exceed 50 percent of its breaking strength.

A weak link, preferably a shackle, swivel or other readily replaceable, cost effective component shall be designed to fail first. Concrete embedments shall have a break out capacity of at least 1.5 times the characteristic load of the weakest link.

Mechanical hardware, such as fasteners shall be sized with a design working load that does not exceed 60 percent of the lower of the yield or breaking load.

Pneumatic and hydro-pneumatic fenders should have at least 50 percent of the contact dimension in bearing on the supporting structure, or as recommended by the manufacturer. The contact surface for all floating fenders when not under load, should have low abrasion characteristics. Typically UHMWPE or plastic is used to face concrete or composite elements in the wear area.

Pneumatic and Hydro-Pneumatic Fenders - Warranty; G

1.4 DELIVERY, HANDLING AND STORAGE

Deliver fenders undamaged. Handle and store fenders as to prevent damage, such as bending or abrading end fittings, cutting of rubber, or damage to coating of hardware. Protect folded fender corners from forklift and/or maintenance while tires that could possibly damage the outer rubber and reinforced layers of the fender. Protect fenders from exposure to damaging liquids, oils, greases and extended exposure to sunlight.

1.4.1 Rejection

Fenders that are delivered to the site in a damaged condition or that are not in conformance with this specification are subject to rejection. Replace any rejected materials with suitable materials, at no additional cost to the Government.

1.4.2 Fender Marking

Unless otherwise specified, identify all fenders in readable characters at least 25 mm 1 inch high, either directly or on corrosion- and sunlight resistant permanently attached tags. For fenders 2500 mm 8 feet in diameter, the letter heights must be a minimum of 100 mm 4 in. The markings must include the following:

a. International Standard number and applicable year, i.e. ISO 17357-1:2014.

b. size (Diameter and Length),

c. initial internal pressure,

d. date of manufacture or its abbreviation,

e. full or abbreviated name of manufacturer

f. individual serial number,

g. type of reinforcement layer,

h. other information as the purchase specification or contact requires.

1.4.3 Fender Instructions and Manual

Provide installation instructions and a fender manual describing maintenance requirements for each fender type.

1.4.4 Handling Coated Material

Store, handle, and place coated material in a manner that will minimize damage to the coating and will not reduce its effective protective value. Repair damaged surfaces as directed and per the Manufacturer's recommendations. Handle coated work which is flexible in a manner that will prevent flexing sufficient to crack coating, especially when temperature is below 4 degrees C 40 degrees F. Do not place coated surfaces on strips or skids until coating has hardened thoroughly. Wide fabric slings used for lifting, and strips, slings, blocks, skids, cradles, and other supports must provide ample bearing areas. In transporting, fasten and protect coated materials in a manner that will prevent movement and preclude chafing and rubbing, and when unloading, do not dump or drop. Place coated material in position carefully on suitably prepared beds and with a minimum of handling.

1.5 QUALITY ASSURANCE

1.5.1 Certificates

Submit pneumatic certificates of compliance and hydro-pneumatic certificates of compliance certifying that materials meet the requirements specified herein.

1.5.2 Elastomer Skin

The elastomer skin of the fender must be free from cracks, burrs, warpage, checks, chipped or blistered surfaces, and must have a smooth surface.

1.5.3 Steel Fabrication

The steel used in fabrication must be free from kinks, sharp bends, and other conditions which would be detrimental to the finished product. Manufacturing processes must not reduce the strength of the steel to a value less than intended by the design. Manufacturing processes must be done neatly and accurately. Make bends by controlled means to insure uniformity of size and shape.

1.5.4 Welding

AWS D1.1/D1.1M. Provide welds of sufficient size and shape to develop the full strength of the parts connected by the welds. Welds must transmit stress without permanent deformation or failure when the parts connected by the weld are subjected to proof and service loadings.

1.6 PNEUMATIC AND HYDRO-PNEUMATIC FENDERS - WARRANTY

****

NOTE: The warranty requirements in this guide specification have been approved by a Level I Contracting Officer in accordance with the requirements of Naval Facilities Acquisition Supplement (NFAS).

NFAS can be found at the following link:
https://www.navfac.navy.mil/

The paragraphs in this guide specification may be used without further approval.
****

Furnish the manufacturer's warranty. Issue the warranty directly to the Government. It must not be limited in dollar value. The warranty period must be not less than 1 year from the date of Government acceptance of the work.

PART 2 PRODUCTS

2.1 PNEUMATIC AND HYDRO-PNEUMATIC FENDERS

2.1.1 Manufacturer's Data

2.1.1.1 Pneumatic Fenders Manufacturer's Data

Prior to fabrication, submit copies of the manufacturer's catalog data, performance curves per ISO 17357-1, dimensions, material specifications, and method of manufacture.

2.1.1.2 Hydro-Pneumatic Fenders Manufacturer's Data

Prior to fabrication, submit copies of the manufacturer's catalog data, performance curves per ISO 17357-1, dimensions, material specifications, and method of manufacture.

2.1.2 Design Data

2.1.2.1 Pneumatic Fenders Design Data

Submit rated performance data (RPD) and published performance curves per ISO 17357-1.

2.1.2.2 Hydro-Pneumatic Fenders Design Data

Submit rated performance data (RPD) and published performance curves per ISO 17357-1.

2.1.3 Configuration

Manufacture fenders in accordance with ISO 17357-1. Fenders must have cylindrical mid-bodies with hemispherical shaped ends terminating in an end fitting on the cylinder's centerline at each end. Size the flange opening fittings (not to exceed 12 percent of fender diameter) so as not to contact loading surfaces when the fender is compressed to 20 percent of its original diameter (80 percent compression). Incorporate a safety valve for Pneumatic and Hydro-Pneumatic fenders 2500 mm 8 feet diameter or larger and pressure monitoring system in their manufacture.

2.1.4 Dimensions

Diameter and length as indicated on the drawings.

2.1.5 Fender Skin

The fender skin must have a minimum strength in accordance with ISO 17357-1. When designing the skin thickness, consider skin strength and the stress induced by the internal operating and berthing pressure, and the abrasion and impact loads caused by handling and berthing operations. Ensure an adequate margin of safety is incorporated for the fender's intended use. Design the connection of the skin to the end fittings to resist the specified minimum endurable pressure at 60 percent compression in ISO 17357-1 for the respective operating pressure. For hydro-pneumatic fenders, the Minimum Endurable Pressure value in Table 5 of ISO 17357-1 (Pneumatic 80 fender pressure requirements) must be used.

2.1.5.1 Elastomer

Provide rubber material test proving the elastomer meets the requirements of ISO 17357-1, material test of rubber.

****

NOTE: After aging refers to air oven aging at 70 degrees C 158 degrees F plus/minus 1 degree C 33.8 degrees F, 96 hours.

****

Per ISO 17357-1, the elastomer used in the outer skin must be rubber, with the following unreinforced properties:

a. Durometer Hardness, Shore A	
(ASTM D2240 or ISO 7619-1)	
Before Aging	[50 to 70] [_____]
After Aging	Not to exceed the original property by more than 8

b. Minimum Tensile strength	
(ASTM D412 or ISO 37)	
Before Aging	[18] [_____] MPa [2600] [_____] psi
After Aging	Not less than 80 percent of original property

c. Minimum Elongation (ultimate)	
(ASTM D412 or ISO 37)	
Before Aging	[400 percent] [_____]
After Aging	Not less than 80 percent of original property

d. Minimum Tear strength	[400] [_____] N per cm [228] [_____] lbs/inch

(ASTM D624 or ISO 34-1)	

e. Compression set	30 percent(70 degrees C 158 degrees F plus/minus 1 degree C 33.8 degrees F, 22 hours) or less
(ISO 815-1)	

f. Static ozone aging test (ISO 1431-1)	No cracks after elongation by 20 percent and exposure to 50 pphm (parts of ozone per hundred million of air by volume) at 40 degrees C 104 degrees F for 96 hours

The elastomer used in the inner skin must be rubber, with the following unreinforced properties:

a. Durometer Hardness, Shore A	
(ASTM D2240 or ISO 7619-1)	
Before Aging	[40 to 60] [_____]
After Aging	Not to exceed the original property by more than 8

b. Minimum Tensile strength	
(ASTM D412 or ISO 37)	
Before Aging	[10] [_____] MPa [1450] [_____] psi
After Aging	Not less than 80 percent of original property

c. Minimum Elongation (ultimate)	
(ASTM D412 or ISO 37)	
Before Aging	[400 percent] [_____]
After Aging	Not less than 80 percent of original property

2.1.5.2 Color

Fender skin color must be black throughout the entire thickness. Galvanized hardware must be unpainted.

2.1.5.3 Repairability

The fender casing must be repairable in the event of tears or punctures in the elastomer skin. The repaired area must have not less than 90 percent of the properties as specified in paragraph ELASTOMER. Required repair materials must be readily available. Each fender must include a detailed repair procedure from the manufacturer that outlines a step by step process for mending tears, punctures or severe abrasions to fender casings.

2.1.6 Test Reports

Perform tests on the specified fender within 5 years of submittal of the reports for approval. Test reports must be accompanied by notarized certificates from the manufacturer certifying that the tested material is of the same type, size, quality, manufacture and make as that proposed to be supplied. Perform the following tests:

2.1.6.1 Performance Requirements

The performance of each fender must be meet the requirements of ISO 17357-1. Confirm the performance of the fender with a prototype fender performance confirmation per ISO 17357-1. The tests must include a parallel performance, angular compression, durability, compression-recovery, and puncture-resistance test.

2.1.6.1.1 Design Proof

Design proof must document minimum endurable pressure based on at least 30 test samples that cover entire range of compression from 0 percent to 60 percent plus or minus 5 percent deflection.

2.1.6.1.2 Pneumatic Fenders Performance Characteristics

****

NOTE: Refer to ISO 17357-1 for guaranteed energy absorption and reaction force values for nominal size of fender under consideration.

****

Provide the performance characteristics of each pneumatic fender ensuring they meet the following:

SIZE	GUARANTEED ENERGY ABSORPTION (GEA)	REACTION FORCE (R)
	at 60 +/- 5 percent deflection	at GEA deflection (+/- 10 percent)
[_____]mm x [_____]mm [_____]ft x [_____]ft	[_____] kN-m [_____] ft-kips	[_____] kN [_____] kips

2.1.6.1.3 Hydro-pneumatic Fenders Performance Characteristics

****

NOTE: The performance of the hydro-pneumatic fenders vary according to the size, water/air ratio and internal pressure. The Manufacturer should be consulted in the selection of the desired performance characteristics.

****

****

NOTE: Refer to ISO 17357-1 for guaranteed energy absorption and reaction force values for nominal size of fender under consideration.

****

Provide the performance characteristics of each hydro-pneumatic fender ensuring they meet the following:

SIZE	GUARANTEED ENERGY ABSORPTION (GEA)	REACTION FORCE (R)
	at 60 +/- 5 percent deflection	at GEA deflection (+/- 10 percent)
[_____]mm x [_____]mm [_____]ft x [_____]ft	[_____] kN-m [_____] ft-kips	[_____] kN [_____] kips

2.1.6.2 Dimensional Inspection

Perform and submit the dimensional inspection results proving the dimensions of all fenders meet the requirements of ISO 17357-1.

****

NOTE: The dimensional tolerances per ISO 17357-1 are as follows:
- length: plus 10 percent, minus 5 percent
- diameter: plus 10 percent, minus 5 percent

The diameter shall be obtained from the average of at least two different measurements taken at the middle of the cylindrical section of the fender.

The diameters of bead ring or other steel material around the flange opening shall be inspected, and the results shall be less than 0.20 fender diameters.

****

2.1.6.3 Air-leakage Test

Perform and submit the results of the air leakage test per ISO 17357-1. The test must confirm that there is no air leakage when the initial pressure is held for more than 30 minutes.

2.1.6.4 Hydrostatic-pressure Test

Perform and submit the Hydrostatic-pressure test results per ISO 17357-1. Perform the test for 10 minutes at the hydrostatic pressure shown as "Testing pressure at 0 percent deflection" in Tables 4 and 5 in ISO 17357-1. There must be no leakage of water and no defects during the test.

****

NOTE: The frequency of the test shall be one per 20 fenders of each size and pressure. If the customer so requests, one per order of each size and pressure if the quantity is less than 20.

Circumferential and longitudinal lengths shall be measured at 10 kPa pressure and at the test pressure shown in Table 4 or Table 5 in ISO 17357-1. The temporary elongation shall be as follows:

a) maximum circumferential temporary elongation:10

percent;
b) maximum longitudinal temporary elongation:10 percent.

The increase in diameter and length shall be obtained by measuring the distance of two points marked circumferentially and longitudinally, at 10 kPa 1.45 psi pressure, on the middle of the fender's body.

The distance between the two points shall be larger than one-fifth of the fender's diameter.

****

2.1.6.5 Pressure Relief Valve Test

Mount the pressure relief valve to a test chamber for a pressure relief test. After mounting, the chamber internal pressure must be slowly increased until the specified relief pressure is attained. Set the pressure relief valve to relieve pressure according to the manufacturers recommendations. If the pressure relief valve opens at a higher or lower pressure than allowed, it must be adjusted as required and tested again until within the specified limits. Maintain a written test procedure and records pertaining to this test.

2.1.7 Connecting Hardware

Galvanize the connecting chain, swivel, and shackles in accordance with ASTM A123/A123M or ASTM A153/A153M, as appropriate. The hardware must be as follows:

Item	Type
Chain	ABS 2, Grade 2, Stud Link or Open Link
Shackle	FS RR-C-271, Type IVA, Class 3, Grade A
Swivel	FS RR-C-271, Type VII, Class 2

All connecting bolts and pins must be of mild steel, matching the properties of the shackle bow. For Class 3 shackles, secure the bolt or pins in place with stainless steel (Type 316) cotter pins or locking pins.

2.1.7.1 Hydro-pneumatic Guy Chain

Provide guy chains for attachment from the upper fender end fitting assembly to the pier. Cover the portion of the chain extending from the fender itself with protective rubber sleeves to a point beyond which the fender will be contacted for fender body protection.

2.1.7.2 Hydro-pneumatic Hanging Chain

Provide hanging chains for attachment from the counterweight to the pier.

2.1.7.3 Hydro-pneumatic Lower End Fitting Assembly

Fabricate the lower end fitting from steel and provide connecting points for the connecting chain and the hanging chain.

2.1.7.4 Hydro-pneumatic Upper End Fitting Assembly

Fabricate the upper end fitting from steel and design to house all necessary valves and fitting necessary to charge and discharge the fender body with air and water necessary for proper installation and operation of the deployed fender. Include the air charging assembly, the water charging assembly, the pressure safety relief valve assembly and lifting eyes adequately sized for guy chain attachment. Attach all valves and related hardware to the inner assembly plate. Include an outer assembly blind flange plate to provide protection during handling and operations. The pressure relief valve must be bronze, adjustable to ensure maintenance of the proper setting, and capable of adequate flow (volume of air released per second) to maintain a safe internal pressure. Make certain a changeable rubber gasket is installed between the top flange and plate to prohibit moisture from collecting inside the upper end fitting assembly that could possibly corrode valve handles and cause debris that could foul the pressure relief valve assembly.

2.1.7.5 Hydro-pneumatic Counterweight

Provide a steel counterweight for attachment to the fender's lower flange assembly by two shackles. Include an upper eye for shackle attachment of the hanging chain and coat with a marine coating system. The counterweight must be sized in accordance with the Manufacturer's recommendation.

PART 3 EXECUTION

3.1 PNEUMATIC AND HYDRO-PNEUMATIC FENDERS

Install the fendering system in accordance with the manufacturer's specifications and shop drawings. Tighten bolts an additional 1/3 turn of the nut, from the snug tight condition, and secured with cotter pins or screw lock.

3.2 WELDING

Perform welding in accordance with AWS D1.1/D1.1M.

3.3 CONNECTIONS

3.3.1 Antiseize Compound

Coat threads of bolts prior to applying washers and nuts. Recoat bolt thread projection beyond nut after tightening.

SECTION 35 73 13

EMBANKMENT FOR EARTH AND ROCKFILL DAMS

11/18

****

NOTES: This guide specification covers the requirements for preparing the embankment and blanket foundations and placing and compacting all permanent fills and backfills for earth and rock fill dams. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

This guide specification has removed paragraphs for related construction activities that have their own UFGS Guide Specifications. These include Section 31 00 00 EARTHWORK, Section 31 66 10 ROCK FOUNDATION PREPARATION and Section 31 11 00 CLEARING AND GRUBBING among others. Those Guide Specifications should be included and referenced as is appropriate..

REMOVE INFORMATION AND REQUIREMENTS NOT REQUIRED IN RESPECTIVE PROJECT, WHETHER OR NOT BRACKETS ARE PRESENT.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: This guide specification provides for furnishing all plant, labor, and equipment, and performing all operations in connection with the

placement of embankment materials for earthen or rockfill dams.

The requirements for rock as prescribed herein are intended to be used on embankments involving rock fill sections. Where rock for slope protection is specified, Section 35 31 19.40 STONE REVETMENTS should be used.

****

This specification provides for furnishing all materials, labor, and equipment, and performing all operations in connection with the placement of embankment materials for construction of the [earthen][rockfill] dam.

1.1 UNIT PRICES

****

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00 as appropriate.

****

1.1.1 Compacted Fill, [Impervious][Pervious][Random]

****

NOTE: Include separate paragraphs for each type of compacted fill material that will be required for the construction of the dam, and select the appropriate bracketed description for each.

****

1.1.1.1 Payment

Payment will be made for costs associated with placement of compacted [impervious] [pervious] [random] fill embankment; spreading, harrowing, moisture control, compacting, removing objectionable materials; and all other incidental work required for the construction, protection, and maintenance of the dam embankment. [This payment is separate to any payment for excavating and transporting of material as specified in Section 31 00 00 EARTHWORK.] Payment for preparation of foundations to receive compacted [impervious] [pervious] [random] fill will be made in accordance with Section 31 66 10 ROCK FOUNDATION PREPARATION.

1.1.1.2 Measurement of Fill Material

Compacted [impervious][pervious][random] fill will be measured for payment in place based upon the established limit lines and the payment lines shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation [including the cut-off trench] and[accomplishment of foundation preparation (except scarifying)] and the lines, grades and slopes of the accepted embankment.

1.1.1.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.2 Backfill, [Impervious][Pervious][Random]

****

NOTE: Include separate paragraphs for each type of backfill material that will be required for the construction of the dam, and select the appropriate bracketed description for each.

****

1.1.2.1 Payment

Payment will be made for costs associated with preparation of contacting surfaces, including the spreading, compacting, moisture control, and all other operations incidental to the placement of [impervious] [pervious] [random] backfill. [This payment is in addition to any payment for excavating and transporting of the material as specified in Section 31 00 00 EARTHWORK.] Payment for preparation of rock foundations to receive [impervious] [pervious] [random] backfill will be done in accordance with Section 31 66 10 ROCK FOUNDATION PREPARATION.

1.1.2.2 Measurement

Backfill, [impervious][pervious][random], will be measured for payment in place based upon the established limit lines and the payment lines indicated on the cross sections shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation [and accomplishment of foundation preparation (except scarifying)]and the lines, grades and slopes of the accepted embankment.

1.1.2.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.3 Filter [Sand][Gravel][Rock]

****

NOTE: If several classes of material are to be used to include transition zones or a multi-stage filter, a separate pay item should be included for each class.

****

1.1.3.1 Payment

Payment will be made for costs associated with obtaining filter [sand] [gravel] [rock], [transportation to the site (whether from required excavation, borrow, or commercial source),] mixing the materials to the required gradation, spreading, moisture control, compacting, removing objectionable materials, and all other incidental work required for the construction, protection, and maintenance of the filter. This payment is in addition to any payment for excavation (from required excavation or borrow) of the material as specified in Section 31 00 00 EARTHWORK.

1.1.3.2 Measurement

Filter [sand][gravel][rock] will be measured for payment in place based upon the established limit lines and the payment lines indicated on the cross sections shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation and [accomplishment of foundation preparation (except scarifying)] and the lines, grades and slopes of the accepted embankment.

1.1.3.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.4 Rock Fill

****

NOTE: If several classes of rock fill material are used, a separate pay item should be included for each class of material.

****

1.1.4.1 Payment

Payment will be made for costs associated with rock fill, including all operations with excavation, quarrying, stockpiling, hauling, placing, moisture conditioning, removing objectionable material, and all other operations incidental to the placement of the rock fill.

1.1.4.2 Measurement

Rock fill will be measured for payment in place based upon the established limit lines and the payment lines indicated on the cross sections shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation [and accomplishment of foundation preparation (except scarifying)]and the lines, grades and slopes of the accepted embankment.

1.1.4.3 Unit of Measure

Unit of measure: cubic meter yard.

[1.1.5 Additional Rolling for Compaction

****

NOTE: If an end result (production) specification is used for compaction in section COMPACTION, delete this item.

****

1.1.5.1 Payment

Payment will be made for costs associated with additional rolling for compaction.

1.1.5.2 Measurement

****

NOTE: Delete the bracketed reference to Section 35 73 13 if this paragraph is not moved to Section 01 20 00.

****

Additional rolling for compaction will be measured for payment on the basis of the number of roller hours the compaction equipment is operated in accomplishing the compaction specified in [Section 35 73 13 EMBANKMENT FOR EARTH DAMS,]paragraph COMPACTION.

1.1.5.3 Unit of Measure

Unit of measure: hour.

]1.1.6 Instrumentation [Piezometer][Settlement Gage][Survey Marker]

****

NOTE: The installation of instrumentation is not strictly speaking an activity of construction of an embankment dam. This activity should be placed within its own specification division as an item of SPECIAL CONSTRUCTION. There is presently no UFGS guide specification for this item. The specification writer should consider the use of a section for SPECIAL CONSTRUCTION, and if so, delete the following paragraphs.

Include paragraphs for all types of instruments as may be utilized.

****

1.1.6.1 Payment

Payment will be made for costs associated with furnishing, installing, [monitoring] and maintaining the [piezometers] [settlement gages] [survey markers] during construction as specified[in Section 35 73 13 EMBANKMENT FOR EARTH DAMS] during construction, including measurements required to be made by the Contractor.

1.1.6.2 Measurement

[Piezometers] [Settlement gages] [Survey markers] to be installed will be measured for payment on the basis of the number specified[in Section 35 73 13 EMBANKMENT FOR EARTH DAMS].

1.1.6.3 Unit of Measure

Unit of measure: each.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM D6938	(2017a) Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)

1.3 DEFINITIONS

****

NOTE: Add applicable definitions as appropriate for the project.

****

1.3.1 Embankment

Embankment, as used in these specifications, is defined as the earth [and rock]fill portions of the dam structure and includes all types of earth [and rock]fill and filter materials for the dam [and cut-off trench,]and all other specified or directed earth and rock fills within the limits of the dam[, excepting those stone and filter materials used for slope protection in accordance with Section 35 31 19.40 STONE REVETMENTS].

1.3.2 Compacted Fill

Compacted fill includes all fill, except backfill and rock fill, deposited in layers and compacted by rolling or tamping. The types of compacted earth fill are:

a. Impervious fill for the [cut-off trench][, horizontal and inclined impervious blankets,][and]impervious section of the embankment;

b. Random fill where indicated on the plans;

c. Pervious fill forming the upstream and downstream sections of the embankment or where indicated on the plans, and

d. Filter drainage layers forming the horizontal [and/or vertical or inclined] pervious drainage blankets.

1.3.3 Uncompacted Fill

All fill, deposited in layers but not compacted except by the controlled movement of hauling and spreading equipment.

1.3.4 Backfill

Backfill, as used in these specifications, is defined as that excavation refill which cannot be placed around or adjacent to a structure until the structure is completed and reached a specified concrete strength, requires special compaction efforts, and is defined by limits indicated on the plans and specifications.

1.3.5 Filter Materials

Filter materials are defined as material used as drainage or transition zones between various types of fill and backfill (impervious, pervious, random, and rock fill).

1.3.6 Rock Fill

Those portions of the embankment where rock is used as embankment fill.

1.3.7 Unsatisfactory Materials

****

NOTE: Unsatisfactory material will be defined in accordance with ASTM D2487. This paragraph should be edited as appropriate to delete inapplicable materials.

****

[Materials which do not comply with the requirements for satisfactory materials are unsatisfactory.] [Materials unsatisfactory for use as fill and backfill are those earth and earth mixtures that classify by ASTM D2487 as [CH], [MH], OL, OH, and PT. In addition all topsoil, organics, roots and other organic matter, biodegradable materials, debris, trash, rubble and contaminated soil is unsatisfactory for use as embankment, backfill or engineered fills. Unsatisfactory materials or processes are not in compliance with these specifications.] Notify the Contracting Officer when encountering any contaminated materials.

1.3.8 Unsatisfactory vs Satisfactory

The use of the terms satisfactory and unsatisfactory in this section is in reference to the Contract requirements. Satisfactory materials or processes are in full compliance with these specifications and unsatisfactory materials or processes are not in compliance with these specifications.

1.4 SYSTEM DESCRIPTION

1.4.1 Haul Roads

****

NOTES: Where roads are to be used by other

Contractors, the limits of responsibility should be stated in the specifications.

With reference to the coverage in this paragraph, it has been found advantageous to establish a project traffic pattern for jobs of considerable scope and to indicate on the plans acceptable haul road locations and to specify maximum grades and minimum road widths which are considered suitable. Where project operations are varied and the use of haul roads by other Contractors is required, the specifications should so indicate. Detailed requirements for haul roads should be based upon the anticipated length of time the roads will be in use, traffic load and probable types of hauling equipment applicable to the specific project. This paragraph should be modified as necessary to clarify the requirements of the particular project.

****

Haul roads must be [located as indicated and][located and] constructed as approved. Design haul roads to maintain the intended traffic, to be free draining and maintain good condition throughout the contract period, unless otherwise directed. Remove haul roads within the area of contact between the embankment and its foundation and abutments and treat the area as specified in paragraph PREPARATION OF FOUNDATION, PARTIAL FILL SURFACE, AND ABUTMENTS.

Submit a Plan of Operations for approval thirty days prior to commencement of haul road construction or placing embankment and backfill, whichever is earlier, for accomplishing all embankment and backfill construction and for the location and construction of haul roads.

1.4.2 Stockpiling from [Approved Borrow Sources][Required Excavations]

When the excavation from [approved borrow sources][or required excavations] progresses at a faster rate than placement in the fill is being accomplished, stockpile excavated material at approved locations adjacent to the work until its use is authorized. No payment will be made for such stockpiling nor for the reloading and hauling of this material to its final position in the embankment.

1.5 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets

following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Plan of Operations; G, DO

30 days prior to commencement of haul road construction or placing embankment and backfill, whichever is earlier, submit for approval a Plan of Operations for accomplishing all embankment and backfill construction and for the location and construction of haul roads. This plan must include, but not be limited to, the proposed sequence of construction for embankment and backfill items, and methods and types of equipment to be utilized for all embankment and backfill operations, including transporting, placing, and compaction. Also include the names and addresses of the commercial testing labs which will perform the soil testing and inspection and describe how all required soils testing will be performed in this plan.

Embankment and Backfill Materials; G, DO

At least 30 days prior to delivery of any Contractor-furnished material to the site of the work, submit soil classification test results, moisture-density curves, gradation curves, and laboratory results of the required tests of the proposed material.

SD-06 Test Reports

Foundation Inspection; G, DO

Provide a foundation inspection report, certified by a registered Professional Geotechnical Engineer or Geologist, documenting the inspection. The report must include, at a minimum, a description of each geologic stratum encountered along the slopes and excavation bottom, laboratory testing results if any tests were performed, and other pertinent information. The report's main body must be a color copy submitted to the Government within four calendar days of completion of the inspection by the Contractor's geologist. Include figures, tables and photographs as necessary.

Measurement of Fill Material; G, RO

Submit a copy of the records of each compliance survey the next work day following the survey.

Testing; G, RO

Within 24 hours of conclusion of physical tests, three copies of test results, including calibration curves and results of calibration tests.

SD-07 Certificates

Testing; G, RO

Qualifications of the [USACE validated] [validate] commercial testing laboratory or the Contractor's validated testing facilities.

Nuclear Density; G, RO

Use nuclear density testing equipment in accordance with ASTM D6938. In addition, the following conditions are applicable:

a. Prior to using the nuclear density testing equipment on the site, submit to the Contracting Officer a certification that the operator has completed a training course approved by the nuclear density testing equipment manufacturer, the most recent data sheet from the manufacturer's calibration, and a copy of the most recent statistical check of the standard count precision.

b. Provide nuclear density testing equipment capable of extending a probe a minimum of 12 inches down into a hole.

c. Field density reports must include the laboratory density reports applicable to the field data presented.

PART 2 PRODUCTS

2.1 MATERIALS

****

NOTE: This paragraph may be modified to specify soils for various types of fill in accordance with the Unified Soil Classification System. When this is done, the optional sentence should be selected.

****

[Classification of soils will be in accordance with ASTM D2487.]

2.1.1 General

The origin of any fill material in no way determines where it may be used in the embankment. Obtain materials for embankment fills from required excavations, from the borrow areas indicated, or from off-site commercial sources as required. The intention is to use the most suitable materials obtainable from these sources. Material to be wasted will be specifically designated at the time the material is excavated. Materials containing brush, roots, sod, organics or other perishable materials will not be considered suitable. The suitability of the materials are subject to approval and their disposition in the embankment will be as directed. Excavate in the borrow areas in the location determined by the Contracting Officer, whenever such control is necessary to obtain the type of material required for the embankment. Use borrow pits in accordance with Section 31 00 00 EARTHWORK paragraph SELECTION OF BORROW MATERIAL and paragraph OPENING AND DRAINAGE OF EXCAVATION AND BORROW PITS. Mixing of materials during the excavating process at the borrow area may be required.

****

NOTE: The designer may choose to limit the definition of impervious with restriction on liquid limit, plasticity index, or fines content. If so, those restrictions should be added to paragraph 2.1.2.

****

2.1.2 Impervious Fill

Provide material for compacted impervious fill consisting of [GC SC ML CL MH CH clays, silty clays, or clayey silts] classified as cohesive materials in accordance with ASTM D4318, ASTM C136/C136M and ASTM D1140 obtained from the designated borrow areas [or required excavation] [or off-site commercial sources].

2.1.3 Random Fill

Provide material for compacted random fill consisting of any or all types of satisfactory material which are suitable for use in the dam embankment.

2.1.4 Pervious Fill

Material for compacted pervious fill must be clean, free draining sand or sand and gravel obtained from natural deposits [within borrow areas and from designated excavations][or][from sources designated]. Provide particles of material that are free from any objectionable coating and not more than [_____] percent of the material, by weight, and passing a 0.075 mm No. 200 sieve.

2.1.5 Uncompacted Fill

Except as otherwise [indicated or]required, material for uncompacted fill may consist of any or all types of material available from required excavations and designated borrow areas with the exception of material that is considered unsatisfactory as defined in Unsatisfactory Materials.

2.1.6 Backfill

Provide backfill consisting of material of a type and quality conforming to that specified for the contiguous embankment fill material, unless otherwise directed.

2.1.7 Filter Drainage Layers

Filter materials must meet the quality requirements of ASTM C33/C33M concrete aggregate except as stated herein. Filter materials must consist of sand, gravel, or crushed stone composed of tough, durable, angular particles; must be free from thin, flat and elongated pieces, and must contain no organic matter or soft, friable particles. The material must be washed with clean water such that the final product has no visible soil, soil slurry, or objectionable coatings.

Gradation of the material must be determined in accordance with ASTM D2487, ASTM D422, ASTM D1140, and ASTM D4318. All points on individual grading curves obtained from representative samples of filter material must lie between the boundary limits as defined by smooth curves drawn through the tabulated grading limits plotted on a mechanical analysis diagram. The individual grading curves within these limits must not exhibit abrupt changes in slope denoting skip grading, scalping of certain sizes or other irregularities which would be detrimental to the proper functioning of the filter; and will be well-graded between the limits specified below:.

SIEVE SIZE	PERCENT BY WEIGHT PASSING
[_____]	[_____]
[_____]	[_____]
[_____]	[_____]

2.1.8 Rock Fill

2.1.8.1 Rock

Stone classed as "rock" must be sound; well graded and free draining.[The presence of rock meeting the requirements of slope protection, Section 35 31 19.40 STONE REVETMENTS, will not be objectionable.] Obtain rock from required excavation[and from already existing stockpiles][and from designated quarries]. Shales, mudstone and other rock and excavated material unsuitable for use as rock fill, will be wasted in designated spoil areas.

PART 3 EXECUTION

3.1 CONSTRUCTION

3.1.1 Lines and Grades

****

NOTE: If settlement of the foundation is expected during construction, install settlement gages as detailed in 3.9.2 and 1.1.11.

****

Construct the embankment to the lines, grades and cross sections indicated, unless otherwise directed. The Government reserves the right to increase or decrease the foundation widths or the embankment slopes or make such other changes in the embankment sections as may be deemed necessary to produce a safe structure. Increases in height of section, made to compensate for shrinkage or consolidation of the embankment material or foundation during construction of the embankment, will not exceed five percent of the height above the foundation indicated without the approval of the Contracting Officer. The end slopes and side slopes of partial fill sections must not be steeper than[one vertical on [_____] horizontal][those shown].

3.1.2 Conduct on the Work

Maintain and protect the embankment in a satisfactory condition at all times until final completion and acceptance of all work under the contract. At all times protect pervious fills, filters, and drainage layers from erosion, runoff, and contamination from different soils or other materials. These materials must be uncontaminated for minimum dimensions shown on the plans. Minimize equipment travel on these zones to prevent segregation, contamination, and breakdown of materials.

If in the opinion of the Contracting Officer the hauling equipment causes horizontal shears or slickensides, rutting, quaking, heaving, cracking or excessive deformation of the embankment, limit the type, load or travel speed of the hauling equipment on the embankment. Replace any embankment material rendered unsuitable after being placed in the embankment and before final acceptance of the work in a satisfactory manner and no additional payment will be made therefor. Excavate and remove from the embankment any material which the Contracting Officer considers objectionable, dispose of such material, and refill the excavated area as directed, all at no cost to the Government. Do not place unsatisfactory materials in the embankment. The Contractor may be required to remove, without additional payment, any embankment material placed outside of prescribed slope lines.

3.2 PREPARATION OF FOUNDATION, PARTIAL FILL SURFACES AND ABUTMENTS

****

NOTE: General preparation of the foundation for dam construction should be addressed in Section 31 66 10 ROCK FOUNDATION PREPARATION. The following paragraphs may be deleted or modified as appropriate to provide explicit direction to preparation of surfaces for placement of embankment fill.

****

3.2.1 Earth

After excavation or stripping of the embankment foundation[and excavation of the cut-off trench] to the extent indicated or otherwise required, break down the sides of stump holes, test pits, and other similar cavities or depressions where so directed to flatten out the slopes, and scarify the sides of the cut or hole to provide bond between the foundation material and the fill.[Scarify the slopes and bottom of the cut-off trench as directed.] Unless otherwise directed, fill each depression with either pervious, random, or impervious[, or rockfill] material dependent upon the type of material which is to be placed immediately above the foundation. Place the fill in layers; moisten and compact in accordance with the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION. Spread materials which cannot be compacted by roller equipment because of inadequate clearances in [_____]-mm-inch layers and compact with power tampers to an extent equal to that of the contiguous embankment fill material. After filling of depressions[and cut-off trench] and immediately prior to placement of compacted fill in any section of the embankment, loosen the foundation of such section thoroughly by scarifying, plowing, discing or harrowing to a minimum depth of [_____] mm [_____] inches, and adjust the moisture content to the amount specified in paragraph MOISTURE CONTROL for the appropriate type of material, except in areas where this requirement is waived by the Contracting Officer. After removal of roots or other debris turned up in the process of loosening, compact the entire surface of the embankment foundation area [by [_____] complete coverages of the compaction equipment as specified for the appropriate type of fill in accordance with paragraph COMPACTION.] [compacted to a density of [_____] percent in accordance with paragraph COMPACTION.][Proof roll foundation areas in accordance with Section 31 00 00 EARTHWORK paragraph PROOF ROLLING.]

Prior to placement of compacted fill on or against the surfaces of any partial fill section, remove all soft or loose material, all material containing cracks or gullies, and all material that does not conform with the specified zoning of the embankment. Loosen the remaining surface of the partial fill by scarifying, plowing, discing or harrowing to a minimum depth of 150 mm 6 inches, and adjust the moisture content as specified in paragraph MOISTURE CONTROL for the appropriate type of material. Compact the surface of the partial fill section upon which fill is to be placed as specified in paragraph COMPACTION for the appropriate type of fill. No separate payment will be made for loosening and rolling the foundation area, the abutment area, or the surfaces of partial fill sections, but include the entire cost in the applicable contract price for fill.

3.2.2 Rock

Claen all rock surfaces upon which or against which embankment materials are to be placed in accordance with the applicable provisions of Section 31 00 00 EARTHWORK and Section 31 66 10 ROCK FOUNDATION PREPARATION.[Prior to the placement of embankment material upon or against a rock surface, fill all open joints and cracks in that surface with mortar to the depths cleaned. Fill those portions of such rock surfaces where, in the opinion of the Contracting Officer, the compaction of the embankment materials cannot be accomplished satisfactorily with power tampers or other specified compaction equipment with mortar or concrete as directed to the extent necessary to permit satisfactory use of the compaction equipment. Do no leave a thin coat of mortar on smooth, intact rock surfaces. Remove large rock overhangs and protrusions by pre-splitting or line drilling techniques in such a manner as to minimize damage to the underlying rock, or the spaces beneath overhangs and fill around protrusions with consolidated concrete so that satisfactory compaction of embankment materials can be accomplished. Provide vertical surfaces that are no more than [_____] meters [_____] feet in height, and provide benches of sufficient width as necessary so that the average slope of any rock face is not steeper than [_____] vertical on [_____] horizontal. Provide mortar and concrete, including forming as necessary, conforming with the applicable provisions of Section [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE][03 30 00 CAST-IN-PLACE CONCRETE][_____].]

[3.2.3 Foundation Inspection and Mapping Procedures

Foundation means any area of the excavation to receive concrete, backfill, or embankment, including the entire excavation bottom and side slopes.

Inspections to determine the adequacy of the foundations will be performed by the Contracting Officer in all foundation areas between completion of the surface preparation and placement of Embankment Fill, Filter Material, Mud Mat, or concrete. The Contractor will cooperate to the extent necessary to assist in the inspection. This will include having equipment and personnel available to assist excavating, compacting, proof rolling, cleaning, etc. The Contractor must coordinate his schedule for foundation preparation and final cleanup with the Contracting Officer to ensure that the cleanup and inspection proceed in an orderly manner.

][3.2.4 Foundation Condition Evaluation

[Government will perform foundation condition inspection of the completed foundation after final cleanup, dental treatment (if required) and mapping/documentation are complete. Notify the Contracting Officer at least seven days before foundation cleanup will be completed and ready for inspection by the Government. Maintain the foundation in a cleaned condition for a period of at least [_____] [days] [hours] for Government foundation inspection. The [____] [days][hours] for Government evaluation starts after the Contracting Officer receives notification from the Contractor that the foundation is completed and ready for mapping and inspection. Government will evaluate excavation surfaces to receive backfill or structures. As used in this Section, evaluation means inspection, testing, mapping, exploratory test pits, interpretation, and decision making. Government will perform inspection of excavated foundation subgrade and cut slopes at each site to obtain a geologic record.

][Proof roll the earth foundation by a fully loaded dump truck or approved roller to detect and eliminate soft spots in the foundation.

][During inspection, following cleanup for geologic mapping, if the Contracting Officer determines that additional excavation is required to improve foundation conditions, perform additional excavation as directed. Clean the areas of additional excavation. The Government will map and inspect the surfaces of additional excavation.

]][3.2.5 Excavation and Foundation Mapping

Foundation mapping will be performed by Government personnel throughout excavation, foundation cleanup, and foundation acceptance inspection. Permit and facilitate safe access to the excavation by Government personnel for geologic mapping, sampling, inspection, and testing of surfaces exposed during construction.

a. Keep traffic and equipment away from test areas during testing to ensure personnel safety and to prevent ground vibrations;

b. Keep traffic and equipment away from personnel performing mapping to ensure personnel safety;

c. Provide support, such as excavating equipment, to permit proper inspection.

Foundation mapping will require excavated surfaces to be closely inspected and documented. The Government will require surfaces to be cleaned by the Contractor to facilitate mapping. Cleaning will require cutting of fresh surface on the excavation bottom and on excavated slopes, and excavation of test pits on excavated slopes and excavation bottom. The Contractor must provide Government personnel access to the excavation bottom for a period of [_____] [days] [hours] after final cleanup and foundation preparation, and before dental treatment. During excavation and foundation mapping, remove any temporary ramps covering side slopes such that the excavation side slopes can be documented and mapped by the Government. The Contractor must provide equipment to perform test pits as deemed necessary by the Government geologist and engineers performing the excavation mapping.

][3.2.6 Equipment for Foundation Excavation and Mapping

The Contractor must have on site and make available to Government personnel performing mapping and inspection the following equipment with equipment operators to aid in performing excavations for test pits, sampling, inspection and cutting fresh surfaces for inspection and mapping:

a. Excavating equipment - Backhoe with smooth edge bucket and bulldozer.

b. Proof roller - Fully loaded dump truck.

c. Hand tools - Shovels, bars, picks, wedges, and brooms.

d. Water jet - A water jet consists of a high flow nozzle with a supply hose connected to a suitable source of water. Provide a system capable of delivering up to 24 gpm. The flow rate must be controllable at the nozzle.

]3.3 PLACEMENT

3.3.1 General

Do not place fill on any part of the embankment foundation until such areas have been inspected and approved by the Contracting Officer in writing. The gradation and distribution of materials throughout the compacted earth fill section of the dam must be such that the embankment will be free from lenses, pockets, streaks, and layers of material differing substantially in texture or gradation from surrounding material of the same classification. Dump successive loads of material at locations on the fill as directed or approved. Do not place fill upon a frozen surface, nor incorporate snow, ice, or frozen earth in the embankment. Fill will not be placed on or against any dry surface, but against a surface that is moist or damp.

3.3.2 Frozen Material

Do not place embankment on frozen material, or on material which has been subjected to freeze-thaw action. This prohibition encompasses natural ground, all prepared subgrades, whether in an excavation or on an embankment, and all layers of previously placed and compacted earth fill upon which successive layers of embankment fill will be placed. Remove all material that freezes or has been subjected to freeze-thaw action during the construction work, or during periods of temporary shutdowns, such as, but not limited to, nights, holidays, weekends, or winter shutdowns or earthwork operations, to a depth that is acceptable to the Contracting Officer and replace with new material. Alternatively, the material must be thawed, dried, reworked, and recompacted to the specified criteria before additional material is placed. The Contracting Officer will determine when placement of fill must cease due to cold weather. Embankment material containing frozen clumps of soil, snow, or ice is not acceptable.

3.3.3 Rate of Placement

****

NOTE: If construction of the embankment involves a closure section, the following considerations should be taken into account and specified by the designer,

if required.

Placement of rock fill in the closure section may be delayed until completion of the compacted fill to elevation [_____] meters feet m.s.l. The rate of placement of materials in the embankment closure section will be such that this section will be completed to elevation [_____] meters feet m.s.l. within a period of [_____] calendar days from the authorized date of diversion, but in no event will the rate of placement in this section be faster than required to construct the embankment to elevation [_____] meters feet m.s.l. within [_____] days from the beginning of fill operations. Subsequent to completion of the embankment closure section to elevation [_____] meters feet m.s.l. and prior to the beginning of topping operations a period of [_____] calendar days will elapse, unless this provision is waived in writing by the Contracting Officer at the time of construction.

Rate of placement of clay fill materials should be governed by the potential for development of high pore pressures in the fill that could lead to instability of the embankment slopes. Appropriate paragraphs should be included to identify elevations where placement may need to cease until pore pressures have dissipated sufficiently to prevent slides or failure of the embankment.

****

Unless otherwise directed, maintain the embankment at approximately the same level regardless of the number of types of materials being placed,[except place rock fills and the adjoining filter blankets with sufficient lag to prevent mixture of embankment and filter blanket and/or rock materials].

3.3.4 Impervious Fill

Place impervious fill in the impervious section of the embankment as shown on the plans[, cut-off trench,][and impervious blanket].

3.3.5 Random Fill

Place random fill in the random sections of the embankment as shown on the plans.

Except as specified below, limits of random sections shown indicate the maximum extent of random material. In general, place the finer grained random material toward the impervious section or blanket and place the coarser-grained random material toward the outer edge of the random section so that a transition in permeability is effected from the impervious section to the [pervious section][outer portions of the embankment].

3.3.6 Pervious Fill

Place pervious fill in the pervious sections of the embankment as shown on the plans.

3.3.7 Filter Drainage Layers

****

NOTE: Where there are vertical or inclined filters and horizontal filters, a different tolerance may be indicated for each.

****

Place [sand filters][, gravel filters,][and][sand and gravel filters] in the embankment in the manner described and to the lines and grades indicated. Tolerance of plus or minus [_____] mm inches will be allowed.

3.3.8 Rockfill

Construct the [upstream][,][and][downstream][and rock drain] sections of the embankment of quarry run sizes of durable rock dumped and bulldozed into place in not greater than [_____] mm foot lifts to the lines and grades shown, or as staked in the field, and in such manner as to produce a reasonably well graded mass with no objectionable pockets of small stones or clusters of larger stones. A tolerance of plus 300 mm 12 inches and minus 150 mm 6 inches from the slope lines and grades shown will be allowed in the finished surfaces of the rock fills, except that the extreme minus tolerance must not be continuous over an area greater than 20 square meters 200 square feet. Break all bridging in rock fills as well as all slabs and slabby rock. Stone having a length to thickness ratio greater than 3:1 are considered flat, elongated, or flat and elongated and will be rejected. Special care must be exercised in placing rock fill in all areas within 1 m 3 feet of structures to avoid damage to such structures.

3.3.9 Spreading

After dumping, spread the materials by bulldozers or other approved means in approximately horizontal layers over the entire fill areas. Unless otherwise directed, the thickness of these layers before compaction with tamping type rollers must not be more than [_____] mm inches for impervious materials, nor more than [_____] mm inches for other embankment materials, except backfill which must be spread in accordance with paragraph BACKFILL. Unless otherwise directed, the thickness of layers before compaction with rubber-tired rollers must not be more than [_____] mm inches for impervious materials, nor more than [_____] mm inches for other embankment materials except backfill. Spread pervious fill and filters in layers not more than [_____] mm inches in thickness. As soon as practicable after commencement of construction of any section of the embankment, raise or crown the [central portion thereof][area adjacent to the inclined or vertical filter drain] with grades not to exceed [_____] percent so that the surface of the fill will drain freely and maintain throughout construction. Filter material placement should lead the placement of adjacent material to avoid contamination of the filter material. If the compacted surface of any layer of material, exclusive of filter material[and rock fill], is determined to be too smooth to bond properly with the succeeding layers, loosen it by harrowing, or by any other approved method, before the succeeding layer is placed. At all times during the dumping and spreading processes, maintain a force of men adequate to remove all roots and debris from all embankment materials and all stones of greater than [_____] mm inches in maximum dimension from impervious materials and greater than [_____] mm inches in maximum dimension from pervious materials, except filters. Remove stone, roots, and debris from the embankment and dispose of in an approved manner.

Maintain the entire surface of any section of the embankment under construction in such condition that construction equipment can travel on any part of any one section. Remove ruts in the surface of any layer by scarifying before placing and compacting additional material.

3.4 MOISTURE CONTROL

Provide materials in each layer of the fill containing the amount of moisture, within the limits, specified below or as directed, necessary to obtain the specified compaction. Rework material that is not within the specified limits after compaction regardless of density.

3.4.1 Impervious Sections

****

NOTE: It is preferable to moisture condition the impervious fill material either at the excavation site, borrow site, or another area that is not on the embankment itself.

****

The moisture content after compaction must be uniform throughout any one layer of impervious materials placed. The moisture content after compaction as determined by ASTM D2216 must be within the limits of [_____] percentage points above optimum and [_____] percentage points below optimum moisture content.

Process material such that the moisture content is within [_____] percent of the specified range prior to placing the material on the embankment. This may require material processing either at the borrow/excavation site or other location near the embankment. Harrowing, or other approved methods may be required ensure a uniform distribution of moisture.

Accurately control the amount of water applied on a layer of fill such that free water does not appear on the surface during spreading and rolling. Should too much water be added to any part of the embankment, so that the material is too wet to obtain the specified compaction, the rolling on that section of the embankment will be delayed until the moisture content of the material is reduced to an amount within the specified limits. Material that is too wet may be worked by discing or harrowing, if necessary, until the moisture content is reduced to an amount within the specified limits. Wet material may also be blended with drier material to produce a product that meets the moisture requirements of this specification.

If, in the opinion of the Contracting Officer, the top or contact surfaces of the partial fill section become too dry to permit suitable bond with the succeeding lift, the Contractor will be required to moisture condition the materials on the fill. The Contractor will loosen the dried materials by scarifying or discing to such depths as may be directed by the COR, dampen the loosened material to an acceptable moisture content, and compact this layer in accordance with the applicable requirements of paragraph COMPACTION, subparagraph IMPERVIOUS FILL.

3.4.2 Random Sections

****

NOTE: The designer should determine if specified control of the moisture content of the random portions of the embankment is important. In many

cases, the density is the only consideration and the random sections may be specified to achieve a certain density regardless of moisture content.

****

The upper and lower limits of moisture content, and the moisture control procedures for random materials must be [the same as that specified for impervious material, or pervious material, dependent upon which of these types it most nearly resembles][such that the specified density can be achieved].

3.4.3 Pervious Section

Wet pervious material by sprinkling after spreading on the embankment and [maintain the moisture content of each layer at the optimum for compaction] [keep each layer in an approximately saturated condition] during rolling. Prewetting of pervious material at the sources of excavation or borrow will not be required. Sprinkle with hoses connected to header pipes along the faces of the embankment, by water trucks with pressure spray bars, or by any other approved method. All connections in the water supply system, including the hose connections to the header pipes, must be watertight. Do not direct jets at the embankment with such force that the finer materials will be washed out. Provide capacities of pumps and sizes of header pipes sufficient to supply the required amount of water at all times.

3.4.4 Filter Drainage Layers

Moisture control of graded gravel filter and bedding layers will not be required and sluicing will not be permitted. Moisture control of filters containing a predominate amount of sand particles will be as required to achieve the density specified in paragraph COMPACTION.

3.4.5 Rock Fill

[No moisture control will be necessary on rock fills.][The moisture content of the rock fill must be reasonably uniform throughout each layer of material placed prior to and during compaction. Add water in an amount equal to [15][_____] percent of the volume of the fill to the material on the embankment prior to compaction by uniform spraying from a water truck. The required water amount may be modified based on results of a test fill, as approved by the Contracting Officer.]

3.5 COMPACTION

3.5.1 Equipment

****

NOTES: In determining the use of a method specification versus an end-result (production) specification, the following should be considered:

a. The use of a method specification involving restrictions on material type, lift thickness, moisture content, and a specified number of passes with approved compaction equipment, a test fill should be required at the start of embankment work, to include foundation preparation. This will allow for the evaluation of the results achieved for particular efforts prior to the beginning of

production work.

b. If the designer chooses an end-result (production) specification which would specify material type, lift thickness, moisture content, and in-place density, the requirements of COMPACTION EQUIPMENT and ADDITIONAL ROLLING FOR COMPACTION may be either removed or tailored to fit the project requirements.

With reference to the use of compaction equipment in this paragraph, the following precautions should be noted:

a.The following paragraphs are provided as examples of the information that should be provided within the specifications to describe the selection of equipment to perform construction. Specifications should be written to ensure that the type of compaction equipment will be used which, in the judgment of the designer and Contracting Officer, is best suited to obtain the desired compaction of the material being utilized. Consideration must be given to soil type, lift thickness and placement location. A requirement should be included in the specifications for the performance evaluation of each type of compaction equipment conforming with the specifications and intended for use by the Contractor at an early stage of embankment construction. This equipment evaluation should be accomplished through analysis of test fill areas that are carefully constructed under representative working conditions with materials and moisture contents as specified. Test fill areas may either be separate or part of the permanent work, and for clarity to prospective bidders, payment under a separate item is recommended to equitably cover costs of required variations in equipment coverages, possible changes in equipment loading or foot sizes, as well as intensified field soils testing.

b. For tamping rollers that are either towed or self-propelled, with drums capable of being ballasted with fluid, the provision for a pressure relief valve and safety head should be included. Over-pressurization of fluid ballasted compaction drums to the level of a safety hazard has been rare, but has occurred on several occasions at locations of high elevation and temperature.

c. In compacting materials consisting of shales, sandstones, weathered rock and similar random materials, consideration should be given to specifying sheepfoot-type tamping equipment that has been modified by replacing the standard feet with "chisel" point tamper feet generally referred to as "shale breakers". The end areas of these modified tamper feet tend to break up weathered rock to prevent the bridling effect sometimes created by

large rock particles.

d. For compaction of sand and gravel fills or filter and drainage layers, equipment characteristics for both a large and small vibratory roller have been provided for optional selection by the designer, depending upon location, selected lift thickness, gradation, grain shape, and durability properties of the materials. The smaller roller should be specified for materials which exhibit degradation under compaction. Other options, based on construction experience may also be exercised. For example, it has been found that improved trafficability can often be achieved when compacting clean, fine grained, uniform sands by specifying a drum driven self-propelled vibratory roller.

****

Provide compaction equipment conforming to the following requirements and use as prescribed in subsequent paragraphs.

3.5.1.1 Tamping Rollers

3.5.1.1.1 Towed

****

NOTE: Towed rollers are generally obsolete and seldom used in modern construction. The specification writer should delete this section unless there is an expectation that towed roller will be used.

****

Provide tamping rollers consisting of two or more non-vibratory roller drums mounted side-by-side in a suitable frame and towed by either a crawler-type or rubber tired tractor having sufficient power to pull the roller satisfactorily when the drums are fully ballasted. Each drum must be free to pivot about an axis parallel to the direction of travel. Control rollers operating in tandem sets in a manner such that the prints produced by the tamping feet of the tandem units are staggered. Each drum of a roller must have an outside diameter of not less than [_____] m [_____] feet and must be not less than [_____] m [_____] feet in length. The space between two adjacent drums, when on a level surface, must not be less than [_____] m [_____] feet nor more than [_____] m [_____] feet. [Equip each drum ballasted with fluid with at least one pressure-relief valve and with at least one safety head. The safety head must be equal to union-type safety heads equipped with rupture discs suitable for rupturing pressures between 350 and 500 kPa50 and 75 psi. The pressure relief valve is a manually operated valve and must be opened periodically. Instruct personnel responsible for opening pressure-relief valves periodically to ascertain that valve openings are free from plugging to assure that any pressure developed in roller drums is released at each inspection.] Provide at least one tamping foot for each [_____] square mm[_____] square feet of drum surface. The length of each tamping foot from the outside surface of the drum must be not more than [_____] mm [_____] inches and must be maintained at not less than [_____] mm [_____] inches. The bearing surface of each tamping foot must be flat with a surface area not less than [_____] mm [_____] inches nor more than [_____] mm [_____] inches. During the operation of rolling, the spaces between the tamping feet must be maintained clear of materials which would impair the effectiveness of the tamping rollers. The weight of a roller when fully loaded must be not less than [_____] N/m[_____] pounds per foot of drum length, and the weight of a roller empty must be not more than [_____] N/m[_____] pounds per foot of drum length. The bearing surface, tamping foot size, the drum loading, and the operation of the rollers must be as required to obtain the desired compaction. If more than one roller is used on any one layer of fill, all rollers so used must be of the same type and essentially of the same dimensions. Draw rollers by crawler-type or rubber-tired tractors at a speed not to exceed [_____] km/h[_____] mph. Discontinue the use of rubber-tired towing equipment if the tires leave ruts that prevent uniform compaction by the tamping roller, and the substitution of crawler-type towing equipment may be directed.

3.5.1.1.2 Self-propelled

The use of self-propelled non-vibratory tamping rollers conforming with the following specification will be permitted, and their design and operation will be subject to approval, and subject to the right, at any time during the prosecution of the work, to direct such modifications to the tamping feet or variations in roller drum weight where applicable, as may be found necessary to secure optimum compaction of the earth fill materials. If use of self-propelled tamping rollers causes shearing of the fill, laminations in the fill, or results in inadequate compaction, the Contracting Officer may direct that such rollers be removed from the fill and that appropriate towed tamping rollers be used. Two-or three-drum side-by-side units that are either in drive position or drawn by separate power equipment must have a clearance between adjacent drums not less than [_____] mm[_____] inches nor more than [_____] mm[_____] inches. Two-drum or four-drum equipment separated by cab and differential and arranged in tandem must have its static weight equally distributed to all compaction drums and must have the tandem drums positioned such that the prints of the tamping feet produced by the tandem drums are staggered. The surface on which the tamping feet are mounted must have a minimum outside diameter of [_____] mm[_____] feet and at least one tamping foot for each [_____] square mm[_____] square feet of drum surface. The distance between the centers of any two adjacent tamping feet must be not less than [_____] mm[_____] inches. The length of each tamping foot from the outside mounting surface of the drum must be not more than [_____] mm[_____] inches and must be maintained at not less than [_____] mm [_____] inches. The bearing surface of each tamping foot must be flat and have a surface area not less than [_____] square mm[_____] square inches nor more than [_____] square mm[_____] square inches. Cupped recesses within the bearing surface of each tamping foot will be permitted but must not exceed [_____] mm[_____] inches in depth. During rolling operations, keep the spaces between the tamping feet clear of materials which would impair the effectiveness of the tamping roller. The weight of all roller drums during compaction of fill materials must be maintained uniform and with the weight per foot of drum length not less than [_____] N [_____] pounds. [For self-propelled rollers with drums capable of being ballasted with fluid, equip each drum with at least one pressure-relief valve and with at least one safety head. The safety head must be equal to union type safety heads equipped with rupture discs suitable for rupturing pressures between 350 and 500 kPa50 and 75 psi. The pressure relief valve is a manually operated valve and must be opened periodically. Instruct personnel responsible for opening pressure-relief valves periodically to ascertain that valve openings are free from plugging to assure that any pressure developed in roller drums is released at each inspection.] For self-propelled rollers in which steering is accomplished through the use of rubber-tired wheels, the tire pressure must not exceed [_____] kPa[_____]

psi. Discontinue use of the compactor if the tires leave ruts that prevent uniform compaction by the tamping roller and the substitution of appropriate towed tamping rollers may be directed. When a self-propelled roller is provided with a dozer blade, do not count coverages made with the blade in operation as compaction coverages. Operate self-propelled rollers at a speed not to exceed [_____] km/h[_____] mph.

3.5.1.2 Vibratory Rollers

Equip vibratory rollers for compacting rock fills, pervious sand and gravel fills, or filter and transition drainage layers with a smooth steel compaction drum and operate at a frequency of vibration during compaction operations between 1100 and 1500 vibrations per minute (vpm). Provide vibratory rollers that are either towed or self-propelled and that have an unsprung drum weight that is a minimum of 60 percent of the rollers' static weight. Provide towed rollers that have at least 90 percent of their weight transmitted to the ground through the compaction drum when the roller is standing in a level position hitched to the towing vehicle. Rollers for compacting rock fill, [sand and gravel fills, or filter and drainage layers] must have a minimum static weight of [_____] kN [_____] pounds, a minimum dynamic force of [_____] kN [_____] pounds when operating at 1400 vpm, and an applied force not less than [_____] kN/m [_____] pounds per foot of compaction drum length. [Rollers for compacting sand and gravel fills or filter and drainage layers must have a minimum static weight of [_____] kN [_____] pounds, a minimum dynamic force of [_____] kN [_____] pounds when operating at 1400 vpm, and an applied force not less than [_____] kN [_____] pounds nor greater than [_____] kN/m [_____] pounds per foot of compaction drum length.] The level of amplitude and vibration frequency during compaction will be maintained uniform throughout the embankment zone within which it is operating. Operate rollers at speeds not to exceed [_____] km/h [_____] mph.

3.5.1.3 Rubber-tired Rollers

Provide rubber-tired rollers that have a minimum of four wheels equipped with pneumatic tires. The tires must be of such size and ply to maintain tire pressures between [_____] and [_____] kPa [_____] and [_____] psi for a [_____] kN [_____] pound wheel load during rolling operations. Locate the roller wheels abreast and design so that each wheel will carry approximately equal load in traversing uneven ground. The spacing of the wheels will be such that the distance between the nearest edges of adjacent tires will be greater than 50 percent of the tire width of a single tire at the operating pressure for a [_____] kN [_____] pound wheel load. Provide the roller with a body suitable for ballast loading such that the load per wheel may be varied, from [_____] to [_____] kN [_____] to [_____] pounds. Tow roller at speeds not to exceed [_____] km/h [_____] mph. The character and efficiency of this equipment will be subject to approval.

3.5.1.4 Power Tampers

Perform compaction of material, in areas where it is impracticable to use a roller or tractor, as provided in paragraph EARTHWORK, by the use of approved power tampers.

3.5.2 Impervious Fill

After a layer of impervious fill material has been dumped and spread, harrow it if required, to break up and blend the fill materials, to remove laminations, ruts or smooth surfaces to enhance bonding between layers.

Perform harrowing to the full depth of the layer.

When the moisture content and the condition of the layer is satisfactory, compact the lift [to at least [_____] percent of maximum dry density as determined by ASTM D698, prior to placement of the next layer. Determination of in-place density must be in accordance with ASTM D1556/D1556M and ASTM D6938.][by [not less than][[_____] complete coverages of the tampering roller][[_____] complete coverages of the rubber-tired roller].][Provide complete coverage consisting of the coverage of the entire lift to be compacted with the roller specified.][A complete coverage must consist of the application of compactive effort to the entire lift to be compacted with a single roller drum having the characteristics as specified in paragraph SELF-PROPELLED. The use of four-drum self-propelled equipment that is laterally separated by operator's cab and differential may be used; however, two complete coverages of the lift to be compacted will be achieved by a subsequent offset trip of the roller for coverage of the previously uncompacted central portion of the roller path.] Place portions of the fill which are not accessible to the roller [_____] mm inch layers loose measurement and compacted with power tampers to a degree equal to that obtained on the other portions of the compacted fill by rolling as specified in accordance with paragraph BACKFILL. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously.

3.5.3 Pervious Fill

After each layer of pervious material has been dumped and spread, and the moisture content is in accordance with the provisions of paragraph PERVIOUS SECTION, compact the entire surface of the layer [to an average of [_____] percent minimum relative density][by not less than [_____] complete coverages of [the rubber-tired roller][the vibratory roller]].

[3.5.4 Additional Rolling for Compaction

If, in the opinion of the Contracting Officer, the desired compaction of any portion of the embankment is not achieved by the minimum number of coverages specified, make additional complete coverages over the surface area of such designated portion until the desired compaction has been obtained.

]3.5.5 Filter and Transition Drainage Layers

****

NOTE: The following paragraph for Transition Layers does not include bedding for riprap slope protection, which should be provided under Section 35 31 19.40 STONE REVETMENTS.

****

Accomplish compaction of filter soil using the compaction equipment described in subparagraph VIBRATORY ROLLERS of paragraph COMPACTION above. The roller must make a minimum of two (2) passes, acting in vibratory mode, across the initial lift of filter material. Upon completion of these first 2 passes, check the density of the filter material. Make additional passes of the vibratory roller until a relative density between [_____] and [_____] percent is attained based on the maximum dry density obtained in accordance with ASTM D4253 and minimum dry density as determined by

ASTM D4254. The number of passes required to achieve a relative density of [_____] percent must be the minimum required number of passes on subsequent lifts of filter material. Compaction equipment must be clean and free from other fill types or debris and must not result in contamination of the filter material. Slightly sope adjacent lifts of other fill types to drain away from the filter material. Remove and replace any contaminated filter material at no additional cost. Placement methods must not result in segregation of the filter material (such as but not limited to placement via conveyor of chute).

3.5.6 Rock Fill

After the rock fill has been dumped and spread to the thickness specified, compact the entire surface of the layer by not less than [_____] complete coverages of the vibratory roller specified in paragraph VIBRATORY ROLLERS. Provide a complete coverage consisting of the entire coverage of the area with one trip of the equipment specified. Each trip of the roller must overlap the adjacent trip not less than [_____] mm feet.

3.6 BACKFILL

3.6.1 General

Do not place embankment fill, filter soil or backfill against a concrete structure until the top of the structure has been completely placed, and has reached 80 percent of its design strength. Bring fill up in lifts evenly on both sides of structure and headwall structures with no more than [_____] m[_____] feet difference in elevation on opposing sides of the structure.

Subsequent to the concrete structure attaining 80 percent of design strength, backfill operations may be initiated but no rolling or hauling equipment will be permitted to pass over the structure, or within [_____] mm [_____] feet of any part of the structure. During this period, backfill may be placed against the sides of the structure and to a minimum thickness of [_____] mm [_____] feet over the top of the structure, if compaction is accomplished by power tampers as specified in paragraph POWER TAMPERS. Before passage of hauling and rolling equipment over the top of the conduit or other structure will be permitted, the depth of fill over the concrete must be sufficient to permit such passage without inducing harmful stresses or vibrations in the structure.

3.6.2 Placement

Place backfill in [_____] mm inch layers and thoroughly compact. Unless otherwise directed, the placing and compacting of all backfill material and the control of its moisture content must conform to the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION. Keep fill in back of wing walls at approximately the same elevations as that of the backfill, gravel blankets, riprap, or derrick stone on the opposite side of the wall until placement has reached the maximum elevation of the materials to be placed on the toe of the wall. Keep drainage openings through walls open at all times.

3.7 FIELD QUALITY CONTROL

****

NOTE: FAR Part 46.312 establishes a requirement for Contractor Quality Control (CQC) in construction

contracts and ER 1180-1-6 requires that a CQC section based on Section 01 45 00 QUALITY CONTROL be included in contracts of $1,000,000 or more. Use of Section 01 45 00 for contracts of less than $1,000,000 is discretionary. This part of the specifications must be consistent with the CQC section.

Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of mica, halloysite, some other chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density. Sand Cone or similar field density tests should be performed periodically at the same location as Nuclear Tests to assure nuclear testing is providing accurate information.

Specifier may desire the use of a tabular format for frequency of testing of materials.
****

Establish and maintain field quality control for embankment and backfill operations to assure compliance with contract requirements and maintain detailed records of field quality control for all operations including but not limited to the following:

3.7.1 Materials Testing

****
NOTE: Types of tests and frequency of testing should be detailed below. Types of tests and frequency of testing will be dependent upon the types of materials utilized, configuration of foundation and embankment, placement and compaction procedures required, moisture control requirements etc. Testing requirements are material type specific rather than embankment fill type specific. It is desirable to present the testing frequency and type in tabular form.
****

Perform sufficient testing to ensure that the fill is being constructed as specified. The testing program specified below will be considered the minimum acceptable frequency of testing. This does not relieve the Contractor from the responsibility of performing additional testing, if required to ensure compliance with these specifications.

[3.7.1.1 Soil Classification Tests

Soil classification tests will be performed in accordance with ASTM D2487. One initial classification test will be required for each different classification of material to be utilized as embankment fill or backfill. As prescribed in ASTM D2487, grain size analyses in accordance with ASTM D422 and Atterberg limits in accordance with ASTM D4318 will be performed on each different classification. Submit additional tests for every [_____] cubic mcubic yards of embankment or backfill material. Soil classification tests will be performed on foundation material as required to determine the acceptability of the in-situ soils. Additional tests will be required if noticeable changes in the material occur.

]3.7.1.2 Cohesive Material Testing

****

NOTE: Edit the following to comply with the method selected to determine the optimum properties (i.e., density and moisture content, LL, PL, PI).

****

3.7.1.3 Moisture Density Relationships

The moisture-density relations for each different classification of cohesive material utilized will be determined in accordance with [_____] [ASTM D698], [Method A] [Method B] [Method C].[Prior to placing any fill material containing cohesive material, a minimum of [_____] five-point [_____] compaction test will be performed on representative samples of the material to be used as fill.] During fill placement a minimum of one additional moisture-density test will be performed for every [_____] cubic m cubic yard placed. Additional tests will be required each time a new material is encountered.[The moisture-density curves will be compiled to form a family of curves which will be utilized to estimate optimum properties (maximum dry density and optimum moisture content) to be used with field density test.]

3.7.1.4 Water (Moisture) Content Tests

Determination of water content will be performed in accordance with ASTM D2216.[ASTM D4643 may be used when rapid moisture content results are needed. All rapid results obtained by ASTM D4643 will be confirmed by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern.] One water content test will be performed for each [_____] cubic mcubic yards of material placed [or each lift of material whichever is less].[These tests will be in addition to the water content tests performed in conjunction with in-place density tests.] Backfill and fills not meeting the required specifications for water content will be retested after corrective measures have been applied.

3.7.1.5 In-place Density Testing for Cohesive Materials

****

NOTE: The designer should pick the method or methods of In-place density which are acceptable. If uncompacted fill is specified density control may not be required.

Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of certain chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density.

****

The in-place density of the cohesive materials will be determined in accordance with [ASTM D1556/D1556M] [, ASTM D2167] [, ASTM D6938] [, ASTM D2937] [, or] [ASTM D5195]. At least one (1) in-place density test will be performed on [each lift of material or] every [_____] cubic mcubic yards of completed fill whichever is more frequent with the horizontal locations randomly staggered in the fill.[At each field density test location, soil samples will be obtained and one [one-point] [two-point] compaction test, one moisture content, [one grain size analysis,] [and one Atterberg limits test,] [if applicable,] will be performed on the sample.][The results of the [one-point] [two-point] compaction test and the moisture content test will be utilized to obtain the optimum properties to compare to the results of the in-place density test.][For use with the family of curves to determine the optimum properties of the material a [one-point] [two-point] compaction tests will be performed in conjunction with each in-place density. A portion of the soil from the in-place field density test and soil obtained immediately adjacent to the field density test location will be used for a [one-point] [two-point] compaction test. The minus 19 mm 3/4-inch portion of the soil will be subjected to [_____] compactive effort using a [150 mm][6-inch][_____] compaction mold in accordance with the procedures presented in ASTM D[_____] [ASTM D698] [ASTM D1557]]. Fill not meeting the required specifications for in-place density will be retested after additional compaction has been completed.[When nuclear method is used for in-place density testing according to ASTM D6938, the first test and every tenth test thereafter for each material type will include a sand cone correlation test in accordance with ASTM D1556/D1556M. The sand cone test will be performed adjacent to the location of the nuclear test, will include a nominal 150 mm6 inch diameter sand cone, and will include a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. Nuclear density testing equipment will not be used during rain. The density correlations will be submitted with test results. Each transmittal including density test data will include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
    (1) Station.
    (2) Coordinates.
c. Elevation of Lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.
l. Pass/Fail.
m. Retest.
n. Comments.]

[3.7.1.6 Cohesionless Material Testing

3.7.1.6.1 Compaction Tests

Run not less than one relative density test for every [3,000] [_____] cubic m[3,900] [_____] cubic yards of cohesionless fill in accordance with ASTM D4253 and ASTM D4254.

[3.7.1.6.2 In-place Density Tests

The in-place density of the cohesionless materials will be determined in accordance with [ASTM D1556/D1556M] [, ASTM D2167] [, ASTM D6938] [, ASTM D2937] [, or] [ASTM D5195]. Run not less than one (1) field in-place density test on [each lift of material or] every [shift][day] [_____] cubic m cubic yards of completed embankment fill or backfill whichever is less. Horizontal locations will be randomly staggered in the fill. When nuclear method is used for in-place density testing according to ASTM D6938, the first test and every tenth test thereafter for each material type will include a sand cone correlation test in accordance with ASTM D1556/D1556M. The sand cone test will be performed adjacent to the location of the nuclear test, and will include a nominal 150 mm6 inch diameter sand cone, and will include a minimum wet soil weight of 2.7 kg6 pounds extracted from the hole. The density correlations will be submitted with test results. Each transmittal including density test data will include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
    (1) Station.
    (2) Coordinates.
c. Elevation of Lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.

][3.7.1.6.3 Water (Moisture) Content Tests

Determination of water content will be performed in accordance with ASTM D2216.[ASTM D4643 may be used when rapid moisture content results are needed. All rapid results obtained by ASTM D4643 will be confirmed by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern.] One water content test will be performed for each [_____] cubic mcubic yards of material placed[or each lift of material whichever is less].[These tests will be in addition to the water content tests performed in conjunction with in-place density tests.] Backfill and fills not meeting the required specifications for water content will be retested after corrective measures have been applied.

][3.7.1.6.4 Additional Testing

The Contracting Officer may request additional tests if there is reason to doubt the adequacy of the compaction, or special compaction procedures are being used, or materials change, or if the Contracting Officer determines that the Contractor's testing is inadequate, or the Contractor is concentrating backfill and fill operations in a relatively small area.

]]3.7.1.7 Materials

Suitability of embankment and backfill materials.

3.7.1.8 Fill Placement

Layout, maintaining existing drainage, moisture control, thickness of layers, removal of oversized material, spreading and compaction for embankment and backfill.

3.7.1.9 Grade and Cross Section

Surveys to verify that the dimensions, slopes, lines and grades conform to those shown on the drawings.[Surveys to monitor settlement gages to measure foundation settlement.] [Surveys to locate core boring locations and elevations to determine foundation settlement.]

3.7.1.10 Testing by the Government

During the life of this contract, the Government [or its Contractors] will perform quality assurance tests. Make available to the Government [or its Contractors] the equipment to perform these test.

3.7.1.11 Reporting

On a daily basis, furnish the inspection records and all material testing results, [the quantity of fill placed,] as well as the records of corrective action taken, in accordance with Section 01 45 00 QUALITY CONTROL.

3.8 SLIDES

In the event of slides, in any part of the embankment prior to final acceptance of the work, remove material from the slide area, as directed, and rebuild such portion of the embankment. In case it is determined that the slide was caused through the fault of the Contractor, perform the removal and disposal of material and the rebuilding of the embankment without cost to the Government; otherwise this work will be paid for at the applicable contract unit prices for borrow excavation and compacted fill or backfill.

3.9 PIEZOMETERS, SETTLEMENT GAGES AND SURFACE REFERENCE MARKS

****

NOTE: The installation of instrumentation is not strictly speaking an activity of construction of an embankment dam. This activity should be placed within its own specification division as an item of SPECIAL CONSTRUCTION. There is presently no UFGS guide specification for this item. The specification writer should consider the use of a section for SPECIAL CONSTRUCTION, and if so, delete the following paragraphs.

Include paragraphs for all types of instruments to be utilized.

****

[3.9.1 Government Installed Piezometers

A number of piezometers will be installed on the embankment foundations by the Government with its own forces. Connections and extensions of riser pipes must be made by the Contractor with materials furnished by the Contractor. Determine the elevation of the top of the riser pipe immediately before and immediately after each extension is added to the pipe. Keep the top of such pipes at least 600 mm 2 feet above the embankment surface. During construction, place a mound of fill around the riser pipes and compact to the same density and moisture content as the surrounding fill material. Conduct the required operations in such a manner that the devices will not be damaged. Place suitable markers and guard posts around the gages for protection. No separate payment will be made for such protection or for special measures required in connection with the installation of these devices; include all costs in the contract prices bid for related items of work.

][3.9.2 Location and Installation of Settlement Gages

Furnish and install settlement gages for determining foundation and embankment settlement during construction. Provide type, arrangement and location of gages as shown. The areas in which adjustment in quantities will be made as a result of foundation settlement are as indicated on the plans. Place the base plate on a level surface of well compacted foundation material. Determine the elevations of the base plates before placing fill material and again within 48 hours after completion of the embankment. Determine the elevation of the stem immediately before and immediately after each extension is added. These elevations will be verified by the Contracting Officer. Carefully install the stem plumb. Extend the stem in increments as the embankment rises with the top of the stem at a minimum of 600 mm 2 feet above the surface of the embankment. Conduct these operations in such a manner that the gages will not be damaged. Place suitable guard posts around the gages for protection. Compact fill around the stem to the same density and moisture content as the surrounding material. Restore or replace any settlement gage damaged or destroyed due to fault or negligence at no additional cost to the Government. No additional payment will be made for compaction of fill around and over the settlement gages or for interference with the Contractor's operations resulting from the settlement gage installations.

][3.9.3 Surface Reference Marks

Furnish and install surface reference marks as shown. Furnish the horizontal and vertical location of each reference mark with respect to established bench marks at the time of installation, and every [_____] calendar days thereafter until completion of the contract. Conduct these operations in such a manner that the reference marks will not be disturbed or damaged. Replace or repair any reference mark disturbed or damaged due to negligence on the Contractor's part and furnish the correct horizontal and vertical locations the Contractor's expense.

****

NOTE: This guide specification covers the requirements for above and below grade liquid process piping located both inside and outside of treatment plants.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: Show the following information on the project drawings:

a. Location of pipelines indicating pipe designation, diameter and valves.

b. Pipe schedule relating pipe designation and service.

c. Valve schedule indicating valve designation and service.

d. Piping details.

****

1.1 UNIT PRICES

****

NOTE: This paragraph does not apply to invitation for bid (IFB) contracts. If it is determined that a lump sum contract may be more advisable, this paragraph will be deleted. If a unit price contract is to be used, the bid items for the unit price contract will be defined for each unit to be furnished and installed.

****

Measurement and payment will be based on completed work performed in accordance with the drawings, specifications and the contract payment schedules. No payment will be made under this section for excavation, trenching, or backfilling. Payment for such work will be made under Section 31 00 00 EARTHWORK.

1.1.1 Measurement

Determine the length of pipelines, for which payment will be made, by measuring along the centerlines of the various piping systems and sizes as furnished and installed. Measure pipe from the center of fitting to center of fitting and from center of main header to end of pipe. Make no deduction for the space occupied by valves or fittings.

1.1.2 Payment

Payment will be made at the price per linear meter foot listed in the bid form for the various types and sizes of piping, and will be full compensation for all pipes, joints, fittings and specialties, complete in place. Payment for valves and other appurtenances will be made at the respective contract unit price for each item complete in place. Payment will include the furnishing of all testing, plant, labor, and material and incidentals necessary to complete the work, as specified and as shown in contract documents.

1.1.2.1 Connections to Existing Piping

Connections to existing piping systems where new fittings in the existing line are required will be paid for according to the contract prices for such connection. The price will be considered as full compensation for material and labor required for the removal and replacement of the existing pipe as necessary.

1.1.2.2 Connections to Existing Equipment

Connections to existing equipment where new fittings for the existing equipment are required will be paid for according to the contract prices for such connection. The price will be considered as full compensation for material and labor required for the installation of new fittings or the removal and replacement of existing fittings, as necessary.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the

publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM A105/A105M	(2023) Standard Specification for Carbon Steel Forgings for Piping Applications
ASTM A106/A106M	(2019a) Standard Specification for Seamless Carbon Steel Pipe for High-Temperature Service
ASTM A108	(2024) Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished

ASTM A126	(2004; R 2023) Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings
ASTM A153/A153M	(2023) Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
ASTM A167	(2011) Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
ASTM A181/A181M	(2014; R 2020) Standard Specification for Carbon Steel Forgings, for General-Purpose Piping
ASTM A182/A182M	(2024) Standard Specification for Forged or Rolled Alloy and Stainless Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service
ASTM A183	(2014; R 2020) Standard Specification for Carbon Steel Track Bolts and Nuts
ASTM A193/A193M	(2024a) Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service and Other Special Purpose Applications
ASTM A194/A194M	(2024) Standard Specification for Carbon Steel, Alloy Steel, and Stainless Steel Nuts for Bolts for High-Pressure or High-Temperature Service, or Both
ASTM A216/A216M	(2021) Standard Specification for Steel Castings, Carbon, Suitable for Fusion Welding, for High-Temperature Service
ASTM A240/A240M	(2024b) Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
ASTM A268/A268M	(2024) Standard Specification for Seamless and Welded Ferritic and Martensitic Stainless Steel Tubing for General Service
ASTM A269/A269M	(2024) Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General Service
ASTM A276/A276M	(2024) Standard Specification for Stainless Steel Bars and Shapes
ASTM A307	(2021) Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60 000 PSI Tensile Strength

ASTM A312/A312M	(2022a) Standard Specification for Seamless, Welded, and Heavily Cold Worked Austenitic Stainless Steel Pipes
ASTM A334/A334M	(2004a; R 2021) Standard Specification for Seamless and Welded Carbon and Alloy-Steel Tubes for Low-Temperature Service
ASTM A351/A351M	(2024) Standard Specification for Castings, Austenitic, for Pressure-Containing Parts
ASTM A352/A352M	(2021) Standard Specification for Steel Castings, Ferritic and Martensitic, for Pressure-Containing Parts, Suitable for Low-Temperature Service
ASTM A395/A395M	(1999; R 2022) Standard Specification for Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures
ASTM A403/A403M	(2022b) Standard Specification for Wrought Austenitic Stainless Steel Piping Fittings
ASTM A423/A423M	(2019) Standard Specification for Seamless and Electric-Welded Low-Alloy Steel Tubes
ASTM A436	(2024) Standard Specification for Austenitic Gray Iron Castings
ASTM A479/A479M	(2024) Standard Specification for Stainless Steel Bars and Shapes for Use in Boilers and Other Pressure Vessels
ASTM A513/A513M	(2024) Standard Specification for Electric-Resistance-Welded Carbon and Alloy Steel Mechanical Tubing
ASTM A536	(2024) Standard Specification for Ductile Iron Castings
ASTM A576	(2023) Standard Specification for Steel Bars, Carbon, Hot-Wrought, Special Quality
ASTM A587	(2022) Standard Specification for Electric-Resistance-Welded Low-Carbon Steel Pipe for the Chemical Industry
ASTM A632	(2004; R 2014) Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing (Small-Diameter) for General Service
ASTM A727/A727M	(2014; R2019) Standard Specification for Carbon Steel Forgings for Piping Components with Inherent Notch Toughness
ASTM A780/A780M	(2020) Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip

	Galvanized Coatings
ASTM A789/A789M	(2024) Standard Specification for Seamless and Welded Ferritic/Austenitic Stainless Steel Tubing for General Service
ASTM A813/A813M	(2024) Standard Specification for Single- or Double-Welded Austenitic Stainless Steel Pipe
ASTM A814/A814M	(2015; R 2019) Standard Specification for Cold-Worked Welded Austenitic Stainless Steel Pipe
ASTM A815/A815M	(2024a) Standard Specification for Wrought Ferritic, Ferritic/Austenitic, and Martensitic Stainless Steel Piping Fittings
ASTM A858/A858M	(2024) Standard Specification for Heat-Treated Carbon Steel Fittings for Low-Temperature and Corrosive Service
ASTM A865/A865M	(2023) Standard Specification for Threaded Couplings, Steel, Black or Zinc-Coated (Galvanized) Welded or Seamless, for Use in Steel Pipe Joints
ASTM B32	(2020) Standard Specification for Solder Metal
ASTM B42	(2020) Standard Specification for Seamless Copper Pipe, Standard Sizes
ASTM B61	(2015; R 2021) Standard Specification for Steam or Valve Bronze Castings
ASTM B62	(2017) Standard Specification for Composition Bronze or Ounce Metal Castings
ASTM B75/B75M	(2020) Standard Specification for Seamless Copper Tube
ASTM B88	(2022) Standard Specification for Seamless Copper Water Tube
ASTM B88M	(2020) Standard Specification for Seamless Copper Water Tube (Metric)
ASTM B98/B98M	(2013) Standard Specification for Copper-Silicon Alloy Rod, Bar, and Shapes
ASTM B124/B124M	(2020) Standard Specification for Copper and Copper Alloy Forging Rod, Bar, and Shapes
ASTM B150/B150M	(2012; R 2017) Standard Specification for Aluminum Bronze Rod, Bar, and Shapes
ASTM B161	(2005; R 2014) Standard Specification for

	Nickel Seamless Pipe and Tube
ASTM B164	(2003; R 2014) Standard Specification for Nickel-Copper Alloy Rod, Bar, and Wire
ASTM B165	(2019) Standard Specification for Nickel-Copper Alloy (UNS N04400)* Seamless Pipe and Tube
ASTM B167	(2023) Standard Specification for Nickel-Chromium-Aluminum Alloys, Nickel-Chromium-Iron Alloys, Nickel-Chromium-Cobalt-Molybdenum Alloy, Nickel-Iron-Chromium-Tungsten Alloy, and Nickel-Chromium-Molybdenum-Copper Alloy Seamless Pipe and Tube
ASTM B210/B210M	(2019a) Standard Specification for Aluminum and Aluminum-Alloy Drawn Seamless Tubes
ASTM B211/B211M	(2023) Standard Specification for Aluminum and Aluminum-Alloy Rolled or Cold Finished Bar, Rod, and Wire
ASTM B241/B241M	(2022) Standard Specification for Aluminum and Aluminum-Alloy Seamless Pipe and Seamless Extruded Tube
ASTM B247	(2020) Standard Specification for Aluminum and Aluminum-Alloy Die Forgings, Hand Forgings, and Rolled Ring Forgings
ASTM B247M	(2020) Standard Specification for Aluminum and Aluminum-Alloy Die Forgings, Hand Forgings, and Rolled Ring Forgings (Metric)
ASTM B302	(2017) Standard Specification for Threadless Copper Pipe, Standard Sizes
ASTM B345/B345M	(2011) Standard Specification for Aluminum and Aluminum-Alloy Seamless Pipe and Seamless Extruded Tube for Gas and Oil Transmission and Distribution Piping Systems
ASTM B361	(2016; R 2024) Standard Specification for Factory-Made Wrought Aluminum and Aluminum-Alloy Welding Fittings
ASTM B366/B366M	(2023) Standard Specification for Factory-Made Wrought Nickel and Nickel Alloy Fittings
ASTM B517	(2019) Standard Specification for Welded Nickel-Chromium-Iron-Alloy (UNS N06600, UNS N06603, UNS N06025, and UNS N06045) Pipe

ASTM B546	(2019; R 2024) Standard Specification for Electric Fusion-Welded Ni-Cr-Co-Mo Alloy (UNS N06617), Ni-Fe-Cr-Si Alloys (UNS N08330 and UNS N08332),Ni-Cr-Fe-Al Alloy (UNS N06603), Ni-Cr-Fe Alloy (UNS N06025), and Ni-Cr-Fe-Si Alloy (UNS N06045) Pipe
ASTM B564	(2022) Standard Specification for Nickel Alloy Forgings
ASTM B574	(2023) Standard Specification for Low-Carbon Nickel-Chromium-Molybdenum, Low-Carbon Nickel-Molybdenum-Chromium, Low-Carbon Nickel-Molybdenum-Chromium-Tantalum, Low-Carbon Nickel- Chromium-Molybdenum-Copper, and Low-Carbon Nickel-Chromium-Molybdenum-Tungsten Alloy Rod
ASTM B619/B619M	(2019; R 2023) Standard Specification for Welded Nickel and Nickel-Cobalt Alloy Pipe
ASTM B622	(2023) Standard Specification for Seamless Nickel and Nickel-Cobalt Alloy Pipe and Tube
ASTM B725	(2022) Standard Specification for Welded Nickel and Nickel Copper Alloy Pipe
ASTM B775/B775M	(2022) Standard Specification for General Requirements for Nickel and Nickel Alloy Welded Pipe
ASTM B813	(2024) Standard Specification for Liquid and Paste Fluxes for Soldering of Copper and Copper Alloy Tube
ASTM B829	(2024) Standard Specification for General Requirements for Nickel and Nickel Alloys Seamless Pipe and Tube
ASTM C552	(2022) Standard Specification for Cellular Glass Thermal Insulation
ASTM C600	(1985; R 2010) Thermal Shock Test on Glass Pipe
ASTM D1418	(2010; R 2016) Standard Practice for Rubber and Rubber Lattices - Nomenclature
ASTM D1527	(1999; R 2005) Standard Specification for Acrylonitrile-Butadiene-Styrene (ABS) Plastic Pipe, Schedules 40 and 80
ASTM D1784	(2020) Standard Specification for Rigid Poly(Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds

ASTM D1785	(2021) Standard Specification for Poly(Vinyl Chloride) (PVC), Plastic Pipe, Schedules 40, 80, and 120
ASTM D2000	(2018; R 2024) Standard Classification System for Rubber Products in Automotive Applications
ASTM D2235	(2004; R 2016) Standard Specification for Solvent Cement for Acrylonitrile-Butadiene-Styrene (ABS) Plastic Pipe and Fittings
ASTM D2239	(2012) Standard Specification for Polyethylene (PE) Plastic Pipe (SIDR-PR) Based on Controlled Inside Diameter
ASTM D2241	(2020) Standard Specification for Poly(Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series)
ASTM D2310	(2006; R 2012) Machine-Made "Fiberglass" (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe
ASTM D2464	(2015) Standard Specification for Threaded Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80
ASTM D2466	(2023) Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40
ASTM D2467	(2020) Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80
ASTM D2564	(2020) Standard Specification for Solvent Cements for Poly(Vinyl Chloride) (PVC) Plastic Piping Systems
ASTM D2609	(2015) Standard Specification for Plastic Insert Fittings for Polyethylene (PE) Plastic Pipe
ASTM D2657	(2007; R 2015) Heat Fusion Joining Polyolefin Pipe and Fittings
ASTM D2683	(2020) Standard Specification for Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing
ASTM D2737	(2012a) Polyethylene (PE) Plastic Tubing
ASTM D2774	(2021a) Standard Practice for Underground Installation of Thermoplastic Pressure Piping

1.3 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's

Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALIFICATIONS

1.4.1 Experience

Submit a statement certifying that the Contractor has the specified experience. Ensure Contractor has successfully completed at least [three] [_____] projects of the same scope and size or larger within the last [six] [_____] years. Demonstrate specific experience in regard to the system installation to be performed.

1.4.2 Double Containment Piping System Manufacturer

****

NOTE: Delete the following paragraph when it is not required.

****

The double containment piping system manufacturer will have at least [ten] [_____] years of installation experience with leak detection/location sensor cable technology.

1.4.3 Welders

Submit the names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, standards tested to, etc. Weld pressure piping systems in accordance with qualifying procedures using performance qualified welders and operators. Use procedures and welders in accordance with Section 40 05 13.96 WELDING PROCESS PIPING. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.

1.5 DELIVERY, STORAGE, AND HANDLING

Materials delivered and placed in storage must be stored with protection from the weather, excessive humidity variation, excessive temperature variation, dirt, dust and/or other contaminants. Proper protection and care of material before, during and after installation is the Contractor's responsibility. Any material found to be damaged must be replaced at the Contractor's expense. During installation, piping must be capped to keep out dirt and other foreign matter. A Safety Data Sheet in conformance with 29 CFR 1910 Section 1200(g) must accompany each chemical delivered for use in pipe installation. At a minimum, this includes all solvents, solvent cements, glues and other materials that may contain hazardous compounds. Handling must be in accordance with ASTM F402. Storage facilities must be classified and marked in accordance with NFPA 704. Materials must be stored with protection from puncture, dirt, grease, moisture, mechanical abrasions, excessive heat, ultraviolet (UV) radiation damage, or other damage. Pipe and fittings must be handled and stored in accordance with the manufacturer's recommendation. Plastic pipe must be packed, packaged and marked in accordance with ASTM D3892.

1.6 PROJECT/SITE CONDITIONS

1.6.1 Environmental Requirements

****

NOTE: HTRW sites are typically well studied and investigated. Site conditions found during these previous investigations (e.g., soil resistivity testing for corrosion control design) must be incorporated into the design. The next paragraph must be edited carefully to address existing site conditions.

****

Buried piping at the site may be subject to corrosion from the surrounding soil. Conduct testing and measurements in accordance with [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM]. Ensure piping system design, supply and installation addresses the external corrosion conditions so indicated.

1.6.2 Existing Conditions

****

NOTE: Connection locations and wet/dry connections must be clearly indicated to avoid confusion and claims.

****

Verify existing piping and penetrations. Prior to ordering materials, expose all existing pipes which are to be connected to new pipelines. Verify the size, material, joint types, elevation, horizontal location, and pipe service of existing pipes, and inspect size and location of structure penetrations to verify adequacy of wall sleeves, and other openings before installing connecting pipes.

1.7 SEQUENCING AND SCHEDULING

For slab, floor, wall, and roof penetrations, keep on site pertinent wall pipes and sleeves before they are required for placement in concrete forms. Verify and coordinate the size and location of building and structure pipe penetrations before forming and placing concrete.

1.8 MAINTENANCE

1.8.1 Service

****

NOTE: Selectively require manufacturer's service. Automatic valves in critical or hazardous systems require service assistance. Coordinate these services with specification sections that address instrumentation and control.

****

Provide services for [automatic valve] [double containment leak detection monitoring system] [double containment leak sensor cable] [_____] systems by a manufacturer's representative who is experienced in the installation, adjustment and operation of the equipment specified. Inspect the installation, and supervise the adjustment and testing of the equipment.

1.8.2 Extra Materials

****

NOTE: Include items needed for future maintenance and repair, items that might be difficult to obtain because of color or pattern match, or spare parts to ensure operation of critical systems.

****

Submit the manufacturer's installation recommendations or instructions for each material or procedure to be utilized, including materials preparation. Concurrent with delivery and installation of the specified piping systems and appurtenances, furnish spare parts for each different item of material and equipment specified that is recommended by the manufacturer to be replaced any time up to [3 years] [_____] of service. For each type and size of valve, provide the following extra materials: lubricator, lubricant (with appropriate temperature rating), lubricator/isolating valve; [galvanized operating wrench, [1.2] [____]m [4.1] [_____] feet long, for T-handled operators;] [galvanized operating key for cross handled valves;] [_____]. Extra materials include [2] [_____] of the following spare parts for each type and size of valve: gaskets; [O-ring seals;] [diaphragms (molded);] all elastomer parts; stem packing; [seat rings [and seat ring pulling tool];] [_____].

PART 2 PRODUCTS

****

NOTE: All materials of construction specified will be retained except under conditions where they would not be suitable (see UFC 3-240-01); upon specific instructions of HQUSACE; as stipulated in specific project directives.; and as described within notes throughout the specification. A study of the process conditions will be made to determine the suitability of the materials. Where a material would be altogether unsuitable, every mention of the unsuitable material and referenced publications that

pertain only to the unsuitable material will be deleted. If a material would be suitable in a part of the system and unsuitable in other parts, the locations where the material may and may not be used will be stated in the contract specifications and shown on the contract drawings.

Soil conditions that may affect the corrosion rate of buried ferrous piping should be evaluated. The evaluation and corrosion control design will be performed in accordance with the directions provided in UFC 3-570-02A.
****

2.1 SYSTEM REQUIREMENTS

This specification covers the requirements for above and below grade liquid process pipe, pipe supports, fittings, equipment and accessories located both inside and outside of treatment plants.

2.1.1 Design Requirements

****
NOTE: Determine the design wind speed from ASCE 7-16 and/or UFC 3-301-01 STRUCTURAL ENGINEERING, although a minimum of 161 km/h (100 miles per hour) will be used. Similarly, use 1.2 kPa 25 psf snow load for most heavy snow climates. In some cases, local climates and topography will dictate that a larger value is required. This may be determined from ANSI A58.1, local codes or by research and analysis data of the effect of local climate and topography. Snow load requirements can be deleted for locations where the maximum snow is insignificant. Provide seismic requirements and show on the drawings. Delete the bracketed phrase if seismic details are not included. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.
****

Select and design support systems in accordance with MSS SP-58 within the specified spans and component requirements. The absence of pipe supports and details on the contract drawings does not relieve the Contractor of responsibility for sizing and providing supports throughout facility. The structural design, selection, fabrication and erection of piping support system components must satisfy the seismic requirements in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 SEISMIC BRACING FOR MECHANICAL SYSTEMS [as indicated], accounting for a [_____] MPa psf soil bearing capacity, a maximum wind speed of [_____] km/h mph, a ground snow load of [_____] kPa psf, a maximum ambient air temperature of [_____] degrees Cdegrees F and a minimum ambient air temperature of [_____] degrees C degrees F.

2.1.2 Performance Requirements

The pressure ratings and materials specified represent minimum acceptable standards for piping systems. Provide piping systems suitable for the services specified and intended. Coordinate each piping system to function as a unit. Provide flanges, valves, fittings and appurtenances with a pressure rating no less than that required for the system in which they are installed.

2.1.2.1 Buried Piping Systems

Provide piping systems suitable for design conditions, considering the piping both with and without internal pressure. Give consideration to all operating and service conditions both internal and external to the piping systems. Ensure buried ferrous piping has cathodic protection in accordance with [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM].

2.1.2.2 Above Grade Piping Systems

Provide piping systems suitable for design conditions, considering the piping both with and without internal pressure, and installation factors such as insulation, support spans, and ambient temperatures. Give consideration to all operating and service conditions both internal and external to the piping systems.

2.2 MATERIALS AND EQUIPMENT

****

NOTE: Verify that the pipe schedule is included in the contract drawings.

****

Submit manufacturer's descriptive and technical literature for each piping system, including design recommendations; pressure and temperature ratings; dimensions, type, grade and strength of pipe and fittings; thermal characteristics (coefficient of expansion and thermal conductivity); and chemical resistance to each chemical and chemical mixture in the liquid stream. Provide piping materials and appurtenances as specified and as shown on the drawings, and suitable for the service intended. Ensure piping materials, appurtenances, and equipment supplied as part of this contract are of equal material and ratings as the connecting pipe, new and unused except for testing equipment. Ensure components that serve the same function and are the same size are identical products of the same manufacturer. Provide general materials to be used for the piping systems in accordance with TABLE I and indicate by service in the [Pipe Schedule] [contract drawings] [_____]. Submit a list of piping systems, pressure ratings and source of supply for each piping system broken out by material, size and application as indicated on the contract drawings. A list of any special tools necessary for each piping system and appurtenances furnished for adjustment, operation, maintenance and disassembly of the system. Provide pipe fittings compatible with the applicable pipe materials.

2.2.1 Standard Products

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacturing of the products and that essentially duplicate items that have been in satisfactory use for at least [2] [_____] years prior to bid opening. Submit the following: Equipment shop drawings and support system detail drawings showing piping systems and appurtenances, such as mechanical joints, valves, local indicators and hangers, including a complete list of equipment and materials. As-built drawings showing pipe anchors and guides, and layout of piping systems relative to other parts of the work including clearances for maintenance and operation. As-built piping and instrumentation diagrams (P&IDs) identifying and labeling equipment, instrumentation, valves, vents, drains, and all other inline devices; if the contract drawings contained P&IDs, revise the P&IDs found in the contract drawings to reflect the constructed process system, as directed by the Contracting Officer. Use nominal sizes for standardized products. Provide pipe, valves, fittings and appurtenances supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.2.2 Identification and Tagging

Each piece of pipe must bear the ASTM designation and all other markings required for that designation. Mark valves in accordance with MSS SP-25 and securely attach an identification tag using [No. 12 AWG copper wire] [stainless steel wire] [chrome-plated beaded chain] [plastic straps designed for that purpose]. Identification tags must be [35 mm 1.375 inch] [[_____] mm inches] minimum diameter, made of [brass] [engraved laminated plastic] [engraved anodized aluminum] [stamped stainless steel] [_____]. [Use black indentations for reading clarity.] Display service, valve identification number shown on the [Operator Schedule] [Valve Schedule] in the contract drawings, the manufacturer's name, and the valve model number.

2.3 DUCTILE IRON PIPING SYSTEM

2.3.1 Ductile Iron Pipe

****

NOTE: Standard thicknesses of ductile iron pipe are governed by AWWA C150/A21.50 or AWWA C151/A21.51, except for integral flanged piping. The thickness of integral flanged pipe is regulated in AWWA C115/A21.15. If restrained joint pipe is used, thickness must conform to AWWA C151/A21.51.

****

Provide ductile iron pipe for pressure service with a design and wall thickness conforming to [AWWA C150/A21.50] [AWWA C151/A21.51] [AWWA C115/A21.15]. Provide ductile iron pipewith a [[standard] [double thickness] cement lining conforming to AWWA C104/A21.4] [standard asphaltic lining] [_____].

2.3.2 Ductile Iron Joints

****

NOTE: Flanged connections should not be used for buried service. Use joints for pipe and fittings installed underground (buried).

****

Provide joints with a working pressure rating for liquids equal to the pressure rating of the connected pipe. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.3.2.1 Mechanical Joints

Provide mechanical joints conforming to AWWA C110/A21.10 and

AWWA C111/A21.11. [Furnish gaskets, glands, bolts and nuts in sufficient quantity for the complete assembly of each mechanical joint. Provide [ductile] [or] [gray] iron glands with an [asphaltic] [_____] coating. Provide gaskets consisting of [vulcanized synthetic rubber, reclaimed rubber is not acceptable] [_____].] [For grooved shoulder piping, use self-centering gasketed couplings designed to mechanically engage piping and lock in a positive watertight couple.] [Compose housing of [malleable iron, ASTM A47/A47M] [or] [ductile iron, ASTM A536] and use gaskets of molded synthetic rubber, [halogenated isobutylene isoprene] [nitrile] [_____]. Bolts and nuts must be [heat treated carbon steel, ASTM A183, minimum tensile 760 MPa 110,000 psi] [_____].] [Mechanical joints must have bolt holes oriented [straddling the vertical centerline of the valves and fittings] [_____].]

2.3.2.2 Push-on Joints

Provide push-on type joints conforming to AWWA C111/A21.11. Supply each push-on joint complete with gasket and lubricant. Ensure gaskets are compatible with joint design and are comprised of [vulcanized synthetic rubber, reclaimed rubber is not acceptable] [_____]. Provide lubricant that is specifically formulated for use with push-on joints, non-toxic, odorless, tasteless and does not support bacteria growth.

2.3.2.3 Restrained Joints

Provide restrained joints conforming to the requirements of AWWA C111/A21.11, and designed for a working pressure equal to connected pipe rating. When using ductile iron pipe with restrained joints, supply field cuts with a lock ring complete with retainer, retainer lock and roll-pin, as required by manufacturer's recommendations, procedures and/or installation instructions.

2.3.2.4 Flanged Joints

Provide flanged joints conforming to AWWA C110/A21.10. Provide gaskets, bolts and nuts with flanged joints in sufficient quantity for the complete assembly of each joint. Gaskets must be [vulcanized synthetic rubber, reclaimed rubber is not acceptable] [_____].

2.3.3 Ductile Iron Fittings

****

NOTE: Fittings for ductile-iron or gray-iron piping involving 1.03 MPa 150 psi and 1.72 MPa 250 psi service are specified in AWWA C110/A21.10; for 2.41 MPa 350 psi service use AWWA 153. Typically, either gray or ductile iron fittings are acceptable. Specify the exact material if service conditions warrant.

Take special precaution with mating flanges specified in this paragraph; that is, mating flanges conforming to AWWA C110/A21.10 with flanges that are specified elsewhere using ASME B16.1 or B16.5 standards.

****

Fittings must be gray iron ASTM A48/A48M or ductile iron [AWWA C110/A21.10] [AWWA C153/A21.53]. Up to [300] [_____] mm [12] [_____] inches inclusive, the fittings must be [1.7] [_____]MPa [250] [_____] psig rated. Gray iron fittings must be cement mortar lined [standard] [double] thickness. Provide flanges and flanged fittings conforming to [AWWA C110/A21.10] [ASME B16.1] and rated for [1.03 MPa 150 psig] [1.72 MPa 250 psig] [[_____] MPa psig] service. Provide [ductile iron] [or] [gray iron] [_____] materials. For tie-in to existing flanges, field check existing flanges for nonstandard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolts and nuts must be [carbon steel conforming to ASTM A307, Grade [B] [_____]] [_____]. Provide bolts with washers of the same material as the bolts. Gaskets must be [rubber] [ring] [_____] [full face], maximum [3.2] [_____] mm [0.125] [_____] inch thick.

2.3.4 Corrosion Control

Ductile iron piping must be [coated with the manufacturer's standard asphaltic coating, approximately [0.025 mm 1 mil] [[_____] mm mil] thick, applied to the outside of pipe and fittings] [hot-dipped galvanized in accordance with ASTM A153/A153M] [_____]. Coat and wrap buried pipe, and provide with cathodic protection in accordance with [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM].

2.4 CARBON STEEL PIPING SYSTEM

****

NOTE: Consult the referenced standards for the proper carbon steel use and fittings. For example, ASTM A53/A53M carbon steel piping is a good general piping material and ASTM A106/A106M carbon steel is for high temperature applications. In addition, some of the types and grades may not be suitable for certain joining methods or cold bending; etc. Steel pipe meeting API Spec 5L is specified only with 50 mm 2 inch and smaller pipe that is subject to a low pressure application and the use of taper-threaded couplings.

****

2.4.1 Carbon Steel Pipe

2.4.1.1 General Service

Provide carbon steel pipe meeting the requirements of [ASTM A53/A53M [seamless] [butt welded] [electric-resistance welded], Grade [A] [B]] [API Spec 5L, Schedule [40] [80] [_____]] and [in accordance with Pipe Schedule] [, hot-dipped galvanized]. Provide Schedule [80] [_____] buried carbon steel piping and fittings.

2.4.1.2 High Temperature Service

Seamless carbon steel pipe for high temperature service must [conform to ASTM A106/A106M Grade [A] [B] [C], [hot-finished] [cold-drawn], Schedule [40] [80] [_____]] [be in accordance with Pipe Schedule] with dimensions conforming to ASME B36.10M.

2.4.1.3 Chemical Process Service

Provide electric-resistance welded low-carbon steel pipe conforming to ASTM A587 with a nominal wall thickness [of [_____] mm inch] [in accordance with Pipe Schedule].

2.4.2 Carbon Steel Tubing

Provide tubing meeting the requirements of [ASTM A334/A334M, [seamless] [welded], Grade [1] [_____] carbon steel] [ASTM A423/A423M, [seamless] [electric-resistance-welded], Grade [1] [2] low-alloy carbon steel] with nominal size and wall thickness [in accordance with Pipe Schedule] [_____].

2.4.3 Carbon Steel Joints

Join carbon steel piping by [straight-threaded couplings] [taper-threaded couplings] [welding fittings] [flanges] [mechanical joints for grooved ends meeting the requirements of AWWA C606]. Join tubing using [compression] [_____] fittings. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.4.4 Carbon Steel Fittings

[Fittings must be [cast malleable iron] [carbon steel] [heat-treated low-carbon steel] [_____].] [Where cast fittings are not available, fabricate segmental welded steel fittings, ASTM A53/A53M, Grade B, meeting the requirements of manufacturer's recommended wall thicknesses.]

2.4.4.1 Threaded Fittings

Threaded fittings must be Class [150] [300] [_____], [malleable iron, ASTM A47/A47M, conforming to ASME B16.3, black, banded] [forged carbon steel ASTM A105/A105M, conforming to ASME B16.11] [low carbon steel, ASTM A858/A858M, conforming to ASME B16.11] [_____], and threaded in accordance with ASME B1.20.2MASME B1.20.1. Threaded, rigid couplings must be [welded] [seamless], [black] [Type I (hot-dipped galvanized)] [Type II (electrogalvanized)] carbon steel in accordance with [ASTM A865/A865M] [_____] and threaded in accordance with ASME B1.20.2MASME B1.20.1. [Use polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.4.4.2 Welding Fittings

Provide [butt-welding] [or] [socket-welding] welding fittings. Provide welding fittings consisting of forged [steel, ASTM A105/A105M Class [150] [300] [_____]] [low-carbon steel, ASTM A858/A858M [seamless] [or] [welded]] [_____] conforming to [ASME B16.9] [, or] [ASME B16.11].

2.4.4.3 Flanged Fittings

Ensure the internal diameter bores of flanges and flanged fittings are the same as that of the associated pipe. The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Flanges and flanged fittings must be [forged steel, [ASTM A105/A105M] [ASTM A727/A727M] [_____]] [_____], faced and drilled to ASME B16.5 Class [150] [300] [_____] with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. [Drill cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, in conformance with [ASME B16.5] [ASME B16.1] Class [150] [_____].] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Provide bolting consisting of [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____]. When mating flange on valves or equipment is cast iron, use [ASTM A193/A193M Grade [B8 Class 1] [_____] bolts and ASTM A194/A194M Grade [8] [_____] heavy hex head nuts] [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 that are a maximum [3.2] [_____] mm [0.125] [_____] inch thick [chloroprene rubber, durometer hardness No.80,] [_____] 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [_____].]

2.4.4.4 Compression Fittings for Tubing

Provide compression fittings consisting of [carbon steel [ASTM A108] [ASTM A576]] [_____] nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

2.4.5 Carbon Steel Coatings

****

NOTE: Carbon steel piping system components will be coated with corrosion resistant materials suitable for exposure to the environmental and process conditions of the site. For potential exposures to pressures less than 70 kPa 10 psi, temperatures less than 100 degrees C 212 degrees F and mild chemicals, prepare the surfaces in accordance with SSPC SP 6/NACE No.3.

For potential exposures to pressures and temperatures greater than those previously mentioned, and mild chemicals, intermediate options may be appropriate. For severe chemical exposures, the thermoplastic resin system should be used.

****

Coat carbon steel piping components with corrosion resistant materials. Ensure coatings and finishes are 100 percent holiday free.

2.4.5.1 Silicone Coating

Prepare carbon steel piping surfaces in accordance with SSPC SP 6/NACE No.3. Provide surfaces with an alkyd primer of [0.0625] [_____] mm [2.5] [_____] mils dry film thickness followed by two alkyd modified silicone final coats.

2.4.5.2 Zinc Coating

Galvanizing must be hot-dip applied and meet the requirements of ASTM A153/A153M; electroplated zinc or cadmium plating is unacceptable. Stainless steel components may be substituted where galvanizing is specified.

2.4.5.3 Thermoplastic Resin Coating System

[Carbon steel piping surfaces must have a minimum of [4] [_____] coats of phenolic type coatings applied at a minimum dry film thickness of [0.040] [_____] mm [1.6] [_____] mils per coat. Bake each coat at [149] [_____] degrees C [300] [_____] degrees F for [10] [_____] minutes. Cure the full coating system in an oven at [190] [_____] degrees C [375] [_____] degrees F for [30] [_____] minutes.] [Coat carbon steel piping system components with an adhesively mounted polyethylene coating system. Ensure the continuously extruded polyethylene and adhesive coating system materials conform to NACE SP0185 Type A.]

2.4.6 Carbon Steel Cathodic Protection

Buried ferrous piping must have cathodic protection.

2.5 LINED STEEL PIPING SYSTEM

2.5.1 Outer Pipe Shell

****

NOTE: For the outer shell, carbon steel is most common; stainless steel will considerably limit suppliers. Flanged joining, Class 150 or 300, is commonly used. Most thermoplastic liners allow some vapors to permeate and become trapped between the liner and the shell. Therefore, venting via weep holes in the outer shell or venting flange collars (note that a single manufacturer has a patent on venting collars) are required to avoid gas accumulation. These are not required for nonpermeable liners such as PVDC. The use of thermoplastics with aggressive chemicals may result in a lower maximum operating temperature than that rated for an unlined pipe composed of the same material.

****

The outer shell of the lined piping system must be [carbon steel meeting the requirements of [ASTM A53/A53M [electric-resistance welded] [_____], Grade [B] [_____]] [_____], Schedule [40] [80] [in accordance with Pipe Schedule]] [TP304 stainless steel, [ASTM A312/A312M [seamless] [welded]] [_____], Schedule [10S] [40S] [80S] [5S] [in accordance with Pipe Schedule]] [_____]. Equip outer pipe with [3] [_____] mm [0.125] [_____] inch vent holes spaced axially at [_____] mm inches on center or locking and venting collars at each flange. If insulated, equip the vents of the lined piping system with the manufacturer's standard vent extensions to avoid blocking. [Coat carbon steel piping components externally with corrosion resistant materials. Ensure coatings and finishes are 100 percent holiday free.]

2.5.2 Lined Steel Joints

Join lined piping by [[cast steel] [forged steel] flanges] [_____].

2.5.3 Lined Steel Fittings

Fittings must be [cast gray iron, [ASTM A126 Grade B] [_____], conforming to ASME B16.1] [cast ductile iron, [ASTM A395/A395M] [_____], conforming to ASME B16.42] [cast carbon steel, [ASTM A216/A216M Grade WCB] [_____], conforming to ASME B16.5] [cast, fabricated or forged carbon steel, [ASTM A587] [ASTM A106/A106M Grade B] [ASTM A53/A53M] [ASTM A105/A105M]] [stainless steel, [ASTM A312/A312M Grade 304L] [ASTM A276/A276M] [_____], conforming to ASME B16.5] [_____].

2.5.4 Lined Steel Flanged Fittings

Ensure the internal diameter bores of flanges and flanged fittings are the same as that of the associated pipe. [Cast steel, [ASTM A216/A216M Grade [WCB] [_____]] [_____],] [Forged steel, [ASTM A105/A105M] [_____],] [Stainless steel, [ASTM A312/A312M Grade 304L] [_____],] flanges and flanged fittings must be faced and drilled to ASME B16.5 Class [150] [300] [_____]. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must be [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____]. When mating flange on valves or equipment is cast iron, use [ASTM A193/A193M Grade [B8 Class 1] [_____] bolts and ASTM A194/A194M Grade [8] [_____] heavy hex head nuts] [______]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5 and nonmetallic conforming to ASME B16.21.

2.5.5 Lined Steel Spacers

For making connections between lined piping systems and other types of pipe or equipment, use spacers. Ensure spacers are composed of the same material as the liner with a bore identical to the internal diameter of the associated lined pipe. Unless otherwise specified for the liner systems, use a gasket between the spacer and the unlined piping system or equipment that conforms to the gaskets required for the unlined piping system or equipment nozzle. Spacers must be [standard ring] [standard full face] [lined steel ring] [as indicated on the contract drawings] [_____] for flanged connections. Provide spacers that are a minimum of [13] [_____] mm [1/2] [_____] inch thick for piping 200 mm 8 inches and smaller in diameter, and a minimum of [15] [_____] mm [5/8] [_____] inch thick for piping larger than 200 mm 8 inches in diameter. [Use] [Do not use] a tapered face spacer for piping directional changes less than [5] [_____] degrees, and do not use for piping directional changes larger than [5] [_____] degrees.

2.5.6 Glass Liner

****

NOTE: A pressure rating of 2 MPa 300 psi is available for the lining and piping system if Class 300 split flanges are used as joints.

****

Lock the liner to the shell. The liner must consist of [1.6] [_____] mm [1/16] [_____] inch of [chemical resistant, low-expansion, Type-I borosilicate glass, Glass A] [porcelain enamel] [_____] conforming to ASTM E438 rated to operate between -29 and plus 66 degrees C -20 and plus 450 degrees F at a nominal working pressure of [1.03] [_____] MPa [150] [_____] psig and full vacuum. [Test thermal shock resistance in accordance with ASTM C600.] [Use polytetrafluoroethylene (PTFE)] [_____] enveloped gaskets that conform to ASTM F336.

2.5.7 Perfluoroalkoxyl (PFA) Liner

****

NOTE: Liner thicknesses range from 1.5 to 3.8 mm 60 to 150 mil, depending on the size of the pipe. Nominal pipe diameters 25 mm 1 inch through 80 mm 3

inches are rated for full vacuum up to 230 degrees C 450 degrees F; 100 mm 4 inches diameter pipe is rated for full vacuum to 150 degrees C 300 degrees F; 150 mm 6 inches diameter pipe is rated for full vacuum at 120 degrees C 250 degrees F; and 200 mm 8 inches diameter pipe is rated for full vacuum at 65 degrees C 150 degrees F. Larger pipe diameters are available.

****

Lock the liner to the shell. The liner must consist of PFA, ASTM D3307 Type II, conforming to ASTM F1545, and rated to operate between -29 and plus 260 degrees C -20 and plus 500 degrees F. Ensure the lined piping system is rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. Provide pipe liner with a minimum wall thickness of [_____] mm mil. Provide liner for fittings with a minimum wall thickness and minimum uniform face thickness of [_____] mmmil. The part of the liner that extends onto a gasket face must have a uniform thickness of no less than 80 percent of the pipe liner wall thickness.

2.5.8 Polypropylene (PP) Liner

****

NOTE: Liner thicknesses range from 3.8 to 8.6 mm 150 to 340 mil), depending on size of pipe. Nominal pipe diameters 25 mm 1 inch through 300 mm 12 inch are rated for full vacuum up to 107 degrees C 225 degrees F, if the liner is of swaged construction. For interference fit type liners, pipe diameters 25 mm 1 inch through 200 mm 8 inch are rated for full vacuum to 107 degrees C 225 degrees F; 250 mm 10 inch and 300 mm 12 inch diameter pipe is rated for full vacuum to 38 degrees C 100 degrees F.

****

Lock the liner to the shell. The liner must consist of PP, ASTM D4101, must conform to ASTM F1545, and rated to operate between -18 and plus 107 degrees C 0 and 225 degrees F. Ensure the lined piping system is rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. Provide pipe liner with a minimum wall thickness of [_____] mm mil. Provide liner for fittings with a minimum wall thickness and minimum uniform face thickness of [_____] mm mil. The part of the liner that extends onto a gasket face must have a uniform thickness of no less than 80 percent of the pipe liner wall thickness.

2.5.9 Polytetrafluoroethylene (PTFE) Liner

****

NOTE: Liner thicknesses range from 1.5 to 3.8 mm 60 to 150 mil, depending on pipe dimensions. Nominal pipe diameters 25 mm 1 inch through 300 mm 12 inch are rated for full vacuum up to 107 degrees C 225 degrees F, if the liner is of swaged construction. For interference fit type liners, pipe diameters 25 mm 1 inch through 100 mm 4 inch are rated for full vacuum to 230 degrees C 450 degrees F; 150 mm 6 inch and 200 mm 8 inch diameter pipe is rated for full vacuum at 180 degrees C 350 degrees F. For swaged fit type liners, pipe diameters 25 mm 1 inch through

200 mm 8 inch are rated for full vacuum to 230 degrees C 450 degrees F. For slip fit type liners, pipe diameters 25 mm 1 inch through 100 mm 4 inch are rated for full vacuum to 230 degrees C 450 degrees F.

****

Lock the liner to the shell. The liner must consist of PTFE, must conform to [_____], and rated to operate between -29 and plus 260 degrees C -20 and plus 500 degrees F. Ensure the lined piping system is rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. Provide pipe liner with a minimum wall thickness of [_____] mm mil. The part of the liner that extends onto a gasket face must have a minimum uniform face thickness of [_____] mm mil.

2.5.10 Polyvinylidene Fluoride (PVDF) Liner

****

NOTE: Liner thicknesses range from 3.81 to 5.33 mm 150 to 218 mil depending on the pipe dimensions. Proper liner thickness assures a non-permeable lining. Nominal pipe diameters 25 mm 1 inch through 200 mm 8 inch are rated for full vacuum up to 135 degrees C 275 degrees F, if the liner is of swaged or interference fit construction. For loose fit type liners, nominal pipe diameters 25 mm 1 inch through 100 mm 4 inch are rated for full vacuum to 135 degrees C 275 degrees F, and 150 mm 6 inch and 200 mm 8 inch diameter pipe is rated for 64.2 kPa 19 inch of mercury of vacuum to 135 degrees C 275 degrees F.

****

Lock the liner to the shell. The liner must consist of PVDF, ASTM D3222, and must be rated to operate between -18 and plus 135 degrees C 0 and 275 degrees F. Ensure the lined piping system is rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. Provide pipe liner with a minimum wall thickness of [_____] mm mil. Provide liner for fittings with a minimum wall thickness and minimum uniform face thickness of [_____] mm mil. The part of the liner that extends onto a gasket face must have a uniform thickness of no less than 80 percent of the pipe liner wall thickness.

2.5.11 Rubber Liner

****

NOTE: Liner thicknesses range from 3.2 mm 0.125 inch to 12.7 mm 0.5 inch. Rubber lined pipe is not rated for vacuum service. Use a standard gasket for hard rubber lining. For soft rubber use a coating or sheet of polyethylene or similar material consistent with the application as a gasket. Operating temperature ranges are as follows:

natural rubber	**-54 to plus 82 degrees C -65 to plus 180 degrees F**

chloroprene	**-54 to plus 107 degrees C -65 to plus 225 degrees F**
isobutylene isoprene	**-54 to plus 149 degrees C -65 to plus 300 degrees F**
nitrile	**-54 to plus 107 degrees C -65 to plus 225 degrees F**
EPDM	**-54 to plus 149 degrees C -65 to plus 300 degrees F**
chlorosulfonated polyethylene	**-54 to plus 121 degrees C -65 to plus 250 degrees F**

****

Lock the liner to the shell. The liner must consist of [_____] mm inch of elastomeric material, ASTM D1418 Class [_____], with a hardness of [_____]. Terminate lining inside of the bolt holes. Fill remaining space from the liner to the flange edge with a [_____] mm inch [polytetrafluoroethylene (PTFE)] [polyvinylidene fluoride (PVDF)] [polypropylene (PP)] [_____] spacer. Provide flange gaskets that are [a maximum [3] [_____] mm [1/8] [_____] inches thick [polyethylene (PE)] [_____] [sheet] [or] [coating]] [[_____] gasket].

2.5.12 Polyvinylidene Chloride (PVDC) Liner

****
NOTE: No vents are needed in the outer pipe for PVDC. Liner thicknesses range from 3.8 to 5.5 mm 150 to 218 mil depending on the pipe dimensions.
****

Lock the liner to the shell. The liner must consist of PVDC conforming to ASTM F1545 and rated to operate between -18 and plus 79 degrees C 0 and 175 degrees F. Ensure the lined piping system is rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. Provide pipe liner with a minimum wall thickness of [_____] mm mil. Provide fittings liner with a minimum wall thickness and minimum uniform face thickness of [_____] mm mil. The part of the liner that extends onto a gasket face must have a uniform thickness of no less than 80 percent of the pipe liner wall thickness.

2.5.13 Lined Steel Cathodic Protection

Buried ferrous piping must have cathodic protection.

2.6 STAINLESS STEEL PIPING SYSTEM

****
NOTE: The following paragraphs specify general liquid service use of stainless steel piping. To specify the material, review the application. For example, of the austenitic steels, TP316 or TP316L have better resistance to pitting corrosion than

TP304 or TP304L where brines, sulphur-bearing waters or halogen salts, such as chlorides, are present.

The option for crimped couplings and fittings requires a low pressure application - less than 1.03 MPa 150 psig, service where the stainless steel piping materials (TP304, TP304L, TP316 and TP316L) are compatible to the fluid and thin wall (schedule 5S) pipe or tubing. A limited number of manufacturers are available so include other joint/fitting option(s).

****

2.6.1 Austenitic Piping

2.6.1.1 Stainless Steel Pipe

Stainless steel pipe intended for general corrosive service must meet the requirements of [ASTM A312/A312M, [seamless] [welded]] [ASTM A813/A813M for fit-up and alignment quality, Class [SW] [DW]] [ASTM A814/A814M for flanged and cold-bending quality, Class [SW] [DW]] [_____], Grade [TP304] [TP304L] [TP316] [TP316L] [_____], Schedule [10S] [40S] [80S] [5S] [in accordance with Pipe Schedule] [_____] with dimensions conforming to ASME B36.19M.

2.6.1.2 Stainless Steel Tubing

Provide stainless steel tubing meeting the requirements of [[ASTM A269/A269M] [ASTM A632], [seamless] [welded], Grade [TP304] [TP304L] [TP316] [TP316L] [_____]] [ASTM A789/A789M, [seamless] [welded], Grade [S32760] [_____]] with nominal size and wall thickness [in accordance with Pipe Schedule] [_____].

2.6.1.3 Stainless Steel Joints

Join stainless steel piping by [threaded couplings] [welded fittings] [flanges] [crimping couplings]. Join tubing using [crimping couplings] [compression] [_____] fittings. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.6.1.4 Stainless Steel Threaded Fittings

Provide threaded fittings consisting of [austenitic stainless steel, [ASTM A182/A182M Grade [TP304] [TP304L] [TP316] [TP316L] [_____], conforming to [ASME B16.11] [_____], and threaded in accordance with ASME B1.20.2M ASME B1.20.1.]] Use [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.6.1.5 Stainless Steel Welding Fittings

Provide [butt-welding] [or] [socket-welding] welding fittings. Provide welding fittings consisting of forged austenitic stainless steel, [ASTM A403/A403M Grade [TP304] [TP304L] [TP316] [TP316L] [_____], [butt-welding fittings, Class [CR], conforming to ASME B16.9] [socket-welding fittings, Class [WP-S] [WP-W] [WP-WX] [WP-WU], conforming to ASME B16.11].] [_____].

2.6.1.6 Stainless Steel Flanged Fittings

Provide internal diameter bores of flanges and flanged fittings that are the same as that of the associated pipe. Ensure flanges are [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Provide flanges and flanged fittings consisting of [forged austenitic stainless steel, ASTM A182/A182M Grade [TP304] [TP304L] [TP316] [TP316L] [_____]] [_____], Class [150] [300] [_____], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. [Drill cast austenitic stainless steel backing flanges, ASTM A351/A351M Grade [_____], Van Stone type, to [ASME B16.5] [ASME B16.1] Class [150] [_____].] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must be [alloy-steel ASTM A193/A193M Grade [B8] [B8C] [_____] hex head bolts and ASTM A194/A194M Grade [8] [8C] [_____] hex head nuts] [_____]. When mating flange on valves or equipment is cast iron, use [ASTM A193/A193M Grade [B8 Class 1] [_____] bolts and ASTM A194/A194M Grade [8] [_____] heavy hex head nuts] [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 and that are a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [_____], 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [_____].]

2.6.1.7 Stainless Steel Crimping Fittings

Crimping fittings must be cold drawn, [TP304] [TP304L] [TP316] [TP316L] austenitic stainless steel. O-ring seals must be [butadiene acrylonitrile] [ethylene propylene diene monomer (EPDM)] [fluoro-elastomeric] [_____].

2.6.1.8 Compression Fittings for Tubing

Provide compression fittings consisting of [ASTM A479/A479M] [_____] stainless steel, Grade TP316, nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

2.6.1.9 Stainless Steel Cathodic Protection

Buried ferrous piping must have cathodic protection.

2.6.2 Ferritic and Martensitic Piping

2.6.2.1 Pipe

Provide stainless steel pipe meeting the requirements of [ASTM A268/A268M, [seamless] [welded], Grade [S44627] [S43035TP430] [_____], Schedule [5S] [10S] [40S] [80S] [in accordance with Pipe Schedule]] [_____] with dimensions conforming to ASME B36.19M.

2.6.2.2 Tubing

Provide stainless steel tubing meeting the requirements of [ASTM A268/A268M, [seamless] [welded], Grade [TP410] [_____]] [ASTM A789/A789M, [seamless] [welded], Grade [S31500] [_____]] [ASTM A268/A268M, welded, unannealed Grade [S44627] [_____]] with nominal size and wall thickness [in accordance with Pipe Schedule] [_____].

2.6.2.3 Joints

Join stainless steel piping by [threaded couplings] [welding fittings] [flanges]. Join tubing using [compression] [_____] fittings. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.6.2.4 Threaded Fittings

Provide threaded fittings consisting of [stainless steel, ASTM A182/A182M Grade [TP430] [6a Class 1] [_____], conforming to [ASME B16.11] [_____], and threaded in accordance with ASME B1.20.2MASME B1.20.1.] [Use polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.6.2.5 Welding Fittings

Provide [butt-welding] [or] [socket-welding] welding fittings. Provide welding fittings consisting of forged stainless steel, [ASTM A815/A815M Grade [TP430] [TP410] [_____], [butt-welding fittings, Class CR, conforming to ASME B16.9] [socket-welding fittings, Class [WP-S] [WP-W] [WP-WX], conforming to ASME B16.11].] [_____].

2.6.2.6 Flanged Fittings

Provide internal diameter bores of flanges and flanged fittings that are the same as that of the associated pipe. Ensure flanges are [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Provide flanges and flanged fittings consistig of [forged stainless steel, ASTM A182/A182M Grade [TP430] [6a Class 1] [_____]] [_____], Class [150] [300] [_____], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. [Drill cast stainless steel backing flanges, ASTM A352/A352M Grade [_____], Van Stone type, to [ASME B16.5] [ASME B16.1] Class [150] [_____].] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must be [alloy-steel ASTM A193/A193M Grade [L7] [L7A] [_____] hex head bolts and ASTM A194/A194M Grade [7] [7A] [_____] hex head nuts] [_____]. When mating flange on valves or equipment is cast iron, use [ASTM A193/A193M Grade Grade [B8 Class 1] [_____] bolts and ASTM A194/A194M Grade [8] [_____] heavy hex head nuts] [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 and a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [_____], 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [_____].]

2.6.2.7 Compression Fittings for Tubing

Provide compression fittings consisting of [ASTM A479/A479M] [_____] stainless steel, Grade TP316, nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

2.6.2.8 Cathodic Protection

Buried ferrous piping must have cathodic protection.

2.7 NICKEL AND NICKEL ALLOYS PIPING SYSTEMS

****

NOTE: The preferred method for joining nickel and nickel alloy pipe is welding due to cost of flanges. In all cases, only Schedules 40S and 80S can be threaded due to wall thickness. Flanges should be used when attaching nickel pipe to pumps, process vessels, and other equipment that requires removal periodically. Generally, for temperatures up to 115 degrees C 240 degrees F, and normal pressures encountered, the chloroprene gasket specified is appropriate for most "dilute" process liquids, water and sludge services. However, other liquids may require other, more suitable gasket materials.

****

2.7.1 Nickel

****

NOTE: Alloy N02200 and alloy N02201 are the 2 basic compositions of nickel pipe. Alloy N02200 is limited to a maximum operating temperature of 315 degrees C 600 degrees F.

****

2.7.1.1 Nickel Pipe

[Alloy N02200] [Alloy N02201] nickel pipe must be [seamless conforming to ASTM B161 and ASTM B829] [welded conforming to ASTM B725 and ASTM B775/B775M], and dimensioned Schedule [5S,] [10S,] [40S,] [80S] [in accordance with the Pipe Schedule in the contract drawings].

2.7.1.2 Nickel Joints

Joining must use [welded] [or] [threaded] [_____] methods, except that connections to equipment or spool pieces that may be periodically removed must be [flanged] [_____]. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.7.1.3 Nickel Fittings

Fittings including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43 must be [butt] [or] [socket] welding and meet the requirements of ASTM B366/B366M. Provide fittings for alloy N02200 that are [corrosion resistant, Grade CRN] [Class [150] [_____], Grade WPN] and for alloy N02201, provide fittings that are [corrosion resistant, Grade CRNL] [Class [150] [_____], Grade WPNL].

2.7.1.3.1 Welding Fittings

Conduct welding in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.1.3.2 Threaded Fittings

Provide threads in accordance with ASME B1.20.2MASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308]

[_____] for lubricant/sealant.

2.7.1.3.3 Flanged Fittings

Provide flanges and flanged fittings consisting of [ASTM B564 forged nickel alloy [N02200] [_____]] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system] [_____], Class [150] [300] [600], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. Ensure flanges are [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Use cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, drilled to [ASME B16.5] [ASME B16.1] Class [150] [_____]. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [nickel-copper alloy, ASTM B164 alloy [N04400] [_____] Temper [_____], bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [_____] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Nonmetallic gaskets must conform to ASME B16.21 and be a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [_____], 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [_____].]

2.7.2 Nickel-Molybdenum-Chromium (NMC) Alloy

2.7.2.1 NMC Pipe

[Alloy N06022] [Alloy N06455] [Alloy N10276] [Hastelloy] [_____] NMC alloy pipe must be [seamless conforming to ASTM B622 and ASTM B829] [welded conforming to ASTM B619/B619M and ASTM B775/B775M], and dimensioned Schedule [5S,] [10S,] [40S,] [80S] [in accordance with the Pipe Schedule].

2.7.2.2 NMC Tubing

Provide seamless tubing conforming to ASTM B622 NMC alloy [N06022] [N06455] [Hastelloy] [_____] with nominal size and wall thickness [in accordance with Pipe Schedule] [_____].

2.7.2.3 NMC Joints

Use [welded] [or] [threaded] [_____] joining methods, except use [flanged] [_____] connections to equipment or spool pieces that may be periodically removed. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.7.2.4 NMC Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43, must be [butt] [or] [socket] welding and meet the requirements of ASTM B366/B366M. Provide fittings for alloy N06022 that are [corrosion resistant, Grade CRHC22] [Class [150] [_____], Grade

WPHC22]; for alloy N06455, provide fittings that are [corrosion resistant, Grade CRHC4] [Class [150] [_____], Grade WPHC4]; and for alloy N10276, provide fittings that are [corrosion resistant, Grade CRHC276] [Class [150] [_____], Grade WPHC276] [_____].

2.7.2.4.1 Welding Fittings

Conduct welding in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.2.4.2 Threaded Fittings

Provide threads in accordance with ASME B1.20.2MASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.7.2.4.3 Flanged Fittings

Provide flanges and flanged fittings consisting of [ASTM B564 forged NMC alloy [N06022] [N10276] [Hastelloy] [_____]] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system, Class [150] [300] [600] and drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face]] [_____]. The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Use cast steel backing flanges, [ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, and drilled to [ASME B16.5] [ASME B16.1 Class [150]] [_____]]. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [low carbon NMC alloy, ASTM B574 alloy [N06022] [_____] Temper [_____], bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [_____] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 and a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [_____], 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [_____].]

2.7.2.5 NMC Compression Fittings for Tubing

Compression fittings must be of ASTM B574 [low carbon NMC alloy] [Hastelloy], nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

2.7.3 Nickel-Copper Alloy

2.7.3.1 Nickel-Copper Pipe

Alloy [N04400] [_____] nickel-copper alloy pipe must be [seamless conforming to ASTM B165, [annealed] [stress-relieved] condition, and ASTM B829] [welded conforming to ASTM B725 and ASTM B775/B775M], and dimensioned Schedule [5S,] [10S,] [40S,] [80S] [in accordance with the Pipe Schedule].

2.7.3.2 Nickel-Copper Tubing

Provide seamless tubing conforming to ASTM B165 nickel-copper alloy N04400, [annealed] [stress-relieved] condition, with nominal size and wall thickness [in accordance with Pipe Schedule] [_____].

2.7.3.3 Nickel-Copper Joints

Use [welded] [or] [threaded] [_____] joining methods, except use [flanged] [_____] connections to equipment or spool pieces that may be periodically removed. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.7.3.4 Nickel-Copper Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43, must be [butt] [or] [socket] welding and meet the requirements of ASTM B366/B366M. Fittings for alloy [N04400] [_____] must be [corrosion resistant, Grade CRNC] [Class [150] [_____], Grade WPNC] [_____].

2.7.3.4.1 Welding Fittings

Conduct welding in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.3.4.2 Threaded Fittings

Provide threads in accordance with ASME B1.20.2MASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.7.3.4.3 Flanged Fittings

Flanges and flanged fittings must be [ASTM B564 forged nickel-copper alloy [N04400] [_____]] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system] [_____], Class [150] [300] [600], and drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. [Use cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, and drilled to [ASME B16.5] [ASME B16.1] Class [150] [_____].] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [nickel-copper alloy, ASTM B164 alloy [N04400] [_____] Temper [_____], bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [_____] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 that are a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [_____], 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [_____].]

2.7.3.5 Nickel-Copper Compression Fittings for Tubing

Compression fittings must be of ASTM B164 nickel-copper alloy [N04400] [N04405] nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Threads must be straight, conforming to [ISO 228-1] [ASME B1.1].

2.7.4 Nickel-Chromium-Iron (NCI) Alloy

2.7.4.1 NCI Pipe

Alloy [N06600] [N06025] [N06045] [_____] NCI alloy pipe must be [seamless conforming to ASTM B167 and ASTM B829] [welded conforming to ASTM B517 and ASTM B775/B775M] [electric fusion-welded conforming to ASTM B546, and dimensioned Schedule [5S,] [10S,] [40S,] [80S]] [in accordance with the Pipe Schedule in the contract drawings].

2.7.4.2 NCI Joints

Use [welded] [or] [threaded] [_____] joining methods, except use [flanged] [_____] connections to equipment or spool pieces that may be periodically removed. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.7.4.3 NCI Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43, must be [butt] [or] [socket] welding and meet the requirements of ASTM B366/B366M. Fittings for alloy N06600 must be [corrosion resistant, Grade CRNCl] [Class [150] [_____], Grade WPNCl]; for alloy N06025, fittings must be [corrosion resistant, Grade CRV602] [Class [150] [_____], Grade WPV602]; and for alloy N06045, fittings must be [corrosion resistant, Grade CRV45TM] [Class [150] [_____], Grade WPV45TM] [_____].

2.7.4.3.1 Welding Fittings

Conduct welding in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.4.3.2 Threaded Fittings

Provide threads in accordance with ASME B1.20.2MASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.7.4.3.3 Flanged Fittings

Provide flanges and flanged fittings consisting of [ASTM B564 forged NCI alloy [N06600] [_____]] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system] [_____], Class [150] [300] [600], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. [Use cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, and drilled to [ASME B16.5] [ASME B16.1] Class [150] [_____].] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [NCI alloy, ASTM B164 alloy [N06600] Temper [_____], bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [_____] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 that are a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [_____], 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and be constructed of [_____].]

2.8 ALUMINUM PIPING SYSTEM

****

NOTE: Alloys 1060, 3003, 5052, 6061 and 6063 are the most common compositions of aluminum pipe. Alloy 6063 is most widely used due to economical cost, good corrosion resistance and mechanical properties.

The preferred method for joining aluminum pipe to handle corrosives is welding. Be aware that welding reduces tensile strength. Threading is not recommended for aluminum piping systems that handle corrosives. Flanges are usually limited to connecting aluminum pipe to pumps, process vessels, etc.

****

2.8.1 Aluminum Pipe

Aluminum and aluminum alloy pipe must be seamless alloy [6063] [6061] [5052] [3003] [1060], Temper [TL] [_____], Schedule [5S] [10S] [40S] [80S] [in accordance with the Pipe Schedule], with AA ANSI H35.2M standard dimensions, and conforming to [ASTM B241/B241M with [ASME B1.20.2M ASME B1.20.1 threaded] [standard] ends] [ASTM B345/B345M with [ASME B1.20.2M ASME B1.20.1ASME B1.20.2M threaded] [grooved] [beveled] [standard] [_____] ends].

2.8.2 Aluminum Tubing

Tubing must be drawn seamless and conform to ASTM B210/B210M alloy [6061, temper T6,] [_____] with nominal size and wall thickness [in accordance with Pipe Schedule] [_____].

2.8.3 Aluminum Joints

Use [welded] [mechanical coupling] [or] [threaded] [_____] joining methods, except use [flanged] [_____] connections to equipment or spool pieces that may be periodically removed. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.8.4 Aluminum Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, must be [butt][or][socket] welding and meet the requirements of ASTM B361. Provide Grade [WP1060] [WP3003] [WP Alclad 3003] [WP6061] [or] [WP6063] fittings.

2.8.4.1 Aluminum Welding Fittings

Welding fittings must be [butt-welding] [or] [socket-welding] and factory made, wrought alloy [WP6063] [_____] in accordance with ASTM B361. [Provide butt-welding fittings conforming to ASME B16.9.] [Provide socket-welding fittings conforming to ASME B16.11.] Conduct welding in accordance with AWS A5.3/A5.3M and AWS A5.10/A5.10M.

2.8.4.2 Aluminum Threaded Fittings

Provide threaded fittings consisting of forged aluminum alloy [3003] [6061] [_____], Temper [_____], in accordance with ASTM B247M ASTM B247 and conforming to ASME B16.11. Provide threads in accordance with ASME B1.20.2M ASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.8.4.3 Aluminum Flanged Fittings

Design flanges and flanged fittings in accordance with ASME B31.3. Flanges must be forged aluminum alloy [3003] [6061] [_____] Temper [_____], conforming to ASTM B247M ASTM B247, Class [150] [300] [600] [_____], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [aluminum bolting material, conforming to ASTM B211/B211M and ASME B16.5, dimensioned to ASME B18.2.1 and ASME B18.2.2 and with ASME B1.1 coarse threads] [_____]. Provide bolts with washers of the same material as the bolts. [Gaskets listed in ASME B16.5, Annex E, Fig. E1, Group 1a may be used with any flange rating class and bolting.] [Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336.]

2.8.4.4 Aluminum Compression Fittings for Tubing

Provide compression fittings consisting of ASTM B211/B211M aluminum alloy [2014], temper [T4] [T6], nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

2.8.5 Aluminum Piping Supports

****

NOTE: Galvanic corrosion must be prevented from occurring on piping support systems. Conventional steel hangers should not be used. Galvanized steel is acceptable only as long as the galvanizing is intact; therefore, a galvanized system should not be used where expansion/contraction or other piping movement is likely.

****

Support piping system using [aluminum] [[galvanized] [alloy] [_____] steel units, integrally padded with [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____],] [_____] piping supports conforming to MSS SP-58. Do not use conventional steel and galvanized pipe hangers for aluminum piping systems.

2.9 COPPER PIPING SYSTEM

****

NOTE: This paragraph covers copper pipe that may be used for corrosive services, and tubing used for noncorrosive water; refrigerant, and sample lines, etc. Copper is rapidly corroded by oxidizing acids such as chromic and nitric acids. The most common copper alloy is alloy 122 (C12200); however, other alloys may also be suitable for use. These include C10200, C10300, C10800 and C12000.

Thin walled piping systems (ASTM B302) can only be assembled using brazed joint pipe fittings. However, for high pressure and Class 'M' fluid services soldered or brazed joints and fittings are not permitted pursuant to ASME B31.3.

****

2.9.1 Copper Pipe

Seamless [C12200] [_____] copper alloy pipe, must be a [[O61 (annealed] [H55 (light-drawn)] [or] [H80 (hard-drawn)] Temper with [regular] [extra strong] standard dimensions conforming to ASTM B42] [H (drawn) Temper with standard dimensions conforming to ASTM B302].

2.9.2 Copper Tubing

Provide seamless copper alloy tubing conforming to [ASTM B88M ASTM B88 alloy C12200, Type [K] [L] [or] [M], with a [O60 (annealed)] [H (drawn)] temper] [ASTM B75/B75M alloy [C12200] [_____] with a [O60 (soft-annealed)] [_____] temper]. Specifications for applications include: [refrigerant tubing - Type L, hard drawn] [P-trap priming connection - Type L, soft Temper] [sample lines - Type L, hard drawn] [_____].

2.9.3 Copper Joints

Join pipe using [threaded] [soldered] [or] [brazed] fittings and [flanged] [_____] connections to equipment. Join tubing using [solder] [flared] [or] [press] [compression] fittings. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.9.4 Copper Fittings

Provide component castings of flanges and fittings consisting of copper alloy [C92200, Temper [_____] conforming to ASTM B61] [C83600 (also known as alloy 85-5-5-5), Temper [_____] in accordance with ASTM B62]. Provide solder joint fittings conforming to ASME B16.22 and ASME B16.18. Provide fittings for flared copper tube conforming to ASME B16.26. Provide cast bronze threaded fittings conforming to ASME B16.15 and are threaded in accordance with ASME B1.20.2MASME B1.20.1. Ensure flanges and flanged fittings are faced and drilled Class [150] [300] [_____] in accordance with ASME B16.26. Provide copper and bronze press fittings conforming to material requirements of ASME B16.18 or ASME B16.22 and performance criteria of IAPMO PS 117. Sealing elements must be of EPDM and factory installed or an alternative supplied by fitting manufacturer. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Tubing compression fittings must be [forged brass alloy C37700, conforming to ASTM B124/B124M] [_____], nuts, ferrules and bodies rated to a minimum [_____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.9.4.1 Bolting For Copper Piping

Provide bolting materials that meet the requirements of ASME B31.1 and consist of [ASTM B98/B98M alloy [C65100] [C66100]] [ASTM B150/B150M alloy [C63000] [C64200]] [ASTM B164 alloy [N04400] [N04405]] [_____] materials. Provide bolts with washers of the same material as the bolts.

2.9.4.2 Gaskets For Copper Piping

[Gaskets listed in ASME B16.5, Annex E, Group [1a] [1b] may be used with any flange rating class and bolting.] [Provide nonmetallic, full faced gaskets used with low strength or non-ferrous bolting with a seating pressure less than 11.0 MPa 1,600 psi.] Ensure gasket dimensions conform to [ASME B16.21] [ASME B16.20].

2.9.5 Solder For Copper Piping

****

NOTE: Solder compositions can be selected from Table 5 contained in ASTM B32. Common solder types are Sb5 and SN95. Selection should be made based on suitability to the application considering temperature and corrosivity.

****

Use solder [and flux] conforming to ASTM B32 [and AWS A5.8/A5.8M]. The solder alloy must [be [_____]] [contain less than 0.2 percent lead]. [Ensure the flux type is [R] [RMA] [RA] [OA] [OS] [IS] and conforms to ASTM B813.]

2.9.6 Copper Piping Supports

****

NOTE: Galvanic corrosion must be prevented from occurring to piping support systems; conventional and galvanized steel hangers should not be used.

****

Support piping system using [copper] [brass] [padded steel] [_____] piping supports that conform to MSS SP-58. Do not use conventional steel and galvanized pipe hangers for copper piping systems. Ensure all valves, instruments and other equipment attached to the piping system are individually supported.

2.10 PLASTIC PIPING SYSTEM

****

NOTE: Plastic Piping Systems - Many of the thermoplastic piping systems are available in both a nominal pipe schedule dimension or in a standard dimension rating (SDR). Schedule based piping has the same dimensions, outer diameter and wall

thickness, as steel pipe but the pressure rating decreases with increasing pipe diameter. For SDR pipe, the pressure rating is kept uniform for all nominal pipe sizes of a given material and SDR value by increasing wall thickness. Refer to ASTM D2241 and ASTM D1785 for PVC SDR piping.

Backing flanges for plastic piping systems can be stainless steel, ductile iron, steel (galvanized and plain), or aluminum, depending on the application. Change the flange subparagraphs accordingly. Similarly, change the gasket material selections as required by the liquid application.

Use PVC for selected chemical services, where pipelines may be subjected to exterior corrosion, and liquid processes of 60 degrees C 140 degrees F or below.

Schedule 40 pipe should not be threaded at all. Schedule 80 pipe should not be threaded in sizes larger than 100 mm 4 inch. Schedule 80 threaded joints larger than 50 mm 2 inch must be back-welded to achieve fully rated maximum operating pressures.

****

Submit documentation certifying that the manufacturer of each thermoplastic piping system is listed with the Plastic Pipe Institute as meeting the recipe and mixing requirements of the resin manufacturer for the resin used to manufacture each of the respective thermoplastic pipe systems.

2.10.1 PVC Pipe

PVC, ASTM D1784, minimum cell classification [12545-C] [_____], pipe must be [Schedule [40] [80] [_____] conforming to ASTM D1785] [manufactured to an SDR rating in accordance with ASTM D2241, so that the pressure rating of the pipe is consistent for all pipe sizes. Provide SDR [_____] pipe with a pressure rating of [_____] MPa psig at [_____] degrees C degrees F] [_____].

2.10.2 PVC Tubing

Provide flexible and clear tubing with nominal size and wall thickness [in accordance with Pipe Schedule] [_____] [and reinforcement].

2.10.3 PVC Joints

Join piping system by [socket-weld] [flanged] [or] [mechanical] connections except where connecting to unions, valves, and equipment with threaded connections that may require future disassembly. Ensure connections at those points are threaded and back-welded. Tubing connections must use compression fittings.

2.10.4 PVC Fittings

****

NOTE: Specify ASTM D2464 for Schedule 80 threaded type; ASTM D2466 for Schedule 40 socket type; ASTM D2467 for Schedule 80 socket type.

****

Ensure the schedule rating for the fittings is not less than that for the associated pipe. Fittings must be ASTM D1784, minimum cell classification [_____], PVC conforming to the requirements of [ASTM D2464, threaded in accordance with ASME B1.20.2MASME B1.20.1] [ASTM D2466, socket type] [ASTM D2467, socket type]. [[No] [_____] thread lubricant is required.]

2.10.4.1 Push-on Joints

Seal push-on type joints with [ethylene propylene rubber (EPR)] [_____] gaskets in accordance with ASTM F477.

2.10.4.2 Flanged Fittings

Provide flanges and flanged fittings that are Class [125] [_____], [one piece, molded hub type, flat faced, and conform to [ASME B16.1] [ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Provide flanges complete with one-piece, molded PVC stub ends]. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3] [_____] mm [1/8] [_____] inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the PVC flange from bolting moment.

2.10.4.3 Tubing Fittings

Provide compression type fittings comprised of [forged brass alloy C37700, conforming to [ASTM B124/B124M] [_____], nuts, ferrules and bodies] [[acetal] [polypropylene] [polyvinylidene fluoride (PVDF)] [_____] nuts and bodies, with elastomeric O-ring seals] [[polypropylene] [_____] bodies, barb and holding nut] [_____], rated to a minimum [_____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.10.5 PVC Solvent Cement

Join socket connections with PVC solvent cement conforming to ASTM D2564. Ensure manufacture and viscosity is as recommended by the pipe and fitting manufacturer to assure compatibility. [Prepare joints with primers conforming to ASTM F656 prior to cementing and assembly.]

2.11 CHLORINATED POLYVINYL CHLORIDE (CPVC)

****

NOTE: Use CPVC for chemical or corrosive services that are between 60 degrees C 140 degrees F and 99 degrees C 210 degrees F.

Like PVC, CPVC Schedule 40 pipe should not be threaded at all. Schedule 80 pipe should not be threaded in sizes larger than 100 mm 4 inch. Schedule 80 threaded joints larger than 50 mm 2 inch must be back-welded to achieve fully rated maximum operating pressures.

****

2.11.1 CPVC Pipe

CPVC, ASTM D1784, minimum cell classification [23447] [_____], pipe must be [Schedule [40] [80] conforming to ASTM F441/F441M] [manufactured to an SDR rating in accordance with ASTM F442/F442M, so that the pressure rating of the pipe is consistent for all pipe sizes. Provide SDR [_____] pipe with a pressure rating of [_____] MPa psig at [_____] degrees C degrees F] [_____].

2.11.2 CPVC Joints

Join piping system by [socket-weld] [flanged] [or] [mechanical] connections except where connecting to unions, valves, and equipment with threaded connections that may require future disassembly. Ensure connections at those points are threaded and back-welded.

2.11.3 CPVC Fittings

****

NOTE: Specify ASTM F437 for Schedule 80 threaded type; ASTM F438 for Schedule 40 socket type; ASTM F439 for Schedule 80 socket type.

****

Ensure the schedule rating for the fittings is not less than that for the associated pipe. Fittings must be ASTM D1784, cell classification [23447] [_____], CPVC conforming to the requirements of [ASTM F437, threaded in accordance with ASME B1.20.2MASME B1.20.1] [ASTM F438, socket type] [ASTM F439, socket type]. [[No] [_____] thread lubricant is required.]

2.11.3.1 Push-on Joints

Seal push-on type joints with [ethylene propylene rubber (EPR)] [_____] gaskets in accordance with ASTM F477.

2.11.3.2 Flanged Fittings

Provide flanges and flanged fittings that are Class [125] [_____], [one piece, molded hub type, flat faced, and conforming to [ASME B16.1] [ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Provide flanges complete with one-piece, molded CPVC stub ends]. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3.2 mm 0.125 inch] [[_____] mm inch] thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the CPVC flange from the bolting moment.

2.11.4 Solvent Cement

Join socket connections with PVC solvent cement conforming to ASTM F493. Ensure manufacture and viscosity is as recommended by the pipe and fitting manufacturer to assure compatibility.

2.12 POLYVINYLIDENE FLUORIDE (PVDF)

****

NOTE: PVDF pipe is chemically resistant to most acids, bases and organics, and can transport liquid halogen solutions of chlorine or bromine. PVDF should not be used with strong alkalis, fuming acids, polar solvents, amines, ketones or esters. PVDF does not degrade in sunlight; therefore, PVDF does not require UV stabilizers or antioxidants. Use on liquids above 49 degrees C 120 degrees F require continuous support. Care must be used in using PVDF piping under suction.

****

2.12.1 PVDF Pipe

[High Purity] PVDF, conforming to ASTM D3222, pipe must be [Schedule [40] [80]] [manufactured to a SDR rating so that the pressure rating of the pipe is consistent for all pipe sizes. The pipe must be SDR with a pressure rating of [1.03 MPa 150 psig at 23 degrees C 73.4 degrees F] [1.6 MPa 232 psig at 23 degrees C 73.4 degrees F]] [_____].

2.12.2 PVDF Tubing

Provide flexible tubing with nominal size and wall thickness [in accordance with Pipe Schedule] [_____].

2.12.3 PVDF Joints

****

NOTE: Fusion welding is the preferred method for joining PVDF pipe. Threading can only be accomplished on Schedule 80 pipe.

****

Join PVDF pipe by [thermal butt-fusion] [socket heat fusion] [or] [socket electric-resistance fusion], except where connecting to valves and equipment that may require future disassembly, provide [threaded] [or] [flanged] joints. Tubing connections must use compression fittings.

2.12.4 PVDF Fittings

Provide molded PVDF fittings. Provide fittings with the same or higher pressure rating as the pipe when installed in accordance with the latest technical specifications. Provide flanges and flanged fittings that are Class [125] [_____], [one piece, molded hub type, flat faced, and conforming to [ASME B16.1] [ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Provide flanges complete with one-piece, molded PVDF stub ends]. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3] [_____] mm [1/8] [_____] inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the PVDF flange from bolting moment. Provide compression type tubing fittings comprised of [forged brass alloy C37700, conforming to ASTM B124/B124M [_____], nuts, ferrules and bodies] [[acetal] [polypropylene] [polyvinylidene fluoride (PVDF)] [_____] nuts and bodies, with elastomeric O-ring seals] [[polypropylene] [_____] bodies, barb and holding nut] [_____], rated to a minimum [_____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.13 ACRYLONITRILE-BUTADIENE-STYRENE (ABS) Piping

****

NOTE: ABS piping is resistant to many chemicals, however, for mixed waste systems chemical analyses and corrosion testing may be necessary to properly select the piping system. The recommended maximum temperature for continuous liquid applications is 82 degrees C 180 degrees F.

Verify acceptance and installation of ABS piping systems with local code enforcement authorities having jurisdiction.

****

2.13.1 ABS Pipe

****

NOTE: While ASTM D1527 has been withdrawn by ASTM without replacement, the standard remains a valid reference.

****

ABS, ASTM D3965, minimum cell classification [42222][_____], pipe must be Schedule [40][80] conforming to ASTM D1527, so that the pressure rating of the pipe is consistent for all pipe sizes. Provide SDR [_____] pipe with a pressure rating of [_____] MPa psig at [_____] degrees C degrees F. Where ABS pipe is subjected to severe temperature fluctuations, provisions for expansion and contraction must be provided. Accomplish this with the use of expansion joints and offset piping arrangements.

2.13.2 ABS Joints

Join pipe by solvent cementing, except where connecting to valves and equipment that may require future disassembly, then provide [flanged] [_____] joints.

2.13.3 ABS Fittings

Provide molded ABS fittings. Ensure fittings have the same or higher pressure rating as the pipe when installed in accordance with the specifications. Provide flanges and flanged fittings that are Class [125][_____], [one piece, molded hub type, flat faced, and conform to [ASME B16.1][ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [ASME B16.1][ASME B16.5] drilling. Provide flanges complete with one-piece, molded ABS stub ends]. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8][B8M][_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Bolts Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3.2 mm 0.125 inch] [[_____] mm inch] thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21. When the mating flange has a raised face, aupplya flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the ABS flange from bolting moment.

2.13.4 ABS Solvent Cement

Join socket connections with ABS solvent cement conforming to ASTM D2235. Use viscosity as recommended by the pipe and fitting manufacturer to assure compatibility.

2.14 POLYETHYLENE (PE)

****

NOTE: The requirements listed below are for normal pressure applications, and where operating temperatures will not exceed 38 degrees C 100 degrees F. For more difficult installations and/or higher temperatures, the ASTM D3350 cell classification should be carefully chosen. In addition, use the cell classification to specify UV stabilizers and color additives.

****

2.14.1 PE Pipe

Ensure pipe is extruded from PE, ASTM D3350 with a minimum cell classification of [324433-C] [_____]. The PE pipe must be [Schedule [40] [80]] [[manufactured to an SDR rating in accordance with ASTM D3035 for piping systems less than 100 mm 4 inch in diameter, or in accordance with ASTM F714 for piping systems with a diameter equal to or greater than 100 mm 4 inch] [manufactured to an SDR rating in accordance with ASTM D2239 for use with insert fittings], so that the pressure rating of the pipe is consistent for all pipe sizes. Provide SDR [_____] pipe with a pressure rating of [_____] MPa psig at [_____] degrees C degrees F] [Schedule 40 conforming to ASTM D2239 for use with insert fittings] [_____].

2.14.2 PE Tubing

Tubing must be flexible [low-density PE conforming to ASTM D3350, minimum cell classification [_____], and dimensioned in accordance with ASTM D2737] [crosslinked PE conforming to ASTM D3350, minimum cell classification [35400] [_____], and dimensioned in accordance with ASTM F876] with nominal size [in accordance with Pipe Schedule] [_____].

2.14.3 PE Joints

Join PE pipe by [thermal butt-fusion] [socket heat fusion] [and/or] [socket electrofusion], except where connecting to valves and equipment that may require future disassembly, use [threaded [polystyrene] [_____] fittings] [or] [flanged] joints.

2.14.4 PE Fittings

Provide PE fittings with the same or higher pressure rating as the pipe when installed in accordance with the latest technical specifications. Provide molded PE fittings. Provide butt-fusion fittings conforming to

ASTM D3261. Provide socket-fusion fittings conforming to ASTM D2683 with tools meeting the requirements of ASTM F1056. Provide insert fittings conforming to ASTM D2609.

2.14.4.1 Couplings

Join couplings and saddle joints by electrofusion in accordance with ASTM F1055.

2.14.4.2 Flanged Fittings

Provide flanges and flanged fittings that are [Class [125] [_____]], [ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Provide flanges complete with one-piece, molded PE stub ends. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3] [_____] mm [1/8] [_____] inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21.

2.14.4.3 Tubing Fittings

Provide compression type fittings comprised of [forged brass alloy C37700, conforming to ASTM B124/B124M [_____], nuts, ferrules and bodies] [[acetal] [polypropylene] [polyvinylidene fluoride (PVDF)] [_____] nuts and bodies, with elastomeric O-ring seals] [[polypropylene] [_____] bodies, barb and holding nut] [_____], rated to a minimum [_____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.15 RUBBER/ELASTOMER PIPING SYSTEM

****

NOTE: Rubber/elastomer piping systems are generally useful in applications requiring unusual flexing, resilience and abrasion service.

****

2.15.1 Elastomeric Hose

Provide elastomeric hose consisting of an elastomeric tube, [reinforced] [not reinforced], and [with] [without] an external cover. Provide hose conforming to RMA IP-2 Class [212-A] [_____], rated for [1.03 MPa 150 psig] [[_____] MPa psig] with a minimum burst pressure of [4] [_____] times the rated working pressure. Provide hose with a nominal diameter [of [_____] mm inch] [as indicated in the Pipe Schedule in the contract drawings] with tolerances conforming to RMA IP-2. Use a minimum bend radius of [6] [_____] times the hose internal diameter.

2.15.1.1 Elastomeric Tube

Provide hose tube composed of [fluoro-elastomer] [isobutylene isoprene] [butadiene acrylonitrile] [chloroprene] [natural polyisoprene] [_____], [ASTM D2000 Grade [_____], Type [_____], Class [_____] base requirements] [_____] materials.

2.15.1.2 Tube Reinforcement

[Strengthen the tube with [[one] [_____] wire-braid] [two spiral wire and one wire-braid] [two rayon-braid] [one textile-braid and one wire-braid] [synthetic-fiber] [[four] [six] -ply, [light] [heavy] spiral-wire] [_____] reinforcement.] [Do not reinforce the tube.]

2.15.1.3 Hose Cover

[Protect the hose with a [synthetic rubber] [thin, nonskive] [textile-braid] [thermoplastic] [_____] cover.] [The hose must not have a cover.]

2.15.2 Hose Joints

[Hose must be continuous, without joints] [Hose must be supplied cut to length with integral end connections] [Join hose using [swaged] [crimped] [insert] [internally expanded - full flow] [_____] fittings]. [_____].

2.15.3 Fittings For Elastomeric System

Ensure all fittings are supplied by the same manufacturer. Join fittings to the hose assembly as specified. Ensure fittings are [supplied in accordance with the Pipe Schedule in the contract drawings and] constructed of [aluminum] [TP304 stainless steel] [TP316 stainless steel] [_____]. Accomplish interconnections through integral couplers configured as [ASME B1.20.7 threaded] [quick connect interlocking] [compression ring] [_____] couplings.

2.16 FIBERGLASS REINFORCED PLASTIC (FRP) PIPING SYSTEM

****

NOTE: Consult a reputable manufacturer to determine the FRP type for given application and temperature. Temperature is ambient if unlisted.

****

Submit the name and qualifications of the manufacturer's representative and written certification from the manufacturer stating that the representative is technically qualified to supply and install FRP piping systems. Provide all FRP pipe, fittings, and flanges for each system complete by one manufacturer and with a design internal pressure rating [in accordance with the Pipe Schedule in the contract drawings] [of 0.69 MPa 100 psig] [of [_____] MPa psig], as specified in ASTM D2310 and ASTM D2992.

2.16.1 FRP Pipe

Provide FRP pressure pipe conforming to ASTM D3754 Type [1] [2] [3] [4], liner designation [_____], surface layer grade [_____], pressure Class [_____], pipe stiffness [_____]. Provide size [in accordance with the Pipe Schedule in the contract drawings] [[_____] mm inches] [_____]. Ensure the inside diameter of the pipe is consistent with the inside diameter of the fittings.

2.16.2 FRP Joints

Join the pipe using [axially unrestrained bell and spigot gasket joints, conforming to ASTM D4161, with elastomeric gaskets meeting the requirements of ASTM F477] [butt-joints with laminated overlays in accordance with

ASTM D3754] [bell and spigot joints with laminated overlays in accordance with ASTM D3754] [adhesive bonded bell and spigot joints in accordance with ASTM D3754] [flanged] [_____].

2.16.3 FRP Fittings

Provide fittings, other than flanges, conforming to [ASTM D5685] [_____]. Provide filament wound fittings of the same thickness specified for adjoining pipe or duct. Provide other fitting types of the minimum pipe wall thickness required for the specified pressure class. Provide contact molded flanges and flanged fittings conforming to ASTM D5421 Type [A] [B], Grade [_____], Class [I] [II], pressure rating [_____]. All other flange types must conform to ASTM D4024 Type [_____], Grade [_____], Class [_____], pressure rating [_____]. Flanges mating with flanges on thermoplastic-lined steel pipe must be ductile iron castings, ASTM A395/A395M or cast steel, ASTM A216/A216M Grade WCB, Van Stone type, conforming to [ASME B16.1] [ASME B16.5] Class [150] [_____].

2.16.3.1 FRP Bolting

With flat ring gaskets, the bolting must be stainless steel, ASTM A193/A193M Grade [B8] [B8M] [_____], hex head bolts and, ASTM A194/A194M Grade [8] [8M] [_____], hex head nuts. Provide bolts with washers of the same material as the bolts.

2.16.3.2 FRP Gaskets

Gaskets must be full-faced, maximum [3.2 mm 0.125 inch] [[_____] mm inch] thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____]. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between the outer diameter of the raised face and the flange outer diameter in order to protect the FRP flange from the bolting moment. When mating a FRP flange, Van Stone type, to a thermoplastic-lined steel pipe, use a [polytetrafluoroethylene (PTFE)] [_____] enveloped, flat ring type gasket in accordance with ASTM F336.

2.17 DOUBLE CONTAINMENT PIPING SYSTEM

****

NOTE: Due to the difficulty of proper installation of double containment pipe, double containment piping should only be specified when it is absolutely required. Refer to the Handbook of Double Containment Piping Systems, Christopher G. Ziu, McGraw-Hill, NY, 1995, for the design and selection of a double containment piping system. According to Ziu, page 71, many pre-engineered double containment piping systems have only been conceptualized and not engineered.

****

Submit manufacturer's engineering end load calculations for anchors in double containment piping systems. Provide double containment piping systems conforming to the requirements of ASME B31.3.

2.17.1 Primary (Carrier) Pipe

The primary, or carrier, pipe of the double containment piping system must be [[PVC][CPVC][PVDF][PE][_____], [Schedule [40] [80] [_____]] [SDR [_____]]][TP304 stainless steel, Schedule [10] [40] [_____]][[FRP], pressure class [_____]] [_____], as specified elsewhere in this Section. Ensure the primary piping is rated at a working pressure of at least [_____] MPa psig at a maximum operating temperature of [_____] degrees C degrees F. Provide piping that is free of flanges and other joints that are not compatible with the secondary piping installation. Equip piping with expansion loops, offsets, or direction changes as necessary to counter thermal expansion and contraction, which must be coordinated with the secondary piping.

2.17.2 Secondary (Containment) Pipe

The secondary, or containment, pipe of the double containment piping system must be [[PVC][CPVC][PVDF][PE][_____], [Schedule [40] [80] [_____]] [SDR [_____]]][carbon steel, Schedule [40] [80] [_____]] [TP304 stainless steel, Schedule [10] [40] [_____]] [_____], as specified elsewhere in this Section. Provide secondary piping that is resistant to weathering, impacts, and ambient temperature variations, and rated at a working pressure of at least [_____] MPa psig at a maximum operating temperature of [_____] degrees C degrees F. Equip piping with expansion joints, expansion loops, offsets, or direction changes as necessary to counter thermal expansion and contraction. Coordinate equipment for addressing thermal movement with the primary piping. Ensure secondary piping is drainable and dryable [, and capable of being tested using air pressure]. The secondary piping system must be [compartmentalized] [continuous] and equipped with drains at all low points and vents at all high points. Equip pressurized secondary piping systems with pressure relief devices. Provide drains, vents and pressure relief devices as specified elsewhere in this Section. Design piping to allow pulling of the leak detection cable into the containment pipe both during and after piping installation. Minimum annular clearance must be [19] [_____] mm [0.75] [_____] inch. Locate containment pull ports a maximum of [150] [_____] m [492] [_____] feet apart for straight runs and reduced by [45] [_____] m [148] [_____] feet for every 90 degree change in direction.

2.17.3 Cathodic Protection For Double Containment System

Buried ferrous piping must have cathodic protection.

2.17.4 Connections and Fittings For Double Containment System

All fittings must be factory manufactured of material compatible with the process fluids and associated piping. [All secondary contained fittings must be of unitized construction with the carrier and containment integrally anchored together to prevent the movement of the carrier relative to the containment within the fitting.] Provide anchors of sufficient thickness to withstand the maximum possible end loads that will be generated by the carrier pipe during the life of the system. [Elbows must be anchored on both ends.] [Tees must be anchored on both the run and the branch.]

2.17.4.1 Fitting Pressure Rating

Ensure pressure rating of connections and fittings is greater than or equal to the design pressure of the system with a minimum safety factor of [five] [_____].

2.17.4.2 End Seals

Provide dnd seals and other subassemblies which are designed and factory prefabricated to prevent the ingress of moisture into the system. Design subassemblies to allow for complete draining of the secondary containment.

2.17.5 Leak Detection

Provide a [cable detection] [sensing probe] [visual detection] leak detection system. [Equip the leak detection system with an electronic monitoring and control unit.]

2.17.5.1 Leak Detection Monitoring Unit

Provide a microprocessor based monitoring unit. The monitoring unit must indicate when any liquid leaks into the secondary containment piping by sounding an alarm, actuating output relays, displaying a message that a leak has been detected and the location of that leak. Ensure the unit is capable of monitoring [sensor cables] [probe sensors] [and] [switch sensors]. The monitoring unit power requirements must be [120] [240] [_____] VAC, [60] [_____] Hz, [single] [_____] phase. Equip monitoring units with [an RS-232 communication port] [and] [one common and one SPDT output relay per cable, rated for 250 VAC, 10 amp]. [Furnish a complete cable-type leak detection and location system consisting of a microprocessor based monitoring unit, sensor cable, probes, system layout map and auxiliary equipment required to provide continuous monitoring of the sensing strings for leaks, shorts, breaks and probe activation. If any of these conditions should occur at any point along the cable, sound an alarm, clearly identify type of condition and clearly display the location. Monitor the interstitial space of double contained piping.]

2.17.5.1.1 Enclosure

Enclose monitoring unit in a NEMA 250 Type [12] [_____] enclosure. [The unit must be Underwriters Laboratory (UL) listed and Factory Mutual approved to provide connections for intrinsically safe sensor circuits for use in Class [1] [_____], Division [I] [_____], Groups [C and D] [_____] hazardous locations.] Ability to locate a leak must not depend on battery backed up functions. In the event of power failure, ensure system conditions and parameters are stored in nonvolatile memory allowing the unit to automatically resume monitoring, without resetting, upon restoration of power. Provide an on-off switch in the panel for servicing. [Furnish a NEMA 250 Type 4X outer enclosure with a viewing window for mounting outdoors] [Furnish a NEMA 250 Type 7 explosion proof outer enclosure] [_____].

2.17.5.1.2 Relay Outputs

Provide relays for remote indication of an alarm condition. The relays must provide indication that no alarm conditions exist, an alarm condition exists but has not yet been acknowledged, and an alarm condition exists and has been acknowledged. [Ensure communications are available via RS-232 and ASCII communication protocols to allow central point monitoring and control via a remote computer.]

2.17.5.1.3 Storage Memory

Record significant events in permanent memory. Store a minimum of [_____] events. When the memory becomes full, delete the recorded events from memory in sequential order beginning with the oldest event. Include the time and date that the event occurred for each recorded event. [Ensure archives are retrievable through RS-232 and ASCII communication protocols.]

2.17.5.1.4 Status Indication

The system must continuously provide positive indication that it is monitoring the sensing string and the status of the sensing string.

2.17.5.1.5 Security

The system must have assignable password security.[Ensure the system has multilevel security passwords for access to operating functions with recording of all password entries to nonvolatile memory.] Do not allow the system to permit unauthorized modifications to the sensing string without causing an alarm condition.

2.17.5.2 Cable System

Submit an as-built location map for the cable leak detection system in double containment piping systems indicating the as installed system configuration and sensing string layout. Provide marks in meters feet along the length of the cable as references to locate leaks. [Ensure sensor cable, connectors, [probes] and jumpers are supplied by the manufacturer of the monitoring unit.]The cable sensing principle must provide for continuous monitoring while short lengths of the cable are in contact with liquids, without altering the system's sensitivity and/or accuracy. The cable system must be a [conductance][or][impedance] type system.

2.17.5.2.1 Requirements

Locate the point of origin of the first liquid leak within [0.1] [_____] percent of the sensor string length. Identify the type of alarm as well as the location. Ensure system is able to monitor (detect and locate) with up to [30 m 98.4 feet] [[_____] m feet] of wetted cable without significant inaccuracy in location. Ensure system is capable of monitoring up to [600 m 1,970 feet] [[_____] m feet] of cable per sensor string from a single monitoring unit. [The system must be capable of monitoring (detecting and locating) for multiple leaks or additional liquid on the sensor cable.]

2.17.5.2.2 Detection Capabilities

[The system must be capable of detecting all liquids, including, but not limited to aqueous, hydrocarbon, and conductive and nonconductive liquids.] [Furnish two cables to detect and differentiate between hydrocarbons/solvents and aqueous liquids.] [Only hydrocarbons are to be detected.] [Only acids are to be detected.] Provide system with field adjustable sensitivity to increase or decrease the amount of wetted cable needed to cause an alarm from several mm to m inches to feet. Ensure system is capable of identifying the location of breaks and shorts on the cable. When either of these faults occur, an alarm must sound and a display visible on the front of the monitoring unit must clearly indicate the type of fault and display the location of the fault.

2.17.5.2.3 Materials

Provide sensor cables suitable for use with the monitoring unit. Provide sensor cables of coaxial construction consisting of an insulated [copper]

[_____] center conductor, a suitable spacer material, and an outer braid. Provide center conductors that are no less than [twenty AWG] [_____] for mechanical strength. Cables must be capable of field installation of connectors by trained technicians. Ensure cable is available in bulk spools. All cables must be field repairable by trained technicians.

2.17.5.3 Sensing Probes

Sensing probes for the leak detection system must be [pH probes] [conductivity probes] [liquid level switches] [specific ion probes] [or] [pressure transducers].

2.17.5.4 Visual Leak Detection System

Equip all low points of the secondary piping system with sample valves meeting the requirements specified in paragraph [SAMPLE PORTS] [_____] of this Section.

2.17.6 Supports

Design and supply supports for the conveyance and containment piping to prevent distortion of the pipes and strain on joints and fittings. Design supports by the double containment piping system manufacturer. No field fabricated supports will be allowed. Design and fabricate the system taking into account pressure and temperature requirements when placing the pipe supports. [Double supports are required throughout the system to minimize stresses due to point loading.] [Support clips are not allowed.]

2.18 ISOLATION JOINTS AND COUPLINGS

****

NOTE: Isolation joints and couplings require gaskets for isolating and/or sealing. The gaskets are typically shaped to meet each particular manufacturer's coupling requirements and may not be interchangeable. Refer to manufacturers' catalogs for material compatibility and selection.

****

2.18.1 Dielectric Fittings

Provide dielectric fittings between threaded ferrous and nonferrous metallic pipe, fittings and valves. Provide dielectric fittings, suitable for the required working pressure, temperature and corrosive application, to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.18.2 Isolation Joints

Provide isolation joints between nonthreaded ferrous and nonferrous metallic pipe fittings and valves. Provide isolation joints consisting of an isolation gasket of the dielectric type, isolation washers and isolation sleeves for flange bolts. Provide full faced isolation gaskets with an outside diameter equal to the flange outside diameter. Bolt isolation sleeves must be full length. Units must be of a shape to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.18.3 Metallic Piping Couplings

Provide thrust ties where shown on the contract drawings and where required to restrain the force developed by [1.5] [_____] times the maximum allowable operating pressures specified. For metallic pipe other than ductile iron, attach thrust ties with fabricated lugs. For ductile iron pipe, attach thrust ties with socket clamps against a grooved joint coupling or flange. For exposed installations, use zinc-plated nuts and bolts. However, high-strength, low-alloy steel, in accordance with AWWA C111/A21.11, may be substituted for use on cast iron and ductile iron couplings. For buried and submerged installations, provide [TP304] [_____] stainless steel bolts and nuts. Use steel middle rings and followers that are [fusion bonded epoxy-lined and coated in accordance with Section 09 90 00 PAINTS AND COATINGS and] pressure tested beyond yield point.

2.18.3.1 Sleeve-Type Couplings

Use sleeve-type couplings for joining plain end pipe sections in a flexible manner with a diameter to properly fit the pipe. A coupling consists of one [steel] [ductile iron] middle ring, two [steel] [ductile iron] followers, two elastomeric [wedge] [_____] section gaskets and elliptic-neck, track-head steel bolts designed to properly compress the gaskets. For pipe sizes between 13 through 40 mm 0.5 through 1.5 inch, ensure the followers are [ductile iron] [malleable iron], and the middle ring is in accordance with [ASTM A513/A513M] [ASTM A395/A395M] with AWWA C111/A21.11 bolting, [light pattern coupling]. For pipe sizes 50 mm 2 inch and larger, ensure the followers are [ASTM A395/A395M] [_____], and the middle ring is [ASTM A513/A513M] [ASTM A395/A395M] [_____] with AWWA C111/A21.11 bolting, [light pattern coupling]. Gaskets must be [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____]. [Split sleeve-type couplings may be used in aboveground installations under special situations and when approved in advance by the Contracting Officer.]

2.18.3.2 Transition Couplings

Transitional couplings may be used to connect two pipes of the same material that have small differences in outside diameter. Size a fully assembled transitional coupling to properly fit pipe diameters. The coupling must consist of one [steel] [ductile iron] [_____] middle ring, two [steel] [ductile iron] [malleable iron] [_____] followers, two elastomeric [wedge] [_____] section gaskets and elliptic-neck, track-head steel bolts designed to properly compress the gaskets. The coupling must use [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____], [wedge] [insulated] gaskets. Size the coupling to match the associated piping.

2.18.3.3 Flanged Coupling Adapters

Provide flanged coupling adapters consisting of fully assembled units manufactured to meet [ASTM A126 Class [B] [_____], cast iron]. The flanges must mate with [ASME B16.1] [ASME B16.5] [AWWA C207] Class [_____] flanges of the same nominal size. [Apply a factory applied corrosion resistant coating.] The coupling must use [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____], [wedge] [insulated] gaskets. Where pipe movement out of the adaptor may occur, provide proper anchorage of the pipe [and furnish couplings with lock pins]. Size the coupling to match the associated piping.

2.18.4 Couplings for Nonmetallic Piping

2.18.4.1 Bellows Coupling

Provide a bellows coupling with a minimum of two [polytetrafluoroethylene (PTFE)] [_____] convolutions unless otherwise shown, with [[ductile iron] [_____] flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [125] [150] [300] [_____]], [_____] end connections, and metal reinforcing bands. The maximum allowable working pressure is [960 kPa 140 psig] [_____] at [49] [_____] degrees C [120] [_____] degrees F. Limit bolting to restrain the force developed by [1.5] [_____] times the specified maximum allowable operating pressure. Size the coupling to match the associated piping.

2.18.4.2 Compression Coupling

A compression coupling consists of one [steel] [_____] middle section, two [steel] [_____] mechanical nuts, two elastomeric gaskets and two machined steel lock rings. The coupling must use [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____], [wedge] [insulated] gaskets. The maximum allowable working pressure is [1.03 MPa 150 psig] [_____] at [49] [_____] degrees C [120] [_____] degrees F. Size the coupling to match the associated piping.

2.19 VALVE BOXES[, SERVICE BOXES][, VALVE MANHOLES][AND VALVE PITS]

****

NOTE: Construction of valve manholes is to be avoided where feasible because of problems with dewatering/drainage and frostproofing. Use manually operated gate and butterfly valves suitable for direct burial and fitted with valve boxes in lieu of valves in manholes whenever possible. Review project-specific valve box requirements. Select and modify as required or refer to Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES.

****

The box length must adapt [to the length required for the depth of the line] [to the depth of cover required over the pipe at the valve location] without full extension. Boxes must be cast iron or concrete, except that concrete boxes may be installed only in locations not subjected to vehicular traffic. Provide boxes with housings of sufficient size to completely cover the valve or service stop and complete with covers.

2.19.1 Valve Boxes

Provide cast-iron valve boxes with minimum metal thickness of 5 mm 3/16 inch and of the extension type with slide-type adjustment and flared base. Provide concrete boxes that are the standard product of a manufacturer of precast concrete equipment.

2.19.2 Service Boxes

Provide extension service boxes with either screw or slide-type adjustment.

2.19.3 Valve [Manholes] [or Pits]

Construct valve [manholes] [or pits] for automatic valves and meters installed below grade in accordance with Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES.

2.20 VALVES

****

NOTE: This paragraph will be coordinated with Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES. Material selection based on piping materials and liquid characteristics is also provided. For critical or hazardous applications, insert specific material requirements, grades and alloys, and standards rather than a general material name.

Valves are grouped together by type. If a valve is required for your application that is not listed, insert the valve specification and notify the Contracting Officer. Check manufacturer's catalogs to make sure valves selected are current. Operator options vary by both manufacturer and valve size.

