************************************

Provide as required by NFPA 24 for fire service. Gate valves shall conform to AWWA C500 or UL 262 with cast iron body and bronze trim, and shall open by counterclockwise rotation.

2.20.3 Post Indicator Valves

**************************************************************************

NOTE: If Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING is included as part of the project specification, requirements for buried gate valves, post indicator valves, and valve boxes may be deleted here and specified in Section 33 11 00. Careful coordination is required to insure that materials rated for fire service are specified.

**************************************************************************

Provide with operating nut located about one meter 3 feet above grade. Gate valves for use with indicator post shall conform to UL 262. Indicator posts shall conform to UL 789. Paint each indicator post with one coat of primer and two coats of red enamel paint.
2.20.4 Valve Boxes

**************************************************************************
NOTE: If Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING is included as part of the project specification, requirements for buried gate valves, post indicator valves, and valve boxes may be deleted here and specified in Section 33 11 00. Careful coordination is required to insure that materials rated for fire service are specified.
**************************************************************************

Except where indicator posts are provided, provide each gate valve in buried piping with an adjustable cast-iron valve box of a size suitable for the valve on which it is to be used. Boxes outside of paved areas may be of Acrylonitrile-Butadiene-Styrene (ABS) plastic or of inorganic fiber reinforced black polyolefin plastic. The head shall be round and the lid shall have the word WATER cast on it. The least diameter of the shaft of the box shall be 133 mm 5 1/4 inches. Coat each cast-iron box with bituminous paint.

2.20.5 Buried Utility Warning and Identification Tape

Provide detectable aluminum foil plastic-backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape shall be detectable by an electronic detection instrument. Provide tape in rolls, 76 mm 3 inches minimum width, color coded for the utility involved, with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall be CAUTION BURIED WATER PIPING BELOW or similar. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material. Bury tape with the printed side up at a depth of 305 mm 12 inches below the top surface of earth or the top surface of the subgrade under pavements.

PART 3 EXECUTION

3.1 EXCAVATION, BACKFILLING, AND COMPACTING

**************************************************************************
NOTE: Select and edit Section 31 23 00.00 20 EXCAVATION AND FILL and include as part of the project specification.
**************************************************************************

Provide under this section as specified in Section 31 00 00 EARTHWORK.

3.2 CONNECTIONS TO EXISTING WATER SUPPLY SYSTEMS

Use tapping or drilling machine valve and mechanical joint type sleeves for connections to be made under pressure. Bolt sleeves around the mains; bolt valve conforming to AWWA C500 or UL 262 to the branch. Open valve, attach drilling machine, make tap, close valve, and remove drilling machine, all without interruption of service. Notify the Contracting Officer in writing at least [_____] [15] calendar days prior to the date the connections are required; approval shall be received before any service is interrupted. Furnish all material required to make connections into the existing water supply systems, and perform all excavating, backfilling, and other incidental labor as required. [Furnish] [Government will furnish only] the
labor and the tapping or drilling machine for making the actual connections to the existing systems.

3.3 AFFF SYSTEM INSTALLATION

Equipment, materials, installation, workmanship, fabrication, assembly, erection, examination, inspection, and testing shall be in accordance with the NFPA standards referenced herein. Install piping straight and true to bear evenly on hangers and supports. Conceal piping to the maximum extent possible. Piping shall be inspected, tested and approved before being concealed. Provide fittings for changes in direction of piping and for all connections. Make changes in piping sizes through standard reducing pipe fittings; do not use bushings. Cut pipe accurately and work into place without springing or forcing. Ream pipe ends and free pipe and fittings from burrs. Clean with solvent to remove all varnish and cutting oil prior to assembly. Make screw joints with PTFE tape applied to male thread only.

3.4 DISINFECTION

**************************************************************************
NOTE: When the water supply for the AFFF system is non-potable water delete this paragraph.
**************************************************************************

Disinfect new water piping from the system control valve to the point of connection at the water main and existing water piping affected by the Contractor's operation in accordance with AWWA C651. Fill piping systems with solution containing minimum of 50 mg/kg parts per million (ppm) of free available chlorine and allow solution to stand for minimum of 24 hours. Flush solution from systems with clean water until maximum residual chlorine content is not greater than 0.2 mg/kg ppm.

3.5 FIELD PAINTING

**************************************************************************
NOTE: For facilities located in a marine environment specify SSPC SP 11 cleaning and specify a second topcoat.
**************************************************************************

Clean, prime, and paint new foam systems including valves, piping, conduit, hangers, miscellaneous metal work, and accessories. Apply coatings to clean dry surfaces using clean brushes. Clean the surfaces in accordance with [SSPC SP 3] [SSPC SP 11]. Immediately after cleaning, prime the metal surfaces with one coat of SSPC Paint 25 or SSPC Paint 25 primer applied to a minimum dry film thickness of 0.04 mm 1.5 mils. Exercise care to avoid the painting of sprinkler heads and operating devices. Upon completion of painting, remove materials which were used to protect sprinkler heads and operating devices while painting is in process. Remove sprinkler heads and operating devices which have been inadvertently painted and provide new clean sprinkler heads and operating devices of the proper type. Finish primed surfaces as follows:

3.5.1 Foam Systems in Unfinished Areas

**************************************************************************
NOTE: For facilities located in a marine environment specify SSPC SP 11 cleaning and specify a second topcoat.
**************************************************************************
Unfinished areas are defined as attic spaces, spaces above suspended ceilings, crawl spaces, foam rooms, pump rooms, pipe chases, and other spaces where ceilings are not painted or not constructed of a prefinished material. Paint primed surfaces with [one] [two] coat[s] of CID A-A-2962 red enamel applied to a minimum dry film thickness of 0.04 mm 1.5 mils.

3.5.2 Foam Systems in All Other Areas

NOTE: For facilities located in a marine environment specify SSPC SP 11 cleaning and specify a second topcoat.

Paint primed surfaces with two coats of paint to match adjacent surfaces, except paint valves and operating accessories with [one] [two] coat[s] of CID A-A-2962 red enamel applied to a minimum dry film thickness of 0.04 mm 1.5 mils. Provide piping with 50 mm 2 inch wide red bands spaced at maximum 6 meters 20 foot intervals throughout the piping systems. Bands shall be red enamel or self adhering red plastic tape.

3.5.3 Piping Labels

Provide permanent labels in foam rooms, spaced at 6 meters 20 foot maximum intervals along pipe, indicating "WATER", "FOAM CONCENTRATE", and "FOAM SOLUTION" on corresponding piping.

3.5.4 Field Touch-Up

Clean damaged areas of shop coated tanks in accordance with SSPC SP 11 and coat cleaned areas with the same materials used for the shop applied coating system.

3.6 ELECTRICAL WORK

NOTE: Edit Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and include as part of the project specification.

NOTE: When project includes requirement for a building fire alarm system, include Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] in the project specification. When project requires only tying into an existing building fire alarm system, fire alarm wiring should be specified in this section. Select the first appropriate Section title when using the basic NAVFAC guide specification covering the subject work, or select the second title when using the EFD regional guide specification covering the subject work.
Electrical work is specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, except for control [and fire alarm] wiring. Fire alarm system is specified in Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] ["Fire Alarm and Fire Detecting Systems (Local)"].

3.6.1 Wiring

Provide control wiring, and connections to fire alarm systems, under this section in accordance with NFPA 70 and NFPA 72. Provide wiring in rigid metal conduit or intermediate metal conduit, except electrical metallic tubing may be used in dry locations not enclosed in concrete or where not subject to mechanical damage. Do not run low voltage DC circuits in the same conduit with AC circuits. Run wiring to UV-IR detectors alone in separate conduit if required by the detector manufacturer.

3.7 FLUSHING

Flush the piping system with potable water in accordance with NFPA 13. Continue flushing operation until water is clear, but for not less than 10 minutes.

3.8 FIELD QUALITY CONTROL

Prior to initial operation, inspect equipment and piping systems for compliance with drawings, specifications, and manufacturer's submittals. Perform tests in the presence of the Contracting Officer to determine conformance with the specified requirements.

3.8.1 Preliminary Tests

NOTE: Specify hydrostatic test not less than 1379 kPa 200 psi or 345 kPa 50 psi above the maximum working pressure when the maximum working pressure is greater than 1034 kPa 150 psi.

Each piping system shall be hydrostatically tested at [1379 kPa (gage)] [200 psig] in accordance with NFPA 13 and shall show no leakage or reduction in gage pressure after 2 hours. The Contractor shall conduct complete preliminary tests, which shall encompass all aspects of system operation. Individually test all detectors, manual actuation stations, alarms, control panels, and all other components and accessories to demonstrate proper functioning. Test water flow alarms by flowing water through the inspector's test connection. When tests have been completed and all necessary corrections made, submit to the Contracting Officer a signed and dated certificate, similar to that specified in NFPA 13, attesting to the satisfactory completion of all testing and stating that the system is in operating condition. Also include a written request for a formal inspection and test.

3.8.2 Formal Inspection and Tests (Acceptance Tests)

The [_____] Division, Naval Facilities Engineering Command Fire Protection
Engineer, will witness formal tests and approve all systems before they are accepted. The system shall be considered ready for such testing only after all necessary preliminary tests have been made and all deficiencies found have been corrected to the satisfaction of the equipment manufacturer's technical representative and written certification to this effect is received by the Division Fire Protection Engineer. Submit the request for formal inspection at least 15 working days prior to the date the inspection is to take place. The control panel(s) and detection system(s) shall be in continuous service for a "break-in" period of at least 15 consecutive days prior to the formal inspection. Experienced technicians regularly employed by the Contractor in the installation of both the mechanical and electrical portions of such systems shall be present during the inspection and shall conduct the testing. All AFFF concentrate, instruments, [including UV-IR detector test lamp and function test kit,] personnel, appliances and equipment for testing shall be furnished by the Contractor. All necessary tests encompassing all aspects of system operation shall be made including the following, and any deficiency found shall be corrected and the system retested at no cost to the Government.

3.8.2.1 Systems and Device Testing

The entire initiating, alarm, actuation systems shall be operated. As a minimum, operation and supervision of the following functions and devices shall be demonstrated:

a. All operational and supervisory functions of the control and annunciator panels.

b. Each manual actuation station and associated circuit(s).

c. All detectors and associated circuits.

d. All alarms and associated circuits.

e. All actuator circuits and system control valve(s) (without foam discharge).

f. Activation of the building fire evacuation alarm system.

g. Activation of the Base fire alarm system (receipt of fire alarm at alarm office).

h. All of the above tests shall then be repeated with the system on battery power only.

3.8.2.2 AFFF Discharge and Concentration Testing

When all of the initiating, alarm, actuation, and supervisory functions of the system operate to the satisfaction of the system manufacturer's technical representative and the Division Fire Protection Engineer, a complete discharge test of each system shall be performed to demonstrate satisfactory performance, proper AFFF concentration, mechanical operation and operation of valves, release devices, alarms, and interlocks which control the protected areas. These tests shall be conducted by experienced personnel according to the equipment and AFFF manufacturers' recommendations.

[ a. Test each deluge system by full flow of foam solution from the
individual systems or combination of systems to achieve maximum design flow rate for at least 60 seconds.

][b. Test each pre-action system at their design flow rate for at least 60 seconds with temporary hose lines and nozzles connected to a test header. Furnish hose and nozzles required for tests.

] c. Test all hose lines and monitor nozzles by full flow of foam solution for at least 60 seconds.

The manufacturer's representative shall test samples of foam solution taken from each system to ensure proper AFFF concentration. Provide protection for all electrical fixtures and equipment exposed to possible damage during tests and protect doors and other openings leading from the protected area(s), to prevent migration of foam solution into other areas or spaces.

3.8.2.3 Flushing and Rinsing

After completion of tests flush all piping carrying AFFF concentrate and solution with fresh water. Piping normally containing AFFF concentrate when the system is in standby mode need not be flushed. Rinse with fresh water all equipment and building surfaces exposed to AFFF discharge.

3.8.3 Environmental Protection

**************************************************************************
NOTE: Consult facility and the Division or District environmental officials to determine local requirements for containment and disposal of discharged AFFF. In sufficient concentrations, AFFF may cause disruption of processes in sewage treatment plants and damage to fisheries. Edit the paragraph as appropriate.
**************************************************************************

Provide temporary measures to prevent AFFF from entering storm drains, [sanitary sewers,] drainage ditches, streams and water courses. [Do not allow AFFF concentrate or solution to come in contact with earth. Contain all discharged AFFF on paved surfaces.][Collect all discharged AFFF and rinse and flushing water and dispose of it in an EPA - approved waste-water treatment facility which provides secondary (biological) treatment]. At least 15 days prior to the date flow testing is to take place, submit written plan for AFFF containment [and disposal] methods(s) to the Contracting Officer for approval.

3.8.4 Additional Tests

When deficiencies, defects or malfunctions develop during the tests required, all further testing of the system shall be suspended until proper adjustments, corrections or revisions have been made to assure proper performance of the system. If these revisions require more than a nominal delay, the Contracting Officer shall be notified when the additional work has been completed, to arrange a new inspection and test of the system. All tests required shall be repeated prior to final acceptance, unless directed otherwise.

3.8.5 AFFF Concentrate Storage Tanks Fill-Up

**************************************************************************
NOTE: Consult facility to determine whether the Government or the Contractor will furnish the initial fill-up of AFFF concentrate.

Fill storage tanks including reserve tanks and piping normally containing concentrate when the system is in standby mode with [Contractor] [Government] furnished AFFF concentrate after acceptance of the system.

3.8.6 Manufacturer's Representative

Provide the services of representatives or technicians from the manufacturers of the foam system, [and] control panel [, and UV-IR detectors], experienced in the installation and operation of the type of system being provided, to supervise installation, adjustment, preliminary testing, and final testing of the system and to provide instruction to Government personnel.

3.9 OPERATING INSTRUCTIONS

Provide operating instructions at control equipment and at each remote control station. Instructions shall clearly indicate all necessary steps for the operation of the system. Submit the proposed legend for operating instructions for approval prior to installation. Instructions shall be in engraved white letters on red rigid plastic or red enameled steel backgrounds and shall be of adequate size to permit them to be easily read.

3.10 TRAINING REQUIREMENTS

Prior to final acceptance, the Contractor shall provide two sessions of 4 hours each of operation and maintenance training to the Base Fire Department and [Public Works] [Civil Engineering] personnel on two different days to accommodate both shifts of the Base Fire Department. Each training session shall include emergency procedures, and unique maintenance and safety requirements. Training areas will be provided by the Government in the same building as the protected areas. The training conducted shall use operation and maintenance manuals specified in paragraph OPERATIONS AND MAINTENANCE MANUALS. Dates and times of the training period shall be coordinated through the Contracting Officer not less than two weeks prior to the session.

3.11 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurement, and not on metric measurement commonly agreed to by the manufacturers or other parties. The inch-pound
and metric measurements shown are as follows:

<table>
<thead>

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for automatic and manual tank farm fire extinguishing foam systems.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](CR).
System requirements must conform to UFC 3-600-01, "Fire Protection Engineering for Facilities".

******************************************************************************************

NOTE: If there are questions concerning type of foam systems required, consult the Engineering Field Division, Naval Facilities Engineering Command.

******************************************************************************************

NOTE: The following information shall be shown on the project drawings:

1. Location and detail of each foam system supply riser, deluge valve, water motor alarm, fire department inlet connection, foam hydrants, hand hose stations, water monitor nozzles, foam chambers, and associated electrical connections.

2. Point of connection to the existing water distribution system.

3. Location of foam system control valves and post indicator valves.

4. Area(s) of foam system coverage, with zone designations (if multiple zones). Do not show piping layout.

5. Capacity, height, and type of fuel tank to be protected.

6. For pipe larger than 305 mm 12 inches, detail methods of anchoring pipe including pipe clamps and tie rods.

7. Location of foam proportioning equipment and storage tank.

8. Show locations of control panel, annunciator(s), alarm devices, manual actuation stations, point of connection to the base fire alarm system, remote trouble device, point of connection to the incoming power supply and fusible safety switch. Do not show conduit sizes or number of conductors for DC circuits. Show mounting details for heat detectors, however, do not show locations of detectors.

