Provide a monitoring facility that is in compliance with UL 827, Central Station Alarm Services. Determine compliance by a UL-Listing in any of the following three categories:

a. UUFX (Protective Signal Services - Central Station)
b. CPVX (Burglar Alarm Systems - Central Station)
c. CVSU (Monitoring Station, Residential)

Substantiate UL-Listing in any of the above categories by submitting the associated UL Certificate of Compliance.

1.4.3.2 Central Monitoring Facility Staffing

**************************************************************************

NOTE: UL reviews the actions taken in response to alarm signals generated by UL certificated alarm systems. UL does not review the handling of alarm signals that are not generated from UL certified alarm systems. UL only addresses alarm signals from non-certified alarm systems if they interfere with the handling of alarm signals from UL certified alarm systems. The handling of alarm signals is affected by the central monitoring facility staffing. Specify an alarm history report be submitted prior to selecting a central monitoring facility to verify that the monitoring facility is staffed such that all alarms have been acknowledged and a response to the alarm has been initiated within 45 seconds per UL 1981.

Select item "a." to require compliance to the 45 second staffing requirement. Select item "b." to exceed the 45 second staffing requirement and specify a new time in the blank space provided.

**************************************************************************

UL 1981 requires monitoring facility staffing be such that all alarm signals be acknowledged and the appropriate dispatch or verification action be initiated not more than 45 seconds after the monitoring facility receiver acknowledges to the alarm panel at the protected site that the alarm signal has been received (receiver kiss-off signal).

[ a. Staffing at the central monitoring facility shall be such that it is in compliance with UL 1981.]

[ b. Staffing at the central monitoring facility shall exceed requirements in UL 1981. Staffing shall be such that all alarm signals be acknowledged and the appropriate dispatch or verification action be initiated not more than [_____] seconds after the monitoring facility receiver acknowledges to the alarm panel at the protected site that the alarm signal has been received (receiver kiss-off signal).]
alarm signal has been received (receiver kiss-off signal).

Submit an **alarm history report** listing all alarms received on [specify unannounced date here] between [specify start time here] and [specify end time here]. The date, time, and type (such as burglar, panic, trouble) of each received alarm signal as well as the date and time at which the operator initiated a response (such as verification or dispatch) shall be included in the report.

**1.4.3.3 Central Monitoring of High Security Assets**

**************************************************************************

NOTE: Requirements related to equipment at the protected site as well as data transmission and response forces are not within the scope of this guide specification. The DCID 6/9, NISPOM and the AA&E manual provide requirements for all aspects of a security system including installation guidelines, maintenance, and testing of equipment installed at a protected site as well as requirements for monitoring facility operations and staffing.

Note that inclusion of the paragraph below does not require compliance with the selected government security document in its entirety (i.e. it does not invoke requirements related to equipment at the protected site). However, designer must ensure that the alarm equipment installed at the protected site complies with regulatory and UL 2050 requirements.

The paragraph below should only be included when it is mandatory that the monitoring facility meet requirements of the DCID 6/9, NISPOM, or the AA&E manual.

**************************************************************************

Submit a **notarized affidavit** attesting to compliance with either of the following referenced standards:

a. UL 827 and the requirements of UL 2050, section 7, and of [DIA DCID 6/9] [DOD 5220.22-M, NISPOM] [DOD 5100.76-M, AA&E Manual] as applicable to the monitoring facility only, or

b. UL 2050, section 6, and of [DIA DCID 6/9] [DOD 5220.22-M, NISPOM] [DOD 5100.76-M, AA&E Manual] as applicable to the monitoring facility only when the area being monitored is [under the authority of the National Industrial Security Program] [Sensitive Compartmented Information] [Arms, Ammunition and Explosives].

**1.4.4 Insurance**

Contractor is required to carry not less than $1,000,000 in general liability insurance, including coverage for omissions and errors. Submit proof of insurance.

**1.4.5 Procedure Development Conference**

Hold a procedure development conference, prior to the start of alarm signal monitoring. The purpose of this conference is to establish a clear
understanding of step-by-step instructions for handling each type of alarm signal to be monitored under this contract. Attendees shall include, at a minimum, a facility manager of the monitoring facility and appropriate Government personnel. Topics for discussion shall include: alarm signal types and the corresponding operator actions, the order in which operator actions are taken, Government contact information and alternate Government contact information. Other topics for discussion may include: when cancel codes are required, alarm log content, how often an alarm log will be submitted, what signals are to be flagged in the alarm log, what operator actions are to be taken if a signal fails to restore, and other topics deemed necessary by the attendees.

1.4.5.1 Scheduling and Location

Coordinate the scheduling and location of the procedure development conference. Provide notification of scheduling and location information to [the Government] [_____] [two weeks] [_____] prior to the conference date. Notification information shall include the procedure development conference date, time, location, the attendees who will represent the Contractor, and their titles.