****

2.20.1 General Requirements For Valves

Valves include operator, actuator, handwheel, chain wheel, extension stem, floor stand, worm and gear operator, operating nut, chain, wrench, and all other accessories required for a complete operation. Ensure valves are suitable for the intended service. Renewable parts are not to be of a lower quality than those specified. [Provide valves that are the same size as adjoining pipe]. Ensure valve ends are compatible with adjacent piping system. Size an operator to operate the associated valve for the full range of pressures and velocities. Valves will open by turning [counterclockwise] [_____]. Provide factory mounted operators, actuators, and accessories.

2.20.2 Valve Schedule

****

NOTE: Verify that the schedules are included in the contract drawings. Delete this subparagraph if the valve schedule is not used.

****

Submit a list of valve materials, pressure ratings, valve operator's materials, air supply pressure, electrical service, location, source of supply, and reference identification as indicated in the contract drawings. Provide a list of any special tools necessary for each valve type and appurtenances furnished for adjustment, operation, maintenance and disassembly. Requirements relative to this paragraph are shown on the [Valve Schedule] [and Operator Schedule] located [in the contract drawings] [_____].

2.20.3 Factory Finishing

[Provide valves with an epoxy [lining and] coating in accordance with

AWWA C550 unless otherwise specified. Ensure the epoxy is either a two-part liquid material or a heat-activated (fusion) material except that only a heat-activated material applies if a valve coating is specified as "fusion" or "fusion bonded" epoxy. Provide epoxy [lining and] coating with a minimum [0.180 mm 7.0 mils] [[_____] mm mils] dry film thickness except where it is limited by valve operating tolerances.] Finish exposed valves in accordance with Section 09 90 00 PAINTS AND COATINGS. [Paint safety isolation valves and lockout valves with handles, handwheels, or chain wheels "safety yellow."]

2.20.4 Check Valves

****

NOTE: "Check valves" are generally service oriented. Specific types of check valves should be specified for the specific applications; for example, the ball check valve is capable of passing solids. Rated operating pressures vary based on body and seat materials, size and other parameters such as wafer class. Consult manufacturer's information to select the appropriate rating for the application.

Piping plane and valve orientation may affect check valve performance. Certain types of check valves will only operate under specific conditions; for example, lift check valves can only operate in horizontal lines, and swing check valves can operate in either horizontal or vertical (flow up) positions.

****

2.20.4.1 Swing Check Valves

****

NOTE: The requirements on subpart c. below are based on general water service and AWWA ratings.

****

Provide swing check valves conforming to the following:

a. Provide swing check valves, 50 mm 2 inches and smaller, with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, in accordance with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.18 solder joint] [_____] ends. Provide valves with a swing type, replaceable [butadiene acrylonitrile] [polytetrafluoroethylene (PTFE)] [_____] disc. Ensure valves are rated for [1.4 MPa 200 psig] [[_____] MPa psig] service.

b. Provide swing check valves, 65 mm 2.5 inches through 300 mm 12 inch, with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, in accordance with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [_____] ends. Provide valves with a bronze-mounted swing type, [bronze] [ductile iron] [cast iron] [_____] disc, [solid bronze] [ductile iron] [_____] hinges, and stainless steel hinge shaft [with outside lever and [weight] [spring]]. Ensure valves are rated for [1.4 MPa 200 psig] [[_____] MPa psig] service.

c. Provide swing check valves, 50 mm 2 inch through 900 mm 36 inch, conforming to AWWA C508, and have [ASME B16.1 Class [_____] flanged], [welding], [mechanical joint] [grooved] [_____] end connections. Provide valves with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, [bronze] [_____] -mounted disc, solid [bronze] [ductile iron] [_____] hinges, and a stainless steel hinge shaft. Provide valves 50 mm 2 inch through 300 mm 12 inch rated for [1.2 MPa 175 psig] [[_____] MPa psig] service and valves 350 through 900 mm 14 through 36 inch rated for [1.03 MPa 150 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F. Fit valves with an [adjustable outside lever and spring] [adjustable outside lever and weight]. An increasing-pattern body valve may be used where increased outlet piping size is shown.

2.20.4.2 Thermoplastic Check Valve

Provide thermoplastic check valves, 8 mm 0.25 inch through 400 mm 16 inch, of a [Y-check] [ball-check] design, manufactured of [polyvinyl chloride (PVC)] [chlorinated polyvinyl chloride (CPVC)] [polypropylene (PP)] [polyvinylidene fluoride (PVDF)] [_____] with [flanged] [socket] [threaded, in accordance with ASME B1.20.2MASME B1.20.1,] end connections. Use valves that are rated for [1.03 MPa 150 psig] [[_____] MPa psig] service. Provide valves with [fluoro-elastomeric O-ring] [_____] seals and seats. [Fit discs with a polyvinyl chloride (PVC) coil guide.] [Caps must be of hex design.]

2.20.4.3 Double Disc Swing Check Valve

Double disc swing check valves, 50 mm 2 inch through 1300 mm 52 inch, must be wafer style, spring loaded swing check valve, with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, a [aluminum-bronze] [ductile iron] [stainless steel] [bronze] [carbon steel] [_____] disc, resilient seats, stainless steel hinge pin, and a stainless steel stop pin spring. Ensure valves 50 mm 2 inch through 300 mm 12 inch are rated for [1.4 MPa 200 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F and valves 350 mm 14 inch through 1300 mm 52 inch are rated for [1.03 MPa 150 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F.

2.20.4.4 Slanting Disc Check Valve

Slanting disc check valves, 50 mm 2 inch through 1500 mm 60 inch, must be of a slanting or tilting disc design, with off-center pivot. Provide valve bodies consisting of [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____], and of a [two-piece] [wafer-style] design. Seats must be [bronze] [stainless steel] [_____] set on a [55] [_____] -degree angle. Discs must be [bronze] [ductile iron] [cast iron] [stainless steel] with pivot pin and bushing constructed of [TP304 stainless steel] [aluminum bronze] [_____], [butadiene acrylonitrile] [_____] disc seal, [TP316 stainless steel] [Monel] [_____] spring, [bottom mounted buffer cylinder for cushion closing] [and] [valve disc position indicator]. Use valves that are rated for [1.03 MPa 150 psig] [[_____] MPa psig] service [and have [ASME B16.5] [ASME B16.1] Class [_____] flanged end connections].

2.20.4.5 Silent Check Valve

Provide silent check valves conforming to the following:

a. Silent check valves, 50 through 250 mm 2 through 10 inch, must be wafer style, center guided valve with a [cast iron] [cast steel] [bronze] [TP316 stainless steel] [_____] body, [bronze] [stainless steel] [_____] trim, [butadiene acrylonitrile] [_____] seat, and [bronze] [stainless steel] [_____] springs. Ensure valves are rated for [1.4 MPa 200 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F.

b. Silent check valves, 65 through 1050 mm 2.5 through 42 inch, must be globe style, center guided valve with [ASME B16.1] [ASME B16.5] Class [125] [250] [_____] flanged end connections, a [cast iron] [ductile iron] [cast steel] [bronze] [TP316 stainless steel] [_____] body, [bronze] [stainless steel] [_____] trim, [butadiene acrylonitrile] [_____] seat, and [bronze] [stainless steel] [_____] spring. Ensure valves are rated for [1.03 MPa 150 psig] [[_____] MPa psig] service.

2.20.4.6 Ball Check Valve

Provide ball check valves, 25 mm 1 inch and larger, in accordance with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] ends, and [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [polyvinyl chloride (PVC)] [_____] bodies with a cleanout and [floating] [sinking] type [hollow steel] [phenolic] [butadiene acrylonitrile covered metal] ball. [Flanges must be ASME B16.1 Class [125] [_____].] Ensure valves are rated for [690 kPa 100 psig] [[_____] MPa psig] service and are suitable for vertical or horizontal flow.

2.20.5 Ball Valves

****

NOTE: Top or bottom entry bronze ball valves are not readily available. An end entry valve requires additional unions or ability to spring pipe clear in order to service valve. Flanged and wafer style valves can be readily removed.

****

2.20.5.1 General Purpose Ball Valves

Provide general purpose ball valves conforming to the following:

a. Ball valves, 50 mm 2 inch and smaller, must be end entry type with [bronze] [brass] [_____] bodies and [threaded, in accordance with ASME B1.20.2MASME B1.20.1,] [soldered] [_____], [full bore] [regular] ports. Provide valves with [polytetrafluoroethylene (PTFE)] [_____] seats and packing, [chrome plated] [brass] [stainless steel] [_____] balls and [hand lever] [tee-handle] [hand wheel] [pneumatically actuated] [electrically actuated] [_____] operators. Ensure valves are rated for [2.76 MPa 400 psig] [[_____] MPa psig] service at 66 degrees C 150 degrees F and conform to ASME B16.34 Class [_____]. [Install a union adjacent to the valves to provide access to the seat.]

b. Ball valves, 65 mm 2.5 inch and larger, must be end entry type with [bronze] [cast iron] [_____] bodies and [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.18 solder joint] [_____] ends. Provide valves with [polytetrafluoroethylene (PTFE)] [_____] packing and seats, a [chrome plated] [brass] [stainless steel] [_____] ball, [regular] [full bore] ports, and [hand lever] [tee-handle] [hand wheel] [pneumatically actuated] [electrically actuated] [_____] operators. Ensure valves are rated for [2.76 MPa 400 psig] [[_____] MPa psig] service at 66 degrees C 150 degrees F and conform to ASME B16.34 Class [_____].

c. Provide ball valves, 50 to 300 mm 2 to 12 inch, conforming to ASME B16.34 Class [_____], and with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, stainless steel ball and stem, polytetrafluoroethylene (PTFE) packing and gasket, and [flanged] [welding] [_____] ends, full port. Ensure valves are rated for [1.38 MPa 200 psig] [[_____] MPa psig] service, and have [hand lever] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.5.2 Multiple Piece Body Ball Valves

Provide multiple piece body ball valves, 40 to 150 mm 1.5 to 6 inch, with [three] [_____] piece bodies constructed of [stainless steel ASTM A276/A276M Grade [TP316] [_____]] [cast steel ASTM A351/A351M Grade [CF8M] [_____]] [ASTM A216/A216M] [_____] stainless steel. Valves must have a [TP316] [_____] stainless steel ball, and [ASME B16.11 threaded] [ASME B16.5 flanged] [_____] end connections. Ensure valves are rated for [6.89 MPa 1000 psig] [_____] service and conform to ASME B16.34 Class [_____]. Provide valves with [reinforced polytetrafluoroethylene (PTFE)] [_____] seats and stem packing, that are [full] [standard] bore, andequipped with [handwheel] [hand lever] [tee-handle] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.5.3 Thermoplastic Ball Valve

Provide thermoplastic ball valves, 150 mm 6 inch and smaller, rated for [1.03 MPa 150 psig] [1.55 MPa 225 psig] [[_____] MPa psig] service at 49 degrees C 120 degrees F, and have ASTM D1784, minimum cell classification [_____], [polyvinyl chloride (PVC)] [chlorinated polyvinyl chloride (CPVC)] [ASTM D3222 polyvinylidene fluoride (PVDF)] [_____] bodies, balls, and stems. Provide valves of end entry, double union design, with [solvent-weld socket] [threaded, in accordance with ASME B1.20.2M ASME B1.20.1,] [flanged] [butt] [_____] ends connections, a [ethylene propylene diene monomer (EPDM)] [fluoro-elastomer] [_____] seat, and [fluoro-elastomer] [polytetrafluoroethylene (PTFE)] [ethylene propylene diene monomer (EPDM)] [_____] O-ring stem seals. Provide valves with [hand lever] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.6 Gate Valves

2.20.6.1 General Service Gate Valves

****

NOTE: The requirements on subpart b. below are based on general water service and AWWA ratings.

****

Provide general service gate valvesconforming to the following:

a. Provide gate valves, 50 mm 2 inch and smaller, with [bronze] [_____] bodies and stems, [screwed] [union] [bolted] [yoke] bronze [_____] bonnets, single [solid] [split] wedge bronze discs, and [rising] [non-rising] stems. Provide valves rated for [1.2 MPa 175 psig] [[_____] MPa psig] service and conforming to ASME B16.34 Class [_____]. End connections must be [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.11 threaded] [_____]. Equip valves with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.

b. Provide gate valves, 65 mm 2.5 inch and larger, with [Ni-resistant] [3 percent nickel-iron] [cast-iron] [_____] bodies with [iron] [bronze] [Ni-resistant stainless steel] [_____] trim. Provide valves meeting the requirements of [AWWA C500] [AWWA C509] and have Class [125] [250] [_____] [flanged] [welding] [threaded, in accordance with ASME B1.20.2M ASME B1.20.1,] [mechanical joint] [push-on] [_____] end connections. Provide a [clamp] [OS&Y Bolted] [NRS Bolted] type bonnet. Discs must be [wedge] [double] type of [iron] [bronze] [ductile iron] [bronze faced iron] [rubber coated ductile iron] [_____] construction, and have [nonrising] [rising] stems [with backseats]. Include a by-pass of the same materials as the gate valve for each gate valve, 400 mm 16 inch and larger. Provide bypass meeting the requirements of AWWA C500. Use valves rated for [1.4 MPa 200 psig] [[_____] MPa psig] service. Equip valves with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.6.2 Thermoplastic Gate Valve

Provide thermoplastic gate valves, 13 mm1/2 inch and larger, with [ASTM D1784 polyvinyl chloride (PVC), minimum cell classification [_____],] [ASTM D1784 chlorinated polyvinyl chloride (CPVC), minimum cell classification [_____],] [_____] bodies, [bolted] [_____] bonnets, single [styrene butadiene rubber] [polypropylene] [_____] wedge discs, [non-rising] [rising] stems, and [flanged] [threaded, in accordance with ASME B1.20.2MASME B1.20.1,] [_____] end connections. Provide valves rated for [1.03 MPa 150 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F. Equip valves with [handwheel] [_____] [pneumatically actuated] [electrically actuated] operators.

2.20.7 Globe Valves

2.20.7.1 General Requirements For Globe Valves

Provide globe valves, 80 mm 3 inch and smaller, that are [angle pattern] [globe style] valve with [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] bodies, with [bronze] [brass] [stainless steel] [_____] trim, and [bronze] [brass] [_____] bonnets. Provide valves conforming to ASME B16.34 Class [_____], and with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.18 solder joint] [_____] end connections. Include [union] [threaded] [OS&Y] bonnets, inside screws, rising stems, [plug] [needle] [conventional] discs constructed of [polytetrafluoroethylene (PTFE)] [butadiene acrylonitrile] [bronze] [stainless steel] [_____], and [bronze] [brass] [stainless steel] [_____] rings. Ensure valves are rated for [1.4 MPa 200 psig] [[_____] MPa psig] service. Equip valves with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.7.2 Needle Valve

Needle valves, 25 mm 1 inch and smaller, must be of a [straight] [angle] [cross] pattern and must have [brass] [TP316 stainless steel] [_____] bodies and trim. Provide valves [conforming to ASME B16.34 Class [_____] with ASME B16.11 [male] [female] threaded, in accordance with ASME B1.20.2M ASME B1.20.1,] [have tubing compression fittings, that match associated tubing fittings,] [_____] end connections. Ensure valves include [threaded] [integral] [union] [_____] bonnets, [TP316 stainless steel]

[_____] stems, [plug] [soft tip] [non-rotating ball] [_____] stem tips constructed of [polytetrafluoroethylene (PTFE)] [butadiene acrylonitrile] [bronze] [stainless steel] [_____], [fluoro-elastomer] [polytetrafluoroethylene (PTFE)] [ethylene propylene diene monomer (EPDM)] [_____] packing [and O-ring stem seals]. Ensure valves are rated for [2.07 MPa 300 psig] [[_____] MPa psig] service. Equip valves with [toggle-handle] [handwheel] [tee-handle] [pneumatically actuated] [_____] operators.

2.20.7.3 Hose Valve

Hose valves, 20 through 80 mm 0.75 through 3 inch, must be [globe style] [angle pattern] hose valves with [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] bodies, [bronze] [stainless steel] [_____] trim, inside screws, rising stems, and [polytetrafluoroethylene (PTFE)] [rubber] [_____] disc. The outlet ports must be [cast brass] [_____] in accordance with [ASME B1.20.2MASME B1.20.1 pipe threads, male by male, nipple adapter with hexagonal wrench feature [and brass cap with chain]] [_____]. Provide valves rated for [860 kPa 125 psig] [[_____] MPa psig] service.

2.20.8 Plug Valves

2.20.8.1 Eccentric Valve

Provide nonlubricated type eccentric valves, 80 mm 3 inch and smaller, rated for [1.2 MPa 175 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F. Valves must have drip-tight shutoff with pressure from either direction, and [cast iron] [bronze] [Ni-resistant] [acid resistant bronze] [aluminum] [carbon steel] [stainless steel] [nickel] [_____] bodies, in accordance with [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.11 threaded] [AWWA C606 grooved] [_____] end connections, [all metal, matching body] [rubber lined] [_____] plugs with [round] [rectangular] ports, [stainless steel] [nickel] [_____] seats, self-lubricating [stainless steel] [Monel] [nickel] [_____] stem bearings, and [butadiene acrylonitrile] [polytetrafluoroethylene (PTFE)] [filled polytetrafluoroethylene (PTFE)] [fluoro-elastomer filled polytetrafluoroethylene (PTFE)] [_____] [U-cup] [_____] seals. [Provide valves conforming to ASME B16.34 Class [_____].] Equip valves with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.8.2 Lined Eccentric Valve

Provide nonlubricated type eccentric valves, 80 through 1350 mm 3 through 54 inch, rated for [1.2 MPa 175 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F. Provide valves with drip-tight shutoff with pressure from either direction, and [cast iron] [bronze] [Ni-resistant] [aluminum] [carbon steel] [stainless steel] [nickel] [_____] bodies in accordance with [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.11 threaded] [AWWA C606 grooved] [AWWA C111/A21.11 mechanical joint] [_____] end connections. Provide cast iron plugs with [round] [or] [rectangular] ports of no less than [80] [_____] percent of the connecting pipe area [and coated with] [butadiene acrylonitrile] [chloroprene] [fluoro-elastomer] [hard natural rubber] [_____]. Provide valves with [stainless steel] [nickel] [_____] seats, self-lubricating [stainless steel] [reinforced polytetrafluoroethylene (PTFE)] [_____] stem bearings, and [multiple [V-rings] [U-cups] [O-rings] stem seals] [[nitrile rubber] grit seals on the stems]. [Equip valves with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.] [Provide valves 150 mm 6 inch and smaller with a wrench lever manual operator and valves 200 mm 8 inch and larger with a totally enclosed, geared, manual operator with handwheel, 2-inch nut, or chain wheel.] [Ensure valves conform to ASME B16.34 Class [_____].]

2.20.9 Butterfly Valves

****

NOTE: Refer to AWWA C504 and manufacturers' data for valve selection and torque calculation data. Only valves with high velocities, heavy grit loads, or severe throttling service should be specified with a seat in the body.

****

2.20.9.1 Standard Service Butterfly Valve

Provide butterfly valves, 50 mm 2 inch and larger, with [ASTM A126 cast iron] [ductile iron] [carbon steel] [stainless steel] [_____] bodies, [[wafer] [lugged] styled] [with [ASME B16.5 flanged] [ASME B16.1 flanged] [AWWA C111/A21.11 mechanical joint] [_____] end connections]. Provide valves conforming to [AWWA C504 Class [125] [150] [_____]] [ASME B16.34 Class [_____]]. Discs must be contoured [ASTM A436 Type 1 Ni-resist cast iron with maximum lead content of 0.003 percent] [ASTM A536 Grade 65-45-12 ductile iron] [stainless steel] [polyvinylidene fluoride (PVDF) coated ductile iron] [bronze] [_____]. Provide [carbon steel] [stainless steel] [_____] valve shafts with self-lubricating, corrosion-resistant sleeve type bearings. Provide valve seats, constructed of [chloroprene] [_____], for [600 mm 24 inch] [_____] and smaller valves and attach to either the valve body or the disc. Provide valve seats for valves larger than [750 mm 30 inch] [[_____] mm inch] which are field replaceable in accordance with AWWA C504. Provide valves with [manual, locking hand lever] [hand wheel] [crank] [chain wheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.9.2 Thermoplastic Butterfly Valves

Provide thermoplastic butterfly valves, 40 mm 1.5 inch and larger, with [wafer] [lugged] style bodies constructed of [polyvinyl chloride (PVC)] [polyvinylidene fluoride (PVDF)] [polypropylene (PP)] [polyvinylidene fluoride (PVDF) coated ductile iron] [_____]. Provide valves with [polyvinyl chloride (PVC)] [polyvinylidene fluoride (PVDF)] [polypropylene (PP)] [polytetrafluoroethylene (PTFE)] [_____] discs, [ethylene propylene diene monomer (EPDM)] [fluoro-elastomeric] [butadiene acrylonitrile] [natural rubber] [ethylene propylene diene monomer (EPDM) backed] [_____] seats, [ethylene propylene diene monomer (EPDM)] [polytetrafluoroethylene (PTFE)] [same material as seats] [_____] seals, and [lever] [gear] [_____] [pneumatically actuated] [electrically actuated] operators. Ensure valves are rated for [1.03 MPa 150 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F.

2.20.10 Pinch Valves

****

NOTE: Pinch valves are commercially available in sizes ranging from 50 mm 2 inch to 1500 mm 60 inch. Consider using an enclosed bevel gear operator for valves 150 mm 6 inch and larger and above 500 kPa

72.6 psig. The pinch valve included is illustrative, consult manufacturers' catalogs for other styles, pressure ratings, and operators.
****

Provide pinch valves with [aluminum] [stainless steel] [carbon steel] [ductile iron] [cast iron] [_____] bodies, in accordance with [ASME B16.1] [ASME B16.5 Class [125] [150] [_____]] flanged end connections, [natural rubber] [chloroprene] [chlorobutyl] [butadiene acrylonitrile] [fluoro-elastomeric] [ethylene propylene diene monomer (EPDM)] [_____] seats, [full port] [double wall] [reduced port] [cone] [variable orifice] sleeves, and [manual] [pneumatically actuated] [electrically actuated] [upper] [and] [lower] pinch bars.

2.20.11 Diaphragm Valves

****
NOTE: Diaphragm valves are commercially available in sizes ranging from 15 mm 0.5 inch to 250 mm 10 inch depending upon the materials of construction. Contact manufacturers to confirm availability based upon size and material.
****

2.20.11.1 Standard Service Diaphragm Valve

Provide diaphragm valves, 13 mm 1/2 inch and larger, with [aluminum] [stainless steel] [carbon steel] [ductile iron] [cast iron] [_____] bodies, [ASME B16.1] [ASME B16.5 Class [125] [150] [_____]] [flanged] [_____] end connections and [natural rubber] [chloroprene] [chlorobutyl] [butadiene acrylonitrile] [fluoro-elastomeric] [ethylene propylene diene monomer (EPDM)] [_____] seals, and are [manually] [pneumatically] [_____] actuated. Provide position indicators to indicate diaphragm position. Valves must be rated for [1.03 MPa 150 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F.

2.20.11.2 Thermoplastic Diaphragm Valve

Provide thermoplastic diaphragm valves, 13 mm 1/2 inch and larger, with [polyvinyl chloride (PVC)] [polypropylene (PP)] [polyvinylidene fluoride (PVDF)] [_____] bodies, [ASME B16.1] [ASME B16.5 Class [125] [150] [_____]] [flanged] [union socket] [butt-fusion] [_____] end connections and [ethylene propylene diene monomer (EPDM)] [polytetrafluoroethylene (PTFE)] [_____] seals, and that are [manually] [pneumatically] [_____] actuated. [Pneumatically operated valves must be [fail-closed] [fail-open] [double acting].] Provide position indicators to indicate diaphragm position. Valves must be rated for [1.03 MPa 150 psig] [[_____] MPa psig] service at 20 degrees C 68 degrees F.

2.20.12 Self-Contained Automatic Valves

2.20.12.1 Pressure-Reducing Valve

****
NOTE: Verify that the valve schedule is included in the contract drawings.
****

Pressure-reducing valves, 13 mm 1/2 inch and larger, must be [direct] [hydraulically] operated, diaphragm actuated, [pilot] [spring] controlled [angle] [globe] valves with [cast iron] [ductile iron] [steel] [aluminum] [stainless steel] [bronze] [_____] bodies. End connections must be [ASME B16.1] [ASME B16.5 Class [150] [_____] flanged] [ASME B16.11 [threaded] [socket-welded]]. Provide [stainless steel] [_____] trim and stem. Valves must be normally [open] [closed] to maintain a constant downstream pressure regardless of fluctuations in flow or upstream pressure [, and prevents backflow,] [and have externally mounted strainers with cocks]. Use valves sizes and ratings as [shown in the Valve Schedule on the contract drawings.] [as follows.] PCV [_____] mm inch, maximum flow of [_____] cubic m/s gpm with inlet pressure of [_____] MPa psig. Outlet pressure set at [_____] MPa psig.

2.20.12.2 Pump Control Valve

Provide pump control valve which is [hydraulically operated, diaphragm actuated, pilot controlled globe valve with [cast iron] [ductile iron] [cast steel] [_____] bodies, [ASME B16.1] [ASME B16.5] Class [_____] flanged end connections, [bronze] [stainless steel] [_____] trim, stainless steel stems, and externally mounted strainers with cocks] [_____]. Design valves to eliminate pipeline surge caused by pump startup and shutdown, and include automatic check features.

2.20.13 Operators

2.20.13.1 Operator Schedule

****

NOTE: Verify that the operator schedule is included in the contract drawings. Delete this subparagraph if an operator schedule is not used.

****

Requirements relative to this paragraph are shown on the Operator Schedule located [in the contract drawings] [_____].

2.20.13.2 Manual Operator

The force in a manual operator is not allowed to exceed [175 N 39.3 pound] [[_____] N pound] under any operating condition, including initial breakaway. Equip the operator with gear reduction when force exceeds [175 N 39.3 pound] [[_____] N pound]. Provide a self-locking type manual operator or equip with a self-locking device. Supply a position indicator on quarter-turn valves. Provide worm and gear operators consisting of a one-piece design with worm-gears of gear bronze material. Worm must be hardened alloy steel with the thread ground and polished. Provide traveling nut type operators with threader steel reach rods with an internally threaded bronze or ductile iron nut.

2.20.13.2.1 Exposed Operators

Provide exposed operators with galvanized and painted handwheels. Lever operators are allowed on quarter-turn valves [200 mm 8 inch] [[_____] mm inch] and smaller. Supply cranks on gear type operators. If located off of the operator floor, provide chain wheel operator with tiebacks, extension stem, floor stands, and other accessories to permit operation from normal operation level. Ensure valve handles are capable of padlocking, and provide wheels that are lockable with a chain and padlock.

2.20.13.2.2 Underground Operators

Buried service operators on valves larger than [65 mm 2.5 inch] [[_____] mm inch] must have a [50 mm 2 inch] [[_____] mm inch] operating nut. Buried operators on valves [50 mm 2 inch] [[_____] mm inch] and smaller must have a cross handle for operation by a forked key. Enclose the moving parts of valve and operator in housing to prevent contact with the soil. Design buried service operators for quarter-turn valves to withstand an input torque of [^610 N-m (450 foot-pound) 450 foot-pound] [[_____] N-m foot-pound] of input torque at the fully open or fully closed positions, and grease pack and gasket to withstand a submersion in water to [70 kPa 10.2 psig] [[_____] MPa psig]. Provide buried valves with extension stems, bonnets, and valve boxes.

2.20.13.3 Pneumatic Operator

****

NOTE: Associated transducers must pneumatically provide the same pressure range as used by the actuator. Do not use piston actuators at less than 275 kPa 40 psig supply pressure. Include a safety vented isolation valve in the operator paragraph for use on air sets.

****

Provide pneumatic operators complete with actuators, air sets, exhaust mufflers, speed controls, pilot solenoids, safety vented isolation valves, and accessories. Ensure pneumatic operators are suitable for full operation range of valve at air supply pressure indicated. Use actuators to return the valve to the closed position upon loss of signal unless otherwise indicated. [Use springs to return valve to this failed position.] Furnish pneumatic operators with features noted on the [Operator Schedule] [Valve Schedule] in the contract drawings. [Provide limit switches on all actuators.]

2.20.13.3.1 Cylinder Actuators

Provide cylinder actuators conforming to ANSI/AWWA C541 and ANSI/AWWA C542, and operate with an air supply pressure of [550 kPa 80 psig] [[_____] MPa psig]. Totally enclose the nonswivel type with travel stops and position indicator, and factory lubricate and seal, requiring no additional lubrication. The double acting type must be nonmetallic for operation on nonlubricated air and must have a [manual] [handwheel] override independent of the cylinder. Locate the manual override [_____].

2.20.13.3.2 Diaphragm Actuators

Provide diaphragm actuators with a spring return with a [steel or aluminum] [_____] diaphragm case and spring barrel, steel spring and actuator stem, and [fabric-reinforced chloroprene] [_____] diaphragm. Use actuators on quarter-turn valves which include a totally enclosed valve actuating mechanism with adjustable travel stops and valve position indicator with manual override if indicated. The actuating mechanism must factory lubricated and sealed. Size and configure diaphragm actuators for the service indicated and an air supply pressure of [240 kPa 35 psig] [[_____] MPa psig].

2.20.13.3.3 Air Sets

Include a pressure regulator with internal relief, filter, outlet pressure gauge, and adjustable reduced pressure range as required by the valve actuator. The air set must have an aluminum body and handwheel, safety vented lockout isolation valve, and gauge range [1.33 to 2] [_____] times maximum operating pressure.

2.20.13.3.4 Limit Switches

Provide single-pole, double-throw (SPDT) type limit switches, rated 10 amps at 120 volts ac, housed in a NEMA 250 Type [4] [_____] enclosure, and adjustable for open and closed valve positions.

2.20.13.3.5 Positioners

The positioners for modulating actuators must be pneumatic force balance instruments to control valve positions as a function of the input signals. The positioners must accomplish positive positioning of valve by a mechanical feedback connection from the valve actuating mechanism. Provide position feedback through a characterized linear cam to allow adjustment of valve positioning and input signal. Provide positioner suitable for either a double acting or spring return actuator. Provide positioner with zero and span adjustment and field reversible for direct or reverse action. Include gauges for supply and output pressure and for input signal pressure. Operate modulating valve positioners on a [21 to 103 kPa 3 to 15 psig pneumatic] [or] [[4 to 20 mA] [1 to 5 v dc] electric] input signal unless otherwise indicated. [A positioner for dc input signal with transducers must convert the electrical signal to the appropriate pneumatic signal. Ensure transducer is [integral with the positioner] [or] [a separate component]. If separate, factory mount the transducer on the pneumatic operator. Line electric power is not required for transducer operation.] Corrosion-resistant enclosures for positioners and transducers must be splash- and moisture-proof with gasketed covers.

2.20.13.3.6 Solenoid Valve

Use a solenoid valve to pilot the control actuator in the appropriate configuration for the type of actuator being controlled. Provide a pilot operated diaphragm type solenoid valve consisting of a [brass] [_____] body and resilient seat and operate with minimum operating pressure differential no greater than [70 kPa 10.2 psi] [[_____] kPa psi] and maximum operating pressure differential no less than [1.03 MPa 150 psi] [[_____] MPa psi]. Provide corrosion-resistant internal parts. Provide solenoid valve with Class F molded coils for operation on 120 volts, 60-Hz, ac, unless otherwise indicated. Provide solenoid enclosure conforming to NEMA 250 Type [4] [_____]. Solenoids on double acting cylinders for open-close and throttling valves must be four-way with dual coils. Solenoids on spring return cylinders for open-close and throttling valves must be three-way, spring return. Furnish an air exhaust muffler in the exhaust port of all actuator pilot solenoid valves.

2.20.13.4 Electric Operator

Provide electric operators complete with actuators, speed controls and accessories. Operate actuators on [120 VAC, 60 Hz] [_____] with a [75] [_____] percent duty cycle and equip with an AC thermal overload protector with automatic rest, reversing (bi-directional) operation for use with quarter-turn valves, or rotating equipment to full rotation. Gearing must be a two-stage planetary, permanently lubricated self-locking gear train with self-lubricating bearings; connections via male output staff. Use start-up torque of [163 N-m 120 foot-pound] [[_____] N-m foot-pound]. Use stall torque of [203 N-m 150 foot-pound] [[_____] N-m foot-pound]. Mount [two] [_____] travel stop limit switches with cams, internal, independent, adjustable, and actuated by cams, on the drive shaft. Provide a side mounted hand turn wheel for a manual override. Ensure actuators have a NEMA 250 Type [4] [_____] enclosure with a corrosion resistant, baked epoxy finish as standard. Operate actuator in a temperature range of -40 to plus 65 degrees C -40 to plus 150 degrees F. Actuators must fail in last position unless otherwise indicated. Furnish electric operators with features noted on the [Operator Schedule] [Valve Schedule] in the contract drawings. [Provide limit switches on all actuators.]

2.20.13.4.1 Limit Switches

Limit switches must be single-pole, double-throw (SPDT) type, rated 10 amps at 120 volts ac, housed in a NEMA 250 Type [4] [_____] enclosure, and adjustable for open and closed valve positions.

2.20.13.4.2 Positioners

Provide positioners for modulating actuators to control valve positions as a function of the input signals. Operate positioner on [120 VAC, 60 Hz.] [_____] voltage. The mode of operation must be [direct acting] [reverse acting]. Operate modulating valve positioners on a [4 to 20 mA] [1 to 5 v DC] [_____] input signal unless otherwise indicated. Provide splash-and moisture-proof corrosion-resistant enclosures with gasketed covers for positioners.

2.20.14 Valve Accessories

2.20.14.1 Extension Bonnet for Valve Operator

Provide all extension bonnets as necessary, complete with stem and accessories applicable to the specific valve and operator.

2.20.14.2 Floor Stand and Extension Stem

Provide the nonrising, indicating type floor stand and extension stem, complete with stem, coupling, handwheel, stem guide brackets, and yoke attachment. Space stem guide such that stem L/R ratio does not exceed [200] [_____]. Supply anchors as required.

2.20.14.3 Floor Box and Stem

Provide the plain type floor box and stem for support of nonrising type stem; complete with stem, operating nut, and stem guide brackets. Space stem guide such that stem L/R ratio does not exceed [200] [_____]. Supply anchors as required.

2.20.14.4 Chain Wheel and Guide

Provide the handwheel direct-mount type chain wheel and guide, complete with galvanized or cadmium-plated chain.

2.21 DRAINS

Valved drains may not be shown on the detailed drawings for individual pipelines; their absence will not relieve the Contractor of the responsibility for providing and installing them as indicated in the piping and instrumentation diagrams to complete the piping system for the use intended.

2.21.1 Locations

[Locate drains as indicated on the contract drawings] [Drain all pipeline low points] [_____].

2.21.2 Sizes

For pipelines 65 mm 2.5 inch and larger, provide [20 mm 0.75 inch] [[_____] mm inch] drains equipped with [gate valves] [globe valves] [ball valves] [_____]. For pipelines [50 mm 2 inch] [[_____] mm inch] and smaller, provide [13 mm 1/2 inch] [[_____] mm inch] drains equipped with [gate valves] [globe valves] [ball valves] [_____].

2.22 SAMPLE PORTS

****

NOTE: Sample port materials of construction typically match the piping system.

For highly critical situations where the materials being sampled are very hazardous or where valves may tend to clog or leak, the first sampling valve option is used to specify a sampling valve. Otherwise, the second option is used to specify the sampling configuration.

****

[Sample ports, shown on the flow diagrams and piping and instrument diagrams of the contract drawings, may not be shown on the detailed drawings of the individual pipelines; their absence does not relieve the Contractor of the responsibility for providing them.] [Provide sample ports as indicated in the piping and instrument diagrams to complete the piping systems for the use intended.] Locate sample ports in easily accessible locations, and avoid potential stagnant points and/or areas where material could collect. [Provide a plug-type sampling valve with a stainless steel piston that extends beyond the inner surface of the pipe when closed at [all the sampling ports] [the sampling ports indicated]. Seal piston by two compressible replaceable [polytetrafluoroethylene (PTFE)] [_____] rings, one above the discharge port, the other below the discharge port. Provide valve body consisting of stainless steel Class [150] [_____] with a [male ASME B1.20.2MASME B1.20.1 pipe threads] [_____] inlet connection and [female ASME B1.20.2MASME B1.20.1 pipe threads] [_____] outlet connection] [Provide sampling ports comprised of pipe fittings, pipe, and [ball] [gate] [_____] valves which comply with material, temperature, and pressure requirements of the associated piping system as specified elsewhere in this Section.] [Provide a double block and bleed configuration] [_____].

2.23 MISCELLANEOUS PIPING COMPONENTS

2.23.1 Air Release and Vacuum Breakers

****

NOTE: For air and vacuum, vacuum, air release and

combination valves, check trim materials for compatibility with service. In addition, discharge points should be designed to be safe for both the environment and personnel.

****

Locate air release vents, and vent such that a hazardous atmosphere will not be created upon operation.

2.23.1.1 Locations

[Locate air release and vacuum breakers as indicated on the contract drawings.] [Ensure all pipeline high points have air release vents [and vacuum breakers].] [_____]. [Provide vacuum breakers on all tanks and process equipment.]

2.23.1.2 Vacuum Breakers

Provide vacuum breakers [50] [_____] mm [2] [_____] inch and smaller of an angle type with all [bronze] [cast iron] [semi-steel] [_____] bodies and bonnets, and [install at least [152] [_____] mm [6] [_____] inch above the flood line of associated equipment] [and] [conforming to ASSE 1001 for pipe applied units].

2.23.1.3 Air and Vacuum Valve Suitable for Corrosive Service

Provide air and vacuum valve conforming to [ASSE 1001] [ASSE 1020] [_____], and automatically exhaust air during the filling of a system while allowing air to re-enter during draining or when vacuum occurs. Ensure valve is rated for [1.03] [_____] MPa [150] [_____] psig working pressure and built with [a special short body] [a standard elongated body]. Provide valve consisting of a [cast iron] [ductile iron] [semi-steel] [_____] body and cover, with [stainless steel] [_____] float and trim. Provide end connections as follows: for 13 through 80 mm 1/2 through 3 inch ASME B1.20.2MASME B1.20.1 pipe threaded inlet and outlet, for 100 mm 4 inch and larger [ASME B16.5] [ASME B16.1] Class [_____] flanged inlet with outlet. Fit air and vacuum valve with blowoff valve, quick disconnect couplings, and a minimum [2] [_____] m [6.6] [_____] feet of hose in order to permit back flushing after installation without dismantling the valve.

2.23.1.4 Air Release Valve Suitable for Corrosive Service

Use [Factory Mutual listed] [ASSE approved] [_____] air release valve to automatically exhaust entrained air that accumulates in a system. Ensure valve is rated for [1.03] [_____] MPa [150] [_____] psig working pressure and built with [a special short body] [a standard elongated body]. Provide valve consisting of a [cast iron] [ductile iron] [semi-steel] [_____] body and cover, with [stainless steel] [_____] float and trim. Ensure valve end connections are [ASME B1.20.2MASME B1.20.1 pipe threaded] [[ASME B16.5] [ASME B16.1] Class [_____] flanged] [_____]. Fit air and vacuum valve with blowoff valve, quick disconnect couplings, and a minimum 2 m 6.6 feet of hose in order to permit back flushing after installation without dismantling the valve.

2.23.1.5 Combination Air Valve Suitable for Corrosive Service

The valve combines the operating functions of both an air and vacuum valve and an air release valve. The air and vacuum portion must automatically exhaust air during filling of a piping system and allow air to re-enter during draining or when a vacuum occurs. Air release portion must automatically exhaust entrained air that accumulates in the piping system. Provide valve consisting of a [single body unit] [or] [an individual air and vacuum valve and an air relief valve mounted on a common header]. Ensure valve is rated for [1.03] [_____] MPa [150] [_____] psig working pressure and built with [a special short body] [a standard elongated body]. Provide valve with a [cast iron] [ductile iron] [semi-steel] [_____] body and cover, with [stainless steel] [_____] float and trim. Ensure valve end connections are [ASME B1.20.2MASME B1.20.1 pipe threaded] [[ASME B16.5] [ASME B16.1] Class [_____] flanged] [_____]. [The air and vacuum valve to be fitted with a blowoff valve, quick disconnect couplings, and a minimum [2] [_____] m [6.6] [_____] feet of hose in order to permit back flushing after installation without dismantling the valve.]

2.23.2 Backflow Preventer

****

NOTE: Under process conditions, backflow prevention can be handled with either a double check valve assembly or a backflow preventer specifically manufactured for that purpose. The backflow preventer should be used if pressure loss is a concern. However, if the backflow prevention device is to be installed on a potable water line at a treatment plant and the potential for contamination of the potable water line exists, a backflow preventer specifically manufactured for that purpose must be used.

The reduced pressure backflow preventer can be used on continuous duty systems only. The other backflow preventer can be used on either continuous or intermediate services.

****

The backflow preventer must be identical in size to pipe. Do not allow total head loss through the complete backflow assembly to exceed [70] [_____] kPa [10.1] [_____] psi at rated flow.

2.23.2.1 Double Check Valve Assembly

Provide backflow preventer consisting of two [check valves] [independently operating, spring loaded, "Y" check valves] rated for [1.25] [_____] MPa [175] [_____]psig service at 60 degrees C 140 degrees F, with [one isolation gate valve] [one isolation ball valve], [one differential relief valve], [and testing cocks]. Use port size of [25] [_____] mm [1] [_____] inch and ASME B1.20.2MASME B1.20.1 threaded, [female] [male]. Ensure check valve assembly is rated for [1.03] [_____] MPa [150] [_____] psig working pressure at 65 degrees C 150 degrees F. Provide assembly meeting the requirements of [ASSE 1015] [AWWA C510].

2.23.2.2 Reduced Pressure Backflow Preventer

Provide assembly body consisting of two independent [bronze] [epoxy coated cast iron] [_____] body check valves rated at [1.2][_____] MPa [150] [_____] psig at 60 degrees C 140 degrees F, with an intermediate relief valve, and [isolation gate valve,] [full-ported [ball valves] [gate valves] [_____]] as testing cocks. [Ensure all internal parts are serviceable in-line.] Use port sizes of [25] [_____] mm [1] [_____] inch and

ASME B1.20.2MASME B1.20.1 threaded, [female] [_____]. Ensure reduced pressure backflow prevention assembly is rated for [1.03] [_____]MPa [150] [_____] psig working pressure at 65 degrees C 150 degrees F. Provide assembly body in accordance with [AWWA C511] [ASSE 1013].

2.23.2.3 Backflow Preventer with Intermediate Vent

Provide assembly body consisting of two independent [bronze] [epoxy coated cast iron] [_____] body check valves rated at [1.2] [_____] MPa [175] [_____] psig at 60 degrees C 140 degrees F, with an intermediate atmospheric vent, and [isolation gate valve,] [full-ported [ball valves] [gate valves] [_____]] as testing cocks. Use port sizes of [25] [_____] mm [1] [_____] inch and ASME B1.20.2MASME B1.20.1 threaded, [female] [_____]. Ensure backflow prevention assembly is rated for [1.03] [_____] MPa [150] [_____] psig working pressure at 65 degrees C 150 degrees F. Provide assembly body in accordance with [AWWA C511] [ASSE 1012].

2.23.3 Strainers

Provide [simplex] [duplex] strainers with a [Y-pattern] [_____] body. Use port sizes of [25] [_____] mm [1] [_____] inch and ASME B1.20.2MASME B1.20.1 threaded, [female] [male]. Ensure strainers are rated for [1.03] [_____] MPa [150] [_____] psig working pressure at 65 degrees C 150 degrees F and conform to [ASTM F1199] [ASTM F1200]. Provide body consisting of [cast bronze] [cast iron] [welded steel] [_____] with a [screwed bronze] [bolted iron] [_____] cap. The screen must be heavy-gauge [stainless steel] [Monel] [_____], [30] [_____] mesh [and equipped with a ASME B1.20.2M ASME B1.20.1 pipe threaded blowoff hole].

2.23.4 Indicating Devices

****

NOTE: This subparagraph will be coordinated with requirements for remote or control instrumentation. The devices specified by this section may be in addition to the control instrumentation.

****

2.23.4.1 Pressure and Vacuum Gauges

Pressure and vacuum gauges must be [stem] [flush] [semi-flush] [panel] [_____] mounted, with [phenolic] [aluminum] [glass filled nylon] [glass filled polypropylene (PP)] [stainless steel] [brass] [acrylonitrile-butadiene-styrene (ABS)] [_____] cases [equipped with safety pressure blowout backs] and [dry] [[glycerine] [_____] -filled] [_____] dials. The gauge sensors must be [diaphragm] [C-Type Bourdon tube] [helical Bourdon tube] [bellows] [_____] actuated and constructed of [phosphor bronze] [stainless steel] [Monel] [silicone rubber] [Inconel] [beryllium-copper] [_____]. Equip gauges with [brass] [Monel] [TP316L stainless steel] [alloy steel] [_____] threaded [8] [_____] mm [0.25] [_____] inch [male] [female] connections. The dials of the gauges must be [114] [152] [_____]mm [4.5] [6] [_____]inch in diameter with scale readings in [MPa and mm of mercury psig and inches of mercury] [_____] ranging from zero to approximately twice the anticipated process operating or equipment pressure. Provide a slotted adjustable pointer with accuracy to conform to [ASME B40.100, Grade A] [_____]. [Provide a lever handled gauge cock and filter type snubber.][Install snubber between the pipeline and the gauge.] [Isolate the gauges from the process fluids using remote corrosion resistant diaphragm seals. Construct the housing of the corrosion resistant seals of [stainless steel] [Monel] [tantalum] [titanium] [polytetrafluoroethylene (PTFE)] [polypropylene (PP)] [polyvinyl chloride (PVC)] [Inconel] [Hastelloy] [_____]. Compose seals of [stainless steel] [Monel] [Hastelloy] [nickel] [polytetrafluoroethylene (PTFE)] [_____].]

2.23.4.2 Thermometers

Provide bi-metal actuated thermometers, with [127] [_____] mm [5] [_____] inch dished anti-parallax dials that have [external] [_____] calibration adjustment and [stainless steel] [_____] cases. Do not use mercury in thermometers. Use thermometers with [stainless steel] [_____] stems, [adjustable angle] [back-connection] [left side-connection] [or] [right side-connection] type for the correct viewing angle. Include union connections with associated thermowells. Scale must be [-5 to plus 50 degrees C 25 to 125 degrees F] [[_____] to [_____] degrees C degrees F] with accuracy within one scale division.

2.23.4.3 Thermowells

Provide [TP316 stainless steel] [brass] [steel] [_____] thermowells with a diameter of [25] [_____] mm [1] [_____] inch. Use length as shown on the contract drawings and coordinate with the associated temperature element. Construct process connections of [stainless steel] [_____] with [flanges, faced and drilled to ASME B16.5 Class [150] [300] [_____]] [fixed hex nipples [male ASME B1.20.2MASME B1.20.1 threaded] [female ASME B1.20.2M ASME B1.20.1 threaded sockets]] [_____]. Use thermowells, equipped with terminal connection heads rated NEMA 250 Type [4X] [4] [7] [_____], with thermocouples or RTDs.

2.23.5 Static Mixer

Design static mixer to disperse the design flow, [_____] cubic m/s gpm of added chemicals in a process flow stream with flows ranging from [_____] to [_____] cubic m/s gpm. The minimum allowable pressure drop is [_____] kPa feet of water column. The maximum allowable pressure drop for the static mixer is [_____] kPa feet of water column in accordance with the requirements of the process stream pumping system. Size diameter of the mixer housing identical to the process piping. Use length in accordance with the number of mixing elements required. Provide [TP316 stainless steel] [_____] housing materials, providing chemical resistance to both the chemical additives and process stream. [Ensure coatings on coated components are factory spark-tested to verify that the coating is free from pinholes.] Ensure end configurations are [plain ends] [ends prepared for welding] [ASME B1.20.2MASME B1.20.1 threaded ends] [[forged steel, [ASTM A105/A105M] [ASTM A727/A727M]] [_____], flanged faced and drilled to [ASME B16.5] [ASME B16.1] Class [150] [300] [_____]] [_____] and compatible with the piping system. Provide injection ports of the same materials as the mixer housing in the number, dimensions, and positions shown on drawings, and with [female ASME B1.20.2MASME B1.20.1 threaded] [flanged] [_____] connections compatible with the chemical feed piping system. Supply each housing with a name plate which at a minimum provides the manufacturer's name and address, part model number, and direction of flow. Construct mixing elements of [TP316 stainless steel] [_____] providing resistance to both the chemical additives and process stream. Install elements consecutively, with the number required designed to provide mixing with a homogeneity of the final mix of less than or equal to [0.05] [_____] by the end of the static mixer.

2.23.6 Expansion Joints

****

NOTE: Thermal expansion of the piping systems must be taken into account. One of the most common methods to accommodate thermal expansion, the incorporation of expansion loops into the piping system, should be carefully investigated when corrosive materials are handled due to the potential of inducing stress corrosion. Alternatives are expansion joints and flexible connections or sections. Calculate maximum expansion compensation based on maximum pipeline temperature and pressure.

****

Provide all structural work and equipment required to control expansion and contraction of piping. Verify that the anchors, guides, and expansion joints provided, adequately protect the piping systems.

2.23.6.1 Expansion Joint for Metallic Pipe

The expansion joint must be a [single slip] [double slip] [ball] [bellows] [elastomer sleeve] [_____] type with [stainless steel] [_____] wetted materials of construction. Size expansion joint to match the associated piping. The maximum allowable working pressure is [1.03] [_____] MPa [150] [_____] psig at [48.9] [_____] degrees C [120] [_____] degrees F. Size expansion joint for a maximum axial [compressing] [expanding] deflection of [_____] mm inches [, a lateral movement of [_____] mm inch,] [and] [an angular rotation of [15] [_____] degrees.] End connections must be [as specified for the associated pipe joints] [[ASME B16.5] [ASME B16.1] Class [_____] flanged] [ASME B16.11 [threaded] [welding]]. Provide required accessories for a complete assembly including: [swivel joints,] [limit stops,] [internal guides,] [anti-torque device,] [internal flow liners,] [control rods,] [control cables,] [_____].

2.23.6.2 Expansion Joint for Nonmetallic Piping

Provide a bellows expansion joint with a minimum of [_____] convolutions to accommodate an axial deflection of [_____] mm inch, [a lateral movement of [_____] mm inch,] [and] [an angular rotation of [_____] degrees,] with [[ductile iron] [_____] flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [125] [150] [300] [_____],] [_____] end connections, and metal reinforcing bands. The maximum allowable working pressure is [960] [_____] kPa [140] [_____] psig at [49] [_____] degrees C [120] [_____] degrees F. Limit bolting to restrain the force developed by [1.5] [_____] times the specified maximum allowable operating pressure. Size expansion joint to match the associated piping.

2.23.7 Pressure Relief Devices

****

NOTE: Pressure relief devices must discharge to a safe location that does not endanger either operators or the environment. Discharge piping and the supports for the discharge piping must be carefully designed to prevent failure during a pressure relief event. Select all materials based upon the application; refer to manufacturers' catalogs.

****

Provide pressure relief devices conforming to the requirements of ASME B31.3.

2.23.7.1 Pressure-Relief Valve

****

NOTE: Verify that the valve schedule is included in the contract drawings.

****

Provide pressure-relief valves conforming to the following:

a. Pressure-relief valves, 50 mm 2 inch and smaller, must be a direct diaphragm, spring controlled type with [cast iron] [_____] bodies and spring cases. Trim must be [bronze] [stainless steel] [_____] and seats, [nitrile] [_____]. Diaphragms must be elastomeric, [chloroprene] [nylon reinforced butadiene acrylonitrile rubber] [or] [_____]. Ensure miscellaneous parts such as the valve stems, nuts, and springs are [stainless steel] [_____]. Ensure end connections are [flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [150] [300] [______]] [ASME B16.11 [threaded] [welding]] [_____]. The valves must open when the upstream pressure reaches a maximum set point. Sizes and ratings [as shown in the Valve Schedule in the contract drawings.] [as follows: PSV- [_____] [_____] mm inch, maximum flow of [_____] cubic m/s gpm with inlet pressure of [_____] MPa psig. Outlet pressure set at [_____] MPa psig].

b. Pressure relief valves, 65 mm 2.5 inch and larger, must be hydraulically operated, diaphragm actuated, pilot controlled [globe] [angle] valves with externally mounted strainers and test cocks. Provide bodies consisting of [cast iron] [ductile iron] [forged steel] [_____] and trim consisting of [bronze] [stainless steel] [_____]. Stem must be [stainless steel] [_____]. Ensure end connections are [flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [150] [300] [_____]] [ASME B16.11 [threaded] [welding]] [_____]. The valves must open when the upstream pressure reaches a maximum set point. Sizes and ratings [as shown in the Valve Schedule in the contract drawings.] [as follows: PSV- [_____] [_____] mm inch, maximum flow of [_____] cubic m/s gpm with inlet pressure of [_____] MPa psig. Outlet pressure set at [_____] MPa psig].

2.23.7.2 Rupture Discs

****

NOTE: Verify that the rupture discs are sized and rated in the contract drawings.

****

Provide [tension loaded] [compression loaded] type rupture discs [as indicated in contract drawings]. Provide discs consisting of [copper] [aluminum] [stainless steel] [dual element with a seal composed of [metal] [plastic] [_____] conforming to piping system] with a maximum operating ratio of [70] [85] [90] [_____] percent. [Provide vacuum support, if required, by the manufacturer.] [Knife blades are not necessary for initiating rupture.] The discs must rupture when the upstream pressure reaches a set maximum. Sizes and ratings [as shown in the contract drawings.] [as follows: PSE- [_____] [_____] mm inch, diameter. Rupture pressure is [_____] MPa psig].

2.24 PIPE SUPPORTS AND PENETRATIONS

****
NOTE: Pipe-support is a major design consideration of any process piping system; carefully design and edit the following paragraphs.
****

Provide auxiliary steel where the support of piping systems and equipment is required between building structural elements. Provide light gauge and structural steel shapes conforming to the requirements of ASTM A36/A36M. The Contractor has the option to use pre-engineered support systems of electrogalvanized steel products. However, a mixture of support system manufacturers products is not permitted. Where auxiliary steel is indicated as stainless steel, provide [TP304] [_____] stainless steel conforming to [ASTM A167, No. 1 Finish] [_____].

2.24.1 Pipe Supports

Provide pipe supports conforming to the requirements of MSS SP-58. Where pipe supports contact bare piping or in-line devices, provide supports of compatible material so that neither has a deteriorating action on the other.

2.24.1.1 Beam Clamps

For upper attachments on structural steel, provide beam clamps of [ASTM A36/A36M carbon steel] [or] [ASTM A181/A181M forged steel] [_____] and MSS SP-58 Types [19 through 23, 25 or 27 through 30] [_____]. Holes drilled in structural steel for hanger support rods will not be permitted. Provide clamps with hardened steel cup-point set screws and lock-nuts for anchoring in place. Base clamp size selection only on the support of the required load.

2.24.1.2 Riser Clamps

Support vertical runs of piping at each floor, or closer where required, with [ASTM A36/A36M carbon steel] [_____] clamps bolted around pipes and attach to the building construction. [Provide copper plated clamps for copper tubing support.] [Use two bolt-type clamps designed for installation under insulation on insulated pipe runs.]

2.24.1.3 Brackets

Where piping is run adjacent to walls or steel columns, provide welded [ASTM A36/A36M steel] [_____] brackets, pre-punched with a minimum of two fastener holes.

2.24.1.4 Offset Pipe Clamp

Where pipes are indicated as offset from wall surfaces, supply a double-leg design two-piece pipe clamp.

2.24.1.5 Racks

Fabricate multiple pipe racks or trapeze hangers from [ASTM A36/A36M steel] [_____], and design to suit the conditions at the points of installation. Keep pipes in their relative positions to each other by the use of clamps or clips. Pipelines subject to thermal expansion must be free to slide or roll.

2.24.1.6 Hangers

Fabricate hangers of [malleable iron, ASTM A47/A47M] [or] [ASTM A36/A36M carbon steel] [_____]. Ensure all hangers are of a uniform type and material for a given pipe run and application. Use coated or plated hangers to isolate steel hangers from dissimilar metal tube or pipe. Ensure hangers for pipe sizes 65 mm 2.5 inch or larger incorporate a means of vertical adjustment after erection while supporting the load. For piping systems with operating temperatures from 50 to 230 degrees C 122 to 446 degrees F, use the following: [MSS SP-58 Type [1] [or] [3 through 12] [_____] hangers with overhead support and appropriate saddle of MSS SP-58 Type [40] [_____] for insulated pipe;] [MSS SP-58 Types [41] [or] [43 through 46] [_____] hangers or supports with roller support and appropriate saddle of MSS SP-58 Type [39] [_____] on insulated pipe;] [MSS SP-58 Types [35 through 38] for sliding support]. For piping systems with liquid temperatures up to 50 degrees C 122 degrees F, use the following: MSS SP-58 [Types 1,3 through 12,] [Types 24 and 26 with overhead support,] [or] [Types 35 through 38 with support from below].

2.24.1.7 Hanger Rods

Provide carbon steel hanger rods conforming to ASTM A576. The diameter of the rods for piping system support must conform to [the contract drawings] [ASME B31.1].

2.24.2 Pipe Guides

2.24.2.1 Intermediate Guides

For piping [150 mm 6 inch] [[_____] mm inch] and smaller, provide a pipe clamp with an oversize pipe sleeve for a minimum [4 mm 0.16 inch] [[_____] mm inch] clearance. For piping [200 mm 8 inch] [[_____] mm inch] and larger, use U-bolts with double nuts that are manufactured for the purpose to provide a minimum [7 mm 0.28 inch] [[_____] mm inch] clearance around pipe. The stock sizes for the U-bolts are as follows: for a [200 mm 8 inch] [[_____] mm inch] pipe use a [16 mm 0.625 inch] [[_____] mm inch] U-bolt; for a [250 mm 10 inch] [[_____] mm inch] pipe, use a [19 mm 3/4 inch] [[_____] mm inch] U-bolt; for a [300 mm 12 inch] [[_____] mm inch] to [400 mm 16 inch] [[_____] mm inch] pipe, use a [24 mm 0.875 inch] [[_____] mm inch] U-bolt; and for [450 mm 18 inch] [[_____] mm inch] to [750 mm 30 inch] [[_____] mm inch] pipes use [25 mm 1 inch] [[_____] mm inch] U-bolts.

2.24.2.2 Alignment Guides

For piping, [200 mm 8 inch] [[_____] mm inch] and smaller, ensure alignment guides are [galvanized steel] [_____], [spider] [or] [sleeve] [_____] type. For piping, [250 mm 10 inch] [[_____] mm inch] and larger, ensure alignment guides are [galvanized steel] [_____], [roller] [_____] type guides.

2.24.3 Flashing Sleeves

[Install[galvanized steel] [_____] flashing sleeves wherever piping passes through concrete roof structures.] [Where piping penetrates roofs, provide [2 kg 4 lb.] [[_____] kg lb.] [lead] [_____] flashing.] Extend flashing [200 mm 8 inches] [[_____] mm inches] from the pipe in all directions, extend up the pipe, and fit with double-threaded flashing for pipes [75 mm

3 inches] [[_____] mm inches] and smaller. Turn down flashing inside the pipe for [100 mm 4 inch] [[_____] mm inch] and larger pipes.

2.24.4 Wall Penetrations

2.24.4.1 Above Grade Wall Penetrations

Provide piping which passes through fire-rated or smoke-rated walls, floors, or ceilings with insulated and encased pipe sleeves. Seal penetrations through an existing fire or fire barrier wall with a fire stop system that has an "F" rating no less than the required fire resistance rating of the penetrated wall. The fire stopping sealant for metal piping systems must be [[a water based] [vibration resistant, polysiloxane (also known as silicone) based,] nonslumping, premixed sealant with intumescent properties] [_____], that is rated for [3] [_____] hours pursuant to ASTM E814 and UL requirements. The fire stopping sealant for plastic and insulated piping systems must be a [polysiloxane (also known as silicone) based, nonslumping, premixed sealant with intumescent properties] [acrylic based, nonslumping, premixed sealant with intumescent properties] [_____], that is vibration and moisture resistant, and is rated for [3] [_____] hours pursuant to ASTM E814 and UL requirements with metal collars. Fit vented plastic pipe penetrations with galvanized steel collars that have intumescent inlays.

2.24.4.2 Below Grade Wall Penetrations

****

NOTE: For critical systems, use the interlocking rubber link system. In other instances, a nonslumping water-resistant elastomeric based sealant with intumescent properties may be used.

****

Provide below-grade wall penetrations with [hydrostatic seals designed to seal opening between pipe or conduit and a through-structure opening. The seals must be modular mechanical type consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe and wall opening] [polysiloxane (also known as silicone) based, nonslumping, vibration and water resistant sealant with intumescent properties] [_____].

2.24.4.3 Galvanizing

Galvanizing must be [hot-dip applied and meet the requirements of ASTM A153/A153M] [or] [zinc or cadmium plating]. Stainless steel components may be substituted where galvanizing is specified.

2.25 MISCELLANEOUS MATERIALS

****

NOTE: In cold climates, exposed pipe, valves, and equipment should be insulated and potentially heat traced to prevent freezing. Method of heat trace will be dictated by hazard classification and site conditions.

****

2.25.1 Pipe Insulation Material

Provide insulation for pipes, valves, instrumentation and controls, and other equipment [in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS] [consisting of 25 mm one inch ASTM C552 cellular glass and integral moisture barriers][_____].

2.25.2 Heat Trace

****

NOTE: Delete subparagraphs a. b. and c. below if steam heat trace is used.

****

Heat trace must be [steam] [electrical] with materials selected for compatibility with transported liquids and ambient environment. The heat trace must be capable of maintaining the liquid process design temperature at [27] [_____] degrees C [80] [_____] degrees F maximum when subjected to an exterior temperature of [-29] [_____] degrees C [-20] [_____] degrees F.[Provide steam piping in accordance with Section 23 58 00.00 10 CENTRAL STEAM HEATING AND UTILITIES SYSTEMS.][Ensure electrical work is in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, and UL listed, and includes all terminations, junction boxes, and automatic controls.] Perform work in conformance to hazard classifications indicated on the drawings[, and implement in accordance with NFPA 70, Section 427].

a. Provide UL listed parallel conduction type heat tape, with adjustable thermostat for outdoor aboveground winterized piping. Ensure tape is not affected by direct sunlight, ambient temperature, operating temperature, rain, or salt laden atmosphere. Provide flexible, parallel circuit construction consisting of a continuous self-limiting resistance, conductive inner core material between two parallel copper bus wires, designed for cut-to-length at the job site and for wrapping around valves and complex fittings. Self-regulation must prevent overheating and burnouts even where the cable overlaps itself.

b. Provide end seals for ends of circuits. Wire at the ends of circuits are not to be tied together.

c. Provide sufficient cable, as recommended by the manufacturer, to keep the pipe surface at [1.1] [_____] degrees C [34] [_____] degrees F minimum during winter outdoor design temperature as indicated, but not less than the following: 80 mm 3 inch pipe and smaller with 25 mm one inch thick insulation, 4 watts/0.3 m 4 watts/feet; and 100 mm 4 inch pipe and larger 38 mm 1.5 inch thick insulation, 8 watts/0.3 m 8 watts/feet of pipe.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 PREPARATION

3.2.1 Protection

Close pipe and equipment openings with caps or plugs during installation. Protect equipment from dirt, water, and chemical or mechanical damage.

3.2.2 System Preparation

3.2.2.1 Pipe and Fittings

Inspect pipe and fittings before exposed piping is installed or buried piping is lowered into the trench. Clean the ends of pipes thoroughly, remove foreign matter and dirt from inside of pipes, and keep piping clean during and after laying.

3.2.2.2 Damaged Coatings

Repair damaged coating areas in the field with material equal to the original coating, except promptly remove damaged glass-lined pipe from the site. Do not install damaged piping materials. Field repair damaged and uncoated areas of galvanized piping conforming to ASTM A780/A780M.

3.2.2.3 Field Fabrication

Notify the Contracting Officer at least [2] [_____] weeks prior to the field fabrication of pipe or fittings and at least [3] [_____] days prior to the start of any surface preparation or coating application work. Perform field welding in accordance with Section 40 05 13.96 WELDING PROCESS PIPING. Provide welding electrodes in accordance with [Table 3.1 of AWS D1.1/D1.1M] [_____] as required for the applicable base metals and welding process. Fabricate fittings in accordance with the manufacturer's instructions.

3.3 EXPOSED PIPING INSTALLATION

Run exposed piping as straight as practical along the alignment shown on the contract drawings and with a minimum of joints. Install piping and appurtenances in conformance with reviewed shop drawings, manufacturer's instructions and ASME B31.3. Install piping without springing or forcing the pipe.

3.3.1 Anchors and Fasteners

Impact expansion (hammer and explosive charge drive-type) anchors and fastener systems are not acceptable. Lead shields, plastic or fiber inserts, and drilled-in plastic sleeve/nail drive systems are also not acceptable.

3.3.1.1 Drilled-In Expansion Anchors and Fasteners

****

NOTE: This subparagraph addresses anchors and fasteners that are used with concrete or masonry applications. The first option is used for masonry brick and precast concrete hollow-core block anchoring/fastening systems and the second is suitable for cast-in-place concrete and solid precast concrete structural elements.

****

[Design anchors to accept both machine bolts and/or threaded rods. Such anchors must consist of an expansion shield and expander nut contained inside the shield. Fabricate and design the expander nut to climb the bolt or rod thread and simultaneously expand the shield as soon as the threaded item, while being tightened, reaches, and bears against the shield bottom. Provide shield body consisting of four legs,taper the inside of each toward shield bottom (or nut end). Elongate the end of one leg and turn across shield bottom. Rib the outer surface of shield body for grip-action. The expander nut must be of square design with sides tapered inward from bottom to top. The anchor materials of construction must be [zinc plated steel] [TP304 stainless steel] [_____] of [300 MPa 43,541 psi] [[_____] MPa psi] minimum tensile strength. Provide fasteners consisting of machine bolts for use with above anchors; provide nuts and washers conforming to ASTM A194/A194M. Ensure the anchor length, diameter, and embedment depth meet the manufacturer's requirements for the maximum allowable working load of the application.] [Provide anchor/fastener assembly which is UL listed with a one-piece stud (bolt) that has integral expansion wedges, nuts and washers. [Construct stud of [TP304] [_____] stainless steel, and nut and washer of [TP304] [_____] stainless steel.] Ensure the anchor length, diameter, and embedment depth meet the manufacturer's requirements for the maximum allowable working load of the application.]

3.3.1.2 Drilled-In Adhesive Anchors

[Do not use drilled-in adhesive anchors for overhead applications.] Compose anchors of an anchor rod assembly and an anchor rod adhesive cartridge. Provide anchor rod assembly composed of a chamfered and threaded stud rod of [zinc plated ASTM A36/A36M steel] [TP304 stainless steel] [_____] with a nut and washer of [ASTM A194/A194M alloy-steel] [TP316 stainless steel] [_____]. Use anchor length, diameter, and embedment depth meeting the manufacturer's requirements for the maximum allowable working load of the application. Ensure the adhesive cartridge is a sealed capsule containing premeasured amounts of resin, quartz sand aggregate, and a hardener contained in a separate vial within the capsule. Activate the capsule ingredients by the insertion procedure of the anchor rod assembly.

3.3.2 Piping Expansion and Contraction Provisions

Install piping to allow for thermal expansion and contraction resulting from the difference between installation and operating temperatures. Design for installation of plastic pipe exposed to ambient conditions or in which the temperature variation of the contents is substantial must have provisions for movement due to thermal expansion and contraction documented to be in accordance with PPI Handbook. Install anchors as shown in the contract drawings to withstand expansion thrust loads and to direct and control thermal expansion. Install an intermediate pipe guide for every pipe at each metal channel framing support not carrying an anchor or alignment guide. Where pipe expansion joints are required, install pipe alignment guides adjacent to the expansion device and within [four] [_____] pipe diameters. Install expansion devices in accordance with the manufacturer's instructions [and at the locations shown in the contract drawings].

3.3.3 Piping Flexibility Provisions

Provide thrust protection as required. Install flexible couplings and expansion joints at connections to equipment, and where shown on the contract drawings. Provide additional pipe anchors and flexible couplings, beyond those shown on the contract drawings, to facilitate piping installation, in accordance with reviewed shop drawings.

3.3.4 Couplings, Adapters and Service Saddles

Thoroughly clean pipes of oil, scale, rust, and dirt in order to provide a clean seat for gaskets. Wipe gaskets clean prior to installation. Lubricate flexible couplings and flanged coupling adapter gaskets with [soapy water] [or] [the manufacturer's standard lubricant] before installation on the pipe ends. Install couplings, service saddles, and anchor studs in accordance with manufacturer's instructions. Tighten bolts progressively, drawing up bolts on opposite sides a little at a time until all bolts have a uniform tightness. Use torque-limiting wrenches to tighten bolts.

3.3.5 Piping Equipment/Component Installation

Install piping components and indicators in accordance with manufacturer's instructions. Provide required upstream and downstream clearances, isolation valves, and miscellaneous devices for an operable installation. [Make straight runs of piping upstream and downstream of flow measuring devices as shown in the contract drawings.] [Use upstream and downstream lengths of undisturbed piping in accordance with flow indicator manufacturer's recommendations.]

3.3.5.1 Backflow Preventers

****
NOTE: Discharge to an open drain with an air gap is required on potable water lines.
****

Install backflow preventers with nameplate and test cocks accessible from front of unit, and with a minimum clearance of [310 mm 12.2 inches] [[_____] mm inches] between the port and grade. Install assemblies in accordance with local codes [and discharge to an open drain with an air gap]; vertical installation [must be avoided] [is prohibited].

3.3.5.2 Local Indicators

Install all direct-reading indicator devices, thermometers, and pressure gauges so that they can be easily read from floor level, and are readily accessible for maintenance and service. Coat all temperature sensing bulbs with a [silver base heat transfer grease] [_____] prior to insertion into the thermowell. Install pressure gauges and thermometers where indicated in the contract drawings. [Field calibrate all indicators at time of installation to ensure measuring and reading accuracy.] Install differential pressure gauges [across all process equipment] [across the process equipment indicated in the contract drawings], in accordance with the manufacturer's recommendations, and arranged for easy observation.

3.3.6 Pipe Flanges

****
NOTE: Specify the requirement for bolting to straddle the vertical centerline of the pipe for the installation of orientation sensitive devices such

as some types of flow meters.
****

Pipe flanges must be set level, plumb, and aligned. Install flanged fittings true and perpendicular to the axis of the pipe. Ensure bolt holes are concentric to the centerline of the pipe [and straddle the vertical centerline of the pipe].

3.3.7 Valve Locations

Locate valves in accordance with the contract drawings where actuators are shown. Where actuators are not shown, locate and orient valves to permit easy access to the valve operator, and to avoid interferences.

3.3.8 Pipe Tap Connections

Taps to pipe barrels are unacceptable. Make taps to ductile iron piping only with a service saddle or at a tapping boss of a fitting, valve body, or equipment casting. Make taps to steel piping only with a welded threadolet connection.

3.3.9 Plastic Pipe Installation

Submit a statement signed by the [reinforced thermosetting resin pipe] [and] [plastic pipe] manufacturer's representative certifying that the Contractor's personnel are capable of properly installing the piping system on the project. Cut, make up, and install all plastic pipe in accordance with the pipe manufacturer's recommendations.

a. Perform heat joining in accordance with ASTM D2657. Perform electrofusion joining in accordance with ASTM F1290. Do not thread Schedule 40 pipe. Use Schedule 80 threaded nipples where necessary to connect to threaded valves or fittings. Use strap wrenches for tightening threaded plastic joints, and do not over tighten these fittings.

b. Do not lay pipe when the temperature is below [4.5 degrees C 40.1 degrees F] [[_____] degrees C degrees F], nor above [32 degrees C 90 degrees F] [[_____] degrees C degrees F] when exposed to direct sunlight. Ensure any plastic pipe installed above grade and outdoors is ultraviolet (UV) protected or UV resistant.

c. Shield pipe ends that are to be joined from direct sunlight prior to and during the laying operation. Provide adequate ventilation when working with pipe joint solvent cement and handle solvent cements, primers and cleaners in accordance with ASTM F402.

d. Provide and install supports and hangers [in accordance with the manufacturer's recommendations] [as specified and indicated] [_____]. Where plastic pipe is subjected to severe temperature fluctuations, provisions for expansion and contraction must be provided. Accomplish this with the use of expansion joints and offset piping arrangements. Hydrostatically test all lines [at the maximum operating pressures] [at the pressures listed in the Pipe Schedule shown on the contract drawings].

e. Submit [6] [_____] copies each of operation and maintenance manuals in indexed booklet form. Detail in the Operation Manuals the step-by-step procedures required for specialized startup, operation and shutdown of piping systems, and include the manufacturer's name, model number, parts list and brief description of piping equipment such as valves and other appurtenances and their basic operating features. List in the Maintenance Manuals routine maintenance procedures and troubleshooting guides for the equipment, and include piping layout and valve locations.

3.3.9.1 PVC Piping

Construct solvent-cemented joints in accordance with ASTM D2855.

3.3.9.2 FRP Piping

Cut, fabricate, and install pipe, duct, and fittings in strict accordance with the pipe manufacturer's written recommendations and as shown on the contract drawings. Ensure all FRP pipe and fittings have interior surfaces which are highly polished, with no exposed fibers. Cure field joints as recommended by the manufacturer. [Where it is absolutely necessary to make a field weld on pipe specified to be field flanged only, make the weld only under direct supervision of the pipe manufacturer's field representative, who is experienced in FRP pipe lay-up techniques.]

3.3.10 Double Containment Piping Installation

Factory trained field representatives of the piping supplier must provide technical field support during critical periods of piping [and leak detection system installation including final check out of the leak detection/location system, and end user training].

3.3.11 Insulation

Install insulation on piping as indicated [on the Pipe Schedule] [in the contract drawings in accordance with the provisions of Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.]

3.4 BURIED PIPE PLACEMENT

[Install thermoplastic piping systems underground in accordance with ASTM D2774.] [Install thermosetting resin and reinforced plastic mortar piping systems underground in accordance with ASTM D3839.]

3.4.1 Excavation and Backfilling

Perform earthwork as specified in Section 31 00 00 EARTHWORK. Accomplish backfilling after inspection by the Contracting Officer. Exercise care when lowering pipe into the trench to prevent damage or twisting of the pipe.

3.4.2 Fittings

Make press connections in accordance with manufacturer's installation instructions using tools approved by the manufacturer. Insert tubing fully into the fitting and then mark at the shoulder of the fitting. Check fitting alignment against the mark on the tubing to ensure the tubing is fully inserted before the joint is pressed. At valves and connections, dig out the trench bottom with sufficient length, width, and depth to ensure clearance between the undisturbed trench bottom and the valves and such connections.

3.4.3 Thrust Restraint

Thrust restraint devices are generally not shown in the contract drawings; their absence will not relieve Contractor of the responsibility for providing them as required to provide complete systems for the use intended. Provide thrust blocks and ties where required, whether or not shown on the contract drawings. At a minimum, provide thrust restraint at pipeline tees, plugs, caps, bends, and other locations where unbalanced forces exist.

3.4.3.1 Thrust Blocks

Thrust blocking must be concrete of a mix not leaner than [1] [_____] cement, [2.5] [_____] sand and [5] [_____] gravel, and have a compressive strength of not less than [14 MPa 2000 psi] [[_____] MPa psi] after [28] [_____] days. Place blocking between solid ground and the fitting to be anchored. Unless otherwise indicated or directed, pour the base and thrust bearing sides of the thrust blocks against undisturbed earth. The sides of thrust blocks not subject to thrusts may be poured against forms. Provide area of bearing as shown or directed. Place blocking so that fitting joints are accessible for repair. Use steel rods and clamps, protected by galvanizing or a coating of bituminous paint, to anchor vertical down bends into gravity thrust blocks.

3.4.3.2 Restrained Joints

****

NOTE: When the restrained pipe length is specified, this paragraph will be modified in accordance with the design requirement. Use UFC 3-230-01 for guidance.

****

[The restrained pipe length is [_____] m feet]. [For ductile iron pipe, design restrained joints in accordance with DIPRA TRD.]

3.4.4 Marking Tape

Provide and install pipe marking tape in accordance with the requirements of Section 31 00 00 EARTHWORK.

3.4.5 Plastic Pipe Installation

****

NOTE: Thrust blocking should be used only where slip joints are used. Otherwise, piping will be designed to withstand compression or expansion forces imposed by trench conditions.

****

Cut, fabricate, and install plastic pipe in strict conformance with the pipe manufacturer's recommendations. Provide offset loops from the trench centerline as recommended by the manufacturer for the maximum temperature variation between the pipe temperature at the time of solvent welding and operating temperature. Design for installation of plastic pipe exposed to ambient conditions or in which the temperature variation of the contents is substantial must have provisions for movement due to thermal expansion and contraction documented to be in accordance with PPI Handbook. Support flexible plastic pipe connected to heavy fittings, manholes, and rigid structures in such a manner that no subsequent relative movement between the plastic pipe at the flanged joint and the rigid structures is possible. [Do not use thrust blocking for flexible plastic piping. Design and install piping to withstand the compression and expansion forces imposed by the trench conditions.] [Construct concrete thrust blocks where shown in the contract drawings] [_____].

3.5 CONNECTING DISSIMILAR PIPE

Install flexible transition couplings, dielectric fittings and isolation joints in accordance with the manufacturer's instructions.

3.6 EXTERNAL CORROSION PROTECTION

Protect all pipe and piping accessories from corrosion and adverse environmental conditions.

3.6.1 Underground Metallic Piping

Protect buried metallic piping from corrosion using [protective coatings] [and] [cathodic protection]. Provide cathodic protection for metallic underground piping systems as specified in [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM]. Where dissimilar metals are joined underground, use gas-tight isolation joints. [Provide insulating joint material where shown to control galvanic or electrical action.]

3.6.2 Above Grade Metallic Piping

Do not paint nonferrous and stainless steel piping except for aluminum alloy piping. Where dissimilar metals are joined, use isolation joints.

3.6.2.1 Ferrous Piping

Touch up shop primed surfaces with ferrous metal primer. Solvent clean surfaces that have not been shop primed. Clean surfaces that contain loose rust, mill scale or other foreign substances mechanically by [power wire brushing] [commercial sand blasting conforming to SSPC SP 6/NACE No.3] and prime with a [ferrous metal primer] [vinyl type wash coat] [_____]. Finish primed surfaces with two coats of exterior [oil] [vinyl] [_____] paint in accordance with Section 09 90 00 PAINTS AND COATINGS. Provide cathodic protection as shown in the contract drawings for above ground ferrous piping systems as specified in [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM].

3.6.2.2 Aluminum Alloy Piping

Paint surfaces of aluminum alloy pipe and fittings to protect against corrosion where they contact masonry, plaster, insulation, or are subject to repeated wettings by water, detergents or chemicals. Solvent clean surfaces must be solvent and treat with a [vinyl type wash coat] [_____]. Apply a first coat of aluminum paint and a second coat of [alkyd gloss enamel] [silicone alkyd copolymer enamel] [_____] in accordance with Section 09 90 00 PAINTS AND COATINGS.

3.7 DOUBLE CONTAINMENT PIPING LEAK DETECTION SYSTEM

a. Install the system in accordance with the manufacturer's recommended installation procedures. Follow all local, state and federal codes and requirements. Install system by properly trained personnel. Provide a location map with the system by the Contractor indicating the "as built" system configuration and sensing string layout. Provide markings along the cable length as references to locate leaks. Base markings upon calibration points. Take and record calibration points along the sensing string in accordance with the manufacturer's recommended procedures. Provide cable not in containment piping with cable tags every [15 m 49.2 feet] [[_____] m feet].

b. Perform tests to demonstrate the ability of the system to detect and locate breaks, shorts and probes on the sensor string. Perform leak testing pursuant to the following procedure in order to verify operation and the ability to work with condensation pools or other static moisture. The double containment piping system leak detection field test procedures are as follows:

    (1) Wet the sensor cable near the start of the sensor string and acknowledge the detection/location alarm and remap the system.

    (2) Wet the sensor cable near the end of the sensor string with the first location still wetted and acknowledge the detection/location alarm and remap the system.

    (3) Wet the sensor cable in three additional locations between the first and second leak locations with each detection/location alarm being acknowledged and with all prior leak locations still wetted.

    (4) Prepare and submit a report verifying each leak location and detection accuracy. Furnish a hard copy report of the test results.

3.8 FLEXIBLE JOINTS AT CONCRETE STRUCTURES

Provide flexible joints at the face of all structures, whether or not shown on the contract drawings. Rubber ring joints, mechanical joints, flexible couplings, and proprietary restrained ductile iron pipe joints are considered flexible joints; welded pipe joints are not. Joints may be flush with the structure face or may be located up to [1] [_____] pipe diameter away from face [, but not further than [450 mm 17.7 inches] [[_____] mm inches] away from face]. [For pipelines larger than [450 mm 18 inch] [[_____] mm inch] in diameter the first joint must be within [1] [_____] pipe diameter.]

3.9 CLOSURES

Install closure pieces as necessary to end pipe runs and conforming to ASME B16.9 or ASME B16.11. Elastomer sleeves bonded to pipe ends are not acceptable. Provide pressure piping with closures of [butt-welded caps] [blind flanges] [threaded plugs] [plain end pieces, with thickness matching the nominal wall thickness of the associated pipe, mounted on double flexible couplings], unless otherwise shown on contract drawings or approved by the Contracting Officer. Ensure pipes with restrained joints have pipe closures installed with thrust tie-rod assemblies [as shown in contract drawings].

3.10 PENETRATIONS

Steel pipe sleeves must be hot-dipped galvanized after fabrication for above grade applications in nonsubmerged areas. For below grade, or in submerged and damp environments, line and coat steel pipe sleeves as specified in Section 09 90 00 PAINTS AND COATINGS. Isolate embedded metallic piping from concrete reinforcement using coated pipe penetrations. Coatings must be as specified in Section 09 90 00 PAINTS AND COATINGS. Support wall pipes securely by form work to prevent contact with reinforcing steel and tie-wires. Ensure joints are [caulked with rubber sealant] [or] [sealed with a wall penetration seal]. For existing concrete walls, rotary drilled holes may be provided in lieu of sleeves.

3.11 VALVE INSTALLATION

Install flanged valve bolt holes so as to straddle the vertical centerline of pipe. Clean flanged faces prior to inserting the gasket and bolts, and then tighten the nuts progressively and uniformly. Clean threads of threaded ends by wire brushing or swabbing prior to installation.

3.11.1 Valve Orientation

Install operating stem of a manual valve in a vertical position when the valve is installed in horizontal runs of pipe having centerline elevations [1.37 m 4.5 feet] [[_____] m feet] or less above finished floor, unless otherwise shown on contract drawings. Install operating stem of a manual valve in a horizontal position in horizontal runs of pipe having centerline elevations between [1.37 m 4.5 feet] [[_____] m feet] and [2.05 m 6.75 feet] [[_____] m feet] above finish floor, unless otherwise shown on contract drawings. Install automatic valves in accordance with [the manufacturer's instructions] [and] [approved drawings].

3.11.1.1 Butterfly Valves

Orientation of butterfly valves must take into account changes in pipe direction. Orient valve shafts so that unbalanced flows caused by pipe direction changes or other disturbances are equally divided to each half of the disc.

3.11.1.2 Plug Valves

If a plug valve seat position is not shown in the contract drawings, locate the seat position as follows: for horizontal flow, the flow must produce an "unseating" pressure, and the plug must open into the top half of valve; and for vertical flow, install the seat in the highest portion of the valve.

3.11.2 Line Size Ball Valves

Install a line size ball valve and union upstream of each solenoid valve, in-line flow switch, or other in-line electrical device, excluding [magnetic flowmeters] [_____], for isolation during maintenance.

3.11.3 Isolation Valve

Install safety isolation valves on compressed air supplies. Locate valve to provide accessibility for control and maintenance. If necessary, install access doors in finished walls and plaster ceilings for valve access.

3.11.4 Operator Extension Stems

Where the depth of the valve is such that its centerline is more than [925 mm 3 feet] [[_____] mm feet] below grade, furnish an operator extension stem with a [50 mm 2 inch] [[_____] mm inch] operating nut to bring the operating nut to a point [150 mm 5.9 inches] [[_____] mm inches] below the surface of the ground and/or box cover. Locate operating nut in a floor box.

3.11.5 Torque Tube

Where the operator for quarter-turn valve is located on a floor stand, furnish an extension stem torque tube, properly sized for the maximum torque capacity of the valve.

3.11.6 Chain Wheel and Guide

Install chain wheel and guide assemblies or chain lever assemblies on manually operated valves located over [2.05 m 6.73 feet] [[_____] m feet] above finished floor elevation. Where chains hang in normally traveled areas, use appropriate ["L" type] [_____] tie-back anchors.

3.12 AIR RELEASE, DRAINS AND SAMPLE PORTS

Provide sample ports where indicated on the contract drawings. Install specified vents at piping high points for entrapped air release and install drains in the low points of pipelines regardless of whether shown on contract drawings.

3.13 PIPING SUPPORT SYSTEMS INSTALLATION

The absence of pipe supports and details on the contract drawings does not relieve the Contractor of responsibility for sizing and providing supports throughout plant.

3.13.1 General Support Requirements

Provide pipe support systems meeting the requirements of MSS SP-58. Install Contractor-designed and selected support systems in accordance with MSS SP-58, and as specified herein. Support piping connections to equipment by pipe supports and not off the equipment. Support large or heavy valves, fittings, and/or equipment independently of associated piping. Do not support pipes off other pipes. Provide supports at piping changes in direction or in elevation, adjacent to flexible joints and couplings, and where otherwise shown on the contract drawings. Do not install pipe supports and hangers in equipment access areas or bridge crane runs. Brace hanging pipes against horizontal movement by both longitudinal and lateral sway bracing. At each channel type support, provide every pipe with an intermediate pipe guide, except where pipe anchors are required. Existing support systems may be used to support additional new piping only if the Contractor can demonstrate that the existing support systems are adequate for the additional loads, or if the existing systems are strengthened to support the additional loads. Provide pedestal type pipe supports under base flanges adjacent to rotating equipment and where required to isolate vibration. Brace piping [65 mm 2.5 inch] [[_____] mm inch] in diameter and larger for seismic forces. Install lateral supports for seismic loads at all changes in direction.

3.13.2 Support of Insulated Piping

Install oversized supports to fit the insulation inserts. Provide supports with galvanized or stainless steel protection shields and oversized rollers.

3.13.3 Dielectric Barriers

Install dielectric barriers between supports and copper or stainless steel piping, and between stainless steel supports and non-stainless steel ferrous piping.

3.13.4 Support Spacing

****

NOTE: Calculate spans and rod sizes pursuant to MSS SP-58. Coordinate with manufacturers data and/or other standards for guidance in determining maximum support spans. Duplicate the following subparagraphs as required.

****

3.13.4.1 Acceptable Limits for Metallic Piping

[Stainless steel] [_____] [Schedule [10S] [_____]] with a wall thickness of [_____] mm inch, diameter [_____] mm inch, must have a maximum span of [_____] mm inch and a minimum rod size for single rod hangers of [_____] mm inch.

3.13.4.2 Acceptable Limits for Thermoplastic Piping

[PVC] [_____], [Schedule [40] [_____]] [SDR [21] [_____]], diameter [_____] mm inch, must have a maximum span of [_____] mm inch and a minimum rod size for single rod hangers of [_____] mm inch.

3.13.4.3 Acceptable Limits for Rubber/Elastomer Piping

[Chloroprene] [_____], internal diameter [_____] mm inch, must have a maximum span of [_____] mm inch and a minimum rod size for single rod hangers of [_____] mm inch.

3.13.5 Support Methods

Provide piping support as specified and as shown in the contract drawings. Support single horizontal suspended piping by [adjustable swivel-ring,] [split-ring,] [or] [clevis] [_____] hangers. Support multiple horizontal suspended piping by [trapeze hangers with channel type supports] [_____]. Provide horizontal pedestal mounted piping with [saddle] [_____] type supports. Provide horizontal wall mounted piping with [wall brackets] [_____]. Support vertical piping by [wall brackets,] [base elbows,] [or] [riser clamps on floor penetrations] [_____].

3.13.6 Supports and Hangers for Stainless Steel Piping

Provide all hanger-pipe contact surfaces with a dielectric barrier consisting of [chloroprene rubber] [_____] wrapping [or plastic coated hangers]. The load rating of universal concrete inserts is not allowed to be less than that of the hanger rods they support.

3.14 PIPE IDENTIFICATION, PAINTING AND COLOR CODING

****

NOTE: Color coding for piping identification as required by the using agency will be developed and inserted in the Color Code Schedule (Table I) in Section 09 90 00 PAINTS AND COATINGS. For Air Force installations, piping will be color coded in accordance with Attachment 4 of Air Force Regulation 88-15.

****

Ensure color, coating, and lettering requirements for exposed piping are in accordance with Section 09 90 00 PAINTS AND COATINGS. [Except where piping is required to be completely painted in its code color, piping or its insulation covering may be banded either with plastic adhesive tapes or painted stripes around pipe designating piping contents [in accordance with following options and requirements].] [Provide a single individual band, of plastic adhesive tape or paint, designating pipe contents with sufficient length to permit the stenciling of pipe contents in letters.] [Provide identification at branch connections, inlets and outlets of equipment, every [6 m 19.7 feet] [[_____] m feet] of straight run, upstream of valves, and within [1 m 3.3 feet] [[_____] m feet] of entrance to or exit from wall curtains, or other similar type barrier.]

3.15 FIELD QUALITY CONTROL

****

NOTE: The general pipe testing requirements are basically taken from ASME B31.3 for Chemical and Petroleum Refinery Piping. Test pressure for hydrostatic pressure and leakage tests will be the working pressure multiplied by 1.33. For a working pressure of 1.03 MPa 150 psig, the test pressure will be 1.38 MPa 200 psig. For other working pressures the test pressure will be adjusted accordingly.

Pneumatic testing should be avoided if possible. Specify pneumatic testing on systems where residual moisture in the lines could be a problem (such as with anhydrous liquid chlorine and hydraulic fluid), and where the use of another nontoxic liquid is not feasible. ASME B31.3 methods should be used.

****

3.15.1 Hydrostatic Tests

Where any section of a pipeline is provided with concrete thrust blocking for fitting, do not make the hydrostatic tests until at least [5] [_____] days after the installation of the concrete thrust blocking, unless otherwise approved by the Contracting Officer.

3.15.1.1 Buried Piping

After the pipe is laid, the joints completed and the trench partially backfilled leaving the joints exposed for examination, subject the newly laid piping or any valved section of piping, unless otherwise specified, for [1] [_____] hour to a hydrostatic test pressure [of [_____] MPa psig] [as listed in the Pipe Schedule in the contract drawings]. Open and close each valve several times during the test. Carefully examine exposed pipe, joints, fittings, and valves during the partially open trench test. Replace joints showing visible leakage as necessary. Remove defective pipe, joints, fittings, and valves found during the pressure test and replace with new material, and repeat the test until the test results are satisfactory. The requirement for the joints to remain exposed for the hydrostatic tests may be waived by the Contracting Officer when one or more of the following conditions are encountered: (1) wet or unstable soil conditions in the trench; (2) compliance would require maintaining barricades and walkways around and across an open trench in a heavily used area that would require continuous surveillance to assure safe conditions; or (3) maintaining the trench in an open condition would delay completion of the Contract. The Contractor may request a waiver, setting forth in writing the reasons for the request and stating the alternative procedure proposed to comply with the hydrostatic tests. Place backfill placed prior to the tests in accordance with the requirements of Section 31 00 00 EARTHWORK.

3.15.1.2 Exposed Piping

Conduct hydrostatic testing in accordance with ASME B31.3. Test piping systems under normal service conditions (as indicated in the Pipe Schedule in the contract drawings) to demonstrate compliance. Test pressure less than [1.5] [_____] times the design pressure is prohibited. Use [water] [_____] as the hydrostatic test fluid. Provide clean test water of such quality to prevent corrosion of the piping system materials. Open air release vents at all high points of the piping system in order to purge air pockets while the piping system is filling.

3.15.1.2.1 Rigid Piping

For rigid piping hydrostatic testing, calculate the maximum test pressure according to ASME B31.3, but do not exceed the yield strength of the piping system. The maximum velocity during filling is [[0.075 m/s 0.25 fps] [[_____] m/s fps] applied over full area of pipe] [in accordance with the manufacturer's instructions]. [Venting during filling may also be provided by loosening flanges with a minimum of four bolts or by the use of equipment vents.] Test all parts of the piping system. Maintain hydrostatic test pressure continuously for [30] [_____] minutes minimum and for such additional time as necessary to conduct examinations for leakage. Examine all joints and connections for leakage. Ensure piping system, exclusive of possible localized instances at pump or valve packing, shows no visual evidence of leaking. Correct visible leakage and retest. Unless otherwise directed by the Contracting Officer, leave the piping system full of water after leaks are repaired.

3.15.1.2.2 [Non-Rigid, Non-Metallic Piping] [and] [Metallic Piping with a Non-Metallic Liner]

For [non-rigid, non-metallic piping] [and] [metallic piping with a non-metallic liner] hydrostatic testing, calculate the maximum test pressure according to ASME B31.3, but do not exceed [1.5] [_____] times the maximum pressure rating of the lowest rated component in the piping system. The maximum velocity during filling is [[0.075 m/s 0.25 fps] [[_____] m/s fps] applied over full area of pipe] [in accordance with the manufacturer's instructions]. Pressurize the system initially to [50] [_____] percent of the normal service conditions and inspect. Repair any leaks . Then pressurize the system to the test pressure. Add small amounts of [water] [_____] as required on a hourly basis for a maximum of [3] [_____] hours in order to maintain the test pressure. After [4] [_____] hours, lower the test pressure by [70 kPa 10.2 psi] [[_____] kPa psi]. If the hydrostatic pressure remains steady for [1] [_____] hour, then no leakage is indicated. Inspect for leaks, repair and retest if necessary. Allow piping system to relax for [8] [_____] hours before retesting.

3.15.1.3   Double Containment Primary Piping

Test the primary piping of a double containment piping system in accordance with Subparagraph [Buried Piping] [Exposed Piping] of this paragraph. Pneumatically pressure test secondary containment piping of a double containment piping system in accordance with Subparagraph Double Containment Secondary Piping. Pressure test at the maximum test pressure of [5 psi] [_____] or manufacturer's recommended maximum, [_____] times the maximum pressure rating of the lowest rated component in the piping system. The maximum velocity during filling is [[0.075 m/s 0.25 fps] [[_____] m/s fps] applied over full area of pipe] [in accordance with the manufacturer's instructions]. Pressurize the system initially to [50] [_____] percent of the normal service conditions and inspect. Repair any leaks. Then pressurize the system to the test pressure. Add small amounts of [water] [_____] as required on a hourly basis for a maximum of [3] [_____] hours in order to maintain the test pressure. After [4] [_____] hours, lower the test pressure by [70 kPa 10.2 psi] [[_____] kPa psi]. If the hydrostatic pressure remains steady for [1] [_____] hour, then no leakage is indicated. Inspect for leaks, repair and retest if necessary. Allow piping system to relax for [8] [_____] hours before retesting.

3.15.1.4   Time for Making Test

Except for joint material setting or where concrete thrust blocks necessitate a delay, underground piping jointed with rubber gaskets, mechanical or push-on joints, or couplings may be subjected to hydrostatic pressure, inspected, and tested for leakage at any time after partial completion of backfill. Conduct tests for above ground pressure piping after the piping has been completely installed, including all supports, hangers, and anchors, and inspected for proper installation but prior to installation of insulation.

3.15.2   Pneumatic Tests

****

NOTE: Do not use pneumatic tests for primary piping of double containment piping systems.

****

Prepare for and conduct pneumatic testing in accordance with the requirements of ASME B31.3. Care must be taken to minimize the chance of a brittle fracture or failure during a pneumatic leak test. Use only non-toxic, nonflammable, inert gases or air.

3.15.2.1   Pressure Relief Device

During pneumatic testing, provide a pressure relief device for each piping section being tested. The device must have a set pressure no higher than the test pressure plus the lesser of [10] [_____] percent of the test pressure or [350 kPa 50.8 psi] [[_____] kPa psi].

3.15.2.2 Pneumatic Testing Procedures

The test fluid must be [air] [_____] and the test pressure must be [110] [_____] percent of the design pressure. Increase test pressure incrementally until the gage pressure reaches the lesser of [50] [_____] percent of the test pressure or [170 kPa 25 psig] [[_____] kPa psig]. Examine piping joints for leakage. If no leakage is occurring, continue to increase the pressure incrementally, while maintaining each incremental increase long enough to equalize pipe strains, until the test pressure is reached. Then reduce the test pressure to the design pressure and maintain for [10] [_____] minutes without additional energy expenditure. If the pneumatic pressure remains steady, then no leakage is indicated. Inspect for and repair leaks, and retest if necessary.

3.15.2.3 Double Containment Secondary Piping

Hydrostatically test the primary piping of a double containment piping system in accordance with Subparagraph [Buried Piping] [Exposed Piping]. Pneumatically pressure test secondary containment piping of a double containment piping system at the maximum test pressure of [5 psi] [_____] or manufacturer's recommended maximum. The test fluid must be [air] [_____]. [Testing procedures must be in accordance with manufacturer's recommendations.] [Increase the test pressure incrementally until the gage pressure reaches [50] [_____] percent of the test pressure. Examine piping joints for leakage. If no leakage is occurring, continue to increase the pressure incrementally, while maintaining each incremental increase long enough to equalize pipe strains, until the test pressure is reached. Then reduce the test pressure to the design pressure and maintain for [10] [_____] minutes without additional energy expenditure. If the pneumatic pressure remains steady, then no leakage is indicated.] Inspect for and repair leaks, and retest if necessary.

3.15.3 Pipe Leakage Tests

Unless approved by the Contracting Officer, conduct leakage testing after the pressure tests have been satisfactorily completed. The duration of each leakage test is at least [2] [_____] hours, and during the test, subject the piping to no less than [1.38 MPa 200 psig] [[_____] MPa psig] pressure. Leakage is defined as the quantity of the test liquid, [water] [_____], that is supplied to the piping system, or any valved or approved section thereof, in order to maintain pressure within [34.5 kPa 5 psi] [[_____] kPa psi] of the specified leakage test pressure after the piping has been filled with the test liquid and all air is expelled. No piping installation will be accepted if leakage exceeds [the values listed in the Pipe Schedule in the contract drawings] [or, if applicable,] [the allowable leakage determined by the following formula:

L = Cf x N x D x P0.5		
Cf	conversion factor	10.786 0.0001351
L	allowable leakage	mm3 per hour gallons per hour
N	number of joints in the length of piping tested	
D	nominal pipe diameter	mm inches

L = Cf x N x D x P0.5		
P	average test pressure during the test	MPa psig

]

Should any test disclose leakage greater than that allowed, locate the leaks and repair until the leakage is within the specified allowance, without additional cost.

3.15.4 Testing New to Existing Connections

Test new piping connected to existing pipe, existing equipment, existing treatment systems, or tanks and treatment systems furnished under other Sections. Isolate the new piping with pipe caps, spectacle blinds, or blind flanges. Test the joint between new piping and existing piping by methods that do not place the entire existing system under the test load. Proceed. then, with the testing of new piping systems as specified herein.

3.15.5 Valve Testing

Submit copies of all field test reports within [24] [_____] hours of the completion of the test. Valves may either be tested while testing pipelines, or as a separate step. Demonstrate that valves open and close smoothly with operating pressure on one side and atmospheric pressure on the other, and in both directions for two-way valve applications. Count and record the number of turns required to open and close each valve, and account for any discrepancies with manufacturer's data. Examine air and vacuum relief valves as the associated pipe is being filled to verify venting and seating is fully functional. Set, verify, and record set pressures for all relief and regulating valves. Test self-contained automatic valves at both maximum and minimum operating ranges, and reset upon completion of test to the design value. [Test automatic valves that are not self-contained in conjunction with control system testing.]

3.16 FINAL CLEANING

3.16.1 Interim Cleaning

Prevent the accumulation of weld rod, weld spatter, pipe cuttings and filings, gravel, cleaning rags, and other foreign material within piping sections during fabrication. Examine the piping to assure removal of these and other foreign objects prior to assembly and installation.

3.16.2 Flushing

Following assembly and testing, and prior to final acceptance, flush piping systems with [water] [_____] to remove accumulated construction debris and other foreign matter. Flush piping until all foreign matter is removed from the pipeline. Provide all hoses, temporary pipes, ditches, and other items as required to properly dispose of flushing water without damage to adjacent properties. The minimum flushing velocity is [0.76 m/s 2.5 fps] [[_____] m/s fps]. For large diameter pipe where it is impractical to flush the pipe at the minimum flushing velocity, clean the pipeline in-place from the inside by brushing and sweeping, then flushing the pipeline at a lower velocity. Install cone strainers in the flushing connections of attached equipment and leave in place until cleaning is completed. Remove accumulated debris through drains, or by removing spools or valves.

3.16.3 Disinfection

****

NOTE: Selectively require the Contractor to perform disinfection work for liquid process piping. This should be limited only to processes where bacteriological interferences could damage process equipment.

****

Disinfect the [pipelines so noted in the Pipe Schedule in the contract drawings] [following pipelines: [_____]] [_____]. Before acceptance of piping system operation, disinfect each section of completed pipeline [in accordance with AWWA C651] [as specified herein]. After pressure tests have been made, thoroughly flush the piping section to be disinfected with water until all entrained dirt and mud have been removed before introducing the chlorinating material. The chlorinating material must be [liquid chlorine] [calcium hypochlorite] [or] [sodium hypochlorite] [_____]. Ensure the chlorinating material provides a dosage of no less than [50] [_____] ppm and introduce into the piping in an approved manner. [Chlorinate PVC pipe lines using only the above specified chlorinating material in solution.] Do not introduce the agent into the line in a dry solid state. Retain the treated water in the pipe long enough to destroy all non-spore-forming bacteria. Except where a shorter period is approved, the retention time is at least 24 hours and produce no less than 25 ppm of free chlorine residual throughout the line at the end of the retention period. Open and close all valves on the lines being disinfected several times during the contact period. Then flush the line with clean water until the residual chlorine is reduced to less than 1.0 ppm. During the flushing period, open and close each outlet on the line several times. From several points in the pipeline section, [the Contracting Officer will take samples of water in sterilized containers for bacterial examination] [Contractor personnel, approved by the Contracting Officer, must take samples in sterilized containers and have a bacterial examination performed by a commercial laboratory in accordance with state approved methods. The commercial laboratory must be certified by the state's approving authority for examination of potable water.] Repeat the disinfection until the piping system passes the bacterial examination for [2] [_____] consecutive days. The piping system will not be accepted until satisfactory bacteriological results have been obtained.

3.17 WASTE WATER DISPOSAL

Submit the method proposed for disposal of waste water from hydrostatic tests and disinfection, and all required permits, prior to performing hydrostatic tests. Dispose of water used for testing, cleaning, flushing and/or disinfection in accordance with all applicable regulations. Disposal is solely the responsibility of the Contractor. Provide the method proposed for disposal of waste water to the Contracting Officer for approval prior to performing any testing, cleaning, flushing and disinfection activities.

3.18 TABLES

****

NOTE: The intention of the Table is to give the designer a structure to specify the most suitable piping system materials for a project. The designer

will edit or delete this table to fit the project. Verify that each pipeline designation is identified for the Contractor and the Contracting Officer on the drawings. Consult EM 1110-1-4008 Liquid Process Piping to determine acceptable materials for each application. Allow the Contractor selection of the most economical of the acceptable systems. Table may be shown on the drawings and deleted from this section of the specifications.

As indicated in paragraph 2.16, Double Containment pipe is supplied in different materials of construction. Selection of which depends upon the fluids being handled and other conditions of installation; i.e., underground, above ground, and temperature.

****

3.19 MANUFACTURER'S FIELD SERVICES

Submit a signed statement certifying that the installation is satisfactory and in accordance with the contract drawings and specifications and the manufacturer's prescribed procedures and techniques, upon completion of the project and before final acceptance. Obtain manufacturer's technical assistance for Contractor training, installation inspection, start up, and owner operating and maintenance training. Follow manufacturer's instructions for installation.

1.3 PERFORMANCE REQUIREMENTS

****

NOTE: If quality control is to be the responsibility of the Government, delete this paragraph.

The paragraphs will be edited and bracketed portions inserted if necessary to ensure proper implementation of the CONTRACTOR QUALITY CONTROL PROGRAM. The specification writer or design engineer must indicate how much quality control of welding is needed for each project and who is to be responsible; i.e., primarily the Contractor or the Government.

In many cases a project may not require 100 percent testing of welds by NDE methods. The designer must determine the required methods and the extent of inspection and testing, and must indicate the extent in this or other sections of the project specifications or on the project drawings by notes, NDE symbols, or other means. The referenced applicable publications will be used for guidance in determining inspection and testing requirements.

The specifications or drawings must clearly indicate which joints require 100 percent NDE inspection, which joints require random NDE inspection, and which NDE methods are to be employed for each joint. For random inspection, the drawings must indicate the location, number of joints, and minimum

increment length of weld that will be NDE inspection without predisclosing the exact spots to be examined. Joints not indicated to be tested by NDE methods must be subject to visual inspection only. In cases where the nature of the welding is such as to require visual inspection only, the requirements for NDE should be deleted from these paragraphs and from paragraph Inspection and NDE Personnel.

****

Quality of all joint preparation, welding, and examination is the Contractor's responsibility for. Clearly identify and record all materials used in the welding operations. The inspection and testing defined in this specification are minimum requirements. Additional inspection and testing is the responsibility of the Contractor when it is deemed necessary to achieve the quality required.

1.4 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Pressure Piping; G, [_____]

SD-03 Product Data

Welding Operations

SD-07 Certificates

Qualifications

1.5 QUALIFICATIONS

Welding procedures, welders, and welding operators previously qualified by test may be accepted for the work without requalification, provided that all of the following conditions are fulfilled:

a. Copies of the welding procedures, the procedure qualification test records, and the welder and welding operator performance qualification test records are submitted and approved in accordance with paragraph SUBMITTALS.

b. Testing was performed by an approved testing laboratory or technical consultant or by the Contractor's approved quality assurance organization.

c. The welding procedures, welders, and welding operators were qualified in accordance with ASME BPVC SEC IX, or AWS B2.1/B2.1M, AR-2 level; and base materials, filler materials, electrodes, equipment, and processes conformed to the applicable requirements of this specification.

d. The requirements of paragraph "Renewal of Qualification" below are met and records showing name of employer and period of employment using the process for which qualified are submitted as evidence of conformance.

1.5.1 Welding Procedures Qualification

Record in detail and qualify the Welding Procedure Specifications for every proposed welding procedure. Qualification for each welding procedure must conform to the requirements of [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8,] and to this specification. Specify end preparation for butt welds including cleaning, alignment, and root openings. Provide preheat, interpass temperature control, and postheat treatment of welds as required by approved welding procedures, unless otherwise indicated or specified. Describe the type of backing rings or consumable inserts, if used, and if they are to be removed, describe the removal process. Submit copies of the welding procedure specifications and procedure qualification test results for each type of welding required in accordance with paragraph SUBMITTALS. Approval of any procedure does not relieve the Contractor of the sole responsibility for producing acceptable welds. Identify welding procedures individually and reference on the detail drawings or key to the contract drawings.

1.5.2 Welder and Welding Operator Performance

Provide qualified welder and welding operator assigned to work in accordance with [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [

ASME B31.8].

1.5.2.1 Certification

Before assigning welders or welding operators to the work, provide the Contracting Officer with their names together with certification that each individual is performance-qualified as specified. State the type of welding and positions for which each is qualified, the code and procedure under which each is qualified, date qualified, and the firm and individual certifying the qualification tests.

1.5.2.2 Identification

Identify each particular weld with the personal number, letter, or symbol assigned to each welder or welding operator. To identify welds, submit written records indicating the location of welds made by each welder or welding operator, and each welder or welding operator must apply the personal mark adjacent to the welds using a rubber stamp or felt-tipped marker with permanent, weatherproof ink or other methods approved by the Contracting Officer that do not deform the metal. For seam welds, place identification marks adjacent to the welds at 1 m 3 foot intervals. Identification by die stamps or electric etchers will not be allowed.

1.5.2.3 Renewal of Qualification

Requalification of a welder or welding operator is required under any of the following conditions:

a. When a welder or welding operator has not used the specific welding process for a period of 3 months; the period may be extended to 6 months if the welder or welding operator has been employed on some other welding process.

b. When a welder or welding operator has not welded with any process during a period of 3 months, all the personal qualifications are considered expired, including any extended by virtue of a., above.

c. There is specific reason to question the person's ability to make welds that will meet the requirements of the specifications.

d. The welder or welding operator was qualified by an employer, other than those firms performing work under this contract, and a qualification test has not been taken within the preceding 12 months.

e. Renewal of qualification for a specific welding process under conditions a., b., and d., above, needs to be made on only a single test joint or pipe of any thickness, position, or material to reestablish the welder's or welding operator's qualification for any thickness, position, or material covered under previous qualification.

1.5.3 Inspection and NDE Personnel

****

NOTE: If quality control is to be the responsibility of the Government, delete these paragraphs.

Coordinate with paragraph Performance.

****

All inspection and NDE personnel must be qualified in accordance with the following requirements.

1.5.3.1 Inspector Certification

Welding inspectors must be qualified in accordance with AWS QC1.

1.5.3.2 NDE Personnel

Furnish certified NDE personnel, and establish a written procedure for the control and administration of NDE personnel training, examination, and certification. Base the procedures on appropriate specific and general guidelines of training and experience recommended by ASNT SNT-TC-1A, [ASNT SNT-TC-1A Q&A Bk A] [ASNT SNT-TC-1A Q&A Bk B] [ASNT SNT-TC-1A Q&A Bk C] [and] [ASNT SNT-TC-1A Q&A Bk D].

1.6 REGULATORY REQUIREMENTS

****

NOTE: The drawings should be checked to ensure that any supplementary information required has been shown and that there is no conflict between the drawings and the specifications.

Project drawings must indicate, or text of project specifications must specify, the welding procedures, and size, length, type, and location of the welds, as necessary.

****

This section covers the welding of pressure piping systems. Submit detail drawings showing location, length, and type of welds; and indicating postweld heat treatment and NDE as required. Deviations from applicable codes, approved procedures, and approved detail drawings will not be permitted without prior written approval. Materials or components with welds made offsite will not be accepted if the welding does not conform to the requirements of this specification, unless otherwise specified. Develop procedures for welding all metals included in the work. Do not start welding until welding procedures, welders, and welding operators have been qualified. Perform qualification testing by an approved testing laboratory, or by the Contractor if approved by the Contracting Officer. Notify the Contracting Officer at least 24 hours in advance of the time and place of the tests. When practicable, perform the qualification tests at or near the worksite. Maintain current records of the test results obtained in the welding procedure, welding operator, welder performance qualifications, and nondestructive examination (NDE) procedures readily available at the site for examination by the Contracting Officer. Qualify the procedures for making transition welds between different materials or between plates or pipes of different wall thicknesses. [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8] requirements for branch connections may be used in lieu of detailed designs. Unless otherwise specified, the choice of welding process is the responsibility of the Contractor. Safety precautions must conform to AWS Z49.1.

1.7 DELIVERY, STORAGE, AND HANDLING

Deliver all filler metals, electrodes, fluxes, and other welding materials to the site in manufacturers' original packages and stored in a dry space until used. Properly label and design packages to give maximum protection from moisture and to insure safe handling.

1.7.1 Material Control

****

NOTE: If additional requirements are necessary regarding limits on out-of-oven exposure time, refer to AWS D1.1/D1.1M.

****

Store materials in a controlled access and clean, dry area that is weathertight and maintained at a temperature recommended by the manufacturer. The materials must not be in contact with the floor and store on wooden pallets or cribbing.

1.7.1.1 Damaged Containers

Store low-hydrogen steel electrodes in their sealed shipping container. If the seal is damaged during shipment or storage, and the damage is not immediately detected, rebake the covered electrodes in that container in accordance with the manufacturer's instructions prior to issuance or discard. If a container is damaged in storage and the damage is witnessed, immediately place the electrodes from that container in a storage oven. Provide storage oven temperature as recommended by the manufacturer or the welding material specification.

1.7.1.2 Partial Issues

When a container of covered electrodes is opened and only a portion of the content is issued, place the remaining portion, within 1/2 hour, in a storage oven.

1.7.2 Damaged Materials

Discard damaged materials. Discard covered electrodes which are oil or water-soaked, dirty, or on which the flux has separated from the wire.

PART 2 PRODUCTS

2.1 MATERIALS

****

NOTE: Normally, selection of the electrodes is done by the Contractor. In special cases, if the selection of the proper electrode is critical to the design, the designer may specify the electrodes to be used. In special cases it also may be necessary to specify the welding process.

****

Provide welding materials which comply with ASME BPVC SEC II-C. Provide welding equipment, electrodes, welding wire, and fluxes capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

PART 3 EXECUTION

3.1 WELDING OPERATIONS

Perform welding in accordance with qualified procedures using qualified welders and welding operators. Submit detailed procedures which define methods of compliance to contract drawings and specifications. Inspection and material procurement records. System and material testing and certification records. Written records and drawings indicating location of welds made by each welder or welding operator.

Do not perform welding when the quality of the completed weld could be impaired by the prevailing working or weather conditions. The Contracting Officer will determine when weather or working conditions are unsuitable for welding. Welding of hangers, supports, and plates to structural members must conform to Section 05 05 23.16 STRUCTURAL WELDING.

3.1.1 Base Metal Preparation

Do not use oxy-fuel cutting on austenitic stainless steel or nonferrous materials.

3.1.2 Weld Joint Fit-Up

Fit, align, and retain parts that are to be joined by welding in position during the welding operation by the use of bars, jacks, clamps, or other mechanical fixtures. Do not used welded temporary attachments except when it is impractical to use mechanical fixtures. When temporary attachments are used, they must be the same material as the base metal. Completely remove by grinding or thermal cutting after the welding operation is completed. If thermal cutting is used, cut the attachment no less than 6 mm 1/4 inch from the member and remove the balance by grinding. After the temporary attachment has been removed, visually examine the area.

3.1.3 Preheat and Interpass Temperatures

Provide preheat temperatures meeting the requirements specified by [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8]. However, preheat below 10 degrees C 50 degrees F for ferritic steel or austenitic stainless steel, or 0 degrees C 32 degrees F for nonferrous alloys is not acceptable. Do not exceed maximum interpass temperatures of 149 degrees C 300 degrees F for austenitic stainless steels, nickel alloys, and copper alloys; and 260 degrees C 500 degrees F for carbon steels. Use preheat techniques to ensure that the full thickness of the weld joint preparation and/or adjacent base material, at least 75 mm 3 inches in all directions, is at the specified temperature. Preheating by induction or resistance methods is preferred. When flame heating is used, employ only a neutral flame. Do not use oxy-fuel heating on austenitic stainless steel or nickel-alloy materials; however, air-fuel heating is acceptable if controlled to insure that the surface temperature does not exceed 66 degrees C 150 degrees F. Check interpass temperatures on the surface of the component within 25 mm 1 inch of the weld groove and at the starting location of the next weld pass, and for a distance of about 150 mm 6 inches ahead of the weld, but not on the area to be welded.

3.1.4 Production Welding Instructions

a. Do not perform welding when the ambient temperature is lower than minus 18 degrees C 0 degree F.

b. Welding is not permitted on surfaces that are wet or covered with ice, when snow or rain is falling on the surfaces to be welded, or during periods of high winds, unless the welders and the work are properly protected.

c. Provide welding grade gases for purging and shielding with a dew point of minus 40 degrees C minus 40 degrees F or lower.

d. Back purges are required for austenitic stainless steels and nonferrous alloys welded from one side and set up such that the flow of gas from the inlet to the outlet orifice passes across the area to be welded. The oxygen content of the gas exiting from the purge vent must be less than 2 percent prior to welding.

e. Maintain the purge on groove welds for at least three layers or 5 mm 3/16 inch.

f. Furnish removable purge dam materials made of expandable or flexible plugs, such as plexiglass, plywood (which must be dry when used), etc. Provide wood dams of kiln-dried quality. Provide nonremovable purge dams and purge dam adhesives made of water soluble materials. Purge dams made of polyvinyl alcohol are not permitted.

g. Do not perform any welding process which requires the use of external gas shielding in a draft or wind unless the weld area is protected by a shelter. This shelter must be of material and shape appropriate to reduce wind velocity in the vicinity of the weld to a maximum of 8 km/hour 5 mph (440 fpm).

h. Welding of low-alloy and hardenable high-alloy steels may be interrupted provided a minimum of at least 10 mm 3/8 inch thickness of weld deposit or 25 percent of the weld groove is filled, whichever is greater, and the preheat temperature is maintained during the time that welding is interrupted. If the temperature falls below the minimum preheat temperature before all welding has been completed on a joint, or, where required, before post weld heat treatment, perform a liquid penetrant or magnetic particle examination to insure sound deposited metal before reheating. Welding of other materials may be interrupted without restriction provided a visual inspection is performed before welding is resumed.

i. Taper the ends of tack welds to be incorporated in the final welds by grinding or welding technique. Remove tack welds that are cracked or defective and retack the groove prior to welding. Remove temporary tack welds, ground the surface smooth, and visually inspect. For low-alloy and hardenable high-alloy steels, the area must be magnetic particle examination inspected.

j. When joining ferritic steel pressure piping components to austenitic stainless steel pressure piping components and postweld heat treatment is required, the following requirements apply:

    (1) Butter the weld-end preps of ferritic steel components, which are to be welded to austenitic stainless steel, with one of the following weld filler metals conforming to the specified requirements: ASME BPVC SEC II-C, SFA 5.14, Classification ERNiCr-3; or ASME BPVC SEC II-C, SFA 5.11, Classification ENiCrFe-2.

(2) Butter the ferritic steel weld-end prep, apply a postweld heat treatment as required by [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8] and then machine with the applicable weld-end preparation. After machining, the buttered layer must be a minimum of 6 mm 1/4 inch thick.

(3) Complete pressure piping transition joints using ERNiCr-3 or ENiCrFe-2 weld filler metals. Do not perform further postweld heat treatment.

k. When joining ferritic steel pressure piping components to austenitic stainless steel pressure piping components and postweld heat treatment is not required, prepare and weld the joint using either ERNiCr-3 or ENiCrFe-2 filler metals. For service temperatures of 93 degrees C 200 degrees F or less, stainless filler metal 309 ASME BPVC SEC II-C, SFA 5.4 or 5.9 is permissible in lieu of the nickel-based alloys.

l. Grinding of completed welds is to be performed only to the extent required for NDE, including any inservice examination, and to provide weld reinforcement within the requirements of [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8]. If the surface of the weld requires grinding, avoid reducing the weld or base material below the minimum required thickness. Provide minimum weld external reinforcement flush between external surfaces.

3.1.5 Postweld Heat Treatment

a. Perform postweld heat treatment in accordance with [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8]. Measure temperatures for local postweld heat treatment continuously by thermocouples in contact with the weldment.

b. Perform postweld heat treatment of low-alloy steels, when required, immediately upon completion of welding and prior to the temperature of the weld falling below the preheat temperature. However, postweld heat treatment may be postponed after the completion of the weld, if, immediately after the weld is completed, it is maintained at a minimum temperature of 149 degrees C 300 degrees F or the preheat temperature, whichever is greater, for 2 hours per 25 mm inch of weld thickness.

c. For low-alloy steels, use cooling rates that avoid temper embrittlement.

3.2 EXAMINATIONS, INSPECTIONS, AND TESTS

****

NOTE: Coordinate with paragraph Performance.

Information based on the table must be developed and included in each project specification. The table must clearly define the systems to be inspected and the type of NDE required. The information presented in TABLE I is based on ASME B31.1. Specific project requirements may necessitate revision or expansion. In no case must the degree of testing and type of NDE be less than that required by the standard applicable to the work.

****

Visual and NDE must be performed [by the Government] [by the Contractor] to detect surface and internal discontinuities in completed welds. [Employ the services of a qualified commercial inspection or testing laboratory or technical consultant approved by the Contracting Officer.] Visually inspect all tack welds, weld passes, and completed welds. In addition, perform [magnetic particle] [liquid penetrant] examination on root passes. [Radiographic] [Liquid penetrant] [Magnetic particle] [or] [Ultrasonic] examination is required as indicated in TABLE I. When inspection and testing indicates defects in a weld joint, repair the weld by a qualified welder in accordance with paragraph CORRECTIONS AND REPAIRS.

TABLE I. MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS

Type Weld	Piping Service Conditions and Nondestructive Test		
	Temperatures over 400 degrees C 750 degrees F and at all pressures	Temperatures between 177 degrees C 350 degrees F and 400 degrees C 750 degrees F inclusive and at pressures above 7100 kPa 1025 psig	All others
Butt Welds (Girth and Longitudinal)	RT for NPS over 50 mm 2 inches MT or PT for NPS 50 mm 2 inches and less	RT for over 50 mm 2 inches NPS with thickness over 20 mm 3/4 inch. Visual for all sizes with thickness 20 mm 3/4 inch or less.	Visual for all sizes and thicknesses
Welded Branch Conncetions (Size indicated is branch size) (See Note 7)	RT for NPS over 100 mm 4 inches MT or PT for NPS 100 mm 4 inches and less	RT for over 100 mm 4 inches NPS with thickness over 20 mm 3/4 inch. Visual for all sizes with thickness 20 mm 3/4 inch or less.	Visual for all sizes and thicknesses
Fillet, Socket Attachment and Seal Welds	PT or MT for all sizes and thicknesses	Visual for all sizes and thicknesses	Visual for all sizes and thicknesses

NOTES TO TABLE I

(1) All welds must be given a visual examination in addition to type of specific nondestructive examination specified.

(2) NPS - nominal pipe size.

(3) RT - Radiographic examination; MT - magnetic particle examination; PT - liquid penetrant examination.

TABLE I. MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS	
Type Weld	Piping Service Conditions and Nondestructive Test
(4) RT of branch welds must be performed before any nonintegral reinforcing material is applied.	
(5) The thickness of butt welds is defined as the thicker of the two abutting ends after end preparation.	
(6) Temperatures and pressures shown are design.	
(7) In lieu of radiography of welded branch connections when required above, liquid penetrant or magnetic particle examination is acceptable and, when used, must be performed at the lesser of one half of the weld thickness or each 13 mm 1/2 inch of weld thickness and all accessible final weld surfaces.	
(8) For nondestructive examination of the pressure retaining component, refer to the standards listed in applicable code or the manufacturing specifications.	
(9) Fillet welds not exceeding 6 mm 1/4 inch throat thickness which are used for the permanent attachment of nonpressure retaining parts are exempt from the PT or MT requirements of the above table.	

3.2.1 Random NDE Testing

****

NOTE: Coordinate with paragraph Performance.

This paragraph will be deleted when the Contractor is not required to perform random inspection. Edit to delete any listed NDE method which is inapplicable. Insert a number from 1 to 99 for percent of welds to be random inspected; 10 percent is recommended for most projects.

****

When random [radiographic] [liquid penetrant] [magnetic particle] [or] [ultrasonic] examination is required, test a minimum of [_____] percent of the total length or number of piping welds. Randomly select welds for inspection, but include an examination of welds made by each welding operator or welder in the selection. If the random testing reveals that any welds fail to meet minimum quality requirements, inspect an additional [_____] percent of the welds in that same group. If all of the additional welds inspected meet the quality requirements, accept the entire group of welds represented and repair the defective welds. If any of the additional welds inspected also fail to meet the quality requirements, reject that entire group of welds. Remove and reweld the rejected welds, or 100 percent inspect the rejected welds and remove and reweld all defective weld areas.

3.2.2 Visual Inspection

Visually inspect weld joints as follows:

3.2.2.1 Before Welding

For compliance with requirements for joint preparation, placement of backing rings or consumable inserts, alignment and fit-up, and cleanliness.

3.2.2.2 During Welding

For cracks and conformance to the qualified welding procedure.

3.2.2.3 After Welding

For cracks, contour and finish, bead reinforcement, undercutting, overlap, and size of fillet welds.

3.2.3 NDE Testing

****

NOTE: Delete any NDE method not required. If magnetic particle inspection is required, specify whether wet or dry particle method is appropriate.

****

Perform NDE in accordance with written procedures. Procedures for [radiographic] [liquid penetrant] [magnetic particle] [or] [ultrasonic] tests and methods must conform to ASME BPVC SEC V. Demonstrate the approved procedure to the satisfaction of the Contracting Officer. In addition to the information required in ASME BPVC SEC V, include the timing of the NDE in relation to the welding operations and safety precautions.

3.2.4 Inspection and Tests by the Government

The Government will perform inspection and supplemental nondestructive or destructive tests as deemed necessary. The cost of supplemental NDE will be borne by the Government. Correct and repair defects and reexamine weld repairs at no additional cost to the Government. Inspection and tests will be performed as required for visual inspection and NDE, except that destructive tests may be required also. When destructive tests are ordered by the Contracting Officer and performed by the Contractor, and the specimens or other supplemental examinations indicate that the materials and workmanship do not conform to the contract requirements, the cost of the tests, corrections, and repairs are borne by the Contractor. When the specimens or other supplemental examinations of destructive tests indicate that materials or workmanship do conform to the specification requirements, the cost of the tests and repairs will be borne by the Government. When destructive tests are made, repairs must be made by qualified welders or welding operators using welding procedures which will develop the full strength of the members cut. Welding is subject to inspection and tests in the mill, shop, and field. When materials or workmanship do not conform to the specification requirements, the work may be rejected at any time before final acceptance of the system containing the weldment.

3.3 ACCEPTANCE STANDARDS

****

NOTE: These acceptance standards were taken from ASME B31.1 and are suitable for most jobs. Evaluations of indications, as given in ASME B31.1, are applicable to these standards. Specific project design requirements may necessitate revision or expansion to cover different items of work and varying standards of acceptance. In no case must the acceptance criteria be less conservative than the criteria specified by the standard applicable to

the work. The 5 mm 3/16 inch dimension specified in sub item c is based on TABLE 127.4.2 of ASME B31.1 for temperatures less than 177 degrees C 350 degrees F and thicknesses less than 25 mm 1 inch. If actual conditions exceed these limits, this requirement must be expanded or revised as required.

****

3.3.1 Visual

The following indications are unacceptable:

a. Cracks.

b. Undercut on surface which is greater than 1 mm 1/32 inch deep.

c. Weld reinforcement greater than 5 mm 3/16 inch.

d. Lack of fusion on surface.

e. Incomplete penetration (applies only when inside surface is readily accessible).

f. Convexity of fillet weld surface greater than 10 percent of longest leg plus 0.76 mm 0.03 inch.

g. Concavity in groove welds.

h. Concavity in fillet welds greater than 2 mm 1/16 inch.

i. Fillet weld size less than indicated or greater than 1.25 times the minimum indicated fillet leg length.

3.3.2 Magnetic Particle Examination

The following relevant indications are unacceptable:

a. Any cracks and linear indications.

b. Rounded indications with dimensions greater than 5 mm 3/16 inch.

c. Four or more rounded indications in a line separated by 2 mm 1/16 inch or less edge-to-edge.

d. Ten or more rounded indications in any 3870 square mm 6 square inches of surface with the major dimension of this area not to exceed 150 mm 6 inches with the area taken in the most unfavorable location relative to the indications being evaluated.

3.3.3 Liquid Penetrant Examination

Indications with major dimensions greater than 2 mm 1/16 of an inch are considered relevant. The following relevant indications are unacceptable:

a. Any cracks or linear indications.

b. Rounded indications with dimensions greater than 5 mm 3/16 inch.

c. Four or more rounded indications in a line separated by 2 mm 1/16 inch or less edge-to-edge.

d. Ten or more rounded indications in any 3870 square mm 6 square inches of surface with the major dimension of this area not to exceed 150 mm 6 inches with the area taken in the most unfavorable location relative to the indications being evaluated.

3.3.4 Radiography

Welds that are shown by radiography to have any of the following discontinuities are unacceptable:

a. Porosity in excess of that shown as acceptable in ASME BPVC SEC I, Appendix A-250.

b. Any type of crack or zone of incomplete fusion or penetration.

c. Any other elongated indication which has a length greater than:

    (1) 6 mm 1/4 inch for "t" up to 19 mm 3/4 inch inclusive. Where "t", here and below, pertains to the thickness of the weld being examined; if a weld joins two members having different thickness at the weld, "t" is the thinner of these two thicknesses.

    (2) 1/3 "t" for "t" from 19 mm 3/4 inch to 57 mm 2-1/4 inch, inclusive.

    (3) 19 mm 3/4 inch for "t" over 57 mm 2-1/4 inch.

d. Any group of indications in line that have an aggregate length greater than "t" in a length of "12t", except where the distance between the successive indications exceeds 6L where L is the longest indication in the group.

3.3.5 Ultrasonic Examination

Where discontinuities are interpreted to be cracks, lack of fusion, and incomplete penetration, they are unacceptable regardless of length. Linear-type discontinuities are unacceptable if the amplitude exceeds the reference level and discontinuities have lengths which exceed the following:

a. 6 mm 1/4 inch for "t" up to 19 mm 3/4 inch. Where "t", here and below, is the thickness of the weld being examined; if the weld joins two members having different thicknesses at the weld, "t" is the thinner of these two thicknesses.

b. 8 mm 1/3 inch for "t" from 19 to 57 mm 3/4 to 2-1/4 inch.

c. 19 mm 3/4 inch for "t" over 57 mm 2-1/4 inch.

3.4 CORRECTIONS AND REPAIRS

Remove and repair defects as specified in [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8] unless otherwise specified. Repair disqualifying defects discovered between weld passes before additional weld material is deposited. Wherever a defect is removed, and repair by welding is not required, blend the affected area into the surrounding surface eliminating sharp notches, crevices, or corners. After defect removal is complete and before rewelding, examine the area by the same test method which first revealed the defect to ensure that the defect has been eliminated. After rewelding, reexamine the repaired area by the same test method originally used for that area. Regard any indication of a defect as a defect unless reevaluation by NDE or by surface conditioning shows that no disqualifying defects are present. The use of any foreign material to mask, fill in, seal, or disguise welding defects will not be permitted.

UNIFIED FACILITIES GUIDE SPECIFICATIONS

References are in agreement with UMRL dated January 2025

****

SECTION 40 17 26.00 20

WELDING PRESSURE PIPING

04/06

****

NOTE: This guide specification covers the requirements for welding of piping and piping system components which will contain fluids under pressure including hydraulic systems.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

****

NOTE: Piping materials, components, and supports are specified in other sections of the project specifications.

****

****

NOTE: The following information must be shown on the project drawings:

1. Tensile strength, elongation, shear strength, size, length, type, and location of the welds, as necessary.

2. The project drawings should be checked to ensure that any supplementary information required by the

paragraphs has been shown and that there is no conflict between the drawings and the specifications. See also Note in DEFINITIONS. The project drawings must indicate, or text of the project specifications must specify, the tensile strength, elongation, shear strength, size, length, type, and location of the welds, as necessary.

****

PART 1 GENERAL

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 RELATED REQUIREMENTS

****

NOTE: The project drawings should be checked to ensure that any supplementary information required by the paragraphs has been shown and that there is no conflict between the drawings and the specifications.

****

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies to this section with the additions and modifications specified herein.

1.3 DEFINITIONS

****

NOTE: Insert the applicable ANSI piping codes. ANSI B31.2, "Fuel Gas Piping," and ASME B31.8, "Gas Transmission and Distribution Piping Systems," not listed under paragraph REFERENCES, may be used.

****

AWS A3.0M/A3.0 [and applicable ANSI piping documents].

1.4 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Welding Pressure Piping

SD-07 Certificates

Welding Procedures Qualification

Nondestructive Examination (NDE) Procedures

NDE personnel Certification Procedures

Inspector Certification

Submit inspector certification and NDE personnel certification for record.

SD-11 Closeout Submittals

Weld Identifications

1.5 QUALITY ASSURANCE

1.5.1 Welding Pressure Piping

Show location, length, and type of welds, and indicate postweld heat treatment and nondestructive testing as required.

1.5.2 Procedures

****

NOTE: Insert the applicable ANSI piping codes. ANSI B31.2, "Fuel Gas Piping," and ASME B31.8, "Gas Transmission and Distribution Piping Systems," not listed under paragraph REFERENCES, may be used.

****

Develop and qualify procedures for welding metals included in the work. Do not start welding until welding procedures, welders, and welding operators have been qualified. Perform qualification testing by an approved testing laboratory, or by the Contractor if approved by the Contracting Officer in accordance with the qualified procedures. Notify the Contracting Officer at least 24 hours in advance of the time and place of the tests. When practicable, perform the qualification tests at or near the work site. Maintain current records of the test results obtained in welding procedure, welding operator/welder performance qualifications, and nondestructive examination (NDE) procedures. These records must be readily available at the site for examination by the Contracting Officer.Qualify the procedures for making transition welds between different materials or between plates or pipes of different wall thicknesses. [ANSI Piping] [_____] requirements for branch connections may be used in lieu of detailed designs. Unless otherwise specified, the choice of welding process must be the responsibility of the Contractor.

1.5.2.1 Previous Qualifications

Welding procedures, welders, and welding operators previously qualified by test may be accepted for the work without requalification provided that the following conditions are fulfilled:

a. Copies of welding procedures, procedure qualification test records, and welder and welding operator performance qualification test records are submitted and approved in accordance with the paragraph SUBMITTALS.

b. Testing was performed by an approved testing laboratory or technical consultant or by the Contractor's approved quality control organization.

c. The welding procedures, welders, and welding operators were qualified in accordance with ASME BPVC SEC IX or AWS B2.1/B2.1M, AR-2 level; and base materials, filler materials, electrodes, equipment, and processes conformed to the applicable requirements of this specification.

d. The requirements of paragraph WELDER AND WELDING OPERATOR PERFORMANCE QUALIFICATION for renewal of qualification were met, and records showing name of employer and period of employment using the process for which qualified are submitted as evidence of conformance.

1.5.2.2 Performance

****

NOTE: The paragraphs will be edited and inserted if necessary to ensure proper implementation of the "CONTRACTOR QUALITY CONTROL PROGRAM." The specification writer or design engineer must indicate how much quality control of welding is needed for each project and who is to be responsible, i.e., primarily the Contractor or the Government. If quality control is to be the responsibility of the Government, delete paragraphs PERFORMANCE and QUALIFICATION OF INSPECTION AND (NDE) PERSONNEL through NDE PERSONNEL CERTIFICATION PROCEDURES and renumber paragraphs as necessary. Rarely will a project require 100 percent testing of welds by NDE methods. The designer must determine the required methods and the extent of inspection and testing and must indicate the extent in this or other sections of the project specifications or on the project drawings by notes, nondestructive test symbols, or other means. The specifications or project drawings must clearly indicate which joints require 100 percent NDE inspection, which joints require random NDE inspection, and which NDE methods are to be employed for each joint. For random inspection, the project drawings must indicate the location, number of joints, and minimum increment length of weld that will be subject to NDE inspection without predisclosing the exact spots to be examined. Joints not indicated to be tested by NDE methods must be subject to visual inspection only. In cases where the nature of the welding is such as to require visual inspection only, the requirements for nondestructive examinations should be deleted from these paragraphs and from paragraph QUALIFICATION OF INSPECTION AND (NDE) PERSONNEL.

****

The Contractor must be responsible for the quality of joint preparation, welding, and examination. Clearly identify and record materials used in the welding operations. The examination and testing defined in this specification are minimum requirements. Provide additional examination and testing as necessary to achieve the quality required.

1.5.3 Welding Procedures Qualification

****
NOTE: The project drawings must indicate, or text of the project specifications must specify, the tensile strength, elongation, shear strength, size, length, type, and location of the welds, as necessary.
****

****
NOTE: Insert the applicable ANSI piping codes. ANSI B31.2, "Fuel Gas Piping," and ASME B31.8, "Gas Transmission and Distribution Piping Systems," not listed under paragraph REFERENCES, may be used.
****

Qualification of the welding procedures for each group of materials to be welded is required as indicated in ASME BPVC SEC IX. Record in detail and qualify the "Welding Procedure Specifications" for every welding procedure proposed. Qualification for each welding procedure must conform to the requirements of ANSI Standards and to this specification. The welding procedures must specify end preparation for welds, including cleaning, alignments, and root openings. Preheat, interpass temperature control, and postheat treatment of welds must be as required by ANSI Piping documents, unless otherwise indicated or specified. Describe the type of backing rings or consumable inserts, if used, and, if they are to be removed, the removal process. Welding procedure qualifications must be identified individually and referenced on the shop drawings or suitably keyed to the contract drawings.

1.5.4 Welder and Welding Operator Performance Qualification

****
NOTE: Insert the applicable ANSI piping codes. ANSI B31.2, "Fuel Gas Piping," and ASME B31.8, "Gas Transmission and Distribution Piping Systems," not listed under paragraph REFERENCES, may be used.
****

Qualify each welder and welding operator assigned to work covered by this specification by performance tests using equipment, positions, procedures, base metals, and electrodes or bare filler wires from the same specification, classification, or group number that will be encountered on his assignment. Welders or welding operators who make acceptable procedure qualification tests will be considered performance-qualified for the welding procedure used. Determine performance qualification in accordance with [ASME BPVC SEC IX, [ANSI Piping Standards]] [_____] and as specified.

1.5.5 Renewal of Qualification

Requalification of a welder or welding operator must be required under one or any combination of the following conditions:

a. When a welder or welding operator has not used the specific welding process for a period of 3 months. The period may be extended to 6 months if the welder has been employed on another welding process.

b. There is specific reason to question the welder's ability to make welds that will meet the requirements of the specifications.

c. The welder or welding operator was qualified by an employer other than those firms performing work under this contract and a qualification test has not been taken within the preceding 12 months. Renewal of qualification under this condition need be made on only a single test joint or pipe of any thickness, position, or material to reestablish qualification for any thickness, position, or material for which the welder or welding operator had qualified previously.

1.5.6 Qualification of Inspection and (NDE) Personnel

Qualification of Inspection and Nondestructive Examination (NDE) Personnel: Qualify inspection and nondestructive examination personnel in accordance with the following requirements:

1.5.6.1 Inspector Certification

Qualify welding inspectors in accordance with AWS QC1.

1.5.6.2 NDE Personnel Certification Procedures

****

NOTE: The paragraphs will be edited and inserted if necessary to ensure proper implementation of the "CONTRACTOR QUALITY CONTROL PROGRAM." The specification writer or design engineer must indicate how much quality control of welding is needed for each project and who is to be responsible, i.e., primarily the Contractor or the Government. If quality control is to be the responsibility of the Government, delete paragraphs PERFORMANCE and QUALIFICATION OF INSPECTION AND (NDE) PERSONNEL through NDE PERSONNEL CERTIFICATION PROCEDURES and renumber paragraphs as necessary. Rarely will a project require 100 percent testing of welds by NDE methods. The designer must determine the required methods and the extent of inspection and testing and must indicate the extent in this or other sections of the project specifications or on the project drawings by notes, nondestructive test symbols, or other means. The referenced applicable publications and Army Technical Manual, "Welding Design, Procedures and Inspection," TM-5-805-7, will be used for guidance in determining inspection and testing requirements. The specifications or project drawings must clearly indicate which joints require 100 percent NDE inspection, which joints require random NDE inspection, and which NDE methods are to be employed for each joint. For random inspection, the project drawings must indicate the location, number of joints, and minimum increment length of weld that will be subject to NDE inspection without predisclosing the exact spots to be examined. Joints not indicated to be tested by NDE methods must be subject to visual inspection only. In cases where the nature of the welding is such as to require visual inspection only, the requirements for nondestructive examinations should be deleted from

these paragraphs and from paragraph QUALIFICATION OF INSPECTION AND (NDE) PERSONNEL.

****

Certify NDE personnel and establish a written procedure for the control and administration of NDE personnel training, examination, and certification. Base procedures on appropriate specific and general guidelines of training and experience recommended by ASNT SNT-TC-1A, [Supplement A-Radiographic] [Supplement B-Magnetic particle] [Supplement C-Ultrasonic] [and] [Supplement D-Liquid Penetrant].

1.5.6.3 Welding Procedures and Qualifications

a. Specifications and Test Results: Submit copies of the welding procedure specifications and procedure qualification test results for each type of welding required. Approval of any procedure does not relieve the Contractor of the responsibility for producing acceptable welds. Submit this information on the forms printed in ASME BPVC SEC IX or their equivalent.

b. Certification: Before assigning welders or welding operators to the work, submit their names, together with certification that each individual is performance qualified as specified. Do not start welding work prior to procedure qualification. The certification must state the type of welding and positions for which each is qualified, the code and procedure under which each is qualified, date qualified, and the firm and individual certifying the qualification tests.

1.5.7 Symbols

Conform to AWS A2.4.

1.5.7.1 Weld Identifications

Submit a list of the welders' names and symbol for each welder. To identify welds, submit written records indicating the location of welds made by each welder or welding operator.

1.5.8 Safety

Conform to AWS Z49.1, 29 CFR 1910-SUBPART Q, "Welding, Cutting, and Brazing," 29 CFR 1926-SUBPART J, "Welding and Cutting."

1.6 ENVIRONMENTAL

Do not perform welding when the quality of the completed weld could be impaired by the prevailing working or weather conditions. The Contracting Officer will determine when weather or working conditions are unsuitable for welding.

1.7 DELIVERY AND STORAGE

Deliver filler metals, electrodes, fluxes and other welding materials to the site in manufacturers' original packages and store in a dry space until used. Label and design packages properly to give maximum protection from moisture and to assure safe handling.

PART 2 PRODUCTS

2.1 WELDING MATERIALS

****

NOTE: Normally, selection of the electrodes is done by the Contractor as part of his qualified welding procedure. In special cases, if the selection of the proper electrode is critical to the design, the designer may specify the electrodes to be used. In special cases it also may be necessary to specify the welding process.

****

Comply with ASME BPVC SEC II-C. Welding equipment, electrodes, welding wire, and fluxes must be capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

PART 3 EXECUTION

3.1 WELDING

Do not deviate from applicable codes, approved procedures and approved shop drawings without prior written approval from the Contracting Officer. Materials or components with welds made off the site will not be accepted if the welding does not conform to the requirements of this specification unless otherwise specified. Assign each welder or welding operator an identifying number, letter, or symbol that must be used to identify his welds. Each welder or welding operator must apply his mark adjacent to his weld using an approved rubber stamp or felt-tipped marker with permanent, weatherproof ink or other approved methods that do not deform the metal. For seam welds, place identification marks adjacent to the welds at one meter 3 foot intervals. Confine identification by die stamps or electric etchers to the weld reinforcing crown, preferably in the finished crater.

3.2 WELDING OPERATORS

Perform welding in accordance with qualified procedures using qualified welders and welding operators.

3.3 SUPPORTS

Welding of hangers, supports, and plates to structural members must conform to AWS D1.1/D1.1M.

3.4 EXAMINATIONS AND TESTS

****

NOTE: The paragraphs will be edited and inserted if necessary to ensure proper implementation of the "CONTRACTOR QUALITY CONTROL PROGRAM." The specification writer or design engineer must indicate how much quality control of welding is needed for each project and who is to be responsible, i.e., primarily the Contractor or the Government. If quality control is to be the responsibility of the Government, delete paragraphs PERFORMANCE and QUALIFICATION OF INSPECTION AND

(NDE) PERSONNEL through NDE PERSONNEL CERTIFICATION PROCEDURES and renumber paragraphs as necessary. Rarely will a project require 100 percent testing of welds by NDE methods. The designer must determine the required methods and the extent of inspection and testing and must indicate the extent in this or other sections of the project specifications or on the project drawings by notes, nondestructive test symbols, or other means. The referenced applicable publications and Army Technical Manual, "Welding Design, Procedures and Inspection," TM-5-805-7, will be used for guidance in determining inspection and testing requirements. The specifications or project drawings must clearly indicate which joints require 100 percent NDE inspection, which joints require random NDE inspection, and which NDE methods are to be employed for each joint. For random inspection, the project drawings must indicate the location, number of joints, and minimum increment length of weld that will be subject to NDE inspection without predisclosing the exact spots to be examined. Joints not indicated to be tested by NDE methods must be subject to visual inspection only. In cases where the nature of the welding is such as to require visual inspection only, the requirements for nondestructive examinations should be deleted from these paragraphs and from paragraph QUALIFICATION OF INSPECTION AND (NDE) PERSONNEL."

****

****

NOTE: Information based on the two tables must be developed and included in each project specification. Tables must clearly define the systems to be inspected and the type of NDE required. Specify 100 percent NDE when required by UFC 3-460-01, "Design: Petroleum Fuel Facilities" and 49 CFR 195, as covered by paragraph "Piping Subject to 100 percent NDE."

****

Visual and nondestructive examinations must be performed [by the Government] [by the Contractor] to detect surface and internal discontinuities in completed welds. [Employ the services of a qualified commercial inspection or testing laboratory or technical consultant approved by the Contracting Officer.] Visually examine welds [Radiographic,] [Liquid penetrant,] [Magnetic particle,] [or] [Ultrasonic] examination must be required as indicated in Tables [IV] [and] [V] attached to this section [or in accordance with other sections where detailed requirements are specified]. Random NDE testing applies to ASME B31.3 and ASME B31.4 piping unless specified otherwise. When examination and testing indicates defects in a weld joint, a qualified welder must repair the weld in accordance with the paragraph CORRECTIONS AND REPAIRS of this section.

3.4.1 Random NDE Testing

****

NOTE: The paragraphs will be edited and inserted if necessary to ensure proper implementation of the

"CONTRACTOR QUALITY CONTROL PROGRAM." The specification writer or design engineer must indicate how much quality control of welding is needed for each project and who is to be responsible, i.e., primarily the Contractor or the Government. If quality control is to be the responsibility of the Government, delete paragraphs QUALIFICATION OF INSPECTION AND (NDE) PERSONNEL through NDE PERSONNEL CERTIFICATION PROCEDURES and renumber paragraphs as necessary. Rarely will a project require 100 percent testing of welds by NDE methods. The designer must determine the required methods and the extent of inspection and testing and must indicate the extent in this or other sections of the project specifications or on the project drawings by notes, nondestructive test symbols, or other means. The referenced applicable publications and Army Technical Manual, "Welding Design, Procedures and Inspection," TM-5-805-7, will be used for guidance in determining inspection and testing requirements. The specifications or project drawings must clearly indicate which joints require 100 percent NDE inspection, which joints require random NDE inspection, and which NDE methods are to be employed for each joint. For random inspection, the project drawings must indicate the location, number of joints, and minimum increment length of weld that will be subject to NDE inspection without predisclosing the exact spots to be examined. Joints not indicated to be tested by NDE methods must be subject to visual inspection only. In cases where the nature of the welding is such as to require visual inspection only, the requirements for nondestructive examinations should be deleted from these paragraphs and from paragraph QUALIFICATION OF INSPECTION AND (NDE) PERSONNEL.

****

****

NOTE: This paragraph will be deleted when the Contractor is not required to perform random inspection. Edit to delete any listed nondestructive test method which is inapplicable. Insert a number from 1 to 99 for percent of welds to be randomly inspected; 10 percent is recommended for most projects.

****

When [radiographic,] [liquid penetrant,] [magnetic particle,] [or] [ultrasonic] examination is required, test a minimum of [10] [_____] percent of the total length or number of piping welds. Randomly select the welds examined, but include an examination of welds made by each welding operator or welder. If random testing reveals that a weld fails to meet minimum quality requirements, examine an additional [10] [_____] percent of the welds in that same group. If the additional welds examined meet the quality requirements, the entire group of welds represented must be accepted and the defective welds must be repaired. If any of the additional welds examined also fail to meet the quality requirements, that entire group of welds must be rejected. Remove and reweld rejected welds or examine rejected welds 100 percent and remove and reweld defects.

3.4.2 Visual Examination

Visually examine welds as follows:

a. Before welding -- for compliance with requirements for joint preparation, placement of backing rings or consumable inserts, alignment and fit-up, and cleanliness.

b. During welding -- for conformance to the qualified welding procedure.

c. After welding -- for cracks, contour and finish, bead reinforcement, undercutting, overlap, and size of fillet welds.

3.4.3 Nondestructive Examination

****

NOTE: Delete any nondestructive test method not required. If magnetic particle inspection is required, specify whether wet or dry particle method is appropriate.

****

NDE must be in accordance with written procedures. Procedures for [radiographic,] [liquid penetrant,] [magnetic particle,] [or] [ultrasonic] tests and methods must conform to ASME BPVC SEC V. The approved procedure must be demonstrated to the satisfaction of the Contracting Officer's QA personnel. In addition to the information required in ASME BPVC SEC V, the written procedures must include:

a. Timing of the nondestructive examination in relation to the welding operations.

b. Safety precautions.

3.4.4 Examinations and Tests by the Government

Examinations and tests will conform to paragraphs "Visual Examination" and "Nondestructive Examination" of this section, except that destructive tests may be required also. When destructive tests are made, qualified welders or welding operators must make repairs using welding procedures which will develop the full strength of the members cut. Welding must be subject to examination and tests in the mill, shop, and field.

3.4.5 Piping Subject to 100 Percent NDE

ASME B31.4 [and ASME B31.3] Piping Subject to 100 Percent NDE: 100 percent of each day's girth welds installed in the following locations must be nondestructively examined 100 percent by radiographic, magnetic particle, or liquid penetrant examination unless impracticable, in which case at least 90 percent must be examined. Nondestructive examination must be impracticable for each girth weld not examined.

a. At onshore locations where a loss of hazardous liquid (petroleum, petroleum products, or anhydrous ammonia) could reasonably be expected to pollute stream, river, lake, reservoir, or other body of water, and any offshore area;

b. Within railroad or public road rights-of-way;

c. At overhead road crossings and within tunnels;

d. Within the limits of any incorporated subdivision of a State government; and

e. Within populated areas, including, but not limited to, residential subdivisions, shopping centers, schools, designated commercial areas, industrial facilities, public institutions, and places of public assembly.

3.5 ACCEPTANCE STANDARDS

****

NOTE: These acceptance standards are taken from ASME B31.1 and are suitable for most jobs. Evaluations of indications as given in ASME B31.1 are applicable to these standards. Visual acceptance standards are given for some other piping codes. It should be noted that specific project design requirements may necessitate revision or expansion to cover different items of work and varying standards of acceptance.

****

3.5.1 Visual

The following indications are unacceptable:

a. Cracks--external surface.

****

NOTE: In the text below, if only ASME B31.3 is applicable, delete all text in brackets. For ASME B31.3 under normal service conditions, use 25 percent with text in brackets and omit last sentence in brackets. For ASME B31.4 use 12.5 percent, and add the material in brackets pertaining to B31.4. Consider use of ASME B31.1 acceptance standard for codes other than B31.3 and B31.4.

****

b. Undercut on surface which is greater than 1.00 mm 1/32 inchdeep [or [25 percent for ASME B31.3] [and] [12.5 percent for ASME B31.4 and ASME B31.9] of the wall thickness, whichever is less,] provided that the remaining wall thickness is not less than the minimum design thickness. [For ASME B31.4 and in accordance with API Std 1104, undercuts over 0.40 mm through 0.80 mm 1/64 inch through 1/32 inch or over 6 to 12.5 percent of the pipe wall thickness, whichever is smaller, must not exceed 51 mm 2 inches in a continuous weld length of 305 mm 12 inches or 1/6 the length of the weld, whichever is smaller; and undercuts 0.40 mm 1/64 inch or 6 percent of the wall thickness, whichever is smaller, are acceptable regardless of length.]

****

NOTE: Include Tables I, II, or III below as applicable to project.

****

c. Weld reinforcement:

(1) ASME B31.1, conform to Table I.

TABLE I REINFORCEMENT OF GIRTH AND LONGITUDINAL BUTT WELDS			
	Maximum Thickness of Reinforcement for Design Temperature		
Thickness of Base Metal, millimeters (mm)	Greater than 400 degrees C	175 degrees C - 400 degrees C	Less than 175 degrees C
	mm	mm	mm
Up to 3.00, incl.	2.00	2.50	5.00
Over 3.00 to 5.00, incl.	2.00	3.00	5.00
Over 5.00 to 13.00, incl.	2.00	4.00	5.00
Over 13.00 to 25.00, incl.	2.50	5.00	5.00
Over 25.00 to 50.00, incl.	3.00	6.00	6.00
Over 50.00	4.00	The greater of 6 mm or 1/8 times the width of the weld in mm.	
NOTES:			
1. For double welded butt joints, this limitation on reinforcement given above must apply separately to both inside and outside surfaces of the joint.			
2. For single welded butt joints, the reinforcement limits given above must apply to the outside surface of the joint only.			
3. The thickness of weld reinforcement must be based on the thickness of the thinner of the materials being joined.			
4. The weld reinforcement thicknesses must be determined from the higher of the abutting surfaces involved.			
5. Weld reinforcement may be removed if so desired.			

TABLE I REINFORCEMENT OF GIRTH AND LONGITUDINAL BUTT WELDS			
	Maximum Thickness of Reinforcement for Design Temperature		
Thickness of Base Metal, inches	Greater than 750 degrees F	350 degrees F - 750 degrees F	Less than 350 degrees C
	inch	inch	inch
Up to 1/8, incl.	1/16	3/32	3/16
Over 1/8 to 3/16, incl.	1/16	1/8	3/16
Over 3/16 to 1/2, incl.	1/16	5/32	3/16
Over 1/2 to 1, incl.	3/32	3/16	3/16
Over 1 to 2, incl.	1/8	1/4	1/4
Over 2	5/32	The greater of 1/4 inch or 1/8 times the width of the weld in inches.	
NOTES:			
1. For double welded butt joints, this limitation on reinforcement given above must apply separately to both inside and outside surfaces of the joint.			
2. For single welded butt joints, the reinforcement limits given above must apply to the outside surface of the joint only.			
3. The thickness of weld reinforcement must be based on the thickness of the thinner of the materials being joined.			
4. The weld reinforcement thicknesses must be determined from the higher of the abutting surfaces involved.			
5. Weld reinforcement may be removed if so desired.			

(2) ASME B31.3, conform to Table II.

TABLE II	
Wall Thickness, mm	Height, mm
Less than or equal to 6.40	Less than or equal to 1.60

TABLE II	
Wall Thickness, mm	Height, mm
Greater than 6.40, is less than or equal to 12.70	Less than or equal to 3.20
Greater than 12.70, is less than or equal to 25.40	Less than or equal to 4.00
Greater than 25.40	Less than or equal to 4.80
NOTES:	
1. Wall thickness is the nominal wall thickness of the thinner of components joined by butt weld.	
2. Height: For "Normal Service" and "Severe Cyclic" conditions, use the listed value. For "Category D Fluid Service," use twice the listed value. Measure from surfaces of adjacent components. The lesser of the two measurements, in any plane through the weld, must not exceed the applicable value at right. Weld metal must merge smoothly into component surfaces.	

TABLE II	
Wall Thickness, inches	Height, inches
Less than or equal to 1/4	Less than or equal to 1/16
Greater than 1/4, is less than or equal to 1/2	Less than or equal to 1/8
Greater than 1/2, is less than or equal to 1	Less than or equal to 5/32
Greater than 1	Less than or equal to 3/16
NOTES:	
1. Wall thickness is the nominal wall thickness of the thinner of components joined by butt weld.	
2. Height: For "Normal Service" and "Severe Cyclic" conditions, use the listed value. For "Category D Fluid Service," use twice the listed value. Measure from surfaces of adjacent components. The lesser of the two measurements, in any plane through the weld, must not exceed the applicable value at right. Weld metal must merge smoothly into component surfaces.	

(3) ASME B31.4, conform to Table I for under 175 degrees C 350 degrees F.

(4) ASME B31.5, conform to Table III.

TABLE III	
Pipe Wall Thickness, mm	Reinforcement Thickness, mm
6.40 and under	1.60
Over 6.40 through 12.70	2.40
Over 12.70, through 25.40	3.20
Over 25.40	4.80

TABLE III	
Pipe Wall Thickness, inches	Reinforcement Thickness, inches
1/4 and under	1/16
Over 1/4 through 1/2	3/32
Over 1/2, through 1	1/8
Over 1	3/16

(5) ASME B31.9: Thickness of weld reinforcement must not exceed 4.80 mm 3/16 inch.

d. Lack of fusion on surface.

e. Incomplete penetration (applies only when inside surface is readily accessible).

f. Convexity of fillet weld surface greater than 10 percent of longest leg plus 1.0 mm 0.03 inch.

g. Concavity in groove welds.

h. Concavity in fillet welds greater than 2.0 mm 1/16 inch.

i. Fillet weld size less than indicated or greater than 1 1/4 times the minimum specified fillet leg length.

3.5.2 Magnetic Particle Examination

The following relevant indications are unacceptable:

a. Any cracks and linear indications.

b. Rounded indications with dimensions greater than 5.0 mm 3/16 inch.

c. Four or more rounded indications in a line separated by 2.0 mm 1/16 inch or less edge-to-edge.

d. Ten or more rounded indications in any 3870 square mm 6 square inches of surface, with the major dimension of this area not to exceed 150 mm 6 inches, with the area taken in the most unfavorable location relative to the indications being evaluated.

3.5.3 Liquid Penetrant Examination

Indications whose major dimensions are greater than 2.0 mm 1/16 inch must be considered relevant. The following relevant indications are unacceptable:

a. Any cracks or linear indications.

b. Rounded indications with dimensions greater than 5.0 mm 3/16 inch.

c. Four or more rounded indications in a line separated by 2.0 mm 1/16 inch or less edge-to-edge.

d. Ten or more rounded indications in any 3870 square mm 6 square inches of surface, with the major dimension of this area not to exceed 150 mm 6 inches, with the area taken in the most unfavorable location relative to the indications being evaluated.

3.5.4 Radiography

Welds that are shown by radiography to have any of the following discontinuities are unacceptable:

a. Any type of crack or zone of incomplete fusion or penetration.

b. Any other elongated indication which has a length greater than:

  (1) 6.0 mm 1/4 inch for t up to 19.0 mm 3/4 inch, inclusive;

  (2) 1/3 t for t from 19.0 mm 3/4 inch to 57.00 mm 2 1/4 inches, inclusive;

  (3) 19.00 mm 3/4 inch for t over 57.00 mm 2 1/4 inches where t is the thickness of the thinner portion of the weld.

("t" pertains to the thickness of the weld being examined. If a weld joins two members having different thickness at the weld, "t" is the thinner of these two thicknesses.)

c. Any group of indications in line that have an aggregate length greater than t in a length of 12t, except where the distance between the successive indications exceeds 6L where L is the longest indication in the group.

d. Porosity in excess of that shown acceptable in Appendix A-250, Acceptance Standard for Radiographically Determined Rounded Indications in Welds, ASME BPVC SEC I.

3.5.5 Ultrasonic Examination

Permitted for ASME B31.3 and ASME B31.4 piping only. Linear type discontinuities are unacceptable if the amplitude exceeds the reference level and discontinuities have lengths which exceed the following:

a. 6.0 mm 1/4 inch for t up to 19.0 mm 3/4 inch

b. 1/3 t for t from 19.0 mm 3/4 inch to 57.0 mm 2 1/4 inches

c. 19.0 mm 3/4 inch for t over 57.0 mm 2 1/4 inches

("t" is the thickness of the weld being examined. If the weld joins two members having different thickness at the weld, "t" is the thinner of these two thicknesses. Discontinuities are interpreted to be cracks, lack of fusion, and incomplete penetration are unacceptable regardless of length.)

3.6 CORRECTIONS AND REPAIRS

****

NOTE: Insert the applicable ANSI piping codes. ANSI B31.2, "Fuel Gas Piping," and ASME B31.8, "Gas Transmission and Distribution Piping Systems," not listed under paragraph REFERENCES, may be used.

****

Remove defects and replace welds as specified in [ANSI Piping Standards] [_____], unless otherwise specified. Repair defects discovered between weld passes before additional weld material is deposited. Wherever a defect is removed, and repair by welding is not required, the affected area must be blended into the surrounding surface eliminating sharp notches, crevices, or corners. After defect removal is complete and before rewelding, reexamine the area by the same test methods which first revealed the defect to ensure that the defect has been eliminated. After rewelding, reexamine the repaired area by the same test methods originally used for that area. For repairs to base material, the minimum examination must be the same as required for butt welds. Indication of a defect must be regarded as a defect unless reevaluation by NDE or by surface conditioning shows that no unacceptable indications are present. The use of foreign material to mask, fill in, seal, or disguise welding defects will not be permitted.

****

NOTE: Regarding Table IV, information based on the table must be developed and included in each project specification. Tables must clearly define the systems to be inspected and the type of NDE required. Specify 100 percent NDE when required by UFC 3-460-01, "Design: Petroleum Fuel Facilities" and 49 CFR 195, as covered by paragraph "Piping Subject to 100 Percent NDE." Where appears, select 100 percent or random but not both.

****

TABLE IV - EXAMINATIONS AND TESTS FOR VARIOUS MATERIALS AND SERVICES				
Examinations or Tests Required				
Material or Application	Visual	Radiographic	[Magnetic Particle] [or] [Liquid Penetrant]	Ultrasonic
High-alloy austenitic or nickel steels or nickel alloys for cryogenic service and vacuum service				
a. Tack welds	Yes	No	No No	
b. Root passes	Yes	No	Yes No	
c. Intermediate passes	Yes	No	No No	
d. Completed weld	Yes	100 percent for DN over 32 mm 60 percent for DN 32mm and less 100 percent for NPS over 1-1/4 inches 60 percent for NAPA PS 1-1/4 inches and less	Yes(PT only); 50 mm 1/2 inch and over	Yes for wall thickness
High-alloy austenitic or nickel steels or nickel alloys for other than cryogenic or vacuum service				
a. Tack welds	Yes	No	No No	

TABLE IV - EXAMINATIONS AND TESTS FOR VARIOUS MATERIALS AND SERVICES

Examinations or Tests Required

Material or Application	Visual	Radiographic	[Magnetic Particle] [or] [Liquid Penetrant]	Ultrasonic
b. Root passes	Yes	No	[No][Yes]	No
c. Intermediate passes	Yes	No	No No	
d. Completed weld	Yes	[100 percent] [Random]	Yes (PT only)	[No] [Yes]

c. Intermediate passes	Yes	No	No	No
d. Completed weld	Yes	[100 percent] [Random]	[No] [Yes MT]	No

****
NOTE: Regarding Table V, information based on the table must be developed and included in each project specification. Tables must clearly define the systems to be inspected and the type of NDE required. Specify 100 percent NDE when required by UFC 3-460-01, "Design: Petroleum Fuel Facilities" and 49 CFR 195, as covered by paragraph "Piping Subject to 100 Percent NDE."
****

TABLE V - MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS FOR ASME B31.1 PIPING

	Temperatures over 400 degrees C and at all pressures.	Temperatures between 175 degrees C and 400 degrees C inclusive and at all pressures over 7100 kPa gage	All others
Buttwelds (Girth and Longitudinal)	RT for DN over 50 mm MT or PT for DN 50 mm and less.	RT for over 50 mm DN with thickness over 19 mm. Visual for all sizes with thickness 19 mm or less.	Visual for all sizes and thicknesses.
Welded Branch Connections (Size indicated is Branch Size)	RT for DN over 50 mm MT or PT for DN 50 mm and less.	RT for branch over 100 mm DN and thickness of branch over 19 mm. Visual for all sizes with branch thickness 19 mm or less.	Visual for all sizes and thicknesses.
Fillet, Socket Welds	PT or MT for all sizes and thicknesses.	Visual for all sizes and thicknesses.	Visual for all sizes and thicknesses.
NOTES:			
1. Thickness refers to pressure boundary wall thickness (such as pipe wall, fitting wall, or nozzle wall thickness).			
2. All welds must be given a visual examination in addition to type of specific nondestructive examination specified.			

TABLE V - MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS FOR ASME B31.1 PIPING

	Temperatures over 400 degrees C and at all pressures.	Temperatures between 175 degrees C and 400 degrees C inclusive and at all pressures over 7100 kPa gage	All others
3. NPS-Nominal Pipe Size.			
4. RT-Radiographic examination; MT-magnetic particle examination; PT-liquid penetrant examination.			
5. RT of branch welds must be performed before any nonintegral reinforcing material is applied.			
6. The thickness of buttwelds is defined as the thicker of the two abutting ends after end preparation.			
7. Temperatures and pressures shown are design.			
8. In lieu of radiography of welded branch connections when required above, liquid penetrant or magnetic particle examination is acceptable and, when used, must be performed at the lesser of one-half of the weld thickness or each 50 mm of weld thickness and all accessible final weld surfaces.			
9. For nondestructive examination of the pressure retaining component, refer to the standards listed in applicable code or the manufacturing specifications.			

TABLE V - MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS FOR ASME B31.1 PIPING

	Temperatures over 750 degrees F and at all pressures.	Temperatures between 350 degrees F and 750 degrees F inclusive and at all pressures over 1052 psig gage	All others
Buttwelds (Girth and Longitudinal)	RT for NPS over 2 inches MT or PT for NPS 2 inches and less.	RT for over 2 inch NPS with thickness over 3/4 inch. Visual for all sizes with thickness 3/4 inch or less.	Visual for all sizes and thicknesses.
Welded Branch Connections (Size indicated is Branch Size)	RT for NPS over 2 inch MT or PT for NPS 2 inch and less.	RT for branch over 4 inch NPS and thickness of branch over 3/4 inch. Visual for all sizes with branch thickness 3/4 inch or less.	Visual for all sizes and thicknesses.
Fillet, Socket Welds	PT or MT for all sizes and thicknesses.	Visual for all sizes and thicknesses.	Visual for all sizes and thicknesses.

NOTES:

1. Thickness refers to pressure boundary wall thickness (such as pipe wall, fitting wall, or nozzle wall thickness).

2. All welds must be given a visual examination in addition to type of specific nondestructive examination specified.

3. NPS-Nominal Pipe Size.

4. RT-Radiographic examination; MT-magnetic particle examination; PT-liquid penetrant examination.

5. RT of branch welds must be performed before any nonintegral reinforcing material is applied.

1.2 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up

to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Contractor Design Drawings; G, [_____]

Draft As-Built Drawings; G, [_____]

SD-03 Product Data

1.3 SITE ENVIRONMENTAL CONDITIONS

The expected site environmental conditions are a minimum of [_____] degrees C [_____] degrees F and a maximum of [_____] degrees C [_____] degrees F.

1.4 SEQUENCING

****

NOTE: Provide Table I provides bracketed text in which the following site number of days between items may be specified. In many cases this information will be specified elsewhere. When project schedule is specified elsewhere remove bracketed text and Table I will provide sequencing but not specific intervals. If time intervals are to be specified here keep the bracketed text and enter the number of days in the space provided.

****

TABLE I: PROJECT SEQUENCING specifies the sequencing of submittals as specified in paragraph SUBMITTALS (denoted by an 'S' in the 'TYPE' column) and activities as specified in PART 3 EXECUTION (denoted by an 'E' in the 'TYPE' column).

1.5.1 Sequencing for Submittals

The sequencing specified for submittals is the deadline by which the submittal must be initially submitted to the Government. Following submission there will be a Government review period as specified in Section 01 33 00 SUBMITTAL PROCEDURES. If the submittal is not accepted by the Government, revise the submittal and resubmit it to the Government within [14] [_____] days of notification that the submittal has been rejected. Upon re-submittal there will be an additional Government review period. If the submittal is not accepted the process repeats until the submittal is accepted by the Government.

1.5.2 Sequencing for Activities

The sequencing specified for activities indicates the earliest the activity may begin.

1.5.3 Abbreviations

In TABLE I the abbreviation AAO is used for 'after approval of' and 'ACO' is used for 'after completion of'.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

****

NOTE: Add site specific requirements. Supplement this specification with drawings which include a piping and instrumentation diagram (P&ID) and a comprehensive control diagram showing devices, a sequence of operations, and a points schedule.

****

The process control system must be used to monitor and control the operation of process equipment as specified and in accordance with the sequence of operation and control schematics shown on the drawings. The process control system must provide for operator interaction, overall process control system supervision, and process equipment control and monitoring. The system must adhere to Section 25 05 11 CYBERSECUIRITY OF FACILITY-RELATED CONTROL SYSTEMS. Provide hardware configured and sized to support expansion as specified and shown on the drawings.

The process control system must be comlete including sensors, field preamplifiers, signal conditioners, offest and span adjustments, amplifiers, transducers, transmitters, control devices, engineering units conversions and algorithms for the applications; and must maintain the specified end-to-end process control loop accuracy from the sensor to display and final control element. Connecting conductors must be suitable for installed controls. Enclosers must be rated for NEMA [1] [4] [_____].

2.1.1 Operation

****

NOTE: Show the number of control panels to be provided on the drawings. Provide setpoint ranges, alarm settings and other parameters not addressed in the sequence of control in a points schedule on the drawings.

****

The process control system provided under this specification must operate using a combination of sequential function charts, function block diagrams, structured text, instruction, and ladder logic type as defined in IEC 61131-3 and supervisory control to provide the required sequences of operation. Input data to the controller must be obtained by using instruments and controls interfaced to mechanical, electrical, utility systems and other systems as shown and specified. All required setpoints, settings, alarm limits, and sequences of operation must be as identified [in the database/ settings tables] [and] [or] [sequences of operation indicated].

2.1.2 Points

****

NOTE: Provide an input/output (I/O) summary table on the drawings. List all inputs to and outputs from the process control system. Identify each point type, analog, binary, pulse accumulator; input, output, control, monitoring, etc. Identify alarms, trends, software and failure mode setting associated with each point in the table. Label each point so that it can be easily referenced to the process control system schematic drawings or process and instrumentation drawings.

****

Provide inputs to and outputs from the process control system in accordance with the Input/Output (I/O) Summary Table indicated. Each connected analog output (AO), analog input (AI), binary output (BO), binary input (BI), pulse accumulator (PA) input and other input or output device connected to the control system must represent a "point" where referred to in this specification.

2.1.3 Building Telecommunications Cabling (BTC)

****

NOTE: Include in the project specification any of the following UFGS for the appropriate BTC: Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM, Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP).

****

Provide data transmission systems for communication [between PLCs] [and] [between PLCs and the central station] [and] [server] as specified in [Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM][Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP)] and as indicated.

2.1.4 System Reliabilty

The system must be designed for maximum reliability, safety and integrity while maintaining an availability of [99.99%] or better.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Product Certifications

****

NOTE: Note: FCC part 15 does not apply to many of the computing devices used for industrial applications. Title 47 Part 15 provides for exqamption of unintentional radiators considered "digital devices used exclusively as an electronic control" or power system utilized by a public utility or in and industrial plant.

****

Computing devices, as defined in FCC Part 15, supplied as part of the process control system must be certified to comply with the requirements of Class B computing devices.

2.2.2 Standard Products

Materials and equipment must be standard unmodified products of a manufacturer regularly engaged in the manufacturing of such products. Units of the same type of equipment must be products of a single manufacturer. Items of the same type and purpose must be identical and supplied by the same manufacturer, unless replaced by a new version approved by the Government.

2.2.3 Nameplates

Each major component of equipment must have the manufacturer's name and address, and the model and serial number in a conspicuous place. Laminated plastic nameplates must be provided for equipment devices and panels furnished. Each nameplate must identify the device, such as pump "P-1" or valve "VLV-402". Labels must be coordinated with the schedules and the process and instrumentation drawings. Laminated plastic must be 3 mm 1/8 inch thick, white with black center core. Nameplates must be a minimum of 25 by 75 mm 1 by 3 inches with minimum 6 mm 1/4 inch high engraved block lettering. Nameplates for devices smaller than 25 by 75 mm 1 by 3 inches must be attached by a nonferrous metal chain. All other nameplates must be attached to the device.

2.3 GENERAL REQUIREMENTS

****

Show hazardous area classification on the drawings.

****

Equipment located outdoors, not provided with climate controlled enclosure, must be capable of operating in the ambient temperature range. Electrical equipment will conform to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Equipment and wiring must be in accordance with NFPA 70, with proper consideration given to environmental conditions such as moisture, dirt, corrosive agents, and hazardous area classification.

2.4 SENSORS

****

NOTE: Provide a schedule on the drawings that includes all required instrumentation. Provide device information such as: Alpha-Numeric designator, the operating range (pressure, temperature, flow) of construction material, media to be monitored or controlled, control signal, valve type (2-way, 3-way, normally open, normally closed, etc.). Include automatic control valves and manually operated control valves.

It may be appropriate to defer the enclosure requirements to the electrical section or to provide different enclosures for different areas: indoor, outdoor, areas with hazard classification indicated on the drawings, etc. Within an area, the requirements should be consistent.

****

2.4.1 Transmitter

****

NOTE: Show all panels on the drawings. Distance between transmitter and sensor is critical. Specifying the digital communication of sensors opens up the possibility of proprietary sensors.

****

Unless indicated otherwise, each sensor must be provided with a transmitter, selected to match the sensor. Except where specifically indicated otherwise on the drawings, the transmitter must be provided with a [four] [_____] digit or analog visual display of the measured parameter and with a [4 to 20 mAdc] [binary] [0-10 vdc] [_____] output signal proportional to the level of the measured parameter. Accuracy must be plus or minus [0.5] [1] [2] [5] [_____] percent of full scale reading with output error not exceeding plus or minus [0.25] [0.5] [_____] percent of [the calibrated measurement] [full scale]. Transmitter must be located where indicated, mounted integrally with the sensor, pipe mounted, wall mounted or installed in the control panel. The distance between the sensor and transmitter must not exceed the manufacturer's recommendation. Field preamplifiers and signal conditioners must be included when necessary to maintain the accuracy from sensor to the programmable logic controller or recorder.

2.4.2 Off-Gas or Vapor Service

****

NOTE: If there are substantial temperature or pressure changes across a blower or unit process, it may be cost effective to specify differing requirements upstream and downstream of the process.

****

Sensors and meters in [off-gas] [or] [vapor] service must be rated for continuous duty service at fluid approach velocities from 2.5 to 25 m/s 500 to 5000 fpm with correspondingly higher constriction velocities over a fluid temperature range from minus [18] [25] [_____] degrees C to [40] [50] [66] [_____] degrees C minus [0] [15] [_____] degrees F to [105] [120] [150] [_____] degrees F at pressures from minus [50] [_____] kPa gage up to [100] [700] [_____] kPa gage minus [7.2] [_____] psi gage up to [15] [100] [_____] psi gage.

2.4.3 Liquid Service

****

NOTE: If there are substantial temperature or pressure changes across a pump or unit process, it may be cost effective to specify differing requirements upstream and downstream of the process.

****

Sensors and meters in liquid service must be rated for continuous duty service at fluid approach velocities from [0.1] [0.75] [_____] m/s to [2] [3] [_____] m/s [0.327] [2.5] [_____] ft/s to [7] [10] [_____] ft/s with correspondingly higher constriction velocities over a fluid temperature range from [0] [-50] [_____] degrees C to [40] [50] [250] [_____] degrees C [32] [-58] [_____] degrees F to [105] [120] [482] [_____] degrees F at pressures up to [70] [350] [700] [1000] [_____] kPa [10] [50] [100]

[150][_____] psi gage.

2.4.4 Flow Rate Sensors and Meters

****

NOTE: Most flow meters need straight unobstructed piping of 10 pipe diameters upstream and 5 pipe diameters downstream. Verify that the location will allow installation meeting the criteria or that the accuracy of type of flow meter selected is not affected by the location. Design includes attendant elements such as mounting devices, differential pressure transmitter and interpretive ancillary components in this and other sections and on the drawings to complete the system.

****

Liquid flow indication must be provided in [L/s] [gpm]. [Off-gas] [or] [Vapor] flow indication must be provided in [cubic m/second] [cubic feet per minute]. Pressure taps must incorporate appropriate snubbers. Unless indicated otherwise, the flow transmitter must produce a signal that is proportional to the volumetric flow rate, compensated for fluid temperature, and must have an accuracy of plus or minus [1] [3] [_____] percent of [full flow] [the actual flow]. Flow transmitter must be located within [5 m] [15 feet] of the flow element. The flow transmitter must include a [digital] [_____] readout of the volumetric flow rate to [3] [_____] significant figures. [The controller must be provided with a minimum of three alarm lights. The first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light must indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input.] [The controller must be provided with a minimum of three sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input.] The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a [4-20 mAdc] [_____] output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost. Flow rate must be controlled to within plus or minus [5] [_____] percent of the design flow.

2.4.4.1 Flow Nozzle

Flow nozzle must be made of austenitic stainless steel. The inlet nozzle form must be elliptical and the nozzle throat must be the quadrant of an ellipse. The thickness of the nozzle wall and flange must be such that the accuracy will not be degraded by distortion of the nozzle throat from strains caused by the pipeline temperature and pressure, flange bolting, or other methods of installing the nozzle in the pipeline. The outside diameter of the nozzle flange or the design of the flange facing must be such that the nozzle throat is centered accurately in the pipe.

2.4.4.2 Flow Switch

Flow switch must have a repetitive accuracy of plus or minus [10] [_____] percent of actual flow setting. Switch actuation must be adjustable over the operating flow range. Flow switch for use in [water] [contaminated groundwater] [sewage] [air] [vapor] [gas] [hot gas] [corrosive vapor] [_____] system must be rated for use and constructed of suitable materials for installation in the environment encountered. The flow switch must have non flexible [paddle] [shuttle/piston] [thermal] [pezio] with Form C snap action contacts, rated in accordance with NEMA ICS 1.

****

NOTE: Magnetic flowmeters are to be used only for conductive fluids.

****

2.4.4.3 Magnetic Flowmeter

Magnetic flowmeter must be [non-intrusive,] DC pulse type and must measure fluid flow through the use of a self generated magnetic field. The meter must have automatic zeroing circuitry. The magnetic flow element must be encapsulated in [type 300 stainless steel] [or] [anodized aluminum]. Flowmeter must be capable of measuring up to a maximum flow velocity of [3] [_____] m/s [10] [_____] fps. The metering tube must be constructed of [316 stainless steel] [anodized aluminum] [_____]. The meter must be rated for a process temperature range of [32 to 212 F] [0 to 100C] and [0 to 149F] [-18 to 65C] ambient. The maximum pressure drop across the meter and appurtenances must be 34 kPa 5 psi at the maximum flow rate.

2.4.4.4 Natural Gas or Propane Flow Meter

Flowmeter for natural gas or propane flows, corrected to standard conditions, of up to 19.7 L/sec 2500 SCFH must be of the positive displacement diaphragm or bellows type and for flows above 0.02 cu. m/sec 2500 cfh, must be of the axial flow turbine type. Meters must be designed specifically for natural gas or propane supply metering and rated for the pressure, temperature and flow rates of the installation. Permanent meters must be suitable for operation in conjunction with an energy monitoring and process control system. Meter body must be constructed of [316 stainless steel] [_____]. Meter must have a minimum turndown ratio of [10] [_____] to [1] [_____] with an accuracy of plus or minus [1] [_____] percent of actual flow rate. The meter index must include a direct reading mechanical totalizing register and electrical impulse dry contact output for remote monitoring. The electrical impulse dry contact output must provide not less than 1 pulse per 2.8 cubic meters 100 cubic feet of gas and must require no field adjustment or calibration. The highest electrical impulse rate available from the manufacturer, not exceeding [15] [_____] pulses per second, for the installed application must be provided.