9. Show single line riser diagram for all detection, activation, and alarm circuits. Connection of equipment shall be indicated by circuit runs and not conduit runs. Do not indicate number and size of conductors for interconnection of fire alarm components.

******************************************************************************************
PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section, with the additions and modifications specified herein.

1.3 SYSTEM DESCRIPTION

1.3.1 Design Requirements

**************************************************************************
NOTE: Identify the tanks which are to be protected by each system.
**************************************************************************

**************************************************************************
NOTE: Include only those NFPA codes applicable to the specific project.
**************************************************************************

Design and [provide a new] [and] [modify an existing] aqueous film forming foam (AFFF) fuel tank protection system for [______]. System shall provide uniform distribution of AFFF solution to provide complete coverage by surface application to the tank(s) indicated. The design, equipment, materials, installation, and workmanship shall be in strict accordance with the required and advisory provisions of NFPA 11, NFPA 13, [NFPA 14,] NFPA 16, [NFPA 24,] [NFPA 30,] NFPA 70, and NFPA 72, except as modified herein. [Each] [The] system [shall be designed for earthquakes and] shall include all materials, accessories and equipment necessary to provide [each] [the] system complete and ready for use. Design and install [each] [the] system to give full consideration to blind spaces, piping, electrical equipment, and all other construction and equipment to provide complete coverage in accordance with the drawings to be submitted for approval. Devices and equipment for fire protection service shall be of a make and type listed by the Underwriter's Laboratories Inc. in the UL Fire Prot Dir, or approved by the Factory Mutual System and listed in FM APP GUIDE. In the publications referred to herein, the advisory provisions shall be considered to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears; reference to the "authority having jurisdiction" shall be interpreted to mean the [[______]] Division, Naval Facilities Engineering Command Fire Protection Engineer] [Corps of Engineers Contracting Officer]. Begin work at the point indicated.

1.3.1.1 Shop Drawings

Prepare shop drawings for the fire extinguishing system in accordance with
the requirements for "Plans" as specified in NFPA 11 and "Working Plans" as specified in NFPA 13. Each drawing shall be A1 841 by 594 mm 34 by 22 inches. Do not commence work until the design of [each] [the] system and the various components have been approved. Show:

a. Tank and tank farm area layout and include data essential to the proper installation of [each] [the] system.

b. Foam chambers, discharge nozzles and system piping layout annotated with reference points for design calculations.

c. Field wiring diagrams showing locations of devices and points of connection and terminals used for all electrical field connections in the system, with wiring color code scheme.

1.3.1.2 Calculations

Submit design calculations for the system.

a. Hydraulic calculations showing basis for design in accordance with NFPA 11 and NFPA 13.

b. Pressure discharge graphs or tables showing relationship for foam chambers and discharge nozzles.

c. Substantiating battery standby power requirements calculations showing battery capacity, supervisory and alarm power requirements.

1.3.1.3 AFFF Containment and Disposal Plan

Submit AFFF containment and disposal plan as required under paragraph entitled "Environmental Protection."

1.3.1.4 As-Built Drawings for the Fire Extinguishing System

Upon completion, and before final acceptance of the work, submit a complete set of as-built drawings [, including complete as-built circuit diagrams,] of each system. Submit A1 841 by 594 mm 34 by 22 inch reproducible as-built drawings on mylar film with 200 by 100 mm 8 by 4 inch title block similar to contract drawings. Submit as-built drawings in addition to the record drawings required by Division 1.

1.3.2 System Operation

**************************************************************************
NOTE: For automatic operation include bracketed phrase.
**************************************************************************

Flow of water and AFFF shall be controlled by deluge valves. Foam proportioning equipment shall activate automatically upon tripping of the deluge valve(s) for the corresponding foam system(s). Valves shall be tripped by remote manual release stations [and by activation of the detection system]. No valve will be operated by a building fire evacuation alarm system. Use of motor-operated valves is prohibited. Once activated, system(s) shall operate until shut down manually. Provide separate circuits from the control panel to each zone of initiating devices. Transmission of signals from more than one zone over a common circuit is prohibited.
1.3.2.1 Tank System

Tank system shall be controlled by valves operated by remote manual release stations [and by activation of the detection system].

1.3.2.2 [Monitor System

**************************************************************************
NOTE: Where monitors are activated solely by manually opening a valve (e.g. post indicator valve), show valves on plans.
**************************************************************************

Monitor nozzles shall be controlled by valves operated [by remote manual release stations separate from those used for tank systems or hose systems] [manually].

]1.3.2.3 [Hose System

Hose reels shall be controlled by valves operated by remote manual release stations, separate from those used for tank systems or monitor nozzles.

]1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed
item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

[ The fire protection engineer, [_____] Division, Naval Facilities Engineering Command will review any approve all submittals in this section requiring Government approval.]

**************************************************************************

NOTE: For projects administered by the Pacific Division, Naval Facilities Engineering Command, use the optional "SUBMITTALS" article immediately below and delete the general "SUBMITTALS" article above.

**************************************************************************

[ The [_____] Division, Naval Facilities Engineering Command, Fire Protection Engineer delegates the authority to the Quality Control (QC) Representative's U.S. Registered Fire Protection Engineer for review and approval of submittals required by this section. Submit to the [_____] Division, Naval Facilities Engineering Command, Fire Protection Engineer one set of all approved submittals and drawings immediately after approval but no more later than 15 working days prior to final inspection.]

1.5 QUALITY ASSURANCE

1.5.1 Qualifications of Installer

Prior to commencing work, submit data showing that the Contractor has successfully installed automatic foam fire extinguishing systems of the same type and design as specified herein, or that he has a firm contractual agreement with a subcontractor having the required experience. Include the names and locations of at least two installations where the Contractor, or the subcontractor referred to above, has installed such systems. Indicate the type and design of each system, and certify that the system has performed satisfactorily for a period of at least 18 months.

**************************************************************************
NOTE: For projects administered by the Pacific Division, Naval Facilities Engineering Command, include the following optional paragraph requiring the minimum qualification of a NICET Level-III technician for preparation of all fire protection system drawings.
**************************************************************************

[Qualifications of System Technician: Installation drawings, shop drawing and as-built drawings shall be prepared, by or under the supervision of, an individual who is experienced with the types of works specified herein, and is currently certified by the National Institute for Certification in}
Engineering Technologies (NICET) as an engineering technician with minimum Level-III certification in Special Hazard System program. Contractor shall submit data for approval showing the name and certification of all involved individuals with such qualifications at or prior to submittal of drawings.

1.6 SPARE PARTS

Furnish the following spare parts:

a. 2 of each type of detector installed.

b. 1 of each type of audible and/or visual alarm device installed.

c. 2 of each type of fuse required by the system.

d. 5 complete sets of system keys.

PART 2 PRODUCTS

2.1 DESIGN OF FOAM SYSTEMS

Design of fuel tank fire extinguishing foam systems shall be by hydraulic calculations for uniform distribution of AFFF solution over the protected area and shall conform to the NFPA standards listed above and to the requirements as specified herein.

2.1.1 Tankside Foam Chambers

Provide chamber(s) as required by NFPA 11. Provide each chamber with a manufacturer-approved diaphragm or rupture disk to prevent entrance of fuel vapors into system piping. Upon discharge of AFFF, diaphragm or disk shall rupture, allowing foam to flow into the tank. Chamber shall be air-aspirating type with screened air intake and hinged or removable inspection cover. [Rupture disk or diaphragm is not required for open top, floating roof tanks].

2.1.2 Deluge Valves

Valves shall be operated by a detection system listed for releasing service and independent of the fire alarm system. [Deluge valve clappers shall incorporate a latching mechanism that will not be affected by changes of pressure in the water system.] If 150 mm 6 inch valves are used in 200 mm 8 inch risers, provide smoothly tapered connections. In addition to automatic operation, arrange each valve for manual release at the valve. Provide pressure gages and other appurtenances at the deluge valves as required by NFPA 13. Provide a detection device at the end of each actuation circuit to test the circuit and mount the device between 1.80 and 2.40 meters 6 and 8 feet above the finish floor or grade. Label each testing device to indicate the valve it activates. [Provide remote manual releases [at [_____]] [where shown].]

2.1.3 AFFF Solution Distribution

Distribution shall be essentially uniform from all foam chambers on any single tank.

2.1.4 AFFF Solution Application Density

**************************************************************************

SECTION 21 13 21.00 20 Page 14
Size system to provide the specified density when the system is discharging
the specified total maximum required flow. Application to tanks being
protected shall be [_____] mL/sec per square meter gallons per minute (gpm)
per square foot over the discharge area [with foam hose stream requirements
of [_____] mL/sec gpm], and with outside water hose stream [and monitor
nozzle] requirements of [_____] mL/sec gpm].

2.1.5 Foam Chamber Discharge Area

Area shall be over the [entire liquid surface] [annular ring seal between
the tank wall and foam dam] as required by NFPA 11.

2.1.6 Friction Losses

Calculate losses in pipe in accordance with the Hazen-Williams Formula with
'C' value of 100 for steel pipe, 150 for copper tube, and 140 for cement
lined ductile iron pipe.

2.1.7 Location of Foam Chambers

Locate chambers on the tank wall just below the roof joint as required by
NFPA 11. Where two or more chambers are required, they shall be equally
spaced around the tank circumference.

2.1.8 Water Supply

[Base hydraulic calculations on a static pressure of [_____] kPa (gage)
pounds per square inch gage (psig) with [_____] L/m gpm being available at
a residual pressure of [_____] kPa (gage) psig at the point [indicated] [of
connection with the base water distribution system].]

[Base hydraulic calculations on [_____] fire pump(s) running. Provide fire
pumps as specified in Section 21 30 00 FIRE PUMPS.]

[Base hydraulic calculations on [_____] fire pump(s) running, with a suction supply having a static pressure of [_____] kPa (gage) psig with [_____] L/m gpm being available at a residual pressure of [_____] kPa (gage) psig at the point [indicated] [of connection with the base water distribution system]. Provide fire pumps as specified in Section 21 30 00 FIRE PUMPS.]

2.1.9 Duration of Discharge

**************************************************************************
NOTE: For discharge duration, consult NFPA 11 and NFPA 30.
**************************************************************************

System shall apply foam solution over the discharge area for a minimum of [_____] minutes [while simultaneously discharging foam solution through hose lines for a minimum of [_____] minutes]. Reduction of the discharge duration based on a discharge rate higher than the specified minimum is not permitted.

2.2 DETECTION DEVICES

Provide electric heat detectors. All wiring shall be supervised and installed in protective metal conduit or tubing.

2.2.1 Control Panel

**************************************************************************
NOTE: Select either "Class B" or "Class A" supervision ("Style B" or "Style D" as defined by NFPA 72). "Class B" supervision which will normally be used, provides a trouble indication when a failure occurs in a circuit. "Class A" supervision provides a trouble indication when a fault occurs in a circuit and at the same time allows continued operation of that circuit. "Class A" supervision should be used for strategically critical facilities. Select first ("Class B") or second ("Class A") supervisory option accordingly.
**************************************************************************

**************************************************************************
NOTE: Provide a remote trouble bell or buzzer in a constantly attended area if the control panel is not so located. Provide a trouble bell at the control panel if the panel is located in a high noise area. Coordinate location of remote trouble bell and remote annunciator panel when both are provided.
**************************************************************************

Modular type panel installed in a [flush] [surface] mounted steel cabinet with hinged door and cylinder lock. Switches and other controls shall not be accessible without the use of a key. The control panel shall be a neat, compact, factory-wired assembly containing all parts and equipment required to provide specified operating and supervisory functions of the system. Panel cabinet shall be finished on the inside and outside with factory-applied enamel finish. Provide main annunciator located on the
exterior of the cabinet door or visible through the cabinet door. Provide audible trouble signal. Provide prominent engraved rigid plastic or metal identification plates, or silk-screened labels attached to the rear face of the panel viewing window, for all lamps and switches. System power shall be 120 volts ac service, transformed through a two winding isolation transformer and rectified to 24 volts dc for operation of all system initiating, actuating, signal sounding, trouble signal and fire alarm tripping circuits. System shall be electrically supervised on all circuits. [A ground fault condition or a single break in any circuit which prevents the required operation of the system shall result in the operation of the system trouble signal.] [A single open or ground fault condition in any detection (initiating) [or signaling] circuit shall not result in any loss of system function, but shall cause the actuation of system trouble signals. A ground fault condition or single break in any other circuit shall result in the activation of the system trouble signals.] Loss of ac power, a break in the standby battery power circuits, or abnormal ac power or low battery voltage shall result in the operation of the system trouble signals. The abnormal position of any system switch in the control panel shall result in the operation of the system trouble signals. Trouble signals shall operate continuously until the system has been restored to normal at the control panel. [Provide a 100 mm 4 inch remote system trouble bell [or buzzer], installed [in a constantly attended area] [where shown], arranged to operate in conjunction with the integral trouble signals of the panel. Provide remote bell [or buzzer] with a rigid plastic or metal identification sign which reads "FOAM SYSTEM TROUBLE." Lettering on identification sign shall be a minimum of 25 mm one inch high.] Control panel, batteries, and battery charger shall be weatherproof type or located in an area not subject to water damage. System control panel shall be UL listed or FM approved for extinguishing system control (releasing device service). [Control panel initiating circuits shall be intrinsically safe for use with line-type heat detection systems.] Permanently label all switches. Provide panel with the following switches:

a. Trouble silencing switch which transfers audible trouble signals (including remote trouble devices, if provided) to an indicating lamp. Upon correction of the trouble condition, audible signals will again sound until the switch is returned to its normal position, or the trouble signal circuit shall be automatically restored to normal upon correction of the trouble condition. The silencing switch may be a momentary action, self-resetting type.

b. Alarm silencing switch which when activated will silence all associated alarm devices without resetting the panel, and cause operation of system trouble signals.

c. Individual zone disconnect switches which when operated will disable only their respective initiating circuit and cause operation of the system and zone trouble signals.

d. Reset switch which when activated will restore the system to normal standby status after the cause of the alarm has been corrected, and all activated initiating devices reset.

e. Lamp test switch.

[f. City disconnect switch which when activated will disconnect the coded device and cause operation of the system trouble signal.]
2.2.1.1 Main Annunciator

Provide integral with the main control panel. Provide separate alarm and trouble lamps for each zone alarm initiating circuit as indicated below, located on the exterior of the cabinet door or visible through the cabinet door. Lamps shall be LED (Light Emitting Diode) type. Supervision will not be required provided a fault in the annunciator circuits results only in loss of annunciation and will not affect the normal functional operation of the remainder of the system. Each lamp shall provide specific identification of the [zone] [area] [device] by means of a permanent label. In no case shall zone identification consist of the words "Zone 1," "Zone 2," etc., but shall consist of the description of the [zone] [area] [device].

2.2.1.2 Initiating Zones

**************************************************************************
NOTE: List zones from 1 to x, with a brief description of each zone; e.g. "Zone 1: Tank No. 123". Expand this list as necessary to identify all the zones required for the project.
**************************************************************************

Shall be arranged as follows:

Zone 1: [_____]
Zone 2: [_____]
Zone 3: [_____]
Zone x: [_____]

2.2.1.3 Remote Annunciator Panel

**************************************************************************
NOTE: Coordinate location of remote trouble bell and remote annunciator panel when both are provided. Locate panel at or near the building entrance to allow fire department quick access to panel.
**************************************************************************

Locate as shown. Panel shall duplicate all requirements specified for the main control panel annunciator, except that in lieu of individual zone trouble lamps a single common system trouble lamp may be provided. Lamps shall be LED (Light Emitting Diode) type, except lamps used in backlit panels shall be LED or neon type. Panel shall have a lamp test switch. Zone identification shall be by means of [permanently attached rigid plastic or metal plate(s)] [silk-screened labels attached to the reverse face of backlighted viewing window(s)]. Panel shall be of the [interior] [weatherproof] type, [flush] [surface] [pedestal]-mounted.