1.4.5.2 Operating Procedure Plan

**************************************************************************
NOTE: Select, in the paragraph below, the operating procedure plan submittal date relative to the start of alarm signal monitoring or relative to the procedure development conference.
**************************************************************************

[Prior to the start of alarm signal monitoring] [Within [_____] days following the procedure development conference], submit for review a comprehensive operating procedure plan detailing alarm signal types and the corresponding operator actions, the order in which the operator actions are to be taken, Government contact information, alternate Government contact information, and other relevant topics discussed at the procedure development conference.

1.4.5.3 Plan Verification

Verify [annually] [_____] with the Government, the information in the operating procedure plan, including Government contact and operating procedure information. Update and submit the verified plan to the Government.

PART 2 PRODUCTS

Not used

PART 3 EXECUTION

3.1 INTERFACE

3.1.1 Alarm Signal Format

**************************************************************************
NOTE: Listed below are several examples of the numerous possible alarm signal formats. Specify the alarm signal format(s) corresponding to the
**************************************************************************
format(s) produced by the alarm system installed at
the protected location.

Contractor shall be capable of receiving and processing the following alarm
signal [format] [formats].

a. [Ademco Contact ID]
b. [FBI Superfast]
c. [4+1]
d. [4+1 Extended]
e. [SIA]
f. [Radionics BFSK]

3.1.2 Communication Means

Contractor shall be capable of receiving alarm signals via the following
communications means.

a. [dial-up network], [___]
b. [cellular network], [___]
c. [long-range radio network], [___]
d. [Internet (TCP/IP)], [___]
e. [leased line (DSL, T-1)], [___]
f. [Local Area Network (LAN)], [___]
g. [Wide Area Network (WAN)], [___]

[3.2 AUDIO VERIFICATION

Contractor shall be capable of supporting audio alarm verification. Audio
alarm verification support shall be such that, in an alarm event, an
operator can establish [two-way communication with a protected site -
similar to an intercom system.] [one-way communication with a protected
site.] Audio alarm verification shall be such that an operator can use it
to help determine what dispatch action(s) is (are) appropriate.

][3.3 VIDEO VERIFICATION

[NOTE: Video verification capabilities may be
specified if a video system will be used at the
protected site. This specification assumes video
data is not recorded at the central monitoring
facility.}
Presently, there are no standardized video alarm verification packages.

Use the first bracketed paragraph below if designer will specify information defining the video alarm verification package. Include information that will ensure compatibility between the protected site and the central monitoring facility.

Use the second bracketed paragraph below if Contractor is to determine video alarm verification compatibility between the central monitoring facility and the protected site.

**************************************************************************
Contractor shall be capable of supporting video alarm verification. Video alarm verification support shall be such that alarm triggered video media can be transmitted to the central station and used by an operator to assess pre-alarm and post-alarm video information. Video alarm verification support shall be such that it can be used by an operator to help determine what dispatch action(s) is (are) appropriate. [Provide resources required to be capable of monitoring the following video alarm verification package:[_____] [Determine compatibility with video alarm verification system to be used at the protected site.]

SECTION 28 31 02.00 20
FIRE ALARM REPORTING SYSTEMS - DIGITAL COMMUNICATORS
02/10

NOTE: This guide specification covers the requirements for a complete base-wide municipal-type fire alarm system which provides reporting of fire alarms to a central location through the use of digital alarm communicator transmitters connected to various building interior fire alarm systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Interior building fire alarm systems are covered by Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE, Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE, Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE, and Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE.

NOTE: The following information shall be shown on
the drawings:

1. A complete layout of the fire alarm watch office showing locations of new equipment and existing equipment that is to remain. Show points of connection to power supplies.
2. Locations of digital alarm communicator transmitters to be installed.
3. Locations of local alarm systems and initiating devices to be connected to digital alarm communicator transmitters, and points of connection to AC power (Note: AC power shall be obtained ahead of the main disconnects).
4. A table showing each transmitter location, phone number, and the number of auxiliary zones to be connected and their descriptions (e.g., Bldg. 591, phone numbers: 555-1212, 555-1213; Zone 1 - FACP Zone 1; Zone 2 - FACP Zone 2; Zone 3 - Sprinkler Riser, etc.).

PART 1 GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

FM GLOBAL (FM)

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE C62.41.1 (2002; R 2008) Guide on the Surges Environment in Low-Voltage (1000 V and
1.2 DESCRIPTION OF WORK