2.4.4.5 Orifice Plate

****

NOTE: Show the operating ranges and ratings on the drawings for operating pressures and flow. Differential pressure output ranges for flow conditions are to be coordinated. Accuracy of computed flow will be improved with inclusion of temperature and pressure of upstream conditions.

****

Orifice plate must be made of [304] [316] series stainless steel sheet. The outlet side of the bore must be beveled at a 45 degree angle. The thickness of the cylindrical face of the orifice must [not exceed one-fiftieth of the pipe inside diameter or one-eighth of the orifice bore, whichever is smaller] [be 3.3 mm 0.125 inch nominal]. The orifice plate must be flat within 0.10 mm 20 mils. The orifice surface roughness must not exceed 0.5 micron 0.02 mils. Orifice plates must be concentric plates with a square and sharp upstream edge of the orifice. Orifice bore must be designed to match the operating parameters stated in the drawings. Plate must be permanently identified with line size, flange rating, orifice bore diameter, plate thickness and material. The accuracy must be plus or minus [1] [_____] percent of full flow.

2.4.4.6 Paddle Type Flowmeter

Sensor accuracy must be plus or minus [1] [_____] percent of rate of flow, minimum operating flow velocity must be [0.3] [_____] m/s [1.0] [_____] fps. Sensor repeatability and linearity must be plus or minus [1] [_____] percent. Sensor must be non-magnetic, with forward curved impeller blades designed for water containing debris. Wetted materials must be made from non-corrosive materials and must not contaminate water. The sensor must be provided with isolation valves. The transmitter housing must be a NEMA 250 Type 4 enclosure. The sensor must be rated for installation in pipes of 76 mm to 1 m 3 to 40 inch diameters.

2.4.4.7 Pitot Tube Air Flow Measurement Array (AFMA)

Each Pitot Tube AFMA must contain an array of velocity sensing elements. The velocity sensing elements must be of the multiple pitot tube type with averaging manifolds. The sensing elements must be distributed across the duct cross section in the quantity and pattern specified or recommended by the published installation instructions of the AFMA manufacturer.

a. Pitot Tube AFMAs for use in airflows over 3.0 m/s 600 fpm must have an accuracy of plus or minus [5] percent over a range of 2.5 to 12.5 m/s 500 to 2500 fpm.

b. Pitot Tube AFMAs for use in airflows under 3.0 m/s 600 fpm must have an accuracy of plus or minus [5] percent over a range of 0.6 to 12.5 m/s 125 to 2500 fpm.

2.4.4.8 Annular Pitot Tube

****

NOTE: Annular pitot tubes should not be used where the flow is pulsating or where pipe vibration is allowed. Pulse flow is characteristic of positive displacement pumps and blowers.

****

Sensor must have an accuracy of plus or minus [2] [_____] percent of full flow and a repeatability of plus or minus [0.5] [_____] percent of measured value. Annular pitot tube must be averaging type differential pressure sensors with no less than four total head pressure ports with an averaging manifold and at least one static port made of austenitic stainless steel. The total head pressure ports must extend diametrically across the entire pipe.

2.4.4.9 Electronic AFMA

Each electronic AFMA must consist of an array of velocity sensing elements of the resistance temperature detector (RTD) or thermistor type. The sensing elements must be distributed across the duct cross section in the quantity and pattern specified or recommended by the published application data of the AFMA manufacturer. Electronic AFMAs must have an accuracy of plus or minus [5] percent over a range of [.6] [_____] m/s to [25][50] m/s [120] [_____] fpm to [5,000] [10,000] fpm and the output must be temperature compensated over a range of 0 to 100 degrees C 32 to 212 degrees F.

2.4.4.10 Positive Displacement Flowmeter

Output accuracy must be plus or minus [2] percent of the flow range. The flow meter must be a direct reading, gerotor, nutating disc or vane type displacement device rated for liquid service. A counter must be mounted on top of the meter, and must consist of a non-resettable mechanical totalizer for local reading, and a pulse transmitter for remote reading. The totalizer must have a six digit register to indicate the volume passed through the meter in L gallons. A sweep-hand dial will indicate down to 5 L 1 gallon. The pulse transmitter must have a hermetically sealed reed switch which is activated by magnets fixed on gears of the counter. The meter must have a bronze body with threaded or flanged connections as required for the application. The maximum pressure drop at full flow must be 35 kPa 5 psi gage.

2.4.4.11 Turbine Meters

****

NOTE: Verify that the location will allow installation with the minimum straight unobstructed piping of 10 pipe diameters upstream and 5 pipe diameters downstream.

****

Turbine meters wetted metal components must be [nickel plated brass][series 300 stainless steel] [series 316 stainless steel][bronze] with an accuracy of plus or minus [1] [_____] percent from [30] [_____] percent to 100 percent of actual flow.

2.4.4.12 Turbine Flowmeter

****

NOTE: Verify that the location will allow installation with the minimum straight unobstructed piping of 10 pipe diameters upstream and 5 pipe diameters downstream. Placement downstream of the blower or pump is preferable for head loss considerations.

****

Design of the flowmeter probe assembly must incorporate integral flow, temperature, and pressure monitoring. The meter flow sensing element must be [single][double] turbine and operate over the temperature range with a pressure loss limited to [1] [_____] percent of operating pressure at maximum flow rate. The internal temperature transmitter must monitor the full temperature range of the fluid. The integral pressure transmitter must monitor the pressure range with end limits of [0] [_____] MPa [0]

[_____] psi to [2] MPa [300] psi gage. The flowmeter electronics must be scaled and rescaled in the field when application data changes. The flowmeter must be designed for installation in pipe sizes of 75 mm 3 inches and larger to accommodate maximum probe insertion depths up to 1.1 m 44 inches. The retractor assembly must have a rotor depth gage having graduations of 2.5 mm 0.1 inches to determine exact position of turbine rotor in the pipe. The meter retractor assembly and the turbine rotor assembly must be constructed of [Series 300 stainless steel] [_____] with [polytetrafluoroethylene (PTFE)] [_____] seals. The meter retractor assembly must be designed to protect the turbine rotor during insertion into the pipeline. Retraction of the turbine rotor must be accomplished by using a hand wheel and must enable insertion and removal of the meter without system shutdown. The retractor assembly must include an isolation valve providing a means of removal of the meter from service to allow for field maintenance and field replacement of the rotor assembly or parts. The turbine rotor must have an over range operating capacity of 150 percent of maximum flow for up to 5 seconds. The rotor must be calibrated at the factory in an actual flow of similar fluid over the flow range performed on test equipment with accuracy traceable to the National Institute of Standards and Technology (NIST). A copy of the calibration test data, including all of the physical parameters under which the calibration tests were performed, must be submitted with each turbine rotor. Calibration test data must be analyzed to determine the rotor's arithmetic average "K" factor, the best line fit and the plus or minus deviation from these figures. Turbine flowmeter accuracy must be plus or minus 1 percent of reading for a minimum turndown ratio of 1:1 through a maximum turndown ratio of 50:1. Repeatability must be plus or minus 0.25 percent of reading. Accuracy of the transmitter must be plus or minus 0.25 percent over the calibrated span. The turbine rotor response time from minimum to maximum flow must be less than 10 milliseconds. The flowmeter must include one of the following: dry contact pulse outputs, 4-20mA, 0-10Vdc or 0-5Vdc outputs.

2.4.4.13 Ultrasonic Flowmeter

****

NOTE: Doppler meters rely on reflectors in the flowing liquid. To obtain reliable measurements attention must be given to the lower limits for concentrations and sizes of solids or bubbles. The flow must also be rapid enough to keep these materials in suspension. One manufacturer gives values of 1.8 m/s 6 ft/s for solids and 0.75 m/s 2.5 ft/s for small bubbles. To perform within their stated specifications, some Doppler meters require a minimum Reynolds number of 4,000.

Transit-time meters rely on an ultrasonic signal's completely traversing the pipe, so the path must be relatively free of solids and air or gas bubbles. To perform within stated specifications, one type of transit-time meter requires a minimum Reynolds number of 10,000.

****

Ultrasonic flowmeter must utilize high frequency [Doppler shift] [transit-time] transducer. Flowmeter must be capable of measuring flow up to a maximum flow rate of [5] [_____] m/s [15] [ ] fps. Provide Ultrasonic Flow Meters complete with matched transducers, self aligning installation hardware and transducer cables. Ultrasonic transducers must be optimized for the specific pipe and process conditions for the application. The flow meter accuracy must plus or minus 1 percent of rate from 0.3 to 12 meters/sec 0 to 40 ft/sec. The flowmeter must include one of the following: dry contact pulse outputs, 4-20mA, 0-10Vdc or 0-5Vdc output.

2.4.4.14 Variable Area Flow Indicator

Indicator must have an accuracy of plus or minus [5] [ ] percent of full scale. The body must be clear acrylic plastic with [brass] [stainless steel] end fittings. The float must be [glass] [or] [stainless steel]. The metering tube must be tapered and must be provided with a direct reading flow scale engraved on the meter body.

2.4.4.15 Venturi Tube

Venturi tube must be made of cast iron or cast steel and must have an accuracy of plus or minus [1] percent of full flow. The throat section must be lined with austenitic stainless steel. Thermal expansion characteristics of the lining must be the same as that of the throat casting material. The surface of the throat lining must be machined to a plus or minus 1.2 micron 50 mils finish, including the short curvature leading from the converging entrance section into the throat. The metering tube must be rated for continuous duty service at minimum pressure of [700] [_____] kPa [100] [_____] psi gage.

2.4.4.16 Vortex Shedding Flowmeter

The accuracy must be within plus or minus [0.8] [_____] percent of the actual volumetric flow. Steam meters must contain density compensation by direct measurement of temperature. Mass flow inferred from specified steam pressure are not acceptable. The flow meter body must be made of austenitic stainless steel and include a weather tight NEMA 4X electronics enclosure. Flowmeter must be rated for continuous duty service at minimum pressure of [700] [_____] kPa [100] [_____] psi gage. The vortex shedding flowmeter body must not require removal from the piping in order to replace the shedding sensor.

2.4.5 Level Instrumentation

****

NOTE: Indicate the location and the NFPA hazard classification on the drawings. Hazard classification of sumps and tank interiors frequently differ from the general area hazard classification. Include a schedule of level sensing elements with operating range requirements. Tabulation of devices is to be included on the drawings. Component identifiers are to be coordinated with the drawings. Use the Instrument Society of America (ISA) suggested alphanumeric system for development of discrete device numbering.

****

Pressure taps must incorporate appropriate snubbers. Relays and housing must be intrinsically safe or explosion proof as required by the NFPA hazard rating for compatibility with the contents of the tank or sump. [The controller must be provided with a minimum of three alarm lights. The first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light must indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input.][The controller must be provided with a minimum of three sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input.] The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a [4-20 mAdc] [_____] output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost.

2.4.5.1 Bubble Type Level Sensor

Bubble type liquid level sensor must be of the hydrostatic balance type, operating from compressed air. Each gauging system must contain the following: an air set including [compressor] [or] [connection to plant air], compressed air pressure regulating valve, air filter and moisture trap; a sight feed bubbler with built-in adjusting needle valve; a tank entry gland with air supply and equalized pilot signal connections; a [13 mm 1/2 inch] [standard weight 316 stainless steel] [schedule 80 carbon steel] dip tube; a direct reading circular gauge 300 mm 12 inch in diameter calibrated for the connected tank and tank liquid; connections to the circular gauge and to the pressure transducer for zero setting and calibration check; a connecting bubbler supply and equalized pilot signal [copper] [aluminum] [stainless] tubing with minimum field made joints; and a pressure transmitter mounted at the top of the dip tube, selected to correspond to the range required to gauge the connected tank. Instrument air lines must be trace heated if there is a frost risk with an air flowrate of [28 L/H][1.0SCFH].

2.4.5.2 Capacitance Type Level Sensor

Liquid level sensor must produce a signal that is proportional to the measured level. Sensor must be capacitance type. Sensor must [work with conductive material] [work with non-conductive material] [be proximity or non-contact type]. The transmitter must have non-interacting zero and span adjustments, and must have an accuracy of plus or minus [0.1] [_____] percent of calibrated span. Assemblies must include wall bracket or mounting plate, austenitic stainless steel rods, stainless steel bolts and corrosion resistant housing.

2.4.5.3 Conductivity Switch

The switch must detect the presence of a fluid by measuring the electrical resistance between a sensor and a ground electrode. Electrodes must be constructed of [316 stainless steel] [Hastelloy] [titanium]. Electrodes must be fully clad using [polyolefin] [polytetrafluoroethylene (PTFE)]. The conductivity switch must be capable of [1] [2] [3] [4] separate level set points. The switch must [be provided with] [use the container as] a ground electrode. Electrode lengths must be as necessary, based on the application and to meet the requirements of the control sequence. A relay switching point must be provided for each sensor. Contacts must be rated for a maximum of 240 VAC, 5 A. Switch must have a maximum response time of 2 seconds. Assembly must be [flange mounted] [NPT thread (male)] [including surface mounting bracket] and suitable for the indicated environment.

2.4.5.4 Displacement Type Level Switch

Liquid level switch must be displacement type, having a minimum of two tandem floats with each float independently activating a set of Form C contacts at two different level settings. Each switch must have an adjustable differential band. The mounting connections must be threaded, flanged or surface mounted to suit the application. All surfaces in contact with the tank contents must be austenitic stainless steel. The switch enclosure must be explosion proof for use in a hazardous environment, complete with a sealed water tight junction box, terminal block, and mounting plate. Each set of contacts must be snap action, dry contact type with one normally open and one normally closed, contact rated in accordance with NEMA ICS 1. The switch must be actuated by a magnetically equipped stainless steel displacer. Repetitive accuracy must be plus or minus 6 mm 1/4 inch of actual displacer setting.

2.4.5.5 Mercury Float Switch

Float switch assemblies for use in liquid systems must consist of wall bracket or mounting plate, galvanized steel rods, stainless steel bolts, explosion proof and corrosion resistant housing, and intrinsically safe relays. Each switch must consist of two normally open mercury switches, encapsulated in epoxy resin. The float casing must be polypropylene. The switch cable must be oil resistant neoprene or PVC cable with 4 No. 18 gauge stranded copper conductors, rated for 600 Volt application.

2.4.5.6 Reed Switch

Switch must consist of a transmitter tube with a reed strip located inside. The tube length must [be of sufficient length to permit adjustment of switch actuation within process parameters] [extend the full height of the tank]. A float containing a permanent magnet must fit over the transmitter tube and must move up and down with the liquid level. The transmitter tube and sliding float assembly must be as required for the application as shown on the drawings. Wetted parts must be [_____], [316 stainless steel,] [PVC,] [polypropylene,] or [polytetrafluoroethylene (PTFE)] suitable for the installed service indicated. Assembly must be [flange mounted] [NPT thread (male)] [include surface mounting bracket]. Maximum switching power must be [15 Watts], maximum switching current [1 amp], maximum carrying current [200Vdc], breakdown voltage [300Vdc], and initial contact resistance [0.10 ohms]. Maximum operating time must be [0.50 msec].

2.4.5.7 Non-Contact Ultrasonic Level Sensor

The sensor must be microprocessor based and must provide continuous, non-contact level measurement of liquids and solids utilizing microwave pulsed time of flight measurement method. [Sensor must have pushbutton calibration and LCD display.] The sensor must operate in a frequency band approved for industrial use. The sensor must be capable of measuring in a range of 0 to [7] [1] [_____] m 0 to [20] [3] [_____] feet with an accuracy of plus or minus [.25] [_____] percent of full scale and repeatability [± 0.125" 3mm]. The sensor must be capable of distinguishing between real echoes, reflections and background noise. The sensor must automatically compensate for temperature changes. The sensor must be capable of operating in a temperature range from minus [25] [_____] degrees C to [40] [50] [_____] degrees C minus [15] [_____] degrees F to [105] [120] [_____] degrees F. Assembly must be [flange mounted] [NPT thread (male)] [include surface mounting bracket] of sufficient size to eliminate echoing and suitable for the installed environment indicated. Mounting assembly must be suitable for service without requiring entry or drainage of the [vessel] [sump] where level is being measured.

2.4.5.8 Leak Detection

Double walled containment system leak detectors must use electrodes mounted in the interstices of double walled containment systems with a minimum time delay of [0.5] [_____] seconds. Leak detectors for open systems must be mounted at slab or floor level with either a minimum time delay of [0.5] [_____] seconds or a minimum built-in-vertical adjustment of [3] [_____] mm [1/8] [_____] inch to prevent activation due to high humidity. Detector must have a contact rating of 1.0 amps resistive or 200 mA inductive at 28 VDC. Leak detector panel must indicate the location and detector causing the alarmed state. The indicator must be manual reset type. A framed, non-fading half-size as-built location map in laminated plastic must be provided for the cable leak detection system in double containment piping systems indicating the as installed system configuration; sensing string layout must be furnished. Marks in meters feet along the length of pipeline interstitial cable must be provided as references to locate leaks.

2.4.6 Pressure Instrumentation

****

NOTE: Indicate on the drawings where visual indication of the measured pressure is required. Include a schedule of pressure sensing elements with operating range requirements. Include a tabulation of devices drawings. Component identifiers are to be coordinated with the drawings using the Instrument Society of America (ISA) suggested alphanumeric system for development of discrete device numbering.

****

Pressure taps must incorporate appropriate snubbers.

2.4.6.1 Pressure Controller

The controller must be provided with a minimum of three [alarm lights. The first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light must indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input] [sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input]. The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a [4-20 mAdc] [_____]

output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost. Pressures must be controlled to within plus or minus [5] [_____] percent of design pressures.

2.4.6.2 Pressure Sensor and Transducer

The sensing element must be either [capsule] [diaphragm] [bellows] [Bourdon tube] [solid state] type. The pressure transducer must withstand up to 150 percent of rated pressure, with an accuracy of plus or minus [1.0] [_____] percent of full scale selected to put the design range of the measured pressure in the middle third of the transducer's range. Pressure must be measured in [kPa psi] gage with a range, plus or minus [10] [_____] percent of design range and must be furnished with [display] [display and printout] to the nearest [1.0] [_____] kPa [0.145] [_____] psi. The transmitter output error must not exceed [0.1] [_____] percent of calibrated span.

2.4.6.3 Pressure Switch

Sensors must be [diaphragm] [Bourdon tube] [solid state] and must be constructed of [brass] [316 stainless steel] [_____]. Pressure switch must have a repetitive accuracy of plus or minus [5.0] [_____] percent of the operating range and must withstand up to [150] [_____] percent of rated pressure.

Switch actuation set point must be adjustable over the operating pressure range with a differential adjustment span of [20] [_____] to [40] [_____] percent of the range of the switch. The switch must have Form C snap-action contacts rated in accordance with NEMA ICS 1.

2.4.6.4 Differential Pressure

The sensor/transmitter assembly accuracy must be plus or minus [1] [_____] percent of full scale. The over pressure rating must be a minimum of [150] [_____] percent of the operating pressure. Transmitter must be suitable for installation with the low pressure connection removed.

2.4.6.5 Differential Pressure Switch

Provide differential pressure switches with a user-adjustable setpoint that are sized for the application such that the setpoint is between 25 percent and 75 percent of the full range. The over pressure rating must be a minimum of 150 percent of the highest design pressure of either input to the sensor. The switch must have two sets of contacts and each contact must have a rating greater than it's connected load. Contacts must open or close upon rise of pressure above the setpoint or drop of pressure below the setpoint as indicated. Each switch must have taps for sensing lines for connection of pressure fittings designed to sense fluid pressure. [For measuring air, gas or vapor stream differential pressure, these fittings must be of the angled-tip type with tips pointing into the air stream.] The adjustable differential range must be a maximum of [0.037] [0.125] [_____] kPa [0.15] [0.5] [_____] inches water at the low end to a minimum of [0.087] [1.49] [_____] kPa [0.35] [6.0] [_____] inches water at the high end. Two Form C contacts rated in accordance with NEMA ICS 1 must be provided.

2.4.6.6 Pneumatic to Electric (PE) Switch

Provide each switch with an adjustable set point range of [20] [_____] to [137] [_____] kPa [3.0] [_____] to [20] [_____] psi gage and an adjustable differential from [13] [_____] to [41] [_____] kPa [2.0] [_____] to [6.0] [_____] psi. Contacts must be Form C rated in accordance with NEMA ICS 1.

2.4.7 Temperature Instrumentation

****

NOTE: Component identifiers are to be coordinated with the drawings using the Instrument Society of America (ISA) suggested alphanumeric system for development of discrete devise numbering.

****

Temperature sensors may be provided without transmitters. Where transmitters are used, the range must be the smallest available from the manufacturer and suitable for the application such that the range encompasses the expected range of temperatures to be measured. The end to end accuracy includes the combined effect of sensitivity, hysteresis, linearity and repeatability between the measured variable and the end user interface (graphic presentation) including transmitters if used.

2.4.7.1 Temperature Controller

The controller must be provided with a minimum of [three] alarm lights. [The first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light must indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input]. Also [3] sets of dry contacts rated in accordance with NEMA ICS 1. [The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input]. The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a [4-20 mAdc] [_____] output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost.

2.4.7.2 Fluid Temperature Range

****

NOTE: Include a schedule of temperature sensing elements with operating range requirements. The following includes sample tables to assist in defining the exposure and service requirements. Alternatively, tabulation of devices may be included on the drawings. Include a table on the drawings with the following headings:

ID No.	Description	Minimum, C	Maximum, C	Type

****

All devices must be suitable for process temperatures, which define the exposure of the element, and are described in the table on the drawings. Mercury must not be used in thermometers.

2.4.7.2.1   Type A Bimetal Thermometer

Direct reading, hermetically sealed, suitable for external adjustment. Accurate within 1 percent of full range. Stainless steel construction. Complete with thermowell. Thermometers must have either 230 mm 9 inch long scales or 90 mm 3.5 inch diameter dials, with insertion, immersion, or averaging elements.

2.4.7.2.2   Type B Remote Reading Gas/Vapor Thermometer

Direct reading, [stainless steel] [aluminum] [phenolic] case designed for panel mounting, complete with armor cable, bulb and ancillary components for complete system.   Motionless design, resistant to shock and vibration and free from error created by elevation.   Provided with gas operated molecular sieve. Accurate within 1 percent over full range.

2.4.7.2.3   Type C Resistance Temperature Detector (RTD)

RTD must be [platinum] [copper] [_____], with an accuracy of plus or minus [0.1] [_____] percent at 0 degrees C 32 degrees F. RTD must be encapsulated in [epoxy,] [stainless steel Series 300,] [anodized aluminum,] [copper].

2.4.7.3   Continuous Averaging RTD

****

NOTE: Indicate on the drawings where averaging temperature probes are required.

****

Continuous averaging RTD must have an accuracy of plus or minus [0.5] [2] [_____] degrees C [0.9] [3.6] [_____] degrees F at the reference temperature, and must be of sufficient length to ensure that the resistance represents an average over the cross-section in which it is installed. The sensor must have a bendable copper sheath.

2.4.7.4   Infrared Temperature Sensor

Infrared temperature sensor must be encapsulated in series 300 stainless steel or anodized aluminum.   Sensor must have an accuracy of plus or minus 1 percent of temperature measured or 1.4 degrees C 2.5 degrees F, whichever is less.

2.4.7.5   Temperature Switch

****

NOTE: Include a table on the drawings with the following headings:

ID No.	**Description**	**Minimum, C**	**Maximum, C**

****

All devices must be suitable for process temperatures, which define the exposure of the element, and as described in the table shown on the drawings. Temperature switch must have a repetitive accuracy of plus or minus [1] [_____] percent of the operating ranges shown. Switch actuation must be adjustable over the operating temperature range. The switch must have Form C snap action contacts, rated in accordance with NEMA ICS 1.

2.4.7.6 Thermocouple

****

NOTE: Thermocouples should not be used for measuring temperatures below 260 degrees C 500 degrees F.

****

Thermocouple must be factory assembled with Series 300 stainless steel sheathing. Wiring insulation must be magnesium oxide. Minimum insulation resistance wire to wire or wire to sheath must be 1.5 megohm at 500 V dc. Thermocouple must be [Type E,] [Type K,] [Type J,] [or] [Type R]. Thermocouple error must not exceed that specified in IEC 60584-1. All wire/cable from thermocouple to transmitter must be of the type necessary to match the thermocouple used. Transmitter selected must match the type of thermocouple provided. The transmitter must include automatic cold junction reference compensation with span and offset adjustments, and upscale open thermocouple detection.

2.4.7.7 Thermowell

Thermowell must be monel, brass, or copper for use in water lines; wrought iron for measuring flue gases; and austenitic stainless steel for other applications. Calibrated thermowells must be provided with threaded plug and chain, 50 mm 2 inch lagging neck and inside diameter insertion neck as required for the application. The thermowell must include a connection box, sized to accommodate the temperature sensing devise.

2.4.8 Process Analytical Instrumentation

****

NOTE: Add requirements for additional site specific measurements, including span and accuracy for any application not included in this specification.

****

Probes must be easily removable without interrupting service. Sampling pumps must be included where necessary or applicable to the sensing device. For sensors integral to the electronic controller the sample may be drawn directly into the sensor or may be drawn through a sample tube. For sensors remotely located the sample may be drawn through a sample tube. Outdoor sample tubes must be heat traced. Sensor and controller construction must be suitable for operation in the monitored medium. Systems requiring automated zero and calibration gas or reagents must be provided with [_____] days supply of calibration gas or reagent. The controller must be provided with a minimum of three [alarm lights. The first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light hall indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input] [sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input]. The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a [4-20 mAdc] [_____] output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost.

2.4.8.1 Ammonia Gas

The sensor must be capable of monitoring ammonia in the range of [0] [_____] to [100] [_____] mg/L with an accuracy of plus or minus [1] [_____] percent of full scale reading. The sensor response time must be [90] [_____] percent in a maximum of [20] [_____] seconds.

2.4.8.2 Calorimeter (Heat Capacity/Fuel Value)

Calorimeter must be a self-contained device capable of measuring the heat capacity of a sample. The colorimeter must measure the heat released from the sample by igniting the sample reading use of multiple temperature sensors. The sensor must be capable of detecting methane in the range of [0] [_____] to [100] [_____] ppmv with an accuracy of plus or minus [1] [_____] percent of full scale reading.

2.4.8.3 Carbon Dioxide

Continuous emissions monitoring systems (CEMS) for measuring CO2 must be provided with installed back-up devices. The CEMS must comply with 40 CFR 60, Appendix B, Performance Specification 2 and the QA/QC requirements of 40 CFR 60, Appendix F. Calculation of emission rates must be in conformance with 40 CFR 60, Appendix A, Reference Method 19. Provide photometric type CO2 sensors with integral transducers and linear output. Carbon dioxide (CO2) sensors must measure CO2 concentrations between [0 to 2000] parts per million (ppm) using non-dispersive infrared (NDIR) technology with an accuracy of plus or minus [50 ppm] and a maximum response time of 1 minute. The sensor must be rated for operation at ambient air temperatures within the range of 0 to 50 degrees C 32 to 122 degrees F and relative humidity within the range of 20 to 95 percent (non-condensing). The sensor must not exceed a maximum drift of 2 percent by volume a year. The sensor chamber must be manufactured with a non-corrosive material that does not affect carbon dioxide sample concentration. Sensors must be designed to protect the sensing element from dust accumulation and mechanical damage. The sensor must have a calibration interval no less than 5 years.

2.4.8.4 Carbon Monoxide - CO

Continuous emissions monitoring systems (CEMS) for measuring CO must be provided with installed back-up devices. The CEMS must comply with 40 CFR 60, Appendix B, Performance Specification 4 and the QA/QC requirements of 40 CFR 60, Appendix F. Calculation of emission rates must be in conformance with 40 CFR 60, Appendix A, Reference Method 19. Carbon monoxide analyzer must consist of an infrared light source in a weather proof steel enclosure for duct or stack mounting. An optical detector/analyzer in a similar enclosure, suitable for duct or stack mounting must be provided. Both assemblies must include internal blower systems to keep optical windows free of dust and ash at all times. The third component of the analyzer must be the electronics cabinet. Automatic flue gas temperature compensation and manual/automatic zeroing devices must be provided. Unit must read parts per million (ppm) of carbon monoxide in the range of [0] [ ] to [100][ ] ppm and the response time must be less than 3 seconds to 90 percent value. Unit measurement range must not exceed specified range by more that 50 percent. Repeatability must be plus or minus 1 percent of full scale with an accuracy of plus or minus 1 percent of full scale.

2.4.8.5 Chlorine Gas

****

NOTE: Follow Chlorine Institute Recommendations.

****

All parts of the chlorine measurement system, including the sensors, transmitters, controllers and peripheral devices, that may come in contact with chlorine or a chlorine-filled environment must be constructed of materials suitable for this application. The chlorine sensor must provide continuous monitoring of the chlorine concentration. The detector must measure concentrations of chlorine in air with a range of [0 to 10 ppm] [with a repeatability of plus or minus [1] percent of full scale] and an accuracy of plus or minus 2 percent of full scale. The Chlorine Detector transmitter must be housed in a non-corrosive NEMA 250 Type 4X enclosure. Detector must include a local panel with adjustable alarm trip level, local audio and visual alarm with silence function. The sensor response time must be [90] [_____] percent in a maximum of [30] [_____] seconds.

2.4.8.6 Chlorine in Liquid

****

NOTE: Follow Chlorine Institute recommendations.

****

All parts of the chlorine measurement system, including the sensors, transmitters, controllers and peripheral devices, that may come in contact with chlorine or a chlorine-filled environment must be constructed of materials suitable for this application. Residual chlorine sensor must continuously monitor the chlorine residual. The sensor must be capable of detecting chlorine in the range of [0] [_____] to [1] [5] [10] [20] [_____] mg/L with an accuracy of plus or minus [1] [_____] percent of full scale reading. The sensor response time must be [90] [_____] percent in a maximum of [60] [_____] seconds.

2.4.8.7 Combustible Gas

Combustible gas sensor must be provided with a means to collect representative continuous samples and measure for the presence of explosive vapors. Measuring range must be from [0] [_____] percent of the lower explosive limit (LEL) to 100 [_____] percent of the [lower explosive limit (LEL)] [upper explosive limit (UEL)]. Response time must be less than [10] [_____] seconds to indicate [50] [_____] percent LEL when exposed to [100]

[_____] percent LEL. Drift must be less than [3] [_____] percent per year. The sensor must have a minimum operational life of [1] [_____] year. The system must be provided with [_____] days of zero and calibration gas.

2.4.8.8 Calorimetric Analyzer

****

NOTE: Limit the range to improve the sensitivity. Substitute the appropriate analyzer name and range in the first sentence. The remainder of the paragraph applies to any of the following:

Phenolphthalein Alkalinity Analyzer	**0 to [50] [100] mg/L**
Total Alkalinity Analyzer	**0 to [50] [100] [500] mg/L**
Free Chlorine Analyzer	**0 to [0.5] [1.0] [2.0] [5.0] mg/L**
Total Chlorine Analyzer	**0 to [0.5] [1.0] [2.0] mg/L**
Hexavalent Chromium Analyzer	**0 to [0.2] [1.0] mg/L**
Copper Analyzer	**0 to [5.0] [10.0] mg/L**
Hardness Analyzer	**0 to [0.5] [1.0] [2.0] [5.0] [10] [20] [50] [100] mg/L**
Silica Analyzer	**0 to [25] [50] mg/L**

****

[Hardness] [_____] analyzer must be suitable for range of [0] [_____] to [_____] mg/L as [Calcium Carbonate (CaCO3) equivalent] [_____]. Calorimetric analyzer must be an on-line continuous reading process instrument using a colorimeter that compensates for moderate changes in the light source, the sample cell condition, sample turbidity and background color. Analyzer must include sampling pumps, reagent storage and dispenser as well as colorimeter and colorimeter cell. System must be self-cleaning. Analyzer must require no more than weekly instrument standardization. Repeatability and reproducibility must be plus or minus [10] percent of the alarm trip value on 1 and 2 mg/L range and plus or minus 4 percent of alarm trip value on the remaining ranges. Reagent requirements must be no greater than 1 L each of indicator and buffer every two months for continuous operation.

2.4.8.9 Flame Ionization Detector (FID)

****

NOTE: A version with non-methane (NMOC) measurement capability is available when regulations require it.

****

A continuous flame ionization detector (FID) must be installed on a pumped sampling line to measure the total hydrocarbon (THC) content. The analyzer must have been configured at the factory for either H2, H2/He, or H2 and nitrogen fuel and calibrated for propane or methane equivalence. Total accuracy (includes calibration gas, response factor, and sample mix accuracies) must be not less than [_____] [4 ppmv] [± 3 percent of full scale] as methane. Repeatability must be [± 1%] maximum. Range and span must be continuously variable. Zero stability must be [± 1% in 30 days], span stability must be [±5% in 1 year]. Linearity must be within 1% of full scale. Outputs must include one 4-20mA and [6] relays for [warning, danger, fault, horn, calibration-in-progress, and service needed]. Detector response time must be [1.2 seconds] or less.

2.4.8.10 Hydrogen Sulfide Gas

****

NOTE: OSHA has established a permissible exposure limit (PEL) of 10 ppm. 10-20 ppm is the borderline concentration for eye irritation. 20 ppm is the acceptable ceiling concentration established by OSHA. 50 ppm is the acceptable maximum peak above the ceiling concentration for an 8 hour shift, with a maximum duration of 10 minutes.

****

The hydrogen sulfide sensor must be rated for continuous monitoring of the hydrogen sulfide level in the range from [0] [_____] to [20] [50] [100] [_____] ppmv with an accuracy of plus or minus [1] [_____] percent of full scale reading. The sensor response time must be a maximum of [30] [_____] seconds with full scale gas applied according to ISA 92.00.01. Repeatability must be ± 2ppm or 10% of the applied gas, whichever is greater. The sensor must have a calibration, calibration check, and setup modes.

2.4.8.11 Oxides of Nitrogen (NOx) Gas

Continuous emissions monitoring systems (CEMS) for measuring NOx must be provided with installed back-up devices. The CEMS must comply with 40 CFR 60, Appendix B, Performance Specification 3 and the QA/QC requirements of 40 CFR 60, Appendix F. Calculation of emission rates must be in conformance with 40 CFR 60, Appendix A, Reference Method 19. Monitor must be designed to verify compliance with standards for NOx normalized to a 3 percent oxygen basis and must have a range of from [0] [_____] to [100] [_____] ppmv. Sensor must be accurate to plus or minus [5] [_____] ppmv. Sensor must be complete with automatic zero and span calibration using a timed calibration gas system, and must require no periodic calibration.

2.4.8.12 Oxygen Gas

Continuous emissions monitoring systems (CEMS) for measuring O2 must be provided with installed back-up devices. The CEMS must comply with 40 CFR 60, Appendix B, Performance Specification 2 and the QA/QC requirements of 40 CFR 60, Appendix F. Calculation of emission rates must be in conformance with 40 CFR 60, Appendix A, Reference Method 19. Oxygen in air must be monitored by an oxygen sensor and electronic controller. The oxygen sensor must be rated for continuous monitoring of the oxygen level in air in the range of [0] [_____] to [20] [25] [30] [_____] percent with an accuracy of plus or minus [1] [_____] percent of full scale reading at constant temperature and pressure and plus or minus [5] percent of full scale reading over operating temperature range. The sensor response time must be [90] [_____] percent in a maximum of [5] [_____] seconds. The controller must have automatic zeroing and must require no normal maintenance or periodic recalibration.

2.4.8.13 Oxygen Dissolved

The dissolved oxygen sensor must provide continuous measure of dissolved oxygen. Wetted materials must be [stainless steel,] [PVC] or glass. Sensor must be rated for continuous use to a depth of [15] [_____] m [50] [_____] feet and must be automatically temperature compensating over the temperature range. Sensor must be capable of measuring dissolved oxygen level of from [0] [_____] to [15] [_____] ppmv. The sensor must have an accuracy of plus or minus [1] [_____] percent of full scale reading, repeatability of [±0.05] and response time of [25 sec to 63%] of final reading at 25°C 77F.

2.4.8.14 Oxygen Reduction Potential (ORP)

The sensor must be [submersible] [flow-through] type. Sensor must have a redox potential range of plus or minus [500] [_____] mV and must have an accuracy of plus or minus [1] percent of sensor span. The sensor must automatically compensate for temperature over the temperature range. The sensor body must be [PVC, CPVC, Liquid Crystal Polymer (LCP) or epoxy] and suitable for installation in the environment.

2.4.8.15 Ozone (O3) Gas

****

NOTE: The standard instrument provides the range 0-1,000 ppmv (parts per million by volume) an alternate display of ozone concentration is in millipascals.

****

Ozone in air must be monitored by an ozone gas sensor and electronic controller. The sensor must be capable of detecting ozone in the range of [0] [_____] to [1,000] [_____] ppmv with an accuracy of plus or minus [1] [_____] percent of the full scale reading. The sensor response time must be [90] [_____] percent in a maximum of [60] [_____] seconds.

2.4.8.16 Ozone (O3) in Water

The dissolved ozone sensor must provide continuous measurement of dissolved ozone level from [0] [_____] to [5] [_____] mg/L. The sensor must automatically compensate for temperature over the temperature range. The sensor must have an accuracy of plus or minus [1] [_____] percent of the full scale reading. [System must include variable area flow meter and needle valve to regulate rate of sample flow through sensor unit.] [Sensor must be suitable for direct submersion.]

2.4.8.17 pH Monitoring

****

NOTE: Limit the range to improve the sensitivity.

****

The sensor must be [submersible] [or] [flow-through] type. [Sensor must be a differential type]. Sensor must have a range of [1] [4] [5] [5.5] [_____]. pH units to [8.5] [9] [11] [14] [_____]. pH units and must have an accuracy of plus or minus [0.1] [0.01] [_____]. pH unit. The sensor must automatically compensate for temperature over the temperature range. The sensor body must be PVC, CPVC or epoxy.

2.4.8.18 VOC Detector

****
NOTE: Show sampling points on the drawings.
****

Detector must be either photoionization or Gas Sensitive Semiconductor type. Contaminant and background concentrations are [as follows:] [_____]. Detector must be provided with a means to collect representative continuous samples and measure for the presence of volatile organic compounds (VOCs). Sampling points are as indicated on the drawings. The system must be provided with automated zero and calibration gas system as well as a [4-20ma] [relay controller] output.

2.4.8.19 Total Dissolved Solids (TDS)

The TDS sensor must measure the specific conductance using a conductivity sensor, displaying the total dissolved solids value in [milligrams per liter (mg/L) of dissolved NaCl equivalent] [microohms (microSiemens) per centimeter (uS/cm)] and transmitting an analog signal for remote processing. System must be industrial grade, [contacting][torodial] and suitable for measurement of conductivity in a solution [by insertion of the sensing element into the pipeline, using a hot tap assembly] [including a variable area flow meter and needle valve to regulate rate of sample flow through sensor unit]. Sensor assembly must be suitable for periodic removal for adjustment and cleaning without requiring shut down of the process. Sensor must be suitable for range of [0] [_____] to [10,000] [_____] [milligrams per liter (mg/L) of dissolved NaCl equivalent] [microohms per centimeter (uS/cm)]. Range must be field verified for the application and adjusted as required. Sensing element must be constructed of [316 stainless steel] [_____] and glass, including temperature element, and be capable of continuous operation. Sensing element must be unaffected by color in the fluid, pressure, and rate of flow. Sensor must have automatic temperature compensation and must require no normal maintenance or periodic recalibration.

2.4.8.20 Water Turbidity

System must be complete and include indicating meter, sensing element and a transmitter. System must be industrial grade and suitable for measurement of turbidity by [insertion of the sensing element into the pipeline, using a hot tap assembly] [direct submersion of the sensing element into the vessel or flow channel]. Sensor assembly must be suitable for periodic removal for adjustment and cleaning without requiring shutdown of the process. Sensor must be suitable for range from [0] [_____] to [2] [20] [200] Nephelometric turbidity units (NTU). The accuracy must be plus or minus [2] [_____] percent of full scale reading. Range must be field verified for the application and adjusted as required. Sensing element must be constructed of [316 stainless steel] [_____] and glass. Sensing element must be unaffected by color in the fluid, pressure, temperature and rate of flow. Sensor must have automatic zeroing and must require no normal maintenance or periodic recalibration. Sensor must have [active and] passive anti-fouling mechanisms.

2.4.9 Electrical Instrumentation

Electrical power measurements with a range for the specific application, plus or minus [1.0] [_____] percent of range (display and print to nearest kWh and kW). Electrical measurements with a range for the specific application plus or minus [1.0] [_____] percent of range (display and print to nearest [0.1] [_____] for volts and amperes, and to the nearest [0.01]

2.4.9.1 Hour Meter

Hour meter must provide a totalized readout of the number of hours of operation for the equipment monitored. Meter must provide readout with a minimum of [5] [6] [7] digits including [1] [_____] decimal places. The display must be non-resettable. The meter must be driven by a [24] [120] [240] VAC synchronous motor.

2.4.9.2 Watt-Hour Meter

Watt-hour meters must be in accordance with Section 23 09 13 INSTRUMENTATION AND CONTROL DEVICES FOR HVAC.

2.4.10 Limit Switch

****

NOTE: See NEMA ICS 5 Part 9 for application guidelines. To increase the number of operations during the life of the contact, select contacts with make and break values much higher than those applied

****

Limit switch must be [rotary/lever] [induction/proximity] type, contacts must be heavy duty and rated A600 or N600. Enclosure must be metal. The actuating head must vary based upon the application.

2.4.11 Absolute Rotary Encoder

The absolute rotary encoder must retain the count upon loss of power without use of battery or alternate power source. The encoder must increase the count when turning in the direction which causes [the gate to raise] [_____] and must decrease the count in the opposite direction. The encoder must be capable of counting at least [4,096] data points per revolution and [counting [4096] revolutions.][tracking the full range of operation.] The output signal must be [synchronous serial interface (SSI)][Common Industrial Protocol (CIP)] [_____]. Draw wire string encoder type of absolute rotary enconder must not be used in outdoor settings.

2.4.12 Linear Displacement Position Sensor

The linear displacement position sensor must be a magnetostrictive position sensor capable of 0.02% accuracy or better along the entire hydraulic cylinder stroke length. The sensor mmust measure the full stroke of the hydraulic cylinder. The sensor must be capable of 4-20mA analog output with an update cycle of at most 10ms. The sensor module and rod must meet IP 67 standards. The sensor must mount to the hydraulic cylinder by threaded flange and be constructed to integrate with the hydraulic cylinder.

2.4.13 Emergency Stop

Emergency stop pushbutton must have red mushroom actuator and yellow background. Actuator must be self-latching and manually reset. Provide contacts that are NEMA ICS A600 and directly opened. Pushbutton must meet NFPA 79 SECTION 10.7.

2.5 COMPRESSED AIR STATIONS

****

NOTE: If the process control system does not utilize pneumatic devices, the air compressor and accessories should be deleted.

****

Submit instrumentation compressed-air station schematic diagram showing equipment utilized, including compressor with motor output and voltage; starter; isolators; manual bypasses; tubing sizes; drain piping and drain traps; reducing valves; air-dryer; and data on manufacturer's names and model numbers, mounting, access, and clearance requirements. Include in the air-compressor and air-dryer data calculations of the air consumption of pneumatic control valves and of other process control system devices to be connected to the compressed-air station; the number of starts per hour, the running time for the unit selected; and the compressed air-supply dewpoint temperature at 552 kPa 80 psig.

2.5.1 Air Compressor Assembly

The air compressor must be a high-pressure compressing unit with electric motor. The compressor must be equipped with a motor with totally enclosed belt guard, an operating-pressure switch, safety relief valves, gauges, intake filter and intake silencer and combination type magnetic starter with under voltage protection and thermal overload protection for each phase, and must be supported by a steel base mounted on an air storage tank. The air compressor must provide the compressed air required for control operation while operating not more than one-third of the time. The tank must be of sufficient volume so that no more than six compressor starts per hour are required with the starting pressure switch differential set at 140 kPa 20 psi gage. The air storage tank must be fabricated for a working pressure of not less than 1380 kPa 200 psi gage and constructed and certified in accordance with ASME BPVC SEC VIII D1. The tank must be provided with an automatic condensate drain trap with manual override feature. [A second (duplex arrangement) compressor of capacity equal to the primary compressor must be provided, with interlocked control to provide automatic changeover upon malfunction or failure of either compressor. A manual selector switch must be provided to index the lead compressor including the automatic changeover.]

2.5.2 Compressed Air Station Specialties

2.5.2.1 Refrigerated Dryer, Filters and Pressure Regulator

A refrigerated dryer must be provided in the air outlet line of the air storage tank. The dryer must be of the size required for the full delivery capacity of the compressor. The air must be dried at a pressure of not less than 483 kPa 70 psi gage to a temperature not greater than 2 degrees C 35 degrees F. The dryer must be provided with an automatic condensate drain trap with manual override feature. The refrigerant used in the dryer must be one of the fluorocarbon gases. A 5 micron prefilter and coalescing-type oil removal filter with shut-off valves must be provided in the dryer discharge. Each filter bowl must be rated for 1034 kPa 150 psi gage maximum working pressure. A pressure regulator with high side and low side pressure gauges and a safety valve must be provided downstream of the filter. Pressure regulators of the relieving type must not be used.

2.5.2.2 Coalescing Filter

A coalescing prefilter, together with an automatic drain valve, must be provided for removal of liquids. The flow through the prefilter must be from inside to outside and reduce an entrained quantity of 50 ppmv oil to 0.0013 ppmv effluent liquid oil and water and remove all particulates greater than 0.6 micron absolute. The prefilter housing (bowl) must be fitted with a drain port to eliminate collected liquids and provide sufficient sump volume to prevent liquid re-entrainment, and an automatic drain valve with adjustable cycle and drain times. Prefilter pressure drop must be less than 21 kPa 3 psi saturated. A particulate after filter, outside to inside flow, designed to remove desiccant fines must be provided. The after filter cartridge must have a particulate removal rating of 0.5 micron absolute. Both prefilter and after filter housings must allow for service of elements without removing the entire assembly from the system. Filter life must be stated and guaranteed by the vendor.

2.5.2.3 Flexible Pipe Connections

The flexible pipe connectors must be designed for 1034 kPa 150 psi gage and 121 degrees C 250 degrees F service and must be constructed of rubber, polytetrafluoroethylene (PTFE) resin or braided corrosion-resistant steel, bronze, monel or galvanized steel. The connectors must be suitable for the service intended and may have threaded or soldered ends. The length of the connectors must be as recommended by the manufacturer for the service intended.

2.5.2.4 Vibration Isolation Units

The vibration isolation units must be standard products with published loading ratings and must be single rubber-in-shear, double rubber-in-shear or spring type.

2.5.2.5 Compressed Air Piping

Control air delivered to the system must conform to ISA 7.0.01. Air lines for pneumatic controls must be seamless copper tubing or nonmetallic tubing. Nonmetallic tubing must be compounded from polyethylene. Air lines concealed in walls must be hard-drawn copper tubing or nonmetallic tubing in rigid conduit. Terminal single lines must be hard-drawn copper tubing except when the run is less than 300 mm 12 inches in length, flexible polyethylene may be used. Nonmetallic tubing will not be used for applications where the tubing could be subjected to a temperature exceeding 55 degrees C 130 degrees F. Fittings for nonmetallic tubing must be for instrument service and may be brass or acetyl resin of the compression or barbed push-on type. Tubing must be as follows:

a. Copper tubing must conform to ASTM B88M ASTM B88 and must have sweat fittings and valves.Exposed tubing must be hard drawn in exposed areas and hard-drawn or annealed in concealed areas. Only tool made bends must be used. Fittings for copper tubing must be brass or copper solder joint type except at connections to the apparatus, where fittings must be brass compression type. Grooved mechanical joints and fittings must be designed for not less than 862 kPa 125 psig service and must be the product of the same manufacturer. Grooved fittings and mechanical coupling housing must be ductile conforming to ASTM A536. Gaskets for use in grooved joints must be molded synthetic polymer of pressure responsive design and must conform to ASTM D2000 for circulating medium up to 110 degrees C 230 degrees F. Grooved joints must conform to AWWA C606. Tubing must be rack mounted where multiple tubes run in parallel. Multiple tubes may be bundled when concealed.

b. Tubing must be flame resistant, multiple polyethylene tubing in an extruded PVC protective sheath, or unsheathed polyethylene tubing in rigid metal, intermediate metal, or electrical metallic tubing conduit for areas where tubing is exposed. Tubing must have barbed fittings and valves, and must conform to the following: Burst pressure must be 3.8 MPa 550 psi gage at 24 degrees C 75 degrees F to 1.2 MPa 175 psi gage at 66 degrees C 150 degrees F, minimum. Stress crack resistance in accordance with ASTM D1693 must be 200 hours, minimum. Tensile strength in accordance with ASTM D638 must be 14 MPa 2000 psi, minimum. Average density in accordance with ASTM D792 must be 920 kg/m3. Average flow rate in accordance with ASTM D1238 must be 0.30 decigram per minute.

c. Plastic tubing must have the burning characteristics of linear low density polyethylene tubing, must be self extinguishing when tested in accordance with ASTM D635, must have UL 94 V-2 flammability classification, and must withstand stress cracking when tested in accordance with ASTM D1693. Polyethylene tubing must not be used for smoke removal systems.

2.5.3 Barrier Jacket

Provide plastic tubing bundles mylar barrier and flame retardant polyethylene jacket. Each tube must be numbered.

2.6 PROGRAMMABLE LOGIC CONTROLLER (PLC)

****

NOTE: Typically, either modular or loop type PLCs will be used throughout the process control system. The designer must determine which is best suited for the application and delete the paragraph pertaining to the type that will not be used. If it is determined that the use of both types is necessary, the drawings will indicate where each type will be used and both types will be included in the edited specification.

****

2.6.1 PLC General Requirements

PLCs must be micro-processor based, capable of receiving binary and analog inputs and, through programming, must be able to control binary and analog output functions, perform data handling operations and communicate with external devices. PLCs must meet the requirements of Class A computing devices, and must be labeled as set forth in 47 CFR 15 and must be able to withstand conducted susceptibility test as outlined in NEMA ICS 1, NEMA ICS 2, NEMA ICS 3, [and] [or] IEEE C37.90.1. PLCs must function properly at temperatures between 0 and 50 degrees C 32 and 122 degrees F at 5 to 95 percent relative humidity non-condensing and must tolerate storage temperatures between minus 40 and plus 60 degrees C 40 and plus 140 degrees F at 5 to 95 percent relative humidity non-condensing.

2.6.2 Modular PLC

PLCs must be based on a modular, field expandable design allowing the system to be tailored to the process control application. The system must be expandable through the use of additional hardware and/or user software. As a minimum, the PLC must include a mounting backplane, power supply module, central processing unit (CPU) module, communications module, and input/output (I/O) module. The modules must be grouped together in a mounting rack or cabinet. The mounting rack backplane must provide the communications mechanism to fully integrate the individual modules located within the rack. Modules other than I/O modules must plug directly into the backplane. The use of wire connectors between modules will not be allowed except for expansion of the system to include multiple backplanes. The rack size must be as needed to hold the equipment necessary while performing the required control functions. [The system configuration must allow for the removal and/or installation of modules under power.]

2.6.2.1 Central Processing Unit (CPU) Module

The CPU module must be a self contained, microprocessor based unit that provides time of day, scanning, application program execution, storage of application programs, storage of numerical values related to the application process and logic, I/O bus traffic control, peripheral and external device communications and self diagnostics. The scan time must be [250 milliseconds] or better including spare I/O channels.

2.6.2.2 Communications Module

The communications module must allow peer-to-peer communication with other PLCs and must allow the PLC to communicate with the central station, or workstation. The communication module must utilize the manufacturer's standard communication architecture and protocol, ethernet architecture and protocol or a combination of these. The communication module must allow programming of the PLC to be done locally through the use of a laptop computer[or from the central station or remote workstation].

2.6.2.3 Power Supply Module

One or more power supply modules must be provided as necessary to power other modules installed in the same cabinet. Power supply modules must plug directly into the backplane. Auxiliary power supplies may be used to supply power to remote cabinets or modules.

a. Power supply modules must use [AC] [DC] power with a nominal voltage of [120 VAC] [220 VAC] [24 VDC] [48 VDC] [125VDC] plus or minus 5 percent. The power supply module must monitor the incoming line voltage level and must provide over current and over voltage protection. If the voltage level is detected as being out of range the power supply module must continue to provide power for an adequate amount of time to allow for a safe and orderly shutdown. Power supply modules must be capable of withstanding a power loss for a minimum of 20 milliseconds while still remaining in operation and providing adequate power to all connected modules.

b. Each power supply module must be provided with an on-off switch integral to the module. If the manufacturer's standard power supply module is not provided with an on-off switch, a miniature toggle type switch must be installed near the PLC and must be clearly labeled as to its function..

c. Provide power supply modules with an indicating light which must be lit when the module is operating properly.

2.6.2.4 Input/Output (I/O) Modules

Modules must be self contained, microprocessor based units that provide an interface to field devices.[The modules must be located in the same cabinet as the other PLC components.] Each module must contain visual indication to display the on-off status of individual inputs or outputs. Each I/O must be protected against reversal of polarity of the signal. Analog inputs and analog outputs must have 'open, short and out of range circuit' detection. It must be configurable per channel.

2.6.3 Loop PLC

PLCs must be single or multiple loop controllers depending on the process control system requirements. Controllers must be self contained and must include a central processing unit (CPU), program memory, power supply, input/output capability, [network communications capability] and display/keyboard. The controller must have a scaleable process variable for each loop. Controller must have proportional, integral and derivative (PID) control logic. Analog outputs must be configured as direct acting or reverse acting. The controller must have keyboard, display, auto/manual selection for control of each loop output, remote setpoint, adjustment/local setpoint adjustment selection with adjustable high-end and low-end limits, ratio and bias adjustment on remote setpoint input, [operator-initiated self-tune/manual-tune selection] [and anti-reset wind-up feature]. Controller must power analog output loops to 20 mAdc when connected to a load of 600 ohms.

2.6.3.1 Central Processing Unit (CPU)

The central processing unit must be microprocessor based and must provide time of day, scanning, application program (ladder rung logic) execution, storage of application programs, storage of numerical values related to the applications process and logic, I/O bus traffic control, peripheral and external device communications and self diagnostics.

2.6.3.2 Power Requirements

Each controller must be powered by [AC] [DC] power with a nominal voltage of [120 VAC] [220 VAC] [24 VDC] [48 VDC] [125VDC]. Power consumption must not exceed 25 watts. Controller must provide electrical noise isolation between the AC power line and the process variable inputs, remote setpoint inputs and output signals of not less than 100 dB at 60 Hertz common mode rejection ration and not less than 60 dB at 60 hertz normal-mode rejection ration.

2.6.3.3 On-Off Switch

Each controller must be provided with an integral on-off switch. If the controller is not provided with a manufacturers standard on-off switch, a miniature toggle type switch must be installed near the controller and must be clearly labeled as to its function.

2.6.3.4 Parameter Input and Display

Enter and display control parameters directly, in the correct engineering units, through a series of keystrokes on a front panel display with decimal point and polarity indication. Provide display [in metric English units] [in metric or English units as selected by the operator].

[2.6.3.5 Self Tuning

****

NOTE: If the process control system does not utilizeAnalog control, or if self tuning is not needed delete this bracketed section as it limits the number of vendors.

****

Provide controllers with self-tuning operation which applies to proportional, integral and derivative modes of control and modify the mode constants as required. Self-tuning must only be in operation when selected from the front panel.

]2.6.3.6 Manual Tuning

Controllers must be provided with manual tuning operation which must apply to proportional, integral and derivative modes of control, by means of individually adjustable mode constants. These adjustments must be set for the appropriate value if a particular control mode action is required or to zero if that particular mode is not desired. The proportional mode constant must be adjustable from 0 to 200 percent of the input signal range. The integral mode constant must be adjustable from 0 to 20 repeats per minute. The derivative mode constant must be adjustable from 0 to [5] [____] minutes.

2.6.4 Program Storage/Memory Requirements

The CPU must utilize the manufacturer's standard non-volatile memory for the operating system. The controller must have electronically [readable and writeable non volatile memory (EPROM, EEPROM, or Flash PROM)] [battery backup volatile memory. Must be possible to change battery with power on] for storage of user programs. The user programs must be loaded through the controller keypad, central station or through the use of a laptop computer. The CPU memory capacity must be based on the system's control requirements. The memory capacity must be sized such that, when the system is completely programmed and functional, no more than 50 percent of the memory allocated for these purposes is used.

2.6.5 Input/Output Characteristics

Each controller must allow for analog input, analog output, binary input and binary output. The number and type of inputs and outputs for the system must be as shown on the drawings and must comply with the sequence of control. The system capacity must include a minimum of 20 percent spare input and output points (no less than two points) for each point type provided. During normal operation, a malfunction in any input/output channel must affect the operation of that channel only and must not affect the operation of the CPU or any other channel. All input circuits must have a minimum optical isolation of 1500 VRMS and must be filtered to guard against high voltage transients from the externally connected devices. All output circuits must have a minimum optical isolation of 1500 VRMS and must be filtered to guard against high voltage transients from the externally connected devices.

2.6.5.1 Analong Inputs

Analog input circuits must be available in [+/-10V] [+/-5V] [0-10V] [0-5V]

[4-20 mA].

2.6.5.2 Binary Inputs

Binary input circuits must be available in [5 volt TTL] [10-30 VDC] [18-26 VDC] [79-132VDC] [79-132 VAC].

2.6.5.3 Analog Outputs

Analog output circuits must be available in [+/-10V] [4-20 mA].

2.6.5.4 Binary Outputs

Binary output circuits must be available in [5 volt TTL] [10-30 VDC] [18-26 VDC] [79-132 VAC].

2.6.5.5 Pulse Inputs

Pulse inputs must be able to detect a pulse of [x milliseconds] or less.

2.6.6 Wiring Connections

Wiring connections must be heavy duty, self lifting, pressure type screw terminals to provide easy wire insertion and secure connections. The terminals must accept two #14 AWG wires. A hinged protective cover must be provided over the wiring connections. The cover must have write-on areas for identification of the external circuits.

2.6.7 On-Off Switch

Each controller must be provided with an integral on-off power switch. If the controller is not provided with a manufacturer's standard on-off switch, a miniature toggle type switch must be installed in the control panel near the controller and must be clearly labeled as to its function.

2.6.8 Diagnostics

Each PLC must have diagnostic routines implemented in firmware. The CPU must continuously perform self-diagnostic routines that will provide information on the configuration and status of the CPU, memory, communications and input/output. The diagnostic routines must be regularly performed during normal system operation. A portion of the scan time of the controller must be dedicated to performing these housekeeping functions. In addition, a more extensive diagnostic routine must be performed at power up and during normal system shutdown. The CPU must log input/output and system faults in fault tables which must be accessible for display. When a fault affects input/output or communications modules the CPU must shut down only the hardware affected and continue operation by utilizing the healthy system components. All faults must be annunciated at [the PLC] [and] [the central station]. Diagnostic software must be useable in conjunction with the portable tester. The following diagnostics must be performed:

a. Analong Inputs: Sensor out of range, open or shorted loop, analog-to-digital converter check

b. Analog Outputs: Open or shorted loop

c. Configuration: Check compatibility and availability of selected I/O hardware and software

d. Memory: Checksum, parity check End-to End CPU memory

2.6.9 Accuracy

Provide controllers with an accuracy of plus or minus [0.25] percent of input span.

[2.6.10 Primary/Secondary PLC

****

NOTE: Determine if the system is critical enough to require a Primary/Secondary PLC arrangement. This is a significant cost addition and makes the system more complex.

****

The Primary/Secondary PLCs must have redundancy built into the process control system by having two systems (power supply and CPU) either of which is capable of controlling the system. Data must be transferred from the primary processor to the secondary processor each logic cycle. [The I/O scan must be transferred from the PLC currently in charge to the other at the end of each logic execution and the logic must be executed.] [The data must be transferred via asynchronous transfer where the primary processor haws two separate microprocessors embedded in its circuitry and at the end of logic execution all data must be passed to the second microprocessor and the second microprocessor must handle all transfer tasks while the first executes the next program scan.] The Primary must perform the execution of the outputs unless a fault is detected in which case execution of the outputs is performed by the Secondary. Switchover must be automatic and indication of the switchover must be displayed on the Central Operator Workstation.

]2.7 PLC SOFTWARE

Furnish all PLC software described in this specification as part of the complete control system.

2.7.1 Operating System

****

NOTE: If loading of control logic is allowed from the central station this presents a security risk.

****

Each PLC must be provided with the manufacturer's standard operating system software package. The PLC must maintain a point database in its memory that includes all parameters, constraints and the latest value or status of all points connected to the PLC. Execution of the PLC application programs must use the data in memory resident files. The operating system must support a full compliment of process control functions. It must be possible to define these functions using a mix of ladder logic diagrams, function blocks, sequential function charts and text programming. Programming methods and interactions must be based on IEC 61131-3. A combination of the programming methods must be possible within a single controller. The operating system must allow loading of control logic locally [or from the central station in which case it must require a password to do so] and data files from the portable tester. It must also support data entry and diagnostics using an operator interface panel attached directly to the PLC. Each PLC must be capable of operating in stand alone mode.

2.7.1.1 Startup

The PLC must have startup software that causes automatic commencement of operation without human intervention, including startup of all connected I/O functions. A PLC restart program based on detection of power failure at the PLC must be included in the PLC software. The restart program must include start time delays between successive commands to prevent demand surges or overload trips.

2.7.1.2 Failure Mode

Upon failure for any reason, each PLC must perform an orderly shutdown. Systems which are not Primary/Secondary must force all PLC outputs to a predetermined (failure mode) state, consistent with the failure modes shown and the associated control device. Primary/Secondary systems must transfer I/O scan and control to the PLC not currently failed.

2.7.2 Functions

The controller operating system must be able to scan inputs, control outputs, and read and write to its internal memory in order to perform the required control as indicated in the sequence of control on the drawings. The controller must periodically perform self diagnostics to verify that it is functioning properly. [If the system is set up as a Primary/Secondary system the system must attempt to switch to the other PLC upon sensing a fault in the currently controlling PLC.]

2.7.2.1 Analog Monitoring

Measure and transmit all analog values including calculated analog points.

2.7.2.2 Logic (Virtual)

Logic (virtual) points must be software points entered in the point database which are not directly associated with a physical I/O function. Logic (virtual) points must be analog or binary points created by calculation from any combination of binary and analog points, or other data having all the properties of real points, including alarms, without the associated hardware. Logic (virtual) points must be defined or calculated and entered into the database. The calculated analog point must have point identification in the same format as any other analog point.

2.7.2.3 State Variables

If an analog point represents more than two (up to 8) specific states, each state must be nameable. For example, a level sensor must be displayed at its measured engineering units plus a state variable with named states usable in programs or for display such as low alarm/low/normal/high/high alarm.

2.7.2.4 Analog Totalization

****

NOTE: If the analog totalization is to be performed at the central station and is not to be

done at the PLC, this requirement will be deleted.

****

Any analog point must be operator assignable to the totalization program. Up to eight analog values must be totalized within a selectable time period.

2.7.3 Alarm Processing

****

NOTE: If the alarm processing function is to be performed at the central station and is not to be done at the PLC, this requirement will be deleted.

****

Each PLC must have alarm processing software for AI, DI, and PA alarms for all real and virtual points connected to that PLC.

2.7.3.1 Binary Alarms

Binary alarms are those abnormal conditions indicated by BIs as specified and shown. The system must automatically suppress analog alarm reporting associated with a binary point when that point is turned off.

2.7.3.2 Analog Alarms

Analog alarms are those conditions higher or lower than a defined value, as measured by an AI. Analog readings must be compared to predefined high and low limits, and alarmed each time a value enters or returns from a limit condition. Unique high and low limits must be assigned to each analog point in the system. In control point adjustment (CPA) applications, key the limit to a finite deviation traveling with the setpoint. The system must automatically suppress analog alarm reporting associated with an analog point when that analog point is turned off.

2.7.3.3 Pulse Accumulator (PA) Alarms

Pulse accumulator alarms are those conditions calculated from totalized values of accumulator inputs or PA input rates that are outside defined limits as specified and shown. PA totalized values must be compared to predefined limits and alarmed each time a value enters a limit condition. Unique limits must be assigned to each PA point in the system.

2.7.4 Constraints

2.7.4.1 Equipment Constraints Definitions

Each control point in the database must have PLC resident constraints defined and entered by the Contractor, including as applicable: maximum starts (cycles) per hour; minimum off time; minimum on time; high limit (value in engineering units); and low limit (value in engineering units).

2.7.4.2 Constraints Checks

All control devices connected to the system must have the PLC constraints checked and passed before each command is issued. Each command point must have unique constraints assigned. High and low "reasonableness" values or one differential "rate-of-change" value must be assigned to each AI. Each individual point must be capable of being selectively disabled by the operator from the central station.

2.7.5 Control Sequences and Control Loops

****
NOTE: Sequences to be implemented will be developed by the designer to meet site requirements. The designer will define allowable process control loop accuracies as a part of the sequences. Control sequences and database tables will be shown on the drawings.
****

Specific functions to be implemented are defined in individual system control sequences and database tables shown on the drawings, and must include, as applicable, the following functions: PI control must provide proportional control and proportional plus integral control; two position control must provide control for a two state device by comparing a set point against a process variable and an established dead band; floating point control must exercise control when an error signal exceeds a selected dead band, and must maintain control until the error is within the dead band limits; signal selection must allow the selection of the highest or lowest analog value from a group of analog values as the basis of control and must include the ability to cascade analog values so that large numbers of inputs can be reduced to one or two outputs; signal averaging must allow the mathematical calculation of the average analog value from a group of analog values as the basis of control and must include the ability to "weight" the individual analog values so that the function output can be biased as necessary to achieve proper control; reset function must develop an AO based on up to two AIs and one operator specified reset schedule.

2.7.6 Command Priorities

A scheme of priority levels must be provided to prevent interaction of a command of low priority with a command of higher priority. Override commands entered by the operator must have higher priority than those emanating from applications programs.

2.7.7 Resident Application Software

****
NOTE: The data base and settings tables will be incorporated into the contract package. Specify only those applications programs to be implemented at time of acceptance. Do not specify a program unless sensors and controls required to implement it are included in the design package.
****

Provide resident applications programs developed in accordance with paragraph GRAPHICAL PROGRAMMING to achieve the sequences of operation, parameters, constraints, and interlocks necessary to provide control of the process systems connected to the process control system. All application programs must be resident in the PLC and must execute in the PLC, and must coordinate with each other, to ensure that no conflicts or contentions remain unresolved.

2.7.7.1 Program Inputs and Outputs

Use program inputs listed for each application program to calculate the required program outputs. Where specific program inputs are not available, a "default" value or virtual point appropriate for the equipment being controlled and the proposed sequence of operation must be provided to replace the missing input, thus allowing the application program to operate.

2.7.7.2 Failure Mode

****

NOTE: Assure that the appropriate failure modes are identified on the drawings.

****

In the event of a PLC failure, the controlled equipment must continue to function in the failure mode shown on the drawings. Systems that are Primary/Secondary must transfer control to the non-failed system.

2.8 CONTROL PANELS

****

NOTE: For locations or equipment that will be powered by an uninterruptible power supply (UPS) during a commercial power outage, the control panel must be included on the UPS.

Include in the design package requirements for sufficient ventilation, heating or air conditioning to ensure that the control panel internal temperature and humidity will be maintained within the PLCs operational parameters when exposed to the temperature and humidity indicated in paragraph SITE ENVIRONMENTAL CONDITIONS. Include allowance for any solar gain. If the requirements for ventilation, heating and air conditioning are not necessary, they will be deleted.

****

2.8.1 Components

2.8.1.1 Enclosures

The enclosure for each control panel must conform to the requirements of NEMA 250 for the types specified. Finish color must be the manufacturer's standard, unless otherwise indicated. Enclosures for installation in mechanical equipment rooms must be Type [1] [4] [12]; those for installation in clean, dry indoor occupied space may be Type 1; other locations must be as otherwise specified or shown. Enclosures for equipment installed outdoors must be Type 4 or as shown. Enclosures for installation in a corrosive environment must be Type 4X and must be constructed of [stainless steel] [fiberglass] [polymer plastic]. Painted steel must not be allowed for use in a corrosive environment. Enclosure must be provided with a single, continuously hinged exterior door with print pocket, 3-point latching mechanism and key lock and a single, continuously hinged interior door.

2.8.1.2 Controllers

Provide controllers in accordance with paragraph Programmable Logic Controller (PLC).

2.8.1.3 Standard Indicator Light

Indicator lights showing on, off, stand-by, automatic, manual depending on the application must comply with NEMA ICS 1, NEMA ICS 2 and UL 508A. Lights must be heavy duty, round and must mount in a 22.5 mm 0.875 inch mounting hole. Indicator lights must be LED type and must operate at 120 VAC or 24 VDC. Long life bulbs must be used. Indicator light must be provided with a legend plate labeled as shown on the drawings. Lens color must be as indicated on the drawings. Lights must be push to test (lamp) type.

2.8.1.4 Selector Switches

****

NOTE: Indicate on the drawings where key operated switches are required.

****

Selector switches must comply with NEMA ICS 1, NEMA ICS 2 and UL 508A. Selector switches must be heavy duty, round and must mount in a 22.5 mm 0.875 inch mounting hole. The number of positions must be as indicated on the drawings. Switches must be [illuminated] [non-illuminated] [as indicted of the drawings]. Switches must be rated for 600 volts, 10 amperes continuous. Selector switches must be provided with a legend plate labeled as shown on the drawings. Where indicated or required, dual auxiliary contacts must be provided for the automatic position to provide position sensing at the central station or workstation. Auxiliary contacts must be rated for 120 VAC, 1A as a minimum. Where indicated on the drawings, switches must be key operated. All keys must be identical.

2.8.1.5 Push Buttons

Push buttons must comply with NEMA ICS 1, NEMA ICS 2 and UL 508A. Push buttons must be heavy duty, round and must mount in a 22.5 mm 0.875 inch mounting hole. The number and type of contacts must be as indicated on the drawings or required by the Sequence of Control. Push buttons must be rated for 600 volts, 10 amperes continuous. Push buttons must be provided with a legend plate labeled as shown on the drawings.

2.8.1.6 Relays

Relays must comply with NEMA ICS 5 and derated for altitude above 1,500 m. Relays must be [single-pole, single-throw (SPST)] [single-pole, double-throw (SPDT)] [double-pole, single throw (DPST)] [double-pole, double-throw (DPDT)] [as required by the Sequence of Control]. Relay coil must be [120 VAC] [24 VDC] and must be provided with matching mounting socket. Power consumption must not be greater than 3 watts. Coils must have a minimum current rating of [___] amps and minimum voltage rating of [___] volts. Contacts must have a minimum current rating of [ ] amps and minimum voltage rating of [___] volts.

2.8.1.7 Terminal Blocks

Terminal blocks must comply with NEMA ICS 4 and UL 1059. Terminal blocks for conductors exiting control panels must be two-way type with double terminals, one for internal wiring connections and the other for external wiring connections. Terminal blocks must be made of bakelite or other suitable insulating material with full deep barriers between each pair of terminals. A terminal identification strip must form part of the terminal block and each terminal must be identified by a number in accordance with the numbering scheme on the approved wiring diagrams.

2.8.1.8 Alarm Horns

Alarm horns must be provided where indicated on the drawings. Horns must be vibrating type and must comply with UL 508A. Horns must provide 100 dB at 10 feet. Exterior mounted horns must be weather proof by design or must be mounted in a weather proof enclosure that does not reduce the effectiveness of the horn.

2.8.2 Panel Assembly

Control panels must be factory assembled and shipped to the jobsite as a single unit. Panels must be fabricated as indicated and devices must be mounted as shown or required. Each panel must be fabricated as a bottom-entry connection point for process control system electrical power, [process control system main air source,] process control system wiring, [control air pneumatic tubing,] [communications system wiring to [other control panels] [operators workstation]].

2.8.3 Electrical Requirements

Each panel must be powered by a dedicated [120 volts ac] [208 volts ac] [125VDC] circuit, with a fuse, [10 amp] [____] [sized as recommended by the equipment manufacturer], and a disconnect switch located inside the panel. Wiring must terminate inside the panel on terminal blocks. Electrical work must be as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and as shown on the drawings.

2.8.4 Power Line Conditioner

Each control panel must be provided with a power line conditioner to provide both voltage regulation and noise rejection. The power line conditioner must be of the ferro-resonant design, with no moving parts and no tap switching, while electrically isolating the secondary from the power line side. The power line conditioner must be sized for 125 percent of the actual connected kva load. Characteristics of the power line conditioner must be as follows:

2.8.4.1 85 Percent Load

At 85 percent load, the output voltage must not deviate by more than plus or minus 1 percent of nominal voltage when the input voltage fluctuates between minus 20 percent to plus 10 percent of nominal voltage.

2.8.4.2 Load Changes

During load changes of zero to full load, the output voltage must not deviate by more than plus or minus 3 percent of nominal voltage. Full correction of load switching disturbances must be accomplished within 5 cycles, and 95 percent correction must be accomplished within 2 cycles of the onset of the disturbance.

2.8.5 Grounding

Control panel enclosures must be equipped with a solid copper ground bus or equivalent. The ground bus must be securely anchored to the enclosure so as to effectively ground the entire structure. Clamp-type terminals sized large enough to carry the maximum expected current must be provided on the ground bus for grounding cables. Where a definite circuit ground is required, a single wire not less than #10 AWG must run independently to the panel ground bus and must be fastened to the ground bus with a bolted terminal lug. Cases of instruments, relays and other devices must be effectively grounded through the enclosures steel structure unless otherwise indicated. Insulated wiring having a continuous rated current of not less than the circuit fuse rating must be used for grounding. Grounding terminals of power receptacles must be solidly grounded to the panel enclosure.

2.8.6 Convenience Outlet

****

NOTE: Coordinate with electrical drawings to provide power for control panel convenience outlet and other required accessories.

****

A 120 volt ac, 20 amp, ground fault interruption (GFI) type duplex convenience outlet must be provided inside the panel. The outlet circuit must be separate from the panel power circuit.

2.8.7 Panel Interior Light

[Where indicated,] [Each] control panel[s] must be provided with a [60 watt incandescent] [40 watt fluorescent] [15 watt LED] light. The light must be operated by a manual on-off switch mounted on the interior door of the enclosure. The light must be powered by the same circuit as the convenience outlet.

2.8.8 Ventilation System

[Where indicated,] [Each] control panel[s] must be provided with two single phase, 120 volt ac ventilation fans. Each fan must supply a minimum of 50 L/s 100 cfm of ventilation air through the enclosure. Each fan must be provided with a line voltage thermostat. Thermostat setpoints must be adjustable in a range of 21 to 60 degrees C 70 to 140 degrees F as a minimum. Each supply and exhaust grille must contain a filter that is easily removed for cleaning or replacement.

2.8.9 Heating System

[Where indicated,] [Each] control panel(s) must be provided with a thermostatically controlled electric heater capable of maintaining an enclosure temperature of [2] [_____] degrees C [35] [_____] degrees F when continuously exposed to an ambient temperature of [_____] degrees C degrees F.

2.8.10 Air Conditioning System

[Where indicated,] [Each] control panel[s] must be provided with a mechanical refrigeration air conditioning system. The system must be capable of maintaining a temperature of [38] [_____] degrees C [100]

[_____] degrees F inside the enclosure with all equipment in the panel operating and while continuously exposed to [full sunlight and] an ambient air temperature of [_____] degrees C degrees F. The compressor and condenser must be located outside the control panel enclosure. Provisions must be made to remove condensate from the control panel and to protect all devices within the enclosure from condensate.

2.9 COMPUTER HARDWARE

****

NOTE: The designer must edit the following paragraph to require only the computer equipment that is necessary based on the requirements and complexity of the process control system. Must Verify that the location for the equipment will be provided with climate controls to provide a suitable environment for the equipment.

****

For computer hardware furnished under this specification provide standard products of a single manufacturer which advertises service in all 48 contiguous states, and provide only model currently in production. Except for PCI-E cards installed into expansion slots provided in a desktop or server computer in order to meet the requirements of this specification, do not modify computer hardware from the manufacturer configuration.

[2.9.1 Server Hardware

****

NOTE: Coordinate with the project site to determine if the server(s) will be contractor supplied or Government Furnished. If contractor supplied, coordinate with the Project Site's NEC (IT group) and include the sites 'standard' server redundancy requirements. Note that computer technology changes quickly and these requirements should be edited to reflect current products. Default requirements (current as of 2012) have been provided in brackets.

****

Computer Server Hardware (server) [will be furnished by the Government] [must be a desktop or server computer meeting the following minimum requirements:]

2.9.1.1 Processor

[____][Quad-core processor designed for server applications. Processor speed must be at least 50 percent of the speed of the fastest Intel server processor commercially available].

2.9.1.2 Random Access Memory (RAM)

[____][300 percent of the recommended requirements of the software to be installed on the server[and no less than 24GB].]

2.9.1.3 Communications Ports

[____][Four USB 3 3.0 3.1 ports.]

2.9.1.4 Hard Drives

2.9.1.4.1 Internal Hard Drives

[____][Solid State Hard drives with SATA-3 Controller providing at least [2TB][____] usable disk space. Hard drives must use RAID (Redundant Array of Inexpensive Disks) at levels 1 or 5 (RAID-1 or RAID-5).]

2.9.1.5 Optical Drive

[____][Blue-Ray burner drive.]

2.9.1.6 Video Output

[____][32-bit color at a minimum resolution of 1920 by 1080 at a minimum refresh rate of 70 Hz and a DVI or display port output.]

2.9.1.7 Network Interface

[[____][[Two] integrated 1000Base-T Ethernet with RJ45 connector.]]

2.9.1.8 Monitor

[____][Widescreen flat panel LCD monitor sized as indicated but no less than 24 inch nominal with a minimum resolution of 1920 by 1080 pixels and a minimum refresh rate of 70Hz.]

2.9.1.9 Keyboard

[____][101 key wired USB keyboard having a minimum 64 character standard ASCII character set based on ANSI INCITS 154.]

2.9.1.10 Mouse

[____][2-button wired USB optical scroll mouse with a minimum resolution of 400 dots per inch.]

2.9.1.11 Power Supplies

[____][Hot-swappable redundant power supplies.]
]

2.9.2 Workstation Hardware (Desktop and Laptop)

****

NOTE: Coordinate with the project site to determine if the workstation(s) will be contractor supplied or Government Furnished, or a mix where some workstations are Gov't furnished and others are contractor supplied:

"Replace Brackets" instructions

1) Government furnished only : Keep first bracketed text and remove the [as indicated].

2) Contractor supplied only: Keep the second bracketed text.

3) Combination of Government furnished and Contractor supplied: Keep all bracketed text. When keeping bracketed text (Contractor supplied or combination of Government and Contactor supplied) note that computer technology changes quickly and these requirements should be edited to reflect current products. Default requirements (current as of 2012) have been provided in brackets.
****

[The Government will provide the] [Provide a standard desktop computer or a laptop meeting the following minimum requirements for the] Computer Workstation Hardware (workstation) [as indicated].

2.9.2.1   Processor

2.9.2.1.1   Desktop

Quad-core processor designed for desktop applications. Processor speed must be at least 75 percent of the speed of the fastest Intel desktop processor commercially available.

2.9.2.1.2   Laptop

Quad-core processor designed for laptop applications. Processor speed must be at least 50 percent of the speed of the fastest Intel laptop processor commercially available.

2.9.2.2   Random Access Memory (RAM)

[____][300 percent of the recommended requirements of the software to be installed on the server[and no less than 16GB].]

2.9.2.3   Communications Ports

2.9.2.3.1   Desktop

[____][Six USB ports.]

2.9.2.3.2   Laptop

[____][Two USB ports, plus a PCMCIA card slot or an additional USB port, plus an integral RS-232 serial port or an additional USB port and a USB to RS-232 serial adapter.]

2.9.2.4   Hard Drive and Controller

2.9.2.4.1   Desktop

[____][[1.5TB][____] or larger with a SATA-3 controller.]

2.9.2.4.2   Laptop

[____][[250GB][____] or larger solid state drive.]

2.9.2.5   Optical Drive

[____][Blue-Ray drive]

2.9.2.6 Video Output

2.9.2.6.1 Desktop

[____][32-bit color with dual monitor support minimum resolutions of 3840 by 2160 at minimum refresh rates of 70 Hz and dual DVI or display port outputs.]

2.9.2.6.2 Laptop

[____][32-bit color with a minimum resolution of 3840 by 2160 at minimum refresh rates of 70 Hz and VGA or HDMI output.]

2.9.2.7 Network Interface

2.9.2.7.1 Desktop

[____][Integrated 1000Base-T Ethernet with RJ45 connector.]

2.9.2.7.2 Laptop

[____][Integrated 1000Base-T Ethernet with RJ45 connector.]

2.9.2.8 Monitor

2.9.2.8.1 Desktop

[____][Dual widescreen flat panel LCD monitors sized as indicated but no less than 600 mm 24 inch nominal with minimum resolutions of 3840 by 2160 pixels and a minimum refresh rate of 70Hz.]

2.9.2.8.2 Laptop

[____][LCD Screen sized as indicated but no less than 325 mm 13 inch nominal with a maximum supported resolution of no less than 3840 by 2160 pixels.]

2.9.2.9 Keyboard

2.9.2.9.1 Desktop

[____][101 key wired USB keyboard having a minimum 64 character standard ASCII character set based on ANSI INCITS 154]

2.9.2.9.2 Laptop

[____][Standard laptop keyboard.]

2.9.2.10 Mouse

2.9.2.10.1 Desktop

[____][2-button wired USB optical scroll mouse with a minimum resolution of 400 dots per inch.]

2.9.2.10.2 Laptop

[____][Integrated touch-pad plus a 2-button wired USB optical scroll mouse with a minimum resolution of 400 dots per inch.]

2.9.2.11 Printers

Provide [local or network] printers as indicated. Provide local printers which have a USB interface. Provide network printers which have a 100Base-T or faster interface with an RJ45 connection.

2.9.2.11.1 Alarm Printer

Provide alarm printers which use sprocket-fed fanfold paper with adjustable sprockets for paper width up to 280 mm 11 inches. Alarm printers must have programmable control of top-of-form. [Provide floor stands with paper racks for alarm printers.]

2.9.2.11.2 Laser Printer

Provide laser printers as indicated meeting the following minimum requirements:

Resolution 600 by 600 dots per inch
Printing Time 10 pages per minute
Data Buffer Size 16 Megabytes
Media Type Paper and transparency film
Media Size ANSI A(216 by 279 mm 8.5 by 11 inches) or 11 by 17 inches
[Color] and other sizes as indicated
Paper Cassette 250 sheet capacity

2.9.3 Uninterruptible Power Supply (UPS)

A self contained UPS suitable for installation and operation at the Server and Workstation must be provided. The unit[s] must be sized to provide a minimum of 10 minutes of operation of the central station [and operator's workstation] computer. The UPS must incorporate surge suppression, noise filtering (normal and common mode) short circuit protection and voltage regulation (brownout and overvoltage protection). UPS must be complete with all necessary power supplies, transformers, batteries, and accessories and must include visual indication of normal power operation, UPS operation, abnormal operation and visual and audible indication of low battery power. The UPS must comply with the Federal Communications Commission Standard 15J part A for radio noise emissions.

2.9.4 Communication and Programming Device

A hand-held communication [and programming]device must be provided. The communication [and programming]device must connect to the PLC directly for readout of variables, override, control, servicing, troubleshooting and adjustment of control parameters. The device must be provided with all necessary cables, connectors and adapters to allow connection to the PLC. The device must communicate in English language for inquiry, reporting [and programming] purposes.

2.10 TOUCHSCREEN HMI

Human Machine Interface (HMI) display screens must be supplied to provide an interface to the PLC. The touch screens must be compatible with the specific PLC being furnished. Locate touch screens in the cabinets as shown in the Contract Drawings. The touch screens must provide maintenance information and indication of the systems. The touch screens must be [15"] [ ] panel mount with a minimum resolution of 1024x768. Provide operator interface as shown on the Contract Drawings or approved equal.

2.10.1 TOUCHSCREEN HMI Display Layout

Develop HMI control and supervision display layouts complying with the minimum requirements of the Control Narrative in the Contract Drawings. Submit for approval prior to implementation.

2.11 MONITORING AND CONTROL SOFTWARE

****

NOTE: The designer should edit this paragraph, as needed, to require only the central station software that is necessary based on the requirements and complexity of the process control system. Where no information is available on future expansion, require a minimum expansion capability of 50 percent. Where specific expansion requirement information is available, it must be used to determine the expansion capability requirements.

****

Provide a single software package which implements the Scheduling, Alarming, Trending, Graphical System Display, and System Display Editor functionality. Other specified M&C functionality may be implemented in the same software package or in additional software packages. The monitoring and control software must provide the communication, programming and control capabilities necessary to support all specified points and functions, plus a minimum expansion of [50] [____] percent of the current number of points, complete with their point database. The monitoring and control station must be online at all times and must perform all required functions as specified. Where multiple modules are used the modules must be capable of sharing data and operating together seamlessly. [Software must be a client-server software package with a graphical user interface (GUI) using web-browser based clients.]The system must support multiple user operation with multiple tasks for each user and must support operation and management of all peripheral devices.

2.11.1 M&C Software Update Licensing

****

NOTE: The installation may procure its own software update licensing or contract and thus need less than 5 years. Alternatively the installation may require longer than five years (although this will likely increase the costs significantly). Coordinate with the installation to determine if they have any specific requirement; if they don't then keep the 5 year requirement.

****

In addition to all other licensing requirements, provide M&C Software licensing which includes licensing of the following software updates for a period [of no less than 5 years][____]:

a. Security and bug-fix patches issued by the M&C Software manufacturer.

b. Security patches to address any vulnerability identified in the National Vulnerability Database at http://nvd.nist.gov with a Common

Vulnerability Scoring System (CVSS) severity rating of MEDIUM or higher.

2.11.2 Graphical Operations

2.11.2.1 Graphical User Interface

****
NOTE: Standalone or web based are designer options.
****

The central station must be provided with a mouse driven, graphical user interface.

2.11.2.2 Display Information

The central station must display information necessary to support all requirements specified, including: operator commands; alarm notification; reports; system graphics as specified and as shown, incorporating dynamic data; and curve plotting.

2.11.2.3 System Graphics Implementation

System graphics displays must be hierarchical displays which integrate dynamic data into the display. System graphics must reflect actual system configuration. Each system schematic must be included as a separate display. Different colors, textures, and use of inverted video must be used for various components and dynamic data. The displays must include standard and/or custom symbols. A library of callable display symbols containing symbols for all necessary equipment and control devices must be furnished. Symbols must conform to ISA 101.01 where applicable. Data associated with a display must be updated within 5 seconds of the binary status change or the analog change in excess of the analog change differential. Any dynamic data which is not current, due to PLC communications failure, PLC failure, or point out of service, must be highlighted or flagged.

2.11.2.4 Display Editor

The display editor must enable the user to create, modify, save and delete displays and symbols. Within the display there must by dynamic fields with the function of linking the dynamic fields with the database and must be executed automatically as the last step of the database generation and modification procedure.

2.11.2.5 Graphical Programming

The system must include a graphical programming function which must be used to create all control sequences utilized in the control panels. This function must reside in the central station to create, modify, and test software for control panel resident programs. The graphical programming function must provide programming elements to be connected together to create a logic diagram. The diagram must be compiliable to produce executable code for the control panel. The graphical programming function must include elements necessary to create logic diagrams that represent sequences of operation. Program elements must be able to be combined into a custom template which can then be used as a standard function. Program checkout and debug facilities must include display of dynamic and/or simulated system variables and points on the programming screens. The user must be able to fix or force values of variables to enable program checkout during debugging. The programming must allow for the use of the portable tester for loading files directly into the control panel, uploading of existing control panel programming and database information and downloading of control panel programming and database information.

2.11.2.6 System Menus and Displays

The user must be able to call up the following displays by dedicated function key, pull down menu or by icon and must be able to page forward and backward on linked multiple page displays. The system menu and index displays must also contain icons which can be used to call up subsequent displays.

a. System Menu (list of all graphics and menus).

b. Index (list of all PLCs).

c. Alarm Summary (list of all uncleared alarms).

d. Abnormal Summary (list of all devices not in normal state; keeps track of alarm conditions which have been cleared).

e. Data Communications Summary (listing of availability for each communication channel, by statistically processing the number of transmission errors, outages, and other abnormal conditions for each channel).

2.11.2.7 Hard-Copy Screen Request

The central station must be able to obtain a hard copy of the monitor display being viewed. This must be an exact "snapshot" of the data and device symbols shown on the selected monitor.

2.11.3 Command Software

The software must provide for defining and selecting points, parameters, graphics, report generation, and all other functions associated with operation. The operator commands must be usable from central station computer and workstation keyboards with individual operator passwords as specified.

2.11.3.1 Command Input

Command menus must utilize full words and acronyms selected to allow operators to use the system without extensive training or data processing backgrounds. The system must prompt the operator.

2.11.3.2 Command Input Errors

The system must supervise operator inputs to ensure they are correct for proper execution. Provide operator input assistance whenever a command cannot be executed because of operator input errors.

2.11.3.3 Special Functions

The system must support the following special functions by using a mouse, in addition to all other commands specified:

2.11.3.3.1 Help

Produce a display of all commands available to the operator. The help command, followed by a specific command, must produce context sensitive listing with a short explanation of the purpose, use, and system reaction to that command.

2.11.3.3.2 Start/Enable

Manually start equipment and enable monitoring and control of points.

2.11.3.3.3 Stop/Disable

Manually stop equipment and disable monitoring and control components.

2.11.3.3.4 Display Diagram

Display diagrams of specific utility systems or other systems.

2.11.3.3.5 Diagram Development

Facilitate development of diagrams of specific utility systems or other systems.

2.11.3.3.6 Auto/Override

Override automatic operation of a point or return a point to automatic operation.

2.11.3.3.7 Print Report

Allow the operator to print reports.

2.11.3.3.8 Confirm Action

Allow the operator to confirm that the desired command sequence has been correctly entered and is to be executed.

2.11.3.3.9 Cancel Action

Perform the opposite function of the confirm action, at any time prior to executing confirm action.

2.11.3.3.10 Memo Pad

Allow the operator to create, store and retrieve pop-up notes.

2.11.3.4 Operator's Commands

The operator's commands must provide the means for entry of control and monitoring commands, and for retrieval of information. The operator's commands must perform such tasks as requesting a display of any binary, analog, or accumulator point, or any group of related points, startup and shutdown selected systems or devices, modifying

2.11.3.5 Level of Addressing

****

NOTE: When specifying level of addressing for

identification, delete Area or Facility where not required.
****

Provide four levels of addressing for identification as follows:

2.11.3.5.1 Point

The individual sensor or control device within a unit.

2.11.3.5.2 Unit

The unit that a point is associated with, such as a blower.

2.11.3.5.3 Sub-System

The sub-system that a point is located in or near.

2.11.3.5.4 System

The system that a sub-system is located in or near.

2.11.3.6 System Access Control

A minimum of [_____] passwords must be usable with the process control system software. The system must maintain an ASCII disk file logging all operators logged onto the system, alarm acknowledgments, commands issued and all database modifications for each password. Each password must be definable as to the functions that the operator can perform.

2.11.4 Alarms

Provide M&C Software meeting the following minimum requirements for alarms:

a. The M&C software must be capable of generating alarms by comparing the value of any point from any connected system to user-configurable limits and must notify an operator of the occurrence of an alarm condition. The process control system alarm history must be stored and must be recallable by the operator using the report generator. Alarm messages must take precedence over other functions. A minimum of the most recent [25] [_____] system alarms must be directly available at the central station computer. Operator acknowledgment of one alarm must not be considered as acknowledgment of any other alarm nor must it inhibit reporting of subsequent alarms. Alarm data to be displayed and stored must include: identification of the alarm; date and time to the nearest second of occurrence; device or sensor type; limit exceeded (if analog); engineering units; current value or status; alarm class; and alarm messages.

b. The M&C software must support at least two alarm priority levels: critical and informational. Critical alarms must remain in alarm until acknowledged by an operator and the alarm condition no longer exists; informational alarms must remain in alarm until the alarm condition no longer exists or until the alarm is acknowledged.

c. The creation, modification, and handling (routing) of alarms must be fully accessible and fully adjustable from the graphical user interface.

d. Alarm Data. Alarm data to be displayed and stored must include:

e. 1) Identification of alarm including building, system (or sub-system), and device name.

   2) Date and time to the nearest second of occurrence.

   3) Alarm type:

   4) Unreliable: Indicates that the source device has failed due to the sensing device or alarm parameter being out-of-range or bad data.

   5) High Alarm.

   6) Low Alarm.

   7) Current value or status of the alarm point, including engineering units

   8) Alarm limits, including engineering units.

   9) Alarm priority.

   10) Alarm Message: A unique message with a field of at least 60 characters. Assignment of messages to an alarm must be an operator editable function.

   11) Acknowledgement status of the alarm including the time, date and user of acknowledgement.

2.11.4.1 Binary Alarms

Binary alarms must be subject to immediate reporting, within the alarm response time, at the central station.

2.11.4.2 Analog Alarms

These alarms must be subject to immediate reporting, within the alarm response time, at the central station. The control panel analog readings must be compared to predefined high and low limits, and alarmed to the central station each time a value enters or returns from a limit condition. The program must automatically change the high or low limits, or both, of any analog point, based on time scheduled operations as specified, allowing for a time interval before the new alarm limit becomes effective. For those applications where setpoint adjustments are made, the alarm limit must be keyed to a finite deviation traveling with the setpoint.

2.11.4.3 Alarm Messages

A unique message with a field of 60 characters must be provided for each alarm. Assignment of messages to a point must be an operator editable function. Secondary messages must be assignable by the operator for printing to provide further information, such as telephone lists or maintenance functions, and must be editable by the operator.

2.11.4.4 Alarm Classes

Classes of alarms, which will be identified for each item, include class 1 and class 2 alarm conditions. Class 1 (Critical) must include display, print, and audible alarm at occurrence and at return-to-normal. Acknowledgment of class 1 alarms by the operator must be required at occurrence and at return-to-normal. Class 2 (Informational) must include display, print, and audible alarm at occurrence and at return-to-normal. No acknowledgment of class 2 alarms is required unless otherwise shown.

2.11.5 Pop-up Note Function

A pop-up note function must be included with the workstation, providing the operator a capability of noting any data which may be associated with alarms or with any other event. A note created by an operator must be automatically called up when any other workstation calls up the associated point, alarm, or alarm summary. The pop-up note function must also support free form entry of data which can be used by any workstation operators as general reminders or instructions.

2.11.6 Real Time Clock Synchronization

****

NOTE: If real time clock synchronization is not required, this paragraph will be deleted.

****

The system must synchronize each central station computer, real time clock, within one second and at least once per day automatically, without operator intervention and without requiring system shutdown. The central station computer must automatically initiate a call once per day to the NIST clock to obtain the correct time and date and update the real time clock. The central station computer must generate a report showing the time difference.

2.11.7 System Reaction

Under system normal heavy load, no more than [10] [_____] seconds must lapse from the time a binary status alarm or analog alarm occurs at a PLC until the change is displayed at the central station [and operator's workstation]. The total system response time from initiation of a control action command to display of the resulting status change must not exceed [20] [_____] seconds under system normal heavy load conditions, assuming a zero response time for operation of the PLC's control device. The alarm printer must continue to print out all occurrences, including time of occurrence, to the nearest second. All system normal heavy load conditions must be introduced to the system via AIs and DIs.

2.11.7.1 Occurrence

System normal heavy load conditions are defined as the occurrence throughout the system of a total of three status changes, three binary alarms, three analog high or low limit alarms, and three analog quantity changes within the high and low limits during a single 1-second interval. This number of similar occurrences must repeat on a continuous basis during successive 1-second intervals for a period of 2 minutes.

2.11.7.2 Location

System normal heavy load conditions, as specified, must have 50 percent of the changes and alarms, including no less than one of each type, occurring at a single PLC with the remaining changes and alarms distributed among the remaining PLCs.

2.11.8 Report Generator

Software must be provided to generate and format standard and custom reports for displaying, printing, and storing on disk. Reports must use database values and parameters, values calculated using the real time static database or historical data base; with the reports subsequently stored on hard disk or zip drive. Dynamic operation of the system must not be interrupted to generate a report. The report must contain the time and date when the sample was taken, and the time and date when the report was printed. The software must allow for automatic and manual generation of reports. For automatic reports an operator must be able to specify the time the initial report is to be generated, the time interval between reports, end of period, and the output format for the report. Manual report generation must allow for the operator to request at any time the output of any report.

2.11.8.1 Periodic Automatic Report

The system must allow for specifying, modifying, or inhibiting the report to be generated, the time the initial report is to be generated, the time interval between reports, end of period, and the output peripheral.

2.11.8.2 Request Report Mode

The system must allow for the operator to request, at any time, an immediate printout of any report.

2.11.9 Data Interchange

Software must be provided to format and store on a government approved removable hard drive the data, trends, profiles, reports and logs as specified in a defined, standard format such as ASCII text or DIF for export and further processing by other software and/or computer systems.

2.11.10 Control Panel and DTS Circuit Alarms

The system must supervise each control panel, I/O function and DTS circuit for alarm reporting, including: control panel not responding; control panel responding (return to normal); control panel to central station DTS circuit high error rate; control panel to control panel DTS circuit high error rate; control panel/central station real time clock error more than 15 seconds (adjustable); control panel intrusion alarm; control panel offline; control panel online (return to normal); control panel failure (self-diagnostics); point not responding to command; and point change of state without command.

2.11.11 Central Station Database

The central station database must be stored on disk and in memory. The static database must be downloadable as required to control panels in the system.

2.11.11.1 Database Definition Process

Software must be provided to define and modify each point in the database using operator commands. The definition must include all physical parameters and constraints associated with each point. Each database item must be callable for display or printing, including EEPROM, ROM and RAM resident data. Each point must be defined and entered into central station database.

2.11.11.2 Dynamic Database

The dynamic database includes those variables which change with time or conditions including all DIs, AIs, PAs, and virtual (logic) points.

2.11.11.3 Dynamic Database Update

Update the dynamic database from the field, allowing the operator to select update times from 0.1 seconds to 2.0 seconds.

2.11.11.4 Static Database

The static database includes those fixed parameters and constraints from all PLCs which define the characteristics of the system and I/O functions such as alarm limits, start/stop times, point names, PLC channel addresses, and sensor spans.

2.11.11.5 Central Station Static Database Update

A copy of each control panels static database must be updated automatically once per day, each time an authorized change is submitted or upon demand from the central station database.

2.11.11.6 Workstation Access to Dynamic Data

Any workstation with proper access password and connected to the central station via the BTS must have access to the central station's dynamic data. Display of data must commence within 5 seconds.

2.11.12 Historical Data Storage and Retrieval

A historical data storage and retrieval function must be provided at the central station to collect and store dynamic data. This function must be in addition to other data storage requirements. The function must have the capability to collect and store alarm status changes, point values, events and operator commands, and system responses. The storage function must also have the capability to collect and store multiple sets of analog data at pre-specified sampling rates. This function must have the capability to retain historical data on hard disk for pre-specified time periods, up to forty five days using last day roll over, for short-term analysis, and then output the data to a solid state drive in a SQL database for long-term retention. The operator must also be able to selectively recall short-term data stored on hard disk. Retrieval and printing of the contents of any selected historical data file must be available using the data retrieval and report generation program. The output of the report generation program must be capable of being viewed on the screen, printed in a report, or stored.

2.11.13 Trending

Provide M&C software capable of creating, modifying, uploading and archiving Point properties and performing real-time display of point properties with a minimum trending rate of 100 points per second.

a. The M&C Software must include a graphical display for trend configuration, creation and deletion accessible through the graphical user interface. Each trend must be user-configurable for:

b. (1) Point to trend.

    (2) Sampling interval: adjustable between 1 second and 1 hour.

    (3) Start and Stop Time of Trend: Start and stop times determined by one or more of the following methods:

        (a) Start time and stop time

        (b) Start time and duration

        (c) Start time and number of samples

c. The M&C software must be capable of displaying and printing a graphical representation of each trend, and of multiple trended points on the same graph. The software must be capable of saving trend logs to a file. If the file format is not plain ASCII text in a Comma-Separated-Value (CSV) format, provide a means to export or convert the file to plain ASCII text in a CSV format.

2.11.14 Analog Monitoring

The system must measure, transmit, and display analog values, including calculated analog points. Differential measurements must be displayed as positive or negative values with respect to their reference points shown. An analog change in value is defined as a change exceeding a preset differential value as specified. Each analog change in value must be operator selectable and settable to provide for a minimum reporting change in value of one-half the specified end-to-end accuracy of the measured variable. Displays and reports must express analog values in proper engineering units with sign. Provide [128] [____] different sets of engineering unit conversions. Each engineering conversion unit must include range, span, and conversion equation.

2.11.15 Analog Totalization

Any analog or calculated point must be operator assignable to the totalization program. The analog totalization time period must be defined uniquely for each point. At the end of the period, totals must be stored on disk for future reference. Totalization must then restart from zero for the next time period. The program must keep track of the peak and total value measured during the current period and for the previous period. The operator must be able to initiate a summary of totalization information on a point, unit, sub-system or system. The operator must be able to set or reset each totalized value individually. The operator must be able to define, modify, or delete the time period online.

2.11.16 LAN Software

A network operating system must be supplied as part of the LAN software. The network operating system must support network device access to the central station. The system must provide workstation access to the central station as a virtual terminal. The network must provide network access to shared peripherals. The LAN software must provide for transparent communication with any node on the system. The LAN software must support the following:

2.11.16.1 Access Control

Access control to the central station computer and workstations. Operators must be able to perform all specified functions, given the proper passwords, including database definition/modification, graphic creation/modification, and trending.

2.11.16.2 Other Functions and Configurations

2.11.17 Virus Protection Software

****
NOTE: Coordinate with the project site to determineif the Virus Protection Software will be contractor supplied or Government Furnished.
****

[Provide Virus Protection Software consisting of the project site's standard virus protection software complete with a virus definition update subscription] [Virus Protection Software will be furnished by the Government].

2.11.18 Disk Imaging (Backup) Software

****
NOTE: Coordinate with the project site to determineif the Disk Imaging (Backup) Software will be contractor supplied or Government Furnished.
****

[Provide Disk imaging (backup) software capable of performing a bare-metal restore (imaging and restoring to a new blank hard drive such that restoration of the image is sufficient to restore system operation to the imaged state without the need for re-installation of software).] [Provide Disk imaging (backup) software consisting of the project site's standard disk imaging software.] [Disk imaging (backup) software will be furnished by the Government.]

2.12 DATA COMMUNICATION REQUIREMENTS

****
NOTE: The designer will edit the following paragraph as needed to require only the data communications requirements that are necessary based on the requirements and complexity of the control system. A communications system layout or block diagram must be provided on the drawings to clearly show the communications system configuration requirements.
****

Process control system data communications must support the specified functions and process control system configuration shown on the drawings.

2.12.1 Central Station/Workstation

Each workstation must be able to communicate with the central station as a virtual terminal. The workstation must be able to initiate uploads or downloads of programs and resident data, including parameters of connected systems PLCs and devices, constraints and programs in the central station.

2.12.2 Central Station/PLC

The central station must be able to initiate an upload or download of PLC data programs.

2.12.3 Communication

****

NOTE: Indicate on the communications system layout diagram, on the drawings, where modem communication is required. Coordinate this with the central station/workstation computer requirements.

****

Communication with other computer systems must be accomplished using an Ethernet communications port. The central station or workstation must be able to initiate upload or download of data files.

2.12.4 Error Detection and Retransmission

Error detection and retransmission must comply with current Ethernet standards.

2.13 FACTORY TEST

****

NOTE: Evaluate the need for factory tests. Take into account the size of the system, the complexity of the system, the devices that comprise the system as well as other pertinent information. If a factory test is deemed necessary, the factory test requirements below must be tailored to the process control system to be tested. If any factory test is deemed unnecessary, delete it from the following paragraphs.

****

The process control system must be tested at the factory prior to shipment. Written notification of planned testing must be given to the Government at least 21 days prior to testing, and in no case must notice be given until after the Contractor has received written Government approval of the test procedures.

2.13.1 Factory Test Setup

****

NOTE: Items not applicable to the factory test should be deleted.

****

Assemble and integrate the factory test setup as specified to prove that performance of the system satisfies all requirements of this project, including system communications requirements in accordance with the approved test procedures. The factory test must take place during regular daytime working hours on weekdays. Equipment used must be the same equipment that is to be delivered to the site. The factory test setup must include the following:

Factory Test	
central station equipment	one each of the components
workstation	one of each type
control panel	not less than two control panels: at least one of each type used in the system plus at least one per
test set	one of each type
portable tester	one of each type
communications circuits	one of each type and speed to be utilized in the proposed system including bridges, modems, encoder/decoders, transceivers and repeaters
surge protection equipment	for power, communications, I/O functions and networks
I/O functions	sufficient to demonstrate the I/O capability and system normal operation
software	software required for proper operation of the proposed system including application programs and sequences of operation

2.13.2 Factory Test Procedure

Test procedures must define the tests required to ensure that the system meets technical, operational, and performance requirements. The test procedures must define location of tests, milestones for the tests, and identify simulation programs, equipment, personnel, facilities, and supplies required. Provide for testing all process control system capabilities and functions specified and shown. Cover actual equipment and sequences to be used for the specified project and include detailed instructions for test setup, execution, and evaluation of test results. The test reports must document results of the tests. Surge testing need not be conducted acceptable documented proof can be provided that such testing has been satisfactorily demonstrated to the Government with identical surge protection applied. The procedures must include the following:

	Test Procedure
equipment	block diagram
hardware and software	descriptions
commands	operator commands

	Test Procedure
I/O functions	test database points with failure modes
passwords	required for each operator access level
each type of digital and analog point in the test	description
test equipment	list
surge protection	circuit diagrams
inputs required (I/O point values and status) and corresponding expected results of each set of input	for each application program
default values	for the application program inputs not implemented or provided for in the contract documents for the application programs to be tested

2.13.3 Factory Test Report

Submit original copies of data produced during the factory test, including results of each demonstration procedure within 7 days after completion of each test. Arrange the report so that commands, responses, and data acquired are correlated to allow logical interpretation of the data.

PART 3 EXECUTION

****

NOTE: Determine the applicability and need for a Factory Test and remove the Factory Test requirements if a Factory Test is not needed.

****

3.1 FACTORY TEST

****

NOTE: Include the reference to section 25 08 10 UTILITY MONITORING AND CONTROL SYSTEM TESTING if appropriate. Otherwise indicate another basis for the Factory Test Procedures.

****

Perform factory testing of the System as specified. The Contractor is responsible for providing personnel, equipment, instrumentation, and supplies necessary to perform required testing. Provide written notification of planned testing to the Government at least 21 days prior to testing, and do not give this notice until after receiving written Government approval of the specific Factory Test Procedures. Provide Factory Test Procedures which define the tests required to ensure that the system meets technical, operational, and performance specifications. Within the Procedures define location of tests, milestones for the tests, and identify simulation programs, equipment, personnel, facilities, and supplies required. Provide procedures which test all capabilities and functions specified and indicated. Perform the Factory Test using equipment and software of the same manufacturer, model and revision as will be used for the specified project. Include detailed instructions for test setup, execution, and evaluation of test results in the Procedures. Upon completion of the test, prepare a Factory Test Report, documenting the results of the Test, and submit it as specified. This report must be approved before any equipment is shipped.

Perform the Factory Test and provide Factory Test Submittals as shown in TABLE II. FACTORY TEST SEQUENCING.

TABLE II FACTORY TEST SEQUENCING

ITEM #	DESCRIPTION	SEQUENCING (START of ACTIVITY or DEADLINE FOR SUBMITTAL)
1	Submit Factory Test Procedure	[[_____] days after notice to Proceed] [_____]
2	Perform Factory Test	After Approval of #1
3	Submit Factory Test Report	[____] days After Completion of #2

3.2 EQUIPMENT INSTALLATION REQUIREMENTS

3.2.1 Installation

Install system components and appurtenances in accordance with the manufacturer's instructions and provide necessary interconnections, services, and adjustments required for a complete and operable system. Adjust or replace devices not conforming to the required accuracies. Replace factory sealed devices, rather than adjusting. Installation, adjustment, and operation of the equipment specified must be supervised by a manufacturer's representative experienced in the installing, adjusting, and testing of the equipment.

a. Install instrumentation and communication equipment and cable grounding as necessary to preclude ground loops, noise, and surges from adversely affecting system operation.

b. Install wiring in exposed areas, including low voltage wiring, in [metallic raceways] [EMT conduit] [rigid conduit] as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Wiring in air plenum areas installed without conduit must be plenum-rated in accordance with NFPA 70.

c. Submit detail drawings containing complete piping, wiring, schematic, flow diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Piping and Instrumentation (P&ID) drawings (prepared using industry recognized device symbols, clearly defined and describing piping designations to define the service and materials of individual pipe segments and instrument tags employing Instrument Society of America suggested identifiers). Include in the Drawings, as appropriate: product specific catalog cuts; a drawing index; a list of symbols; a series of drawings for each process control system using abbreviations, symbols, nomenclature and identifiers as shown; valve schedules; compressed instrument air station schematics and ASME air storage tank certificates for each type and make of compressed instrument air station.

3.2.1.1 Isolation, Penetrations and Clearance from Equipment

Dielectric isolation must be provided where dissimilar metals are used for connection and support. Penetrations through and mounting holes in the building exteriors must be made watertight. Holes in concrete, brick, steel and wood walls must be drilled or core drilled with proper equipment; conduits installed through openings must be sealed with materials which are compatible with existing materials. Openings must be sealed with materials which meet the requirements of NFPA 70 and Section 07 84 00 FIRESTOPPING. Installation must provide clearance for control-system maintenance. Process control system installation must not interfere with the clearance requirements for mechanical and electrical system maintenance.

3.2.1.2 Device Mounting

Devices must be installed in accordance with manufacturers' recommendations and as shown. Control devices to be installed in piping must be provided with required gaskets, flanges, thermal compounds, insulation, piping, fittings, and manual valves for shutoff, equalization, purging, and calibration. Any deviations must be documented and submitted to the Government for approval prior to mounting. Damaged insulation must be replaced or repaired after devices are installed to match existing work. Damaged galvanized surfaces must be repaired by touching up with zinc paint.

3.2.1.3 Pneumatic Tubing

Tubing must be concealed in finished areas. Tubing may be run exposed in unfinished areas, such as mechanical equipment rooms. For tubing to be enclosed in concrete, rigid metal or intermediate metal conduit must be provided. Tubing must be installed parallel or perpendicular to building walls throughout. Maximum spacing between tubing supports must be 1.5 m 5 feet. Each tubing system must be tested pneumatically at 1.5 times the working pressure for 24 hours, with a maximum pressure drop of [0.15] [____] kPa [1.0] [____] psig with compressed air supply turned off. Joint leaks must be corrected by remaking the joint. Caulking of joints will not be permitted. Tubing and two insulated copper phone wires for installation checkout may be run in the same conduit. Tubing and electrical power conductors must not be run in the same conduit; however, control circuit conductors may be run in the same conduit as polyethylene tubing.

3.2.1.4 Grooved Mechanical Joints

Grooves must be prepared according to the coupling manufacturer's instructions. Grooved fittings, couplings, and grooving tools must be the products of the same manufacturer. Pipe and groove dimensions must comply with the tolerances specified by the coupling manufacturer. The diameter of grooves made in the field must be measured using a "go/no-go" gauge, vernier or dial caliper, narrow-land micrometer, or other method specifically approved by the coupling manufacturer for the intended application. Groove width and dimension of groove from end of pipe must be measured and recorded.

3.2.2 Sequences of Operation

Study the operation and sequence of local equipment controls, as a part of the conditions report, and note any deviations from the described sequences of operation on the contract drawings. Perform necessary adjustments to make the equipment operate in an optimum manner and must fully document changes made.

3.3 INSTALLATION OF EQUIPMENT

Install equipment as specified, as shown and as required in the manufacturer's instructions for a complete and fully operational control system.

3.3.1 Control Panels

Control panels must be located as indicated on the drawings. Devices located in the control panels must be as shown on the drawings or as needed to provide the indicated control sequences.

3.3.2 Flow Measuring Device

Fluid flow instruments must be installed in accordance with manufacturer's recommendations, unless otherwise indicated in the specification. The minimum straight unobstructed piping for the flowmeter installation must be 10.0 pipe diameters upstream and 5.0 pipe diameters downstream. Meters for gases and vapors must be installed in vertical piping, and meters for liquids must be installed in horizontal piping, unless otherwise recommended by the manufacturer or indicated in the specifications.

3.3.2.1 Flow Nozzle

Flow nozzles flanges must be installed so that the pressure taps are in a horizontal plane with the centerline of the pipe. Flow nozzles must be installed for ease of accessibility for periodic maintenance. Differential pressure sensors must be installed as close to the flow nozzle as possible.

3.3.2.2 Flow Switch

Flow switches must be installed in such a manner as to minimize disturbance of the flow of fluid while maintaining reliable operation of the switch.

3.3.2.3 Magnetic Flowmeter

****

NOTE: Locating magnetic flowmeters near large electric motors or transformers should be avoided.

****

Meter must be installed in vertical piping so that the flow tube remains full of the process fluid under all operating conditions. A minimum of ten pipe diameters straight run upstream of the flowmeter and five pipe diameters straight run downstream of the flowmeter must be provided. The flowmeter and piping system must be grounded to earth ground.

3.3.2.4 Natural Gas or Propane Flowmeter

Install meters in accordance with ASME B31.8. Permanent gas meters must be installed with provisions for isolation and removal for calibration and maintenance, and must be suitable for operation in conjunction with an energy monitoring and control system.

3.3.2.5 Orifice Plates

Orifice plates must be installed for ease of accessibility for periodic maintenance. Differential pressure sensors must be as close to the orifice plates as possible. Orifice plates for liquid measurement must be located in horizontal pipe runs with the orifice plate flanges installed so that the pressure taps are in the horizontal plane with the centerline of the pipe. For liquid, the differential pressure transmitter must be installed below the orifice taps. For gas measurement, the orifice plate flanges must be installed so that the pressure taps are 45 degrees or more above the horizontal plane with the centerline of the pipe. For gas measurement the required differential pressure transmitter must be physically installed above the orifice taps.

3.3.2.6 Paddle Flowmeter

Meter must be installed using manufacturer's published procedures. Installers must be trained for such installations in the pipes encountered. Provide certificates demonstrating installer's qualifications.

3.3.2.7 Annular Pitot Tubes

Annular pitot tubes must be installed so that the total head pressure ports are set-in-line with the pipe axis upstream and the static port facing downstream. The total head pressure ports must extend diametrically across the entire pipe. Annular pitot tubes must not be used where the flow is pulsating or where pipe vibration is allowed.

3.3.2.8 Positive Displacement Flow Meters

Flow meters must be installed horizontally, and aligned correctly in the direction of flow.

3.3.2.9 Turbine Meters

Turbine meters must be installed so that the sensor is located in the center of the fluid flow pipe on the main axis. Turbine meters must be installed without interruption to service. Install a welded flanged riser of appropriate pipe line rating, with a full opening valve bolted to it. Sensor must be located in accordance with the manufacturer's instructions for the specified flow rates and installation conditions. Reduced diameter pipe sections must be provided as necessary to achieve required flow velocities. Meters must be installed using the hot-tap method with tools recommended by the manufacturer. The minimum straight unobstructed piping for the flow meter installation must be 10 pipe diameters upstream and 5 pipe diameters downstream. The meter must be installed in a horizontal section unless manufacturer specifically allows otherwise.

3.3.2.10 Ultrasonic Flowmeter

Meter must be installed using manufacturer's published procedures for installation. Installers must be trained for such installations in the pipes encountered. Provide certificates demonstrating installer's qualifications.

3.3.2.11 Variable Area Flowmeter

Meters must be installed in a vertical piping section with full flow through the meter.

3.3.2.12 Venturi Flowmeter

The flowmeter must be installed with its top above the pipeline in horizontal pipe run installations. The direction of flow must be upward in vertical pipe run installations. The flowmeter must be aligned to the direction of the flow and must be rigidly mounted and vibration free. The minimum straight unobstructed piping for the flow meter installation must be 10 pipe diameters upstream and 5 pipe diameters downstream.

3.3.2.13 Vortex Shedding Flowmeters

The flowmeter must be installed with its top above the pipeline in horizontal pipe run installations. The direction of flow must be upward in vertical pipe run installations. The flowmeter must be aligned to the direction of the flow and must be rigidly mounted and vibration free. The minimum straight unobstructed piping for the flow meter installation must be 10 pipe diameters upstream and 5 pipe diameters downstream.

3.3.3 Level Instruments

3.3.3.1 Liquid Level Sensor (Bubble Type)

The air pressure regulating valve, air filter, moisture trap, air flow adjustment valve, level gauge, air isolation valve and pressure transducer must be mounted on a panel where indicated on the drawings. The level gauge must be labeled to identify the tank being measured. The isolation valve must be located in the air supply line upstream of the moisture trap, air filter and pressure regulator. The air inlet line to the dip tube and the dip tube must be mounted to a flange at the top of the tank. The dip tube must extend to the bottom of the tank, leaving the manufacturer's recommended clearance between the dip tube and tank bottom. The dip tube material must be compatible with the tank contents. The pressure regulating valve must be adjusted to the outlet pressure recommended by the manufacturer. Where exposed, the air supply line to the tank and from the tank to the level gauge and pressure transducer must be protected from damage.

3.3.3.2 Capacitance Liquid Level Sensors

The sensing probes must be located close to, and parallel with, the tank or sump wall.

3.3.3.3 Conductivity Level Switch

Level switches must be installed vertically and in accordance with the manufacturer's instructions. Switches must be accessible for maintenance and calibration. In applications where switches cannot be directly mounted to a tank by the threaded or flanged connection, a mounting bracket must be provided for connection to the inside tank wall, maintaining the minimum recommended distance from the tank fill opening.

3.3.3.4 Displacement Type Liquid Level Switch

Level switches must be installed in accordance with the manufacturer's instructions. Switches must be accessible for maintenance and calibration. In applications where switches cannot be directly mounted to a tank by the threaded or flanged connection, a mounting bracket must be provided for connection to the inside tank wall.

3.3.3.5 Mercury Float Switches

Switches must be mounted in accordance with manufacturer's published instructions. Procedures must be those used for equipment in hazardous locations.

3.3.3.6 Ultrasonic Level Sensor

Sensor must be installed vertically in the top of the tank and in accordance with the manufacturer's instructions. Switches must be accessible for maintenance and calibration. In applications where switches cannot be directly mounted to a tank by the threaded or flanged connection, a mounting bracket must be provided for connection to the inside tank wall. Sensor must be positioned to maximize the return echo signal and minimize vessel obstructions in the sensors line of sight. The minimum recommended distance from the tank fill opening and from the side of the tank must be maintained.

3.3.4 Pressure Instruments

****

NOTE: Do not use differential pressure switches on liquid pumps. Gage pressure switches are better suited for liquid application. Indicate by appropriate icon on the drawings where the switches are to be located and which type is to be used.

****

Pressure sensors and pressure transducers must be verified by calibration. All pressure taps must incorporate appropriate snubbers. Pressure sensors and pressure switches must have valves for isolation, venting, and taps for calibration. Pressure switches and pressure transducers installed on liquid or steam lines must have drains. Pressure transducers, differential pressure sensors and differential pressure switches must have nulling valves. Pressure switches must be adjusted to the proper setpoint and must be verified by calibration. Switch contact ratings and duty must be selected for the application.

3.3.5 Temperature Instrument Installation

3.3.5.1 RTD

[When the RTD is installed in pipe or is susceptible to corrosion or vibration, the] [Each] RTD must be installed in a thermowell. Thermowells must be filled with conductive heat transfer fluid prior to installation of the RTD in the thermowell. RTDs used for space temperature sensing must include a housing suitable for wall mounting. RTDs used for outside air sensing must have an instrument shelter or sun shield as shown to minimize solar effects, and must be mounted to minimize building effects. RTD assemblies must be readily accessible and installed to allow easy replacement.

3.3.5.2 Temperature Switches

Temperature switches must be installed as specified for RTDs. Temperature switches must be adjusted to the proper setpoint and must be verified by calibration. Switch contact ratings and duty must be selected for the application.

3.3.5.3 Thermometers and Temperature Sensing Elements

Thermometers and temperature sensing elements installed in liquid systems must be installed in thermowells.

3.3.5.4 Thermocouples

Each thermocouple must be installed in a protective tube or in a thermowell. Thermocouples must be insulated from ambient temperature effects. Thermocouple wires must not be installed in the same conduits as power wiring. Thermocouples must not be used for measuring temperatures below 260 degrees C 500 degrees F. Type E thermocouples may be used when the atmosphere is chemically reducing environment. Type K thermocouples may be used when the atmosphere is a chemically oxidizing environment.

3.3.6 Process Analytical Instrumentation

3.3.6.1 Ammonia Monitor

The controller must be located as shown on the drawings. The ammonia sensor must be mounted as recommended by the manufacturer. The location of the sensor must be representative of the area to be monitored and must allow access to the sensor for periodic calibration. The sensor must be located in a dry area or must be protected from moisture without restricting the flow of ammonia gas to the sensor.

3.3.6.2 Carbon Dioxide Measurement

The controller must be located in the control panel or other location as shown on the drawings. Where a sample tube is used, the size and maximum length of sample tubing must be as recommended by the manufacturer. Sample tubing must be not crimped or kinked.

3.3.6.3 Carbon Monoxide Measurement

Carbon monoxide controller and sensor must be located as shown on the drawings or as recommended by the manufacturer. The location must be representative of the area to be monitored. Installation must be in accordance with the manufacturer's instructions.

3.3.6.4 Chlorine in Air

The controller must be located in the control panel or other location as shown on the drawings. Where a sample tube is used, the size and maximum length must be a recommended by the manufacturer. The sample tube must not be crimped or kinked. The location of the [controller] [sample tube inlet] must be near the bottom of the area to be monitored.

3.3.6.5 Chlorine in Water

The controller must be located in the control panel or other location as shown on the drawings. The chlorine sensor must be immersed in the fluid being monitored using an assembly that will allow removal of the sensor from the water. The sensors must be located in an area of continuous flow.

3.3.6.6 Combustible Gas Sensor

The sensor and transmitter must be located as shown or the drawings or as recommended by the manufacturer. The location of the sensor must be representative of the area to be monitored and must allow access to the sensor for periodic replacement.

3.3.6.7 Hydrogen Sulfide

The controller must be located as shown on the drawings or as recommended by the manufacturer. Where a sample tube is used, the tube size and maximum length must be a recommended by the manufacturer. The sample tube must not be crimped or kinked. The location of the [controller] [sample tube inlet] must be representative of the area to be monitored.

3.3.6.8 NOx Monitor

The controller must be mounted in the control panel or as otherwise shown. Sensor must be located in the flue as shown and in accordance with the manufacturer's recommendation. Installation must prevent all leakage of flue gases at the sensor.

3.3.6.9 Oxygen and Ozone in Air Monitor

The controller must be mounted in the control panel or as otherwise shown on the drawings. The oxygen sensor must be located in accordance with the manufacturer's recommendations and as shown on the drawings. High and low alarm settings must be set as required by the sequence of control. Settings must be verified through the use of a manufacturer's standard calibration kit.

3.3.6.10 Dissolved Oxygen

The dissolved oxygen sensor must be immersed in the fluid to be monitored using manufacturer's mounting assembly. The sensor must be located in an area of continuous fluid flow. [The transmitter must be located remote from the sensor.] The transmitter and wiring connections must be in a weathertight enclosure. [The transmitter must be mounted to allow the digital readout to be easily viewed.]

3.3.6.11 PH and ORP Sensor

Pipe mounted flow sensor must be located in a threaded tee or fitting to allow removal from the pipe. Submersible sensor must be completely immersed in the fluid being monitored using an ensemble that will allow for removal of the sensor from the fluid for replacement. The sensor must be located in an area of continuous flow. The transmitter must be located [at the sensor] [remote from the sensor]. [The transmitter must be mounted to allow the digital readout to be easily viewed].

3.3.6.12 Total Dissolved Solids

The sensor must be [pipe] [tank] [submersible] type as indicated on the drawings. [Pipe mounted sensor must be mounted in a threaded tee or fitting to allow removal of the sensor.] [Tank mounted sensor must be mounted in a threaded fitting to allow removal of the sensor.] [Submersible sensor must be mounted in an assembly that will allow removal of the sensor from the fluid for replacement.] The transmitter must be located [at the sensor] [remote from the sensor]. The transmitter and wiring connections must be located in a weathertight enclosure.

3.3.7 Instrument Shelters

Instrument shelters must be installed in the location shown with the bottom 1.2 meter 4.0 feet above the supporting surface using legs and secured rigidly to minimize vibrations from winds. Instrument shelters must be oriented with door facing North. Instruments located in shelters must be mounted in the 3-dimensional center of the open space of the shelter.

3.3.8 Electric Power Devices

3.3.8.1 Potential and Current Transformers

Install potential and current transformers in enclosures unless otherwise shown. Current transformer leads must be shorted when they are not connected to the measurement circuits.

3.3.8.2 Hour Meters

Meters must be located in the control panel or as otherwise shown. Power to the meter must be connected to the motor starter auxiliary contacts for pumps, blowers and other motor driven devices. For devices without motor starters, the meter must be connected in parallel with the load. Where the meter voltage differs from the metered devices voltage, transformer must be provided as necessary.

3.3.8.3 Watt-hour Meters

Install watt-hour meters and transducers in enclosures unless otherwise shown.

3.3.8.4 Transducers

Transducers must be wired in accordance with the manufacturer's instructions, and installed in enclosures.

3.3.8.5 Current Sensing Relays and Current Transducers for Motors

When used to sense meter/fan/pump status, current sensing relays must be used for applications under 4 kW 5 hp. Applications over 4 kW 5 hp must use a current transducer.

3.3.9 Output Devices

Output devices (transducers, relays, contactors, or other devices) which are not an integral part of the control panel, must be mounted in an enclosure mounted adjacent to the control panel, unless otherwise shown. Where H-O-A and/or override switches on the drawings or required by the control sequence, the switches must be installed so that the process control system controls the function through the automatic position and other controls work through the hand position.

3.3.10 Enclosures

All enclosure penetrations must be from the bottom of the enclosure, and must be sealed to preclude entry of water using a silicone rubber sealant.

3.3.11 Transformers

Transformers for control voltages below 120 VAC must be fed from the nearest power panel or motor control center, using circuits provided for the purpose. Provide a disconnect switch on the primary side and a fuse on the secondary side. Transformers must be enclosed in a steel cabinet with conduit connections.

3.4 WIRE, CABLE AND CONNECTING HARDWARE

3.4.1 LAN Cables and Connecting Hardware

LAN cables and connecting hardware must be installed in accordance with Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM and Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP).

3.4.2 Metering and Sensor Wiring

Metering and sensor wiring must be installed in accordance with the requirements of ANSI C12.1, NFPA 70, Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.4.2.1 Power Line Surge Protection

Control panels must be protected from power line surges. Protection must meet the requirements of IEEE C62.41.1 and IEEE C62.41.2. Fuses must not be used for surge protection.

3.4.2.2 Sensor and Control Wiring Surge Protection

Digital and analog inputs must be protected against surges induced on control and sensor wiring. Protect binary and analog outputs against surges induced on control and sensor wiring installed outdoors and as shown. Fuses must not be used for surge protection. Test the inputs and outputs in both the normal and common mode using the following two waveforms: The first waveform must be 10 microseconds by 1000 microseconds with a peak voltage of 1500 volts and a peak current of 60 amperes. The second waveform must be 8 microseconds by 20 microseconds with a peak voltage of 1000 volts and a peak current of 500 amperes. Submit certified test results for surge protection.

3.5 SOFTWARE INSTALLATION

Load software required for an operational process control system, including databases (for points specified and shown), operational parameters, and system, command, and application programs. Adjust, tune, debug, and commission all software and parameters for controlled systems to assure proper operation in accordance with the sequences of operation and database tables.

3.6 CONTROL DRAWINGS

3.6.1 Control

Control drawings, [framed, non-fading half-size in laminated plastic] [reproducible, with corresponding CADD files] [____], must be provided for equipment furnished and for interfaces to equipment at each respective equipment location. Condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system manually must be prepared in typed form, [framed as specified for the instrumentation and control diagrams] [reproducible, with corresponding word processor files] [____] and posted beside the diagrams. Diagrams and instructions must be submitted prior to posting. The framed instructions must be posted before acceptance testing of the system.

3.6.2 Contractor Design Drawings

Contractor Design Drawings as a single complete package: [_____] hard copies and [_____] copies in electronic form. As a minimum they must include wiring, logic, and layout. Submit hardcopy drawings on [ISO A1 841 by 594 mm 34 by 22 inches][or][A3 420 by 297 mm 17 by 11 inches] sheets, and electronic drawings in PDF and in [AutoCAD][Microstation][Bentley BIM V8][Autodesk Revit 2013] format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule. Contractor Design Drawings must be approved prior to any fabrication.

3.6.2.1 Draft As-Built

Draft As-Built Drawings as a single complete package: [_____] hard copies and [_____] copies in electronic form. Submit hardcopy drawings on [ISO A1 841 by 594 mm 34 by 22 inches][or][A3 420 by 297 mm 17 by 11 inches] sheets, and electronic drawings in PDF and in [AutoCAD][Microstation][Bentley BIM V8][Autodesk Revit 2013] format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule.

3.6.2.2 Final As-Built

Final As-Built Drawings as a single complete package: [_____] hard copies and [_____] copies in electronic form. Submit hardcopy drawings on [ISO A1 841 by 594 mm 34 by 22 inches][or][A3 420 by 297 mm 17 by 11 inches] sheets, and electronic drawings in PDF and in [AutoCAD][Microstation][Bentley BIM V8][Autodesk Revit 2013] format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule.

3.6.3 Points Schedule

****

NOTE: Template Points Schedules in electronic format for use with this section are available in online at: http://www.wbdg.org/ccb/NAVGRAPH/graphtoc.pdf

****

Provide a Points Schedule in tabular form for each system, with the indicated columns and with each row representing a hardware point, network point or configuration point in the system.

a. When a Points Schedule was included in the Contract Drawing package, use the same fields as the Contract Drawing with updated information in addition to the indicated fields.

b. When Point Schedules are included in the contract package, items requiring contractor verification or input have been shown in angle brackets ("<" and ">"), such as <___> for a required entry or <value> for a value requiring confirmation. Complete all items in brackets as well as any blank cells. Do not modify values which are not in brackets without approval. Points Schedule Columns must include:

3.6.3.1 Point Name

The abbreviated name for the point using the indicated naming convention.

3.6.3.2 Description

A brief functional description of the point such as "Supply Air Temperature".

3.6.3.3 DDC Hardware Identifier

The Unique DDC Hardware Identifier shown on the DDC Hardware Schedule and used across all drawings for the DDC Hardware containing the point.

3.6.3.4 Settings

The value and units of any setpoints, configured setpoints, configuration parameters, and settings related to each point.

3.6.3.5 Range

The range of values, including units, associated with the point, including but not limited to setpoint adjustment range, a sensor measurement range, or the status of a safety.

3.6.3.6 Input or Output (I/O) Type

The type of input or output signal associated with the point. Use the following abbreviations for entires in this column:

a. AI: The value comes from a hardware (physical) Analog Input

b. AO: The value is output as a hardware (physical) Analog Output

c. BI: The value comes from a hardware (physical) Binary Input

d. BO: The value is output as a hardware (physical) Binary Output

e. PULSE: The value comes from a hardware (physical) Pulse Accumulator Input

f. NET-IN: The value is provided from the network (generally from another
device). Use this entry only when the value is received from another device as part of scheduling or as part of a sequence of operation, not when the value is received on the network for supervisory functions such as trending, alarming, override or display at a user interface.

g. NET-OUT: The value is provided to another controller over the network.

Use this entry only when the value is transmitted to another device as part of scheduling or as part of a sequence of operation, not when the value is transmitted on the network for supervisory functions such as trending, alarming, override or display at a user interface.

3.6.3.7 Network Data Exchange Information

(Gets Data From, Sends Data To) Provide the DDC Hardware Identifier of other DDC Hardware the point is shared with.

3.6.3.8 Override Information

For each point requiring an Override, indicate if the Object for the point is Commandable.

3.6.3.9 Trend Object Information

For each point requiring a trend, indicate if the trend is Local or Remote. For remote trends provide the DDC Hardware Identifier for the device performing the trend.

3.6.3.10 Alarm Information

Indicate the Alarm Generation Type.

3.7 FIELD TESTING AND ADJUSTING EQUIPMENT

Provide personnel, equipment, instrumentation, and supplies necessary to perform site testing. The Government will witness the PVT, and written permission must be obtained from the Government before proceeding with the testing. Original copies of data produced, including results of each test procedure, during PVT must be turned over to the Government at the conclusion of each phase of testing prior to Government approval of the test. The test procedures must cover actual equipment and functions specified for the project.

3.7.1 Testing, Adjusting and Commissioning

****

NOTE: Delete reference to a factory test if no factory test is to be required.

****

After successful completion of the factory test as specified, the Contractor will be authorized to proceed with the installation of the system equipment, hardware, and software. Once the installation has been completed, tested, adjusted, and commissioned each control loop and system in accordance with NIST SP 250 and must verify proper operation of each item in the sequences of operation, including hardware and software. Calibrate field equipment, including control devices, adjust control parameters and logic (virtual) points including control loop setpoints, gain constants, constraints, and verify data communications before the system is placed online. Test installed ground rods as specified in IEEE 142 and submit certification stating that the test was performed in accordance with IEEE 142. Calibrate each instrumentation device connected to the process control system control network by making a comparison between the reading at the device and the display at the workstation, using a standard at least twice as accurate as the device to be calibrated. Check each control point within the process control system control network by making a comparison between the control command at the central station and field-controlled device. Deliver trend logs/graphs of all points showing to the Government that stable control has been achieved. Points on common systems must be trended simultaneously. One log must be provided showing concurrent samples taken once a minute for a total of [4] [___] hours. One log must be provided showing concurrent samples taken once every 30 minutes, for a total of [24] [___] hours. Verify operation of systems in the specified failure modes upon Process control system network failure or loss of power, and verify that systems return to process control system control automatically upon a resumption of process control system network operation or return of power. Deliver a report describing results of functional tests, diagnostics, calibrations and commissioning procedures including written certification to the Government that the installed complete system has been calibrated, tested, adjusted and commissioned and is ready to begin the PVT. The report must also include a copy of the approved PVT procedure.

3.7.2 Performance Verification Test (PVT)

Submit test procedures for the PVT. The test procedure must describe all tests to be performed and other pertinent information such as specialized test equipment required and the length of the PVT. The test procedures must explain, in detail, step-by-step actions and the expected results, to demonstrate compliance with all the requirements of the drawings and this specification. The test procedure must be site specific and based on the inputs and outputs, required calculated points and the sequence of control. Refer to the actions and expected results to demonstrate that the process control system performs in accordance with the sequence of control. Include a list of the equipment to be used during the testing plus manufacturer's name, model number, equipment function, the date of the latest calibration and the results of the latest calibration.

Demonstrate that the completed Process control system complies with the contract requirements. All physical and functional requirements of the project including communication requirements must be demonstrated and shown. Demonstrate that each system operates as required in the sequence of operation. The PVT as specified must not be started until after receipt of written permission by the Government, based on the written report including certification of successful completion of testing, adjusting and commissioning as specified, and upon successful completion of training as specified. Upon successful completion of the PVT, furnish test reports and other documentation.

3.7.3 Endurance Test

Use the endurance test to demonstrate the overall system reliability of the completed system. The endurance test must be conducted in phases. The endurance test must not be started until the Government notifies the Contractor in writing that the PVT is satisfactorily completed, training as specified has been completed, outstanding deficiencies have been satisfactorily corrected, and that the Contractor has permission to start the endurance test. Provide an operator to man the system [8 hours per day during daytime operations, including weekends and holidays,] [during Phase I endurance testing, in addition to any Government personnel that may be made available.] The Government may terminate testing at any time when the system fails to perform as specified. Upon termination of testing by the Government or by the Contractor, commence an assessment period as described for Phase II. Upon successful completion of the endurance test, deliver test reports and other documentation, as specified, to the

Government prior to acceptance of the system.

3.7.3.1 Phase I (Testing)

****

NOTE: The designer will determine the required Phase I testing period. The testing period should be based on the system size and complexity.

****

The test must be conducted 24 hours per day, 7 days per week, for [_____] consecutive calendar days, including holidays, and the system must operate as specified. Make no repairs during this phase of testing unless authorized by the Government in writing.

3.7.3.2 Phase II (Assessment)

After the conclusion of Phase I, identify failures, determine causes of failures, repair failures, and deliver a written report to the Government. The report must explain in detail the nature of each failure, corrective action taken, results of tests performed, and must recommend the point at which testing should be resumed. After delivering the written report, convene a test review meeting at the job site to present the results and recommendations to the Government. The meeting must not be scheduled earlier than 5 business days after receipt of the report by the Government. As a part of this test review meeting, demonstrate that failures have been corrected by performing appropriate portions of the performance verification test. [The Government reserves the right to cancel the test review meeting if no failures or deficiencies occur during the Phase I testing. If the Government chooses to do so, the Contractor will be notified in writing.] Based on the Contractor's report and the test review meeting, the Government will determine if retesting is necessary and the restart point. The Government reserves the right to require that the Phase I test be totally or partially rerun. Do not commence any required retesting until after receipt of written notification by the Government. After the conclusion of any retesting which the Government may require, the Phase II assessment must be repeated as if Phase I had just been completed.

3.7.3.3 Exclusions

The Contractor will not be held responsible for failures resulting from the following: Outage of the main power supply in excess of the capability of any backup power source, provided that the automatic initiation of all backup sources was accomplished and that automatic shutdown and restart of the process control system performed as specified. Failure of a Government furnished communications link, provided that the PLC automatically and correctly operates in the stand-alone mode as specified, and that the failure was not due to Contractor furnished equipment, installation, or software. Failure of existing Government owned equipment, provided that the failure was not due to Contractor furnished equipment, installation, or software.

3.8 FIELD TRAINING

****

NOTE: The number of hours required to instruct a Government representative in operation and maintenance of the system will depend on the complexity of the system specified. Designer is to

establish the number of hours of each type (preliminary, additional maintenance, specialized, flow meter, and specialized sensor) of training based on equipment manufacturer recommendations, system complexity and consultation with the installation..

****

Field training oriented to the specific system must be provided for designated personnel. Furnish a copy of the training manual for each trainee plus [two] [_____] additional copies. Manuals must include an agenda, the defined objectives for each lesson, and a detailed description of the subject matter for each lesson. Furnish audiovisual equipment and other training supplies and materials. Copies of the audiovisuals must be delivered with the printed training manuals. The Government reserves the right to videotape training sessions for later use. A training day is defined as 8 hours of classroom instruction, excluding lunchtime, Monday through Friday, during the daytime shift in effect at the training facility. Submit the training manual and schedule to receive approval from the Government at least 30 days before the training.

3.8.1 Preliminary Operator Training

Prior to the start of field testing, preliminary operator training must be taught at the project site for [___] consecutive training [days] [hours]. Upon completion of this course, each student, using appropriate documentation, should be able to perform elementary operations with guidance and describe the general hardware architecture and functionality of the system. This course must include: general system architecture; functional operation of the system, including workstations; operator commands; application programs, control sequences, and control loops; database entry and modification; reports generation; alarm reporting; diagnostics; and historical files.

3.8.2 Additional Operator Training

Following the field testing, additional classroom training for operators must be taught for [___] consecutive training days; individual instruction sessions of [4] [___] -hour periods in the morning (or afternoon) of the same weekday for [___] consecutive weeks and an additional [___] day classroom session for answering operator questions. Individual instruction must consist of "hands-on" training under the constant monitoring of the instructor. Classroom training must include instruction on the specific hardware configuration of the installed process control system and specific instructions for operating the installed system. Schedule activities during this period so that the specified amount of time on the equipment will be available for each student. The final session will address specific topics that the students need to discuss and to answer questions concerning the operation of the system. Upon completion of the course, the students should be fully proficient in system operation and have no unanswered questions regarding operation of the installed process control system. Each student should be able to start the system, operate the system, recover the system after a failure and describe the specific hardware architecture and operation of the system and be fully proficient in all system operations. Report the skill level of each student at the end of this course.

3.8.3 Maintenance Training

****
NOTE: Edit training requirements to the systems.
****

Following the [endurance test] [_____] a minimum period of [one] [_____] training [days][hours] must be provided by a factory representative or a qualified Contractor trainer for [five] [_____] designated personnel on maintenance of the equipment. The training must include: physical layout of each piece of hardware, calibration procedures, preventive maintenance procedures, schedules, troubleshooting, diagnostic procedures and repair instructions.

3.8.4 Specialized Training

****
NOTE: Coordinate with specifications for the unit processes, adding or deleting parts.
****

Following the maintenance training, a minimum period of [five] [_____], total training day(s) mustbe provided by a factory representative or a qualified Contractor trainer for [ten] [_____] people on the input devices.

3.8.4.1 Flow Meter Training

Each type of flow meter, to include calibration, maintenance and testing of flow elements and transducers.

3.8.4.2 Specialized Sensor Training

Provide training on each type of specialized sensor such as [chlorine,] [turbidity,] [pH,] [NOx,] [_____] to include calibration, maintenance and testing of sensing elements and transducers for [five] people.

3.9 OPERATION AND MAINTENANCE DATA REQUIREMENTS

Outline the step-by-step procedures required for system startup, operation and shutdown. Include in the instructions layout, wiring and control diagrams of the system as installed, the manufacturer's name, model number, service manual, parts list and a brief description of all equipment and their basic operating features. List routine maintenance procedures, possible breakdowns and repairs and troubleshooting guides.

SECTION 41 22 13.14

BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING

11/19, CHG 1: 02/21

****

NOTE: This guide specification covers the requirements for top running overhead electric traveling (OET) cranes with top running bridges and trolleys, Crane Manufacturers Association of America (CMAA) 70 service class A, B, C, D, E, and F and with capacities less than 27 metric ton 30 ton 27,000 kg 60,000 pounds, suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments.

This guide specification incorporates the design criteria and requirements identified in NAVCRANECEN INSTRUCTION 11450.2A (December 2018).

This guide specification includes tailoring options for NAVFAC, pounds (per NAVFAC P-307), and tons. The NAVFAC tailoring option also includes requirements specific to the Navy and Marine Corps. Crane procurements for the Navy and Marine Corps must select the NAVFAC tailoring option.

Crane tailoring options are included for the Air Force, outdoor, ordnance/explosives handling, or hazardous (explosive) environments. Only one unique specialized application tailoring option should be selected at a time, however multiple can be used with additional specific project editing in the resulting sections. "General Purpose Service" is the default crane condition and that tailoring option should be selected if the crane is not to be used in any specialized applications. When "Maximum Anti-Spark" protection is required, the "Minimum Anti-Spark" tailoring option MUST ALSO be selected as the maximum requirements are in addition to the minimum requirements.

Selection or deselection of a tailoring option (select view-tailoring options) will include or

exclude that option in the section. Specific project editing is still required for the resulting section.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

****

Use this guide specification to specify cranes that are procured as part of a building construction contract for such applications as machine shops, warehouses, and other areas, including those that do require specialized weight handling equipment.

Explanations of CMAA service classifications A through E are covered in the notes portion of the "Classification" sub-section of "OET Design Criteria". The minimum allowable classification for Ordnance/Explosive Handling is CMAA service class D. Navy Crane Center minimum requirement is CMAA service class C.

Forward all procurement of OET systems at Naval Shore based activities with rated capacities of 9000 kg 20,000 pounds or greater or for use in specialized applications (e.g. ordnance handling, molten metal handling, special purpose service as defined in NAVSEA Publication 0989-030-7000, hazardous/explosive area environments, or precision handling operations requiring complex or synchronized lifting capacity) to: Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000. (See NAVCRANECEN INSTRUCTION 11450.1C of 11 JULY 2019).

****

****

NOTE: This specification covers cranes with top-running bridge and trolley, multiple-girder, with CMAA 70 service class of A through E.

Control types and systems may be specified as follows:

1. Remote, Cab, or Pendant Crane Controls or a combination of the three can be provided.

2. Alternating current (AC) control systems must be specified. The vast majority of new cranes are AC powered and AC controlled.

Terminology: - refer to DEFINITIONS in this specification.

a. Top-running bridge is a bridge which travels on the top surface of rails of a fixed runway structure.

b. Top-running Trolley is a trolley which travels on the top surfaces of rails of the bridge girder(s).

c. Ordnance/Explosives Handling – Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Minimum requirement of CMAA service class D.

d. Hazardous (Explosive) Environments – Cranes operating in hazardous environments as defined by the cognizant activity safety office shall be equipped with electrical safety features that meet NEC Article 500. The activity safety office must identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

d.1. Minimum Anti-Spark Protection applies when only the load block enters the hazardous area.

d.2. Maximum Anti-Spark Protection applies when the hazardous area envelops the entire crane.

****

****

NOTE: The RFP must provide the relevant dimensions and load data for the crane. See "Crane Inquiry Data Sheet" in CMAA 70 section 6.1 or see "Crane Information Form for Over Head Electric Traveling Cranes(s)" pages 6 and 7 at the following Navy Crane Center link:

https://www.navfac.navy.mil/navfac_worldwide/specialty_centers/ncc/about_us/resources/downloads.html

****

****

NOTE: Show the following information on the project drawings:

1. Complete details of plan, elevations and sections of crane, including building clearances.

2. Maximum span of runway girder.

3. Runway rail size.

4. Runway girder size.

5. Channel cap size.

6. Size and location of crane stops.

7. Electrical junction box location (including mounting height).

****

PART 1 GENERAL

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

a. Bridge Crane: That part of an overhead crane system consisting of girder(s), end trucks, end ties, walkway, and drive mechanism which carries the trolley(s) and travels along the runway rails parallel to the runway.

b. Crane Runway: The track system along which the crane operates horizontally, including track hangar rods, track connection devices, and runway structural supports.

c. Dead Loads: The loads on a structure which remain in a fixed position relative to the structure.

d. Girder: The principal horizontal beam of the crane bridge. It is supported by the crane end trucks.

e. Lifted Load: The load consisting of the rated load and the weight of lifting devices attached to the crane such as the load block, bucket, or other supplemental devices.

f. Pendant: A control for a hoist and a crane. The pendant hangs from the hoist or the crane by a cable at a height that is easy for the operator to reach.

g. Rated Load: The maximum working load suspended under the load hook.

h. Standard Commercial Cataloged Product: A product which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing" on the manufacturer's published product data sheets. These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

i. Top Running Crane: An electric overhead traveling crane that runs on rails on top of support girders.

j. Trolley Load: Weight of the trolley and its associated equipment carried by the trolley wheels.

k. Operating Environments:

    (1) General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as General Purpose Service if they are operating in routine environments.

    (2) Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Minimum requirement of CMAA service class D.

    (3) Hazardous (Explosive) Environments: Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NEC Article 500. The activity safety office will identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Choose materials for mechanical components to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

        (a) Minimum Anti-Spark Protection is used when only the load block enters the explosive area.

        (b) Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane.

1.3 SYSTEM DESCRIPTION

****

NOTE: Remove the following sentence if the runway rail is not to be installed as a part of the crane procurement. If rail is to be installed, ensure Section 05 12 00 STRUCTURAL STEEL is included in the Request for Proposal (RFP).

****

[The requirements for the crane runway system and rail supporting structures are specified in Section 05 12 00 STRUCTURAL STEEL, and must conform to AISC 360.

]1.3.1 Crane Design Criteria

****

NOTE: Clearly show the area of hook coverage, runway dimensions, rail size, hook vertical travel, clear hook height, and lifting capacity on drawings.

****

Cranes will operate in the given spaces and match the runway dimensions and rails indicated. Hook coverage, hook vertical travel, clear hook height, lifting capacity, and load test weight must not be less than that indicated.

1.3.1.1 General

****

NOTE: Add number of cranes, building name, and crane rated load capacity in kilograms pounds.

****

Include the following: Number of cranes [_____], located in building identified as [_____], with the capacity expressed in [_____] metric tons tons kilograms pounds, for each overhead electric traveling (OET) crane. Also clearly locate and identify each multiple girder hoist and system components.

1.3.1.2 Classification

****

NOTE: For NAVFAC, specify CMAA service class C or higher. For Ordnance/Explosives Handling specify CMAA service class D or higher.

****

****

NOTE: Refer to NFPA 70 for environmental requirements. Make a selection from the following CMAA 70 service classifications:

Class A (Standby or Infrequent Service): This service covers cranes which may be used in installations such as powerhouses, public utilities, turbine rooms, motor rooms and transformer stations where precise handling of equipment at slow speeds with long, idle periods between lifts are required. Capacity loads may be handled for initial installation of equipment and for infrequent maintenance.

Class B (Light Service): This service covers cranes which may be used in repair shops, light assembly operations, service buildings, and light warehousing where service requirements are light and the speed is slow. Loads may vary from no load to occasional

full rated loads with 2 to 5 lifts per hour, averaging 3 m 10 feet per lift.

Class C (Moderate Service): This service covers cranes which may be used in machine shops of paper mill machine rooms, where service requirements are moderate. In this type of service, the crane will handle loads which average 50 percent of the rated capacity with 5 to 10 lifts per hour, averaging 4.5 m 15 feet, not over 50 percent of the lift at rated capacity.

Class D (Heavy-Duty): This service covers cranes which may be used in heavy machine shop, foundries, fabricating plants, steel warehouses, container yards, lumber mills, and standard duty bucket and magnet operations where heavy-duty production is required. In this type of service, loads approaching 50 percent of the rated capacity will be handled constantly during the working period. High speeds are desirable for this type of service with 10 to 20 lifts per hour averaging 4.5 m 15 feet, not over 65 percent of the lifts at rated capacity. This service is the minimum requirement for Ordnance/Explosive Handling.

Class E (Severe Service): This type of service requires a crane capable of handling loads approaching rated capacity throughout its life. Applications may include magnet, bucket, magnet/bucket combination cranes for scrap yards, cement mills, lumber mills, fertilizer plants, and container handling with 20 or more lifts per hour at or near the rated capacity.

Class F (Continuous Severe Service): This type of service requires a crane capable of handling loads approaching rated capacity continuously under severe service conditions throughout its life. Applications may include custom designed specialty cranes essential to performing the critical work tasks affecting the total production facility. These cranes must provide the highest reliability with special attention to ease of maintenance features.

****

****

NOTE: Operating Environments

General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as General Purpose Service if they are operating in routine environments. Cranes operating in non-routine environments or unique, dedicated service should meet the requirements of one of the below Specialized Applications:

Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Minimum requirement of CMAA service class D.

Hazardous (Explosive) Environments: Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NEC Article 500. The activity safety office must identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

a. Minimum Anti-Spark Protection is used when only the load block enters the explosive area.

b. Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane.

****

Provide top running overhead electric traveling (OET) multiple girder crane[s] conforming to CMAA 70 service class [A] [B] [C] [D] [E] [F] for operation in an [indoor] [outdoor] environment, [general purpose] [ordnance handling] [hazardous area] service, meeting the requirements of ASME B30.2, with an ambient temperature range of [_____] to [_____] degrees Celsius Fahrenheit. This crane must operate in an NEC Class [_____], Division [_____], Group [_____] hazardous area. Hazardous protection is required for the [full height of the crane][18 inches above ground level][_____]. The crane span must be [_____] meters feet with a vertical lift of [_____] meters feet and as specified herein.

The crane must be [pendant controlled] [radio controlled] [cab controlled] and operate in the spaces and within the loading conditions indicated.[The pendant controller must be mounted on a separate festooned cable system from the trolley power supply.] The crane must operate on [_____]-volts AC, [60] [50] [_____] Hz, [single] [three] phase power source. Maximum crane wheel loads (without impact) due to dead, trolley, and lifted loads, with the trolley in any position, must not cause a more severe loading condition in the runway support structure than that produced by the design wheel loads and spacing indicated.

1.3.1.3 Rated Capacity and Speeds

****

NOTE: Specify the rated speed under full load for the main hoist, auxiliary hoist (if specified), bridge, and trolley.

1. Hoist: Select hoist speed which conforms to the recommendations of CMAA 70 or ASME tables, based on capacity.

2. Trolley: Trolley travel speed must conform to the recommendations of CMAA 70, based on capacity.

3. Bridge: Bridge travel speed must conform to the suggested speeds per minute for floor controlled cranes as stipulated in CMAA 70.
****

Provide crane with rated capacity of [_____] metric tons tons kilograms pounds.[Provide auxiliary hoist with [_____] metric tons tons kilograms pounds capacity.] Lower load block or assembly of hook, swivel bearing sheaves, pins, and frame suspended by the hoisting ropes are not considered part of the rated capacity.

Rated (maximum) speeds plus or minus 10 percent (in meters/second) (feet/min) for the main hoist, [auxiliary hoist,] bridge, and trolley at the rated load are specified in the table below. The minimum speed must not exceed the values listed.[Values in the table are for a fully loaded crane. Using overspeed, the hoist function must be capable of [_____] when not loaded.]

Rated Speeds meters/second feet/min		
Description	Minimum	Maximum
Main Hoist	[_____]	[_____]
[Auxiliary Hoist]	[_____]	[_____]
Trolley	[_____]	[_____]
Bridge	[_____]	[_____]

1.4 VERIFICATION OF DIMENSIONS

The Contractor is responsible for the coordination and proper relation of their work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

1.5 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for

Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Manufacturer Qualification

Overhead Electric Traveling Crane must be designed and manufactured by a company with a minimum of 10 years of specialized experience in designing and manufacturing the type of overhead crane required to meet requirements of the Contract Documents. Crane design must be accomplished by, or directly supervised by, a registered professional engineer (PE). PE licensing must be by a board or agency authorized to license and register professional engineers. The PE may be a Contractor's regular employee or a consultant. The PE's review and attestation of specification compliance and professional responsibility must be signified by his or her PE original seal and dated signature on the final drawings. The professional engineers must only undertake and perform work under this contract in the branch(s) of engineering in which they are licensed.

1.6.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing, and documentation. Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane.

1.6.2.1 Inspection of Steel Castings

****

NOTE: Navy Crane Center does not require magnetic-particle testing of steel castings. Magnetic testing for USACE projects should be coordinated with the Contracting Officer.

****

Visually inspect [and test]load-carrying steel castings[using the magnetic-particle inspection method][using ultrasonic testing].[Reference allowable degree of discontinuities to ASTM E125, and relationship to service loads and stresses, critical configuration, location and type.] All load bearing components, couplings, shafts, and gears, in the hoist drive train must be rolled or forged steel, except brake drums which may be ductile iron. Methods of repairing the discontinuities is subject to review by the Contracting Officer.

1.6.2.2 Inspection of Hook Assembly

Inspect hook[by a magnetic-particle type inspection] [and X-rayed] [and tested ultrasonically] prior to delivery. Furnish documentation of hook inspection to Contracting Officer prior to field operational testing. As part of the acceptance standard, linear indications[greater than 1/16 inch] are not allowed. Welding repairs of hook are not permitted. A hook showing linear indications, damage or deformation is not acceptable and must be replaced immediately.

[1.6.2.2.1 Hook Non-Destructive Test (NDT)

****

NOTE: Delete this paragraph if selected agency does not require magnetic particle testing.

****

****

NOTE: For NAVFAC, substitute tailored paragraph.

****

Magnetic-particle inspect the hook over the entire area in accordance with ASTM A275/A275M. Acceptance standard is no defects. A defect is defined as a linear indication that is greater than [3 mm 1/8 inch][1.5 mm 1/16 inch] long. For hooks of non-magnetic material, NDT will be liquid penetrant (PT) method in accordance with ASTM E1417/E1417M. For PT testing of hooks containing stainless steels, titanium, or nickel based alloys, total halogens and Sulphur used in the NDT process must be controlled as specified in T9074-AS-GIB-010/271.

Inspect each hook and shank over the entire surface area by magnetic particle inspection.

a. Procedure: Conduct magnetic particle inspection in accordance with ASTM A275/A275M with the following restrictions: Do not use DC yokes (including switchable AC/DC yokes used in the DC mode) or permanent magnet yokes. Do not use automatic powder blowers or any other form of forced air other than from a hand-held bulb for the application or removal of dry magnetic particles. Remove arc strikes. Equipment ammeters must have an accuracy of plus or minus 5 percent of full scale (equipment ammeter accuracy other than that stated is acceptable provided the MT procedure states that a magnetic field indicator is used to establish and verify adequate field strength for all aspects of the inspection.)

b. Acceptance Criteria: Defects found on the hook will result in rejection of defective items for use on furnished hoist. For this inspection, a defect is defined as a linear indication for which the largest dimension is greater than 1.5 mm 1/16 inch.

c. Test Report: Submit a test report of the magnetic particle inspection of each hook provided the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The NDT procedures including technique sheets specific to the types, shapes, and size of the parts being examined must adequately describe the orientation of the hooks within the magnetizing equipment. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheet, and certification to the Contracting Officer with the test report.

][1.6.2.3 Hook Proof Test

****

NOTE: Hook proof tests are required for custom designed or non-ferrous (bronze or stainless steel) hooks. Bronze/stainless steel hooks are generally associated with minimum hazardous area requirements.

****

Proof test the load hook per ASME B30.10. Perform the proof test prior to Hook NDT.

]1.6.3 Certificates

All certifications must be dated and bear the original signature (above the printed name) of the authorized representative of the Contractor or the manufacturer of the items or equipment being certified. Each certification will clearly identify the crane, the drives, components, and location (as applicable) to which it applies:

a. Submit a Wire Ropes Certification with the wire rope manufacturer's certification that the rope meets the published breaking strength or the actual breaking strength of a sample taken from the reel and tested. Certification is to be traceable to the hoist, crane, and reel.

b. Submit a Crane Runway System Certificate stating that the new crane will operate properly on the runway; if the crane(s) cannot operate without restriction, the Contractor must indicate crane limitations.

c. Submit a Hazardous Material Certificate that the crane does not contain hazardous material including asbestos, lead, cadmium, chromium, PCBs, or elemental mercury. Products required for the designing and manufacturing of cranes must not contain the prohibited materials.

d. Submit a Loss of Power Test Certificate stating that a test may be performed in which power is removed from the crane while the hoist, bridge, and trolley are in operation.

e. Submit a Certificate of the Coupling Alignment Verification Record.

f. Submit an Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus 0 minus 5 percent) of rated load.

g. Submit an Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus [0] [_____] minus [5] [_____] percent) of rated load.

h. Submit a Certificate of the Brake Adjustment Record. Provide a brake adjustment record and installation/maintenance manuals for each brake on the crane. Each brake measurement must have a tolerance traceable to the associated brake manual or documentation provided by the brake manufacturer, location of measurements, and the actual brake setting. Changes made to settings of the brake, at any time, will void the record.

i. Submit a Certificate of Compliance with Listed Standards

j. Provide a Contractor Hazardous Environment Certificate stating that the new crane and all associated components excluding the hoist are designed for operation in the hazardous environment specified in the Classification section.

k. The Contractor must provide a Public Domain Software Certificate declaring that public domain software (e.g., freeware, shareware) is not used in the system.

l. The Contractor must provide a certificate stating that all Software and Services that are not required for operation and/or maintenance of the product have been removed. The software/services to be removed are identified in paragraph SOFTWARE AND SERVICES.

1.6.4 Drawings: Overhead Electric Traveling Crane

a. Submit drawings showing the general arrangement of all components in plan, elevation, and end views. Show all major features of the crane including: hook approaches on all four sides, clearances and principal dimensions, assemblies of hoist, trolley and bridge drives, motor nameplate data, overcurrent protective device ratings, and electrical schematic drawings. Include weights and centers of gravity of major components. Provide maximum wheel loads (without impact) and spacing imparted to the crane runway system track beams. Indicate the crane speeds along the runway, the trolley speeds along the bridge girder, and the hoist lifting speeds; all speeds indicated are speeds with hoist loaded with rated crane capacity load.

b. Submit shop drawings of all fabricated components. Shop drawing quality must be equivalent to the contract drawings accompanying this solicitation. Drawings must be reviewed, signed, and sealed by a registered professional engineer.

c. Provide integral schedule of crane components on each drawing. The schedule must provide a cross reference between manufacturer data and shop drawings. Components listed on the schedule of crane components must include total quantity, description, original manufacturer, and part number. Distributing agents will not be acceptable in lieu of the original manufacturer.

d. Provide control system and network drawings. Network diagram must show equipment locations, names, models, and IP addresses on network communications schematic for all Programmable Logic Controllers (PLCs), Remote Terminal Unit (RTU), Supervisory Controller, and Other Network-Capable Devices. In addition, the drawings must consist of all software block, flow, and ladder diagrams.

1.6.5 Design Data: Load and Sizing Calculations

****

NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys.

****

Submit complete list of equipment and materials, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Submit calculations reviewed, signed, and sealed by a registered professional engineer verifying the load cases, sizing of the bridge girders, end trucks, travel drives, brake selections, and overcurrent protection for motors, controllers, and branch circuits. Provide a list of all codes and standards, design assumptions, equations, specified efficiencies, limits, factors of safety, component ratings, and sources of values used. Include free body diagrams or sketches of each load case.[Include seismic analysis of crane.]

1.6.6 Welding Qualifications and Procedures

Welding must be in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep and not exceed those specified in AWS D14.1/D14.1M and CMAA 70. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M.

1.7 CRANE SAFETY

****

NOTE: Add ASME HST-4 if commercial hoist/trolley unit will be used.

****

Comply with the mandatory and advisory safety requirements of ASME B30.10, ASME B30.2[, ASME HST-4], CMAA 70, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306, and all applicable provisions of 29 CFR 1910 and NFPA 70. Where personal fall arrest anchorages are provided, design anchorages in accordance with ASSP Z359.

[1.7.1 Nuclear Safety Analysis

****

NOTE: Certification is required for cranes handling nuclear materials. Results from the Safety Analysis will be utilized by the Using Agency as a basis for bridge crane certification. Delete this paragraph if the crane is not required to handle nuclear

materials.

This section is not applicable to NAVFAC projects. The Navy Crane Center must be involved with the procurement and overhaul of all NAVY cranes that handle Nuclear material as identified in the forward notes section of this specification.

****

Nuclear certification, testing, and rules of construction must be in accordance with 29 CFR 1910.147 and ASME NOG-1. Air Force Nuclear certified hoists must meet requirements of AFMAN 91-118. Submit analysis and test reports to Contracting Officer for approval.

]PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment. Material will be free from defects and imperfections that might affect the serviceability and appearance of the finished product. All material must be new and unused.

2.1.2 Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two bridge identification plates, one for each side of the bridge. Provide noncorrosive metal identification plates with letters which are easily read from the floor, showing a separate number such as BC-1, BC-2, for each bridge crane.

2.1.3 Capacity Marking

Mark the rated capacity in metric ton ton kilograms pounds units on each side of the crane on the bridge girders. Capacity marks must be large enough to be clearly visible from the floor. The markings must be positioned to be visible at the operator's position after the crane has been installed.[Provide additional markings in operator's cab.]

2.1.4 Safety Warnings

Affix labels in a readable position to each lift block or control station in accordance with ASME B30.2. Submit safety warnings, diagrams and other instructions suitably framed and protected for display as indicated by the Contracting Officer as follows:

Design and locate the word "WARNING" or other legend to bring the label to the attention of the operator. Provide durable type warning labels and display the following information concerning safe-operating procedures: Cautionary language against lifting more than the rated load; operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; operating damaged or malfunctioning hoist; operating a rope hoist with a rope that is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

2.2 STRUCTURAL REQUIREMENTS

Structural requirements must be in accordance with CMAA 70, Section 3. Structural steel materials must conform to the standards permitted in CMAA 70 and AISC 360.

2.2.1 Structural Connections

High-strength bolted structural connections must be designed and installed in accordance with RCSC A348. Bolts must be of ASTM F3125/F3125M Grade A325/A325M or Grade A490/A490M material. Galvanized bolts are not acceptable.

Welded connections must be performed in accordance with AWS D14.1/D14.1M. Allowable stress values must comply with CMAA 70.

2.2.2 Bridge Girder or Girders

****

NOTE: Suggest specifying welded structural steel box girders for CMAA 70 Class C, D, or E with a capacity greater than 18 metric tons 20 tons 16330 kg 36,000 pounds or a span greater than 12 m 40 feet.

****

Provide [welded structural steel box section] [wide flange beam, standard I-Beam, or section fabricated from rolled plates and shapes] bridge girders. If the ends of bridge girders are notched to fit over the end trucks, the notches must be reinforced with vertical diaphragms and horizontal stiffeners.

2.2.3 Bridge Rails

Provide bridge rails, crane girders and other sections that are straight and true. Make all rail joints flush and true without misalignment of running tread and design to minimize vibration. The gap between adjacent rail ends and the vertical misalignment of running treads must not exceed 0.794 mm 1/32 inch. Solid stock (e.g. square bar, roundstock) is not permitted as bridge rail. Center bridge rail on top flange or position bridge rail over girder web for torsion box girders. Fasten rail to girder with welded clips. Position rail clips in pairs and at not more than 914 mm 36 inches on center. Bolt bridge rail joints using standard joint bars. Stagger and position rail joints directly over girder diaphragms. Provide a positive stop at bridge rail ends to prevent creep.

2.2.4 End Ties and Bridge Girder End Connections

****

NOTE: Specify end ties for cranes with more than 4 wheels. Specify welded structural steel box sections for CMAA 70 Class C, D, or E with a capacity greater than 18 metric tons 20 tons 18000 kg 40,000 pounds or a span greater than 12 m 40 feet.

****

If equalizing end trucks are used, provide rigid end ties between girders to form a frame that is rigid about the vertical and horizontal axes. If compensating end trucks are used, provide end ties which are rigid about the vertical axis but relatively flexible about the horizontal axis to permit partial rocking motion for wheel load compensation. Provide full depth diaphragms at girder connections and jacking points. Provide horizontal gusset plates at the elevation of top and bottom end tie flanges for connection to girder ends. Make end connections with high-strength bolts in accordance with the Structural Connections section of this specification. Use tapered alignment pins to maintain original shop alignment between bridge girders and end ties/trucks.

2.2.5 End Trucks

Provide [rotating] [fixed axle] type end trucks fabricated from structural steel plate to provide a rigid box section structure. Center wheels between the webs of the box section. Configure bridge and trolley trucks with a feature that limits load movement to 25.4 mm 1 inch in the event of wheel or shaft failure. Provide jacking pads for removal of wheel assemblies. Wheel axle bearing seats must be designed such that wheel and axle bearing assembly can be removed with not more than 76 mm 3 inches of jacking.

[2.2.6 Trolley Frame

Provide trolley frame as a one-piece structural steel weldment. Provide pads for the use of jacks or wedges when changing truck wheels. Make all trolley yokes and load bars of drop forged, cast or rolled steel.[Equip trolley with permanent lifting attachments.]

]2.2.7 End Stops and Bumpers

Fit bridge girders with structural steel end stops. Locate stops to permit maximum trolley travel. Fit bridge end trucks and trolley frames with shock-absorbing bumpers capable of decelerating and stopping the bridge and trolley within the limits stated by 29 CFR 1910 and CMAA 70. Bumpers must fully engage end stops. Mount bumpers so that there is no direct shear on mounting bolts (if any) upon impact. Bumpers must provide adequate clearance between the crane and surrounding structure when compressed to preclude damaging equipment. Ensure bridge and trolley bumper retention in accordance with ASME B30.2. When more than one crane is located and operated on the same runway, bumpers must be provided on their adjacent ends or on one end of one crane. Fit the other end of the end-truck with a structural steel stop to engage the bumpers of the adjacent crane. Ensure bridge bumpers are properly aligned with runway end stops. Metal to metal contact at the bumper to end stop connection is not permitted.

[2.2.8 Footwalks

****

NOTE: A footwalk is recommended unless: the crane can be safely serviced by another means or where lack of clearance would prohibit one.

****

Set the location and construction of footwalks conforming to ASME B30.2 and 29 CFR 1910. A structural platform is required on the drive girder side of the crane. The length of the drive side footwalk must be [adequate to provide access to the trolley and provide sufficient room for mounting control cabinets] [along the entire length of the bridge]. Provide checkered steel flooring for platform.[To give access to the opposite side of the trolley, bridge conductors, or other equipment, mount a footwalk [twice the length of the trolley] [the full length of the girder] on the opposite side of the crane. Provide a cross-over footwalk over an end tie between the two girder footwalks.] Mate the drive side footwalk with the crane access platform. Footwalks must be free of exposed hazardous moving parts and electrical components that may injure personnel and not require the use of safety harnesses or other extraordinary means.

][2.2.9 Operator's Cab

****

NOTE: Applicable if a cab is specified, otherwise delete paragraph. Specify enclosed cab for outdoor use. Open cab may be used indoors. Enclosed cabs can be provided with a heating and air conditioning unit according to environmental conditions. Specify the location of cab and the direction the operator should face.

****

[2.2.9.1 Design

Design and construct operator's cab in accordance with CMAA 70 and ASME B30.2. Locate cab access to facilitate entry and exit by crane operator. Provide space for a carbon-dioxide, dry chemical, or equivalent hand fire extinguisher. In addition to the operator's seat, the cab must have a seat for a back-up operator.

][2.2.9.2 Cab Construction

Provide [fixed cab mounted on bridge] [trolley mounted cab] of the [open] [enclosed] type for [indoor] [outdoor] use, and designed to provide a clear view of the operating floor and hook for the operator.[Provide cab with a suitable [heating] [heating and air conditioning] unit]. Locate cab on the [_____] of the [bridge] [trolley] with the operator facing [_____].[Provide [sliding] [fixed] windows of laminated safety type glass.]

]]2.2.10 Additional Provisions for Outside Service

****

NOTE: This paragraph is applicable for outdoor cranes only.

****

Seal weld structural members on outdoor cranes. Provide crane bridges with parking brakes which will sufficiently hold the crane against a wind pressure of 2404 Pa 5 psf for in-service conditions. Provide crane bridges with manually-operated pin locks at each rail, designed to securely anchor the crane against a wind pressure of 1.44 kPa 30 psf for out-of-service conditions. Design members to prevent the collection of water on crane.

[2.2.11 Seismic Forces

****

NOTE: Seismic forces must be considered in the design of the cranes with a component importance factor of greater than 1.0 and in facilities with a Seismic Design Category of D, E, or F per ASCE 7-16 or ASME NOG-1. Seismic input (e.g. design spectrum)

must be specified for ASME NOG-1 analysis to be performed.

****

Perform a seismic analysis as a part of the design of the crane in accordance with ASCE 7-16 or ASME NOG-1. The seismic analysis must be included in the CMAA 70 extraordinary load case (Case 3). For project locations beyond the scope of ASCE 7-16, a widely accepted design standard may be used for seismic analysis.

]2.3 MECHANICAL REQUIREMENTS

****

NOTE: For ordnance handling further material restrictions exist.

****

a. Provide steel shafts, gears, keys, and couplings. Cast iron and aluminum used to support components of the hoist power transmission train must be ductile. Gray cast iron load bearing parts are prohibited.

b. All bearings, except those subject only to small rocker motion, must be anti-friction type. All connections subject only to small rocking motion are to be fitted with bushings or thrust washers in the pivot pin bore, as applicable. Bronze bushings must have provisions for grease lubrication.

c. All mechanical components must be accurately aligned and positively secured to maintain the alignment. Parts must not be forced into position to obtain apparent alignment.

2.3.1 Hoists

****

NOTE: For ordnance handling CMAA class D is required and, if used, packaged hoists must be HST-4 Duty Class H4 or better.

For ordnance handling custom hoist shafts must have a fatigue design factor of 1.5.

****

Provide hoist conforming to ASME B30.2 and CMAA 70 service class [A] [B] [C] [D] [E] [F] or better, double reeved, except as modified and supplemented in this section.[Standard commercial hoist and trolley units (packaged hoists), if used, must meet ASME HST-4 Duty Class [H1] [H2] [H3] [H4] or better.] For custom hoist shafts, the fatigue design factor must be a minimum of 1.5.

2.3.2 Drives

2.3.2.1 Bridge Drives

****

NOTE: If the span is less than 12 m 40 feet and the application is CMAA Class "A" or "B", then A-1 drive may be included as an option. Outdoor drive wheel requirement is optional since paragraph ADDITIONAL

PROVISIONS FOR OUTSIDE SERVICE also requires additional parking brakes for outdoor cranes.

****

Provide [either A-1 or] [A-4] bridge drive arrangement as specified in CMAA 70 consisting of a single electric motor mechanically connected through gear reduction and drive shafts to the drive wheels or separate drive motors at each end of bridge. Outdoor cranes must have half of the total wheels driven.

Acceleration and deceleration must meet the requirements specified in this section. Gears must conform to applicable AGMA standards. Provide oil tight fully enclosed gear reducers with pressure or splash type lubrication. Bridge travel limit switches are optional.

2.3.2.2 Trolley Drives

Provide complete trolley drive arrangement with a minimum of two wheels driven by an integral electric motor. Drive mechanism must run in totally enclosed oil bath. Limit switches are optional for drive mechanism. Acceleration and deceleration controls must meet requirements specified in this section.

2.3.3 Load Blocks and Hooks

****

NOTE: The following paragraphs contain tailoring for NAVFAC. For text tailored to Minimum Anti-Spark requirements, remove conflicting requirements (i.e. load block cannot simultaneously be steel and anti-sparking or steel hook meeting ASTM A668 cannot also be non-sparking).

For Ordnance Handling: The insulated link(s) are required unless the following conditions are met:
1. There is no threat of a lightning strike during operations;
2. There is no chance for contact with overhead power lines;
3. RF emissions control is in effect regardless of the HERO classification of the ordnance being held.

****

The load block must be constructed of steel non-sparking materials and designed to prevent steel-to-steel contact of moving parts. The block must be fully enclosed, concealing the sheaves and wire ropes, except for wire rope slots and drain holes. The block must be clearly marked with the capacity in kilograms pounds on both sides. The load block sheaves must be constructed of non-sparking materials.[An insulated link must be provided on each hook block per the requirements of NAVSEA OP-5.] Standard commercial blocks may be used at their published ratings when their published design factors are 5.0 or greater.

Provide an unpainted single barbed forged steel hook complying with ASTM A668/A668M. Provide an unpainted single barbed hook of non-sparking material with a minimum material longitudinal elongation of 16 percent in 2 inches. Bronze clad hooks are prohibited. Hook dimensions must be as shown on the drawings. Fit hook with a safety latch designed to preclude inadvertent displacement of slings from the hook saddle. The hook and hook nut must be removable without unreeving of the hoist. Provide hook nut with a removable type set screw or other similar fastener, installed in a plane parallel to the longitudinal axis of the hook shank. Do not weld hook nut. Uniquely mark the hook in a permanent fashion that is traceable to the NDT certification. The hook nut must be of non-sparking materials. Hook must be free to rotate through 360 degrees when supporting the test load up to 125 percent of the rated capacity. Provide only hooks which are designed and commercially rated in accordance with CMAA and conforming to ASME B30.10 and CMAA 70. Upper hooks of hook suspended hoists must be of non-sparking materials.

2.3.4 Wire Ropes

****

NOTE: For NAVFAC, add tailored paragraph section.

For minimum anti-spark protection, add tailored paragraph section.

****

a. Wire ropes must conform to ASTM A1023/A1023M and be tested as required by ASTM A931. The wire rope must be in a double reeved configuration and equalized with a sheave. Provide wire rope with a minimum design factor of [5 to 1] [_____ to 1] based on the load experienced at rated capacity and minimum breaking strength of the wire rope.

b. Provide hoisting ropes with improved plow steel, extra improved plow steel, or extra-extra improved plow steel, regular lay, bright, and uncoated with an independent wire rope, wire strand, or otherwise, steel core. Hot-dipped galvanized wire rope is not permitted.

c. Provide stainless steel construction hoist ropes.

d. Maximum hoisting rope fleet angles must be 4 degrees for drums and 4.75 degrees for sheaves. Hoisting rope end connections, other than drum connections, must be speltered sockets with forged steel terminals or swaged fittings installed in a fashion that provides 100 percent of the breaking strength of the wire rope. Provide proof of Wire Rope breaking strength. Wedge sockets or aluminum swages are not permitted on wire rope end connections.

2.3.5 Sheaves

****

NOTE: Select 16 rope diameters for CMAA service class A or B, 18 rope diameters for class C, 20 rope diameters for class D, 24 rope diameters for class E, or 30 rope diameters for class F.

****

****

NOTE: For NAVFAC, add additional requirements in the tailored paragraph section.

****

Provide steel sheaves. Minimum pitch diameters must be [16] [18] [20] [24] times the rope diameter for running sheaves, and no less than 12 times the rope diameter for equalizer sheaves. Sheave surfaces which contact wire rope are not to be painted.

The sheaves must be heat treated to a minimum hardness of 320 Brinell Hardness Number (BHN) in the wire rope contact area, have a groove depth not less than 1.5 times the hoisting rope diameter, with a throat angle of 30 to 40 degrees.

2.3.6 Hoist Drum

****
NOTE: Select 16 rope diameters for CMAA service class A or B, 18 rope diameters for class C, 20 rope diameters for class D, 24 rope diameters for class E, or 30 rope diameters for class F.
****

Provide drum made of steel. Design the drum such that all hoisting rope is wound in a single layer and so that not less than two dead wraps of hoisting rope remain on each anchorage when the hook is in its extreme low position. Drum grooving must be machined right and left hand beginning at the ends and grooving toward the center of the drum. Minimum drum groove depth must be 0.375 times the rope diameter. Minimum drum groove pitch must be either 1.14 times the rope diameter or the rope diameter plus 3 mm 1/8 inch, whichever is smaller. Minimum drum pitch diameter must be [16] [18] [20] [24] times the rope diameter. Do not paint, coat, or galvanize the surface of the drum which comes in contact with wire rope.

For wire rope drums installed directly onto the output shaft of the hoist speed reducer without an intermediate flexible coupling, the drum to shaft connection must be a barrel coupling.

2.3.7 Gearing

Provide gearing of the enclosed gear reducers type. Provide steel spur, helical, or herringbone type gears and pinions only. Gearing must conform to ANSI/AGMA 2001 and AGMA 908. Internal and external gear dimensional tolerances must conform to the applicable AGMA standard for tooth geometry and tolerances. Open-type gearing is not acceptable, except for final drives.

2.3.7.1 Gear Reducers

****
**NOTE: For CMAA service class D, enclosed gearing must be selected for "Mill Duty" service.
For NAVFAC, CMAA service class C enclosed gearing must be selected for "Industrial Duty".**
****

Gear reducers must be [integral components of standard hoists or hoist/trolley units of manufacturers regularly engaged in the design and manufacture of hoists or hoist/trolley units for Class A, B, or C cranes][or][standard items of manufacturers regularly engaged in the design and manufacture of gear reducers for Class D and E cranes]. Gear reducers must be designed, manufactured, and rated in accordance with ANSI/AGMA 6113 (ANSI/AGMA 6013) (for trolley drives only), as applicable. Except for final reduction, the gear reduction units must be fully enclosed in oil-tight housing.[Enclosed gearing must be selected for ["Industrial Duty"] ["Mill Duty"].] Gearing must be designed to AGMA standards and operate in an oil bath. Operation must be smooth and quiet.