2.2.2 Auxiliary Power Supply

2.2.2.1 Storage Batteries

**************************************************************************
NOTE: Consult the Public Works Department for battery preference.
**************************************************************************
Provide [sealed lead calcium,] [or] [sealed lead acid,] [or] [vented wet cell nickel cadmium,] batteries and charger. Drycell batteries are not acceptable. House batteries in the control panel or in a well constructed vented steel cabinet with cylinder lock, non-corrosive base, and louvered vents. Provide batteries of adequate ampere-hour rating to operate the system under supervisory conditions for 60 hours, at the end of which time batteries shall be capable of operating the entire system in a full alarm condition for not less than [30] [15] minutes. Provide calculations substantiating the battery capacity. Provide reliable separation between cells to prevent contact between terminals of adjacent cells and between battery terminals and other metal parts. Provide batteries with post-and-nut, "L"-blade, or similar terminals. Slip-on tab type terminals are not acceptable. When a separate battery cabinet is used, provide a fuse block for battery leads within the cabinets. Finish the cabinet on the inside and outside with enamel paint. Locate the top of the battery cabinet not more than 1.22 meters 4 feet above floor level.

2.2.2.2 Battery Charger

Provide completely automatic high/low charging rate type charger capable of recovery of the batteries from full discharge to full charge in 24 hours or less. Provide an ammeter for recording rate of charge and a voltmeter to indicate the state of battery charge under load. Meters shall be factory installed, or factory-supplied plug-in modules. Field installation of meters other than the panel manufacturer's plug-in modules is prohibited. Provide a trouble light to indicate when batteries are manually placed on a high rate of charge as part of the unit assembly if a high-rate switch is provided. House charger in the control panel or battery cabinet.

2.3 MANUAL RELEASE STATIONS

Operation of a manual station shall cause the control panel to go into alarm condition and shall cause the valve(s) controlling the foam discharge to the corresponding hazard to trip. Stations shall be of a type not subject to operation by jarring or vibration. Stations shall have a dual action release configuration to prevent accidental system discharge. Break-glass-front stations are not permitted; however a pull lever break-glass-rod type is acceptable. Station color shall be red. Station shall provide positive visible indication of operation. Restoration shall require use of a key or special tool. Place warning signs at each station indicating that operation of the station will cause immediate AFFF discharge. Where a fire alarm pull station is also mounted in the vicinity of a foam release station, separate the stations by at least one meter 3 feet horizontally. Provided permanent engraved rigid plastic or metal labels to clearly distinguish foam release stations from fire alarm stations, and to indicate the function of each foam release station. Stations shall be weatherproof type.

2.4 HEAT DETECTORS

**************************************************************************

NOTE: Select the type of heat detector most suited for application or design. Do not use rate-of-rise detectors in areas subject to rapid temperature changes. Consult the Division Fire Protection Engineer.

**************************************************************************
2.4.1 Spot-Type Heat Detectors

Designed for detection of fire by [combination fixed temperature rate-of-rise] [rate compensating] principle. Space detectors in accordance with their listing by UL or FM but not more than 15.25 meters 50 feet apart around the tank perimeter. For fixed roof tanks provide detectors on the tank wall just below the roof joint and at the center of the roof. For floating roof tanks provide detectors on the interior side of the tank wall above the highest possible elevation of the roof. Detectors shall be intermediate temperature rated as defined by NFPA 72. Detectors, located in hazardous locations as defined by NFPA 70, shall be types approved for such locations. Provide with terminal screw type connections. Removal of detector head from its base shall cause activation of system trouble signal. Detectors shall be weatherproof type.

2.4.1.1 Combination Fixed Temperature Rate-of-Rise Detectors

Designed for [surface] [semi-flush] outlet box mounting and supported independently of conduit, tubing or wiring connections. Contacts shall be self-resetting after response to rate-of-rise actuation. Operation under fixed temperature actuation shall result in an external indication. Detector units located in areas subject to abnormal temperature changes shall operate on fixed temperature principle only.

2.4.1.2 Rate Compensating Detector

Designed for [surface] [flush] [vertical unit] outlet box mounting and supported independently of conduit, tubing or wiring connections. Detectors shall be hermetically sealed and automatically resetting type which will operate when ambient air temperature reaches detector setting regardless of rate of temperature rise. Detector operation shall not be subject to thermal time lag.

2.4.2 Line-Type Heat Detectors

Provide [thermister] [or] [thermostatic] line-type heat detection cable with weather-resistant outer covering. Cable shall be suitable for severe industrial exposure. Cable shall be UL listed or FM approved, shall be intermediate temperature rated as defined by NFPA 72 and shall operate on fixed temperature only. Locate on tank perimeter and mount as recommended by the manufacturer.

2.5 ELECTRICAL WORK

******************************************************************************
NOTE: Edit Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and include as part of the project specification.
******************************************************************************

******************************************************************************
NOTE: When project includes requirement for a building fire alarm system, include Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE].
******************************************************************************
When project requires only tying into an existing building fire alarm system, fire alarm wiring should be specified in this section. Select the first appropriate Section title when using the basic NAVFAC guide specification covering the subject work or select the second title when using the EFD regional guide specification covering the subject work.

**************************************************************************

Electrical work is specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, except for control [and fire alarm] wiring. [ Fire alarm system is specified in Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] [
"Fire Alarm and Fire Detecting Systems (Local)"].]

2.5.1 Wiring

Provide wiring and connections to fire alarm systems, under this section and conforming to NFPA 70 and NFPA 72. Wire for 120 volt circuits shall be No. 12 AWG minimum solid conductor. Wire for low voltage DC circuits shall be No. [14] [16] AWG minimum solid conductor [, except wire to remote annunciators, if provided, may be 18 AWG minimum solid conductor]. All wiring shall be color coded. Wiring, conduit and devices exposed to weather, water or foam discharge shall be weatherproof. Wiring, conduit and devices located in hazardous atmospheres, as defined by NFPA 70 [and as shown], shall be explosion proof. All conduit shall be minimum 20 mm 3/4 inch size.

2.5.2 Operating Power

Power shall be 120 volts AC service, transformed through a two winding isolation type transformer and rectified to 24 volts DC for operation of all signal initiating, signal sounding, trouble signal, and actuating (releasing) circuits. Provide secondary DC power supply for operation of system in the event of failure of the AC supply. Transfer from normal to emergency power or restoration from emergency to normal power shall be fully automatic and shall not cause transmission of a false alarm. Obtain AC operating power for control panel, and battery charger from the line side of the incoming building power source ahead of all building services. Provide independent properly fused safety switch, with provisions for locking the cover and operating handle in the "POWER ON" position for these connections and locate adjacent to the main distribution panel. Paint switch box red and suitably identify by a lettered designation.

2.5.3 Conductor Identification

Identify circuit conductors within each enclosure where a tap, splice or termination is made. Identify conductors by plastic coated self sticking printed markers or by heat-shrink type sleeves. Attach the markers in a manner that will not permit accidental detachment. Properly identify control circuit terminations.
2.6 SYSTEM ACTIVATION

2.6.1 Tank System Activation

**************************************************************************
NOTE: Depending on the tank size, more than one riser may be required for each tank. Follow the requirements specified in NFPA 11. Tank systems and hose systems shall be served by separate mains.
**************************************************************************

Each zone shall encompass one tank. Upon activation of the tank system manual release station(s), [or the detection system], all foam chambers protecting that tank shall discharge foam.

2.6.2 Monitor System Activation

**************************************************************************
NOTE: Where monitors are activated solely by manually opening a value (e.g. post indicator valve), delete this paragraph and show valves on plans.
**************************************************************************

Each zone shall encompass the monitors indicated. Upon activation of a monitor manual release station, all piping to monitors in that zone shall be charged. Provide a manual release station at each monitor.

2.6.3 Hose System Activation

**************************************************************************
NOTE: Tank systems and hose systems shall be served by separate mains.
**************************************************************************

[Each] [The] zone shall encompass [all hose stations] [the hose stations indicated]. Hose stations shall be activated upon activation of a hose station manual release station. Provide a manual release station at each hose station.

2.7 ALARMS

2.7.1 Water Motor Alarms

Provide weatherproof and guarded type alarm for each deluge valve. Alarms shall sound locally on the flow of foam solution in each system to which it is connected. Mount alarms on the outside of the outer walls of each building, at locations indicated. When more than one alarm gong is provided, provide permanent engraved rigid plastic or metal signs indicating to which system each gong is connected.

2.7.2 Local Alarm

**************************************************************************
NOTE: Delete if a fire alarm system exists or is being provided under this project.
**************************************************************************

Provide electric [alarm horns] [alarm bells] sound locally on operation of
any system, regardless of whether water flows or not. When more than one alarm is provided, provide permanent engraved rigid plastic or metal signs indicating to which system each alarm is connected.

2.7.3 Fire Alarm

Provide equipment for the automatic transmittal of an alarm over the facility fire alarm system. Arrange so that the detection system and the flow of solution in each system will actuate the alarm.

2.7.3.1 Pressure Switch

Provide switch with SPDT contacts to automatically transmit alarms upon flow of water or AFFF. Alarm actuating device shall [have mechanical diaphragm controlled retard device adjustable from 10 to 60 seconds and shall] instantly recycle.

2.7.3.2 [Master Fire Alarm Boxes

**************************************************************************

NOTE: Specify master fire alarm boxes for connection to a positive non-interfering successive (PNIS) type base fire alarm system and when there is also a need for a new exterior coded fire alarm box. In mercantile, manufacturing, and industrial districts it shall not be necessary to travel in excess of one block or 150 meters 500 feet to reach an exterior fire alarm box. Specify local energy tripping devices unless approved otherwise by the Division or District Fire Protection Engineer.

**************************************************************************

Master fire alarm boxes shall be of the coded, positive non-interfering type with succession features having a local energy type auxiliary tripping device. Boxes shall be of the prewound, open-door pull-lever type. Mechanism shall be housed in a weatherproof cottage shell housing with metallic bronze or nickel-alloy or rigid plastic code number plate mounted on the exterior face of the cottage shell. Operation of the actuating pull-lever shall cause the box to transmit four complete rounds of code. Driving springs shall have the capability to transmit not less than 8 complete four round groups of code before being rewound. Boxes shall be designed for operation at 100 milliamperes and shall be capable of full operation between 70 and 120 milliamperes DC line current. Boxes shall have the ability to transmit signals through ground to overcome an open circuit. Box mechanism shall be capable of transmitting signals at varying rates of speed ranging from electrical impulses at 3 1/4 second intervals to 1/4 second intervals and shall be field adjustable to any speed within this range. Each box shall have a manual signaling key, telephone jack, silent test device and box shunt device. Code wheel shall be metallic. Box code shall be as directed by the Contracting Officer. Box shall be [wall] [pole] [pedestal]-mounted with center of box 1.50 meters 5 feet above grade. Mounting bolts, brackets, and fastenings shall be copper alloy or cadmium or zinc-coated steel. Transmitter housing shall be finished in gloss red enamel. Housing shall have a reflective, highly visible label imprinted with the word "FIRE" in minimum 50 mm two inch block characters on both sides of the box.
2.7.3.3  [Automatic Auxiliary Transmitters]

**************************************************************************
NOTE: Specify automatic auxiliary transmitters for connection to a PNIS type base fire alarm system when there is no requirement for a new exterior coded fire alarm box. For connection to a shunt non-interfering (SNI) type base fire alarm system, specify automatic auxiliary transmitters in all instances. Master boxes are not manufactured for SNI systems.
**************************************************************************

Auxiliary transmitters shall be of the coded, [positive non-interfering type with succession features] [shunt non-interfering type]. Transmitters shall be [prewound spring mechanism type having a local energy type auxiliary tripping device] [or] [solid state electronic type utilizing form "A" or form "C" dry contacts] which, when activated by the fire alarm control panel, will transmit four rounds of code. Driving springs if required shall have the capability to transmit not less than 8 complete four-round groups of code before being rewound. [Electronic transmitters shall have a standby battery with the capacity to power the transmitter in a standby status for 60 hours and then transmit not less than 8 complete four-round groups of code.] Transmitters shall be designed for operation at 100 milliamperes and shall be capable of full operation between 70 and 120 milliamperes DC line current. Transmitters shall have the ability to transmit signals through ground to overcome an open circuit. Transmitters shall have a device to disconnect the transmitter for maintenance purposes. Code wheel if required shall be metallic. Transmitter code shall be as directed by the Contracting Officer. The transmitter shall be capable of transmitting signals at varying rates of speed ranging from electrical impulses at 3 1/4 second intervals to 1/4 second intervals and shall be field adjustable to any speed within this range. Mechanism shall be housed in a wall mounted locked metal cabinet. Cabinet shall be finished in gloss red enamel. Provide engraved metallic bronze or nickel-alloy or rigid plastic code number plate mounted on face of transmitter housing.

2.7.3.4  [Radio Fire Alarm Transmitters]

**************************************************************************
NOTE: Specify radio fire alarm transmitters for bases having radio fire alarm systems. Transmitters must be obtained from the manufacturer of the base system. Provide manufacturer's name, model number, color and frequency or frequencies to match the existing system. Interface panels are required by some manufacturer's systems, whereas with other manufacturer's systems all required functions are contained within the transmitter enclosure. Edit accordingly. A level I Contracting Officer must approve use of this paragraph for specifying a proprietary product. Reason for specifying a proprietary product is that only the manufacturer of the existing system would have a transmitter which would be FM approved or UL listed for use with the existing base radio fire alarm system.
**************************************************************************

Provide a [_____] model [_____] radio [fire alarm [master box] [auxiliary
transmitter] [fire alarm [master box] [auxiliary transmitter] and model [_____] interface panel] [combination auxiliary transmitter and interface panel] to be compatible with the existing base system. Notwithstanding any other provisions of this contract, no other product will be acceptable. Transmitter shall operate on a frequency of [_____] MHz [AM] [FM]. Transmitter code number(s) shall be as specified by the Contracting Officer. Transmitter [and interface] shall operate on 120 VAC and shall also be provided with the manufacturer's approved battery charger and standby battery adequate to supply standby power for at least 60 hours. Transmitter housing shall be [red] [lime yellow] in color. Mounting shall be [wall] [pole] [pedestal], 1.50 meters 5 feet above grade. [Arrange the transmitter(s) to send a separate alarm signal for each zone on the fire alarm control panel as specified in the paragraph entitled "Initiating Zones", and a common trouble signal for any trouble condition on the control panel.] Provide antenna as recommended by the transmitter manufacturer. Provide engraved metallic bronze or nickel-alloy or rigid plastic code number plate mounted on face of transmitter housing.

2.7.4 Trouble Alarm

**************************************************************************
NOTE: Delete if a fire alarm system exists or is being provided under this project.
**************************************************************************

Provide local [100 mm 4 inch] electric alarm [bell] [horn] [_____] to indicate trouble [or failure of the detection system] and label "Foam System Trouble".

2.8 [MASTER BOX PEDESTAL]

**************************************************************************
NOTE: Select master box pedestal for pedestal mounted telegraphic master boxes. Select radio master box pedestal for pedestal mounted radio master boxes.
**************************************************************************

Construct pedestal of galvanized sheet metal with heavy cast iron base, designed to support the fire alarm box and light. The shaft shall be rectangular in cross section with a hollow compartment inside, readily accessible and containing facilities for installing cable terminals. Such facilities shall be capable of mounting no less than ten two-point terminals. The pedestal shall have a suitable red and white finish of the same shades as those used for the fire alarm boxes.

2.9 [RADIO MASTER BOX PEDESTAL]

Pedestal shall have a round aluminum barrel with a bell base, designed to support the radio transmitter, location light, and antenna. The bell base shall contain a compartment with access plate to permit pulling and splicing of cables in the base.

2.10 [MASTER BOX LOCATION LIGHT] [RADIO MASTER BOX LOCATION LIGHT]

Light shall be a vaporight, incandescent type fixture constructed of a cast aluminum housing and unbreakable, heat resistant, threaded ruby globe. The light shall be supported with 15 mm 1/2 inch galvanized steel conduit screwed into the hub on the top of the master box. Light shall be located...
approximately one foot above the master box. Light shall be provided with an incandescent 25-watt, 130-volt AC extended service lamp.

2.11 **APFF CONCENTRATE**

**************************************************************************

NOTE: Select percentage when specifying MIL-PRF-24385 concentrate. Consult the facility fire department and the Division Fire Protection Engineer. MIL-PRF-24385 does not cover alcohol resistant-type concentrate. Specify UL listed alcohol resistant-type concentrate if there is a possibility of alcohol-based liquids being present. When alcohol resistant foam is required, it must be used at the UL listed application rate. Currently 3 percent alcohol resistant-type concentrate is not available.