Work includes provision of labor, material, tools and equipment necessary for and incidental to the provision of a complete and usable base-wide digital alarm communicator fire alarm system. The system shall be in accordance with NFPA 72 and as specified herein. Materials and equipment furnished under this contract shall be the current products of one manufacturer regularly engaged in production of such equipment. Electronics shall be solid state. The system shall be listed by the Underwriters' Laboratories (UL) or approved by Factory Mutual Engineering and Research (FM) as a public fire reporting system, in accordance with NFPA 72. Equipment used to interconnect the system with local building fire alarm systems shall be UL listed or FM approved, in accordance with NFPA 72. As an alternate to the above listing requirements, all equipment shall be UL Fire Prot Dir listed or FM APP GUIDE approved as a proprietary protective signaling system in accordance with NFPA 72, provided the system meets the requirements as specified herein without violating such listing or approval. The system shall conform to the Federal Communications Commission's rules and regulations concerning connection of telephone
equipment, systems, and protective apparatus to the public switched telephone network. In the National Fire Protection Association (NFPA) publications referred to herein, the advisory provisions shall be considered mandatory, as though the word "shall" had been substituted for "should" wherever it appears; reference to the "authority having jurisdiction" shall be interpreted to mean the [[_____ Division] [Engineering Field Activity [_____]], Naval Facilities Engineering Command, Fire Protection Engineer

1.3 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Include all types of initiation devices/panels to which system shall be connected. A/E shall investigate existing systems in each building. In some cases it may be necessary to replace old, unapproved "drill panels" and shunt systems with new local energy panel/systems (refer to Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE, Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE, Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE, Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE, as appropriate).
**************************************************************************

1.3.1 SYSTEM DESIGN

System shall be a complete base-wide public fire reporting system, complying with NFPA 72, except as modified herein. The exterior fire alarm reporting and receiving system shall comply with NFPA 72 [2], [3], [4], [5-8]-line Hunt Group. The system shall consist of digital alarm communicator transmitters (DACT) at each protected premise and digital alarm communicator receivers (DACR) at the fire alarm receiving station located at [______]. The system shall be supervised such that any telephone line connected to a DACT which fails due to loss of line voltage shall be announced at the receiving station. The system shall be designed to operate from direct current supplied from a rectifier and from storage batteries. The system shall be designed to record alarm and trouble information from each DACT as well as supervisory alarms received at the DACR. Provide spare DACRs in accordance with NFPA 72. Connect system to existing [and new] local building fire alarm systems, [and] [sprinkler water flow detectors] [and] [existing] [manual pull stations] [and] [existing extinguishing system control panels] as shown to form auxiliary alarm systems in accordance with NFPA 72.[ New local energy fire alarm systems are specified in [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE].] System shall include [street boxes] [and] [master boxes] as specified herein and where shown, to allow manual initiation of fire alarm transmission by the general public.)

1.3.2 Power Calculations

Submit design calculations to substantiate battery capacity exceeds supervisory and alarm power requirements for digital alarm communicator transmitters, receiving consoles and interface panels (if provided).
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

The Fire Protection Engineer, Naval Facilities Engineering Command, [_____] will review and approve all submittals in this section requiring Government approval.

NOTE: For projects administered by NAVFAC PAC, use the submittal paragraph below in lieu of the above paragraph. Delete the "G" in the asterisk tokens after each submittal item, except under "SD-08, Statements."
[The Pacific Division, Naval Facilities Engineering Command delegates the authority for review and approval of all submittals required by this section to the U.S. Registered Fire Protection Engineer employed in the quality control (QC) organization, specified under Section 01 45 00.00 10 01 45 00.00 20 01 45 00.00 40 QUALITY CONTROL. Submit to the Pacific Division, Naval Facilities Engineering Command, Fire Protection Engineer two sets of approved submittals and drawings immediately after approval but no later than 15 working days prior to final inspection.]

1.5 QUALITY ASSURANCE

1.5.1 Qualifications of Installer

The Contractor or installer shall have satisfactorily installed fire alarm reporting systems of the same type and design as specified herein [and shall be UL certified for the installation and testing of fire alarm systems].

Prior to commencing fire alarm reporting system work, submit data showing that the Contractor or installer has satisfactorily installed three fire alarm systems of the same type and design as specified herein within the past 3 years [and certify that each system has performed satisfactorily in the manner intended for a period of not less than 18 months]. [Submit proof of UL certification and a list of installer's personnel.]

For each system installed, submit the following:

a. A detailed summary of the type and design of the system;
b. The contract name or number, completion date of the project, and total cost of the system;
c. The name and telephone number of the facility or installation for whom the work was performed; and
d. The name and telephone number of a supervisory level point of contact at the facility or installation who has knowledge of the performance of the Contractor's or installer's work.

1.5.2 Manufacturer's Representative

Provide the services of a qualified manufacturer's representative or technician, experienced in the installation and operation of the type of system being provided to supervise the installation, testing (including final testing), and adjustment of the system. [Ensure that the installer is UL certified for the installation and testing of the fire alarm system].
systems. Provide proof of this listing. A list of installers personnel shall be provided as part of the submittal package under the subparagraph titled "SD-07, Certificates."]