2.3.7.2 Open Gearing

Provide all gears and pinions with adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2015-1 Accuracy Grade A8 or better. Open gears must be enclosed with safety guards provided with openings with covers for inspection and access for grease lubrication.

2.3.8 Wheels

****

NOTE: For maximum anti-spark protection, add the tailored words. Remove any conflicting items (i.e. wheels cannot be non-sparking and steel). Remove the 320 BHN sentence since the wheels will not be steel.

****

Provide double flanged, straight tread trolley and bridge travel wheels of rolled-to-shape or roll-forged steel. Provide double flanged, straight tread trolley and bridge travel wheels of non-sparking materials with sufficient diameter and hardness to meet allowable wheel loads. The rim, flanges, and wheel tread must be hardened to not less than 320 Brinell Hardness Number (BHN). Wheel sizing and flange-to-rail head clearances must be in accordance with CMAA 70 recommendations.

2.3.9 Bridge and Trolley Travel Brakes

Provide bridge and trolley drives with electro-mechanical brakes or non-freecoasting mechanical drive capable of stopping the motion of the bridge or trolley within a distance in feet equal to 10 percent of the full load speed in feet per minute when traveling at full speed with a full load. The brakes must have a minimum torque rating per CMAA 70 according to the applicable environment, but not sized larger than 150 percent of the motor torque. Brakes must have an externally accessible means to manually release the brake. The brakes must be equipped with a manual self-return to ON brake release and designed to permit inspection and adjustment without disassembly of the brake.

2.3.10 Hoist Brakes

****

NOTE: Each hoist must have, at a minimum, two brakes. Two electro-mechanical brakes are recommended.

Consider the Controls section under ELECTRICAL REQUIREMENTS. If a variable frequency drive (VFD) is selected for use, the brake configuration must reflect the type of VFD selected (open loop vs closed loop).

If closed loop controls are selected, brake configuration must be two electro-mechanical/thruster type brakes.

If open loop controls are selected, brake configuration must be one electro-mechanical/thruster type brake and one

mechanical load brake.

If not using a VFD, and electromatic controls are selected, the brake configuration can be the manufacturer's option as long as there are a minimum of two holding brakes provided.

Cranes with two electro-mechanical/thruster holding brakes must have a time delay between the setting of the primary and secondary brakes.

Service brakes which slow down and stop the load must be adjustable down to 50 percent of their torque rating. Holding brakes which hold the load after the variable frequency drive (VFD) slows down and stops the brake are not required to be adjustable.

Additional tailoring options are provided for NAVFAC cranes.

****

a. Equip hoist with a minimum of two holding brakes, each with a minimum torque rating of 125 percent of the rated load hoisting torque.[Provide a brake configuration with [one electro-mechanical or thruster brake and one mechanical load brake that stops and holds 125 percent of the hoist's rated load and does not require the load to be raised before being lowered.] [two electro-mechanical or thruster brakes.]][A mechanical load brake may be utilized in lieu of one of the hoist holding brakes provided it stops and holds 125 percent of the hoist's rated load and does not require the load to be raised before being lowered].

[b. For cranes with two electro-mechanical or thruster brakes, designate each brake as primary or secondary with the primary brake being the brake mounted closer to the motor. Provide the primary brake with a non-time delayed setting and secondary brake with an adjustable setting time delay, set between one to three seconds after the primary brake in any stopping condition. Do not use an uninterruptible power supply (UPS) to create the secondary brake time delay.

] c. Electro-mechanical or thruster brake [must be adjustable to 50 percent of its rated capacity, and]must have an externally accessible means of manual release. On drives where the brakes are utilized as holding brakes only, torque adjustment is not required. The brakes must be equipped with a manual self-return to ON brake release and designed to permit inspection and adjustment without disassembly of the brake.

2.3.11 Couplings

****

NOTE: This section is tailored to NAVFAC.

****

Chain and continuous sleeve type couplings must not be used. Spline couplings are acceptable as installed on c, d, or p-face assemblies. Conventional couplings must not be loaded in the radial direction. Brake wheel or brake disc couplings (if used) must be compatible with the required coupling type. Flexible couplings must not be relied upon to compensate for inaccurate alignment. Ends of coupled shafts must be aligned within the recommended installation criteria of the coupling manufacturer.

[2.3.12 Drip Pans

****

NOTE: Drip pans may be added for general purpose service or any other type of crane specialized service, if there is an additional requirement to prevent lubrication from falling to the floor or lifted load. Modify the section as needed to specific the desired drip pans.

****

a. The crane must be designed to preclude leakage of lubricants onto the lifted loads or the floor. Equipment or components, which cannot be made leak-proof, must be fitted with unpainted corrosion resistant steel drip pans or must have the foundations seal welded to create a dam. Drip pans that utilize liquid sealant to prevent leakage of lubricants are not permitted.

b. The drip pans must be sized to hold the entire gear case fluid capacity, installed under all drive machinery, designed to permit easy removal of collected lubricant. A trolley floor designed to contain any lubricant drips may be used as fluid containment for any equipment that is mounted on it.

c. Provide drip pans fitted around the shank of the hook and extending outward to encompass all possible points of lubrication drips from the load block or wire rope. The drip pans must be easily removable without disassembly of the hook or load block and cannot interfere with the crane structure during testing of the upper limits.

]2.4 ELECTRICAL REQUIREMENTS

2.4.1 Motors

****

NOTE: Inverter duty motors are required for open loop variable frequency drives (VFD). Vector duty motors are required for closed loop variable frequency drives (VFD).

Select two speed motors for bridge and trolley drives if magnetic controls are specified in paragraph CONTROLS; select single speed motors if electronic controls are specified in paragraph CONTROLS.

****

Motors must meet all applicable requirements of NEMA MG 1 and UL 1004-1. All motors must have a minimum of a 60 minute duty rating and be Totally Enclosed Non Ventilated (TENV), Totally Enclosed Fan Cooled (TEFC), or Totally Enclosed Blower Cooled (TEBC).[Provide inverter duty motors for Open Loop Variable Frequency Drives (VFD).][Provide vector duty motors for Closed Loop VFDs.][Provide [two] [single] speed AC squirrel cage induction type motors for the bridge and trolley drives.][Provide two speed, AC squirrel cage induction type motor for the hoist.] Provide motors with a minimum of Class F insulation. Provide motor overload protection utilizing a thermal sensitive device embedded in its windings. Provide motors painted to manufacturer's standard for "wash-down" service. Motors located outdoors must be furnished with anti-condensation heaters that remain energized when the mainline contactor is deenergized.

2.4.2 Controls

****

NOTE: Use the first three paragraphs to select electronic variable frequency drive controls for either the hoist, bridge or trolley. With VFD controls the hoist can be configured as open loop or closed loop (flux vector). Open loop is more cost effective and requires a mechanical load brake while closed loop control offers better load control and requires hoist motors with encoders for position feedback. Ensure the Hoist Brakes section of this specification reflect the type of controls chosen. Use the fourth, fifth, and sixth paragraphs to select one or two speed control for the hoist, bridge, or trolley. Selections can be made using a combination of electronic controls and one or two speed motor controls for the various functions.

When the two-speed bridge and trolley motor is specified, the slow speed will be 1/3 to 1/4 of rated travel speed. Reduced voltage starting, acceleration, and deceleration, serve to reduce the acceleration rate that is normal for squirrel-cage motors. Squirrel-cage motors with two-speed magnetic controls provide satisfactory results with slow bridge and trolley speeds, and should be specified when short travel distances are involved and where fine positioning is not required.

For faster bridge and trolley speeds or finer positioning requirements, specify electronic controls.

Various VFD manufacturers offer an option to overspeed the hoist to a value over 60Hz (usually 120Hz). This allows the operator to position the hoist at faster speeds when it is not loaded. When selecting this feature list the maximum no load speed in section "Rated Capacity and Speeds".

****

[a. Provide static reversing, variable frequency drives (VFD) for the [bridge,] [trolley] [and] [hoist] electric controls.[Provide static reversing, VFD, speed regulated, closed loop, flux vector electric controls for the hoist[s]. For feedback, provide hoist motors with encoders. The hoist controller must enable the drive motor to develop full torque continuously at zero speed. The hoist secondary brake must be controlled separate from the primary and connected to different output (within the drive) from the primary brake.] VFD controllers must meet NEMA ICS 8, Part 8 and at a minimum, provide under-voltage protection, electronic instantaneous over current protection, DC bus over voltage protection, and be able to withstand output line to line shorts without component failure. Select bridge and trolley drives such that the continuous rating of the controller is not less than the calculated motor full load current based on CMAA 70 5.2.9.1.1.1 and NEC Table 430.250. Select hoist drives such that the continuous rating of the controller is not less than 130 percent of the calculated motor full load current based on CMAA 70 5.2.9.1.1.1 and NEC Table 430.250. All hoist drives must have a motor over-torque limit to lock out the hoist and prevent gross overload of the associated hoist. Provide dynamic braking for each electric drive that is sized per VFD manufacturer's requirements. Submit VFD Control Parameter Settings.

b. Provide speed control which is infinitely variable for each function, controlled via [radio control system][and][pendant pushbutton station][and][cab control station].[Provide controls designed such that the maximum speed of each function will be limited to 25 percent of rated speed when a slow speed switch is actuated on the controller[s]. Energize a yellow/amber light/indicator while in slow speed mode.]

[c. The hoist control system may utilize overspeed up to 120hz, unloaded only, if the drivetrain equipment has all been balanced and is rated for the resulting speed.

] d. The [hoist][,] [trolley][,] and [bridge] brakes must set after the associated controller decelerates the drive motor to a controlled stop. The hoist, trolley, and bridge controllers must be sized to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 125 percent of rated load on the hook. The hoist controller must prove torque before release of the brakes and enable the drive motor to develop full torque continuously at zero speed. Motors must operate smoothly at all speeds without torque pulsations, and must only be energized within the frequency range of 50-60 Hz at rated speed.

][e. Provide [one][two]-speed magnetic controls for the [bridge drive][,] [trolley drive][,][and][hoist] drive. Controllers must meet the requirements of NEMA ICS 8. Ensure that an energized drive motor initially rotates only in the direction selected by the operator by activating the corresponding direction; i.e., is not overhauled. For AC squirrel cage motor controllers, the requirements of NEMA ICS 2, Part 2, for general-purpose controllers, must be met.

[f. Provide the bridge and trolley motor control systems with a drift point between OFF and the first speed control point in each direction.

]]g. The use of definite purpose contactors is prohibited. If IEC contactors are used, the application cannot exceed the contactor manufacturer's AC3 ratings for the contactor at a minimum.

h. On hoist function roll-up must be less than 1/8 inch measured at the hook block and roll-back must not occur over the entire load range.

i. Use of Uninterruptable Power Supplies (UPS) is prohibited. Feed control circuits from a single phase, air cooled, double wound transformer with a grounded metal screen between the primary and secondary windings of the transformer.

j. Provide a main line contactor. Energization of the main line contactor must be controlled by the POWER-OFF/POWER-ON switch/pushbutton on all controllers. Upon actuation of the POWER-OFF pushbutton; power to all drive motors, brakes, and controls must be removed. The mainline contactor must not be able to be energize while the POWER-OFF pushbutton is actuated. The POWER-OFF pushbutton circuitry must be independent of all controls or any other electronic devices.

2.4.3 Protection

Protection must not be less than that required by NEMA ICS 8, CMAA 70, NFPA 70,UL 1004-1, UL 1449, UL 489, UL 50, UL 943, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306 and all applicable provisions of 29 CFR 1910. Provide enclosed type circuit breaker readily accessible to the crane operator for crane disconnect. Provide an On/Off button that removes power from the motors, brakes and control circuit on all operator control stations[and][or] [radio controllers]. Provide for lockout/tagout of all hazardous energy sources.

2.4.4 Resistors

Provide resistors with natural convection cooling sized as recommended by the VFD OEM and fabricated of corrosion resistant metal; the use of "wire wound" type resistors is prohibited for segments of 8 ohms or less. Mount resistors in substantial, ventilated enclosures constructed entirely of non-combustible materials. When mounted outdoors provide stainless steel resistor enclosures. Provide resistors with terminals fitted in the coolest position in the enclosure.

[2.4.5 Transients and Harmonics Protection

****

NOTE: The following items are required only for VFD Controls.

****

a. Provide contactors and relays with appropriate Metal Oxide Varistors (MOV) or resistor-capacitor (R-C) surge absorbers installed across the respective coil.

b. Provide transient protection for electronic drive controllers that is either internal to the drive or via an MOV connected line-to-ground close to the line terminals of the drive.

c. Provide line reactors rated for continuous duty operation based upon the motor nameplate amperes. With motors of 50 horsepower or greater, harmonics protection must be provided by an isolations transformer or as recommended by the VFD OEM. For a drive motor branch circuit that exceeds 150 feet in length, a reactor must also be connected in series with the controller load (output) terminals to provide standing wave protection or as otherwise recommended by the VFD or motor OEM.

]2.4.6 Limit Switches

a. Limit switches must be rated for the NEC Hazardous Classifications specified in the Classification section of this specification.

b. Provide primary upper and lower geared limit switches. Geared limits must allow reversing direction to back out of the limit without resetting. The lower limit switch must be set such that there are a minimum of two wraps of rope on the hoist drum.

c. Provide a backup mechanical hook block activated upper limit switch wired independent of the directional controllers and the primary upper limit switch that removes power from the hoist motor, hoist brake and hoist controls conforming to NEMA ICS 5. The backup limit must require hoist resetting prior to operation of the hoist in any direction.

[d. Travel limit switches must be provided for the [bridge][and][trolley] motion to slow the crane to [25 percent] [_____] of its rated speed [[10] [_____] feet before the bridge end stops][and][[5] [_____] feet from the trolley end stops]. Limit switches must be mounted rigidly in a manner so as to protect the switch from misalignment or damage. The target/trip arm must be large enough to provide interception given a misalignment were to occur.

]2.4.7 Operator Controls

****

NOTE: Available operator controls are operator's cab, pendant, and radio control. Cranes can also be set-up to be controlled by two separate systems. For cranes with one set of controls use paragraph 1. For cranes with two sets of controls use paragraph 2. In such a case some type of interlock must exist to prevent control from both systems simultaneously.

The pendant can be suspended from the trolley or an independent festooned messenger track system. The festooned system allows the operator to have maximum separation from the load. When this is a requirement include PENDANT CONDUCTOR SYSTEM section of this specification.

When specifying a radio control system, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANECENINST 11450.2:
1. What type of batteries? Rechargeable?
2. Are spare batteries needed? How many?
3. Are spare remote control units required? How many?
4. Is a battery charger required?
5. Type of transmitter unit.
6. Is a belt/harness required for the remote control?

When specifying a cab operated crane, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANECENINST 11450.2:
1. Where would the user like the operator controls/indicators to be located (master switches, push buttons, key switches, lights)? See paragraphs LEFT-HAND OPERATOR CONTROL PANEL and RIGHT-HAND OPERATOR CONTROL PANEL under CAB CONTROL STATION.
2. Specific details on controllers can be listed.

****

[a. Provide crane equipped with a [pendant pushbutton station] [cab control station] [radio control system].

][b. Provide crane equipped with both a [pendant pushbutton station] [cab control station] [radio control system] (see paragraph PENDANT PUSHBUTTON STATION) and a [pendant pushbutton station] [cab control station] [radio control system] (see paragraph RADIO CONTROL SYSTEM). Provide a selector switch to allow the use of only one of the two available control stations [in the operator's cab] [on the pendant controller].

] c. If VFD controls are not provided, provide directional contactors with both mechanical and electrical interlocks.

d. Operator controls must be rated for the NEC Hazardous Classifications specified in the Classification section of this specification.

[2.4.7.1 Pendant Pushbutton Station

****

NOTE: Pendants can be suspended from either the trolley or an independent conductor system that is independent of the trolley (recommended). If cost is a concern and maximum separation of the operator from the load is not a requirement, suspending the pendant from the trolley is the best option. Otherwise specify a pendant conductor system by including paragraph PENDANT CONDUCTOR SYSTEM and suspending the pendant from "an independent festooned messenger track system."

****

The cranes must be controlled from a pendant pushbutton station suspended from [the trolley] [an independent festooned messenger track system, operating the length of the bridge]. Provide multiconductor flexible cords for pendant pushbutton stations with No. 16 AWG minimum conductors. Provide a method of strain relief to protect the electrical conductors from damage. Locate the pendant pushbutton station [1200 mm 4 feet] [_____] above the finished floor. Pushbutton pendant station must have its elements legibly marked and arranged vertically, in order, in accordance with CMAA 70.[Provide [one speed] [two speed] [3-step infinitely variable] [2-step infinitely variable] pendant pushbuttons for control of the [hoist] [bridge][and][trolley].] Provide pendant pushbuttons for control that spring return to the OFF position. Voltage in the pendant pushbutton station must not exceed 150 Volts AC or 300 Volts DC.[Provide a maintained two-position selector switch for slow speed selection.] The pendant must be rated for the NEC Hazardous Classifications specified in the Crane Design Criteria "Classification" Section.

[2.4.7.1.1 Pendant Conductor System

Provide a festoon type pendant conductor system. The festoon cables must be flat cables suspended from carriers riding on an I-beam or C-track. The pendant controller must be capable of traveling the entire length of the bridge and move independently of the trolley. Festoon loops must not extend below the high hook position.

]][2.4.7.2 Radio Control System

Provide each system with a [belly box] [handheld] [_____] type portable transmitter unit [and an identical back-up transmitter unit].[Provide each transmitter with an adjustable belt or harness to support it when worn by the operator]. Only one transmitter at a time can control the crane and there must be no interference from one crane's controller affecting operation of the other cranes in the building. Each transmitter must include: individual [infinitely variable spring return joystick motion control levers] [push button controls] for each hoist, trolley, and bridge; a maintained contact, keyed switch, marked ON-OFF, for portable transmitter unit power; indication of Battery Power, and indication of Transmitting Status; a red emergency STOP mushroom pushbutton; [and]a floodlight on/off pushbutton[and a maintained slow speed selector switch]. The transmitters and all controls must each be clearly and permanently labeled with functionality and direction. Directions for controllers must be in accordance with CMAA 70 recommendations. The remote radio control system must be designed to meet the requirements of NEMA ICS 8, Part 9 and ECMA 15. Each radio remote control lever must be in the OFF position before the associated crane function can begin. The system frequency must be within the unlicensed FCC Part 15 range. Each control unit must maintain a continuous status signal to the associated receiver during operation. There must be no significant loss in systems efficiency and function at the end of eight hours of continuous battery use. Provide a contact monitoring board with the crane radio system receiver.

][2.4.7.3 Cab Control Station

All crane motions/functions must be able to be controlled from an integral operator's control chair.[Provide three master switches integrated into the chair, two on the left side and one on the right side.][All master switches must be of the single axis type operating in the forward/reverse direction.][Provide all master switches with infinitely variable speed control to the particular function.] Directional contacts must be utilized to ensure proper motions are executed. Provide all master switches with a detent neutral position. All master switch operating handles must be in the OFF position before any initial crane function can begin. Provide all master switches with dead man controls. All controllers must be clearly and permanently labeled for proper function and direction. Provide pushbuttons that are guarded to prevent accidental activation, except for the STOP/POWER OFF pushbutton.[Directions for controller movement must be in the general direction of movement of load and in accordance with CMAA 70 recommendations. The two left side master switches must control the bridge function (outermost stick) and the trolley function (innermost stick). The right master switch must control the Main hoist.]

[2.4.7.3.1 Left-Hand Operator Control Panel

Identified as follows:

NAMEPLATE: Description – Function.

a. POWER ON: Blue momentary pushbutton – Energizes the mainline contactor as long as all joysticks are in the OFF position.

b. POWER OFF: Push-pull type, red mushroom head pushbutton – Emergency Stop / De-energizes the mainline contactor.

][2.4.7.3.2 Right-Hand Operator Control Panel

Identified as follows:

NAMEPLATE (SECOND LINE OF NAMEPLATE): Description – Function.

a. SPEED RANGE (MICRO - NORMAL): Two-position selector switch – Toggles between the micro and normal drive operations.

b. HORN: Black momentary pushbutton – Sounds the warning horn mounted outside of the operator's cab.

c. FLOODLIGHTS: Two-position selector switch – Toggles the floodlights On/Off.

]]2.4.8 Electrification Systems

****

NOTE: Various methods may be used to transfer power from the runway to the crane (Runway Conductor System) and then again to the trolley (Bridge Conductor system). Typically, the Runway Conductor System is a set of conductor bars on the runway and collector shoes on the crane. Bridge Conductor system is typically a set of festoon cables.

Site conditions and environment might require the design to deviate from the norm. Hazardous locations will need to be designed with either a cable reel or festoon system.

****

2.4.8.1 Runway Conductor System

[a. Provide a rigid runway Conductor Bar System for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. UV resistant. Steel (non-stainless) conductor bars are prohibited. The crane must be grounded through the runway electrification system. The grounded conductors must be a minimum of 70 square millimeters. Provide runway conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. If there is any way the hook block or wire rope can swing into the runway electrification, provide a guard installed to prevent contact.

b. Provide two Collector Shoes (tandem design) for each conductor; each collector shoe must be rated for not less than the overcurrent protective device for the runway conductor system, so as to provide redundancy.

][c. Provide a Festoon System for the runway conductor system utilizing cables suspended from carriers riding on an I-beam or C-track for the crane, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. Conductors must be fabricated from copper. The crane is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG. Provide conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][d. Provide a Cable Reel System for the runway conductor system, including all necessary cables and hardware to connect the cable reel to the floor level fused disconnect switch. The cable reel must have three power conductors and an equipment grounding conductor. The crane is required to be grounded through this conductor system. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The grounded conductors must be a minimum of 2/0 AWG.

][e. Provide a totally enclosed flexible cable tray electrification system (cable chain) for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. The cable chain must have three power conductors and an equipment grounding conductor. The conductors must be selected so as to be of the longest length without splices. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The crane is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG.

]2.4.8.2 Bridge Conductor System

[a. Provide Festoon System for the bridge conductor system utilizing cables suspended from carriers riding on an I-beam or C-track. Conductors must be fabricated from copper. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][b. Provide a Cable Reel System for the bridge conductor system. The cable reel must have three power conductors, an equipment grounding conductor, and all necessary control cables. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley must be grounded through the cable reel connection and all conductors must be of copper construction. The grounded conductors must be a minimum of 2/0 AWG.

][c. Provide a totally enclosed flexible cable tray electrification system (cable chain) for the bridge conductor system. The cable chain must have three power conductors, an equipment grounding conductor, and all necessary control cables. The conductors must be selected so as to be of the longest length without splices and must be copper. A minimum of 20 percent of the control circuit conductors in the flexible cable tray system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG.

]2.4.9 Capacity Overload Protective Device [and Load Indicating Device]

****

NOTE: Overload protection on a crane is required and is provided by two types of systems: Capacity

Overload Protection and Over-Torque Limit.

The Over-Torque Limit only applies to cranes with VFD controls. It is a parameter setting in the drive and is typically set at 150 percent. Cranes with magnetic controls do not have this feature. Delete third paragraph if VFD controls are not specified.

Capacity Overload Protection is usually adjustable. If adjustable, it needs to be set at less than the crane's minimum test load. This protection can take the form of one of the following devices:
1. Clutch – Not adjustable and is common on package hoists.
2. Load Limit Switch – Installed on the wire rope and measures deflection. Does not require a break in the wire rope and is simply clamped onto the wire. Typically used on smaller hoists that have magnetic controls.
3. VFD Drive Overload Protection – Similar to the Over-Torque Limit, but is set at a lower setting. Adjusted via parameters within the drive.
4. Separate Load Indicating Device – This involves the installation of a load cell and a digital readout that displays weight. The load cell is usually bolted onto the end of the wire rope or is installed as a pin in one of the sheaves.

****

a. Provide a capacity overload protective device for all hoist systems [using VFD drive capacity overload protection (separate from torque limiting feature of the VFD)] [using the load indicating device (LID) described in the next paragraph]. Set hoist capacity overload protection at [_____]. Hoist capacity overload protection must be adjustable between 80 and 150 percent of hoist capacity. Provide a keyed override or other means to disable the hoist capacity overload protection when performing a load test.[If a non-adjustable slip clutch is utilized, the OEM factory setting is acceptable and must be identified.]

[b. Provide an LID for the [main][and][auxiliary] hoist[s].[Provide [a display] [displays] installed on the underside of the bridge of each crane to provide load information from the load indicating system, to be displayed in kilograms pounds, for [both] the [main][and][auxiliary] hoist[s].][Provide [a display] [displays] installed in the cab of each crane to provide alarm circuits and continual load readout information from the load indicating system, to be displayed in kilograms pounds, for [both] the [main][and][auxiliary] hoist[s].] The display[s] must be large enough so that the operator can read the load value[s] [from the ground level] [while seated in the operator's cab]. The load indicating system capacity is to be compatible with the maximum test load for each hoist. The accuracy of the load indicating system is to be such that the indicated load is not less than 100 percent of the actual load, and not more than 110 percent of the actual load. The load indicating system must be configured with a set point for an overload limit. Provide Tare (zero) functionality at each operator's station for [the] [each] load indicating system. Any load bearing components used in the LID system must be steel, have a minimum design factor of 5 to 1 based on ultimate tensile strength and a hardness not to exceed HRC 40. Precipitation hardened stainless steel load bearing elements must be aged hardened at a minimum temperature of 1025 degrees F.

][c. Initially, set the torque limiting capability of the VFD (that is separate from the capacity overload protective device) to 150 percent of the motor torque (amperage) necessary to hoist 100 percent load. It may be adjusted up only to avoid nuisance trips and adjusted down if possible while still avoiding nuisance trips.

]2.4.10 Enclosures

****

NOTE: Select classification of control panels, controls, and brakes based on the environmental conditions in which the crane will be installed:
1. Choose one of the following for an indoor installation: 1, 2, or 12.
2. Choose one of the following for an outdoor installation: 3, 4X, or 8.
3. Choose on of the following for a Class I Hazardous installation: 7 (indoor) or 8 (indoor/outdoor).
4. Choose one of the following for a Class II Hazardous installation: 9 (indoor).

Other enclosure types exist that might be a better alternative for a particular installation. If necessary, refer to NEMA 250.

****

a. Provide enclosures for control panels, controls, and brakes in accordance with NEMA 250 and NEMA ICS 6, Classification Type [1 indoor, general purpose] [12 indoor without knockouts, general purpose] [2 indoor, drip-proof] [3 outdoor, dust-tight, rain-tight, sleet-resistant] [4X outdoor] [7 indoor Class I hazardous] [9 indoor Class II hazardous] [8 indoor/outdoor Class I hazardous][_____]. Provide enclosures with listed drains to prevent accumulation of water within the enclosure. There must not be any condensation inside the control panels. If anti-condensation heaters are provided, these heaters must remain energized when the main line contactor is deenergized.

b. Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.

c. Gaskets of enclosures and fixtures, and joints and contact surfaces of hazardous/explosive enclosures must be kept free of any paint to prevent damage during removal and reinstallation of gaskets of enclosures.

[2.4.11 Warning Devices

****

NOTE: A warning horn or light is required for all radio controlled cranes and recommended for all others.

****

[Provide a warning horn that is operable from a push button at the [pendant pushbutton] [radio control] station.][Provide a warning [strobe] [rotating beacon] that is illuminated at all times during movement of the hoist, trolley, or bridge function.]

][2.4.12 Floodlights[and Walkway Illumination]

****

NOTE: Outdoor cranes require exterior footwalks, ladders, and stairs to be illuminated to 5 foot-candles.

****

Provide evenly spaced floodlights along the bridge. Select floodlights to provide an illumination level of 40 foot-candles at three feet above the finished floor. All lights must be vibration resistant and designed to prevent any material from falling from the fixture. Switch the floodlights from the [pendant pushbutton] [radio controlled] station.

[[Exterior] footwalks, ladders and stairs must be illuminated to 5 foot-candles.

]][2.4.13 Indicator Lights

Provide Indicator Lights mounted in an enclosure on the bottom of the bridge with lights sized and positioned to be visible from the ground. The lights must be the dual-lamp type. Provide a white light to indicate that power is available on the load side of the crane disconnect and a blue light to indicate that the main contactor is energized. Light voltage must be 115 VAC. Provide nameplates that are legible from ground level. The nameplates must read, in their respective order, "POWER AVAILABLE" and "CRANE ENERGIZED". The POWER AVAILABLE light must be supplied by a separate, fused transformer for its energization.

]2.4.14 Wind Speed Indicating System

Provide a wind speed indicating device. The transmitter must be mounted on the highest unobstructed location.

[2.4.15 Electrical Outlets

Provide a minimum of [one] [_____] 120 VAC duplex outlet[s] on the crane, mounted [on] [in] the [outside of the control panel(s)] [trolley] [cab] [_____]. The circuit(s) supplying receptacles must incorporate ground-fault circuit-interrupter protection for personnel and be protected by a circuit breaker with a minimum rating of [15] [20] amps.

]2.4.16 Cyber Security of Control Systems

****

NOTE: Cyber Security of Control Systems requirements are tailored to NAVFAC.

****

****

NOTE: SECNAVINST 5400.15 designates NAVFAC as the functional technical authority for WHE. NAVFAC is

designated as Functional Security Control Assessor (FSCA) and the Functional Authorizing Official (FAO) for Ashore Control Systems in their domain; therefore, this includes WHE control systems. WHE control system owners are responsible for the Information System Security Engineer (ISSE) functions and producing artifacts (documentation) for review by the FSCA and FAO.

All new and electrically overhauled cranes must implement the following cybersecurity requirements as applicable to the control system architecture (i.e., networked drives, non-networked drives, and any wireless applications) so that supporting artifacts and considerations are available for the implementation of the RMF process.

****

a. Provide the following for PLC, RTU, Supervisory Controller, or other network-capable (whether networked or not upon delivery) control devices as applicable:

  (1) Hardware list (Hardware list must include the following for each device):
    (a) Manufacturer
    (b) Model
    (c) Location
    (d) Key technical ratings (e.g. memory)
    (e) Serial number
    (f) MAC addresses
    (g) IP addresses

  (2) Software List (Software list must include the following for each device):
    (a) Manufacturer
    (b) Version/subversion
    (c) Location/device
    (d) Used network ports/protocols/services

  (3) List and discussion of all security features of Contractor hardware and software.

b. For every PLC, RTU, Supervisory Controller, or other network-capable control devices (whether networked or not upon delivery), deliver the following on CD/DVD:

  (1) Original firmware
  (2) Original firmware hash
  (3) SOP for application of firmware updates/patches
  (4) POC or website for firmware updates/patches
  (5) Count of interfaces and types
  (6) Protocols in use, per interface
  (7) Configuration file
  (8) SOP for configuration

2.4.16.1 Control System and Network

****

NOTE: Select options a. & b. if a standalone laptop

is required.
****

[a. Provide a rugged laptop type workstation (computer) complete with all compatible software (including software licenses), redundant physical back-up copies on CD/DVD of the installed software, and all necessary cables and special connectors to allow crane software to be troubleshot, checked and upgraded, and for the data recorder to be accessed and information retrieved. Equip the workstation with a CD/DVD drive and the associated CD/DVD burning software. The workstation must also be equipped with USB ports (2.0 and 3.0), an Ethernet port, and a serial port. Delivering the software on a USB (flash drive) device is prohibited.

b. The laptops must be designed for an industrial environment and must be shock resistant and weatherproof as a minimum. Provide the laptop with a built-in CD/DVD reader with the capability to burn CDs and DVDs including associated software to burn CDs and DVDs.

] c. The Contractor must provide all equipment, including software and hardware, necessary for testing, installation, and communicating/troubleshooting all systems provided with the crane (e.g. engine/generator, control system, LID, etc.). The Contractor must provide all crane specific operational software files (e.g. ladder logic, functional block programming, etc.) for their associated systems (e.g. control systems, LID, engine generator, etc.).

d. A single common networked design must not be used for the control systems. A network for an individual function may be used as long as a failure of the network does not affect any other function/network except as defined for specific safety interlocks (e.g. LMI system). A common crane network may be used in a monitoring mode for recording faults and trending and is encouraged. Failure of the monitoring system must not affect crane functions.

e. All provided hardware and software must be currently marketed products, not currently scheduled for end of life or obsolescence, to ensure system sustainability.

f. Ensure there is no remote access capability enabled as remote access capabilities are prohibited. Physically disable or remove all modem/network devices not required for operational purposes.

2.4.16.2 Software and Services

a. Remove all Software and Services not required for operation and/or maintenance of the product. If removal is not technically feasible, then disable software not required for the operation and/or maintenance of the product. Configure the product to allow the ability to re-enable ports and/or services if they are disabled by software. The removal of software or services may not impede the primary function of the product. If software that is not required cannot be removed or disabled, document a specific explanation and provide risk mitigating recommendations and/or specific technical justification. The software/service to be removed and/or disabled includes, but is not limited to:

(1) Cameras

(2) Games

(3) Device drivers for product components not procured/delivered

(4) Messaging services (e.g., email, instant messenger, peer-to-peer file sharing)

(5) Source code

(6) Software compilers in user workstations and servers

(7) Software compilers for programming languages that are not used in the control system

(8) Unused networking and communications protocols

(9) Unused administrative utilities, diagnostics, network management, and system management functions

(10) Backups of files, databases, and programs used only during system development

(11) All unused data and configuration files

(12) Remove and/or disable, through software, physical disconnection, or engineered barriers, all services and/or ports in the procured product not required for normal operation, emergency operations, or troubleshooting. This includes communication ports and physical input/output ports (e.g., USB docking ports, video ports, and serial ports).

b. Provide documentation showing all disabled ports, connectors, and interfaces for all network-capable devices. In addition, the documentation must provide summary documentation of the procured product's security features and security-focused instructions on product maintenance, support, and reconfiguration of default settings.

c. For the evaluation status of hardware and software, the Contractor must provide information on Common Criteria or National Information Assurance Partnership (NIAP) or Federal Information Processing Standards (FIPS) evaluation status of hardware and software.

2.4.16.3 Access Control

a. The Contractor must configure each component of the procured product to operate using the principle of least privilege. This includes operating system permissions, file access, user accounts, application-to-application communications, and energy delivery system services.

b. Provide user accounts with configurable access and permissions associated with one or more organizationally defined user role(s), where roles are used.

c. Provide a system administration mechanism for changing user(s') role (e.g., group) associations.

d. The Contractor must document control system access control options by defining access and security permissions, user accounts, and applications with associated roles.

e. Provide recommended methods for the Acquirer to prevent unauthorized changes to the Basic Input/Output System (BIOS) and other firmware. If it is not technically feasible to protect the BIOS to reduce the risk of unauthorized changes, the Contractor must document this case and provide mitigation recommendations.

2.4.16.4 Control System Account Management

The Contractor must document all accounts (including, but not limited to, generic and/or default) that need to be active for proper operation of the procured product.

Remove or disable any accounts that are not needed for normal or maintenance operations, emergency, or troubleshooting of the energy delivery system.

2.4.16.5 Session Management

The Contractor may not allow multiple concurrent logins using the same authentication credentials, allow applications to retain login information between sessions, provide any auto-fill functionality during login, or allow anonymous logins.

Provide account-based and group-based configurable session-based logout and timeout settings (e.g., alarms and human-machine interfaces).

2.4.16.6 Authentication/Password Policy and Management

Provide a configurable account password management system that allows for, but is not limited to, the following:

a. Changes to passwords (including default passwords)

b. Selection of password length

c. Frequency of change

d. Setting of required password complexity

e. Number of login attempts prior to lockout

f. Inactive session logout

g. Screen lock by application

h. Comparison to a library of forbidden strings

i. Derivative use of the user name

j. Denial of repeated or recycled use of the same password

The Contractor must time stamp log files.

2.4.16.7 Logging and Auditing

Provide logging capabilities that cover the following events, at a minimum (as appropriate to their function):

a. Information requests and server responses

b. Successful and unsuccessful authentication and access attempts

c. Account changes

d. Privileged use

e. Application start-up and shutdown

f. Application failures

g. Major application configuration changes

2.4.16.8 Heartbeat Signals

The Contractor must identify heartbeat signals or protocols and recommend which should be included in network monitoring. At a minimum, a last gasp report from a dying component or equivalent must be included in network monitoring.

The Supplier must provide packet definitions of the heartbeat signals and examples of the heartbeat traffic if the signals are included in network monitoring.

2.4.16.9 Patch Management and Updates

The Contractor must verify that procured products (including third-party hardware, software, firmware, and services) have appropriate updates and patches installed prior to delivery.

Provide documentation of the patch management program and update process (including third-party hardware, software, and firmware). This documentation must include resources and technical capabilities to sustain this program and process. Provide the Contractor's method or a recommendation for how the integrity of the patch is validated by the Acquirer as well as the Supplier's approach and capability to remediate newly reported zero-day vulnerabilities.

2.4.16.10 Malware Detection and Protection

a. The Contractor is required to implement at least one of the following:

   (1) Provide a host-based malware detection capability that quarantines (instead of automatically deleting) suspected infected files. Provide an updating scheme for malware signatures. The Contractor must test and confirm compatibility of malware detection application patches and upgrades.

   (2) If the Contractor is not providing the host-based malware detection capability, the Contractor must suggest malware detection products to be used and provide guidance on malware detection and configuration settings that will work with Contractor products.

b. The Contractor must validate that cybersecurity services running on the procured product (e.g., virus checking and malware detection) do not conflict with other such services running on the procured product.

c. For malware detection and protection, the Contractor must provide, or specify how to implement, the capability to automatically scan any removable media that is introduced to the product being acquired.

2.4.16.11 Physical Security

Provide lockable or locking enclosures or rooms for energy delivery systems and system components (e.g., servers, clients, and networking hardware) and for the systems used to manage and control physical access (e.g., servers, lock controllers, and alarm control panels). Provide a method for tamper detection on lockable or locking enclosures. If a physical security and monitoring system is used, tamper detection must be compatible. The Contractor must ensure that physical security features do not hamper the crane system operations. Provide the tools and instructions for making changes to locks, locking codes, keycards, and any other keyed entrances.

2.4.16.12 Wireless Technology

For wireless technology provisions, the Contractor must document:

a. Specific protocols and other detailed information required for wireless devices to communicate with the control network, including other wireless equipment that can communicate with the Contractor-supplied devices.

b. Use, capabilities, and limits for the wireless devices.

c. Power and frequency requirements of the wireless devices (e.g., microwave devices meet the frequency requirements of Generic Requirements [GR]-63 Network Equipment Building System [NEBS] and GR-1089).

d. Range of the wireless devices and verify that the range of communications is minimized to both meet the needs of the Acquirer's proposed deployment and reduce the possibility of signal interception from outside the designated security perimeter.

e. Wireless technology and associated devices compliance with standard operational and security requirements specified in applicable wireless standard(s) or specification(s) (e.g., applicable IEEE standards, such as 802.11).

f. Configuration control options that enable varying of the security level of the devices.

2.4.16.13 Control System Inventory

Provide the complete control system inventory. The Control System Inventory must include the following attributes, in tabular format, as applicable:

General Information	Location Information	Hardware Details	Operating System and Platform	Network Information (Actual Function, not potential function)
Unique ID	Facility Name	Device Type	Embedded OS (Yes/No)	MAC Address(es)
Barcode or Identifier	NFAID	Device Sub-Type	OS Contractor	IP Address(es)
Region	Commodity	Device Function	Operating System (O/S)	Upstream Device
Installation	Floor	Manufacturer	O/S Version	Protocols In Use
Special Area (Option DNA1)	Room	Product Line	Platform Contractor	Host Name
	Location	Model No.	Platform Product Line	
	System Type	Serial No.	Platform	
	Functional System or Equipment Control	Remote Connectivity: (Wired / Wireless / None)	Platform Version	
		Network Type Used: (Serial / Ethernet / Both / None)		

2.5 PAINTING SYSTEM

****

NOTE: Three-coat zinc primer/epoxy/polyurethane system is provided for mild to severe atmospheric, indoor and outdoor cranes. For cranes in abnormal environments including exposure to chemicals or in immersion service, a system designed for that environment should be used. Other systems may suffice for milder environments.

****

a. Remove all grease, oil, and surface debris by solvent wiping or detergent/water scrubbing, prior to blast cleaning. Prepare surfaces to be coated by abrasive blasting to SSPC SP 6/NACE No.3, Commercial Blast Cleaning, or in accordance with the coating manufacturer's requirements, whichever is more stringent.

b. Use a painting system appropriate for the conditions provided in the Crane Design Criteria section. Paint exposed portions of the crane using a [three] [_____]-coat system as follows: [zinc-rich primer consisting of a minimum of 85 percent zinc by weight in the dry film, an anticorrosive epoxy intermediate coat, and an aliphatic polyurethane top coat] [_____]. All paint products must be supplied by a single manufacturer and free of chromates, lead, and mercury. Apply each coat in accordance with manufacturer's instructions and requirements. Ensure each coat is smooth, even, and free of runs, sags, orange peel, and other defects. Desired color of finish coat is [brilliant yellow] [_____]. Submit product data for painting system.

c. Coat faying surfaces of bolted connections per RCSC A348, but do not apply finish paint.

d. Paint the load block [brilliant yellow] [_____] with black diagonal striping. Paint, coatings, or galvanizing on the following items or areas is not acceptable: hoist wire ropes, hooks, hook nuts, running bearing surfaces (including sheaves and wheel treads), grease fittings, or other items not normally painted.

e. Factory paint electrical and mechanical equipment in accordance with the manufacturer's best standard practice (for the specified environment), except that electrical equipment doors, which expose current-carrying electrical conductors when opened, must be orange.

2.6 IDENTIFICATION PLATES

Furnish and install identification plates. Provide non-corrosive metal identification plates with clearly legible permanent lettering giving the manufacturer's name, model number, serial number, capacity in both kilogram and pound units printed in different colors, and other essential information or identification.

2.6.1 Markings on Crane, Trolley, and Hook

To avoid operation of the crane in the wrong direction, affix the appropriate directions (NORTH, SOUTH, EAST, and WEST) with arrows on the bottom of the girder where they can be easily seen by the operator and from the loading point. Provide labels on the controls with corresponding directional (NORTH, SOUTH, EAST, and WEST) markings. Markings must agree with the markings on controller. Do not indicate directional arrows on controller.

Mark the hook rated capacity in kilograms pounds on both sides of the hoist load block.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

[3.2 SHOP ASSEMBLY AND TESTS

Shop assemble major components as completely as possible, except for reeving of drums and sheaves. Functionally test the crane system at the construction facility prior to shipment. The Government reserves the right to inspect the crane for compliance with this specification and to witness the functionality tests. Notify the Contracting Officer [14] [_____] days prior to starting testing operations.

]3.3 ERECTION AND INSTALLATION

Perform the entire crane erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's representative.

3.3.1 Mechanical Alignment

Align motors, couplings, brakes, gear boxes and drive components in accordance with manufacturer's instructions. Complete the Coupling Alignment Verification Record.

3.3.2 Electrical Adjustments

Adjust control system in accordance with manufacturer's instructions. Store a copy of all Control Parameter Settings (PLC, VFD). Provide the final alignment data on the Complete Schematic Wiring Diagram, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents. Provide the test conditions such as ambient temperature, motor load, date performed and person performing the alignment as part of the Operational Tests report.

3.3.3 Field Welding

Perform welding indoors, where possible. Surface of parts to be welded must be free from rust, scale, paint, grease or other foreign matter. Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M. Perform welding of girders and beams conforming to AWS D14.1/D14.1M.

3.3.4 Field Painting

Perform painting indoors, where possible. Field painting (including touch-up) must conform to the requirements of the coating manufacturer and as specified in PAINTING SYSTEM.

3.4 FIELD QUALITY CONTROL

3.4.1 Post-Erection Inspection

[After erection, the Contractor[, the Activity Crane Inspector/Test Director,] and the Contracting Officer must jointly inspect the crane bridge and hoist systems and components to determine compliance with specifications and approved submittals. Notify the Contracting Officer [_____] days before the inspection.]Provide a report of the inspection indicating the crane is considered ready for operational tests.

3.4.2 Operational Tests

****

NOTE: Determine if Government furnished certified test weights are available at the site. If not they must be provided by the Contractor.

****

Check the clearance envelope of the entire crane prior to picking or traversing any load to ensure there are no obstructions. Test the systems in service to determine that each component of the system operates as specified, is properly installed and adjusted, and is free from defects in material, manufacture, installation, and workmanship. Rectify all deficiencies disclosed by testing and retest the system or component to prove the crane is operational.[The Contractor must furnish test weights, operating personnel, instruments, and other apparatus necessary to conduct field tests on each crane. Solid weights must be measured using calibrated equipment traceable to National Institute of Standards and Technology (NIST) with a minimum accuracy of plus or minus two percent.]

3.4.2.1 No-Load Test

Raise and lower each hook through the full range of normal travel at rated speed for three complete cycles. Raise and lower each hook, testing other speeds of the crane. Verify proper operation of hoist limit switches. Operate the bridge and trolley in each direction the full distance between end stops. Operate through the entire speed range and verify proper brake operation. Verify correct operation of all indication and ancillary devices.

3.4.3 Test Data

Record test data on appropriate test record forms suitable for retention for the life of the crane. Record operating and startup current measurements for hoist, trolley, and bridge motors using appropriate instrumentation (i.e., clamp-on ammeters). Compare recorded values with design specifications or manufacturer's recommended values; abnormal differences (i.e., greater than 10 percent from manufacturer's or design values) must be justified or appropriate adjustments performed. In addition, note, investigate, and correct any high temperatures or abnormal operation of any equipment or machinery. Record hoist, trolley, and bridge speeds during each test cycle.

3.4.4 Hook Tram Measurement

Establish a throat dimension base measurement by installing two tram points and measuring the distance between these tram points (plus or minus 0.4 mm 1/64 inch). Record this base dimension. Measure the distance between tram points before and after load test. An increase in the throat opening from the base measurement is cause for rejection.

3.4.5 Load Tests

****

NOTE: The following paragraph contains NAVY Tailoring. The NAVY requires a load test of 125 percent (plus 0 minus 5) of the rated load.

****

Perform the following tests for each hoist, as specified below.

Test loads used in this section are defined as the following:

Wire rope run-in load: 25 – 50 percent of rated load.

Rated load test: [100 percent (plus 0 minus 10)] [100 percent (plus [_____] minus [_____])] of rated load.

Overload test: [125 percent (plus 0 minus 5)] [125 percent (plus [0] [_____] minus [5] [_____])] of rated load.

3.4.5.1 Wire Rope Run-In

The primary purpose of this procedure is to exercise the newly installed wire rope.

Place the load on the hook. Start at ground level and hoist up to one foot below upper limit at slow speed. Hoist down to lower limit at slow speed. Repeat hoisting and lowering of the load for approximately 10 hoisting cycles, increasing the speed for each cycle. During this test, the capacity overload lockout should not activate.

3.4.5.2 Rated Load Test

3.4.5.2.1 Hoist

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees to check bearing operation with no binding. Observe lowering that may occur which indicates a weakness in the structure or malfunction of hoisting components or brakes. Verify that maximum beam and girder deflections do not exceed CMAA 70 design limits.

b. For hoists with primary and secondary holding brakes, raise the test load and release the secondary holding brake while testing the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage secondary holding brake and release the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage the primary holding brake. Recheck proper operation of time delay and ensure smooth positive stopping.

c. Hoist Mechanical Load Brake (if present): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

d. Raise and lower test load through the full lift range and visually observe smooth control and acceleration between points. Completely stop the machinery at least once in each direction to ensure proper brake operation.

e. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.2.2 Trolley

Operate the trolley (if space is available) the full distance of the bridge rails in each direction with a test load on the hook. Check proper functioning through the range of speeds. Verify proper brake action.

3.4.5.2.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway (if space is available) in one direction with the trolley at the far end of the bridge, and in the opposite direction with the trolley at the opposite end of the bridge. Use extreme caution. Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

3.4.5.2.4 Trolley Loss of Power Test

With a test load of 100 percent of rated load, raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of trolley travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the trolley stops and that the brake sets properly. Measure the distance required for the trolley to stop.

3.4.5.2.5 Bridge Loss of Power Test

With a test load of 100 percent of rated load, raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of bridge travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the bridge stops and that the brake sets properly. Measure the distance required for the bridge to stop.

3.4.5.3 Overload Test

3.4.5.3.1 Hoist

Disconnect or adjust the overload limit device to allow the hoist to lift the test load. Verify proper operation of the overload limit device after it is reconnected.

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees to check bearing operation with no binding. Observe lowering that may occur which indicates a weakness in the structure or malfunction of hoisting components or brakes.

   For hoists with primary and secondary holding brakes, raise the test load and release the secondary holding brake while testing the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage secondary holding brake and release the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage the primary holding brake. Recheck proper operation of time delay and ensure smooth positive stopping.

b. Raise and lower test load and visually observe smooth control. Stop the load during raising and lowering to verify that the brakes holds the load.

c. Hoist Load Brake (if present): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.3.2 Trolley

Operate the trolley the full distance of the bridge rails in each direction with a test load on the hook (one cycle) through the range of speeds. Verify proper brake action.

3.4.5.3.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway in one direction with the trolley at the extreme end of the bridge, and in the opposite direction with the trolley at the opposite extreme end of the bridge (one cycle). Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on-site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [two] [_____] hard copies of operation and [two] [_____] hard copies of maintenance manuals for the equipment furnished along with an electronic copy (PDF) of each on a Compact Disc. Provide one complete set prior to performance testing and final copies upon acceptance. Provide operation manuals that detail the step-by-step procedures required for system startup, operation and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, including weekly, monthly, semi-annual, and annual required maintenance items, possible breakdowns and repairs, and troubleshooting guides. Also include as-built drawings, piping and equipment layout, design calculations, Control Parameter Settings and printouts of any software, and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course.

[3.7 FIELD TRAINING

****

NOTE: Training is recommended, but not required.

****

Conduct a training course for [_____] operating and maintenance staff[and provide a copy of the training material to each participant]. Provide a training period consisting of a total of [_____] hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and [_____].

][3.8 FINAL ACCEPTANCE

****

NOTE: Use this paragraph as written for projects where the crane is the principal construction element, or represents a very significant portion of the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.

****

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on wire rope, hook, and electrical collector bars.

SECTION 41 22 13.15

BRIDGE CRANES, OVERHEAD ELECTRIC, UNDER RUNNING TROLLEY

11/22, CHG 1: 02/23

****

NOTE: This guide specification covers requirements for top running and under running single girder electric traveling (OET) cranes with under running trolleys and hoists, Crane Manufacturers Association of America (CMAA) 74 Class A, B, C and D suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments Crane capacities less than 23 metric ton 25 ton 23,000 kg 50,000 pounds. For NAVY, crane capacities in this specification should be limited to 9,100 kg 20,000 pounds for administrative purposes.

Single girder under running crane configuration is not recommended for spans greater than 12 meters 40 feet or capacities greater than 9,100 kg 20,000 pounds. Utilize multiple single girder spans or see Section 41 22 13.14 BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING for top running double girder configurations more appropriate at longer spans and higher capacities. Contact Navy Crane Center for more information (Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000)

This guide specification incorporates the design criteria and requirements identified in NAVCRANECEN INSTRUCTION 11450.2A (December 2018).

This guide specification includes tailoring options for NAVFAC, pounds (per NAVFAC P-307), and tons. The NAVFAC tailoring option also includes requirements specific to the Navy and Marine Corps. Crane procurements for the Navy and Marine Corps must select the NAVFAC tailoring option.

Crane tailoring options are included for the Air Force, outdoor, ordnance/explosives handling, or hazardous (explosive) environments. Only one unique

specialized application tailoring option should be selected at a time, however multiple can be used with additional specific project editing in the resulting sections. "General Purpose Service" is the default crane condition unless an alternate specialized tailoring option is selected. When "Maximum Anti-Spark" protection is required, the "Minimum Anti-Spark" tailoring option MUST ALSO be selected as the maximum requirements are in addition to the minimum requirements.

Selection or deselection of a tailoring option (select view-tailoring options) will include or exclude that option in the section. Specific project editing is still required for the resulting section.

****

****

NOTE: Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

****

NOTE: Use this guide specification to specify cranes that are procured as part of a building construction contract for such applications as machine shops, warehouses, and other areas that do require specialized weight handling equipment.

Explanations of CMAA service classifications A through D are covered in the "Notes" portion of paragraph CRANE DESIGN CRITERIA, sub-paragraph CLASSIFICATION. The minimum allowable classification for Ordnance/Explosive Handling is CMAA service class D. Navy Crane Center minimum requirement is CMAA service class C.

Forward all procurement of OET systems at Naval Shore based activities with rated capacities of 9000 kg 20,000 pounds or greater or for use in specialized applications (e.g., ordnance handling, molten metal handling, special purpose service as defined in NAVSEA Publication 0989-030-7000, hazardous/explosive area environments, or precision

handling operations requiring complex or synchronized lifting capacity) to: Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000. (See NAVCRANECEN INSTRUCTION 11450.1C of 11 JULY 2019).
****

****
NOTE: This specification covers cranes with top running or under running bridge and under running trolley and hoist, single girder, with CMAA 74 service class of A through D.

Control types and systems may be specified as follows:

1. Remote or Pendant Crane Controls or a combination of the two can be provided.

2. Alternating current (AC) control systems must be specified. The vast majority of new cranes are AC powered and AC controlled.
****

****
NOTE: The RFP must provide the relevant dimensions and load data for the crane. See "Crane Inquiry Data Sheet" in CMAA 74 section 6.1 or see "Crane Information Form for Under running Cranes(s)" pages 5 and 6 at the following Navy Crane Center link:

https://ncc.navfac.navy.mil/Popular-Links/DOWNLOADS/

Projects that are routed through Navy Crane Center should be accompanied by a completed Crane Information Form (CIF) per the above link.
****

****
NOTE: Show the following information, as a minimum, on the project drawings:

1. Complete details of plan, elevations, and sections of crane.

2. Runway track system (if installed), including span and size of girder, runway rail size, channel cap size, size and location of crane stops, and building clearances.

3. Electrical junction box location (including mounting height).
****

PART 1 GENERAL

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

a. Crane Bridge: That part of an overhead crane system consisting of a girder, end trucks, walkway, and drive mechanism which carries the trolley(s) and travels along the runway rails parallel to the runway.

b. Crane Runway: The track system along which the crane operates horizontally, including track hangar rods, track connection devices, and runway structural supports.

c. Dead Loads: The weight of all effective parts of the bridge structure, the machinery parts, and the fixed equipment supported by the structure.

d. Crane Bridge Girder: The principal horizontal beam of the crane bridge structure. It is supported by the crane end trucks. Typically for single girder cranes the trolley mounted hoist is suspended from the girder below the crane. For double girder cranes, the trolley is typically run on top of the bridge girder and the hoist is mounted on top of the trolley.

e. Insulated Link: A component normally installed between the hook and the lifting wire rope or lower load block, or below the hook to prevent the flow of electrical energy. Insulated links are primarily used when there is the possibility radio frequency energy collecting on the weight handling equipment structure. Insulated links are used extensively in the handling of ordnance.

f. Lifted Load: The load consisting of the rated load and the weight of lifting devices attached to the crane such as the load block, bucket, or other supplemental devices.

g. Original Equipment Manufacturer (OEM): the Company that produced the part or original equipment.

h. Packaged Hoist: A commercially designed and mass produced hoist characterized by the motor, gearing, brake(s), and drum contained in a single package often connected by the use of c, d, or p-face flanges.

i. Patented Track: A generic term referring to track built in accordance with MHI MH27.1 utilizing a composite track section incorporating a proprietary bottom flange shape. For this crane system, it is provided for the crane bridge girder and also the crane runway track, if under running.

j. Pendant: A control for a hoist and a crane. The pendant hangs from the hoist or the crane by a cable at a height that is easy for the operator to reach.

k. Rated Load: The maximum working load suspended under the load hook.

l. Standard Commercial Cataloged Product: A product which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing on the manufacturer's published product data sheets. These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

m. Top Running Crane: An overhead electric traveling crane that is supported by end trucks which run on top of supporting rails.

n. Trolley Load: The weight of the trolley and its associated equipment carried by the trolley wheels.

o. Under running (Underhung) Crane: An electric overhead traveling crane that is supported by crane end trucks suspended below the crane runway. The load is supported by hanging from the lower flange of a beam or patented track.

1.3 SYSTEM DESCRIPTION

****

NOTE: Remove the following sentence if the runway rail is not to be installed as a part of the crane procurement. If rail is to be installed, ensure Section 05 12 00 STRUCTURAL STEEL is included in the Request for Proposal (RFP).

Top running runway beam and runway crane rail are typically provided by the facility. Under running runway rail is typically provided by the crane contractor. See also CRANE BRIDGE GIRDER.

****

[The requirements for the structures supporting the crane runway are specified in Section 05 12 00 STRUCTURAL STEEL, and must conform to AISC 360.

]1.3.1 Crane Design Criteria

****

NOTE: Cranes installed outside the United States are still required to meet the features and characteristics specified.

When necessary, the design may be able to use the host nation's consensus standards in lieu of US standards. An equivalency study may be requested from the contractor to justify use of the international standard.

****

****

NOTE: Clearly show the area of hook coverage, runway dimensions, rail size, hook vertical travel, clear hook height, and lifting capacity on drawings.

****

Cranes will operate in the given spaces and match the runway dimensions and rails indicated. Hook coverage, hook lift, clearances, lifting capacity, and load test weight must not be less than that indicated. Provide loaded hook coverage to the maximum extent possible.

1.3.1.1 General

****

NOTE: For NAVY, crane capacity should be limited to 9,100 kg 20,000 pounds, since Navy Crane Center is required to be contacted for cranes with higher capacities.

****

****

NOTE: Add number of cranes, building name, bay, and crane rated load capacity in metric tons tons.

****

****

NOTE: For NAVFAC projects, capacity markings MUST be expressed in pounds unless the crane is located in Europe or Asia.

****

Include the following: Number of cranes [_____], located in building identified as [_____], [bay [_____],] with the capacity expressed in [_____] metric tons tons, for each crane. Also clearly locate and identify each hoist and system components.

1.3.1.2 Classification

****

NOTE: The need for single or double girder design is influenced by the capacity, span, and runway type.

For under running bridge girders (with runway suspended from the facility ceiling):

1. **Recommend a single bridge girder for total spans less than 12 meters 40 feet.**
    a. **If the total span is more than 12 meters 40 feet recommend two or more bridge girder spans of equal length.**

2. **For total spans more than 12 meters 40 feet or capacity more than 9,100 kg 20,000 pounds, an alternative option is two separate bridge girders for use with an underhung trolley/hoist.**
    a. **Double girder designs are unique for this type of application and are not covered under this specification.**

For top running bridge girders:

Recommend a single bridge girder for total spans less than 12 meters 40 feet for use with an underhung trolley/hoist. Multiple bridge girder spans is not an option for top running girders.
    a. **For total spans more than 12 meters 40 feet or capacity more than 9,100 kg 20,000 pounds, recommend two separate bridge girders for use with a top running trolley/hoist. For this configuration, see Section 41 22 13.14 BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING.**

****

****

NOTE: For NAVFAC, specify CMAA service class C or higher. For Ordnance/Explosives Handling, specify CMAA service class D.

****

****

NOTE: Make a selection from the following CMAA 74 service classifications:

Class A (Standby or Infrequent Service): This service covers cranes which may be used in installations such as powerhouses, public utilities, turbine rooms, motor rooms and transformer stations where precise handling of equipment at slow speeds with long, idle periods between lifts are required. Capacity loads may be handled for initial installation of equipment and for infrequent maintenance.

Class B (Light Service): This service covers cranes which may be used in repair shops, light assembly operations, service buildings, and light warehousing, where service requirements are light and the speed is slow. Loads may vary from no load to occasional full rated loads with 2 to 5 lifts per hour, averaging 3 m 10 feet per lift.

Class C (Moderate Service): This service covers cranes which may be used in moderate service requirements such as machine shops of paper mill machine rooms. In this type of service, the crane will handle loads which average 50 percent of the rated capacity with 5 to 10 lifts per hour, averaging 4.5 m 15 feet, not over 50 percent of the lift at rated capacity.

Class D (Heavy-Duty): This service covers cranes which may be used in heavy machine shop, foundries, fabricating plants, steel warehouses, container yards, or lumber mills and standard duty bucket and magnet operations where heavy-duty production is required. In this type of service, loads approaching 50 percent of the rated capacity will be handled constantly during the working period. High speeds are desirable for this type of service with 10 to 20 lifts per hour averaging 4.5 m 15 feet, not over 65 percent of the lifts at rated capacity. This service is the minimum requirement for Ordnance/Explosive Handling.

****

****

NOTE: Operating Environments

(1) General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as

General Purpose Service if they are operating in routine environments.

(2) Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Minimum requirement of CMAA service class D.

(3) Hazardous (Explosive) Environments: Locations where fire or explosion hazards may exist due to flammable gases, flammable liquid–produced vapors, combustible liquid–produced vapors, combustible dusts, or ignitable fibers/flyings. Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NFPA 70 Article 500. The activity safety office must identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

(a) Minimum Anti-Spark Protection is used when only the load block and pendant enter the explosive area. Anti-spark protection is required for the pendant controller, hook, hook block, and wire rope.

(b) Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane. In addition to the minimum anti-spark protections, the entire crane and runway components must also be protected against sparking.

****

****

NOTE: Hazardous Area Environments

Refer to NFPA 70 National Electric Code (NEC), Article 500 for hazardous area environment requirements and classifications. The determination(s) for hazardous area are made by the facility or project. Some, but not all, of the options are:
Class I, Division 1 or 2, and Group A, B, C, or D.
Class II, Division 1 or 2, and Group E, F, or G.
Class III, Division 1 or 2.

Class I: a location where explosive gases, vapors, or liquids are present.
Class II: a location where explosive or combustible dust is present.
Class III: a location where combustible fibers or flyings are present.
Division I: a location where the hazardous material

is present continuously, long term, or frequently.
Division II: a location where the hazardous material is not likely to be present or is present only in the short term.
Groups A, B, C, and D: a location where the hazardous material is a specific gas, liquid, or vapor.
Groups E, F, and G: a location where the hazardous material is specific dust, fiber, or flyings.

The height of the hazardous area directly affects crane requirements. For areas that encompass the floor and immediate area above the floor, the minimum anti-spark provisions for crane components entering the hazardous area are sufficient (anti-spark measures for the hook, load block, wire rope, and pendant). Minimum anti-spark protection is far more common than maximum anti-spark protection.

For hazardous areas that cover the entire crane envelope (i.e., bridge and trolley), the "maximum hazardous" tailoring option must be selected. This tailoring option adds anti-spark measures for the entire crane, such as electrical enclosures and wheels.
****

****
NOTE: The bracketed option for separate runways is necessary if ensuring more than one crane is not installed on the same runway for contracts with multiple cranes in the same building, bay, or location.
****

Provide [under running] [top running] single girder electric bridge crane(s), with under running trolley mounted hoist, conforming to MHI MH27.1, CMAA 70, and CMAA 74 service class [C] [D] [A] [B], as applicable. The crane(s) must be designed for operation in an [indoor] [outdoor] environment, [general purpose] [ordnance handling] [hazardous area] service, meeting the requirements of ASME B30.16 and ASME B30.17, with an ambient temperature range of [_____] to [_____] degrees Celsius Fahrenheit. The crane(s) must operate in an NFPA 70 Class [I] [II] [_____], Division [2] [1] [_____], Group [D] [_____] hazardous area. Hazardous protection is required from the finished floor level up to [1.5 meters 5 feet above ground level] [0.5 meters 1.5 feet above ground level] [full height of the crane] [[_____] meters feet above ground level]. The total crane span must be [_____] meters feet with a minimum vertical hook lift of [_____] meters feet and as specified herein. Provide runways for multiple span cranes equally spaced apart.[Provide separate runways for each crane.]

The crane must be [pendant controlled] [radio controlled] and operate in the spaces and within the loading conditions indicated. Provide a crane, including hooks and hoisting rope or load chain, that is able to clear permanent obstructions in all operating configurations.[The pendant controller must be mounted on a separate festooned cable system from the trolley power supply.] The crane must operate on [_____]-volts AC, [60 Hz] [_____], [three] [single] phase power source. Maximum loading on the facility (without impact) due to dead loads, trolley loads, and lifted loads, with the trolley in any position, must not exceed the allowable wheel loading and wheel spacing of the facility (or not exceed maximum hanger loading for under running cranes).

1.3.1.3 Rated Speeds

****

NOTE: Slow full-load operating speeds invariably provide improved load control and increased productivity.

****

****

NOTE: Specify the maximum rated speed under full load for the main hoist, bridge, and trolley.

1. Hoist speeds must conform to the recommendations of CMAA 74 or ASME tables. Trolley travel speed must conform to the recommendations of CMAA 74. A table of suggested hoisting and travel speeds can be found at the end of section 6 in CMAA 74.

2. Bridge travel speed must not exceed the maximum speed that the floor walking, crane pendent control operator can comfortably negotiate in a work area, approximately 750 mm/s 150 ft/min, and as recommended in CMAA 74.

****

****

NOTE: Recommend "Medium" rated speeds, where appropriate. Another consideration for operating speeds is the distance travelled per minute (e.g., 20 ft hook lift height corresponds to hook lift speed of 20 fpm). Consider limiting bridge or trolley travel speeds when operation occurs over shorter distances (e.g., for a 50 ft runway, a bridge travel speed of 50 fpm may be more appropriate than the 115 fpm "medium" speed).

Most projects will have a minimum and maximum speed entered. The speeds can be the same whether using two speed motors with magnetic controls or variable frequency drive controls.

Single speed motors will be selected if electronic controls are specified in paragraph CONTROLS. For 1-speed motors, only enter a maximum operating speed.

Two speed motors will be selected if magnetic controls are specified in paragraph CONTROLS. For 2-speed motors, recommend selecting a minimum speed that is 1/4 to 1/3 the maximum speed. Common maximum speed selections:
Wire Rope Hoists IAW ASME HST-4 (fpm): 15, 20, 30, 40
Chain Hoists IAW ASME HST-1 (fpm): 8, 15, 30
Trolley (fpm): 30, 50, 75, 100, 125
Bridge (fpm): 50, 75, 100, 150, 175

Cranes using variable frequency drive controls are more flexible regarding speed selection than magnetic contactor controls.

****

Provide the crane with rated (maximum) speeds within plus or minus 10 percent (in meters/second feet/min) for the main hoist, bridge, and trolley at the rated load as specified in the table below. The minimum speed must not exceed the values listed.

Rated Speeds meters/second feet/min		
Description	Minimum	Maximum
Main Hoist	[_____]	[_____]
Trolley	[_____]	[_____]
Bridge	[_____]	[_____]

The hook lift capacity and speed must be the manufacturer's standard within the limits specified.

[1.3.1.4 Foreign Design Standards and Practices

****

NOTE: This subpart is tailored to NAVFAC. This subpart will NOT typically be included and is to only be used when cranes are procured for international locations (outside of the United States), which could use contractors that design and build equipment for localities under different laws and standards.

****

a. Foreign design standards and engineering practices are acceptable, provided they are accompanied by satisfactory explanation and are shown to meet corresponding U.S. standards and practices, as approved by Navy Crane Center. Design calculations and drawings that use foreign language and nomenclature must be provided with corresponding English equivalents. Metric units may be used for both calculations and shop drawings, but they must include conversions to English units. In the case of calculations, only the initial inputs and final results need to be so converted. Professional training and accreditation of foreign engineers may vary in some aspects from those in the U.S., but they are satisfactory if comparable for the design work in which they engage. Mechanical properties and quality standards of common construction materials of foreign sources supplied in accordance with recognized standards that resemble those of ASTM and other U.S. standards are acceptable, as approved by Navy Crane Center. Typically, foreign welding procedures, materials, standards, and welder qualifications are comparable to those of AWS and are therefore acceptable. Provide all necessary certifications and other data for review and approval prior to start of work. Special attention must be given to ensure the weld sizes are being specified and measured uniformly. Unique constructions and metric sizes not complying with FS RR-W-410, the Wire Rope Users

Manual, or ASTM A1023/A1023M, may be used on Navy cranes, subject to Navy Crane Center review and approval of the specific applications. In selecting metric wire ropes for installation on new cranes with sheave and hoist drum grooves configured for a specific US wire rope size, the metric diameter must be within the limits of the wire ropes for which the sheave and drum are grooved. When the wire rope is installed on an older crane with sheave and hoist drum grooves configured for a specific U.S. produced wire rope size, the sheave and hoist drum grooving must be considered to ensure a satisfactory match with the wire rope. The capacities or ratings of components produced in foreign countries in compliance with foreign standards, and their installation requirements, must be converted to the English engineering units and verified for specification compliance.

b. Some components from foreign sources are prohibited due to practical considerations - either susceptibility to counterfeiting or maintenance and timely support. Specific examples are:

   (1) High-Strength Structural Bolts and Nuts. The use of structural bolts from foreign manufacturers is allowed provided the bolts meet Research Council on Structural Connections (RCSC) Specification for Structural Joints Using High-Strength Bolts (RCSC A348).

   (2) Electronic controls of foreign manufacturers are prohibited unless technical support is available in the U.S.

]1.4 VERIFICATION OF DIMENSIONS

The Contractor is responsible for the coordination and proper relation of their work to the building structure and to the work of all trades. Coordinate with the crane support structure design, where applicable, to provide the desired crane operating envelope (i.e., hook envelope and hook height). Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

1.5 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office

(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Manufacturer Qualification

Overhead Electric Crane System, including sub-system components manufactured by vendors, must be designed by, or directly supervised by, a registered professional engineer (PE). PE licensing must be by a board or agency authorized to license and register professional engineers. The PE may be a Contractor's regular employee or a consultant. The PE's review and attestation of specification compliance and professional responsibility must be signified by their PE original seal and dated signature on the final drawings. The professional engineers must only undertake and perform work under this contract in the branch(s) of engineering in which they are licensed.

1.6.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing, and documentation.

[1.6.2.1 Hook Proof Test

****

NOTE: Hook proof tests are required by the NAVY for custom designed or non-ferrous (bronze or stainless steel) hooks. Bronze/stainless steel hooks are generally associated with minimum hazardous area requirements. Hook material selected in LOAD BLOCK AND HOOK.

Outside of hazardous area anti-spark protection, this section will likely not be required for the NAVY. The hooks are required to be standard commercial components (i.e., not custom designed and manufactured).

****

Proof test custom designed or non-ferrous load hooks per ASME B30.10. Perform the proof test prior to Hook NDT.

]1.6.2.2 Inspection of Hook Assembly

****

NOTE: For NAVY, carbon steel hooks require magnetic-particle type inspections and non-ferrous hooks (typically anti-spark hooks for hazardous areas) require liquid penetrant type inspection.

NAVY acceptance criterion is no linear indications greater than 1.5 mm 1/16 inch. General recommendation is that linear indications greater than 1.5 mm 1/16 inch not be allowed.

Use of X-ray and ultrasonic inspection is not required for NAVY cranes.

****

Inspect hook [by a magnetic particle type inspection] [by liquid penetrant type inspection] [and X-rayed] [and tested ultrasonically] prior to delivery. Furnish documentation of hook inspection to Contracting Officer prior to field operational testing.

Acceptance standard is no defects. A defect is defined as a linear indication for which the largest dimension is greater than [1.5 mm 1/16 inch] [3 mm 1/8 inch] [_____] long. Welding repairs of hooks are not permitted. A hook showing linear indications, damage, or deformation is not acceptable.

[1.6.2.2.1 Hook Non-Destructive Test (NDT)

****

NOTE: This section is required for NAVY cranes.

Remove this section if the selecting agency does not require hook non-destructive testing or the necessary non-destructive testing is not IAW NAVY requirements.

For NAVFAC, add tailored paragraphs with additional requirements.

****

For hooks of ferromagnetic materials, magnetic-particle inspect the hook over the entire area in accordance with NAVSEA T9074-AS-GIB-010/271 or ASTM A275/A275M. For hooks of non-magnetic material, NDT must be liquid penetrant (PT) method in accordance with ASTM E1417/E1417M or NAVSEA T9074-AS-GIB-010/271. For PT testing of hooks containing stainless steels, titanium, or nickel based alloys, total halogens and Sulphur used in the NDT process must be controlled as specified in NAVSEA T9074-AS-GIB-010/271.

Inspect each hook and shank over the entire surface area. If NDT cannot be performed on surfaces inside small holes (e.g., hook/nut captivation roll pin holes), visually inspect those surfaces to the maximum extent practical.

a. Procedure for magnetic particle inspection: Conduct magnetic particle inspection in accordance with NAVSEA T9074-AS-GIB-010/271. ASTM A275/A275M may be used with the following restrictions: Do not use DC yokes (including switchable AC/DC yokes used in the DC mode) or permanent magnet yokes. Do not use automatic powder blowers or any other form of forced air other than from a hand-held bulb for the application or removal of dry magnetic particles. Remove arc strikes. Equipment ammeters must have an accuracy of plus or minus 5 percent of full scale (equipment ammeter accuracy other than that stated is acceptable provided the MT procedure states that a magnetic field indicator is used to establish and verify adequate field strength for all aspects of the inspection.)

b. Acceptance Criteria: Defects found on the hook will result in rejection of defective items for use on furnished hoist.

c. Test Report: Submit a test report of the inspection of each hook to the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The NDT procedures including technique sheets specific to the types, shapes, and size of the parts being examined must adequately describe the orientation of the hooks within the magnetizing equipment, as applicable. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheets, and certification to the Contracting Officer with the test report.

][1.6.2.3 Insulated Link Non-Destructive Test (NDT)

****

NOTE: Insulated link non-destructive test is required when an integral insulated lifting link is installed as selected in the LOAD BLOCK AND HOOK section. The insulating link is typically associated with OUTDOOR ordnance handling cranes. Insulated links integrated with the load block is uncommon, even for ordnance handling cranes.

****

Disassemble the link and connecting stud(s) in conjunction with disassembly of the hook and nut. Perform a visual inspection of the metal link ends for thread damage, wear, and corrosion. Apply a temporary sealing tape over the threaded holes to prevent moisture entry into the link while the link is disassembled. Perform a magnetic particle inspection of the stud in accordance with ASTM A275/A275M or NAVSEA T9074-AS-GIB-010/271. Acceptance criterion is no linear indications greater than 1.5 mm 1/16 inch.

Test Report: Submit a test report of the inspection to the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The NDT procedures including technique sheets specific to the types, shapes, and size of the parts being examined must adequately describe the orientation of the hooks within the magnetizing equipment, as applicable. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheets, and certification to the Contracting Officer with the test report.

]1.6.3 Drawings: Overhead Electric Crane System

a. Submit drawings showing the general arrangement of all components in plan, elevation, and end views to demonstrate proper interface with the facility and relation to other cranes on the same rail system, if applicable. Show all major features of the crane including: hook approaches on all four sides, clearances and principal dimensions, hoist, trolley and bridge drives, motor nameplate data, overcurrent protective device ratings, and electrical schematic drawings. Include weights and centers of gravity of major components (e.g., bridge girder(s), trolley/hoist). Indicate on the drawings the wind speed above which the crane must be placed in the stowed position.

b. Submit shop drawings of all fabricated components. Shop drawing quality must be equivalent to the contract drawings accompanying this solicitation. Drawings must be reviewed, signed and sealed by a licensed professional engineer.

c. Provide Bill of Materials for crane components on each drawing. The schedule must provide a cross reference between manufacturer data and shop drawings. Components listed on the schedule of crane components must include total quantity, description, original manufacturer, and part number. Distributing agents will not be acceptable in lieu of the original manufacturer.

d. Provide control system and network drawings. Network diagram must show equipment locations, names, models, and IP addresses on network communications schematic for all Programmable Logic Controllers (PLCs), Remote Terminal Unit (RTU), Supervisory Controller, and Other Network-Capable Devices. In addition, the drawings must consist of all software block, flow, and ladder diagrams.

1.6.4 Design Data: Load and Sizing Calculations

****

NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys. Coordinate seismic analysis requirement with paragraph SEISMIC FORCES.

****

Submit complete list of equipment and materials, including manufacturer's descriptive data, technical literature, and performance charts and curves. Submit calculations reviewed, signed, and sealed by a registered professional engineer verifying the load cases, sizing of the bridge girder(s), end trucks, travel drives, motors, overcurrent protection, and conduit. Provide a list of all codes and standards, design assumptions, equations, specified efficiencies, limits, factors of safety, component ratings, and sources of values used. Include free body diagrams or sketches of each load case. Ensure the crane is designed for the operating wind load case in accordance with CMAA 74 or MHI MH27.1, as appropriate. Determine the wind forces that will cause the outdoor crane to move in a parked condition with the brakes provided.[Include seismic analysis of crane.]

1.6.5 Certificates

All certifications must be dated and bear the original signature (above the printed name) of the authorized representative of the Contractor or the manufacturer of the items or equipment being certified. Submit certifications that clearly identify the crane, the drives, components, and location (as applicable) to which it applies:

[a. Wire Rope Certification with either the wire rope manufacturer's certification that the rope meets the published breaking force, or certification of the actual breaking force of a sample taken from the reel and tested. Show the published breaking force on the wire rope certificate; the actual wire rope breaking force must meet or exceed the published value. Certification must be traceable to the hoist, crane, and reel.

****

NOTE: A solid non-sparking wire rope (e.g., stainless steel) is the preference for hazardous areas.

Include the requirement for end user notification if the crane operates in a Division 2 hazardous area (per CLASSIFICATION) and drawn galvanized wire rope is allowed per HOISTING ROPE.

****

[(1) Drawn Galvanized Wire Rope End User Notification from the crane, hoist, or wire rope OEM notifying the end user that the crane is operated in a Division 2 hazardous area as defined by NFPA 70, which is a location where the hazardous material is not likely to be present or is present only in the short term. The wire rope is made of drawn galvanized steel, meaning it is manufactured from sparking materials but provided with a spark resistant outer layer. The outer layer or individual wire strands could become compromised if the wire rope is used in an improper manner or inadequately maintained, which would affect the integrity of the spark-resistant protection. In this scenario, immediate replacement is recommended. The wire rope will need to be evaluated and potentially replaced with a compliant configuration if the hazardous area Division is changed.

]]a. Load Chain Certification from either the load chain manufacturer or the hoist manufacturer that the chain samples taken and tested meet the chain manufacturer's designed minimum breaking force, and the load chain has been proof tested with a load at least equivalent to one and a half times the hoist rated load divided by the number of chain parts supporting the load. Certification must be traceable to the crane and hoist.

] **

NOTE: Insulated link mechanical and electrical proof test certifications are required when an integral insulated lifting link is installed as selected in the LOAD BLOCK AND HOOK section. The insulating link is typically associated with OUTDOOR ordnance handling cranes. Insulated links integrated with the load block are uncommon, even for ordnance handling cranes. Commands typically prefer to use insulated links in below the hook lifting devices (e.g., rigging gear).

****

[b. Insulated Link Mechanical Proof Test Certification from the insulating lifting link OEM showing that the insulated link was mechanically proof tested in accordance with ASTM F2973.

c. Insulated Link Electrical Proof Test Certification from the insulating lifting link OEM showing that the insulated link was electrically proof tested in accordance with ASTM F2973.

] d. Crane Runway Certificate stating that the new crane will operate properly on the runway. For runways provided by Contractor, include statement certifying runway has been aligned in accordance with CMAA 74 or MHI MH27.1, as applicable.

e. Hazardous Material Certificate that the crane does not contain hazardous material including asbestos, lead, cadmium, chromium, PCBs, or elemental mercury. Products required for the designing and manufacturing of cranes must not contain the prohibited materials.

f. Loss of Power Test Certificate stating that a test may be performed in which power is removed during operation without any detrimental effects to the crane.

****

NOTE: For NAVFAC, the Overload Test Certificate must state that the cranes can be periodically load tested to 125 percent (plus 0 minus 5 percent). Remove the conflicting Overload Test Certificate which allows for testing at different tolerances.

****

g. Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus 0 minus 5 percent) of rated load. Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus [0] [_____] minus [5] [_____] percent) of rated load.

h. Certificate of the Brake Adjustment Record. Provide a brake adjustment record and installation/maintenance manuals for each brake on the crane. Each brake measurement must have a tolerance traceable to the associated brake manual or documentation provided by the brake manufacturer, location of measurements, and the actual brake setting. Changes made to settings of the brake, at any time, will void the record.

i. Contractor Hazardous Environment Certificate stating that the new crane and all associated components including the hoist are designed for operation in the hazardous environment specified in the paragraph CLASSIFICATION.

j. Public Domain Software Certificate declaring that public domain software (e.g., freeware, shareware) is not used in the system.

k. Certificate stating that all Software and Services that are not required for operation and/or maintenance of the product have been removed. The software/services to be removed are identified in paragraph SOFTWARE AND SERVICES.

1.6.6 Welding Qualifications and Procedure

Welding must be in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep and not exceed those specified in AWS D14.1/D14.1M, MHI MH27.1 and CMAA 74. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M.

1.7 CRANE SAFETY

Comply with the mandatory and advisory safety requirements of ASME B30.10, ASME B30.16, ASME B30.17, ASME HST-4 or ASME HST-1, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306, and all applicable provisions of 29 CFR 1910 and NFPA 70.

[1.7.1 Nuclear Safety Analysis

****

NOTE: Certification is required for cranes handling nuclear materials. Results from the Safety Analysis will be utilized by the Using Agency as a basis for bridge crane certification. Delete this paragraph if the crane is not required to handle nuclear materials.

This paragraph is not applicable to NAVFAC projects. The Navy Crane Center must be involved with the procurement and overhaul of all NAVY cranes that handle Nuclear material as identified in the forward notes section of this specification.

****

Nuclear certification, testing, and rules of construction must be in accordance with 29 CFR 1910.147 and ASME NUM-1. Air Force Nuclear certified hoists must meet requirements of AFMAN 91-118. Submit analysis and test reports to Contracting Officer for approval.

]PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment. Material will be free from defects and imperfections that might affect the serviceability and appearance of the finished product. All material must be new and unused.

2.1.2 Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two bridge identification plates, one for each side of the bridge. Provide noncorrosive metal identification plates with letters which are easily read from the floor, showing a separate number such as BC-1, BC-2, for each bridge crane.

2.1.3 Capacity Marking

****

NOTE: NAVFAC requires markings to be indicated in pound units. The kilogram marking option is provided for cranes installed in a foreign country.

****

Mark the rated capacity in pound units [with kilogram units printed in a different color] on each side of the crane on the bridge girder. Capacity marks must be large enough to be clearly visible from the floor. Individual hoist units must have their rated capacity clearly marked on their lower block, and additionally labeled on the hoist body.

2.1.4 Safety Warnings

Affix labels in a readable position to each lift block or control station in accordance with ASME B30.16 and ASME B30.17. Submit safety warnings, diagrams and other instructions suitably framed and protected for display as indicated by the Contracting Officer as follows:

Design and locate the word "WARNING" or other legend to bring the label to the attention of the operator. Provide durable type warning labels and display the following information concerning safe-operating procedures: Cautionary language against lifting more than the rated load; operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; operating damaged or malfunctioning hoist; operating a rope hoist with a rope that is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

2.2 STRUCTURAL REQUIREMENTS

Structural requirements must be in accordance with CMAA 74 and MHI MH27.1, as applicable. Structural steel materials must conform to the standards permitted in CMAA 74, MHI MH27.1, and AISC 360. Skewing and other applicable lateral loads must be considered in the design.

2.2.1 Structural Connections

High-strength bolted structural connections must be designed and installed in accordance with RCSC A348. Bolts must be of ASTM F3125/F3125M Grade A325/A325M or Grade A490/A490M material. Galvanized bolts are not acceptable.

Welded connections for the crane must be performed in accordance with AWS D14.1/D14.1M. Welded connections to the building must be performed in accordance with AWS D1.1/D1.1M. Allowable stress values must comply with CMAA 74 or MHI MH27.1, as applicable.

2.2.2 Crane Bridge Girder

****

NOTE: Ordnance handling cranes must run on patented track. Tailor requirement to ordnance handling. Remove conflicting or redundant track options.

****

a. Provide crane bridge girder(s) of [rolled steel shape conforming to CMAA 74] [or] [patented track conforming to MHI MH27.1]. For ordnance handling cranes, provide crane bridge girders of patented track. Intermittent ("skip") welds on bridge girder elements (e.g., web and flange interfaces) are prohibited. If the girder is notched to fit over the end trucks, reinforce the girder ends with vertical and horizontal stiffeners. Splices in the unsupported length of the girder are prohibited.

b. For patented track girder(s), submit manufacturer's standard published tables that verify the crane bridge girder is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the bridge. Patented track girder must be of welded steel construction and fabricated by a manufacturer regularly engaged in the production of this type of beam.

c. Keep splices in the bridge girder(s) to a minimum and splices in high stress locations must be avoided. Make splices with complete joint penetration welds. Field (on-site) welded splices are prohibited.

2.2.3 Bridge End Trucks

****

NOTE: For cranes in hazardous areas which encompass the entire crane envelope, the drop lugs pose a sparking risk if it is metal-to-metal. Use the maximum anti-spark tailoring option to minimize this sparking risk.

****

Provide bridge end trucks conforming to ASME B30.17 and CMAA 74 or MHI MH27.1, as applicable. Configure end trucks with a feature that limits end truck movement to 25.4 mm one inch in the event of wheel or shaft failure. Provide drop (safety) stops with contact surfaces of non-sparking materials.

2.2.4 End Stops

Fit the crane bridge girder(s) with structural steel end stops. Locate stops to permit maximum trolley travel. Design end stops in accordance with MHI MH27.1 and ASME B30.17. Provide a system in which the travel wheels do not contact the end stops. End stops must be designed to absorb the maximum kinetic energy and impact force developed by the bumper contact. Provide end stops compatible with trolley bumpers and designed to bolt to the crane bridge girder.

2.2.5 Bumpers

****

NOTE: The following paragraph contains tailoring for MAXHAZ for cranes located in hazardous areas which encompass the entire crane envelope; the bumper to end stop connection poses a sparking risk if it is metal-to-metal. Use the maximum anti-spark tailoring option to minimize this sparking risk.

****

Fit bridge end trucks and trolley frames with shock-absorbing bumpers capable of decelerating and stopping the bridge and trolley within the limits stated by ASME B30.17. Ensure bumpers conform to ASME B30.17. Bumpers must fully engage end stops. Mount bumpers so that there is no direct shear on mounting bolts (if any) upon impact. Bumpers must provide adequate clearance between the crane and surrounding structure when compressed to preclude damaging equipment (clearance requirements are defined in MHI MH27.1 or CMAA 74, as applicable, and ASME B30.17). When more than one crane is located and operated on the same runway, bumpers must be provided on their adjacent ends or on one end of one crane. Fit the other end of the end-truck with a structural steel stop to engage the bumpers of the adjacent crane. Ensure bridge bumpers are properly aligned with runway end stops. Metal to metal contact at the bumper to end stop connection is not permitted.

[2.2.6 Crane Runway System

****

NOTE: For under running cranes, the runway and its support structure is usually supplied by the crane contractor. Use Crane Runway System only if crane contractor is to provide a new runway.

In general, the top running runway rail is outside the scope of this specification as it is typically provided by the facility. The crane must be designed to operate on a rail that meets CMAA 70 alignment criteria.

****

****

NOTE: For top running cranes, bridge end stops are typically provided by the facility and not the crane contractor. The crane contractor does supply end stops for under running cranes, since they typically supply the runway and its support structure.

****

a. Provide the complete runway track suspension system that is required to hang the crane runway track at its indicated location from the structural supports indicated on the drawings. Provide runway and support structure for under running crane of rolled steel shapes conforming to CMAA 74 or patented track girders conforming to MHI MH27.1.

b. For rolled steel shapes, locate splices under structural support members.

c. For patented track girders, perform splices as necessary in accordance with the manufacturer's recommendations and requirements. Align ends of lower T-section to minimize the horizontal gap on the running surface to not greater than 1.5 mm 1/16 inch and not greater than a vertical difference of 0.75 mm 1/32 inch for the wheel running surface alignment for a smooth crossing by the wheels. Splice assemblies must be from the same manufacturer as the patented track and located under structural support members. When runways are suspended, bracing preventing damaging lateral or longitudinal movement is required. Loads transmitted to the building through the suspension must have the review and approval of the building engineer of record (EOR) prior to installation. Submit manufacturer's standard published tables that verify the crane runway track is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the beams.

d. Runway support structure must be designed, fabricated, and installed such that runway rails meet the alignment tolerances of CMAA 74 or MHI MH27.1, as applicable. Provide means to allow for vertical adjustment of the runway track both before and after the system has been put in operation so that track can be erected and maintained level. Brace runway to restrain the track against damaging lateral and longitudinal movements. Where the runway track is suspended from hanger rods, provide means preventing the hanger rod nuts from backing off the rods. Allowable stress in hanger rods is 20 percent of the minimum specified ultimate strength of the material used.

e. For under running crane runways, design, fabricate, and install new runway end stops in accordance with ASME B30.17 and CMAA 74 or MHI MH27.1, as applicable. End stops must be designed to absorb the maximum kinetic energy and impact force developed by the bumper contact. Provide end stops compatible with end truck bumpers, designed to bolt to the runway support girders, and maximize bridge travel.

][2.2.7 Seismic Forces

****

NOTE: Seismic forces for under running cranes with under running trolley where the trolley is free to swing on the girder (i.e., single girder) are typically considered negligible. If not considered negligible, include the analysis section below. Seismic forces must be considered in the design of the cranes with a component importance factor of greater than 1.0 and in facilities with a Seismic Design Category of D, E, or F per ASCE 7.

Coordinate selection with paragraph DESIGN DATA: LOAD AND SIZING CALCULATIONS

****

Perform a seismic analysis as a part of the design of the crane in accordance with ASCE 7-16. The seismic analysis must be included in the CMAA 74 or MHI MH27.1 extraordinary load case (Case 3), as applicable.

For project locations beyond the scope of ASCE 7-16, a widely accepted design standard may be used for seismic analysis.

][2.2.8 Additional Provisions for Outside Service

****

NOTE: This paragraph is applicable for outdoor cranes only. See also TRAVEL DRIVES and TRAVEL BRAKES.

****

Seal weld structural members on outdoor cranes. Design members to prevent the collection of water on the crane. Provide a means to secure the crane against a wind pressure of 1.44 kPa 30 psf in accordance with ASME B30.17.

]2.3 MECHANICAL REQUIREMENTS

****

NOTE: For ordnance handling, further material restrictions exist.

****

a. Provide steel shafts, gears, and keys, with the exception of worm gears which may be bronze. No three or more bearing shaft configurations are allowed.

b. Cast iron and aluminum used to support components of the hoist power transmission train must be ductile. For the purposes of this specification, "ductile" is defined as having a minimum elongation of 5 percent in 2.00 inches. Gray cast iron load bearing parts are prohibited. Provide hoist speed reducer housings that are steel or ductile/malleable cast iron and hoist electric motor housings that are steel or ductile/malleable cast iron or cast aluminum.

c. Provide steel or ductile/malleable cast iron brake housings of motor mounted disc brakes, brake lining backing plates, shoes and shoe holders. Provide spring-set brake shoe or pad linings of a non-asbestos material.

d. All mechanical components must be accurately aligned and positively secured to maintain the alignment. Parts must not be forced into position to obtain apparent alignment.

e. Provide minimum bearing life in accordance with ASME hoist performance standards and MHI MH27.1 or CMAA 74, as applicable.

f. All "should" statements in CMAA 74, MHI MH27.1, and ASME B30 are considered to be "must" statements.

2.3.1 Threaded Fasteners

Fasten mechanical connections that are not part of a commercial packaged assembly with SAE J429 Grade 5 fasteners, ASTM F436/F436M washers, and SAE J995 Grade 5 nuts. Lubricate all mechanical fasteners unless otherwise specified by the original component manufacturer.

2.3.2 Hoist

****

NOTE: Generally, hoist duty class roughly aligns with CMAA class. An H3 hoist service duty class would typically be specified for a CMAA 74 service class C crane; H4 for service class D. See paragraph CRANE DESIGN CRITERIA, sub-paragraph CLASSIFICATION to identify the CMAA service duty class specified for this crane.

Selecting either electric chain hoists (ASME HST-1) and wire rope hoists (ASME HST-4) is not straight forward or consistent across all scenarios. Generally recommend electric chain hoists for lower lift heights (less than 6 meters 20 feet or lower capacities 4500 kilograms 10,000 pounds. Electric chain hoists only have the possibility of hoist duty

classes H2, H3, or H4.

For ordnance handling, CMAA class D is required and packaged hoists must be Duty Class H4 or better; generally recommend the use of chain hoists (ASME HST-1), if practical.

****

Provide hoist conforming to ASME B30.16, except as modified and supplemented in this section. Packaged hoist and trolley units (packaged hoists) must be [electric chain hoist conforming to ASME HST-1] [double reeved electric wire rope hoist conforming to ASME HST-4] Duty Class [H3] [H4] [H1] [H2]or better and be rated for the operating environment.

Configure trolley such that the trolley frame contacts the trolley stops and prevents the trolley from dropping more than one inch in the event of an axle or wheel failure. Provide drop (safety) stops with contact surfaces of non-sparking materials. Metal to metal contact at the bumper to end stop connection is not permitted.

2.3.2.1 Hoist Brakes

****

NOTE: Each hoist must have, at a minimum, two brakes. For packaged hoists, the most common brake configuration is one electro-mechanical spring set brake and one mechanical load brake (or self-locking worm gear).

Consider the CONTROLS paragraph under ELECTRICAL REQUIREMENTS.

If a variable frequency drive (VFD) is selected for use, the brake configuration must reflect the type of VFD selected (open loop). If open loop controls are selected, brake configuration must be one electro-mechanical brake and one mechanical load brake (or self-locking worm gear).

If not using a VFD, and electromatic controls are selected, the brake configuration must still be one electro-mechanical brake and one mechanical load brake (or self-locking worm gear).

Additional tailoring options are provided for NAVFAC cranes.

****

a. Equip the hoist with two holding brakes, each with a minimum torque rating of 125 percent of the rated load hoisting torque. Provide a brake configuration with one electro-mechanical spring set brake and one mechanical load brake, or self-locking worm gear, that stops and holds 125 percent of the hoist's rated load and does not require the load to be raised before being lowered.

b. Electro-mechanical brakes must have an externally accessible means of manual release. Provide manual-adjusting brakes designed to permit inspection and adjustment without disassembly of the brake. The brakes must be equipped with a manual self-return to ON brake release;

maintained brake releases must reset when power is applied. Double face-mounted brakes are not permitted.

2.3.2.2 Load Block and Hook

****

NOTE: Some text tailored to NAVFAC.

For text tailored to Minimum Anti-Spark requirements, remove conflicting requirements (i.e., load block cannot simultaneously be steel and anti-sparking or steel hook meeting ASTM A668 cannot also be non-sparking).

****

****

NOTE: Where space permits, the NAVY prefers forged carbon steel hooks due to NDT periodicity requirements, however that option is not mandated.

****

****

NOTE: In list item 'a.', select the load block option for sheaves and wire ropes for wire rope hoists and or chain hoists select the load block option for load chains.

List item 'c.', requirements for an integrated insulated link, is tailored to ordnance handling as that is the most likely scenario in which this component will be added to protect the load against the flow of electrical energy.

****

****

NOTE: For Ordnance Handling, the crane may need to be outfitted with an insulated link. If possible, the more flexible (and cheaper) option is to use an insulated link with the rigging gear (per NAVFAC P-307) when needed for specific lifts. However, an integrated insulated link may be necessary in the load block. Insulated links integrated with the load block are not common. For ordnance handling cranes, integral insulated links are more likely for OUTDOOR applications.

Insulated links must be provided to prevent the flow of electricity from radio frequency (RF) energy from traveling through the wire ropes and metal hook to the item being lifted in accordance with NAVSEA OP 5 Volume 1, Section 10-6.1, unless the following conditions are met:
1. There is no threat of a lightning strike during operations;
2. RF emissions control is in effect regardless of the HERO classifications of the ordnance being handled.

****

a. Provide a load block constructed of steel. Provide a load block constructed of non-sparking materials. Covering the exposed surfaces of the load block with bronze, stainless steel, or aluminum covers attached with similar fasteners is acceptable. The load block must be designed to prevent metal-to-metal contact of moving parts.[The block must be fully enclosed, concealing the sheaves and wire ropes, except for wire rope slots and drain holes. The design must preclude the wire rope from being cut, pinched, crushed, or chafed in case of two-blocking.][The design must preclude the load chain from being cut, pinched, crushed, or chafed in case of two-blocking. Provide sprockets constructed of non-sparking metals in the load block.] Standard commercial blocks may be used at their published ratings when their published design factors are 5.0 or greater.

b. Provide an unpainted and unplated forged [carbon] steel single barbed hook with a minimum material longitudinal elongation of 16 percent in 2 inches. Provide an unpainted and unplated single barbed hook of non-sparking material. Bronze clad hooks are prohibited. Hooks must conform to the requirements of ASME B30.10. The hook must be a standard commercial product with a published design factor of 5.0 or greater. Fit hook with a safety latch designed to preclude inadvertent displacement of slings from the hook saddle. The hook and hook nut must be removable without unreeving of the hoist. Provide hook nut secured to the hook with a commercial standard removable and reusable means. Do not weld hook nut. When provided, provide shank and nut threads with a Class 1 or 2 fit, per ASME B1.1. Uniquely mark the hook in a permanent fashion that is traceable to the NDT certification. The nut must be marked to match the hook. The hook nut must be of non-sparking materials. Hook must be free to rotate through 360 degrees when supporting the test load up to 125 percent of the rated capacity. Upper hooks of hook suspended hoists must be of non-sparking materials.

[c. Provide an insulated lifting link that is integrated with the load block and hook to prevent the flow of electrical energy to the lifted load.

(1) The insulated link must conform with ASTM F2973 and be designed with a minimum safety factor of five times the rated hook load.

(2) Each insulated link must be legibly and permanently marked with its safe working load in pounds.

(3) Provide each insulated link with a unique, legible, and permanent identification mark traceable back to its base tram measurement and nondestructive test (NDT).

(4) Establish tram points across the dielectric structure of the link. Tram reading must be recorded before and after the insulated link proof test. The link will be rejected if the difference in measurement exceeds the base tram measurement by more than one percent. Provide copy of insulated link proof test and NDT.

(5) Cover exposed metal portions of the insulated link with a non-sparking material, such as neoprene or polyurethane.

]2.3.2.3 [Hoisting Rope] [Hoisting Chain]

****

NOTE: Items a and b apply to wire rope and are for wire rope hoists only. In the hoist section, the appropriate packaged hoist must be chosen (ASME HST-4). If a wire rope hoist is chosen, item c (hoisting chain) must be removed from the specification. There is a tailored paragraph b option for wire rope in minimum hazardous areas; if selected, the standard item b wording must be removed.

Item c is optional and only applies to chain hoists. In the hoist section, the appropriate packaged hoist must be chosen (ASME HST-1). If a chain hoist is chosen, paragraphs a and b must be removed from the specification.

****

****

NOTE: For minimum anti-spark protection, add tailored paragraph section for stainless steel wire rope or chain. If stainless steel wire rope is required, remove entire conflicting paragraph requiring improved, extra improved, or extra-extra improved plow steel.

****

****

NOTE: A solid non-sparking wire rope (e.g., stainless steel) is the preference for hazardous areas.

There are some packaged hoist and capacity combinations (e.g., 5 ton capacity) in which the published stainless steel wire rope breaking strength for the given rope diameter cannot meet the prescribed design factors per ASME B30.16. In those instances an alternative wire rope material is necessary. Drawn galvanized wire rope is acceptable in Division 2 hazardous areas provided the crane, hoist, or wire rope OEM provide a notification to the end user with the wire rope certification / submittal. This notification will identify that the wire rope is made of drawn galvanized steel, meaning it is manufactured from sparking materials but provided with a spark resistant outer layer. The outer layer or individual wire strands could become compromised if the wire rope is used in an improper manner or inadequately maintained, which would affect the integrity of the spark-resistant protection.

****

[a. Wire rope must comply with ASME B30.30 and FS RR-W-410, ASTM A1023/A1023M, or BS ISO 4309 and have a rope classification appropriate for the usage. Wire ropes must be handled and seized in accordance with ASME B30.30. The wire rope must be in a double reeved configuration equalized with a sheave. Select wire rope minimum design factor in accordance with ASME B30.16. Provide proof of Wire Rope breaking force.

b. Provide hoist wire ropes with improved, extra-improved, or extra-extra-improved plow steel (or appropriate ISO grades), pre-formed, regular lay, bright, and uncoated, with an independent wire rope, wire strand, or otherwise, steel core. Hot-dipped galvanized wire rope is not permitted.

c. Wire rope must be spark resistant. Provide stainless steel hoist ropes with an independent wire rope, wire strand, or otherwise, steel core.[Drawn galvanized wire rope is acceptable in Division 2 hazardous areas when provided with a drawn galvanized wire rope end user notification.]

][d. Provide a welded link load chain suitable for powered hoist service with no less than a 5.0 to 1 design factor based on the minimum breaking force of the chain. Provide stainless steel load chain. The chain must be pitched and sized to pass over load sprockets without binding. Provide an equalizing method when the load is supported by more than one part of load chain. Provide the chain with a chain stop or dead end connection to prevent the load chain from running out of the hoist at its fully extended position. Provide chain hoists with 3 m 10 foot lift or more with a load chain bucket.

][2.3.2.4 Drum

****

NOTE: The DRUM and SHEAVE paragraphs apply to wire rope hoists (ASME HST-4). Remove DRUM and SHEAVE paragraphs for chain hoists (ASME HST-1).

****

Provide grooved drum made of steel. Design drum in accordance with ASME B30.16. All hoisting rope is to be wound in a single layer and provided with no less than two dead wraps of hoisting rope remaining at each anchorage when the hook is in its extreme low position.

2.3.2.5 Sheaves

****

NOTE: The DRUM and SHEAVE paragraphs apply to wire rope hoists (ASME HST-4). Remove DRUM and SHEAVE paragraphs for chain hoists (ASME HST-1).

****

****

NOTE: Tailoring option for minimum hazardous to provide sheaves of non-sparking metals in the load block. Steel sheaves in the upper nest may still be provided.

****

Provide steel sheaves. Provide sheaves constructed of non-sparking metals in the load block. Size sheaves in accordance with ASME B30.16 for the minimum pitch diameters of running and equalizer sheaves.

]2.3.3 Travel Drives

****

NOTE: Outdoor tailoring option for cranes to have half of the total wheels driven in order to provide adequate holding capability against non-operating wind loads without providing additional wind tie-downs. See also paragraph TRAVEL BRAKES

****

Provide under running travel assemblies with a minimum of one driven wheel on each side of the web and at least one quarter of all wheels driven.

The travel drive arrangement must consist of motor(s) driving through self-contained gear reduction units located at each driven wheel assembly. Gear reducers must be fully enclosed in an oil-tight housing and provided with a convenient means of lubricant level indication and draining. Open-type gearing is not acceptable, except for final drives. Outdoor cranes must have half of the total wheels driven.

2.3.3.1 Trolley Drives

****

NOTE: Trolley limit switches are an optional safety device.

Trolley travel limit switches are used to prevent the crane trolley from contacting the travel end stops at high speed should the crane operator mistakenly forget to slow down. If selected, ensure the appropriate options are chosen in the ELECTRICAL REQUIREMENTS, Limit Switches section.

****

Provide a motor-driven trolley arrangement. Acceleration and deceleration must meet the requirements specified in CMAA 70.[Provide trolley travel limit switches].

2.3.3.2 Bridge Drives

****

NOTE: Bridge limit switches are an optional safety device.

Bridge travel limit switches are used to prevent the crane bridge from contacting the travel end stops at high speed should the crane operator mistakenly forget to slow down. If selected, ensure the appropriate options are chosen in the ELECTRICAL REQUIREMENTS, Limit Switches section.

****

Provide a motor-driven bridge arrangement. Acceleration and deceleration must meet the requirements specified in CMAA 74.[Provide bridge travel limit switches].

2.3.3.2.1 Bridge Travel Gearing

Gearing must conform to ANSI/AGMA 2001 and AGMA 908, with internal and external gear dimensional tolerances conforming to the applicable AGMA standard for tooth geometry and tolerances.

2.3.3.2.1.1 Bridge Travel Reducer

Gear reducers must be standard commercial products designed, manufactured, and rated in accordance with ANSI/AGMA 6013. Provide cranes with a CMAA service class "C" or higher with the corresponding "Industrial Duty" service factors. The speed reducer input (high speed) gear set must use helical (including double helical and herringbone), spiral bevel, or worm gear tooth forms. Provide torque arms that are not of the threaded rod type. Operation must be smooth and quiet.

2.3.3.2.1.2 Bridge Open Gearing

Provide all gears and pinions with adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2015-1 Accuracy Grade A8 or better. Wherever feasible, open gears must be enclosed with safety guards provided with openings with covers for inspection and access for grease lubrication.

2.3.4 Travel Brakes

****

NOTE: NAVFAC tailoring option for additional travel brake requirements.

Outdoor tailoring option for parking brake requirements. Parking brakes are one of the methods that can technically be used to secure outdoor cranes against high winds, however the requirements of TRAVEL DRIVES pushes the crane manufacturer in this direction. Another option chosen by the crane manufacturer could be rail clamps/anchors.

****

Provide travel drives with an end-mounted electro-mechanical spring set brake conforming to the requirements of CMAA 74 or non-freecoasting mechanical drive capable of stopping the motion of the travel function within a distance in meters feet equal to 10 percent of the full load speed in meters feet per minute when traveling at full speed with a full load. Parking brakes used to secure outdoor bridge cranes in accordance with ASME B30.17 must be sized to secure against a wind pressure of 1.44 kPa 30 psf.

Spring set brakes must be provided with an externally accessible means to manually release the brake. Provide manual-adjusting brakes designed to permit inspection and adjustment without disassembly of the brake. The brakes must be equipped with a manual self-return to ON brake release; maintained brake releases must reset when power is applied. Double face-mounted brakes are not permitted.

2.3.4.1 Trolley Brake

****

NOTE: NAVFAC tailoring option to require electro-mechanical brakes be end-mounted.

****

Provide brakes for underrunning trolleys/carriers sized in accordance with ASME B30.17, but not sized larger than 150 percent of the drive motor rated torque.

2.3.4.2 Bridge Brake

****

NOTE: NAVFAC tailoring option to require electro-mechanical brakes be end-mounted.

****

Provide brakes with a minimum torque rating per CMAA 74 according to the applicable environment, but not sized larger than 150 percent of the drive motor rated torque.

2.3.5 Wheels

****

NOTE: Wheels are typically steel for top running and steel or ductile cast iron for under running.

a. For ordnance handling, underhung wheels must be forged steel.

b. For hazardous areas requirement maximum anti-spark protection, wheels must be made of non-sparking material (e.g., bronze or stainless steel). Remove any conflicting items (i.e., wheels cannot be non-sparking and steel).

c. EXCEPTION: For ordnance handling cranes that also happen to require maximum anti-spark protection, the anti-spark protection is the controlling factor and wheels must be made of non-sparking material (e.g., bronze or stainless steel).

****

a. Top running wheels are to be straight tread, double flanged, and sized in accordance with CMAA 74 recommendations for wheel sizing and flange to rail head clearances. Wheel material must be forged steel. Provide wheels made from non-sparking material. Bronze wheels must have a minimum tread hardness of 225 BHN. Hollow stamped and gray cast iron wheels may not be used; the use of plate steel is prohibited. Provide steel wheels with a minimum tread hardness of 320 BHN.

b. Provide under running wheel sizing and flange-to-rail head clearances in accordance with MHI MH27.1 and CMAA 74 recommendations, as applicable. The wheels must be compatible with their respective runway profile. Wheel material is to be cast or forged steel, or ductile or malleable cast iron. Wheels are to be made of forged steel. Provide wheels of non-sparking material. Bronze wheels must have sufficient size and hardness to withstand the intended loading and use. Hollow stamped and gray cast iron wheels may not be used; the use of plate steel is prohibited. Minimum tread hardness for underhung wheels (non-bronze) that run on patented track is 375 BHN. Minimum tread hardness for wheels (non-bronze) running on structural shapes is 320 BHN.

[2.3.6 Drip Pans

****

NOTE: Drip pans may also be added for GPS or any other type of crane service if there is an additional requirement to prevent lubrication from falling to the floor or lifted load. Any portion of this section may be used to support the request of the Activity. Not recommended for outdoor service.

List items a. and b. are generic drip pan requirements for inclusion beneath gearboxes. List item c is less likely to be needed.

****

a. The crane must be designed to preclude leakage of lubricants onto the lifted loads or the floor. Equipment or components, which cannot be made leak-proof, must be fitted with unpainted corrosion resistant steel drip pans or must have the foundations seal welded to create a dam. Drip pans that utilize liquid sealant to prevent leakage of lubricants are not permitted.

b. The drip pans must be sized to hold the entire gear case fluid capacity, installed under all drive machinery, designed to permit easy removal of collected lubricant. A trolley floor designed to contain any lubricant drips may be used as fluid containment for any equipment that is mounted on it.

c. Provide drip pans fitted around the shank of the hook and extending outward to encompass all possible points of lubrication drips from the load block. The drip pans must be easily removable without disassembly of the hook or load block and cannot interfere with the crane structure during testing of the upper limits.

]2.4 ELECTRICAL REQUIREMENTS

****

NOTE: List item d., the voltage selected (e.g., 480) must match that provided for the crane in CLASSIFICATION.

****

a. The design, selection, rating, and installation of the electrical portions of the crane and its accessories must conform to the requirements of NEMA ICS 3,NEMA ICS 8, the applicable ASME HST standard, and NFPA 70, and other requirements specified herein.

b. All electrical components must be industrial grade, commercially available and comply with established national or internationally recognized approving organizations such as Underwriters Laboratories (UL) and Canadian Standards Association (CSA). All electrical components installed or operated in hazardous areas including but not limited to enclosures, junction boxes, disconnects, pendant controller, and electrification must be designed and rated for the NFPA 70 Hazardous Classifications specified in the paragraph CLASSIFICATION.

c. All electrical components must be located so they are easily accessible for inspection and maintenance without removing other parts, doors, or door center posts. Electrical equipment and panel wiring must be installed in a neat and workmanlike manner in accordance with Electrical Construction Standard NECA NEIS 1. Each motion of the crane must be provided with a separate control system or drive. The loss of any one function must not prevent the operation of other unaffected functions. Two independent relays, contactors, drive inputs, or other equivalent components/logic must be utilized for each function to provide directional control such that the failure of a single relay/contactor/component cannot result in motion in an unintended direction.

d. Disconnecting means for cranes must be in accordance with NFPA 70 Article 610.32. A permanent placard must be installed on the face of the main line disconnect that states "WARNING – THIS DOES NOT ISOLATE POWER TO LIGHTING, RECEPTACLES, AND ANCILLARY EQUIPMENT". Additionally, a lighting (ancillary equipment) disconnect must be provided, with lockout feature, as the isolation means for the lighting transformer and lighting circuit breaker panel, which must power the crane's ancillary equipment. It must feed [_____] VAC to the primary side of the transformer directly from the runway conductors via tapping the line side of the main power disconnect. Provide individual disconnects, with lockout feature, capable of being locked in the open position for bridge lights and receptacles.

e. Unless otherwise specified, interconnecting wiring must be of copper stranded construction complying with Table 310.104(A) of NFPA 70. Interconnecting wiring containing asbestos in the insulation or outer covering are prohibited. Aluminum conductors must not be used. Aluminum connectors are allowed if they are rated for use with copper conductors (marked "AL/CU"). All conductors connected to or routed above resistors must have insulation shown in NFPA 70 Table 610.14(a) for 125 degrees C 257 degrees F. For packaged hoists and hoist/trolleys, provide wiring sizes in accordance with NFPA 70 Table 610.14(a). Motor branch circuit conductors not part of a packaged hoist and hoist/trolley must be sized as to have an ampacity not less than 150 percent of the motor full load current rating and to be no smaller than 12 AWG. Conductors must be selected and de-rated based on maximum ambient temperature. Continuous loads such as utility, heating, lighting, and air conditioning must be multiplied by 2.25 to determine ampacity in order to permit application of NFPA 70 610.14 (A) for crane supply conductors. Wire-nuts are not permitted on splices. However, connections for lighting ballasts may be made using wire-nuts (if applicable).

f. Excluding conduit directly connected to dynamic breaking resistors, raceways must maintain a 12-inch clearance between the raceway and dynamic braking resistors. A separate grounding wire, sized in accordance with Section 250.122 of NFPA 70, must be routed with all ungrounded conductors. Only one equipment grounding conductor must be run in each conduit and be the largest size required for any circuit routed in that conduit. All wiring must be numbered or tagged at all connection points. Power conductors which are shielded such that their wire size cannot be easily determined must be labeled as to the conductor size. All unused conduit openings must be plugged.

g. When fiber optic cable is utilized, inspections and performance checks must be accomplished upon completion of on-site installation to ensure cable cleanliness and proper signal integrity. Testing and verification must be conducted by a knowledgeable fiber optics technician using specialized, calibrated equipment. Cables must be tested for signal loss/attenuation. The fiber optic system must also be tested using an Optical Time Domain Reflectometer (OTDR). Final attenuation and OTDR readings from each fiber optic cable run, including spares, must be documented as a baseline for future reference. All spare fiber optic cables must have protective covers over their ends to maintain cleanliness while not in use. When fiber optic cable is utilized the drive OEM's recommendations for encoders and optical to digital converters must be followed. All system components utilized for this purpose must have known compatibility prior to integration.

h. Power cables and low voltage signal cables may not be mixed in the same conduit.

i. The crane manufacturer must furnish and install all electrical equipment on the crane conforming to NEMA ICS 6, including motors, conforming to NEMA MG 1, electrically released brakes, switches, crane controllers, panels, operating station, wiring system, cables, and crane electrification.

2.4.1 Motors

****

NOTE: Inverter duty motors are required for open loop variable frequency drives (VFD).

Select two speed motors for bridge and trolley drives if magnetic controls are specified in paragraph CONTROLS; select single speed motors if electronic controls are specified in paragraph CONTROLS.

U.S. Navy allows only 60-minute duty rating motors. 30-minute duty rating motors require Navy Crane Center approval. For non-Navy applications, the motor duty rating may be selected to match what is required by the class of HST-1 or HST-4 hoist (such as H1, H2, H3) specified.

****

Motors must meet all applicable requirements of NEMA MG 1 and UL 1004-1. Use CMAA 70 calculations for motor horsepower in selecting bridge, trolley, and hoist drive motors. All motors must have a minimum of a [60] [30] [_____] minute duty rating and be Totally Enclosed Non Ventilated (TENV), Totally Enclosed Fan Cooled (TEFC), or Totally Enclosed Blower Cooled (TEBC).[Provide [two] [single] speed AC squirrel cage induction type motors for the bridge and trolley drives.] [Provide two speed, AC squirrel cage induction type motor for the hoist.][Provide inverter duty motors for Open Loop Variable Frequency Drives (VFD).] Provide motors with a minimum of Class F insulation. Provide motor overload protection utilizing a thermal sensitive device embedded in its windings. Provide motors painted to manufacturer's standard for "wash-down" service. Motors located outdoors must be furnished with anti-condensation heaters that remain energized when the mainline contactor is deenergized.

2.4.2 Controls

****

NOTE: If one or two speed point controls are

required, recommend magnetic controls. If three or more speed points or infinitely variable speed adjustment is needed, Variable Frequency Drive (VFD) controls are required.

****

****

NOTE: Use the first two paragraphs to select one or two speed control for the hoist, bridge, or trolley. Selections can be made using a combination of electronic controls and one or two speed motor controls for the various functions. Use the third, fourth, and fifth paragraphs to select electronic variable frequency drive controls for either the hoist, bridge or trolley. With VFD controls the hoist must be configured as open loop. Open loop is more cost effective and requires a mechanical load brake (or self-locking worm gear). Ensure the Hoist Brakes section of this specification reflect the type of controls chosen.

When the two-speed bridge and trolley motor is specified, the slow speed will be 1/3 to 1/4 of rated travel speed. Reduced voltage starting, acceleration, and deceleration, serve to reduce the acceleration rate that is normal for squirrel-cage motors. Squirrel-cage motors with two-speed magnetic controls provide satisfactory results with slow bridge and trolley speeds, and should be specified when short travel distances are involved and where fine positioning is not required.

For faster bridge and trolley speeds or finer positioning requirements, specify electronic controls.

Various VFD manufacturers offer an option to overspeed the hoist to a value over 60Hz (usually 120Hz). This allows the operator to position the hoist at faster speeds when it is not loaded. When selecting this feature list the maximum no load speed in paragraph RATED CAPACITY AND SPEEDS.

****

****

NOTE: The final paragraph for hoist brake bypass keyswitch is optional for hoists with one electro-mechanical spring set brake and one mechanical load brake. Choose this option if the Activity wants the functionality; the intent for this keyswitch is to allow for easier load testing of all hoist brakes while the crane is installed by bypassing the primary electro-mechanical brake for independent testing of the mechanical load brake.

****

[a. Provide [one] [two]-speed magnetic controls for the [bridge drive][,] [trolley drive][,] [and] [hoist] drive. Controllers must meet the requirements of NEMA ICS 8. Ensure that an energized drive motor initially rotates only in the direction selected by the operator by activating the corresponding direction; i.e., is not overhauled. For AC squirrel cage motor controllers, the requirements of NEMA ICS 2, Part 2, for general-purpose controllers, must be met.

[b. Provide the bridge and trolley motor control systems with a drift point between OFF and the first speed control point in each direction.

]]c. Provide static reversing, variable frequency drives (VFD) for the [bridge,] [trolley] [and] [hoist] electric controls.[Provide static reversing, VFD, speed regulated, closed loop, flux vector electric controls for the hoist[s]. For feedback, provide hoist motors with encoders. The hoist controller must enable the drive motor to develop full torque continuously at zero speed. The hoist secondary brake must be controlled separate from the primary and connected to different output (within the drive) from the primary brake.] VFD controllers must meet NEMA ICS 8, Part 8 and at a minimum, provide under-voltage protection, electronic instantaneous over current protection, DC bus over voltage protection, and be able to withstand output line to line shorts without component failure. Select bridge and trolley drives such that the continuous rating of the controller is not less than the calculated motor full load current based on CMAA 70 paragraph 5.2.9.1.1.1 and NFPA 70 Table 430.250. Select hoist drives such that the continuous rating of the controller is not less than 125 percent of the calculated motor full load current based on CMAA 70 paragraph 5.2.9.1.1.1 and NFPA 70 Table 430.250. All hoist drives must have a motor over-torque limit to lock out the hoist and prevent gross overload of the associated hoist. Provide dynamic braking for each electric drive that is sized per VFD manufacturer's requirements. Submit VFD Control Parameter Settings.

d. Provide speed control which is infinitely variable for each function, controlled via [radio control system] [and] [pendant pushbutton station].[Provide controls designed such that the maximum speed of each function will be limited to 25 percent of rated speed when a slow speed switch is actuated on the controller[s].[Energize a yellow/amber light/indicator while in slow speed mode.]]

e. The [hoist][,] [trolley][,] and [bridge] brakes must set after the associated controller decelerates the drive motor to a controlled stop. The hoist, trolley, and bridge, controllers must be sized to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 125 percent of rated load on the hook. The hoist controller must prove torque before release of the brakes and enable the drive motor to develop full torque continuously at zero speed. Motors must operate smoothly at all speeds without torque pulsations and must only be energized within the frequency range of 50-60 Hz at rated speed.[The hoist control system may utilize overspeed up to 120hz, unloaded only, if the drivetrain equipment has all been balanced and is rated for the resulting speed.]

] f. The use of definite purpose contactors is prohibited. If IEC contactors are used, the application cannot exceed the contactor manufacturer's AC3 ratings for the contactor at a minimum.

g. On hoist function roll-up must be less than 1/8 inch measured at the hook block and roll-back must not occur over the entire load range.

h. Use of Uninterruptible Power Supplies (UPS) is prohibited. Feed control circuits from a single phase, air cooled, double wound transformer with a grounded metal screen between the primary and secondary windings of the transformer.

i. Provide a main line contactor. Energization of the main line contactor must be controlled by the POWER-OFF/POWER-ON switch/pushbutton on all controllers. Upon actuation of the POWER-OFF pushbutton; power to all drive motors, brakes, and controls must be removed. The mainline contactor must not be able to be energize while the POWER-OFF pushbutton is actuated. The POWER-OFF pushbutton circuitry must be independent of all controls or any other electronic devices.

[j. Provide a spring returned brake bypass keyswitch for each hoist. The switch allows for actuation of the electro-mechanical brake for independent testing of the mechanical load brake. The normal position allows both brakes to work in their normal operating configuration. Label the keyswitch positions as "NORMAL" and "LOAD BRAKE TEST".

]2.4.3 Protection

Protection must not be less than that required by NEMA ICS 3, NEMA ICS 8, CMAA 74, NFPA 70, UL 1004-1, UL 943, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306 and all applicable provisions of 29 CFR 1910. All protection must be by circuit breakers or fuses. Provide a disconnect switch or enclosed type circuit breaker readily accessible to the crane operator for the crane disconnect. Motor branch circuits must be individually protected by inverse time circuit breakers capable of being locked in the open position. The means for locking must remain in place with or without the lock installed. Motor full load current from NFPA 70 Article 430, Part XIV (Tables) must be used to calculate the circuit breaker size.

Provide disconnecting means on the crane in accordance with NFPA 70 Article 610.32. Provide for lockout/tagout of all hazardous energy sources. Provide product data for all circuit breakers and fuses.

2.4.3.1 Conductors

a. The crane contractor is responsible for ensuring that all conductors from the load side of the existing floor level disconnect to the motor branch circuits have adequate overcurrent protection complying with one of the following:

   (1) Not be greater than the largest rating or setting of any branch circuit protective device plus the sum of the nameplate rating of all other loads per NFPA 70 Article 610.41(A).

   (2) Not be greater than the ampacity of all feeder conductors after all ampacity correction factors have been applied.

b. Conductors for brake coils must be protected by fuses or other protective devices. The device must be chosen to protect the brake circuit conductors from ground faults or short circuits.

2.4.4 Resistors

Provide resistors with natural convection cooling sized as recommended by the VFD OEM and fabricated of corrosion resistant metal; the use of "wire wound" type resistors is prohibited for segments of 8 ohms or less. Mount resistors in substantial, ventilated enclosures constructed entirely of non-combustible materials. When mounted outdoors provide stainless steel resistor enclosures. Provide resistors with terminals fitted in the coolest position in the enclosure.

[2.4.5 Transients and Harmonics Protection

****

NOTE: The following items are required only for VFD Controls.

****

a. Provide contactors and relays with appropriate Metal Oxide Varistors (MOV) or resistor-capacitor (R-C) surge absorbers installed across the respective coil.

b. Provide transient protection for electronic drive controllers that is either internal to the drive or via an MOV connected line-to-ground close to the line terminals of the drive.

c. Provide line reactors rated for continuous duty operation based upon the motor nameplate amperes. With motors of 50 horsepower or greater, harmonics protection must be provided by an isolations transformer or as recommended by the VFD OEM. For a drive motor branch circuit that exceeds 150 feet in length, a reactor must also be connected in series with the controller load (output) terminals to provide standing wave protection or as otherwise recommended by the VFD or motor OEM.

]2.4.6 Limit Switches

a. Provide primary upper and lower geared limit switches. Geared limits must allow reversing direction to back out of the limit without resetting. The lower limit switch must be set such that there are a minimum of two wraps of rope on the hoist drum.

b. Provide a backup mechanical hook block activated upper limit switch wired independent of the directional controllers and the primary upper limit switch that removes power from the hoist motor, hoist brake and hoist controls conforming to NEMA ICS 5. The backup limit must require hoist resetting prior to operation of the hoist in any direction.

c. For chain hoists, the upper hoist limit switch must be wired to remove all power from the hoist drive motor and brake(s) independent of the microprocessor drive. A two-position spring-returned bypass switch must be provided that allows for resetting of the final limit switch prior to resuming operation. During resetting of the final limit, the hoist must operate in the lowering direction only.

[d. Travel limit switches must be provided for the [bridge][and][trolley] motion to slow the crane to [25 percent] [_____] of its rated speed [[10] [_____] feet before the bridge end stops][and][[5] [_____] feet from the trolley end stops]. Limit switches must be mounted rigidly in a manner so as to protect the switch from misalignment or damage. The target/trip arm must be large enough to provide interception given a misalignment were to occur.

] e. Limit switches must be rated for the NFPA 70 Hazardous Classifications specified in the CLASSIFICATION paragraph of this specification.

2.4.7 Operator Controls

****

NOTE: Available operator controls are pendant, and radio control. Cranes can also be set-up to be controlled by two separate systems. For cranes with one set of controls use paragraph 1. For cranes with two sets of controls use paragraph 2. In such a case some type of interlock must exist to prevent control from both systems simultaneously.

The pendant can be suspended from the trolley or an independent festooned messenger track system. The festooned system allows the operator to have maximum separation from the load. When this is a requirement include section Pendant Conductor System section of this specification.

When specifying a radio control system, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANECENINST 11450.2:
1. What type of batteries? Rechargeable?
2. Are spare batteries needed? How many?
3. Are spare remote control units required? How many?
4. Is a battery charger required?
5. Type of transmitter unit.
6. Is a belt/harness required for the remote control?

****

[a. Provide crane equipped with a[pendant pushbutton station][radio control system].

][b. Provide crane equipped with both a pendant pushbutton station and a radio control system. Provide a selector switch to allow the use of only one of the two available control stations on the pendant controller.

] c. If VFD controls are not provided, provide directional contactors with both mechanical and electrical interlocks.

d. "Operator controls must be rated NEMA Type 7 for Class I, or NEMA Type 9 for Class II according to the NFPA 70 Hazardous Classifications specified in the CLASSIFICATION paragraph of this specification."

[2.4.7.1 Pendant Pushbutton Station

The cranes must be controlled from a pendant pushbutton station suspended from [the trolley] [an independent festooned messenger track system, operating the length of the bridge]. Provide multiconductor flexible cords for pendant pushbutton stations with No. 16 AWG minimum conductors. Provide a method of strain relief to protect the electrical conductors from damage. Locate the pendant pushbutton station [1200 mm 4 feet] [_____] above the finished floor. Pushbutton pendant station must have its elements legibly marked and arranged vertically, in order, in accordance with CMAA 74.[Provide [one speed] [two speed] [3-step infinitely variable] [2-step infinitely variable] pendant pushbuttons for control of the [hoist][,] [trolley][,] [and] [bridge].] Provide pendant pushbuttons for control that spring return to the OFF position. Voltage in the pendant pushbutton station must not exceed 150 Volts AC or 300 Volts DC.[Provide a maintained two-position selector switch for slow speed selection.] The pendant must be rated for the NFPA 70 Hazardous Classifications specified in the CRANE DESIGN CRITERIA, sub- paragraph CLASSIFICATION. Provide the pendant pushbutton station with a NEMA Type 7 for Class I, hazardous environments and NEMA Type 9 for Class II, hazardous environments, as classified by NFPA 70.

[2.4.7.1.1 Pendant Conductor System

Provide a festoon type pendant conductor system. The festoon cables must be flat cables suspended from carriers riding on an I-beam or C-track. The pendant controller must be capable of traveling the entire length of the bridge and move independently of the trolley. Festoon loops must not extend below the high hook position.

][2.4.7.1.2 Radio Control System

Provide each system with a [belly box] [handheld] [______] type portable transmitter unit [and an identical back-up transmitter unit].[Provide each transmitter with an adjustable belt or harness to support it when worn by the operator]. Only one transmitter at a time can control the crane and there must be no interference from one crane's controller affecting operation of the other cranes in the building. Each transmitter must include: individual [infinitely variable spring return joystick motion control levers] [push button controls] for each hoist, trolley, and bridge; a maintained contact, keyed switch, marked ON-OFF, for portable transmitter unit power; indication of Battery Power, and indication of Transmitting Status; a red emergency STOP mushroom pushbutton;[and]a floodlight on/off pushbutton[and a maintained slow speed selector switch]. The transmitters and all controls must each be clearly and permanently labeled with functionality and direction. Directions for controllers must be in accordance with CMAA 74 recommendations. The remote radio control system must be designed to meet the requirements of NEMA ICS 8, Part 9 and ECMA 15. Each radio remote control lever must be in the OFF position before the associated crane function can begin. The system frequency must be within the unlicensed FCC Part 15 range. Each control unit must maintain a continuous status signal to the associated receiver during operation. There must be no significant loss in systems efficiency and function at the end of eight hours of continuous battery use. Provide a contact monitoring board with the crane radio system receiver.

The Contractor must submit the frequency allocation application to the National Telecommunications and Information Administration (NTIA) via EL-CID version 6.1 software found on NTIA.gov. Provide the temporary authorization, and the final approved application when available. The technical section of the application must be completed by the manufacturer of the radio control equipment being furnished under this contract. Verify frequency availability at this activity prior to design approval.

]]2.4.8 Electrification Systems

****

NOTE: Various methods may be used to transfer power from the runway to the crane (Runway Conductor System) and then again to the trolley (Bridge Conductor system). Typically, the Runway Conductor

System is a set of conductor bars on the runway and collector shoes on the crane. The Bridge Conductor system is typically a set of festoon cables.

Site conditions and environment might require the design to deviate from the norm. Hazardous locations will need to be designed with either a cable reel or festoon system.

****

2.4.8.1 Runway Conductor System

[a. Provide a rigid runway Conductor Bar System for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. UV resistant. Steel (non-stainless) conductor bars are prohibited. The crane must be grounded through the runway electrification system. The grounded conductors must be a minimum of 70 square millimeters. Provide runway conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. If there is any way the hook block or wire rope can swing into the runway electrification, provide a guard installed to prevent contact.

b. Provide two Collector Shoes (tandem design) for each conductor; each collector shoe must be rated for not less than the runway conductor sizing, so as to provide redundancy.

][c. Provide a Festoon System for the runway conductor system utilizing cables suspended from carriers riding on an I-beam or C-track for the crane, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. Conductors must be fabricated from copper. The crane is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG. Provide conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][d. Provide a Cable Reel System for the runway conductor system, including all necessary cables and hardware to connect the cable reel to the floor level fused disconnect switch. The cable reel must have three power conductors and an equipment grounding conductor. The crane is required to be grounded through this conductor system. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The grounded conductors must be a minimum of 2/0 AWG.

][e. Provide a totally enclosed flexible cable tray electrification system (cable chain) for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. The cable chain must have three power conductors and an equipment grounding conductor. The conductors must be selected so as to be of the longest length without splices. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The crane is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG.

]2.4.8.2 Bridge Conductor System

[a. Provide Festoon System for the bridge conductor system utilizing cables suspended from carriers riding on an I-beam or C-track. Conductors must be fabricated from copper. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][b. Provide a Cable Reel System for the bridge conductor system. The cable reel must have an equipment grounding conductor, and all necessary control cables. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley must be grounded through the cable reel connection and all conductors must be of copper construction. The grounded conductors must be a minimum of 2/0 AWG.

][c. Provide a totally enclosed flexible cable tray electrification system (cable chain) for the bridge conductor system. The cable chain must have three power conductors, an equipment grounding conductor, and all necessary control cables. The conductors must be selected so as to be of the longest length without splices and must be copper. A minimum of 20 percent of the control circuit conductors in the flexible cable tray system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG.

]2.4.9 Overload Protection

****

NOTE: Overload protection on a crane is required and is provided by two types of systems: Capacity Overload Protection and Over-Torque Limit.

The Over-Torque Limit only applies to cranes with VFD controls. It is a parameter setting in the drive and is typically set at 150 percent of rated motor torque. Cranes with magnetic controls do not have this feature. Delete third paragraph if VFD controls are not specified.

Capacity Overload Protection is usually adjustable. If adjustable, it needs to be set at less than the crane's minimum test load; recommend setting at 100 percent of rated capacity or less. This protection can take the form of one of the following devices:

1. Clutch – Not adjustable and is common on package hoists.
2. Load Limit Switch – Installed on the wire rope and measures deflection. Does not require a break in the wire rope and is simply clamped onto the wire. Typically used on smaller hoists that have magnetic controls. Can also be installed as part of the equalizer sheave.
3. VFD Drive Overload Protection – Similar to the

Over-Torque Limit, but is set at a lower setting. Adjusted via parameters within the drive.

****

a. Provide a capacity overload protective device for all hoist systems[using VFD drive capacity overload protection (separate from torque limiting feature of the VFD)]. Set hoist capacity overload protection at [100] [_____] percent of rated capacity. Hoist capacity overload protection must be adjustable between 80 and 150 percent of hoist capacity. Provide a keyed override or other means to disable the hoist capacity overload protection when performing a load test. If a slip clutch is used as the overload limiting device, it must comply with all ASME B30.16 requirements. Provide adjustable slip clutches set at or less than the cranes maximum test load. If the slip clutch is non-adjustable, the OEM factory setting is acceptable and must be identified with the Product Data sheets and O&M manual.

[b. Initially, set the torque limiting capability of the VFD (that is separate from the capacity overload protective device) to 150 percent of the motor torque (amperage) necessary to hoist 100 percent load. It may be adjusted up only to avoid nuisance trips and adjusted down if possible while still avoiding nuisance trips.

]2.4.10 Enclosures

****

NOTE: Select classification of control panels, controls, and brakes based on the environmental conditions in which the crane will be installed:
1. Choose one of the following for an indoor installation: 1, 2, or 12.
2. Choose one of the following for an outdoor installation: 3, 4X, or 8.
3. Choose one of the following for a Class I Hazardous installation: 7 (indoor)or 8(indoor/outdoor).
4. Choose one of the following for a Class II Hazardous installation: 9 (indoor).

Other enclosure types exist that might be a better alternative for a particular installation. If necessary, refer to NEMA 250.

****

a. Provide enclosures for control panels, controls, and brakes in accordance with NEMA 250 and NEMA ICS 6, Classification Type [1 indoor, general purpose] [12 indoor without knockouts, general purpose] [2 indoor, drip-proof] [3 outdoor, dust-tight, rain-tight, sleet-resistant] [4X outdoor] [7 indoor Class I hazardous] [9 indoor Class II hazardous] [8 indoor/outdoor Class I hazardous] [_____]. Provide enclosures with listed drains to prevent accumulation of water within the enclosure. There must not be any condensation inside the control panels. If anti-condensation heaters are provided, these heaters must remain energized when the main line contactor is deenergized.

[b. Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.

] c. Gaskets of enclosures and fixtures, and joints and contact surfaces of hazardous/explosive enclosures must be kept free of any paint to prevent damage during removal and reinstallation of gaskets of enclosures.

2.4.11 Warning Devices

****

NOTE: A warning horn or light is required for all radio controlled cranes and recommended for all others.

****

[Provide a warning horn that is operable from a push button at the [pendant pushbutton] [radio control] station.] [Provide a warning [strobe light] [rotating beacon] that is illuminated at all times during movement of the hoist, trolley, or bridge function[, but may be deactivated on the operator control station].]

[2.4.12 Floodlights

Provide evenly spaced floodlights along the bridge. Select floodlights to provide an illumination level of 40 foot-candles at three feet above the finished floor. All lights must be vibration resistant and designed to prevent any material from falling from the fixture. Switch the floodlights from the [pendant pushbutton] [radio controlled] station.

][2.4.13 Pilot Devices

Provide Indicator Lights mounted in an enclosure on the bottom of the bridge with lights sized and positioned to be visible from the ground. The lights must be the dual-lamp type. Provide a white light to indicate that power is available to the crane and a blue light to indicate that the main contactor is energized. Light voltage must be 115 VAC. Provide nameplates that are legible from ground level. The nameplates must read, in their respective order, "POWER AVAILABLE" and "CRANE ENERGIZED". The POWER AVAILABLE light must be supplied by a separate, fused transformer for its energization.

]2.4.14 Wind Speed Indicating System

****

NOTE: This section is tailored to outdoor requirements, as wind speed indicating devices are required on outdoor cranes.

****

Provide a wind speed indicating device in accordance with ASME B30.17, which provides a visible and audible alarm to the crane operator at a predetermined wind speed. The transmitter must be mounted on the highest unobstructed location.

[2.4.15 Electrical Outlets

****

NOTE: Electrical outlets are typically provided on trolleys for maintenance purposes on double girder cranes with top running custom built-up hoists

(which typically have walkways). The addition of electrical outlets may not be a standard manufacturer option on packaged hoists and is not recommended for single girder cranes or underhung packaged hoists.
****

Provide a minimum of [one] [_____] 120 VAC duplex outlet[s] on the crane, mounted [on] [in] the [outside of the control panel(s)] [trolley] [cab] [_____]. The circuit(s) supplying receptacles must incorporate ground-fault circuit-interrupter protection for personnel and be protected by a circuit breaker with a minimum rating of [15] [20] amps.

]2.4.16 Cyber Security of Control Systems

****
NOTE: Cyber Security of Control Systems requirements are tailored to NAVFAC. This subpart must be included for NAVFAC, it is not replaced by Division 25 Cybersecurity Section.
****

****
NOTE: SECNAVINST 5400.15 designates NAVFAC as the functional technical authority for WHE. NAVFAC is designated as Functional Security Control Assessor (FSCA) and the Functional Authorizing Official (FAO) for Ashore Control Systems in their domain; therefore, this includes WHE control systems. WHE control system owners are responsible for the Information System Security Engineer (ISSE) functions and producing artifacts (documentation) for review by the FSCA and FAO.

All new and electrically overhauled cranes must implement the following cybersecurity requirements as applicable to the control system architecture (i.e., networked drives, non-networked drives, and any wireless applications) so that supporting artifacts and considerations are available for the implementation of the RMF process.
****

a. Provide the following for PLC, RTU, Supervisory Controller, or other network-capable (whether networked or not upon delivery) control devices as applicable:

    (1) Hardware list (Hardware list must include the following for each device):

        (a) Manufacturer

        (b) Model

        (c) Location

        (d) Key technical ratings (e.g., memory)

        (e) Serial number

(f) MAC addresses

(g) IP addresses

(2) Software List (Software list must include the following for each device):

(a) Manufacturer

(b) Version/subversion

(c) Location/device

(d) Used network ports/protocols/services

(3) List and discussion of all security features of Contractor hardware and software.

b. For every PLC, RTU, Supervisory Controller, or other network-capable control devices (whether networked or not upon delivery), deliver the following on CD/DVD:

(1) Original firmware

(2) Original firmware hash

(3) SOP for application of firmware updates/patches

(4) POC or website for firmware updates/patches

(5) Count of interfaces and types

(6) Protocols in use, per interface

(7) Configuration file

(8) SOP for configuration

2.4.16.1 Control System and Network

****

NOTE: Select options a. & b. if a standalone laptop is required. Recommend including one laptop if the activity regularly performs all crane maintenance.

****

[a. Provide one rugged laptop type workstation (computer) complete with all compatible software (including software licenses), redundant physical back-up copies on CD/DVD of the installed software, and all necessary cables and special connectors to allow crane software to be troubleshot, checked and upgraded, and for the data recorder to be accessed and information retrieved. Equip the workstation with a CD/DVD drive and the associated CD/DVD burning software. The workstation must also be equipped with USB ports (2.0 and 3.0), an Ethernet port, and a serial port. Delivering the software on a USB (flash drive) device is prohibited.

b. The laptop must be designed for an industrial environment and must be shock resistant and weatherproof as a minimum. Provide the laptop with a built-in CD/DVD reader with the capability to burn CDs and DVDs including associated software to burn CDs and DVDs.

] c. The Contractor must provide all equipment, including software and hardware, necessary for testing, installation, and communicating/troubleshooting all systems provided with the crane (e.g., engine/generator, control system, LID, etc.). The Contractor must provide all crane specific operational software files (e.g., ladder logic, functional block programming, etc.) for their associated systems (e.g., control systems, LID, engine generator, etc.).

d. A single common networked design must not be used for the control systems. A network for an individual function may be used as long as a failure of the network does not affect any other function/network except as defined for specific safety interlocks (e.g., LMI system). A common crane network may be used in a monitoring mode for recording faults and trending and is encouraged. Failure of the monitoring system must not affect crane functions.

e. All provided hardware and software must be currently marketed products, not currently scheduled for end of life or obsolescence, to ensure system sustainability.

f. The control system engineering workstation hardware and operating system must be in conformance to the Common Criteria for IT Security Evaluation (IEC ISO 15408, visit https://www.niap-ccevs.org for more information).

g. Ensure there is no remote access capability enabled as remote access capabilities are prohibited. Physically disable or remove all modem/network devices not required for operational purposes.

2.4.16.2 Software and Services

a. Remove all Software and Services not required for operation and/or maintenance of the product. If removal is not technically feasible, then disable software not required for the operation and/or maintenance of the product. Configure the product to allow the ability to re-enable ports and/or services if they are disabled by software. The removal of software or services may not impede the primary function of the product. If software that is not required cannot be removed or disabled, document a specific explanation and provide risk mitigating recommendations and/or specific technical justification. The software/service to be removed and/or disabled includes, but is not limited to:

(1) Cameras

(2) Games

(3) Device drivers for product components not procured/delivered

(4) Messaging services (e.g., email, instant messenger, peer-to-peer file sharing)

(5) Source code

(6) Software compilers in user workstations and servers

(7) Software compilers for programming languages that are not used in the control system

(8) Unused networking and communications protocols

(9) Unused administrative utilities, diagnostics, network management, and system management functions

(10) Backups of files, databases, and programs used only during system development

(11) All unused data and configuration files

(12) Remove and/or disable, through software, physical disconnection, or engineered barriers, all services and/or ports in the procured product not required for normal operation, emergency operations, or troubleshooting. This includes communication ports and physical input/output ports (e.g., USB docking ports, video ports, and serial ports).

b. Provide documentation showing all disabled ports, connectors, and interfaces for all network-capable devices. In addition, provide summary documentation of the procured product's security features and security-focused instructions on product maintenance, support, and reconfiguration of default settings.

c. For the evaluation status of hardware and software, the Contractor must provide information on Common Criteria (IEC ISO 15408) or National Information Assurance Partnership (NIAP) or Federal Information Processing Standards (FIPS) evaluation status of hardware and software.

2.4.16.3 Access Control

a. The Contractor must configure each component of the procured product to operate using the principle of least privilege. This includes operating system permissions, file access, user accounts, application-to-application communications, and energy delivery system services.

b. Provide user accounts with configurable access and permissions associated with one or more organizationally defined user role(s), where roles are used.

c. Provide a system administration mechanism for changing user(s') role (e.g., group) associations.

d. The Contractor must document control system access control options by defining access and security permissions, user accounts, and applications with associated roles.

e. Provide recommended methods for the Acquirer to prevent unauthorized changes to the Basic Input/Output System (BIOS) and other firmware. If it is not technically feasible to protect the BIOS to reduce the risk of unauthorized changes, the Contractor must document this case and provide mitigation recommendations.

2.4.16.4 Control System Account Management

The Contractor must document all accounts (including, but not limited to, generic and/or default) that need to be active for proper operation of the procured product.

Remove or disable any accounts that are not needed for normal or maintenance operations, emergency, or troubleshooting of the energy delivery system.

2.4.16.5 Session Management

The Contractor may not allow multiple concurrent logins using the same authentication credentials, allow applications to retain login information between sessions, provide any auto-fill functionality during login, or allow anonymous logins.

Provide account-based and group-based configurable session-based logout and timeout settings (e.g., alarms and human-machine interfaces).

2.4.16.6 Authentication/Password Policy and Management

Provide a configurable account password management system that allows for, but is not limited to, the following:

a. Changes to passwords (including default passwords)

b. Selection of password length

c. Frequency of change

d. Setting of required password complexity

e. Number of login attempts prior to lockout

f. Inactive session logout

g. Screen lock by application

h. Comparison to a library of forbidden strings

i. Derivative use of the user name

j. Denial of repeated or recycled use of the same password

The Contractor must time stamp log files.

2.4.16.7 Logging and Auditing

Provide logging capabilities that cover the following events, at a minimum (as appropriate to their function):

a. Information requests and server responses

b. Successful and unsuccessful authentication and access attempts

c. Account changes

d. Privileged use

e. Application start-up and shutdown

f. Application failures

g. Major application configuration changes

2.4.16.8 Heartbeat Signals

The Contractor must identify heartbeat signals or protocols and recommend which should be included in network monitoring. At a minimum, include a last gasp report from a dying component or equivalent.

The Supplier must provide packet definitions of the heartbeat signals and examples of the heartbeat traffic if the signals are included in network monitoring.

2.4.16.9 Patch Management and Updates

The Contractor must verify that procured products (including third-party hardware, software, firmware, and services) have appropriate updates and patches installed prior to delivery.

Provide documentation of the patch management program and update process (including third-party hardware, software, and firmware). This documentation must include resources and technical capabilities to sustain this program and process. Provide the Contractor's method or a recommendation for how the integrity of the patch is validated by the Acquirer as well as the Supplier's approach and capability to remediate newly reported zero-day vulnerabilities.

2.4.16.10 Malware Detection and Protection

a. The Contractor is required to implement at least one of the following:

    (1) Provide a host-based malware detection capability that quarantines (instead of automatically deleting) suspected infected files. Provide an updating scheme for malware signatures. The Contractor must test and confirm compatibility of malware detection application patches and upgrades.

    (2) If the Contractor is not providing the host-based malware detection capability, the Contractor must suggest malware detection products to be used and provide guidance on malware detection and configuration settings that will work with Contractor products.

b. The Contractor must validate that cybersecurity services running on the procured product (e.g., virus checking and malware detection) do not conflict with other such services running on the procured product.

c. For malware detection and protection, the Contractor must provide, or specify how to implement, the capability to automatically scan any removable media that is introduced to the product being acquired.

2.4.16.11 Physical Security

Provide lockable or locking enclosures or rooms for energy delivery systems and system components (e.g., servers, clients, and networking hardware) and for the systems used to manage and control physical access (e.g., servers, lock controllers, and alarm control panels). Provide a method for tamper detection on lockable or locking enclosures. If a physical security and monitoring system is used, tamper detection must be compatible. The Contractor must ensure that physical security features do not hamper the crane system operations. Provide the tools and instructions for making changes to locks, locking codes, keycards, and any other keyed entrances.

2.4.16.12 Wireless Technology

For wireless technology provisions, the Contractor must document:

a. Specific protocols and other detailed information required for wireless devices to communicate with the control network, including other wireless equipment that can communicate with the Contractor-supplied devices.

b. Use, capabilities, and limits for the wireless devices.

c. Power and frequency requirements of the wireless devices (e.g., microwave devices meet the frequency requirements of Generic Requirements [GR]-63 Network Equipment Building System [NEBS] and GR-1089).

d. Range of the wireless devices and verify that the range of communications is minimized to both meet the needs of the Acquirer's proposed deployment and reduce the possibility of signal interception from outside the designated security perimeter.

e. Wireless technology and associated devices compliance with standard operational and security requirements specified in applicable wireless standard(s) or specification(s) (e.g., applicable IEEE standards, such as 802.11).

f. Configuration control options that enable varying of the security level of the devices.

2.4.16.13 Control System Inventory

Provide the complete control system inventory. The Control System Inventory must include the following attributes, in tabular format, as applicable:

General Information	Location Information	Hardware Details	Operating System and Platform	Network Information (Actual Function, not potential function)
Unique ID	Facility Name	Device Type	Embedded OS (Yes/No)	MAC Address(es)
Barcode or Identifier	NFAID	Device Sub-Type	OS Contractor	IP Address(es)
Region	Commodity	Device Function	Operating System (O/S)	Upstream Device

Installation	Floor	Manufacturer	O/S Version	Protocols In Use
Special Area (Option DNA1)	Room	Product Line	Platform Contractor	Host Name
	Location	Model No.	Platform Product Line	
	System Type	Serial No.	Platform	
	Functional System or Equipment Control	Remote Connectivity: (Wired / Wireless / None)	Platform Version	
		Network Type Used: (Serial / Ethernet / Both / None)		

2.5 PAINTING SYSTEM

****

NOTE: Three-coat zinc primer/epoxy/polyurethane system is provided for mild to severe atmospheric, indoor and outdoor cranes. For cranes in abnormal environments including exposure to chemicals or in immersion service, a system designed for that environment should be used. Other systems may suffice for milder environments.

****

a. Remove all grease, oil, and surface debris by solvent wiping or detergent/water scrubbing, prior to blast cleaning. Prepare surfaces to be coated by abrasive blasting to SSPC SP 6/NACE No.3, Commercial Blast Cleaning, or in accordance with the coating manufacturer's requirements, whichever is more stringent.

b. Use a painting system appropriate for the conditions provided in the Crane Design Criteria section of this specification. Paint exposed portions of the crane [and crane runway system] using a [three] [_____]-coat system as follows: [zinc-rich primer consisting of a minimum of 77 percent zinc by weight in the dry film, an anticorrosive epoxy intermediate coat, and an aliphatic polyurethane top coat] [_____]. All paint products must be supplied by a single manufacturer and free of chromates, lead, and mercury. Apply each coat in accordance with manufacturer's instructions and requirements. Ensure each coat is smooth, even, and free of runs, sags, orange peel, and other defects. Desired color of finish coat is [brilliant yellow] [_____]. Submit product data for painting system.

c. Coat faying surfaces of bolted connections per RCSC A348, but do not apply finish paint.

d. Paint the load block [brilliant yellow] [_____] with black diagonal striping.

e. Paint, coatings, or galvanizing on the following items or areas is not acceptable: hoist wire rope or load chain, hooks, hook nuts, sheave and drum grooves, sprockets, wheel treads, lubrication fittings, nameplates, flange mounting faces, corrosion resistant steel, bronze, or other items not normally painted.

f. Factory paint electrical and mechanical equipment in accordance with the manufacturer's best standard practice for the specified environment.

2.6 IDENTIFICATION PLATES

****

NOTE: NAVFAC P-307 requires the capacity be displayed in pound units. The kilogram marking option is provided for cranes installed in a foreign country.

****

Furnish and install identification plates. Provide non-corrosive metal identification plates with clearly legible permanent lettering giving the manufacturer's name, model number, serial number, capacity in pound units, [with kilogram units printed in a different color,] and other essential information or identification.

2.6.1 Markings on Crane, Trolley, and Hook

****

NOTE: NAVFAC P-307 requires the capacity be displayed in pound units. The kilogram marking option is provided for cranes installed in a foreign country.

****

To avoid operation of the crane in the wrong direction, affix the appropriate directions (NORTH, SOUTH, EAST, and WEST) with arrows on both sides of the bridge and both sides of trolley, as applicable. Markings must be visible by the operator and from the loading point. Labels on the controls must have corresponding directional (NORTH, SOUTH, EAST, and WEST) markings. Markings must agree with the markings on controller. Do not indicate directional arrows on controller.

Mark the hook rated capacity in pound units[, with kilogram units printed in a different color,] on both sides of the hoist load block.

2.7 ELECTRICAL ASSEMBLY

Installation of all electrical wiring, conduit, and components must be performed in accordance with the requirements of NFPA 70. As a minimum, items a. through g. below must be followed:

a. All electrical connections must be installed in accordance with NFPA 70 Articles 110.14 or 430.9, as applicable, or as recommended by the device manufacturer.

b. Crimped terminal lugs, if used, must be properly sized for the wire and installed using the device(s) – e.g., crimping tool and indenter – recommended by the terminal lug manufacturer.

c. All spare conductors must be identified as spare conductors, and must have their ends insulated to preclude accidental contact with energized equipment.

d. Bonding straps and equipment grounding conductors must be connected to engineered ground points, have all paint removed from their termination points, or have tooth lockwashers (star lockwashers) installed, to insure proper grounding of the equipment.

e. Rigid Polyvinyl Chloride conduit may be used to protect festoon cable from physical damage when the cable is run along the footwalk of the crane, provided that only sections of conduit are used.

f. Festoon cable must be installed with suitable strain relief and protected from physical damage in accordance with NFPA 70 Article 610.11(E)(1). This includes damage from chafing against the crane structure and any other type of damage that may be incurred.

g. Fiber optic cable must be installed in accordance with the manufacturer's installation guidelines. However, at a minimum the following guidelines must be adhered to: no sharp bends (bend radii must be greater than 1 inch or as prescribed by the manufacturer), avoid tight loops, no zip ties, and no stretching of cable.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

[3.2 SHOP ASSEMBLY AND TESTS

****

NOTE: Shop inspection and testing at the manufacturing facility is typically recommended for specialized applications (e.g., ordnance handling, molten metal handling, special purpose service, hazardous/explosive area environments, precision handling operations requiring complex or synchronized lifting capacity, or custom designs). This section may not be necessary for standard commercial packaged hoists.

****

Shop assemble major components as completely as possible. Reeving of drums and sheaves is not advisable for shop testing, however it is acceptable for packaged hoists. Functionally test the crane system at the construction facility prior to shipment. The Government reserves the right to inspect the crane for compliance with this specification and to witness the functionality tests. Notify the Contracting Officer [14] [_____] days prior to starting testing operations.

]3.3 ERECTION AND INSTALLATION

Perform the entire crane system erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's representative.

3.3.1 Mechanical Alignment

Align motors, couplings, brakes, gear boxes, and drive components in accordance with manufacturer's instructions.

3.3.2 Electrical Adjustments

Adjust control system in accordance with manufacturer's instructions. Store a copy of all Control Parameter Settings (PLC, VFD). Provide the final settings and configurations data on the Complete Schematic Wiring Diagram, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents. Provide the test conditions such as ambient temperature, motor load, date performed and person performing the adjustments as part of the Operational Tests report.

3.3.3 Field Welding

Perform welding indoors, where possible. Surface of parts to be welded must be free from rust, scale, paint, grease, and other foreign matter. Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M.

3.3.4 Field Painting

Perform painting indoors, where possible. Field painting (including touch-up) must conform to the requirements of the coating manufacturer and as specified in paragraph PAINTING SYSTEM.

3.4 FIELD QUALITY CONTROL

3.4.1 Post-Erection Inspection

After erection, the Contractor[, the Activity Crane Inspector/Test Director,] and the Contracting Officer must jointly inspect the crane bridge and hoist systems and components to verify compliance with specifications and approved submittals. Notify the Contracting Officer [14] [_____] days before the inspection. Provide for approval a report of the inspection indicating the crane is considered ready for operational tests.

Document the results of this inspection and submit the post-erection inspection report to the Contracting Officer for approval.

3.4.2 Operational Tests

****

NOTE: Determine if Government furnished certified test weights are available at the site (recommended). If not, they must be provided by the Contractor. These weights are for acceptance testing and will not be permanently retained by the Government.

****

Check the clearance envelope of the entire crane prior to picking or traversing any load to ensure there are no obstructions. Test the systems in service to determine that each component of the system operates as specified, is properly installed and adjusted, and is free from defects in material, manufacture, installation, and workmanship. Rectify all deficiencies disclosed by testing and retest the system or component to prove the crane is operational.[The Contractor must furnish test weights, operating personnel, instruments, and other apparatus necessary to conduct field tests on each crane. Solid weights must be measured using calibrated equipment traceable to National Institute of Standards and Technology (NIST) with a minimum accuracy of plus or minus two percent.]

3.4.2.1 No-Load Test

Raise and lower each hook through the full range of normal travel at rated speed for three complete cycles. Raise and lower each hook, testing other speeds of the crane. Verify proper operation of hoist limit switches. Operate the bridge and trolley in each direction the full distance between end stops and bring bumpers into contact with the end stops. Operate through the entire speed range and verify proper brake operation. Verify correct operation of all indication and ancillary devices.

3.4.3 Test Data

Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane. Record operating and startup current measurements for hoist, trolley, and bridge motors using appropriate instrumentation (i.e., clamp-on ammeters). Compare recorded values with design specifications or manufacturer's recommended values; abnormal differences (i.e., greater than 10 percent from manufacturer's or design values) must be justified or appropriate adjustments performed. In addition, note, investigate, and correct any high temperatures or abnormal operation of any equipment or machinery. Record hoist, trolley, and bridge speeds during each test cycle.

3.4.4 Hook Tram Measurement

Establish a throat dimension base measurement by installing two tram points and measuring the distance between these tram points (plus or minus 0.4 mm 1/64 inch). Record this base dimension. Measure the distance between tram points before and after load test. An increase in the throat opening from the base measurement is cause for rejection.

3.4.5 Load Tests

****

NOTE: For NAVFAC, require a rated load test of 100 percent (plus 0 / minus 10) and an overload test of 125 percent (plus 0 / minus 5) of the rated load.

Wire rope run-in is applicable to wire rope hoists.

****

a. Perform the following tests, as specified below.

b. Test loads used in this section are defined as the following:

Wire rope run-in load (when applicable): 25 - 50 percent of rated load.

Rated load test: 100 percent (plus [0] [_____] minus [10] [_____]) of rated load.

Overload test: 125 percent (plus [0] [_____] minus [5] [_____]) of rated load.

c. Testing of cranes must be done with the use of test weights. The use of dynamometers in lieu of lifting test weights is not permitted. Each test weight for crane tests must be marked with a unique identification number and the weight in pounds. The weight marked must be the actual weight taken from the scale or other measuring device. Solid weights must be measured using calibrated equipment traceable to the National Institute of Standards and Technology (NIST), with a minimum accuracy of plus or minus two percent (i.e., indicated weight must be within plus or minus two percent of actual weight). A list of test weights, with identification numbers and weights, must be retained. The list must include the type and serial number (or other identifier) of the weighing device(s) used to weigh the test weights. Where a lifting attachment supports multiple test weights (e.g., stacked weights or multiple weights suspended from a padeye), the total capacity must be marked on the attachment. All rigging gear must meet OSHA and ASME requirements.

[3.4.5.1 Wire Rope Run-In

****

NOTE: This section is not applicable for hoists with load chain.

****

The primary purpose of this procedure is to exercise the newly installed wire rope.

Place the load on the hook. Start at ground level and hoist up to one foot below upper limit at slow speed. Hoist down to lower limit at slow speed. Repeat hoisting and lowering of the load for approximately 10 hoisting cycles, increasing the speed for each cycle. During this test, the capacity overload lockout should not activate.

]3.4.5.2 Rated Load Test

3.4.5.2.1 Hoist

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees clockwise and counterclockwise to check bearing operation with no binding. Observe for lowering of the load, which may indicate a malfunction of hoisting components or brakes. Verify that maximum beam and girder deflections do not exceed CMAA 74 and MHI MH27.1 design limits, as applicable.

b. Dynamic Load Test: Raise and lower test load through the full lift range and visually observe smooth control and acceleration between points. Completely stop the machinery at least once in each direction to ensure proper brake operation.

c. Hoist Mechanical Load Brake (or Self-locking Worm Gear): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.2.2 Trolley

Operate the trolley (if space is available) the full distance of the bridge rails in each direction with a test load on the hook. Check proper functioning through the range of speeds. Verify proper brake action and stopping distance.

3.4.5.2.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway (if space is available) in one direction with the trolley at the far end of the bridge, and in the opposite direction with the trolley at the opposite end of the bridge. Use extreme caution. Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks. Verify proper brake action and stopping distance. Record deficiencies. Secure from testing if deficiencies are found.

3.4.5.2.4 Trolley Loss of Power Test

Raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of trolley travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the trolley stops and that the brake sets properly. Measure the distance required for the trolley to stop.

3.4.5.2.5 Bridge Loss of Power Test

Raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of bridge travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the bridge stops and that the brake sets properly. Measure the distance required for the bridge to stop.

3.4.5.3 Overload Test

3.4.5.3.1 Hoist

Disconnect or adjust the overload limit device to allow the hoist to lift the test load. Verify proper operation of the overload limit device after it is reconnected.

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees clockwise and counterclockwise to check bearing operation with no binding. Observe for lowering of the load, which may indicate a malfunction of hoisting components or brakes.

b. Dynamic Load Test: Raise and lower test load and visually observe smooth control. Stop the load during raising and lowering to verify that the brakes holds the load.

c. Hoist Mechanical Load Brake (or Self-locking Worm Gear): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.3.2 Trolley

Operate the trolley the full distance of the bridge rails in each direction with a test load on the hook (one cycle) through the range of speeds. Verify proper brake action.

3.4.5.3.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway in one direction with the trolley at the extreme end of the bridge, and in the opposite direction with the trolley at the opposite extreme end of the bridge (one cycle). Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on-site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [two] [_____] hard copies of operation and [two] [_____] hard copies of maintenance manuals for the equipment furnished along with an electronic copy (PDF) of each on a Compact Disc. Provide one complete set prior to performance testing and final copies upon acceptance. Provide operation manuals that detail the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, including weekly, monthly, semi-annual, and annual required maintenance items, possible breakdowns and repairs, and troubleshooting guides. Also include as-built drawings, piping and equipment layout, design calculations, Control Parameter Settings and printouts of any software, and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course (as applicable).

[3.7 FIELD TRAINING

****

NOTE: Training is recommended, but not required.

Additional items that could be included in the blank: general review of the entire capabilities, limitations, and safety features of the crane.

An optional variable frequency drive (VFD) training is available, should the crane be provided with VFD's and the command feel the additional training is beneficial.

****

Conduct a training course for [eight] [_____] operating and maintenance staff[and provide a copy of the training material to each participant]. Provide a training period consisting of a total of [four] [eight] [_____] hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and basic troubleshooting[, and [_____]].

[Provide a minimum [four] [_____] hour training session on the Variable Frequency Drives (VFDs) discussing maintenance, troubleshooting of fault codes, theory of operation, and adjustment of crane parameters. This training session will be for an audience of approximately [eight] [_____] people.

]][3.8 FINAL ACCEPTANCE

****

NOTE: Use this paragraph as written for projects where the crane is the principal construction element, or represents a very significant portion of the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.

****

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on wire rope, hook, and electrical collector bars.

GANTRY CRANES

04/08, CHG 1: 02/20

****

NOTE: This guide specification covers the requirements for overhead electric traveling (OET) gantry cranes with capacities in excess of 9 tons 10 tons 9072 kg 20,000 pounds capacity but less than 27 metric tons 30 tons 27,000 kg 60,000 pounds, suitable for [indoor][or outdoor] use in [hazardous][or non-hazardous] environments.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

Forward all procurement of crane systems at Naval Shore based activities with rated capacities of 9072 kg 20,000 pounds or greater, or for use in specialized applications to: Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000. (See NAVFAC Instruction 11450.1a of 22 January, 1997)

****

PART 1 GENERAL

****

Use SECTION 41 22 13.14 BRIDGE CRANES, OVERHEAD

ELECTRIC, TOP RUNNING for top running cranes with top running bridges and trolleys with capacities less than 27 metric ton 30 ton 27,000 kg 60,000 pounds, CMAA 70 Class A, B, C, D, E, or F, suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments.

Use SECTION 41 22 13.15 BRIDGE CRANES, OVERHEAD ELECTRIC, UNDER RUNNING for top running and under running single girder cranes with under running trolleys and hoists, with capacities less than 27 metric ton 30 ton 27,000 kg 60,000 pounds, CMAA 74 Class A, B, C, or D, suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments.

Use SECTION 41 22 23.19 MONORAIL HOISTS (manual, electric, or air-powered).

Types of crane covered, (more than 9.07 tons 10 tons 9072 kg 20000 pounds, but less than 27 tons 30 tons 27215 kg 60000 pounds, including:

Top-running gantry and trolley, single or multiple-girder, with CMAA 70 or CMAA 74 service class of A through E. Control types and systems may be specified as follows:

1. Remote, Cab, or Pendant Crane Controls or a combination of the three can be provided.

2. Alternating current or direct current control systems can be specified.

Crane Terminology: - refer to DEFINITIONS in this specification.

a. Tracks for gantry crane travel may be at the same (gantry) or different (semi-gantry) levels, depending on the leg design and intended purpose. Trolley travel and leg position defines the type of gantry.

b. Top-running Trolley is a trolley which travels on the top surfaces of rails of the gantry girder(s).

c. Types of Gantry Cranes may include; Deck-Leg Gantry, Through-Leg Gantry, Semi-Gantry Deck-Leg, Semi-Gantry Through Leg, Outdoor Storage or Hauling Gantry, and Polar Gantry.

Show the following information, as a minimum, on the project drawings:

1. Complete details of plan, elevations, and sections of Gantry Crane system including data.

2. Maximum span of runway girder.

3. Gantry Runway rail size.

[4. Runway girder size (for semi-gantry applications).]

5. Channel cap size.

6. Size and location of gantry crane stops.

7. Electrical junction box location (including mounting height).

****

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

a. Crane Bridge: That part of an overhead crane system consisting of girder(s), end trucks, end ties, walkway, and drive mechanism which carries the trolley(s) and travels along the runway rails perpendicular to the gantry runway.

b. Crane Runway: The track system along which the crane operates horizontally, including track, track hangar rods, track connection devices, and runway structural supports.

c. Dead Loads: The loads on a structure which remain in a fixed position relative to the structure.

d. Girder: The principal horizontal beam of the crane gantry. It is supported by the crane end legs. Normally the crane trolley is mounted on top of the girder, and the hoist is suspended from the trolley to below the crane girder; however,the trolley and cab may also be suspended from the girder.

e. Live Load: A load which moves relative to the structure under consideration.

f. Pendant: A control for a hoist and/or a crane. The pendant hangs from the hoist or the crane by a cord at a height that is easy for the operator to reach.

g. Rated Load: For the purpose of this specification the rated load is defined as the maximum working load suspended under the load hook.

h. Standard Commercial Cataloged Product: A product which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing on the manufacturer's published product data sheets. These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

i. Top Running Crane: An electric overhead traveling (OET) crane that runs on rails on top of support beams (bridge girders); or OET with equal or unequal legs supporting a girder, trolley, hoist (and cab)which travels horizontally on legs. The load is supported by the entire cross-section of the beam in bridge cranes. The load is carried by the cross-section of the beam supported by movable legs for a gantry crane, distributing the load to the legs, wheels, and gantry track.

j. Trolley Mounted Hoist: A combined unit consisting of a wheeled trolley that provides horizontal motion along the gantry girder, and a hoist suspended from the trolley, that provides lifting and lowering of a freely suspended load.

k. Under running (Underhung) Crane: An electric overhead traveling crane that is supported by crane end trucks suspended below the crane runway. The load is supported by hanging from the lower flange of a beam.

1.3 SYSTEM DESCRIPTION

The requirements for the crane runway and rail supporting structures are specified in Section 05 12 00 STRUCTURAL STEEL.

[1.3.1 Load and Sizing Calculations

****

NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys.

****

Submit complete list of equipment and materials, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Submit calculations verifying the sizing of the gantry girder, end trucks and travel drives.[Include seismic analysis of gantry girder and end trucks.]

]1.3.2 OET Design Criteria

****

NOTE: Clearly show the area of hook coverage, runway dimensions, rail size, hook vertical travel, clear hook height and lifting capacity on drawings.

****

Cranes will operate in the given spaces and match the runway dimensions and rails indicated. Hook coverage, hook vertical travel, clear hook height, lifting capacity, and load test weight must not be less than that indicated.

1.3.2.1 General

****

NOTE: Add number of cranes, building name, crane span and rated load capacity expressed in tons pounds. The last sentence may be deleted if only one hoist system is in project.

****

Include the following: Number of cranes [_____], located in building identified as [_____], the required span, and the rated capacity expressed in [_____] metric tons tons kilograms pounds, for each OET. Also clearly locate and identify each multiple girder hoist and system components.

1.3.2.2 Classification

****

NOTE: CMAA 70 covers top running bridge and gantry electric overhead traveling cranes with a duty rating of A, B, C, D, E and F. CMAA 74 covers top running and under running single girder electric traveling cranes utilizing an under running trolley with a duty rating of A ,B, C and D. Make a selection from the following CMAA 70 and CMAA 74 service classifications.

Class A (Standby or Infrequent Service): This service covers cranes which may be used in installations such as powerhouses, public utilities, turbine rooms, motor rooms and transformer stations where precise handling of equipment at slow speeds with long, idle periods between lifts are required. Capacity loads may be handled for initial installation of equipment and for infrequent maintenance.

Class B (Light Service): This service covers cranes which may be used in repair shops, light assembly operations, service buildings, light warehousing, etc., where service requirements are light and the speed is slow. Loads may vary from no load to occasional full rated loads with 2 to 5 lifts per hour, averaging 3 m 10 feet per lift.

Class C (Moderate Service): This service covers cranes which may be used in machine shops of paper mill machine rooms, etc., where service requirements are moderate. In this type of service the crane will handle loads which average 50 percent of the rated capacity with 5 to 10 lifts per hour, averaging 4.5 m 15 feet, not over 50 percent of the lift at rated capacity.

Class D (Heavy-Duty): This service covers cranes which may be used in heavy machine shop, foundries, fabricating plants, steel warehouses, container

yards, lumber mills, etc., and standard duty bucket and magnet operations where heavy-duty production is required. In this type of service, loads approaching 50 percent of the rated capacity will be handled constantly during the working period. High speeds are desirable for this type of service with 10 to 20 lifts per hour averaging 4.5 m 15 feet, not over 65 percent of the lifts at rated capacity.

Class E (Severe Service): This type of service requires a crane capable of handling loads approaching rated capacity throughout its life. Applications may include magnet, bucket, magnet/bucket combination cranes for scrap yards, cement mills, lumber mills, fertilizer plants, container handling, etc., with 20 or more lifts per hour at or near the rated capacity.

Class F (Continuous Severe Service): This type of service requires a crane capable of handling loads approaching rated capacity continuously under severe service conditions throughout its life. Applications may include custom designed specialty cranes essential to performing the critical work tasks affecting the total production facility. These cranes must provide the highest reliability with special attention to ease of maintenance features.

****

Provide crane designed and constructed to[CMAA 70 Class [_____], [_____] service][CMAA 74 [Duty Class A][Duty Class B] [Duty Class C] service] requirements for operation in[indoor][outdoor][hazardous][non-hazardous] environment with[multiple girder hoist system][electric chain hoist conforming to ASME HST-1][electric wire rope hoist conforming to ASME HST-4].

1.3.2.3 Rated Capacity and Speeds

NOTE: Auxiliary [monorail hoist][multiple girder hoist] may be specified. VFAC drive should be specified if precise handling and position are required. VFAC drives are normally capable of driving the crane at 5 mm/s 1 fpm or less. Delete reference to VFAC-drive and auxiliary hoist if not applicable.

Delete micro-drive and columns from the table if not applicable.

****

Provide crane conforming to[CMAA 70][CMAA 74] with rated capacity of [_____] metric tons tons kg pounds.[Provide auxiliary hoist with [_____] metric tons tons kg pounds capacity.] Lower load block or assembly of hook, swivel bearing sheaves, pins and frame suspended by the hoisting ropes are not considered part of the rated capacity. Rated speeds (in meters/second fpm) for the hoist,[hoist micro-drive, gantry micro-drive, trolley micro-drive,] gantry and trolley at the rated load are as follows:

Rated Speeds [meters per second] [feet per minute]			
Description	Minimum	Maximum	[Micro-drive]
Main Hoist	[_____]	[_____]	[[_____].]
[Auxiliary Hoist]	[_____]	[_____]	[[_____].]
Trolley	[_____]	[_____]	[[_____].]
Gantry	[_____]	[_____]	[[_____].]

1.4 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Overhead Electric Traveling (OET) Crane(s); G, [_____]

Crane Runway System; G, [_____]

Complete Schematic Wiring Diagram; G, [_____]

1.5 QUALITY ASSURANCE

1.5.1 Manufacturer Qualification

Overhead Electric Traveling (OET) Crane(s) must be designed and manufactured by a company with a minimum of 10 years of specialized experience in designing and manufacturing the type of overhead crane required to meet requirements of the Contract Documents.

1.5.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing and documentation of steel castings, hook assembly and nuclear safety as follows. Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane. Visually inspect and test load-carrying steel castings ASTM A668/A668M using the magnetic-particle inspection method per ASTM A275/A275M. Reference allowable degree of discontinuities to ASTM E125, and relationship to service loads and stresses, critical configuration, location and type. Methods of repairing the discontinuities is subject to review by the Contracting Officer.

1.5.3 Certificates

Submit an Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus 5 to minus 0) 131.25 percent of rated load. Also submit the following certificates:

a. stating that No Hazardous Material, including, but not limited to asbestos, cadmium, chromium, lead, elemental mercury, or PCB'c, is contained within system or components.

b. stating that the system is safe to perform a Loss of Power Test

c. stating that the Crane Runway System conforms to the requirements as specified herein and as specified in Section 05 12 00 STRUCTURAL STEEL.

d. Certificate of Compliance with Listed Standards

e. Provide manufacturer's Wire Ropes Breaking Strength certification that each rope meets the published breaking strength, or actual breaking strengths, of samples taken from reels and tested. Certifications must be traceable to the crane and to the hoist to which the wire rope is installed. Wire rope must conform to ASTM A1023/A1023M. and ASTM A931.

f. Hook NDT Reports

1.5.4 NDT Vendor Certification

Provide certification that the NDT vendor meets the requirements of ASTM E543. Provide the NDT report to the Government which is traceable to the unique ID number on the hook and nut.

a. Submit for review the NDT vendor's procedures, including technique sheets specific to the types, shapes, and sizes of the parts being examined (e.g., shank hook, eye hook, duplex hook, eye bar, nut).

b. For the magnetic particle method, adequately describe the procedures for the orientation of the hooks, nuts, or pins with the magnetizing equipment. Procedures must bear the approval of an independent Level III examiner.

c. Prior to performing any operational testing of the cranes, inspect the hook and hook nut by the magnetic particle method (MT) over their entire surface area[in accordance with NAVSEA Technical Publication T9074-AS-GIB-010/271]. ASTM A275/A275M may be used with the following restrictions:

  (1) . Do not use DC yokes (including switchable AC/DC yokes used in the DC mode) and permanent magnet yokes;

  (2) . Do not use automatic powder blowers or any other form of forced air other than from a hand-held bulb for the application or removal of dry magnetic particles;

  (3) . Remove all arc strikes;

  (4) . Equipment ammeters must have an accuracy of plus or minus 5 percent of full scale (equipment ammeter accuracy other than that stated is acceptable provided the MT procedure states that a magnetic field indicator is used to establish and verify adequate field strength for all aspects of the inspection).

  (5) . If NDT cannot be performed on surfaces inside holes, visually inspect those surfaces to the maximum extent practical. Acceptance criterion is "no linear indications greater than 1/16 inch".

1.5.5 Overhead Electric Traveling (OET) Crane(s)

a. Submit shop drawings detailing all OET Design Criteria, showing the general arrangement of all components in plan, elevation, and end views; hook approaches on all four sides, clearances and principal dimensions, assemblies of hoist, trolley and gantry drives, and complete schematic wiring diagram with description of operation, and Runway Electrification System. Include weights of components and maximum gantry wheel loads and spacing.

b. Provide shop drawings whose quality is equivalent to the contract drawings accompanying this solicitation.

c. Provide integral schedule of crane components on each drawing. Provide maximum wheel loads (without impact) and spacing imparted to the crane runway system track beams. Indicate the crane speeds along the runway, the trolley speeds along the gantry girder, and the hoist lifting speeds; all speeds indicated are speeds with hoist loaded with rated crane capacity load.

[1.5.6 Welding Qualifications and Procedures

Perform welding in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep not exceeding those specified in AWS D14.1/D14.1M. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M. Allowable stress values must comply with CMAA 70.

]1.5.7 Safety Requirements

****

NOTE: Certification is required for cranes handling nuclear materials. Results from the Safety Analysis will be utilized by the Using Agency as a basis for gantry crane certification. Delete this paragraph if the crane is not required to handle nuclear materials.

****

Comply with the mandatory and advisory safety requirements of ASME B30.10, ASME B30.11,ASME B30.16, ASME B30.17, ASME B30.2, ASME HST-1, ASME HST-4, NFPA 70, 29 CFR 1910, 29 CFR 1910.179, and 29 CFR 1910.306. Nuclear certification, testing, and rules of construction must be in accordance with 29 CFR 1910.147, and [ASME NOG-1 top running type cranes][ASME NUM-1 for underhung type cranes]. Submit analysis and test reports to Contracting Officer for approval.

1.6 DELIVERY, STORAGE, AND HANDLING

Protect all delivered and stored equipment from the weather, humidity, temperature variations, dirt and dust, and other contaminants.

[1.7 EXTRA MATERIALS

****

NOTE: The extent to which spare parts are stocked is an economic judgment determined by the user. The impact of downtime expense must be weighed versus the prompt availability and amount of cost allocated to spare parts. Power plant cranes, and similar use cranes receive severe service during the plant construction period, and normal wearing parts should be maintained at the project site.

****

Submit spare parts data for each different item of material and equipment specified and/or as recommended by the manufacturer, after approval of the detail drawings and not later than [_____] months prior to the date of beneficial occupancy. Include in data a complete list of parts and supplies, with current unit prices and source of supply. Furnish and deliver one set of manufacturer's recommended spare parts to the site. Suitably package the spare parts for long-term protection and storage. Legibly label the packaging to identify the spare parts. Also include a list of the furnished spare parts in the Maintenance manual.

]PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment.

2.1.2 Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two gantry identification plates , one for each side of gantry. Provide noncorrosive metal identification plates with letters which are easily read from the floor, showing a separate number such as BC-1, BC-2, for each gantry crane.

2.1.3 Prohibited Use of Asbestos Products

Materials and products required for designing and manufacturing cranes must not contain asbestos.

2.1.4 Capacity Plates

Two capacity plates indicating the crane capacity in metric tons and tons tons kilograms pounds are required, one secured to each side of gantry. Fabricate each capacity plate with a steel backing plate and exterior quality/fade-resistant stick-on labels with letters large enough to be easily read from the floor. Place capacity plates in a location visible to pendant operator's position after the crane has been installed.

2.1.5 Safety Warnings

Affix labels in a readable position to each lift block or control pendant in accordance with ASME B30.16, ASME B30.2 and ASME B30.17. Submit safety warnings, diagrams and other framed instructions suitably framed and protected for display as indicated by the Contracting Officer as follows:

a. Design and locate the word "WARNING" or other legend to bring the label to the attention of the operator. Provide durable type warning labels and display the following information concerning safe-operating procedures:

b. Cautionary language against lifting more than the rated load; operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; operating damaged or malfunctioning hoist; operating a rope hoist with a rope that is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

c. To avoid operation of the crane in the wrong direction, affix the appropriate directions, with arrows, NORTH, SOUTH, EAST and WEST on the bottom of the girder where they can be easily seen by the operator. Labels on the controls must have corresponding direction (NORTH, SOUTH, etc.). Markings must agree with the markings on control pendant. Do not indicate directional arrows on control pendant.

2.2 STRUCTURAL MATERIALS

2.2.1 Bolts, Nuts and Washers

Utilize corresponding lockwashers with high-strength bolted connections ASTM F436M ASTM F436, nuts ASTM A563M ASTM A563, etc., conforming to requirements of AISC 325. Bolts, nuts and washers ASTM F959/F959M must conform to ASTM A325M ASTM A325 bolts or ASTM A307. Galvanized bolts are not acceptable. Do not use ASTM A490M ASTM A490 bolts.

2.2.2 Gantry Girder or Girders

****

NOTE: Specify welded structural steel box sections for multiple girder cranes Class C, D, or E with a capacity greater than 18 metric tons 20 tons 16330 kg 36,000 pounds or a span greater than 12 m (40 feet).