**************************************************************************

[MIL-PRF-24385, [3] [6 percent] [UL listed alcohol/polar solvent resistant type].

2.11.1 Concentrate Fill Pump

Provide one pump to fill foam system tank. Pump shall have a minimum flow rate of 27 L/m 7 gpm. Pump shall be complete with 115 VAC motor, fused switch, power cord with plug and 3 meters 10 foot minimum suction and clear discharge hoses.

2.12 **DIAPHRAGM PRESSURE PROPORTIONING EQUIPMENT**

**************************************************************************

NOTE: Select the method of proportioning best suited for the project.

Diaphragm pressure proportioning systems operate by water pressure, require no electrical power, and minimal control circuitry for automatic operation. Maintenance requirements are minimal, however refilling the tank is a difficult operation requiring the services of a qualified technician to avoid rupturing the diaphragm.

Balanced pressure proportioning systems require reliable electrical power and more complex control circuitry for automatic operation. In some cases an emergency generator will be required. The primary advantage of the non-diaphragm systems is the ease in refilling the tanks. Tanks may be refilled even while the system is in operation, if necessary. This feature is valuable when prolonged fire fighting operations may be encountered.

Skid-mounted balanced pressure proportioning systems perform proportioning at a central location, avoiding long runs of concentrate lines. They are well suited for systems which have a relative narrow range of flow rates.
In-line balanced pressure proportioning is useful when there are multiple hazards with widely varying discharge rates which are to be supplied from the same proportioning system, and any time it is desired to proportion foam remotely at risers or discharge devices instead of at the pump room. Their disadvantage is the need for much more concentrate piping in the field.

Line proportioners (venturi type) are fixed-flow rate devices which are useful on relatively small systems which have only one set flow rate per proportioner. They require no electric power but have limited application, since they require high water pressure and low discharge back pressure.

Foam solution shall be produced by introducing AFFF concentrate into the water stream by the balanced pressure proportioning method using a diaphragm pressure tank and ratio controller. [Provide proportioning system and storage tanks for hose lines independent of main proportioning system and tanks.]

2.12.1 Diaphragm Pressure Proportioning Tanks

NOTE: When large quantities of AFFF concentrate are required, consider two or more tanks in parallel vs one large tank. (This is in addition to reserve tanks.) Approved diaphragm tanks larger than 9.50 to 11.40 cu meters 2,500 to 3,000 gallons are not readily available.

NOTE: Designer must calculate foam tank capacity based on maximum flow for maximum duration to determine size of tank and space required. Do not label foam tank capacity on drawing. Exact tank size (which may be larger) will be determined by Contractor's hydraulic calculations.

Tanks shall be cylindrical steel ASME INTERNATIONAL (ASME) pressure vessels with a full Buna-N impregnated nylon inner tank or bladder designed to contain AFFF concentrate and to be used in conjunction with the concentrate ratio controller. Tanks shall be designed for working pressure of [1206 kPa (gage)] [175 psig] [_____] and hydrostatically tested at 1.5 times the working pressure in accordance with ASME standards at the factory. Tanks shall have UL or FM label and ASME stamp affixed to the vessel. Size tank to provide sufficient AFFF concentrate for the time specified when the system is discharging foam solution at total maximum system flow. Also provide connected reserve tanks(s) of equal capacity. Permanently label each tank with its capacity, type and percentage of concentrate, which system(s) it serves, and whether it is a main or reserve tank. Conspicuously post filling instructions near each group of tanks. Provide a gage or unbreakable sight glass to permit visual determination of level of tank contents. Prior to shop painting, abrasive blast clean tank exterior surface in accordance with SSPC SP 6/NACE No.3to a surface profile.
not to exceed 0.05 mm 2.0 mils and provide a MIL-DTL-24441 or SSPC coating system to the tank exterior. Prime tank exterior with one coat of MIL-DTL-24441/1, Formula 150 or SSPC Paint 22 primer applied to a dry film thickness of 0.076 mm 3 mils and topcoat with one coat of MIL-DTL-24441/7 Formula 156 (red) or SSPC Paint 22 topcoat (red) applied to a dry film thickness of 0.076 mm 3 mils.

2.12.2 Concentrate Ratio Controller

Ratio controller shall be a modified venturi device with AFFF concentrate feed line from diaphragm tank(s), and integral concentrate metering orifice. Size for specified flow rate(s).

2.13 BALANCED PRESSURE PROPORTIONING SYSTEM

**************************************************************************
NOTE: Select the method of proportioning best suited for the project.

Diaphragm pressure proportioning systems operate by water pressure, require no electrical power, and minimal control circuitry for automatic operation. Maintenance requirements are minimal, however refilling the tank is a difficult operation requiring the services of a qualified technician to avoid rupturing the diaphragm.

Balanced pressure proportioning systems require reliable electrical power and more complex control circuitry for automatic operation. In some cases an emergency generator will be required. The primary advantage of the non-diaphragm systems is the ease in refilling the tanks. Tanks may be refilled even while the system is in operation, if necessary. This feature is valuable when prolonged fire fighting operations may be encountered.

Skid-mounted balanced pressure proportioning systems perform proportioning at a central location, avoiding long runs of concentrate lines. They are well suited for systems which have a relative narrow range of flow rates.

In-line balanced pressure proportioning is useful when there are multiple hazards with widely varying discharge rates which are to be supplied from the same proportioning system, and any time it is desired to proportion foam remotely at risers or discharge devices instead of at the pump room. Their disadvantage is the need for much more concentrate piping in the field.

Line proportioners (venturi type) are fixed-flow rate devices which are useful on relatively small systems which have only one set flow rate per proportioner. They require no electric power but have limited application, since they require high water pressure and low discharge back pressure.

**************************************************************************
Foam solution shall be produced by introducing AFFF concentrate into the water stream by the balanced pressure proportioning method using a pump and proportioner. [Provide proportioning system and storage tanks for hose lines independent of main proportioning system and tanks.]

2.13.1 [Skid-Mounted Balanced Pressure Proportioning System]

Self-contained, skid-mounted system, fully assembled at the factory and delivered complete and ready for use. Field connections shall be limited to water, electrical, and AFFF concentrate inputs, foam solution output, and foam concentrate return line to storage tank. Size system for required flow rate(s). The concentrate pump and all piping, valves, and fittings in contact with foam concentrate shall be of materials resistant to the corrosive effects of the AFFF concentrate. Concentrate pump shall be electric motor driven, drip proof, 240/480 volts, 60 Hz AC. Activation and operation of system shall be fully automatic, with manual over-ride and manual shut-down. Provide permanent engraved rigid plastic or corrosion resistant metal instruction plate for emergency manual operation, along with a similarly constructed label for each control device.

2.13.2 [In-Line Balanced Pressure Proportioning System]

Size system for required flow rates. AFFF concentrate pump shall be positive displacement, electric motor driven, drip proof, 240/480 volts, 60 Hz AC. System operation shall be fully automatic, with manual over-ride and manual shut-down. Provide a pressure regulating device in the AFFF concentrate pump return line to maintain constant pressure on the concentrate piping system at all AFFF solution flow rates. Provide an in-line balanced pressure proportioning device at each system riser to automatically balance the AFFF concentrate pressure with the water pressure at the riser to provide correct proportioning over the range of flow rates calculated for that riser. The pump and all piping, valves, and fittings in contact with the foam concentrate shall be of materials resistant to the corrosive effects of the AFFF concentrate. Provide permanent engraved rigid plastic or corrosion-resistant metal instruction plate for emergency manual operation, along with a similarly constructed label for each control device.

2.13.3 AFFF Concentrate Storage Tanks

Designer must calculate foam tank capacity based on maximum flow for maximum duration to determine size of tank and space required. Do not label foam tank capacity on drawing. Exact tank size (which may be larger) will be determined by Contractor's hydraulic calculations.

Consult the Division or District Fire Protection Engineer to determine need for reserve.
Tank shall be designed for storage of AFFF concentrate at atmospheric pressure, and shall be [horizontal] [or] [vertical] cylindrical, fiberglass or polyethylene construction. Tank shall have the following: Drain valve located at the lowest point in the tank, connections for concentrate supply and return lines to the proportioners, top-mounted fill connections and inspection hatch, and a pressure/vacuum relief vent. All openings and tank connections shall be installed at the factory, no holes shall be made in the tank shell in the field. Tank shall include all necessary supports for free-standing installation. Provide a gage or unbreakable sight glass to permit visual determination of level of tank contents, unless liquid level is clearly visible through shell of tank. Size tank to provide sufficient AFFF concentrate for the time specified when the system is discharging foam solution at total maximum system flow. [Also provide connected reserve tank(s) of equal capacity.] Permanently label each tank with its capacity, type and percentage of concentrate, which system it serves [, and whether it is a main or reserve tank].

2.14 LINE PROPORTIONING (VENTURI TYPE) SYSTEM

NOTE: Select the method of proportioning best suited for the project.

Diaphragm pressure proportioning systems operate by water pressure, require no electrical power, and minimal control circuitry for automatic operation. Maintenance requirements are minimal, however refilling the tank is a difficult operation requiring the services of a qualified technician to avoid rupturing the diaphragm.

Balanced pressure proportioning systems require reliable electrical power and more complex control circuitry for automatic operation. In some cases an emergency generator will be required. The primary advantage of the non-diaphragm systems is the ease in refilling the tanks. Tanks may be refilled even while the system is in operation, if necessary. This feature is valuable when prolonged fire fighting operations may be encountered.

Skid-mounted balanced pressure proportioning systems perform proportioning at a central location, avoiding long runs of concentrate lines. They are well suited for systems which have a relative narrow range of flow rates.

In-line balanced pressure proportioning is useful when there are multiple hazards with widely varying discharge rates which are to be supplied from the same proportioning system, and any time it is desired to proportion foam remotely at risers or discharge devices instead of at the pump room. Their disadvantage is the need for much more concentrate piping in the field.
Line proportioners (venturi type) are fixed-flow rate devices which are useful on relatively small systems which have only one set flow rate per proportioner. They require no electric power but have limited application, since they require high water pressure and low discharge back pressure.

**************************************************************************
Size system for required flow rates. Provide separate proportioner for each [tank] [,] [riser] [, or] [group of discharge devices required to operate simultaneously]. Ensure suction lift of proportioner(s) and system back pressure do not exceed limits specified by the proportioner manufacturer.

2.14.1 AFFF Concentrate Storage Tank

**************************************************************************
NOTE: Designer must calculate foam tank capacity based on maximum flow for maximum duration to determine size of tank and space required. Do not label foam tank capacity on drawing. Exact tank size (which may be larger) will be determined by Contractor's hydraulic calculations.

**************************************************************************
NOTE: Consult the Division or District Fire Protection Engineer to determine need for reserve tanks.

**************************************************************************
Tank shall be designed for storage of AFFF concentrate at atmospheric pressure, and shall be [horizontal] [or] [vertical] cylindrical, fiberglass or polyethylene construction. Tank shall have the following: Drain valve located at the lowest point in the tank, connections for concentrate supply and return lines to the proportioners, top-mounted fill connections and inspection hatch, and a pressure/vacuum relief vent. All openings and tank connections shall be installed at the factory, no holes shall be made in the tank shell in the field. Tank shall include all necessary supports for free-standing installation. Provide a gage or unbreakable sight glass to permit visual determination of level of tank contents, unless liquid level is clearly visible through shell of tank. Size tank to provide sufficient AFFF concentrate for the time specified when the system is discharging foam solution at total maximum system flow. [Also provide connected reserve tank(s) of equal capacity.] Permanently label each tank with its capacity, type and percentage of concentrate, which system it serves [, and whether it is a main or reserve tank].

2.15 [WATER MONITOR NOZZLES

**************************************************************************
NOTE: Refer to MIL-HDBK-1008 to determine the density required.

**************************************************************************
Manually operated, [free standing] [hydrant mounted] type with 6.30 radian 360 degree rotation and capable of being locked at any position. Nozzle shall be adjustable while in operation from 0.35 radian 20 degrees below to 1.40 radian 80 degrees above horizontal, with lock or latching mechanism.
[Nozzle shall be adjustable while in operation from straight stream to
spray.] Nozzle shall produce a straight stream of 46 meters 150 feet at
[1920 L/m] [500 gpm] [_____] and [690 kPa (gage)] [100 psig] [_____.]
Provide [post indicator] [0$\times$Y gate] [quarter-turn indicating] valve in
water supply line at each monitor location.

2.16 HAND HOSE LINES

At each hose station, provide [flow-through reel with 40 mm 1 1/2 inch hard
rubber] [automatic hose rack in cabinet with 40 mm 1 1/2 inch lined, double
jacket] hose and nozzles. Provide minimum [_____] meter feet of hose.
Nozzle shall have pistol-grip ball shutoff valve. Nozzle shall be [non
aspirating] [air aspirating] type. Provide normally closed quarter-turn
valve in supply line at each hose station. Nozzle flow rate shall be [139
L/m] [50 gpm] [_____] minimum.

2.17 FOAM HYDRANTS

**************************************************************************
NOTE: Provide foam hydrants for testing of
proportioners or where additional foam hand hose
lines are required. Determine number of outlet
connections based upon a ratio of one outlet for each
948 L/m 250 gpm of design flow, up to a maximum of
8 outlets.
**************************************************************************

Provide [single] [dual] outlet connections with integral gate valves and
locate about one meter 3 feet above grade. Provide each outlet with 65 mm
2 1/2 inch male National Standard hose threads with 65 to 40 mm 2 1/2 to 1
1/2 inch reducer with cap and chain. Provide wall escutcheon plate with
"FOAM HYDRANT" in raised letters cast in plate.

2.18 ABOVEGROUND PIPING SYSTEMS

2.18.1 Pipe, Fittings, and Mechanical Couplings

NFPA 11, except steel piping shall be Schedule 40 for sizes smaller than
200 mm 8 inches, and Schedule 30 or 40 for sizes 200 mm 8 inches and
larger. All steel piping shall be zinc-coated. Pipe nipples 150 mm 6
inches long and shorter shall be Schedule 80 steel pipe. Water motor alarm
piping shall be zinc-coated steel pipe and fittings. Rubber gasketed
grooved-end pipe and fittings with mechanical couplings shall only be
permitted in pipe sizes 40 mm 1 1/2 inches and larger. Rubber gaskets
shall be UL listed for use in dry-pipe sprinkler systems. Gasketed
fittings are not permitted inside the diked area. Use of restriction
orifices, reducing flanges, and plain-end fittings with mechanical
couplings (which utilize steel gripping devices to bite into the pipe when
pressure is applied) are not permitted. Pipe and fittings in contact with
AFFF concentrate shall be [material resistant to the corrosive effects of
AFFF concentrate as approved by the manufacturer of the proportioning
system] [stainless steel]. [Fittings on concentrate lines shall be flanged
or welded only. Screwed or mechanical fittings will not be permitted.]

2.18.2 Jointing Material

CID A-A-58092, Polytetrafluoroethylene (PTFE) tape. Pipe joint compound
(pipe dope) is not acceptable.
2.18.3  [Duplex Basket Strainers]

**************************************************************************
NOTE: Include for systems with high volume flow, and for untreated water supply.
**************************************************************************

FS WW-S-2739, Style Y (Y pattern). Provide duplex basket strainers with removable screens having standard perforations, 3 mm 0.125 inch in diameter in the riser beneath the deluge valves.

2.18.4  Pipe Hangers and Supports

NFPA 11 and NFPA 13.

2.18.5  Valves

Provide valves as required by NFPA 11 and NFPA 13 and of types approved for fire service. Gate valves shall open by counterclockwise rotation. Check valves shall be flanged clear opening swing check type with flanged inspection and access cover plate for sizes 100 mm 4 inches and larger. Provide an OS&Y valve beneath each deluge valve in each riser, when more than one valve is supplied from the same water supply pipe. Butterfly valves are not acceptable.

2.18.6  Identification Signs

Attach properly lettered approved metal signs conforming to NFPA 13 to each valve and alarm device. Permanently affix design data nameplates to the riser of each system.