1.5.3 [Qualifications of System Technician

**************************************************************************
NOTE: For projects administered by the NAVFAC PAC HQ, include the following paragraph requiring the minimum qualification of a NICET Level -III technician for preparation of all fire protection system drawings.
**************************************************************************

Installation drawings, shop drawings, and as-built drawings shall be prepared by, or under the supervision of, a qualified technician. Qualified technician shall be an individual who is certified by the National Institute for Certification in Engineering Technologies (NICET) as an engineering technician with minimum Level III certification in fire alarm system program. Contractor shall submit data showing the names and certification of the technician at or prior to submittal of drawings.

]1.5.4 Regulatory Requirements

Materials and equipment for fire alarm service shall be listed UL Fire Prot Dir or approved by FM APP GUIDE. Provide current materials and equipment of one manufacturer regularly engaged in production of such equipment, and provide items that have performed satisfactorily for at least 2 years prior to bid opening.

1.5.5 Drawing Requirements

1.5.5.1 System Floor Plans

Submit shop drawings of the system floor plans showing locations of fire alarm equipment and devices. Show wire color coding, wire counts, and device wiring order.

1.5.5.2 System Wiring Diagrams

Submit complete wiring diagrams of the system showing points of connection and terminals used for electrical connections in the system. Show modules, relays, switches, and lamps within the equipment.

1.5.5.3 System As-built Drawings

Upon completion, and before final acceptance of the work, furnish to the Contracting Officer [_____][3] complete sets of as-builts drawings, including complete as-built circuit diagrams of the system. The as-built drawings shall be "D" size 850 by 550 reproducible drawings on mylar film drawn to the same scale as the contract drawings and with tile block similar to contract drawings. The as-built drawings shall be furnished in addition to the record drawings required by Division 01.

1.5.6 System UL Listing or FM Approval

Submit copies of current UL Fire Prot Dir listings or FM APP GUIDE approvals for the system in configurations offered, with copies of the actual UL or FM test reports.
1.6 MAINTENANCE

1.6.1 Spare Parts

Furnish the following spare parts:

a. 5 complete sets of system keys

b. 3 sets of fuses of each type and size

1.6.2 Manuals

Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Inscribe the following identification on the cover: the words OPERATION AND MAINTENANCE MANUAL, the location of the building, the name of the Contractor, system manufacturer and the contract number. The instructions shall be legible and easily read, with large sheets of drawings folded in. The manual shall include: circuit drawings; wiring and control diagrams with data to explain detailed operation and control of each item of equipment; a control sequence describing start-up, operation and shutdown instructions; installation instructions; maintenance instructions; safety precautions, diagrams, and illustrations; test procedures; performance data; and parts list.

PART 2 PRODUCTS

2.1 DIGITAL ALARM COMMUNICATOR TRANSMITTER (DACT)

Each digital alarm communicator transmitter shall be completely assembled, tested at the factory, and delivered ready for installation and operation. The transmitter electronics package shall be contained within the housing as a complete assembly, removable to facilitate servicing and replacement. The DACT shall be capable of seizing a telephone line at the protected premise and sending digital alarm or trouble information over the telephone network to a DACR. [Provide interface device for digital alarm communicator transmitter to be compatible with existing system.]

2.1.1 Transmitter Identity Code

**************************************************************************
NOTE: For NAVFAC PAC MIDPAC projects, delete the third sentence and include the bracketed sentence.
**************************************************************************

Each DACT shall include a unique identity code as part of each transmission. Setting the code shall be readily accomplishable in the field. The specific code number for each DACT shall be as shown on the drawings. [Submit in writing, within 30 calendar days after award, the specific code number for each DACT. Obtain the code numbers from the Federal Fire Department, Telephone No. (808) 474-2222.]

2.1.2 Transmission Confirmation

Each DACT shall produce an audible or visual indication that the transmitter is operating and a signal is being sent, when the transmission is initiated by an alarm condition or manual test switch.
2.1.3 Automatic DACT Test

Each DACT shall automatically transmit a test message at least once in each 24 hour period. Test message shall also allow manual actuation by means of a secured (not publicly accessible) switch. Automatic actuation shall be initiated by a solid state programmable electronic device. Stability of the electronic device shall be plus or minus one minute per month or better. Test time(s) shall be programmable without removing the DACT from the enclosure.

2.1.4 Battery Supervision

Each DACT shall constantly monitor and supervise its battery power supply. A low battery or trouble message shall be transmitted when battery voltage under load falls below 85 percent of the rated battery voltage, but in any case prior to the point at which the battery will fail to operate the transmitter. This message shall be included as part of every subsequent transmission until the problem is corrected if the battery is the primary source of energy powering the DACT.

2.1.5 Trouble Supervision

Disarrangement of the DACT wiring which prevents proper operation of the DACT, or the abnormal position of any switch shall cause transmission of a trouble message and actuation of a local audible trouble alarm. DACT shall have a switch to silence the audible trouble alarm, however, while the audible alarm is silenced an amber trouble lamp shall remain lit. Upon correction of the trouble conditions, the audible alarm shall again sound until the silencing switch is returned to normal, or the silencing switch may be the momentary action, self-resetting type.