****

Provide[welded structural steel box section][wide flange beam, standard I-Beam, reinforced beam or section fabricated from rolled plates and shapes] gantry girders.

2.2.3 Gantry Rails or Bars

****

NOTE: Remove this paragraph for underhung cranes and cranes having a capacity less than 18 metric tons 20 tons 16330 kg 36,000 pounds (many crane manufacturers do not need or want rails or bars).

****

Trolley runway rails, crane girders and other sections must be straight and true. When loaded with motor driven cranes the deflection of rails must not exceed 1/888 of the span. Calculate the deflection with the worst case of two loaded gantry cranes located adjacent each other. Make all rail joints flush and true without misalignment of running tread and design to minimize vibration. The gap between adjacent rail ends and the vertical misalignment of running treads must not exceed 1.588 mm 0.0625 inch. Level the gantry rail to a plus-or-minus 3 mm 1/8 inch at all rail support joints.[Fasten upper gantry rail to[top cover plate][wide flange] or centered on flange or offset near web plate for welded box sections, complete with welded clips.] Bolt gantry rail joints using standard joint bars. Stagger rail joints. Provide a positive stop at gantry rail ends to prevent creep.

2.2.4 End Ties and Gantry Girder End Connections

****

NOTE: Specify end ties for cranes with more than four wheels. Specify welded structural steel box sections for multiple-girder cranes Class C, D, or E with a capacity greater than 18 metric tons 20 tons 16330 kg 36,000 pounds or a span greater than 12 m 40 feet.

****

Use welded steel box sections for end ties. Provide full depth diaphragms at girder connections and jacking points. Provide horizontal gusset plates at the elevation of top and bottom end tie flanges for connection to girder ends. Make end connections with high-strength bolts per AISC 325. Use body-bound bolts fitted in drilled and reamed holes to maintain the crane square.

2.2.5 Gantry End Trucks

Provide[rotating][fixed axle] type end trucks fabricated of structural tubes or from structural steel to provide a rigid box section structure. Provide jacking pads for removal of wheel assemblies.

[2.2.6 Trolley Frame

****

NOTE: Trolley frame is applicable only to multiple girder cranes.

****

Provide trolley frame consisting of two structural steel side frames or trucks welded together with one or more structural steel load girts to form a one-piece unit. Provide pads for the use of jacks or wedges when changing truck wheels.

]2.2.7 End Stops and Bumpers

****

NOTE: Rubber bumpers dry out with time. Hydraulic type bumpers are more expensive. Using the words shock-absorbing allows the manufacturer to choose. Rubber like materials are not acceptable as an option.

****

Fit crane runways and gantry girders with structural steel end stops. Fit gantry end trucks and trolley frames with shock-absorbing, [spring][or][hydraulic] type bumpers capable of decelerating and stopping the gantry and/or trolley within the limits stated by OSHA and MHI CMAA. Provide trolley end stops of sufficient strength to withstand the impact of a fully loaded trolley moving at 50 percent of maximum rated travel speed. When two gantry cranes are on the same runway, fit one crane with shock-absorbing bumpers on each face of each end-truck, and the other crane must have shock-absorbing bumpers as per above on one face only of each end-truck which is the opposite face of the adjacent crane. Fit the other face of the end-truck with a structural steel stop to engage the bumpers of the adjacent crane. Provide gantry bumper stops as specified in Section 05 12 00 STRUCTURAL STEEL. Locate stops to permit maximum gantry and trolley travel.

[2.2.8 Footwalks

****

NOTE: Delete the following paragraph if footwalks are not required. Provide footwalk fall protection with guard rails or static line with safety belts.

****

The location and construction of footwalks must conform to ASME B30.2. A full-length structural platform is required on the driver's side of the gantry. Provide[checkered steel][non-slip] flooring for platform, double member handrail and a suitable toe-guard, with 760 mm 30 inch clearance in front of control equipment. Minimum 380 mm 15 inch clearance is required in front of gantry machinery.[To give access to the opposite side of the trolley, gantry conductors, or other equipment, mount a footwalk a minimum of twice the length of the trolley on the opposite side of the crane. Provide a cross-over footwalk over an end tie between the two girder footwalks.] Mate the drive side footwalk with the crane access platform. Make the length of the drive side footwalk[adequate to provide access to the trolley and provide sufficient room for mounting control cabinets][along the entire length of the gantry]. Provide safety handrails for footwalks.

]2.2.9 Runway Rails

Provide runway rail size as specified in Section 05 12 00 STRUCTURAL STEEL.

[2.2.10 Operator's Cab

****

NOTE: Applicable if a cab is specified, otherwise delete paragraph. Specify enclosed cab for outdoor use. Open cab may be used indoors. Enclosed cabs can be provided with a heating and/or air conditioning unit according to environmental conditions. Specify the location of cab and the direction the operator should face.

****

[2.2.10.1 Design

Design and construct operator's cab in accordance with[CMAA 70][CMAA 74][and ASME B30.2]. Locate cab access to facilitate entry and exit by crane operator. Provide space near cab entrance for storage of a carbon-dioxide, dry chemical, or equivalent hand fire extinguisher.

][2.2.10.2 Cab Construction

Provide a[standing][seated] type[fixed cab mounted on gantry][trolley mounted cab] of the[enclosed][open] type for[outdoor][indoor] use, and designed to provide a clear view of the operating floor and hook for operator.[Provide cab with a suitable[heating][heating and air conditioning] unit]. Locate cab on the [_____] of the[gantry][trolley] with the operator facing [_____].

]][2.2.11 Additional Provisions for Outside Service

****

NOTE: This paragraph is applicable for outdoor cranes only.

****

Seal weld structural members on outdoor cranes. Provide crane gantries with parking brakes which will sufficiently hold the crane against a wind pressure of 244 Pa 5 psf for in-service conditions. Provide crane gantries with manually-operated pin locks at each rail, designed to securely anchor the crane against a wind pressure of 1.5 kPa 30 psf for out-of-service conditions.

]2.3 MECHANICAL EQUIPMENT

2.3.1 Variable Frequency Drives

2.3.1.1 Gantry Drives

****

NOTE: If the span is less than 12 m 40 feet and the application is CMAA Class "A" or "B", then A-1 drive may be included as an option. A-1 and A-4 drives are only referenced in CMAA 70, and if selected, delete the reference to CMAA 74.

****

Provide Variable Frequency AC (VFAC) [either the A-1 or][A-4] gantry drive arrangement as specified in[CMAA 70][CMAA 74], consisting of a single electric motor mechanically connected through gear reduction and drive shafts to the drive wheels or separate drive motors at each end of gantry. Perform acceleration and deceleration meeting the requirements specified in this section. Gears must conform to applicable AGMA standards. Provide gear reducers that are oil tight and fully enclosed with pressure or splash type lubrication. Gantry-travel limit-switches are optional.

2.3.1.2 Trolley Drives

Provide complete trolley drive arrangement with a minimum of two wheels driven by an integral electric motor. Drive mechanism must run in totally enclosed oil bath. Limit switches are optional for drive mechanism. Provide acceleration and deceleration controls meeting the requirements specified in this section.

[2.3.1.3 Micro-Drives

****

NOTE: Current industry standards use Variable Frequency Alternating Current Drives (VFAC) in lieu of micro-drive motors. The following paragraph is included in this section for instances where the micro-drive motors will not be replaced with newer VFAC drives. If micro-drives are not to be used, delete this paragraph.

Include those motions where a micro-drive is required. If micro-drive is not specified, delete these paragraphs. Micro-drives are generally required when slow speeds are required for an extended amount of time. If precision movement is required for limited time for final positioning of loads, use adjustable frequency or dc variable voltage crane controls instead of micro-drives.

****

Provide the following crane motions with a separate micro-drive: [main hoist,] [auxiliary hoist,] [trolley drive][and][gantry drive]. The micro-drives are used to precisely position loads. Provide each micro-drive with an electric motor, gear reducer, magnetic coupling clutch and necessary controls. Connect the output shaft of the reducer to an extension of the primary drive high-speed shafting with a magnetic coupling clutch. Coupling must normally be disengaged and become engaged only if the micro-drive is required. Provide electrical clutch components, required for proper operation, conforming to the requirements specified in paragraph ELECTRICAL COMPONENTS. Provide magnetic coupling type clutches which engage and disengage the micro-drives from the high speed shafts of the main drive arrangement. The clutch must be engaged by electromagnet and released by springs. Provide clutch ratings not less than 150 percent of the micro-motor rated torque as amplified by the intervening gearing. Provide clutch enclosures to facilitate easy access for wear inspection of the friction elements and visual examination of the clutch assemblies.

]2.3.2 Gearing

Provide enclosed gear reducers type gearing. Gears and pinions must be spur, helical, or herringbone type only, and be forged, cast or rolled steel. Open-type gearing is not acceptable, except for final drives. Provide gears and pinions with adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2001 Quality Class 6 or better precision per [AGMA ISO 10064-6] [AGMA ISO 17485] [AGMA 2011] [ANSI/AGMA 2015-1].

2.3.2.1 Gear Reducers

Provide gear reducers which are [standard items of manufacturers regularly engaged in the design and manufacture of gear reducers for Class D and E cranes][or][integral components of standard hoists or hoist/trolley units of manufacturers regularly engaged in the design and manufacture of hoists or hoist/trolley units for Class A, B or C cranes]. Provide gear reducers designed, manufactured and rated in accordance with ANSI/AGMA 6113 ANSI/AGMA 6013 (for trolley drives only), as applicable. Except for final reduction, provide the gear reduction units with fully enclosed in oil-tight housing. Design gearing to AGMA standards and to operate in an oil bath. Operation must be smooth and quiet.

2.3.2.2 Open Gearing

Provide gears and pinions possessing adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2001 quality class 6 or better precision per [AGMA ISO 10064-6] [AGMA ISO 17485] [AGMA 2011] [ANSI/AGMA 2015-1]. Enclose open gears with safety guard removable covers over openings for inspection and access for grease lubrication.

2.3.3 Hoist Brakes

a. General: In addition to the requirements of CMAA 70, provide shoe, disc, or conical type brakes with thermal capacity suitable for class and service specified in this section. Shoe, disc, and conical brakes must be spring-set and electrically-released by a continuously rated direct acting magnet. Provide brakes which are self-aligning and easily adjusted for torque setting and lining wear. Use brake lining material which is asbestos free. Provide cast iron brake wheels conforming to ASTM A159 or the manufacturer's standard high-strength ductile cast-iron brake wheels, provided that the material exhibits wear characteristics in the form of powdered wear particles and is resistant to heat-checking. Provide disc brakes totally enclosed and having multiple discs with stationary releasing magnets. Brake torque must be easily adjustable over a 2:1 torque range.

b. Gantry Brakes:[Provide gantry braking system with a spring-applied and electrically-released single shoe, disc, or conical brake for each gantry drive motor.] Braking system which automatically sets when controls are released or power is interrupted. Make provisions to facilitate easy brake adjustment. Provide brakes with a torque rating of at least 50 percent of gantry drive motor rated torque.

2.3.4 Wheels

****

NOTE: Include the second sentence for CMAA 70 class D and E, cranes; otherwise delete. Include the

requirement for trolley wheels only for multiple girder cranes.
****

Furnish wheels manufactured of rolled or forged steel.[Wheel treads and flanges must be rim toughened to between 320 and 370 Brinell hardness number.] Provide double-flanged [gantry][gantry and trolley]wheels. Trolley and gantry wheels must have straight treads. Equip wheels with self-aligning double-row spherical roller-bearings of capacity as recommended by bearing manufacturer for design load of trolley or gantry.

2.3.5 Bearings

****
NOTE: Equalizer sheaves compensate for unequal length, stretch of the hoisting, and swinging of the load block.
****

All bearings, except those subject to a small rocker motion, must be anti-friction type. Provide a means for lubrication for bearings not considered lifetime lubricated by the manufacturer. Equip equalizer sheaves with sintered oil-impregnated type bushings in accordance with ASTM B438 or ASTM B439.

[2.3.6 Anti-Drip Provisions

Design cranes to preclude leakage of lubricants onto the lifted loads, floor, or external grounds. Fit all equipment and components which cannot be made leak-proof with suitable drip pans. Provide drip pans manufactured of steel and designed to permit removal of collected lubricant.

]2.4 ELECTRICAL COMPONENTS

[2.4.1 Explosion Proof Requirements

****
NOTE: Delete this paragraph if explosion proofing is not part of design criteria. Define hazardous classification and evaluate Contractor's proposal for electrical equipment. Show location of the hazardous areas.
****

Provide equipment and wiring in locations indicated conforming to NFPA 70 for Class [I] [II] [III], Division [1] [2] hazardous locations. Provide equipment suitable for[Group [_____]][operating temperature of [_____] degrees C degrees F]. Provide wiring and equipment in locations indicated of the classes, groups, divisions, and suitable for the operating temperature as specified.

]2.4.2 Control Systems

Provide a separate controller for each motor; however, use a duplex controller two motor gantry drives. Provide overload protection in conformance with the requirements of NEMA ICS 2 and mechanically and electrically interlock contactors that are used for starting, stopping, and reversing.

2.4.2.1 Travel Motion Control System

Provide AC inverter duty, totally enclosed non-ventilated (TENV), squirrel cage induction type bridge and trolley drive motors.

2.4.2.2 Drive Control System

Provide static reversing, adjustable frequency controllers conforming to[NEMA ICS 3][,][NEMA ICS 8] for the [hoist][trolley][and bridge]infinitely variable electric drives. Provide dynamic braking. Provide two step infinitely variable speed control for the bridge and trolley functions, controlled via pendant pushbuttons. The trolley, and bridge brakes must set after associated controller decelerates motor to a controlled stop. Size the bridge and trolley controllers to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 131.25 percent of rated load on the hook and not produce any hook rollback. Drive motors must run smoothly, without torque pulsations at the lowest speed, and be energized at a frequency not exceeding 60 HZ.

2.4.3 Power Sources

2.4.3.1 System Supply Voltage

Design cranes to be operated from a [_____] volt,[three-phase, 60 Hz, alternating current][direct current] system power source. Design energy isolating devices for such machine or equipment to accept a lockout device in accordance with NFPA 70.

2.4.3.2 Transformers

****

NOTE: This paragraph is applicable to ac power supplies only.

****

Provide dry type transformers and carry full load continuously at rated voltage and frequency without exceeding an average temperature rise of 115 degrees C above an ambient temperature of 40 degrees C. Provide transformer with totally enclosed case finished with manufacturer's standard coating system. Fully encapsulate transformers, except for those specifically designed for use as an isolation transformer for static power conversion units.

2.4.4 Motors

****

NOTE: Motor heaters are desirable for outdoor cranes, unheated warehouse service cranes, or any other condensing high-humidity application, but specify heaters only if an integral component of the hoist and motor manufacturer. Select a motor from the following types and coordinate with the desired control type.

Select industrial motors for CMAA 70, Class A, B, C and D cranes, as follows:

a. For critical load handling, self-excited

alternator with electrical load brakes or emergency dynamic braking is preferred.

b. Select crane type motors for ac motors.

c. Select 800 Series dc mill type motors or dc industrial motors for dc motors.

d. If crane and/or industrial type motors are specified, select NEMA MG 1.

Select mill motors for CMAA 70, Class E cranes, as follows:

a. If 800 Series dc mill type motors are specified, select AISLE Std No. 1.

b. Select dc motor type (squirrel cage, wound rotor) for the appropriate control system.

c. Select dc series wound motors for dc constant potential control.

d. Select dc shunt wound for dc variable voltage control.

e. Select ac motor (squirrel cage, wound rotor) for the appropriate control system.

****

2.4.4.1 General Requirements for Motors

a. Provide motors designed specifically for crane and hoist duty. Provide drain holes at low points near each end; inspection and service covers with gaskets; and hardware which is corrosion-resistant. Provide motors conforming to the requirements of NFPA 70[,] [NEMA MG 1]and UL 1004-1.

[b. Motor heaters must energize when mainline contactor is de-energized, and water heaters de-energize when mainline contactor is de-energized. Provide motors 15 kW 20 HP and larger with a suitable heater to prevent condensation during long periods of inactivity. Provide motor heater which is an integral component of the hoist and motor manufacturer.

] c. Provide one embedded thermal sensitive device in hoist motor windings. Device and associated circuitry must serve as an alarm activating an amber signal or pilot light visible to control stations when motor temperatures become excessive. Establish set point below the Class B insulation temperature limit. Thermal-sensitive device and associated circuits must be self-restoring (automatic reset). Two-speed, two-winding motors with a solid-state control are not allowed for creep-speed use.

2.4.4.2 Gantry and Trolley Drive Motors

Provide [ac crane type] [dc industrial type] [800 Series dc mill type] [[single-speed; single-winding] [two-speed; two-winding]] [NEMA design B squirrel cage ac type rated] [wound rotor ac induction type] [ac type designed for ac adjustable frequency operation] [dc series wound type] [dc shunt-wound type] gantry and trolley drive motors.

2.4.4.3 Motor Enclosures

****

NOTE: Applicable to 1 or 2 speed ac magnetic control of ac squirrel cage motor. If it is not desirable to have the motor immediately reverse direction, include sentence on plugging to allow the motor to stop prior to reversing direction. If excessive load swing cannot be tolerated during the start of the gantry or trolley, include sentence on reduced voltage starting.

a. Select drip-proof enclosure for indoor usage, except in a hazardous atmosphere.

b. Select totally enclosed nonventilated enclosure for outdoor use and indoor use in a hazardous atmosphere.

c. Select totally enclosed fan cooled enclosure for motors operating at rated speed for long periods.

d. Select forced ventilated enclosure for Class E service.

****

Provide motor enclosures which are [totally enclosed, non-ventilated (TENV)] [totally enclosed, fan cooled (TECH)] [totally enclosed, air-over frame (TAO)] [drip-proof] [drip-proof forced ventilation] conforming to NEMA 250.

2.4.4.4 Motor Insulation and Time Rating

****

NOTE: For gantry and trolley motors, select Class F or H insulation based on rated temperature rise of 105 (Class F)/125 (Class H) degrees C by resistance above a 40 degree C ambient for CMAA Class A, B, C cranes and CMAA 74 cranes with ac or dc magnetic control and electrical control braking.

For gantry and trolley motors, select Class F insulation for Duty Class H1, H2, and H3 hoists and CMAA 70 Class A, B, C cranes and CMAA 74 cranes with ac or dc magnetic control.

For all motors, select Class F or H insulation with a rated temperature rise of 105 (Class F)/125 (Class H) degrees C by resistance above a 40 degree C ambient for CMAA 70 Class A, B, C and CMAA 74 cranes with ac or dc static controls.

For all motors, select Class F or H insulation based on a rated temperature rise of 105 (Class F)/125 (Class H) degrees C by resistance above a 40 degree C ambient for CMAA 70 Class D and E cranes.

Delete frame size selection if not needed for the project.
****

Provide motors with [Class F] [Class H] rated insulation based on an [105] [125] degree C motor temperature rise above 40 degrees C ambient, with frame size selection based on continuous ratings.

[2.4.4.5 Micro-Motors

Micro-motors for gantry [and trolley] drives must be [direct current industrial type, shunt wound motors] [industrial type, single-speed; single-winding; ac squirrel cage motor] and conform to the requirements of NEMA MG 1. Provide totally enclosed micro-motor , fan cooled (TEFC), with Class F or H insulation. Motor voltage rating must comply with system supply voltage rating specified.

]2.4.5 Electric Hydraulic Brakes

[2.4.5.1 Travel Brakes

****
NOTE: Delete this paragraph if hydraulic braking system is not required.

If electric brakes are used, provide a drift point so the brakes will release after the motor is de-energized, thereby allowing the motion to coast and reduce swing of the load. A drift point can also allow the trolley to center itself over the load before actually starting to lift.

For pendant control cranes and cab controlled cranes where hydraulic braking is not desired, select spring-applied electrically-released brakes.

For cab operated cranes, specify electric-hydraulic brakes for gantry or trolley brakes except in the case of constant speed/speed regulated (at a particular controller setting) type controls.

Limit electric-hydraulic brakes to ac magnetic or secondary saturable reactor and dc magnetic controls for ac wound rotor motors and dc series/compound wound motors respectively. Limit electric-hydraulic brakes to gantry brakes on gantry mounted cabs and trolley brakes for trolley mounted cabs.

Do not specify electric-hydraulic brakes for the following:

a. Single and multi-speed magnetic control of squirrel cage motors.

b. Alternating current adjustable frequency control of squirrel cage motors.

c. Direct current variable voltage control of shunt wound ac motors.

****

Provide electric-hydraulic [gantry][trolley] brakes which are dc shunt magnet type equipped with hydraulic actuators manually-operated with a foot-operated master control unit in the operator's cab, and electrically released with the operation of the mainline contactor POWER-OFF pushbutton or power failure. Provide remote control bleeders operable by pushbutton and foot pedal except for power-assisted brake systems. Remote control bleeders must be complete with pushbutton clearly labeled and located in operator's cab where the operator can easily depress the pushbutton and pump the brake simultaneously. In lieu of the combination electric-hydraulic brakes, separate hydraulic and electric brakes may be provided. Design hydraulic brake system to ensure equal pressure at each brake cylinder.

][2.4.5.2 Hoist Brake Time Delay

****

NOTE: Delete this paragraph if one brake is specified.

****

Provide one of the hoist holding brakes with a time-delay setting (from 1 to 3 seconds). Initiate the time-delay upon releasing the control pushbutton or returning the master switch to OFF. Operation of mainline POWER-OFF pushbutton or power failure must result in each hoist brake's setting without any time-delay.

]2.4.5.3 Automatic Stop System

Provide fail-safe spring set electrically-controlled brakes when power is interrupted. Release brakes with a mainline contactor POWER-OFF pushbutton or a master switch for the associated drive. Brakes must automatically stop when there is a power failure. Design electric system to be mechanically released. Provide enclosures for electrical-controlled brake components conforming to NEMA ICS 6 Type [_____]. Provide direct current shunt magnetic shoe brakes with an electrical forcing circuit for rapid release of brake. Circuit each shunt coil brake for both conductors to open simultaneously when the brake is de-energized.

2.4.6 Controls

2.4.6.1 Control Panels

****

NOTE: Control panel heaters are desirable for outdoor cranes, unheated warehouse service cranes or any other condensing high-humidity application.

Alternating current or dc static crane control for outdoor cranes need thermostatically-controlled panel heaters for outdoor panels or any other application which is colder than 0 degrees C. Alternating current or dc static crane control may need both thermostatic control and mainline contactor control.

****

Fabricate control panels of solid sheet steel designed and constructed to conform to requirements of NEMA ICS 6 Type [_____]. [Provide thermostatically-controlled heaters to keep control enclosure temperatures at or above 0 degrees C in each static crane control panel.][Control panel heaters must be energized when mainline contactor is de-energized, and be de-energized when mainline contactor is energized to prevent anti-condensation.]Hinge and equip control panel doors with gaskets and fitted with key-lock handle design, complete with a single key to open all locks. Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.

2.4.6.2 Drift Point

****

NOTE: Provide gantry and trolley directions normally oriented to main compass headings.

Select method of festoon suspension. For multiple girder cranes select underneath footwalk and for single girder cranes select auxiliary girder. If a hoist thermal sensor is specified, include requirement for yellow pilot light. If a micro-drive is specified, include the sentence, "A 2-position [_____]."

Pendant handles are required only if pendant is in an explosion area. Monorail cranes do not require an independent track for pendants.

****

Provide trolley and gantry main control systems with a drift point between OFF and first speed control point in each direction or have a separate pushbutton.

[2.4.6.3 Micro-Drive Motor and Clutch Control

Design micro-drive system such that when micro-drive is selected at control station, all main motors are disconnected, and all micro-drive clutches energized. Operation of micro-drive motors must be from crane control station. Provide micro-motor control systems with single-speed in each direction by means of an electrically-operated, full-magnetic, [reduced][full] voltage type starter. Do not apply power to any micro-motor unless all clutches are fully engaged. If a clutch disengages during operation of micro-motors, the mainline contactors must open and all brakes must set. Prevent application of power to any main motor with any clutch engaged. Provide a transfer switch at crane control station to allow transfer from either mode of operation to the other only when all brakes have been set for not less than 5 seconds. Provide a single CLUTCH-ENGAGED green pilot light [at the pendant station][in the cab] when all clutches are energized; also provide individual CLUTCH ENGAGED pilot lights on drive control panels.

][2.4.7 Cab Control Station

****

NOTE: Delete this and the following four paragraphs if a cab is not required.

****

2.4.7.1 General

****

NOTE: Provide gantry and trolley directions normally oriented to main compass headings. If stepped speeds and/or drift point are specified, include the applicable requirements in this paragraph. Delete auxiliary hoist switch if not necessary for the project.

****

Accomplish crane control by a [gantry-mounted][trolley-mounted] cab control. Provide spring-return to "OFF" for master switch operating handles, with [distinct drift point detents,][distinct speed-point intents,] and OFF position latching. Provide NEMA Type 1 master switch enclosures. Provide POWER-OFF pushbutton with a red mushroom head and a green or black POWER-ON pushbutton. Provide the following cab master switches:

a. Main Hoist - up/down.

[b. Aux Hoist - up/down.

] c. Gantry - [_____] [_____].

d. Trolley - [_____] [_____].

e. POWER-OFF.

f. POWER-ON.

2.4.7.2 Cab Indications

****

NOTE: If hoist thermal sensor is specified, include requirement for red light. Voltmeter applicable to dc control systems only. If rail clamps are specified, include sentence regarding rail clamp operation and indication. If flood lighting is specified, include requirement for toggle switch.

****

Provide red pilot lights to indicate excessive hoist motor temperature. Provide a white pilot light to indicate that power is available on load side of crane disconnect switch. Provide a blue pilot light to indicate that the main contactor is energized.[Supply a minus 300 to plus 300 Dc voltmeter to monitor the main rectifier output voltage, and provide a selector switch to select the voltage to be monitored.][Provide a red pilot light to indicate the rail clamps are set.][Provide a single-toggle switch to operate crane floodlights.][Provide a single green pilot to indicate all micro-drive clutches are engaged.]

[2.4.7.3 Cab Controls

****

NOTE: Delete this paragraph if combination controls (cab and pendant or cab and radio control) are not used. If it is desirable to raise the pendant out of the way, include the last sentence. Otherwise,

delete.

****

Provide cab with a 2-position key-operated switch to allow transfer of control from cab to [pendant][radio control] station and a red pilot light mounted in cab to indicate that the control has been transferred to other station. Selection of one operating station must lock out the controls of other stations.[Also provide a 2-position switch to raise and lower the pendant station.]

][2.4.7.4 Cab Heating & Ventilating [& Air-Conditioning]

****

NOTE: If heating or air conditioning of the cab is required, edit this paragraph to specify design requirements; otherwise delete this paragraph. Refer to UFC 3-400-02, "Design: Engineering Weather Data" ambient temperatures for cab heating and air conditioning.

****

Provide thermally-insulated cab with [air-conditioner][and electric heater]. Provide a filter unit to pressurize the cab with filtered outside air. Provide air filter which is a standard commercial type capable of removing airborne dust and located where it can be readily cleaned or changed. Provide adjustable thermostat to control [air conditioner][with][heater]. The unit must meet the Energy Efficient requirements of ASHRAE 90.1 - SI ASHRAE 90.1 - IP. Keep the cab interior at 18 degrees C 65 degrees F in winter with [_____] degrees C F ambient temperature and [_____] degrees C F in summer with [_____] degrees C F dry bulb and [_____] degrees C F wet-bulb ambient temperatures. Provide corrosion-resistant material or protection against corrosion for all other hardware and components. Mount motor compressor assembly on vibration isolators.

]][2.4.8 Pendant Control Station

****

NOTE: Delete the following paragraphs if pendant control is not specified. If the crane is higher than 18 m 60 feet above the operating floor and the span is greater than 15 m 50 feet, consider including a pendant drive for ease of movement of the pendant if it is not towed by the trolley; otherwise delete this paragraph. Pendant drive speed should be the same as the trolley.

****

[2.4.8.1 General

Provide NEMA Type [1] [3R] [7] [9] [12] pendant control station. Hold physical size of pendant to a minimum. Provide a separate cable of corrosion-resistant chain consisting of minimum 6.4 mm 1/8 inch wire. Attach pendant station to [underside of crane gantry footwalk][an auxiliary girder] and hang vertically with bottom of pendant at 1 m 40 inches above floor. Do not support weight of pendant by control cable.

]2.4.8.2 Operating Pushbuttons

****

NOTE: Provide gantry and trolley directions normally oriented to main compass headings. Select method of festoon suspension: For multiple girder cranes select underneath footwalk and for single-girder cranes select auxiliary girder. If a hoist thermal sensor is specified, include requirement for yellow pilot light.

****

Provide heavy-duty, dust-and-oil-tight type operating pushbuttons with distinctly-felt operating positions which meet requirements of NEMA ICS 2. Pendant control buttons must be momentary pushbuttons. Provide recessed type pushbuttons (except the POWER-OFF button) to avoid accidental operation. Make diameter of buttons a size which will make operation possible with a thumb while holding the pendant with same hand. Provide nameplates adjacent to each pushbutton. Provide barriers on pendant between various pushbutton functions, except on elements mounted in junction box. In a multi-speed application, provide dual-position pushbuttons that have a definite click-detent position for each speed. Design and manufacture pushbuttons not to hang up in control case. Include with the pendant a separate set of pushbuttons for each motion and for POWER-ON POWER-OFF. Provide the following pushbuttons:

POWER-OFF.

POWER-ON.

Hoist-up.

Hoist-down.

[Gantry]-[_____].

[Gantry]-[_____].

Trolley-[_____].

Trolley-[_____].

2.4.8.3 Light Indicators

****

NOTE: Coordinate requirement for pilot lights and selector switches. Delete micro-drive if not applicable.

****

Provide pilot lights meeting heavy-duty requirements of NEMA ICS 5. Provide one red pilot light to indicate excessive hoist motor temperature on pendant station. Provide a blue pilot light to indicate that the main contactor is energized, and a white pilot light to indicate that power is available on the load side of crane disconnect switch. Provide a bright red mushroom head for the POWER-OFF pushbutton. Provide a 2-position selector switch to select between normal and micro-drive.[Provide a single green pilot light to indicate all [micro-drive]clutches are engaged.]

[2.4.8.4 Pendant Drive Control

****

NOTE: If the crane is higher than 18 meters 60 feet above the operating floor and the span is greater than 15 meters 50 feet, consider including a pendant drive for ease of movement of the pendant if it is not towed by the trolley; otherwise delete this paragraph. Pendant drive speed should be the same as the trolley.

****

Provide a 3-position momentary contact spring-return to OFF toggle switch to control the motorized trolley for pendant.

][2.4.8.5 Transfer of Control Stations

Provide pendant with a green pilot light to indicate that control has been transferred to pendant station from cab with key lock-out.

]][2.4.9 Radio Remote Control, Infrared Remote Control

****

NOTE: Include this and the following paragraph if radio remote control or infrared remote control is desired; otherwise delete.

****

2.4.9.1 General

Equip crane with a complete digital radio remote-control system to permit full control of crane from a portable wireless transmitter. Provide a system which is the use-proven product of a manufacturer regularly engaged in design and manufacture of crane radio remote-control systems. Provide a "fail-safe" designed system so that the failure of any component or loss of signal will cause all crane motors to stop. The system must permit complete, independent and simultaneous operation of all crane functions.[Set system frequency in the 72MHz-76MHz band.][Frequencies must conform to FCC Part 15.] Include transfer relays in receiver if crane is also cab or pendant controlled.

2.4.9.2 Transmitter

****

NOTE: Provide gantry and trolley directions normally oriented to main compass headings.

****

Provide portable transmitter complete with an adjustable belt or harness. Crane motion switches must spring-return to OFF. Provide transmitter with two spare batteries and battery charger to permit continuous operation. Provide a key-lock with the key removable in the OFF position only to control transmitter operation. Provide a blue signal light mounted on crane visible from floor to indicate the main contactor is energized. Make POWER-OFF toggle-switch bright red. Provide the transmitter with the following controls:

Hoist-up/down.

Gantry-[_____].

Trolley-[_____].

POWER-ON.

POWER-OFF.

]2.4.10 Protection

2.4.10.1 Main Line Disconnect

Provide a main line disconnect consisting of a combination circuit breaker (50,000 AIC) and non-reversing starter, starter without overloads (mainline contactor) in NEMA Type [_____] enclosure. Control circuit of mainline disconnect must cause all crane motions to stop upon mainline undervoltage, overload, control circuit fuse failure, or operation of POWER OFF pushbutton. Equip mainline disconnect with energy isolating devices designed to accept lockout devices.

2.4.10.2 Isolation Transformer

****

NOTE: Specify an isolation transformer and surge protection to protect electronics from external faults. Recommended for dc static control systems. Applicable to ac power supplied systems only.

****

Provide an SCR drive type isolation transformer specifically designed for cranes, with a continuous rating which will exceed that required of the sum of rated full-load full-speed KVA of hoist plus 50 percent of rated full-load full-speed KVA of trolley and gantry motors plus the rated KVA of controls. Multiply the total KVA by 1.05 (efficiency factor). Connect the isolation transformer to the load side of mainline disconnect of the transformer. Supply crane dc static control electric power distributed on the crane through this isolation transformer.

2.4.10.3 Surge Protection

Provide surge suppressors meeting the requirements of UL 1449. Provide three metal oxide varistors on the line side of each SCR drive isolation transformer to provide transient over-voltage protection.

2.4.10.4 Circuit Breakers

Provide circuit breakers meeting the requirements of UL 489.

2.4.10.5 Overloads

****

NOTE: Select applicable overload protection based on control circuit type.

****

[Provide alternating current circuit overload relays of the ambient compensated, automatic reset, inverse time type located in all phases individual motor circuits. Arrange overload relays to de-energize the associated motor on an overload condition.] [Provide an automatically reset inverse time-trip running overload relay for each dc motor circuit. Provide an automatically reset instantaneous trip overload relay in each dc motor circuit or for a pair of series-connected motors. Arrange overload relays to de-energize the associated motor on an overload condition.] [Alternating current adjustable frequency-control motor overload-protection must be electronic and protected by inverse time and current versus output frequency which will allow less current for a given amount of running time when frequency (speed) is lower than rated.] [Provide electronic direct current variable voltage control motor overload-protection.]

2.4.11 Limit-Switches

****

NOTE: Delete reference to micro-drive control system if not applicable.

****

Provide heavy-duty quick-break double-pole double-throw type gear limit switches conforming to NEMA ICS 2. The geared limit-switch interruption of a motion in one direction must not prevent the opposite motion. Geared limit-switches must reset automatically. Provide NEMA Type [1] [4] limit switch housings. Provide limit-switches to interrupt power to the primary [and micro-drive]control systems. Provide a geared limit switch to limit upward travel at an upper limit and a geared limit switch to limit downward travel at a lower limit. Provide also a block activated mechanical limit switch that removes power from the brake, motor and control drive simultaneously.

2.4.11.1 Gantry and Trolley Travel Limit-Switches

Provide runway (track-type) limit-switches for crane gantry and trolley motions to stop the gantry and trolley motions, respectively. Install limit-switch actuators on building and trolley frame to actuate the limit-switches and stop the crane gantry or trolley prior to contacting the trolley frame bumpers. Locate trip mechanism for trolley motion on crane runway to trip the switch before the bumper contacts the stop. Locate trip mechanism for gantry motion on crane runway to trip switch before bumper contacts the stop. When the switch is tripped, permit the switch opposite travel in the direction of stop and to automatically reset.

[2.4.11.2 Rail Clamp Limit-Switches

****

NOTE: Include paragraph for outdoor cranes; otherwise delete. Delete reference to micro-drive when not applicable.

****

When rail clamps are set, furnish each rail clamp with a limit-switch designed to interrupt the primary [and micro-drive]control circuits to gantry drive. Provide a red pilot light at control station to indicate the rail clamps are set.

]2.4.12 Wiring

Perform wiring complying with Article 610 of NFPA 70. Number or tag wires at connection points. Make all splices in boxes or panels on terminals boards or standoff insulators. Base motor loop, branch circuit and brake conductor selection on NFPA 70 for 90 degrees C 194 degrees F conductor rating on indoor cranes, and for 75 degrees C 164 degrees F conductor rating on outdoor cranes. Provide Type SRML conductors in the vicinity of resistors and conductors connected to resistors.

2.4.13 Electrification

2.4.13.1 Main Power Electrification

Main power electrification system must provide power to crane starter/disconnect circuit breaker.

2.4.13.2 Crane Runway Conductors

****

NOTE: Select covered conductor bar system for:

a. Indoor non-hazardous service
b. Outdoor non-corrosive environment

Select festoon system for:

a. Indoor - hazardous service
b. Outdoor - corrosive (marine) environment

****

[Provide covered conductor bar type crane runway conductor system designed and manufactured to meet UL requirements. Provide rigid or flexible self-closing type protective cover designed to cover all live conductors and shaped to prevent accidental contact with conductors. Provide heavy-duty sliding shoe type collectors compatible with the electrification system. Provide two tandem designed collector heads for each conductor rail to provide redundancy.] [Provide festooned type crane runway conductor system consisting of a support rail, cables, junction boxes, cable cars and accessories. Hardware must be corrosion-resistant or protected against corrosion. Festoon storage area must not restrict the crane travel at the ends of runway.]

2.4.13.3 Gantry Span Conductors

Provide[festooned type consisting of a support rail, electrical cables, junction boxes, cable cars and accessories][rigid conductor/collector type located within enclosure] gantry span conductor system. Do not allow cable loops to drop below the hook high position. Furnish corrosion resistant, outdoor crane gantry festoon, system hardware.

[2.4.13.4 Pendant Festoon System

****

NOTE: The pendant festoon system is an option to the Designer.

****

Provide pendant festoon system consisting of a support rail, cables, junction boxes, cable cars and accessories. Do not allow cable loops to drop below the hook high position. Provide pendant control car with NEMA Type [1] [3R] [12] junction box. Pendant festoon must be[towed by trolley][independent of trolley motion]. Furnish corrosion resistant, outdoor crane, pendant festoon system hardware.

][2.4.13.5 Pendant Drive System

Provide pendant festoon system with a motor-drive system capable of driving the pendant control car at [_____] m/s fpm. Control of pendant motor drive must be from the pendant.

][2.4.13.6 Pendant Retraction System

****

NOTE: Select method of pendant retraction if specified; otherwise delete paragraph.

****

[Provide pendant control car with an electric-powered cable reel so that the pendant station will retract fully.][Provide a wire-rope hoist to hoist the pendant station. Pendant and pendant drop-cable must be retractable to approximately 1/3 of drop cable length.]Control retraction system from cab.

]2.4.14 Special Requirements

2.4.14.1 Warning Horn

****

NOTE: Delete last sentence if not applicable to project.

****

Provide a solid-state electronic warning horn on the crane. Accompany any gantry or trolley motion by a continuous series of alternating tones.[The warning horn must not sound when the crane is in the micro-drive mode.]

2.4.14.2 Accessory Power

****

NOTE: If lighting, motor or control cabinet heaters or receptacles are specified, include the following paragraph if 460 volt ac is the power source. Select the components requiring power.

****

Use three-phase 208Y/120 volt ac power supplied via a circuit breaker and isolation transformer from the line side of the main line disconnect for [lighting,] [heaters,] [and accessory circuits] on the crane. Provide the circuit breaker with a NEMA Type [1] [3R] [12] enclosure. The enclosure must have provisions to lock the breaker in the OFF position. Provide each circuit breaker pole with individual thermal and magnetic trip elements and the enclosure cover with a button for mechanically tripping the circuit breaker. Supply three-phase 480 volt delta primary and 208Y/120 volt wye secondary general lighting transformer from the accessory circuit breaker and feed a 208Y/120 volt UL listed circuit breaker panelboard and a heater circuit breaker/combination starter. Provide a panelboard to supply branch circuits for utilization of various accessories such as [receptacles,] [lighting,] [panel internal lighting,] [motor heaters and control enclosure which meets NEMA requirements]. Transformer and panelboard must have the same NEMA classification as the circuit breaker.

2.4.14.3 Receptacles

****
NOTE: Specify receptacles for multiple girder cranes. Specify ground fault protection for outside cranes. Delete requirement for receptacle in cab when not applicable.
****

Provide single-phase, 120-volt 15-amp, grounded, duplex type receptacles complete with metal weather-proof enclosure with self-closing weatherproof receptacle cover. Provide a receptacle on the trolley at each end of the front gantry walkway in the vicinity of gantry travel drive motors and in the cab. Provide several receptacles in the vicinity of the control equipment equally spaced every 3 m 10 feet. Breakers used to protect circuits supplying the receptacles for outside cranes must incorporate ground fault current interruption feature and meet the requirements of UL 943.

2.4.14.4 Lighting

****
NOTE: Specify lighting for outdoor cranes or in dimly lighted areas.
****

Provide control panels with a 120-volt lamp fixture with an unbreakable lens and switch. Provide floodlights to illuminate the work area under the crane and drum area on crane, controlled from crane control station. Provide metal halide industrial floodlight luminaries. Totally enclose each floodlight, vapor-tight design, gasketed and provided with a heat-resistant and impact-resistant glass lens. Space and attach floodlights to underside of crane to provide uniform lighting.

[2.4.14.5 Anti-Condensation Heaters

****
NOTE: Motor heaters recommended for outdoor cranes, unheated warehouse service cranes or any other condensing high-humidity application; if not desired delete this paragraph. Thermostatically-controlled heaters is a designer option.
****

Equip motor and control panels with anti-condensation heaters. Provide thermostatically-controlled heaters in each static-control panel to keep control enclosure temperatures at or above 0 degrees C. Provide NEMA Type [1] [3R] [12] enclosure for circuit breaker combination magnetic starter. Equip magnetic starter with manually-reset overload relays and interlock with the mainline disconnect so that anti-condensation heaters are de-energized when the mainline contactor is energized and the magnetic starter is energized when the mainline contactor is de-energized.

][2.4.14.6 Wind Indication and Alarm

****
NOTE: Specify location of wind alarm station for outdoor cranes, normally mounted near center of the gantry. Provide location of cutout. Delete

paragraph if not applicable.
****

Provide a wind-indicating device with an adjustable alarm trip point. Provide alarm trip with time-delay for wind gusts. Adjustable trip must actuate an oscillating blue light and bell mounted near [_____]. Provide ability to cut off bell alarm from the[pendant station][cab].

][2.4.14.7 Electrically-Driven Oil Pump Alarm

****
NOTE: Delete this paragraph for equipment which does not contain an oil pump.
****

Provide electrically -driven lubricating pump complete with an audible alarm and red light for indication of pump malfunction. Make location of alarm the factory standard location.

]2.4.15 Load-Limit System

****
NOTE: Specify load sensing if loads approaching the capacity of the crane are to be lifted routinely.
****

Provide a load-limit visual/audible system for the main hoist to inform the operator that the preset load has been exceeded. Provide a load-limit system consisting of a load-cell, load-sensing electronics, overload indicator lights, overload alarm bell and alarm cut-out switch. Mount load cell to receive the load from equalizing sheave pin or upper block sheave pin. The alarm setpoint must be adjustable.

2.4.15.1 Load-Sensing Electronics

Provide NEMA Type [1] [3R] [12] enclosures for load sensing electronics. Alarm setpoint must be adjustable.

2.4.15.2 Alarm and Indicator Light

Provide an overload alarm light to indicate a load greater than the preset maximum. Indicate overload alarm with a red light and clearly labeled "OVERLOAD". Also provide a bell to indicate when an overload condition exists. Make provisions to turn off the bell from[pendant station][cab] [_____].

2.4.16 Fungus Resistance

****
NOTE: Specify fungus resistance for cranes in marine or humid environments.
****

Coat electrical connections such as terminal connections, circuit connections, components and circuit elements with fungus-resistant varnish. Do not treat components and elements which are inherently inert to fungi or hermetically sealed. Do not treat elements whose operation will be adversely affected with the application of varnish.

2.5 ELECTROMAGNETIC INTERFERENCE SUPPRESSION

****

NOTE: Specify EMI suppression if electro-magnetic interference from the crane may be a problem to sensitive electronics in the work area.

****

2.5.1 Shielded Cable

Provide shielded type pendant and festooned cables of braided tinned-copper. Ground each cable shielding with a single connection to equipment grounding conductor.

2.5.2 EMI/RFI Shielded Boxes

2.5.2.1 General

Boxes designed to house electronic and electrical control equipment, instruments, metering equipment, etc., in installations where electromagnetic compatibility and/or system security is required must protect interior components from stray radio frequency (RF) fields and contain RF signals produced by interior components.

2.5.2.2 Construction

Design Electromagnetic Interference/Radio Frequency Interference (EMI/RFI) shielded boxes to meet UL 50 Type 12 and Type 13. Construct the shielded boxes of [1.519] [1.897] mm [16] [14] gauge steel with seams continuously welded and ground smooth, without holes and knockouts. Cover gasket must be a combination of woven plated steel mesh and oil-resistant gasket which will provide an EMI/RFI seal as well as an oil-tight, dust-tight and water-tight seal between cover and body. Attach gasket to cover with oil-resistant adhesive. Provide stainless steel cover clamps and screws which are quick and easy to operate on three sides of hinged cover for positive clamping.

2.5.2.3 Attenuation

Design EMI/RFI shielded boxes to provide maximum shielding of electric and magnetic components of radiated RF energy. Provide RF filters to suppress conducted radio frequency in cables and conductors. Provide shielded boxes with attenuation greater than 60 db at 14.5 KHz to greater than 100 db at 1 MHz for magnetic fields and greater than 100 db from 14.5 KHz to 430 MHz for electric fields.

2.5.2.4 Finish

Provide zinc-plated EMI/RFI shielded boxes in accordance with ASTM B633 SC3/Type II to provide corrosion-resistant conductive surfaces for gasket contact area and conduit entries. Match the finish coat with the crane finish.

[2.5.3 Hoist Drum Grounding

****

NOTE: A grounding drum is required for non-sparking environment only (general nuclear or explosive).

****

Provide a copper ring/collector assembly to ground each drum. Provide electrically-bonded ring to drum. Collector must be stationary and connected to equipment grounding conductor system with a No. 8 AWG copper wire.

]PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field and submit a letter describing the results of this verification including discrepancies to the Contracting Officer and crane manufacturer. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

3.2 ERECTION

Perform the entire crane erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's representative. Provide a written certificate from crane manufacturer indicating the crane is erected in accordance with manufacturer's recommendations before testing the completed installation.

3.2.1 Shop Assembly

Shop assemble major crane components as completely as possible. Match mark disassembled parts and tag electrical connections after complete no-load shop testing. Protect all parts and equipment at site from weather, damage, abuse and loss of identification. Erection procedures must ensure that the crane is erected without initial stresses, forced or improvised fits, misalignments, nicks of high-strength structural steel components, stress-raising welds and rough burrs. Clean and repaint damaged surfaces after crane is erected. Provide all necessary grease and oil of approved quality and grade for the initial servicing and field test.

3.2.2 Mechanical Alignment

Align motors, couplings, brakes, gear boxes and drive components when reinstalled in accordance with manufacturer's instructions.

3.2.3 Electrical Alignment

Align control system in accordance with manufacturer's instructions. Store a copy of the final alignment data in control panel door, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents and test conditions such as ambient temperature, motor load, date performed and person performing the alignment.

3.2.4 Welding

Qualify or pre-qualify welders, welding operations and welding procedures in accordance with AWS D14.1/D14.1M. Perform welding indoors. Surface of parts to be welded must be free from rust, scale, paint, grease or other foreign matter. Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M. Perform welding in accordance with written procedures which specify the Contractor's standard dimensional tolerances for deviation from camber and sweep. Such tolerances must not exceed those specified in accordance with AWS D14.1/D14.1M. Allowable stress ranges must be in accordance with CMAA 70. Perform welding of girders and beams conforming to AWS D14.1/D14.1M.

3.2.5 Field Painting

****
NOTE: The last sentence will only be required if the gantry crane is in an explosion proof area.
****

Painting required for surfaces not otherwise specified, and finish painting of items only primed at the facility, must conform to SSPC SP 6/NACE No.3 and as specified in Section 09 90 00 PAINTS AND COATINGS. Paint gantry crane including gantry, trolley, hoist and all attached items in accordance with the manufacturer's standard practice. Paint the complete crane of one color. Paint gantry rail, supports and bracing in accordance with Section 09 90 00 PAINTS AND COATINGS. **Do not paint** items such as surfaces in contact with the rail wheels, wheel tread, hooks, wire rope, surfaces on the electrical collector bars in contact with the collector shoes and nameplates.[Coordinate the requirements of explosion proof cables with cable manufacturer.]

3.3 ACCEPTANCE TESTING

3.3.1 General

****
NOTE: This paragraph applies to new construction only. Specify the test weights required. The weights normally required are the rated load, 125 percent of the rated load and 10 percent of the rated load (for the grounding and the acceleration/deceleration test).
****

Provide all personnel necessary to conduct the required testing, including but not limited to, crane operators, riggers, rigging gear and test weights. Perform testing in the presence of Contracting Officer or his designated representative. Notify the Contracting Officer [_____] days prior to testing operations. Operate all equipment and make all necessary corrections and adjustments prior to the testing operations witnessed by Contracting Officer. A representative of the Contractor responsible for procuring and installing hoist equipment must be present to direct the field testing. Use compact test loads and permit a minimum of 50 percent of vertical lift. Test loads must be minus 0 percent to plus 5 percent of the required weight, and be verified prior to testing. Test weights required are [_____], [_____] and [_____] kg [_____], [_____] and [_____] pounds. Do not perform operational testing until after building interior has been painted. Furnish [three] [_____] copies of all test reports to Contracting Officer.

3.3.1.1 Test Sequence

Test crane in accordance with applicable paragraphs of this procedure in the sequence provided. Verify clearance envelope is clear to ensure there are no interferences.

3.3.1.2 Test Data

Record operating and startup current measurements for coils, hoist, trolley, and gantry motors using the appropriate instrumentation. Record speed measurements as required by facility evaluation tests (normally at 100 percent load). Compare recorded values with design specifications or manufacturer's recommended values. Abnormal differences must be justified in the remarks and appropriate adjustments performed. Note any high temperatures or abnormal operation of any equipment or machinery, investigate and correct. Record hoist, trolley and gantry speeds during each test cycle.

3.3.1.3 Equipment Monitoring

Monitor improper operation or poor condition of safety devices, electrical components, mechanical equipment and structural assemblies during the load test. Report defects observed to be critical during the testing period immediately to the Contracting Officer and suspend the testing operations until the defects are corrected. During each load test and immediately following each load test, make the following inspections:

a. Inspect for evidence of bending, warping, permanent deformation, cracking or malfunction of structural components.

b. Inspect for evidence of slippage in wire rope sockets and fittings.

c. Check for overheating in brake operation; check for proper stopping. Test all safety devices including emergency stop switches and POWER-OFF pushbuttons and inspect separately to verify proper operation of the brakes. When provided, inspect all safety accessories including warning horn, lighting, gauges, warning lights and accuracy of wind indicating device and alarm.

d. Check for abnormal noise or vibration and overheating in machinery drive components.

e. Check wire rope sheaves and drum spooling for proper reeving and operation, freedom of movement, abnormal noise or vibration.

f. Check electrical drive components for proper operation, freedom from chatter, noise, overheating, and lockout/tag-out devices for energy isolation.

g. Inspect gears for abnormal wear patterns, damage, or inadequate lubrication.

h. Verify that locations of crane capacity plates are visible from pendant operator's position.

[3.3.2 Trolley Travel

****

NOTE: Delete references to micro-drive when not applicable.

****

Operate trolley the full distance of gantry rails exercising all primary drive [and micro-drive]speed controls in each direction. Verify brake operation in each direction. In slow speed [or micro-drive,]trolley bumpers must contact trolley stops located on the gantry girders. In slow speed, test the proper operation (interrupt power, automatic reset) of the trolley limit-switches at both limits of trolley motion.

]3.3.3 Gantry Travel

****

NOTE: Delete references to micro-drive when not applicable.

****

Operate gantry in each direction the full distance of runway exercising all primary drive [and micro-drive]speed controls. Verify brake operation in each direction.[In slow speed the proper operation (interrupt power, automatic reset) of the gantry, test limit-switches at both limits of gantry motion.] In slow speed [or micro-drive]the crane gantry bumpers must contact the runway rail stops.

3.3.4 Gantry Crane Tests

3.3.4.1 Dynamic Load Tests

a. Trolley Dynamic Load Test: While operating the trolley the full distance of gantry rails in each direction with test load on the hook (one cycle), test proper functioning of all primary drive and micro-drive speed control points and proper brake action.

b. Gantry Dynamic Load Test: With test load on hook, operate gantry for the full length of runway in both directions with trolley at each extreme end of gantry. Verify proper functioning of all primary drive and micro-drive speed control points and brake action. Binding of the gantry end trucks indicates a malfunction requiring adjustment.

3.3.4.2 Trolley and Gantry Loss of Power Test

A test load of 100 to 105 percent of rated load must be raised clear of any obstructions on operating floor. Starting at a safe distance from walls or other obstructions, select a slow speed using the trolley and gantry primary drive. While maintaining a safe distance to obstructions, disconnect the main power source and verify brakes have set and that the equipment stops within the distance recommended by manufacturer.

3.3.5 Overload Tests

After the operational tests, test gantry crane system and all functions of gantry crane at 125 percent of rated load. With the trolley in the center of the bridge span, raise the test load approximately 1 foot and hold the load for 10 minutes. Verify the load does not move. Verify the girder deflection is within specifications.

3.3.6 Acceleration and Deceleration Tests

Test the acceleration and deceleration of gantry and trolley with approximately 10 percent of rated load at lowest possible location of hook. Operate gantry and trolley to run up to high speed and then stop without jarring or swinging the load.

3.3.7 Grounding Test

Test hoist to determine that the hoist, including hook and pendant, are grounded to building during all phases of hoist operation. Test the grounding of gantry and trolley with approximately 10 percent of rated load on hook. Test grounding between hoist hook and the structure's grounding system.

3.3.8 Adjustments and Repairs

Perform adjustments and repairs under the direction of the Contracting Officer at no additional cost to the Government, until satisfactory conditions are maintained, and contract compliance is affected. After adjustments are made to assure correct functioning of the components, repeat pertinent testing.

3.4 SCHEMATIC DIAGRAMS

Store schematic diagrams for equipment where indicated on drawings.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [six] [_____] copies of operation and [six] [_____] copies of maintenance manuals for the equipment furnished. One complete set prior to performance testing and the remainder upon acceptance. Detail in the operation manuals the step-by-step procedures required for system startup, operation and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Also include piping and equipment layout and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course.

3.7 FIELD TRAINING

Conduct a training course for the operating staff. Provide a training period consisting of a total of [_____] hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and [_____]. Give Contracting Officer at least 2 weeks advance notice of field training.

3.8 FINAL ACCEPTANCE

****

NOTE: Use this paragraph as written for projects where the crane is the principal construction element, or represents a very significant portion of

the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.
****

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on wire rope, hook and electrical collector bars.

SECTION 41 22 13.33

PORTAL CRANE TRACK INSTALLATION

05/10

****

NOTE: This guide specification covers the requirements for procurement, installation and testing of portal crane trackage.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

****

NOTE: Use this specification in conjunction with the following NAVFAC Standard Drawings that form part of MIL-DTL-82020 and MIL-DTL-29229 and following Definitive Drawings and UFC 4-860-02N, "Design: Trackage ." These are available in inch-pound units only.

NAVFAC NO./TITLE

1404353 "Definitive Drawing - Fabricated Portal Crane Track Switch Throw Linkage"

1404354 "Definitive Drawing - Portal Crane Track Switch Power Mechanism"

1404355 "Definitive Drawing - Portal Crane Track Turntable Frog Power Mechanism"

Crane track material, especially fittings, frequently require long lead time to become available to the Contractor. Ensure that the lead time required for material specified in this guide specification is considered when project construction time is established.

NOTE: Show the following information on the project drawings:

1. Existing material to be reused, if required

2. Crane rail system type

3. Crane wheel type

4. Rail curvature geometry

5. Switch throw mechanism

6. Utility line connections for power operated switch throw mechanism

7. Drainage for track fittings and switch throw mechanism housings

8. Rail alignment and gage

9. Rail joint connection types

10. Welding method at each welded joint

11. Sketch No. 41 22 13.33-1 and Sketch No. 41 22 13.33-2

Scheduling restraints which impact on the Contractor's time or cost to perform the work, station operations affected by the Contractor's work, and station operations which may affect the performance of the Contractor's work should be addressed in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS. The following is a sample paragraph which may be used in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS, paragraph "Special Scheduling Requirements."

INTERFACE WITH TRACK OPERATIONS: Schedule work to

minimize interference to crane, (train,) and vehicular traffic operations. Crane and/or train operations will be scheduled to minimize interruptions to Contractor's work. However, critical materials must be transported as necessary. When it is required to transport critical material over trackage where Contractor is working, or to utilize portal cranes in work areas, Government will notify Contractor at least 5 calendar days, or as required, in advance so that he may schedule his work accordingly. If necessary, work scheduling for the entire project will be discussed during the pre-construction conference and present a proposed work schedule not later than 5 calendar days (or as required) after the pre-construction conference.

1.2 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

[Crane track fittings; G, [_____]]

[Switch throw mechanisms and housings; G, [_____]]

[Drainage lines connections; G, [_____]]

[Weldable, adjustable rail clips; G, [_____]]

[Impact pads; G, [_____]]

SD-03 Product Data

Rail materials; G, [_____]

joint bars and methods of installation; G, [_____]

Aggregate materials; G, [_____]

Welding method; G, [_____]

Welder qualification; G, [_____]

1.3 QUALITY ASSURANCE

1.3.1 Welder, Welding Method, and Welder Qualification

a. Manual Shielded-Arc Welding Method: AWS D1.1/D1.1M, submit certification for each welder stating the type of welding and positions qualified for, the code and procedure qualified under, date qualified, and the firm and individual certifying the qualification tests.

b. Thermite Welding Method: Welder qualification requirements for thermite welding method are defined in Section 34 11 19.00 20 WELDING CRANE AND RAILROAD RAIL - THERMITE METHOD.

1.3.2 Certifications Required

Submit certifications for standard railway fittings as outlined in AREA Manual and for base plates, grout, and aggregate materials used in crane track support in accordance with requirements specified herein.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver assembled items, and other materials to the job site in an undamaged condition. Handle and store materials to protect against damage before and after delivery. [Prevent distortion of double-tongue switches in transit and storage.]

1.5 EXISTING CONDITIONS

****

NOTE: An additional description of existing conditions may be included in this paragraph. If there is doubt as to foundation location, provide for confirmation by the Contractor. A description of any special conditions, such as any required salvage or reuse of existing crane track components or fittings, may be included in this paragraph.

****

****

NOTE: When existing crane rail trackage is to be removed, use Section 34 11 00 RAILROAD TRACK AND ACCESSORIES, subparts 1.2 38 through 1.2.46 as applicable, or the EFD regional guide specification for removal work. Provide specific requirements for removal of crane rail trackage material. When existing materials are to be reused, list materials here and indicate quantities on project drawings. The designer must determine the appropriateness of reusing existing materials. When it is determined that existing materials to be reused require reconditioning, identify the materials and include reconditioning requirements at the end of Part 2.

This "NOTE" applies to Parts 2 and 3.

****

Confirm existing rail, rail fittings, foundations, and utility locations by means of a field survey. Do not prepare drawings before the completion of field survey and measurements.

Submit details for [casting] [and] [fabrication] of fittings. Include complete dimensioning, alignment data, shop instructions, and a material list indicating description and quantity of components and fasteners for each fitting. Submit drawings for each individual fitting which is adequate to determine the conformance of fittings with project drawings and as provided for herein. Show details of drainage connections from fittings and housings to drain pipes.

Do not manufacture materials until drawings have been approved.

PART 2 PRODUCTS

2.1 RAIL MATERIALS

Provide new track material [except for existing material approved for reuse. Perform removal work as specified in Section 34 11 00 RAILROAD TRACK AND ACCESSORIES. The following material is existing and may be reused: [_____]].

2.1.1 Crane Rail

2.1.1.1 Rail Section Weight and Hardness

****

NOTE: Requirements for minimum length of closure rail sections do not apply to stub rail sections provided as part of fabricated crane rail fittings.

****

****

NOTE: All references in this section to rail section specify per yard (135-CR) crane rail. The 135-CR section is the most common for new and replacement portal crane track. In some work, rail sections other than 135-CR may be required for crane use. These include heavier rail section or, for connection to older existing installations, use of 60 kilogram 132 pound or other railroad rail may be specified. Make changes where rail sections are required that are different than the 135-CR.

This also applies to subparts 2.1.4 through 2.1.6, and 2.2.1.

****

AREMA Eng Man and ASTM A1. Rails must be [664] [_____] kg per meter [135] [_____] pounds per yard in weight and be control-cooled, [fully heat-treated,] [321 to 388] [250 minimum] Brinell hardness carbon steel referred to herein as [135-CR] [_____]. Crane rail hardness must not exceed crane wheel Brinell hardness of [388] [_____]. Provide standard 12 m 39 foot rail lengths except for closure rails. Provide closure rails in one or two sections as long as practical, but in no case less than 4 m 13 feet long.

2.1.1.2 Metallurgical Composition

Provide steel crane rail with chemical composition within the following limits:

a. Carbon, percent 0.67 to 0.82

b. Manganese, percent 0.60 to 1.00

c. Phosphorus, percent 0.04 maximum

d. Silicon, percent 0.10 to 0.23

e. Sulfur, percent 0.04 maximum

2.1.2 Joint Bars

ASTM A49 and AREMA Eng Man, Chapter 4. Provide heat-treated carbon steel six-hole joint bars sized to fit the rail section.

2.1.3 Track Bolts, Nuts, and Washers

AREMA Eng Man, Chapter 4. Provide track bolts not less than 23 mm one inch in diameter.

2.1.4 Rail Clips

****

NOTE: Rail clips should be used on curves for lateral support. If rail clips are not used provide some form of lateral restraint.

****

Provide single clips and holders designed for tight fit and sized to match [135-CR] [_____] crane rail section.

2.1.5 [Weldable, Adjustable Rail Clips

****

NOTE: Rail clips should be used on curves for lateral support. If rail clips are not used provide some form of lateral restraint.

****

****

NOTE: Use weldable, adjustable rail clips if the rail will not be permanently anchored in the pavement. Adjustable rail clips are normally used on overhead electric traveling cranes.

****

Provide weldable, adjustable rail clips sized for [135-CR] [_____] crane rail section. Provide rail clips made by a manufacturer currently manufacturing crane rail clips. Rail clips must be forged steel which can be welded directly to structural steel. Rail clip bolts must conform to ASTM A325M ASTM A325. Provide rail clips designed for a side thrust of [_____] kg [_____] pounds. Provide rail clips designed to allow rail removal without the removal of the welded portion of the rail clip.

]2.1.6 [Impact Pads

****

NOTE: Use impact pads where there will be a large number of crane movements or where vibration could cause excessive wear on the crane or rail.

****

Provide impact pads sized for [135-CR] [_____] crane rail section. Provide pads which are impervious to water, oil, fuels, grease and ultraviolet rays. Provide pads with vulcanized reinforcing and encapsulated in synthetic rubber. The required properties are:

a. Shore hardness: [75 to 85] [_____] to [_____] degrees

b. Thickness (minimum): [6] [_____] mm [1/4] [_____] inch

c. Ultimate tensile strength (minimum): [17] [_____] MPa [2500] [_____] pounds per square inch

d. Reduction in load per square mm inch (minimum): [30] [_____] percent

e. Temperature range: Minus 7 to 100 degrees C 20 to 212 degrees F

f. Wheel Load: [_____] kg [_____] pounds

g. Crane rail bending stress (maximum): 75 percent of allowable bending

The pads must meet the required properties for a minimum of 1,000,000 wheel passes at the maximum permissible wheel load.

]2.1.7 Electrodes

****

NOTE: Welded rail joints are preferred for crane rail except at connections between rail and rail fittings such as switches and frogs where bolted joints are recommended. Indicate on the drawings each joint type (bolted and/or welded). Accomplish welded connections between carbon steel rail and rail fittings fabricated from carbon steel, using either of the methods identified in paragraph "Welded Crane Rail Joints." Determine the welding method(s) to be used and show on project drawings location of each welding method. Welded connections between carbon steel rail and cast manganese steel are not recommended. However, if the activity requires a dissimilar metal welded connection such as this, the cast manganese stub rail end section must be prepared for welding in accordance with Sketch NFGS-14606-1. Use the manual shielded arc welding method in accordance with paragraph "Manual Shielded-arc Welding Method" and electrodes in accordance with paragraph "Electrodes" . Thermite method is not acceptable for welding dissimilar metal.

****

Provide AWS low-hydrogen, high-tensile E 14018 or E 14016 electrodes. Utilize electrodes of the smallest practical diameter worked at the lowest compatible current. Coating on low-hydrogen type electrodes must be thoroughly dry when the electrode is used. Use electrodes taken from hermetically sealed packages within one hour of the time the package is opened. Dry electrodes not used within this one hour period and electrodes taken from nonhermetically sealed packages for at least one hour between 370 and 430 degrees C 700 and 800 degrees F before use. Store dried electrodes at temperatures between 110 and 200 degrees C 225 and 400 degrees F until used, or if not stored and not used within one hour after this drying is completed,re-dry before use. [Do not use electrodes which have been wet.] [Hard surfacing rod used on top 3 mm 1/8 inch of railheads must be alloy with the following composition:

a. Carbon, percent 0.4 to 0.6

b. Manganese, percent 4.0

c. Chromium, percent 18.0 to 21.0

d. Nickel, percent 9.0 to 10.5

e. Molybdium, percent 1.2

f. Iron, base

Heat railhead to a minimum temperature of 260 degrees C 500 degrees F for a distance of 200 mm 8 inches on each side of the joint before welding overlay.]

2.2 CRANE TRACK FITTINGS

****

NOTE: Two types of crane rail fittings are available:

1. Manganese Steel Castings: Most existing crane track fittings are of this type, which has a superior ability to withstand wear. These castings are, however, costly when custom-manufactured, and require long lead time to order.

2. Fabricated (Build-up) Fittings: Fabricated crane track switches and frogs are alternatives to the conventional cast fittings. They consist of stock rails and a number of steel plates bolted and/or welded together into the required configuration. Due to the use of standard components, many machine shops are capable of producing fabricated fittings, thus reducing cost and lead time. Fabricated fittings are, however, heavier and less wear-resistant than cast fittings.

Military standards as listed in this guide specification are available for both types of fittings and paragraphs are provided for both types. Delete paragraphs referring to inapplicable types of fittings. For further information on use of cast and fabricated fittings contact:

Commander
Atlantic Division
Naval Facilities Engineering Systems Command
Code 15C2
Bldg. N-26, Room 234
Norfolk, VA 23511-6287

****

Provide configuration and geometry of fittings as indicated and as specified herein. Substitutions will not be accepted. Fittings include [switches] [and] [frogs] for use with crane wheels indicated.

2.2.1 Four-Rail Portal Crane Track Systems

****

NOTE: There are two types of portal crane trackage systems in use in the Naval Shore Establishment:

1. Four-Rail System: This system consists of two standard gage (railroad) tracks. The cranes for this system are equipped with single-flanged wheels. Switches and frogs are of the standard railroad type except for some small frog angles, where turntable frogs may be required. For details of two- and four-rail system applications, see UFC 4-860-02N. This guide specification may be used for either two-rail or four-rail crane track systems by deletion of inapplicable paragraphs describing the use of specific types of switches and frogs. For four-rail systems, additional references based on Section 34 11 00 RAILROAD TRACK AND ACCESSORIES for Standard Gage Railroad Track may be used.

2. Two-Rail System: The cranes for this system are equipped with double-flanged wheels. Special double-tongue switchpoints and ramp-type frogs are required for this system. Turntable frogs may also be required for small frog angles.

****

Crane track switches and frogs for use with single-flanged wheels must conform to applicable requirements of the AREMA Eng Man and AREMA Track Plans, with the following limitations:

a. Provide fittings for use with [135-CR] [_____] crane rail section.

b. [b. Provide turntable frogs.]

2.2.2 Two-Rail Portal Crane Track Systems

Crane track switches and frogs for use with double-flanged wheels must be special fittings meeting the following requirements:

2.2.2.1 Cast Manganese Steel Double-Tongue Switch Points

****

NOTE: If deviation from the military specification is necessary, include the phrase, "except as specified in paragraph entitled "_____." Either specify the deviations in the appropriate paragraph or list together in a new paragraph.This NOTE applies to subparts 2.2.2.1 through 2.2.2.6

****

MIL-DTL-82020 [, except as specified in paragraph [_____],] for use with double-flanged wheels. Provide manganese steel castings conforming to ASTM A128/A128M. [Provide double-tongue switch points with rail curvature geometry indicated. Variations will not be accepted.] [Confirm switch point dimensions by preparation of full-size patterns before molds for castings are made.] [Provide switch points for use in a single crane track turnout in matched pairs.]

2.2.2.2 Cast Manganese Steel Rigid Ramp-Type Frogs

MIL-DTL-82020 [, except as specified in paragraph [_____],] for use with double-flanged crane [and railroad] wheels. Provide manganese steel castings conforming to ASTM A128/A128M. [Provide rigid frogs with frog angle and rail curvature geometry indicated. Variations will not be accepted.] [Cast half-crossings at the intersection of a crane rail and a standard gage railroad track as an integral one- or two-piece unit.]

2.2.2.3 Cast Manganese Steel Turntable Frogs

MIL-DTL-82020 [, except as specified in paragraph [_____],] for use with double-flanged crane [and railroad] wheels. Provide manganese steel castings conforming to ASTM A128/A128M. [Provide turntable frogs with frog angle and rail curvature geometry indicated. Variations will not be accepted.]

2.2.2.4 Fabricated Double-Tongue Switch Points

MIL-DTL-29229 [, except as specified in paragraph [_____],] for use with double-flanged wheels. [Provide double-tongue switch points with rail curvature geometry indicated. Variations will not be accepted.] [Confirm switch point dimensions by preparation of full-size patterns before fabrication is commenced.] [Provide switch points for use in a single crane track turnout in matched pairs.]

2.2.2.5 Fabricated Rigid Ramp-Type Frogs

MIL-DTL-29229 [, except as specified in paragraph [_____],] for use with double-flanged crane [and railroad] wheels. [Provide rigid frogs with frog angle and rail curvature geometry indicated. Variations will not be accepted.]

2.2.2.6 Fabricated Turntable Frogs

MIL-DTL-29229 [, except as specified in paragraph [_____],] for use with double-flanged crane [and railroad] wheels. [Provide turntable frogs with frog angle and rail curvature geometry indicated. Variations will not be accepted.]

2.2.2.7 Manually-Operated Switch Throw Mechanisms and Housings

****

NOTE: Manually-operated switch throw mechanisms and housings are commercially available items preferably supplied and pre-tested by the switch manufacturer whenever possible. NAVFAC Definitive Drawing No. 1404353, "Portal Crane Track Switch Throw Linkage," contains definitive details for a manually operated throw mechanism but may not be similar to commercially available units. If paragraph entitled "Power-Operated Switch Throw Mechanism" is used, then paragraph entitled "Manually-Operated Switch Throw Mechanisms and Housings" must be used.

The power throw mechanism utilizes a hydraulic linear actuator of a manufacturer's standard design employing an electric or air-driven motor pump. NAVFAC Definitive Drawing No. 1404354 "Portal Crane Track Switch Power Mechanism" and 1404355 "Portal Crane Track Turntable Frog Power Mechanism" contain definitive details for the layout of a power-operated switch throw mechanism but may not be similar to commercially available designs. The minimum performance characteristics for the NAVFAC Definitive Design power throw mechanisms are as follows:

Turntable Frog:

Stroke: 300 mm 12 inches

Speed: 20 mm/s 3/4 inches per second

Force: 5 kN 1200 pounds working: 70 kN 16,000 pounds maximum

Switch Points:

Stroke: 250 mm 10 inches

Speed: 20 mm/s 3/4 inches per second

Force: 13 kN 3000 pounds working: 187 kN 42,000 pounds maximum

Satisfactory commercially available power throw mechanisms for certain site specific crane rail switches have recently been installed at:

Puget Sound, Naval Shipyard, Bremerton, Washington

The Public Works Departments at that activity may be able to provide additional information pertaining to these units. If paragraph "Power-Operated Switch Throw Mechanism," is used, then paragraph "Manually-Operated Switch Throw Mechanisms and Housings," must be used.
****

a. Provide switch points in a single crane track turnout (including turnouts containing shared railroad tracks) to operate simultaneously by a single throw mechanism.

b. Provide each switch with a manually operated throw mechanism. [Provide switch throw as indicated.] [Provide switch throw designed and fabricated by the manufacturer of the switch point.] Base the design on a [bell crank] [lever] operator principle so that the switch can be readily and easily operated by one person without causing damage to the linkage or component parts.

c. Provide throw mechanism to automatically lock into place at the end of the throw in both operating positions.

d. Provide throw handles which indicate the position of the switch, easily accessible, and visible to the crane operator

e. [Provide visible indicators capable of being seen by the crane operator to indicate position of switch.]

f. Provide throw mechanism of a heavy-duty type for specific use with double-flange wheel crane rail fittings.

g. Provide linkage oriented 90 degrees to the switch tongue.

h. All component parts must be readily accessible to allow for inspection, cleaning, maintenance and easy removal and replacement of parts.

i. Provide turn buckles of the open type to permit inspection to ensure engagement of ends of threaded rods.

j. Provide rods and throw linkage components adequately sized and laterally supported to prevent bending and buckling during operation.

k. Provide box housing frames bolted to base plates and equipped with heavy-duty cover plates designed to fit neatly over the housing frame.

l. [When an unequal throw is required for crane track switch points, achieve throw using mechanical bar linkage and not by use of lost motion spring action.]

m. [Lost motion utilizing a spring system action may be employed to facilitate the operation of a railroad switch used in conjunction with the throw of a crane rail switch.]

2.2.2.8 [Power-Operated Switch Throw Mechanism

****

NOTE: If deviation from the military specification is necessary, include the phrase, "except as specified in paragraph entitled "_____." Either specify the deviations in the appropriate paragraph or list together in a new paragraph.

Manually-operated switch throw mechanisms and housings are commercially available items and should be supplied and pre-tested by the switch manufacturer whenever possible. NAVFAC Definitive Drawing No. 1404353, "Portal Crane Track Switch Throw Linkage," contains definitive details for a manually operated throw mechanism but may not be similar to commercially available units. If paragraph entitled "Power-Operated Switch Throw Mechanism" is used, then paragraph entitled "Manually-Operated Switch Throw Mechanisms and Housings" must be used.

****

Provide power-operated switch throw mechanism with all the features specified for the manually operated switch, except remove the throw handle mechanism (and retain at the site for backup operation) and allow the switch operation to be accomplished with the aid of a hydraulic linear actuator driven by [compressed air] [electric] power. Provide utility line connections to the power unit as indicated. Minimum performance characteristics for [turntable frog] [switch point] are as follows:

a. Stroke: [_____] mm [_____] inches

b. Speed: [_____] mm/s [_____] inches per second

c. Force: [_____] N working [_____] pounds

d. [d. [_____] N [_____] pounds maximum]

]2.3 DRAINAGE LINES FOR FITTINGS

Provide storm water drains for [turntable frogs,] [double-tongue switch points,] [_____] and [throw mechanism housings] to prevent ponding of water therein. Provide 100 mm 4 inch diameter steel drainage pipe lines conforming to ASTM A53/A53M to drain the fittings and housings as indicated. Slope pipes not less than 2 percent.

2.4 FOUNDATION MATERIALS

2.4.1 Base Plates

ASTM A36/A36M or ASTM A283/A283M. [Provide continuously welded plates, except where existing crane rail base covers the joint between the plates.] [Stagger rail joints and base plate joints.] Shape plates to conform to the configuration of rail curvature and to each special fitting. Minimum width of plates under rails must be 300 mm 12 inches. Minimum length of plates must be 1200 mm 4 feet and maximum length 3000 mm 10 feet. Minimum edge distance for holes as indicated. Provide [28] [_____] mm [1 1/8] [_____] inch diameter anchor bolt holes, field or shop fabricated. Provide grouting holes 50 mm 2 inches in diameter in plates wider than 900 mm 3 feet. Center grout holes, spaced approximately 600 mm 2 feet apart, and locate so as not to interfere with the proper function of the plate.

2.4.2 Anchor Bolts

ASTM A183, square head [25] [_____] mm 1 [_____] inchdiameter steel. Provide each bolt with two finished hexagon nuts and one spring washer. Provide bolt threads conforming to ASME B18.2.1, and nuts and threads to ASME B18.2.2. [For bolts fastened to existing grade beams determine lengths in the field after the elevation of the concrete support beams has been determined and the finished profile grade from the drawings has been taken into consideration.] [Minimum length of anchor bolt is [_____] mm [_____] inches.]

2.4.3 Nonmetallic Nonshrink Grout

Provide grout under base plates as indicated. Provide high early strength, nonshrink, nonmetallic grout, with components passing the No. 4 sieve and proportioned so as to provide a 3-day compressive strength of not less than [28] [45] MPa [4,000] [6,500] psi as determined by ASTM C109/C109M, an expansion-to-original length ratio of 0.018 to 0.020 as determined by ASTM C157/C157M. As an option, commercial premixed grout may be used if it meets the strength, workability, nonshrink, and nonmetallic requirements herein specified. When the depth of grouting exceeds 25 mm one inch, the addition of crushed stone, 6 to 10 mm 1/4 inch to 3/8 inch maximum size, to the grout mixture will be allowed. The ratio of grout to crushed stone by weight must be maximum 2:1 or as specified in the manufacturer's instructions. After installation, cure the nonshrink grout a minimum of 3 days in accordance with the curing requirements as recommended by the manufacturer.

2.4.4 Epoxy Grout

ASTM D1763, two component, Grade 1. Provide epoxy grout for cored anchor bolt holes in existing concrete grade beams. Aggregates for epoxy grout must conform to ASTM C144.

2.4.5 Portland Cement Concrete

Provide concrete for flangeways, [grade beams] and [encasements] conforming to Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.5 STANDARD GAGE RAILROAD TRACK

****

NOTE: Use Section 34 11 00 RAILROAD TRACK AND ACCESSORIES and AREMA Eng Man and PTWP for standard gage railroad track intersecting with crane tracks. Provide specification for guardrails as required opposite rigid frogs for use by standard gage wheels. Where guardrail flangeway is for use by crane wheels, provide adequate flangeway width or flare. For a railroad in dual gage with crane track, add references as required for half ties or rail on grade beam foundation.

****

In accordance with Section 34 11 00 RAILROAD TRACK AND ACCESSORIES.

2.6 OIL FOR TRACK FIXTURES

Meet the following requirements:

a. Flash point, minimum: 57 degrees C 135 degrees F.

b. Asphalt, 100 penetration, minimum 45 percent viscosity, saybolt Universal: 54 degrees C 130 degrees F, 240 to 350 seconds

PART 3 EXECUTION

3.1 WORKMANSHIP

Handle fittings, rails, and accessories to avoid kinking or other damage. Maintain tracks in proper grade, alignment, curvature, and gage.

3.2 INSTALLATION OF CRANE TRACK AND FITTINGS

3.2.1 Crane Rails

Install crane rails to the alignment indicated. Install rails atop continuous steel base plates with anchor bolts and rail clips. Do not bend rail in the field, but preform rail to the required radii in a plant prior to installation. [Assemble the entire curved layout with all pieces match-marked.] Completely lay out and mark in the field and have approved by the Contracting Officer before any portion of crane rail alignment is installed. Tolerances are as follows:

a. Horizontal alignment: Place rails within plus or minus 6 mm 1/4 inch of the designed rail centerline alignment indicated.

b. Crane track gage: Provide track gage between railheads within plus or minus 12 mm 1/2 inch of the design gage indicated. Crane rail gage is measured from centerline of rail to centerline of rail.

c. Vertical alignment: Place top of rails within plus or minus 3 mm 1/8 inch of the designed rail elevation indicated.

d. Cross-level elevation: Elevation differences between rails must not exceed 3 mm 1/8 inch.

****
NOTE: Regarding the text below, use Section 34 11 00 RAILROAD TRACK AND ACCESSORIES and AREMA Eng Man and PTWP for standard gage railroad track intersecting with crane tracks. Provide specification for guardrails as required opposite rigid frogs for use by standard gage wheels. Where guardrail flangeway is for use by crane wheels, provide adequate flangeway width or flare. For a railroad in dual gage with crane track, add references as required for half ties or rail on grade beam foundation.
****

e. Where the crane rail also serves as one rail of a standard gage railroad track, gage the railroad rail from the crane rail based on standard gage requirements in accordance with Section 34 11 00 RAILROAD TRACK AND ACCESSORIES.

3.2.2 Welded Crane Rail Joints

****
NOTE: Welded rail joints are preferred for crane rail except at connections between rail and rail fittings such as switches and frogs where bolted joints are recommended. The project drawings must indicate each joint type (bolted and/or welded). Welded connections between carbon steel rail and rail fittings fabricated from carbon steel, if desired, may be accomplished using either of the methods identified in paragraph "Welded Crane Rail Joints." Determine the welding method(s) to be used and show location of each welding method on project drawings. Welded connections between carbon steel rail and cast manganese steel are not recommended. However, if the activity requires a dissimilar metal welded connection such as this, the cast manganese stub rail end section must be prepared for welding in accordance with Sketch 14606-1. Use the manual shielded arc welding method in accordance with paragraph "Manual Shielded-arc Welding Method" and electrodes in accordance with paragraph "Electrodes". Thermite method is not acceptable for welding dissimilar metal.
****

Weld crane rail joints [, except those joints at fittings]. The welding together of rails which have been bored for bolted joints is not permitted. Clean rails of foreign substances prior to welding. [Welded compromise joints must be by the thermite method.] Align and weld rail in accordance with the recommendations and specifications of the manufacturer and supplier of the particular welding process used. Do not weld when the rail temperature is lower than that recommended for the welding method used. Use the following method[s].

3.2.2.1 Thermite Method

In accordance with Section 34 11 19.00 20 WELDING CRANE AND RAILROAD RAIL - THERMITE METHOD.

3.2.2.2 Manual Shielded-Arc Welding Method

AWS D1.1/D1.1M and the following:

****

NOTE: Regarding the text below, when manual shielded-arc welding method is specified, prepare rail ends in accordance with Sketch No. NFGS-41 22 13.33-1. Show sketch information on the project drawings.

****

a. Prepare rail end as indicated and as specified herein. Bevel ends of the rails at approximately 35 degrees full bevel on the head, 35 degrees double bevel on the web, and 35 degrees full bevel on the upper side of the base. Retain a narrow "nose" of approximately 2 mm 1/16 inch of original rail-end face across the base and up the web, following beveling operation, to permit proper alignment of rail ends. When beveling with a torch, first preheat each rail end to 260 degrees C 500 degrees F. After torch cutting, grind off scale and oxides. Grind level faces only after preheating. Use proper grinding wheel and speed to avoid grinding "burns" or formation of "hard spots" from localized overheating.

b. Align the beveled rail ends, allowing approximately 3 mm 1/8-inch root clearance, and place a copper shim under the joint opening. Clamp the rails during the welding with up to 6 mm 1/4 inch vertical camber (ends high) in 1200 mm 4 feet, centered over the joint to compensate for contracting distortion.

c. Preheat the joint area to approximately 260 degrees C 500 degrees F for a distance of 150 to 200 mm 6 to 8 incheson each side of the joint using a suitable heat source, such as an oxy-acetylene or propane torch.

d. Initiate arc welding of the joint immediately after preheating in the following sequence: base, web, and head. Weld alternately on both sides of base and web. Do not entrap foreign material, such as slag, in the weld. Grind, chip, or arc-air the root of the initial weld to sound metal before welding is started from the second side. Maintain a 260 degrees C 500 degree F to moderately higher interpass temperature. Proceed with welding until the joint is completed and sufficient metal has been deposited to permit grinding to finish contour in the head area. Provide slight reinforcement of the web and top of the base areas.

e. Postheat the joint area to approximately 370 degrees C 700 degrees F immediately after the welding operation, using the same technique for preheating. After postheating, protect the weld area against rain and snow and cool as slowly as possible by covering with an insulating blanket.

f. Grind the excess deposited weld metal from sides and top of rail head using heavy-duty grinder. Heat area of the weld to at least 290 degrees C 550 degrees F before and during grinding. Grind the area smooth, finishing to within plus or minus 0.5 mm 0.020 inch of original contour. Use proper grinding wheel, speed, and rate of metal removal to avoid grinding "burns" or formation of "hard spots" from localized overheating. Prevent grinding cracks.

g. Measure temperatures specified by temperature pencils.

3.2.2.3 Electrical Flash-Butt Method

Welding process must conform to applicable provisions of Chapter 4 of AREMA Eng Man.

3.2.3 Bolted Rail Joints

****

NOTE: Welded rail joints are preferred for crane rail except at connections between rail and rail fittings such as switches and frogs where bolted joints are recommended. Indicate on project drawings each joint type (bolted and/or welded). Welded connections between carbon steel rail and rail fittings fabricated from carbon steel, if desired, may be accomplished using either of the methods identified in paragraph "Welded Crane Rail Joints." Determine the welding method(s) to be used and show location of each welding method on drawings. Welded connections between carbon steel rail and cast manganese steel are not recommended. However, if the activity requires a dissimilar metal welded connection such as this, prepare the cast manganese stub rail end section for welding in accordance with Sketch 14606-1. Use the manual shielded arc welding method in accordance with paragraph "Manual Shielded-Arc Welding Method" and electrodes in accordance with paragraph "Electrodes". Thermite method is not acceptable for welding dissimilar metal.

****

[Provide bolted joints at rail connectors.] [Provide bolted rail joints to connect crane rail to crane rail fittings.] Bolted joints will be permitted for connection of crane rail fittings to intersecting railroad rail not for use by cranes. Chamfer rail head at joints in accordance with AREMA Eng Man.

3.2.3.1 Joint Bars

Install joint bars with the full number of bolts, nuts and washers. After track has been tested as provided for herein and before flangeway concrete is poured, check and tighten bolts. The openings between railheads must not deviate more than 3 mm 1/8 inch from the opening recommended for a given temperature. Vertical or horizontal mismatch at joints must not exceed 2 mm 1/16 inch. Joints must conform to applicable AREMA Eng Man. Tighten joint bar bolts to a tension no less than the proof load given in ASTM A183. Perform tightening with a properly calibrated wrench[or by turn of the nut method].

3.2.3.2 Compromise Joints

Provide bolted [and welded] compromise joints for connection of adjoining rails or fittings of differing cross sections. Make joints by means of either cast or fabricated compromise bars or welded transition rails. Provide step chairs, as required, at joints of rails of differing height. Provide compromise joints with proper allowance for rail wear. The offset of compromise joints or of either surface or gage alignment must not exceed

3 mm 1/8 inch. Rails at compromise joints of rails for double-flanged wheels must have the centerlines of the rails in alignment and provide a smooth surface along the top of rails. Grind edges of the wider of the two rail heads smooth over a minimum transition length of 450 mm 18 inches. Heat area to be ground to at least 290 degrees C 550 degrees F before and during grinding. Clad welding is not permitted to achieve transitions for compromise joints. [Align compromise joints of rails for single-flange wheels only along top and gage side of rails.] [Use thermite method to weld compromise joints.]

3.2.4 Anchor Bolts

Provide pairs of anchor bolts for connection of rail clips and crane rails to base plate and supporting grade beam. At crane track fittings, provide separate groups of anchor bolts for connection of fittings to base plate and to supporting grade beam. [Install anchor bolts with epoxy grout specified herein into 50 mm 2 inch diameter holes drilled into existing concrete rail support beams.] [Cast anchor bolts into new concrete grade beams.] Tighten anchor bolt nuts to snug tight using the effort of an ordinary man with a 6'-0" spud wrench. Perform tightening with properly calibrated wrenches [or by turn of nut method]. Make longitudinal spacing as indicated.

3.2.5 Base Plates

****

NOTE: Install base plates in accordance with Sketch No. NFGS-41 22 13.33-2. The sketch is based on 61 kilogram 135 pound crane rail and should be modified as required to reflect actual size of crane rail to be installed. Show sketch information on the project drawings.

****

Install as indicated and as specified herein. Install 25 mm 1 inch thick base plates to support rail, switches, frogs, and throw mechanism housings. Shape base plates, as necessary, under [switches] [and] [frogs]. Furnish plates with anchor bolt holes located and drilled in field or shop fabricated; use as template for setting anchor bolts. Do not enlarge bolt holes in the field. Do not torch, cut holes. Provide finished plate free of bows, bends, and lips, and cleaned of grease and oil. After installation of rail, vertically align base plates to within plus or minus 3 mm 1/8 inch of the profile grade elevation indicated by adjustment of base leveling nut and washer underneath plates. After installation, check to ensure proper grade and alignment of the base plates and install temporary hold-down nuts before grouting with nonshrink grout. After grout has hardened, and with rail clips, crane rail, and fittings in place, tighten anchor bolt nuts to snug tight using the effort of an ordinary man with a 6'-0" spud wrench.

3.2.6 Crane Track Fittings

3.2.6.1 Crane Switches

Install fittings and throw mechanisms atop steel base plates and align vertically by means of leveling nuts as indicated. Connect switch points to adjacent rails by means of [bolted] [welded] joints. [Secure the nuts of bolted joints in place with a cotter pin through the bolt.] Install throw mechanisms complete in housings as indicated. Mechanisms must operate smoothly and reliably and hold the switchpoints in position securely, against motion of crane wheels.

3.2.6.2 Rigid Frogs

Install crane track rigid frogs atop steel base plates and align vertically be means of leveling nuts as indicated. Connect to adjacent crane rails [and railroad rails] by means of [bolted] [welded] joints.

3.2.6.3 Turntable Frogs

Install frog [and throw mechanism] atop steel base plates and align vertically by means of leveling nuts as indicated. Connect fittings to adjacent rails by means of [bolted] [welded] joints. Install throw arm complete in housings as indicated. Mechanism must operate smoothly and reliably, and hold the turntable in position securely, against motion of crane wheels.

3.2.7 Standard Gage Railroad Tracks

Install in accordance with Section 34 11 00 RAILROAD TRACK AND ACCESSORIES.

3.2.8 Oiling Track Fixtures

Swab [track bolts,] [switch points,] [throw mechanisms,] and [joint bars] with oil specified.

3.2.9 Concrete

Install concrete for flangeways [, grade beams] and [encasements] in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.3 CLEANUP

Upon completion of the work, clear job site of equipment, surplus material, and debris. [Dispose of such material [off Government property] [at the site indicated].] [Disposal is as required in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.]

3.4 FIELD QUALITY CONTROL

3.4.1 Test for Grout

Verify nonmetallic, nonshrink grout strength during placement of grout at daily intervals by molding and testing standard cubes of samples taken at the job site. Take three test cubes each day for grout placed that day. Mold and cure test specimens in accordance with ASTM C109/C109M. Furnish necessary labor, materials, and facilities for molding the samples and for handling and storing the cubes at the site of the work. Transport cubes to the laboratory not sooner than 24 hours after molding. Test specimens for compressive strength in accordance with ASTM C109/C109M. Grout strength test evaluation is the average of the strengths of specimens tested at 3 days.

3.4.2 Visual Inspection

Inspect rail fittings thoroughly. Inspect for defects that might hinder satisfactory operation. [Inspect bolted joints for loose bolts and smooth transitions between rails of different sections.] Inspect each welded joint thoroughly after removal of the mold and grinding of excess metal. Correct or replace welds containing surface cracking, slag inclusion, gas pockets, and lack of fusion. Method of correction must be approved by the Contracting Officer.

3.4.3 Ultrasonic Inspection of Welded Rail Joints

[The Government will inspect each weld ultrasonically following the visual inspection.] Perform ultrasonic inspection and testing of each weld in accordance with MIL-STD-1699. Correct or replace defective welds. Clean rails at testing locations as directed by Contracting Officer. The method of correction must be approved by Contracting Officer.

3.4.4 Load Test

Load test of trackage will be performed by the Government prior to work on concrete flangeways, encasements, and pavement. The load test is to be performed after completion of track work, but before rails are covered by concrete flangeways and encasements. The load test for crane trackage consists of a portal crane supporting a load designated by the Contracting Officer traversing new track work. The crane must operate without difficulty, without binding of crane wheel flanges, or without visible rail deflection. Vertical movement of the ends of crane [switches] [and] [turntable frogs] must not exceed 3 mm 1/8 inch during the passage of any crane. Correct or replace defective welded rail joints, rail, and fittings. Correct the causes of excess deflections, and retighten anchor bolts loosened under crane wheel loading.

3.4.5 Throw Mechanism Operational Test

Test throw mechanisms for effectiveness, security, integrity, and reliability in accordance with the operational requirements of the mechanical and electrical sections of the specifications.

3.4.6 Retesting

Retest corrected and replaced items.

3.4.7 Record Drawing Survey

****

NOTE: A Record Drawing survey may be required where alignment of crane rails, gage reduction, or orientation of fittings is expected to be critical or problematic. The survey may be performed by Contractor, Government, or independent surveyor.

****

****

NOTE: Include bracketed (last) sentence if Contractor is to perform record drawing survey.

****

At completion of crane track replacement work, and before start of work on concrete flangeways, encasements, and paving, [perform] a record drawing survey of crane track alignment [will be performed by Contracting Officer. Notify Contracting Officer [_____] calendar days in advance of the availability of the crane trackage for conducting the survey. Execution of the survey will require [_____] days for completion]. Deviation of record drawing horizontal crane rail alignment in excess of tolerances specified herein will constitute grounds for rejection of the work. Surveys, in addition to the initial survey made necessary by nonconforming work, are at Contractor's expense. [Provide two sets of full-size contract drawings marked-up to show record drawing conditions. The requirements for these surveys are in addition to the requirements of Division 1 for quality control.]

SECTION 41 22 13.55

BRIDGE CRANES, UNDER RUNNING, AIRCRAFT HANGAR
02/22, CHG 3: 02/23

****

NOTE: This guide specification addresses requirements for under running bridge cranes that are procured as part of a building construction contract for Aircraft Maintenance Hangars. As a result of the installation location, all cranes will meet hazardous area requirements.

This guide specification covers requirements for under running single girder electric traveling (OET) cranes with under running trolleys and hoists, Crane Manufacturers Association of America (CMAA) 74 Class C and D and with capacities up to 9.1 metric ton 10 ton 9,100 kg 20,000 pounds, suitable for indoor use in hazardous area environments.

This guide specification incorporates the design criteria and requirements identified in NAVCRANECEN INSTRUCTION 11450.2A (December 2018). Also included are hangar crane requirements identified in UFC 4-211-01 Change 2, 2020. This guide specification does not cover requirements for custom built-up hoists, which would be an abnormal requirement for an aircraft hangar crane. Contact NAVY CRANE CENTER for assistance with this hoist type.

Consider the use of multiple bridge spans for total crane span lengths greater than 12 meters 40 feet or capacities greater than 9,100 kg 20,000 pounds. See Section 41 22 23.19 MONORAIL HOISTS for any aircraft hangar monorail hoists.

****

****

NOTE: Forward all procurement of OET systems at Naval Shore based activities with rated capacities of 9000 kg 20,000 pounds or greater or for use in specialized applications (e.g., ordnance handling, molten metal handling, special purpose service as defined in NAVSEA Publication 0989-030-7000,

hazardous/explosive area environments, or precision handling operations requiring complex or synchronized lifting capacity) to: Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000. (See NAVCRANECEN INSTRUCTION 11450.1C of 11 July 2019).

****

****

NOTE: This guide specification includes tailoring options for NAVFAC, pounds (per NAVFAC P-307), and tons. The NAVFAC tailoring option also includes requirements specific to the Navy and Marine Corps. Crane procurements for the Navy and Marine Corps must select the NAVFAC tailoring option.

Crane tailoring options are included for the Army, Air Force, Navy, and maximum hazardous (explosive) environments. The default crane configuration includes additional minimum anti-spark, hazardous area requirements. Maximum anti-spark protection includes requirements that are in addition to the minimum anti-spark requirements.

Selection or deselection of a tailoring option (select view-tailoring options) will include or exclude that option in the section. Specific project editing is still required for the resulting section.

****

****

NOTE: Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

****

NOTE: This specification covers cranes with under running bridge and under running trolley and hoist, single girder, with CMAA 74 service class C or D, with provisions for operation in hazardous areas.

Explanations of CMAA service classifications C and D are covered in the "Notes" portion of paragraph

CRANE DESIGN CRITERIA, sub-paragraph CLASSIFICATION. The minimum allowable classification for hangar cranes is CMAA service class C.

Explanations of hazardous areas are covered in the DEFINITIONS paragraph as well as the "Notes" portion of paragraph CRANE DESIGN CRITERIA, sub-paragraph CLASSIFICATION. All hangar cranes must meet minimum anti-spark protection.

Control types and systems may be specified as follows:

1. Remote or Pendant Crane Controls or a combination of the two can be provided.

2. Alternating current (AC) control systems must be specified. The vast majority of new cranes are AC powered and AC controlled.

****

****

NOTE: The RFP must provide the relevant dimensions and load data for the crane. See "Crane Inquiry Data Sheet" in CMAA 74 section 6.1 or see "Crane Information Form for Underrunning Cranes(s)" pages 5 and 6 at the following Navy Crane Center link:

https://ncc.navfac.navy.mil/Popular-Links/DOWNLOADS/

Projects that are routed through Navy Crane Center should be accompanied by a completed Crane Information Form (CIF) per the above link.

****

****

NOTE: Show the following information, as a minimum, on the project drawings:

1. Complete details of plan, elevations, and sections of crane.

2. Runway track system (if installed), including span and size of girder(s), runway rail size, channel cap size, size and location of crane stops, and building clearances.

3. Electrical junction box location (including mounting height).

****

PART 1 GENERAL

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide

specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

a. Crane Bridge: That part of an overhead crane system consisting of a girder, end trucks, walkway, and drive mechanism which carries the trolley(s) and travels along the runway rails parallel to the runway.

b. Crane Runway: The track system along which the crane operates horizontally, including track hangar rods, track connection devices, and runway structural supports.

c. Dead Loads: The weight of all effective parts of the bridge structure, the machinery parts, and the fixed equipment supported by the structure.

d. Crane Bridge Girder: The principal horizontal beam of the crane bridge structure. It is supported by the crane end trucks. Typically, for single girder cranes the trolley mounted hoist is suspended from the girder below the crane.

e. Lifted Load: The load consisting of the rated load and the weight of lifting devices attached to the crane such as the load block, bucket, or other supplemental devices.

f. Original Equipment Manufacturer (OEM): the Company that produced the part or original equipment.

g. Packaged Hoist: A commercially designed and mass produced hoist characterized by the motor, gearing, brake(s), and drum contained in a single package often connected by the use of c, d, or p-face flanges.

h. Patented Track: A generic term referring to track built in accordance with MHI MH27.1 utilizing a composite track section incorporating a proprietary bottom flange shape. For this crane system, it is provided for the crane bridge girder and also the crane runway track, if under running.

i. Pendant: A control for a hoist and a crane. The pendant hangs from the hoist or the crane by a cable at a height that is easy for the operator to reach.

j. Rated Load: The maximum working load suspended under the load hook.

k. Standard Commercial Cataloged Product: A product which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing on the manufacturer's published product data sheets." These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

l. Trolley Load: The weight of the trolley and its associated equipment carried by the trolley wheels.

m. Under running (Underhung) Crane: An electric overhead traveling crane that is supported by crane end trucks suspended below the crane runway. The load is supported by hanging from the lower flange of a beam or patented track.

1.3 SYSTEM DESCRIPTION

****

NOTE: Remove the following sentence if the runway rail is not to be installed as a part of the crane procurement. If rail is to be installed, ensure Section 05 12 00 STRUCTURAL STEEL is included in the Request for Proposal (RFP).

****

[The requirements for the structures supporting the crane runway are specified in Section 05 12 00 STRUCTURAL STEEL, and must conform to AISC 360.

]1.3.1 Crane Design Criteria

****

NOTE: Cranes installed outside the United States are still required to meet the features and characteristics specified.

When necessary, the design may be able to use the host nation's consensus standards in lieu of US standards. An equivalency study may be requested from the contractor to justify use of the international standard.

****

****
NOTE: Clearly show the area of hook coverage, runway dimensions, rail size, hook vertical travel, clear hook height, and lifting capacity on drawings.
****

Cranes will operate in the given spaces and match the runway dimensions and rails indicated. Hook coverage, hook lift, clearances, lifting capacity, and load test weight must not be less than that indicated. Provide loaded hook coverage to the maximum extent possible in the Aircraft Maintenance Bay.

1.3.1.1 General

****
NOTE: Add number of cranes, hangar name, hangar bay location, and crane rated load capacity in metric tons tons.
****

****
NOTE: For NAVFAC projects, capacity markings MUST be expressed in pounds unless the crane is located in Europe or Asia.
****

Include the following: Number of cranes [_____], located in Hangar identified as [_____], [bay [_____],] with the capacity expressed in [_____] metric tons tons, for each crane. Also clearly locate and identify each hoist and system components.

1.3.1.2 Classification

****
NOTE: Make a selection from the following CMAA 74 service classifications:

Class C (Moderate Service): This service covers cranes which may be used in moderate service requirements such as machine shops of paper mill machine rooms. In this type of service, the crane will handle loads which average 50 percent of the rated capacity with 5 to 10 lifts per hour, averaging 4.5 m 15 feet, not over 50 percent of the lift at rated capacity.

Class D (Heavy-Duty): This service covers cranes which may be used in heavy machine shop, foundries, fabricating plants, steel warehouses, container yards, or lumber mills and standard duty bucket and magnet operations where heavy-duty production is required. In this type of service, loads approaching 50 percent of the rated capacity will be handled constantly during the working period. High speeds are desirable for this type of service with 10 to 20 lifts per hour averaging 4.5 m 15 feet, not over 65 percent of the lifts at rated capacity. This service is the minimum requirement for

Ordnance/Explosive Handling.

****

****

NOTE: Hazardous Area Crane Operating Environments

The design engineer will have to determine if the hazardous area envelops just the load block and pendant or the entire crane bridge girder and runway. The hazardous area encompassing just the load block and pendant is standard for this specification. If the hazardous area does encompass the entire crane and runway, then the tailoring option for maximum hazardous area protections is required.

Hazardous (Explosive) Environments: Locations where fire or explosion hazards may exist due to flammable gases, flammable liquid-produced vapors, combustible liquid-produced vapors, combustible dusts, or ignitable fibers/flyings. Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NFPA 70 Article 500. The activity safety office must identify the specific Class and Division, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

(1) Minimum Anti-Spark Protection is used when only the load block enters the explosive area. Anti-spark protection is required for the pendant controller, hook, hook block, and wire rope.

(2) Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane. In addition to the minimum anti-spark protections, the entire crane and runway components must also be protected against sparking.

****

****

NOTE: Refer to NFPA 70 National Electric Code (NEC) for environmental requirements.

Section 500.5 covers classifications of hazardous locations: Classes I, II, and III, along with Divisions 1 and 2. It is unlikely that Classes II or III will be required for Aircraft Hangars.

Section 500.6 covers material groups A, B, C, D, E, F and G.

Section 513 covers specific requirements for

Aircraft Hangars.
****

****
NOTE: NFPA 70, Section 513 Aircraft Hangars. See also NEC Handbook, Section 513.3, Exhibit 513.1 for visual representation of these requirements.

Pits or Depression: In accordance with NFPA 70, Section 513.3, any pit or depression below the level of the hangar floor must be classified as a Class I, Division 1 or Zone 1 location that extends up to said floor level. Items that may be installed or operated in these areas such as wiring, radio controller, and pendant controller must comply with the requirements of Section 513 of NFPA 70.

Aircraft Maintenance and Storage Hangars: In accordance with NFPA 70, Section 513.3, the hangar is classified as Class 1, Division 2 up to 18 inches above the floor and within 5 feet horizontally from engines and fuel tanks up to 5 feet above the engine or fuel tank enclosure. Items that may be installed or operated in these areas such as wiring, radio controller, and pendant controller must comply with the requirements of Section 513 of NFPA 70.

Aircraft Painting Hangars: In accordance with NFPA 70, Section 513.3, the hangar is classified as Class 1, Division 2 up to 18 inches above the floor and Class I, Division 1 or Class I, Zone 1 within 3 m 10 ft horizontally from aircraft surfaces from the floor to 3 m 10 ft above the aircraft. The area horizontally from aircraft surfaces between 3.0 m and 9.0 m 10 ft and 30 ft from the floor to 9.0 m 30 ft above the aircraft surface must be classified as Class I, Division 2 or Class I, Zone 2. Electrical and mechanical items that are installed or operated in these areas must comply with the requirements of Section 513 of NFPA 70.
****

****
NOTE: Ensure the correct hazardous area is specified (class, division, and group) for the actual hangar bay.

The first of the options provided is the more likely option for a standard aircraft hangar crane: NEC Class I, Division 2 hazardous area. Another potential option for aircraft hangars: NEC Class 1, Division 1 hazardous area.

Group requirements are dependent on Class and combustible gases/vapors in the hangar. For Class I locations, Groups A, B, C, and D are possible. Group D is typical due to fumes from jet fuel.

The blanks are provided should a slight variance

exist in the hangar bay hazardous classification.

The height of the hazardous area directly affects crane requirements. For areas that encompass the floor and immediate area around the aircraft, the default anti-spark provisions for crane components entering the hazardous area are sufficient (anti-spark measures for the hook, load block, wire rope, and pendant). For hazardous areas that cover the entire crane envelope (i.e., bridge and trolley), the "maximum hazardous" tailoring option must be selected. This tailoring option adds anti-spark measures for the entire crane, such as electrical enclosures and wheels.

****

****

NOTE: Minimize the lowest overall crane depth for the configuration.

The minimum hook clearance height requirements, (measured from the finished floor elevation to the saddle of the hook at full elevation are referenced in each specific Service's Chapter of UFC 4-211-01.

Cranes may have wire connected controls (pendants) or wireless controls. Coordinate the selection of wire connected controls and wireless controls with the users. When wireless controls are provided, coordinate the frequency of wireless controls with the local frequency manager.

****

****

NOTE: The bracketed option for separate runways is necessary if ensuring more than one crane is not installed on the same runway for contracts with multiple cranes in the same building, bay, or location.

****

Provide under running, single girder electric bridge crane(s), with under running trolley mounted hoist, conforming to MHI MH27.1, CMAA 70, and CMAA 74 service class [C] [D], as applicable. The crane(s) must be designed for operation in an indoor environment, hazardous area service, meeting the requirements of ASME B30.16 and ASME B30.17, with an ambient temperature range of [_____] to [_____] degrees Celsius Fahrenheit. The crane(s) must operate in an NFPA 70 Class [I] [_____], Division [2] [1] [_____], Group [D] [_____] hazardous area. Hazardous protection is required from the finished floor level up to [1.5 meters 5 feet above wing upper surface and engine enclosures] [3 meters 10 feet above the aircraft] [9 meters 30 feet above the aircraft surface] [[_____] meters feet]. The total crane span must be [_____] meters feet with a minimum vertical hook lift of [_____] meters feet and as specified herein. Provide runways for multiple span cranes equally spaced apart.[Provide separate runways for each crane.]

The crane must be [pendant controlled] [radio controlled] and operate in the spaces and within the loading conditions indicated. Provide a crane, including hooks and hoisting ropes, that in all operating configurations is able to clear the vertical lift fabric door maintenance catwalk or other obstructions.[The pendant controller must be mounted on a separate festooned cable system from the trolley power supply.] The crane must operate on [_____]-volts AC, [60 Hz] [_____], [three] [single] phase power source. Maximum loading on the facility (without impact) due to dead loads, trolley loads, and lifted loads, with the trolley in any position, must not exceed the allowable wheel loading and wheel spacing of the facility (or not exceed maximum hanger loading for under running cranes).

1.3.1.3 Rated Speeds

****

NOTE: Slow full-load operating speeds invariably provide improved load control and increased productivity.

****

****

NOTE: Specify the maximum rated speed under full load for the main hoist, bridge, and trolley.

1. Hoist speeds must conform to the recommendations of CMAA 74 or ASME tables. Trolley travel speed must conform to the recommendations of CMAA 74. A table of suggested hoisting and travel speeds can be found at the end of section 6 in CMAA 74.

2. Bridge travel speed must not exceed the maximum speed that the floor walking, crane pendent control operator can comfortably negotiate in a work area, approximately 750 mm/s 150 ft/min, and as recommended in CMAA 74.

****

****

NOTE: Recommend "Medium" rated speeds, where appropriate. Another consideration for operating speeds is the distance travelled per minute (e.g., 20 ft hook lift height corresponds to hook lift speed of 20 fpm). Consider limiting bridge or trolley travel speeds when operation occurs over shorter distances (e.g., for a 50 ft runway, a bridge travel speed of 50 fpm may be more appropriate than the 115 fpm "medium" speed).

Common maximum speed selections:
Wire Rope Hoists IAW ASME HST-4 (fpm): 15, 20, 30, 40
Trolley (fpm): 30, 50, 75, 100, 125
Bridge (fpm): 50, 75, 100, 150, 175

A common minimum speed selection is 1/10th of maximum speed. Cranes using variable frequency drive controls are more flexible regarding speed selection.

****

Provide the crane with rated (maximum) speeds within plus or minus 10 percent (in meters/second feet/min) for the main hoist, bridge, and trolley at the rated load as specified in the table below. The minimum speed must not exceed the values listed.

Rated Speeds meters/second feet/minute		
Description	Minimum	Maximum
Main Hoist	[_____]	[_____]
Trolley	[_____]	[_____]
Bridge	[_____]	[_____]

The hook lift capacity and speed must be the manufacturer's standard within the limits specified.

[1.3.1.4 Foreign Design Standards and Practices

****

NOTE: This subpart is tailored to NAVFAC. This subpart will NOT typically be included and is to only be used when cranes are procured for international locations (outside of the United States), which could use contractors that design and build equipment for localities under different laws and standards.

****

a. Foreign design standards and engineering practices are acceptable, provided they are accompanied by satisfactory explanation and are shown to meet corresponding U.S. standards and practices, as approved by Navy Crane Center. Design calculations and drawings that use foreign language and nomenclature must be provided with corresponding English equivalents. Metric units may be used for both calculations and shop drawings, but they must include conversions to English units. In the case of calculations, only the initial inputs and final results need to be so converted. Professional training and accreditation of foreign engineers may vary in some aspects from those in the U.S., but they are satisfactory if comparable for the design work in which they engage. Mechanical properties and quality standards of common construction materials of foreign sources supplied in accordance with recognized standards that resemble those of ASTM and other U.S. standards are acceptable, as approved by Navy Crane Center. Typically, foreign welding procedures, materials, standards, and welder qualifications are comparable to those of AWS and are therefore acceptable. Provide all necessary certifications and other data for review and approval prior to start of work. Special attention must be given to ensure the weld sizes are being specified and measured uniformly. Unique constructions and metric sizes not complying with FS RR-W-410, the Wire Rope Users Manual, or ASTM A1023/A1023M, may be used on Navy cranes, subject to Navy Crane Center review and approval of the specific applications. In selecting metric wire ropes for installation on new cranes with sheave and hoist drum grooves configured for a specific US wire rope size, the metric diameter must be within the limits of the wire ropes for which the sheave and drum are grooved. When the wire rope is installed on an older crane with sheave and hoist drum grooves configured for a specific U.S. produced wire rope size, the sheave and hoist drum grooving must be considered to ensure a satisfactory match with the wire rope. The capacities or ratings of components produced in foreign countries in compliance with foreign standards, and their installation requirements, must be converted to the English engineering units and verified for specification compliance.

b. Some components from foreign sources are prohibited due to practical considerations – either susceptibility to counterfeiting or maintenance and timely support. Specific examples are:

(1) High-Strength Structural Bolts and Nuts. The use of structural bolts from foreign manufacturers is allowed provided the bolts meet Research Council on Structural Connections (RCSC) Specification for Structural Joints Using High-Strength Bolts (RCSC A348).

(2) Electronic controls of foreign manufacturers are prohibited unless technical support is available in the U.S.

]1.4 VERIFICATION OF DIMENSIONS

The Contractor is responsible for the coordination and proper relation of their work to the building structure and to the work of all trades. Coordinate with the crane support structure design, where applicable, to provide the desired crane operating envelope (i.e., hook envelope and hook height). Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

1.5 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding

Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Manufacturer Qualification

Overhead Electric Crane System, including sub-system components manufactured by vendors, must be designed by, or directly supervised by, a registered professional engineer (PE). PE licensing must be by a board or agency authorized to license and register professional engineers. The PE may be a Contractor's regular employee or a consultant. The PE's review and attestation of specification compliance and professional responsibility must be signified by their PE original seal and dated signature on the final drawings. The professional engineers must only undertake and perform work under this contract in the branch(s) of engineering in which they are licensed.

1.6.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing, and documentation.

[1.6.2.1 Hook Proof Test

****

NOTE: Hook proof tests are required by the NAVY for custom designed or non-ferrous (bronze or stainless steel) hooks. Bronze/stainless steel hooks are generally associated with the minimum hazardous area requirements, which applies to all cranes specified by this document.

****

Proof test custom designed or non-ferrous load hooks per ASME B30.10. Perform the proof test prior to Hook NDT.

]1.6.2.2 Inspection of Hook Assembly

****

NOTE: For NAVY, crane hooks require liquid penetrant type inspections for non-ferrous hooks with acceptance criterion being no linear indications greater than 1.5 mm 1/16 inch. General recommendation is that linear indications greater than 1.5 mm 1/16 inch not be allowed. Use of X-ray and ultrasonic inspection is not required for NAVY cranes.

****

Inspect hook [by liquid penetrant type inspection] [and X-rayed] [and tested ultrasonically] prior to delivery. Furnish documentation of hook inspection to Contracting Officer prior to field operational testing.

Acceptance standard is no defects. A defect is defined as a linear indication for which the largest dimension is greater than [1.5 mm 1/16 inch] [3 mm 1/8 inch] [_____] long. Welding repairs of hooks are not permitted. A hook showing linear indications, damage, or deformation is not acceptable.

[1.6.2.2.1 Hook Non-Destructive Test (NDT)

****

NOTE: This section is required for NAVY cranes.

Remove this section if the selecting agency does not require hook non-destructive testing or the necessary non-destructive testing is not IAW NAVY requirement.

NOTE: For NAVFAC, add tailored paragraphs with additional requirements.

****

For hooks of non-magnetic material, NDT must be liquid penetrant (PT) method in accordance with ASTM E1417/E1417M or NAVSEA T9074-AS-GIB-010/271. For PT testing of hooks containing stainless steels, titanium, or nickel based alloys, total halogens and Sulphur used in the NDT process must be controlled as specified in NAVSEA T9074-AS-GIB-010/271.

Inspect each hook and shank over the entire surface area. If NDT cannot be performed on surfaces inside small holes (e.g., hook/nut captivation roll pin holes), visually inspect those surfaces to the maximum extent practical.

a. Acceptance Criteria: Defects found on the hook will result in rejection of defective items for use on furnished hoist.

b. Test Report: Submit a test report of the inspection of each hook provided the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheets, and certification to the Contracting Officer with the test report.

]1.6.3 Drawings: Overhead Electric Crane System

a. Submit drawings showing the general arrangement of all components in plan, elevation, and end views to demonstrate proper interface with the facility and relation to other cranes on the same rail system, if applicable. Show all major features of the crane including: hook approaches on all four sides, clearances and principal dimensions, hoist, trolley and bridge drives, motor nameplate data, overcurrent protective device ratings, and electrical schematic drawings. Include weights and centers of gravity of major components (e.g., bridge girder, trolley/hoist).

b. Submit shop drawings of all fabricated components. Shop drawing quality must be equivalent to the contract drawings accompanying this solicitation. Drawings must be reviewed, signed, and sealed by a licensed professional engineer.

c. Provide Bill of Material for crane components on each drawing. The schedule must provide a cross reference between manufacturer data and shop drawings. Components listed on the schedule of crane components must include total quantity, description, original manufacturer, and part number. Distributing agents will not be acceptable in lieu of the original manufacturer.

d. Provide control system and network drawings. Network diagram must show equipment locations, names, models, and IP addresses on network communications schematic for all Programmable Logic Controllers (PLCs), Remote Terminal Unit (RTU), Supervisory Controller, and Other Network-Capable Devices. In addition, the drawings must consist of all software block, flow, and ladder diagrams.

1.6.4 Design Data: Load and Sizing Calculations

****

NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys. Coordinate seismic analysis requirement with specification section SEISMIC FORCES.

****

Submit complete list of equipment and materials, including manufacturer's descriptive data, technical literature, and performance charts and curves. Submit calculations reviewed, signed, and sealed by a registered professional engineer verifying the load cases, sizing of the bridge girder, end trucks, travel drives, motors, overcurrent protection, and conduit. Provide a list of all codes and standards, design assumptions, equations, specified efficiencies, limits, factors of safety, component ratings, and sources of values used. Include free body diagrams or sketches of each load case.[Include seismic analysis of crane.]

1.6.5 Certificates

All certifications must be dated and bear the original signature (above the printed name) of the authorized representative of the Contractor or the manufacturer of the items or equipment being certified. Submit certifications that clearly identify the crane, the drives, components, and location (as applicable) to which it applies:

a. Wire Rope Certification with either the wire rope manufacturer's certification that the rope meets the published breaking force, or the actual breaking force of a sample taken from the reel and tested. Show the published breaking force on the wire rope certificate; the actual wire rope breaking force must meet or exceed the published value. Certification must be traceable to the hoist, crane, and reel.

****

NOTE: A solid non-sparking wire rope (e.g., stainless steel) is the preference for hazardous areas.

Include the requirement for end user notification if the crane operates in a Division 2 hazardous area (per CLASSIFICATION) and drawn galvanized wire rope is allowed per HOISTING ROPE.

****

[(1) Drawn Galvanized Wire Rope End User Notification from the crane, hoist, or wire rope OEM notifying the end user that the crane is operated in a Division 2 hazardous area as defined by NFPA 70, which is a location where the hazardous material is not likely to be present or is present only in the short term. The wire rope is made of drawn galvanized steel, meaning it is manufactured from sparking materials but provided with a spark resistant outer layer. The outer layer or individual wire strands could become compromised if the wire rope is used in an improper manner or inadequately maintained, which would affect the integrity of the spark-resistant protection. In this scenario, immediate replacement is recommended. The wire rope will need to be evaluated and potentially replaced with a compliant configuration if the hazardous area Division is changed.

] b. Crane Runway Certificate stating that the new crane will operate properly on the runway. For runways provided by Contractor, include statement certifying runway has been aligned in accordance with MHI MH27.1.

c. Hazardous Material Certificate that the crane does not contain hazardous material including asbestos, lead, cadmium, chromium, PCBs, or elemental mercury. Products required for the designing and manufacturing of cranes must not contain the prohibited materials.

d. Loss of Power Test Certificate stating that a test may be performed in which power is removed during operation without any detrimental effects to the crane.

****

NOTE: For NAVFAC, the Overload Test Certificate must state that the cranes can be periodically load tested to 125 percent (plus 0 minus 5 percent). Remove the conflicting Overload Test Certificate which allows for testing at different tolerances.

****

e. Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus 0 minus 5 percent) of rated load. Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus [0] [_____] minus [5] [_____] percent) of rated load.

f. Certificate of the Brake Adjustment Record. Provide a brake adjustment record and installation/maintenance manuals for each brake on the crane. Each brake measurement must have a tolerance traceable to the associated brake manual or documentation provided by the brake manufacturer, location of measurements, and the actual brake setting. Changes made to settings of the brake, at any time, will void the record.

g. Contractor Hazardous Environment Certificate stating that the new crane and all associated components including the hoist are designed for operation in the hazardous environment specified in the Classification section.

h. Public Domain Software Certificate declaring that public domain software (e.g., freeware, shareware) is not used in the system.

i. Certificate stating that all Software and Services that are not required for operation and/or maintenance of the product have been removed. The software/services to be removed are identified in

SOFTWARE AND SERVICES.

1.6.6 Welding Qualifications and Procedure

Welding must be in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep and not exceed those specified in AWS D14.1/D14.1M and MHI MH27.1. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M.

1.7 CRANE SAFETY

Comply with the mandatory and advisory safety requirements of ASME B30.10, ASME B30.16, ASME B30.17, ASME HST-4, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306, and all applicable provisions of 29 CFR 1910 and NFPA 70.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment. Material will be free from defects and imperfections that might affect the serviceability and appearance of the finished product. All material must be new and unused.

2.1.2 Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two bridge identification plates, one for each side of the bridge. Provide noncorrosive metal identification plates with letters which are easily read from the floor, showing a separate number such as BC-1, BC-2, for each bridge crane.

2.1.3 Capacity Marking

****

NOTE: NAVFAC requires markings to be indicated in pound units. The kilogram marking option is provided for cranes installed in a foreign country.

****

Mark the rated capacity in pound units [with kilogram units printed in a different color] on each side of the crane on the bridge girder. Capacity marks must be large enough to be clearly visible from the floor. Individual hoist units must have their rated capacity clearly marked on their lower block, and additionally labeled on the hoist body.

2.1.4 Safety Warnings

Affix labels in a readable position to each lift block or control station in accordance with ASME B30.16 and ASME B30.17. Submit safety warnings, diagrams and other instructions suitably framed and protected for display as indicated by the Contracting Officer as follows:

Design and locate the word "WARNING" or other legend to bring the label to the attention of the operator. Provide durable type warning labels and display the following information concerning safe-operating procedures: Cautionary language against lifting more than the rated load; operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; operating damaged or malfunctioning hoist; operating a rope hoist with a rope that is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

2.2 STRUCTURAL REQUIREMENTS

Structural requirements must be in accordance with MHI MH27.1. Structural steel materials must conform to the standards permitted in MHI MH27.1 and AISC 360. Skewing and other applicable lateral loads must be considered in the design.

2.2.1 Structural Connections

High-strength bolted structural connections must be designed and installed in accordance with RCSC A348. Bolts must be of ASTM F3125/F3125M Grade A325/A325M or Grade A490/A490M material. Galvanized bolts are not acceptable.

Welded connections for the crane must be performed in accordance with AWS D14.1/D14.1M. Welded connections to the building must be performed in accordance with AWS D1.1/D1.1M. Allowable stress values must comply with MHI MH27.1.

2.2.2 Crane Bridge Girder

a. Provide a crane bridge girder of patented track conforming to MHI MH27.1. Intermittent ("skip") welds on bridge girder elements (e.g., web and flange interfaces) are prohibited. If the girder is notched to fit over the end trucks, reinforce the girder ends with vertical and horizontal stiffeners. Splices in the unsupported length of the girder are prohibited.

b. Submit manufacturer's standard published tables that verify the crane bridge girder is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the bridge. Patented track girder must be of welded steel construction and fabricated by a manufacturer regularly engaged in the production of this type of beam.

c. Keep splices in the bridge girders to a minimum and splices in high stress locations must be avoided. Make splices with complete joint penetration welds. Field (on-site) welded splices are prohibited.

2.2.3 Bridge End Trucks

****

NOTE: For cranes in hazardous areas which encompass the entire crane envelope, the drop lugs pose a sparking risk if it is metal-to-metal. Use the maximum anti-spark tailoring option to minimize this sparking risk.

****

Provide bridge end trucks conforming to ASME B30.17 and MHI MH27.1. Configure end trucks with a feature that limits end truck movement to 25.4 mm one inch in the event of wheel or shaft failure. Provide drop (safety) stops with contact surfaces of non-sparking materials.

2.2.4 End Stops

Fit the crane bridge girder(s) with structural steel end stops. Locate stops to permit maximum trolley travel. Design end stops in accordance with MHI MH27.1 and ASME B30.17. Provide a system in which the travel wheels do not contact the end stops. End stops must be designed to absorb the maximum kinetic energy and impact force developed by the bumper contact. Provide end stops compatible with trolley bumpers and designed to bolt to the crane bridge girder.

2.2.5 Bumpers

****

NOTE: The following paragraph contains tailoring for MAXHAZ for cranes located in hazardous areas which encompass the entire crane envelope; the bumper to end stop connection poses a sparking risk if it is metal-to-metal. Use the maximum anti-spark tailoring option to minimize this sparking risk.

****

Fit bridge end trucks and trolley frames with shock-absorbing bumpers capable of decelerating and stopping the bridge and trolley within the limits stated by ASME B30.17. Ensure bumpers conform to ASME B30.17. Bumpers must fully engage end stops. Mount bumpers so that there is no direct shear on mounting bolts (if any) upon impact. Bumpers must provide adequate clearance between the crane and surrounding structure when compressed to preclude damaging equipment (clearance requirements are defined in MHI MH27.1 or CMAA 74, as applicable, and ASME B30.17). When more than one crane is located and operated on the same runway, bumpers must be provided on their adjacent ends or on one end of one crane. Fit the other end of the end-truck with a structural steel stop to engage the bumpers of the adjacent crane. Ensure bridge bumpers are properly aligned with runway end stops. Metal to metal contact at the bumper to end stop connection is not permitted.

[2.2.6 Crane Runway System

****

NOTE: For underrunning cranes, the runway and its support structure is usually supplied by the crane contractor. Use Crane Runway System only if crane contractor is to provide a new runway.

****

a. Provide the complete runway track suspension system that is required to hang the crane runway track at its indicated location from the structural supports indicated on the drawings. Provide runway and support structure for underrunning crane of patented track girders conforming to MHI MH27.1.

b. Splice assemblies must be from the same manufacturer as the patented track and located under structural support members. Submit manufacturer's standard published tables that verify the crane runway track is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the beams.

c. Runway support structure must be designed, fabricated, and installed such that runway rails meet the alignment tolerances of MHI MH27.1. Provide means to allow for vertical adjustment of the runway track both before and after the system has been put in operation so that track can be erected and maintained level. Brace runway to restrain the track against damaging lateral and longitudinal movements. Where the runway track is suspended from hanger rods, provide means preventing the hanger rod nuts from backing off the rods. Allowable stress in hanger rods is 20 percent of the minimum specified ultimate strength of the material used.

d. The lower T-section ends of the runway must be aligned to minimize the horizontal gap on the running surface to not greater than 1.5 mm 1/16 inch and not greater than a vertical difference of 0.75 mm 1/32 inch for the wheel running surface alignment for a smooth crossing by the wheels. Provide splices located directly under structural support members. When runways are suspended, bracing preventing damaging lateral or longitudinal movement is required. Loads transmitted to the building through the suspension must have the review and approval of the building engineer of record (EOR) prior to installation.

e. Design, fabricate, and install new runway end stops in accordance with MHI MH27.1 and ASME B30.17. End stops must be designed to absorb the maximum kinetic energy and impact force developed by the bumper contact. Provide end stops compatible with end truck bumpers, designed to bolt to the runway support girders, and maximize bridge travel.

][2.2.7 Seismic Forces

****

NOTE: Seismic forces for underrunning cranes are typically considered negligible. If not considered negligible, include the analysis section below. Seismic forces must be considered in the design of the cranes with a component importance factor of greater than 1.0 and in facilities with a Seismic Design Category of D, E, or F per ASCE 7. Coordinate requirement with specification section DESIGN DATA: LOAD AND SIZING CALCULATIONS.

****

Perform a seismic analysis as a part of the design of the crane in accordance with ASCE 7-16. The seismic analysis must be included in the MHI MH27.1 extraordinary load case (Case 3).

For project locations beyond the scope of ASCE 7-16, a widely accepted design standard may be used for seismic analysis.

]2.3 MECHANICAL REQUIREMENTS

a. Provide steel shafts, gears, and keys, with the exception of worm gears which may be bronze. No three or more bearing shaft configurations are allowed.

b. Cast iron and aluminum used to support components of the hoist power transmission train must be ductile. For the purposes of this specification, "ductile" is defined as having a minimum elongation of 5 percent in 2.00 inches.

c. Provide steel or ductile/malleable cast iron brake housings of motor mounted disc brakes, brake lining backing plates, shoes and shoe holders. Provide spring-set brake shoe or pad linings of a non-asbestos material.

d. All mechanical components must be accurately aligned and positively secured to maintain the alignment. Parts must not be forced into position to obtain apparent alignment.

e. Provide minimum bearing life in accordance with ASME hoist performance standards and MHI MH27.1.

f. All "should" statements in CMAA 74, MHI MH27.1, and ASME B30 are considered to be "shall" statements.

2.3.1 Threaded Fasteners

Fasten mechanical connections that are not part of a commercial packaged assembly with SAE J429 Grade 5 fasteners, ASTM F436/F436M washers, and SAE J995 Grade 5 nuts. Lubricate all mechanical fasteners unless otherwise specified by the original component manufacturer.

2.3.2 Hoist

****

NOTE: Generally, hoist duty class roughly aligns with CMAA class. An H3 hoist service duty class would typically be specified for a CMAA 74 service class C crane; H4 for service class D. See the Crane Design Criteria – Classification section to identify the CMAA service duty class specified for this crane.

****

Provide hoist conforming to ASME B30.16 except as modified and supplemented in this section. Packaged hoist and trolley units (packaged hoists) must be double reeved electric wire rope hoist conforming to ASME HST-4 Duty Class [H3] [H4] or better and be rated for the operating environment.

Configure trolley such that the trolley frame contacts the trolley stops and prevents the trolley from dropping more than one inch in the event of an axle or wheel failure. Provide drop (safety) stops with contact surfaces of non-sparking materials. Metal to metal contact at the bumper to end stop connection is not permitted.

2.3.2.1 Hoist Brakes

****

NOTE: Each hoist must have, at a minimum, two brakes. For packaged hoists, the most common brake configuration is one electro-mechanical spring set brake and one mechanical load brake (or self-locking worm gear).

Consider the CONTROLS paragraph under ELECTRICAL REQUIREMENTS.

If a variable frequency drive (VFD) is selected for use, the brake configuration must reflect the type of VFD selected (open loop). If open loop controls are selected, brake configuration must be one electro-mechanical brake and one mechanical load brake (or self-locking worm gear).

NAVFAC tailoring option is for brakes utilized as holding brakes only.

****

a. Equip the hoist with two holding brakes, each with a minimum torque rating of 125 percent of the rated load hoisting torque. Provide a brake configuration with one electro-mechanical spring set brake and one mechanical load brake, or self-locking worm gear, that stops and holds 125 percent of the hoist's rated load and does not require the load to be raised before being lowered.

b. Electro-mechanical brakes must have an externally accessible means of manual release. Provide manual-adjusting brakes designed to permit inspection and adjustment without disassembly of the brake. The brakes must be equipped with a manual self-return to ON brake release; maintained brake releases must reset when power is applied. Double face-mounted brakes are not permitted.

2.3.2.2 Load Block and Hook

****

NOTE: NAVFAC tailoring options for uniquely marked hook and nut and commercial blocks.

Tailoring option for maximum anti-spark protection (upper hooks must be non-sparking).

****

a. Provide a load block constructed of non-sparking materials. Covering the exposed surfaces of the load block with bronze, stainless steel, or aluminum covers attached with similar fasteners is acceptable. The load block must be designed to prevent metal-to-metal contact of moving parts. The block must be fully enclosed, concealing the sheaves and wire ropes, except for wire rope slots and drain holes. The design must preclude the wire rope from being cut, pinched, crushed, or chafed in case of two-blocking. Standard commercial blocks may be used at their published ratings when their published design factors are 5.0 or greater.

b. Provide an unpainted and unplated single barbed hook of non-sparking material. Bronze clad hooks are prohibited. Hooks must conform to the requirements of ASME B30.10. The hook must be a standard commercial product with a published design factor of 5.0 or greater. Fit hook with a safety latch designed to preclude inadvertent displacement of slings from the hook saddle. The hook and hook nut must be removable without unreeving of the hoist. Provide a hook nut secured to the hook with a commercial standard removable and reusable means. Do not weld hook nut. When provided, provide shank and nut threads with a Class 1 or 2 fit, per ASME B1.1. Uniquely mark the hook in a permanent fashion that is traceable to the NDT certification. The nut must be marked to match the hook. The hook nut must be of non-sparking materials. Hook must be free to rotate through 360 degrees when supporting the test load up to 125 percent of the rated capacity. Upper hooks of hook suspended hoists must be of non-sparking materials.

2.3.2.3 Hoisting Rope

****

NOTE: A solid non-sparking wire rope (e.g., stainless steel) is the preference for hazardous areas.

There are some packaged hoist and capacity combinations (e.g., 5 ton capacity) in which the published stainless steel wire rope breaking strength for the given rope diameter cannot meet the prescribed design factors per ASME B30.16. In those instances an alternative wire rope material is necessary. Drawn galvanized wire rope is acceptable in Division 2 hazardous areas provided the crane, hoist, or wire rope OEM provide a notification to the end user with the wire rope certification / submittal. This notification will identify that the wire rope is made of drawn galvanized steel, meaning it is manufactured from sparking materials but provided with a spark resistant outer layer. The outer layer or individual wire strands could become compromised if the wire rope is used in an improper manner or inadequately maintained, which would affect the integrity of the spark-resistant protection.

****

a. Wire rope must comply with ASME B30.30 and FS RR-W-410, ASTM A1023/A1023M, or BS ISO 4309 and have a rope classification appropriate for the usage. Wire ropes must be handled and seized in accordance with ASME B30.30. The wire rope must be in a double reeved configuration equalized with a sheave. Select wire rope minimum design factor in accordance with ASME B30.16. Provide proof of Wire Rope breaking force.

b. Wire rope must be spark resistant.Provide stainless steel hoist ropes with an independent wire rope, wire strand, or otherwise, steel core.[Drawn galvanized wire rope is acceptable in Division 2 hazardous areas when provided with a drawn galvanized wire rope end user notification.]

2.3.2.4 Drum

Provide grooved drum made of steel. Design drum in accordance with ASME B30.16. All hoisting rope is to be wound in a single layer and provided with no less than two dead wraps of hoisting rope remaining at each anchorage when the hook is in its extreme low position.

2.3.2.5 Sheaves

Provide sheaves constructed of non-sparking metals in the load block. Provide sheaves constructed of steel for the equalizer and in the upper sheave nest. Size sheaves in accordance with ASME B30.16 for the minimum pitch diameters of running and equalizer sheaves.

2.3.3 Travel Drives

Provide travel assemblies with a minimum of one driven wheel on each side of the web and at least one quarter of all wheels driven. The travel drive arrangement must consist of motor(s) driving through self-contained gear reduction units located at each driven wheel assembly. Gear reducers must be fully enclosed in an oil-tight housing and provided with a convenient means of lubricant level indication and draining. Open-type gearing is not acceptable, except for final drives.

2.3.3.1 Trolley Drives

****

NOTE: Trolley limit switches are an optional safety device.

Trolley travel limit switches are used to prevent the crane trolley from contacting the travel end stops at high speed should the crane operator mistakenly forget to slow down. If selected, ensure the appropriate options are chosen in the ELECTRICAL REQUIREMENTS, Limit Switches section.

****

Provide a motor-driven trolley arrangement. Acceleration and deceleration must meet the requirements specified in CMAA 70.[Provide trolley travel limit switches.]

2.3.3.2 Bridge Drives

****

NOTE: Bridge limit switches are an optional safety device.

Bridge travel limit switches are used to prevent the crane bridge trucks from contacting the travel end stops at high speed should the crane operator mistakenly forget to slow down. If selected, ensure the appropriate options are chosen in the ELECTRICAL REQUIREMENTS, Limit Switches section.

****

Provide a motor-driven bridge arrangement. Acceleration and deceleration must meet the requirements specified in CMAA 74.[Provide bridge travel limit switches.]

2.3.3.2.1 Bridge Travel Gearing

Gearing must conform to ANSI/AGMA 2001 and AGMA 908, with internal and external gear dimensional tolerances conforming to the applicable AGMA standard for tooth geometry and tolerances.

2.3.3.2.1.1 Bridge Travel Reducer

Gear reducers must be standard commercial products designed, manufactured, and rated in accordance with ANSI/AGMA 6013. Provide cranes with a CMAA service class "C" or higher with the corresponding "Industrial Duty" service factors. The speed reducer input (high speed) gear set must use helical (including double helical and herringbone), spiral bevel, or worm gear tooth forms. Provide torque arms that are not of the threaded rod type. Operation must be smooth and quiet.

2.3.3.2.1.2 Bridge Open Gearing

Provide all gears and pinions with adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2015-1 Accuracy Grade A8 or better. Wherever feasible, open gears must be enclosed with safety guards provided with openings with covers for inspection and access for grease lubrication.

2.3.4 Travel Brakes

****

NOTE: NAVFAC tailoring option for additional travel brake requirements.

****

Provide travel drives with an end-mounted electro-mechanical spring set brake conforming to the requirements of CMAA 74 or non-freecoasting mechanical drive capable of stopping the motion of the travel function within a distance in meters feet equal to 10 percent of the full load speed in meters feet per minute when traveling at full speed with a full load.

Spring set brakes must be provided with an externally accessible means to manually release the brake. Provide manual-adjusting brakes designed to permit inspection and adjustment without disassembly of the brake. The brakes must be equipped with a manual self-return to ON brake release; maintained brake releases must reset when power is applied. Double face-mounted brakes are not permitted.

2.3.4.1 Trolley Brake

****

NOTE: NAVFAC tailoring option to require electro-mechanical brakes be end-mounted.

****

Provide brakes for underrunning trolleys/carriers sized in accordance with ASME B30.17, but not sized larger than 150 percent of the drive motor rated torque.

2.3.4.2 Bridge Brake

****

NOTE: NAVFAC tailoring option to require electro-mechanical brakes be end-mounted.

****

Provide brakes with a minimum torque rating per CMAA 74 according to the applicable environment, but not sized larger than 150 percent of the drive motor rated torque.

2.3.5 Wheels

****

NOTE: The following paragraph contains tailoring regarding the use of non-sparking wheels with maximum anti-spark protection. Remove any conflicting items (i.e., wheels cannot be non-sparking and steel or ductile cast iron).

****

Provide under running wheel sizing and flange-to-rail head clearances in accordance with MHI MH27.1 recommendations. The wheels must be compatible with their respective runway profile. Wheel material is to be cast or forged steel, or ductile or malleable cast iron. Provide wheels of non-sparking material. Bronze wheels must have sufficient size and hardness to withstand the intended loading and use. Hollow stamped and gray cast iron wheels may not be used; the use of plate steel is prohibited. Minimum tread hardness for underhung wheels (non-bronze) that run on patented track is 375 BHN.

[2.3.6 Drip Pans

****

NOTE: Drip pans may also be added for any type of crane service if there is an additional requirement to prevent lubrication from falling to the floor or lifted load. Any portion of this section may be used to support the request of the Activity. Not recommended for outdoor service.

List items a. and b. are generic drip pan requirements for inclusion beneath gearboxes. Paragraph c is less likely to be needed.

****

a. The crane must be designed to preclude leakage of lubricants onto the lifted loads or the floor. Equipment or components, which cannot be made leak-proof, must be fitted with unpainted corrosion resistant steel drip pans or must have the foundations seal welded to create a dam. Drip pans that utilize liquid sealant to prevent leakage of lubricants are not permitted.

b. The drip pans must be sized to hold the entire gear case fluid capacity, installed under all drive machinery, designed to permit easy removal of collected lubricant. A trolley floor designed to contain any lubricant drips may be used as fluid containment for any equipment that is mounted on it.

c. Provide drip pans fitted around the shank of the hook and extending outward to encompass all possible points of lubrication drips from the load block or wire rope. The drip pans must be easily removable without disassembly of the hook or load block and cannot interfere with the crane structure during testing of the upper limits.

]2.4 ELECTRICAL REQUIREMENTS

a. The design, selection, rating, and installation of the electrical portions of the crane and its accessories must conform to the requirements of NEMA ICS 3, NEMA ICS 8, the applicable ASME HST standard, and NFPA 70, and other requirements specified herein.

b. All electrical components must be industrial grade, commercially available and comply with established national or internationally recognized approving organizations such as Underwriters Laboratories (UL) and Canadian Standards Association (CSA). All electrical components installed or operated in hazardous areas including but not limited to enclosures, junction boxes, disconnects, pendant controller, and electrification must be designed and rated for the NFPA 70 Hazardous Classifications specified in Classification section.

c. All electrical components must be located so they are easily accessible for inspection and maintenance without removing other parts, doors, or door center posts. Install electrical equipment and panel wiring in a neat and workmanlike manner in accordance with Electrical Construction Standard NECA NEIS 1. Each motion of the crane must be provided with a separate and independent variable frequency drive unit. The loss of any one function must not prevent the operation of other unaffected functions. Two independent relays, contactors, drive inputs, or other equivalent components/logic must be utilized for each function to provide directional control such that the failure of a single relay/contactor/component cannot result in motion in an unintended direction.

d. Disconnecting means for cranes must be in accordance with NFPA 70 Article 610.32. A permanent placard must be installed on the face of the main line disconnect that states "WARNING – THIS DOES NOT ISOLATE POWER TO LIGHTING, RECEPTACLES, AND ANCILLARY EQUIPMENT". Additionally, a lighting (ancillary equipment) disconnect must be provided, with lockout feature, as the isolation means for the lighting transformer and lighting circuit breaker panel, which must power the crane's ancillary equipment. It must feed 480 VAC to the primary side of the transformer directly from the runway conductors via tapping the line side of the main power disconnect. Provide individual disconnects, with lockout feature, capable of being locked in the open position for bridge lights and receptacles.

e. Unless otherwise specified, interconnecting wiring must be of copper stranded construction complying with Table 310.104(A) of NFPA 70. Interconnecting wiring containing asbestos in the insulation or outer covering are prohibited. Aluminum conductors must not be used. Aluminum connectors are allowed if they are rated for use with copper conductors (marked "AL/CU"). All conductors connected to or routed above resistors must have insulation shown in NFPA 70 Table 610.14(a) for 125 degrees C 257 degrees F. For packaged hoists and hoist/trolleys, provide wiring sizes in accordance with NFPA 70 Table 610.14(a). Motor branch circuit conductors not part of a packaged hoist and hoist/trolley must be sized as to have an ampacity not less than 150 percent of the motor full load current rating and to be no smaller than 12 AWG. Conductors must be selected and de-rated based on maximum ambient temperature. Continuous loads such as utility, heating, lighting, and air conditioning must be multiplied by 2.25 to determine ampacity in order to permit application of NFPA 70 610.14 (A) for crane supply conductors. Wire-nuts are not permitted on splices. However, connections for lighting ballasts may be made using wire-nuts (if applicable).

f. Excluding conduit directly connected to dynamic breaking resistors, raceways must maintain a 12-inch clearance between the raceway and dynamic braking resistors. A separate grounding wire, sized in accordance with Section 250.122 of NFPA 70, must be routed with all ungrounded conductors. Only one equipment grounding conductor must be run in each conduit and be the largest size required for any circuit routed in that conduit. All wiring must be numbered or tagged at all connection points. Power conductors which are shielded such that their wire size cannot be easily determined must be labeled as to the conductor size. All unused conduit openings must be plugged.

g. When fiber optic cable is utilized, inspections and performance checks must be accomplished upon completion of on-site installation to ensure cable cleanliness and proper signal integrity. Testing and verification must be conducted by a knowledgeable fiber optics technician using specialized, calibrated equipment. Cables must be tested for signal loss/attenuation. The fiber optic system must also be tested using an Optical Time Domain Reflectometer (OTDR). Final attenuation and OTDR readings from each fiber optic cable run, including spares, must be documented as a baseline for future reference. All spare fiber optic cables must have protective covers over their ends to maintain cleanliness while not in use. When fiber optic cable is utilized the drive OEM's recommendations for encoders and optical to digital converters must be followed. All system components utilized for this purpose must have known compatibility prior to integration.

h. Power cables and low voltage signal cables may not be mixed in the same conduit.

i. The crane manufacturer must furnish and install all electrical equipment on the crane conforming to NEMA ICS 6, including motors, conforming to NEMA MG 1, electrically released brakes, switches, crane controllers, panels, operating station, wiring system, cables, and crane electrification.

2.4.1 Motors

****

NOTE: Inverter duty motors are required for open loop variable frequency drives (VFD).

U.S. Navy allows only 60-minute duty rating motors. 30-minute duty rating motors require Navy Crane Center approval. For non-Navy applications, the motor duty rating may be selected to match what is required by the class of HST-4 hoist (such as H1, H2, H3) specified.

****

Motors must meet all applicable requirements of NEMA MG 1 and UL 1004-1. CMAA 70 calculations for motor horsepower shall be used in selecting bridge, trolley, and hoist drive motors. All motors must have a minimum of a [60] [30] [_____] minute duty rating and be Totally Enclosed Non Ventilated (TENV), Totally Enclosed Fan Cooled (TEFC), or Totally Enclosed Blower Cooled (TEBC).[Provide inverter duty motors for Open Loop Variable Frequency Drives (VFD).][Provide AC squirrel cage induction type motors for the bridge, trolley, and hoist drives.] Provide motors with a minimum of Class F insulation. Provide motor overload protection utilizing a thermal sensitive device embedded in its windings.

2.4.2 Controls

****

NOTE: Use the first three paragraphs to select electronic variable frequency drive controls for either the hoist, bridge or trolley. With VFD controls, the hoist must be configured as open loop. Open loop is more cost effective and requires a mechanical load brake (or self-locking worm gear). Ensure the Hoist Brakes section of this specification reflect the type of controls chosen. Use the fourth, fifth, and sixth paragraphs to select one or two speed control for the hoist, bridge, or trolley. Selections can be made using a combination of electronic controls and one or two speed motor controls for the various functions.

When the two-speed bridge and trolley motor is specified, the slow speed will be 1/3 to 1/4 of rated travel speed. Reduced voltage starting, acceleration, and deceleration, serve to reduce the acceleration rate that is normal for squirrel-cage motors. Squirrel-cage motors with two-speed magnetic controls provide satisfactory results with slow bridge and trolley speeds, and should be specified when short travel distances are involved and where fine positioning is not required.

For faster bridge and trolley speeds or finer positioning requirements, specify electronic controls.

Various VFD manufacturers offer an option to overspeed the hoist to a value over 60Hz (usually 120Hz). This allows the operator to position the hoist at faster speeds when it is not loaded. When selecting this feature list the maximum no load speed in paragraph RATED CAPACITY AND SPEEDS.

****

a. Provide static reversing, variable frequency drives (VFD) for the [bridge,] [trolley] [and] [hoist] electric controls. VFD controllers must meet NEMA ICS 8, Part 8 and at a minimum, provide under-voltage protection, electronic instantaneous over current protection, DC bus over voltage protection, and be able to withstand output line to line shorts without component failure. Select bridge and trolley drives such that the continuous rating of the controller is not less than the calculated motor full load current based on CMAA 70 paragraph 5.2.9.1.1.1 and NFPA 70 Table 430.250. Select hoist drives such that the continuous rating of the controller is not less than 125 percent of the calculated motor full load current based on CMAA 70 paragraph 5.2.9.1.1.1 and NFPA 70 Table 430.250. All hoist drives must have a motor over-torque limit to lock out the hoist and prevent gross overload of the associated hoist. Provide dynamic braking for each electric drive that is sized per VFD manufacturer's requirements. Submit VFD Control Parameter Settings.

b. Provide speed control which is infinitely variable for each function, controlled via [radio control system] [and] [pendant pushbutton station].[Provide controls designed such that the maximum speed of each function will be limited to 25 percent of rated speed when a slow speed switch is actuated on the controller[s].[Energize a yellow/amber light/indicator while in slow speed mode.]]

c. The [hoist][,] [trolley][,] [and] [bridge] brakes must set after the associated controller decelerates the drive motor to a controlled stop. The hoist, trolley, and bridge, controllers must be sized to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 125 percent of rated load on the hook. The hoist controller must prove torque before release of the brakes and enable the drive motor to develop full torque continuously at zero speed. Motors must operate smoothly at all speeds without torque pulsations and must only be energized within the frequency range of 50-60 Hz at rated speed.[The hoist control system may utilize overspeed up to 120hz, unloaded only, if the drivetrain equipment has all been balanced and is rated for the resulting speed.]

d. The use of definite purpose contactors is prohibited. If IEC contactors are used, the application cannot exceed the contactor manufacturer's AC3 ratings for the contactor at a minimum.

e. On hoist function roll-up must be less than 3 mm 1/8 inch measured at the hook block and roll-back must not occur over the entire load range.

f. Use of Uninterruptible Power Supplies (UPS) is prohibited. Feed control circuits from a single phase, air cooled, double wound transformer with a grounded metal screen between the primary and secondary windings of the transformer.

g. Provide a main line contactor. Energization of the main line contactor must be controlled by the POWER-OFF/POWER-ON switch/pushbutton on all controllers. Upon actuation of the POWER-OFF pushbutton; power to all drive motors, brakes, and controls must be removed. The mainline contactor must not be able to be energize while the POWER-OFF pushbutton is actuated. The POWER-OFF pushbutton circuitry must be independent of all controls or any other electronic devices.

2.4.3 Protection

Protection must not be less than that required by NEMA ICS 3, NEMA ICS 8, CMAA 74, NFPA 70, UL 1004-1, UL 943, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306 and all applicable provisions of 29 CFR 1910. All protection must be by circuit breakers or fuses. Provide a disconnect switch or enclosed type circuit breaker readily accessible to the crane operator for the crane disconnect. Motor branch circuits must be individually protected by inverse time circuit breakers capable of being locked in the open position. The means for locking must remain in place with or without the lock installed. Motor full load current from NFPA 70 Article 430, Part XIV (Tables) must be used to calculate the circuit breaker size.

Provide disconnecting means on the crane in accordance with NFPA 70 Article 610.32. Provide for lockout/tagout of all hazardous energy sources. Provide product data for all circuit breakers and fuses.

2.4.3.1 Conductors

a. The crane contractor is responsible for ensuring that all conductors from the load side of the existing floor level disconnect to the motor branch circuits have adequate overcurrent protection complying with one of the following:

(1) Not be greater than the largest rating or setting of any branch circuit protective device plus the sum of the nameplate rating of all other loads per NFPA 70 Article 610.41(A).

(2) Not be greater than the ampacity of all feeder conductors after all ampacity correction factors have been applied.

b. Conductors for brake coils must be protected by fuses or other protective devices. The device must be chosen to protect the brake circuit conductors from ground faults or short circuits.

2.4.4 Resistors

Provide resistors with natural convection cooling sized as recommended by the VFD OEM and fabricated of corrosion resistant metal; the use of "wire wound" type resistors is prohibited for segments of 8 ohms or less. Mount resistors in substantial, ventilated enclosures constructed entirely of non-combustible materials. Provide resistors with terminals fitted in the coolest position in the enclosure.

[2.4.5 Transients and Harmonics Protection

****

NOTE: The following items are required only for VFD Controls.

****

Provide contactors and relays with appropriate Metal Oxide Varistors (MOV) or resistor-capacitor (R-C) surge absorbers installed across the respective coil.

Provide transient protection for electronic drive controllers that is either internal to the drive or via an MOV connected line-to-ground close to the line terminals of the drive.

Provide line reactors rated for continuous duty operation based upon the motor nameplate amperes. With motors of 50 horsepower or greater, harmonics protection must be provided by an isolations transformer or as recommended by the VFD OEM. For a drive motor branch circuit that exceeds 150 feet in length, a reactor must also be connected in series with the controller load (output) terminals to provide standing wave protection or as otherwise recommended by the VFD or motor OEM.

]2.4.6 Limit Switches

a. Provide primary upper and lower geared limit switches. Geared limits must allow reversing direction to back out of the limit without resetting. The lower limit switch must be set such that there are a minimum of two wraps of rope on the hoist drum.

b. Provide a backup mechanical hook block activated upper limit switch wired independent of the directional controllers and the primary upper limit switch that removes power from the hoist motor, hoist brake and hoist controls conforming to NEMA ICS 5. The backup limit must require hoist resetting prior to operation of the hoist in any direction.

[c. Travel limit switches must be provided for the [bridge] [and] [trolley] motion to slow the crane to [25 percent] [_____] of its rated speed

[[10] [_____] feet before the bridge end stops] [and] [[5] [_____] feet from the trolley end stops]. Limit switches must be mounted rigidly in a manner so as to protect the switch from misalignment or damage. The target/trip arm must be large enough to provide interception given a misalignment were to occur.

] d. Limit switches must be rated for the NFPA 70 Hazardous Classifications specified in the Classification section of this specification.

2.4.7 Operator Controls

****

NOTE: Available operator controls are pendant, and radio control. Cranes can also be set-up to be controlled by two separate systems. For cranes with one set of controls use paragraph 1. For cranes with two sets of controls use paragraph 2. In such a case some type of interlock must exist to prevent control from both systems simultaneously.

The pendant can be suspended from the trolley or an independent festooned messenger track system. The festooned system allows the operator to have maximum separation from the load. When this is a requirement include section Pendant Conductor System section of this specification.

When specifying a radio control system, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANECENINST 11450.2:

1. What type of batteries? Rechargeable?
2. Are spare batteries needed? How many?
3. Are spare remote control units required? How many?
4. Is a battery charger required?
5. Type of transmitter unit.
6. Is a belt/harness required for the remote control?

****

[Provide crane equipped with a [pendant pushbutton station] [radio control system].

][Provide crane equipped with both a pendant pushbutton station and a radio control system. Provide a selector switch to allow the use of only one of the two available control stations on the pendant controller.

] If VFD controls are not provided, provide directional contactors with both mechanical and electrical interlocks.

Operator controls must be rated NEMA Type 7 for Class I, or NEMA Type 9 for Class II according to the NFPA 70 Hazardous Classifications specified in the CLASSIFICATION section of this specification.

[2.4.7.1 Pendant Pushbutton Station

The cranes must be controlled from a pendant pushbutton station suspended from [the trolley] [an independent festooned messenger track system, operating the length of the bridge]. Provide multiconductor flexible cords for pendant pushbutton stations with #16 AWG minimum conductors. Provide a method of strain relief to protect the electrical conductors from damage. Locate the pendant pushbutton station [1200 mm 4 feet] [_____] above the finished floor. Pushbutton pendant station must have its elements legibly marked and arranged vertically, in order, in accordance with CMAA 74.[Provide [one speed] [two speed] [3-step infinitely variable] [2-step infinitely variable] pendant pushbuttons for control of the [hoist][,] [trolley][,] [and] [bridge].] Provide pendant pushbuttons for control that spring return to the OFF position. Voltage in the pendant pushbutton station must not exceed 150 Volts AC or 300 Volts DC.[Provide a maintained two-position selector switch for slow speed selection.] The pendant must be rated for the NFPA 70 Hazardous Classifications specified in the Crane Design Criteria "Classification" Section. Provide the pendant pushbutton station with a NEMA Type 7 for Class I, hazardous environments and NEMA Type 9 for Class II, hazardous environments, as classified by NFPA 70.

[2.4.7.1.1 Pendant Conductor System

Provide a festoon type pendant conductor system. The festoon cables must be flat cables suspended from carriers riding on an I-beam or C-track. The pendant controller must be capable of traveling the entire length of the bridge and move independently of the trolley. Festoon loops must not extend below the high hook position.

][2.4.7.1.2 Radio Control System

Provide each system with a [belly box] [handheld] [_____] type portable transmitter unit[and an identical back-up transmitter unit].[Provide each transmitter with an adjustable belt or harness to support it when worn by the operator.] Only one transmitter at a time can control the crane and there must be no interference from one crane's controller affecting operation of the other cranes in the building. Each transmitter must include: individual [infinitely variable spring return joystick motion control levers] [push button controls] for each hoist, trolley, and bridge; a maintained contact, keyed switch, marked ON-OFF, for portable transmitter unit power; indication of Battery Power, and indication of Transmitting Status; a red emergency STOP mushroom pushbutton;[and]a floodlight on/off pushbutton[and a maintained slow speed selector switch]. The transmitters and all controls must each be clearly and permanently labeled with functionality and direction. Directions for controllers must be in accordance with CMAA 74 recommendations. The remote radio control system must be designed to meet the requirements of NEMA ICS 8, Part 9 and ECMA 15. Each radio remote control lever must be in the OFF position before the associated crane function can begin. The system frequency must be within the unlicensed FCC Part 15 range. Each control unit must maintain a continuous status signal to the associated receiver during operation. There must be no significant loss in systems efficiency and function at the end of eight hours of continuous battery use. The technical section of Form DD 1494 frequency allocation application (found on the NAVFAC/NCC website), addressing the Contractor's equipment, must be completed by the manufacturer of the radio control equipment being furnished under this contract.[For unlicensed radio control systems, Form DD 1494 must be submitted to the activity's frequency coordinator for information.][For licensed radio control systems, Form DD1494 must be submitted to the local frequency coordinator to initiate equipment approval for use in the geographical location.] The Contractor must receive approval from the

Government for the frequency to be used (licensed or unlicensed) for the radio remote system prior to design approval. Forms may be submitted via the Equipment Location Certification Information Database (EL CID) on-line system in lieu of submitting Form DD 1494.

]]2.4.8 Electrification Systems

****

NOTE: Various methods may be used to transfer power from the runway to the crane (Runway Conductor System) and then again to the trolley (Bridge Conductor system). Typically, the Runway Conductor System is a set of conductor bars on the runway and collector shoes on the crane. The Bridge Conductor system is typically a set of festoon cables.

Site conditions and environment might require the design to deviate from the norm. Hazardous locations will need to be designed with either a cable reel or festoon system.

****

2.4.8.1 Runway Conductor System

[Provide a rigid runway Conductor Bar System for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. The crane must be grounded through the runway electrification system. Provide runway conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. If there is any way the hook block or wire rope can swing into the runway electrification, provide a guard installed to prevent contact.

Provide two Collector Shoes (tandem design) for each conductor; each collector shoe must be rated for not less than the runway conductor sizing, so as to provide redundancy.

][Provide a Festoon System for the runway conductor system utilizing cables suspended from carriers riding on an I-beam or C-track for the crane, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. Conductors must be fabricated from copper. The crane is required to be grounded through this conductor system. Provide conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][Provide a Cable Reel System for the runway conductor system, including all necessary cables and hardware to connect the cable reel to the floor level fused disconnect switch. The cable reel must have three power conductors and an equipment grounding conductor. The crane is required to be grounded through this conductor system. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads.

][Provide a totally enclosed flexible cable tray electrification system (cable chain) for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. The cable chain must have three power conductors and an equipment grounding conductor. The conductors must be selected so as to be of the longest length without splices. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The crane is required to be grounded through this conductor system.

]2.4.8.2 Bridge Conductor System

[Provide Festoon System for the bridge conductor system utilizing cables suspended from carriers riding on an I-beam or C-track. Conductors must be fabricated from copper. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][Provide a Cable Reel System for the bridge conductor system. The cable reel must have an equipment grounding conductor, and all necessary control cables. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley must be grounded through the cable reel connection and all conductors must be of copper construction.

][Provide a totally enclosed flexible cable tray electrification system (cable chain) for the bridge conductor system. The cable chain must have three power conductors, an equipment grounding conductor, and all necessary control cables. The conductors must be selected so as to be of the longest length without splices and must be copper. A minimum of 20 percent of the control circuit conductors in the flexible cable tray system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system.

]2.4.9 Overload Protection

****

NOTE: Overload protection on a crane is required and is provided by two types of systems: Capacity Overload Protection and Over-Torque Limit.

The Over-Torque Limit only applies to cranes with VFD controls. It is a parameter setting in the drive and is typically set at 150 percent of rated motor torque.

Capacity Overload Protection is usually adjustable. If adjustable, it needs to be set at less than the crane's minimum test load; recommend setting at 100 percent of rated capacity or less. This protection can take the form of one of the following devices:

1. Clutch – Not adjustable and is common on packaged hoists.
2. Load Limit Switch – Installed on the wire rope and measures deflection. Does not require a break in the wire rope and is simply clamped onto the wire. Typically used on smaller hoists that have magnetic controls. Can also be installed as part of

the equalizer sheave.
3. VFD Drive Overload Protection – Similar to the Over-Torque Limit, but is set at a lower setting. Adjusted via parameters within the drive.

****

a. Provide a capacity overload protective device for all hoist systems using VFD drive capacity overload protection (separate from torque limiting feature of the VFD). Set hoist capacity overload protection at [100] [_____] percent of rated capacity. Hoist capacity overload protection must be adjustable between 80 and 150 percent of hoist capacity. Provide a keyed override or other means to disable the hoist capacity overload protection when performing a load test.

[b. Initially, set the torque limiting capability of the VFD (that is separate from the capacity overload protective device) to 150 percent of the motor torque (amperage) necessary to hoist 100 percent load. It may be adjusted up only to avoid nuisance trips and adjusted down if possible while still avoiding nuisance trips.

]2.4.10 Enclosures

****

NOTE: Select classification of control panels, controls, and brakes based on the environmental conditions in which the crane will be installed:

1. Choose one of the following for an indoor installation: 1, 2, or 12.
2. Choose one of the following for an outdoor installation: 3, 4X, or 8.
3. Choose one of the following for a Class I Hazardous installation: 7 (indoor) or 8 (indoor/outdoor).
4. Choose one of the following for a Class II Hazardous installation: 9 (indoor).

Other enclosure types exist that might be a better alternative for a particular installation. If necessary, refer to NEMA 250.

****

a. Provide enclosures for control panels, controls, and brakes in accordance with NEMA 250 and NEMA ICS 6, Classification Type [1 indoor, general purpose] [12 indoor without knockouts, general purpose] [2 indoor, drip-proof] [3 outdoor, dust-tight, rain-tight, sleet-resistant] [4X outdoor] [_____] [7 indoor Class I hazardous] [9 indoor Class II hazardous] [8 indoor/outdoor Class I hazardous], or all controls must be intrinsically safe as defined by NFPA 70 Article 504.

[b. Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.

] c. Gaskets of enclosures and fixtures, and joints and contact surfaces of hazardous/explosive enclosures must be kept free of any paint to prevent damage during removal and reinstallation of gaskets of enclosures.

2.4.11 Warning Devices

****
NOTE: A warning horn or light is required for all radio controlled cranes and recommended for all others.
****

[Provide a warning horn that is operable from a push button at the [pendant pushbutton] [radio control] station.] [Provide a warning [strobe light] [rotating beacon] that is illuminated at all times during movement of the hoist, trolley, or bridge function[, but may be deactivated on the operator control station].]

[2.4.12 Floodlights

Provide evenly spaced floodlights along the bridge. Select floodlights to provide an illumination level of 40 foot-candles at three feet above the finished floor. All lights must be vibration resistant and designed to prevent any material from falling from the fixture. Switch the floodlights from the [pendant pushbutton] [radio controlled] station.

][2.4.13 Pilot Devices

Provide Indicator Lights mounted in an enclosure on the bottom of the bridge with lights sized and positioned to be visible from the ground. The lights must be the dual-lamp type. Provide a white light to indicate that power is available to the crane and a blue light to indicate that the main contactor is energized. Light voltage must be 115 VAC. Provide nameplates that are legible from ground level. The nameplates must read, in their respective order, "POWER AVAILABLE" and "CRANE ENERGIZED". The POWER AVAILABLE light must be supplied by a separate, fused transformer for its energization.

][2.4.14 Electrical Outlets

****
NOTE: Electrical outlets are typically provided on trolleys for maintenance purposes on double girder cranes with top running custom built-up hoists (which typically have walkways). The addition of electrical outlets may not be a standard manufacturer option on packaged hoists and is not recommended for single girder cranes or underhung packaged hoists.
****

Provide a minimum of [one] [_____] 120 VAC duplex outlet[s] on the crane, mounted [on] [in] the [outside of the control panel(s)] [trolley] [cab] [_____]. The circuit(s) supplying receptacles must incorporate ground-fault circuit-interrupter protection for personnel and be protected by a circuit breaker with a minimum rating of [15] [20] amps.

]2.4.15 Cyber Security of Control Systems

****
NOTE: Cyber Security of Control Systems requirements are tailored for NAVFAC. This subpart must be included for NAVFAC, it is not replaced by

Division 25 Cybersecurity Section.
****

****
NOTE: SECNAVINST 5400.15 designates NAVFAC as the functional technical authority for WHE. NAVFAC is designated as Functional Security Control Assessor (FSCA) and the Functional Authorizing Official (FAO) for Ashore Control Systems in their domain; therefore, this includes WHE control systems. WHE control system owners are responsible for the Information System Security Engineer (ISSE) functions and producing artifacts (documentation) for review by the FSCA and FAO.

All new and electrically overhauled cranes must implement the following cybersecurity requirements as applicable to the control system architecture (i.e., networked drives, non-networked drives, and any wireless applications) so that supporting artifacts and considerations are available for the implementation of the RMF process.
****

a. Provide the following for PLC, RTU, Supervisory Controller, or other network-capable (whether networked or not upon delivery) control devices as applicable:

  (1) Hardware list (Hardware list must include the following for each device):

    (a) Manufacturer

    (b) Model

    (c) Location

    (d) Key technical ratings (e.g., memory)

    (e) Serial number

    (f) MAC addresses

    (g) IP addresses

  (2) Software List (Software list must include the following for each device):

    (a) Manufacturer

    (b) Version/subversion

    (c) Location/device

    (d) Used network ports/protocols/services

  (3) List and discussion of all security features of Contractor hardware and software.

b. For every PLC, RTU, Supervisory Controller, or other network-capable control devices (whether networked or not upon delivery), deliver the following on CD/DVD:

(1) Original firmware

(2) Original firmware hash

(3) SOP for application of firmware updates/patches

(4) POC or website for firmware updates/patches

(5) Count of interfaces and types

(6) Protocols in use, per interface

(7) Configuration file

(8) SOP for configuration

2.4.15.1 Control System and Network

****

NOTE: Select options a. and b. if a standalone laptop is required. Recommend including one laptop if the activity regularly performs all crane maintenance.

****

[a. Provide one rugged laptop type workstation (computer) complete with all compatible software (including software licenses), redundant physical back-up copies on CD/DVD of the installed software, and all necessary cables and special connectors to allow crane software to be troubleshot, checked and upgraded, and for the data recorder to be accessed and information retrieved. Equip the workstation with a CD/DVD drive and the associated CD/DVD burning software. The workstation must also be equipped with USB ports (2.0 and 3.0), an Ethernet port, and a serial port. Delivering the software on a USB (flash drive) device is prohibited.

b. The laptop must be designed for an industrial environment and must be shock resistant and weatherproof as a minimum. Provide the laptop with a built-in CD/DVD reader with the capability to burn CDs and DVDs including associated software to burn CDs and DVDs.

] c. The Contractor must provide all equipment, including software and hardware, necessary for testing, installation, and communicating/troubleshooting all systems provided with the crane (e.g., engine/generator, control system, LID, etc.). The Contractor must provide all crane specific operational software files (e.g., ladder logic, functional block programming, etc.) for their associated systems (e.g., control systems, LID, engine generator, etc.).

d. A single common networked design must not be used for the control systems. A network for an individual function may be used as long as a failure of the network does not affect any other function/network except as defined for specific safety interlocks (e.g., LMI system). A common crane network may be used in a monitoring mode for recording faults and trending and is encouraged. Failure of the monitoring system must not affect crane functions.

e. All provided hardware and software must be currently marketed products, not currently scheduled for end of life or obsolescence, to ensure system sustainability.

f. The control system engineering workstation hardware and operating system must be in conformance to the Common Criteria for IT Security Evaluation (IEC ISO 15408, visit https://www.niap-ccevs.org for more information).

g. Ensure there is no remote access capability enabled as remote access capabilities are prohibited. Physically disable or remove all modem/network devices not required for operational purposes.

2.4.15.2 Software and Services

a. Remove all Software and Services not required for operation and/or maintenance of the product. If removal is not technically feasible, then disable software not required for the operation and/or maintenance of the product. Configure the product to allow the ability to re-enable ports and/or services if they are disabled by software. The removal of software or services may not impede the primary function of the product. If software that is not required cannot be removed or disabled, document a specific explanation, and provide risk mitigating recommendations and/or specific technical justification. The software/service to be removed and/or disabled includes, but is not limited to:

(1) Cameras

(2) Games

(3) Device drivers for product components not procured/delivered

(4) Messaging services (e.g., email, instant messenger, peer-to-peer file sharing)

(5) Source code

(6) Software compilers in user workstations and servers

(7) Software compilers for programming languages that are not used in the control system

(8) Unused networking and communications protocols

(9) Unused administrative utilities, diagnostics, network management, and system management functions

(10) Backups of files, databases, and programs used only during system development

(11) All unused data and configuration files

(12) Remove and/or disable, through software, physical disconnection, or engineered barriers, all services and/or ports in the procured product not required for normal operation, emergency operations, or troubleshooting. This includes communication ports and physical

input/output ports (e.g., USB docking ports, video ports, and serial ports).

b. Provide documentation showing all disabled ports, connectors, and interfaces for all network-capable devices. In addition, provide summary documentation of the procured product's security features and security-focused instructions on product maintenance, support, and reconfiguration of default settings.

c. For the evaluation status of hardware and software, the Contractor must provide information on Common Criteria (IEC ISO 15408) or National Information Assurance Partnership (NIAP) or Federal Information Processing Standards (FIPS) evaluation status of hardware and software.

2.4.15.3 Access Control

a. The Contractor must configure each component of the procured product to operate using the principle of least privilege. This includes operating system permissions, file access, user accounts, application-to-application communications, and energy delivery system services.

b. Provide user accounts with configurable access and permissions associated with one or more organizationally defined user role(s), where roles are used.

c. Provide a system administration mechanism for changing user(s') role (e.g., group) associations.

d. The Contractor must document control system access control options by defining access and security permissions, user accounts, and applications with associated roles.

e. Provide recommended methods for the Acquirer to prevent unauthorized changes to the Basic Input/Output System (BIOS) and other firmware. If it is not technically feasible to protect the BIOS to reduce the risk of unauthorized changes, the Contractor must document this case and provide mitigation recommendations.

2.4.15.4 Control System Account Management

The Contractor must document all accounts (including, but not limited to, generic and/or default) that need to be active for proper operation of the procured product.

Remove or disable any accounts that are not needed for normal or maintenance operations, emergency, or troubleshooting of the energy delivery system.

2.4.15.5 Session Management

The Contractor may not allow multiple concurrent logins using the same authentication credentials, allow applications to retain login information between sessions, provide any auto-fill functionality during login, or allow anonymous logins.

Provide account-based and group-based configurable session-based logout and timeout settings (e.g., alarms and human-machine interfaces).

2.4.15.6 Authentication/Password Policy and Management

Provide a configurable account password management system that allows for, but is not limited to, the following:

a. Changes to passwords (including default passwords)

b. Selection of password length

c. Frequency of change

d. Setting of required password complexity

e. Number of login attempts prior to lockout

f. Inactive session logout

g. Screen lock by application

h. Comparison to a library of forbidden strings

i. Derivative use of the user name

j. Denial of repeated or recycled use of the same password

The Contractor must time stamp log files.

2.4.15.7 Logging and Auditing

Provide logging capabilities that cover the following events, at a minimum (as appropriate to their function):

a. Information requests and server responses

b. Successful and unsuccessful authentication and access attempts

c. Account changes

d. Privileged use

e. Application start-up and shutdown

f. Application failures

g. Major application configuration changes

2.4.15.8 Heartbeat Signals

The Contractor must identify heartbeat signals or protocols and recommend which should be included in network monitoring. At a minimum, include a last gasp report from a dying component or equivalent.

The Supplier must provide packet definitions of the heartbeat signals and examples of the heartbeat traffic if the signals are included in network monitoring.

2.4.15.9 Patch Management and Updates

The Contractor must verify that procured products (including third-party hardware, software, firmware, and services) have appropriate updates and patches installed prior to delivery.

Provide documentation of the patch management program and update process (including third-party hardware, software, and firmware). This documentation must include resources and technical capabilities to sustain this program and process. Provide the Contractor's method or a recommendation for how the integrity of the patch is validated by the Acquirer as well as the Supplier's approach and capability to remediate newly reported zero-day vulnerabilities.

2.4.15.10 Malware Detection and Protection

a. The Contractor is required to implement at least one of the following:

  (1) Provide a host-based malware detection capability that quarantines (instead of automatically deleting) suspected infected files. Provide an updating scheme for malware signatures. The Contractor must test and confirm compatibility of malware detection application patches and upgrades.

  (2) If the Contractor is not providing the host-based malware detection capability, the Contractor must suggest malware detection products to be used and provide guidance on malware detection and configuration settings that will work with Contractor products.

b. The Contractor must validate that cybersecurity services running on the procured product (e.g., virus checking and malware detection) do not conflict with other such services running on the procured product.

c. For malware detection and protection, the Contractor must provide, or specify how to implement, the capability to automatically scan any removable media that is introduced to the product being acquired.

2.4.15.11 Physical Security

Provide lockable or locking enclosures or rooms for energy delivery systems and system components (e.g., servers, clients, and networking hardware) and for the systems used to manage and control physical access (e.g., servers, lock controllers, and alarm control panels). Provide a method for tamper detection on lockable or locking enclosures. If a physical security and monitoring system is used, tamper detection must be compatible. The Contractor must ensure that physical security features do not hamper the crane system operations. Provide the tools and instructions for making changes to locks, locking codes, keycards, and any other keyed entrances.

2.4.15.12 Wireless Technology

For wireless technology provisions, the Contractor must document:

a. Specific protocols and other detailed information required for wireless devices to communicate with the control network, including other wireless equipment that can communicate with the Contractor-supplied devices.

b. Use, capabilities, and limits for the wireless devices.

c. Power and frequency requirements of the wireless devices (e.g., microwave devices meet the frequency requirements of Generic Requirements [GR]-63 Network Equipment Building System [NEBS] and GR-1089).

d. Range of the wireless devices and verify that the range of communications is minimized to both meet the needs of the Acquirer's proposed deployment and reduce the possibility of signal interception from outside the designated security perimeter.

e. Wireless technology and associated devices compliance with standard operational and security requirements specified in applicable wireless standard(s) or specification(s) (e.g., applicable IEEE standards, such as 802.11).

f. Configuration control options that enable varying of the security level of the devices.

2.4.15.13 Control System Inventory

Provide the complete control system inventory. The Control System Inventory must include the following attributes, in tabular format, as applicable:

General Information	Location Information	Hardware Details	Operating System and Platform	Network Information (Actual Function, not potential function)
Unique ID	Facility Name	Device Type	Embedded OS (Yes/No)	MAC Address(es)
Barcode or Identifier	NFAID	Device Sub-Type	OS Contractor	IP Address(es)
Region	Commodity	Device Function	Operating System (O/S)	Upstream Device
Installation	Floor	Manufacturer	O/S Version	Protocols In Use
Special Area (Option DNA1)	Room	Product Line	Platform Contractor	Host Name
	Location	Model #	Platform Product Line	
	System Type	Serial #	Platform	
	Functional System or Equipment Control	Remote Connectivity: (Wired / Wireless / None)	Platform Version	
		Network Type Used: (Serial / Ethernet / Both / None)		

2.5 PAINTING SYSTEM

****

NOTE: Three-coat zinc primer/epoxy/polyurethane system is provided for mild to severe atmospheric, indoor and outdoor cranes. For cranes in abnormal environments including exposure to chemicals or in immersion service, a system designed for that environment should be used. Other systems may suffice for milder environments.

****

a. Remove all grease, oil, and surface debris by solvent wiping or detergent/water scrubbing, prior to blast cleaning. Prepare surfaces to be coated by abrasive blasting to SSPC SP 6/NACE No.3, Commercial Blast Cleaning, or in accordance with the coating manufacturer's requirements, whichever is more stringent.

b. Use a painting system appropriate for the conditions provided in the Crane Design Criteria section of this specification. Paint exposed portions of the crane [and crane runway system] using a [three] [_____]-coat system as follows: [zinc-rich primer consisting of a minimum of 77 percent zinc by weight in the dry film, an anticorrosive epoxy intermediate coat, and an aliphatic polyurethane top coat] [_____]. All paint products must be supplied by a single manufacturer and free of chromates, lead, and mercury. Apply each coat in accordance with manufacturer's instructions and requirements. Ensure each coat is smooth, even, and free of runs, sags, orange peel, and other defects.[Desired color of finish coat is [brilliant yellow] [_____].] Submit product data for painting system.

c. Coat faying surfaces of bolted connections per RCSC A348, but do not apply finish paint.

d. Paint, coatings, or galvanizing on the following items or areas is not acceptable: hoist wire ropes, hooks, hook nuts, sheave and drum grooves, wheel treads, lubrication fittings, nameplates, flange mounting faces, corrosion resistant steel, bronze, or other items not normally painted.

e. Factory paint electrical and mechanical equipment in accordance with the manufacturer's best standard practice for the specified environment.

2.6 IDENTIFICATION PLATES

****

NOTE: NAVFAC P-307 requires the capacity be displayed in pound units. The kilogram marking option is provided for cranes installed in a foreign country.

****

Furnish and install identification plates. Provide non-corrosive metal identification plates with clearly legible permanent lettering giving the manufacturer's name, model number, serial number, capacity in pound units, [with kilogram units printed in a different color,] and other essential information or identification.

2.6.1 Markings on Crane, Trolley, and Hook

****

NOTE: NAVFAC P-307 requires the capacity be displayed in pound units. The kilogram marking option is provided for cranes installed in a foreign country.

****

To avoid operation of the crane in the wrong direction, affix the appropriate directions (NORTH, SOUTH, EAST, and WEST) with arrows on both sides of the bridge and both sides of trolley, as applicable. Markings must be visible by the operator and from the loading point. Labels on the controls must have corresponding directional (NORTH, SOUTH, EAST, and WEST) markings. Markings must agree with the markings on controller. Do not indicate directional arrows on controller.

Mark the hook rated capacity in pound units[, with kilogram units printed in a different color,] on both sides of the hoist load block.

2.7 ELECTRICAL ASSEMBLY

Installation of all electrical wiring, conduit, and components must be performed in accordance with the requirements of NFPA 70. As a minimum, items a. through g. below must be followed:

a. All electrical connections must be installed in accordance with NFPA 70 Articles 110.14 or 430.9, as applicable, or as recommended by the device manufacturer.

b. Crimped terminal lugs, if used, must be properly sized for the wire and installed using the device(s) – e.g., crimping tool and indenter – recommended by the terminal lug manufacturer.

c. All spare conductors must be identified as spare conductors, and must have their ends insulated to preclude accidental contact with energized equipment.

d. Bonding straps and equipment grounding conductors must be connected to engineered ground points, have all paint removed from their termination points, or have tooth lockwashers (star lockwashers) installed, to insure proper grounding of the equipment.

e. Rigid Polyvinyl Chloride conduit may be used to protect festoon cable from physical damage when the cable is run along the footwalk of the crane, provided that only sections of conduit are used.

f. Festoon cable must be installed with suitable strain relief and protected from physical damage in accordance with NFPA 70 Article 610.11(E)(1). This includes damage from chafing against the crane structure and any other type of damage that may be incurred.

g. Fiber optic cable must be installed in accordance with the manufacturer's installation guidelines. However, at a minimum the following guidelines must be adhered to: no sharp bends (bend radii must be greater than 1 inch or as prescribed by the manufacturer), avoid tight loops, no zip ties, and no stretching of cable.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

[3.2 SHOP ASSEMBLY AND TESTS

****

NOTE: Shop inspection and testing at the manufacturing facility is typically recommended for specialized applications (e.g., ordnance handling, molten metal handling, special purpose service, hazardous/explosive area environments, precision handling operations requiring complex or synchronized lifting capacity, or custom designs). This section may not be necessary for standard commercial packaged hoists.