2.18.7  Main Drains

Provide drain piping to discharge at safe points outside each building or to sight cones attached to drains of adequate size to readily receive the full flow from each drain under maximum pressure. Provide auxiliary drains as required by NFPA 11 and NFPA 13.

2.18.8  Pipe Sleeves

Provide where piping passes through walls, floors, roofs, and partitions. Secure sleeves in proper position and location during construction. Provide sleeves of sufficient length to pass through entire thickness of walls, floors, roofs, and partitions. Provide not less than 6.50 mm 1/4 inch space between exterior of piping and interior of sleeve. Firmly pack space with insulation and caulk at both ends of the sleeve with plastic waterproof cement.

2.18.8.1  Sleeves in Masonry and Concrete Walls, Floors, Roofs

ASTM A53/A53M, schedule 40 or standard weight, zinc-coated steel pipe sleeves. Extend sleeves in floor slabs 80 mm 3 inches above the finished floor.

2.18.8.2  Sleeves in Partitions

Provide zinc-coated steel sheet having a nominal weight of not less than 4.40 kg per sq meter 0.90 pounds per square foot.
2.18.9 Escutcheon Plates

Provide one piece or split hinge type plates for piping passing through floors, walls and ceilings, in both exposed and concealed areas. Provide chromium plated metal plates where pipe passes through finished ceilings. Provide other plates of steel or cast iron with aluminum paint finish. Securely anchor plates in place.

2.18.10 Fire Department Inlet Connections

[Two] [Three] way type with 65 mm 2 1/2 inch National Standard female hose threads with plug, chain, and identifying fire department connection escutcheon plate. Provide inlet connections about one meter 3 feet above grade.

2.18.11 Backflow Preventers

**************************************************************************
NOTE: When the water supply for the AFFF system is non-potable water delete this paragraph.
**************************************************************************

Reduced pressure principle type. Proof shall be furnished that each make, model/design, and size of backflow preventer being furnished for the project is approved by and has a current "Certificate of Approval" from the FCCCHR List. Listing of the particular make, model/design, and size in the current FCCCHR List will be acceptable as the required proof.

2.19 BURIED PIPING SYSTEMS

2.19.1 Pipe and Fittings

**************************************************************************
NOTE: For pipe sizes larger than 305 mm 12 inches, method for pipe anchorage including pipe clamps and the rods shall be shown on the drawings. Avoid velocities greater than 4.50 meters per second 15 feet per second.
**************************************************************************

**************************************************************************
NOTE: Select first bracketed phrase for connection to an existing water distribution system located a short distance from the work. Select second bracketed phrase when a new water distribution line is being provided as part of this project. For new water distribution system, select Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING, edit the appropriate guide specification and include as part of the project specification.
**************************************************************************

NFPA 24, outside coated cement lined ductile iron pipe and fittings for piping under the building and to a point 1.50 meters 5 feet outside the building walls. Anchor the joints in accordance with NFPA 24 using pipe clamps and steel rods. Minimum pipe size shall be 150 mm 6 inches. Minimum depth of cover shall be [_____] [one meter] [3 feet]. Piping more than 1.50 meters 5 feet outside the building walls shall be [outside coated cement lined ductile iron pipe and fittings conforming to NFPA 24]
[provided under Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING].

2.19.2 Valves

**************************************************************************
NOTE: If Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING is included as part of the project specification, requirements for buried gate valves, post indicator valves, and valve boxes may be deleted here and specified in Section 33 11 00. Careful coordination is required to insure that materials rated for fire service are specified.
**************************************************************************

Provide as required by NFPA 24 for fire service. Gate valves shall conform to AWWA C500 or UL 262 with cast iron body and bronze trim, and shall open by counterclockwise rotation.

2.19.3 Post Indicator Valves

**************************************************************************
NOTE: If Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING is included as part of the project specification, requirements for buried gate valves, post indicator valves, and valve boxes may be deleted here and specified in Section 33 11 00. Careful coordination is required to insure that materials rated for fire service are specified.
**************************************************************************

Provide with operating nut located about one meter 3 feet above grade. Gate valves for use with indicator post shall conform to UL 262. Indicator posts shall conform to UL 789. Paint each indicator post with one coat of primer and two coats of red enamel paint.

2.19.4 Valve Boxes

**************************************************************************
NOTE: If Section 33 11 00 WATER UTILITY DISTRIBUTION PIPING is included as part of the project specification, requirements for buried gate valves, post indicator valves, and valve boxes may be deleted here and specified in Section 33 11 00. Careful coordination is required to insure that materials rated for fire service are specified.
**************************************************************************

Except where indicator posts are provided, provide each gate valve in buried piping with an adjustable cast-iron valve box of a size suitable for the valve on which it is to be used. Boxes outside of paved areas may be of Acrylonitrile-Butadiene- Styrene (ABS) plastic or of inorganic fiber reinforced black polyolefin plastic. The head shall be round and the lid shall have the word WATER cast on it. The least diameter of the shaft of the box shall be 133 mm 5 1/4 inches. Coat each cast-iron box with bituminous paint.

2.19.5 Buried Utility Warning and Identification Tape

Provide detectable aluminum foil plastic-backed tape or detectable magnetic
plastic tape manufactured specifically for warning and identification of buried piping. Tape shall be detectable by an electronic detection instrument. Provide tape in rolls, 80 mm 3 inches minimum width, color coded for the utility involved, with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall be CAUTION BURIED WATER PIPING BELOW or similar. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material. Bury tape with the printed side up at a depth of 305 mm 12 inches below the top surface of earth or the top surface of the subgrade under pavements.

PART 3 EXECUTION

3.1 EXCAVATION, BACKFILLING, AND COMPACTING

**************************************************************************
NOTE: Select and edit Section 31 23 00.00 20 EXCAVATION AND FILL and include as part of the project specification.
**************************************************************************

Provide under this section as specified in Section 31 00 00 EARTHWORK.

3.2 CONNECTIONS TO EXISTING WATER SUPPLY SYSTEMS

Use tapping or drilling machine valve and mechanical joint type sleeves for connections to be made under pressure. Bolt sleeves around the mains; bolt valve conforming to AWWA C500 or UL 262 to the branch. Open valve, attach drilling machine, make tap, close valve, and remove drilling machine, all without interruption of service. Notify the Contracting Officer in writing at least [_____] [15] calendar days prior to the date the connections are required; approval shall be received before any service is interrupted. Furnish all material required to make connections into the existing water supply systems, and perform all excavating, backfilling, and other incidental labor as required. [Furnish] [Government will furnish only] the labor and the tapping or drilling machine for making the actual connections to the existing systems.

3.3 AFFF SYSTEM INSTALLATION

Equipment, materials, installation, workmanship, fabrication, assembly, erection, examination, inspection, and testing shall be in accordance with the NFPA standards referenced herein. Install piping straight and true to bear evenly on hangers and supports. Piping shall be inspected, tested and approved before being concealed. Provide fittings for changes in direction of piping and for all connections. Make changes in piping sizes through standard reducing pipe fittings; do not use bushings. Cut pipe accurately and work into place without springing or forcing. Ream pipe ends and free pipe and fittings from burrs. Clean with solvent to remove all varnish and cutting oil prior to assembly. Make screw joints with PTFE tape applied to male thread only.

3.4 DISINFECTION

**************************************************************************
NOTE: When the water supply for the AFFF system is non-potable water delete this paragraph.
**************************************************************************
Disinfect new water piping from the system control valve to the point of connection at the water main and existing water piping affected by the Contractor's operation in accordance with AWWA C651. Fill piping systems with solution containing minimum of 50 mg/kg parts per million (ppm) of free available chlorine and allow solution to stand for minimum of 24 hours. Flush solution from systems with clean water until maximum residual chlorine content is not greater than 0.2 mg/kg ppm.

3.5 FIELD PAINTING

**************************************************************************
NOTE: For facilities located in a marine environment specify SSPC SP 11 cleaning and specify a second topcoat.
**************************************************************************

Clean, prime, and paint new foam systems including valves, piping, conduit, hangers, miscellaneous metal work, and accessories. Apply coatings to clean dry surfaces using clean brushes. Clean the surfaces in accordance with SSPC SP 3 SSPC SP 11. Immediately after cleaning, prime the metal surfaces with one coat of SSPC Paint 25 or SSPC Paint 25primer applied to a minimum dry film thickness of 0.04 mm 1.5 mils. Exercise care to avoid the painting of operating devices. Upon completion of painting, remove materials which were used to protect operating devices while painting is in process. Remove operating devices which have been inadvertently painted and provide new clean operating devices of the proper type. Finish primed surfaces as follows:

3.5.1 Foam Systems in Unfinished Areas

**************************************************************************
NOTE: For facilities located in a marine environment specify SSPC SP 11 cleaning and specify a second topcoat.
**************************************************************************

Unfinished areas are defined as locations exposed to weather, attic spaces, spaces above suspended ceilings, crawl spaces, foam rooms, pump rooms, pipe chases, and other spaces where ceilings are not painted or not constructed of a prefinished material. Paint primed surfaces with [one] [two] coat[s] of CID A-A-2962 red enamel applied to a minimum dry film thickness of 0.04 mm 1.5 mils. Paint surfaces exposed to weather with two coats of red enamel as specified herein.

3.5.2 Foam Systems in All Other Areas

**************************************************************************
NOTE: For facilities located in a marine environment specify SSPC SP 11 cleaning and specify a second topcoat.
**************************************************************************

Paint primed surfaces with two coats of paint to match adjacent surfaces, except paint valves and operating accessories with [one] [two] coat[s] of CID A-A-2962 red enamel applied to a minimum dry film thickness of 0.04 mm 1.5 mils. Provide piping with 50 mm 2 inch wide red bands spaced at maximum 6 meters 20 foot intervals throughout the piping systems. Bands shall be red enamel or self adhering red plastic tape.
3.5.3 Piping Labels

Provide permanent labels in foam rooms, spaced at 6 meters 20 foot maximum intervals along pipe, indicating "WATER", "FOAM CONCENTRATE", and "FOAM SOLUTION" on corresponding piping.

3.5.4 Field Touch-Up

Clean damaged areas of shop coated tanks in accordance with SSPC SP 11 and coat cleaned areas with the same materials used for the shop applied coating system.

3.6 ELECTRICAL WORK

******************************************************************************
NOTE: Edit Section 26 20 00, INTERIOR DISTRIBUTION SYSTEM and include as part of the project specification.
******************************************************************************

******************************************************************************
NOTE: When project includes requirement for a building fire alarm system, include Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] in the project specification. When project requires only tying into an existing building fire alarm system, fire alarm wiring should be specified in this section. Select the first appropriate Section title when using the basic NAVFAC guide specification covering the subject work or select the second title when using the EFD regional guide specification covering the subject work.
******************************************************************************

Electrical work is specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM except for control [and fire alarm] wiring. Fire alarm system is specified in Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] ["Fire Alarm and Fire Detecting Systems (Local)"]..

3.6.1 Wiring

Provide control wiring and connections, to fire alarm systems, under this section in accordance with NFPA 70 and NFPA 72. Provide wiring in rigid metal conduit or intermediate metal conduit, except electrical metallic tubing may be used in dry locations not enclosed in concrete or where not subject to mechanical damage. Do not run low voltage DC circuits in the same conduit with AC circuits.

3.7 FLUSHING

Flush the piping system with potable water in accordance with NFPA 13. Continue flushing operation until water is clear, but for not less than 10
3.8 FIELD QUALITY CONTROL

Prior to initial operation, inspect equipment and piping systems for compliance with drawings, specifications, and manufacturer's submittals. Perform tests in the presence of the Contracting Officer to determine conformance with the specified requirements.

3.8.1 Preliminary Tests

**NOTE: Specify hydrostatic test not less than 1379 kPa or 200 psi or 50 psi above the maximum working pressure when the maximum working pressure is greater than 1034 kPa or 150 psi.**

Each piping system shall be hydrostatically tested at [1379 kPa (gage)] [200 psig] in accordance with NFPA 11 and NFPA 13 and shall show no leakage or reduction in gage pressure after 2 hours. The Contractor shall conduct complete preliminary tests, which shall encompass all aspects of system operation. Individually test all detectors, manual actuation stations, alarms, control panels, and all other components and accessories to demonstrate proper functioning. Test water flow alarms by flowing water. When tests have been completed and all necessary corrections made, submit to the Contracting Officer a signed and dated certificate, similar to that specified in NFPA 13, attesting to the satisfactory completion of all testing and stating that the system is in operating condition. Also include a written request for a formal inspection and test.

3.8.2 Formal Inspection and Tests (Acceptance Tests)

The [_____] Division, Naval Facilities Engineering Command Fire Protection Engineer, will witness formal tests and approve all systems before they are accepted. The system shall be considered ready for such testing only after all necessary preliminary tests have been made and all deficiencies found have been corrected to the satisfaction of the equipment manufacturer's technical representative and written certification to this effect is received by the Division Fire Protection Engineer. Submit the request for formal inspection at least 15 working days prior to the date the inspection is to take place. The control panel(s) and detection system(s) shall be in continuous service for a "break-in" period of at least 15 consecutive days prior to the formal inspection. Experienced technicians regularly employed by the Contractor in the installation of both the mechanical and electrical portions of such systems shall be present during the inspection and shall conduct the testing. All AFFF concentrate, instruments, personnel, appliances and equipment for testing shall be furnished by the Contractor. All necessary tests encompassing all aspects of system operation shall be made including the following, and any deficiency found shall be corrected and the system retested at no cost to the Government.

3.8.2.1 Systems and Device Testing

The entire initiating, alarm, actuation systems shall be operated. As a minimum, operation and supervision of the following functions and devices shall be demonstrated:

a. All operational and supervisory functions of the control and
annunciator panels.

b. Each manual actuation station and associated circuit(s).

c. All detectors and associated circuits.

d. All alarms and associated circuits.

e. All actuator circuits and system control valve(s) (without foam discharge).

f. Activation of the fire alarm system.

g. Activation of the Base fire alarm system (receipt of fire alarm at alarm office).

h. All of the above tests shall then be repeated with the system on battery power only.

3.8.2.2 AFFF Discharge and Concentration Testing

When all of the initiating, alarm, actuation, and supervisory functions of the system operate to the satisfaction of the system manufacturer's technical representative and the Division Fire Protection Engineer, a complete discharge test of each system shall be performed to demonstrate satisfactory performance, proper AFFF concentration, mechanical operation and operation of valves, release devices, alarms, and interlocks which control the protected areas. These tests shall be conducted by experienced personnel according to the equipment and AFFF manufacturers' recommendations.

a. Test each system by full flow of foam solution from the individual systems or combination of systems to achieve maximum design flow rate for at least 60 seconds. Test tank-side foam chambers by turning chambers and flowing foam solution down outside of tank.

[b. Test all hose lines by full flow of foam solution for at least 60 seconds.]

[c. Test monitor nozzles by full flow of water.]

The manufacturer's representative shall test samples of foam solution taken from each system to ensure proper AFFF concentration. Provide protection for all electrical fixtures and equipment exposed to possible damage during tests and take necessary steps to prevent soil erosion [and contain runoff] during testing.

3.8.2.3 Flushing and Rinsing

After completion of tests flush all piping carrying AFFF concentrate and solution with fresh water. Piping normally containing AFFF concentrate when the system is in standby mode need not be flushed. Rinse with fresh water all equipment and surfaces exposed to AFFF discharge.

3.8.3 Environmental Protection

**************************************************************************

NOTE: Consult facility and the Division or District
environmental officials to determine local requirements for containment and disposal of discharged AFFF. In sufficient concentrations, AFFF may cause disruption of processes in sewage treatment plants and damage to fisheries. Edit the paragraph as appropriate.

Provide temporary measures to prevent AFFF from entering storm drains, [sanitary sewers,] drainage ditches, streams and water courses. [Do not allow AFFF concentrate or solution to come in contact with earth. Contain all discharged AFFF on paved surfaces or in tanks.] [Collect all discharged AFFF and rinse and flushing water and dispose of it in an EPA-approved waste-water treatment facility which provides secondary (biological) treatment]. At least 15 days prior to the date flow testing is to take place, submit written plan for AFFF containment [and disposal] methods(s) to the Contracting Officer for approval.