2.1.6 DACT Power Supplies

**************************************************************************
NOTE: the voltage available at each building must be verified. If 120-volt service is not available at certain buildings, the need for transformers shall be noted on the contract drawings.
**************************************************************************

Each DACT shall be powered by locally available 120 VAC power. Upon loss of AC power, the transmitter shall automatically and instantaneously switch to standby battery power, without loss of any alarm signals. Loss of AC power shall also cause the local audible trouble alarm to sound [and a trouble message to be transmitted if power is not restored within [1] minutes]. Upon restoration of AC power, transfer back to AC operation and silencing of audible trouble alarm shall be automatic. Power supply filtering shall prevent false message transmissions caused by transient or steady-state electrical disturbances.

2.1.6.1 Battery Power Supply

Batteries shall be spillproof, sealed lead acid or lead calcium. The battery package shall be capable of supplying power requirements of the DACT. DACT standby battery capacity shall provide sufficient power to operate the transmitter in a normal standby status for a minimum of 60 hours and be capable of transmitting an alarm signal at the end of that period. Batteries shall be located within the DACT housing.
Converter/float charger: Under presence of 120 VAC power, DACT batteries shall be charged through a converter/float charger. Charger shall recharge a fully discharged battery in not more than 48 hours while the transmitter is operating under normal conditions (presence of 120 VAC power), or provide a charger which maintains a battery at full charge under normal daily testing load and provide batteries having capacity for 6 months field service without recharge.

2.2 OVERVOLTAGE AND SURGE PROTECTION

2.2.1 Power Line Surge Protection

Protect equipment connected to AC circuits from power line surges. Equipment shall meet the requirements of IEEE C62.41.1 and IEEE C62.41.2.

2.2.2 Communications Link Surge Protection

Protect communications equipment against surges induced on communications links. Install surge protection circuits at each end of cables and conductors, except fiber optics, which serve as communications links, to meet the following two waveforms:

a. A 10 microsecond by 1000 microsecond waveform with a peak voltage of 1500 volts and a peak current of 60 amperes.

b. An 8 microsecond by 20 microsecond waveform with a peak voltage of 1000 volts and a peak current of 500 amperes. Provide protection at the equipment. Install additional triple electrode gas surge protectors, rated for the applications, on each wireline circuit within 3 feet of the building entrance. Do not use fuses for surge protection.

2.2.3 Sensor Wiring Surge Protection

Protect digital and analog inputs and outputs against surges induced by sensor wiring installed outdoors and as shown. Test inputs and outputs with the following waveforms:

a. A 10 microsecond by 1000 microsecond waveform with a peak voltage of 1500 volts and a peak current of 60 amperes.

b. An 8 microsecond by 20 microsecond waveform with a peak voltage of 1000 volts and a peak current of 500 amperes. Do not use fuses or surge protection.

2.3 DIGITAL ALARM COMMUNICATOR RECEIVER (DACR)

Provide two identical DACRs or control consoles. Install both consoles at the main fire alarm watch office as indicated. Each system console shall be completely assembled, wired, and tested at the factory, and delivered ready for installation and operation. Each base station console (system) shall perform the receipt, processing, and display of emergency and non-emergency messages transmitted by the DACTs specified herein, independently of the other console. Each console shall contain a complete independent receiving system, decoder, audio devices, visual display, clock, printer, primary and emergency power supplies, power supply monitors, memory devices, and interconnecting cable. If the automatic DACT tests specified under paragraph titled "Automatic DACT Test" are initiated by a polling (interrogation) device located at the base station, then each of the two required consoles shall have its polling device. One such
device shall always be active, with the other in standby status. Failure of the active device shall automatically cause the second device to take over the polling (interrogation) function. Each DACR shall be capable of receiving signals from a minimum of four separate telephone circuits.

2.3.1 Display

Each console shall do the following:

a. Display incoming alarms in alphanumeric format, by means of a light emitting diode, illuminated dot matrix, or cathode ray tube.

   (1) Indicate the identity with a minimum of a four digit 0002-9999, time, date, and type of signal (alarm, trouble) code number assigned to the originating transmitter.

   (2) Include a message of a minimum of 3 lines of 20 characters each for each transmission (minimum 500 transmitter capacity). The message shall be operator-programmable into the memory through a keyboard which shall be provided.

b. Include a means to manually clear and reset the display. If the display is not reset at the time additional alarms are received, the additional alarms shall be retained in memory and a distinctive audible or visual indication given to the operator that additional alarms are waiting to be acknowledged.

   Alarms shall be printed immediately upon receipt.

2.3.2 Memory

Provide each console with a programmable memory capable of retaining at least 500 transmitter codes, together with specific messages, total number of zones possible, and related information associated with each of the 500 transmitters. If memory is operator-programmable, restrict access into the memory for the purpose of making additions or deletions by the use of a key switch for access code to prevent unauthorized changes. Memory shall not be lost in the event of a total loss of primary and emergency power supplies.