****

Shop assemble major components as completely as possible. Reeving of drums and sheaves is not advisable for shop testing, however it is acceptable for packaged hoists. Functionally test the crane system at the construction facility prior to shipment. The Government reserves the right to inspect the crane for compliance with this specification and to witness the functionality tests. Notify the Contracting Officer [14] [_____] days prior to starting testing operations.

]3.3 ERECTION AND INSTALLATION

Perform the entire crane system erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's representative.

3.3.1 Mechanical Alignment

Align motors, couplings, brakes, gear boxes, and drive components in accordance with manufacturer's instructions.

3.3.2 Electrical Adjustments

Adjust control system in accordance with manufacturer's instructions. Store a copy of all Control Parameter Settings (PLC, VFD). Provide the final settings and configurations data on the Complete Schematic Wiring Diagram, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents. Provide the test conditions such as ambient temperature, motor load, date performed and person performing the adjustments as part of the Operational Tests report.

3.3.3 Field Welding

Perform welding indoors, where possible. Surface of parts to be welded must be free from rust, scale, paint, grease, and other foreign matter. Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M.

3.3.4 Field Painting

Perform painting indoors, where possible. Field painting (including touch-up) must conform to the requirements of the coating manufacturer and as specified in paragraph PAINTING SYSTEM.

3.4 FIELD QUALITY CONTROL

3.4.1 Post-Erection Inspection

After erection, the Contractor[, the Activity Crane Inspector/Test Director,] and the Contracting Officer must jointly inspect the crane bridge and hoist systems and components to verify compliance with specifications and approved submittals. Notify the Contracting Officer [14] [_____] days before the inspection. Provide for approval a report of the inspection indicating the crane is considered ready for operational tests.

Document the results of this inspection and submit the post-erection inspection report to the Contracting Officer for approval.

3.4.2 Operational Tests

****

NOTE: Determine if Government furnished certified test weights are available at the site (recommended). If not, they must be provided by the Contractor. These weights are for acceptance testing and will not be permanently retained by the Government.

****

Check the clearance envelope of the entire crane prior to picking or traversing any load to ensure there are no obstructions. Test the systems in service to determine that each component of the system operates as specified, is properly installed and adjusted, and is free from defects in material, manufacture, installation, and workmanship. Rectify all deficiencies disclosed by testing and retest the system or component to prove the crane is operational.[The Contractor must furnish test weights, operating personnel, instruments, and other apparatus necessary to conduct field tests on each crane. Solid weights must be measured using calibrated equipment traceable to National Institute of Standards and Technology (NIST) with a minimum accuracy of plus or minus two percent.]

3.4.2.1 No-Load Test

Raise and lower each hook through the full range of normal travel at rated speed for three complete cycles. Raise and lower each hook, testing other speeds of the crane. Verify proper operation of hoist limit switches. Operate the bridge and trolley in each direction the full distance between end stops and bring bumpers into contact with the end stops. Operate through the entire speed range and verify proper brake operation. Verify correct operation of all indication and ancillary devices.

3.4.3 Test Data

Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane. Record operating and startup current measurements for hoist, trolley, and bridge motors using appropriate instrumentation (i.e., clamp-on ammeters). Compare recorded values with design specifications or manufacturer's recommended values; abnormal differences (i.e., greater than 10 percent from manufacturer's or design values) must be justified or appropriate adjustments performed. In addition, note, investigate, and correct any high temperatures or abnormal operation of any equipment or machinery. Record hoist, trolley, and bridge speeds during each test cycle.

3.4.4 Hook Tram Measurement

Establish a throat dimension base measurement by installing two tram points and measuring the distance between these tram points (plus or minus 0.4 mm 1/64 inch). Record this base dimension. Measure the distance between tram points before and after load test. An increase in the throat opening from the base measurement is cause for rejection.

3.4.5 Load Tests

****

NOTE: For NAVFAC, require a rated load test of 100 percent (plus 0 / minus 10) and an overload test of 125 percent (plus 0 / minus 5) of the rated load.

****

a. Perform the following tests, as specified below.

b. Test loads used in this section are defined as the following:

Wire rope run-in load: 25 - 50 percent of rated load.

Rated load test: 100 percent (plus [0] [_____] minus [10] [_____]) of rated load.

Overload test: 125 percent (plus [0] [_____] minus [5] [_____]) of rated load.

c. Testing of cranes must be done with the use of test weights. The use of dynamometers in lieu of lifting test weights is not permitted. Each test weight for crane tests must be marked with a unique identification number and the weight in pounds. The weight marked must be the actual weight taken from the scale or other measuring device. Solid weights must be measured using calibrated equipment traceable to the National Institute of Standards and Technology (NIST), with a minimum accuracy of plus or minus 2 percent (i.e., indicated weight must be within plus or minus 2 percent of actual weight). A list of test weights, with identification numbers and weights, must be retained. The list must include the type and serial number (or other identifier) of the weighing device(s) used to weigh the test weights. Where a lifting attachment supports multiple test weights (e.g., stacked weights or multiple weights suspended from a padeye), the total capacity must be marked on the attachment. All rigging gear must meet OSHA and ASME requirements.

3.4.5.1 Wire Rope Run-In

The primary purpose of this procedure is to exercise the newly installed wire rope.

Place the load on the hook. Start at ground level and hoist up to one foot below upper limit at slow speed. Hoist down to lower limit at slow speed. Repeat hoisting and lowering of the load for approximately 10 hoisting cycles, increasing the speed for each cycle. During this test, the capacity overload lockout should not activate.

3.4.5.2 Rated Load Test

3.4.5.2.1 Hoist

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees clockwise and counterclockwise to check bearing operation with no binding. Observe for lowering of the load, which may indicate a malfunction of hoisting components or brakes. Verify that maximum beam and bridge girder deflections do not exceed MHI MH27.1 design limits.

b. Dynamic Load Test: Raise and lower test load through the full lift range and visually observe smooth control and acceleration between points. Completely stop the machinery at least once in each direction to ensure proper brake operation.

c. Hoist Mechanical Load Brake (or Self-locking Worm Gear): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.2.2 Trolley

Operate the trolley (if space is available) the full distance of the bridge rails in each direction with a test load on the hook. Check proper functioning through the range of speeds. Verify proper brake action and stopping distance.

3.4.5.2.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway (if space is available) in one direction with the trolley at the far end of the bridge, and in the opposite direction with the trolley at the opposite end of the bridge. Use extreme caution. Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks. Verify proper brake action and stopping distance. Record deficiencies. Secure from testing if deficiencies are found.

3.4.5.2.4 Trolley Loss of Power Test

Raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of trolley travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the trolley stops and that the brake sets properly. Measure the distance required for the trolley to stop.

3.4.5.2.5 Bridge Loss of Power Test

Raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of bridge travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the bridge stops and that the brake sets properly. Measure the distance required for the bridge to stop.

3.4.5.3 Overload Test

3.4.5.3.1 Hoist

Disconnect or adjust the overload limit device to allow the hoist to lift the test load. Verify proper operation of the overload limit device after it is reconnected.

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees clockwise and counterclockwise to check bearing operation with no binding. Observe for lowering of the load, which may indicate a malfunction of hoisting components or brakes.

b. Dynamic Load Test: Raise and lower test load and visually observe smooth control. Stop the load during raising and lowering to verify that the brakes holds the load.

c. Hoist Mechanical Load Brake (or Self-locking Worm Gear): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.3.2 Trolley

Operate the trolley the full distance of the bridge rails in each direction with a test load on the hook (one cycle) through the range of speeds. Verify proper brake action.

3.4.5.3.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway in one direction with the trolley at the extreme end of the bridge, and in the opposite direction with the trolley at the opposite extreme end of the bridge (one cycle). Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on-site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [two] [_____] hard copies of operation and [two] [_____] hard copies of maintenance manuals for the equipment furnished along with an electronic copy (PDF) of each on a Compact Disc. Provide one complete set prior to performance testing and final copies upon acceptance. Provide operation manuals that detail the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, including weekly, monthly, semi-annual, and annual required maintenance items, possible breakdowns and repairs, and troubleshooting guides. Also include as-built drawings, piping and equipment layout, design calculations, Control Parameter Settings and printouts of any software, and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course (as applicable).

[3.7 FIELD TRAINING

****

NOTE: Training is recommended, but not required.

Additional items that could be included in the blank: general review of the entire capabilities, limitations, and safety features of the crane.

An optional variable frequency drive (VFD) training is available, should the command feel the additional training is beneficial.

****

Conduct a training course for [eight] [_____] operating and maintenance staff[and provide a copy of the training material to each participant]. Provide a training period consisting of a total of [four] [eight] [_____] hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and basic troubleshooting[, and [_____]].

[Provide a minimum [four] [_____] hour training session on the Variable Frequency Drives (VFDs) discussing maintenance, troubleshooting of fault codes, theory of operation, and adjustment of crane parameters. This training session will be for an audience of approximately [eight] [_____] people.

]][3.8 FINAL ACCEPTANCE

****

NOTE: Use this paragraph as written for projects where the crane is the principal construction element, or represents a very significant portion of the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.

****

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on wire rope, hook, and electrical collector bars.

UNIFIED FACILITIES GUIDE SPECIFICATIONS

References are in agreement with UMRL dated January 2025

****

SECTION 41 22 23.19

MONORAIL HOISTS

05/20

****

NOTE: This guide specification covers the requirements for monorail hoists with manual, electric, or air powered lifting chains or wire rope; with or without manual, electric or air powered trolleys and other accessories; suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments.

This guide specification incorporates the design criteria and requirements identified in NAVCRANECEN INSTRUCTION 11450.2A (December 2018).

This guide specification includes tailoring options for NAVFAC, pounds (per NAVFAC P-307), and tons. The NAVFAC tailoring option also includes requirements specific to the Navy and Marine Corps. Crane procurements for the Navy and Marine Corps must select the NAVFAC tailoring option.

Crane tailoring options are included for the Air Force, outdoor, ordnance/explosives handling, or hazardous (explosive) environments. Only one unique specialized application tailoring option should be selected at a time, however multiple can be used with additional specific project editing in the resulting sections. "General Purpose Service" is the default crane condition unless an alternate specialized tailoring option is selected. When "Maximum Anti-Spark" protection is required, the "Minimum Anti-Spark" tailoring option MUST ALSO be selected as the maximum requirements are in addition to the minimum requirements.

Selection or deselection of a tailoring option (select view-tailoring options) will include or exclude that option in the section. Specific project editing is still required for the resulting section.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present. Of particular note, if procurement is to go on an existing monorail system, all references to installing and testing a new monorail and associated equipment such as end stops must be removed.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

****

NOTE: Use this guide specification to specify cranes that are procured as part of a building construction contract for such applications as machine shops, warehouses, and other areas that do require specialized weight handling equipment.

Forward all procurement of OET systems at Naval Shore based activities with rated capacities of 9000 kg 20,000 pounds or greater or for use in specialized applications (e.g. ordnance handling, molten metal handling, special purpose service as defined in NAVSEA Publication 0989-030-7000, hazardous/explosive area environments, or precision handling operations requiring complex or synchronized lifting capacity) to: Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000. (See NAVFAC Instruction 11450.1B of 28 March 2014).

****

****

NOTE: Control types and systems may be specified as follows:

1. Remote or Pendant Crane Controls or a combination of the two can be provided.

2. Alternating current (AC) control systems must be specified. The vast majority of new cranes are AC powered and AC controlled.

Terminology: - refer to DEFINITIONS in this specification.

a. Ordnance/Explosives Handling – Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Hoists are required to must meet ASME HST-1 and ASME HST-4 duty class H4 (electric chain or wire rope hoists), ASME HST-5 and HST-6 duty class A4 (air chain and wire rope hoists), or the requirements of ASME HST-2 and ASME HST-3 (manual chain and manual lever hoists). Hoists are also required to have two brakes.

b. Hazardous (Explosive) Environments – Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NEC Article 500. The activity safety office must identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

c(1) Minimum Anti-Spark Protection applies when only the load block enters the hazardous area.

c(2) Maximum Anti-Spark Protection applies when the hazardous area envelops the entire crane.

****

****

NOTE: The RFP must provide the relevant dimensions and load data for the crane. See "Crane Inquiry Data Sheet" in CMAA 74 section 6.1 or see "Crane Information Form for Underrunning Cranes(s)" pages 5 and 6 at the following Navy Crane Center link:

https://www.navfac.navy.mil/navfac_worldwide/specialty_centers/ncc/about_us/re

****

****

NOTE: Indicate on the plan drawings a schematic line for the location of the centerline of monorail track beam, including curves and switches. Only indicate the dimensions that are critical to locating points such as the end of the travel range of the hoist operating hook at each end of the track beam. Indicate any critical clearance requirements for the area adjacent the monorail track beam.

Indicate on the elevation drawings a generic elevation for the monorail beam. Only indicate the dimensions that are critical to locating points such as the ends of the vertical travel range of the hoist operating hook. Indicate any clearance requirements for the area above the monorail track

beam.

When there is one hoist on one monorail system, the capacity rating of the monorail track beam and beam hangers must be equal to the hoist capacity. When there is more than one hoist on the monorail track beam, design and construct the monorail track beam and beam hangers for the most stressful positioning of the hoists on the track beam.

Indicate on the plan drawings the electrical junction box location (including mounting height).

****

PART 1 GENERAL

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

a. Monorail Track: The track system along which the crane operates horizontally, including track hangar rods, track connection devices, and runway structural supports.

b. Lifted Load: The load consisting of the rated load and the weight of lifting devices attached to the crane such as the load block, bucket, or other supplemental devices.

c. Pendant: A control for a hoist or a crane. The pendant hangs from the hoist by a cable at a height that is easy for the operator to reach.

d. Patented Track: A generic term referring to track built in accordance with MHI MH27.1 utilizing a composite track section incorporating a proprietary bottom flange shape.

e. Enclosed Track: A generic term referring track built in accordance with MHI MH27.2 whose related equipment operates on the internal lower operating or running flange of such track.

f. Rated Load: The maximum working load suspended under the load hook.

g. Standard Commercial Cataloged Product: A product, which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing on the manufacturer's published product data sheets. These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

h. Operating Environments:

  (1) h(1) General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as General Purpose Service if they are

operating in routine environments.

(2) h(2) Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Hoists are required to must meet ASME HST-1 and ASME HST-4 duty class H4 (electric chain or wire rope hoists), ASME HST-5 and ASME HST-6 duty class A4 (air chain and wire rope hoists), or the requirements of ASME HST-2 and ASME HST-3 (manual chain and manual lever hoists). Hoists are also required to have two brakes.

(3) h(3) Hazardous (Explosive) Environments: Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NFPA 70 Article 500. The activity safety office must identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

(a) Minimum Anti-Spark Protection is used when only the load block enters the explosive area.

(b) Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane.

1.3 SYSTEM DESCRIPTION

****

NOTE: Remove the following sentence if the track rail is not to be installed as a part of the crane procurement. If rail is to be installed, ensure Section 05 12 00 STRUCTURAL STEEL is included in the Request for Proposal (RFP).

****

[The requirements for the supporting structures of the monorail track and rail are specified in Section 05 12 00 STRUCTURAL STEEL, and must conform to AISC 360.

]1.3.1 Crane Design Criteria

****

NOTE: Clearly show the area of hook coverage, track dimensions, rail size, hook vertical travel, clear hook height, and lifting capacity on drawings.

****

Cranes will operate in the given spaces and match the track dimensions and rails indicated. Hook coverage, hook vertical travel, clear hook height, lifting capacity, and load test weight must not be less than that indicated.

1.3.1.1 General

****

NOTE: Add number of hoists, building name, and

hoist rated load capacity in kilograms pounds.
****

Include the following: Number of hoists [_____], located in building identified as [_____], with the capacity expressed in [_____] metric tons tons kilograms pounds, for each hoist. Also clearly locate and identify each hoist and system components.

1.3.1.2 Classification

****
NOTE: For NAVFAC, specify ASME HST-1 and ASME HST-4 duty class H3 (electric) or ASME HST-5 and ASME HST-6 duty class A4 (air hoist) or higher.
****

****
NOTE: Refer to NFPA 70 for environmental requirements.
****

****
NOTE: Operating Environments

General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as General Purpose Service if they are operating in routine environments. Cranes operating in non-routine environments or unique, dedicated service should meet the requirements of one of the below Specialized Applications:

Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Specify duty class as described in the paragraph DEFINITIONS for ordnance.

Hazardous (Explosive) Environments: Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NEC Article 500. The activity safety office must identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

a. Minimum Anti-Spark Protection is used when only the load block enters the explosive area.

b. Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane.

****

Provide a monorail system with [manual hoist][electric powered hoist][air-powered hoist] and [plain type (hand operated)][hand chain operated][electric powered]trolley for operation in an [indoor] [outdoor] environment, [general purpose] [ordnance handling] [hazardous area] service, with an ambient temperature range of [_____] to [_____] degrees Celsius Fahrenheit. This hoist must operate in an NFPA 70 Class [_____], Division [_____], Group [_____] hazardous area. Hazardous protection is required for the [full height of the crane] [18 inches above ground level] [_____]. Monorail, hoist, trolley, equipment, materials, installation, examination, inspection, and workmanship must conform to the applicable requirements of NFPA 70, ASME B30.17, ASME B30.16,[ASME HST-1,][ASME HST-2,][ASME HST-3,][ASME HST-4,][ASME HST-5,][ASME HST-6,] MHI MH27.1[and MHI MH27.2], as modified and supplemented by this specification.

The hoist must be [pendant controlled] [radio controlled] and operate in the spaces and within the loading conditions indicated. The hoist must operate on [_____psi tool air] [[_____]-volts AC, 60 Hz [_____], [single] [three] phase] power source. Maximum trolley wheel loads (without impact) due to dead, trolley, and lifted loads, with the trolley in any position, must not cause a more severe loading condition in the track support structure than that produced by the design wheel loads and spacing indicated.

1.3.1.3   Rated Capacity and Speeds

****

NOTE: Plain type (hand operated) trolleys are recommended where trolley motion is infrequent or the distance is short, providing good load spotting ability and use for hoists of 3 metric ton 3 tons capacity and under. Plain type trolleys are not recommended for hoists of 3 metric ton 3 tons capacity and greater, or for tracks higher than 6 m 20 feet above the floor level. Motor operated trolleys are recommended where the operating frequency, travel distance, rated load, or beam elevation makes other types of trolleys impractical.

Unless otherwise specified, the nominal rated maximum speed of the hoists and trolley will be the manufacturer's standard within the limits of Table 2 of ASME HST-1, HST-4, HST-5, HST-6, AS APPLICABLE. For higher tonnage ratings, consult with the manufacturer(s).

****

Provide hoist with a rated capacity of [_____] metric tons tons kg pounds. The hook lift capacity and speed must be the manufacturer's standard within the limits specified. The hoist and trolley must meet the minimum design requirements specified in [ASME HST-1, Duty Class [H3][H4]][ASME HST-2][ASME HST-3][ASME HST-4, Duty Class [H3][H4][H5]][ASME HST-5, Duty Class [A4][A5]][ASME HST-6, Duty Class [A4][A5]].

1.4   VERIFICATION OF DIMENSIONS

The Contractor is responsible for the coordination and proper relation of their work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the monorail system and notify the Contracting Officer of any discrepancy before finalizing the crane order.

1.5 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Manufacturer Qualification

Monorail System, including sub-system components manufactured by vendors, must be designed and manufactured by a company with a minimum of 10 years of specialized experience in designing and manufacturing the type of overhead crane required to meet requirements of the Contract Documents.

1.6.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing, and documentation. Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane.

[1.6.2.1 Inspection of Steel Castings

****

NOTE: Navy Crane Center does not require magnetic-particle testing of steel castings. Magnetic testing for USACE projects should be coordinated with the Contracting Officer.

****

Visually inspect [and test]load-carrying steel castings[using the magnetic-particle inspection method][using ultrasonic testing].[Reference allowable degree of discontinuities to ASTM E125, and relationship to service loads and stresses, critical configuration, location and type.] All load bearing components, shafts, and gears, in the hoist drive train must be rolled or forged steel, except brake drums which may be ductile iron. Methods of repairing the discontinuities is subject to review by the Contracting Officer.

][1.6.2.2 Inspection of Hook Assembly

Inspect hook[by a magnetic-particle type inspection][and X-rayed][and tested ultrasonically] prior to delivery. Furnish documentation of hook inspection to Contracting Officer prior to field operational testing. As part of the acceptance standard, linear indications[greater than 1.5 mm 1/16 inch] are not allowed. Welding repairs of hook are not permitted. A hook showing linear indications, damage or deformation is not acceptable.

1.6.2.2.1 Hook Non-Destructive Test (NDT)

****
NOTE: Delete this paragraph if selected agency does not require magnetic particle testing.
****

****
NOTE: For NAVFAC, substitute tailored paragraph.
****

Magnetic-particle inspect the hook over the entire area in accordance with ASTM A275/A275M or NAVSEA T9074-AS-GIB-010/271. Acceptance standard is no defects. A defect is defined as a linear indication that is greater than [3 mm 1/8 inch][1.5 mm 1/16 inch] long. For hooks of non-magnetic material, NDT must be liquid penetrant (PT) method in accordance with ASTM E1417/E1417M. For PT testing of hooks containing stainless steels, titanium, or nickel based alloys, total halogens and Sulphur used in the NDT process must be controlled as specified in NAVSEA T9074-AS-GIB-010/271.

Inspect each hook and shank over the entire surface area by magnetic particle inspection.

a. Procedure: Conduct magnetic particle inspection in accordance with ASTM A275/A275M with the following restrictions: Do not use DC yokes (including switchable AC/DC yokes used in the DC mode) or permanent magnet yokes. Do not use automatic powder blowers or any other form of forced air other than from a hand-held bulb for the application or removal of dry magnetic particles. Remove arc strikes. Equipment ammeters must have an accuracy of plus or minus 5 percent of full scale (equipment ammeter accuracy other than that stated is acceptable provided the MT procedure states that a magnetic field indicator is used to establish and verify adequate field strength for all aspects of the inspection.)

b. Acceptance Criteria: Defects found on the hook will result in rejection of defective items for use on furnished hoist. For this inspection, a defect is defined as a linear indication for which the largest dimension is greater than 1.5 mm 1/16 inch.

c. Test Report: Submit a test report of the magnetic particle inspection of each hook provided the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The NDT procedures including technique sheets specific to the types, shapes, and size of the parts being examined must adequately describe the orientation of the hooks within the magnetizing equipment. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheets, and certification to the Contracting Officer with the test report.

][1.6.2.3 Hook Proof Test

****
NOTE: Hook proof tests are required for custom designed or non-ferrous (bronze or stainless steel)

hooks. Bronze/stainless steel hooks are generally associated with minimum hazardous area requirements.
****

Proof test the load hook per ASME B30.10. Perform the proof test prior to Hook NDT.

]1.6.3 Drawings

1.6.3.1 Monorail Crane System

a. Submit drawings showing the general arrangement of all components in plan, elevation, and end views. Show all major features of the crane including: [assemblies of hoist [and trolley] drive[s],]hook envelope, and the general arrangement of the track beam system with switches and curves, details of all structural connections, clearances and principal dimensions. Include weights and centers of gravity of major components.

b. Submit shop drawings of all fabricated components. Shop drawing quality must be equivalent to the contract drawings accompanying this solicitation. Drawings must be reviewed, signed, and sealed by a licensed professional engineer.

c. Provide integral schedule of crane components on each drawing. The schedule must provide a cross reference between manufacturer data and shop drawings. Components listed on the schedule of crane components must include total quantity, description, original manufacturer, and part number. Distributing agents will not be acceptable in lieu of the original manufacturer.

[1.6.3.2 Complete Schematic Wiring Diagram

Provide electrical schematic drawings with motor nameplate data[, VFD drive nameplate data] and overcurrent protective device ratings

]1.6.4 Design Data: Load and Sizing Calculations

****
NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys.
****

Submit complete list of equipment and materials, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Provide a list of all codes and standards, design assumptions, equations, specified efficiencies, limits, factors of safety, component ratings, and sources of values used. Include free body diagrams or sketches of each load case.[Include seismic analysis of crane.]

1.6.5 Certificates

All certifications must be dated and must bear the original signature (above the printed name) of the authorized representative of the Contractor or the manufacturer of the items or equipment being certified. Each certification must clearly identify the crane, the drives, components, and location (as applicable) to which it applies:

[a. Submit a Wire Rope Certification for each hoist with the wire rope manufacturer's certification that the rope meets the published breaking strength or the actual breaking strength of a sample taken from the reel and tested. Certification must be traceable to the hoist, and reel.

][b. Submit a Load Chain Certification clearly indicating load chain breaking strength for each hoist, and clearly identified for traceability. Submit factory certification of load chain rated capacity.

][c. Submit a Monorail Track System Survey certifying monorails have been aligned in accordance with CMAA 74, MHI MH27.1, or MHI MH27.2 as applicable. If monorail(s) are existing and if the crane(s) cannot operate without restriction, the Contractor must indicate crane limitations.

] d. Submit a Hazardous Material Certificate that the crane does not contain hazardous material including asbestos, lead, cadmium, chromium, PCBs, or elemental mercury. Products required for the designing and manufacturing of cranes must not contain the prohibited materials.

[e. Submit a Loss of Power Test Certificate stating that a test may be performed in which power is removed from the crane while the hoist and trolley are in operation.

] f. Submit a Certificate of the Brake Adjustment Record. Provide a brake adjustment record and installation/maintenance manuals for each brake on the crane. Each brake measurement must have a tolerance traceable to the associated brake manual or documentation provided by the brake manufacturer, location of measurements, and the actual brake setting. Changes made to settings of the brake, at any time, will void the record.

g. Submit a certificate stating that the hoist, hook, and trolley system design and fabrication is in compliance with all listed standards.

1.6.6 Welding Qualifications and Procedure

Welding must be in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep and not exceed those specified in AWS D14.1/D14.1M, MHI MH27.1, MHI MH27.2 and CMAA 74 as applicable. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M.

1.7 CRANE SAFETY

Comply with the mandatory and advisory safety requirements of ASME B30.10, ASME B30.16, ASME B30.17, [ASME HST-1] [ASME HST-2] [ASME HST-3] [ASME HST-4] [ASME HST-5] [ASME HST-6], 29 CFR 1910.147, 29 CFR 1910.306, and all applicable provisions of 29 CFR 1910 and NFPA 70.

[1.7.1 Nuclear Safety Analysis

****

NOTE: Certification is required for cranes handling nuclear materials. Results from the Safety Analysis will be utilized by the Using Agency as a basis for

crane certification. Delete this paragraph if the crane is not required to handle nuclear materials.

This section is not applicable to NAVFAC projects. The Navy Crane Center must be involved with the procurement and overhaul of all NAVY cranes that handle Nuclear material as identified in the forward notes section of this specification.
****

Nuclear certification, testing, and rules of construction must be in accordance with 29 CFR 1910.147 and ASME NUM-1. Air Force Nuclear certified hoists must meet requirements of AFMAN 91-118. Submit analysis and test reports to Contracting Officer for approval.

]PART 2   PRODUCTS

2.1   MATERIALS

2.1.1   General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment. Material will be free from defects and imperfections that might affect the serviceability and appearance of the finished product. All material must be new and unused.

2.1.2   Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two monorail identification plates, one for each side of the track beam. Provide noncorrosive metal identification plates with letters which are easily read from the floor, showing a separate number such as M-1, M-2, for each monorail hoist.

2.1.3   Capacity Marking

Mark the rated capacity in metric tons tons kg pounds units on each side of the monorail track beam. Capacity marks must be large enough to be clearly visible from the floor. Individual hoist units must have their rated capacity clearly marked on their bottom block, and additionally labeled on the hoist body. Rated capacity must include all accessories below the hook, such as load bars, magnets, grabs, and other weight handling equipment as part of the load to be handled.

2.1.4   Safety Warnings

Affix labels in a readable position to each lift block or control station in accordance with ASME B30.16 and ASME B30.17.

2.2   STRUCTURAL REQUIREMENTS

Structural steel materials must conform to the standards permitted in CMAA 74, MHI MH27.1, MHI MH27.2 and AISC 360 as applicable.

2.2.1 Structural Connections

High-strength bolted structural connections must be designed and installed in accordance with RCSC A348. Bolts must be of ASTM F3125/F3125M Grade A325/A325M or Grade A490/A490M material. Galvanized bolts are not acceptable.

Welded connections for the crane must be performed in accordance with AWS D14.1/D14.1M. Welded connections to the building must be performed in accordance with AWS D1.1/D1.1M.

2.2.2 Monorail Track System

****

NOTE: For Monorail Hoists, track and its support structure is usually supplied by crane contractor. Use Monorail Track System only if crane contractor is to provide a new track.

Monorail tracks may be of three types. "Patented track" as defined in the definitions section and built IAW MHI MH27.1, "enclosed track" built IAW MHI MH27.2 and "rolled steel shapes" which is defined in CMAA 74. The activity may decide the track type to be used or allow the provider to decide, except ordinance handling cranes require patented track.

****

Provide the complete track suspension system that is required to hang the monorail track at its indicated location from the structural supports indicated on the drawings. Provide monorail and support structure for underrunning monorail of rolled steel shapes conforming to CMAA 74, patented track beams conforming to MHI MH27.1, or enclosed track beams conforming to MHI MH27.2.

For rolled steel shapes, locate splices under structural support members.

For patented track beams, perform splices as necessary in accordance with the manufacturer's recommendations and requirements. Align ends of lower T-section to minimize the horizontal gap on the running surface to not greater than 1.59 mm 1/16 inch and not greater than a vertical difference of 0.79 mm 1/16 inch for the wheel running surface alignment for a smooth crossing by the wheels. Splice assemblies must be from the same manufacturer as the patented track and located under structural support members. Submit manufacturer's standard published tables that verify the monorail track is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the beams.

Monorail support structure must be designed, fabricated, and installed such that monorail meet the alignment tolerances of CMAA 74, MHI MH27.1 or MHI MH27.2, as applicable. Provide means to allow for vertical adjustment of the track both before and after the system has been put in operation so that track can be erected and maintained level. Brace track to restrain against damaging lateral and longitudinal movements. Where the track is suspended from hanger rods, provide means preventing the hanger rod nuts from backing off the rods. Allowable stress in hanger rods is 20 percent of the minimum specified ultimate strength of the material used.

2.2.3 End Stops

Fit monorail track system with end stops at all open end locations. Locate stops to contact the trolley bumper and permit maximum trolley travel. Metal to metal contact at the bumper to end stop connection is not permitted.

2.2.4 Additional Provisions for Outside Service

****

NOTE: This paragraph is applicable for outdoor cranes only.

****

Provide hoist trolley with parking brakes which will sufficiently hold the crane against a wind pressure of 240 Pa 5 psf for in-service conditions. Provide hoist trolley with manually-operated pin locks at each rail, designed to securely anchor the crane against a wind pressure of 1.44 kPa 30 psf for out-of-service conditions. Design members to prevent the collection of water on crane.

2.3 MECHANICAL REQUIREMENTS

****

NOTE: For ordnance handling, further material restrictions exist.

****

Cast iron and aluminum used to support components of the hoist power transmission train must be ductile. Gray cast iron load bearing parts are prohibited.

2.3.1 Hoist

****

NOTE: Electric chain hoists (ASME HST-1) only have the possibility of hoist duty classes H2, H3, or H4.

For ordnance handling, packaged hoists must be HST-4 Duty Class H4 or better.

For ordnance handling, custom hoist shafts must have a fatigue design factor of 1.5.

****

[2.3.2 [Manual Hoist][Electric Chain Hoist][Air Chain Hoist]

Provide [manually][lever][Air] operated chain hoist conforming to ASME B30.16, and [ASME HST-2] [ASME HST-3] [ASME HST-5].[Electric chain hoist must conform to ASME HST-1, NEMA ICS 8, NEMA MG 2, and NEMA ESPG] except as modified herein.

2.3.2.1 Hoisting Chain

a. Provide a welded link load chain.

b. Provide a chain stop or dead end connection to prevent the load chain from running out of the hoist at its fully extended position.

c. Provide chain hoists with 3 m (10 foot) lift or more with a load chain bucket.

][2.3.3 [Electric][Air]Wire Rope Hoist

Provide [Electric Wire Rope Hoist conforming to ASME HST-4][Air Powered Wire Rope Hoist conforming to ASME HST-6] except as modified herein.

2.3.3.1 Hoisting Ropes

****

NOTE: Paragraph b is shown as optional only because there is a tailored paragraph b option for minimum hazardous area. One of the two options must be chosen and included in the specification.

****

****

NOTE: For minimum anti-spark protection, add tailored paragraph section.

****

Provide the following:

a. Rope lengths sufficient to maintain a minimum of two full wraps of rope at the dead end(s) of the drum, with the block in its lowest indicated position. The wire rope must be in a double reeved configuration with the equalizing method perpendicular to the running sheaves.

b. Provide hoisting ropes with improved plow steel, extra improved plow steel, or extra-extra improved plow steel, regular lay, bright, and uncoated with an independent wire rope, wire strand, or otherwise, steel core. Hot-dipped galvanized wire rope is not permitted. Provide stainless steel hoist ropes.

2.3.3.2 Sheaves

Provide steel sheaves. Provide sheaves constructed of non-sparking materials.

2.3.3.3 Drum

Provide drum made of steel. Design the drum such that all hoisting rope is wound in a single layer and so that not less than two dead wraps of hoisting rope remain on each anchorage when the hook is in its extreme low position.

]2.3.4 Trolley

Provide a [manual][geared manual][air motor powered][electric motor powered] trolley drive designed to operate from [[_____] track beam section][the track beam section furnished under this contract]. Configure trolley such that the trolley frame contacts the track end stops or bumper of an adjacent trolley and prevents the trolley from dropping more than one inch in the event of an axle or wheel failure (drop lugs). Drop lug contact surfaces must be of non-sparking materials.

2.3.4.1 Trolley Wheels

****

NOTE: For maximum anti-spark protection, add the tailored words. Remove any conflicting items (i.e. wheels cannot be non-sparking and steel).

****

Wheel material is to be steel or ductile cast iron. Hollow stamped steel and gray cast iron wheels are prohibited. Wheels are to be made of forged steel. Provide wheels of non-sparking material. The minimum tread hardness for bronze wheels is 225 BHN.

[2.3.4.2 Bumpers

For powered trolleys, fit the trolley frames with shock-absorbing bumpers. Ensure bumpers and end stops conform to ASME B30.17. Mount bumpers so that there is no direct shear on mounting bolts (if any) upon impact. Bumpers must provide adequate clearance between the hoist and surrounding structure when compressed to preclude damaging equipment. When more than one hoist is located and operated on the same track, bumpers must be provided on their adjacent ends or on one end of one hoist such that the trolley frame of the adjacent hoist comes in contact with the bumper.

][2.3.4.3 Trolley Brakes

****

NOTE: Only powered trolleys that don't have a non-coasting drive need a brake.

****

Provide trolley with either a non-coasting (i.e. worm) drive or with an end-mounted [air] [electro-mechanical] brake that is spring applied, [air] [electrically] released. The brakes must be equipped with a manual self-return to ON brake release and designed to permit inspection and adjustment without disassembly of the brake.

]2.3.5 Hoist Brakes

****

NOTE: NAVFAC requires each hoist to have, at a minimum, two brakes, with the exception of manual hoists and non-ordnance handling pneumatic hoists which may have only one, which is typically a mechanical load brake.

****

2.3.5.1 Hoist Mechanical Load Brake

Provide a mechanical load brake that is capable of stopping and holding [125][100]125 percent of the hoist's rated load and does not require the load to be raised before being lowered.

[2.3.5.2 Hoist Secondary Brake

Provide a spring set electro-mechanical brake that stops and holds [125][100]125 percent of the hoist's rated load. Equip spring set brake with a manual release mechanism that automatically resets when power is applied to the brake. If the hoist has more than one brake, each brake must independently stop and hold [125][100]125 percent of rated capacity.

][2.3.5.3 Air Hoist Brake

Equip [air] hoists with a braking means that prevents the lowering of the load in the event of a loss of air supply, can stop and hold [125][100]125 percent of the hoist's rated load, and does not require the load to be raised before being lowered.

2.3.5.4 Air Hoist Secondary Brake

Ordnance handling air hoists are to be equipped with a second holding brake with a minimum torque rating of [125][100]125 percent of the rated load hoisting torque.

]2.3.6 Load Block and Hook

****

NOTE: Some text tailored to NAVFAC. For text tailored to Minimum Anti-Spark requirements, remove conflicting requirements (i.e. load block cannot simultaneously be steel.

For Ordnance Handling: The insulated link(s) are required unless the following conditions are met:
c. There is no threat of a lightning strike during operations;
d. There is no chance for contact with overhead power lines;
e. RF emissions control is in effect regardless of the HERO classification of the ordnance being held.

****

****

NOTE: Include sentences for custom design load block with trunnion if requested by using activity.

****

The load block must be constructed of steel non-sparking materials and designed to prevent metal-to-metal contact of moving parts. and designed to prevent metal-to-metal contact of moving parts. [The design must preclude the wire rope from being cut, pinched, crushed, or chafed in case of two-blocking.]The block must be clearly marked with the capacity in kilograms pounds on both sides. An insulated link must be provided on each hook block per the requirements of NAVSEA OP-5. Standard commercial blocks may be used at their published ratings when their published design factors are 5.0 or greater.

Provide an unpainted single barbed forged steel hook which complies with ASME B30.10. Provide an unpainted single barbed hook of non-sparking material with a minimum material longitudinal elongation of 16 percent in 2 inches. Bronze clad hooks are prohibited. Fit hook with a safety latch designed to preclude inadvertent displacement of slings from the hook saddle. The hook and hook nut must be removable [without unreeving of the hoist or]disassembly of the block. Provide an easily removable and reusable means to positively secure the hook nut to the hook shank. Do not weld hook nut. Uniquely mark the hook in a permanent fashion that is traceable to the NDT certification. The nut must be marked to match the hook. The hook nut must be of non-sparking materials. Hook must be free to rotate through 360 degrees when supporting the test load up to [125][100] 125 percent of the rated capacity. Upper hooks of hook suspended hoists must be of non-sparking materials.

2.3.7 Wind Speed Indicating Device

Provide a wind speed indicating device in accordance with the requirements of ASME B30.17.

[2.3.8 [Air][Manual] Hoist Capacity Overload Protection

Capacity overload protection which prevents further hoisting of a load set at or less than the crane's minimum test load. If a non-adjustable slip clutch is utilized, the OEM factory setting is acceptable and must be identified. If the device is adjustable, it must be adjusted to prevent hoisting in excess of the test load.

][2.3.9 Air Hoist Limit Switches

Provide a Hoist limit switch to limit hook over-travel in both the raising and lowering direction.[The lower limit switch must be set such that there are no less than a minimum of two wraps of hoist on the hoist drum upon limit switch actuation.][For chain hoists, chain stops and an overload clutch that meets the requirements of ASME B30.16 are acceptable as upper and lower limit switches.]

2.3.10 Air Hoist Air Supply

****

NOTE: If the provided shop air is not lubricated chose the option to provide air lubricator.

****

The air supply hose must not hang below the high hook position.[Provide an air lubricator.]

][2.4 ELECTRICAL REQUIREMENTS

The design, selection, rating, and installation of the electrical portions of the crane and its accessories must conform to the requirements of NEMA ICS 8, the applicable ASME HST standard, and NFPA 70, and other requirements specified herein.

The crane manufacturer must furnish and install all electrical equipment on the crane conforming to NEMA ICS 6, including motors, conforming to NEMA MG 1, electrically released brakes, switches, crane controllers, panels, operating station, wiring system, cables, and crane electrification.

2.4.1 Motors

****

NOTE: Select two speed motors for trolley drives if magnetic controls are specified in paragraph CONTROLS; select single speed motors if electronic controls are specified in paragraph CONTROLS.

U.S. Navy allows only 60-minute duty rating motors. 30-minute duty rating motors require Navy Crane Center approval. For non-Navy applications, the

motor duty rating may be selected to match what is required by the class of HST-4 hoist (such as H1, H2, H3) specified.

****

Motors must meet all applicable requirements of NEMA MG 1 and UL 1004-1. All motors must have a minimum of a 60 [30] [60] [_____] minute duty rating and be Totally Enclosed Non Ventilated (TENV), Totally Enclosed Fan Cooled (TEFC), or Totally Enclosed Blower Cooled (TEBC). Provide inverter duty motors if Variable Frequency Drives (VFD) are used. Provide motors with a minimum of Class F insulation. Provide motor overload protection utilizing a thermal sensitive device embedded in its windings. Provide motors painted to manufacturer's standard for "wash-down" service. Motors located outdoors must be furnished with anti-condensation heaters that remain energized when the mainline contactor is deenergized.

2.4.2 Controls

****

NOTE: Use the first three paragraphs to select electronic variable frequency drive controls for either the hoist or trolley.

Use the fourth paragraph to select one or two speed control for the hoist or trolley which the manufacturer may accomplish with magnetic controls or a simple VFD. Selections can be made using a combination of electronic controls and one or two speed motor controls split between the hoist and trolley.

When the two-speed trolley motor is specified, the slow speed will be 1/3 to 1/4 of rated travel speed. Reduced voltage starting, acceleration, and deceleration, serve to reduce the acceleration rate that is normal for squirrel-cage motors. Squirrel-cage motors with two-speed magnetic controls provide satisfactory results with slow trolley speeds and should be specified when short travel distances are involved and where fine positioning is not required.

For faster trolley speeds or finer positioning requirements, specify electronic controls.

Various VFD manufacturers offer an option to overspeed the hoist to a value over 60Hz (usually 120Hz). This allows the operator to position the hoist at faster speeds when it is not loaded. When selecting this feature list the maximum no load speed in section "Rated Capacity and Speeds".

NAVY requires hoist drives with a controller continuous rating of 125 percent of the motor full load current. Tailor to NAVFAC. All other groups may use 100 percent.

****

[Provide static reversing, variable frequency drives (VFD) for the [trolley][and][hoist] electric controls. VFD controllers must meet NEMA ICS 8, Part 8 and at a minimum, provide under-voltage protection, electronic instantaneous over current protection, DC bus over voltage protection, and be able to withstand output line to line shorts without component failure. Select trolley drive such that the continuous rating of the controller is not less than the motor full load current. Select hoist drives such that the continuous rating of the controller is not less than 125 100 percent of the motor full load current. All hoist drives must have a motor over-torque limit to lock out the hoist and prevent gross overload of the associated hoist. Provide dynamic braking for each electric drive that is sized per VFD manufacturer's requirements. Submit VFD Control Parameter Settings.

Provide speed control, which is infinitely variable for each function, controlled via [radio control system][and][pendant pushbutton station]. [Provide controls designed such that the maximum speed of each function will be limited to 25 percent of rated speed when a slow speed switch is actuated on the controller[s].][Energize a yellow/amber light/indicator while in slow speed mode.]

The [hoist][and][trolley] brakes must set after the associated controller decelerates the drive motor to a controlled stop. The hoist and trolley controllers must be sized to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 125 100 percent of rated load on the hook. The hoist controller must prove torque before release of the brakes and enable the drive motor to develop full torque continuously at zero speed. Motors must operate smoothly at all speeds without torque pulsations, and must only be energized within the frequency range of 50-60 Hz at rated speed.[The hoist control system may utilize overspeed up to 120hz, unloaded only, if the drivetrain equipment has all been balanced and is rated for the resulting speed.]

][Provide [one][two]-speed controls for the [trolley drive][and][hoist] drive. Controllers must meet the requirements of NEMA ICS 8. Ensure that an energized drive motor initially rotates only in the direction selected by the operator by activating the corresponding direction; i.e., is not overhauled. For AC squirrel cage motor controllers, the requirements of NEMA ICS 2, Part 2, for general-purpose controllers, must be met.

[Provide the trolley motor control systems with a drift point between OFF and the first speed control point in each direction.

] The use of definite purpose contactors is prohibited. If IEC contactors are used, the application cannot exceed the contactor manufacturer's AC3 ratings for the contactor at a minimum.

]

[On wire rope hoist, roll-up must be less than 1/8-inch measured at the hook block and roll-back must not occur over the entire load range.

] Use of Uninterruptible Power Supplies (UPS) is prohibited. Feed control circuits from a single phase, air cooled, double wound transformer with a grounded metal screen between the primary and secondary windings of the transformer.

Provide a main line contactor. Energization of the main line contactor must be controlled by the POWER-OFF/POWER-ON switch/pushbutton on all controllers. Upon actuation of the POWER-OFF pushbutton; power to all drive motors, brakes, and controls must be removed. The mainline contactor must not be able to be energize while the POWER-OFF pushbutton is actuated.

The POWER-OFF pushbutton circuitry must be independent of all controls or any other electronic devices.

2.4.3 Protection

Protection must not be less than that required by NEMA ICS 8, CMAA 74, NFPA 70, UL 1004-1, 29 CFR 1910.147, 29 CFR 1910.306 and all applicable provisions of 29 CFR 1910. Provide enclosed type circuit breaker readily accessible to the crane operator for crane disconnect. Provide an On/Off button that removes power from the motors, brakes and control circuit on all [operator control stations][and][radio controllers]. Provide for lockout/tagout of all hazardous energy sources.

2.4.4 Resistors

Provide resistors with natural convection cooling sized as recommended by the VFD OEM and fabricated of corrosion resistant metal; the use of "wire wound" type resistors is prohibited for segments of 8 ohms or less. Mount resistors in substantial, ventilated enclosures constructed entirely of non-combustible materials. When mounted outdoors provide stainless steel resistor enclosures. Provide resistors with terminals fitted in the coolest position in the enclosure.

[2.4.5 Transients and Harmonics Protection

****

NOTE: The following items are required only for cranes with VFD or radio controls.

****

Provide contactors and relays with appropriate Metal Oxide Varistors (MOV) or resistor-capacitor (R-C) surge absorbers installed across the respective coil.

Provide transient protection for electronic drive controllers that is either internal to the drive or via an MOV connected line-to-ground close to the line terminals of the drive.

[Provide line reactors rated for continuous duty operation based upon the motor nameplate amperes. With motors of 50 horsepower or greater, harmonics protection must be provided by an isolations transformer or as recommended by the VFD OEM. For a drive motor branch circuit that exceeds 150 feet in length, a reactor must also be connected in series with the controller load (output) terminals to provide standing wave protection or as otherwise recommended by the VFD or motor OEM.

]]2.4.6 Limit Switches

Limit switches must be rated for the NFPA 70 Hazardous Classifications specified in the Classification section of this specification.

Provide primary upper and lower geared limit switches. Geared limits must allow reversing direction to back out of the limit without resetting. [The lower limit switch must be set such that there are a minimum of two wraps of rope on the hoist drum.]Provide a backup mechanical hook block activated upper limit switch wired independent of the directional controllers and the primary upper limit switch that removes power from the hoist motor, hoist brake and hoist controls conforming to NEMA ICS 5. The backup limit must require hoist resetting prior to operation of the hoist in any direction. For chain hoists, chain stops and an overload clutch that meets the requirements of ASME B30.16 are acceptable as upper and lower limit switches.

[Travel limit switches must be provided for the trolley motion to slow the crane to [25 percent] [_____] of its rated speed [[5] [_____] feet before the monorail end stops]. Limit switches must be mounted rigidly in a manner so as to protect the switch from misalignment or damage. The target/trip arm must be large enough to provide interception given a misalignment were to occur.

]2.4.7 Operator Controls

****

NOTE: Available operator controls are pendant and radio control. Cranes can also be set-up to be controlled by two separate systems. For cranes with one set of controls use paragraph 1. For cranes with two sets of controls use paragraph 2. In such a case some type of interlock must exist to prevent control from both systems simultaneously.

When specifying a radio control system, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANECENINST 11450.2A:

1. What type of batteries? Rechargeable?
2. Are spare batteries needed? How many?
3. Are spare remote control units required? How many?
4. Is a battery charger required?
5. Type of transmitter unit.
6. Is a belt/harness required for the remote control?

****

[Provide crane equipped with a [pendant pushbutton station] [radio control system].

][Provide crane equipped with both a pendant pushbutton station and a radio control system. Provide a selector switch to allow the use of only one of the two available control stations on the pendant controller.

] If VFD controls are not provided, provide directional contactors with both mechanical and electrical interlocks.

Operator controls must be rated for the NEC Hazardous Classifications specified in the Classification section of this specification.

[2.4.7.1 Pendant Pushbutton Station

The cranes must be controlled from a pendant pushbutton station suspended from the trolley. Provide multiconductor flexible cords for pendant pushbutton stations with #16 AWG minimum conductors. Provide a method of strain relief to protect the electrical conductors from damage. Locate the pendant pushbutton station [1200 mm] [4 feet] [_____] above the finished floor. Pushbutton pendant station must have its elements legibly marked and arranged vertically, in order, in accordance with CMAA 74.[Provide [one speed] [two speed] [3-step infinitely variable] [2-step infinitely variable] pendant pushbuttons for control of the [hoist][and][trolley].] Provide pendant pushbuttons for control that spring return to the OFF position. Voltage in the pendant pushbutton station must not exceed 150 Volts AC or 300 Volts DC.[Provide a maintained two-position selector switch for slow speed selection.] The pendant must be rated for the NEC Hazardous Classifications specified in the Crane Design Criteria "Classification" Section.

][2.4.7.2 Radio Control System

Provide each system with a [belly box] [handheld] [_____] type portable transmitter unit[and an identical back-up transmitter unit].[Provide each transmitter with an adjustable belt or harness to support it when worn by the operator]. Only one transmitter at a time can control the crane and there must be no interference from one crane's controller affecting operation of the other cranes in the building. Each transmitter must include: individual [infinitely variable spring return joystick motion control levers] [push button controls] for each hoist and trolley; a maintained contact, keyed switch, marked ON-OFF, for portable transmitter unit power; indication of Battery Power, and indication of Transmitting Status; a red emergency STOP mushroom pushbutton;[and] a floodlight on/off pushbutton[and a maintained slow speed selector switch]. The transmitters and all controls must each be clearly and permanently labeled with functionality and direction. Directions for controllers must be in accordance with CMAA 74 recommendations. The remote radio control system must be designed to meet the requirements of NEMA ICS 8, Part 9 and ECMA 15. Each radio remote control lever must be in the OFF position before the associated crane function can begin. The system frequency must be within the unlicensed FCC Part 15 range. Each control unit must maintain a continuous status signal to the associated receiver during operation. There must be no significant loss in systems efficiency and function at the end of eight hours of continuous battery use. Provide a contact monitoring board with the crane radio system receiver.

][2.4.8 Runway Conductor System

Provide a rigid runway Conductor Bar System for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. UV resistant. Steel (non-stainless) conductor bars are prohibited. The crane must be grounded through the runway electrification system. The grounded conductors must be a minimum of 70 square millimeters. Provide runway conductors sized for simultaneous motions of the hoist, trolley mechanisms, and any ancillary loads. If there is any way the hook block or [load chain] [wire rope] can swing into the runway electrification, provide a guard installed to prevent contact.

Provide two Collector Shoes (tandem design) for each conductor; each collector shoe must be rated for not less than the runway conductor sizing, so as to provide redundancy.

]2.4.9 Overload Protection [and Load Indicating Device]

****

NOTE: Overload protection on a crane is required and is provided by two types of systems: Capacity Overload Protection and Over-Torque Limit.

The Over-Torque Limit only applies to cranes with VFD controls. It is a parameter setting in the drive and is typically set at 150 percent. Manual hoists, air hoists, and electric hoists with magnetic controls do not have this feature. Delete third paragraph if VFD controls are not specified.

Capacity Overload Protection is usually adjustable. If adjustable, it needs to be set at less than the crane's minimum test load. This protection can take the form of one of the following devices:
1. Clutch – Not adjustable and is common on package hoists.
2. Load Limit Switch – Installed on the wire rope and measures deflection. Does not require a break in the wire rope and is simply clamped onto the wire. Typically used on smaller hoists that have magnetic controls. Can also be installed as part of the equalizer sheave.
3. VFD Drive Overload Protection – Similar to the Over-Torque Limit but is set at a lower setting. Adjusted via parameters within the drive.
4. Separate Load Indicating Device – This involves the installation of a load cell and a digital readout that displays weight. The load cell is usually bolted onto the end of the wire rope or is installed as a pin in one of the sheaves.

****

Provide capacity overload protection for all hoist systems [separate from torque limiting feature of the VFD] [using the load indicating device (LID) described in the next paragraph]. Set hoist capacity overload protection at [_____]. Hoist capacity overload protection must be adjustable between 80 and 150 percent of hoist capacity. Provide a keyed override or other means to disable the hoist capacity overload protection when performing a load test. If a non-adjustable slip clutch is utilized, the OEM factory setting is acceptable and must be identified.

[Provide an LID for the hoist[s]. Provide [a display][displays] installed on the underside of [each] hoist to provide load information from the load indicating system, to be displayed in kilograms pounds. The display[s] must be large enough so that the operator can read the load value[s] from the ground level. The load indicating system capacity is to be compatible with the maximum test load for each hoist. The accuracy of the load indicating system is to be such that the indicated load is not less than 100 percent of the actual load, and not more than 110 percent of the actual load. The load indicating system must be configured with a set point for an overload limit. Provide Tare (zero) functionality at the operator's station for [the] [each] load indicating system. Any load bearing components used in the LID system must be steel, have a minimum design factor of 5 to 1 based on ultimate tensile strength and a hardness not to exceed HRC 40. Precipitation hardened stainless steel load bearing elements must be aged hardened at a minimum temperature of 1025 degrees F.

][Initially, set the torque limiting capability of the VFD (that is separate from the capacity overload protective device) to 150 percent of the motor torque (amperage) necessary to hoist 100 percent load. It may be adjusted up only to avoid nuisance trips and adjusted down if possible while still avoiding nuisance trips.

]2.4.10 Enclosures

****

NOTE: Select classification of control panels, controls, and brakes based on the environmental conditions in which the crane will be installed:
1. Choose one of the following for an indoor installation: 1, 2, or 12.
2. Choose one of the following for an outdoor installation: 3, 4X, or 8.
3. Choose one of the following for a Class I Hazardous installation: 7 (indoor)or 8(indoor/outdoor).
4. Choose one of the following for a Class II Hazardous installation: 9 (indoor).
Other enclosure types exist that might be a better alternative for a particular installation. If necessary, refer to NEMA 250.

****

Provide enclosures for control panels, controls, and brakes in accordance with NEMA 250 and NEMA ICS 6, Classification Type [1 indoor, general purpose] [12 indoor without knockouts, general purpose] [2 indoor, drip-proof] [3 outdoor, dust-tight, rain-tight, sleet-resistant] [4X outdoor] [7 indoor Class I hazardous][9 indoor Class II hazardous] [8 indoor/outdoor Class I hazardous] [_____]. Provide enclosures with listed drains to prevent accumulation of water within the enclosure. There must not be any condensation inside the control panels. If anti-condensation heaters are provided, these heaters must remain energized when the main line contactor is deenergized.

[Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.

] Gaskets of enclosures and fixtures, and joints and contact surfaces of hazardous/explosive enclosures must be kept free of any paint to prevent damage during removal and reinstallation of gaskets of enclosures.

[2.4.11 Warning Devices

****

NOTE: A warning horn or light is required for all radio controlled cranes.

****

[Provide a warning horn that is operable from a push button at the [pendant pushbutton] [radio control] station.][Provide a warning [strobe] [rotating beacon] that is illuminated at all times during movement of the hoist or trolley function.]

][2.4.12 Indicator Lights

Provide Indicator Lights mounted in an enclosure on the bottom of the trolley with lights sized and positioned to be visible from the ground. The lights must be the dual-lamp type. Provide a white light to indicate that power is available to the crane and a blue light to indicate that the main contactor is energized. Light voltage must be 115 VAC. Provide nameplates that are legible from ground level. The nameplates must read, in their respective order, "POWER AVAILABLE" and "CRANE ENERGIZED". The POWER AVAILABLE light must be supplied by a separate, fused transformer for its energization.

]2.4.13 Wind Speed Indicating System

Provide a wind speed indicating device. The transmitter must be mounted on the highest unobstructed location.

][2.5 PAINTING SYSTEM

****

NOTE: Three-coat zinc primer/epoxy/polyurethane system is provided for mild to severe atmospheric, indoor and outdoor cranes. For cranes in abnormal environments including exposure to chemicals or in immersion service, a system designed for that environment should be used. Other systems may suffice for milder environments.

****

Remove all grease, oil, and surface debris by solvent wiping or detergent/water scrubbing, prior to blast cleaning. Prepare surfaces to be coated by abrasive blasting to SSPC SP 6/NACE No.3, Commercial Blast Cleaning, or in accordance with the coating manufacturer's requirements, whichever is more stringent.

Use a painting system appropriate for the conditions provided in the Crane Design Criteria section. Paint exposed portions of the crane [and crane track system] using a [three] [_____]-coat system as follows: [zinc-rich primer consisting of a minimum of 77 percent zinc by weight in the dry film, an anticorrosive epoxy intermediate coat, and an aliphatic polyurethane top coat] [_____]. All paint products must be supplied by a single manufacturer and free of chromates, lead, and mercury. Apply each coat in accordance with manufacturer's instructions and requirements. Ensure each coat is smooth, even, and free of runs, sags, orange peel, and other defects. Desired color of finish coat is [brilliant yellow] [_____]. Submit product data for painting system.

Coat faying surfaces of bolted connections per RCSC A348, but do not apply finish paint.

Paint the load block [brilliant yellow] [_____] with black diagonal striping. Paint, coatings, or galvanizing on the following items or areas is not acceptable: hoist [load chain] [wire ropes], hooks, hook nuts, running bearing surfaces (including[sheaves and] wheel treads), grease fittings, or other items not normally painted.

Factory paint electrical and mechanical equipment including hoist, trolley, and track in accordance with the manufacturer's best standard practice (for the specified environment).

]2.6 IDENTIFICATION PLATES

Furnish and install identification plates. Provide non-corrosive metal identification plates with clearly legible permanent lettering giving the manufacturer's name, model number, serial number, capacity in both kilogram and pound units printed in different colors, and other essential information or identification.

2.6.1 Markings on Crane, Trolley, and Hook

****
NOTE: NAVFAC requires markings to be indicated in pounds.
****

To avoid operation of the crane in the wrong direction, affix the appropriate directions (NORTH, SOUTH, EAST, and WEST) with arrows on both sides of the trolley, as applicable. Markings must be visible by the operator and from the loading point. Labels on the controls must have corresponding directional (NORTH, SOUTH, EAST, and WEST) markings. Markings must agree with the markings on controller. Do not indicate directional arrows on controller.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

[3.2 SHOP ASSEMBLY AND TESTS

Shop assemble major components as completely as possible. Functionally test the crane system at the construction facility prior to shipment. The Government reserves the right to inspect the crane for compliance with this specification and to witness the functionality tests. Notify the Contracting Officer [14] [_____] days prior to starting testing operations.

]3.3 ERECTION AND INSTALLATION

Perform the entire monorail system erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's representative.

[3.3.1 Electrical Adjustments

Adjust control system in accordance with manufacturer's instructions.[Store a copy of all Control Parameter Settings (PLC, VFD, and other microprocessor-controlled equipment).] Provide the final settings and configurations on the Complete Schematic Wiring Diagram, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents. Provide the test conditions such as ambient temperature, motor load, date performed and person performing the configuration as part of the Operational Tests report.

]3.3.2 Field Welding

Perform welding indoors, where possible. Surface of parts to be welded must be free from rust, scale, paint, grease, and other foreign matter.

Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M.

3.3.3 Field Painting

Perform painting indoors, where possible. Field painting (including touch-up) must conform to the requirements of the coating manufacturer and as specified in the paragraph PAINTING SYSTEM.

3.4 FIELD QUALITY CONTROL

3.4.1 Post-Erection Inspection

After erection, the Contractor[, the Activity Crane Inspector/Test Director,] and the Contracting Officer must jointly inspect the crane monorail track and hoist systems and components to verify compliance with specifications and approved submittals. Notify the Contracting Officer [_____] days before the inspection. Provide a report of the inspection indicating the crane is considered ready for operational tests.

Document the results of this inspection and submit the post-erection inspection report to the Contracting Officer for approval.

3.4.2 Operational Tests

****

NOTE: Determine if Government furnished certified test weights are available at the site. If not, they must be provided by the Contractor.

****

Check the clearance envelope of the entire crane prior to picking or traversing any load to ensure there are no obstructions. Test the systems in service to determine that each component of the system operates as specified, is properly installed and adjusted, and is free from defects in material, manufacture, installation, and workmanship. Rectify all deficiencies disclosed by testing and retest the system or component to prove the crane is operational.[The Contractor must furnish test weights, operating personnel, instruments, and other apparatus necessary to conduct field tests on each crane. Solid weights must be measured using calibrated equipment traceable to National Institute of Standards and Technology (NIST) with a minimum accuracy of plus or minus two percent.]

3.4.2.1 No-Load Test

Raise and lower each hook through the full range of normal travel at rated speed for three complete cycles. Raise and lower each hook, testing other speeds of the crane. Verify proper operation of hoist limit switches. Operate the trolley in each direction the full distance between end stops. Operate through the entire speed range and verify proper brake operation. Verify correct operation of all indication and ancillary devices.

3.4.3 Test Data

Record test data on appropriate test record forms suitable for retention for the life of the crane. Record operating and startup current measurements for hoist and trolley motors using appropriate instrumentation (i.e., clamp-on ammeters). Compare recorded values with design specifications or manufacturer's recommended values; abnormal differences (i.e., greater than 10 percent from manufacturer's or design values) must be justified or appropriate adjustments performed. In addition, note, investigate, and correct any high temperatures or abnormal operation of any equipment or machinery. Record hoist and trolley speeds during each test cycle.

3.4.4 Hook Tram Measurement

Establish a throat dimension base measurement by installing two tram points and measuring the distance between these tram points (plus or minus 0.4 mm 1/64 inch). Record this base dimension. Measure the distance between tram points before and after load test. An increase in the throat opening from the base measurement is cause for rejection.

3.4.5 Load Tests

****

NOTE: NAVFAC Tailoring - the NAVY requires a load test of 125 percent (plus 0 minus 5) of the rated load.

****

Perform the following tests as specified below.

Test loads used in this section are defined as the following:

Rated load test: [100 percent (plus 0 minus 10)] [100 percent (plus [_____] minus [_____])] of rated load.

Overload test: [125 percent (plus 0 minus 5)] [125 percent (plus [0] [_____] minus [5] [_____])] of rated load.

3.4.5.1 Rated Load Test

3.4.5.1.1 Hoist

a. Static Load Test: With the trolley centered between hangar supports, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees to check bearing operation with no binding. Observe lowering that may occur which indicates a weakness in the structure or malfunction of hoisting components or brakes. Measure and verify deflection for the longest monorail beam section do not exceed MHI MH27.1/MHI MH27.2 and L/600 for rolled steel shapes design limits, as applicable.

b. Hoist Mechanical Load Brake: Raise test load approximately 1500 mm (5 feet). With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

c. For hoists with primary and secondary holding brakes, raise the test load and release the secondary holding brake while testing the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage secondary holding brake and release the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage the primary holding brake. Recheck proper operation of time delay and ensure smooth positive stopping.

d. Raise and lower test load through the full lift range. Stop the machinery at least once in each direction to ensure proper brake operation.

[e. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

]3.4.5.1.2 Trolley

Operate the trolley the full distance of the monorail system including all curves and switches in each direction with rated load on the hook. Check proper functioning through the range of speeds. Completely stop the machinery at least once in each direction during each cycle to ensure proper brake action.

[3.4.5.1.3 Trolley Loss of Power Test

With rated load, raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of trolley travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the trolley stops and that the brake sets properly.

]3.4.5.2 Overload Test

3.4.5.2.1 Hoist

Disconnect or adjust the overload limit device to allow the hoist to lift the test load. Verify proper operation of the overload limit device after it is reconnected.

a. Static Load Test: With the trolley centered between vertical supports, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees to check bearing operation with no binding. Observe lowering that may occur which indicates a weakness in the structure or malfunction of hoisting components or brakes.

b. For hoists with primary and secondary holding brakes, raise the test load and release the secondary holding brake while testing the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage secondary holding brake and release the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage the primary holding brake. Recheck proper operation of time delay and ensure smooth positive stopping.

c. Raise and lower test load and visually observe smooth control. Stop the load during raising and lowering to verify that the brakes holds the load.

d. Hoist Mechanical Load Brake: Raise test load approximately 1500 mm 5 feet. [With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake.]The load brake must hold the test load. [Again, with the holding brake in the released position.]Start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

[e. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

]3.4.5.2.2 Trolley

Operate the trolley the full distance of the monorail rail system including all curves and switches in each direction with a test load on the hook (one cycle) through the range of speeds. Verify proper brake action.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on-site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [two] [_____] hard copies of operation and [two] [_____] hard copies of maintenance manuals for the equipment furnished along with an electronic copy (PDF) of each on a Compact Disc. Provide one complete set prior to performance testing and final copies upon acceptance. Provide operation manuals that detail the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, including weekly, monthly, semi-annual, and annual required maintenance items, possible breakdowns and repairs, and troubleshooting guides. Also include as-built drawings, piping and equipment layout, design calculations, Control Parameter Settings and printouts of any software, and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course.

[3.7 FIELD TRAINING

****

NOTE: Training is recommended, but not required.

****

Conduct a training course for [_____] operating and maintenance staff[and provide a copy of the training material to each participant]. Provide a training period consisting of a total of [_____] hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and [_____].

][3.8 FINAL ACCEPTANCE

****

NOTE: Use this paragraph as written for projects where the crane is the principal construction element or represents a very significant portion of the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.

****

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on [wire rope] [load chain], hook, and electrical collector bars.

SECTION 41 36 30.00 10

ULTRASONIC INSPECTION OF PLATES

01/08

****

NOTE: This guide specification covers the requirements for ultrasonic inspection of rolled steel plates.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

PART 1 GENERAL

****

NOTE: This guide specification covers the ultrasonic inspection of rolled plates both in air and by immersion techniques for laminar types of flaws, for lack of bonding between plate and cladding, and for lack of fusion between the welded overlay and the base metal. Where ultrasonic inspection of weldments is to be required, use Section 05 05 23.13 10 ULTRASONIC INSPECTION OF WELDMENTS. If the work will involve both ultrasonic inspection of plates and of weldments, this section and Section 05 05 23.13 10 ULTRASONIC INSPECTION OF WELDMENTS may be used as separate sections of the contract specifications, or may be combined into a single section to be titled ULTRASONIC INSPECTION.

If combined, repetitions will be deleted, and the entire specification will be edited for appropriate paragraphs and definitions, reference specimens, acceptance/rejection standards, and other associated data.

****

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

1.2.1 A Scan

Method of data presentation on a cathode ray tube using rectangular coordinates in which a horizontal base line indicates elapsed time when reading from left to right. A vertical deflection in the base line indicates reflect signal amplitude.

1.2.2 Acoustically Similar Material

Material the same as that to be inspected; or another material proven to have acoustical velocity within plus or minus 3 percent and an attenuation within plus or minus 0.001 dB/mm 0.25 dB/inch of the inspected material for the inspection frequency and wave mode, using the same mode as that to be used for inspection.

1.2.3 Amplitude

When referring to an indication in A scan presentation, amplitude is the vertical height of the indication measured from peak-to-peak for radio frequency indications and trace-to-peak for video indications.

1.2.4 Attenuation

Dissipation or loss of energy as ultrasonic vibrations travel through the material. Attenuation is caused almost entirely by scattering of the ultrasonic vibrations generated by the search unit.

1.2.5 Attenuation-Correction Controls

Circuitry to provide a continuous increased amplification with respect to time. This circuitry compensates for the reduction in sensitivity with depth as a result of sound beam divergence and its attenuation in material.

1.2.6 Back Reflection or End Reflection

Reflection from the opposite side, end, or boundary of the material into which the ultrasonic energy was introduced.

1.2.7 Calibrated Gain Control (Attenuator)

Circuitry with which gain can be increased or reduced finite amounts by switching electrical signal attenuation into the circuit.

1.2.8 Calibration

Process of comparing an instrument or device with a standard to determine accuracy or produce a scale.

1.2.9 Cathode Ray Tube (CRT)

Electron tube in which a controlled beam of electrons from the cathode is used to produce an image on a fluorescent screen at the end of the tube.

1.2.10 Couplant

Any material, usually a liquid or semiliquid, used between the search unit and the inspection surface to exclude air and convey the ultrasonic vibrations between the search unit and the material being inspected.

1.2.11 Damping Control

Control that varies the duration of transducer ringing.

1.2.12 Decibel (dB)

Units for the logarithmic expression of the ratio of power levels. Power levels can be functions of voltage, current, or impedance. Decibel units have no values of their own and are only significant when a reference is stated, as 10 dB above one reference level or 6 dB below another reference level.

1.2.13 Delay Control

Means of delaying the pattern obtained on the cathode ray tube.

1.2.14 Discontinuity

Anything within a material that will cause a detectable interruption in an ultrasonic beam.

1.2.15 Distance-Amplitude Correction Curve

Curve showing the relationship between signal amplitude and equal-sized reflecting surfaces at various distances from the transducer. Reference standards are used to obtain such curves.

1.2.16 Dynamic Range

Ratio of maximum to minimum size of reflective areas that can be adequately distinguished on the cathode ray tube at a constant gain setting.

1.2.17 Effective Depth of Penetration

Maximum depth at which the sensitivity is satisfactory for the quality of test desired.

1.2.18 Examination

Within the context of this specification, the word "examination" is equivalent to the word "inspection."

1.2.19 Gain Control

Circuitry designed into the ultrasonic system to vary reflection amplitude. This control is usually calibrated in decibels. It is also called the sensitivity control.

1.2.20 Gross

Background displacement of the trace on the cathode ray tube from the established baseline due to the gain setting, the characteristics of the test equipment, or the material under examination.

1.2.21 Hertz

One complete set of recurrent values of a periodic quality comprises a cycle. In other words, any one set of periodic variations starting at one condition and returning once to the same condition is a cycle. A hertz is a unit of frequency equal to one cycle per second.

1.2.22 Immersion Techniques

Test methods in which the part to be tested and the search units are immersed in water or other suitable liquid couplant. A mechanical device is used to firmly hold and direct the wave angle of the search unit. The search unit does not contact the item being inspected.

1.2.23 Indication

Visual presentation on the cathode ray screen resulting from a sound beam reflection from a boundary surface or discontinuity.

1.2.24 Initial Pulse Indication

Usually called the "initial pulse". A signal on the CRT screen marking the instant at which a voltage impulse is applied to the transmitting crystal. Its rising edge is frequently invisible due to the time lag in the probe shoe and the consequent necessity to ensure coincidence between the time base zero and the instant at which the transmitter pulse actually enters the material under test.

1.2.25 Linearity

Property of an instrument revealed by a linear change in reflected signal or displacement. The vertical linearity is determined by plotting by change in ratios of signal amplitude from two adjacent reflections from an area of known size. The horizontal linearity is determined by plotting the distance the signal is displaced along the sweep against the change in material thickness or by noting the spacing of multiple back reflections.

1.2.26 Longitudinal or Compressional Waves

Simple compression refraction waves in which particle motion within a material is linear and in the direction of wave propagation. Also called straight beams, or compressional or normal waves.

1.2.27 Longitudinal Wave Inspection

Ultrasonic technique, normally using straight beam methods, in which longitudinal waves are the dominant form.

1.2.28 Mid-Screen Reflection

Reflection whose amplitude is equal to one-half the usable screen height on the CRT.

1.2.29 Megahertz (MHz)

One million hertz per second frequency.

1.2.30 NDT Level I

An NDT Level I individual should be qualified to properly perform specific calibrations, specific NDT, and specific evaluations for acceptance or rejection determinations according to written instructions, and to record results.

1.2.31 NDT Level II

An NDT Level II individual should be qualified to set up and calibrate equipment and to interpret and evaluate results with respect to applicable codes, standards, and specifications.

1.2.32 NDT Level III

An NDT Level III individual should be capable of establishing techniques and procedures; interpreting codes, standards, specifications, and procedures; and designating the particular NDT methods, techniques, and procedures to be used.

1.2.33 Node

Distance a shear wave travels in a straight line from the inspection surface before being reflected by the opposite surface.

1.2.34 Pulse Repetition Rate

Number of spaced pulses of sound per second sent into the material being inspected.

1.2.35 Range Control

Means of expanding the pattern obtained on the CRT so any portion of the total distance being tested can be presented.

1.2.36 Reference Reflector

Standard reflector 1.52 mm 0.060 inch diameter reference hole in the IIW reference block. Other approved blocks may have a different diameter reflector.

1.2.37 Reflector

Boundary, consisting of an opposite side, crack, or separation, or a distinct change in material such as slag or porosity that reflects the ultrasonic energy the same as a mirror reflects light.

1.2.38 Refracted Waves

Waves that have undergone change of velocity and direction by passing from one material to another material with different acoustical properties. Refraction will occur wherever the angle of the incident wave to the interface is other than perpendicular.

1.2.39 Rejectable Discontinuity (Defect)

Reflector large enough to produce a signal (decibel rating) that exceeds the reject/repair line.

1.2.40 Resolution

Ability to clearly distinguish signals obtained from two reflective surfaces with a minimum separation distance. Near-surface resolution is the ability to clearly distinguish a signal from a reflector at a minimum distance under the contact or near surface without interference from the initial pulse signal. Far-surface resolution is the ability to clearly distinguish signals from reflectors displaced at minimum distance from the far or back surface when the sound beam is normal to that back surface.

1.2.41   Ringing

Excitation of the transducer crystal due to a short pulse of high-voltage electricity.

1.2.42   Scanning

Process of moving the search unit or units along a test surface to obtain complete inspection of the entire volume of a material being inspected.

1.2.43   Search Unit

Device containing a piezoelectric material used for introducing vibrations into a material to be inspected or for receiving the vibrations reflected from the material. The active element of the search unit is defined as the effective transmitting area. Search units are also called transducers or probes. They may be single or dual and contain one or two piezoelectric elements, respectively, for transmission and reception. The single search unit is sometimes enclosed in a transducer wheel or search unit wheel. The search unit may be manually handled and placed in direct contact with the material to be inspected or may be held in a fixture for immersion technique.

1.2.44   Sensitivity

Measure of the ultrasonic equipment's ability to detect discontinuities. Quantitatively, it is the level of amplification of the receiver circuit in the ultrasonic instrument necessary to produce the required indication on the scope from the reference hole in the reference block. Also see "standard reference level".

1.2.45   Shear Waves

Waves in which the particles within the material vibrate perpendicularly to the direction in which the wave travels or propagates. Also called transverse waves.

1.2.46   Shear Wave Inspection

Inspection technique using shear waves in a material. The search unit is placed at an angle to the contact surface of the material so the resultant refracted sound is a shear wave at an angle to the normal.

1.2.47   Standard Reference Level

Mid-screen height reflection when beaming at the 1.52 mm 0.060 inch hole in the primary reference block or the reference hole in the secondary standard.

1.2.48   Surface Waves

Waves that propagate along the surface of the material and penetrate it to only about 1/2 wavelength. Also known as Rayleigh waves.

1.2.49 Test Frequency

Operating frequency in hertz per second of the search unit during period of activation. Frequency is usually expressed in megacycles per second or megahertz. The latter term has been adopted for international use and is preferred.

1.2.50 Video Form

Type of signal presentation on a CRT in which only the upper or position half of the signal appears.

1.3 SYSTEM DESCRIPTION

****

NOTE: The designer will indicate the extent of inspection required, where the inspection will be made, and the number of plates to be inspected. The number will depend on the service to which the plates will be subjected. For example, inspect all plates intended for pressure vessels and dynamically loaded structures such as rail and highway bridges, cranes, and missile service towers. In the case of plates for statically loaded structures such as buildings and storage tanks, inspection must be on the basis of heats in which the sample size must be in accordance with the governing specifications or standards for tensile tests. However, the plates intended for ultrasonic inspection will not be the same as those from which the tensile specimens were taken. For economy, plates should be inspected at the mill following final processing and before shipment. However, in some instances, this may not be expedient. Where critical, the designer will specify in detail the occasion for inspection in the construction process.

****

This section includes procedures, methods, standards, and descriptions of equipment which are used for [mill] [shop] [field] inspection of rolled plate, including clad materials which are 13 mm 1/2 inch or thicker, through which interpretable ultrasonic penetration is possible. Inspect plate [individually.] [by lots. Use a sample size of two plates per lot. A lot is defined as being all plates in a 50 mm 2 inch thickness interval rolled from the same heat. Include in the thickness determination any overlay, pressure cladding, or weld deposit.] Perform ultrasonic inspection to detect the following defects:

a. [Internal laminar discontinuities.]

b. [Lack of bond between roll or explosive bonded sheet.]

c. [Lack of fusion between welded overlays and base plate.]

1.4 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit

the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Procedures and Methods

Personnel Qualification and Certification

Equipment Qualification Requirements

SD-06 Test Reports

Reports and Results

1.5 QUALITY ASSURANCE

1.5.1 Personnel Qualification and Certification

Personnel must be qualified to perform ultrasonic inspection, as defined in ASNT SNT-TC-1A. Personnel must be certified under ASNT SNT-TC-1A and ASNT SNT-TC-1A Q&A Bk C within a period of 1 year before the date of this contract. Other qualification or certification may be accepted at the Contracting Officer's discretion. Personnel with only an operator or inspector trainee certification will not be considered qualified to pass judgment on the acceptability of inspected items, but may work under the direct supervision of a qualified ultrasonic inspector. Qualified ultrasonic inspectors must be able to pass judgement on the acceptability of the item in accordance with paragraph ACCEPTANCE/REJECTION LIMITS.

1.5.2 Examinations

If the Contracting Officer doubts an individual's ability as an operator, inspector, or supervisor, recertify the individual in accordance with ASNT SNT-TC-1A. The Contracting Officer may participate in administering the examination and in evaluating the results.

1.6 REFERENCE STANDARDS

Use reference standards to calibrate the inspection equipment, test its operating condition, and record the sensitivity or response of the equipment during the inspection in accordance with paragraph EQUIPMENT QUALIFICATION REQUIREMENTS. Use standards that comprise a standard reference block and working standards as described next.

1.6.1 Standard Reference Block

Provide the standard reference block or primary standard consisting of the International Institute of Welding (IIW) reference block in AWS D1.1/D1.1M, Section: Inspection, subsection, Reference Standards. Also use the standard reference block in any reinspection on the same basis as the original inspection, even though the reinspection is to be performed by other ultrasonic instruments and accessories.

1.6.2 Working Standards

Recognized working standards detailed with the IIW block in AWS D1.1/D1.1M, such as the Sensitivity Calibration Block, may be used. Details of their use must be included in the procedure description submitted for approval. Use blocks of the same acoustical material as the plates to be inspected, that are suited for the applicable tests specified in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, and use as follows except where the IIW block is specifically required:

a. To assure adequate penetration of the base material.

b. To provide a secondary field standard.

c. To calibrate the equipment and to establish the standard reference level.

1.6.3 Resolution Test Block

Furnish a resolution test block in accordance with the details shown in AWS D1.1/D1.1M, Section: Inspection, subsection Reference Standards.

1.7 EQUIPMENT QUALIFICATION REQUIREMENTS

Evaluate the ultrasonic instrument and accessories on their arrival at the jobsite just before the start of the inspection, using the Contractor's furnished primary standard; meet or exceed the requirements below. Do not use equipment that does not meet these requirements.

Submit the procedure specifications, the procedure qualification test records and the personnel qualification test records.

1.7.1 Requalification

Requalify equipment after normal use at intervals not to exceed 40 hours. In addition, requalify equipment immediately after maintenance or repair or when the Contracting Officer considers its operation questionable.

1.7.2 Longitudinal Wave System

1.7.2.1 Horizontal Linearity

Space the first three multiple reflections obtained through the thickness of the primary or secondary standard equally within plus or minus 5 percent when spread over 90 percent of the sweep length.

1.7.2.2 Vertical Amplitude Linearity

Two adjacent reflections of different amplitudes obtained through the thickness of the primary or secondary standard must vary in the same proportion as the amplitude of the first reflection is increased in discrete 2-dB increments between 20 and 80 percent of full screen height. For each gain setting, the amplitude of each reflection must vary by the same factor within plus or minus 5 percent.

1.7.2.3 Near-Surface Resolution

Excessive ringing that appears on the cathode ray tube (CRT) just to the right of the sound entry point must not exceed a 13 mm 1/2 inch equivalent distance in steel with the search unit placed on the 100 mm 4 inch edge of the IIW block and positioned for maximum amplitude reflection from the 1.52 mm 0.060 inch hole. Set the reference reflector to mid-screen and increase the gain 20 dB. In either case, excessive ringing must not appear on the CRT to the right of the sound entry point in excess of a 13 mm 1/2 inch equivalent distance in steel. Use the reference hole located at least 13 mm 1/2 inch from one edge of the AWS D1.1/D1.1M, Type SC secondary standards similarly. Acceptability must be on the same basis as in the primary standard.

1.7.2.4 Far-Surface Resolution

Delineate the three resolution holes in the resolution block appropriate for the angle of the transducer to be used in the inspection.

1.7.2.5 Signal-to-Noise Ratio

With the search unit located as in the near-surface resolution tests, set the gain to obtain an 80-percent full screen height first reflection from the respective reference reflector. A reference reflection-to-noise less than 10 to 1 is not acceptable.

1.7.2.6 Penetration

Obtain at least three multiple back reflections through plates up to 75 mm 3 inches thick and at least one for plates greater than 75 mm 3 inches thick. In either case, the initial or back reflection only must fall within mid-screen range with a gain input no greater than 50 percent of the instrument capacity.

1.7.3 Immersion Testing

For immersion techniques, the back reflection from the interface between the couplant and the plate surface is called the "first interface signal". All measurements are to be referenced to this signal. Provide equipment that meets all requirements of paragraph EQUIPMENT SENSITIVITY CALIBRATION.

1.8 EQUIPMENT SENSITIVITY CALIBRATION

Perform sensitivity calibration immediately after a change of operators and at least every 30 minutes thereafter as testing proceeds. Recalibration is also required after any power interruption, including a change of source, when the equipment is suspected of being in error, or after relocation on the jobsite. The 30-minute and relocation calibrations may coincide. Before calibration is attempted, allow the instrument to warm up.

1.8.1 Calibration of Longitudinal Wave System

Adjust the instrument range and delay controls to display signals from the far surface of the plate to be inspected. Adjust the gain to produce a first back reflection 50 percent of full-scale. Establish the reject/repair line at 40 percent of full-scale or 2 dB below mid-screen height. Determine the relationship between the 50-percent reflection and the first back reflection from the 1.52 mm 0.060 inch reference hole in the primary standard in the following way: without further adjustment of the instrument gain after the initial sensitivity setting, couple the transducer to the primary standard and positioned for a maximum first back reflection from the 1.52 mm 0.060 inch reference hole. Adjust the instrument gain to bring the maximum reflection to mid-screen height and record this instrument gain setting. Also record a similar relationship, correlated with the respective plate identifications, for each subsequent plate inspected. Compensate for adjustment for loss of signal due to distance as specified below. However, for plates less than 25 mm 1 inch thick, no adjustment for loss of signal is required.

1.8.2 Calibration of Secondary Standard

After adjusting the first reflection from the reference hole in the secondary standard to a 50-percent full-scale response for a shear or longitudinal wave inspection, obtain a maximized reflection from the 1.52 mm 0.060 inch reference hole in the primary standard without changing the gain setting. Readjust this gain setting to obtain a 50-percent full-scale reflection. Record the readjusted setting to provide a basis for recalibration when the secondary standard is unavailable.

1.8.3 Equipment With a Calibrated Gain Control

When a calibrated gain control attenuator is used, position the transducer for maximum reflection from the reference hole in the secondary standard representing approximately 1/2 the longest inspection distance. Adjust this reflection to mid-scale by varying the gain control accordingly. Measure the difference in decibels between this amplitude and the signals obtained from the first, second, and longest distance reflections obtainable on the secondary standard. Record and plot the differences on a curve to determine the necessary correction to the amplitude at the various inspection distances. A level 80 percent of the primary level, obtained from the corrected signal heights, is equal to the reject/repair line.

1.8.4 Equipment With Electronic Distance Compensation Circuitry

If the distance in amplitude between the first reflection and the reflection obtained from the maximum inspection distance is 1 dB or less, the instrument may be used as is. If not, use the procedure used for equipment with a calibrated decibel control to determine the necessary correction for the reflections obtained at the various inspection distances.

1.8.5 Longitudinal Wave Distance-Amplitude Corrective Curve

Construct and draw a longitudinal wave distance-amplitude correction curve on the face of the CRT when longitudinal waves are to be used in the inspection and when material thickness exceeds 50 mm 2 inches if the test equipment design permits. Use the reference hole in the secondary standard. Adjust the instrument sensitivity to 50 percent full-scale of the maximized response from the reference hole at 1/2 maximum inspection distance. Construct the reject/repair line at 80 percent of the established distance-amplitude curve. Take the reflection amplitudes to define this curve from the faces of the secondary sensitivity standard which are 25 mm 1 inch, 50 mm 2 inches, 1/2 maximum inspection distance, and the longest distance obtainable from the secondary standard, respectively, from the reference hole. When a correction curve cannot be drawn on the face of the CRT, apply an approved distance-amplitude correction method.

1.8.6 Longitudinal Wave Inspection Using Immersion Techniques

Use the reference hole in a secondary standard for each different inspection distance. Establish reject/repair limits by immersing both the search unit and secondary standard in the liquid bath in which the inspection is to be conducted. Use the following procedure:

a. Direct the longitudinal waves from the search unit toward the face of the secondary standard closest to the reference hole.

b. Position the search unit for maximum response. Adjust the amplitude of reflection to 50 percent full-scale. Mark the top of that indication on the CRT with a wax pencil or by other means. This establishes the standard reference level. Calculate and mark a point at 80 percent of the standard reference level. This locates the reject/repair point. Repeat the above procedure for each different surface-to-hole distance to establish reject/repair lines.

c. With the gain at the same setting and primary standard and search unit in the bath, obtain a maximized reflection from the 1.52 mm 0.060 inch reference hole in the primary standard. Readjust the gain setting to obtain a 50-percent full-scale reflection. Record the readjusted setting to provide a basis for recalibration when the secondary standard is unavailable.

1.8.7 Angle Wave System

The sensitivity level must be a minimum of a mid-screen height, 50-percent back reflection, with the transducer placed at the first node position from a plate edge. No other calibration tests are required unless repair of discontinuity excavation is accomplished by welding. In that case, when inspection of the weld repair is required, accomplish qualification and calibration of the shear wave equipment in accordance with Section 05 05 23.13 10 ULTRASONIC INSPECTION OF WELDMENTS.

PART 2 PRODUCTS

2.1 ULTRASONIC EQUIPMENT

Provide ultrasonic test instrument conforming to the requirements listed in AWS D1.1/D1.1M, Section: Inspection, subsection, Ultrasonic Equipment, except any requirement relating to weld inspection and the following additional requirements:

2.1.1 Pulses

Provide an ultrasonic test instrument able to generate, receive, and present pulses in any frequency in the 1- to 10-megahertz (MHz) range.

2.1.2 Horizontal Linearity Test

Test the horizontal linearity of the ultrasonic instrument in accordance with the requirements for horizontal linearity of paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, in addition to the AWS D1.1/D1.1M requirement.

2.1.3 Resolution Tests

In addition to the resolution test specified in AWS D1.1/D1.1M for ultrasonic equipment, conduct both near- and far-surface resolution tests in accordance with the procedures specified for those characteristics in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS.

2.2 PROCEDURES AND METHODS

Use the pulse echo contact method with an A scan presentation for the ultrasonic inspection of plate except when immersion techniques may be approved for use in some applications. Submit for approval the procedures to be used for personnel and equipment qualification, equipment calibration, and inspection at least 30 days before their intended use. Approval will in no way affect the Contractor's obligation to employ qualified personnel, equipment, and procedures, and to perform the inspection as specified. Include the following in the procedure description:

a. Type of couplant.

b. Search unit characteristics including shape, nominal frequency, diameter, type, and transducer angle if other than straight.

c. Method and type of wave.

d. Equipment and accessories including manufacturer, model number, date of manufacture, last date of calibration, and the manufacturer's electrical, physical, and performance specifications.

e. Decibel (dB) compensation system for distance-amplitude correction.

2.3 TEST FREQUENCY

Provide test frequency for ferrous materials as specified in AWS D1.1/D1.1M, Section: Inspection, subsection, Ultrasonic Equipment. For other materials that are difficult to penetrate, any frequency within the operating range of the equipment may be used. Demonstrate the effective depth of penetration and sound beam divergency to the Contracting Officer.

2.4 WAVE TYPES

Use types of waves and conditions as follows:

2.4.1 Longitudinal Waves

Use longitudinal waves to locate, identify, and evaluate defects in the various plate materials to be inspected.

2.4.2 Shear Waves

Shear waves may be used as a supplementary means of inspection to locate questionable areas.

2.5 CHANGES IN PROCEDURE

Should application of an approved procedure not provide for good resolution or adequate ultrasonic penetration as specified in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, make and approve changes in procedure or equipment such as frequency, pulse repetition rate, angle of search unit, couplant, or oscilloscope. Demonstrate adequacy of the new procedure to the Contracting Officer. During these tests, if any of the test system's characteristics fall below the levels listed in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, the Government reserves the right to require a change in procedure or equipment.

PART 3 EXECUTION

3.1 PREPARATION OF MATERIALS FOR INSPECTION

Provide inspection surface that is clean and free of loose scale, dirt, rust, grease, oil (other than couplant), and paint. Grind smooth any roughness on the inspection surface that could interfere with transmission of the ultrasound into the material enough to obtain a back or end reflection in excess of 40 percent full-scale. Inspect plates after final heat treatment or processing. Restore plate identification removed by grinding or other means after inspection.

3.2 INSPECTION PROCEDURE

****

NOTE: The designer will specify limits closer than those cited if the application is judged critical.

Delete inapplicable words, sentences, and paragraphs when the item mentioned is not to be furnished under this contract; for example, if clad plate is not furnished, delete all reference to clad plate.

****

Make inspection for [laminar types of flaws and] lack of fusion between welded overlay [or explosion bonded sheet] [and the base metal] as detailed below with the search unit coupled to the base plate. Use the correct frequency as defined in paragraph TEST FREQUENCY. Perform final evaluation for acceptance or rejection with the equipment properly calibrated and the gain control set at the reference level. Use the reject/repair line to evaluate the quality of each item inspected. If a periodic calibration check shows that the equipment is not operating properly or that the sensitivity of the system has decreased more than 20 percent or 2 dB from the established sensitivity level, reexamine all items that have been inspected since the previous calibration. When adequate penetration, as specified in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, cannot be obtained by the proposed longitudinal wave method, modify the procedure in accordance with paragraph CHANGES IN PROCEDURE.

3.2.1 Couplants

****

NOTE: The designer may limit the choice of couplants if some couplants are considered injurious to the item to be inspected.

****

The choice of couplant, such as oil or water, is optional, except as follows:

a. Use the same couplant as that used for equipment qualification and calibration.

b. Do not use couplants that may cause corrosion of the reference standards or the material being tested.

c. Do not use oil for plate to be installed in systems that will handle liquid oxygen.

d. Provide couplants that have the proper viscosity to overcome surface roughness or irregularities.

3.2.2 Detection of Laminar Types of Flaws

a. Mark off plates in grid lines with a maximum spacing of 12 inches between lines, test along each grid line and also along a path within one thickness (T) of the plate from each plate edge.

b. Maintain back or end reflection from the far surface of the plate in excess of 40-percent of full-scale screen height during the entire inspection to assure adequate ultrasonic penetration.

c. When a complete loss of back or end reflection occurs along any grid line, inspect the entire area of the square adjacent to that point. Continue complete testing of all additional adjacent squares until the extent of the defective area is defined.

3.2.3 Detection of Lack of Bonding: Base Plate and Cladding

a. Inspect the clad area for any lack of bonding between the cladding and the base metal. Mark off the clad area in grid lines with a maximum spacing of 150 mm 6 inches between lines, test along each grid line and also along a path within T of each edge.

b. Perform inspection from the base metal side, provided the interface between the base plate and overlay can be resolved.

3.2.4 Detection of Lack of Fusion: Welded Overlay and Base Plate

a. Inspect the fusion-welded area for any lack of fusion between the overlay and the base plate. Mark off the fusion-welded area in grid lines with a maximum spacing of 150 mm 6 inches between lines, test along each grid line and also along a path within T of each edge.

b. Perform inspection from the base metal side, provided the interface between the base plate and overlay can be resolved.

3.2.5 Immersion Techniques for Longitudinal Wave Inspection

This procedure may be used at the Contractor's option unless otherwise specified. Inspect plates for laminar type of flaws, lack of bonding between base plate and cladding, or lack of fusion between welded overlay and the base metal, as appropriate. In addition, make provision for immersing the plate and mounting the transducer in a fixture so that its motion along the required grid patterns can be controlled accurately.

3.3 ACCEPTANCE/REJECTION LIMITS

Evaluate discontinuities only when the ultrasonic equipment is properly calibrated. If discontinuities are detected, direct the sound beam to maximize the signal amplitude. To determine the length of a discontinuity, move the search unit parallel to the discontinuity axis in both directions from the position of maximum signal amplitude. One-half the amplitude (or a 6-dB increase in sensitivity) from a point at which the discontinuity signal drops rapidly to the baseline is defined as the extremity of the discontinuity. For discontinuities whose signal amplitudes exceed full screen height, consider 50-percent full-screen half peak amplitude of the signal. At this point, mark the scanning surface at the position indicated by the center of the transducer. Repeat this procedure to determine the other extremity. The length of the discontinuity is defined as the distance between these two marks. Determine and report the maximum signal amplitude, length, depth, and position within the inspection zone for discontinuities yielding a signal amplitude equal to or exceeding the reject/repair line. The minimum recordable length of discontinuity is 13 mm 1/2 inch.

3.3.1 Investigation of Questionable Indications

Bring any indications considered doubtful to the attention of the Contracting Officer, and repair the plate or investigate further as directed. Investigate indications detected within 10 mm 3/8 inch or less of accessible surfaces further by liquid penetrant as provided in ASTM E165/E165M, or by magnetic particle methods in accordance with ASTM E709, as applicable, to determine if they penetrate the surface. Failure to locate the flaws by one of these methods requires further investigation by the other. For nonmagnetic materials, only dye penetrant inspection is required. Further investigate questionable defects by modifications of the inspection procedure in accordance with paragraph CHANGES IN PROCEDURE.

3.3.2 Inspection of Repairs

Reexamine repairs by the same procedure that originally detected the faults, and meet the standards of acceptance for the original plate. More than two repairs to the same area are to be accepted at the discretion of the Contracting Officer.

3.3.3 Acceptance Standards

****

NOTE: The extent and diameters of defective areas depend on the class of service intended for the plates undergoing inspection. The designer will indicate the applicable class or classes and the intended service in the blank space provided for this purpose. For example: "All plate materials intended for dynamically loaded structures must conform to Class I requirements; those designed for foundations must conform to Class III requirements". Where only one class of service is required, inapplicable matter in parentheses will be deleted.

The tolerable extent of lack of bond depends on the service requirement of the plates and the severity of forming operations which might increase the size of the discontinuities judged acceptable. Reinspection of areas for lack of bond or fusion must be specified if the designer believes the original "safe" areas will extend after cold forming.

****

Plates will be unacceptable if they contain any of the defective areas detailed below:

a. Evaluate laminar types of flaws on the basis of their proximity to the plate surfaces. For evaluation, apply the zonal locations defined below in terms of base plate thickness, T. The T/4 criteria apply when the flaw is situated within T/4 distance of their nonoverlaid or base plate surfaces. The T/2 criteria apply to flaws located in the cross sectional area between T/4 layers of either overlaid or base plate surface. The T/4 criteria applies if the flaw extends from one zone to the other. Any single or two or more defects resulting in a reflection that exceeds the reject/repair line simultaneously with a continuous loss of back reflection from the far surface is cause for rejection, provided the extent of the single or multiple defects cannot be contained within a circle whose diameter is subject to the limits listed in TABLE II. Plate materials intended for [_____] must conform to class [_____] requirements whereas those intended for [_____] must conform to class [_____]. [Other plate materials must conform to class [_____] requirements.]

b. Lack of bond criteria applies to areas at which the cladding is overlaid on the base plate by a pressure or forging process. Lack of bond type flaws include:

(1) Any area that results in an interface back reflection exceeding the reject/repair line and that cannot be contained within a circle of 150 mm 6 inch diameter.

(2) Two or more smaller areas, each of which results in interface back reflection exceeding the reject/repair line, and which cannot be contained within a circle of 150 mm 6 inch diameter unless separated by a distance equal to the maximum dimension of the larger detective area.

(3) Any area that results in an interface back reflection exceeding the reject/repair line and that is closer than 50 mm 2 inches or less to any point at which penetrations are to be made through the cladded thicknesses.

c. Lack of fusion criteria applies to areas at which cladding is overlaid on the base plate by a fusion welding process. Lack of fusion type flaws include:

(1) Any area that results in an interface back reflection exceeding the reject/repair line and that cannot be contained within a circle of 150 mm 6 inch diameter.

(2) Two or more smaller areas, each of which results in an interface back reflection exceeding the reject/repair line, and which cannot be contained within a circle of 150 mm 6 inch diameter unless separated by a dimension equal to, or greater than the larger defect.

(3) Any in-line inclusions in the overlay, 25 mm 1 inch long or equal to 1/2 the plate thickness, whichever is greater.

(4) Any area that results in an interface back reflection exceeding the reject/repair line that is closer than 50 mm 2 inches or less to any point at which penetrations are to be made through the cladded thickness.

3.4 REPAIRS AND REPLACEMENT

****

NOTE: The designer will indicate or specify, directly or by reference to a suitable publication, the limiting dimensions for repairable defects. Where no applicable specifications exist, repairs will be limited to those areas at which their depth extends within 3/8 the plate thickness of the surface.

****

Replace plates containing defects in excess of the limit specified on a one-for-one basis or, at the Contractor's option, may be repaired if such defects are within the limits shown in TABLE I. [When plates are inspected on a lot basis, individually inspect each plate in the lot if more than one plate in the representative sample is found defective.] Reexamine repairs by the same procedure originally used to detect the faults, and the repairs must conform to the standards listed in paragraph ACCEPTANCE/REJECTION LIMITS.

TABLE I. PERCENTAGE OF PLATE AREA ALLOWED FOR REPAIRS

Plate Class	Area Allowed for Repairs
I	1.0 pct
II	1.5 pct
III	2.0 pct

3.5 REPORTS AND RESULTS

Submit reports containing the following information to the Contracting Officer:

a. Identification of each production plate by heat number and plate number, plate thickness, and the initial and final decibel settings needed for correlation of the plate back reflection with the standard reference block reflection as specified in paragraph EQUIPMENT SENSITIVITY CALIBRATION. Permanently record heat number and plate number on each production plate.

b. Place of plate inspection.

c. Identification and description of the standard reference block.

d. Details of methods, types of waves used, search unit, frequencies, inspection equipment identification, and calibration data with enough detail to permit duplication of the inspection later.

e. Locations, dimensions, area (if any) of unacceptable defects and their repairs. These may be noted on a sketch or marked-up drawing.

f. A record of repaired areas as well as the results of the repaired area reinspection.

TABLE II. SINGLE AND MULTIPLE AREA REJECTION LIMITS FOR LAMINAR TYPE FLAWS

Class	Criterion	No. of Defects	Diameter of Enclosing Circle	Minimum Spacing Between Defects
I	T/4	Single	75 mm3 in. or 1/2 plate thickness, whichever is greater	
		Multiple	Same as single	Equal to or greater than the maximum dimension of the larger defect
	T/2	Single	90 mm3.5 in. or 5/8 plate thickness, whichever is greater	
		Multiple	Same as single	Equal to or greater than 7/8 maximum dimension of the larger defect

TABLE II. SINGLE AND MULTIPLE AREA REJECTION LIMITS FOR LAMINAR TYPE FLAWS

Class	Criterion	No. of Defects	Diameter of Enclosing Circle	Minimum Spacing Between Defects
II	T/4	Single	90 mm3.5 in. or 5/8 plate thickness, whichever is greater	
		Multiple	Same as single	Equal to or greater than 3/4 maximum dimension of the larger defect
	T/2	Single	95 mm3.75 in. or 3/4 plate thickness, whichever is greater	
		Multiple	Same as single	Equal to or greater than 5/8 maximum dimension of the larger defect
III	T/4	Single	100 mm4 in. or 7/8 plate thickness, whichever is greater	
		Multiple	Same as single	Equal to or greater than 1/2 maximum dimension of
	T/2	Single	110 mm4.25 in. or plate thickness, whichever is greater	
		Multiple	Same as single	Equal to or greater than 3/8 maximum dimension of larger defect

SECTION 41 65 10.00 10

[DIESEL][NATURAL GAS] FUELED ENGINE PUMP DRIVES

05/09

****

NOTE: This guide specification covers the requirement for diesel or natural gas fueled engines used as prime movers for vertical pumps at civil works flood control pumping stations. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

PART 1 GENERAL

****

NOTE: This guide is intended to be used in the preparation of project specifications along with Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE, and Section 35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS. The Designer should edit the title of this section to reflect appropriate project requirements.

The designer is responsible for making a prime mover selection from either an electric motor, a diesel engine, or a natural gas engine. The guidance for

making proper selection is contained in EM 1110-2-3105, "Mechanical and Electrical Design of Pumping Stations".

The specification is written for a construction contract. Under a construction contract, these components can be purchased and installed by a Construction Contractor. A single contract allows the Contractor to obtain the most optimum combination and be responsible for the total performance of the unit, including shaft alignment. This also makes it feasible for the Contractor to perform a dynamic analysis of the pump, speed reducer, and prime mover system, as described in Section 35 45 01, and makes the Contractor solely responsible for acquiring the necessary data to perform such analysis.

****

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up

to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 WELDER QUALIFICATIONS

Perform welding in accordance with qualifying procedures using performance qualified welders and welding operators. Qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1.[Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.][Welding and nondestructive testing procedures for pressure piping are specified in Section 40 05 13.96 WELDING PROCESS PIPING.]

Notify the Contracting Officer 24 hr in advance of tests, and perform the tests at the work site, if practical. The welder or welding operator must apply the assigned symbol near each weld made as a permanent personal record. Submit a letter listing the welder-qualifying procedures for each welder, complete with all supporting data such as test procedures used, what was tested to, and a list of the names of all welders and their identification symbols.

1.4 REGULATORY REQUIREMENTS

1.4.1 General

Conform design, fabrication, and installation of the equipment to the [specified] [applicable national, state, and local] codes. Submit documentation for conformance according to paragraph SUBMITTALS.

1.4.2 Layout and Shop Drawings

Submit layout and shop drawings including the following:

a. Base-mounted equipment, complete with base and all attachments including anchor bolt template and recommended clearances for maintenance and operation.

b. Complete starting system.

c. Complete fuel system.

d. Complete cooling system.

e. Complete intake and exhaust systems.

f. Layout of relays, breakers, switches, and instrumentation provided and applicable single line and wiring diagrams with a written description of the sequence of operation.

g. Lubrication system complete including piping, pump(s), strainers, filters, [heat exchangers for lube oil and turbocharger cooling], [electric heater], controls, and wiring.

h. Location, type, and description of vibration isolation devices for all applications.

i. The safety system, together with a detailed description of its operation. Include wiring schematics, safety devices with a listing of their normal ranges, alarm and shutdown valves (to include operation parameters such as pressures, temperatures, voltages, currents, and speeds).

j. Layout of the engine control panel and alarm panel.

k. Mounting and support for each panel and major piece of electrical equipment.

l. Engine lifting points and rigging instructions.

m. Alignment information for the engine, [gear box] and [pump] specifying sequences, tolerances, and temperature change effects.

1.5 DELIVERY, STORAGE, AND HANDLING

Protect material and equipment from weather, humidity, temperature variation, dirt, dust, and other contaminants during delivery and storage. Lift, move, and store the engine in accordance with manufacturer's requirements.

1.6 PROJECT/SITE CONDITIONS

****

NOTE: The designer should specify the ambient conditions where the engine drive will be installed. Maximum and minimum air temperature is determined by location. For indoor installation, use indoor design maximum and minimum temperatures. For outdoor installations use the 99-percentile selection from ASHRAE Guide application tables for the installation location.

****

Maximum Air Temperature	[_____] degrees C F
Minimum Air Temperature	[_____] degrees C F

Raw Water Temperature	Max. [_____] degrees C F
	Min. [_____] degrees C F
Installation Elevation	[_____] m ft above sea level

Submit the record of the survey of the existing installation site conditions and verification of site work details.

1.7 MAINTENANCE

1.7.1 Extra Materials

****

NOTE: Spare parts to be furnished under this contract should be specified here. The designer is responsible for determining and providing a list of spare parts requirements. The following is a partial list:

****

Furnish the following minimum spare parts when applicable to the type of engine proposed.

UNITS	DESCRIPTION
[_____]	Complete engine cylinder head(s) and valve set, etc. (if applicable)
[_____]	Complete valve set(s) for one cylinder with springs, cages, etc
[_____]	Cylinder liner(s) with all necessary water seal rings
[_____]	Complete piston(s) with rings and connecting rod assemblies
[_____]	Wrist pins with retaining rings and wrist pine bearing shells
[_____]	Complete set(s) of piston rings for one engine
[_____]	Complete set(s) of main bearing shell of each size and type for the crankshaft of each engine rating supplied
[_____]	Crankpin bearing shell for each crankshaft of each engine rating supplied
[_____]	Complete fuel injector nozzle assembly and fuel injector pump assembly
[_____]	Air start motor (if applicable)
[_____]	Air start check valve (if applicable)
[_____]	Complete gaskets set for one engine
[_____]	Refills, with storage box, for all lubricating oil filters for each engine
[_____]	Refills, with storage box, for all fuel oil filters for each engine

UNITS	DESCRIPTION
[_____]	Spare lubricating oil circulating pump assembly
[_____]	Jacket water pump
[_____]	Pre-lube oil pump and motor assembly (if applicable)
[_____]	Pressure transducer(s)

1.7.2 Special Tools

Provide one complete set of special tools required for maintenance. Special tools are those that only the manufacturer provides for special purposes or to reach otherwise inaccessible parts. Supply tools complete with a suitable tool box.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 General Requirements

Provide and install complete and totally functional, [the] [each] engine with all necessary ancillary equipment including, but not limited to, air filtration, starting system, instrumentation, lubrication, fuel system, cooling system, and engine exhaust system. [The] [Each] engine rating must be in accordance with SAE J1995. Provide DieselNatural Gas Fueled Engine Pump Drive composed of complete units with all components, accessories, and system interconnections coordinated, so that the complete assembly has the capabilities required, for proper operation with the pump specified under Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE and the speed reducer specified in Section 35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS.

Submit written documentation that the products being supplied are appropriate for this engine pump drive, including past performance of the drive on certain types of service, i.e., marine generators, pump drives, locomotives, metal shredders, etc., with a minimum operation of 2,000 hr per year of service with a minimum of 2 years of qualifying service. The certification of the unit's speed, horsepower, and duty rating that forms the basis of the qualifying experience is required for acceptance and must be within 30 percent of [this drive's rating] [these drives' ratings].

2.1.2 Performance Requirements

****

NOTE: The designer should specify the service requirements for the pump drive: Continuous, Standby, or Emergency. The designer should furnish pump manufacturer's data including pump curves and plans unless this specification is used in

conjunction with pump specification Section 35 45 01 as a package. The selection of the engine speed should follow the guidance given in EM 1110-2-3105. Rated capacity should be based on the pump manufacturer's recommendation.

****

Service Requirements	**[Continuous][Standby][Emergency]**
Rated Capacity	110 percent maximum kW (hp)required from the pump curves at specified speed plus power required by the accessories
Overload Capacity	110 percent rated capacity for 2 hours in 24 consecutive hours
Maximum Speed	[_____][900][1,200][1,800] RPM
[Characteristics of the pump load for the engine drive are described in the pump curves and pump plans included in [_____].]	
Site Ambient Conditions: The site characteristics are as described in paragraph PROJECT/SITE CONDITIONS.	

2.1.3 Arrangement

****

NOTES: The engine shaft can be connected to the gear box by either a flexible coupling or universal joint assembly. In cases where the engine is large or the operating floor space is limited, a flexible coupling would be more appropriate. Manufacturer's recommendations should be solicited for arrangement alternatives. The designer should determine the configuration of the day tank, main fuel storage tank, and engine injection ports. If the main storage fuel tank is the lowest point in the engine fuel system, then a pump will be required to deliver fuel oil to the day tank.

****

Each engine, as shown and specified, is to be used as the prime mover for the vertical pump.[Connect the engine shaft to the reducer input shaft with two universal joints and an intermediate shaft.][Connect the engine shaft to the reducer input shaft with a flexible coupling.] Coordinate among the manufacturers of the dieselnatural gas fueled engine, gear reducer, and the pump manufacturer to ensure the compatibility of these components including, but not limited to, the proper fit of engine and reducer shafts, the interaction of major components, and control of safety and alarm signals. Supply fuel for each engine by an individual day tank located near the engine and in accordance with NFPA 37. Fuel oil will be [supplied by gravity] [pumped] to day tank from outside storage tanks. Supply natural gas to the fuel solenoid shutoff valve to be supplied on the engine. Use a cooling system to maintain engine and lubricating oil temperatures at the temperatures recommended by the manufacturer. Furnish a starting system along with necessary accessories for engine start-up. Provide each engine with a completely independent lubrication [and pre-lubrication] system with an engine-driven primary pump.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials and equipment, comprising the engine drive system, which are the standard products of manufacturers regularly engaged in the production of dieselnatural gas fueled engine pump drives and that essentially duplicate products which have been used satisfactorily for at least two years prior to bid opening. An offer proposing an experimental engine, one having a lesser or greater number of cylinders than the offerers' standard production engines, or one without a demonstrated satisfactory service record as a full dieselnatural gas fueled engine operating not less than 1,200 hr a year at not less than 75 percent rated load, will be rejected. All products must be new.

2.2.2 Equipment and Performance

Submit equipment and performance data certifying that the engine and cooling system function properly in the ambient temperature specified and provides the following design and performance data:

a. The maximum allowable inlet temperature of the [coolant fluid] [coolant air].

b. The minimum allowable inlet temperature of the [coolant fluid] [coolant air].

c. The maximum allowable temperature rise in the [coolant fluid through the engine] [cooling air across the engine].

d. The magnitude of monitored values defining alarm or action set points, and the tolerance (plus and/or minus) at which the protective device activates the alarm or action.

e. The minimum allowable inlet fuel temperaturefuel supply pressure.

f. The maximum impact/dynamic load that will be transferred from the engine to the structure.

Manufacturer's standard catalog data including a description and depiction of each engine and all ancillary equipment in sufficient detail to demonstrate complete specification compliance. If standard catalog data does not contain sufficient detail to verify compliance, then submit supplementary support documentation to verify compliance. Submit all data on the engine manufacturer's letterhead and signed by a representative or official of the manufacturer authorized to make technical representations of his company's products.

2.2.3 Nameplates

Provide each major component with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the equipment. As a minimum, provide nameplates for the following items:

a. Engines
b. Pumps and pump motors
c. Radiators

d. Heaters
e. Exhaust mufflers
f. Heat exchangers
g. Day tanks

2.2.4 Personnel Safety Devices

Insulate, fully enclose, guard, or fit with other types of safety devices all exposed moving parts, parts that produce high operating temperatures, parts which may be electrically energized, and parts that may be a hazard to operating personnel. Install the safety devices so that proper operation of the equipment is not impaired.

2.3 MATERIALS

2.3.1 Filter Elements

Provide fuel-oil, lubricating-oil, and combustion-air filter elements which are the manufacturer's standard type and able to filter out particles down to a 25 to 40 micron size, unless otherwise noted.

2.3.2 Pipe (150 psi System and Under)

Provide pipe for sleeves, fuel/lube-oil, compressed air, coolant, exhaust, and miscellaneous uses in compliance with ASTM A53/A53M, or ASTM A106/A106M steel pipe. Pipe smaller than 50 mm 2 inch must be Schedule 80. Pipe 50 mm 2 inch and larger must be Schedule 40.

a. Flanges and flanged fittings: ASTM A181/A181M, Class 150, or ASME B16.5.

b. Pipe welding fittings: ASTM A234/A234M, Grade WPB or WPC, Class 150 or ASME B16.11, 1360.7 kg 3,000 lbs.

c. Threaded fittings: ASME B16.3, Class 150.

d. Valves: MSS SP-80, Class 150.

e. Gaskets: manufacturer's standard.

2.3.3 Temperature Gauges for Oil or Water Service

Manufacturer's standard flush-mounted, 100 mm 4 inch minimum diameter dial size with standard operating point at 50 percent of the full gauge range. Provide gauge construction and materials that are appropriate for the intended service.

2.3.4 Pipe Hangers

MSS SP-58

2.3.5 Pressure Gauges

Manufacturer's standard flush mounted, 100 mm 4 inch minimum dial diameter with standard operating point at 50 percent of the full gauge range. Ensure gauge construction and materials are appropriate for the intended service.

2.4 DIESELNATURAL GAS FUELED ENGINE

****

NOTES: Specify the fuel type if different than No. 2 diesel. The rating of the equipment should be in accordance with SAE standards. If the facility is located below 457 m 1,500 ft in elevation above sea level and the intake air temperature is under 38 degrees C 100 degrees F, then de-rating is not required.

Naturally aspirated engines are available to about 1,500 kW continuous. Turbocharged engines are generally available from 50 to 350 kW continuous. Turbocharged-aftercooled engines are generally available from 200 kW to over 4,000 kW continuous. Engine suppliers should be contacted for recommendations regarding the appropriate engine based on the application.

****

a. The engine must be a full diesel, 2 or 4 cycle, compression-ignition type, for stationary applications and operate on No. 2-D diesel fuel conforming to ASTM D975. The engine must be naturally aspirated, turbocharged, or turbocharged-aftercooled.

a. The engine must be a natural gas fueled, 2 or 4 cycle, spark ignition type, for stationary applications and operate on standard pipeline natural gas. The engine must be naturally aspirated or turbocharged-aftercooled.

b. Provide engine rating as specified in paragraph PERFORMANCE REQUIREMENTS. The engine must be of the vertical in-line, vee, or opposed-piston type, with a solid cast block or individually cast cylinders. Provide opposed-piston engines with no less than four cylinders. Provide current models of a type in regular production complete with all devices specified or normally furnished with the engine.

2.4.1 Fuel Consumption

Do not exceed the following maximum limits based on the conditions listed below:

SIZE RANGE NET kW	PERCENT OF RATED FULL LOAD	FUEL USAGE kg/kWhLbs/bhp-hr
100 - 299	75 - 100	0.2720.447
300 - 999	75 - 100	0.2610.429
1,000 - 2,500	75 - 100	0.2430.400

Conditions:

a. 45 MJ/kg 19,350 BTU/pound heat value for fuel.

b. Sea level operation.

c. Intake air temperature not over 32 degrees C 90 degrees F.

d. Intake air barometer pressure not less than 95.7 kPa 28.25 inch of mercury.

SIZE RANGE NET kW	PERCENT OF RATED FULL LOAD	FUEL USAGE kJ/kWhbtu/bhp-hr
100 - 299	75 - 100	12,3408,700
300 - 999	75 - 100	11,3258,000
1,000 - 2,500	75 - 100	11,3258,000

Conditions:

a. Based on 118 octane natural gas with a heat value of 33,500 kJ/m3 900 btu/ft3.

b. Sea level operation.

c. 25 degrees C 77 degrees F ambient air temperature at 30 percent relative humidity.

d. 100 kPa 29.53 inch of mercury barometer pressure.

2.4.2 Crankcase Pressure Relief Valve

****

NOTES: Engines larger than 20 kW 27 hp must utilize a pressure relief valve on the crankcase to relieve primary crankcase explosions. The crankcase pressure relief valve vents quickly and then reseats to prevent return of air and to protect against secondary explosions. The plans should show the crankcase pressure relief valve vent piping on indoor engine installations.

****

Provide a pressure relief valve in the crankcase. Vent the crankcase in accordance with the manufacturer's recommendations, except do not use the engine exhaust as the venting system. Pipe crankcase breathers, if provided on engines installed in either a building or enclosure, to vent to the outside. If the engine is located outside, fit the crankcase breather with a goose-neck to prevent rain entry.

Provide a pressure relief valve in the crankcase. Vent the crankcase in accordance with the manufacturer's recommendations. Crankcase breathers using the venturi effect of the exhaust system will be allowed only when designed, installed, and provided directly from the engine manufacturer. Otherwise, vent the crankcase to the outside and fit with a goose neck to prevent rain entry.

2.5 FUEL SYSTEM

The fuel system for each engine must conform to requirements of NFPA 30 and NFPA 37. Include the following items.

2.5.1 Fuel Pump

Provide each engine with an engine-driven, positive displacement engine fuel pump. Provide pump with the capacity to transfer fuel from the day tank at a rate in excess of maximum fuel consumption stated in paragraph FUEL CONSUMPTION, as well as supplying adequate pressure for the fuel injectors.

Provide each engine with a fuel solenoid shutoff wired to a shutdown system and a fuel pressure regulator supplied by the engine manufacturer to control the fuel over air mixture to the engine. The fuel supply pressure available at the site is [_____] kPainch H20. The engine fuel system design must be adequate to power to 110 percent load at the site fuel supply pressure as stated above.

2.5.2 Filter

Supply a minimum of one duplex filter with a trans-flow change-over valve for each engine. Provide filter with inlet and outlet connections plainly marked. Provide an indicating differential pressure gauge across the filter. Locate the filter on the inlet side of the fuel pump. Ensure the filter is capable of filtering out particles down to 25 micron size.

Provide each engine with a fuel filter located upstream of the fuel solenoid shutoff to filter 100 percent of the incoming gas. Provide filter with inlet and outlet connections plainly marked. Provide an indicating differential pressure gauge across the filter. Ensure the filter is capable of filtering out particles down to 5 micron size.

2.5.3 Strainer

Provide a full flow strainer of the replaceable cartridge type between the engine and the fuel tank, upstream of the duplex filter. Provide an indicating differential pressure gauge for upstream and downstream of the strainer. Ensure the strainer cartridge is capable of filtering out particles down to 125 micron size.

2.5.4 Fuel Gas Compressor

Where the basic engine fuel system design requires fuel pressures above that available at the site, a fuel gas compressor is required. Select and certify this fuel gas compressor by the engine manufacturer to comply with both these specifications and the requirements of the engine throughout its load range and up to 110 percent load. Package the fuel gas compressor on the same skid as the engine with a fully plumbed fuel system providing one point for fuel connection and junction boxes as required for electrical connections.

2.5.5 Safety Bypass Valve

Provide a safety bypass valve next to the pump isolation valve to prevent the buildup of excessive pressures if the discharge line or fuel pump filters become clogged. This bypass must protect the fuel piping from over-pressurizing and will relieve it at [_____] kPa psi. The bypass valve relief line must return the fuel to the engine day tank.

2.5.6 Day Tank

****

NOTE: See NFPA 37 and NFPA 30 for day tank restrictions on allowable day tank sizes. The day tank should be located in close proximity to the engine to avoid exceeding the total suction head capabilities of the engine-driven fuel pump (paragraph FUEL PUMP). Nominal suction head capabilities of typical engine-driven fuel pumps are in the range of 2.75 to 3.65 m 9 to 12 ft.

Delete this paragraph in its entirety if natural gas fueled engines are specified.

****

Provide each engine with a day tank located next to the engine. Fit each day tank with a fuel supply line, fuel return line, local fuel fill port, direct reading liquid level indicator, vent, fill limit float switch assembly for automatic control of the fuel oil transfer pump (if provided), alarm level sensing device, and a drain line. Provide a fuel return line cooler, if recommended by the engine manufacturer. Provide each day tank with [a [_____] L gal capacity] [capacity sufficient to supply the engine without interruption for 2 hr] [capacity sufficient to supply the engine for [_____] hr continuously at 100 percent rated load without being refilled].

2.5.6.1 Drain Line

Equip each day tank drain line with a shutoff valve and arrange to allow drainage into 220 L 55 gal drums.

2.5.6.2 Local Fuel Fill

Provide each local fill port with a [screw-on cap][hinged, fill cap]. Provide an air vent with brass screen so that the day tank does not develop a vacuum leading to the collapse of the day tank as the system empties.

2.5.6.3 Fuel Level Limit Devices

a. Provide each day tank with a fill level float switch assembly device to:

    (1) Initiate refueling of the day tank at the low level mark, (e.g., 30 percent volume remaining).

    (2) Stop refueling of the day tank at the high level mark, (e.g., 90 percent volume).

b. Provide each day tank with a separate level-sensing device to activate alarms at day tank overfill and day tank empty. Day tank empty must indicate at 20 percent volume remaining. Day tank overfill must indicate at 95 percent volume. See paragraph ALARM PANEL for further function requirements.

2.5.6.4 Redundant Fuel Shutoff

To stop fuel flow to the day tank, provide an automatic shutoff valve on the fill line of the day tank and provide an automatic safety device to stop the pump supplying fuel to the day tank. Activate the valve and the safety device at the overfill level as defined in paragraph SAFETY SYSTEM, and respond before any fuel is forced out of the fuel overflow line.

2.5.6.5 Arrangement

Position and arrange the day tank so that fuel level in the day tank at the day tank empty level is above the suction port of the engine-driven fuel pump. Position and arrange the day tank overflow connection so that the highest possible fuel level in the day tank is below the fuel injectors. The fuel supply line from the day tank to the engine connections must be welded steel pipe. Provide a water drain at the low point of the day tank.

2.5.7 Fuel Supply System

Provide diesel fuel supply from the main diesel fuel storage to the day tank as specified in Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS. Provide natural gas fuel supply system as specified in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES and Section 23 11 20 FACILITY GAS PIPING.

2.5.8 Main Fuel Storage Tank

****

NOTE: The location of this tank is important for day tank draining and day tank fuel supply. The appropriate type and location should be determined by costs and operational requirements and should follow local, state, and Federal Environmental Protection Agency regulations, Section 33 56 10 and NFPA-30.

****

The main fuel storage tank is specified in [Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS][_____].

2.6 LUBRICATION

****

NOTE: Delete the adjustable requirement for pressure regulation on the pressurized lube oil system for engines smaller than 1,000 kW 1,350 hp.

****

Provide each engine with a separate lube-oil system conforming to NFPA 30 and NFPA 37. Pressurize each system by engine-driven pumps.[Adjust and regulate the system pressure as recommended by the engine manufacturer.] Furnish a sump tank as required. The lube-oil pump must draw oil from the oil pan or sump tank through a mesh intake strainer and force it through a lubricating oil cooler and a single or duplex full-flow strainer into the engine. Protect the pump by a relief valve to bypass the oil into sump. Bypass a portion of the oil from the sump through a lubricating oil filter and back into the engine oil pan or sump. Regulate the lubricating oil temperature by means of an automatic temperature regulator which will control the amount of bypass oil around the cooler. Make the system readily accessible for service such as draining or refilling. Permit the addition of oil and have oil-level indication with the set operating.

2.6.1 Pump Filters

Provide one full-flow, duplex, 80 micron filter for each pump. Ensure the filter is readily accessible and capable of being changed without disconnecting the piping or disturbing other components. Provide filter with inlet and outlet connections plainly marked. Provide an indicating differential pressure gauge across the filter.

2.6.2 Lube-Oil Sensors

Equip each engine with lube-oil temperature and pressure sensors. Use temperature sensors to provide signals for pre-high and high lube-oil indication and alarms. Locate pressure sensors downstream of the filters and provide signals for pre-low and low lube-oil indication and alarms.

2.6.3 Lubricating Oil Strainer

Furnish a full-flow, oil strainer in-line, ahead of the engine. The strainer must be as recommended by the engine manufacturer. Provide a bottom drain plug to allow easy removal of the sludge.

[2.6.4 Pre-Lubrication Oil Pump

****

NOTE: Normally, engine size greater than 350 kW 470 hp and engines with a period in excess of two weeks between operations require pre-lubrication. If pre-lubrication is required, utilize this paragraph.

****

Provide pre-lubricating oil pump with a capacity and head rating as recommended by the engine manufacturer. Incorporate a built-in relief valve and directly connect to an electric motor with the motor-pump assembly mounted on a common case iron or steel base. Furnish the pump complete and ready for operation with all controls inclusive. Allow the pre-lubrication pump to completely fill the engine oil lines and establish lubricating oil pressure prior to starting. Provide pump motor in accordance with the requirements of paragraph MOTORS.

]2.7 COOLING SYSTEM

****

NOTE: There are three basic types of engine cooling systems available. These are systems using liquid-to-air heat exchangers (radiators) or cooling towers, systems using liquid-to-liquid heat exchangers (systems using shell and tube, plate and frame heat exchangers) and systems using submerged pipe systems. No matter which system is specified, engine outlet water temperature should be kept constant, and the differential between inlet water to outlet water of the cooling system should be kept at about 8 degrees C 15 degrees F. The radiator requires forced air through the heat exchanger causing higher noise levels. For an indoor application, the radiator can be located outside with a higher pressure pumping system to deliver the required flow to the radiator. The radiator should be mounted less than 15 m 50 ft above the engine to

avoid leakage at the engine water pump seal.

When the approach between coolant and air temperatures is under 15 degrees C 27 degrees F, towers become more economical. A surrounding clean environment is required with towers due to the openness of the design. The shell and tube heat exchanger requires an expansion tank to remove air from the system. The raw water supply system should be closely coordinated when applying a shell and tube heat exchanger.

Cooling towers have limiting working ranges and can be applied successfully only in certain climates.

The submerged pipe cooling system requires a large quantity of raw water and an expansion tank. Factors for consideration when evaluating cooling systems include engine size, space limitations, acceptable noise levels, raw water supply, maintenance, operational requirements, and system operating costs. Engine suppliers should be contacted for assistance in selecting the appropriate cooling system for the application.

****

a. Each engine must have its own cooling system. Provide closed type system that operates automatically while the engine is running.

b. Provide cooling system with an engine-driven water pump, [fin-tube radiator,] [cooling tower,] [remotely mounted fin-tube radiator,] [shell-tube heat exchanger, expansion tank,] [plate and frame heat exchanger, expansion tank,] [submerged pipe, expansion tank,] and an automatic temperature regulating valve. The maximum temperature rise of the coolant across each engine is not allowed to exceed the engine manufacturer's recommendation as submitted in paragraph SUBMITTALS.

c. Provide closed type engine cooling system arranged to prevent rust and minimize formation of scale deposits within the engine. Circulate jacket-coolant through the engine at the temperature and flow rate recommended by the engine manufacturer. The coolant must be an ethylene-glycol water mixture with a concentration sufficient for freeze protection at the minimum outdoor temperature specified. The maximum temperature rise of the coolant is no more than that recommended and submitted in paragraph SUBMITTALS.

2.7.1 Coolant Pumps

****

NOTE: Delete raw-water pump option for closed-loop systems.

****

Provide centrifugal type engine-driven jacket water pumps.[Raw-water centrifugal circulating pumps must be [electric motor driven equipped with manual-off-automatic controllers] [engine driven].] Provide each engine with an engine-driven primary pump. Provide electric motor driven secondary pumps with automatic controllers. Provide a bronze fitted, single stage type pump with removable seal rings and stuffing box and properly sized for the intended purpose.

2.7.2 Radiator

****

NOTE: Radiator location and mounting details should be shown on the plans. An electric motor-driven fan is provided on remotely located radiators to circulate air across the radiator. The fan should operate when the engine operates.

****

Size each radiator to limit the maximum allowable temperature rise on the coolant across the engine to that recommended and submitted in paragraph SUBMITTALS, for the maximum outdoor design temperature and site elevation. Use radiator fabrication materials that are corrosion resistant and suitable for service in the ambient application conditions. The radiator may be factory coated with corrosive resistant film provided that corrective measures are taken to restore the heat rejection capability of the radiator to the initial design requirement via over-sizing or other compensating methods. Internal surfaces must be compatible with liquid fluid coolant used. Materials and coolant are subject to approval by the Contracting Officer. Ensure radiators are the pressure type incorporating a pressure valve, vacuum valve, and a radiator cap. Provide radiator cpas for pressure relief prior to removal. Ensure each radiator and the entire cooling system is capable of withstanding a minimum pressure of 48.4 kPa 7 psig. Protect each radiator with a strong grille or screen guard. Radiators must have at least two tapped holes. Equip one tapped hole in the radiator with a drain cock; plug the rest. [Provide the remote located radiator with an electric motor-driven fan. Wire the fan to operate when the engine operates.]

[2.7.2.1 Shell and Tube Heat Exchanger

Provide a multiple pass shell type heat exchanger with removable U-tube bundles to facilitate cleaning and retubing. The heat exchanger must be of sufficient capacity to cool the engine with [_____] degrees C F input cooling water. Operate the heat exchanger with low temperature water in the shell and high temperature coolant in the tubes. Construct exchangers in accordance with requirements of ASME BPVC SEC VIII D1 and certify with an ASME stamp secured to the heat exchanger. Construct shells with seamless steel, welded steel, or cast iron. Provide tubes that are either cupronickel or inhibited admiralty, meeting requirements of ASTM B395/B395M, suitable for the temperature and pressure specified. Design the shell side and tube side of the heat exchanger for 1.03 MPa 150 psig working pressure and factory test at 2.06 MPa 300 psig. Locate high temperature, low temperature, and pressure relief connections in accordance with the manufacturer's standard practice. Coolant pressure loss through clean tubes must be as recommended by the engine manufacturer. Minimum coolant velocity through the tubes must be at least 300 mm/sec 12 inch/sec and sufficient to assure turbulent flow. Provide one or more pressure relief valves for each heat exchanger in accordance with ASME BPVC SEC VIII D1. Install a drain connection with a 19 mm 3/4 inch hose bib connection at the lowest point in the system near the heat exchanger.

][2.7.2.2 Plate and Frame Heat Exchanger

The heat exchanger must be a multiple pass type with removable plates to facilitate cleaning. The heat exchanger must be of sufficient capacity to cool the engine with [_____] degrees C F input cooling water. Construct heat exchanges in accordance with ASME BPVC SEC VIII D1 and certify with an ASME stamp secured to the heat exchanger. Select materials for the plate and frames that are appropriate for the service required. Locate high and low temperature and pressure relief connections in accordance with the manufacturer's standard practice. Water pressure loss through clean plates must be as recommended by the engine manufacturer. Provide one or more pressure relief valves for each heat exchanger in accordance with ASME BPVC SEC VIII D1. Install a drain connection with a 19 mm 3/4 inch hose bib connection at the lowest point in the system near the heat exchanger.

][2.7.2.3 Cooling Tower

****

NOTE: The maximum outdoor design temperature, coolant temperature, and availability of water are critical to the proper selection of the appropriate cooling tower. Applicable ASHRAE guides should be consulted for application guidance.

****

Size the cooling tower to limit the maximum allowable temperature rise in the coolant across the engine to that recommended by the engine manufacturer. The Contractor is responsible for the proper selection of system components based on the site conditions and the dieselnatural gas fueled engine pump drive[s] used. Internal and external materials must be appropriate for the heat used. Use cooling towers in conjunction with a liquid-to-liquid heat exchanger to keep the engine cooling in a closed loop with conditioned coolant. Furnish the cooling tower as a complete operating system with a liquid-to-liquid heat exchanger, a surge tank, an auxiliary water pump, necessary filters in the water return lines, and interconnecting piping and isolation valves as required for maintenance and operation.

][2.7.2.4 Submerged Pipe

****

NOTE: Protection for the submerged pipe or coil should be considered. The pipe or coil should be kept out of mud or silt and away from the bottom of the cooling pond to ensure maximum efficiency.

****

Provide pipe or coil of sufficient length to cool the engine at the specified raw water temperature. Use piping materials as specified in paragraph PIPE (150 PSI SYSTEM AND UNDER). Install pipe as specified in paragraph PIPING INSTALLATION. Always slope the pipe from the return bend up to prevent air locks in the system. Furnish a drain plug at the lowest point of the system. Connect the system so that the jacket water flows from the engine to the cooling coils and then to the expansion tank before returning to the jacket water pump inlet.

]2.7.3 Thermostatic Control Valve

Provide a modulating type, thermostatic control valve in the coolant system to maintain the engine coolant temperature in the range submitted in paragraph SUBMITTALS.

2.7.4 Ductwork

Provide ductwork as specified in [Section 23 30 00 HVAC AIR DISTRIBUTION] [_____] except use a flexible connection to connect the engine radiator. Material for the connection must be wire-reinforced fiber glass. The connection must be airtight.

2.7.5 Temperature Sensors

Equip each engine with coolant temperature sensors. Use temperature sensors to provide signals for pre-high and high coolant temperature indication and alarms.

Equip each engine with coolant temperature systems for both the jacket water system and the intercooler system when the engine is turbocharged.

2.7.6 Expansion Tank

****

NOTE: Size of the expansion tank at least 15 percent of the coolant volume in the total system to take care of expansion.

****

Furnish an expansion tank of no less than [_____] L gal for each engine. Properly fit the tank for vent, overflow, expansion, and make-up lines. The tank must be suitable for an operating temperature of 121 degrees C 250 degrees F and a working pressure of 860 kPa 125 psig. Construct tank of welded steel, hot-dipped galvanized inside and outside after fabrication, test, and stamp in accordance with ASME BPVC SEC VIII D1 and register with the National Board of Boiler and Pressure Vessel Inspectors. Mount tank so that the bottom of the tank is above the top of the engine. Support tank by steel legs or bases for vertical installations or steel saddles for horizontal installation.

2.8 SPECIAL LIMITATIONS

2.8.1 Sound Limitations

****

NOTE: The noise limits must conform to applicable local and OSHA codes. The designer is responsible for determining code noise limit requirements for specific site applications. Specific information regarding applicable noise limits should be inserted in this section. Site specific requirements and limitations are key components in the criteria selection. Generally, the most cost effective approach is to use hearing protection in conjunction with building and room insulation to control noise.

****

[_____]

2.8.2 Vibration Isolation and Seismic Restraints

****

NOTE: Provide seismic requirements and show details on the drawings if the Government designer (either

Corps office or A/E) is the Engineer of Record. Delete the bracketed phrase in the last sentence of this paragraph if seismic details are not provided. Pertinent portions of UFC 3-301-01 and properly edited Sections 13 48 73 and 23 05 48.19 must be included in the contract documents.

****

Limit the maximum engine vibration in the horizontal, vertical, and axial directions to 0.15 mm 6 mils peak-peak RMS, with an overall velocity limit of 24 mm/sec 0.95 inch/sec RMS.[Install a vibration-isolation system between the floor and the base. The vibration-isolation system must limit the maximum vibration transmitted to the floor at all frequencies to a maximum of [_____] [_____] peak force.][Provide engine with a vibration-isolation system in accordance with the manufacturer's standard practice.] Design and qualify vibration-isolation systems (as an integral part of the base and mounting system) to the seismic forces specified. Where the vibration-isolation system does not secure the base to the structure floor or unit foundation, provide seismic restraints in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 SEISMIC BRACING FOR MECHANICAL SYSTEMS[and as indicated].

2.9 AIR INTAKE EQUIPMENT

Provide filters and silencers in locations that are convenient for servicing as shown on the project plans. The silencer must be of the high-frequency filter type, located in the air intake system as recommended by the engine manufacturer. A combined filter silencer unit meeting requirements for the separate filter and silencer items may be provided. Expansion elements in air-intake lines must be [copper][rubber].

2.10 EXHAUST SYSTEM

Provide a separate and complete system for each engine. Support exhaust piping to minimize vibration. Make provisions for pipe thermal expansion. Where a V-type engine having more than one exhaust outlet is provided, use a V-type connector, with necessary flexible sections and hardware, to connect the engine exhaust outlets. Incorporate engine-mating and silencer-mating flanges, eliminating the need for adapters. Ensure the muffler and exhaust piping together is capable of reducing the noise level at the exhaust discharge location to a point below the maximum sound levels specified in paragraph SOUND LIMITATIONS, at a distance of [_____] m ft from the end of the exhaust piping directly along the path of discharge for horizontal discharged exhaust; or at a radius of [_____] m ft from the muffler/discharge piping, at 45 deg apart in all directions, for vertically discharged exhausts, with the engine operating at 100 percent of service load.

2.10.1 Flexible Sections and Expansion Joints

Provide a flexible section at each engine and an expansion joint at each muffler. Provide flexible sections and expansion joints with flanged connections. Ensure flexible sections are multiple-ply stainless steel expansion bellows type with standard 38 and 76 mm 1.5 and 3 inch allowable axial expansion. Use elements in the flexible sections that are capable of absorbing vibration from the engine and compensating for thermal expansion and contraction.

2.10.2 Exhaust Muffler

****

NOTE: Muffler locations and mountings should be shown on the plans. The designer should consider the use of first cost versus life-cycle cost analysis to determine the appropriate metal to use. Stainless steel Series 321 and aluminized steel should be considered in lieu of painted steel materials.

****

Provide a chamber type exhaust muffler. Fabricate the muffler of welded steel and design for [outside] [inside] [vertical] [horizontal] mounting. Provide eyebolts, lugs, flanges, or other items as necessary for support of the muffler in the location and position indicated on the plans. Do not allow the pressure drop through the muffler to exceed the recommendations of the engine manufacturer. Fabricate outside mufflers from [aluminized steel] [stainless steel]. Provide muffler with a drain valve, nipple, and cap at the low-point of the muffler. Supply a complete muffler with any necessary soot boxes or inspection ports required for adequate operation and maintenance. Size the entire exhaust system appropriately so that the operation of the engine is not affected by the exhaust system.

2.10.3 Exhaust Piping

****

NOTE: Exhaust piping should be sized at a gas velocity of less than 25.4 m/sec 5,000 fpm. The exhaust piping location and routing should be shown on the plans.

****

Slope horizontal sections of the exhaust piping downward away from the engine to a condensate trap and drain valve. Make changes in direction utilizing long radius fittings. Run exhaust piping not covered in this paragraph in accordance with paragraph PIPING INSTALLATION. Insulate exhaust piping, mufflers, and silencers with ASTM C533 calcium silicate insulation, minimum of 75 mm 3 inch thickness or an appropriate thickness to limit the surface temperature to values below 80 degrees C 175 degrees F. Secure insulation with no less than 9.525 mm 0.375 inch wide Type 304 stainless steel bands spaced no farther apart than 200 mm 8 inches on center. Provide an aluminum jacket encasing the insulation. Provide aluminum jacket with a minimum thickness of 0.406 mm 0.016 inch with a factory-applied polyethylene and kraft paper moisture barrier. Secure the jacket with no less than 13 mm1/2 inch wide stainless steel bands, spaced no farther apart than 200 mm 8 inch on centers. Lap longitudinal and circumferential seams of the jacket no less than 75 mm 3 inch. Install jackets on horizontal lines so that the longitudinal seams are on the bottom side of the pipe. Place the seams of the jacket for the vertical lines on the off-weather side of the pipe. On vertical lines, overlap the circumferential seams of the jacket so that the lower edge of each jacket overlaps the upper edge of the jacket below. Provide vertical exhaust piping with a hinged, gravity-operated, self-closing rain cover. When the exhaust pipe exits the building, isolate the pipe from the [wall][roof] by means of thimbles in accordance with NFPA 37.

2.11 PYROMETER

****

NOTE: For engines smaller than 1,000 kW 1,340 hp delete this paragraph. Pyrometers with individual thermocouples are not normally available and should not be specified for engines smaller than 1,000 kW 1,340 hp.

****

Provide a pyrometer [multi-point selector with individual thermocouples][and thermocouple] with calibrated leads to indicate the temperature [in each engine cylinder and the combined exhaust] [in the combined exhaust]. For a supercharged engine, provide additional points, thermocouples and leads to show the temperature in the turbocharger exhaust gas outlet and combustion air discharge passages. Provide a double pole selector switch, with an off position, one set of points for each thermocouple, and a suitable indicating dial. Calibrate the pyrometer, thermocouple, leads, and compensating devices to show true exhaust temperature within ñ1 percent above the highest temperature encountered at 110 percent load conditions.

2.12 EMISSIONS

The finished installation must comply with Federal and local regulations and restrictions regarding the limits of emissions such as carbon monoxide (CO), hydrocarbon (HC), and nitros (NOx).

2.13 STARTING SYSTEM

****

NOTE: The engine can be started by either pneumatic (compressed air) or an electric starting system. The selection of the starting system should be based on costs and availability of compressed air or electric power. The starting system should be of adequate capacity to start the engine under the coldest conditions encountered. Generally, in pumping plants with an existing station air system or where a station air system will be installed, a pneumatic system will have the lowest initial cost. The designer should ensure that the requirements for the station air system include an air receiver of adequate size to accommodate the cranking cycle of each engine in the station without recharge by the station air compressor. Paragraph ELECTRICAL STARTING SYSTEM should be deleted if a pneumatic starting system is specified. Paragraph COMPRESSED AIR STARTING SYSTEM should be deleted if an electric starting system is specified.

Torque available from air motors of pneumatic systems is capable of accelerating the engine to twice the engine cranking speed in about half the time required by electric starters. The starting system should be the manufacturer's standard equipment.

The starting system, regardless of type, should have a start-stop switch providing functions including

testing, reset, manual run/start manual stop, an adjustable cranking cycle and cool down mode of operation.

If an electric system is provided, an adjustable cranking limit device should be specified to limit the engine cranking to a specified time limit.

****

Provide each diesel engine with a starting system. Provide a [pneumatic] [electric] system of sufficient capacity to start the engine at the minimum temperature specified. Provide system with a start-stop switch which provides functions including testing, reset, manual run/start, manual stop, and adjustable cranking and cooling down operation. Ensure the starting system is the manufacturer's standard equipment.

2.13.1 Electrical Starting System

****

NOTE: Delete this paragraph and subparagraphs in their entirety if a pneumatic starting system is specified.

****

Provide an electrical starting system to operate on a [24] [_____]-V DC utilizing a negative circuit ground. Include an adjustable cranking device to limit the engine cranking to a specified time limit. Provide starting motors in accordance with SAE ARP892.

2.13.1.1 Battery

****

NOTE: Select a nickel-cadmium type battery only when the battery temperature cannot be maintained above -6 degrees C 22 degrees F.

****

Provide a starting battery system and include the battery, battery rack, intercell connectors, spacers, automatic battery charger with overcurrent protection, metering, and relaying. Provide battery in accordance with SAE J537. Design critical system components (rack, protection, etc.) to withstand the seismic acceleration forces specified in subparagraph VIBRATION ISOLATION AND SEISMIC RESTRAINTS under paragraph SPECIAL LIMITATIONS. The battery must be a [lead-acid] [nickel-cadmium] type, with sufficient capacity, at the minimum [outdoor] [indoor] temperature specified, to provide a minimum cranking cycle consisting of three cranking periods of up to 8 sec per period with 8-sec intervals between crank periods.

2.13.1.2 Battery Charger

Provide a current-limiting battery charger, conforming to UL 1236, to automatically recharge the batteries. Ensure charger is capable of providing both automatic float charging and equalizing charging of the battery installation. The charger must be capable of recharging fully depleted batteries within [8] [_____] hr and providing a floating charge rate for maintaining the batteries in a fully charged condition. Provide an ammeter and voltmeter on the charger to indicate charging rate and voltage. Ensure charger has alarm functions providing indications of low battery voltage, high battery voltage, and battery charger malfunction.

2.13.2 Compressed Air Starting System

****

NOTES: Delete this paragraph and subparagraphs in their entirety if an electric starting system is specified.

The complete compressed air system should be shown on the plans. Two receivers, redundant piping, and two compressors may be required so that starting capability is not lost when tank maintenance is required. Valve arrangement should permit any receiver to be removed from service, drained, repaired, or replaced without loss of starting air from the system. The check valves between the plant air system and the air starting receivers should be considered to ensure that failure of the plant air system does not deplete the backup supply. The designer should analyze various starting scenarios and determine the necessity of providing a gasoline or diesel engine-driven compressor for a black-plant (no electrical sources available) start-up.

Each compressor should have sufficient capacity to refill the air starting system air receiver in a maximum of 3 min. Size the receiver to crank the largest engine for 15 sec at an ambient temperature of 21 degrees C 60 degrees F without recharging.

Either the air-motor starting option or the cylinder injection starting option should be used and the other paragraph deleted.

****

Provide a compressed air starting system. Use station service air. Furnish a complete system with oilers, regulators, and solenoid control valves. Provide air motor type system with a working pressure of 1.03 MPa 150 psig or cylinder injection type with a working pressure of 2.07 MPa 300 psig. Provide compressed air system piping as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.13.2.1 Air Filter

Install an air filter upstream of the air connection to each engine. The filter must be capable of removing particles 10 mm 3/8 inch and larger.

2.13.2.2 Air Driven Motors or Cylinder Injection

Either type of air starting system, air motors or direct injection, is acceptable. If an air motor starting system is used, the cranking motors must be complete with a solenoid valve, strainer, and lubricator. If cylinder injection starting is used it must be accomplished by admitting compressed air into two or more engine cylinders through a timing valve, or through a distributor into a sufficient number of cylinders to ensure successful starting regardless of piston positions.

2.13.3 Starting Aids

****

NOTE: Jacket coolant and/or lube-oil heaters are normally provided for most applications to aid starting. Either injection or glow plugs may also be required for combustion air temperatures significantly below 0 degrees C 32 degrees F. Consult manufacturers for availability and need in the application size range.

****

2.13.3.1 Jacket-Coolant Heaters

Mount a thermostatically controlled electric heater in the engine coolant jacketing to automatically maintain the coolant within ñ10 deg of the control temperature. Operate the heater independently of engine operation so that starting times are minimized, condensation is controlled, and the system ensures dependable, cold weather starts. Power supply for the heaters will be [_____] volts AC.

2.13.3.2 Glow Plugs

Design glow plugs to provide sufficient heat for fuel combustion within the cylinders to guarantee starting at an ambient temperature of -23 degrees C -20 degrees F.

[2.13.3.3 Lube Oil Heaters

Mount a thermostatically controlled electric heater in the engine lube oil storage tank to automatically maintain the lube oil within ñ10 deg of the control temperature. Operate the heater independently of engine operation so that starting times are minimized and the system ensures dependable cold weather starts. Select heaters so that heater skin temperatures do not exceed 150 degrees C 300 degrees F and have maximum heat densities of 0.02 W/mm square 13 W/inch square. Power supply for the heaters will be [_____] volts AC.

]2.14 SAFETY SYSTEM

Provide and install all system items, such as devices, wiring, remote annunciator panels, and alarm panels, as a complete system to automatically activate the appropriate signals and initiate appropriate safety actions. Provide safety system with a self-test method to verify its operability. Provide alarm signals with manual acknowledgment and reset devices. The alarm signal systems must reactivate for new signals after acknowledgment is given to any signal. The systems must be dealt with as an alarm on that system element. Provide remote annunciator panels and alarm panel as specified in paragraph PANELS.

2.14.1 Audible Signal

****

NOTE: High dB levels are required for audible alarms located near an engine. Audible signaling devices with sound levels in excess of 100 dB should be specified for engine room application, and the alarm location should be shown on the plans.

****

The audible alarm signal must sound at a frequency of [70] [_____] Hz at a volume of [75] [_____] dB at 3.1 m 10 ft. The sound must be continuously activated upon alarm and silenced upon acknowledgment. Provide signal locations as shown on the plans.

2.14.2 Visual Signal

The visual signal must be a panel light. Ensure the light is normally be off but activates to blinking upon alarm. The light must change to continuously lit upon acknowledgment. If automatic shutdown occurs, the display must remain in an activated status to indicate the cause of failure and must not reset until the cause of alarm has been cleared and/or restored to the normal condition. Shutdown alarms must be amber.

2.14.3 Alarms and Action Logic

2.14.3.1 Shutdown

Use shutdown signals to simultaneously activate the audible signal, activate the visual signal, and stop the engine.

2.14.3.2 Problem

Use problem signals to activate the visual signal.

2.14.4 Alarm Panel

Fabricate and locate the panel as specified in paragraph PANELS, and contain the following functions:

FUNCTION OR INDICATION/CONTROL ACTION (AUXILIARY ACTION)

a. Red emergency stop (push button or switch)/shutdown engine.

b. Day tank overfill indication (95 percent volume)/problem (shutdown pump supplying fuel to day tank).

b. Panel-mounted detonation sensing system with alarm and shutdown lights. The detonation system will sense individual cylinder detonation and individually adjust cylinder timing to avoid detonation. The system must be programmable by standard PC with software and operating manual supplied at no additional charge. The system installed must have the capability of up to 30 crankshaft degrees of total timing variation for each cylinder. Beyond a programmed limit, the system will act to shut down the engine.

c. Engine overspeed indication (overspeed indication point as recommended by the engine supplier)/shutdown engine.

d. High lube-oil temperature indication (temperature as submitted)/shutdown engine.

e. Low lube-oil pressure indication (pressure as submitted)/shutdown engine.

f. High coolant fluid outlet temperature indication (temperature as submitted)/shutdown engine.

g. Pre-low lube-oil pressure indication (110 percent of low lube-oil pressure)/problem (none).

h. Pre-high coolant fluid temperature indication (5 degrees C 10 degrees F lower than high coolant-fluid outlet temp. alarm)/problem (none).

i. Pre-high lube oil temperature indication (5 degrees C 10 degrees F) lower before problem (none).

j. Day tank empty indication (20 percent volume remaining)/shutdown engine.

j. Crankcase pressure switch (adjustable) to detect crankcase pressure increase associated with scoring of liner and possible short term catastrophic failure. Shutdown with setpoint as submitted. Setpoint of the crankcase pressure switch is to be adjusted during start-up to provide close tolerance protection without nuisance tripping.

k. Failure to start within the specified time indication/problem (none).

[l. Compressed air low-pressure indication (80 percent of working pressure)/problem (none).

][m Engine battery voltage-low/problem (none).

][n. Engine battery voltage-high/problem (none).

][o. Engine battery charger malfunction/problem (none).]

2.14.5 Time-Delay on Alarms

For startup of the engine, install time-delay devices bypassing the low lubricating oil pressure alarm during cranking[and the low coolant-fluid outlet temperature alarm]. The lube-oil time-delay device must return its alarm to normal status after the engine starts.[The coolant time-delay device must return its alarm to normal status 5 minutes after the engine starts.]

[2.14.6 Remote Alarm Panel

****

NOTE: The remote alarm panel location should be shown on the plans. Delete requirements for the remote alarm panel where it is not used. The remote panel may be furnished loosely and unmounted, to be installed on the pump station control console by others.

****

Provide a remote alarm panel with 100 percent functional redundancy to the alarm panel.[Locate amd mount the remote panel as shown on the plans.] [Pack and ship the remote panel as directed by the Contracting Officer for installation by others on the station control console.]

]2.15 GOVERNOR

Provide each engine with a governor to control the rotational speed of the engine in response to changing load requirements. Configure the governor for safe manual adjustment of the speed during operation of the engine, without special tools.

2.15.1 Speed Regulating Governor

Maintain close speed regulation under all load conditions. Do not allow the speed variation to exceed 6 percent of normal speed when full load is suddenly applied or removed. Design the governor such that the engine speed may be changed by governor adjustment during engine operation to any speed between 80 and 100 percent of the normal speed (corresponding to normal operating pump speeds) within 2 percent. The speed fluctuation at any load is not allowed to exceed 2 percent. Mount a raise/lower speed control on the engine instrument board.[Provide speed adjust control with provisions for allowing control of the speed control circuits from a remote location.] Provide engine fuel rack servomotor suitable for operation from a 120-V AC source.

2.15.2 Emergency Overspeed Governor and Load Limit

****

NOTE: If the pump drive is out of service for extended periods with little or no maintenance, then the shutdown mechanisms for overspeed should prevent both fuel and air supplies from entering the cylinders. If the units are well maintained and used frequently, either type termination should work satisfactorily.

****

Provide an emergency governor with overspeed trip on each engine to shutdown the unit should the speed exceed a predetermined RPM. Also provide an alarm signal for remote indication. The emergency governor must be independent of the regulating governor. When the overspeed stop has been tripped, the shutdown mechanisms must be such that the engine fuel[and][or] air supply is prevented in the shortest time practicable from entering the engine cylinders. The trip mechanism may be part of the governor. Set the overload fuel limit at 110 percent of the full load as specified in paragraph FUEL PUMP.

2.15.3 Governor Controls Location

Locate governor control at a point convenient to the location of the engine instrument board as shown on the plans.

2.16 ENGINE INSTRUMENT BOARD

****

NOTES: All panels (including the engine instrument board), except the remote panel, can be combined. Delete the pyrometer devices for engines smaller than 1,000 kW 1,340 hp. See paragraph PYROMETER.

Use the first subparagraph "f" and first subparagraph "g" if diesel engines are specified; use the second subparagraph "f" and second subparagraph "g" if natural gas fueled engines are specified.

****

Provide engine instrument board as specified in paragraph PANELS, and contain the following items:

a. Coolant-fluid inlet temperature display

b. Lubricating-oil pressure indicator

c. Lubricating-oil inlet temperature display

d. Red emergency stop (push-button or switch)

e. Run-time meter

f. Fuel meter display

g. Fuel-header-pressure display

h. Manifold vacuum display

i. Intake air temperature display

j. Tachometer display

k. Engine start-stop switch

l. Start-attempt indicator light

m. Lubricating-oil prelubricating pump start-stop switch

n. Alarm panel

[o. Pyrometer display with selector switch]

****

NOTE: The following instrumentation may be included on the engine instrument board.

****

[p. Ammeter for starting battery charger

][q. Voltmeter for starting battery

][r. Timer for setting the starting battery charger's equalize charging rate duration

][s. Air starting system pressure]

2.17 PANELS

****

NOTE: All panels (including the engine instrument board), except the remote panel, can be combined into a single panel paragraph. Provide a panel-mounting location and detail for panels not mounted on the engine base. The designer may elect other locations such as adjacent to the engine, etc. Provide panel nameplate and instrument nameplate, unique identifiers, or user-preferred

identifiers. Provide sizes, materials, and attachment preferences.

Delete either the analog or electronic instruments paragraph option.

****

Each panel must be of the type and kind necessary to provide specified functions. Mount panels [on the engine base by vibration/shock absorbing type mountings][as shown on the plans]. Mount instruments flush or semiflush. Provide convenient access to the back of panels to facilitate maintenance. Calibrate instruments using recognized industry calibration standards. Provide a panel identification plate which clearly identifies the panel function as indicated on each panel. For each instrument and device on the panel, provide a plate which clearly identifies the device and its function as indicated. Ensure all instruments and devices are vibration resistant.

2.17.1 Enclosures

Design enclosures for the application and environment, conforming to NEMA ICS 6. Locking mechanisms [are optional] [must be keyed alike].

2.17.2 [Analog] [Electronic]

****

NOTE: Select appropriate alternative paragraph.

****

[Provide analog electrical indicating instruments in accordance with ANSI C39.1 with semiflush mounting. Panel-mounted instruments must [be the manufacturer's standard][have 100-deg scales] with an accuracy of no less than 2 percent. The instrument's operating temperature range must be -20 to +65 degrees C -4 to +150 degrees F.]

[Provide electronic indicating instruments that are 100 percent solid state, state-of-the-art, microprocessor controlled to provide all specified functions. Ensure control, logic, and function devices are compatible as a system, sealed, dust and water tight, and utilize modular components with metal housings and digital instrumentation. Provide an interface module to decode serial link data from the electronic panel and translate alarm, fault, and status conditions to a set of relay contacts. Ensure instrument accuracy is no less than 2 percent for unit mounted devices, and 1 percent for control room, panel mounted devices, throughout a temperature range of -20 to +65 degrees C -4 to +150 degrees F. Data display must utilize LED or back-lit LCD. Additionally, the display must provide indication of cycle programming and diagnostic codes for troubleshooting. Use a numeral height of [13 mm1/2 inch] [[_____] mminch].]

2.17.3 Parameter Display

Provide continuous indication of the tachometer, lubricating-oil pressure, and safety system parameters. Specify a momentary switch for other panels.

2.18 BASE

****

NOTES: The diesel-engine pump drive can be equipped so that it has its own base, or it can be on an

integral base with the pump and speed reducer. With an integral base, coordination with the other equipment specifications and the use of the statement, "suitable holes for anchor bolts", should be included in the plans and specifications.

Coordinate with the subparagraph VIBRATION ISOLATION AND SEISMIC RESTRAINTS under paragraph SPECIAL LIMITATIONS.
****

Construct the base of structural steel. Design the base to rigidly support the engine, ensure permanent alignment of all rotating parts, arrange to provide easy access to allow changing of lube-oil, and ensure that alignment is maintained during shipping and normal operation. Do not permit skidding in any direction during installation. Mitigate and withstand the effects of synchronous vibration of the engine and pump. Provide base with [suitable holes for anchor bolts] [[_____] mm inch diameter holes for anchor bolts]. Ensure the entire engine assembly is capable of withstanding the load imposed by earthquake forces.

2.19 MOTORS

Provide electric motors conforming to the requirements of NEMA MG 1. Provide motors with sealed ball bearings and a maximum speed of 1,800 rpm. Provide motors with drip-proof frames; ensure alternating current motors larger than 373 W 1/2 hp are of the squirrel-cage induction type for operation on [_____] V, [50] [60] Hz, three-phase AC power. Provide alternating current motors 373 W (1/2 hp) or smaller, that are suitable for operation on 120 V, [50] [60] Hz, single-phase, AC power. Use direct current motors that are suitable for operation on [125] [_____] V DC. Provide motor controllers and starters conforming to the requirements of NFPA 70 and NEMA ICS 2.

2.20 PAINTING

Clean, prime, and paint the engine and the accessory equipment including, but not limited to, panels, valves, piping, intake, and exhaust system components [in accordance with the manufacturer's standard color and practice] [as specified in Section [09 90 00 PAINTS AND COATINGS] [09 97 02 PAINTING: HYDRAULIC STRUCTURES].]

2.21 FACTORY INSPECTION AND TESTS

Prior to shipment, inspect and test each engine at the factory in the presence of the Contracting Officer or the authorized government representatives. Inspect and test all components including, but not limited to, governors, instrumentation panels, engine starting system, intake and exhaust, lubrication system, cooling system, and fuel system. Complete inspection and make all necessary repairs prior to testing. Unless otherwise directed by the Contracting Officer or the authorized government representative, perform the following factory tests:

a. Simulated emergency or overspeed trip test.

b. Sustained operation test of 4 hr at rated full load.

c. Sustained operation test of 2 hr at 70 percent of rated full load.

d. Fuel consumption tests of not less than 1 hr each at 70 and 100 percent rated full load, respectively, using [the type of diesel fuel specified][natural gas].

e. Operate engine at no load to demonstrate that the governor and its associated engine manifold shutoff valve function properly.

f. Take test data at 30-min intervals and record on the manufacturer's dieselnatural gas fueled engine test data sheets. The test data sheets must provide entries for all data required for the evaluation of diesel natural gas fueled engine performance including noise and vibration. Subbmit test data for approval as required in paragraph SUBMITTALS. Do not ship engine until the test data has been approved by the Contracting Officer.

PART 3 EXECUTION

3.1 EXAMINATION

Before performing any work, visit the installation site and verify all details of the work. For new construction, review plans and elevations for adequacy and notify the Contracting Officer in writing of any discrepancies.

3.2 INSTALLATION

****

NOTE: Provide an equipment layout on the plans which allow clear space for operation and maintenance in accordance with NFPA 70 and IEEE C2. Include requirements for staging and a laydown area for disassembly or removal and replacement of major parts of the engine. Additionally, it is advisable to provide access to remove the unit and/or major parts of equipment from the engine room and the building through either doors/passageways or equipment hatches. For large units, specify a bridge crane of an adequate capacity as recommended by the engine manufacturer.

****

Coordinate the installation of the equipment furnished under this section and related pumps and gear reducers under other sections and install in accordance with the approved installation procedures. Submit a copy of the manufacturer's installation and alignment procedures, including a detailed description of the manufacturer's recommended break-in procedure.

3.3 PIPING INSTALLATION

Do not allow any section of pipe within a building to exceed 6 m 20 ft in length between flanged fittings. Except where otherwise specified, utilize flanged fittings to allow for complete dismantling and removal of each piping system from the facility without disconnecting or removing any portion of any other system's equipment or piping. Make connections to all equipment with flexible connectors and isolation valves. Bend pipe with pipe benders, and ensure no malformation is visible on bent pipe. Properly flash pipes extending through the roof. Support piping and permit to expand and contract without damage to joints or hangers. Install drain valves of 15 mm 0.6 inch at each low point in the piping.

3.3.1 Supports

Provide hangers, inserts, and supports of sufficient size to accommodate any insulation and conform to MSS SP-58. Space supports in accordance with ASME B31.1. Do not attach piping supports to metal decking. Do not attach supports to the underside of concrete filled floors or concrete roof decks unless approved by the Contracting Officer.

3.3.1.1 Ceiling and Roof

Support exhaust piping with appropriate sized Type-41 single pipe roll and threaded rods; support all other piping with appropriately sized Type 1 clevis and threaded rods.

3.3.1.2 Wall

Make wall supports for pipe by suspending the pipe from appropriately sized Type 33 brackets with the appropriate ceiling and roof pipe supports.

3.3.2 Flanged Joints

Provide Class 125 type flanges, drilled, and of the proper size and configuration to match the exhaust outlet of the engine. Ensure flanged joints are gasketed and made to be square and tight.

3.3.3 Cleaning

After fabrication and before assembly, manually wipe clean all piping interiors of all debris.

3.3.4 Pipe Sleeves

Fit pipes passing through construction such as ceilings, floors, or walls with sleeves. Extend each sleeve through and securely fasten in its respective structure and cut flush with each surface. Build the structure tightly to the sleeve. The inside diameter of each sleeve must be a minimum of 15 mm 0.6 inch larger than the outside diameter of the passing pipe or pipe covering, and where pipes pass through combustible materials, 25 mm 1 inch larger than the outside diameter of the passing pipe or pipe covering.

3.4 ELECTRICAL INSTALLATION

Electrical installation must comply with NFPA 70, IEEE C2, and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide vibration isolation for all conduit, cable trays, and raceways attached to the engine.

3.5 ONSITE INSPECTION AND TESTS

Perform the tests outlined in the subsequent subparagraphs after complete installation of each engine and its associated equipment and in accordance with the approved Dynamic Analysis of Engine, Pump, and Governor. Include supporting calculations with the Dynamic Analysis submittal.

Record data taken during runs at 30-min intervals and include all available pressure and temperature data which is monitored by the instrumentation furnished with the engine.

3.5.1 Instruments

Verify readings of items such aspanel gauges, meters, displays, and instruments provided under the specification during all test runs by test instruments of greater precision and accuracy than the operational equipment. Calibrate instruments used in the tests by a recognized standards laboratory within 30 days prior to testing.

3.5.2 Sequence

Follow the sequence outlined in subsequent paragraphs. Make measurements and record all parameters necessary to verify that each engine meets specified parameters. If the results of any of the test sequences are not satisfactory, make adjustments or replacements and repeat the test sequence until satisfactory results are obtained.

3.5.2.1 Piping Test

a. Flush lube-oil and fuel-oil piping with the same type of fluid intended to flow through the piping, until the out-flowing fluid is free of obvious sediment and emulsions.

b. Hydrostatically pressure test the lube oil, fuel-oil and coolant piping [and piping and pressure vessels of the air starting system] at 150 percent of the maximum anticipated working pressure, but in no case less than 1.03 MPa 150 psig for a period of 2 hr to demonstrate the piping has no leaks. If piping is to be insulated, perform the test before the insulation is applied.

Submit certificates of compliance for pressure vessels including official, signed statements from the fabricators of heat exchangers and expansion tanks associated with the engine cooling system certifying compliance with ASME BPVC SEC VIII D1.

3.5.2.2 Initial Inspection

a. Visually inspect and check engine mounting bolts for proper application and torque.

b. Demonstrate correct functioning of the high and pre-high lubricating oil temperature circuit by removing the temperature-sensing elements from the engine and immersing the elements in a vessel containing controlled-temperature hot oil and recording the temperature at which the elements activate.

c. Demonstrate correct functioning of the high and pre-high coolant-fluid outlet temperature circuit by removing the temperature-sensing elements of the circuit from the engine and immersing the elements in a vessel containing controlled-temperature hot coolant-fluid and recording the temperature at which the elements activate.

3.5.2.3 Electric Protective Device Tests

Visually and mechanically inspect, adjust, test, and calibrate protective devices in accordance with the manufacturer's published instructions. Document device ratings, settings, and other operational data.

3.5.2.4 Safety Run Test

Should there be insufficient water available to operate the plant and to perform the engine tests, the Contracting Officer may delay the test for up to 9 months. The safety run test consists of the following sequence of tests:

a. Start the engine, record the starting time, and perform all of the engine manufacturer's recommended after-starting checks and inspections following a reasonable warm-up period.

b. Operate engine for at least 2 hr at 75 percent rated speed.

c. Verify proper operation of all controls.

d. Verify proper operation and set points of all gauges and instruments. Record setpoints.

e. Verify proper operation of all ancillary equipment.

f. Activate manual emergency stop switch and record the time to stop the engine.

g. Start the engine, record the starting time, perform and record the engine manufacturer's after-starting checks and inspections, and operate the engine for at least 15 min at 75 percent of rated speed.

h. Manually adjust the governor to increase engine speed past the overspeed limit. Record the engine RPM at shutdown.

[i. Mnaually fill the day tank to a level above the overfill limit. Record the level at which the overfill alarm activates. Verify shutdown of the fuel transfer pump. Drain the day tank below the overfill limit following the test.]

j. Remove the time-delay low-lube oil pressure alarm bypass temporarily from the engine safety circuits and make an attempt to start the engine. Record the results.

k. Attach a manifold to the engine oil system containing a shutoff valve in series with a connection for the engine's oil pressure sensor, followed by an oil pressure gauge, ending in a bleed valve. Move oil pressure sensor from the engine to the manifold and temporarily seal its normal location on the engine. Place the manifold shutoff valve in the open position and close the bleed valve.

l. Start the engine, record the starting time, perform and record the engine manufacturer's after-starting checks and inspections, and operate the engine for at least 15 min at 75 percent of rated speed.

m. Close the manifold shutoff valve. Slowly bleed off the pressure in the manifold through the bleed valve while observing the pressure gauge. Record the pressure at which the engine shuts down. Capture oil spillage from the bleed valve in a container. Refill oil system, remove the manifold, and reinstall the engine's oil pressure sensor on the engine following the test.

n. Start the engine, record the starting time, perform and record the engine manufacturer's after-starting checks and inspections, and operate the engine for at least 15 min at 100 percent of rated speed. Record the maximum sound level in each frequency band at a distance of 22.9 m 75 ft from the end of the exhaust piping directly along the path of discharge for horizontally discharged exhausts. Record the maximum sound level in each frequency band at a distance of [22.9 m 75 ft] [10.7 m 35 ft] from the silencer at 45 deg apart in all directions around the unit.

[o. Slowly drain the fuel from the day tank to lower the fuel level below the no fuel level limit and record the level at which the audible alarm sounds. Add the fuel back to the day tank, filling it above the low level alarm limit following the test.]

3.5.2.5 Final Inspection

a. Remove the lube-oil filter and examine the oil and filter by the engine manufacturer for excessive metal, abrasive foreign particles, and other indications of engine distress. Verify any corrective actions for effectiveness by running the engine for 8 hr at full rated speed, then re-examine the oil and filter.

b. Inspect the engine and check all engine mounting bolts for tightness and visible damage.

3.6 MANUFACTURER'S FIELD SERVICE

3.6.1 Onsite Training

****

NOTE: Delete video taping if not required.

****

Conduct training courses for the plant operating staff as designated by the Contracting Officer. The training period consists of a total of [_____] hr of normal working time and commence after the system is functionally completed, but prior to final acceptance. Cover pertinent points involved in operating, starting, stopping, and servicing the equipment, as well as all major elements addressed in the operations and maintenance manuals. Additionally, include demonstrations and instruction in all routine maintenance operations including oil change, oil filter change, air filter change, etc. [Submit two [CD] [DVD] copies of the entire training session.]

Submit a letter giving the proposed date for conducting the onsite training course[and][,] the agenda of instruction [, a description of the video taping service to be provided, and the kind and quality of the tape].

3.6.2 Field Engineer

Furnish a qualified engineer to supervise the complete installation of the engine, assist in performance of the onsite tests, and instruct personnel regarding operational and maintenance features of the equipment. Submit certification that the field engineer is qualified to perform the functions.

3.7 FIELD PAINTING

Perform field painting as specified in Section [09 90 00 PAINTS AND COATINGS] [09 97 02 PAINTING: HYDRAULIC STRUCTURES].

3.8 MANUFACTURER'S PUBLISHED INSTRUCTIONS

Post instructions, including wiring and control diagrams showing the key mechanical and electrical control elements and a complete layout of the entire system. The instruction set must be weatherproof, laminated in plastic, framed, and posted at a location as directed.

3.9 ACCEPTANCE

Final acceptance of the engine will not be made until the Contractor has successfully completed all tests, corrected all defects in installation material, and/or installation procedures, and all deficiencies identified in on-site testing or routine operation have been corrected.

3.10 CLOSEOUT ACTIVITIES

3.10.1 As-Built Drawings

Submit As-Built Drawings accurately depicting the as-built configuration of the supplied, installed, and accepted dieselnatural gas fueled engine pump drive.

3.10.2 Operation and Maintenance Manual

Also submit an Operation and Maintenance Manual for the dieselnatural gas fueled engine detailing start-up and operating procedures, lubrication instructions, installation and alignment procedures, routine maintenance requirements and procedures, complete detailed procedures for disassembly and reassembly of the engine, parts list for all parts detailed, assembly plans of the engine showing all parts, suppliers for all parts, settings and adjustment for protective devices, and a list of all tools, handling devices, and spare parts furnished.

NOTE: This guide specification covers the requirements for fans, blowers or vacuum pumps and drive units.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

PART 1 GENERAL

1.1 UNIT PRICES

****

NOTE: On many hazardous, toxic, radioactive waste (HTRW) projects, the Contractor is required to treat air or off-gas, as well as furnish the equipment. Measurement and payment and unit pricing may be necessary to cover treatment costs.

When it is determined that lump sum contract is advisable this paragraph will be deleted.

****

Measurement and payment will be based on completed work performed in accordance with the drawings, specifications, and the contract payment schedules. No additional payment will be made for installation, calibration or commissioning of the equipment.

1.1.1 Measurement

Volume of [air supplied] [off-gas treated] will be determined by initial and final meter readings.

1.1.2 Payment

Payment will be made for volume of [air supplied] [off-gas treated] at the contract unit price per actual cubic meter foot. Payment will include the furnishing of testing, plant, labor, and material and incidentals necessary to complete the work, as specified and as shown.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detailed Drawings; G, [_____]

Detailed Process Flow Diagrams; G, [_____]

SD-10 Operation and Maintenance Data

Operating and Maintenance Instructions

1.4 QUALITY ASSURANCE

1.4.1 Contractor

Contractor must have a minimum of [2] [3] [5] [_____] years of experience in the construction of systems for handling sour gas, condensable gas, off-gas or vapor.

1.4.2 Single Source Supplier

Assign to a single supplier full responsibility for the furnishing of the off-gas moving system. The designated single supplier, however, need not manufacture the system but must coordinate the selection, assembly, installation, and testing of the entire system as specified herein.

1.4.3 Manufacturer's Representative

Provide the services of a manufacturer's field service representative who is experienced in the installation of the equipment furnished and who has complete knowledge of the proper operation and maintenance of the system. Submit the names and qualifications of the manufacturer's representative and training engineers, and certification from the manufacturer that the representative and trainers are qualified in the appropriate technical areas.

1.4.4 Detailed Drawings

Submit detailed drawings including location of components, layout and anchorage of equipment and appurtenances, equipment relationship to other parts of the work, clearances for maintenance and operation of the off-gas system and subsystems. Drawings must be to the approved scale.

1.4.5 Detailed Process Flow Diagrams

Submit detailed process flow diagrams and data including, but not limited to: air and off-gas stream flows, direction of flow, range of flow rate and range of composition, identified by lines and arrows denoting the direction and destination of the flow; material, mass and energy balances for the entire air and off-gas system; subsystem equipment, operating capacity and operating conditions; blowers and pumps, valves and other in-line devices; sizes of conveying devices (pipe, ducts, etc.); number of parallel components or lines.

1.4.6 Piping and Instrumentation Diagram

Submit a piping and instrumentation diagram indicating: process equipment; instrumentation; piping and valves; stacks, vents and dampers; control equipment (including sensors, process controllers, control operators, valves, interlocks, and alarms); labels and other necessary information to correlate to the process flow diagram. Include blowers and pumps, valves and other in-line devices.

1.5 PARTNERING/PRE-INSTALLATION MEETING

****

NOTE: Remove this paragraph when meeting is not required.

****

[Partnering] [Pre-installation] meeting will be required. Ensure that involved subcontractors, suppliers, and manufacturers are [notified] [represented]. Furnish the date and time of the meeting to the Contracting Officer for approval.

1.6 DELIVERY, STORAGE, AND HANDLING

Store in a clean, dry location equipment delivered to the site and designated for storage; cover the equipment for protection against dust and moisture. For equipment stored longer than 60 days, suspend silica bags in the outlet and inlet of unit, fill bearings full of grease, fill unit with oil, coat machine surfaces with grease, and enclose entire unit with plastic or tarps. Turn shaft of rotating equipment, including motors, every two weeks to prevent flat spots on bearings.

1.7 SEQUENCING AND SCHEDULING

****

NOTE: Coordinate with the appropriate air pollution control equipment. The temperature increase induced by the air moving equipment may affect the materials selected in other Sections of the contract. Review the table of contents to assure that appropriate specifications have been included.

****

Details of and requirements for [stack] [vapor injection] [vapor extraction well construction] [_____] and treatment equipment are included in other sections of this specification. Notify the Contracting Officer of any deviations from head conditions specified for the source and discharge to ensure coordination with this Section. Provide pipe and valves not specified in this Section in accordance with Section 31 21 00 OFF-GASSING

MITIGATION.

1.8 EXTRA MATERIALS

****

NOTE: This paragraph covers items to be furnished to the Government by the Contractor for future maintenance and repair. Items that might be difficult to obtain because of color or pattern match, or spare parts needed to ensure continued operation of critical equipment should be included. Specifications should identify the items, state the quantities required, and indicate to whom, when, and where items are to be delivered. Insert text as required or remove this paragraph.

****

Deliver auxiliary equipment, tools and spare parts at the same time as the equipment to which they pertain. Protect and safeguard the equipment, tools and parts until completion of the work, at which time deliver them to the Contracting Officer. Furnish auxiliary equipment and spare as follows:

a. Spare parts for each different item of material and equipment specified including the parts recommended by the manufacturer to be replaced after [1] [and] [3] [year] [years] service.

b. For each air mover: one extra of each part used that is made from glass, hard rubber, or clear plastic; one complete set of gaskets; [4] [_____] air intake filter replacement cartridges.

c. Provide one complete set of special tools, calibration devices, and instruments [as recommended by the manufacturer for field maintenance of the system] [as required for operation, calibration, and maintenance of the equipment]. Special tools are considered to be those tools which, because of their limited use, are not normally available but which are necessary for the particular equipment. Special tools must be high-grade, smooth, forged, alloy, tool steel.

d. One or more [tool boxes] [tool boards] [steel tool cases] complete with flat key locks, two keys, and clips or hooks to hold each special tool mounted [in the equipment room] [on the wall in a convenient location] [as directed by the Contracting Officer].

e. One [pressure] [lever type] grease gun or other lubricating device for each type of grease required.

f. [_____] sheaves of differing diameter covering the range of operation of belt driven equipment.

g. [_____].

1.9 MAINTENANCE SERVICE

****

NOTE: This paragraph covers provisions for maintenance service as applicable to critical systems, equipment, and landscaping. Insert text as required or remove this paragraph.

****

Maintenance service includes [_____].

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Design Requirements

****

NOTE: Determine design wind speed from ASCE 7-16 or UFC 3-301-01. Use 161 km/h 100 mph minimum. Use 1.2 kPa 25 psf snow load for most heavy snow climates; delete snow load where maximum snow is not a factor. In some cases, local climates and topography will dictate that a value greater than 197 Pa 25 psf be used for snow loading; this may be determined from ANSI A58.1, local codes, or by research and analysis of the effect of local climate and topography. Coordinate with paragraph Seismic Requirements in PART 3.

****

Ensure capacity and design of the air moving equipment and accessories is suitable for 24-hour full load service in an [outdoor] [indoor] [_____] location, and meets the following criteria.

Design Life	
Minimum	[_____] years
Altitude (above MSL)	
Minimum	[_____] m ft
Barometric pressure	
Maximum	[_____] kPa in Hg
Minimum	[_____] kPa in Hg
Ambient air temperature	
Maximum	[_____] degrees C F
Minimum	[_____] degrees C F
Seismic parameters	[_____]
Soil bearing capacity	
Maximum	[_____] MPa psf
Wind speed	
Maximum	[_____] km/h mph

Ground snow load	
Minimum	[_____] kPa psf
i. Air relative humidity	
Maximum	[100+] [_____] percent
Minimum	[_____] percent

2.1.2 Selection Criteria

****

NOTE: Requirements included here may limit the selection of specified equipment.

****

Design air moving equipment using criteria based upon actual model developmental test data, and select it at a point within the maximum efficiency for a given impeller/casing combination. Deviations within [10] [5] [3] percent of maximum efficiency are permissible. Air moving equipment having impeller diameters larger than [90] [95] percent of the published maximum impeller diameter for the casing, or less than [15] [10] [5] percent larger than the published minimum impeller diameter for the casing, will be rejected. Do not base acceptable maximum impeller diameter calculations on percentage of impeller diameter range for a given casing.

2.1.3 Performance Requirements

****

NOTE: Provide required information for each air mover identified on the drawings. Co-ordinate with PART 2 and delete inapplicable requirements. Verify that more than one manufacturer's product can meet the efficiency requirement, ideally more than three.

****

Equipment identification number [_____] must be [appropriate for the capacity requirements of this paragraph] [a fan] [a blower] [a vacuum pump] [_____]. [Standard] [Actual] output volume must be a minimum of [_____] cubic meters/second cfs at a [minimum inlet] [minimum positive discharge] pressure of [_____] kPa feet of water [gage] [actual] [positive] [vacuum]. The minimum efficiency must be [_____] percent under the stated conditions.

2.1.4 Service Conditions

****

NOTE: Delete chemical data if the equipment is designed to deliver a fresh air supply. Standard materials will be adequate.

****

Service [air supply to] [vapor collected from] [municipal landfill] [hazardous waste landfill] [petroleum spill] [subsurface remediation unit] [air stripper]. Anticipated contaminant concentration in the [air] [vapor] [off-gas] is:

[_____]	[_____] ug/L Maximum
	[_____] ug/L Average
pH	[_____] Minimum
	[_____] Average
	[_____] Maximum
Sulfide	[_____] mg/L Maximum
	[_____] mg/L Average
Ammonia	[_____] mg/L Maximum
	[_____] mg/L Average

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate equipment that has been in satisfactory operation at least [2] [_____] years prior to bid opening. Provide equipment supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Ensure pieces of equipment of the same types are products of the same manufacturer. Provide new and unused equipment, except for test equipment. Materials may be reprocessed/recycled with equivalent durability and product warranty/guarantee.