3.8.4 Additional Tests

When deficiencies, defects or malfunctions develop during the tests required, all further testing of the system shall be suspended until proper adjustments, corrections or revisions have been made to assure proper performance of the system. If these revisions require more than a nominal delay, the Contracting Officer shall be notified when the additional work has been completed, to arrange a new inspection and test of the system. All tests required shall be repeated prior to final acceptance, unless directed otherwise.

3.8.5 AFFF Concentrate Storage Tanks Fill-Up

NOTE: Consult facility to determine whether the Government or the Contractor will furnish the initial fill-up of AFFF concentrate.

Fill storage tanks including reserve tanks and piping normally containing concentrate when the system is in standby mode with [Contractor] [Government] furnished AFFF concentrate after acceptance of the system.

3.8.6 Manufacturer's Representative

Provide the services of representatives or technicians from the manufacturers of the foam system and control panel, experienced in the installation and operation of the type of system being provided, to supervise installation, adjustment, preliminary testing, and final testing of the system and to provide instruction to Government personnel.

3.9 OPERATING INSTRUCTIONS

Provide operating instructions at control equipment and at each remote control station. Instructions shall clearly indicate all necessary steps for the operation of the system. Submit the proposed legend for operating instructions for approval prior to installation. Instructions shall be in engraved white letters on red rigid plastic or red enameled steel backgrounds and shall be of adequate size to permit them to be easily read.
3.10 TRAINING REQUIREMENTS

Prior to final acceptance, the Contractor shall provide two sessions of 4 hours each of operation and maintenance training to the Base Fire Department and [Public Works] [Civil Engineering] personnel on two different days to accommodate both shifts of the Base Fire Department. Each training session shall include emergency procedures, and unique maintenance and safety requirements. Training areas will be provided by the Government. The training conducted shall use operation and maintenance manuals specified in paragraph entitled "Operations and Maintenance Manuals." Dates and times of the training period shall be coordinated through the Contracting Officer not less than two weeks prior to the session.

3.11 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

<table>
<thead>
<tr>
<th>Products</th>
<th>Inch-Pound</th>
<th>Metric</th>

3.10 TRAINING REQUIREMENTS
3.11 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for automatic pre-action, dry pipe and deluge fire extinguishing foam systems for hazardous and flammable handling and storage facilities.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: For fuel tank farm protection use Section 21 13 21.00 20 FOAM FIRE EXTINGUISHING FOR FUEL TANK PROTECTION. For aircraft hangar protection use Section 21 13 20.00 20 FOAM FIRE EXTINGUISHING FOR AIRCRAFT HANGARS. Choose the type of system most appropriate for the hazard. Deluge systems are primarily intended for fire protection of occupancies such as truck or rail loading/unloading racks. Pre-action or dry pipe systems are normally utilized in other areas requiring foam protection, such as hazardous/flammable liquid warehouses, fuel pump houses, and laboratories. Dry pipe systems eliminate the need for complex detection systems, however they are somewhat slower to react to a developing fire, and require a 30 percent larger
design area and consequently higher flow rates. Pre-action systems provide added safety against accidental discharge by requiring both actuation of a detector and fusing of a sprinkler head before foam discharge will occur. Deluge systems provide the fastest fire extinguishment. Do not use pre-action sprinklers for in-rack systems unless in-rack detectors are specified. Areas larger than 279 sq meters 3,000 square feet and all deluge systems must be hydraulically designed for uniform distribution. Assure that up to date reliable hydraulic data is used in design of the project. Do not show sprinkler piping layout and heads on project drawings. System requirements must conform to UFC 3-600-01, "Fire Protection Engineering for Facilities".

**************************************************************************
**************************************************************************

NOTE: If there are questions concerning type of foam systems required, consult the Engineering Field Division, Naval Facilities Engineering Command.

**************************************************************************
**************************************************************************

NOTE: The following information shall be shown on the project drawings:

1. Location and detail of each foam system supply riser, pre-action, dry-pipe, or deluge valve, water motor alarm, fire department inlet connection, foam hydrants, hand hose stations, monitor nozzles, air compressor(s), and associated electrical connections.

2. Point of connection to the existing water distribution system.

3. Location of foam system control valves and post indicator valves.

4. Area(s) of foam system coverage, with zone designations (if multiple zones). For truck or rail car loading/unloading racks indicate limits of the containment area. Do not show piping layout.

5. For in-rack protection show rack locations, number of tiers and height. Also, show generic mounting details for sprinkler heads, detectors, piping and conduit.

6. For pipe larger than 305 mm 12 inches, detail methods of anchoring pipe including pipe clamps and tie rods.

7. Location of foam proportioning equipment and storage tank.

8. Show locations of control panel, annunciator(s), alarm devices, manual actuation stations, point of
UFGS

connection to the building fire evacuation alarm system, remote trouble device, point of connection to the incoming power supply and fusible safety switch. Do not show conduit sizes or number of conductors for DC circuits. Do not show locations of detectors.

9. Show single line riser diagram for all detection, activation, and alarm circuits. Connection of equipment shall be indicated by circuit runs and not conduit runs. Do not indicate number and size of conductors for interconnection of fire alarm components.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section, with the additions and modifications specified herein.

1.3 SYSTEM DESCRIPTION

1.3.1 Design Requirements

******************************************************************************
NOTE: Identify the rooms, spaces or areas, as appropriate, which are to be protected by each system.
******************************************************************************

******************************************************************************
NOTE: Include only those NFPA codes applicable to the specific project.
******************************************************************************

Design and [provide a new] [and] [modify an existing] automatic aqueous film forming foam (AFFF) [pre-action] [dry-pipe] [deluge] sprinkler
System shall provide uniform distribution of AFFF solution to provide complete coverage throughout the building areas indicated. The design, equipment, materials, installation, and workmanship shall be in strict accordance with the required and advisory provisions of NFPA 11, NFPA 13, [NFPA 14], [NFPA 15], [NFPA 16], [NFPA 24], [NFPA 30], NFPA 70, NFPA 72, [NFPA 1971], except as modified herein. Each system shall be designed for earthquakes and shall include all materials, accessories and equipment necessary to provide each system complete and ready for use. Design and install each system to give full consideration to blind spaces, piping, electrical equipment, ductwork, and all other construction and equipment to provide complete coverage in accordance with the drawings to be submitted for approval. Devices and equipment for fire protection service shall be of a make and type listed by the Underwriter's Laboratories Inc. in the UL Fire Prot Dir, or approved by the Factory Mutual System and listed in FM APP GUIDE. In the publications referred to herein, the advisory provisions shall be considered to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears; reference to the "authority having jurisdiction" shall be interpreted to mean the [[_____] Division, Naval Facilities Engineering Command, Fire Protection Engineer] [Corps of Engineers, Contracting Officer]. Begin work at the point indicated.

1.3.1.1 Shop Drawings

Prepare shop drawings for the fire extinguishing system in accordance with the requirements for "Plans" as specified in NFPA 11 and "Working Plans" as specified in NFPA 13. Each drawing shall be A1 841 by 594 mm 34 by 22 inches. Do not commence work until the design of each system and the various components have been approved. Show:

a. Room, space or area layout and include data essential to the proper installation of each system.

b. Sprinkler heads, discharge nozzles and system piping layout annotated with reference points for design calculations.

c. Field wiring diagrams showing locations of devices and points of connection and terminals used for all electrical field connections in the system, with wiring color code scheme.

[d. UV-IR detector manufacturer's recommended detector layout (plan view) including horizontal and vertical angles for correct aiming].

1.3.1.2 Calculations

a. Hydraulic calculations showing basis for design in accordance with NFPA 11 and NFPA 13.

b. Pressure discharge graphs or tables showing relationship for sprinkler heads and discharge nozzles.

**************************************************************************
NOTE: Regarding the text below, consult with the Division Fire Protection Engineer before specifying 2-wire smoke detectors as a Contractor option. 2-wire detectors must be carefully matched to the control panel by the manufacturer, and are not universally interchangeable between systems for maintenance purposes.
c. Substantiating battery standby power requirements calculations showing battery capacity, supervisory and alarm power requirements. [If 2-wire smoke detectors are proposed for use show comparison of the detector power requirements per zone versus the control panel smoke detector power output per zone in both the standby and alarm modes.]

[d. System surge analysis showing surge pressure occurring throughout the system at both design flow and nonflow conditions.]

1.3.1.3 AFFF Containment and Disposal Plans

Submit AFFF containment and disposal plans as required under paragraph entitled "Environmental Protection."

1.3.1.4 As-Built Drawings for the Fire Extinguishing System

Upon completion, and before final acceptance of the work, submit a complete set of as-built drawings [, including complete as-built circuit diagrams,] of each system. Submit A1 841 by 594 mm 34 by 22 inch reproducible as-built drawings on mylar film with 200 by 100 mm 8 by 4 inch title block similar to contract drawings. Submit as-built drawings in addition to the record drawings required by Division 1.

1.3.2 System Operation

Flow of water and AFFF shall be controlled by [pre-action] [dry-pipe] [deluge] valves. Foam proportioning equipment shall activate automatically upon tripping of the [pre-action] [dry pipe] [deluge] valve(s) for the corresponding foam system(s). [[Pre-action] [Deluge] valves shall be tripped by independent detection systems.] No valve will be operated by the building fire evacuation alarm system. Use of motor-operated valves is prohibited. Once activated, system(s) shall operate until shut down manually. Provide separate circuits from the control panel to each zone of initiating devices. Transmission of signals from more than one zone over a common circuit is prohibited.

1.3.2.1 Overhead [and In-Rack] Systems

Overhead [and in-rack] systems shall be controlled by [[pre-action] [deluge] valves operated by automatic detection systems and by remote manual release stations] [dry pipe valves tripped by loss of air pressure in the system piping].

1.3.2.2 [Monitor System

NOTE: Specify monitor systems for unroofed truck or rail car loading/unloading facilities.

Monitor nozzles shall be controlled by deluge valves operated by [automatic ultraviolet-infrared (UV-IR) optical detection systems] [and] [manual release stations].

1.3.2.3 Hose System

Hose reels shall be controlled by deluge valves operated by remote manual
release stations, separate from those used for overhead systems [and monitor nozzles].

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

[ The fire protection engineer, [_____] Division, Naval Facilities Engineering Command will review any approve all submittals in this section requiring Government approval.]

**************************************************************************

NOTE: For projects administered by the Pacific Division, Naval Facilities Engineering Command, use the optional "SUBMITTALS" article immediately below and delete the general "SUBMITTALS" article above.

**************************************************************************
[The [_____] Division, Naval Facilities Engineering Command, Fire Protection Engineer delegates the authority to the Quality Control (QC) Representative's U.S. Registered Fire Protection Engineer for review and approval of submittals required by this section. Submit to the [_____] Division, Naval Facilities Engineering Command, Fire Protection Engineer one set of all approved submittals and drawings immediately after approval but no more later than 15 working days prior to final inspection.]

1.5 QUALITY ASSURANCE

1.5.1 Qualifications of Installer

Prior to commencing work, submit data showing that the Contractor has successfully installed automatic foam fire extinguishing sprinkler systems of the same type and design as specified herein, or that he has a firm contractual agreement with a subcontractor having the required experience. Include the names and locations of at least two installations where the Contractor, or the subcontractor referred to above, has installed such systems. Indicate the type and design of each system, and certify that the system has performed satisfactorily for a period of at least 18 months.

**************************************************************************
NOTE: For projects administered by the Pacific Division, Naval Facilities Engineering Command, include the following optional paragraph requiring the minimum qualification of a NICET Level-III technician for preparation of all fire protection system drawings.
**************************************************************************
[Qualifications of System Technician: Installation drawings, shop drawing and as-built drawings shall be prepared, by or under the supervision of, an individual who is experienced with the types of works specified herein, and is currently certified by the National Institute for Certification in Engineering Technologies (NICET) as an engineering technician with minimum Level-III certification in Special Hazard System program. Contractor shall submit data for approval showing the name and certification of all involved individuals with such qualifications at or prior to submittal of drawings.]

1.6 SPARE PARTS

Furnish the following spare parts:

a. 2 of each type of detector installed.

b. 1 of each type of audible and/or visual alarm device installed.

c. 2 of each type of fuse required by the system.

d. 5 complete sets of system keys.

PART 2 PRODUCTS

2.1 DESIGN OF FOAM SYSTEMS

Design of [pre-action] [dry-pipe] [deluge] fire extinguishing foam systems shall be by hydraulic calculations for uniform distribution of AFFF solution over the protected area and shall conform to the NFPA standards listed above and to the requirements as specified herein.

2.1.1 Sprinkler Heads

Heads shall have 15 [or 13.50] mm 1/2 [or 17/32] inch orifice. No o-rings will be permitted in sprinkler heads. [For deluge systems, provide open heads.] [For [pre-action] [dry-pipe] systems, the release element of each head shall be of the ["intermediate"] ["high"] temperature rating or higher as suitable for the individual location installed.] [For [pre-action] [dry-pipe] systems protecting rack storage, the release elements of ceilings heads shall be of the "high" (141 degrees C 286 degrees F) temperature rating or higher as required by NFPA 13 and the release elements of the in-rack sprinklers shall be of the "ordinary" (74 degrees C 165 degrees F) temperature rating.] Provide chromium plated ceiling plates and pendent sprinklers below suspended ceilings. Provide corrosion resistant sprinkler heads and sprinkler head guards as required by NFPA 13. [Provide water shields and head guards for all in-rack sprinklers.]

2.1.2 Cabinet

**************************************************************************

NOTE: Deluge systems do not require a sprinkler head cabinet.
**************************************************************************

Provide extra sprinkler heads and sprinkler head wrench in a metal cabinet adjacent to the pre-action valve within each building. The number and types of extra sprinkler heads shall be as specified in NFPA 13.
2.1.3 [Pre-Action] [Deluge] Valves

Valves shall be operated by a detection system listed for releasing service and independent of the building fire alarm system. [[Pre-action] [Deluge] valve clappers shall incorporate a latching mechanism that will not be affected by changes of pressure in the water system.] If 150 mm 6 inch valves are used in 200 mm 8 inch risers, provide smoothly tapered connections. In addition to automatic operation, arrange each valve for manual release at the valve. Provide pressure gages and other appurtenances at the [pre-action] [deluge] valves as required by NFPA 13. Provide a detection device at the end of each actuation circuit to test the circuit and mount the device [adjacent to the valve] between 1.83 and 2.44 meters 6 and 8 feet above the finish floor. Label each testing device to indicate the valve it activates. [Provide remote manual releases [at [_____]] [where shown].]

2.1.4 [Dry-Pipe Valves]

Provide valves complete with accessories and appurtenances for the proper operation of each system. Provision shall be made to prevent excessive water columnning. Provide an approved quick-opening device for each dry-pipe valve controlling a system having a capacity greater than 500 gallons. Provide gages and other appurtenances as required by NFPA 13.

2.1.5 AFFF Solution Distribution

[Distribution shall be essentially uniform throughout the area in which it is assumed the sprinkler heads will open. Variation in discharge from individual heads in the hydraulically most remote area shall be between 100 and 120 percent of the specified density.]

[Distribution shall be essentially uniform throughout the area. Variation in discharge from individual heads shall be between 100 and 120 percent of the specified density.]

2.1.6 AFFF Solution Application Density

[Refer to MIL-HDBK-1008A and the appropriate NFPA standard(s) governing the particular facility to determine the density required.]
Size system to provide the specified density when the system is discharging the specified total maximum required flow. Application to horizontal surfaces below the ceiling sprinklers shall be [_____] mL/sec gallons per minute (gpm) per square meter foot with simultaneous operation of [3 in-rack sprinklers on each level of the hydraulically most remote rack at a minimum discharge pressure of 207 kPa 30 psi,] [and] [_____] operating foam monitor nozzles, [and] [_____] operating foam hose lines, [and with outside water hose stream requirements of [_____] mL/sec gpm].

2.1.7 Sprinkler Discharge Area

**************************************************************************
NOTE: Refer to MIL-HDBK-1008A and the appropriate NFPA standard(s) governing the particular facility to determine the discharge area required. For deluge system, discharge area shall be the entire area protected by the system.
**************************************************************************

Area shall be the hydraulically most remote [_____] square meter feet area as defined by NFPA 13 [and NFPA 1971].