2.3.3 Digital Clock

Each console shall incorporate an electronic digital clock. Clock shall display the current time expressed in 24-hour time and date (day and month) and shall transmit to each interconnected printer the time and date that signals are received. Provide manual means of resetting the clock.

2.3.4 Printers

Provide printers of high speed, computer compatible, low noise design, capable of printing incoming messages with no messages being lost. Upon reception of an alarm, each printer shall print on paper the required visually displayed data, including the date and time received. Provide standard size paper for recording messages, commercially available from three or more manufacturers, usable on a computer printer or adding machine, and continuous feed. Include paper take-up devices for storing printouts. Print alarms in a manner to make them readily distinguishable from acknowledgments and routing messages, or by use of a different color, typeface, type size, or other distinguishable means.
2.3.5 Audible Trouble and Alarm Devices

The audible alarm device used to indicate the receipt of alarms shall produce a sound distinct from other audible trouble signals. The device shall be internally mounted in the console, and activated upon receipt of an alarm. The audible sounds used to indicate trouble messages shall be separate and distinct from the sound used to denote receipt of alarm messages.

2.3.6 Power Supplies

For each console, primary power supply shall be 120 V, 60 Hz AC. Emergency backup power shall be supplied by batteries capable of powering the system for a minimum of 48 hours. The 120 V, 60 Hz AC power supply for each console shall be obtained [through a single connection into the line side of the building's regular AC service circuit] [from the building emergency service circuit as shown] through a lockable fused disconnect switch. Provide a separate disconnect switch for each console.

2.3.7 Emergency Power Source

**************************************************************************
Note: Batteries shall not be located in areas where personnel are normally present.
**************************************************************************

Emergency backup power shall be supplied by lead acid type batteries having plastic cases and explosionproof vents. Batteries shall be of sufficient capacity to operate all functions of the console for no less than 48 continuous hours, in the event of loss of AC power. Batteries shall be mounted on rack(s) designed for that purpose. A termination cabinet shall be part of the rack. Battery rack(s) shall be located where shown.

2.3.7.1 Emergency Power Switchover

In the event of loss of normal AC power, transfer to the emergency power mode shall be automatic and without interruption or loss of console memory. When AC power is restored, transfer back to normal mode shall also be automatic.

2.3.8 Console Battery Charger

Battery chargers shall be self-regulating. Each charger shall have the capacity to completely recharge its associated batteries from full discharge within 48 hours with the console fully operational on primary AC power. The console shall remain operational on AC power with the batteries removed.

2.3.9 Console Supervision

Supervisory controls shall provide constant supervision of the operating condition of the console. Individual indicators shall be provided for each major component, and an audible signal shall be produced in the event of failure of any major component. This audible signal shall be distinctly different from the signal used to annunciate alarms. A switch shall be provided to silence the audible trouble signal.
2.3.10  Power Supervision

Each console shall continuously monitor its primary and emergency power supplies. Any malfunction shall be indicated visually and audibly. In the event of a primary power supply failure, the console shall automatically and without interruption switch to battery backup and indicate the failure within 15 seconds. An "open" in the battery circuit or standby battery voltage below 85 percent of rated voltage (while on AC power) shall cause activation of console trouble signals.

2.3.11  Electrical Connections

Consoles shall be designed with modular components to allow interchange of components for maintenance purposes. Interconnecting cables and connectors shall be compatible with computer quality signal data transmission.

2.4  CONDUIT

2.4.1  Rigid Steel Conduit (Zinc-Coated)

    ANSI C80.1.

2.4.2  Intermediate Metal Conduit (IMC)

    UL 1242, zinc-coated steel only.

2.4.3  Electrical Metallic Tubing (EMT)

    ANSI C80.3.

2.5  OUTLET BOXES

2.6  WIRING

    NFPA 70 and NFPA 72. Wire for 120 V circuits shall be No. 12 AWG minimum. Wire for low voltage DC circuits shall be No. 14 AWG minimum. Color code wiring.

2.7  GROUND RODS

******************************************************************************

NOTE: For projects administered by NAVFAC LANT, change 10 ohms to 5 ohms.

******************************************************************************

UL 467. Rods shall be the sectional type, copper-encased steel, with a minimum diameter of 19 mm 3/4 inch and a minimum length of 3050 mm 10 feet. The rods shall have a hard, clean, smooth, continuous copper surface, and the proportion of copper shall be uniform throughout the length of the rod. The copper shall have a minimum wall thickness of .33 mm .013 inch at any point on the rod. Ground rods shall not protrude more than 150 mm 6 inches above grade. Non-current carrying metallic parts associated with new fire alarm equipment shall have maximum resistance to solid "earth" ground not to exceed the following values:
PART 3 EXECUTION

3.1 INSTALLATION

Installation shall be in accordance with the requirements of NFPA 70 and NFPA 72. Wire for 120 V circuits shall be No. 12 AWG minimum. Wire for low voltage DC circuits shall be No. 14 AWG minimum. Color code wiring. Wiring shall be in rigid steel conduit, intermediate metal conduit, or electrical metallic tubing. Circuit conductors shall be identified within each enclosure where a tap, splice, or termination is made. Conductor identification shall be by plastic coated, self-sticking printed markers or by heat-shrink type sleeves. The markers shall be attached in a manner that will permit accidental detachment. Control circuit terminations shall be properly identified. Unless indicated otherwise, wiring and conduit shall be new. Do not run fire alarm circuits in the same conduit as non-fire alarm circuits. Do not run AC circuits in the same conduit with DC circuits.