2.2.2 Nameplates

Provide each piece of equipment with a standard nameplate securely affixed in a conspicuous place showing the manufacturer's name, address, type or style, model, serial number, and catalog number. In addition, the nameplate for each air moving unit must show the capacity in standard cubic meters/second feet per minute (SCFM) at rated speed in rpm and head in kPa inches of water. Nameplate for each electrical motor must show, at least, the minimum information required by paragraph 10.38 of NEMA MG 1. Show any other information that the manufacturer may consider necessary to complete identification on the nameplate.

2.3 AIR MOVING EQUIPMENT

****

NOTE: Coordinate these paragraphs with a schedule on the drawings showing the air moving equipment identification number and type and with paragraph Performance Requirements. Delete inappropriate types of equipment or service.

****

Furnish and install air moving equipment complete with drive units, filters, controls and appurtenances indicated or specified. Provide equipment capable of operating at partial-load conditions without increased vibration over the normal vibration at full load operation and capable of continuous operation down to the lowest step of unloading. Provide each unit with unloading, vibration isolators, thermal overloads, high-and-low pressure safety cutoffs, low oil pressure cutout, internal motor-winding temperature sensing protection device, internal pressure relief valve, a complete oil charge, and protection against short cycling. Submit the following:

2.3.1 Capacities and pressure differentials

Make and model with associated performance charts and curves (including the complete selection of impeller sizes for a given casing for centrifugal blowers).

2.3.2 System Layout

Diagrams showing the complete layout of the entire system, including equipment, piping, valves, wiring and control sequence. Condensed operating instructions in typed form explaining preventative maintenance procedures, safe methods of checking the equipment for normal operation, and safe procedures for starting and stopping the equipment. Post diagrams and instructions, framed under glass or in approved laminated plastic, where directed before acceptance testing of the systems.

2.3.3 Component Items List

Complete list of equipment and materials. A listing covering component items forming a system or items that are interrelated and scheduled to be coordinated and submitted concurrently. Schedule certifications to be submitted with the pertinent drawings. Include in the data tabular lists showing location, features, or other pertinent information regarding products, materials, equipment, or components to be used in the work.

2.3.4 Manufacturer Testing Certification

Date statements after contract award. State the Contractor's name and address, project and location, and the specific requirements which are being certified. Indicate in the certificate the methods of testing used. In lieu of a certificate, a seal or label from a nationally recognized testing agency will be acceptable as evidence that the equipment conforms to agency requirements.

2.4 FANS

****

NOTE: See Section 1 (Fans and Systems) of AMCA 201 (Fan Application Manual) for additional guidance on selection of fans.

****

Provide centrifugal or propeller type fans as best suited for the application.

2.4.1 Single-Stage

****

NOTE: Fan pressure will vary with fan revolutions per minute (RPM) ratio squared. Single stage

equipment allows flow variation at low end pressure.

Fans are generally divided into two classifications based on the airflow through the impeller. The classes are centrifugal and axial. In axial fans, airflow is parallel to the shaft. Axial fans are most commonly used in low static pressure applications, while centrifugal fans are used at higher static pressures.

****

A single-stage fan is allowable for the capacity range 0.025 to 50 cubic meters/second 53 to 106,000 cfm at pressure ranges from 0.25 to 15 kPa 0.08 to 5 feet of water column.

2.4.2 Industrial Centrifugal

An industrial centrifugal fan is allowable for the capacity range over 45 cubic meters/second 95,000 cfm at pressure ranges from 7.5 to 12 kPa 2.5 to 4 feet of water column.

2.4.3 Pressure Blower

A pressure blower fan is allowable for the capacity range of less than 2.4 cubic meters/second 5,100 cfm at pressure ranges from 10 to 30 kPa 3.3 to 10 feet of water column.

2.4.4 Multiple Stage

****

NOTE: Multiple stages limit volume and develop pressures toward the upper end.

****

A multi-stage pressure blower fan is allowable for the capacity of less than 3.3 cubic meters/second 7,000 cfm at pressure ranges up to 70 kPa 23 feet of water column or vacuum to -40 kPa -13 feet of water column.

2.4.5 Backwards Inclined Impeller

****

NOTE: If the flow is relatively clean, backwards inclined impeller fans should be specified for higher efficiency and quieter operation.

****

A backwards inclined impeller fan is allowable for the capacity range over 190 cubic meters/second 403,000 cfm and pressure ranges from 2.5 to 4.5 kPa 0.84 to 1.5 feet of water column.

2.5 DYNAMIC BLOWERS

****

NOTE: Dynamic blowers should be designed for highest inlet pressure loss and highest inlet air temperature conditions within the design operating range.

****

Provide oil-free dynamic blowers of modular design with the required number of compression stages to comply with the specified operating requirements.

2.5.1 Single Stage Centrifugal

A single stage centrifugal blower is allowable for pressure ranges from 0.25 to 7.5 kPa 0.084 to 2.5 feet of water column.

2.5.2 Regenerative

****

NOTE: Regenerative blowers are compact single or multi-stage centrifugal blowers.

****

A regenerative blower is allowable for capacity up to 5 cubic meters/second 10,000 cfm and pressure ranges of 20 to 60 kPa 6.7 to 20 feet of water column or vacuum up to -35 kPa -12 feet of water column.

2.5.3 Axial Flow

An axial flow blower is allowable for pressure ranges higher than 70 kPa 23 feet of water column or vacuum requirements greater than -40 kPa -13 feet of water column.

2.6 POSITIVE DISPLACEMENT BLOWERS

2.6.1 Rotary Lobe

A rotary lobe blower is allowable for capacity up to 14 cubic meters/second 30,000 cfm at pressures higher than 125 kPa 42 feet of water column or up to 10 cubic meters/second 21,200 cfm at vacuum up to -125 kPa -41.8 feet of water column.

2.6.2 Helical Screw

A helical screw blower is allowable for capacity up to 1 cubic meter/second 2,100 cfm and pressure ranges of 30 to 60 kPa 10 to 20 feet of water column or vacuum up to -35 kPa -11.7 feet of water column.

2.7 VACUUM PUMPS

2.7.1 Dry Rotary Blower

A dry rotary blower vacuum pump is allowed for vacuum flows of 1 cubic meter/second 2,100 cfm at -90 kPa -30.1 feet of water column to 6 cubic meters/second 12,700 cfm at -60 kPa -20.1 feet of water column.

2.7.2 Water-Sealed Rotary Blower

A water-sealed rotary blower vacuum pump is allowed for vacuum flows of 1 cubic meter/second 2,100 cfm at -80 kPa -26.8 feet of water column to 6 cubic meters/second 12,700 cfm at -70 kPa -23.4 feet of water column.

2.7.3 Rotary Vane

A rotary vane vacuum pump is allowed for vacuum flows of 2.5 cubic m/second 5,300 cfm at -100 kPa -33.5 feet of water column to 4.25 cubic m/second 9,000 cfm at -60 kPa -20.1 feet of water column. Include oil injection and outlet demisting systems for each rotary vane vacuum pump.

2.7.4 Liquid Ring

A liquid ring vacuum pump is allowed for vacuum flows of 2.5 cubic m/second 5,300 cfm at -80 kPa -26.8 feet of water column to 8 cubic m/second 16,950 cfm at -60 kPa -20.1 feet of water column. Include water injection systems and outlet water separation systems for each liquid ring vacuum pump.

2.8 CASING OR HOUSING

Provide casing or housing of modular design to permit inspection or removal and replacement of wearing parts. Provide ample clearance between the impeller or blades and casing. Incorporate ribbed construction to resist heat accumulation, deflection and distortion under the specified operating conditions.

2.8.1 Construction Materials

****

NOTE: Three types of spark resistant construction are available for fans as detailed by AMCA 99 (Classification for Spark Resistant Construction). Temperature is limited to 177 degrees C 350 degrees F when using aluminum parts.

Type A - all aluminum fan housing, inlet cone and wheel with a ground and polished steel shaft cover with an aluminum sleeve.

Type B - aluminum wheel and wear plate where shaft passes through the housing.

Type C - aluminum inlet cone and wear plate where shaft passes through the housing.

****

Fabrication must be from [alloy steel] [monel] [316 stainless steel] [304 stainless steel] [heavy gauge hot rolled low carbon steel with continuous welds] [fiberglass in accordance with ASTM D4167]. Construction must be close grain cast [iron] [aluminum Type [A] [B] [C] in accordance with AMCA 99] of uniform quality and free from blowholes, porosity, hard spots, shrinkage defects, cracks, and other injurious defects.

2.8.2 Single Piece Casing

Provide single piece casings with separate head plates.

2.8.3 Horizontally Split Casing

Machine horizontally split casings at the split to maintain the pressure without a gasket.

2.8.4 Vertically Split Casing

Provide vertically split casings consisting of rigid sections secured between inlet and outlet heads by steel tie rods.

2.8.5 Connections

2.8.5.1 Inlet and Discharge Connections

****

NOTE: Threaded and sweat connections should be considered if flange-connected types are not available in small capacity units.

****

Inlet and discharge connections must be ASME B16.1 or ASME B16.5 [Class 125] [125 pound] [_____] drilled and tapped flanges and are an integral part of the head. Connections 75 mm 3 inches in diameter and smaller must be [threaded] [sweat] [_____].

2.8.5.2 Casing Drains

Provide tapped and plugged drains at the low points in the casing.

2.8.5.3 Lifting Eyes

Provide casing with lifting eyes capable of supporting the equipment for installation and maintenance purposes.

2.9 BLADES OR IMPELLERS

****

NOTE: Require non-sparkling impeller material if it is likely that the mixture of air and other gases will be within the explosive limits during the project life.

****

Cast or fabricate blades, vanes or impellers [iron] [aluminum] [aluminum alloy] [fiberglass] [monel] [steel] [carbon steel] [phenolic coated steel] [PTFE coated steel] [304 stainless steel] [316 stainless steel] [non-sparkling material].

2.9.1 Dynamic Impellers

Provide guide or diffuser vanes configured to receive and direct flow to the downstream impeller at the inlet to each centrifugal blower stage. Ensure centrifugal impellers are [open radial bladed] [closed backward bladed]. Butt multiple stage impeller hubs against each other either directly or through one piece metal spacers.

2.9.2 Rotary Lobe Impellers

Provide straight, two-lobe involute type rotary lobe impellers which operate without rubbing, liquid seals, or lubrication.

2.10 SHAFT

Make shaft of accurately machined, ground and polished high grade [ductile iron casting] [alloy steel] [stainless steel] [carbon steel]. Impellers or blade [and shaft must be a common casting.] [assembly must be mounted and keyed to the shaft and secured by a lock nut.] Design must permit inspection or replacement of the [seals] [and] [bearings] without [disconnecting suction or discharge piping] [disassembling the casing].

Design the shaft to operate at below [80] [90] percent of the first critical speed. Provide shaft of sufficient diameter, mass and strength to perform the work required with minimum vibration.

2.11 SEALS, GASKETS AND PACKING

Select gasket and packing material in accordance with WEF MOP 11. Ensure gaskets and seal ratings encompass the maximum pressure or vacuum capacity of the equipment and the ranges of temperature and quality of the off-gas or air.

2.11.1 Shaft Seals

Provide solid carbon mechanical ring shaft seals where the shaft passes through the inlet and discharge heads. Ensure seals are [purged] [or] [non purged], [balanced] [or] [unbalanced] to conform to specified service requirements. Ventilate to the atmosphere on the impeller side of shaft seals to eliminate carry-over of lubricant into the air stream.

2.11.2 Internal Seals

Provide labyrinth seals between blower stages.

2.11.3 Bearing Seals

Provide a [lip type oil] [grease] seal at each bearing to prevent lubricant from leaking into the output. Ventilate to the atmosphere on the impeller side of oil seals to to eliminate any carry-over of lubricant into the air stream.

2.12 BEARINGS

****

NOTE: Verify bearing L-10 life requirements.

****

2.12.1 Shaft Bearings

Support shaft by anti-friction [spherical ball] [roller] bearings designed for both radial and thrust loads and sized for a minimum L-10 life of [30,000 hours] [50,000 hours] [5 years] continuous operation as defined by ABMA 9 or ABMA 11.

2.12.2 Blower Bearings

****

NOTE: Delete inapplicable lubrication methods.

****

Provide each blower with two [pressure, oil lubricated, sleeve type journal] [splash, oil lubricated, anti-friction type] [oil bath lubricated] [grease lubricated] bearings. Bearings must be self-aligning, designed for both radial and thrust loads and sized for an L-10 life of [30,000 hours] [50,000 hours] [5 years] continuous operation as defined by ABMA 9 or ABMA 11. Replace the bearings without disassembling the casing or disconnecting piping.

2.13 DRIVE CONNECTION

****

NOTE: Direct-driven equipment is limited to common synchronous motor speeds (3600, 1800, and 1200 rpm). This equipment is usually noisier than belt-driven equipment because it tends to run at higher speeds. Motors that run slower than 1800 rpm are expensive and not as readily available.

On belt-driven equipment, the speed is increased or decreased by changing pulleys or changing the diameter of adjustable pitch pulleys. On a fixed air moving system, flow rate is directly proportional to speed. The power requirement varies with the cube of the speed. A 25 percent increase in speed raises the flow rate 25 percent, but it almost doubles the power requirement. V-belts are generally used on positive displacement blowers.

****

Each unit must be [close coupled] [directly connected through a flexible coupling] [driven by a V-belt].

2.13.1 Coupling

Provide heavy-duty, flexible forged steel spacer coupling, keyed or locked to the shaft. Disconnect without removing the driver half of the driven unit half of the coupling from the shaft. Machine outside surface of coupling parallel to the axis of the shaft. Machine coupling faces perpendicular to the axis of the shaft.

2.13.2 V-Belt Drive

Design v-belt drive for no less than 150 percent of the driving motor capacity. When belt drive is provided, provide an adjustable sheave to furnish no less than 20 percent speed adjustment. Select sheaves to provide the required capacity at the approximate midpoint of the adjustment. The drive belt must be [covered with an acoustically treated sheet metal guard] [or] [completely enclosed within the unit casing].

2.14 GEARS

Make gears of hardened, helical, alloy steel, manufactured in accordance with AGMA 6011 with a minimum 1.5 service factor applied to full power rating of the motor. [Furnish single speed centrifugal blower with high speed increasing gears.] [Time positive displacement impellers by a pair of machined, heat-treated, spur tooth timing gears.] Mount timing gears on the impeller shafts on a tapered fit and secure by a lock nut.

2.15 LUBRICATION SYSTEM

****

NOTE: Delete inapplicable lubrication systems.

****

Provide [pressure oil lubricated] [splash oil lubricated] [grease lubricated] drive. Provide [pressure oil lubricated] [splash oil lubricated] timing gears and gear end bearings. Lubricate bearings and seals as previously indicated. Design system to prevent leakage and contamination. Design oil-lubrication systems and vents so that oil vapors do not enter the air stream or motor and the shaft bearings will be isolated. Provide each oil reservoir with an opening for filling, an overflow opening with overflow container at the proper location to prevent overfilling, and a drain at the lowest point.

2.15.1 Pressure Oil

Provide console mounted pressure oil lubrication system and include a main oil pump driven by the shaft, an auxiliary electric motor driven oil pump, an oil cooler, an oil [strainer] [or] [filter], oil reservoir with 3-minute minimum retention time, and the switches, temperature and pressure gauges and controls necessary to protect unit. The electric motor driving the auxiliary oil pump must be totally enclosed fan cooled (TEFC), Design Type B in accordance with NEMA MG 1, with Class F insulation and equipped with 120 volts space heaters. Provide control in accordance with NEMA ICS 1. Provide factory piped and wired lubrication system with minimal interconnecting piping between the console and the oil pump required in the field.

2.15.2 Splash Oil

Provide splash lubrication by a slinger on the shaft splashing oil into the bearing whenever the compressor is running. A constant level oiler located on the bearing housing or a metering orifice will be provided to maintain the oil level in the oil reservoir integral with the bearing housing. Provide a sight level gauge in the bearing housing. Provide a labyrinth seal combined with an atmospheric vent to prevent oil contamination of the air stream.

2.15.3 Grease

Equip grease type bearings with grease fittings. Extend grease tubing to a convenient location if fittings are inaccessible. Provide grease fittings which prevent over-lubrication and over-pressurization.

2.16 INTAKE FILTER

Install intake [screen and filter] [filter] on inlet to each unit.

2.16.1 Efficiency

Intake filter must be at least [90] [96] percent efficient when tested in compliance with ASHRAE 52.2 dust spot method. [Provide high volume bag intake filter for filtration down to 5 microns 2 mils on vacuum pump intake.]

2.16.2 Surface Area

Provide a minimum filter surface area of 1 square meter per 0.127 cubic m/second 1 square foot per 25 cubic feet/minute to produce a filter flow through velocity of less than 0.127 m/second 25 feet per minute.

2.16.3 Media

Filter media must be [washable] [or] [disposable] dry type felt material made from [glass fiber,] [polyester,] fiber resistant to moisture and chemicals to which it will be exposed with 25 mm 1 inch pleat separation.

2.16.4 Weather Hood

Coat steel intake hood and filter housings with a chemically resistant coating and ensure entire unit element is resistant to moisture and chemicals to which it will be exposed.

2.17 NOISE MINIMIZATION

****

NOTE: Equipment selection should consider the pressure drop through silencer or muffler.

****

Install flexible connections and silencers, muffler or sound barriers on the equipment [discharge] [inlet and discharge] to attenuate sound level.

2.17.1 Silencer

****

NOTE: Canister type silencers should be considered for attenuation of low frequency sound levels, pressures higher than 5 kPa 20 inches of water and velocities greater than 20 meters per second 4,000 feet per minute. Use high temperature acoustical packing for temperature greater than 122 degrees C 250 degrees F.

****

Provide each blower with [inlet] [and] [discharge] silencers. Use silencers for [standard] [critical] grade silencing. Provide [absorption] [canister] [chamber] type intake silencers. Provide [absorption] [canister] [chamber] [combination chamber-absorption] type discharge silencers. Construct canister type silencer of two concentric perforated cylinders lined with high temperature acoustical packing forming an annular flow path, with an internal plug creating a blocked line of sight. Use silencer size as recommended by the silencer manufacturer and compatible with the blower requirements. Ensure silencer connections match the adjacent piping. Provide mounting brackets as required for silencer support. Construct silencer of heavy-duty rolled and welded steel plate with the inner liner welded to the outer shell to acoustically deaden the outer shell.

2.17.2 Muffler

****

NOTE: Hot-gas mufflers should be considered to effectively minimize the transmission of hot-gas pulsations whenever the noise level is an important consideration.

****

Install hot-gas muffler [on the intake] [on the exhaust] [in-line] to minimize the transmission of hot-gas pulsations.

2.17.3 Acoustical Insulation

Wrap silencers, [interior air piping,] [expansion joints,] [valves,] [and] [drive guards] with 25 mm 1 inch thick high density woven glass fiber mat having a minimum density of 4.6 kg/square meter 15 ounces/square foot and lag with a 0.41 mm 0.016 inch thick aluminum jacket. Provide insulation conforming to EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.

2.17.4 Sound Barriers

****

NOTE: Barriers generally have limited high frequency attenuation.

****

Make sound barriers of insulated ductwork fastened to sheet steel walls. Limit flow velocity parallel to barriers to 1200 m 4000 feet per minute at pressures less than 5 kPa 20 inches of water.

2.18 MONITORING

****

NOTE: On projects with extensive process monitoring and control, replace text with a reference to Section 40 60 00 PROCESS CONTROL.

****

Equip each unit for monitoring the flow downstream of any bypass connections. Calibrate sensors with standards traceable to NIST and in conformance with NIST SP 250.

2.18.1 Flow

[Provide a turbine type flow meter equipped with transmitter and recorder for continuous metering of the process flow. Ensure accuracy is within 0.5 percent of full scale.] [Provide gas meters conforming to AGA ANSI B109.2.]

2.18.2 Temperature

2.18.2.1 Thermometers

Provide thermometers conforming to ASME PTC 19.3 TW with wells and temperature range suitable for the use encountered. Provide thermometers to indicate [inlet air temperature,] [discharge air temperature,] [and] [lubrication oil temperature.] Ensure thermometers are either red-reading mercury-in-glass type or dial type. Scale range must include full range of expected operation and up to 125 percent, but no more than 150 percent of maximum. Ensure accuracy is within 0.5 percent of full scale.

2.18.2.2 Thermocouples

Provide sensors conforming to ISA MC96.1, Type K, and provide downstream of each blower or as otherwise directed. Ensure thermocouple is suitable for continuous operation and control at temperatures up to [_____] degrees C F, accurate to [0.75] [_____] percent of full scale, and long enough to be inserted 150 mm 6 inches into the air flow. Provide thermocouple with an adjustable flange and with a protecting tube suitable for insertion into the air flow without support of the projecting end. Supply compensating lead wire 1.52 mm 16 gauge in diameter and 30 m 100 feet long with a weatherproof braid for connecting the thermocouple to the instrument. The installed unit must indicate gas passage temperatures and activate the high temperature alarm when the set point temperature is exceeded.

2.18.3 Pressure

****
NOTE: Verify the pressure ranges for the system.
****

Provide 6 mm 1/4 inch NPT female high and low pressure connections with a [stainless steel bar stock valve] [suitable shutoff cock] at each connection. [Provide high pressure connection to the gauge with a 10 micrometer 10 micron pleated paper filter and the low pressure connection with a fine mesh stainless steel strainer.] [Provide each pressure connection to the gauge with a snubber.]

2.18.3.1 Draft Gauge

Provide gauge conforming to ASME B40.100 with a diaphragm or bellows actuating system, a circular scale and a zero adjustment screw. Provide inlet gauges with a range of 0 to 7.5 kPa 0 to 30 inches water gauge vacuum. Include the accessories for [control panel] [wall] [pipe] mounting.

2.18.3.2 Pressure Gauge

Provide gauges conforming to ASME B40.100 with a single Bourdon tube style actuating system, a circular scale and a zero adjustment screw. Provide discharge gauges with a range of 0 to 75 kPa 0 to 11 psi. Include the accessories for [control panel] [wall] [pipe] mounting.

2.18.3.3 Differential Pressure Gauge

Equip housing of each unit with a direct-reading gauge that measures the differential pressure range [of 0 to 100 kPa 0 to 14.5 psi with an accuracy of plus or minus 2 percent of full scale, calibrated linearly with 2 kPa 0.34 psi scale graduations] [necessary to operate in conjunction with the corresponding venturi tube]. During operating conditions the pointer must be within the mid-range of the gauge. Ensure accuracy is within 0.5 percent of full scale.

2.18.3.4 Piston Element

Provide piston type element consisting of a spring-supported, corrosion resistant piston moving inside a glass cylinder with an operating pressure of 1.03 MPa 150 psi. Provide cylinder with stainless steel end flanges with Viton O-ring seals and a cylinder burst pressure of no less than 4.15 MPa 600 psi. Construct the gauge such that a 3-valve manifold is not necessary. If only one bar stock valve is closed, do not damage the gauge by up to 2.1 MPa 300 psi differential pressure in either direction.

2.18.3.5 Bellows Element

Install bellows pressure sensing element to measure pressure differential across the air moving equipment and dual opposed, liquid filled, rupture-proof type with bellows movement converted to rotation and transmitted by a torque tube. Provide stainless steel bellows housing with a rated working pressure of no less than 3.5 MPa 500 psi. Use liquid to fill the bellows that is suitable for the expected maximum temperature of the off-gas and the minimum ambient temperature.

2.18.4 Contaminant Monitoring and Sampling

2.18.4.1 Explosimeter

Perform continuous monitoring and recording of percentages of upper and lower explosive limits.

2.18.4.2 Hygrometer

Locate humidity sensor downstream of the heat exchanger or blower.

2.18.4.3 Sampler

Provide sampling port and equipment for collecting discrete and composite samples with adequate access for personnel and equipment.

2.18.4.4 Transmitter

Use transmitter to provide an analog two-wire electrical 4-20 milliamp signal directly proportional to the differential pressure and accurate to within 0.25 percent of sensor indication. Provide transmitter with built-in pulsation damper and suitable over-range protection. Do not require recalibration due to power outages. Transmitter must be UL listed for [Class 1, Division 1, Group D hazardous locations] [the electrical classification for the area as indicated on the drawings]. Supply each transmitter with a factory assembled five-valve stainless steel manifold. Furnish vent valves on upper ports of each transmitter. Mount and install transmitter according to manufacturer's recommendations.

2.18.4.5 Remote Indicator and Recorder

Display monitored parameters and excursion alarms locally on the control panel. Record digital data at intervals not exceeding one minute. Maintain process data in the control room and record on magnetic media in the approved micro computer compatible digital format. Flow information must include rate monitoring, integration and totalizing. Maintain hard copies of recorded data and summaries of recorded data in the control room. Ensure copies are available upon request.

2.19 CONTROL SYSTEM

****

NOTE: The designer will decide which automatic controls are needed and delete any inapplicable items.

****

Provide [a manual][an automatic] control system. Automatic controls are responsible for the balancing of the capacity with system requirements. Use these controls to automatically balance the equipment capacity with the load. Provide the system with the necessary control devices required for normal operation. TAlso include each of the following: a safe system operating mode when controls fail, indications for system failure, protective mechanisms and controls that are required for the safe operation of system equipment in an enclosure conforming to NEMA ICS 6. Submit wiring and ladder diagrams, and control sequences showing the control of the entire system.

2.19.1 Sequence of Control

****

NOTE: Develop and insert the sequence of control for each system.

****

The sequence of control are as follows: [_____].

2.19.2 Sequence of Equipment Operation

****

NOTE: Develop the sequence of equipment operation and insert requirements in this paragraph.

Include instrumentation to modulate the output to meet pressure and/or volume demands as well as start or stop units if the system requires pressure and/or volume control.

****

Include logic to allow for automatic or manual alternation of lead/lag/standby assignments of units installed in parallel. Include Instrumentation to modulate the pressure and volume output as well as start or stop units to meet pressure and/or volume demands. Off-gas systems with safety, emission, or process controls are subject to automatic control logic permissives. Include start and stop push button switches, [hand-off-automatic (H-O-A) switches where the system controls operation] [safety features such as blade and belt guards, vibration or temperature switches] [surge warning and shutdown,] [low oil pressure,] [high oil temperature switches] [process oriented switches such as upstream or downstream process equipment failure shutdown or emission detection shutdown]. Provide additional controls or protective devices as indicated.

Submit detailed manufacturer's data on the overall controls, sensors, process controllers, control operators, valves, interlocks and alarms.

2.19.3 Intake Volume Control

****

NOTE: Under colder air operating conditions, in centrifugal blowers with a relatively flat characteristic flow curve, volume may be controlled over a narrow working range by adjusting variable inlet guide vanes to vary the pressure-volume characteristics. Variable inlet vanes are acceptable, but inefficient. A butterfly valve may be used to create inlet head losses to throttle the blower inlet and reduce volumetric flow rate.

****

Install [automatically] [manually] controlled [adjustable guide vanes] [line sized butterfly valve] on blower inlet to create inlet head losses and reduce the volumetric flow rate.

2.19.4 Outlet Volume Control

****

NOTE: The most efficient method to vary both volume

and pressure is to vary the speed of the driver.

Other methods of controlling output are outlet damper and eddy current coupling (generally an outdated way to achieve speed control). Outlet dampers may serve if high pressure at low volume is desired and high energy costs are not of concern.

****

[Install variable speed control to control output volume] [Provide automatically controlled bypass to recirculate directly around the blower] [Install manual line sized [unloading] [check] [butterfly] valve on blower outlet to create system head losses and reduce the volumetric flow rate].

2.19.5 Panel

****

NOTE: Delete inapplicable items. Consider site location and operational factors for alarm requirements. Indicate equipment on drawings and/or reference other specifications as appropriate.

****

A NEMA [4] [7] [12] [explosion proof] [weather proof] [instrument panel] [control panel] enclosing relays, Contractor, timers, and selector switches must be [floor mounted] [wall mounted] [mounted with vibration isolators on the unit] and provided with hinged cover and latch. Provide direct reading type instruments that are factory mounted and connected. Connect shutdown feature to the annunciator on the instrument panel and identify each shutdown feature. Include the following features and instruments:

a. Running time meter.

b. Alarm annunciator [with single audible alarm] [and] [with contacts to operate a remote alarm] and individual lights for each alarm condition.

2.19.6 Protective Devices

Provide blower protective devices, upon alarm condition, to cause immediate de-energization of the motor, initiate the automatic shutdown sequence, and provide audible and visual alarm indication.

2.19.6.1 Bearing Temperature

Install temperature sensors with switches on each bearing. The control relay, selector switch, test push buttons, and running indicator, or light, on the panel must indicate bearing status. High temperature of any bearing must initiate protective shutdown and the indicator, or light, must indicate the affected bearing.

2.19.6.2 Surge and Overload Protection

****

NOTE: Centrifugal blowers are subject to a characteristic called "surge" or minimum flow point below which the blower performance is unstable. The instability manifests itself in pressure pulsations and flow reversals which can become severe enough to damage the blower or system. Surge occurs when the

system resistance is greater than the pressure that the blower is capable of producing at a given inlet volume; this results in a backward rush through the blower and out the inlet, lowering the pressure in the discharge line at which time normal compression resumes and cycle is repeated, until discharge pressure is decreased or blower pressure increased. Surge may be prevented by using manual or automatic controls.

****

Provide a set-point controller to monitor current input to the motor. Allow the controller to open and close the inlet [guide vanes] [butterfly valve] in response to current. Initiate automatic shutdown sequence and give visual indication of reason for shutdown if surge conditions are indicated by the motor current. Provide manual control and override to enable equipment startup and shutdown.

2.19.6.3 Oil Temperature and Pressure

Install temperature and pressure sensors with switches on each oil pump. The control relay, selector switch, test push buttons, and running indicator, or light, on the panel must indicate status. High oil temperature, high oil pressure or low oil pressure must initiate protective shutdown and the indicator, or light, must indicate the affected setting.

2.20 ELECTRICAL EQUIPMENT

****

NOTE: Show hazardous area classification on the drawings.

****

Provide electrical equipment conforming to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical motor driven equipment herein specified complete with motors, motor starters, and controls. Provide electrical equipment and wiring in accordance with NFPA 70, with proper consideration given to environmental conditions such as moisture, dirt, corrosive agents, and hazardous area classification.

2.20.1 Electric Motors

Drive each electric motor-driven unit by a weather-protected, Type [I][II][totally-enclosed fan cooled] continuous-duty electric motor. Provide motor with a [_____] service factor. Provide [squirrel-cage induction][synchronous] motors with normal-starting-torque and low-starting-current characteristics, and sized to avoid exceeding the nameplate power rating throughout the entire published characteristic curve. Provide premium efficiency type integral size motors in accordance with NEMA MG 1. Use motor bearings to provide smooth operations under the conditions encountered for the life of the motor. Provide adquate thrust bearing in the motor to carry the weight of the rotating parts plus the hydraulic thrust that are capable of withstanding upthrust imposed during starting [and under variable head] conditions specified. Ensure motors are rated [_____] volts, [_____] phase, 60 Hz and such rating is stamped on the nameplate. Motors must conform to NEMA MG 1.

2.20.2 Control Equipment

[Manually controlled units must have START-STOP pushbutton in cover.][Automatically controlled units must have three-position MANUAL-OFF-AUTOMATIC selector switch in cover.] Provide additional controls or protective devices as indicated.

2.20.3 Variable Speed Controls

****

NOTE: Include this paragraph if any of the motors has a variable speed control.

****

The variable speed motor controller must convert 460 volt plus 15 percent, minus 5 percent, three phase, 60 Hz (plus or minus 2 Hz) utility power to adjustable voltage/frequency, three phase, ac power for stepless motor control from 5 percent to 105 percent of base speed. With the product data submittal for the controls, provide capacities and capacity ranges; performance charts and curves.

2.20.3.1 Description

Use variable speed drive to produce an adjustable ac voltage/frequency output for complete motor speed control. The variable speed drive must be automatically controlled by [a pneumatic 20.7 to 103.4 kPa 3 to 15 psig control signal] [a grounded electronic control signal]. The variable speed drive must be self contained, totally enclosed in a NEMA MG 1 ventilated cabinet and capable of operation between 0 and 40 degrees C 32 and 104 degrees F. The variable speed drive maximum output current rating must be equal to or exceed the motor nameplate full load. The manufacturer must advise the maximum recommended motor sine wave current for each controller rating. Variable speed drive multiple motor operation at same frequency/speed must be possible as long as the sum of connected motor full load sine wave currents are less than or equal to the variable speed drive maximum continuous current rating. Variable speed drive must be [85] [90] [95] percent efficient at 100 percent of rated output power.

2.20.3.2 Governing Requirements

Provide variable speed drive in compliance with 47 CFR 15 regulation of RF1/EM1 emission limits for Class A computing devices. Display the FCC label of compliance on the variable speed drive. Variable speed drive and option design and construction thereof must comply with the applicable provisions of NFPA 70, Article 43D, Sections A-L.

2.20.3.3 Basic Features

Provide variable speed drive with the following basic features:

a. Hand/off/auto operation.

b. Manual/auto speed reference switch.

c. Minimum/maximum adjustable speeds.

d. Speed potentiometer.

e. Auto restart.

f. Linear timed acceleration and deceleration for soft starting and stopping.

g. Controlled speed range 3-63 Hz. (Factory set at 15 Hz minimum).

h. Terminal connections for time clock control, fire, smoke, freeze detectors, and EP relay pre-set speed override.

i. Output frequency terminals for remote metering.

2.20.3.4 Protective Circuits and Features

Provide variable speed drive controller including the following protective circuits/features:

a. Current limits to 100 percent design by slowing the down motor.

b. Instantaneous electronic trip to automatically shut down the motor if current exceeds 120 percent of design or phase-to-phase output short circuit occurs.

c. The variable speed drive will restart automatically when input line returns to normal in the event of intermittent power outage or phase loss or overvoltage shutdown.

d. Input power protection shuts down the unit on low input line voltage or loss of an input phase.

e. Insensitive to incoming power phase.

f. Fast acting current limiting input fuses, (Class J) rated with 200,000 interrupting amperes capability.

g. Isolated 115 volt control circuit and dedicated control transformer.

h. Line-to-line fault protection.

i. Line-to-ground short circuiting and accidental motor grounding protection.

j. Output thermal overload relay trip.

2.20.3.5 Adjustments

The variable speed drive must have 0 to 75 percent of minimum speed, and 100 percent of maximum speed, adjustments available via potentiometers located on the faceplate of a single, regulator printed circuit board.

2.21 APPURTENANCES

2.21.1 Dielectric Fittings

Install dielectric fittings between threaded ferrous and nonferrous metallic pipe, fittings and valves. Use dielectric fittings, suitable for the required working pressure, to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.21.2 Isolation Joints

Install isolation joints between nonthreaded ferrous and nonferrous metallic pipe, fittings and valves. Isolation joints must consist of a sandwich-type flange isolation gasket of the dielectric type, isolation washers, and isolation sleeves for flange bolts. Isolation gaskets must be full faced with outside diameter equal to the flange outside diameter. Bolt isolation sleeves must be full length. Units must be of a shape to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.21.2.1 Sleeve-type Couplings

Use sleeve-type couplings for joining plain end pipe sections. The two couplings must consist of one steel middle ring, two steel followers, two gaskets, and the necessary steel bolts and nuts to compress the gaskets.

2.21.2.2 Split-sleeve Type Couplings

Use split-sleeve type couplings, in aboveground installations when approved in special situations, that consist of gaskets and a housing in two or more sections with the necessary bolts and nuts.

2.21.3 Valves

****

NOTE: Evaluate the need for silencers and/or carbon adsorption units if handling toxic gases downstream of relief and/or unloading valves.

Threaded connections are common on valves 25 mm 1 inch and smaller, and are sometimes used on valves up to 50 mm 2 inch. If a welded end connection is desired for valves 50 mm 2 inch and smaller, a socketweld is usually chosen. Socketweld end dimensions are standardized by ASME B16.11. Buttweld ends are preferred when zero leakage is required. The valve body material must be compatible with the adjoining pipe material for welding.

****

Valve diameter must be equal to the diameter of the pipe in which the valve is located unless otherwise indicated. Ensure valves are [screw] [socket weld] [buttweld] [sweat] [flange] connected. Rated operating conditions are [_____] degrees C F and [_____] kPa psig, minimum. Materials of construction are [aluminum] [bronze] [stainless steel] [_____] body, [bronze] [316 stainless steel] trim, and [Buna-N] [EPR] [Viton] [PTFE] elastomers. Mark valves in accordance with MSS SP-25 to identify the manufacturer, valve sizes, pressure rating, body and seat material.

2.21.3.1 Relief Valve

****

NOTE: Relief valves are provided in the following configurations: weighted type (install in horizontal position only), spring type and pilot operated diaphragm type which (with an optional solenoid valve) can be used for an unloading valve as well. Relief valves are also used to relieve possible

thermal expansion in a pipe line if no other provisions exist. Indicate on the drawings a site flow indicator downstream of each relief valve. Indicate the operating pressure required for each valve.

ASTM F1508 covers only spring-loaded, angle style valves.
****

Provide relief valve capable of maintaining a constant upstream pressure regardless of the downstream demand for each air mover. Valve must be [ASTM F1508 angle spring loaded] [weighted] [pilot-operated diaphragm] differential pressure relief valve with a [_____] percent accumulation. Rate valve to relieve [the full capacity of the air moving equipment] [[_____] cubic meters/second feet/minute]. Ensure vlve is factory-set to open at the [actual] [gauge] [pressure] [vacuum] of [_____] kPa psi and field adjustable within a minimum range of plus or minus 20 percent. Locate valve within [_____] m feet upstream of vacuum equipment or downstream of pressure equipment.

2.21.3.2 Unloading Valve

****
NOTE: Unloading valves allow the blower to start under reduced pressure.
****

Unloading valve must be [pilot-operated diaphragm valve with auxiliary solenoid operator] [butterfly valve] actuated by the system controls and field adjustable within a minimum range of plus or minus 20 percent. Set unloading valve to relieve [_____] cubic m/second feet/minute at a set gage pressure of [_____]kPa psi or a vacuum of [_____] kPa inches Hg.

2.21.3.3 Combination Relief and Unloading Valve

****
NOTE: Combination valves should be carefully located with respect to heavily contaminated off-gas streams or deleted in favor of separate valves.
****

Set combination relief and unloading valve to relieve at a set [actual] [gauge] [pressure] [vacuum] of [_____] kPa psi.

2.21.3.4 Purge Valve

****
NOTE: For vacuum pump applications, an automatic purge valve is useful in clearing the system of vapors which may condense in shutdown or startup.
****

Equip each vacuum unit with a manually adjustable, normally closed automatic purge valve. Ensure valve is factory-set to open at at the gauge pressure of 0.5 kPa 0.15 inches Hg and field adjustable within a minimum range of plus or minus 20 percent. Locate valve within 1 m 3.3 feet downstream of vacuum equipment.

2.21.3.5 Vacuum Breaker

****

NOTE: Edit the settings appropriately for the equipment required.

****

Provide [pilot-operated diaphragm type with auxiliary solenoid operator] [butterfly valve actuated by blower system controls] vacuum breaker to protect blower or vacuum pump from surges. Rate valve to relieve 0.05 cubic m/second 1.76 cfm at a set gage pressure of 100 kPa 14.7 psi or a vacuum of -50 kPa -15 inches Hg. Materials must be [aluminum] [bronze] [stainless steel] body, [bronze] [316 stainless steel] trim, and [Buna-N] [EPR] [Viton] [Teflon] elastomers. Provide rating of 100 degrees C 212 degrees F and 1000 kPa 147 psi, minimum.

2.21.3.6 Check Valve

Provide a [pilot-operated diaphragm valve with auxiliary solenoid operator] [butterfly valve actuated by system controls] with a closing time of 1 to 5 seconds, located on the discharge side of each air mover. Prevent reverse flow and open at a controlled rate to keep air mover starting surges from shocking downstream equipment. Opening rate must be adjustable from 5 to 60 seconds.

2.21.3.7 Control Valve

****

NOTE: Starting and stopping the air moving equipment is preferable to operation against a closed system.

****

Valve must be a [pilot-operated diaphragm valve with auxiliary solenoid operator] [butterfly valve actuated by system controls].

2.21.3.8 Back Pressure Valve

Valve must be capable of maintaining a constant upstream pressure regardless of the downstream demand.

2.21.3.9 Manual Valve

[Provide ball valves in accordance with MSS SP-72. Provide gate, plug and ball valves in accordance with API Spec 6D. Provide thermoplastic gas shutoffs and valves in accordance with ASME B16.40. Manual valve must be wrench operated, rising stem, with cap.] [Provide non-automatic valve as required by Section 31 21 00 OFF-GASSING MITIGATION.]

2.21.4 Inlet and Discharge Elbows

Inlet and discharge elbows must be of the long sweep type with ASME B16.1, Class 125 flanges.

2.21.5 Expansion Coupling

Provide inlet and the outlet of each unit with flexible expansion couplings of extra heavy gauge rubber, wire reinforced type suitable for temperature range of minus 29 to plus 121 degrees C minus 20 to plus 250 degrees F and pressure range from 51 to 103 kPa 15 inches of mercury vacuum to 15 psig.

2.21.6 Heat Exchanger

Provide [an air-to-air] [a water cooled] heat exchanger on the blower [inlet] [outlet] with sufficient capacity to reduce the air temperature [_____] degrees C F.

2.21.7 Flame Arrestor

Locate flame arrestor immediately upstream of any source of flame. Submit rating, capacity and pressure differentials. Also include installation instructions with the submittal.

2.21.8 Drip Trap

Provide drip trap in accordance with ASTM F1139.

2.21.9 Liquid Receiver

Design, fit, and rate liquid receivers for 0.345 MPa 50 psi working pressure. Provide each receiver with a storage capacity no less than [_____] L gal. Equip each receiver with inlet and outlet drop pipe, drain with valve, relief valve and two bull's-eye liquid-level sight glasses. Ensure sight glasses are in the same vertical plane, 90 degrees apart, perpendicular to the axis of the receiver, and not over 75 mm 3 inches horizontally from the drop pipe measured along the axis of the receiver. In lieu of bull's-eye sight glass, provide external gauge glass with metal glass guard and automatic closing stop valves. The outside of liquid receivers must be galvanized or supplied with commercial enamel finish.

2.21.10 Air Receiver

Design receiver for 0.345 MPa 50 psi working pressure. Equip receivers with safety relief valves and accessories, including pressure gauges and automatic and manual drains. Design and construct receivers in accordance with ASME BPVC SEC VIII D1 and with the design working pressures specified herein. Provide a display of the ASME seal on the receiver or a certified test report from an approved independent testing laboratory indicating conformance to the ASME Code. The outside of air receivers must be galvanized or supplied with commercial enamel finish.

2.22 BASE PLATE

Mount each unit on all-welded structural steel or cast iron base complete with vibration isolators with published load rating. Provide base plate with vertical jacking screws to facilitate leveling. Isolate the entire unit from the building structure.

2.23 WEATHERPROOF ENCLOSURE

****

NOTE: Include this paragraph for equipment mounted partially or completely outdoors.

****

Provide a weatherproof enclosure for the air moving equipment and motor assembly. Provide enclosure with lockable access doors and louvered for ventilation. [Insulate and equip the enclosure with a thermostatically controlled electric heating and ventilation.]

2.24 ATTACHMENTS

Provide shafts, chains or gear driven equipment with all-metal guards enclosing the drive mechanism. Construct guard of galvanized sheet steel, or galvanized woven wire, or expanded metal set in galvanized steel frame. Secure guards in position by steel braces or straps which will permit easy removal for servicing the equipment.

2.25 COATINGS OR FINISHES

****

NOTE: Consult with coatings supplier on specific coating once liquid and gas composition are known. Be aware of the VOC content of the coating and the regulations that restrict application of high VOC coatings; use low VOC coatings unless quality of coating will not meet requirements.

****

Clean and prime motors, casings and similar parts of equipment finished in the shop and give two finish coats with [alkyd primer followed by two alkyd modified silicone final coats] [severe chemical service phenolic type coatings] [paint suitable for the environment in which the unit is to be placed] at the factory. Give ferrous surfaces not painted at the factory a shop coat of grease or other suitable rust resistant coating.

2.26 FACTORY TESTS

****

NOTE: Delete inapplicable tests.

****

Equipment is subject to in-plant shop and quality control inspections before approval for shipment from manufacturer's facilities. Operate rotating parts of the equipment throughout the required range without excessive end thrust, vibration or noise.

2.26.1 Integrity

Test each [impeller] [rotor] assembly by operating at a speed to [20] [_____] percent above operating speed and check for cracks using the dye penetrant method or similar method of equal accuracy.

2.26.2 Balance

Statically and dynamically balance rotating parts in accordance with ISO 1940-1. First critical speed is at least 150 percent of maximum operating speed. Statically and dynamically balance the shaft and impeller or blade assembly as a unit. Removing of metal from the impeller or blades by boring is not an acceptable means of balancing the shaft and impeller unit. Impeller or blade assemblies must be statically and dynamically balanced to within 0.5 percent of W times R squared, where W equals weight and R equals impeller radius.

2.26.3 Deflection

Total shaft peak-to-peak dynamic deflection measured by vibrometer at seal face is not allowed to exceed 5.1 microns 2 mils under the complete range of operating conditions.

2.26.4 Vibration

****

NOTE: Deflection is normally specified for centrifugal blowers. Velocity is normally specified for positive displacement blowers.

****

[Vibration is not allowed to exceed 2.5 microns 1.0 mil at the bearing housing with the equipment operating.] [Ensure peak vibration velocity is less than 7.62 mm/second 0.30 inch per second.]

2.26.5 Capacity

Determine volume and pressure characteristics of air moving equipment by the [manufacturer] [a nationally recognized testing agency] in accordance with AMCA 210. Submit certified test results and sample calculation from test readings to the Contracting Officer. Where two or more identical units are specified, the capacity of only one representative unit needs to be tested.

2.26.6 Noise

Test air moving equipment with sound attenuation devices installed by the [manufacturer] [a nationally recognized testing agency]. Submit certified test results and sample calculation from test readings to the Contracting Officer. Where two or more identical units are specified, only one representative unit needs to be tested. Test fans in accordance with AMCA 300 with results interpreted in accordance with AMCA 301.

2.26.7 Variable Speed Drive

Subject each variable speed drive to an in-plant quality control inspection. Integrated circuits must undergo a 160-hour "burn-in" to test reliability. Cycle the temperature between 0 and 70 degrees C 32 and 158 degrees F during the "burn-in". Each completed unit must undergo a fully loaded 24-hour "burn-in".

2.26.8 Continuity

Check wiring and instrumentation assembled at the factory for continuity prior to shipping.

2.26.9 Receivers

Ensure receivers are factory air tested to 1.5 times the specified working pressure.

2.26.10 Valve Testing

Test relief valves in accordance with ASME PTC 25.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

****

NOTE: Rotary lobe blowers must be absolutely horizontal to operate properly.

****

Install vibration dampener in sufficient quantity to isolate each unit from the structural base on which the unit is installed. Install, align and level each air moving unit and motor in accordance with the written instruction of the manufacturer [and under the direct supervision of the manufacturer's representative]. [Deviation from horizontal must be below limits of measurement.] [Set impellers by the manufacturer's representative]. Do not use flexible couplings to compensate for misalignment between driver and driven unit. Blower venting is not allowed toviolate the provisions of either ACGIH 2098 or AMCA 99.

3.2.1 Concrete Foundations

Provide concrete for equipment foundations [as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE] [with a minimum compressive strength of at least 17 MPa 2,500 psi]. Provide concrete foundations that are [integral with and of the same class as that of the building floor] [entirely separated from the surrounding floor with a premolded filler strip installed between the foundation and floor slab as shown]. Furnish foundation bolts, as required, for proper positioning during the placement of the concrete.

3.2.2 Seismic Requirements

****

NOTE: Provide seismic requirements, if a Government designer (either Corps office of A/E) is the Engineer of Record and show on the drawings. Delete the bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-310 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 SEISMIC BRACING FOR MECHANICAL SYSTEMS, properly edited, must be included in the contract documents.

****

Support and bracequipment and attached valves to resist seismic loads as specified under UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 SEISMIC BRACING FOR MECHANICAL SYSTEMS[as shown on the drawings].

3.3 FIELD PAINTING

Do not paint stainless steel, galvanized steel, and nonferrous surfaces.

3.3.1 Touch-Up Painting

Clean factory painted items, requiring touching up in the field, of foreign material and prime top-coat with the manufacturer's standard factory finish, provided it does not discolor in the presence of hydrogen sulfide fumes, high water vapor atmosphere, alkaline water vapor, and concentrated chlorine (oxidizing) conditions.

3.3.2 Exposed Ferrous Surfaces

Paint equipment which did not receive a factory finish and other exposed ferrous surfaces as specified in Section 09 90 00 PAINTS AND COATINGS. Ensure coating is not less than 0.05 mm 1.75 mils thick.

3.4 MANUFACTURER'S FIELD SERVICES

Provide the services of a manufacturer's representative experienced in the installation, adjustment, and operation of the equipment specified. Supervise the installing, adjusting, and testing of the equipment.

3.5 POSTING FRAMED INSTRUCTIONS

Post framed instructions containing wiring and control diagrams where directed. Post condensed operating instructions as specified. Post the framed instructions before acceptance testing of the systems.

3.6 FIELD TESTING

3.6.1 Deficiencies

If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests.

3.6.2 Correct Installation

Assure that the units and appurtenances have been installed correctly, there is no objectionable heating or vibration, noise from any part is not excessive, and manual and automatic controls function properly.

3.6.3 Field Equipment Test

After installation of the air moving units and appurtenances is complete, carry out operating tests to ensure that the installation operates properly. [Make arrangements to have the manufacturer's representative present when field equipment tests are made.] Give each unit a running field test in the presence of the Contracting Officer for a minimum of [4] [_____] hours [at its rated capacity] [at the point of maximum power requirement indicated on the head-capacity curve or point on the curve selected by the Contracting Officer]. Provide an accurate and acceptable method of measuring the discharge flow and pressure.

3.6.4 Noise Suppression

Sound level must be less than [60] [70] [80] dB measured at 1.5 m 5 feet from the source.

3.6.5 Reporting

Submit test reports in booklet form showing field tests performed to adjust each component and field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed equipment. Identify test methods used and record test results. Indicate the final position of controls in each test report.

3.7 CLOSEOUT ACTIVITIES

3.7.1 Field Training

****

NOTE: The number of hours required to instruct a Government representative in operation and maintenance of the system will depend on the complexity of the system specified. Designer is to establish the number of hours of training based on equipment manufacturer recommendations, system complexity and consultation with the installation.

****

Conduct a field training course for designated operating, maintenance and supervisory staff members. Submit training course curriculum and training instructions 14 days prior to the start of training. Provide training after the system is functionally complete but prior to final acceptance tests, for a total period of [16] [24] [_____] hours of normal working time. Cover the items contained in the operating and maintenance instructions.

3.7.2 Operating and Maintenance Instructions

3.7.2.1 Operating Instructions

Submit [six] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include in the operating instructions the following for system components: manufacturer's name, model number, service manual, parts list, and brief description of each piece of equipment and its basic operating features; flow diagrams; system layout showing piping, valves, and controls; [as-built] [approved] wiring and control diagrams; control sequence describing startup, operation, and shutdown; manufacturer's bulletins, cuts, and descriptive data.

3.7.2.2 Maintenance Instructions

Submit [six] [_____] complete copies of maintenance instructions for each piece of equipment including the following: manufacturer's complete list of parts, recommended spare parts and supplies, with current unit prices and source of supply; routine maintenance procedures, including the requirements of WEF MOP 11, as a minimum; possible breakdowns and repairs; a troubleshooting guide to help the operator determine what steps must be taken to correct any equipment problems.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section, with the additions and modifications specified herein.

1.3 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Air compressor

Air Dryer

Air receiver

Desiccant air dryers

Desiccant

Pipe

Fittings

Valves

Pressure gages

Hangers and supports

Quick disconnect couplings

Filters

Strainers

1.4 QUALITY ASSURANCE

****

NOTE: The SMACNA Seismic Restraint Manual referenced in the paragraph below must be applied to locations subject to significant risk of seismic induced loads. The degree to which this manual is to be used for contract drawings and specifications must be determined by the designer of record in coordination with the NAVFAC Engineering Field Division's Mechanical Design Branch.

****

Provide work specified in this section, including design, materials, fabrication, assembly, erection, installation, and examination, inspection and testing of compressed air systems in conformance with ASME B31.9[and SMACNA 1981], as modified and supplemented by this specification section and accompanying drawings. In ASME B31.1, ASME BPVC SEC VIII D1, and ASME BPVC SEC IX, the advisory provisions must be considered mandatory, as though the word "must" had been substituted for "should" wherever it appears; reference to the "authority having jurisdiction" and "owner" must be interpreted to mean the Contracting Officer.

1.4.1 Welding procedures and qualifications

Provide welding work specified in this section for compressed air piping systems in conformance with ASME B31.9, as modified and supplemented by this specification section and the accompanying drawings. The welding work includes: qualification of welding procedures, welders, welding operators, and nondestructive examination personnel; maintenance of welding records, and examination methods for welds.

1.4.1.1 Butt Welded Joints

Butt welded joints must be full penetration joints.

1.4.2 Employer's Record Documents

Submit to the ROICC for his review and approval the following documentation. This documentation and the subject qualifications must be in compliance with ASME B31.9.

a. List of qualified welding procedures that is proposed to be used to provide the work specified in this specification section.

b. List of qualified welders, and welding operators that are proposed to be used to provide the work specified in this specification section.

c. List of qualified weld examination personnel that are proposed to be used to provide the work specified in this specification section.

1.4.3 Welding Procedures and Qualifications

Specifications and Test Results: Submit copies of the welding procedure specifications and procedure qualification test results for each type of welding required. Approval of any procedure does not relieve the Contractor of the responsibility for producing acceptable welds. Submit this information on the forms printed in ASME BPVC SEC IX or their equivalent.

1.4.3.1 Certification

Certification: Before assigning welders or welding operators to the work, submit a list of qualified welders, together with data and certification that each individual is performance qualified as specified. Do not start welding work prior to submitting welder, and welding operator qualifications. The certification must state the type of welding and positions for which each is qualified, the code and procedure under which each is qualified, date qualified, and the firm and individual certifying the qualification tests.

1.4.3.2 Renewal of Qualification

Requalification of a brazer or brazing operator must be required under any of the following conditions:

a. When a brazer or brazing operator has not used the specific brazing process for a period of 6 months.

b. There is specific reason to question his ability to make brazes that will meet the requirements of the specifications.

1.4.4 Equipment Data

Submit the following data for equipment listed for "Operation and Maintenance Instructions, Parts and Testing."

a. Name and address of authorized branch or service department.

b. Characteristic curves.

c. Following applicable data completely filled in:

    (1) Manufacturer and model number [_____]

(2) Operating speed [_____]

(3) Capacity [_____ (CMS) (CFM)]

(4) Type of bearings in unit [_____]

(5) Type of lubrication [_____]

(6) Type and adjustment of drive [_____]

(7) Capacity of tank [_____]

(8) Electric motor: Manufacturer, frame and type [_____]

(9) Motor speed [_____] rad/sec RPM

(10) Current characteristics and kW hp of motor [_____]

(11) [_____] Thermal cut-out switch: Manufacturer, type and model [_____]

(12) Starter: Manufacturer: Type and model [_____]

1.5 SAFETY PRECAUTIONS

1.5.1 Temperature Restriction

****

NOTE: The designer must assure that the piping design temperature is not exceeded, especially for high pressure systems. Provide aftercoolers and high temperature shutdown devices as required for safe operation of the systems.

****

Compressors or other equipment must not discharge compressed air to the piping systems above [38] [_____] degrees C [100] [_____] degrees F unless approved by the Contracting Officer. Aftercoolers or other devices must be provided to comply with the temperature restriction.

1.5.2 Rotating Equipment

Fully guard couplings, motor shafts, gears and other exposed rotating or rapidly moving parts in accordance with OSHA 29 CFR 1910.219. Provide rigid and suitably secured guard parts readily removable without disassembling guarded unit.

1.5.3 Welding and Brazing

Safety in welding, cutting, and brazing of pipe must conform to AWS Z49.1.

PART 2 PRODUCTS

2.1 LOW PRESSURE AIR COMPRESSOR, 7 1/2 TO 224 KW 10 TO 300 HP

****

NOTE: Prepare section for cooling water and include in project specification. See Section 23 64 26

CHILLED, CHILLED-HOT, AND CONDENSER WATER PIPING SYSTEMS for piping and equipment which may be useful.
****

7 1/2 kW to 224 kW, up to 862 kPa (gage) 10 to 300 hp, up to 125 psig. Configuration and dimensions of the air compressor must be compatible with the indicated space allocated. Sound level must not exceed 84 dBA one meter from compressor unit. Conform to FS XX-C-2816and following ordering data (paragraph 6.2) thereof:

a. Specification title, number and date: As listed hereinbefore under "REFERENCES."

b. Type: [I - Single acting (reciprocating)] [II - Double acting (reciprocating)] [III -Rotary (vane, screw)].

c. Issue date of applicable specifications and standards: As specified.

d. Packaged assembly requirement: [Packaged Unit required] [Field assembled].

e. First article inspection: [Not required; furnish certified test report.] [Required.]

f. Capacity (cms) (cfm): [At least as indicated.] [cms cfm:[_____].]

    (1) Discharge working pressure: [At least as indicated.] [kPa (gage) psig: [_____].]

g. Number of stages for Type I compressor: [Single stage.] Type I [Two stages.].

    (1) Water-jacketed cooling: [Not applicable.] [Required] [Not required].

h. Number of stages for Type II compressor: [Single Stage] [Two stages] [Not applicable].

i. Oil-free air delivery Type II compressors: [Required.] Type II [Not required.]

j. Type bearings: Manufacturer's standard.

k. Air filter to function as muffler: Required.

l. Air Filter conformance with MS: Not required; provide manufacturer's standard.

m. Safety valve in discharge line when no receiver provided: [Not applicable.] [Required, ASME BPVC SEC VIII D1 and ASME BPVC SEC IX Code stamped safety relief valve.]

n. Shut-off valve on compressor discharge: [Not required] [Required].

o. Oil Filter compliance with FS F-F-351: Not required; provide manufacturer's standard.

p. Drain plug conformance with MS: Not required; provide manufacturer's standard.

q. Electric, thermostatically controlled immersion oil heater: [Not] required.

r. Compressor regulation method: [Constant-speed control]. [Dual control: Alternative constant speed or automatic start-stop.]

s. Timed stop control (for constant speed control: [Not applicable] [Required].

****

NOTE: Edit Table A to select only the optional safety controls required for the project.

****

(1) t. Optional safety controls required: As specified on Table A.

TABLE A. OPTIONAL SAFETY CONTROLS

	Type I		Type II		Type III	
	Alarm	Shut Down	Alarm	Shut Down	Alarm	Shut Down
High-lubrication oil temp.	-	-	x	x	x	x
Cylinder lubrication failure	-	-	-	x	-	-
High main bearing temperature	-	x	-	x	-	x
High discharge-air temperature	x	x	x	x	x	x
High discharge-air pressure	x	x	x	x	x	x
High intercooler air temp.	x	x	x	x	-	-
Low cooling water flow	-	x	-	x	-	-
Low water pressure	-	x	-	x	-	-
High water temperature	x	x	x	x	-	-
High intercooler moisture separator level (two-stage compressors only)	x	x	x	x	-	-
Excessively high motor temp.	x	-	x	-	x	-
Excessive vibration	-	x	-	x	-	-

t. Gages and visual I.D. lights mounting (optional controls): [Panel-mounted.] [Mounted on separate console.]

(1) [Not applicable.]

u. Aftercooler: Required; [Water-cooled, shell-and-tube type] [or] [air-cooled, tube-and-fin type]. A centrifugal moisture separator is also required.

v. Air receiver: [Required] [Not required].

w. Receiver volume: [As specified in FS XX-C-2816.] [As indicated.] [[_____] liter gal.] [[_____] cu. meter ft.] [Not applicable.]

x. Receiver mounting stand: [Required] [Not required] [Not applicable].

(1) Position of receiver: [Horizontal] [Vertical].

y. Compressor and motor: [Required] [Not required]. To be mounted on receiver: [Not applicable].

z. Compressor housing (III units): [Not applicable] [Required].

aa. Motor: As specified in FS XX-C-2816.

ab. Electrical power supply characteristics: As indicated.

ac. Motors 93 kW 125 hp and larger to be synchronous: [Required] [Not required] [Not applicable].

ad. Motor starter: As specified in FS XX-C-2816.

ae. Provision for limitation of starting current inrush: [Required] [Not required] [Not applicable].

af. Type Drive: [Direct drive] [Multi-V-Belt drive].

(1) Direct drive coupling: [Close-coupled] [Integral-coupled] [Flexible-coupled] [Not applicable].

ag. Electromagnetic interference control: [Not required] [Required].

ah. Fungus resistance: Not required.

ai. Cleaning, treatment, and painting: [As specified in FS XX-C-2816] [Other: (specify)].

aj. Cleaning, treatment and painting in accordance with Section 09 90 00 PAINTS AND COATINGS.

ak. Color of finish coat: [Manufacturer's standard] [Other: [_____]-(specify)-Samples required.]

al. Initial lubrication: Factory lubrication service required.

am. Skid base (Type II or III): Required.

an. Lifting attachments and tiedown device: Lifting attachments as required. Tiedown devices [required.] [Not required.]

ao. Spare parts and maintenance tools: Not required.

ap. Tool boxes: Not required.

aq. Production pack inspection: Not required.

ar. Level of preservation packaging, and packing: Level C or better (Delivery of unit to project site in undamaged condition is Contractor's responsibility.)

as. Preservation-packaging: Not applicable.

2.2 LOW PRESSURE AIR COMPRESSOR UNIT, LESS THAN 7 1/2 kW 10 HP

Low pressure air compressor unit, less than 7 1/2 kW 10 hp, up to 862 kPa (gage) 125 psig, must conform to the following.

2.2.1 Compressor and Receiver Capacity

Sized as indicated. [Oil-free air] [Air] delivered at indicated pressure.

2.2.2 Mounting

Common sub-base for receiver and compressor.

2.2.3 Compressor Type

Reciprocating [or rotary].

2.2.4 Nameplate

Metal, securely fastened to equipment or base, listing:

Manufacturer's name and address
Model and serial numbers
Compressor operating data and rating.

2.2.5 Receiver

ASME BPVC SEC VIII D1 and ASME BPVC SEC IX stamp. Provide service valve, pressure gage, and ASME BPVC SEC VIII D1 and ASME BPVC SEC IX code safety valve.

2.2.6 Receiver Condensate Drain

Automatic float-type trap per CID A-A-60001.

2.2.7 Compressor Accessories

Air inlet filter and silencer. Air-cooled intercooler and aftercooler which reduce air discharge temperature to 38 degrees C 100 degrees F.

2.2.8 Control

Unloaded start with enclosed diaphragm-type pressure switch automatically controlling start-and-stop.

2.2.9 Motor

Squirrel-cage induction motor with drip-proof enclosure and conforming with NEMA MG 1, suitable for operation on the indicated power supply. Rated horsepower of motor must equal or exceed power required for continuous operation of compressor at full load.

2.2.10 Starter

Capacity and electrical characteristics must be compatible with motor. Starter must conform with NEMA ICS 2 with NEMA ICS 6 enclosure. Include thermal overload protection of all phases.

2.2.11 Noise

84 dBA maximum sound level one meter from compressor unit.

2.3 LOW PRESSURE AIR RECEIVER

ASME BPVC SEC VIII D1, labeled and rated for [862] [1379] kPa (gage) [125] [200] psig, equipped with required valves and trimmings, including gage and automatic drain valve and ASME BPVC SEC VIII D1 and ASME BPVC SEC IX pressure safety relief valve. Pressure as indicated. [Sandblast exterior and interior to SSPC SP 10/NACE No. 2, near-white. Lining must be a factory applied 0.20 mm 8 mil minimum white epoxy coating.] Exterior finish must be [standard factory finish] [two coats of rust inhibitor primer and one coat epoxy enamel].

2.4 LOW PRESSURE COMPRESSED AIR DRYERS

****

NOTE: Normally used for under 944 scms 2000 SCFM capacity systems.

****

Provide low pressure compressed air dryers of the mechanical refrigeration type, equipped with an automatic temperature shutdown switch to prevent freezing, a regenerative air to air exchanger (in capacity sizes above 4.72 or 28.31 scms 10 or 60 scfm as standard with the manufacturer), and a main compressed air cooling exchanger. Refrigeration system must cool compressed air to dry the air. Dryer must have no internal traps or filters and must have pressure drop not greater than [20.68] [_____] kPa [3] [_____] psi [indicated]. Air must leave the dryer at a temperature of [_____] degrees C F and dew point of [_____] degrees C F, based on an inlet temperature of [38] [_____] [100] [_____] degrees C F. Provide internal tubing, wiring, and piping complete, such that only connections to air inlet and outlet, to refrigerant compressor contactor, and to condensate drain are necessary.

2.4.1 Air Circuit

a. Regenerative Heat Exchanger: Inlet compressed air to outlet compressed air heat exchanger (in capacity sizes above 4.70 or 28.30 scms 10 or 60 scfm as standard with the manufacturer) designed to reduce cooling load at design conditions minus 7 degrees C 20 degrees F by inlet air precooling.

b. Main Heat Exchanger: Single-pass, with air in the tubes, heat sink, direct expansion, or flooded cooler type.

c. Separator: Fabricated in accordance with ASME B31.1; code stamp not required; moisture separator low velocity type incorporating change of air flow direction to prevent moisture carryover.

d. Dryer Operating Pressure: 862 kPa (gage) 125 psig working pressure.

e. Drain Line: Provide with exterior mounted condensate trap to facilitate servicing.

2.4.2 Refrigeration System

a. Refrigeration Compressor: ANSI/AHRI 520. Hermetic, semi-hermetic, or open reciprocating type equipped with automatic start-stop or unloading capacity control; standard components include inherent motor protection, crankcase oil strainer, and suction screen. Refrigerant must be R-22.

b. Dryer Controls: Capable of automatic 0 to 100 percent capacity control. Refrigeration controls must maintain pressure dew point within the specified range without freezing of condensate. Controls must include such devices as capillary tube, expansion valve, suction pressure regulator, thermostat, or other approved devices as standard with the manufacturer. Dryer must have automatic shutdown switch sensor located at point of lowest temperature to prevent freezing.

c. Refrigerant dryer and suction line strainer.

d. Air-cooled condenser, with condenser fan and motor.

2.4.3 Instrumentation and Control

Include control panel in dryer cabinet containing:

a. Indicators for the Following Services: Inlet air pressure gage, discharge air pressure gage, inlet air temperature gage, main exchanger temperature gage, refrigeration compressor suction pressure gage, refrigeration compressor discharge pressure gage, green "Power On" light, power interruption light, and high temperature light.

b. Electrical Relays: Locate in an enclosed portion of the panel, accessible for ease of servicing.

c. Controls and Interlocks: To maintain required compressed air dew point and to cycle air-cooled condenser with refrigeration compressor [while maintaining head pressure control with low ambient temperature].

2.5 LOW PRESSURE COMPRESSED AIR DRYER (CHILLED WATER TYPE)

****

NOTE: Chilled water air dryers are usually provided for 944 scms 2000 scfm and larger capacities. CAUTION: Specify correct system pressure. If the specification is edited to use a dryer with direct heat exchange between air and refrigerant, assure that the air is not used for breathing since refrigerant leakage into the compressed air may be hazardous to personnel; warning signs may be required.

****

Provide low pressure compressed air dryer of the mechanical refrigerator type, with closed chilled water system, regenerative air to air exchanger, and main compressed air to water heat exchanger. Refrigeration system must produce chilled water which, in turn, circulates through air-water exchanger to dry the air. Provide internal tubing, wiring and piping complete, such that only connections to air inlet and outlet, to pump contactor, to refrigerant compressor contactor, to condensate drain, and to air cooled condenser need be provided. Dryer must be suitable for a compressed air operating pressure of 862 kPa (gage) 125 psig, with air leaving temperature of [_____] degrees C F and dew point of [_____] degrees C F at rated pressure.

2.5.1 Air Circuit

a. Regenerative Heat Exchanger: Air to air exchanger, with inlet air passing through tubes and outlet air in shell, designed to reduce cooling load at design conditions by precooling inlet air minus 7 degrees C 20 degrees F.

b. Main Heat Exchanger: Shell and tube construction, single-pass, with air in tubes and water in shell, designed for minimum air pressure drop, flanged connections, tubes rolled into tube sheets, and ASME BPVC SEC VIII D1 and ASME BPVC SEC IX Code stamped.

c. Separator: Fabricated of carbon steel to ASME BPVC SEC VIII D1and ASME BPVC SEC IX Code and stamped.

d. Drain: With condensate trap.

2.5.2 Chilled Water Circuit

a. Circulating Pump: Single stage, mechanical seals, electric motor driven with line shut-off valves.

b. Liquid Cooler: Direct expansion, refrigerant in tubes, water in shell, designed for 2068 kPa (gage) 300 psig working pressure, removable tube bundle, ASME BPVC SEC VIII D1 and ASME BPVC SEC IX Code stamped and insulated with foam type insulation.

c. Expansion Tank: With sight glass, vent, and fill cock.

d. Flow Switch: To shut down refrigeration compressor on loss of chilled water flow.

2.5.3 Refrigeration System

a. Refrigeration Compressor: ANSI/AHRI 520. Hermetic or semihermetic reciprocating type, with 183 rad/sec 1750 rpm motor, integral capacity control, oil pressure pump, oil scavenger pump, full-flow oil filter, oil sight glass, inherent motor protection, crankcase heater, suction and discharge service valve, crankcase oil strainer, Monel suction screen, and hot gas bypass capacity control below last step of unloading. Refrigerant must be R-22.

b. Accessories: Include a discharge line muffler, sight glass, refrigerant dryer, solenoid valve, thermostatic expansion valve, and suction line strainer.

c. Air-cooled Condenser: As indicated. Complete air-cooled condenser factory-fabricated and assembled unit consisting of coils, fans, and electric-motor drive. Base capacity at design conditions on minus 7 degrees C 20 degrees F temperature differential between entering air and condensing refrigerant. Saturated refrigerant condensing temperature not over 40.5 degrees C 105 degrees F. Base entering dry bulb outside air temperature on [32] [_____] degrees C [90] [_____] degrees F. Do not take subcooling into account in determining compressor and condenser capacities. Air-cooled condenser may be used for refrigerant storage in lieu of a separate receiver, provided that condenser storage capacity is 20 percent in excess of fully charged system. [Provide head pressure control during low ambient temperature.]

2.5.4 Instrumentation and Control

Provide a control panel on the dryer containing:

a. Pressure gages 114 mm 4 1/2 inches diameter) for the following services:

    (1) Inlet air

    (2) Condenser water inlet

    (3) Refrigeration compressor suction

    (4) Refrigeration compressor oil pressure

    (5) Outlet air

    (6) Condenser water outlet

    (7) Refrigeration compressor discharge

b. Electrical Relays: Locate in an enclosed portion of the panel, accessible from front of panel.

c. Start-Stop buttons and green running indicating light.

d. Controls and Interlocks

    (1) 115-volt control transformer

    (2) Circulating pump across the line contactor

    (3) Compressor across the line contactor

    (4) Condenser water pressure safety switch

    (5) Freeze protection safety switch

    (6) Pump-out relay with normally open and normally closed contacts

    (7) Oil safety switch

    (8) Four stage thermostatic control

    (9) Refrigerant dual pressure switch

2.5.5 Temperature Indicators

a. Air inlet

b. Air outlet

c. Chilled water in

d. Chilled water out

e. Dew point

2.6 DESICCANT AIR DRYERS

Chamber of welded steel, 862 kPa (gage) 125 psig working pressure, ASME labeled conforming to ASME BPVC SEC VIII D1, with flanged or threaded fittings, and [manual] [automatic] drain valve. Manufacturer's recommended desiccant in tablet form which will not nest or cake. Contractor must provide a supply of desiccant for initial operations in unbroken shipping containers equal to not less than four charges of desiccant for the dryer.

2.7 LOW PRESSURE COMPRESSED AIR PIPING AND ACCESSORIES

Low pressure compressed air piping and accessories 862 kPa (gage) at 65 1/2 degrees C 125 psig at 150 degrees F, must conform to the following:

2.7.1 Steel Piping

a. Pipe: ASTM A53/A53M, seamless [or electric resistance welded] carbon steel, Schedule 40, black.

b. Fittings, size 50 mm 2 inches and larger: ASME B16.9, carbon steel, butt welding, schedule 40, or ASME B46.1, carbon steel welding neck flanges, Class 150, ASME B46.1, flanged fittings, carbon steel, Class 150, gaskets 1.50 mm 1/16 inch oil resistant synthetic rubber ASTM D1330, bolts ASTM A193/A193M, Grade B7, and nuts, ASTM A194/A194M, Grade 7. Butt welded joints must be full penetration consumable insert or backing ring type.

c. Fittings, size 40 mm 1 1/2 inches and smaller: ASME B16.3, threaded malleable iron, Class 150, or ASME B16.11, forged carbon steel Class 3000 socket welding or Class 2000 threaded. Joints may also be butt welded or flanged, as specified for sizes 50 mm 2 inches and larger.

d. Flat-faced steel flanges: Where connections are made to Class 125 cast iron flanges with steel flanges, use only flat-faced Class 150 steel flanges.

e. Unions: ASME B16.39, Class 1 (2068 kPa (gage) 300 psig WOG).

2.7.2 Copper Tubing

a. Tubing: ASTM B88M ASTM B88, Type K or L, hard drawn, Class 1.

b. Fittings: ASME B16.22 wrought copper or bronze, with silver brazed joints.

c. Brazing filler metal: FS QQ-B-654, Class III.

d. Unions: bronze, CID A-A-59617, brazed joint type.

e. Flanges and flanged fittings: ASME B16.24, bronze, Class 150, gaskets, oil resistant synthetic rubber, ASTM D1330, bolts ASTM A193/A193M, Grade B7, and nuts ASTM A194/A194M, Grade 7.

f. Flared fittings: ASTM B88M ASTM B88, Type K or L, annealed, with ASME B16.26 or SAE J513 flared fittings.

2.7.3 Valves

2.7.3.1 Gate Valves

a. Bronze Gate Valves: MSS SP-80, Class 150, 50 mm 2 inches and smaller, wedge disc, rising stem, inside screw type, with brazed joints ends when used with copper tubing.

b. Steel Gate Valves: ASME B16.34, 50 mm 2 inches and smaller, ASME B16.34, over 50 mm 2 inches, flanged ends, outside screw and yoke type with solid wedge or flexible wedge disc, [Class 150] [as recommended by the manufacturer for the conditions indicated.] [Provide motor operator where indicated.]

2.7.3.2 Globe and Angle Valves

a. Bronze globe and angle valves: MSS SP-80, Class 150, 50 mm 2 inches and smaller, Class 200, except that Class 150 valves with brazed ends may be used for copper tubing. Valves must have renewable seats and discs except brazed-end valves which must have integral seats.

b. Steel globe and angle valves: ASME B16.34, 50 mm 2 inches and smaller, ASME B16.34, over 50 mm 2 inches, flanged ends, [Class 150.] [As recommended by the manufacturer for the conditions indicated.] [Provide motor operator where indicated.]

2.7.3.3 Pressure Reducing Valves

ANSI/NFLPA T3.12.3, with nominal pressure rating of not less than inlet system pressure indicated. Provide pressure reducing valves capable of being adjusted to specified flow and pressure, and suitable for intended service. Provide pilot valve for dome loaded type if required for proper operation.

2.7.3.4 Safety Valves

ASME BPVC SEC VIII D1 and ASME BPVC SEC IX Code stamped safety valve), 862 kPa (gage) 125 psig, for unfired pressure vessels, bronze, with threaded or flanged connections; factory set and sealed.

2.7.3.5 Check Valves

MSS SP-80, Bronze body with brazed joint or threaded ends or steel body with flanged end, ASME B16.34, or threaded ends, ASME B16.34. The check valve must have a perforated piston with closed downstream end, in line with the pipe and held closed by a steel poppet return spring.

2.7.3.6 Pressure Regulators

Diaphragm type, air loaded, tight closing single seat, brass body [with integral filter and bowl]. [Pressure regulators used to deliver compressed air for cleaning must be factory set at not more than 207 kPa (gage) 30 psig and must be nonadjustable.]

2.7.3.7 Needle Valves

One-piece bodies with integral or screwed bonnet, stems of hardened stainless steel with fine thread for metering and ease of adjusting, teflon packing; and must be of the pressure balanced type. Needle valves must be of the slow opening type.

2.7.3.8 Ball Valves

Full port design, copper alloy body, except sizes 65 mm 2.5 inches and larger must be ANSI Class 150 steel-bodied. Valves must have two-position lever handles.

2.7.4 Pressure Gages

ASME B40.100, Accuracy Grade A, for air, with steel or brass case, and nonshatterable safety glass, and a pressure blowout back to prevent glass from flying out in case of an explosion. Gages must have a 90 mm 3 1/2 inch minimum diameter dial and a dial range of approximately twice working pressure.

2.7.5 Hangers and Supports

Provide pipe hangers and supports conforming to MSS SP-58 and ASME B31.1, except as specified or indicated otherwise. Furnish zinc plated pipe hangers and supports except for copper plated inserts for copper piping. Provide tubing supports of U-shaped steel bolts and nuts firmly secured to adequately support structures such as walls, columns, floors, or brackets. Clips must fit closely around piping but must have sufficient clearance to permit longitudinal movement of piping during normal expansion and contraction. Provide supports at valves, fittings, branch lines, outlets, changes in direction, equipment, and accessories.

2.7.6 Quick Disconnect Couplings

All brass and suitable for a working pressure of not less than 862 kPa (gage) 125 psig. Female side of coupling (fixed end) must have male thread connection with automatic shutoff. Provide male side of coupling with hose stem and ball check to bleed pressure from hose and prevent hose whipping.

2.7.7 Single Cartridge Type Filters

862 kPa (gage) 125 psig operating pressure and filter housing of brass or bronze. Provide cellulose cartridge filters of graded density construction capable of removing liquids and solids of 5 microns and larger. Filter capacity must be compatible with rated flow of equipment or pressure reducing valves provided.

2.7.8 Strainers

FS WW-S-2739. Bronze or malleable iron body, Class 125, Style Y, Type II, simplex type, with 20-mesh Monel or stainless steel screen.

2.7.9 Traps

CID A-A-60001 to drain water and other liquids from system. Type of traps, as indicated, and rated working pressure not less than system operating pressure.

2.7.10 Lubricators

Brass body, 862 kPa (gage) 125 psig minimum rating, with [clear plastic bowl and metal guard.] [metal bowl.]

2.7.11 Flexible Connections

Vibration isolation, wire braid reinforced corrugated metal hose type, line-sized, with bronze end connections, suitable for pressure indicated. Length as recommended by manufacturer but not less than [457] [_____] mm [18] [_____] inches.

2.7.12 Dielectric Unions

Steel female pipe thread end and copper solder-joint ends, conforming to dimensional, strength and pressure requirements of ASME B16.39, Class 1. Steel parts must be galvanized or plated. Union must have a water-impervious insulation barrier capable of limiting galvanic current to one percent of the short-circuit current in a corresponding bimetallic joint. When dry, it must also be able to withstand a 600-volt breakdown test.

2.7.13 Tetrafluoroethylene Tape

CID A-A-58092 for screw-jointed pipe.

2.7.14 Hose Reel Assembly

Complete with 15 meters 50 foot hose rated for a minimum of 862 kPa (gage) 125 psig, ball stop, hose extension with air coupler, hose rollers, [reel enclosure,] [nonsparking ratchet pawl,] and required accessories.

2.8 SLEEVES

2.8.1 Floor Slabs, Roof Slabs, and Outside Walls Above and Below Grade

Galvanized-steel pipe having an inside diameter at least 12.70 mm 1/2 inch larger than the outside diameter of the pipe passing through it. Provide sufficient sleeve length to extend completely through floors, roofs, and walls, so that sleeve ends are flush with finished surfaces except that ends of sleeves for floor slabs must extend 15 mm 1/2 inch above finished floor surface. Sleeves located in waterproofed construction must include flange and clamping ring.

2.8.2 Partitions

Galvanized sheet steel, 26 gage or heavier, of sufficient length to completely extend through partition thickness with sleeve ends flush with partition finished surface.

2.9 VALVE BOX

Provide rectangular concrete design with words "Compressed Air" cast or otherwise marked on the cover. Size must be large enough for removal of valve without removing box. Provide valve box for areas as follows:

a. Roads and traffic areas: Heavy Duty, cast iron cover

b. Other areas: Standard duty, heavy steel plate or concrete cover

2.10 IDENTIFICATION LABELS FOR PIPING

Labels for pipes 20 mm 3/4 inch o.d. and larger must bear printed legends to identify contents of pipes and arrows to show direction of flow. Except that of pipes smaller than 20 mm 3/4 inch o.d., labels must have color coded backgrounds to signify levels of hazard in accordance with ASME A13.1. Legends and type and size or characters must also conform to ASME A13.1. Labels must be made of plastic sheet in conformance with CID A-A-1689 with pressure-sensitive adhesive suitable for the intended applications or they may be premolded of plastic to fit over specific pipe outside diameters 20 mm 3/4 inch and larger. For pipes smaller than 20 mm 3/4 inch o.d., furnish brass identification tags 38 mm 1 1/2 inches in diameter with legends in depressed black-filled characters.

2.11 BURIED UTILITY WARNING AND IDENTIFICATION TAPE

Polyethylene plastic tape manufactured specifically for warning and identification of buried utility lines. Tape must be of the type provided in rolls, 150 mm 6 inches minimum width, color codes for compressed air (gray) with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification must be "CAUTION BURIED COMPRESSED AIR LINE BELOW" or similar wording. Code and letter coloring must be permanent, unaffected by moisture and other substances contained in trench backfill material.

2.12 FRESH WATER

Fresh water for cleaning, flushing, and testing must be clean and potable.

2.13 SOURCE QUALITY CONTROL

Test air compressors and compressed air dryers at the factory to assure proper operation. Certify satisfactory accomplishment of tests.

PART 3 EXECUTION

3.1 INSTALLATION

Install materials and equipment as indicated and in accordance with the manufacturer's recommendations.

3.1.1 Excavation and Backfilling

Section 31 00 00 EARTHWORK.

3.1.2 Corrosion Protection

Provide corrosion protection for buried steel piping in accordance with Section 09 97 13.28 PROTECTION OF BURIES STEEL PIPING AND STEEL BULKHEAD TIE RODS.

3.1.3 Piping

Provide Non-Destructive Examination (NDE) report for welding of piping. Unless specifically stated to the contrary, fabrication, assembly, welding, and brazing must conform to ASME B31.1 for all piping of the air system. Piping must follow the general arrangement shown. Cut piping accurately to measurements established for the work. Work piping into place without springing or forcing, except where cold-springing is specified. Piping and equipment within buildings must be entirely out of the way of lighting fixtures and doors, windows, and other openings. Locate overhead piping in buildings in the most inconspicuous positions. Do not bury or conceal piping until it has been inspected, tested, and approved. Where pipe passes through building structure, pipe joints must not be concealed, but must be located where they may be readily inspected and building structure must not be weakened. Avoid interference with other piping, conduit, or equipment. Except where specifically shown otherwise, vertical piping must run plumb and straight and parallel to walls. Piping connected to equipment must be installed to provide flexibility for vibration. Adequately support and anchor piping so that strain from weight of piping is not imposed on the equipment.

3.1.3.1 Fittings

****

NOTE: Delete bending of medium and high pressure pipe when not included in project.

****

Use long radius ells where appropriate to reduce pressure drops. Pipe bends in lieu of fittings may be used for low pressure piping where space permits. Pipe bends must have a uniform radius of at least five times the pipe diameter and must be free from any appreciable flattening, wrinkling, or thinning of the pipe. Mitering of pipe to form elbows, notching straight runs to form full sized tees, or any similar construction must not be used. Make branch connections with welding tees, except factory made forged welding branch outlets or nozzles having integral reinforcements conforming to ASME B31.1 may be used.

3.1.3.2 Clearances for Welding

Provide clearances from walls, ceilings, and floors to permit the installation of joints. The clearances must be at least 150 mm 6 inches for pipe sizes 100 mm 4 inches and less, 250 mm 10 inches for pipe sizes over 100 mm 4 inches, and sufficient in corners. However, the specified clearances must not waive requirements for welders to be qualified for the positions to be welded.

3.1.3.3 Cleaning and Flushing Procedures

Before jointing and erection of piping or tubing, thoroughly clean interiors of pipe sections, tube, and components. In steel pipe, loosen scale and other foreign matter by rapping sharply and expel by wire brush and swab. Blow out both steel pipe and copper tube and components with compressed air at 689 kPa (gage) 100 psig or more. Maintain cleanliness by closure of pipe/tube openings with caps or plugs. Before making final terminal connections, blow out complete system with compressed air at 689 kPa (gage) 100 psig or more.

3.1.3.4 Changes in Pipe Size

Use reducing fittings for changes in pipe size. The use of bushings will not be permitted. In horizontal lines, 65 mm 2 1/2 inches and larger, reducing fittings must be of the eccentric type to maintain the bottom of the lines in the same plane.

3.1.3.5 Drainage and Flexibility

Compressed air piping must be free of unnecessary pockets and pitched approximately 25 mm per 10 meters 3 inches per 100 feet in the direction of flow to low points. Where pipes must be sloped so that condensate flows in opposite direction to air flow, slope 50 mm per 10 meters 6 inches per 100 feet or greater. Provide flexibility by use of fittings, loops, and offsets in piping. Install branches at top of a main to prevent carryover of condensate and foreign matter.

3.1.4 Threaded Joints

Where possible use pipe with factory cut threads, otherwise cut pipe ends square, remove fins and burrs, and cut taper pipe threads in accordance with ASME B1.20.1. Threads must be smooth, clean, and full cut. Apply thread tape to male threads only. Work piping into place without springing or forcing. Backing off to permit alignment of threaded joints will not be permitted. Engage threads so that not more than three threads remain exposed.

3.1.5 Welding and Brazing Procedures

Perform welding and brazing in accordance with qualified procedures using qualified welders and welding operators and brazers. Do not perform welding and brazing when the quality of the completed weld or braze could be impaired by the prevailing working or weather conditions. The Contracting Officer will determine when weather or working conditions are unsuitable for welding. Welding of hangers, supports, and plates to structural members must be in accordance with AWS D1.1/D1.1M.

3.1.5.1 Cleaning for Welding and Brazing

Surfaces to be welded or brazed must be free from loose scale, slag, rust, paint, oil, and other foreign material. Joint surfaces must be smooth and free from defects which might affect proper welding. Clean each layer of weld metal thoroughly by wire brushing, grinding, or chipping prior to inspection or deposition of additional weld metal.

3.1.5.2 Stress Cracking During Brazing

For material susceptible to stress corrosion cracking from molten brazing filler metal, avoid applying stress during brazing.

3.1.5.3 Welding or Brazing of Valves

Welding or Brazing of Valves: Disassemble valves subject to damage from heat during welding or brazing and reassemble after installation. Open valves two or three turns off the seat when not subject to heat damage during welding or brazing; do not backseat valve.

3.1.6 Flare Fittings

Provide flare fittings only where necessary to connect copper tubing to equipment. Use short sections of annealed tubing soldered or brazed to hard drawn tubing using couplings on expanded ends on the annealed tubing made with special tools designed for that purpose. Make flares with the appropriate flaring tools. Cut annealed tubing only with cutting wheel tool. Do not ream out inside burr or lip left by the cutting wheel but fold back lip with flare tool to form seal/gasket inside flare. When new, the flare should cover not more than 75 percent of the flare seating surface of either the male or female flare fittings. Put the flare nut on the tube before making the flare.

3.1.7 Valves

ASME B31.1. Install valves at the locations indicated and elsewhere as required for the proper functioning of the system.

3.1.7.1 Gate Valves

Provide gate valves unless otherwise directed. Install valves in positions accessible for operation and repair. Install valve with stem horizontal or above.

3.1.7.2 Globe Valves

Install globe valves so that the pressure will be below the disk. Install globe valves with the stems vertical.

3.1.7.3 Pressure-Reducing Valves

Provide compressed air entering each pressure-reducing valve with a strainer. Provide each pressure-reducing valve unit with two block valves and with a globe or angle bypass valve and bypass pipe. Provide a bypass around a reducing valve of reduced size to restrict its capacity to approximately that of the reducing valve. Provide each pressure reducing valve unit with an indicating gage to show the reduced pressure, and a safety valve on the low pressure side. These requirements do not apply to small pressure regulating valves used to adjust pressure for pneumatic equipment.

3.1.8 Hangers and Supports

****

NOTE: See NAVFAC P-355, "Seismic Design for Buildings," Chapter 10, "Mechanical and Electrical Elements," for calculating pipe support spacing for schedules not shown. Delete Table I and reference to seismic requirements if not required.

****

Selection, fabrication and installation of piping hangers and supports must conform to MSS SP-58,[except that spacing of the hangers and supports must be as per Table I.][Provide seismic restraints for piping in accordance with PPIC Seismic Restraint.]

TABLE I. MAXIMUM SPAN FOR PIPE (METERS)

DIAMETER MM	STD. WT. STEEL PIPE SCHEDULE 40	EX. STRONG STEEL PIPE SCHEDULE 80	COPPER TUBE TYPE K	COPPER TUBE TYPE L

10	17'-0"	17'-6"		
12	18'-3"	19'-0"		

3.1.9 Pressure Gages

Provide pressure gages with a shut-off valve or petcock installed between the gage and the line.

3.1.10 Strainers

Provide strainers with meshes suitable for the services where indicated, or where dirt might interfere with the proper operation of valve parts, orifices, or moving parts of equipment.

3.1.11 Equipment Foundations

Provide equipment foundations of sufficient size and weight and of proper design to preclude shifting of equipment under operating conditions or under any abnormal conditions which could be imposed upon the equipment. Provide foundations which meet the requirements of the equipment manufacturer, and when required by the Contracting Officer, obtain from the equipment manufacturer approval of the foundation design and construction for the equipment involved. Equipment vibration must be maintained within acceptable limits, and must be suitably dampened and isolated.

3.1.12 Equipment Installation

Install equipment strictly in accordance with these specifications, and the manufacturers' installation instructions. Grout equipment mounted on concrete foundations before piping is installed. Install piping in a manner that does not place a strain on any of the equipment. Do not bolt flanged joints tight unless they match properly. Extend expansion bends adequately before installation. Grade, anchor, guide and support piping without low pockets.

3.1.13 Cleaning of System

Clean the various system components before final closing as the installations are completed. Remove foreign matter from equipment and surrounding areas. Preliminary or final tests will not be permitted until the cleaning is approved by the Contracting Officer.

3.1.14 Pipe Sleeves

Provide pipe sleeves where pipes and tubing pass through masonry or concrete walls, floors, roofs, and partitions. Hold sleeves securely in proper position and location before and during construction. Sleeves must be of sufficient length to pass through entire thickness of walls, partitions, or slabs. Extend sleeves in floor slabs 50 mm 2 inches above the finished floor. Pack space between the pipe or tubing and the sleeve firmly with oakum and caulk both ends of the sleeve with elastic cement.

3.1.15 Floor, Wall, and Ceiling Plates

Provide chromium-plated steel or nickel-plated cast iron plates on pipes passing through floors and partitions of finished rooms. Provide painted cast-iron, malleable iron, or steel for other areas.

3.1.16 Flashing for Buildings

Provide flashing [as required] [in accordance with Section 07 60 00 FLASHING AND SHEET METAL] where pipes pass through building roofs and outside walls.

3.1.17 Unions and Flanges

Provide unions and flanges where necessary to permit easy disconnection of piping and apparatus, and as indicated. Provide a union for each connection having a screwed-end valve. [Provide unions or flanges not farther apart than 30 meters 100 feet.] [Provide unions or flanges as indicated.] Provide unions on piping under 50 mm 2 inches in diameter, and provide flanges on piping 50 mm 2 inches and over in diameter. Install dielectric unions or flanges between ferrous and non-ferrous piping, equipment, and fittings; except that bronze valves and fittings may be used without dielectric couplings for ferrous-to-ferrous or non-ferrous to non-ferrous connections.

3.1.18 Painting of Piping and Equipment

Paint piping and equipment in accordance with Section 09 90 00 PAINTS AND COATINGS.

3.1.19 Identification of Piping

Identify piping in accordance with ASME A13.1. Use commercially manufactured piping identification labels. Space identification marking on runs not farther apart than 15 meters 50 feet. Provide two copies of the piping identification code framed under glass and install where directed.

3.1.20 Warning and Identification Tape

Coordinate installation of utility warning and identification tape with backfill operation. Provide tape above buried lines at a depth of 200 to 300 mm 8 to 12 inches below finish grade.

3.2 CLEANING SILVERBRAZED PIPING

****

NOTE: All silverbrazed piping, including low pressure systems, should be cleaned to preclude corrosion from residual brazing flux.

****

Clean silverbrazed piping to remove residual flux remaining in the system after fabrication. Use one of the procedures below. The hot flush and hot recirculating flush are preferred. Minimum flow rate through any part of the system in liters per second gallons per minute must be 0.0037 1.5 times the inside diameter of the pipe in mm inches. For any flushing method used, the system must be full of water so that joints are completely submerged at all times.

3.2.1 Hot Flushing Method

Hot flush the system for one hour using heated fresh water. No part of the system must go below 43 degrees C 110 degrees F.

3.2.2 Hot Recirculating Flush Method

Perform hot recirculating flush for one hour. Heat water during flushing so that no part of the system falls below 43 degrees C 110 degrees F. After completing the hot recirculating flush, flush the system with cold fresh water for 15 minutes.

3.2.3 Cold Soak Method

Cold soak the system using fresh water at not less than 15.50 degrees C 60 degrees F for 12 hours. Following the 12 hour soak, flush the system with fresh water at not less than 15.50 degrees C 60 degrees F for 4 hours.

3.3 FIELD QUALITY CONTROL

3.3.1 Examinations

3.3.1.1 Welding Examinations

[The Contractor must] [The Government will] perform visual examinations to detect surface and internal discontinuities in completed welds. NDE on piping welds covered by ASME B31.9 is visual inspection only. Verify piping welds meet the acceptance criteria. Submit a NDE report meeting the requirements specified in ASME B31.9. Visually examine all welds. When examination indicates defects in a weld joint, the weld must be repaired by a qualified welder. Remove and replace defects as specified in ASME B31.1, unless otherwise specified. Repair defects discovered between weld passes before additional weld material is deposited. Whenever a defect is removed, and repair by welding is not required, blend the affected area into the surrounding surface, eliminating sharp notches, crevices, or corners. After defect removal is complete and before rewelding, examine the area by the same methods which first revealed the defect to ensure that the defect has been eliminated. After rewelding, reexamine the repaired area by the same test methods originally used for that area. Any indication of a defect must be regarded as a defect unless reevaluation by surface conditioning and reexamination shows that no unacceptable defects are present. The use of any foreign material to mask, fill in, seal, or disguise welding defects will not be permitted.

3.3.1.2 Brazing Examinations

The Contractor must perform brazing examinations. Visually examine all compressed air systems as follows:

a. Check brazed joint fit-up. Diametrical clearances must conform to brazing procedure requirements.

b. Check base material of pipe and fitting for conformance to the applicable drawing or specification.

c. Check grade of brazing alloy for conformance to the brazing procedure before fit-up or brazing.

d. Check completed brazed joint for a complete ring of brazing alloy between the outside surface of the pipe and the face of the fitting, and for a visible fillet.

e. Check stainless steel and other susceptible material for evidence of stress cracks. Check inside of joint if possible with borescope or other aids.

Defective joints may be repaired. However, no more than two attempts to repair by reheating and additional face feeding of brazing filler metal will be permitted, after which the defective joint must be unsweated, reprepared as a new joint, examined for defects on pipe and fittings, and rebrazed.

3.3.2 Testing

****

NOTE: If air (pressure) drop tests are used for system acceptance, assure leakages at acceptable rates through valves (or other components) are not causing pressure drop. Most hard-seated valves have some allowable leakage rate (about 10 cubic centimeters 0.0026 gal per hour of water per 25 mm one inch of valve size or 3 liters per hour 0.1 cubic feet per hour of gas per mm inch of valve size). Delete check for cross-connection if only one type of system is involved in project.

****

3.3.2.1 General Requirements, Testing

Perform testing after cleaning. Contractor must provide everything required for tests. Tests must be subject to the approval of the Contracting Officer. Calibrate the test pressure gages with a dead weight tester within [15] [_____] days before use and certify by initial and date on a sticker applied to dial face. [Pressurize each piping system individually and check to assure that there are no cross-connections between different systems prior to hydrostatic and operational tests.]

3.3.2.2 Hydrostatic Tests and Leak Tightness Tests

a. Preliminary Preparation

Remove or isolate from the system the compressor, air dryer, filters, instruments, and equipment which would be damaged by water during hydrostatic tests and reinstall after successful completion of tests.

b. Performance of Hydrostatic Tests

****

NOTE: Specify or show on the drawings the design working pressure of each system in the project.
****

Hydrostatically test piping systems in accordance with ASME B31.1. Vent or flush air from the piping system. Pressurize system for 10 minutes with water at one and one-half times design working pressure, then reduce to design working pressure and check for leaks and weeps.

c. Compressed Air Leak Test

After satisfactory completion of hydrostatic pressure test, blow systems dry with clean, oil-free compressed air, and test with clean, dry air at design working pressure. Brush joints with soapy water solution to check for leaks. Install a calibrated test pressure gage in piping system to observe any loss in pressure. Maintain required test pressure for a sufficient length of time to enable an inspection of joints and connections.

3.3.2.3 Operational Tests

Test equipment as in service to determine compliance with contract requirements and warranty. During the tests, test equipment under every condition of operation. Test safety controls to demonstrate performance of their required function. Completely test system for compliance with specifications.

3.4 INSTRUCTION TO GOVERNMENT PERSONNEL

Provide [2] [_____] man-days of instruction to [2] [_____] Government personnel in accordance with Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS for each type of compressor and compressed air dryer in the project.

SECTION 43 21 29

FLOW MEASURING EQUIPMENT [POTABLE WATER] [SEWAGE TREATMENT PLANT]

04/06, CHG 1: 11/24

****

NOTE: This guide specification covers the requirements for flow measuring equipment for use in potable water or sewage treatment plant.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

****

NOTE: Special consideration not included in this guide must be given to sewage with high salt water concentration or carrying industrial wastes containing components detrimental to materials used in typical treatment plant and biodegrading micro-organisms.

****

1.2 SYSTEM REQUIREMENTS

The flow measuring equipment must be the [variable head meter type for closed channel] [variable head meter type for open channel] [variable area meter type] [propeller meter type] [electromagnetic meter type] [volumetric meter for [open] [closed] channel] [ultrasonic meter type]. The design must permit ease of installation and must not have any features hazardous to personnel or detrimental to the equipment. Provision must be made to align and adequately lubricate moving parts. Interior parts must be easily accessible for adjustment, repair, and replacement.

1.3 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Flow Measuring Equipment Components

Read-out Device

SD-06 Test Reports

Flow Measuring Equipment Calibration

Open Channel Test

Dimensional Inspection Report

Closed Channel Test

SD-08 Manufacturer's Instructions

Flow measuring Equipment Components

Submit manufacturer's written recommendation for installation and handling.

1.4 QUALITY ASSURANCE

1.4.1 Requirements

Perform calibration and submit test report for flume in variable head meter for open channel. Submit dimensional inspection report and flow versus differential head curve for variable head meters for closed channel; accuracy must be plus or minus 1.0 percent over a 10 to 1 flow range. Submit as required in paragraph entitled "Field Tests and Inspections."

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

****

NOTE: Choose the paragraphs which follow based on type of meter needed for the system selected in the paragraph entitled "System Requirements."

****

Unless otherwise specified, all materials and equipment must be standard commercial products in regular production by the manufacturer and suitable for the required service.

2.1.1 Variable Head Meter for Closed Channel

****

NOTE: Delete this paragraph and the subparagraphs which follow when variable head meter for closed channel is not required.

****

must include [an orifice plate] [a flow nozzle] [a Venturi tube] as differential head producer, a diaphragm meter as differential measurement, and [an indicator] [and an integrator] as read-out device[s]. [Remote transmission also must be included.] Meter must be provided for [potable water] [plant water] [water for chlorination] [air for aeration] [recirculated plant effluent] [plant effluent] [plant influent] [bypass line] [primary sludge] [return sludge] [sludge to waste] [digested sludge] flow where indicated.

[2.1.1.1 Orifice Plate

****

NOTE: Select this paragraph ORIFICE PLATE or the paragraphs below FLOW NOZZLE, VENTURI TUBE, or MODIFIED VENTURI.

****

must be of the differential producing type with circular hole, and designed for insertion in a [_____] mm inch pipe where indicated. The orifice plate must measure the flow of [_____] to [_____] [cubic meter per second] [gpm]. Provide the orifice plate with a flange union to hold the plate perpendicular to the axis of the pipe. The flange must have a pressure rating of 862 kPa 125 psi and must have threaded ends. The orifice plate must be of stainless steel and must be furnished with a tab designating line size, orifice size, and flow direction. The orifice plate must be in accordance with recommendations of the ASME PTC 19.5, except as modified herein. The pressure taps must be of the [flange] [one diameter upstream and one-half diameter downstream] [corner] type and sized in accordance with recommendations of the ASME PTC 19.5.

][2.1.1.2 Flow Nozzle

must be of the differential producing type having a modified Venturi flow nozzle contour, and designed for at least 90 percent head recovery for insertion in [_____] mm inch pipe where indicated. The nozzle must measure the flow of [_____] to [_____] [cubic meter per second] [gpm]. The flow nozzle must have 862 kPa 125 psi flanged ends conforming to ASME B16.1. Construct the nozzle of cast iron conforming to ASTM A126, Grade B. The throat liner must be of bronze conforming to ASTM B61. The length of the throat liner must be equal to 75 percent of the throat diameter. The inlet pressure tap must be one diameter upstream and the outer pressure tap must be [one-half diameter downstream] [the throat type]. [The taps for use with sewer and sludge must have built-in capabilities for manual rodding of the holes.]

][2.1.1.3 Venturi Tube

must be of the differential producing type, and designed for [potable water] [sewage] [sludge] service with at least 90 percent head recovery [in accordance with recommendations of the ASME PTC 19.5] for use in a [_____] mm inch pipe where indicated. The Venturi must measure the flow of [_____] to [_____] [cubic meter per second] [gpm]. The Venturi must have 862 kPa 125 psi flanged ends conforming to ASME B16.1. The laying length must be approximately that indicated. Construct the body of cast iron conforming to ASTM A126, Grade B. The throat section and vent bushing must be bronze conforming to ASTM B61. [For sludge service, equip the tube with manual vent cleaners requiring not more than 1.57 rad 90 degrees rotation for full operation.] [For sludge service, provide a water purge system and two matched assemblies of piping, valves, rotometers, and fittings. The purge system must operate on a clean water supply of 0.000063 cubic meter per second one gpm at a regulated pressure of 69 kPag 10 psiggreater than line pressure. The Venturi interior waterways must be finished with an anti-stick coating.]

][2.1.1.4 Modified Venturi

must be of the differential producing type, and designed for [potable water] [sewage] [sludge] service with at least a 90 percent head recovery for use in a [_____] mm inch pipe where indicated. The Venturi must measure the flow of [_____] to [_____] [cubic meter per second] [gpm]. The laying length must be approximately that indicated. The modified Venturi must be of the insert type constructed of fiberglass reinforced polyester. The holding flange must be carbon steel, bronze, or fiberglass reinforced plastic with integral pressure taps for mounting between 862 kPa 125 psi ASME B16.1 flanges.

]2.1.1.5 Diaphragm Meter

must have a range of [_____] to [_____] [cubic meter per second] [gpm], and a minimum differential of not less than 25 mm one inch. The maximum differential must be equal to the range squared but must not exceed 2500 mm 100 inches of water column. It must have stainless steel bellows with built-in overrange protection to prohibit deformation of the bellows. Contain the bellows in a forged brass or cadmium-plated forged carbon steel housing to withstand a working pressure of at least 3.45 MPa 500 psi. Transmit the output motion of the bellows to the local read-out device. There must be zero adjustment in the diaphragm meter. Accuracy must be plus or minus 0.5 percent of full scale over a 3 to 1 flow range.

[2.1.2 Variable Head Meter for Open Channel

****

NOTE: Delete these paragraphs when variable head meter for open channel is not required.

****

must include [a weir] [a flume] as head producer, a stilling well with float and cable as head measurement, and [an indicator] [a recorder] [and an integrator] as read-out device(s). [Remote transmission also must be included.] Provide meter for [potable water] [plant influent] [bypass line] [plant effluent recirculation] [return sludge] [plant effluent] flow where indicated.

[2.1.2.1 Weir

****

NOTE: Select this paragraph WEIR, or the paragraphs below PARSHALL FLUME or FLUME."

****

must be of the [rectangular] [1.05 rad] [60 degree] [triangular (V-notch)] [1.57 rad] [90 degree] [triangular (V-notch)] [Cipolletti] type as indicated. The weir must measure the flow of [_____] to [_____] [cubic meter per second] [mgd]. The upstream face of the weir plate must be flat and smooth. Any bolts or rivets used to fasten the plate must be countersunk flush with the plate. Bolt holes must include provision for adjustment of height and level. The edges of the weir plate exposed to flow must not exceed 3 mm 1/8 inch in thickness; where thicker plates must be used, the edge must be beveled 0.78 rad 45 degrees or more to the required 3 mm 1/8 inch. Make the weir plate of stainless steel or fiberglass reinforced polyester laminate containing at least 30 percent fiberglass by weight.

][2.1.2.2 Parshall Flume

must be of the Parshall type, and must measure the flow of [_____] to [_____] [cubic meter per second] [mgd]. The flume must have a converging upstream section, a throat, and a diverging downstream section. The complete unit must have vertical walls. Stilling wells and throat floor must be inclined downward. Construct the flume of polyester resin reinforced with not less than 30 percent fiberglass by weight and provided with locking devices for engagement with the grout around the liner. Reinforcing ribs must be an integral part of the flume while removable bracing must be provided to ensure proper maintenance of liner dimensions during shipment and installation.

][2.1.2.3 Flume

must be of the characterized type, and must measure the flow of [_____] to [_____] [cubic meter per second] [mgd]. The flume must have a cast iron measuring section having a circular inlet and a characterized outlet. The inlet line size must be [_____] mm inches. The inlet must be ASME B16.1, 862 kPa 125 psi, flanged. The flume must have a flat invert free from pockets and obstructions. [Equip the flume with a manual vent cleaner and sediment trap.]

]2.1.2.4 Float and Cable

must have a range of [_____] to [_____] [cubic meter per second] [mgd] with a head measurement of [_____] mm inches. Measure the crest level in a stilling well as indicated. The measuring system must include a float, cable, drum, transfer gear assembly, and cam mechanism to provide uniformly graduated units of flow. The float must be of polyester, stainless steel, or copper, and of a weight and shape that conform to the application requirements. The cable must be plastic-coated multi-strand stainless steel, stainless steel beads, or multi-strand monel. Groove the drum to prevent overlapping of the cable. Provide the float and cable with stops to prevent overranging and to provide a zero adjustment. All materials of construction must be corrosion-resistant. Provide protection tubes for the cables. Accuracy must be plus or minus 2 percent of the actual rate over a 5 to 1 range.

]2.1.3 Variable Area Meter for [Open] [Closed] Channel

****

NOTE: Delete this paragraph when a variable area meter for an open or closed channel is not required.

****

Provide a variable area meter as indicated. Make the variable area meter of a tapered tube with a float that will indicate a flow range of [_____] to [_____] [cubic meter per second] [gpm]. The tube must be glass with flow units etched on it and must be placed vertically for reading. It must consist of fiberglass, stainless steel, or aluminum with stainless steel fitted ends and fluorinated hydrocarbon rubber or chloroprene O-rings. The float must be stainless steel and easily read. The metering tube must be easily removed for range change or cleaning without tools or removing the meter from the line. Provide a needle valve for adjusting flow where indicated. Accuracy must be plus or minus 5 percent over a 3 to 1 range.

[2.1.4 Propeller Meter

****

NOTE: Delete this paragraph when a propeller meter is not required.

****

Provide a propeller meter where indicated. The meter must measure the velocity and convert it to flow units. The meter must have a range of [_____] to [_____] [cubic meter per second] [gpm] for use in a [_____] mm inch pipe. Materials must conform to the applicable requirements of AWWA C704. [The propeller meter must be of the saddle type for a working pressure of 862 kPa 125 psi and be supplied with a steel welding saddle and separate straightening vanes.] [The propeller meter must be of the tube type for a working pressure of 862 kPa 125 psi and be furnished complete with a tube, built-in straightening vanes, and 862 kPa 125 psi ASME B16.1 flanged ends, or threaded connections, as appropriate for the pipe.] Provide the meter head with a conical shaped three-blade propeller mounted transversely in the line. The meter must be completely sealed from water pressure and able to withstand thrust on the front of the propeller. Accuracy must be plus or minus 2 percent of actual rate over a 10 to 1 range.

][2.1.5 Electromagnetic Meter

****

NOTE: Delete this paragraph when an electromagnetic meter is not required.

****

****

NOTE: For plant influent service, allow the optional use of chloroprene-lined stainless steel or steel, polyurethane-lined stainless steel or steel, or fiberglass tubes. For primary sludge service, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, vitreous enamel-lined stainless steel or steel, glass-lined stainless steel or steel, or tetrafluoroethylene-lined aluminum tubes. For recirculated plant effluent, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, chloroprene-lined stainless steel or steel, or fiberglass tubes. For return sludge service, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, chloroprene-lined stainless steel or steel, or fiberglass tubes. For sludge to waste service, allow the optional use of tetrafluoroethylene-lined stainless steel, vitreous enamel-lined stainless steel or steel, or glass-lined stainless steel or steel tubes. For digested sludge service, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, chloroprene-lined stainless steel or steel, or fiberglass tubes. For plant effluent service, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, chloroprene-lined stainless steel or steel, or fiberglass tubes.

****

****

NOTE: Delete the bracketed sentence beginning "Provide a transformer..." when power supply is 120 volts.

****

****

NOTE: Delete requirements for cleaning except when meter is for any sludge service.

****

Provide a magnetic flow meter where indicated. The magnetic flow meter must measure the flow of [_____] to [_____] [cubic meter per second] [mgd] and be suitable for a [_____] mm inch pipe. The magnetic flow meter system must include a flow tube, local read-out receiver, [remote transmission,] and interconnecting cable where indicated. The flow meter must be a [tetrafluoroethylene-lined stainless steel or steel] [chloroprene-lined stainless steel or steel] [polyurethane-lined stainless steel or steel] [vitreous enamel-lined stainless steel or steel] [glass-lined stainless steel or steel] [tetrafluoroethylene-lined aluminum] [fiberglass] tube with the necessary cores and coils to provide a magnetic field without any interference and with [1034 kPa] [150 psi] [modified ASME B16.1 carbon steel flanges] [Dresser type coupling] [Victaulic type couplings] [integral fiberglass flanges]. Electrodes must be of stainless steel. The tube must operate from [120] [240] volts, [_____] hertz, single-phase ac power. A weatherproof housing must cover the magnets, coils, and connections. [Provide a transformer within the transmitter housing to provide 120 volts power to the receiver.] [Provide a system for cleaning the electrodes or tube automatically without taking the tube out of service. Automatic mechanical cleaning of electrodes or tube will not be acceptable.] The metering tube must have an approximate laying length as indicated. Provide all necessary cable between the transmitter and receiver. Accuracy must be plus or minus one percent over a 10 to 1 range. The receiver must convert the ac voltage signal generated in the flow tube to a uniform flow signal. There must be an adjustment for zero and span.

][2.1.6 Volumetric Meter

****

NOTE: Delete this paragraph when a volumetric meter is not required

****

Provide a volumetric meter where indicated. The meter must conform to AWWA C700. The meter must be of the rotating-disc type for use in a [_____] mm inch pipe and must be of the frostproof type, if applicable.

][2.1.7 Ultrasonic Meter

****

NOTE: Delete this paragraph when an ultrasonic meter is not required.

****

Provide an ultrasonic meter where indicated. The meter must have a velocity range of 0 to 1.52 meters per second through 0 to 6.10 meter per second 0 to 5 feet per second through 0 to 20 feet per second for use with a [_____] mm inch pipe. The flow meter must consist of [separate transmitting and receiving transducers clamped to the outside of the pipe to measure the liquid flow without, in anyway, intruding into or altering the pipe.] [the primary element employing a single pair of electro-acoustic transducers mounted diagonally in a flow tube, and in direct contact with the liquid flow to be measured] [a single transducer with twin crystals encapsulated in an epoxy housing mounted on the outside of the pipe. The transmitting crystal must emit a continuous ultrasonic pulse or frequency into the liquid stream to be reflected back to the receiving crystal. It must measure the difference in frequencies which is proportional to the liquid flow.] The transmitter must contain all necessary circuitry enclosed in NEMA 4 [indoor] [outdoor] housing suitable for [wall] [panel] mounting and connected to the transducers by [_____] m feet of cable. It must produce an accurate 4 to 20 mA dc signal linear with flow rate. It must provide linearity of plus of minus 0.5 percent and repeatability of 0.1 percent under simulated flow. Long term drift of the pulse rate output must be less than 0.1 percent. It must operate with 115 or 230 volt plus or minus 10 percent, 50 or 60 Hz electrical power. The unit must function over an ambient temperature range of [_____] degrees C F to [_____] degrees C F indoor or [_____] degrees C F to [_____] C F outdoor. The flow rate indicator must be integrally mounted in the transmitter housing. Graduate 150 mm 6 inch scale length in [meter per second] [cubic meter per second] [fps] [gpm].

]2.2 READ-OUT DEVICE

****

NOTE: Retain appropriate paragraphs and delete others.

****

Provide the meter with the following read-out device which must read from [_____] to [_____] [cubic meter per second] [gpm].

[2.2.1 Local Read-Out

****

NOTE: Choose this paragraph entitled "Local Read-Out," or the paragraph below entitled "Local Read-Out and Remote Transmission," including its subparagraphs "Indicator," "Recorder," and "Integrator."

****

Provide [an indicator] [a recorder] [and an integrator] for local read-out of flow. The scale graduation must be [uniform] [square root]. The read-out must be visible through a shatterproof clear window. The read-out mechanism must not be affected by the intended end use environment. The unit must be non-corrosive and weatherproof or provided with a separate weatherproof housing with a sealed door for access to the mechanism, and designed to prevent the accumulation of moisture or fog inside the case. Provide a suitable mounting.

][2.2.2 Local Read-Out and Remote Transmission

Provide [an indicating transmitter] [a recording transmitter] [and an integrator] for local read-out and transmission of flow data to remote read-out. The scale graduation must be [uniform] [square root]. The read-out must be visible through a shatterproof clear window. The read-out and transmission mechanism must not be affected by the intended end use of environment. The transmission must be impulse duration type or milliampere dc analog signal type to the remote read-out. Actuate all transmission by the output motion or the ac voltage signal of the meter. Power required [must come from the meter] [must be [_____] volts, [_____] hertz, ac]. When impulse duration type transmission is used, the system must have a 15 second maximum cycle actuating a cam-operated contact. The contact must be of the totally-enclosed type. The unit must be non-corrosive and weatherproof or provided with a separate weatherproof housing with a sealed door for access to the mechanism, and designed to prevent the accumulation of moisture or fog inside the case. Provide a suitable mounting.

2.2.2.1 Indicator

must be a minimum of 150 mm 6 inches long.

2.2.2.2 Recorder

must be a minimum of 250 mm 10 inches in diameter and must rotate once [daily] [weekly] [monthly]. The chart drive must be driven by a synchronous motor from [_____] volts, [_____] hertz, ac.

2.2.2.3 Integrator

must read the total flow in the units specified using only a whole power of 10 multiplier.

]2.2.3 Remote Read-Out

Provide [an indicator] [a recorder] [and an integrator] for remote read-out of flow. The scale graduation must be [uniform] [square root]. The read-out must accept the signal output and be of the same range and flow units as the local read-out and remote transmission device. The signal must actuate an electro-mechanical receiver in which the input duplicates the output of the remote transmission device. Ac or dc power supply must be provided, if required. The read-out must be visible through a shatterproof clear window. The read-out must not be affected by the intended end use environment. The unit must be weatherproof or provided with a separate weatherproof housing with a sealed door for access to the mechanism, and designed to prevent the accumulation of moisture or fog inside the case. Provide a suitable mounting.

2.2.3.1 Remote Read-Out Indicator

must be a minimum of 150 mm 6 inches long.

2.2.3.2 Remote Read-Out Recorder

must be a minimum of 250 mm 10 inches in diameter and must rotate once [daily] [weekly] [monthly]. The chart drive must be driven by a synchronous motor from [_____] volts, [_____] hertz, ac.

2.2.3.3 Remote Integrator

must read the total flow in the units specified using only a whole power of 10 multiplier.

2.3 ELECTRICAL REQUIREMENTS

****

NOTE: Delete paragraph except when electromagnetic meter, electric drive chart for recorders, or remote read-out is required.

****

****

NOTE: Delete requirements for signal circuit when remote read-out is not required.

****

Unless indicated or specified otherwise, the electrical components of the meters, such as chart drives and electrical disconnecting (isolating) means, are included under this section. [Provide wiring for signal circuit as specified by the equipment manufacturer.] The interconnecting conduit and wire (except when otherwise specified herein, or when included in factory-assembled equipment) and the electrical connection of the meters to the electrical power circuit are specified in Division 26.

2.4 SPARE PARTS

****

NOTE: Delete the bracketed sentence when recorder is not required.

****

Provide all standard recommended spare parts as specified in the manufacturer's instruction manuals for each component in the system. [Furnish one year's supply of charts and ink for each recording device.]

PART 3 EXECUTION

3.1 MATERIALS PROTECTION

The entire tube, except the throat section of the [flow nozzle] [Venturi] [characterized flume], must receive a series of coats of paint conforming to MIL-DTL-24441. Apply the paint in the following order: one coat of Formula 150, one coat of Formula 151, one coat of Formula 156, and one coat of Formula 152. The final total dry-film thickness must be not less than 0.25 mm 10 mils. Furnish all other items in accordance with the manufacturer's standard practice suitable for end use environment.

3.2 INSTALLATION

Furnish the services of an engineer representative of the manufacturer of the flow measuring equipment for checking the installation, making the necessary adjustments and calibrations, placing the equipment in operation, and performing the acceptance tests. The representative also must be available for not less than 2 days to instruct operating personnel in the use, operation, and maintenance of the equipment during the initial operating period. Install all flow measuring equipment in accordance with the recommendations of the manufacturer. Install variable head meter[s] for closed channel[s] in accordance with the ASME PTC 19.5. Install weir[s] with the top exactly level at the elevation indicated.

3.3 FIELD TESTS AND INSPECTIONS

Test and calibrate in place the flow measuring equipment to demonstrate that it meets the accuracy requirements for the full range of flows specified herein. Provide all labor, equipment, and incidentals required for the tests, including electric power and water required for tests. The Contracting Officer will witness all field tests and conduct all field inspections. The Contractor must give the Contracting Officer ample notice of the dates and times scheduled for tests. Rectify any deficiencies found and retest work affected by such deficiencies at the Contractor's expense. Record data from each field test must be recorded and documented in a formal field test report.

****
NOTE: This guide specification covers the requirements for systems to transfer organic contaminants from water to activated carbon adsorption media.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**
****

PART 1 GENERAL

1.1 UNIT PRICES

****
NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.
****

The Payment Schedule included with the Bid Form describes how treated water is paid. Unit payment for each modular activated carbon unit includes delivery, installation and placement in service. Unit payment for [reactivation][disposal] and replacement of the activated carbon includes placement of the spare unit in service, disconnection of the exhausted unit, drainage and treatment of the free water, transport of the activated carbon [to and from reactivation][to the disposal] facility, [reactivation][disposal and replacement] of the activated carbon and placement of the fresh carbon filled unit in the spare position.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 Pre-Installation Meeting

****

NOTE: Remove this paragraph when meeting is not required.

****

[Partnering][Pre-installation] meeting isrequired. Ensure that involved subcontractors, suppliers, and manufacturers are [notified][represented]. Furnish the date and time of the meeting to the Contracting Officer for approval.

1.4 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Preventive Maintenance Plan And Schedule

1.5 MAINTENANCE MATERIAL SUBMITTALS

Provide special tools necessary for adjustment, operation, maintenance, and disassembly for each type of equipment furnished; a lever type grease gun or other lubricating device for each type of grease required; and one or more steel cases mounted on the wall complete with flat key locks, two keys, and clips or hooks to hold each tool in a convenient location. Provide tools that are high-grade, smooth, forged, alloy, tool steel. Deliver tools at the same time as the equipment and hand over on completion of the work.

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

Provide pressure rated adsorption shells bearing the ASME BPVC SEC VIII D1 code stamp.

1.6.2 Qualifications

1.6.2.1 Constructor

Requires a cumulative minimum of [2][3][5][_____] years of experience in the construction of water treatment plants, wastewater treatment plants, industrial wastewater treatment plants, or industrial wastewater pretreatment plants.

1.6.2.2 Single Source Supplier

Assign full responsibility for the furnishing of the adsorption system to a single supplier. The designated single supplier coordinates the selection, assembly, installation, and testing of the entire system as specified herein. The designated single supplier need not manufacture the entire system.

1.6.2.3 Manufacturer's Representative

Provide the services of a manufacturer's field service representative experienced in the installation, adjustment, and operation of the equipment furnished and who possesses complete knowledge of the proper operation and maintenance of the system.

1.6.2.4 Welding

Provide documentation including welding procedures, lists of welders, and qualifications of welding operators in accordance with Sections 8.2 and 8.8 of AWWA D100.

1.6.2.5 Reactivation Facility

Provide qualifications of reactivation facility procedures and operation in accordance with AWWA B605.

1.7 DELIVERY, STORAGE, AND HANDLING

Submit instructions for any required sampling, preparation and shipping of activated carbon to reactivation or disposal facility. Submit a copy of the safety data sheet along with [materials] [materials and each chemical] delivered to the site. Submit the safety data sheet in conformance with 29 CFR 1910 Section 1200(g) for [activated carbon][activated carbon and each chemical].

1.7.1 Granular Activated Carbon

Package, mark, and ship granular activated carbon for potable water treatment in accordance with [AWWA B604,][AWWA B604 and AWWA B605].

1.7.2 Powdered Activated Carbon

Package, mark, and ship powdered activated carbon for potable water treatment in accordance with AWWA B600.

1.7.3 Equipment and Accessories

Protect equipment delivered and placed in storage from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide an activated carbon adsorption units system as a complete process for removal of organic and inorganic contaminants from water as specified herein. Provided equipment to include, but not be limited to, vessels containing activated carbon, supporting equipment and accessories. Terminology is in conformance with ASTM D2652.

2.1.1 System Submittals

Submit the following data:

a. Process flow diagrams and instrumentation diagrams(s) showing all major pieces of process equipment with controls. Show on the drawings complete piping, wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and properly functions as a unit. Also show proposed layout and anchorage of equipment and appurtenances; equipment relationship to other parts of the work; clearances for maintenance and operation; and shop and erection details, including cuts, copes, connections, holes, bolts, and welds.

b. List of Federal, State, and local laws, regulations, and permits concerning activated carbon adsorption units that are applicable to operations and the requirements imposed by those laws, regulations, and permits.

c. Instrumentation and controls; capacities and pressure drop; make and model; complete list of equipment and materials, including manufacturer's descriptive and technical literature; performance charts and curves; catalog cuts; and installation instructions.

d. A complete list of parts, supplies and recommended spare parts for each different item of material and equipment specified, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [1] and [3] year(s) of service.

e. Structural calculations for the adsorber shells, tanks and mounting and support details. Verification from a Registered Professional Engineer, licensed to practice mechanical or structural engineering, as appropriate, in the State in which the system was fabricated, stating that the fabrication drawings and pressure calculations for the shells and tanks were designed for the listed conditions in accordance with the appropriate codes and standards.

f. Designs for foundations, footings and supports. Verification from a Registered Professional Engineer, licensed to practice mechanical or structural engineering, as appropriate, in the State in which the system was fabricated, stating that the erection drawings for the shell and tank foundations and supports were designed for the listed conditions in accordance with the appropriate codes and standards.

g. Submit removal and replacement instructions including handling and reactivation of spent activated carbon in accordance with AWWA B605.

2.1.2 Design Requirements

****

NOTE: Determine wind speed from ASCE 7-16, Chapter 1. Provide seismic requirements, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase in the first paragraph if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT, properly edited, must be included in the contract documents.

****

Provide seismic details in accordance with UFC 3-301-01 and [Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT][as indicated].

Minimum design life, modular unit		[_____] years
Minimum design life, other equipment		[_____] years
Adsorption system dimensions		
	Maximum vertical projection	[_____] m ft
	Maximum ground surface coverage	[_____] by [_____] m ft

Soil bearing capacity		[_____] MPa psf
Seismic parameters		[_____]
Wind speed (maximum)		[_____] km/h mph
Ground snow load		[_____] kPa psf
Ambient air temperature		
	Maximum	[_____]degrees C F
	Minimum	[_____]degrees C F

2.1.3 Influent Chemical Conditions

****

NOTE: Obtain an analysis of the water to be treated giving appropriate information to be inserted in the blank spaces. Provide all the available information. Average values for inorganic constituents may be adequate if additional information is not available.

Use of activated carbon for filtration is rarely cost effective. Plain or enhanced sedimentation is the preferred method for removal of suspended solids. Length of runs between backwash cycles and the media capacity may be reduced by biological activity or physical plugging which may result from continuous application of iron bearing or bioactive turbid waters to the adsorption unit. Activated carbon is fouled by growth on the media and formation of deposits on the carbon surface. Iron in the ferrous state may pass through the system. Ferric compounds are insoluble over a pH range of about 3 to 8, the pH range of most water supplies. Manganese is insoluble at a pH of 9 or greater. Pretreatment should be evaluated if iron exceeds 0.2 mg/L, manganese exceeds 0.1 mg/L, calcium exceeds 80 mg/L or magnesium exceeds 40 mg/L.

Lowering the pH by addition of mineral acids has been used to decrease the hydrogen bonding of dissolved organics and to increase metal solubility.

Raw water should be coagulated and filtered if the suspended solids exceed 5 mg/L (ppm) or if the turbidity exceeds 2.5 NTU. Prefiltration may aid in reducing deposition of iron or manganese.

Oxidizing agents, commonly chlorine or oxygen, may result in a loss of volume capacity and more frequent replacement of the media. Sources of oxidizing agents should be removed where feasible.

****

Influent inorganic chemical concentrations of [waste water][water from surface impoundment][ground water] are as determined by the AWWA 10084 method for each.

Influent Characteristic	Minimum	Average	Maximum
pH	[_____]	[_____]	[_____]

2.1.4 Performance Requirements

2.1.4.1 Flow Rate

Minimum [_____] L/second gpm
Average [_____] L/second gpm
Maximum [_____] L/second gpm

2.1.4.2 Water Temperature

Minimum [_____] degrees C degrees F
Average [_____] degrees C degrees F
Maximum [_____] degrees C degrees F

2.1.5 Bench Scale Data

****

NOTE: Include results, require performance of tests or both.

****

2.1.5.1 Isotherm Data

[Results of isotherm tests, as determined by ASTM D3860, are as follows: [_____].] [Carry out the isotherm test data with activated carbon similar to that to be supplied for use. If applicable, use reprocessed/reactivated carbon typical of the type to be supplied in the isotherm tests, including the same type of manufacture if from processed coal, coconut shell, wood, etc.]

2.1.5.2 Operating Performance Data

Results of operating performance tests are as follows: [_____].

2.1.5.3 Carbon Equivalency Test Data

Results of carbon equivalency tests are as follows: [_____].

2.1.6 Organic Contaminant Concentrations

****

NOTE: Water treated for potable use should meet the maximum contaminant level goals (MCLGs) of 40 CFR 141 for each identified organic contaminant. Additional requirements for potable water may be imposed by regulators or the Army Center for Health Promotion and Preventive Medicine. Because concentrated organic solutions are more readily treated than dilute solutions, overstatement of the influent concentrations of organic chemicals usually leads to problems. It is more prudent to increase the contact requirement in Paragraph: ADSORPTION BATTERY COMPONENTS and not apply safety factors here.

****

Organic Contaminant		
Influent Concentration (µg/Lppb	Maximum Effluent Concentration (µg/Lppb)	Percent Removal Requirement
Total Organic Carbon (TOC)		
Maximum [_____]	[_____]	NA
Average [_____]	NA	NA
Minimum [_____]	NA	[_____]
[_____]		
Maximum [_____]	[_____]	NA
Average [_____]	NA	NA

Average [_____]	NA	NA
Minimum [_____]	NA	[_____]
[_____]		
Maximum [_____]	[_____]	NA
Average [_____]	NA	NA
Minimum [_____]	NA	[_____]

Determine removal percentage as follows:

$$\frac{100\% \text{ x (Influent concentration - Effluent concentration)}}{\text{Influent concentration}}$$

2.2 EQUIPMENT

****

NOTE: Completeness of steam regeneration is pressure/temperature dependent.

****

Provide new and unused materials and equipment with the exceptions noted for reprocessed activated carbon, reprocessed materials and modular treatment units. Provide an estimate or analysis of the pre-existing "heel" and the nature of any residual with the supply documentation if reprocessed carbon is to be supplied. The Contracting Officer reserves the option to refuse delivery of reprocessed carbon if, in the opinion of the Contracting Officer, the quality might interfere with accomplishment or verification of the treatment.

2.2.1 Activated Carbon

****

NOTE: To determine the working capacity of a specific brand of activated carbon: Determine the contact time (inverse of reaction rate) for the particular brand of carbon at the known total volatile organic content in the influent water and determine the amount of carbon required (isotherms) to obtain the reduction of the known volatile organic carbon content in the influent water.

Utilize rapid small-scale column test procedures to verify properties of activated carbon being used.

Designer should also evaluate with government whether full-scale column testing is warranted based on project size, flow rate, economics, etc. in an effort to ensure the Government is getting the optimum GAC and not wasting.

Activated carbon used in treatment of water for potable use should conform to AWWA requirements. Wastewater carbon is not manufactured to AWWA standards. Remove or reword this paragraph when carbon is not required to conform to AWWA.

Activated carbon should be in accordance with AWWA if the treated water goes into a potable water system. Verify with the appropriate authorities that wastewater carbon is acceptable for water that is to be discharged or re-injected.

****

Provide material free from impurities that affect the serviceability and appearance of the finished product. Provided activated carbon that does not require dosing or addition of a chemical mixture or solution to the water to be treated or to the water used for backwashing. Furnish the following quantity: [[_____] cubic meters cubic feet][[_____] kg pounds] of processed and graded activated carbon for [potable] [waste] water treatment. Submit design calculations indicating removals of each of the listed compounds in the carbon bed. Material must conform to the following:

a. Adsorptive capacity, iodine number as determined by ASTM D4607, not less than [500][650][900][950][1,000][_____] milligrams per gram. Submit the iodine number; isotherm and column test data.

b. Apparent density, as determined by [ASTM D2854][ASTM D5158], [0.4 to 0.6][_____] grams per cc[25 to 37][_____] lb. per cu. ft, corrected for moisture.

c. Effective size [0.35 to 1.30][_____] mm [0.14 to 0.5][_____] inches and uniformity coefficient not greater than [2.1][_____], as determined by ASTM D2862, with the following gradation:

(1)

SIEVE	PERCENT PASSING
2.36 mm No. 8	[90] [_____]
2.00 mm No. 10	[_____]
1.70 mm No. 12	[85] [_____]
1.40 mm No. 14	[_____]
1.18 mm No. 16	[_____]
0.85 mm No. 20	[_____]
0.60 mm No. 30	[4] [_____]
0.42 mm No. 40	[4] [_____]
0.30 mm No. 50	[4] [_____]

d. Submit manufacturer's certificates, including the name and address of the production facility, attesting that the activated carbon furnished meets the specified requirements. Submit certification of the activated carbon [supplier][transporter][reactivation facility in accordance with AWWA B605]. Submit copies of the Department of Transportation licenses of carbon reactivation service

2.2.1.1 Powdered Activated Carbon

Provide powdered activated carbon for potable water service in conformance with AWWA B600.

2.2.1.2 Granular Activated Carbon

Provide clean and hard granules.

2.2.1.2.1 Potable Water Service

Provide granular activated carbon for potable water service conforming to [AWWA B604][AWWA B604 and AWWA B605],as appropriate. Submit reports of testing granular activated carbon in accordance with AWWA B604.

2.2.1.2.2 Waste Water Service

Provide granular activated carbon for waste water service [reprocessed from previous as long as it meets the specified requirements][of a type suitable for reactivation] and supported by services for transportation of [shell][and spent carbon] and reactivation[of spent carbon]. Submit documentation and copies of licenses to the Contracting Officer.

2.2.2 Adsorption Battery Components

****

NOTE: See EM 1110-1-4008 Liquid Process Piping for compatibility of materials with the solution being treated. General rules for configuration of a liquid phase activated carbon system are as follows:

a. Two stage serial operation to provide longer contact and more complete exhaustion of the carbon is preferred, particularly when anticipated carbon consumption is high, required bed depths exceed 4.5 meters 15 feet and/or contact times in excess of 30 minutes are required for contaminant reduction. In serial operation, the unit with the freshest carbon at any given time should be in the lag position. For critical operations, lead, lag and standby units should be provided.

b. Multiple units in parallel operation are frequently used for high flows with low contamination levels when short contact times are adequate. Single units should be used only in installations in which the system can be shut down for change out of the activated carbon adsorption media. Multiple smaller units are always preferable to single large units containing the same amount of carbon and providing equal contact.

c. Upflow pulsed bed operation should be considered in lieu of multiple units in series.

d. An appropriate piping configuration arrangement can adapt the units for serial or parallel operation. Arrangements that allow conversion from parallel to series and the reverse, provide the flexibility to respond to differing conditions.

e. Design surface loadings range between 0.7 and 4 liters per second per square meter 1 and 6 gpm/sq ft. Lower surface loadings result in longer runs between backwashes and higher backwash flow rate requirements.

f. Minimum bed depth is based on the contact time required to achieve the required removal. Additional bed volume allows time between carbon changes. The minimum bed depth specified should not be less than 0.75 m 30 inches to avoid short circuiting. Minimum freeboard above the bed must be not less than 25 percent of bed depth. At loading

rates between 3.4 and 4 liters per second per square meter 5 and 6 gpm/sq ft the minimum bed depth should be increased from 0.75 m 30 inches to 1 m 36 inches in proportion to the surface loading to maintain the volumetric loading below 4.5 liters per second per cubic meter 2 gpm per cubic foot.

g. Coordinate number and location of units with the appropriate drawings.

****

Provide adsorption batteries consisting of [_____] units. Performance specified refers to each unit and not to the battery as a whole. Provide a downflow liquid adsorption unit, having a capacity to treat [_____] liters gallons of water at a flow rate not exceeding [_____] L/second gpm with a maximum influent total organic carbon concentration of [_____] [milligrams][micrograms] per liter during the interval between carbon replacements to a maximum effluent total organic carbon concentration of [_____] [milligrams][micrograms] per liter. Ensure carbon replacement intervals are not less than [_____] days.

2.2.2.1 Head Loss

****

NOTE: Compare several manufacturers data and select a reasonable number.

****

Head loss in each unit at rated flow must not exceed [2][3][7][30][60][_____] kPa [0.3][0.44][1][4][8][_____] psig when filled with fresh media. Submit demonstration of, or design calculations for, the total head loss through the carbon, adsorbers and appurtenant piping.

2.2.2.2 Adsorption Shell

****

NOTE: Avoid pressurizing shells that do not conform to ASME BPVC SEC VIII.

****

Ensure adsorber shells have a minimum effective cross sectional area of [_____] square meters square feet with a minimum straight shell (tangent line to tangent line) height of [_____] meters feet.

2.2.2.2.1 Modular units

****

NOTE: Transportable units should be considered for units containing less than 900 kg 2000 pounds of activated carbon and the required hydraulic capacity is less than 600 liters per second 10,000 gpm or the appropriate configuration is a standard product of a nearby supplier. Spare units are used for replacement of exhausted units, which are returned to the carbon manufacturer for reactivation of the activated carbon. Drum style containers may be used for very small amounts of carbon.

****

Modular units need not be new if pressure rating and all other requirements of this section are met. Provide factory assembled units secured to a structural frame suitable for shipment or transport with a forklift and set on a level area for operation. Prepare unit for connection to on-site pipelines. Mount shell on skid supports of cast-iron or steel to support the weight of the units, carbon and water while in service without point bearing on the floor slab. Fabricate skid mountings and shells for the live and dead loads of the shell full of water. Provide assembly structure that is adequate to provide support to the units during transport. Provide connectors for connection of modular tank inlets and outlets to the permanent piping system. Provide modular units in compliance with [AWWA B605][Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS] for transport of spent carbon.

2.2.2.2.2 Permanent Units

Design, fabricate, and erect adsorption shells not equipped with an open vent of steel in accordance with ASME BPVC SEC VIII D1 for a gage working pressure of [8.8][_____] MPa [125][_____] psi. Stamp working pressure on shell. Fiberglass or polyethylene adsorption shells are acceptable if equipped with an open vent or overflow. Ensure fiberglass shells comply with AWWA D120 or with ASTM D3299 with nozzle flanges in accordance with ASTM D5421. Ensure polyethylene shells conform to ASTM D1998. Line steel shell and both sides of false bottom with nontoxic epoxy, vinyl ester or rubber. Supply shells with cast-iron or steel supports. Fabricate supporting structures and shells for the seismic and wind loads listed in the design requirements, plus live and dead loads of the shell full of water.

2.2.2.2.3 Connections

Provide a vent and a rupture disc on the influent of each adsorber. Provide each adsorber with a means for carbon fill and removal and with permanent connections for water inlet, outlet, and backwash.

2.2.2.2.4 Openings

****

NOTE: Access openings 100 by 150 mm 4 x 6 inches or larger will be provided in upper head of shells less than 0.9 meter 36 inches in diameter; access openings 275 by 400 mm 11 x 15 inches or larger will be provided for shells 0.9 meters 36 inches in diameter and larger.

****

Provide each shell with an access opening [100 x 150][275 x 375][_____] mm [4 x 6][11 x 15][_____] inches or larger. Provide openings with closure and positive seal adequate for the tank pressure rating.

2.2.2.2.5 Hardware

Provide stainless steel bolts and attaching hardware conforming with ASTM F593.

2.2.2.3 Collection/Underdrain System

****

NOTE: Select appropriate system and remove

subparagraphs describing systems not needed in the project.
****

Provide an underdrain system within the shell for collecting treated water as specified below and to distribute the backwash water uniformly over the entire bed cross-section at velocities that prevent channeling of the carbon bed. Under actual operating conditions do not wash the activated carbon out of the apparatus regardless of the change of demand rate up to the maximum on the apparatus.

2.2.2.3.1 Nozzle Type

Provide a collector/backwash nozzle for each [93,000][_____] square mm [1][_____] square foot of carbon surface area.

2.2.2.3.2 Deflector-Plate Type

****
NOTE: Shells smaller than 1500 mm 60 inches in diameter will be equipped with nozzles or deflector-plate collector system.
****

Provide a deflector-plate made of [cast-iron][or][steel], and [rubber][or][nontoxic epoxy] lined, fastened to the bottom of the shell, and arranged for discharge through radial slots. Provide pipe connections for treated water outlet or backwash inlet on the underside between the deflector and the shell bottom.

2.2.2.3.3 False Bottom Type

****
NOTE: Shells larger than 1500 mm 60 inches in diameter may be equipped with false-bottom or header-lateral-distributor type collector system.
****

Provide a false bottom with attached strainers constructed of stainless steel strainers and fasteners.

2.2.2.3.4 Header-Lateral-Distributor Head Type

****
NOTE: The false bottom or header-lateral-distributor head type will be allowed for all shells 900 mm 36 inches in diameter or larger.
****

Provide a header-lateral-distributor head consisting of a circular, square or branched manifold or header, connected to laterals provided with strainer heads or strainers with openings placed radically so as to discharge horizontally or downward. Provide [stainless steel, conforming to ASTM A312/A312M and ASTM A530/A530M][polyvinyl chloride, conforming to ASTM D1785 or ASTM D2241] headers and laterals. Manufacture strainer heads and strainers of materials compatible with the header-lateral system, (polyethylene, polypropylene, polyvinyl chloride or stainless steel). Ensure laterals and strainer heads, after being placed, do not protrude into the header or laterals. Support system by [a steel plate or steel angles conforming to ASTM A666 with [vinyl ester][nontoxic epoxy][or rubber] linings][or by][concrete fill][or][directly on the bottom of the shell].

2.2.3 Mode of Operation

2.2.3.1 Serial Operation

Provide valves on the influent, effluent and backwash connections of each unit to allow any unit to operate and function as the lead or lag unit or stand-by as required.

2.2.3.2 Parallel Operation

Provide valves on the influent, effluent and backwash connections on each of the parallel units adequate to allow the unit to be taken out of service to backwash or change out the activated carbon in the unit without affecting the operation of the other units.

2.2.3.3 Parallel or Serial Operation

Provide units designated for use in either series or parallel operation with valves on the connections that allow switching between modes of operation without disconnecting any of the piping.

2.2.4 Total Organic Carbon Analyzer

****

NOTE: Optimum operation for serial operation would be for the lead column to be operated until the influent and effluent are of equal concentration and the carbon bed is completely spent. The combination of a predictable influent and a well developed sampling program would eliminate the need for the on-line analyzer.

****

Provide a wall mounted analyzer for automatically testing the total organic carbon content of the water in the effluent line leading from each adsorption unit. Provide analyzer capable of carrying out intermittent tests on the effluent and giving visual warning that the residual organic carbon present exceeds a predetermined limit. Equip the analyzer with necessary wiring and [controls for automatic alternation of units][an alarm device to give notice] when the total organic carbon in the water delivered by the lead adsorption unit exceeds [_____] [milligrams][micrograms] per liter [ppm][ppb].

2.2.5 Water Meter

Provide each adsorption unit with a displacement or turbine-type water meter reading in [_____] liters gallons, conforming to AWWA C700 or AWWA C701 as appropriate. Provide meter in the adsorption unit [influent line][effluent line] and locate to be readily accessible for reading and setting. Provide infinitely adjustable meter contacts over the range of the meter to permit setting to suit actual total organic carbon content of the water being treated. Equip meter with necessary wiring and electric controls for automatic backwashing or an alarm device to give notice when the adsorber has delivered [_____] liters gallons of water.

2.2.6 Differential Pressure Sensor

Provide differential pressure sensor capable of measuring plus or minus 5 percent variation in the pressure drop across the media. Equip sensor with necessary wiring and controls for automatic backwashing or an alarm device to give notice when the pressure differential exceeds the set point.

2.2.7 Interlocks and Alarms

Provide interlock system to prevent backwashing of more than one unit at a time and to prevent backwashing when the waste backwash tank capacity is inadequate to contain any additional backwash. Provide a manual-reset alarm timer on the backwash control panel for timing backwash cycles. Locate alarm lights on the local control panel and duplicate on a panel in the main control room. Locate audible annunciator above the appropriate vessel with an automatically resetting waterproof manual shut-off located with no obstructions to access [_____][1.2] m [_____][4] feet above grade.

2.2.8 Pressure Gauges and Sampling Cocks

2.2.8.1 Pressure Gauges

Provide pressure gauges connected to the influent and effluent to indicate the pressure loss through the adsorber and its pipe, valve, and fitting assembly for each adsorption unit. Provide precision type gauges with bronze Bourdon tube and phenolic case and an accuracy of plus or minus 1/2 percent conforming to ASME B40.100.

2.2.8.2 Sampling Cocks and Valves

Provide [steel,][PVC][or][brass], ground key, lever handle, faucet type sampling cocks or ball valves upstream of the adsorbers and on the downstream side of each unit for sampling the influent and the effluent of each of the individual adsorbers.

2.2.9 Valves

****

NOTE: Delete the inapplicable types of operation.

****

Ensure the design of the valve operators and mechanisms avoids initial surges and sudden inrushes of influent or backwash by gradually allowing flows to increase as ports are opened. Provide a dial pointer to indicate each step of the operation.

2.2.9.1 Butterfly Valves

Provide butterfly valves 75 through 1,800 mm 3 through 72 inches conforming to AWWA C504.

2.2.9.2 Gate Valves

Provide gate valves less than 75 mm 3 inches in diameter made of bronze with screwed ends, conforming to MSS SP-70 and valves 75 mm 3 inches or larger must conform to AWWA C509. Provide valves that open in counter clockwise direction, with an operating wheel having an arrow, cast in the metal, indicating the direction of opening.

2.2.9.3 Package-Type Valve Nest

Provide package-type valve nest consisting of a pilot valve connected with fittings as may be required to each one of a nest of valves hydraulically or pneumatically operated. Connect the nest of valves to raw water inlet, treated water outlet, backwash inlet and outlet, and activated carbon refill inlet and outlet.

2.2.9.4 Ball Valves

Provide full port stainless steel ball valves on carbon fill and discharge lines.

2.2.10 Isolation Joints

2.2.10.1 Dielectric Fittings

Provide dielectric fittings between threaded ferrous and nonferrous metallic pipe, fittings and valves, to prevent metal-to-metal contact of dissimilar metallic piping elements. Ensure fittings are suitable for the required working pressure.

2.2.10.2 Isolation Joints

Provide isolation joints between nonthreaded ferrous and nonferrous metallic pipe, fittings and valves. Provide isolation joints consisting of a sandwich-type flange isolation gasket of the dielectric type, isolation washers, and isolation sleeves for flange bolts. Provide full faced isolation gaskets with outside diameter equal to the flange outside diameter. Bolt isolation sleeves must be full length. Provide units shaped to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.2.10.2.1 Sleeve-type Couplings

Use sleeve-type couplings for joining plain end pipe sections. Provide couplings consisting of one steel middle ring, two steel followers, two gaskets, and the necessary steel bolts and nuts to compress the gaskets.

2.2.10.2.2 Split-sleeve Type Couplings

Use split-sleeve type couplings in aboveground installations when approved in special situations; consisting of gaskets and a housing in two or more sections with the necessary bolts and nuts.

2.2.11 Pipe and Fittings

Provide pipe hangers and supports with Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING. Provide pipe, valves and fittings for liquids in accordance with Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING. Provide pipe, valves and fittings for compressed air in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.2.12 Bolts, Nuts, and Fasteners

Unless otherwise indicated, furnish galvanized bolts, anchor bolts, nuts, washers, plates, bolt sleeves, and all other types of supports necessary for the installation of the equipment with the equipment.

a. Where indicated, specified, or required, provide anchor bolts with square plates at least 100 by 100 by 9 mm 4 by 4 by 3/8 inch thick or with square heads and washers set in the concrete forms with suitable sleeves.

b. Provide expansion bolts with malleable-iron and lead composition elements.

c. Unless otherwise specified, provide stud, tap, and machine bolts of refined bar iron, with threads conforming to ASME B1.1.

d. Zinc coat bolts, anchor bolts, nuts, and washers specified to be galvanized after being threaded, by the hot-dip process in conformity with ASTM A123/A123M or ASTM A153/A153M. Provide Type 316 stainless steel bolts, anchor bolts, nuts, and washers indicated to be stainless steel.

2.2.13 Electrical Work

****

NOTE: Carbon dust is conductive and ignitable and can form explosive mixtures with air. Coordinate hazard areas with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and the drawings. AWWA calls for water tight enclosures.

****

Implement indicated hazard classifications in accordance with NFPA 70. Perform electrical work in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2.13.1 Motors

Provide electrical motor-driven equipment complete with starters and alternating current motors conforming to NEMA MG 1. Provide single-phase 115-volt 60 cycle fractional horsepower electric motors. Provide three-phase 60 cycle integral horsepower electric motors. Provide motor starters complete with properly sized thermal overload protection and other appurtenances necessary for the motor specified. Design each motor for operation in a 40 degree C 104 degree F ambient temperature.

2.2.13.2 Controls and Panels

Provide manual or automatic controls and protective or signal devices required for the operation specified, and any control wiring required for controls and devices. Ensure motor controls conform to NEMA ICS 1 and enclosures for power and control panels conform to NEMA ICS 6.

2.2.14 Storage Tanks

Fabricate each tank from steel conforming to ASTM A666 not less than 5 mm 3/16 inch thick, lined with enamel, or of fiber glass filament-wound reinforced plastic construction, conforming to ASTM D3299.

2.2.15 Backwash System

****

NOTE: The backwash system is a major system that

should be shown on the drawings. Four or more adsorbers in parallel may have sufficient effluent flow for backwashing because the backwash flow requirement for a single adsorber is approximately equal to three times the effluent flow. Backwash supply tankage and backwash pumps might not be required if the discharge pressure is adequate. Elimination of waste backwash tankage is rarely feasible.

****

Initiate backwash operation via [fully automatic differential pressure sensors or timers][semiautomatic push button switch in response to an alarm connected to a water meter][manual in response to an alarm connected to a water meter].

2.2.15.1 Backwash Flow Controller

Install an adjustable flow control valve on the backwash supply header to regulate the flow at any set point between [_____] and [_____] L/second gpm to the backwashing adsorber regardless of variations in upstream head conditions.

2.2.15.2 Backwash Initiation and Return to Service

[Ensure automatic and semiautomatic controls permit backwashing to proceed automatically with no manual assistance.][Control manual backwash and return to service manually by the operator by turning the multiport valve or pilot valve.] Controls are subject to convenient and accurate manual adjustment designed for manual operation in the event of failure of the electrical equipment.

2.2.15.3 Backwash Supply Tankage

****

NOTE: Each filter is backwashed at approximately 10.2 liters per second per square meter 15 gallons per minute per square foot to provide 25 to 50 percent bed expansion. Backwash supply 10.2 liters per second x 900 seconds x 2 backwashes for each square meter 15 gpm x 15 minutes x 2 backwashes for each square foot of activated carbon bed surface area.

****

Provide backwash supply system with a minimum effective capacity to provide storage of [_____] liters gallons.

2.2.15.4 Backwash Waste Holding Tankage

****

NOTE: To provide time for backwash wasting or recycling, the minimum waste backwash holding capacity is 1.5 to 2 times the backwash supply holding capacity.

****

Provide waste backwash system holding tank having a minimum capacity to provide storage of [_____] liters gallons.

2.2.15.5 Valves, Switches, and Sensors

Equip each tank with a [float][or][solenoid] operated inlet valve. Activate solenoid-operated valve by a [probe,][a float-operated switch][or][a timer together with a float switch] to automatically shut off the incoming flow in the event of failure of the timing mechanism. Mount water inlet valves and switches externally. Mount floats and probes internally or externally, as long as the rapid evacuation of the tank does not interfere with their operation.

2.2.15.6 Pumps

Provide backwash pump in accordance with Section 23 21 23 HYDRONIC PUMPS. Provide waste backwash return pump in accordance with Section 23 21 23 HYDRONIC PUMPS.

2.2.16 Carbon Storage and Transfer System

****

NOTE: Most vessels are pneumatically charged directly from the carbon delivery truck. On-site storage and transfer is provided for remote and large systems. The transfer system is a major system that should be shown on the drawings. Activated carbon storage guidelines for medium to large systems: fresh carbon storage should allow for 1 truck + 1 tank of 44,000 kg 20,000 lbs and spent carbon storage should allow for 1 truck + 2 tanks.

****

2.2.16.1 Fresh Carbon Storage Tanks

Provide a fresh carbon storage system with a minimum capacity of the system provides storage of [_____] kg pounds of dry carbon at a bulk density of [_____] kg per cubic meter pounds per cubic foot.

2.2.16.2 Spent Carbon Storage Tanks

Provide a spent carbon storage supply system with a minimum capacity to store [_____] kg pounds of wet carbon saturated with organics.

2.2.16.3 Carbon Slurry Transfer Pump

Provide carbon slurry transfer pump in accordance with Section 23 21 23 HYDRONIC PUMPS.

2.3 TESTS, INSPECTIONS, AND VERIFICATIONS

Assemble the adsorption system equipment in the shop to the maximum practical extent. Conduct a factory pressure test at [125][250][_____] percent of the rated pressure of the equipment. Examine fiberglass tanks in accordance with ASTM E1067/E1067M. [Furnish test reports with the equipment][Submit factory pressure test reports to the Contracting Officer prior to shipment of the equipment].

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

3.2.1 Equipment Installation

****

NOTE: Pump bases and footings for adsorbers should be located and detailed on the drawings.

****

Mount each adsorber shell or tank [by anchoring to a footing isolated from the floor slab][on a skid base]. Provide anchor brackets, anchor rods or straps to hold the shell to anchors in the footing. Fabricate skids from [cast iron][or][steel] channels and design to support the equipment and to distribute the weight in transit and in service filled with water without point loading on the tank or concrete slab.

3.2.2 Pipe, Valves, Fittings and Appurtenances

Install piping, including cleaning, cutting, threading and jointing, in accordance with Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING or Section 22 00 00 PLUMBING, GENERAL PURPOSE, as appropriate to the application. Provide differing metals with isolation devices.

3.2.2.1 Strainers

****

NOTE: This paragraph is needed only for header-lateral-distributor collectors.

****

Protect strainer heads and strainers during placement of concrete fill provided for support of the header-lateral-distributor head.

3.2.2.2 Heat Trace and Insulation

Provide exterior pipe and appurtenances with an electrical heat trace and insulate in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.2.3 Electrical Work

Perform electrical work as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

Transfer

3.2.4 Onsite

****

NOTE: The flow rate is usually based on a 50 mm 2 inch pipe diameter. Average velocity in the pipe

during transfer should be between 0.9 and 2.1 meters 3 and 7 feet per second to maintain the carbon in suspension. Design velocities above 3 meters 10 feet per second result in excessive head losses and unstable operation. The slurry carries between 0.1 and 0.4 kg carbon per liter 0.7 and 3 lbs. carbon per gallon of water.
****

Unload spent media from and load new media in permanently mounted adsorbers. Transfer carbon slurry between vessels at a rate between [_____] and [_____] L/second gpm.

3.2.5 Offsite Reactivation of Modular Units

Remove modular units from service, disconnect from the permanent piping, drain of free water and return to the supplier for reactivation.

3.3 FIELD QC

3.3.1 Sequencing and Scheduling

****
NOTE: Head conditions for the influent pumps, backwash pumps and carbon slurry transfer pumps specified in Section 23 21 23 HYDRONIC PUMPS depend on the head losses encountered in the equipment specified in this Section.
****

Perform sampling and analyses to demonstrate system performance and effluent compliance.

3.3.2 Tests

Carefully inspect all products for defects in workmanship and material; clean debris and foreign matter out of valve openings and seats; operate all operating mechanisms to check their proper functioning; and check all nuts and bolts for tightness. Repair or replace valves and other equipment which do not operate easily or are otherwise defective.

3.3.2.1 Hydrostatic Tests

****
NOTE: Disinfection of vessels that are supplied prefilled with carbon is not feasible. The test pressure for vessels supplied with carbon should not exceed the rated pressure. Testing of pipe and fittings should be specified in the same section that the pipe is specified in.
****

After installation, test all tanks for water tightness. Include testing plugs or caps, all necessary pressure pumps, pipe connections, gauges, other equipment, and all labor. Test at a pressure of [[_____] kPa psi][as indicated in the schedule]. Isolate the piping systems from the tanks for pressure testing at the specified test pressures.

3.3.2.2 Performance Tests

****

NOTE: The approximate constant flow rate for the operating capacity test will be inserted in the blank spaces provided. For some adsorption units, the tests may be modified as necessary where high capacity activated carbons are used and the total organic carbon is such that complete tests would require abnormally extended periods of time. In such cases this paragraph will be suitably rewritten.

****

After installation of the activated carbon adsorption system, carry out operating tests to assure that the system operates properly. If any deficiencies are revealed during any tests, correct such deficiencies and repeat the tests. Put [each][a typical] adsorption unit through a complete cycle of operation [at a constant flow rate][to exhaustion at a constant flow rate] of approximately [_____] L/second gpm for the capacity test. Document a complete log of each test run, with the following data: date, time of readings and sampling, total backwash, and total water treated. Determine total organic carbon removed by analyses of the influent at such intervals as gives a representative organic carbon content. When the required quantity of water, [_____] liters gallons, has been run through the adsorber, take samples of the effluent for analysis. Use results of the tests in determining the capacity and performance of the adsorption unit.

3.3.2.3 Liquid Sampling and Analyses

Collect, mark, preserve and analyze influent and effluent samples .

3.3.2.4 Activated Carbon Sampling and Analyses

Perform sampling and analyses of the activated carbon media in accordance with [requirements for spent carbon transport and requirements of AWWA B605 and of the reactivation facility][requirements of the RCRA permitted treatment, storage and disposal facility].

3.3.2.5 Discharge

During the capacity test, store treated water as necessary to maintain the required flow rate. Submit reports for discharge permit compliance.

3.3.2.6 Utilities

The contractor is responsible for obtaining water, electric power and other utility items as well as the disposal of water drainage during testing.

3.3.3 Manufacturer Field Service

Provide the services of a representative of the manufacturer experienced in the installation, adjustment, and operation of the equipment specified to supervise the installation, adjustment, and testing of equipment.

3.3.4 Posting Framed Instructions

Post framed instructions containing wiring and control diagrams showing the complete layout of the system where directed. Prepare, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system, frame and post beside the diagrams. Submit wiring and control diagrams, systems layouts and isometrics, instructions, and other sheets, prior to posting. Post the framed instructions before acceptance testing of the systems.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Painting/Corrosion Prevention

Coat or paint all ferrous surfaces.

3.4.1.1 Exterior Surfaces

Solvent-clean factory primed surfaces before painting. Prepare and prime surfaces that have not been factory primed in accordance with the paint manufacturer's recommendations. Apply the paint system to the outside of the tank in accordance with Section 09 90 00 PAINTS AND COATINGS. Provide color as indicated on the paint schedule or as otherwise approved.

3.4.1.2 Interior Surfaces

****

NOTE: Some state and local health agencies have listings of acceptable paint materials for the interior of potable water tanks. Contact the appropriate state and local authorities to determine if the paint systems are acceptable. If these systems are not acceptable, determine the best acceptable system and revise this specification accordingly. Some states require NSF approval for coatings in contact with potable water. The zinc coating system specified in Section 3.8 of AWWA D102 is not acceptable.

****

Coat tank interior surfaces with the coating conforming to Section 3.2, 3.3, 3.4, 3.5, 3.6, or 3.7 of AWWA D102. System of three coats, 0.10 - 0.15 mm 3.9 - 5.9 mils dry film thickness (DFT) per coat, for total of 0.30 - 0.45 mm 11.7 - 17.7 mils minimum DFT.

3.4.1.3 Touch-Up Painting

Touch up factory painted items as needed. Factory painted items requiring touching up in the field must be thoroughly cleaned of all foreign material, primed and top-coated with the manufacturer's standard factory finish.

3.4.1.4 Field Painting

Paint equipment which did not receive a factory finish as specified in Section 09 90 00 PAINTS AND COATINGS.

3.4.1.5 Corrosion Resistant Metals

Painting of corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel is not required unless otherwise specified.

3.4.2 Field Training

Conduct a training course for designated operating, maintenance and support staff members. The training period, for a total of [8][12][16][_____] hours of normal working time, must start after the system is functionally completed but prior to final acceptance tests. Field training must cover each item contained in the operating and maintenance data.

3.5 MAINTENANCE

Submit a preventive maintenance plan and schedule including routine recommended chemical preventive measures for handling contaminant/biofouling of the carbon adsorption unit under conditions of the application including strong acid/alkali/alternative chemical soaks and instructions for storage and handling of treatment chemicals and waste products.

1.2 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S"

classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

1.3 QUALIFICATIONS

1.3.1 Welding

****

NOTE: If the need exists for more stringent requirements for weldments, delete the first bracketed statement and the last bracketed statement applies. Dust collection equipment covered by the guide specification is not normally manufactured to the requirements of the ASME Boiler and Pressure Vessel code. Welding of these vessels will be governed by Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

****

[Weld piping welded in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and welders are to be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests and the tests furnished at the work site if practicable. The Contracting Officer will furnish a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators. The welder or welding operator must apply his assigned symbol near his welds using a rubber stamp or felt-tipped marker with permanent weatherproof ink or other methods approved by the Contracting Officer that do not deform the metal. Structural members are to be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] [Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING.] Non-Pressurized dust collection vessels must be welded in accordance with provisions of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.3.2 Contractor

Contractor must have a minimum of [2][3][5][_____] years of experience in the construction and maintenance of industrial air pollution control systems.

1.3.3 Manufacturer's Field Representative

Provide a manufacturer's field representative and training engineer, who is experienced in the installation, adjustment, and operation of the equipment furnished, and who has complete knowledge of the proper operation and maintenance of the system. Field representative will be onsite to supervise the installation, adjustment and compliance testing of the equipment. Field representative must provide supervision of the system for [_____] days after startup of the system.

1.4 CONSTRUCTION REQUIREMENTS

Ensure system is suitable for [indoor] [outdoor] installation and provided [with] [without] a weather enclosure. [Provide unit with [_____] mm inch of insulation with a k value of [_____] W/m K Btu/h ft] [Unit will not be insulated]. System must be designed for [a wind load of [_____] kph mph] [and] [an internal [negative] [positive] static pressure of [_____] Pa inch of water gauge]. [Design system for a snow load of [_____] kPa psf]. Seismic protection of equipment must be in accordance with UFC 3-301-01, Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT, Section 23 05 48.19 SEISMIC BRACING FOR MECHANICAL SYSTEMS, and Section 26 05 48 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT.

1.5 DELIVERY, STORAGE, AND HANDLING

Store all equipment delivered and placed in storage as recommended by the manufacturer, with protection from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

1.6 EXTRA MATERIALS

****

NOTE: Include items needed for future maintenance and repair, items that might be difficult to obtain and spare parts needed to ensure continued operation of critical equipment.

****

Provide auxiliaries for maintenance with the equipment and include all special tools, rigs, jigs, fixtures, equipment, or other devices required for normal operation and service. Provide any equipment required for routine maintenance such as filter wash facilities, oil or refrigerant removal, and replacement devices. Include tests or measurement instruments or gauges. Also furnish the following:

[a. Spare parts for each different item of material and equipment specified including all the of parts recommended by the manufacturer to be replaced after [1 year] [1 year and 3 years] service.]

b. [One set of special tools for each type of equipment, including calibration devices, and instruments required for adjustment, calibration, disassembly, operation, and maintenance of the equipment.] [One set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment].

[c. One or more steel tool cases mounted on the wall, installed in a location agreed to by the government, complete with flat key locks, two keys, and clips or hooks to hold each special tool.]

[d. [_____].]

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Standard Products

Provide material and equipment that are the standard products of a manufacturer regularly engaged in the manufacture of the products. Use items of equipment that essentially duplicate equipment that has been in satisfactory use at least 2 years prior to bid opening. Provide equipment supported by maintenance organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Maintenance organization must respond to a service call within [_____] hours [_____] days.

2.1.2 General Requirements

Provide equipment and appurtenances as specified and as shown on the approved detail drawings, and suitable for the service intended. Provide new and unused materials and equipment including testing equipment furnished under the contract. Ensure components that serve the same function and are the same size are identical products of the same manufacturer.

Detail drawings contain complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

2.1.3 Nameplates

Provide each major component of equipment with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the equipment. Ensure each piece of equipment bears the approval designation and the markings required for that designation. Mark valves in accordance with MSS SP-25 and securely attach tag with the manufacturer's name, catalog number and valve identification permanently displayed.

2.1.4 Equipment Guards[and Access]

****

NOTE: Catwalk, ladder, stair, and guardrail may be required. If so, select the applicable item, delete the others, and indicate on drawings the selected item.

****

Enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts so located that any person may come in close proximity thereto, to prevent accidental personal injury, in accordance with 29 CFR 1910, Subpart O, Machinery and Machine Guarding. Provide removable guards and arrange to allow access to the equipment for maintenance. Guard or cover high-temperature equipment and piping so located as to endanger personnel or to create a fire hazard with insulation of type specified for service. Provide [items such as[catwalk,][stair,][ladder,][and][guardrail] where shown and in accordance with Section [08 31 00 ACCESS DOORS AND PANELS][05 51 33 METAL LADDERS][05 51 00 METAL STAIRS][05 52 00 METAL RAILINGS]]

Platforms, Walkways, Stairways, Handrails, Kick plates and Fixed Ladders that are required for operation, examination, testing and maintenance of pollution and waste control equipment must be provided as required for access. Platforms, walkways, stairways, handrails, kick plates and fixed ladders must be factory or shop fabricated, must provide suitable access, and must meet 29 CFR 1910-SUBPART D for safety of maintenance and operating personnel. Walkways must be provided for maintenance and inspection of maintenance points. Walkways and platforms must be connected by stairways or fixed ladders. Platforms, walkways, stairways, fixed ladders, handrails, and kick plates must be hot dipped galvanized after fabrication in accordance with ASTM A123/A123M. Minimum galvanized coating weight per surface must be not less than 0.70 kilogram per square meter 2.3 ounces per square foot.

2.2 GAUGE

****

NOTE: Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process must dictate material selection.

****

Conform gauge to the following:

2.2.1 Draft Gauge

ASME B40.100. Provide tubing for gauges for service above 66 degrees C 150 degrees F conforming to ASTM B68/B68M; for service below 66 degrees C 150 degrees F, plastic tubing conforming to ASTM D3350 may be used.

2.2.2 Gauges, Pressure and Vacuum

ASME B40.100, select a pressure range that is approximately twice the normal operating pressure of the media. The maximum operating pressure should not exceed 75% of the full-scale range..

2.3 LOW-WATER CUTOFF

****

NOTE: Low-water cutoff applies to all wet scrubber tanks, reservoirs, and sumps if low level or loss of water can affect scrubber or boiler operation and safety. Coordinate requirement for deenergizing boiler panel to stop firing the boiler if scrubber components are subject to damage from excess heat in a loss of water supply.

****

Provide low-water cutoff for all scrubber liquid sumps, holding tanks, reservoirs, and mixing tanks. Cut-off must cause a safety shutdown of the scrubber and must be provided with auxiliary contacts to be used to sound an alarm. [Low-water shutdown must require a manual reset before any equipment can recycle or operate.]

2.4 PIPE, FITTINGS, AND TUBING

Provide pipe, fittings, and tubing conforming to the following:

2.4.1 Pipe

ASTM A53/A53M, Type S, Grade A, standard weight; or copper pipe, ASTM B42.

2.4.2 Nipples

ASTM A733, standard weight to match adjacent piping.

2.4.3 Pipe Fittings

2.4.3.1 Steel Pipe Fittings

ASME B16.9 for butt-welding fittings; ASME B16.11 for socket-welding fittings; and ASME B16.5 for flanged fittings.

2.4.3.2 Brass or Bronze Pipe Fittings

ASME B16.15, Class A, 862 kPa 125 pound.

2.4.3.3 Malleable-Iron Pipe Fittings

ASME B16.3, type to match adjacent piping.

2.4.3.4 Unions

ASME B16.39, type to match adjacent piping.

2.4.3.5 Flanges, Cast-Iron and Bronze

ASME B16.1 and ASME B16.24.

2.4.3.6 Pipe Threads

ASME B1.20.2MASME B1.20.1.

2.4.4 Tube, Copper

2.4.4.1 Tube for Air, Water, Gas, and Drains

ASTM B68/B68M or ASTM B88M ASTM B88.

2.4.4.2 Tube for Refrigeration Systems

ASTM B280.

2.5 STEEL SHEET

Provide steel sheets conforming to the following:

2.5.1 Zinc Coated (Galvanized)

ASTM A653/A653M;ASTM A924/A924M for dust collector casings, housing, and components. Gauges specified are manufacturers' standard gauge.

2.5.2 Low-Carbon

ASTM A568/A568M. Gauges specified, for dust collector casings, housings, and components, refer to manufacturers' standard gauge.

2.5.3 Corrosion Resistant

ASTM A240/A240M, Class 304 or 316. Gauges specified refer to U.S. Standard Gauge.

2.6 AIR TRAPS

Provide air traps for removal of moisture from plant compressed air supplied to air pollution control equipment conforming to ASTM F1139.

2.7 THERMOMETERS

Provide thermometers conforming to ASME PTC 19.3 TW with wells and temperature range suitable for the use encountered.

2.8 VALVES

Provide valves conforming to ASME B16.34, and the following:

2.8.1 Angle Valves

MSS SP-80, Types 1, 2, or 3, Class 125, except that valves over 80 mm 3 inch must have iron bodies and brass or bronze standard trim with glands or followers in the stuffing boxes. Provide valves with nonmetallic renewable composition discs and raised flat seats designed for 862 kPa 125 psi steam. Secure wheels with hexagonal nuts.

2.8.2 Check Valves

MSS SP-80, Types 1, 2, 3, or 4, Class 125, as required. Ensure valves over

80 mm 3 inch have iron bodies and are the swing type designed for 862 kPa 125 psi steam. Provide check valves with renewable composition discs or with metallic discs of the regrinding type to permit regrinding without removing valve from the line.

2.8.3 Ball Valves

Provide ball valves having flanged or buttwelded end connections conforming to MSS SP-72; provide ball valves having threaded end connections conforming to MSS SP-110. Ball valves must be one piece construction, full port, and adjustable packing glands. Seats and seals must be made of tetrafluoroethylene, and be designed for 862 kPa125 psi.

2.8.4 Globe Valves

MSS SP-80, Type 1. Ensure valves over 80 mm 3 inch iron bodies and brass or bronze standard trim and glands or followers in the stuffing boxes. Provide valves with nonmetallic renewable composition discs and raised flat seats designed for 1035 kPa 150 psi steam. Secure wheels to the stems with hexagonal nuts.

2.9 WATER METERS

Provide disc type water meters with reinforced disc for hot water above 66 degrees C 150 degrees F, and rubber or carbon disc for cold water, that are constructed of bronze composition or cast iron protected by noncorrosive coating. Ensure moving parts subject to wear are easily replaceable. Provide meters conforming to the requirements of AWWA C700.

2.10 ELECTRICAL WORK

****

NOTE: Indicate on drawing the type and class of motor enclosure depending on environment in which the motor is to be used.

****

Provide electrical motor-driven equipment specified complete with motors, motor starters, and controls. Provide electrical equipment and wiring in accordance with [Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM]. [Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION]. [Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION]. Ensure electrical characteristics are as indicated or specified. Provide motor starters complete with thermal overload protection and other appurtenances necessary for the motor control specified. Ensure each motor is of sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Provide manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices specified but not shown. Motors must conform to NEMA MG 1, with enclosures as indicated [except as specified for Petrol Vapor Recovery Unit]. Assemble controls, interlocks, instruments, status indication lights, and other devices required for operation and observation of equipment status on an [open face panel] [enclosed panel with [latched door] [key locked door]]. Provide [factory-assembled panel, connected to equipment, and mounted on unit] [or] [factory assembled panel and boxed for field installation]. [Instrumentation and control system must include local control panels and a central control panel located in the facility control room. The control system must integrate local controls provided with equipment, as specified, so that complete system operation can be monitored and controlled from the control room]. Integrate the air pollution control system with the emission generating equipment. The control system must provide integrated control of all system processes and equipment, and contain all necessary instrumentation required for monitoring and operation of the air pollution control system. Ensure control system panels graphically display the system. Provide local control panels with selector switches so that equipment can be operated manually for test and maintenance purposes. Incorporate suitable safety interlocks to assure that proper permissive conditions have been met prior to changing the operating status of major system components. Automatically initiate shutdown of the air pollution control equipment system, or portion thereof, with alarms should unsafe conditions arise during operation of the system. Provide visible and audible alarms on critical functions locally and at central control room. Provide controls conforming to NEMA ICS 1. Provide enclosures for power and control panels conforming to NEMA ICS 6.

2.11 DRAFT FANS

****

NOTE: In new installations, coordinate design with boiler or incinerator specification. For retrofit, fans will be sized for air pollution control equipment. For fans operating in corrosive or erosive environment, provide liners for scroll sheets and rotor blades. References to draft fans will be deleted if inapplicable for the equipment specified.

****

Furnish centrifugal fans conforming to AMCA 801 [Type I] [Type II] [forced draft] [and] [induced draft] as an integral part of air pollution control equipment design. Provide [centrifugal] [_____] fans with [backward curved blades] [radial tip blades] [or] [axial flow type]. Size each fan for an output volume and static pressure rating sufficient for pressure losses, leakages, temperature, and elevation corrections for ASHRAE 169, 1 percent Cooling Dry Bulb, Mean-Coincident Wet Bulb ambient conditions. In addition, ensure fan sizing includes margins of 10 percent volume and 21 percent static pressure, plus margins of [5] [_____] degrees C [10] [_____] degrees F for forced draft fans and [22] [_____] degrees C [40] [_____] degrees F for induced draft fans. [Provide induced draft fans with outlet dampers]. Ensure noise levels for fans do not exceed 85 decibels in any octave band at a 914 mm 3 foot station. Provide fan bearings which are [air cooled] [or] [water cooled], and backward curved fan blade type with bearings not requiring water cooling may be of the self-aligning antifriction type. [Provide scroll sheets and rotor blades with liners.]

2.11.1 Draft Fan Control

****

NOTE: Variable speed control, inlet vane control, and inlet damper control are, in descending order of efficiency, capable of control draft fan conditions. The choice is based on economics. However, in erosive services, inlet vane control is not desirable.

****

Provide forced draft centrifugal fans with [inlet vane control] [variable speed control] where indicated. Provide induced draft centrifugal fans with [inlet vane control] [inlet damper control] [variable speed control]. [Provide axial propeller fans with variable propeller pitch control and variable speed drive.] Provide inlet vanes or dampers suitable for use with air pollution control equipment.

2.11.2 Draft Fan Drives

****

NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.

Steam driven boiler auxiliaries will not be used unless the exhaust steam can be utilized completely. Reference to steam drives will be deleted if inapplicable for the equipment specified.

****

Drive fan by [an electric motor] [or] [a steam turbine]. [Provide [drip-proof] [totally enclosed nonventilated] [totally enclosed fan-cooled] [totally enclosed fan-cooled], electric motor suitable for installation in a Class II, Division 1, Group F, hazardous location conforming to NFPA 70]. [Provide magnetic [across-the-line] [reduced voltage start] type motor starter with [general-purpose] [weather-resistant] [water tight] [dust-tight] [explosion-proof] enclosure and furnish with four auxiliary interlock contacts]. [Operate steam turbines properly with a steam inlet pressure of [_____] Pa psig and with steam back pressure of [_____] Pa psig. Provide turbines with horizontally-split, centerline support casings, water-cooled bearing housings with ring-oiled, babbitt-lined, bronze packed sleeve bearings. Also equip turbines with a mechanical shaft speed governor and valve, and independent emergency overspeed governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, removable stainless steel steam strainer [without disconnecting piping], any special wrenches and tools required for servicing turbine, and a sentinel warning on the exhaust casings. Turbines must conform to ASME PTC 6].

2.12 DUCTWORK

****

NOTE: References to ductwork will be deleted if inapplicable for the equipment specified. Ductwork thickness or gauge will depend on both size and pressure.

****

Ductwork must be [galvanized sheet metal conforming to ASTM A653/A653M] [_____] with a minimum thickness of [_____] mm [_____] gauge [_____] inch [_____] gauge.Ductwork must be sized to limit friction losses in accordance with ASHRAE 90.1 - IP Fan Power Limitation Guidelines. Ductwork must be constructed in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION. Seismic protection of equipment must be in accordance with UFC 3-301-01, Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT, and Section 23 05 48.19 SEISMIC BRACING FOR MECHANICAL SYSTEMS. Brace ducts externally and install and anchor so as to be free of vibration. Provide access and inspection doors as indicated, with a minimum of one in each section between dampers or items of equipment. Construct duct with long radius elbows having a centerline radius of 1.5 times the duct width, or where the space does not permit the use of long radius elbows, short radius or square elbows with factory-fabricated turning vanes may be used. Ensure duct joints are substantially air-tight and have adequate strength for the service.

2.13 AIR POLLUTION CONTROL EQUIPMENT

****

NOTE: Delete all equipment requirements not required on the project. Title 40, Part 60 of the Code of Federal Regulations for Protection of Environment (40 CFR 60), state and local codes contain regulations pertaining to air pollution control. 40 CFR 60 contains Standards of Performance for New Stationary Sources. In addition, EPA Test Report No. AP-42 with latest supplements contains emission factors for the specific pollutant emitter (uncontrolled). Determine the degree of required pollutant removal from the gas stream to meet the more stringent of local, state and EPA regulations and indicate whether EPA, state or local regulations apply. With the information thus obtained, determine the most effective and economical air pollution control equipment required. This process will be repeated for each pollutant emitter identifying the pertinent regulation. Indicate on drawings for each pollution control equipment electric power requirements including motor sizes, etc., where applicable. Coordinate performance, operation, and control of pollution control equipment with all other related system components to assure total system operation and that safety requirements are met. Indicate on drawings any such items as walkways, guardrails, stairs, and ladders furnished as part of the pollution control equipment, if required.

****

Performance of equipment must be as indicated in Paragraph SCHEDULES. [Provide paint spray and wet process gas ductwork in compliance with AIHA Z9.3 and NFPA 91.][Provide air and water piping in conpliance with ASME B31.1.][Use particulate emission control equipment conforming to ASME PTC 38].[Provide equipment with steel walkways, safety rails and stairs, or ladders as indicated. Ensure access is by means of [29 CFR 1910.28compliant ladder][step stairs with handrails]].

a. Submit a complete list of equipment and material, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Spare parts data for each different item of material and equipment specified, after approval of detail drawings and not later than [_____] months prior to the date of beneficial occupancy. Include a complete list of parts and supplies, with current unit prices and source of supply.

b. Submit proposed diagrams, instructions, and other sheets, prior to posting. Post framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, including equipment, piping, valves, and control sequence, where directed. Prepare condensed operating instructions explaining preventative maintenance procedures, methods of checking the system for normal, safe operation, and procedures for safely starting and stopping the system in typed form, frame as specified above for the wiring and control diagrams, and post beside the diagrams. Post the framed instructions before acceptance testing of the system.

c. Submit detailed manufacturer's data on the instrumentation and controls. Include overall controls, sensors, process controllers, control operators, ladder diagrams, timers, sequence of controls, valves, alarms, signals, interlocks and cut off systems. Data describing in detail the equipment used to monitor emissions, including the sampling probe, filters, sampling pump, moisture separator/drier, tubing, analyzer, analyzer calibration system, data recorder, and alarms. Process and instrumentation diagrams (P&IDs).

2.13.1 Dry Dynamic Precipitator

****

NOTE: Select construction features required including drive component and delete all others. Dry dynamic precipitators may be used for collecting coarse dry particulates from coal crusher, conveyor, and bunker ventilation where the objective is to control material losses and to remove coarse fly-ash particulates from boiler flue gases of chain-grate or stoker-fired boilers. It is not effective in removing gaseous pollutants or particles of 7 micrometers and under.