2.1.8 Friction Losses

Calculate losses in pipe in accordance with the Hazen-Williams Formula with 'C' value of 100 for steel pipe [except 120 for steel pipe used in deluge systems], 150 for copper tube, and 140 for cement lined ductile iron pipe.

2.1.9 Location of Sprinkler Heads

Location of heads in relation to the ceiling and spacing of sprinkler heads shall conform to NFPA 13 for ordinary hazard occupancy; except for discharge density of more than 170 mL per second per sq meter 0.25 gpm per square foot, the spacing of the sprinkler heads shall conform to NFPA 13 for extra hazard occupancy. The spacing of sprinklers on the branch lines shall be essentially uniform. [Location of in-rack sprinklers shall conform to NFPA 1971.]

2.1.10 Water Supply

**************************************************************************
NOTE: Select first option if the water supply is provided directly from the base water distribution system and show or specify the point of connection. Select second option if the water supply is provided from fire pumps dedicated to the AFFF system, which are taking suction from a static water source. Select third option if the water supply is provided from booster fire pumps being supplied from the base water distribution system, and show or specify the point of connection to the base system. Edit Section 21 30 00, FIRE PUMPS and include as part of the project specification when using the second or third option.
**************************************************************************

[Base hydraulic calculations on a static pressure of [_____] kPa (gage) pounds per square inch gage (psig) with [_____] L/m gpm being available at a residual pressure of [_____] kPa (gage) psig at the point [indicated] [of
connection with the base water distribution system.]

[Base hydraulic calculations on [_____] fire pump(s) running. Provide fire pumps as specified in Section 21 30 00 FIRE PUMPS.]

[Base hydraulic calculations on [_____] fire pump(s) running, with a suction supply having a static pressure of [_____] kPa (gage) psig with [_____] L/m gpm being available at a residual pressure of [_____] kPa (gage) psig at the point [indicated] [of connection with the base water distribution system]. Provide fire pumps as specified in Section 21 30 00 FIRE PUMPS.]

2.1.11 Duration of Discharge

**************************************************************************
**************************************************************************

System shall apply foam solution over the sprinkler discharge area for a minimum of [_____] minutes [while simultaneously discharging foam solution through monitors for a minimum of [_____] minutes]. Hose station discharge time shall be a minimum of [_____] minutes. Reduction of the discharge duration based on a discharge rate higher than the specified minimum is not permitted.

2.2 ELECTRIC DETECTION SYSTEM

**************************************************************************
NOTE: Electric detection system may be used with all detector types specified in this guide specification and are necessary for complex controls. Delete electric detection system if dry-pipe system is used.
**************************************************************************

Provide electric [heat detectors,] [and] [smoke detectors,] [and] [combination ultraviolet-infrared detectors]. All wiring shall be supervised and installed in protective metal conduit or tubing.

2.2.1 Control Panel

**************************************************************************
NOTE: Select either "Class B" or Class A" supervision ("Style B" or "Style D" as defined by NFPA 72). "Class B" supervision which will normally be used, provides a trouble indication when a failure occurs in a circuit. "Class A" supervision provides a trouble indication when a fault occurs in a circuit and at the same time allows continued operation of that circuit. "Class A" supervision should be used for strategically critical facilities. Select first ("Class B") or second ("Class A") supervisory option accordingly.
**************************************************************************

**************************************************************************
NOTE: Provide a remote trouble bell or buzzer in a
constantly attended area if the control panel is not so located. Provide a trouble bell at the control panel if the panel is located in a high noise area. Coordinate location of remote trouble bell and remote annunciator panel when both are provided.

**************************************************************************

Modular type panel installed in a [flush] [surface] mounted steel cabinet with hinged door and cylinder lock. Switches and other controls shall not be accessible without the use of a key. The control panel shall be a neat, compact, factory-wired assembly containing all parts and equipment required to provide specified operating and supervisory functions of the system. Panel cabinet shall be finished on the inside and outside with factory-applied enamel finish. Provide main annunciator located on the exterior of the cabinet door or visible through the cabinet door. Provide audible trouble signal. Provide prominent engraved rigid plastic or metal identification plates, or silk-screened labels attached to the rear face of the panel viewing window, for all lamps and switches. System power shall be 120 volts AC service, transformed through a two winding isolation transformer and rectified to 24 volts DC for operation of all system initiating, actuating, signal sounding, trouble signal and fire alarm tripping circuits. System shall be electrically supervised on all circuits. [A ground fault condition or a single break in any circuit which prevents the required operation of the system shall result in the operation of the system trouble signal.] [A single open or ground fault condition in any detection (initiating) [or signaling] circuit shall not result in any loss of system function, but shall cause the actuation of system trouble signals. A ground fault condition or single break in any other circuit shall result in the activation of the system trouble signals.] Loss of AC power, a break in the standby battery power circuits, or abnormal AC power or low battery voltage shall result in the operation of the system trouble signals. The abnormal position of any system switch in the control panel shall result in the operation of the system trouble signals. Trouble signals shall operate continuously until the system has been restored to normal at the control panel. System trouble shall also be annunciated on the appropriate zone of the building fire alarm panel. [Provide a 100 mm 4 inch remote system trouble bell [or buzzer], installed [in a constantly attended area] [where shown], arranged to operate in conjunction with the integral trouble signals of the panel. Provide remote bell [or buzzer] with a rigid plastic or metal identification sign which reads "Foam System Trouble." Lettering on identification sign shall be a minimum of 25 mm one inch high.] Control panel, batteries, and battery charger shall be weatherproof type or located in an area not subject to water damage. System control panel shall be UL listed or FM approved for extinguishing system control (releasing device service). Permanently label all switches. Provide panel with the following switches:

a. Trouble silencing switch which transfers audible trouble signals (including remote trouble devices, if provided) to an indicating lamp. Upon correction of the trouble condition, audible signals will again sound until the switch is returned to its normal position, or the trouble signal circuit shall be automatically restored to normal upon correction of the trouble condition. The silencing switch may be a momentary action, self-resetting type.

b. Alarm silencing switch which when activated will silence all associated alarm devices without resetting the panel, and cause operation of system trouble signals.
c. Individual zone disconnect switches which when operated will disable only their respective initiating circuit and cause operation of the system and zone trouble signals.

d. Reset switch which when activated will restore the system to normal standby status after the cause of the alarm has been corrected, and all activated initiating devices reset. [Operation of reset switch shall restore activated smoke detectors to normal standby status.]

e. Lamp test switch.

[f. City disconnect switch which when activated will disconnect the coded device and cause operation of the system trouble signal.]

2.2.1.1 Main Annunciator

Provide integral with the main control panel. Provide separate alarm and trouble lamps for each zone alarm initiating circuit as indicated below, located on the exterior of the cabinet door or visible through the cabinet door. Lamps shall be LED (Light Emitting Diode) type. Supervision will not be required provided a fault in the annunciator circuits results only in loss of annunciation and will not affect the normal functional operation of the remainder of the system. Each lamp shall provide specific identification of the [zone] [area] [device] by means of a permanent label. In no case shall zone identification consist of the words "Zone 1," "Zone 2," etc., but shall consist of the description of the [zone] [area] [device].

2.2.1.2 Initiating Zones

**************************************************************************
NOTE: List zones from 1 to x, with a brief description of each zone; e.g. "Zone 1: Aerosol Storage Room." Expand this list as necessary to identify all the zones required for the building. Careful coordination with paragraph "System Activation" and the number and location(s) of system risers shown on drawings is required.
**************************************************************************

Shall be arranged as follows:

Zone 1: [_____]
Zone 2: [_____]
Zone 3: [_____]
Zone x: [_____]

2.2.1.3 Remote Annunciator Panel

**************************************************************************
NOTE: Coordinate location of remote trouble bell and remote annunciator panel when both are provided. Locate panel at or near the building entrance to allow fire department quick access to panel.
**************************************************************************
Locate as shown. Panel shall duplicate all requirements specified for the main control panel annunciator, except that in lieu of individual zone trouble lamps a single common system trouble lamp may be provided. Lamps shall be LED (Light Emitting Diode) type, except lamps used in backlit panels shall be LED or neon type. Panel shall have a lamp test switch. Zone identification shall be by means of [permanently attached rigid plastic or metal plate(s)] [silk-screened labels attached to the reverse face of backlighted viewing window(s)]. Panel shall be of the [interior] [weatherproof] type, [flush] [surface] [pedestal]-mounted.

2.2.2 Auxiliary Power Supply

2.2.2.1 Storage Batteries

**************************************************************************
NOTE: Consult the Public Works Department for battery preference.
**************************************************************************

Provide [sealed lead calcium,] [or] [sealed lead acid,] [or] [vented wet cell nickel cadmium,] batteries and charger. Drycell batteries are not acceptable. House batteries in the control panel or in a well constructed vented steel cabinet with cylinder lock, non-corrosive base, and louvered vents. Provide batteries of adequate ampere-hour rating to operate the system under supervisory conditions for 60 hours, at the end of which time batteries shall be capable of operating the entire system in a full alarm condition for not less than [30] [15] minutes. Provide calculations substantiating the battery capacity. Provide reliable separation between cells to prevent contact between terminals of adjacent cells and between battery terminals and other metal parts. Provide batteries with post-and-nut, "L"-blade, or similar terminals. Slip-on tab type terminals are not acceptable. When a separate battery cabinet is used, provide a fuse block for battery leads within the cabinets. Finish the cabinet on the inside and outside with enamel paint. Locate the top of the battery cabinet not more than 1.22 meters 4 feet above floor level.

2.2.2.2 Battery Charger

Provide completely automatic high/low charging rate type charger capable of recovery of the batteries from full discharge to full charge in 24 hours or less. Provide an ammeter for recording rate of charge and a voltmeter to indicate the state of battery charge under load. Meters shall be factory installed, or factory-supplied plug-in modules. Field installation of meters other than the panel manufacturer's plug-in modules is prohibited. Provide a trouble light to indicate when batteries are manually placed on a high rate of charge as part of the unit assembly if a high-rate switch is provided. House charger in the control panel or battery cabinet.

2.3 PNEUMATIC DETECTION SYSTEM

**************************************************************************
NOTE: Pneumatic detection system may be used only with single acting rate-of-rise heat detectors. Consult with the Division Fire Protection Engineer for guidance on use of pneumatic detection systems.
**************************************************************************

Provide pneumatic single acting rate-of-rise heat detectors. All tubing shall be supervised and installed in protective metal conduit or tubing.
2.3.1 Air Compressor

Shall be automatic, electric motor driven and include piping, pressure switch, regulator, and tank if required. Provide compressor with a minimum capacity capable of charging the pneumatic detection system to normal system pressure in 15 minutes and shall include all controls necessary to maintain the system fully charged. [Provide at least one compressor for every [_____] detection circuits.]

2.3.2 Piping and Control Panel

Provide copper piping. Provide a control panel or equivalent device(s) to automatically maintain the required pneumatic pressure in the detection system, and limit the quantity of air that enters the detection/release system. Provide supply air and system air pressure gages.

2.4 PIPING SUPERVISION

**************************************************************************
NOTE: Include for projects involving pre-action sprinkler piping systems or pneumatic detection systems only.
**************************************************************************

[Pre-action sprinkler piping] [and] [pneumatic detection system] shall be supervised. A break in the piping or tubing systems resulting in loss of pneumatic pressure shall result in the activation of a trouble signal. Provide a silencing switch which transfers trouble signals to an indicating lamp and arrange so that correction of the trouble condition will automatically transfer the trouble signal from the indicating lamp back to the trouble signal until the switch is restored to normal position.

2.5 MANUAL RELEASE STATIONS

Provide overhead system, [and] [monitor nozzle] release stations where shown and separate hose station release stations at each hose station. Stations shall be of a type not subject to operation by jarring or vibration. Stations shall have a dual action release configuration to prevent accidental system discharge. Break-glass-front stations are not permitted; however a pull lever break-glass-rod type is acceptable. Station color shall be red. Station shall provide positive visible indication of operation. Restoration shall require use of a key or special tool. Place warning signs at each station indicating that operation of the station will cause immediate AFFF discharge. Where a building fire alarm pull station is also mounted in the vicinity of a foam release station, separate the stations by at least one meter 3 feet horizontally. Provided permanent engraved rigid plastic or metal labels to clearly distinguish foam release stations from building fire alarm stations, and to indicate the function of each foam release station. Stations shall be weatherproof type.

2.6 HEAT DETECTORS

**************************************************************************
NOTE: Select the type of heat detector most suited for application or design. Do not use rate-of-rise detectors in areas subject to rapid temperature changes (e.g. near unit heaters, etc.). Consult the Division Fire Protection Engineer.
**************************************************************************
Designed for detection of fire by [combination fixed temperature rate-of-rise] [rate compensating] principle. Locate detectors in accordance with their listing by UL or FM and the requirements of NFPA 72, except provide at least two detectors in all rooms of 56 sq meters 600 square feet or larger in area. Temperature rating of detectors shall be in accordance with NFPA 72. Reduce heat detector spacing in areas with ceiling heights exceeding 3 meters 10 feet, in accordance with NFPA 72. No detector shall be located closer than 305 mm 12 inches to any part of any lighting fixture nor closer than 610 mm 24 inches to any part of an air supply diffuser. Detectors, located in hazardous locations as defined by NFPA 70, shall be types approved for such locations. Provide with terminal screw type connections. Removal of detector head from its base shall cause activation of system trouble signal. Detectors shall be weatherproof type.

2.6.1 Combination Fixed Temperature Rate-of-Rise Detectors

**NOTE:** Only single acting rate-of-rise heat detectors may be specified for use with a pneumatic detection system.

Designed for [surface] [semi-flush] outlet box mounting and supported independently of conduit, tubing or wiring connections. Contacts shall be self-resetting after response to rate-of-rise actuation. Operation under fixed temperature actuation shall result in an external indication. Detector units located in areas subject to abnormal temperature changes shall operate on fixed temperature principle only.

2.6.2 Rate Compensating Detector

Designed for [surface] [flush] [vertical unit] outlet box mounting and supported independently of conduit, tubing or wiring connections. Detectors shall be hermetically sealed and automatically resetting type which will operate when ambient air temperature reaches detector setting regardless of rate of temperature rise. Detector operation shall not be subject to thermal time lag.

2.7 OPEN-AREA (SPOT-TYPE) SMOKE DETECTORS

**NOTE:** Consult with the Division Fire Protection Engineer before specifying 2-wire smoke detectors as a Contractor option. 2-wire detectors must be carefully matched to the control panel by the manufacturer, and are not universally interchangeable between systems for maintenance purposes.

Designed for detection of abnormal smoke densities by the [ionization] [or] [photoelectric] principle. Provide necessary control and power modules required for operation integral with the main control panel. Provide detectors and associated modules which are compatible with the main control panel and suitable for use in a supervised circuit. Detector circuits shall be of the 4-wire type whereby the detector operating power is transmitted over conductors separate from the initiating circuit. Provide
a separate, fused, power circuit for each smoke detection initiating circuit (zone). Failure of the power circuit shall be indicated as a trouble condition on the corresponding initiating circuit. [As an alternate, detector circuits of the 2-wire type whereby the detector operating power is transmitted over the initiating circuit are permitted, provided the detectors used are approved by the control panel manufacturer for use with the control panel provided and are UL listed or FM approved as being compatible with the control panel (copies of the UL or FM listings showing compatibility shall be submitted). When 2-wire smoke detectors are used, the total number of detectors on any detection circuit shall not exceed 80 percent of the maximum number of detectors allowed by the control panel manufacturer for that circuit and the standby current draw of the entire system shall not exceed 80 percent of the rated output of the system power supply module(s). Provide additional zones above those specified in the paragraph entitled "Initiating Zones" if required to meet the above requirements. Calculations showing compliance with the power consumption limitation requirements specified above shall be submitted with the calculations required by the paragraph entitled "Design Data." The data submitted under the paragraph entitled "Test Reports" shall clearly indicate the compatibility of the detectors with the control panel provided and the maximum number of detectors permitted per zone.] Malfunction of the electrical circuits to the detector or its control or power units shall result in the operation of the system trouble signals. Equip each detector with a visible indicator lamp that flashes when the detector is in the normal standby mode and glows continuously when the detector is activated. [Provide remote indicator lamps for each detector that is concealed from view.] Provide plug-in type detectors with tab-lock or twist-lock, quick disconnect head and separate base in which the detector base contains screw terminals for making all wiring connections. Detector head shall be removable from its base without disconnecting any wires. Removal of detector head from its base shall cause activation of system trouble signals. Provide each detector with an integral screen to prevent entrance of insects into the detection chamber(s).