3.1.1 Continuity of Protection

During the installation of this system, there shall be no loss of function of the existing base fire alarm system, or of the local building alarm systems connected thereto. Transfer of local alarm system connections from the existing base alarm system shall not result in loss of alarm transmitting or receiving capability. Temporary interruption of individual building alarm connections, not to exceed 8 hours duration, will be permitted at the discretion of the Contracting Officer. No interruption of alarm or communications functions at the fire alarm watch office will be permitted.

3.2 FIELD QUALITY CONTROL

3.2.1 Preliminary Testing

Conduct the following tests during installation of wiring and system components. Correct any deficiency pertaining to these requirements prior to final functional and operational tests of the system.

a. Ground resistance: The resistance of each connection to ground shall be measured and shall not exceed 10 ohms.

b. Each cable shall be checked at the transmitter or receiver connection for continuity, shorts, and grounds on the conductor and on the shield prior to connection to equipment. Assemblies failing these tests shall not be connected to equipment.

c. Operation of each digital alarm communicator transmitter function.

d. Operation of each interface device (where interface panels are provided).

e. Operation of each local alarm system zone.
f. Operation of each initiating device circuit if connected directly to the digital alarm communicator transmitter.

g. Operation of supervisory features.

h. Operation of all features of each digital alarm communicator receiver.

Tests of system components shall be conducted both with normal power on and with emergency (battery) power on and normal power off.

3.3 FINAL ACCEPTANCE TEST

The system shall have been in service for at least 30 days prior to the final inspection. The Contractor shall notify the Contracting Officer in writing when the system is ready for final acceptance tests. Notification shall be at least 15 days prior to the date of the final acceptance test. The system shall be considered ready for such testing only after necessary preliminary tests have been made and deficiencies found have been corrected to the satisfaction of the equipment manufacturer's technical representative. The system shall be tested for approval in the presence of representative of the manufacturer, the Contracting Officer, and the Division Fire Protection Engineer. The Contractor shall furnish instruments, labor, and materials required for the tests, and the technician who supervised the installation shall conduct the tests. Any deficiencies found shall be corrected and the system retested at no cost to the Government. Tests specified in paragraph entitled "Tests During Installation" shall be repeated as directed by the Division Fire Protection Engineer during the conduct of final acceptance tests.

3.4 ADDITIONAL TESTS

When deficiencies, defects, or malfunctions develop during the tests required, further testing of the system shall be suspended until proper adjustments, corrections, or revisions have been made to ensure proper performance of the system. If these adjustments, corrections, or revisions require more than a nominal delay, the Contracting Officer shall be notified when the additional work has been completed to arrange a new final inspection and test of the fire alarm system. Tests required shall be repeated prior to final acceptance, unless directed otherwise.

3.5 MAINTENANCE INSTRUCTIONS

Furnish to the Contracting Officer prior to final testing of the system a complete set of reproducible as-built approved wiring diagrams with six sets of copies.

3.6 INSTRUCTION OF GOVERNMENT PERSONNEL

Upon completion of the work and at a time designated by the Contracting Officer, Government personnel at the activity shall receive a complete training session of 40 hours, comparable to the equipment manufacturer's factory training procedure. The training shall include an explanation and review of the theory of operation, the function, the description, and analysis; and the troubleshooting of equipment provided. Training shall include a review of manuals, drawings, and lists supplied, together with any clarifications required. At least one period of 8 hours shall be spent demonstrating routine maintenance procedures and
troubleshooting equipment with actual faults being introduced for training purposes. The instructional personnel providing requirements above shall be factory certified by the related equipment manufacturer to provide instruction services. The training shall take place at the site.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for analogor addressable interior fire alarm systems in single or multiple buildings, requirements for fire detection and alarm systems, and addressable systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

Section 01 78 23 OPERATION AND MAINTENANCE DATA AND METHODS, and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM apply to work specified in this section with the additions and modifications specified herein.