****

Unit must be a mechanical collector consisting of a motor-driven fan, a fan casing, a hopper or dust bin, fan motor, fan motor starter with overload protection, [fan drive coupling] [belt drive with fan and motor pulleys and adjustable motor base], fan and motor mounting base on hopper, and a [ceiling mounting] [floor mounting] stand for the entire assembly. The fan must comply with AMCA 99, Section 99-0401, Classification for Spark Resistant Construction, AMCA 210, and AMCA 300.

2.13.1.1 Fan Impeller

Fan Impellers must be steel and designed to provide the static head required for pumping the dirty and cleaned gas streams through the duct systems and related components. Ensure impeller is keyed and locked on a cold drawn, turned and polished steel shaft mounted on heavy duty grease or oil lubrication ball or roller bearings. Provide shaft with a diameter and stiffness that will limit deflection at the maximum shaft loading, within the operating range of the fan, to no more than 0.167 mm/meter 0.002 inch/foot of shaft. Provide shaft with a locked key slot for mounting a pulley, a direct drive, or coupling. Balance the entire rotating assembly dynamically at operating speeds. Balance fans dynamically and factory-test in accordance with AMCA 204 at the design operating RPM to Fan Application Category BV-3, Balance Quality Grade G6.3 or approved equivalent. Installed vibration levels must not exceed the levels specified in AMCA 801.

2.13.1.2 Fan Casing

Fan casing must be abrasion resistant cast iron conforming to ASTM A48/A48M or abrasion resistant steel consisting of a fan support base with back-housing, involute fan discharge scroll with inlet and discharge duct connections, and a dirt discharge port. Provide scroll with readily replaceable wear plates and constructed to permit field positioning the direction of discharge in at least eight different directions. Scroll must provide means for accumulating and diverting the bulk of the particulate enriched gas stream into the hopper before the gas stream is returned to the inlet to the scroll.

2.13.1.3 Hopper Storage

****

NOTE: Determine the rate and quantity of pollutant material collected, the final disposition of the material, and the manner and frequency of transport to disposal location. From this, determine the hopper size to be indicated and select the bracketed hopper outlet. Delete those not selected.

****

Hopper storage capacity must be as indicated. Construct unit of no less than 3.4 mm 10 gauge [welded low carbon] [corrosion resistant] steel plate for the vertical sides and bottom which must be sloped steeper than the slump angle of the material being collected to minimize bridging over at the outlet. Construct top to support the fan, motor, and drive without buckling or being resonated by the fan and no less than 6.4 mm 1/4 inch thick. Provide hopper with an access door and [a manually-operated rotary lock] [a motor-driven rotary lock] [a guillotine-type slide gate].

2.13.1.4 Test Connections

Provide pressure test connections at the suction and discharge ducts connecting to the precipitator.

2.13.2 Wet Dynamic Precipitator

****

NOTE: Select construction features required including drive component and delete all others. Wet dynamic precipitators are frequently used for ventilation air cleaning of coal crushing, conveying, and storage facilities where the dust loading is 1 to 4.6 grams per cubic meter 1/2 to 2 grains (weight) per cubic foot of air and the particles are 50 percent or more of 2 to 7 micrometers size. It will remove some gaseous pollutants.

****

Provide a mechanical collector unit consisting of a motor-driven fan, a fan casing with water sprayhead, [a hopper or slurry bin,] fan motor, fan motor starter with overload protection, [fan drive coupling,] [belt drive with fan and motor pulleys and adjustable motor base,] [fan and motor support on [the hopper] [a rigid structural steel base] arranged for [floor mounting]]. Provide in compliance with AMCA 99,Section 99-0401, Classification for Spark Resistant Construction, AMCA 210, and AMCA 300.

2.13.2.1 Collector

****

NOTE: Delete inapplicable materials and equipment. Pipe, fitting, and valve materials listed in this

section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process must dictate material selection.

****

Provide collector consisting of a heavy steel plate fan housing constructed of low carbon steel. Provide fan with ASTM A240/A240M stainless steel blades and rivets. Fasten blades to a heavy forged steel hub mounted on a forged, ground, and polished ASTM A302/A302M stainless steel shaft supported on ball or roller bearings. Provide shaft with a diameter and stiffness that will limit deflection at the maximum shaft loading to no more than 0.167 mm/meter 0.002 inch/foot of shaft. Ensure impeller and driven units are lock-keyed to the shaft with the entire assembly dynamically balanced at all operating speeds. Dynamically balance fans and factory-test in accordance with AMCA 204 at the design operating RPM to Fan Application Category BV-3, Balance Quality Grade G6.3 or approved equivalent. Provide housing and impeller with components that will provide for uniformly covering rotating and stationary parts with a film of moving water to provide for wetting and capturing of centrifugally impinged particulates. Provide means for separation from the air stream and drainage of the water and particulate slurry from the collector. Installed vibration levels must not exceed the levels specified in AMCA 801.

2.13.2.2 Hopper Storage

****

NOTE: Determine hopper storage capacity and indicate an open drain or valved outlet. Omit entire paragraph if hopper is not required for an installation piped to drain filtrate to a coal recovery or ash pit.

****

Hopper storage capacity must be as indicated. Construct unit of no less than 3.4 mm 10 gauge [welded black] [welded corrosion resistant] steel plate for the vertical sides and sloped bottom. Construct top to support the fan, motor, and drive without buckling or being resonated by the fan and no less than 6.4 mm 1/4 inch thick. Slope hopper bottom for complete drainage of slurry of collected material; free of ledges and pockets; and provide for full free flushing of particulate when operating wet. Provide hopper with an inspection window, cleanout, and access door. Provide hopper with electric heating coils, modules, or blankets to keep collected material dry and free flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F.

2.13.2.3 Nonstainless Components

Coat water wetted, nonstainless components with a permanently bonded, abrasion and corrosion resistant rubber facing suitable for the operating temperature of the gas stream.

2.13.2.4 Water Supply Components

Provide precipitator with water supply components sized to meet equipment capacity requirements and include:

a. A stainless steel water supply strainer with removable screen, flow control valve [with rate adjustment] [pressure gauge] [low pressure alarm switch] [water meter].

b. Analog solenoid water flow control valve.

c. Adjustable water pressure control switch with contacts to open on low pressure to stop or prevent operation of the fan motor if water pressure is below the minimum required for efficient operation of the collector. [An additional set of contacts to close on low pressure to permit operation of an annunciator alarm.] The adjustable range of the switch trip must be from [_____] to [_____] kPa [_____] to [_____] psig.

d. Water pressure gauges with 0 to 690 kPa 0-100 psig range.

e. Adjustable automatic water pressure or water flow rate regulator to provide a steady controlled rate of water flow as required for optimum collector performance.

f. Water flow meter sized for rate required by the collector.

2.13.2.5 Test Connections

Provide pressure test connections at the suction and discharge ducts connecting to the precipitator.

2.13.2.6 Drain Connections

Provide slurry drain connections which are screwed or flanged pipe connections sized as recommended by the manufacturer.

2.13.3 Conical Dry Dust Collector

****

NOTE: The conical dry dust collector removes up to 80 percent by weight of particles, 10 micrometers and over, from a gas stream and is used primarily on general industrial dusts and occasionally to clean boiler flue gases since it has a temperature tolerance up to 371 degrees C 700 degrees F. It is not effective in removing gaseous pollutants or particles of 7 micrometers size and under. Its high air friction drop may require a booster fan. It normally is selected for pressure drops in the 890 Pa to 1652 Pa 3-1/2 to 6-1/2 inch water gauge range at operating conditions.

****

Provide a mechanical collector unit consisting of a top horizontal involute scroll gas inlet and outlet mounted over a vertical cylindrical shell or cone which has a narrow angle cone below. Design unit specifically to impart a high velocity vortex spin to the incoming downflowing gas stream to throw particulates to the wall of the cylinder and cone before turning upward in an internal vortex to the outlet. Replaceable wear plates [are] [are not] required.

2.13.3.1 Scrolls, Cylinder, and Cone

****

NOTE: Delete inapplicable materials and equipment. Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process must dictate material selection.

****

Provide scrolls, cylinder, and cone consisting of no less than [3.4 mm 10 gauge] [4.8 mm 3/16 inch] [9.5 mm 3/8 inch] [welded black] [corrosion resistant] steel. Connect inlet and outlet scrolls for [clockwise] [counterclockwise] connection and rotation of the vortex when looking down on the collector. Provide four equally spaced, welded steel support brackets on the bottom of the inlet scroll or on the vertical walls of the cylindrical section of the collector. Do not use collector cone for storage. Remove and collect particulate, and provide cone bottom with an air-tight seal. Provide [a guillotine-type slide gauge] [a manually-operated rotary lock] [a motor-driven rotary lock] on the [bottom of cone] [bottom of surge tank] [bottom of storage receptacle].

2.13.3.2 Test Connections

Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.3.3 Self-Cleaning Ductwork to Collector

The design velocities of self-cleaning duct must be determined for specific dust handled and duct sized accordingly to maintain required velocity range.

Design all ductwork between dust source and collector to be self-cleaning. Ductwork meeting the following requirements will be considered to be self-cleaning.

a. A duct at an angle greater than 45 degrees to the horizontal plane with gas flowing downward.

b. A duct at an angle greater than 60 degrees to the horizontal plane with gas flowing upward.

2.13.4 Multitube, Centrifugal Dry Dust Collector

****

NOTE: The multitube centrifugal dust collector has similar performance to the conical dry dust collector except it removes more of both coarse and fine particulates. This collector is often used on stoker-fired boiler applications. The pressure drop range is normally 635 Pa to 1144 Pa 2.5 to 4.5 inches water gauge at operating conditions. Sixty

degree hopper valley angle is considered adequate for worse case coal/ash scenario. If designer can confirm that application is less demanding, he should consider a lower valley angle 55 degrees or 45 degrees. In certain applications the size of the unit may require some subassembly in the field, negating the restrictions on field assembly.

****

Provide a mechanical collector unit utilizing a number of parallel vertical or horizontal tubes of small diameter in an enclosure having a single gas inlet and single gas outlet.

2.13.4.1 Inlet Tube Assemblies, Casing and Hopper

Provide inlet tube assemblies that are replaceable [cast iron] [wear resistant steel with replaceable cast iron spinner vanes and cones] [wear resistant steel with replaceable spinner vanes and cones]. Provide [3.4 mm 10 gauge] [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [low carbon] [corrosion resistant] steel casing with the dust released into a [3.4 mm 10 gauge] [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [black] [corrosion resistant] steel sloped bottom dust hopper. Ensure hopper valley angle is 60 degrees from the horizontal. Provide hopper with a poke hole and access door. Provide hopper bottom outlet with [a guillotine-type slide gate] [a gravity-type trip gate opened by the weight of the collected material] [a manually-operated rotary lock] [a motor-driven rotary lock]. Provide unit with a welded steel support assembly for field erection with no additional work other than setting and bolting the unit in place.

2.13.4.2 Test Connections

Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.5 Dry Electrostatic Precipitator (Dry ESP)

****

NOTE: Electrostatic precipitators are highly effective with efficiencies up to 99.9 percent by weight in removing fine particulates down to 0.3 micrometers in size from gas streams having light loading of material by weight. They are frequently applied in gas streams of 371 degrees C 700 degrees F or higher but may require a precleaner such as a dynamic precipitator, conical, or multitube centrifugal to bring the gas stream down to an optimum loading. They require a relatively large space. They have a very low gas flow friction but are quite sensitive to having a uniform distribution of gas flow through the unit. The efficiency may sharply fall under a gas flow above design rate. Efficiency is also affected by dust particle electrical resistivity which can be too high or too low for maximum performance. Frequently in these situations the addition of relatively small quantities of flue gas conditioning agents have been very effective in improving precipitator performance. Depending on the particle electrical resistivity level, flue gas conditioning will be

considered a viable option. Commercial systems are available for ammonia, sodium compounds (carbonate and sulfate), and sulfur trioxide flue gas addition. Pulse energization, the modification to a conventional precipitator power supply to include the capability to superimpose a high voltage pulse on the base voltage, is a second enhancement technique for high resistivity particle applications. Intermittent pulsation, the programmed interruption of normal high voltage waveform, is another enhancement technique. Optimization of precipitator energization and rapping systems through the use of microprocessor-based controls results in lower power levels, reduced electrode failure, and overall improved collection efficiency. Examples of control schemes that can be accomplished with properly programmed microprocessors include:

a. Spark Prediction and Advance

b. Back Corona Detection

c. Opacity Feed Back

d. Rapping Optimization

e. Electrical Power Conservation

Reentrainment of collected material can be limited by a proper balance of factors that affect performance, such as gas velocity through the plates; uniformity of gas velocity profile; ratio of plate height to depth; size of lumps of agglomerated material rapped from the collecting plates and discharge electrodes; and others. Control may also be achieved by a system of automatic programmed gas flow dampers coordinated to operate with related rappers for sequential cleaning of each of the chambers.

Power consumption is generally equivalent to the additional power required by other collecting methods. The pressure drop across units is typically less than 127 Pa 0.5 inch water gauge. Caution should be exercised in their use where combustible or explosive coal dusts or oil fumes may be present and could be ignited by a "spark-over" of the high voltage across the electrodes.

****

Provide unit in compliance with requirements of ICAC EP-1, ICAC EP-7, and ICAC EP-8, to remove [aerosols] [and] [particulates] from processed gas stream by impressing a polarized electrostatic charge to the contaminants causing them to be drawn to and deposited upon opposite polarity charged plates. Unit must contain multiple chambers and be of gas-tight construction. Unit must be suitable for [indoor] [outdoor] installation. Provide unit with [insulator compartments] [penthouse]. Provide unit with anti-sneak baffles to force all gas flow through ionizing gas passages and to prevent gas bypassing the precipitator sections. Provide assembly consisting of discharging electrodes and opposite charged plates, high voltage power pack and controls, a rapping system for knocking dust from the discharge electrodes and collector plates, perforated gas distribution plates, sheet steel enclosure with dust collecting hopper bottom, dirty gas inlet, clean gas outlet, and structural steel frame. Ensure precipitator systems include microprocessor based controls [flue gas conditioning systems] [pulse energization] [intermittent energization].

2.13.5.1 Electrostatic Precipitator Layout and Component Drawings

Drawings must indicate the kind, size, arrangement, weight of each component, and breakdown for shipment; the external connections, location of local controls, remote control panels, anchorages, and supports required; the dimensions needed for installation and correlation with other materials and equipment; [seismic structural calculations;] and foundation and loading information. Supply drawings for each component showing design and assembly. Provide schematics of all electrical and pneumatic circuits used. Submission must include, but not limited to the following details:

a. Transformer-rectifier equipment.

b. High voltage switches and disconnects.

c. High voltage fuses and circuit breakers.

d. Control systems.

e. Ground lugs.

f. Protection against electrolysis.

g. Graphic display panel indicating power components.

h. Lubrication locations.

i. Electrodes and collecting surfaces.

j. Platforms, walkways, stairways, and ladders which will be required for operation, inspection, testing, and maintenance, and furnished with the precipitator.

k. Location of field welds, in conformance to AWS D1.1/D1.1M

2.13.5.2 Discharge Electrodes

Discharge electrodes must be [wires and weights] [rigid electrodes] [rigid frame]. Provide top supported discharge electrodes with the bottom free to expand and contract with gas stream temperature changes. Provide laterally restrained electrodes to maintain optimum spacing from the plates. Provide electrodes with a stiffness, length, or restraints required to prevent vibration or flutter when the unit is in service.

2.13.5.3 Collecting Plates

Provide collecting plates consisting of vertical panels of multiple steel strips hanging edgewise in the horizontal air stream so as to form the equivalent of many vertical splits of the gas stream into many gas passages. Use strips that are convoluted, stiffened or constructed with raised ribs, to provide sufficient stiffness to prevent distortion of the plates and also present vertical ridges to support boundary layer edges to increase plate dust retention. Provide top supported plates with the bottom free to expand and contract with changes of gas stream temperature. Coordinate plate configuration and support system design with the plate rapping system design and operation to shed collected material from the plates and to retain a consistent and optimum spacing from the discharge electrodes. Assemble the collecting surfaces at the factory. Factory assembled modules which can be shipped to the field for erection may be provided. Provide high voltage frames with sway braces or other devices as required to prevent swaying. Incorporate gas baffles into the collecting plates to provide a gas flow quiescent zone and to provide stiffening.

2.13.5.4 Power Supply and Control System

Provide solid state microprocessor type power supply and control system. Control system must provide for continuous monitoring and regulating of applied voltage for effective maximum performance of precipitation over the range of plate loadings with minimum sparking and arcing to the plates. Provide entire system with a system of safety interlocks and grounding devices to prevent personnel physical contact with high voltage components. Provide voltage insulators with heaters.

2.13.5.5 Rapping Systems

Provide rapping systems consisting of multiple hammers or other impact devices to cause particulate shedding from the collecting plate. Ensure rapping is automatically programmed so that a minimum number of collecting plates and discharge electrodes are rapped simultaneously. Ensure rapper controls have adjustments for independent field repeat intervals and for independent field rest time. Design unit to limit reentrainment of collected material falling from the collecting plates and discharge electrodes during the rapping operation without exceeding the design cleaning efficiency. Provide the rapper system with surge suppressors and other devices as required to eliminate high voltage spikes.

2.13.5.6 Inlet and Discharge Ducts

Provide inlet and discharge ducts with turning vanes, deflectors, and baffle plates to provide for uniform distribution of gas flow through all gas passages and in each gas passage in accordance with ICAC EP-7. Provide pressure test connections at the inlet and discharge ducts connecting to the precipitator.

2.13.5.7 Dust Storage Hopper

Provide unit with a [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [low carbon] [corrosion resistant] sloped steel bottom dust storage hopper having the dust holding capacity indicated. Arrange hopper to prevent reentrainment of collected material into the gas stream. Provide hopper bottom with rappers or fluidizing pads and a hopper valley angle of 60 degrees which is free of pockets, ribs, fins, or any other obstruction to hold or interfere with free release of collected material to the outlet. Provide outlet with [a guillotine-type slide gate] [a manually-operated rotary lock] [a motor-driven rotary lock]. Provide hopper with a poke hole and gasketed access door and with a collected material level indicator for [local indication] [local indication with terminals for wiring to a remote indicator]. Provide a special plate reinforced "pounding area" on each hopper face for external manual vibrating. Each pounding plate will be 300 by 300 by 25 mm12 by 12 by 1 inch thick ASTM A36/A36M plate steel. Provide a work platform with stairs to each pounding area for units with pounding areas more than 1.50 meters5 feet above ground. [The level indicator must include a high material level audible alarm.] [Provide hopper with electric heating coils, modules, or blankets to keep collected material dry and free flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F]. [The capacity of the heating coil module or blanket must be as shown.] [Base the heating coil module or blanket's size on the ambient temperature of [_____] degrees C degrees F]. [Provide an individually, thermostatically controlled hopper heater system with adjustable setpoint and include power, control, and alarm components.] [Size the system to provide a hopper skin temperature of not less than [_____] degrees C degree F when the insulation is in place during minimum ambient temperatures specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Insulation must be installed in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Design the system with a minimum heating safety factor of 1.1 and a minimum wind heat loss factor of 1.12.]

2.13.6 Wet Electrostatic Precipitator (WESP)

****

NOTE: Wet Electrostatic precipitators are highly effective with efficiencies up to 99 percent by weight in removing fine particulates down to 0.3 micrometers in size from gas streams having light loading of material by weight. They are frequently applied in gas streams of 371 degrees C700 degrees F or higher but may require a pre-cleaner such as a dynamic precipitator, conical, or multitube centrifugal to bring the gas stream down to an optimum loading. They require a relatively large space. They have a very low gas flow friction but are quite sensitive to having a uniform distribution of gas flow through the unit. The efficiency may sharply fall under a gas flow above design rate. Unlike dry ESPs, WESP control systems sometimes include a prequench (water spray) to cool and saturate the gases prior to entering the electrical fields. As Particulate Matter accumulates on the collector plates of a WESP, the plates are cleaned by a continuous or intermittent film of water spray. Pulse energization, the modification to a conventional precipitator power supply to include the capability to superimpose a high voltage pulse on the base voltage, is a second enhancement technique for high resistivity particle applications. Intermittent pulsation, the programmed interruption of normal high voltage waveform, is another enhancement technique. Optimization of precipitator energization and rapping systems through the use of microprocessor-based controls results in lower power levels, reduced electrode failure, and overall improved collection efficiency. Examples of control schemes that can be accomplished with properly programmed microprocessors include:

a. Spark Prediction and Advance

b. Back Corona Detection

c. Opacity Feed Back

d. Rapping Optimization

e. Electrical Power Conservation

When recycled water is used, the solids content of the water increases with each recycling. If the solids content becomes excessive, the effectiveness of the cleaning mechanism is reduced. Increased solids content can also lead to plugging of spray nozzles.

Power consumption is generally equivalent to the additional power required by other collecting methods. The pressure drop across units is typically less than 127 Pa0.5 inch water gauge. Caution should be exercised in their use where combustible or explosive coal dusts or oil fumes may be present and could be ignited by a "spark-over" of the high voltage across the electrodes.

****

2.13.6.1 Wet Electrostatic Precipitator Layout and Component Drawings

Drawings must indicate the kind, size, arrangement, weight of each component, and breakdown for shipment; the external connections, location of local controls, remote control panels, anchorages, and supports required; the dimensions needed for installation and correlation with other materials and equipment; [seismic structural calculations;] and foundation and loading information. Supply drawings for each component showing design and assembly. Provide schematics of all electrical and pneumatic circuits used. Submission must include, but must not be limited to the following details:

a. Transformer-rectifier equipment.

b. High voltage switches and disconnects.

c. High voltage fuses and circuit breakers.

d. Control systems.

e. Ground lugs.

f. Protection against electrolysis.

g. Graphic display panel indicating power components.

h. Lubrication locations.

i. Electrodes and collecting surfaces.

j. Platforms, walkways, stairways, and ladders which will be required for operation, inspection, testing, and maintenance, and furnished with the precipitator.

k. Location of field welds, in conformance to AWS D1.1/D1.1M

2.13.6.2 Discharge Electrodes

Discharge electrodes must be [wires and weights] [rigid electrodes] [rigid frame]. Discharge electrodes must be top supported with the bottom free to expand and contract with gas stream temperature changes. Electrodes must be laterally restrained to maintain optimum spacing from the plates. Electrodes must have a stiffness, length, or restraints required to prevent vibration or flutter when the unit is in service.

2.13.6.3 Collecting Plates

Collecting plates must be configured in a [circular], [concentric], [tubular], or [flat] plate manner. The plates must be of sufficient stiffness to prevent distortion of the plates. Plates must be top supported with the bottom free to expand and contract with changes of gas stream temperature. Plate configuration and support system design must be coordinated with the plate spray system design and operation to shed collected material from the plates and to retain a consistent and optimum spacing from the discharge electrodes. Assemble the collecting surfaces at the factory. Factory assembled modules which can be shipped to the field for erection may be provided. Provide high voltage frames with sway braces or other devices as required to prevent swaying. Incorporate gas baffles into the collecting plates to provide a gas flow quiescent zone and to provide stiffening.

2.13.6.4 Power Supply and Control Systems

Power supply and control system must be solid state microprocessor type. Control system must provide for continuous monitoring and regulating of applied voltage for effective maximum performance of precipitation over the range of plate loadings with minimum sparking and arcing to the plates. Entire system must be provided with a system of safety interlocks and grounding devices to prevent personnel physical contact with high voltage components. Voltage insulators must be provided with heaters.

2.13.6.5 Spray System

The WESP must be provided with a [prequench cycle], [continuous wash cycle], [intermittent wash cycle, operating every __ hours]. Recycled water must be provided with a conditioning system to keep a consistent [_____], [5-7] pH. Blowdown systems must keep suspended solids under [_____] ppm, and chloride concentration below [_____] ppm. All water used in the WESP spray system must be routed to a water treatment facility before discharge.

2.13.6.6 Inlet and Discharge Ducts

Inlet and discharge ducts must be provided with turning vanes, deflectors, and baffle plates to provide for uniform distribution of gas flow through all gas passages and in each gas passage in accordance with EP-7. Pressure test connections must be provided at the inlet and discharge ducts connecting to the precipitator.

2.13.6.7 Corrosion Resistance

Due to the saturated conditions of the process gas WESPs are susceptible to corrosion. Proper analysis of the Material selection must be based on the process gas, expected pH and chloride levels of the water. Material of construction must be [carbon], [corrosion resistant]steel, or [_____].

2.13.7 Wet Scrubber

****

NOTE: Select scrubber type based on efficiency required. Wet scrubbers are used for the removal of gaseous pollutants such as sulfur oxides, nitrogen oxides, and other gaseous materials from boiler flue gases. Removal of sulfur oxides (flue gas desulfurization) is covered by Paragraphs "Wet Flue Gas Desulfurization System" and "Spray Dryer Flue Gas Desulfurization System". Wet scrubbers will also remove fumes, mists, dusts, and smoke particles from laboratory fume hood and welding booth exhausts. With appropriate adsorbents they can collect vapors of paint thinners and solvents. They can handle boiler flue gases as high as 371 degrees C 700 degrees F, but impose a heavy water demand for evaporative cooling causing a heavy water vapor plume from the chimney. This water use also increases flue and chimney condensation and possible corrosion damage. Those problems can be minimized with a heat exchanger with a pump and water coils to precool the hot flue gas to the scrubber and deliver the recovered heat to the relatively cool cleaned gas out of the scrubber, as required. Any surplus heat can be used for other heating applications. The scrubber requires a water and chemicals supply system with problems of slurry or sludge removal; chemicals storage, mixing, feeding, and monitoring; and corrosion prevention of wetted parts. Since the scrubber system is relatively costly to install and operate, care should be exercised to limit its use to the function that only it can perform. In addition to its primary function of removing gaseous pollutants, it will also remove particulates. In addition to water sources shown within brackets, there may be other sources such as recycled water from waste treatment plant among others. Insert source within brackets and delete the others.

****

Provide unit in compliance with ICAC EP-1 and all federal and state regulations as a wet scrubber for removing gases, fumes, and particulates from the air exhausted from [welding] [and] [paint spray] booths [and from [_____]]. Ensure scrubber is one of the types identified as a [venturi,] [spray,] [tray,] [fixed packed bed,] [mobile bed,] [impingement,] [or] [entrainment] type [or a combination of these types].[Unit must have moisture eliminator with chevron, mist pad, or loose fill type design.] Unit must employ a small quantity of water or chemical neutralizing water solution to provide for maximum scouring and pollutant removal of the gas stream. Water demand rates of less than 0.13 L/second per cubic meter per second one gpm per 1000 cfm of processed gases must use [potable] [cooling tower blowdown] [_____] water with waste to drain. Water demand in excess of the above flow rate must provide for recirculation of the washing liquor. Provide unit with [an automatic water supply control valve,] [a float-operated water level control valve,] [a totalizing water meter,] strainer, and water pressure gauge.

2.13.7.1 Chemical System

****

NOTE: Investigate user agency, facility operation, and maintenance standards and procedures; analyze the pollution control equipment's consumption of materials; confer with equipment suppliers; and determine the optimum time period for reserve capacity. Select the "reserve" time period, and delete all other periods. The above investigation will also determine if the last sentence within the brackets should be retained or deleted.

****

Provide each unit requiring neutralizing chemical additives with a complete automatic chemical monitoring, control, mixing, feeding, and reserve storage system. Provide chemical system with a reserve capacity for [[24] [36] [48] hours] [[3] [7] [10] days] of continuous scrubber operation at design conditions without requiring servicing. [Provide components that must be taken out of service for routine maintenance or chemical loading in duplicate arranged for transfer by manual operation of switches and valves.]

2.13.7.2 Scrubber

Scrubber must be fluid-tight construction of [glass fibre reinforced polyester] [rolled low-carbon steel coated with a protective coating that is suitable for the process gas and temperature] [ASTM A302/A302M stainless steel] [ASTM A240/A240M stainless steel] [PVC] [CPVC] [polypropylene] [FRP lined mild steel]. Provide unit with leak-tight viewing windows and access doors to permit appraisal of entire operation as well as full access for all service operations or parts replacement. Use vanes, baffles, deflectors, or diffuser plates to provide for uniform gas flow through the processing area. Scrubber must be factory assembled, piped, and wired on floor mounted welded steel bases as indicated.

2.13.7.3 Recirculation Pumps

****

NOTE: Determine if facility will require continuous operation or if it can be shut down or if the pollution control equipment can be out of service for extended periods. If continuous operation is required, select wording for duplicate pumps and remove brackets.

****

Unit requiring recirculation of the scrubbing liquor must be provided with [direct] electric motor centrifugal pumps [in duplicate] to conform to HI ANSI/HI 3.1-3.5. Pumps must develop the system pressure head required by the scrubber. Ensure materials, construction, ratings, application, and testing conform to the standards and recommendations of HI ANSI/HI 3.1-3.5 for corrosion resistant operation of pumping the scrubber liquor. [Provide a manual selector switch for selection of "Lead" and "Lag" operation of the duplicate pumps.] Provide each pump with a discharge pressure gauge appropriate for the pump head and a low pressure limit switch to [start the backup pump] [and] [close a circuit for an alarm]. Provide pumps with corrosion-resistant strainers, valves, and piping suitable for the system and the gas to be processed. [Provide pumps for metering the feed rate of scrubber chemical additives with [manual] [automatic] means for varying the feed rate.]

2.13.7.4   Piping Materials

****

NOTE: Delete inapplicable materials and equipment. Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process must dictate material selection.

****

Provide piping materials that are compatible with the scrubber fluids. Nozzles must be non-plugging type for wetting packing.

2.13.7.5   Scrubber Collector System

Provide each scrubber requiring the use of chemical additives with a system for removing and dewatering the collected material and chemical residues of the scrubber process. Provide related equipment and controls. Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.8   Dry Fabric Collector for Boiler Flue Gases

****

NOTE: Dry fabric collectors are highly effective in removing up to 99.9 percent by weight of particulates of submicron size and larger from gas streams of more than 229 mg per cubic meter 0.1 grain (weight) per cubic foot. Emissions will consistently be less than 11 mg per cubic meter 0.005 grain/actual cubic foot. Fabrics are available for gas streams up to 288 degrees C 550 degrees F and are often used for particulate removal from coal handling operations and boiler flue gases. Fibre selection and fabric construction and finish are extremely critical to the performance and service life of a dry fabric collector. Chemical, temperature and abrasion resistance, strength, and dimensional stability are important fibre selection considerations. Fabric weave, weight, finish, and dimensional stability are major fabric requirements. Fabric filters can be harmed by corrosive chemicals. It may be necessary to scrub the gas prior to the dry fabric collector. The space requirement is rather large and pressure drop is typically in the 1.02 kPa to 1.53 kPa 4 to 6 inch water gauge range. An important consideration is

whether the processed stream can be interrupted, such as a nonproduction type welding facility exhaust, or if it must remain in continuous operation, such as for a base boiler plant. If the process is relatively small and the dust loading is relatively light, or if the process is intermittent, it may be desirable and economic to use replaceable deep pocket type or automatic moving media type filters. If the loading is high and process must not be interrupted, a cleanable baghouse type unit may be desired.

****

Unit must be type identified as [an unsupported tubular [unibag] [multibag] [side entry] [top entry] type] [a supported filter element [tubular] [or] [envelope] type]. Provide fabric collectors in compliance with ICAC F-3. Coordinate the collector provided with the boiler combustion control and safety system so as to assure that the boilers operate within design conditions throughout entire operating range at design capacity of the collector. Ensure collector is an ICAC [standard collector, medium-to-heavy duty, usually continuous service cleaning gases at [_____] degrees C degrees F] [special or custom-designed collector, heavy duty continuous service cleaning gases at [_____] degrees C degrees F].

2.13.8.1 Filter Cleaning

****

NOTE: In the last sentence, three filter cleaning methods are available, any or all of which may be allowed depending upon site conditions and available utilities. Under the present state of the art, the use of compressed air pulse jet cleaning should be limited to systems below 142 cubic meter per second 300,000 acfm (actual cfm). Efforts to reduce flue gas pressure drop in fabric collectors have led to the development of more vigorous cleaning methods, in particular, the use of sonic horns in combination with conventional air exchange cleaning methods, such as reverse air, pulsed jet, or shake/deflate. Up to 60 percent reduction in pressure drop has been realized using sonic horns with no deterioration in particulate emission levels. Pressure level, frequency, power levels, and spatial distribution of horns within the collector compartment are all important specification criteria.

****

Filter element cleaning must be automatically initiated and executed [on an adjustable programmer time cycle] [by operation of an adjustable high filter pressure drop switch]. Accomplish cleaning by powered vibrator or shaker devices, reverse cleaned air flow with [positive] [negative] air pressure in the unit, a combination of shaker and reverse air flow [or compressed air pulse jet cleaning]. [Filter element cleaning must include sonic horns.]

2.13.8.2 Filter Enclosure

Fabricate filter enclosure of [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [low carbon] [corrosion resistant] steel of welded or bolted construction or combinations thereof. Give enclosure sheets supporting strength and rigidity by folding or bending or support on supplemental structural steel shapes. Provide unit with gas inlet and outlet connections and baffles, vanes, deflectors, or low friction diffuser plates that will ensure uniform gas flow to all elements of the fabric system without causing flutter, vibration, or erosion of the fabric. Provide hinged, latched, and gasketed access doors for all parts and areas that require inspection or service. Secure and support fabric elements by internal rings or equivalent method so that the entire fabric surface is so deployed that gas flow and particulate collection will be uniform over entire working surface. Ensure dust shedding properties are uniform so that entire fabric surface will be equally cleared by a cleaning operation without damage to media other than normal service wear. Arrange media in elements, sections, pockets, or tubes that can be handled, removed, replaced, and secured without special facilities.

2.13.8.3 Collector Cleaning

Provide units with means for isolating a compartment or section for cleaning while other compartments are performing their normal dust removal function. Compartment isolation must effectively prevent reentrainment of the particulate during the cleaning operation. Base unit rating upon operation with one section out for cleaning. Cleaning operation must be [operator initiated and executed by manually operating the cleaning cycle on each compartment in sequence until all filters have been cleaned] [operator initiated to have the filters cleaned automatically one compartment at a time until all filters have been cleaned] [automatically initiated by an adjustable filter air pressure drop switch operating at a high pressure set point to initiate the filter cleaning operation] [automatically initiated by a timer to initiate the filter cleaning operation]. Once started, the cleaning operation must progressively clean one compartment at a time until all filters are cleaned. Remove collected particulate by discharging from a hopper below. Collector manufacturer must provide all of the components required for the entire cleaning operation including [manual rappers] [motorized rappers] [rotary air valve] [manual dampers] [motorized dampers] [compressed air surge receiver] [air compressor with receiver, motor drive, and controls] [blast or pulse jet controls, nozzles, and valves] [shaker or flutter blower, motor, drive, and controls]. [Provide automatic operations with a manual override for starting, stopping, interrupting, and restarting operation.]

2.13.8.4 Test Connections

Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.8.5 Flue Gas Dust Collectors Designed for In-Place Cleaning

Provide dust collectors designed and constructed for in-place cleaning of the fabric with a [3.4] [4.8] [6.4] mm [10 gauge] [3/16 inch] [1/4 inch] [low carbon] [corrosion resistant] steel sloped bottom dust storage hopper having the dust holding capacity as indicated. Construct collector and hopper system to minimize reentrainment of collected material into the gas stream. Provide hopper bottom with rappers or fluidizing pads and with a hopper valley angle of 60 degrees from the horizontal and free of pockets, ribs, fins, or any other obstruction to hold or interfere with free and complete release of all collected material to the outlet. Provide outlet with [a guillotine-type slide gate] [a motor-driven rotary lock] [automatic lock hoppers]. Provide hopper with a poke hole and gasketed access door and with a collected material level indicator for [local indication] [local indication with terminals for wiring to a remote indicator]. Level indicator must include a high material level audible alarm. [Provide hopper with electric heating coils, modules, or blankets to keep collected material dry and free flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F].

2.13.9 Dry Fabric Collector for Dust Control

****

NOTE: Dry fabric collectors are highly effective in removing up to 99.9 percent by weight of particulates of submicron size and larger from gas streams of more than 229 mg per cubic meter 0.1 grain (weight) per cubic foot. Emissions will consistently be less than 11 mg per cubic meter 0.005 grain/actual cubic foot. Fabrics are available for gas streams up to 288 degrees C 550 degrees F and are often used for particulate removal from coal handling operations and boiler flue gases. Fibre selection and fabric construction and finish are extremely critical to the performance and service life of a dry fabric collector. Chemical, temperature and abrasion resistance, strength, and dimensional stability are important fibre selection considerations. Fabric weave, weight, finish, and dimensional stability are major fabric requirements. Fabric filters can be harmed by corrosive chemicals. It may be necessary to scrub the gas prior to the dry fabric collector. The space requirement is rather large and pressure drop is typically in the 1.02 kPa to 1.53 kPa 4 to 6 inch water gauge range. An important consideration is whether the processed stream can be interrupted, such as a nonproduction type welding facility exhaust, or if it must remain in continuous operation, such as for a base boiler plant. If the process is relatively small and the dust loading is relatively light, or if the process is intermittent, it may be desirable and economic to use replaceable deep pocket type or automatic moving media type filters. If the loading is high and process must not be interrupted, a cleanable baghouse type unit may be desired.

****

Provide unit of the type identified as [an unsupported tubular [unibag] [multibag] [side entry] [top entry] type.] [a supported filter element [tubular] [or] [envelope] type.] Provide fabric collector in compliance with ICAC F-5 and ICAC F-3. The collector must be an ICAC F-5 [unit, Type I, for light duty, intermittent service cleaning gases at or near room temperature.] [standard collector, for light-to-medium duty [intermittent] [continuous] service cleaning gases at continuous temperatures from room temperature to 135 degrees C 275 degrees F] [standard collector, for medium to heavy duty 260 degrees C 500 degrees F] [special or custom designed collector, heavy duty continuous service cleaning gases at [_____] degrees C degrees F].

2.13.9.1 Filter Cleaning

****

NOTE: The choice of filter cleaning methods should be based on site conditions, available utilities, and operational requirements. For example, dust control of coal bunkering is usually intermittent as related to arrival of coal transporters and does not warrant a fully automatic continuous operation facility. Under the present state-of-the-art, the use of pulse jet cleaning should be limited to systems up to 142 cubic meters per second 300,000 acfm (actual cfm).

****

Filter cleaning of collector units processing air or gas streams at or near ambient temperatures, must be [manually initiated and executed by [operating the required dampers and cleaning devices]] [automatically initiated and executed [on an adjustable or timed cycle] [by operation of an adjustable high filter pressure drop switch]]. [Powered cleaning must be for [intermittent] [continuous] service employing [powered vibrator or shaker devices] [reverse air flow with atmospheric air and] [reverse cleaned air pressurized air flow with] [positive] [negative] air pressure in the unit [compressed air pulse jet cleaning] [of individual or a few elements] [of an entire compartment].] [Filter element cleaning must include sonic horns.]

2.13.9.2 Filter Enclosure Construction

Fabricate filter enclosure of [3.4] [4.8] [6.4] mm [10 gauge] [3/16 inch] [1/4 inch] [low carbon] [corrosion resistant] steel of welded or bolted construction or combinations thereof. Give enclosure sheets supporting strength and rigidity by folding or bending or support on supplemental structural steel shapes. Provide unit with gas inlet and outlet connections and baffles, vanes, deflectors, or low friction diffuser plates that will insure uniform gas flow to all elements of the fabric system without causing flutter, vibration, or erosion of the fabric. Provide hinged, latched, and gasketed access doors for all parts and areas that require inspection or service. Secure and support fabric elements in a manner to have the entire fabric surface so deployed that gas flow and particulate collection will be uniform over the entire working surface. Ensure dust shedding properties are uniform so that the entire fabric surface will be equally cleared by a cleaning operation without damage to the media other than normal service wear. Arrange media in elements, sections, pockets, or tubes that can be handled, removed, replaced, and secured without special facilities.

2.13.9.3 Intermittent and Continuous Service Units

[Equip intermittent service units with [washable] [cleaning-in-place] fabric filters.] [Provide continuous service units with means for isolation of a compartment or section for cleaning while other compartments are performing their normal dust removal function. Ensure compartment isolation effectively prevents reentrainment of particulate during the cleaning operation.] Base unit rating upon operation with one section out for cleaning. Cleaning operation must be [operator initiated and executed by manually operating the cleaning cycle on each compartment in sequence until all filters have been cleaned] [operator initiated to have the filters cleaned automatically one compartment at a time until all filters have been cleaned] [automatically initiated by an adjustable filter air pressure drop switch operating at a high pressure set point to initiate the filter cleaning operation] [automatically initiated by a timer to initiate filter cleaning operation]. Once started, the cleaning operation must progressively clean one compartment at a time until all filters are cleaned. Removal of collected particulate must be by [raking out] [removal and dumping of a particulate pan or tray] [draining from a hopper below]. Collector manufacturer must provide all of the components required for the entire cleaning operation including [manual rappers] [motorized rappers] [manual dampers] [motorized dampers] [compressed air surge receiver] [air compressor with receiver, motor, drive, and controls] [blast or pulse jet controls, nozzles, and valves] [shaker or flutter blower, motor, drive, and controls] [traveling ring components]. [Provide automatic operations with a manual override for starting, stopping, interrupting, and restarting operation.]

2.13.9.4 Test Connections

Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.9.5 Dust Collectors Designed for In-Place Cleaning

Provide dust collectors designed and constructed for in-place cleaning of the fabric with a [3.4] [4.8] [6.4] mm [10 gauge] [3/16 inch] [1/4 inch] [low carbon] [corrosion resistant] steel sloped bottom dust storage hopper having the dust holding capacity as indicated. Construct collector and hopper system to minimize reentrainment of collected material into the gas stream. Provide hopper bottom with rappers or fluidizing pads and ensure the hopper valley angle is 60 degrees from the horizontal and free of pockets, ribs, fins, or any other obstruction to hold or interfere with free and complete release of all collected material to the outlet. Provide outlet with [a guillotine-type slide gate] [a manually-operated rotary lock] [a motor-driven rotary lock] [automatic lock hoppers]. Provide hopper with a poke hole and gasketed access door, and a collected material level indicator for [local indication] [local indication with terminals for wiring to a remote indicator]. Include a high material level audible alarm. [Provide hopper with electric heating coils, modules, and blankets to keep collected material dry and flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F].

2.13.10 Gaseous Emissions Control Unit

****

NOTE: The gaseous emissions control units are to be used for cleaning particulate and gaseous solvent materials from the exhaust air at laboratory fume hoods, welding booths, water curtain paint spray booths, and other similar type problems. The fabric prefilter will collect a reasonable amount of particulates and the carbon will adsorb the gaseous vapors. The unit may be used without the prefilter to collect gasoline vapor from small storage tank vents, but the tank should be installed underground or be shaded to minimize boil-off. Project conditions may make regeneration of the carbon desirable. A typical gaseous emission control with carbon regeneration unit consists of two or more

adsorber vessels with deep bed (typically 450 to 600 mm 18 to 24 inches) of high grade gas phase activated carbon. The manufacturer should provide the bed depth as part of his design, and should consider the life cycle cost when sizing the adsorbent unit. The dampers and control valves will be based on timer operation or solvent sensor operation. Once the adsorption bed is saturated with solvent vapors, the flow into the adsorber is automatically diverted to the second adsorber. Low pressure steam is used to desorb the saturated adsorber, regenerating the carbon and producing a steam and solvent mixture which is condensed in a shell and tube condenser. Water insoluble solvents should be separated in a decanter for reuse. The system must be complete with adsorber vessels, blower, filter, condenser, and controls. Deposition of the waste effluents is dependent on the specific project and cannot be determined in the guide specification.

****

Ensure unit complies with ICAC G-1 and consists of a dry type particulate removal precleaner followed by an adsorption unit of activated carbon or other approval adsorbent material.

2.13.10.1 Prefilter

Provide [cleanable] [replaceable] prefilter. Provide prefilter with a cleaning performance equal to or exceeding ASHRAE 52.2 of 95 percent arrestance by weight, 80 to 90 percent atmospheric dust spot efficiency, and a dust-holding capacity of not less than 530 grams per 1 cubic meter per second 250 grams per 1,000 cfm cell. Provide media complying with UL 900 and with a support frame or construct to be self-supporting without sagging either with or without gas flow. Hold each cell securely in place with applied pressure leak-tight joint between the media, media flange, and media collar, and secure the filter to the media bulkhead with latches or clips to permit removal, replacement, and securing without special tools.

2.13.10.2 Adsorbent Unit

Provide adsorbent section consisting of [a system of trays, hollow panels, canisters, or other means of holding a deep bed of activated carbon conforming to ASTM D2854 and ASTM D2862, or other adsorbent material, to cause the processed gas to pass through a uniform depth of material in the gas flow direction][a system of filter frames constructed of activated carbon loaded in a pleated, non-woven synthetic media, with a V-bank configuration].[Design trays, panels, and canisters to assure that the adsorbent bed will be uniform, full and free of voids or thin spots and supported and contained to prevent movement, pulverizing, abrasion, or dusting of the adsorbent and easy and full recharging without special facilities or tools.] Secure adsorbent units leak-tight in a [bulkhead] [filter frame] forcing all gas to pass through the adsorbent bed.

2.13.10.3 Prefilter and Adsorbent Assemblies

Enclose prefilter and adsorbent assemblies in a welded, bolted, or riveted sheet metal enclosure that limits both in-leakage or out-leakage of gas. Ensure enclosure access doors or panels are bolted, or gasket-sealed and latched to provide independent access to the prefilter and the adsorbent plenums. Design the enclosure for the maximum differential pressure (positive or negative) under any mode of operation.

2.13.10.4 Inlet and Outlet Ducts

Provide unit with inlet and discharge vanes, baffles, diffusers, or other devices to assure uniform gas flow through the processors. Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.11 Petrol Vapor Recovery Unit

****

NOTE: The petrol vapor recovery unit is intended for use at fuel depots or fuel distribution terminal facilities. It is used to recover fuel vapors by refrigerated condensation of the material from tank and transporter vents. Underground storage tanks at petrol dispensing stations do not commonly require refrigerated petrol recovery units but are equipped to have the unloading fuel displace a like volume of vapor from the underground tank into the transporter through a vent hose and manifold which are integral with the transporter vehicle. The transporter then hauls this vent gas to the local depot for recovery as the transporter is reloaded. Some jurisdictions may require vehicle tank venting back to the storage tank as the vehicle is loaded. Gaseous emission activated carbon emission control units, with and without carbon regeneration, can be used in this application.

****

Provide a complete air-cooled mechanical refrigerated electric-operated unit designed for condensing the fuel vapors vented from gasoline system storage tanks. Ensure recovery process is in two steps. Precool the vent gas to slightly above water freeze point to remove most of the water vapor without a defrost cycle in the first step. During second step, cool the gas to the required vapor pressure with minimum frost collection. Include storage capacity and circulation system for defrosting fluid. Provide refrigerants which are classified as nontoxic, nonflammable, conforming to ASHRAE 15 & 34, Group 1.

2.13.11.1 Defrosting

[Fuel handling operation will allow defrosting for about [4] [5] [6] hours after midnight.] [Fuel handling operation will not allow time for defrosting and provide a duplicate cooler with automatic controls to alternate the units between cool and defrost modes with status indication of each.]

2.13.11.2 Unit Operation and Control

Provide unit for [complete monitoring and control at the unit] [operation and control at the unit with remote indication of ON-OFF position of unit power supply switch] [operation and control at the unit with remote indication of operating and control of the unit with complete process indication with maintenance and service operation at the unit]. [Provide [visible] [and] [audible] alarms on critical functions [locally] [and at remote station].]

2.13.11.3 Design and Fabrication Requirements

Provide unit from single supplier and of coordinated design, fully assembled and subjected to factory tests before shipment. Skid mount unit on a permanent steel base with pick-up lugs and anchor bolt holes for installation on a concrete foundation. Provide electric power connection, vent gas inlet, return line for condensed hydrocarbons, and drain for aqueous liquids. Install components in a ventilated weather proof enclosure with full accessibility for operation and service through hinged access doors with latches or removable panels. Use doors for access to all operating functions. Insulate cold components and piping of the entire system subject to sweating or frosting. Provide electrical equipment and installation work conforming to requirements of hazardous locations for Class I, [Division I,] [Division II,] Group D, of NFPA 70 and NFPA 496, and Type X conforming to UL 5, UL 674, UL 1203, and UL 823 requirements. Inlet vent gas flow to the unit must be through a 0.075 mm 200 mesh removable ASTM A240/A240M stainless steel or equal strainer. Perform refrigeration work complying with ASHRAE 15 & 34 and ASME B31.5. Ensure petrol vapor, condensed hydrocarbon returns, and aqueous waste piping is in compliance with ASME B31.3.

2.13.12 Gravel Bed Filter

****

NOTE: Electrostatically enhanced gravel beds, combining granular filtration and electrostatic collection, are highly effective with collection efficiencies in excess of 99 percent on submicron particles. Gravel beds without electrostatic enhancement have collection efficiency greater than 95 percent on coarser particulate. They are frequently applied to gas streams in excess of 371 degrees C 700 degrees F and are particularly suitable for the collection of high resistivity particulates with potential fire and explosion hazards. Gravel beds are more compact then electrostatic precipitators or fabric filters for comparable applications. The unit is relatively insensitive to variations in gas flow and temperature excursions, and, in most cases, chemical makeup of the exhaust gas and particulate. Pressure drop across the gravel bed ranges from 763 Pa to 1271 Pa 3 to 5 inches water gauge. Carbon steel is the normal material of construction although high temperature and/or corrosive environments require the use of alloys or stainless steel.

****

The system must remove particulates from process gas streams through granular filtration in a moving bed of filter media supplemented by electrostatic collection resulting from the application of high voltage power to [an electrical grid located in the bed] [an ionization grid located upstream of the bed in addition to an electrical grid located in the bed].

2.13.13 Wet Flue Gas Desulfurization System

****

NOTE: A flue gas desulfurization (FGD) system is used to reduce emission of sulfur dioxide from solid waste incinerator and boiler flue gases. It can also reduce other acid gas emissions such as hydrochloric acid and hydrofluoric acid. FGD systems are classified as either wet or dry processes. In the wet process, the flue gas reacts with a sorbent solution, producing a liquid product. The reagent selected will result in either a waste product, which must be disposed of, or a by-product, in which the sulfur recovered is in useable form. In general, the capital cost of regenerative systems may be up to twice the cost of non-regenerable systems.

****

System must remove sulfur dioxide, [hydrochloric acid] [hydrofluoric acid] [particulates] [and] [______] from processed gas stream. Provide [non-regenerative] [regenerative] system and use wet scrubbing process. Include all equipment required for a complete, operable FGD system, including wet scrubbing system, complete reagent feed system, [waste] [by-product] handling system, and instrumentation and controls for safe, reliable operation of the system.

2.13.13.1 Wet Scrubber System

Provide wet scrubber complying with ICAC EP-1. Scrubber must be a [venturi,] [spray,] [tray,] [fixed packed bed,] [mobile bed,] [impingement,] [or] [entrainment,] type [or a combination of these types]. Provide scrubber consisting of fluid-tight construction of [glass fiber reinforced plastic] [rolled low-carbon steel coated with a protective coating that is suitable for process gas and temperatures] [ASTM A302/A302M stainless steel] [ASTM A240/A240M stainless steel] [_____]. Construct unit with leak-tight viewing windows and access doors to permit appraisal of scrubbing process as well as full access for all service operations or parts replacement. Use vanes, baffles, deflectors, or diffuser plates that provide for uniform gas flow through the scrubbing chamber. Design scrubber internal components to minimize scaling and plugging inside the tower. Provide mist eliminator consisting of fluid-tight construction. Ensure vanes, baffles, or deflectors provide for uniform gas flow to the mist eliminator elements. Design mist eliminator to minimize re-entrainment of liquid into the gas stream. Provide mist eliminator with a water washing system to prevent solids buildup on the blades. Size and orient washing nozzles to spray entire mist eliminator area. Provide system with clean gas reheater upstream of stack to prevent acidic condensation and corrosion in the stack.

2.13.13.2 Reagent Feed System

Provide reagent feed system including all components required for storage of dry reagent, preparation of reagent slurry, delivery and re-circulation of the selected reagent. Use one reagent feed system to serve all scrubbers. Reagent feed system must have a reserve capacity for [[24] [36] [48] hours] [[3] [7] [10] days] of continuous FGD operation at design capacity without servicing. [Provide components that must be taken out of service for routine maintenance or reagent loading in duplicate, arrange for transfer by manual operation of switches and valves.] Include all tanks, agitators, pumps, piping, valves and other equipment required by a specific system design. Provide system equipment of design, material and construction appropriate for scrubbing solution delivery and for re-circulation of scrubbing effluent. Design piping to prevent settling of scrubbing solution inside the pipes. Include provisions for drainage and clean-out of feed system components, including pumps and piping in the design.

2.13.13.3 Waste Handling System

Provide waste handling system including all equipment required for pre-disposal treatment of the scrubbing effluent, including tanks, agitators, liquid-solid separator, vacuum filter, solid waste holding bin, pumps, piping, and valves as required.

2.13.13.4 Test connections

Provide pressure test connections at the inlet and outlet ducts connecting to the scrubber.

2.13.14 Spray Dryer Flue Gas Desulfurization System

****

NOTE: A flue gas desulfurization (FGD) system is used to reduce emission of sulfur dioxide from solid waste incinerator and boiler flue gases. It can also reduce other acid gas emissions such as hydrochloric acid and hydrofluoric acid. FGD systems are classified as either wet, wet/dry, or dry processes. The spray dryer FGD process is a wet/dry process, in which the flue gas reacts with an alkaline reagent, usually a lime slurry, and the reaction product is in dry form. The reagent selected will result in either a waste product, which must be disposed of, or a by-product, in which the sulfur recovered is in useable form. In general, the capital cost of regenerative systems may be up to twice the cost of non-regenerable systems.

****

System must remove sulfur dioxide, [hydrochloric acid] [hydrofluoric acid] [particulates] [and] [_____] from processed gas stream. Provide non-regenerative system and use a spray dryer scrubbing process. Include all equipment required for a complete, operating FGD system, including spray dryer scrubbing system, complete slurry feed system, waste handling system, particulate collecting unit consisting of [fabric filter collector,] [electrostatic precipitator,] and instrumentation and controls for safe, reliable operation of the system.

2.13.14.1 Spray Dryer System

Provide spray dryer in compliance with ICAC EP-1. Spray dryer must be of gas-tight construction. Construct unit with leak-tight viewing windows and access doors to permit appraisal of scrubbing process as well as full access for all service operations or parts replacement. Spray dryer system must include flue gas preheater prior to spray dryer inlet. Design vanes, baffles, deflectors, or diffuser plates to provide complete mixing of flue gas and chemical reagent, and to provide adequate time for chemical reaction and evaporation of liquid in spray dryer chamber. Provide [rotary] [or] [dual fluid] atomizing system to provide uniform dispersion of the chemical reagent in the spray dryer chamber and prevent gas droplet deposition on spray dryer walls. [Dual fluid nozzle atomizers must use compressed air as the atomizing fluid. Provide a dedicated air compressor system for dual fluid atomizing system.] Design scrubber internal components to minimize scaling inside the tower.

2.13.14.2 Reagent Feed System

Provide chemical reagent feed system including all components required for storage, preparation, delivery and re-circulation of the chemical reagent. Use one reagent feed system to serve all scrubbers. Reagent feed system must have a reserve capacity for [[24] [36] [48] hours] [[3] [7] [10] days] of continuous FGD operation at design capacity without servicing. [Provide components that must be taken out of service for routine maintenance or reagent loading in duplicate, arrange for transfer by manual operation of switches and valves.] Include all tanks, agitators, filters, pumps, piping, valves and other equipment required by a specific system design. Provide system equipment of design, material and construction appropriate for reagent delivery and for re-circulation of spray dryer effluent. Design piping to prevent settling of solids inside the pipes. Include provisions for drainage and clean-out of feed system components, including pumps and piping in the design.

2.13.14.3 Particulate Collecting Unit

Design particulate collecting unit to collect spray dryer products and fly ash remaining in the gas stream exiting the spray dryer. Provide particulate collection unit consisting of [fabric filter collector] [electrostatic precipitator]. [Provide fabric filter collector in accordance with paragraph DRY FABRIC COLLECTOR FOR BOILER FLUE GASES]. [Provide electrostatic precipitator in accordance with paragraph DRY ELECTROSTATIC PRECIPITATOR (DRY ESP)].

2.13.14.4 Test connections

Provide pressure test connections at the inlet and outlet ducts of each spray dryer and fabric filter collector.

2.13.15 Selective Catalytic Reduction (SCR) System

****

NOTE: All fossil fuel burning processes produce nitrogen oxides (NOx). Selective catalytic reduction (SCR) reduces NOx to N2 in the presence of a catalyst. The reducing gas is usually ammonia (NH3), and the catalyst may be composed of various materials, such as oxides of vanadium or tungsten. The catalytic reduction reaction requires temperatures in the range of about 300 to 425 degrees C 600 to 800 degrees F. Selection of the catalyst material and configuration, as well as the operating temperature, depends on the type of fuel being burned. The catalytic reactor will receive a high dust, low dust, or tail end gas stream, depending on its location in the system. In the

high dust location, the catalyst is located upstream of an electrostatic precipitator. Location of the SCR system downstream of an electrostatic precipitator results in a low dust environment for the catalyst. In the tail end location, the SCR system is located downstream of an electrostatic precipitator and/or a flue gas desulfurization system, which provides the cleanest gas to the catalyst. Location of the SCR in the system will have an impact on catalyst life.

Efficiency of conventional SCR equipment in removal of NOx is about 80-90 percent. SCR may be used in conjunction with combustion modifications, such as low NOx burners. A potential complication of SCR using ammonia when high sulfur coal is burned is the formation of ammonium bisulfate. When unreacted ammonia passes through the catalytic reactor, called ammonia slip, it will combine with SO3 present in the flue gas, forming ammonium bisulfate. Ammonium bisulfate, a sticky, corrosive material, will condense on downstream equipment. Ammonia slip is a major design concern when burning high sulfur coal.

****

Design system to reduce nitrogen oxides from processed gas stream. Use ammonia as the reducing agent. Include all equipment required for a complete, operable SCR system, including, but not limited to, ammonia delivery system, catalytic reactor [with sootblowers], ash removal system, instrumentation and controls for safe, reliable operation of the system, and other pollution control devices as required.

2.13.15.1 Ammonia Delivery System

Provide ammonia delivery system including all components required for storage, preparation, and delivery of ammonia to the flue gas stream downstream of the economizer, prior to the catalytic reactor. Design ammonia delivery system to automatically deliver ammonia based on the quantity of NOx detected in the gas stream. Design ammonia vaporizers to ensure uniform ammonia distribution in the gas stream. Locate ammonia vaporizers in ductwork at a sufficient distance upstream of the catalytic reactor to provide complete mixing of ammonia and flue gas prior to the catalytic reactor inlet.

2.13.15.2 Catalytic Reactor

Catalytic reactor must provide environment for chemical reaction between ammonia and nitrogen oxides, to produce elemental nitrogen and water as the products. Ensure catalytic reactor configuration provides for uniform gas flow through all elements of the reactor. Catalytic reactor must be of gas tight construction Locate catalytic reactor between boiler economizer and boiler air preheater. [Locate catalytic reactor [upstream of an electrostatic precipitator] [downstream of an electrostatic precipitator] [downstream of a flue gas desulfurization system] [downstream of an electrostatic precipitator and a flue gas desulfurization system].] [Provide catalytic reactor with sootblowers.] Limit ammonia slip to [_____] ppm.

2.14 EMISSION MONITORING SYSTEM

****

NOTE: Provide in-situ opacity monitoring equipment where applicable to insure emission compliance of the particulate control equipment.

State and local regulatory authorities should be contacted at an early stage of the project design to determine if they consider the test methods cited to be adequate, and if they have any additional requirements.

****

Provide emission monitoring system complete with all components, accessories, analyzers [analyzer calibration system] [and recorders,] [alarms], and free-standing factory assembled panel to [monitor opacity, sulfur dioxide, nitric oxide, nitrogen dioxide, and carbon monoxide emissions in boiler flue gases.] [In-situ opacity monitoring.] [_____]. System must [continuously monitor] [time program monitor as indicated] [be manually operated to monitor] the emissions. Submit reports for emissions permit compliance. Indicate [and record] emissions in ppm and percent of sample.

Emission monitoring system must be designed for monitoring the specific flue gas characteristics (moisture) discharged.

2.14.1 Gas Sampling System

Sampling locations for air pollution control equipment performance must be in accordance with 40 CFR 60, Appendix A. Use a vacuum pump to draw a gas sample through a filter probe mounted inside the stack, a prefilter, and a moisture separator/drier. It must discharge the sample through a flow meter on each analyzer to atmosphere as indicated. Provide equipment and necessary tubing for automatically purging pollutants from sampling tubing, stack probe, and drier tubing, and for automatic regeneration of the drier. Cleaning and drying operation must be time programmed.

2.14.2 Analyzing System

System must provide simultaneous measuring and analyzing of sample gas by each analyzer with independent flow meters, valves, piping, and accessories. Each analyzer must indicate ppm of the measured pollutant. Provide each analyzer with a visual color coded, panel mounted, high limit alarm with a single audible alarm with silencing button for all alarms. Provide a relay on each analyzer for connection to a remote alarm.

Analyzers must incorporate only approved methods of detection as per 40 CFR 60, Appendix B, Performance Specification 1 (PS-1), ASTM D6216, and Clearance Permit System 001 (CPS-001) when applicable. Analyzers must be capable of satisfying applicable EPA and/or local regulations as listed in the operating permit for relative accuracy. Analyzer Sensitivity must meet all performance criteria of PS-1 and all other applicable state and federal regulations. Analyzer output signals must have the capability of communicating a signal directly to the [plant control system] [existing Data Acquisition System]. The output signal must be linearly proportional to the opacity value sensed for entire scale in use. Discrete Output Signals of System Controller must be available for Analyzer malfunction, Analyzer is in calibration, and Measured concentration exceeds predefined limits. Analyzers must be equipped with a direct readout display or an independent output for a local panel display device. Analyzer displays must provide readings in accepted engineering units.

2.14.3 System Mounting

Gas sampling, analyzing [, and recording] systems must be piped, wired, and mounted within a factory fabricated 2.657 mm 12 gauge cold rolled black steel enclosure with angle frame support and key-locked doors for [wall] [floor] mounting. Entire system must be suitable for 120 Vac, 60 Hz, single-phase electric service.

2.14.4 Calibration

Provide calibration gas tanks of capacities indicated complete with regulators, valving, and tubing for the specified emissions.

2.15 FACTORY APPLIED INSULATION

****

NOTE: Insert equipment and related piping, casings, and enclosures requiring insulation as applicable.

****

Insulate the following equipment and appurtenances with materials, jacketing, and finishes, as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS:

a. [_____]

b. [_____]

2.16 PAINTING AND FINISHING

Provide equipment and component items that are factory primed and finish coated with the manufacturer's standard finish. Painting must be in accordance with SSPC SSPM. Clean exterior surfaces to base metal in accordance with SSPC SP 6/NACE No.3 and paint at the factory with two coats of paint conforming to FS TT-P-28FS TT-P-28. Items located outside the building must have weather resistant finish. Refinish damaged finish surfaces with an identical type of finish used at the factory. Power clean to bare material and touch up exterior surfaces damaged during field installation or during shipment.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Install work as indicated and in accordance with manufacturer's diagrams and written instructions. [A factory installation specialist must be at the site for erection of [dry electrostatic precipitator,] [wet electrostatic precipitator,] [baghouse,] [scrubber,] [wet flue gas desulfurization system] [spray dryer flue gas desulfurization system] [selective catalytic reduction system] [and] [petrol vapor recovery unit]

[and] [emission monitoring system].] Field applied insulation must be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Provide an aluminum, brass, or type 304 or 316 stainless steel nameplate and fasten to equipment in a visible location by means of rivets or sheet metal screws of the same material as the nameplate material. Nameplate must contain data that consists of the manufacturer's name, model or series number, and serial number. Indent or emboss the information in the metal. Offset the nameplate a sufficient amount to avoid being covered by insulation.

3.3 OPERATION AND PERFORMANCE REQUIREMENTS

****

NOTE: Select the appropriate performance data forms required for the equipment selected. Fill in the data on the forms. Delete or retain the topic items as appropriate. EPA Technical Report AP-42 including Supplements 1 through 9 (and later supplements if issued) will be used to determine the properties or qualities and quantities of uncontrolled emissions from the various polluting equipments, systems, and operations to be corrected under this guide specification. Show in tables on drawings operating performance requirements for fans, pumps, motors, and other auxiliaries, indicating cfm, gpm, hp, etc. Fill out separate table for each air pollution control equipment selected for a given project in accordance with the following guide:

Table	**Type Effluent**	**Applicable Equipment**
I	**General Dust**	**Dry Dynamic Centrifugal Fabric, Fabric, or Wet Dynamic**
II	**Boiler Fly Ash**	**Dry Dynamic, Centrifugal Fabric, or ESP**
III	**Boiler Flue Gases & Other Fume Sources**	**Scrubber, Flue Gas Desulfurization System, Selective Catalytic Reduction System**
IV	**Petrol & Other Vapor**	**Refrigeration Unit or Sources Fabric Prefilter with Activated Carbon with Regeneration**

****

Air pollution control equipment must process and remove pollutants from exhaust gas streams to produce an effluent that will conform to 40 CFR 50 and other federal, state, and local regulations, without degrading the performance of related system components. The air pollution control equipment installed must perform the cleaning operation as indicated on the Air Pollution Equipment Performance Data forms attached to this section.

3.4 FRAMED INSTRUCTIONS

Post framed instructions containing wiring and control diagrams under glass or in laminated plastic where directed. The instructions must show wiring and control diagrams and complete layout of the entire system. The instructions must include, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. Post the framed instructions before acceptance testing of the system.

3.5 FIELD QUALITY CONTROL

3.5.1 System Performance Test

The right is reserved by the Government to inspect the equipment at the manufacturer's plant, during or after manufacture. Acceptance at the factory will not constitute final acceptance.

Upon completion, and prior to acceptance of the project, test the air pollution control equipment and monitoring system in accordance with 40 CFR 60, Appendix A and state and local codes by an independent testing organization accredited by The American Association for Laboratory Accreditation (A2LA) to meet three environmental standards; the Stack Testing Accreditation Council (STAC) for ASTM D7036. [A factory startup specialist must be at the site to direct and monitor startup for testing of [electrostatic precipitator,] [baghouse,] [scrubber,] [wet flue gas desulfurization system] [spray dryer flue gas desulfurization system] [selective catalytic reduction system] [and] [petrol vapor recovery unit] [emission monitoring system].] Notify the Contracting Officer [_____] days in advance of the test date. [An independent testing organization must furnish all instruments and personnel required for the tests.]Submit a proposed performance test procedure, 30 days prior to the proposed test date, containing a complete description of the proposed tests and sample locations, with calibration curves or test results by an independent testing laboratory of each instrument, meter, and gauge to be used in the tests. The test must not commence until the procedure has been approved. Electricity and water will be furnished by the Government. Conduct and fully document emission monitoring certification testing as required by local, state, and federal regulatory requirements to demonstrate compliant system operation.

3.5.1.1 Retesting

If any deficiencies are revealed during test, correct such deficiencies and reconduct the tests.

3.5.1.2 Reporting

Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed, including results, to provide compliance with the specified performance criteria, upon completion and testing of the installed system. Each test report must indicate the final position of controls and performance criteria.

3.5.2 Manufacturer's Field Service

Provide services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the specified equipment.

The representative must supervise the installing, adjusting, and [testing] [testing start-up] of the equipment.

3.6 CLOSEOUT ACTIVITIES

3.6.1 Training

****

NOTE: Insert number of hours required to train personnel for the equipment operations.

****

Conduct training course for operating and maintenance staff as designated by the Contracting Officer.[Contractor to provide maintenance for first year after acceptance, and provide proposal for annual maintenance thereafter.] The training period, of a total of [_____] hours of normal working time, must start after the system is functionally completed, but prior to final acceptance tests. The field instructions must cover all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations. Submit training course curriculum and training instructions [14] [_____] days prior to the start of training.

3.6.2 Operations and Maintenance

Submit complete copies of operation manual outlining the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and its basic operating features. Also, submit complete copies of maintenance manual listing routine maintenance procedures, possible breakdowns and repair, and troubleshooting guides. Include piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed. Ensure operation and maintenance manuals are approved prior to training course.

3.7 SCHEDULES

a. TABLES I and II: List any or all properties of particulate materials such as corrosive, toxic, abrasive, sticky, flammable, explosive, abrasive, friable, spherical fibrous, and hygroscopic.

b. TABLES I and III: Delete reference to particulates if the scrubber is to be installed with a particulate precleaner.

c. TABLE III: Delete reference to water supply data if not applicable for equipment selected.

d. TABLES III and IV: The volume to be listed here is the total volume of exhaust or ventilation air flow with which the pollutant is mixed. Add or delete items under Analysis of Gaseous Pollutants.

SECTION 44 13 10.13

VAPOR PHASE ACTIVATED CARBON ADSORPTION UNITS

05/20

****

NOTE: This guide specification covers the requirements for systems to transfer organic contaminants from a contaminated air/gas stream (e.g. landfill off gas, soil vapor extraction, air stripping, process tank vapors, thermal desorption) to activated carbon adsorption media.

Adhere to UFC 1-300-02 **Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.**

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)**.**

****

PART 1 GENERAL

****

NOTE: This specification only covers offsite disposal or regeneration of activated carbon; it does not cover onsite regeneration

****

1.1 UNIT PRICES

****

NOTE: On many hazardous, toxic and radioactive waste (HTRW) projects, the Contractor is required to treat contaminated air/gas, as well as furnish the

equipment. Measurement and payment and unit pricing may be necessary to cover treatment costs. Write the contract to provide an incentive for the Contractor to do the job efficiently. It may be preferable to base payment on the kg lbs of contaminants removed from the air/gas stream entering the carbon vessel. However, if carbon is being used to treat the air from an air stripper, the basis would be the volume of water treated in the air stripper or kg lbs of volatile organic chemicals in the water stream entering the air stripper. Or, if the mass of contaminant decreases during the long term operation of the unit, while at the same time the O&M expenses stay approximately constant, it may be preferable to base the payment on the volume of air/gas treated.

****

Payment for contaminated air/gas treated will be as described in the Payment Schedule of the Bid Form.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for

Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

1.4 QUALIFICATIONS

1.4.1 Contractor

Provide documentation of having [a minimum of [2] [_____] years experience in the construction, startup and operation of industrial air pollution control devices] [installed a minimum of [2] [_____] vapor phase carbon adsorption units in the past [5] [_____] years].

1.4.2 Single Source Supplier

Assign to a single supplier full responsibility for furnishing of the activated carbon system. The designated single supplier, however, need not manufacture the system but coordinates the selection, assembly, installation, and testing of the entire adsorption system, including preheater, the blower and ductwork specified in other Sections. The supplier has [been in the business of manufacturing, fabricating or installing these systems for a minimum of [2] [_____] years] [manufactured and supplied a minimum of [5] [_____] vapor phase carbon adsorption units].

1.4.3 Carbon Vessel Fabricator

****

NOTE: Verification from a registered professional engineer should only be required for large systems which have to be bolted to the foundation. Delete this paragraph for small units which are on forktubes or a flat base and not fastened to the foundation.

****

Provide verification from a Registered Professional Engineer, licensed to practice mechanical or structural engineering, as appropriate, in the State in which the system is to be installed to verify that: 1) The fabrication drawings and pressure calculations for the vessels and appurtenances were done for the site conditions in accordance with the appropriate codes and standards. 2) The erection drawings for the shells and tank foundations and supports were done for the site conditions in accordance with the appropriate codes and standards. Submit certification from this Engineer documenting the verification.

1.5 PARTNERING AND/OR PRE-SUBMITTAL MEETING

****

NOTE: Remove this paragraph when a meeting is not required.

****

A [partnering] [and] [Pre-submittal] meeting will be required. Ensure that involved subcontractors, suppliers, and manufacturers are notified. Furnish the date and time of the meeting to the Contracting Officer for approval.

1.6 DELIVERY, STORAGE, AND HANDLING

Preassemble parts to the largest extent possible, compatible with transportation limitations and equipment protection considerations. Field assembly, if any, requires merely bolting together of match-marked components. Crate and deliver equipment to protect against damage during shipping. Protect flange faces from damage. Cover all openings to prevent entrance of dirt, water and debris. Properly protect all parts so that no damage or deterioration will occur during a prolonged delay from the time of shipment until installation is completed and until the units and equipment are ready for operation. Properly protect finished iron or steel surfaces to prevent rust and corrosion. Protect all equipment, delivered and designated for storage, from the weather (humidity and temperature), dirt and dust, and other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

****

NOTE: Provide additional information about equipment preceding and following the carbon vessel. This is to provide the vendor with a complete picture of the unit's purpose and operation. Some paragraphs may be eliminated or modified if this Section is to be issued as a performance specification. Others will be eliminated or modified if it is to be issued as a design specification.

Laboratory adsorption studies are seldom done for air/gas adsorption. Estimates are obtained from isothermal data or from vendor computer programs. The ASTM Standards do not provide information on the minimum and maximum values that are acceptable for specifying carbon. Manufacturers may need to be contacted to determine the acceptable values. The characteristics for virgin and regenerated carbon will be different. Verify that the requirements are correct for the type of carbon specified.

****

Provide a vapor phase activated carbon adsorption system as a complete once-through forced flow system. Furnish system capable of reducing the levels of the listed organic contaminants to the values shown in paragraph Performance Requirements. Fill the unit with granular activated carbon for removal of organic contaminants from [landfill gas] [soil vapor extraction air/gas] [air stripping air/gas] [process tank vapor emissions] [low temperature thermal desorption air/gas] [_____]. Equipment includes, but is limited to, vessels containing activated carbon, supporting equipment and accessories. Terminology is in conformance with ASTM D2652. Provide complete system with [[2] [_____] parallel trains of [2] [_____] carbon vessels in [series] [parallel]] [[2] [_____] carbon vessels [in series] [parallel]], activated carbon, [blowers], instruments, controls, valves, piping, pre-heater/cooler and other specified appurtenances. Arrange the piping [as shown on the drawings] [_____] to allow any of the [2] [_____] units to serve as the primary unit and to also allow any unit to operate alone while the other units are being emptied and refilled with fresh carbon. Design the system to operate continuously, 24 hours per day, 7 days per week.

2.1.1 Design Requirements

****

NOTE: The most difficult part of designing an activated carbon adsorption system may be determining the contaminant concentration in the air/gas stream to be treated. Many times design estimates are based on limited data. The actual rate, particularly after the unit has operated for a while, may be much different. An approach may be to design the process for easy addition or removal of carbon units as determined after startup.

Determine seismic parameters from paragraph Seismic Requirements, and wind speed from ASCE 7-16, Chapter 1, or UFC-3-301-01. Specify whether the unit will be installed inside or outside and any other conditions that will affect the operation of the unit. Coordinate this Section with other pertinent Sections to ensure that information is presented only once. Verify that the floor and footings are designed to support the equipment.

****

Meet the following requirements:

a. Minimum equipment design life: [_____] years.

b. Vessel type: [permanent with carbon] [replacement] [interchangeable canisters].

c. Adsorption system design requirements:

  (1) Maximum vertical projection: [_____] m ft.

  (2) Maximum ground surface coverage: [_____] by [_____] m ft.

d. Seismic parameters: [_____].

e. Wind speed (maximum): [_____] km/h mph.

f. Ground snow load: [_____] kPa psf.

g. Ambient air temperature:

  (1) Maximum: [_____] degrees C degrees F.

  (2) Minimum: [_____] degrees C degrees F.

2.1.2 Influent Air/Gas Conditions

****

NOTE: Remove this paragraph if the specification is to be issued as a design specification. Obtain an analysis of the air/gas to be treated giving appropriate information to be inserted in the blank spaces. The inlet air/gas composition may be difficult to obtain. If the specification is to be issued as a performance specification the inlet

composition will need to be estimated.

Oxygen and methane data are useful if the methane concentration is high enough to have a potential to be in the explosive range. If the concentration is well below this range, remove the methane and oxygen concentration lines. Provide all available information. All available pertinent site characterization data should be placed in an appendix of the technical specifications or on the drawings, and referenced here. Indicate the detail to which site characterization has been performed and indicate where data gaps exist. The information should also include soil gas data, chemical data, geotechnical data, sampling locations, and boring logs. Table must be edited to add contaminants not listed and delete those that are not applicable. Verify that carbon will adsorb the organic chemicals since many organic chemicals do not adsorb well on carbon.

****

	Minimum	Average	Maximum	Unit of Measure
Oxygen			[_____]	percent
Methane			[_____]	percent
Relative Humidity	[_____]	[_____]	50	percent
Carbon Tetrachloride	[_____]	[_____]	[_____]	ppmv
Trichloroethen	[_____]	[_____]	[_____]	ppmv
Benzene	[_____]	[_____]	[_____]	ppmv
Toluene	[_____]	[_____]	[_____]	ppmv
Xylene	[_____]	[_____]	[_____]	ppmv
Carbon Monoxide	[_____]	[_____]	[_____]	ppmv
Ozone	[_____]	[_____]	[_____]	ppmv
[_____]	[_____]	[_____]	[_____]	ppmv

2.1.3 Performance Requirements

****

NOTE: Remove these paragraphs if the specification is to be issued as a design specification. Removal expressed as a percent is dependent on inlet concentrations which can vary. Ensure that the desired emission rates can be met before using percent removal.

****

2.1.3.1 Physical Requirements

	Minimum	Maximum
Air/gas flow rate	0.0005 cu m/s1 scfm	
Air/gas temperature		60 degrees C140 degrees F
Inlet Pressure		70 kPa10 psig

2.1.3.2 Chemical Requirements

	Maximum Emission	Percent Removal
Carbon Tetrachloride	[_____] ppmv	[_____]
Trichloroethene	[_____] ppmv	[_____]
Benzene	[_____] ppmv	[_____]
Toluene	[_____] ppmv	[_____]
Xylene	[_____] ppmv	[_____]
[_____]	[_____] ppmv	[_____]

2.1.3.3 Carbon Replacement

Replace carbon at intervals no less than [_____] days.

2.1.4 Design Calculations

****

NOTE: Delete this paragraph when design is done by the Government.

****

Supply a copy of all the design calculations to the Contracting Officer before initiation of construction.

2.1.5 Conformance to Design

Provide calculations, layouts and drawings of the carbon adsorption system to clearly show the basis for the design; including isotherms, estimated breakthrough volumes, and calculations to show that the entire system will conform to paragraph Performance Requirements.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least [2] [_____] years prior to bid opening. Provide materials and equipment supported by a service organization that is located within [_____] km miles of the site.

2.2.2 Nameplates

Provide major equipment items such as adsorption vessels, blowers and motors with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.3 VAPOR PHASE ACTIVATED CARBON

****

NOTE: Performance specifications are recommended to allow the Contractor to install proven "off-the-shelf" units supplied by two or three reputable manufacturers. Determine if the first charge of carbon needs to be virgin carbon for liability requirements. Remove items not required below.

****

Provide material conforming to the following list; submit certificates attesting that the activated carbon furnished meets the specified requirements. Also, submit the type of activated carbon, with isotherms for the selected carbon, with each of the volatile organic compounds listed in the effluent requirements for the anticipated temperature range at 50 percent relative humidity. Use design calculations or vendor computer models to estimate the mass of carbon required and the breakthrough curves for the listed organic compounds in the carbon bed.

a. Provide an initial charge of carbon that is [virgin] [regenerated] [virgin or regenerated] carbon. Provide subsequent charges that are [virgin] [regenerated] [virgin or regenerated] carbon.

b. Furnish carbon adsorption system capable of reducing emissions for individual compounds to below the limits specified in SYSTEM DESCRIPTION.

c. Base approximate average volatile organic composition of the vapor stream on estimated influent component levels as specified in SYSTEM DESCRIPTION.

d. Provide minimum butane working capacity of new activated carbon of [23.8] [_____] percent by weight as determined by ASTM D5228.

e. Provide minimum iodine number of virgin or reactivated carbon of [1000] [_____] as determined by ASTM D4607.

f. Provide maximum moisture content of [2] [_____] percent by weight as determined by ASTM D2867.

g. Provide maximum total ash content of [10] [_____] percent by weight as determined by ASTM D2866.

h. Provide minimum hardness number of [90] [_____] necessary for the required life in vapor phase applications as determined by ASTM D3802.

i. Provide uniform activated carbon particle size for consistent pressure drop characteristics. Provide maximum particle size of 4.6 mm 0.2 inch diameter as determined by ASTM D2862.

j. The granular activated carbon must be of the type that can be accepted for offsite regeneration of the spent activated carbon by an approved carbon regeneration facility.

k. Provide minimum apparent density of [0.45] [_____] g/cc as determined by ASTM D2854.

l. Maximum pressure drop is [_____] kPa/m inches of water per foot of bed depth, measured in air at 21 degrees C 70 degrees F.

m. US Sieve size is [4 x 8] [_____].

n. Furnish material that is free from impurities that affect the serviceability and appearance of the finished product.

2.4 ACTIVATED CARBON ADSORPTION UNITS

****

NOTE: General rules to the system designer for configuration of a vapor phase activated carbon system are as follows:

a. Two stage series operation to provide longer contact and more complete exhaustion of the carbon is preferred. In series operation, the unit with the freshest carbon at any given time should be in the lag position. For critical operations, lead, lag and standby units should be provided as specified in paragraph SYSTEM DESCRIPTION.

b. Multiple units in parallel operation are frequently used for high flows with low contamination levels when short contact times are adequate. Single units should be used only in installations in which the system can be shut down for change out of the activated carbon adsorption media. Multiple smaller units containing the same amount of carbon and providing equal contact are usually preferable to single large unit.

c. An appropriate piping configuration which can adapt the units for series or parallel operation should be considered. Arrangements that allow conversion from parallel to series and the reverse allow the flexibility to respond to differing conditions.

d. Surface loading ranges between 12 and 24 cu m/min/sq m 40 and 80 cfm/min/sq ft are often used.

e. Minimum bed depth at a given velocity is based on the minimum contact time required to achieve the required removal. Additional bed volume allows more time between carbon changes.

f. The relative humidity of the air/gas entering

the carbon unit should be 50 percent or less. If the air/gas entering the unit has entrained water an air/gas-water separator should be used. Without this, the temperature of the air/gas will have to be elevated enough to vaporize the mist and lower the relative humidity to about 50 per cent. At this higher temperature the organic chemical may not adsorb well.

****

2.4.1 Velocity

****

NOTE: In an up-flow system the velocity should generally be in the range of 12 to 24 m/sec 40 to 80 feet per minute; this depends on the particle size. In a down-flow system, the flow velocity is only limited by the allowable pressure drop.

****

The minimum and maximum acceptable flow velocities are as follows: 0.25 m/sec at [_____] cu m/sec minimum; and 0.375 m/sec at [_____] cu m/sec maximum 40 ft/min at [_____] scfm minimum; and 80 ft/min at [_____] scfm maximum.

2.4.2 Vapor Distribution/Collection Systems

Provide effective distribution across the bed throughout the stated capacity range. Provide a system to minimize short circuiting or channeling of contaminated air/gas through the carbon vessel. Design the system to evenly distribute the controlled contaminated air/gas flow across the cross section, with the nominal velocity under design conditions not exceeding 0.41 m/sec 80 fpm for up-flow systems. Adequately design the inlet and outlet to prevent local pressurization in excess of the vessel rating or design.

2.4.3 Shell Design

****

NOTE: Most carbon vessels are not designed for vacuum. Verify that a vacuum cannot be drawn on the vessel exceeding the manufacturer's recommendation. If the vessel will have internal pressure greater than 103 kPa 15 psig, it may need to be ASME rated. Vessels with less than this pressure may or may not need to be pressure rated depending on special ASME or State/local codes.

****

2.4.3.1 Corrosion Prevention

Use corrosion resistant steel, fiberglass, or other plastic for shell construction or a steel shell with a corrosion resistant [enamel] [_____] coating. Provide lining system with a corrosion resistant [epoxy or phenolic resin] [_____] coating. Furnish paint kits for use after assembly and finishing.

2.4.3.2 Manways

Minimum manway requirements, for access, addition and removal of carbon are [1] [_____] per adsorber and 610 mm 24 in minimum nominal diameter.

2.4.3.3 Insulation

****

NOTE: Insulation is optional. It may be needed if the carbon units are installed outside in cold climates. A high differential pressure across a fan or blower that precedes the carbon unit may result in a high air/gas discharge temperature. Pipes and fittings down stream may not need insulation. Plastic or fiberglass pipes and fittings should not be used if the discharge temperature can exceed that recommended for the material.

****

Install insulation [and heat tape] to prevent cooling of the air/gas in the system as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Insulate all outside surfaces of the following equipment: [adsorbers] [pipes] [fittings] [stacks] [_____].

2.4.3.4 Vessel

****

NOTE: If the specification is to be issued as a performance specification, remove adsorber diameter and carbon quality in this paragraph. Delete the minimum bed depth for a performance specification. Small units do not need inlet air/gas distributors. Add a paragraph requiring an outside access ladder if the top of the vessel must be accessed frequently. The number of carbon vessels should conform to those specified in SYSTEM DESCRIPTION.

****

Comply with the following requirements:

a. Minimum Number of Vessels: [2] [_____].

b. Minimum Adsorber Diameter: [_____] m ft.

c. Material of Construction: [carbon steel] [_____].

d. Maximum Allowable Working Pressure: [_____] kPa psig.

e. Minimum Carbon Quantity per Vessel: [_____] kg lbs.

f. Minimum Carbon Bed Depth: 922 mm 36 inches.

g. Flow Direction: [upflow] [downflow].

h. Outlet Collector: [_____].

i. Inlet Distributor: Integral

j. Min. Allowable Temperature: [_____] degrees C degrees F.

Each unit must be [skid-mounted. Fabricate skids of [cast iron] [steel] channels and design to support the equipment and to distribute the weight in transit and in service without loading on the tank or concrete slab;] [equip with lifting lugs] and pre-pipe internally. Secure each vessel to a structural steel frame suitable for shipment or transport with a forklift or crane and set on a level area for operation. Coat exterior structural steel surfaces with a suitable primer and top coat to resist corrosion due to water spray. Provide a minimum of one ground connection for each unit. If required, provide each unit with an inlet air/gas distributor. Provide sampling ports on the inlet and outlet pipes of each vessel to allow independent sampling and measurement of breakthrough for each unit.

2.4.3.5 Fire Sprinklers

****

NOTE: A fire suppression system is needed if the carbon manufacturer believes the adsorbed contaminant can react and cause a fire.

****

Equip carbon vessels with an internal water sprinkler to suppress carbon fires.

2.4.3.6 Seismic Requirements

****

NOTE: Provide seismic requirements, if a government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Remove the bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 SEISMIC BRACING FOR MECHANICAL SYSTEMS properly edited, must be included in the contract documents.

****

Support and brace adsorption units to resist seismic loads as specified under UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 SEISMIC BRACING FOR MECHANICAL SYSTEMS [as shown on the drawings].

2.4.4 Unit Submittals

2.4.4.1 Layout and Detail Drawings

Drawings showing complete equipment layout, piping, wiring and schematic diagrams, and installation instructions and any other details required to show equipment relationships, clearances for maintenance and operation and to demonstrate that the system has been coordinated and will properly function as a unit. Process flow diagrams and instrumentation diagrams showing all major pieces of process equipment with controls. Details on the carbon adsorber shell including information on vapor diffusion, carbon contact shell dimensions, construction materials and structural and supporting design calculations.

2.4.4.2 Calculations and Modeling

Design calculations or computer modeling results for vapor phase carbon adsorption system indicating removals of each of the organic compounds listed. Demonstration of, or design calculations for, the total head loss through the carbon unit. Provide isotherm and design calculations or manufacturer's computer models to estimate the mass of carbon required and the breakthrough curves. Calculations showing how the vapor phase carbon adsorption system functions with the entire air/gas system including carbon vessel, [regeneration equipment], preheater, instrumentation and controls, dimensions, capacities, make and model, materials of construction, coating systems, pressure drop through each component of the system, including line sizing, valving, pressure and temperature gauges. Structural calculations for fabrication and erection drawings if requested (not needed for drum/canister applications).

2.4.4.3 System Supplier Testing

Submit certificate from system supplier showing that the equipment has been tested and has passed all quality control criteria.

2.5 ACCESSORIES

2.5.1 Blowers

Conform to Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS.

2.5.2 Preconditioning Equipment for Inlet Air/Gas Stream

****

NOTE: An air/gas preheater may not be needed if the carbon unit is preceded with a blower. Blowers heat the air/gas which reduces the relative humidity. A blower may raise the temperature of the air/gas more than needed. If this occurs, cooling will be required before entering the carbon unit. If a specific type of preheater is needed, specific information on the type of heater, materials of construction and type of energy source (electricity, steam, natural gas) should be indicated on the drawings or added to the specifications. Either the paragraph on the air/gas preheater or the air/gas cooler or both should be deleted.

****

[A preheater is required if the relative humidity is greater than [50] [_____] per cent. Provide preheater [of the type and size as shown on the schedule on the drawings] [_____]. The preheater must lower the relative humidity of the influent to [50] [_____] percent. Provide materials of construction and controls and cutoffs. Provide heating element that is [directly] [indirectly] heated.] [The vapor stream leaving a forced draft blower that precedes the carbon vessel must pass through a heat exchanger that cools the air/gas stream. Provide heat exchanger of the type and size as shown on the schedule on the drawings. The heat exchanger must lower the temperature enough to raise the relative humidity to no more than 50 percent.]

2.5.3 Carbon Storage and Transfer System

****

NOTE: Fresh carbon storage vessels and exhausted carbon storage vessels are not usually used in vapor phase systems. In large systems, the carbon is vacuumed or removed by eductor (water) and put into a truck. In smaller systems the carbon is usually removed by vacuum.

If there is no onsite storage, two trucks are needed, one empty to receive the used carbon and one with fresh carbon. Economics should dictate whether to install extra vessels at the site or to have an empty truck accompany the truck with the fresh carbon. It is often desirable to size the vessels to hold a full truck load of activated carbon to reduce shipping costs. On many small systems, the entire vessel containing the used carbon is replaced with a vessel containing fresh carbon. Vessels are sometimes filled from 400 to 450 kg 900 to 1000 pound sacks or 90 kg 200 pound drums. In this situation, no storage tanks are needed. Remove the paragraph on fresh Carbon Storage Tank and Exhausted Carbon Storage Tanks if these will not be required.

****

2.5.3.1 Fresh Carbon Storage Tanks

Provide a fresh carbon storage system. Minimum capacity of the system must provide storage of [_____] kg pounds of dry carbon at a bulk density of [_____] kg/cubic meter pcf.

2.5.3.2 Exhausted Carbon Storage Tanks

Provide an exhausted carbon storage supply system. Minimum capacity of the system must provide storage of [_____] kg pounds of wet carbon saturated with organic chemicals.

2.5.3.3 Sampling Valves

Provide sampling valves at the inlet and outlet of each carbon unit.

2.5.3.4 Piping

Furnish piping in accordance with Section 31 21 00 OFF-GASSING MITIGATION.

2.6 ACTIVATED CARBON INSTRUMENTATION AND CONTROLS

****

NOTE: These paragraphs can be used in conjunction with Sections 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION and 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC modified as required for this application. An instrumentation and control Guide Specification for hazardous waste systems is being written.

****

2.6.1 Sensors and Transmitters

****

NOTE: The humidity interlock will prevent condensation of water vapor in the carbon during startup if conditions exist that could allow high humidity air to the carbon unit.

****

Provide sensors and transmitters that have a range selected for the application, using the smallest range available from the controls manufacturer that will meet all expected sensed conditions in the sequence of control. Provide sensors and transmitters consisting of the following:

2.6.1.1 Relative Humidity Sensors

Provide relative humidity sensing element with a relative humidity sending range from 0 to 100 percent (condensing). Provide sensor capable of sensing a condensing air stream (100 percent RH) without affecting the sensors calibration or harming the sensor. Provide sensing elements with an accuracy of plus or minus 5 percent of full scale within the range of 20 to 80 percent relative humidity. Mount all sensors in locations that are accessible for calibration and fit for ease of calibration and re-calibration.

2.6.1.2 Airflow Measuring

****

NOTE: Pitot-tube type flow measuring devices can malfunction if the air/gas contains water droplets.

****

Provide velocity sensing elements that are the [RTD or thermistor type, with linearizing means. Distribute the sensing elements across the pipe in the quantity and pattern set forth for measurements and instructions in ASHRAE FUN SIASHRAE FUN IP and SMACNA 1780 for traversing of ducted airflows. The resistance to airflow through the airflow measurement station must not exceed 2 mm 0.08 inch water gauge at an airflow of 600 m/min 2,000 fpm. Station construction must be suitable for operation at airflows of up to 1500 m/min 5,000 fpm over a temperature range of 4 to 60 degrees C 40 to 140 degrees F, and an accuracy of plus or minus 3 percent over a range of 40 to 760 m/min 125 to 2,500 fpm scaled to air volume.] [multiple pitot tube type with averaging manifolds. Distribute the sensing elements across the pipe in the quantity and pattern set forth for measurements and instruments in ASHRAE FUN SIASHRAE FUN IP or SMACNA 1780 for the traversing of ducted airflows. The resistance to airflow through the airflow measurement station must not exceed 2 mm 0.08 inch water gauge at an airflow of 600 m/min 2,000 fpm. Station construction must be suitable for operation at airflows of up to 1500 m/min 5,000 fpm over a temperature range of 4 to 60 degrees C 40 to 140 degrees F, and an accuracy of plus or minus 3 percent over a range of 150 to 760 m/min 500 to 2,500 fpm scaled to air volume. Do not use this device if the required velocity measurement is below 210 m/min 700 fpm.]

2.6.1.3 Pressure Gauges

Provide pressure gauges conforming to ASME B40.100.

2.6.1.4 Thermometers

Provide dial type thermometers, 88 mm 3-1/2 inch diameter, chromium plated case; remote or direct-type bulb as required; plus or minus 0.5 degree C 1 degree F accuracy; white face with black digits graduated in 1 degree C 2 degree F increments. Provide thermometer wells of the separable socket type for each thermometer with direct-type bulb. Range of thermometers is [_____] to [_____] degrees C degrees F.

2.6.2 Controllers

Provide controllers that have set point, action, proportional band, authority throttling range, ratio, and remote set point adjustment as required to meet requirements of the sequence of control. Mount controllers on a unit control panel located [in the same room as the system being controlled] [near the carbon vessels].

2.6.2.1 Relative Humidity Controllers

Provide space-type humidity controllers that take full control action for a relative humidity change of plus or minus 5 percent of the setting of the controller. Set point adjustment range is approximately [20] [_____] percent to [80] [_____] percent relative humidity. Provide controllers with adjustable throttling ranges. Mount insertion type controllers in the interior of piping and fit with air shields where so recommended by the manufacturer.

2.6.2.2 Alarms

Alarm annunciation must be by [visual] [and] [audible] indication. Alarm signals must be locked in and require manual reset. [Furnish an auto dialer] [Telemeter alarms to the master control panel in the control room].

2.6.2.3 Relative Humidity Alarms

Install relative humidity alarms immediately upstream from the carbon vessels to alert the operator of relative humidity exceeding [50] [_____] percent.

2.6.2.4 Pressure Alarms

Install pressure [alarms] [indicators] on each side of the carbon vessels to alert the operator of excessive pressure drop.

2.6.2.5 Temperature Alarms

****

NOTE: Temperature or carbon monoxide alarms can be used to monitor for fire in the carbon bed.

****

Provide temperature on excursions (drop or rise) of [10] [_____] degrees C [18] [_____] degrees F outside the control range in the duct leaving the carbon vessel.

2.6.2.6 Carbon Monoxide Alarms

Provide carbon monoxide alarms to alert the operator of concentrations in excess of [100] [_____] ppm in the exit gas.

2.6.2.7 Timing Interlock

Provide a timing interlock to delay starting the blower until the preheater has been turned on for [15] [_____] seconds. Provide interlock to prevent saturation of the carbon during startup procedures and to delay blower stops after every shut performed.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with the details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancies before performing the work.

3.2 EQUIPMENT INSTALLATION

Install equipment as shown and in accordance with written instructions of the manufacturer. Each vessel must be [anchored to a footing isolated from the floor slab] [mounted on a skid base]. Provide anchor brackets, anchor rods or straps to hold the shell to anchors in the footing. Design reinforced concrete foundations for each carbon unit to support the unit and in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.3 PAINTING FOR CORROSION PREVENTION

Paint equipment which did not receive a factory finish, unless specified otherwise. Apply paint system to the outside of the tank in accordance with Section 09 90 00 PAINTS AND COATINGS. Prime surfaces that have not been factory primed and top coat with the manufacturer's standard factory finish. Provide factory painting conforming to manufacturer's standard factory finish. Repair all defects in the finish prior to or during installation of the equipment as specified in Section 09 90 00 PAINTS AND COATINGS. Paint all exposed ferrous surfaces not painted in the factory in accordance with Section 09 90 00 PAINTS AND COATINGS. Painting of corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel is not required, unless otherwise specified. Coat or paint all ferrous surfaces. Provide color as indicated on the paint schedule or as otherwise approved.

3.4 POSTED FRAMED INSTRUCTIONS

Post installation instructions, sequences, and precautions, including tolerances for level, horizontal, and vertical alignment as specified. Submit for approval prior to posting: Grouting requirements, including grout spaces and materials; wiring and control diagrams; system layouts and isometrics; instructions and other sheets; operating instructions explaining preventive maintenance procedures and checks to assure the system is operating normally and safely. Methods of checking the system for normal safe operation; procedures for operating the system; and prepare procedures for safely starting and stopping the system in typed form, framed and posted beside the diagrams. Write instructions for any required sampling, carbon transfer and shipping of activated carbon to regeneration or disposal facility. Catalog cuts are not acceptable.

3.5 FIELD QUALITY CONTROL

Submit reports on tests performed to show compliance with instructions.

Include in the test reports all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Indicate in each test report the final position of all controls. Reflect performance test data in the operating instructions.

3.5.1 Equipment Tests

After installation of the carbon adsorption system is complete, carry out operating tests to ensure that the unit installed operates properly. Inspect all products carefully for defects in workmanship and material; clean debris and foreign matter out of all equipment; test all operating mechanisms to check their proper functioning; and check all nuts and bolts for tightness. Repair or replace valves and other equipment which do not operate easily or are otherwise defective. Assure that there is no vibration, or noise from any parts. If deficiencies are revealed during tests, correct such deficiencies and reconduct the tests at the Contractor's expense.

3.5.2 Performance Tests

****

NOTE: Running the unit to exhaustion should only be required if this is expected to occur within the test period. Some vessels may not get to exhaustion for a long period of time. Verify that the sample ports are addressed in Section 31 21 00 OFF-GASSING MITIGATION. Coordinate sampling requirements of this paragraph with the sampling requirements of other units/processes in the entire treatment train.

****

After installation of the activated carbon adsorption system, carry out operating tests to ensure that the system operates properly. Include the adsorption units, all accessories and instruments and controls. If any deficiencies are revealed during any tests, correct such deficiencies and repeat the tests. Run[each] [a typical] adsorber at a constant flow rate of approximately [_____] cubic meters/second scfm [until the maximum emissions as listed in paragraph Chemical Requirements occur] [for [24] [_____] hours]. Make a complete log of each test run, giving the following data: date, time of readings and sampling. Determine total chemicals removed by analyses of the inlet and outlet for the chemical requirements listed in paragraph Performance Requirements. Take samples of the emissions for analysis after [each [_____] cubic meters feet have been run through the adsorber] [[_____] hours of operation]. Use results of the tests in determining the capacity and performance of the adsorption unit. Submit the reports to document emissions permit compliance. Perform sampling and analyses in accordance with [_____].

3.5.3 Spent Activated Carbon Sampling and Analyses

Perform sampling and analyses of the spent activated carbon media in accordance with requirements [for spent carbon transport and requirements of the regeneration facility] [of the RCRA permitted treatment, storage and disposal facility].

3.5.4 Carbon Testing

Test the carbon to be used during the performance testing to ensure it meets the requirements of [_____].

3.5.5 Breakthrough Monitoring

****

NOTE: Continuous emission monitors are not addressed in this Section. If continuous emission monitors are required, verify that the detector used is specific for the chemicals to be monitored.

****

Monitoring the emissions for the chemicals listed in paragraph CHEMICAL REQUIREMENTS once every [7] [_____] days to determine when to replace the granular activated carbon. Record the volume of air/gas that was treated, from the time that the vessel was placed in the upstream position until breakthrough was consistently determined, as the breakthrough volume. Breakthrough volume is the volume of air/gas that was treated before the concentration of any one of the chemicals in paragraph Chemical Requirements was exceeded. The criteria for determining when to replace granular activated carbon may be modified as more data are generated.

3.5.6 Noncompliance with Performance Requirements

Removals must meet or exceed those specified in the performance requirements of this specification. If at any time during the first [12] [_____] months of operation the results of the organic analyses of the air/gas emissions are not in compliance with maximum emissions levels listed in paragraph CHEMICAL REQUIREMENTS, except for periods when the carbon is saturated, flow through the unit and the system is inoperable. If at any time the operation of the system does not meet the flow rate requirements, instrumentation or control requirements set forth in this contract, stop flow through the system. Proceed immediately to repair or modify the system for compliance with the contract documents. Make repairs or modifications entirely at the Contractor's expense. Notify the Contracting Officer one day before the system is to be restarted and retested.

3.6 OPERATION AND MAINTENANCE SUPPLIES

3.6.1 PARTS, TOOLS AND HANDLING EQUIPMENT

Submit a complete list of parts, supplies, special tools, instruments and accessories and special lifting and handling devices required for periodic maintenance, repair, adjustment and calibration and recommended spare parts for each different item of material and equipment specified, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [one] [_____] and [three] [_____] years of service.

3.6.2 EXTRA MATERIALS

Within 30 days of system approval, furnish a spare parts list for each different item of material and equipment specified with the shop drawings submitted. Include in the list parts, supplies, prices and sources schedule. Furnish those spare parts and special tools which are recommended by the manufacturer. Also provide 12 months supply of any expendable items and frequently replaced parts, except for carbon, as identified by the manufacturer. Following completion of the startup and operating period [replenish the spare parts inventory and provide a twelve month supply] [supply the [carbon regeneration] [carbon disposal] facility name, address and price schedule].

3.7 MANUFACTURER'S FIELD SERVICE

Provide the services of the manufacturer's representative, who is experienced in the installation, adjustment and operation of the equipment specified, for a minimum of [16] [_____] hours at the site. Supervise the installation, adjustment, and testing of the equipment. Prior to startup, inspect the equipment for alignment and connections by a factory representative. Inspect the final installation and supervise the adjustment and testing of the equipment. Schedule and coordinate the testing to coincide with the later phases of the carbon column testing, to prove out the complete installation in the presence of a Government representative. After completion of all testing, assist the plant operators in plant startup.

3.8 CLOSEOUT ACTIVITIES

3.8.1 Operating and Maintenance Manuals

Submit [six] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include in the instructions layout, wiring, and control diagrams of the system as installed. Also the manufacturer's name, model number, service manual, parts list, brief description of all equipment and their basic operation features, and operating instructions for each piece of equipment and bulletins, cut sheets and descriptive data. [Six] [_____] complete copies of maintenance instructions listing routine preventative maintenance procedures, possible breakdowns and repairs, and trouble shooting guides list showing lubricants for each item of mechanical equipment, approximate quantities needed per year and recommended lubrication intervals.

3.9 FIELD TRAINING

Conduct a training course of operating staff as designated by the Contracting Officer. Start the training period, for a total of [24] [36] hours of normal working time, after the system is functionally complete but prior to final acceptance tests. Cover the topics included in the Operating and Maintenance Manuals. Also provide [16] [_____] hours of training, as directed by the Contracting Officer, following completion of the [one year] [_____] operating period for the follow-in Contractor.

UNIFIED FACILITIES GUIDE SPECIFICATIONS

References are in agreement with UMRL dated January 2025

****

SECTION 44 13 51

THERMAL OXIDATION EQUIPMENT

05/20

****

NOTE: This guide specification covers the requirements for systems to destroy, by thermal oxidation, organic contaminants contained in an off-gas stream; with options to use concentration system, heat recovery and/or a catalyst to conserve fuel.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

****

PART 1 GENERAL

1.1 UNIT PRICES

****

NOTE: Measurement and payment requirements will be specified for work subject to extreme variation in estimated quantity when unit price bidding is required. This paragraph is not used when quantities can be reasonably calculated from information included in the contract.

****

Measurement and payment and unit prices for quantities of off-gas treated will be determined in accordance with the Bid Schedule.

1.2 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUBMITTALS

****

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or

complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALIFICATIONS

1.4.1 Contractor

Have had a minimum of [2] [3] [5] [_____] years of experience in the construction of industrial air pollution control systems, sanitary wastewater sludge digestion gas systems, landfill off-gas or vapor extraction off-gas handling systems.

1.4.2 Single Source Supplier

Assign to a single supplier full responsibility for the furnishing of the adsorption system. The designated single supplier, however, need not manufacture the system but coordinate the selection, assembly, installation, and testing of the entire specified system.

1.4.3 Manufacturer's Field Representative

Provide the services of a manufacturer's field representative and training engineer, who is experienced in the installation, adjustment, and operation of the equipment furnished, and who has complete knowledge of the proper operation and maintenance of the system. Submit names and qualifications of each manufacturer's field representative and training engineer with written certification from the manufacturer that each representative and trainer is technically qualified.

1.4.4 Welders

[Welders must have passed qualification tests using procedures covered in AWS B2.1/B2.1M or ASME BPVC SEC IX and have the appropriate certification.] [Qualifications of welders, and welding and nondestructive testing procedures for piping will be as specified in Section 40 05 13.96 WELDING PROCESS PIPING.] [Structural members must be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] Require any welder to retake the test when, in the opinion of the Contracting Officer, the work of the welder creates reasonable doubt as to proficiency.

1.5 REGULATORY REQUIREMENTS

****

NOTE: Add applicable regional, state, or local requirements. Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS includes basic requirements.

****

Abide by the following requirements: [_____].

1.6 PARTNERING OR PRE-INSTALLATION CONFERENCE

[Partnering] [Pre-installation] conference [may] [will] be [requested] [required]. Ensure that involved subcontractors, suppliers, and manufacturers are [notified] [represented]. Submit the date and time of the conference to the Contracting Officer for approval.

1.7 DELIVERY, STORAGE, AND HANDLING

Protect from the weather, excessive humidity, excessive temperature variation, and dirt, dust, or other contaminants all equipment delivered and placed in storage. Catalyst material are to be protected in accordance with the manufacturer's recommendations.

1.8 SEQUENCING AND SCHEDULING

****

NOTE: Testing of the thermal oxidation system should be concurrent with the start of gas flow from the landfill, vapor extraction system, or other source.

****

Installation of the thermal oxidizer must be complete and the system operational prior to completion of the [gas collection system] [vapor extraction system] [landfill cap]. Avoid point source release of untreated off-gas to the maximum extent consistent with completion of the contract. Perform sampling and analyses to demonstrate system performance and emission compliance.

1.9 EXTRA MATERIALS

****

NOTE: Include items needed for future maintenance and repair, items that might be difficult to obtain and spare parts needed to ensure continued operation of critical equipment. Consider whether an initial operating period is included in the contract.

****

[Provide an inventory of all equipment, tools, and items to the Contracting Officer at the start of the operating period. Update the inventory monthly. A current inventory must be delivered to the Contracting Officer when the operating period is complete.] [Concurrent with delivery and installation of the specified equipment, furnish auxiliary equipment and spare parts.] Furnish the following:

a. [Spare parts for each different item of material and equipment specified including all of the parts recommended by the manufacturer to be replaced after [1 year] [1 year and 3 years] service.] [Spare parts, replacement parts and other items duplicated or replaced during the operating period.]

b. For each type of grease, one lever type grease gun or other lubricating device.

c. [One set of special tools for each type of equipment including calibration devices, and instruments required for adjustment, calibration, disassembly, operation, and maintenance of the equipment.] [One set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment.]

d. One or more steel tool cases mounted on the wall in a convenient location complete with flat key locks, two keys, and clips or hooks to hold each special tool.

e. A [three] [six] month supply of lubricants, [fuel,] [and] [consumable items] at the end of the contract.

f. [_____].

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a thermal (catalytic) oxidation system as a complete unit process for destruction of organic contaminants carried in the [off-gas] [vapor phase]. Equipment must include, but not limited to, a complete and operational thermal oxidation system, including supporting equipment and accessories.

2.1.1 Design Requirements

****

NOTE: Find the wind speed and seismic zone for the stack design in ASCE 7-16.

****

Provide the thermal oxidation system in conformance with section 60.18 of 40 CFR 60. Provide vertical and lateral supports for the stack in accordance with NFPA 82 and NFPA 211, as applicable, for the wind forces indicated. Design the system for the following parameters:

Altitude	[_____] m ft above mean sea level (MSL)
Stack discharge	[3] [_____] m [10] [_____] ft above [existing grade at the site] [MSL]
Minimum equipment [service] [design] life	[_____] years
Oxidizer system dimensions	
1) Maximum vertical projection, (excluding stack)	[_____] m ft
2) Maximum ground surface coverage	[_____] x [_____] m [_____] x [_____] ft
Soil bearing capacity	[_____] MPa psf
Seismic zone	[_____]
Wind speed (maximum)	[_____] km/h mph
Ground snow load	[_____] kPa psf
Ambient air temperature	
1) Maximum	[_____] degrees C F
2) Minimum	[_____] degrees C F
Groundwater temperature	

1) Maximum	[_____] degrees C F
2) Minimum	[_____] degrees C F

2.1.2 Inorganic Chemical Concentrations

****

NOTE: Indicate method in the first blank. The table is an example. Include all identified site contaminants.

Volatile metals, chlorine, fluorine, phosphorus, sulfur or freon at low concentrations will poison, foul or mask catalysts. More innovative technologies should be strongly considered when freon is present.

****

2.1.2.1 Estimated Influent Inorganic Chemical Concentrations

Determine estimated influent inorganic chemical concentrations in the [off-gas] [vapor phase] by [_____].

Influent Concentration	Minimum	Average	Maximum
Fluorides	[_____]	[_____]	[_____]
Total Metals (as CaCO3)	[_____]	[_____]	[_____]
Copper	[_____]	[_____]	[_____]
Lead	[_____]	[_____]	[_____]
Zinc	[_____]	[_____]	[_____]

2.1.2.2 Chemical Concentrations of Entrained [Water] [Groundwater] [_____]

Determine chemical concentrations of entrained [water] [groundwater] [_____] by AWWA 10084.

Concentration	Minimum	Average	Maximum
pH			
Total hardness (mg/L as CaCO3)			
Calcium (mg/L)			
Magnesium (mg/L)			
Total iron (mg/L)			

Concentration	Minimum	Average	Maximum
Ferric iron (mg/L)			
Ferrous iron (mg/L)			
Manganese (mg/L)			
Sodium (mg/L)			
Potassium (mg/L)			
Copper (mg/L)			
Total alkalinity (mg/L as CaCO3)			
Hydroxide alkalinity (mg/L as CaCO3)			
Carbonate (mg/L as CaCO3)			
Bicarbonate (mg/L as CaCO3)			
Nitrate (mg/L)			
Nitrite (mg/L)			
Sulfate (mg/L)			
Sulfide (mg/L)			
Phosphate (mg/L)			
Chloride (mg/L)			
Chloride (mg/L)			
Fluoride (mg/L)			
Free carbon dioxide (mg/L as CaCO3)			
Dissolved oxygen (mg/L)			
Free chlorine residual (mg/L)			
Silica (mg/L)			
Total solids (mg/L)			
Total dissolved solids (mg/L)			
Suspended solids (mg/L)			
Turbidity in nephelometric turbidity units (NTU)			

Concentration	Minimum	Average	Maximum
Color by platinum standard comparison			

2.1.3 Performance Requirements

****

NOTE: Coordinate controls with the blower specified in Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS.

Select the retention time appropriate for the oxidation device considering any regulated compounds.

****

Minimum retention time in the combustion chamber will be [0.5] [1.0] [1.5] [2.0] [2.5] [_____] seconds at [1095] [982] [820] [760] [400] [260] degrees C [2,000] [1,800] [1,500] [1,400] [750] [500] degrees F minimum at maximum flow. The flow rate must be [constant at [_____] cu m/second scfm] [off and on at [_____] cu m/second scfm maximum, with a turndown range of four to one (4:1)] [variable between [_____] cu m/second scfm minimum and [_____] cu m/second scfm maximum]. Flow rates are to be based on measurement at standard temperature and pressure (STP), 101.3 kPa at 15.5 degrees C 14.7 psia at 60 degrees F. Influent gauge pressure must vary between [_____] Pa inch H2O minimum, [_____] Pa inch H2O average, and [_____] Pa inch H2O maximum. Inlet temperature must vary between [_____] degrees C degrees F minimum, [_____] degrees C degrees F average and [_____] degrees C degrees F maximum. Materials of construction are to be compatible with the ambient and operating temperatures and long term exposure to untreated and treated gas constituents.

2.1.4 Off-Gas Composition

****

NOTE: Reduce the dew point to below 50 degrees C 120 degrees F ahead of the thermal oxidizer.

If the unit will be classified as a hazardous waste incinerator, required emission limits for specific compounds are given in the National Emission Standard for Hazardous Air Pollutants (NESHAP) Maximum Achievable Control Technology (MACT) Standard. The MACT standard is scheduled to be finalized the end of 1998 and will not appear in hard copies of the 40 CFR 63 until the July 1999 edition is issued by EPA. Until the 1999 CFR is available, it will be necessary for designers to obtain the Federal Register in which the new standard is given.

Establishing and enforcing air regulations is primarily done at the State level; therefore, it is critical that designers research State specific requirements applicable to the unit.

The BDT control device is a combustion device capable of reducing NMOC emissions by 98

weight-percent or an outlet NMOC concentration of 20 ppmv or less. The EPA 98 percent DRE requirement applies to total emissions as determined by stack gas analysis (to include aerosols, particulates, VOCs, etc.), not individual contaminants, and may not be attainable on individual contaminants in long term performance.

Include appropriate off-gas discharge requirements (or DRE) and products of incomplete combustion (if appropriate). Use energy conservation/recovery on long term or high volume devices.
****

The system must be capable of oxidation of the organic components of gaseous, solid and aerosol type emissions, as follows. Submit reports for permit compliance.

Off-Gas Constituent		Influent Estimate	Effluent Requirement	Destruction Requirement
Total Hydrocarbon (ppmv)	Maximum			NA
	Average			NA
	Minimum		NA	[98*] [_____] percent
Methane (ppmv)	Maximum			NA
	Average		NA	NA
	Minimum		NA	[98*] [_____] percent
Non Methane Organic Compounds (NMOC) (ppmv)	Maximum		[20**] [_____]	NA
	Average		NA	NA
	Minimum		NA	[98*] [_____] percent
[_____]	Maximum			NA
	Average		NA	NA
	Minimum		NA	[95] [_____] percent
Carbon Monoxide (ppmv)	Maximum			NA
	Average		NA	NA
	Minimum		NA	[98*] [_____] percent

Off-Gas Constituent		Influent Estimate	Effluent Requirement	Destruction Requirement
Nitrogen, NOX (ppmv)	Maximum			NA
	Average		NA	NA
	Minimum		NA	
Total Sulfur, as SO2 (ppmv)	Maximum		NA	NA
	Average		NA	NA
	Minimum		NA	NA
Sulfer, SOX (ppmv)	Maximum			NA
	Average		NA	NA
	Minimum		NA	
Total Chlorine, as HCl (ppmv)	Maximum			NA
	Average		NA	NA
	Minimum		NA	
HCl (ppmv)	Maximum			NA
	Average		NA	NA
	Minimum		NA	
Water Vapor (percent saturation)	Maximum	100 percent	NA	NA
	Average		NA	NA
	Minimum		NA	NA
Particulates (mg/m3 gr/dscf)	Maximum			NA
	Average		NA	NA
	Minimum		NA	
Opacity (percent)	Maximum			NA
	Average		NA	NA
	Minimum		NA	NA

Off-Gas Constituent		Influent Estimate	Effluent Requirement	Destruction Requirement
Oxygen (percent)	Maximum		NA	NA
	Average		NA	NA
	Minimum			NA
* Destruction percentage will be determined as follows: 100% x ((Influent mass - Effluent mass)/(Influent mass)).				
** Dry basis, as hexane at 3 percent oxygen.				

2.2 MATERIALS AND EQUIPMENT

****

NOTE: A life cycle cost analysis should be performed before selection of the equipment option: flare, enclosed combustor, thermal oxidizer, catalytic thermal oxidizer, regenerative thermal oxidizer, recuperative thermal oxidizer or catalytic recuperative thermal oxidizer.

****

2.2.1 Standard Products

Materials and equipment are to be the standard products of a manufacturer regularly engaged in the manufacture of such products and essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment must be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.2.2 General Requirements

Equipment and appurtenances are to be as specified and as shown on the detail drawings, and be suitable for the service intended. Materials and equipment will be new and unused, except for testing equipment. Components that serve the same function and are the same size are to be identical products of the same manufacturer. The system will be rejected upon failure to achieve both the minimum temperature and the minimum retention time specified in paragraph PERFORMANCE REQUIREMENTS.

Provide detail drawings containing complete flow diagrams, piping, wiring, schematic, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings must show capacities and pressure drop; heat and material balances; make and model; complete list of equipment and materials. Show on drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation

2.2.3 Nameplates

Each major item of equipment must have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment. Each piece of equipment must bear the approval designation and the markings required for that designation.

Valves are to be marked in accordance with MSS SP-25 and bear a securely attached tag with the manufacturer's name, catalog number and valve identification permanently displayed.

2.2.4 Equipment Guards [and Access]

Belts, chains, couplings, and other moving parts are to be completely enclosed by guards, to prevent accidental personal injury, in accordance with 29 CFR 1910, Subpart O, Machinery and Machine Guarding. Guards are to be removable and arranged to allow access to the equipment for maintenance. Enclose high temperature components with thermal insulation to prevent ignition of combustible materials and to preclude personnel contact.

2.3 FLARE

****

NOTE: See 40 CFR 60.18 for shroud requirements; edit this paragraph if shroud is not needed.

****

The [candlestick] [open] [ground] flare are to be composed of an open combustion chamber without enclosure or shroud.

2.4 ENCLOSED COMBUSTOR

****

NOTE: Enclosed combustors must demonstrate either 98 percent NMOC reduction or outlet NMOC concentration of 20 ppmv or less.

****

The enclosed combustor must be composed of a vertical enclosed combustion chamber that maintains a constant temperature by controlling fuel and combustion air.

2.5 THERMAL OXIDIZER

****

NOTE: Catalytic oxidation operates at a reduced temperature and should be considered when the organic carbon is between 150 ppmv and 2,000 ppmv. Review the anticipated off-gas analysis for substances that mask or poison catalysts. Edit this paragraph as required.

****

The thermal oxidizer must be composed of a horizontal enclosed combustion chamber, with catalyst, that maintains a constant temperature by controlling fuel and combustion air. Ensure catalyst is suitable for use under the conditions listed in paragraph SYSTEM DESCRIPTION and fabricated in modules for ease of installation in the combustion chamber. Thermal oxidizer must be compatible reduced temperature operation with the catalyst in place and high temperature operation without using the modular catalyst unit.

2.6 REGENERATIVE THERMAL OXIDIZER

****

NOTE: This system is a high temperature operation that recovers energy by cycling exhaust and inlet gases through regenerative heat exchange media.
****

Compose the thermal oxidizer of a horizontal enclosed combustion chamber that maintains a constant temperature by controlling fuel and combustion air.

2.7 RECUPERATIVE THERMAL OXIDIZER

****
NOTE: This system consists of a high temperature operation, without catalyst, or low temperature operation, with catalyst, that recovers energy by counter current passing of the exhaust and inlet gases through the heat exchanger. Edit this paragraph as required for job conditions.
****

Compose the thermal oxidizer of a horizontal enclosed combustion chamber, with catalyst modules, that maintains a constant temperature by controlling fuel and combustion air. The thermal oxidizer must be compatible with the temperatures of operation with or without using the modular catalyst unit.

2.8 CONTAMINANT CONCENTRATION SYSTEM

****
NOTE: Fuel costs for dilute or wet off-gas streams are substantially reduced by using a concentration system. Consider a concentration system if the organic carbon is less than 2,000 ppmv.
****

Increase inlet gas concentration of [total hydrocarbon] [methane] [non methane organic compounds (NMOC)] [_____] by a minimum of [ten] [five] [two] times the initial concentration.

2.9 HEAT RECOVERY SYSTEM

****
NOTE: Use media for regenerative systems or heat exchanger for recuperative systems.
****

2.9.1 Media Chambers

Ensure exhaust flow through media chambers recycle a minimum of [50] [_____] percent of the heat input at maximum operating conditions (maximum flow and temperature).

2.9.2 Heat Exchanger

Ensure the multiple pass, or single pass plate heat exchanger, or tube and shell heat exchanger recycle a minimum of [80] [_____] percent of the heat input at maximum operating conditions (maximum flow and temperature).

2.10 FLAME TRAP/ARRESTER

****
NOTE: This is a safety requirement that must be implemented.
****

Provide flame arrester, in accordance with FM APP GUIDE, at the inlet to the oxidation system. The pressure drop across the flame arrester must be a maximum of [_____] [1.5] kPa [_____] [6] in W.C. at maximum flow. Ensure the flame arrester has a clean-out cover to facilitate maintenance.

2.11 INLET PROTECTION

****
NOTE: The system should be protected by moisture reduction.
****

2.11.1 Knock-Out Pot

Provide knock out pot, with a minimum collection efficiency of [98] [98.5] [99] percent.

2.11.2 Mist Eliminator

Provide a mist eliminator, with a minimum collection efficiency of [85] [98] [98.5] [99] [_____] percent of the impinging mist.

2.12 IGNITION SYSTEM/BURNER ASSEMBLY

2.12.1 Pilot

****
NOTE: ASCE 25-16 applies to earthquake actuated systems.
****

Provide automatic gas shutoff system conforming to ASCE 25-16 on the pilot supply. The pilot assembly must be removable and provided with pressure indicator, pressure regulator, solenoid valve, manual shutoff valve and pilot gas pressure manometer port. Pilot inlet nozzle will be 150# ANSI, stainless steel, flanged.

2.12.2 Igniter

Provide electronic spark ignition. The igniter assembly must be removable from outside the combustion chamber without disconnecting conduit or wiring.

2.12.3 Burner Assembly

Ensure the primary air mixed burner is compatible with the specified fuel, has multiple small gas ports or jets, and constructed of 304L/316L stainless steel, heat and corrosion resistant alloy steel, ceramic and/or castable refractory. The burner must be of adequate capacity to maintain the required combustion temperature at the maximum flow with no fuel value in the off-gas.

2.12.4 Refractory Insulation

Provide removable, cast venturi burner lining assemblies with a [1500] [_____] degrees C [2,700] [_____] degrees F rating. Refractory insulation will be continuous, a minimum of 50 mm 2 inches of ceramic fiber insulation blanket surrounding the combustion cylinder, attached to the wall and floor with Inconel studs and washers, with plate retainers installed around all open edges of the blanket. Coat the refractory insulation with a high temperature, surface sealer protectant.

2.13 EXHAUST TREATMENT

2.13.1 Adsorber

****

NOTE: Adsorbers are not commonly required.

****

Treat exhaust gas with an activated carbon adsorption system in accordance with Section 44 13 10.13 VAPOR PHASE ACTIVATED CARBON ADSORPTION UNITS.

2.13.2 Scrubber

****

NOTE: Scrubber is used only for high acid concentrations resulting from chlorine or sulfur in the feed or combustion of nitrogen.

****

Ensure scrubber removes [85] [90] [95] [_____] percent of the acid gas formed.

2.14 STACK

2.14.1 Minimum Exit Velocity

The stack exit velocity will be no less than [_____] m/sec ft/sec.

2.14.2 Minimum Elevation

The stack elevation will be no less than stated in paragraph Design Requirements.

2.14.3 Lining

Stack will be lined with ceramic and/or castable refractory.

2.14.4 Lightning Protection

Provide an engineered lightning protection system with grounding.

2.14.5 Lugs

Provide lifting lugs at the top of the stack for ease of installation; each lug must be capable of supporting the entire weight of the stack.

2.14.6 Access

Provide access to the interior of the stack by an insulated, [hinged or supported 0.6 x 0.6 m 24 x 24 inch square or 0.6 m 24 inch diameter, manway] [150 x 150 mm 6 x 6 inch square or 150 mm 6 inch diameter, hand hole] located above the burners.

2.14.7 Ladder

Mount an aluminum or galvanized steel fixed ladder to allow access for removal or replacement of each of the thermocouples. The ladder furnished with the system will have side rails. Individual rung ladders are not acceptable. Conform ladder 29 CFR 1910, Part 27 Fixed Ladders, except as specified herein. Provide the safety cage with locking device to prevent unauthorized access.

2.15 PROVISIONS FOR OBSERVATION AND SAMPLING

2.15.1 Observation Ports

Provide observation ports or sight glasses with removable tempered glass covers and cooling holes. View port diameter will be a minimum of [75] [50] mm [3] [2] inch. Ports must be located to allow viewing the pilot flame, the base of the main flame, and a view of each of the thermocouples.

2.15.2 Inlet Sample Port

Inlet sample port [50] [_____] mm [2] [_____] inch minimum diameter, with cap and cooling holes, located upstream of all contributing flows, with the exception of the off-gas.

2.15.3 Outlet Sample Port

Outlet sample port [50] [_____] mm [2] [_____] inch minimum diameter, with cap and cooling holes, located [upstream of the cooling or dilution air inlet] [and] [two stack diameters from the top of stack].

2.15.4 Sampling Equipment

****

NOTE: Add sampler requirements.

****

Provide the following equipment: [_____].

2.16 CONTROLS

****

NOTE: Blower controls are in Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS. Omit last sentence if not applicable to the project.

****

Link set points, signals and control functions and dampers by a central programmable logic controller (PLC) located in the control panel. Control signals are to be 4-20 ma or 0-10 Vdc, compatible with the controller and sensor or control device. Include burner control diagnostics. For parameters specified to be continuously recorded, record digital data at intervals not exceeding one minute. Sensors are to be calibrated with standards traceable to NIST and in conformance with NIST SP 250. Connect each alarm to an [auto-dialer] [or] [telemetry] system.

2.16.1 Ultraviolet (UV) Flame Scanner

Provide ultraviolet scanner, installed and calibrated to provide for safety shutdown on the absence of flame. The signal from each scanner must incorporate a time delay appropriate to the control sequence. The burner flame scanner will monitor the burner flame. The pilot flame scanner will monitor the pilot flame.

2.16.2 Timers

Automatic timers must provide independent adjustment of the start and duration of each step in the control sequence.

2.16.2.1 Purge Timer

Set the minimum purge cycle at four changes of [air] [or] [inert gas]. Purge cycle must have both automatic and manual start.

2.16.2.2 Igniter Timer

****

NOTE: The spark duration adjustment extends the life of the plug, transformer and other pilot components.

****

Provide an igniter timer, with [manual] [automatic] adjustment of the spark duration, to set the time and duration of the igniter spark during the ignition cycle, and to compensate for the distance of the pilot gas supply from the oxidizer.

2.16.2.3 Pilot Timer

At the end of the purge, the pilot timer must begin automatic ignition. If the UV sensor fails to sense the pilot flame, close the pilot solenoid valve, extinguish the pilot flame, the system must shut down and the pilot fail alarm activated.

2.16.2.4 Main Flame Timer

Extend the main flame timer beyond the pilot timer cycle. When the burner flame lights and the temperature exceeds the low temperature set point on the temperature controller, shut off the pilot flame. Shut down the system , and activate the main flame fail alarm , if the UV sensor fails to sense the pilot flame or the flame temperature does not reach the low temperature set point by the end of the main flame step.

2.16.3 Temperature Sensors, Transmitters and Controllers

Submit detailed manufacturer's data on the overall controls, sensors, process controllers, control operators, ladder diagrams, timers, sequence of controls, valves, alarms, signals, interlocks and cut off systems. Data describing in detail the equipment used to monitor emissions, including the sampling probe, filters, off-gas transport tubing, sampling pump, moisture removal system, analyzer calibration systems, and data recorder. Process and instrumentation diagrams (P&IDs).

2.16.3.1 Thermocouples

****

NOTE: Narrow temperature ranges are more responsive than broad ranges because the sensitivity is a percentage of the range.

****

Conform thermocouples to ASTM E230/E230M, Type K, suitable for continuous operation and control at temperatures up to [50] [100] [150] [_____] degrees C [80] [180] [260] [_____] degrees F above the temperature specified in the performance requirements and accurate to 0.75 percent of the maximum temperature. Provide each thermocouple used for control with high and low set points and an adjustable time delay before initiation of each control action. A thermocouple located in or immediately downstream of the combustion chamber must control burner operation and [indicate] [and] [record] combustion chamber temperatures. Space [three] [_____] additional thermocouple ports at vertical intervals equal to the stack diameter, starting two stack diameters from the top of the stack. Compensating lead wire connecting the thermocouple to the read out must be 16 gauge with a weatherproof braid.

2.16.3.2 Thermometers

Conform thermometers to ASME PTC 19.3 TW, with wells and temperature range suitable for the use encountered.

2.16.3.3 Combustion Chamber Temperature Controller

The combustion temperature control must [record the combustion chamber temperature] [and] [maintain the temperature between the adjustable high temperature and low temperature set points]. The controller will control the [damper actuator motors] [blowers]. Control logic will include auto position signal and automatic switch over capabilities.

a. Shut down the system and do not attempt to restart if the temperature exceeds the allowable combustion chamber temperature range. A high temperature shutdown must activate the high temperature alarm.

b. During operation, shut down the system and not attempt to restart if the temperature falls below the allowable combustion chamber temperature range. During the ignition cycle, if the temperature does not reach or exceed the low temperature shutdown setting, the system must shut down and not attempt to restart. A low temperature shutdown during operation or during the ignition cycle must activate the low temperature alarm.

2.16.3.4 Primary Combustion Air Control

****

NOTE: For this and the following paragraph, refer to Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS for combustion air control.

****

Furnish fully adjustable air dampers on each burner with remote operation by external lever control, sized to provide a minimum of [100] [115] percent of theoretical stoichiometric air as primary air. Ensure dampers allow the operator to adjust the primary air/fuel ratio while burner is in operation.

2.16.3.5 Total Combustion Air Control

[Provide motor operated louver dampers. Actuators must cause louvers to fail open on loss of signal or power.] [Provide two multistage centrifugal blower trains, each with a suction valve, discharge valve, and discharge check valve.]

2.16.3.6 Quenching/Dilution Air Control

Provide motor operated louver dampers. Ensure actuators cause louvers to fail open on loss of signal or power.

2.17 FLOW METERS, TRANSMITTERS AND FLOW CONTROLLER

The flow control system must include an automatically actuated main fuel valve with fail-closed feature and limit switches for position indication. Ensure the flow rate metering system includes recording, totaling and alarm capabilities.

2.17.1 Off-Gas Flow Meter

Conform flow metering for the off-gas AGA Report No 3.

2.17.2 Supplemental Fuel Flow Meter

****

NOTE: Supplemental fuel meters should be sized on peak requirement. Off-gas meters should be based on blower size.

****

Conform gas meters to [AGA ANSI B109.1] [AGA ANSI B109.2] [AGA ANSI B109.3].

2.18 PRESSURE MEASUREMENT AND CONTROL

Furnish one differential pressure sensor with large diameter sensing holes. Provide a differential pressure transmitter and mount within 1 m 3 feet of the sensor. Install a compound vacuum/pressure gauge on each blower. Furnish the compound gauges with a differential pressure range of [0.1 to 100] [_____] kPa [0.015 to 15] [_____] psig. The piping from the sensor to the transmitter must be 3 mm 1/8 inch stainless steel tubing with stainless steel drain valves on each pipe, at low points. Piping must be plumbed so that condensate will drain back into the pipe. The transmitter must be equipped with zero and span adjustment, and provide a standard volumetric output rate reading to the chart recorder (included with the control system) without the need for separate compensating pressure or temperature transducers. A pressure gauge must be installed on the discharge side of each blower. The pressure gauges must be furnished with a range of 0 to 34 kPa 0 to 5 psi. The gauges are to be weatherproof, with 113 mm 4-1/2 inch dials and Type 316 stainless steel Bourdon tubes. Furnish the gauges with pressure snubbers and diaphragm seals and valves. Isolation valves are to be installed between the process pipe and the seal. Diaphragm seals are to be furnished with top and bottom housings and diaphragms of Type 316 SS. The diaphragm cavities are to be liquid filled with silicone.

2.18.1 Draft Gauges

Draft gauges are to be Type I, Class 1 or 2, as applicable, conforming to ASME B40.100 with a diaphragm or bellows actuating system and a circular scale. The gauges will have a zero adjustment screw. Provide suitable shutoff cocks.

2.18.2 Pressure Gauges

Conform pressure gauges to ASME B40.100 and be of pressure detecting Class, single Bourdon tube style, and suitable for detecting air pressure.

2.18.3 Pressure Switches

Pressure switches are to be provided to activate the blowers.

2.18.4 Pressure Release

A pressure release valve are to be located on the off-gas line upstream of the oxidizer.

2.19 EXPLOSIMETER

****

NOTE: The fuel concentration should be greater than 30 percent of LEL. Combustion air should be less than 30 percent of LEL.

****

A combustible gas analyzer, with a minimum of four in-line sensors, calibrated to methane are to be located in the control panel.

2.19.1 Lower Explosive Limit (LEL)

The lower explosive limit of the fuel and of the off-gas must be continuously indicated. The lower explosive limit of the off-gas must be continuously recorded.

2.19.2 Upper Explosive Limit (UEL)

The upper explosive limit of the combustion air and of the off-gas are to be continuously indicated.

2.20 OXYGEN METERING AND MAKE-UP AIR CONTROL

2.20.1 Oxygen Meter

The upper oxygen level of the combustion air and of the off-gas are to be continuously indicated.

2.20.2 Methane Monitor

The methane level of the combustion air and of the off-gas are to be continuously indicated.

2.21 OPERATING INDICATORS AND ALARMS

Simulated running lights to indicate normal operating conditions and alarms are to be displayed at the control panel.

2.21.1 Visible Alarms

Each visible alarm are to be indicated at the control panel and by a red light at the device.

2.21.2 Audible Alarms

Locate each audible alarm at the device.

2.21.3 Remote Alarms

****

NOTE: The Contractor should respond to alarms for the duration of the contract.

****

Remote alarms must activate the programmable auto dialer. A prerecorded message must provide specific information to the operator about the alarm condition. At contract close out, the dialer must be reprogrammed to the number indicated by the Contracting Officer.

2.22 ELECTRICAL WORK

****

NOTE: Hazard classifications in accordance with NFPA 70 should be indicated on the drawings.

****

Ensure all electrical equipment, wiring and controls comply with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and with NFPA 70, with proper consideration given to environmental considerations such as moisture, dirt, corrosive agents and proper NFPA 70 hazardous area classification. Provide lightning and surge protection.

2.22.1 Motors

Provide electric motor driven equipment complete with starters and alternating current motors conforming to NEMA MG 1. Fractional horsepower motors are to be 115-volt, single-phase, 60 cycle. Integral horsepower motors are to be three-phase, 60 cycle. Provide motor starters complete with properly sized thermal overload protection and other appurtenances necessary for the motor specified. Each motor will be designed for operation in ambient temperatures up to 40 degrees C 104 degrees F. Submit manufacturer's certificates attesting that the motors meet the NFPA 70 requirements for the hazardous area classification.

2.22.2 Control Panels

A complete control panel with options for various control schemes and control wiring must be included. Manual or automatic controls, protective or signal devices and control wiring for the controls and devices required for the operation specified must be provided. Conform motor controls to NEMA ICS 1. Conform enclosures for power and control panels to NEMA ICS 6. Panels located outdoors will be [NEMA 4X] [NEMA 4] and be weatherproof.

2.22.3 Resistance Heaters

****

NOTE: The designer should select the most cost effective heat source for the application.
****

Electric resistance pre-heaters and dryers are to be used where indicated on the drawings.

2.23 AUXILIARY FUEL SYSTEM

****
NOTE: The designer should select the most cost effective heat source for the location.
****

2.23.1 Feed Capability

The auxiliary fuel system will have direct feed capability to the thermal destruction system with meters, pressure gages and controls to maintain the specified operating conditions. Design must be in conformance with the applicable requirements of NFPA 30 and NFPA 31, NFPA 54 or NFPA 58, as appropriate to the fuel type.

2.23.2 Auxiliary Fuel Regulator

Auxiliary fuel rate must be controlled by the temperature of the combustion chamber.

2.23.3 Secondary Containment

Fuel storage tanks are to be provided with secondary containment as required by NFPA 30, paragraph 2-3.4 Control of Spillage from Aboveground Tanks.

2.24 VALVES

Design of valve operators and mechanisms must avoid initial surges and sudden inrushes by gradually allowing flows to increase.

2.24.1 Butterfly Valves

Butterfly valve will be cast iron body with resilient seat, 316 stainless steel disc and shaft and actuator. Valve will have fail-safe closing in ease of a power failure. Valve will have location limit switch for use in the control system.

2.24.2 Other Valves

Conform other valves to API Spec 6D, ANSI Z21.15/CSA 9.1 or ASME B16.33 as appropriate for the type.

2.25 JOINTS

2.25.1 Dielectric Fittings

Install dielectric fittings between threaded ferrous and nonferrous metallic pipe, fittings and valves. Dielectric fittings must prevent metal-to-metal contact of dissimilar metallic piping elements and be suitable for the required working pressure.

2.25.2 Isolation Joints

Isolation joints must be installed between non-threaded ferrous and nonferrous metallic pipe, fittings and valves. Isolation joints will consist of a dielectric sandwich type flange isolation gasket with isolation washers and isolation sleeves for flange bolts. Isolation gaskets are to be full faced with outside diameter equal to the flange outside diameter. Bolt isolation sleeves are to be full length. Units are to be of a shape to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.25.2.1 Sleeve Type Couplings

Sleeve type couplings must be used for joining plain end pipe sections. Each coupling will consist of a steel middle ring, two steel followers, two gaskets, and the necessary steel bolts and nuts to compress the gaskets.

2.25.2.2 Split Sleeve Couplings

Split sleeve type couplings may be used in aboveground installations, when approved in special situations, and consist of gaskets and housing in two or more sections with the necessary bolts and nuts.

2.25.3 Bolts, Nuts, and Fasteners

Bolts, anchor bolts, nuts, washers, plates, bolt sleeves, and all other types of supports necessary for the installation of the equipment are to be furnished with the equipment and are to be galvanized unless otherwise indicated. Anchor bolts must be provided with square plates at least 100 by 100 by 9 mm 4 by 4 by 3/8 inch or have square heads and washers and be set in the concrete forms with suitable sleeves. Expansion bolts must have malleable-iron and lead composition elements. Unless otherwise specified, stud, tap, and machine bolts are to be of refined bar iron. Conform all threads to ASME B1.1. Bolts, anchor bolts, nuts, and washers specified to be galvanized, be zinc coated, after being threaded, by the hot-dip process in conformance with ASTM A123/A123M or ASTM A153/A153M. Bolts, anchor bolts, nuts, and washers indicated to be stainless steel will be Type 316 stainless steel.

2.26 FACTORY TESTS

Skid mount and assemble the thermal oxidation system equipment in the shop, to the maximum practical extent, in the configuration outlined in the detail drawings and specifications. Perform a factory pressure test at [125] [250] [_____] percent of the rated pressure of the equipment. Perform continuity check and process simulation at the factory before shipping the control panel. Test fire the system with the specified fuel and air and maintained at the temperature specified in paragraph PERFORMANCE REQUIREMENTS for [two] [_____] hours. Submit test reports [with the equipment] [to the Contracting Officer prior to shipment of the equipment].

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 PREPARATION

Inspect all equipment and products for defects in workmanship and material. Clean debris and foreign matter out of valve openings and seats. Check each operating mechanism during operation to check proper functioning. Each nut must be checked for tightness. Valves and other equipment that do not operate easily or are otherwise defective are to be repaired or replaced.

3.3 FOUNDATIONS AND SKID BASES

Foundations for the thermal oxidizer and appurtenances, and pads for skid bases, are to be constructed of concrete, reinforced where necessary, in conformance with the applicable requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE, except as otherwise shown or specified. Concrete surface are to be [75] [_____] mm [3] [_____] inch above grade in outdoor locations. Mounting feet must be provided so that appropriate anchorage can be provided. Anchor embedment depth and spacing must be sufficient for seismic attachment to the foundation and for prevention of overturning. Concrete pad must extend [150] [_____] mm [6] [_____] inch beyond the equipment.

3.4 ERECTION

3.4.1 Welding

****

NOTE: Use second set of brackets when critical pipe welding is required.

****

[Welding procedures will be as specified in AWS D1.1/D1.1M] [Welding and nondestructive testing procedures for piping will be as specified in Section 40 05 13.96 WELDING PROCESS PIPING] [Structural members will be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING].

3.4.2 Painting/Corrosion Prevention

All ferrous surfaces must be coated or painted. Exposed ferrous surfaces are to be painted in accordance with Section 09 90 00 PAINTS AND COATINGS. Color will be as indicated on the paint schedule or as otherwise approved.

3.4.2.1 Factory Primed Surfaces

Factory primed surfaces are to be solvent-cleaned before painting.

3.4.2.2 Touch-Up Painting

Factory painted items must be touched up as needed. Factory painted items requiring touching up in the field must be thoroughly cleaned of foreign material, primed and top coated with the factory finish.

3.4.2.3 Field Painting

Equipment which did not receive a factory finish are to be prepared, primed and painted, as specified in Section 09 90 00 PAINTS AND COATINGS.

3.4.2.4 Corrosion Resistant Metals

Painting of corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel is not required unless otherwise specified.

3.5 INSTALLATION

3.5.1 Insulation

Equipment and piping will be insulated in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.5.2 Utilities

****

NOTE: Points of connection are normally shown on the drawings. Occasionally, the name, address and telephone number of each utility company is shown on the drawings. Delete the following paragraphs if the information is shown elsewhere.

****

Fuel and utilities are to be provided at locations shown on the drawings. Verify availability and locations of utilities and compensate the utility company for connection and usage. Fuel, water, sewer, power and any other utility bills must be paid on receipt.

3.5.2.1 Electricity

The power [utility] [company] is [_____], telephone number [_____].

3.5.2.2 Water

The water [utility] [company] is [_____], telephone number [_____].

3.5.2.3 Natural Gas

The natural gas [utility] [company] is [_____], telephone number [_____].

3.5.3 Fuel System

****

NOTE: Coordinate requirements for the fuel source specified in paragraph Feed Capability.

****

Fuel system installation and testing will comply with the applicable requirements of NFPA 30 and NFPA 31, NFPA 54 or NFPA 58, as appropriate to the type of fuel.

3.6 POSTING FRAMED INSTRUCTIONS

****

NOTE: If the user preference is known, show the location on the drawings and edit this paragraph.

****

Wiring and control diagrams and typed condensed operating instructions framed under glass or in laminated plastic must be posted where directed. Diagrams will show the complete layout, wiring and control of the entire system. Condensed operating instructions will explain preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. The diagrams and instructions must be posted before acceptance testing of the system.

3.7 FIELD QUALITY CONTROL/TESTS

3.7.1 Pressure and Leakage Test

****

NOTE: Testing of pipe and fittings should be specified in the pipe specification. The test pressure for vessels should not exceed the rated pressure.

****

After installation, test all piping, equipment, joints and connections for gas tightness. Test connections and piping by subjecting the complete system to pneumatic pressure of not less than [[105] [_____] kPa [15] [_____] psi] [the pressure indicated in the schedule] for 6 hours. During the test, the system must be disconnected from the source of pressure and, with corrections made for barometric and temperature changes, the pressure must remain constant for the test period, as indicated by a test gauge. Test joints using a soapy water solution to detect leaks.

3.7.2 Operational/Performance Tests

****

NOTE: Coordinate with the blower specification and the design sequence of operation. Testing requirements should be edited to fit the intended mode of operation for the system. Flow rates for operating capacity tests will be inserted in the blank spaces provided.

****

After installation and pressure testing, the entire off-gas system must be subjected to [an operational test] [a performance test] to demonstrate satisfactory functional efficiency. Use results of the tests in determining the capacity and performance of the oxidation unit. Correct any deficiencies revealed during the tests and repeat the tests.

3.7.2.1 Constant Flow Tests

****

NOTE: This procedure is appropriate for a system without blowers or with a single constant speed blower.

****

Operate each unit at a constant flow rate of approximately [_____] cubic m/second cubic feet/second (actual) for the capacity test. Take samples of the influent and effluent at [[1] [8] hour] [1 day] [1 week] intervals for analysis.

3.7.2.2 Variable Flow Tests

****

NOTE: This procedure is appropriate for a system with variable speed blowers regulated by a pressure controller.

****

Operate each unit at flow rates varying between [_____] and [_____] cubic m/second [_____] and [_____] cubic feet/second (actual). Take samples of the influent and effluent at the high flow rate and [1 intermediate rate] [[2] [3] [_____] intermediate rates] for analysis.

3.7.2.3 Cyclic Flow Tests

****

NOTE: This procedure is appropriate for a system with constant speed blowers operated by on/off control.

****

Put each unit through a complete cycle of operation [at a constant flow rate of approximately [_____] cubic m/second cubic feet/second (actual)] [through the complete range of flows]. Take samples of the influent and effluent at the beginning and end of each cycle and at [1 intermediate time] [[2] [3] [_____] intermediate times] for analysis.

3.7.3 Sampling and Analyses

Collect samples of influent and effluent off-gas and analyze for the parameters listed in Paragraph OFF-GAS COMPOSITION in accordance with the Sampling and Analysis Plan.

3.7.4 Test Logs and Reports

Provide a complete log of each test, giving the following data: date, time of each reading and each sampling event, fuel use, and total off-gas treated. Upon completion and testing of the installed system, submit test reports, with corresponding logs and in booklet form, showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Indicate the final position of controls on each test report.

3.7.5 Manufacturer's Field Service

Emplay services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative must supervise the installation, adjustment, calibration, commissioning, start-up and operational/performance testing of the equipment.

3.8 CLOSEOUT ACTIVITIES

3.8.1 Operating Instructions

Provide complete copies of detailed operating instructions with step-by-step procedures and sequences for system startup, operation and shutdown. The instructions include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and the operating features of each element. The instructions will include as-built drawings of the piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed. Describe automatic controls, functional logic, control loops, set points and alarm signals. Include flow diagrams in the instructions.

3.8.2 Maintenance Instructions

Provide complete copies of maintenance instructions listing maintenance procedures, possible breakdowns and repairs, and trouble shooting guides.

3.8.3 Field Training

****

NOTE: Complexity of the system and experience of the user operators should be taken into consideration.

****

Provide a field-training course for designated operating and maintenance personnel. Submit the training course curriculum and training instructions, [14] [_____] days prior to the start of training. Provide training for a total period of [_____] hours of normal working time and start after the system is functionally complete but prior to the [performance] [operational] test. Field training must cover each item contained in the operating and maintenance manuals, as well as demonstrations of routine maintenance operations.

3.9 MAINTENANCE

****

NOTE: Select the option that is compatible with the Bid Schedule.

****

Manage, operate, maintain, and monitor the off-gas control system [until contract close out] [for at least [one year] [_____] after construction, startup and performance testing are complete]. Provide at a minimum, an operator on site [eight] [_____] hours per week to operate, maintain, and calibrate the equipment and instruments, and to collect samples for analyses. A qualified person must be on call to respond to emergencies and alarm conditions at the off-gas system within two hours of alarm conditions. Prepare compliance and monitoring records and reports and maintain for the Contracting Officer and regulatory agencies. The operator must maintain a log of the actions taken.

SECTION 44 41 00

WATER POLLUTION CONTAINMENT AND CLEANUP EQUIPMENT

08/20, CHG 1: 02/24

****
NOTE: This guide specification covers the requirements for factory fabricated storage tanks used to contain fire suppressant discharge. Except when used to contain fire suppressant discharge during an emergency, the containment tank must remain empty. The containment tank must be expeditiously emptied after each emergency that discharges fire suppressant, water or fuel. The tank operator will need to use the strapping chart and stick gauge to determine quantity for disposal. The tank is not meant for storing hazardous substances other than emergency discharges that are expeditiously emptied and would not include connections that would allow any discharges to storm or sanitary sewer.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
****

PART 1 GENERAL

****
NOTE: This specification is intended for systems using factory-fabricated storage tanks with

capacities less than or equal to 227,000 L 60,000 gal. Additional system components/devices necessary to meet state and local regulations must be added by the designer.

Coordinate the design and installation of underground factory-fabricated storage tanks with Base Environmental.

****

1.1 REFERENCES

****

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

****

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

****

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy

and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

****

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY CONTROL

1.3.1 Regulatory Requirements

1.3.1.1 Permitting

Obtain necessary permits in conjunction with the installation of storage tanks as required by federal, state, or local authority.

1.3.1.2 Registration

****

NOTE: Confirm with the DoD Installation the number of days required to obtain the permit documentation.

****

Obtain and complete all tank registration forms required by federal, state, and local authorities. Submit all completed tank registration forms within [30][_____] days after contract award to the Contracting Officer. The Contracting Officer will ensure the Base Environmental staff for the DoD Installation submits the forms to the proper regulatory agencies.

1.3.1.3 Licensed Personnel

Tank installers must be licensed by the state when required by state law or regulations.

1.3.2 Contractor Qualifications

****

NOTE: Include specific local regulatory requirements into the specification as applicable.

****

Each installation Contractor must have successfully completed at least 3 projects of the same or similar scope, and the same size or larger within the last 3 years and demonstrated specific installation experience in regard to underground tank installation. Submit a letter listing prior projects, the date of construction, a point of contact for each prior project, the scope of work of each prior project, and a detailed list of work performed. The letter must also include evidence of prior manufacturer's training, and other related information.

[State certified installers must be provided by the Contractor.]Each installation Contractor must have taken, if applicable, manufacturer's training courses on the installation of storage tanks and meet all applicable licensing requirements in the state. Installers must also be trained and certified by the manufacturer to install the equipment and materials[and be STI certified].[Contractor must have Pollution Liability Insurance.]

1.4 DELIVERY, STORAGE, AND HANDLING

Handle, store, and protect system components and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer, upon recommendation by Base Environmental for the DoD Installation. Replace damaged or defective items.

1.5 PROJECT/SITE CONDITIONS

Exposed moving parts, parts that produce high operating temperatures and pressures, parts that may be electrically energized, and parts that may be a hazard to operating personnel must be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Install safety devices so that proper operation of equipment is not impaired.

1.6 WARRANTY

All factory fabricated storage tanks must come with a manufacturer's warranty of a minimum period of 30 years. All warranty paperwork will be completed and submitted by Contractor to both the tank and system component manufacturers, the Contracting Officer, and the Base Environmental for the DoD Installation. This includes all applicable completed manufacturers' equipment installation checklists.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

This section defines the requirements for factory fabricated storage tanks used to contain fire suppressant discharge.

2.1.1 Design Requirements

2.1.1.1 Electrical Work

****

NOTE: Coordinate the ignition temperature of the fuel(s) to be handled with the electrical design. Ignition temperatures will be as defined in NFPA 497. Fuel ignition temperatures will dictate the maximum allowable location classification of the electrical system components.

****

2.1.1.1.1 Grounding and Bonding

Grounding and bonding must be in accordance with NFPA 70, NFPA 77, NFPA 780, API RP 540, API RP 2003, IEEE 142, and IEEE 1100. Provide jumpers to overcome the insulating effects of gaskets, paints, or nonmetallic components.

2.1.1.2 Earthwork

****

NOTE: The designer developing the earthwork specifications will evaluate the need for a filter fabric to be installed between the native soil and the new backfill material. The intent of a filter fabric would be to prevent the displacement of new backfill material with native soil due to a high water table. If the new backfill material is displaced, it could affect the structural integrity of the tank. If a filter fabric is determined to be necessary, include the requirements for the new fabric in the excavation and backfilling specifications.

****

Excavation and backfilling for tanks must be as specified in Section 31 00 00 EARTHWORK.

2.2 MANUFACTURED UNITS

Provide materials and system components that are standard products of a manufacturer regularly engaged in the manufacturing of such products and that are of a similar material, design and workmanship. Provide materials and system components that have been in satisfactory commercial or industrial use for a minimum 3 years prior to bid opening. The 3 year period must include applications of the system components and materials under similar circumstances and of similar size. Provide materials and system components that have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 3 year period.

Internal parts and components of system components, piping, piping components, and valves that could be exposed to fuel during system operation must not be constructed of zinc coated (galvanized) metal, brass, bronze, or other copper alloys. Do not install cast iron bodied valves in piping systems that could be exposed to fuel during system operation.

2.2.1 Underground Storage Tank

Provide a factory fabricated double wall storage tank. Tank may be either steel with a non-metallic outer jacket or a double wall fiberglass tank. Tank must be designed and manufactured for an underground, horizontal installation. The exterior tank walls must be separated from the interior tank walls by standoffs; creating an open or interstitial space. The entire interstitial space must be monitorable for leaks.

****

NOTE: Provide a concrete anchor pad(s) or deadmen for any tank that will be installed in areas subject to high water tables or flooding. Size the pad(s)

or deadmen in accordance with API RP 1615. Require the tank to be connected to the pad(s) or deadmen in accordance with the tank manufacturer's recommendations.

Delete the bracketed sentences if concrete anchor pads or deadmen are not required.
****

[For tanks requiring concrete anchor pads or concrete deadmen, provide holddown straps and accessories as recommended by the tank manufacturer. Use filler strips between the tank shell and any metal holddown straps that conform to the tank manufacturer's requirements.

]2.2.1.1 Double Wall Tank (Steel with Non-Metallic Jacket)

The primary tank must be constructed of steel and jacketed with a non-metallic secondary containment tank. The entire tank assembly must conform to UL 58 Type II and UL 1746 Part III. The UL 58 label must be affixed to the exterior surface of the tank.

2.2.1.2 Double Wall Fiberglass Tank

Provide a UL 1316 compliant fiberglass tank. The tank manufacturer must be recognized by Underwriters Laboratories as a manufacturer of tanks listed to the UL 1316 standard. The UL 1316 label must be affixed to the exterior surface of the tank.

2.2.1.3 Tank Protective Coatings

2.2.1.3.1 Interior Surfaces

Use an SSPC QP-3 certified coating company to apply interior coating. Coat 100 percent of a metal tank's interior surfaces including all metal piping and metal appurtenances with the manufacturer's standard coating system.

2.2.1.4 Tank Piping Penetrations

****
NOTE: Use tank manholes as the primary point of entry for piping penetrations unless unfeasible. Pipe penetrations into an underground storage tank are the most likely place for a leak to occur. Designing pipe penetrations to enter through a tank manhole allows each of the penetrations to be contained in a manhole containment sump. The piping that penetrates the manhole must be flanged on both sides of the manhole hatch. This will allow the piping to be removed from the manhole and allow removal of the manhole without having to cut the piping.

Where stand alone tank piping penetrations are required, indicate on the drawings the required number, size, and location of each penetration.

Flanged nozzles must be installed in locations with ISO Corrosivity Categories C3, C4, and C5.
****

Provide a flanged pipe nozzle for each tank piping connection. Seal all unused or spare tank piping penetrations with a steel blind flange.

2.2.1.5 Tank Striker/Impact Plates

****

NOTE: Striker plates under all openings used for manual gauging in steel tanks and all openings in fiberglass tanks.

****

Provide an interior striker/impact plate under the manual gauging/sampling hatch and each tank manhole and pipe connection. Each plate must be a minimum of 6 mm 1/4 inch in thickness, be larger in diameter than the tank penetration, fit the curvature of the tank bottom, and be completely coated in the same fashion as the interior tank bottom coating. Each plate must be welded or bonded to the tank bottom at the factory (full circumference connection). The welds must be non-destructive tested using the appropriate means.

2.2.1.6 Manual Gauging/Sampling Hatch

Provide a combination gauging and sampling hatch assembly that includes a bronze top-seal type adapter with a corresponding locking type cap (adapter and cap both externally-mounted to the top of the tank)[and a [steel][or][aluminum] stilling well pipe.][The stilling well pipe must be a minimum 100 mm 4 inches in size and extend downward through the top of the tank to within 75 mm 3 inches of the tank bottom. Provide the entire length of pipe inside the tank with 13 mm 1/2 inch wide by 300 mm 12 inches long slots at alternate locations. Coat the pipe in the same fashion as the interior tank bottom coating.]

2.2.1.7 Tank Manhole

****

NOTE: Indicate the number, size, and location of each tank manhole required.

Provide tanks 18,900 L 5,000 gallons and smaller with a minimum of one 760 mm 30 inch tank manhole to allow for internal tank access. Provide tanks larger than 18,900 L 5,000 gallons with a minimum of two 915 mm 36 inch tank manholes (one manhole for access).

****

Provide a minimum of [2][1][_____] tank manholes with an internal diameter of [760 mm][813 mm][915 mm][30 inches][32 inches][36 inches]. Provide each manhole with a matching flanged watertight manhole cover. Manhole covers must be UL listed, be constructed of pressed or mild steel, and include a UL listed gasket.[Frame and cover assembly must be rated to withstand H-20 highway loading as defined by AASHTO HB-17.]

2.2.1.8 Atmospheric Vent

Provide atmospheric, updraft type cap no closer than 5 feet from any building openings. Cap must be constructed of aluminum or carbon steel and have an internal brass or bronze insect screen, minimum 40-mesh. Cap must prevent rain, snow, or ice from entering the vent piping.

2.2.1.9 Nameplates

****

NOTE: In a salt water environment, substitute acceptable non-corroding metal such as, but not limited to, nickel-copper, 304 stainless steel, or monel. Aluminum is unacceptable. Nomenclature (or system identification) should be established by the designer.

Require melamine plastic nameplates for all NAVFAC projects. Also, for NAVFAC projects, require nameplates to be associated or keyed to system charts and schedules.

****

Attach nameplates to all specified system components defined herein. List on each nameplate the manufacturer's name, address,[contract number,][acceptance date,] component type or style, model or serial number, catalog number, capacity or size, and the system that is controlled. Construct plates of[anodized aluminum][stainless steel][melamine plastic, 3 mm 0.125 inch thick, UV resistance, black with white center core, matte finish surface and square corners][_____]. Install nameplates in prominent locations with nonferrous screws, nonferrous bolts, or permanent adhesive. Minimum size for nameplates is 25 by 65 mm 1 inch by 2.5 inches. Provide manufacturer's storage tank nameplates as required. Provide normal block style lettering with a minimum height of 6 mm 0.25 inches. Accurately align all lettering on nameplates.[For plastic nameplates, engrave lettering into the white core.][Key the nameplates to a chart and schedule for each system. Frame charts and schedule under glass, and locate where directed near each system. Furnish two copies of each chart and schedule. Each nameplate description must identify its function.]

2.2.2 Manhole Containment Sump

****

NOTE: Require on the drawings a containment sump to be installed directly above each tank manhole. Do not require the sump to be connected in any way to the surfaces above (e.g., street manhole cover, concrete and similar accessories).

Typical installations include a street manhole cover to be installed directly above each sump in order to allow access to the sump and the tank manhole below. Size the manhole cover large enough to allow the removal of the sump access cover below.

****

Provide a factory fabricated, direct-buried sump that provides a watertight connection either directly to the exterior of the tank or to a flanged manhole opening. Sump must be constructed of [fiberglass reinforced plastic][_____]. Sump construction must be chemically compatible with the type of products being handled within the connecting tank. Sump must allow access to a tank manhole cover without disturbing surrounding backfill. Sump must be larger in diameter than the connecting tank manhole, designed to withstand the underground burial loads, and prevent the influx of rainfall drainage or ground water.

2.2.2.1 Piping Penetrations

Sump sides allow the penetration of carrier pipes, exterior containment pipes, conduits, and vapor pipes as required. Boot or seal sump penetrations to ensure that liquid will not escape from the sump in the event that the liquid level within the sump rises above the pipe penetration. Boots and seals used must be chemically compatible with the type of products being handled, be water resistant to prevent the influx of water from outside the sump, and be designed and installed to accommodate the anticipated amount of thermal expansion and contraction in the piping system.

2.2.2.2 Access Cover

****

NOTE: Require watertight covers if high ground water is a problem and frequent access to the manhole below is not necessary. Watertight covers are generally bolted or strapped down. Strapped down covers provide easy access to the sumps without the use of tools. Friction fit covers will prevent the influx of rainwater and are easily removable by hand.

****

Where indicated, cap the entire top of a containment sump with a[friction fit][bolted down, watertight][strapped down, watertight] access cover that allows water to flow away from the manhole. Construct cover of the same material as the sump. Cover must have a larger diameter than the tank manhole cover below.[Provide lightweight cover not exceeding 16 kilograms 35 pounds].

2.2.3 Interstitial Space Access Sump

Provide an access sump around the interstitial monitoring pipe to allow for manual monitoring of the interstitial space of the tank in accordance with RP900-17 Section 7.5.7. Cap the monitoring pipe with a watertight[threaded cap,][quick release cap,][or other cap as may be recommended by the manufacturer]. Both the monitoring pipe and the sump will be labeled respectively as the "interstitial monitoring pipe" and "interstitial monitoring pipe access". Label must be affixed to the exterior surface of the tank

2.3 COMPONENTS

Provide materials and system components that are standard products of a manufacturer regularly engaged in the manufacturing of such products, that are of a similar material, design and workmanship. Provide materials and system components that have been in satisfactory commercial or industrial use for a minimum 3 years prior to bid opening. The 3 year period must include applications of the system components and materials under similar circumstances and of similar size. Provide materials and system components that have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 3 year period.

Internal parts, system components, piping, piping components, and valves that could be exposed to fuel during system operation must not be constructed of zinc coated (galvanized) metal, brass, bronze, or other copper alloys. Do not install cast iron bodied valves in piping systems that could be exposed to fuel during system operation.

2.3.1   Independent Level Alarm System

****

NOTE: Level alarms are used to ensure that the tank does not fill by infiltration in the drain line or other means. The containment tanks needs to remain empty so that it can contain fire suppressant discharge during the anticipated fire event.

Use this paragraph for tanks equal to or greater than 112,500 L 30,000 gallons. These tanks are required to have an independent level alarm system in addition to an independent manual tank gauging system.

This paragraph should be used for tanks less than 112,500 L 30,000 gallons to provide a level alarm system.

Include the bracketed options if multiple tanks are to be monitored as part of the design.

****

[Provide an independent level alarm system that will monitor [2][_____] programmable liquid level setpoints. The system must delineate between each individual setpoint[as well as each individual tank]. The system must produce an audible and visible alarm in the event of monitoring an alarm condition. Mechanically-actuated float assemblies must be field adjustable. The system must be totally independent of the tank gauging system.

]2.3.1.1   Setpoints

****

NOTE: The suggested low-low level alarm setpoint for underground tanks is 5 percent tank capacity.

****

Configure the alarm system's setpoints in accordance with the following.

a. Low Level Setpoint. Produce an audible and visual alarm condition when a tank's liquid level rises above [10][_____] percent capacity.

b. Low-Low Level Setpoint. Produce a visual alarm condition when a tank's liquid level rises above [5][_____] percent capacity.

2.3.1.2   Independent Level Alarm Control Panel

****

NOTE: Indicate on the drawings the location of the system control panel. Panels located outdoors will require NEMA 4 enclosures. Panels located indoors will only require a standard industrial enclosure. Explosion-proof enclosures are typically unavailable.

****

Install the control panel for the alarm system in a[NEMA 4 rated enclosure in accordance with NEMA 250][standard industrial enclosure]. Provide panel with left and right swinging doors.

2.3.1.2.1 Audible Alarm

****

NOTE: If speakers external to the panel are necessary, indicate their location on the drawings.

****

Provide panel with [internal][external] speakers that produce a buzzer sound of [70][_____] decibels or greater in the event of a detected alarm condition.

2.3.1.2.2 Visual Alarm

Provide panel with a visual alarm that illuminates in the event of a detected alarm condition. The visual alarm may include either individual lights for each alarm condition or a single light and a liquid crystal display (LCD) panel that displaces information regarding each alarm condition.

2.3.1.2.3 Acknowledge Switch

Provide panel with a [pushbutton][keyed] acknowledge switch that will deactivate the audible alarm. The acknowledge switch must not deactivate subsequent audible alarms unless depressed manually again for each occurrence. Under no circumstance will this acknowledgement switch extinguish the visual alarms until the alarm condition has been corrected. The acknowledge switch must be an integral component located on the front of the control panel.

2.3.1.2.4 Test Pushbutton

Provide panel with a manual test pushbutton that will enable operators to verify that the panel is powered, and the visual and audible alarms are working properly.

2.4 MATERIALS

2.4.1 Piping

Pipe shall be of the sizes indicated and conform to the specified requirements.

2.4.1.1 Poly Vinyl Chloride (PVC) Pipe

Submit the pipe manufacturer's resin certification, indicating the cell classification of PVC used to manufacture the pipe, prior to installation of the pipe.

2.4.1.1.1 Type PSM PVC Pipe

ASTM D3034, Type PSM, maximum SDR 35, produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.1.2 Profile PVC Pipe

ASTM F794, Series 46, produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.1.3 Smooth Wall PVC Pipe

ASTM F679 produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.1.4 Corrugated PVC Pipe

ASTM F949 produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.2 Polyethylene (PE) Pipe

Submit the pipe manufacturer's resin certification, indicating the cell classification of PE used to manufacture the pipe, prior to installation of the pipe. The minimum cell classification for polyethylene plastic will apply to each of the seven primary properties of the cell classification limits in accordance with ASTM D3350.

2.4.1.2.1 Smooth Wall PE Pipe

ASTM F714, maximum DR of 21 for pipes 80 to 600 mm 3 to 24 inches in diameter and maximum DR of 26 for pipes 650 to 1200 mm 26 to 48 inches in diameter. Produce pipe from PE certified by the resin producer as meeting the requirements of ASTM D3350, minimum cell class 335434C.

2.4.1.2.2 Corrugated PE Pipe

****

NOTE: Do not install corrugated PE pipe culverts and storm drains beneath airfield pavements unless approved in writing by the major command. Type S pipe has a full circular cross-section, with an outer corrugated pipe wall and a smooth inner liner. Type C pipe has a full circular cross-section, with a corrugated surface both inside and outside. Corrugations may be either annular or helical.

****

AASHTO M 294Type [S][C]. For slow crack growth resistance, determine acceptance of resins by using the notched constant ligament-stress (NCLS) test meeting the requirements of AASHTO M 294. Provide pipe with pipe walls having the following properties:

Nominal Size (mm) (inch)	Minimum Wall Area (square mm/m) (square in/ft)	Minimum Moment of Inertia of Wall Section (mm to the 4th/mm) (in. to the 4th/in.)
300 12	3200 1.5	390 0.024
375 15	4000 1.91	870 0.053

Nominal Size (mm) (inch)	Minimum Wall Area (square mm/m) (square in/ft)	Minimum Moment of Inertia of Wall Section (mm to the 4th/mm) (in. to the 4th/in.)
450 18	4900 2.34	1020 0.062
600 24	6600 3.14	1900 0.116
750 30	8300 3.92	2670 0.163
900 36	9500 4.50	3640 0.222
1050 42	9900 4.69	8900 0.543
1200 48	10,900 5.15	8900 0.543
1350 54	12,000 5.67	13,110 0.800
1500 60	13,650 6.45	13,110 0.800

2.4.1.2.3 Profile Wall PE Pipe

ASTM F894, RSC 160, produced from PE certified by the resin producer as meeting the requirements of ASTM D3350, minimum cell class 334433C. Provide pipe with pipe walls having the following properties:

Nominal Size (mm) (inch)	Minimum Wall Area (square mm/m) (square in/ft)	Minimum Moment of Inertia of Wall Section (mm to the 4th/mm) (in to the 4th/in)	
		Cell Class 334433C	Cell Class 335434C
450 18	6300 2.96	850 0.052	620 0.038
525 21	8800 4.15	1150 0.070	840 0.051
600 24	9900 4.66	1330 0.081	970 0.059

1050 42	16,500 8.08	4540 0.277	3720 0.227
1200 48	18,700 8.82	5540 0.338	4540 0.277

2.4.1.3 Steel Reinforced Polyethylene (SRPE) Pipe

SRPE pipe will meet the requirements of ASTM F2562/F2562M 200 - 3000 mm 8 - 120 inch diameter pipe and AASHTO MP 20 (300 - 152512 - 60 inch diameter pipe).

2.4.1.4 Polypropylene (PP) Pipe

Double wall and triple wall pipe with a diameter of 300 to 1525 mm 12 to 60 inches must meet the requirements of ASTM F2736, ASTM F2764/F2764M, or ASTM F2881/F2881M.

2.5 ACCESSORIES

2.5.1 Stick Gauge

****

NOTE: Provide each tank with a stick gauge and tank calibration chart. Provide a minimum of one additional gauge for each tank.

****

For each tank, provide [2][_____] wooden stick gauges with length sufficient to allow the measurement of the entire level in the corresponding tank. Provide gauges compatible with the fuel to be measured (no swelling or damage from fuel contact). Provide gauge with non-sparking caps on each end. Mark gauges in m/mm in 1 mm increments feet/inches in 1/16 inch increments. Marking must be embossed into the stick and painted in a contrasting color impervious to water and hydrocarbon products.

2.5.2 Manual Interstitial Space Monitoring Equipment

Provide all equipment and materials required to monitor the interstitial space.

2.5.2.1 Dip Stick

Provide [2][_____] dipsticks for manual interstitial space monitoring.

2.5.3 Tank Strapping Table

****

NOTE: Provide each tank with a tank calibration chart.

Reference API MPMS 2.2E is for horizontal tank applications. For tanks smaller than 19,000 L 5,000 gallons, choose tank manufacturer certified strapping tables.

****

Furnish [2][_____] API MPMS 2.2E [tank manufacturer]certified strapping tables (calibration charts) for each tank. One of the tables must indicate the liquid volume in liters for each 1 mm of tank depth and the other in gallons for each 1/16 inch of tank depth. Strapping table volumes for all tanks 19,000 liters 5,000 gallons and larger must be determined using physical measurements and not calculated values. For each tank, provide an electronic media file of each strapping table.[For tanks larger than 19,000 L 5,000 gallons, perform tank strapping after installation at the site.]

2.5.4 Concrete Anchor Bolts

Provide concrete anchor bolts that conform to ASTM A307, Grade C, hot-dipped galvanized.

2.5.5 Bolts and Studs

Provide carbon steel bolts and studs that conform to ASTM A307, Grade B, hot-dipped galvanized. Provide stainless steel bolts and studs conforming to ASTM A193/A193M, Grade 8.

2.5.6 Nuts

Provide carbon steel nuts conforming to ASTM A563, Grade A, hex style, hot-dipped galvanized. Provide stainless nuts conforming to ASTM A194/A194M, Grade 8.

2.5.7 Washers

Provide flat circular washers under each bolt head and each nut. Washer materials must be the same as the connecting bolt and nut. Provide carbon steel washers conforming to ASTM F844, hot-dipped galvanized. Provide stainless washers conforming to ASTM A194/A194M, Grade 8.

2.5.8 Street Manhole Assembly

****

NOTE: Delete this paragraph if street manhole assemblies are addressed in the Civil specifications.

Style A frames are for manholes up to 760 mm 30 inches in diameter. Style B frames are for manholes between 915 and 1070 mm 36 and 42 inches in diameter.

****

Round street manhole frames and covers must be the straight traffic type. Frames and covers must be constructed of[cast steel in accordance with ASTM A27/A27M, grade 60-30 as a minimum][cast iron in accordance with ASTM A48/A48M][aluminum in accordance with ASTM B26/B26M][or][an engineered lightweight laminate material].[Covers must be the solid plate type with a checker pattern.] Covers must form a watertight seal with the manhole frame to prevent surface water inflow. Frame and cover assembly must be rated to withstand H-20 highway loading as defined by AASHTO HB-17.

PART 3 EXECUTION

3.1 INSTALLATION

****

NOTE: During design, layout system components to allow adequate access for routine maintenance. Do not rely solely on the Contractor to make these judgments. Show access doors where applicable for maintenance.

****

Install work so that parts requiring periodic inspection, operation, maintenance, and repair are readily accessible. Handle storage tanks with extreme care to prevent damage during placement and install in accordance with the manufacturer's installation instructions and NFPA 30. Inspect the exterior surface of each tank for obvious visual damage prior to and during the placement of each storage tank. Repair surface damage to a storage tank according to manufacturer's requirements before proceeding with the system installation. Provide the termination of fill lines within a tank with an anti-splash deflector. Provide nylon dielectric bushings on pipe connections to a steel tank.

3.1.1 Underground Storage Tank

Install underground storage tanks in accordance with API RP 1615 except as modified herein. Place tank on a 3 mm per 30 mm 1/8 inch per foot slope with the fill point at the low end and the vent connection at the high end. Locate tank so that discharge pipes slope up uniformly toward the outlet. Install containment sumps prior to any backfill being added above the storage tanks.

3.1.1.1 Steel Underground Storage Tank Handling

Store, handle, and place externally coated steel tanks with care and in a manner that will minimize damage to the coating and will not reduce its protective value. Place coated tanks in position carefully and with a minimum of handling. Prior to backfilling a tank, visually inspect the tank exterior protective coating for damage. Repair any damaged tank coating in accordance with the appropriate UL standard, UL 1746 or UL 58.

3.1.1.2 Steel Underground Storage Tank Installation Procedures

****

NOTE: Provide straps and anchors designed to prevent flotation of underground tanks located in areas with high groundwater level or subject to flooding. Provide electrical isolation strips between hold-down straps and metal tanks. Anchors may be concrete anchor slab under the tank or concrete deadmen. Tailor paragraph to suit design. Underground storage tanks occasionally rely on backfill and top slab to hold the tank in place in addition to the hold down straps and concrete deadmen. When new or existing USTs are exposed, the contractor must take steps to ensure the tank remains safely in place without damage. Manufacturer's suggestions for installation of new tanks must be followed and used on existing tanks until the tank is safe from damage due to a sudden or slow influx of water. Existing hold down straps must be inspected to assure they are adequate for holding the tank in place and compromised hold downs reported to the Resident Engineer with a suggested solution. The recommendations of API 1615 must also be followed.

****

[Set tank on a minimum of 150 mm 6 inches of backfill material.][Anchor tank to a reinforced concrete anchor pad as indicated using manufacturer's supplied holddown straps. Separate tank from an anchor pad by a minimum of 300 mm 12 inches of backfill material. Coat metal straps, turnbuckles, anchors, and accessories to resist corrosion.]Uniformly place backfill material around the entire tank and extend to grade level. Inspect tank cathodic protection anodes, if applicable, to ensure integrity during backfill operations.

3.1.1.3 Fiberglass Underground Storage Tank Handling

Handle tank with extreme care to prevent damage during installation and transportation to the site. Any damaged tank must be replaced or repaired and tested under direct supervision and advice of the tank manufacturer, using the manufacturer's written procedures.

3.1.1.4 Fiberglass Underground Storage Tank Installation Procedures

****

NOTE: Provide straps and anchors designed to prevent flotation of underground tanks located in areas with high groundwater levels or subject to flooding. Anchors may be a concrete anchor slab under the tank or concrete deadmen. Tailor paragraph to suit design. Underground storage tanks occasionally rely on backfill and top slab to hold the tank in place in addition to the hold down straps and concrete deadmen. When new or existing USTs are exposed, the contractor must take steps to ensure the tank remains safely in place without damage. Manufacturer's suggestions for installation of new tanks must be followed and used on existing tanks until the tank is safe from damage due to a sudden or slow influx of water. Existing hold down straps must be inspected to assure they are adequate for holding the tank in place and compromised hold downs reported to the Resident Engineer with a suggested solution. The recommendations of API 1615 must also be followed.

Use 300 mm 12 inches of backfill in Maryland. Maryland requires 300 mm 12 inches of backfill under a UST.

****

[Set tank on a minimum of [300 mm][150 mm] [12 inches][6 inches] of backfill material.][Anchor tank to a reinforced concrete anchor pad as indicated through the use of manufacturer's supplied holddown straps. Separate tank from an anchor pad by a minimum of 300 mm 12 inches of backfill material.]

3.1.2 System Components

Properly level, align, and secure system components in place in accordance with manufacturer's instructions. Provide supports for system components, appurtenances, and pipe as required. Install anchors, bolts, nuts, washers, and screws where required for securing the work in place. Sizes, types, and spacing of anchors and bolts not indicated or specified must be in accordance with manufacturer's instructions for proper installation.

3.2 FIELD QUALITY CONTROL

3.2.1 Underground Storage Tank Tightness Tests

****

NOTE: Pneumatic tests are the preferred type of tightness tests. Brine level tests will only be specified for Fiberglass tanks. Delete the

inapplicable tests.
****

Perform a tightness test on each underground storage tank on-site just prior to their placement into the ground. Pneumatically pressurize each storage tank's primary chamber to 35 kPa 5 psig and monitor for a drop in pressure over a 2-hour period during which there must be no drop in pressure in the tank greater than that allowed for thermal expansion and contraction. Following the successful completion of the primary chamber test, bleed the pressure from the primary chamber into the interstitial space. Maintain this pressure while applying soapsuds or equivalent material over the exterior of the tank. While applying the soapsuds, visually inspect the entire tank, including the bottom surfaces, for leaks (bubble formations). Inspection of the bottom surfaces of a tank may be performed by rotating the tank; however, a tank may only be rotated in strict accordance with the manufacturer's recommendations. Do not rotate a tank more than 90 degrees from the upright position. During testing, install a pressure relief device that relieves at the tank manufacturer's suggested pneumatic pressure limit. Gauges used in pneumatic tests must have a scale with a maximum limit of 103 kPa 15 psig.

3.2.1.1 Brine Level Test

In lieu of the pneumatic testing procedures described above, a brine level test may be performed on the interstitial space of double-walled Fiberglass tanks (not applicable to steel tanks). For a brine level test, completely fill a Fiberglass tank's interstitial space with a brine solution. Connect a riser pipe to the interstitial space that will allow the solution to rise within the riser at least 300 mm 12 inches. After filling the interstitial space, the tank must set approximately 3 hours. Following the 3-hour period, measure and record the level of solution within the riser. After a subsequent 4-hour period, again measure and record the level of solution within the riser. If the level of solution within the interstitial decreases anytime during the test, the tank is considered leaking and therefore fails the test.

3.2.1.2 Repairs

Repair leaks discovered in either the primary chamber or the interstitial space in accordance with the tank manufacturer's instructions. Following any tank repairs, re-test the tank until the tank successfully passes the testing requirements defined herein.

3.2.2 Tank Manufacturer's Tests

In addition to the tests required herein, perform any additional tests (i.e., leak tests) on each storage tank that are required by the tank manufacturer's written test procedures. Manufacturer's tests that are redundant to tests already required by this specification will only be performed once per tank. Repair all leaks discovered during the tests in accordance with manufacturer's instructions. Following tank repairs, re-test the tank until the tank successfully passes the manufacturer's testing requirements.

3.2.3 Tank Inspection Reports