2.7.1  Ionization Detectors

Multiple chamber type which is responsive to both visible and invisible particles of combustion. Detectors shall not be susceptible to operation by changes in relative humidity.

2.7.2  Photoelectric Detectors

Operate on a multiple cell concept using an infra-red light-emitting diode (LED) light source.

2.7.3  Detector Spacing and Location

NFPA 72, the manufacturer's recommendations and the requirements stated herein, however, in no case shall spacing exceed 9 by 9 meters 30 by 30 feet per detector, and 9 linear meters 30 lineal feet per detector along corridors. Detectors shall not be placed closer than [1] [1 1/2] meters [3] [5] feet from any air discharge or return grille, nor closer than 305 mm 12 inches to any part of any lighting fixture.

2.8  [COMBINATION ULTRAVIOLET-INFRARED FLAME DETECTORS

**************************************************************************
NOTE: Specify UV-IR detectors for unroofed truck or rail car loading/unloading facilities when automatic
Flame detectors shall operate on the dual spectrum ultraviolet-infrared (UV-IR) principle. Detector shall employ a solar-blind UV sensor with a high signal-to-noise ratio, and a narrow band IR sensor. Detector logic shall require UV and IR signals to be present, in the proper ratio or signature as emitted by a hydrocarbon fire, before the detector initiates an alarm. [Detectors shall respond within 5 seconds to a JP-4 fire 3 meters (10 feet) square, 46 meters (150 feet) from the detector.] Detector shall not be activated by non-fire sources such as continuous or intermittent direct or reflected solar radiation, arc-welding, lightning, radiant heat, x-rays, artificial lighting, radio transmissions, and normal jet engine functions. Detector shall have an automatic through-the-lens self-testing feature. Malfunction of the detector circuitry, or degradation of the sensors' lens cleanliness to the point where the detector will not detect the design fire signature, shall cause operation of the system trouble signals. Logic circuits necessary for operation of the detector shall be integral to the detector or located in separate flame detector control panel(s) located adjacent to the foam system control panel(s). Each detector in alarm shall be individually annunciated by an LED on the detector or at the detector control panel. Primary and auxiliary power supply shall be taken from the foam system control panel(s). Detectors, and associated control panels if required, shall be compatible with the foam system control panel(s). Detectors and associated control panels shall be weatherproof, or housed in weatherproof enclosure(s) when in an area subject to system discharge and shall also be explosion-proof when located in hazardous areas as defined by NFPA 70. Detector spacing and location shall be in accordance with NFPA 72, their UL listing or FM approval, and the manufacturer's recommendations. The detector manufacturer shall determine or approve the detector layout. Detector layout drawings shall include horizontal and vertical angles for correct aiming. Locate detectors so that every portion of the protected area is within the field of view of at least [two] [three] detectors, taking into account fixed obstructions. Provide detectors with manufacturer's swivel mounting bracket. Provide a permanent engraved rigid plastic or metal label at each detector location with detector aiming information (degrees horizontal and vertical) for the corresponding detector.

2.9 ELECTRICAL WORK

NOTE: Edit Section 26 20 00, INTERIOR DISTRIBUTION SYSTEM and include as part of the project specification.

NOTE: When project includes requirement for a building fire alarm system, include Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] in the project specification. When project requires only tying into an existing building fire alarm system, fire alarm wiring should be specified in this section. For Navy projects, select the first
appropriate Section title when using the basic NAVFAC guide specification covering the subject work or select the second title when using the EFD regional guide specification covering the subject work.

Electrical work is specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, except for control [and fire alarm] wiring. [Fire alarm system is specified in Section [28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE] ["Fire Alarm and Fire Detecting Systems (Local)"].

2.9.1 Wiring

Provide control wiring and connections to fire alarm systems, under this section and conforming to NFPA 70 and NFPA 72. Wire for 120 volt circuits shall be No. 12 AWG minimum solid conductor. Wire for low voltage DC circuits shall be No. [14] [16] AWG minimum solid conductor [, except wire to remote annunciators, if provided, may be 18 AWG minimum solid conductor]. All wiring shall be color coded. Wiring, conduit and devices exposed to water or foam discharge shall be weatherproof. Wiring, conduit and devices located in hazardous atmospheres, as defined by NFPA 70[and as shown], shall be explosion proof. All conduit shall be minimum 20 mm 3/4 inch size.

2.9.2 Operating Power

Power shall be 120 volts AC service, transformed through a two winding isolation type transformer and rectified to 24 volts DC for operation of all signal initiating, signal sounding, trouble signal, and actuating (releasing) circuits. Provide secondary DC power supply for operation of system in the event of failure of the AC supply. Transfer from normal to emergency power or restoration from emergency to normal power shall be fully automatic and shall not cause transmission of a false alarm. Obtain AC operating power for control panel, [and] battery charger [, and air compressor] from the line side of the incoming building power source ahead of all building services. Provide independent properly fused safety switch, with provisions for locking the cover and operating handle in the "POWER ON" position for these connections and locate adjacent to the main distribution panel. Paint switch box red and suitably identify by a lettered designation.

2.9.3 Conductor Identification

Identify circuit conductors within each enclosure where a tap, splice or termination is made. Identify conductors by plastic coated self sticking printed markers or by heat-shrink type sleeves. Attach the markers in a manner that will not permit accidental detachment. Properly identify control circuit terminations.

2.10 SYSTEMS ACTIVATION

2.10.1 Overhead System Activation

**************************************************************************

NOTE: Follow the requirements specified in NFPA 13
to determine the number of risers required. Careful coordination between paragraph "Initiating Zones" and the number and location(s) of system risers shown on the drawings is required. Overhead systems, monitor systems and hose systems shall be served by separate risers.

Upon activation of detection system or overhead system manual release station(s), the corresponding [combination] overhead [and in-rack] system protecting that area shall activate.

2.10.2 [Monitor System Activation]

**************************************************************************

NOTE: Overhead systems, monitor systems and hose systems shall be served by separate risers.
**************************************************************************

Upon activation of [two UV-IR detectors for more than 5 seconds or activation of] a manual release station, all monitors in that zone shall be activated. [Activation of a single UV/IR detector shall cause activation of the fire alarms but shall not cause activation of the monitor nozzle(s).]

2.10.3 Hose System Activation

**************************************************************************

NOTE: Overhead systems, monitor systems and hose systems shall be served by separate risers.
**************************************************************************

[Each] [The] zone shall encompass [all hose stations] [the hose stations indicated]. Hose stations shall be activated upon activation of a hose station manual release station. Provide a manual release station at each hose station.

2.11 ALARMS

2.11.1 Water Motor Alarm

Provide weatherproof and guarded type alarm for each [group of] [pre-action] [deluge] valve(s). Alarms shall sound locally on the flow of foam solution in each system to which it is connected. Mount alarms on the outside of the outer walls of each building, at locations indicated. When more than one alarm gong is provided, provide permanent engraved rigid plastic or metal signs indicating to which system each gong is connected.

2.11.2 Local Alarm

**************************************************************************

NOTE: Delete if a building fire alarm system exists in the building or is being provided under this project.
**************************************************************************

Provide electric [alarm horns] [alarm bells] to sound locally on operation of any system, regardless of whether water flows or not. When more than one alarm is provided, provide permanent engraved rigid plastic or metal signs indicating to which system each alarm is connected.
2.11.3 Fire Alarm

Provide equipment for the automatic transmittal of an alarm over the [facility] [building] fire alarm system. Arrange so that the detection system and the flow of solution in each system will actuate the alarm. [Activation of a single UV-IR detector shall not cause activation of the foam system but shall cause activation of the fire alarm system.]

2.11.3.1 Pressure Switch

Provide switch with SPDT contacts to automatically transmit alarms upon flow of water or AFFF. Alarm actuating device shall [have mechanical diaphragm controlled retard device adjustable from 10 to 60 seconds and shall] instantly recycle.

2.11.4 Trouble Alarm

**************************************************************************
NOTE: Delete if a building fire alarm system exists in the building or is being provided under this project.
**************************************************************************

**************************************************************************
NOTE: Pre-action sprinkler piping systems require supervision.
**************************************************************************

Provide local [100 mm 4 inch] electric alarm [bell] [horn] [_____] to indicate trouble [or failure of the [detection system] [or] [pre-action sprinkler piping system]]. [Alarm shall operate when air pressure in the dry-pipe system drops halfway from the normal pressure to the tripping point.] Also connect trouble alarm into the building fire alarm control panel to indicate "trouble" on a separate zone labeled "Foam System Trouble."

2.12 TANK MOUNTED AIR COMPRESSOR

**************************************************************************
NOTE: Include for projects involving pre-action or dry-pipe sprinkler piping systems only.
**************************************************************************

Provide an approved automatic type electric motor driven air compressor including pressure switch, air piping, and [38 liter] [10 gallon] [_____] minimum capacity tank. Compressor shall have a minimum capacity capable of charging the complete sprinkler system to normal system air pressure within 30 minutes. Provide each system with an approved automatic air pressure regulating device.

2.13 AFFF CONCENTRATE

**************************************************************************
NOTE: Select percentage when specifying MIL-PRF-24385 concentrate. Consult the facility fire department or the Division Fire Protection Engineer. MIL-PRF-24385 does not cover alcohol resistant-type concentrate. Specify UL listed
alcohol resistant-type concentrate if there is a possibility of alcohol-based liquids being present. When alcohol resistant foam is required, it must be used at the UL listed application rate. Currently 3 percent alcohol resistant-type concentrate is not available.

[MIL-PRF-24385, [3] [6] percent] [UL listed alcohol/polar solvent resistant type].

2.13.1 Concentrate Fill Pump

Provide one pump to fill foam system tank. Pump shall have a minimum flow rate of 26.4 L/m 7 gpm. Pump shall be complete with 115 VAC motor, fused switch, power cord with plug and 3 meters 10 foot minimum suction and clear discharge hoses.

2.14 DIAPHRAGM PRESSURE PROPORTIONING EQUIPMENT

NOTE: Select the method of proportioning best suited for the project.

Diaphragm pressure proportioning systems operate by water pressure, require no electrical power, and minimal control circuitry for automatic operation. Maintenance requirements are minimal, however refilling the tank is a difficult operation requiring the services of a qualified technician to avoid rupturing the diaphragm.

Balanced pressure proportioning systems require reliable electrical power and more complex control circuitry for automatic operation. In some cases an emergency generator will be required. The primary advantage of the non-diaphragm systems is the ease in refilling the tanks. Tanks may be refilled even while the system is in operation, if necessary.

Skid-mounted balanced pressure proportioning systems perform proportioning at a central location, avoiding long runs of concentrate lines. They are well suited for systems such as deluge sprinklers and monitor nozzles which have a relative narrow range of flow rates.

In-line balanced pressure proportioning is useful when there are multiple hazards with widely varying discharge rates which are to be supplied from the same proportioning system, and any time it is desired to proportion foam remotely at risers or discharge devices instead of at the pump room. Their disadvantage is the need for much more concentrate piping in the field.

Foam solution shall be produced by introducing AFFF concentrate into the water stream by the balanced pressure proportioning method using a
diaphragm pressure tank and ratio controller. [Provide proportioning system and storage tanks for hose lines independent of main proportioning system and tanks.]

2.14.1 Diaphragm Pressure Proportioning Tanks

**************************************************************************  
NOTE: When large quantities of AFFF concentrate are required, consider two or more tanks in parallel vs one large tank. (This is in addition to reserve tanks.) Approved diaphragm tanks larger than 9475 to 11370 liters 2,500 to 3,000 gallons are not readily available.
**************************************************************************
**************************************************************************  
NOTE: Designer must calculate foam tank capacity based on maximum flow for maximum duration to determine size of tank and space required. Do not label foam tank capacity on drawing. Exact tank size (which may be larger) will be determined by Contractor's hydraulic calculations.
**************************************************************************

Tanks shall be cylindrical steel ASME pressure vessels with a full Buna-N impregnated nylon inner tank or bladder designed to contain AFFF concentrate and to be used in conjunction with the concentrate ratio controller. Tanks shall be designed for working pressure of [793 kPa (gage)] [115 psig] [_____] and hydrostatically tested at 1.5 times the working pressure in accordance with ASME standards at the factory. Tanks shall have UL or FM label and ASME stamp affixed to the vessel. Size tank to provide sufficient AFFF concentrate for the time specified when the system is discharging foam solution at total maximum system flow. Also provide connected reserve tanks(s) of equal capacity. Permanently label each tank with its capacity, type and percentage of concentrate, which system(s) it serves, and whether it is a main or reserve tank. Conspicuously post filling instructions near each group of tanks. Provide a gage or unbreakable sight glass to permit visual determination of level of tank contents. Prior to shop painting, abrasive blast clean tank exterior surface in accordance with SSPC SP 6/NACE No.3 to a surface profile not to exceed 0.05 mm 2.0 mils and provide a MIL-DTL-24441 or SSPC coating system to the tank exterior. Prime tank exterior with one coat of MIL-DTL-24441/1, Formula 150 or SSPC Paint 22 primer applied to a dry film thickness of 0.076 mm 3 mils and topcoat with one coat of MIL-DTL-24441/7 Formula 156 (red) or SSPC Paint 22 topcoat (red) applied to a dry film thickness of 0.076 mm 3 mils.

2.14.2 Concentrate Ratio Controller

Ratio controller shall be a modified venturi device with AFFF concentrate feed line from diaphragm tank(s), and integral concentrate metering orifice. Size for specified flow rate(s).

2.15 BALANCED PRESSURE PROPORTIONING SYSTEM

**************************************************************************  
NOTE: Select the method of proportioning best suited for the project.
**************************************************************************
Diaphragm pressure proportioning systems operate by water pressure, require no electrical power, and minimal control circuitry for automatic operation. Maintenance requirements are minimal, however refilling the tank is a difficult operation requiring the services of a qualified technician to avoid rupturing the diaphragm.

Balanced pressure proportioning systems require reliable electrical power and more complex control circuitry for automatic operation. In some cases an emergency generator will be required. The primary advantage of the non-diaphragm systems is the ease in refilling the tanks. Tanks may be refilled even while the system is in operation, if necessary.

Skid-mounted balanced pressure proportioning systems perform proportioning at a central location, avoiding long runs of concentrate lines. They are well suited for systems such as deluge sprinklers and monitor nozzles which have a relative narrow range of flow rates.

In-line balanced pressure proportioning is useful when there are multiple hazards with widely varying discharge rates which are to be supplied from the same proportioning system, and any time it is desired to proportion foam remotely at risers or discharge devices instead of at the pump room. Their disadvantage is the need for much more concentrate piping in the field.

Foam solution shall be produced by introducing AFFF concentrate into the water stream by the balanced pressure proportioning method using a pump and proportioner. [Provide proportioning system and storage tanks for hose lines independent of main proportioning system and tanks.]

2.15.1 [Skid-Mounted Balanced Pressure Proportioning System]

Self-contained, skid-mounted system, fully assembled at the factory and delivered complete and ready for use. Field connections shall be limited to water, electrical, and AFFF concentrate inputs, foam solution output, and foam concentrate return line to storage tank. Size system for required flow rate(s). The concentrate pump and all piping, valves, and fittings in contact with foam concentrate shall be of materials resistant to the corrosive effects of the AFFF concentrate. Concentrate pump shall be electric motor driven, drip proof, 240/480 volts, 60 Hz AC. Activation and operation of system shall be fully automatic, with manual over-ride and manual shut-down. Provide permanent engraved rigid plastic or corrosion resistant metal instruction plate for emergency manual operation, along with a similarly constructed label for each control device.
2.15.2 [In-Line Balanced Pressure Proportioning System]