1.1 SCOPE

NOTE: Indicate the location of fire alarm system devices and riser locations on floor plans. Provide a fire alarm system riser diagram indicating circuits and risers.
This work includes designing and providing [a new, complete,] [and]
[modifying the existing] analog or addressable fire alarm system as
described herein and on the Contract drawings for the [building name]. The
system includes wiring, raceways, pull boxes, terminal cabinets, outlet and
mounting boxes, control equipment, alarms, supervisory signal-initiating
deVICES, alarm notification appliances, supervising station fire alarm
system transmitter, and other accessories and miscellaneous items required
for a complete operating system even though each item is not specifically
mentioned or described. Provide system[s] complete and ready for
operation. Provide equipment, materials, installation, workmanship,
inspection, and testing in strict accordance with the required and advisory
provisions of NFPA 72 [and] [], except as modified herein. [The
system layout on the drawings shows the intent of coverage and the in
suggested locations. Determine the final quantity and layout, and
coordinate all necessary activity. ][A single fire alarm control panel
(FACP) is indicated, with terminal cabinets at each floor at each riser
location. Where needed, provide remote fire alarm control units at a
terminal cabinet location. ]Power each remote fire alarm control unit from
a wiring riser specifically for that use or from a local emergency power
panel located on the same floor as the remote fire alarm control unit.
Where remote fire control units are provided, it is permissible to locate
equipment for notification appliances in the remote fire alarm control
units.

1.2 REFERENCES

1.3 DEFINITIONS

Wherever mentioned in this specification or on the drawings, the equipment, devices, and functions are defined as follows:

a. Analog or Addressable System: A system in which multiple signals are transmitted via the same conduction path to a remote fire alarm control unit and fire alarm control panel, decoded, and separated so that each signal initiates the specified response.

b. Hard-Wired System: A system in which alarm- and supervisory-initiating devices are directly connected, through individual dedicated conductors, to a central control panel, without the use of analog or addressable circuits or devices.

c. Interface Device: An addressable device that interconnects hard-wired systems or devices to an analog or addressable system.

d. Fire Alarm Control Unit: A control panel, remote from the fire alarm control panel, that receives inputs from automatic and manual fire alarm devices; may supply power to detection devices and interface devices; may provide transfer of power to the notification appliances; may provide transfer of condition to relays or devices connected to the
control unit; and reports to and receives signals from the fire alarm control panel.

e. Fire Alarm Control Panel (FACP): A master control panel having the features of a fire alarm control unit and to which fire alarm control units are interconnected. The panel has central processing, memory, input and output terminals, [video display units (VDUs),] [and] [printers].

f. Terminal Cabinet: A steel cabinet with a locking, hinge-mounted door in which terminal strips are mounted.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

A "G" following a submittal item indicates that the submittal requires Government approval. Some submittals are already marked with a "G". Only delete an existing "G" if the submittal item is not complex and can be reviewed through the Contractor's Quality Control system. Only add a "G" if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 MAINTENANCE MATERIAL SUBMITTALS

1.5.1 Special Tools and Spare Parts

NOTE: Remove last sentence of the first paragraph when not required.

Furnish software, connecting cables and proprietary equipment, necessary for the maintenance, testing, and reprogramming of the equipment to the Contracting Officer. Furnish two spare fuses of each type and size required. Furnish 2 percent of the total number of each different type of detector, but no less than two each.[ Mount spare fuses in the fire alarm panel.]

Provide spare parts data for each different item of material and equipment specified, not later than [3] [_____] months before the date of beneficial occupancy. Include a complete list of parts and supplies, with the current unit prices and source of supply and a list of the parts recommended by the
manufacturer to be replaced after [1] [_____] year[s] of service.

1.5.2  Spare Parts and Tools

Provide spare parts data for each different item of material and equipment specified, not later than [3] [_____] months before the date of beneficial occupancy. Include a complete list of parts and supplies with the current unit prices and source of supply and a list of the parts recommended by the manufacturer to be replaced after [1] [_____] year of service.

1.5.2.1  Interchangeable Parts

Ensure that spare parts furnished are directly interchangeable with the corresponding components of the installed system. Package and identify spare parts by nameplate, tagging, or stamping. Deliver spare parts to the Contracting Officer at the time of the final acceptance testing.

1.5.2.2  Spare Parts

Furnish the following spare parts and accessories:

a. [4][_____] audiovisual devices of each type installed
b. [4] [_____] fuses for each fused circuit
c. [1] [_____] electromagnetic door holders
d. [1] [_____] manual stations
e. [9] [_____] spare reams of paper for the system printer, plus sufficient paper for fire alarm acceptance tests
f. [2] [_____] smoke sensors and bases of each type installed
g. [2] [_____] heat sensors and bases of each type installed
h. [3] [_____] test magnets or devices for each type of sensor installed
i. [3] [_____] break rods for manual stations

1.5.2.3  Parts List

Furnish a list, in duplicate, of all other parts and accessories that the manufacturer of the system recommends to be stocked for maintenance.

1.6  QUALITY CONTROL

Ensure that equipment and devices are compatible and operable with existing station fire alarm system and do not impair reliability or operational functions of existing supervising-station fire alarm systems. [Existing supervising-station fire alarm system is [_____]].

1.6.1  Regulatory Requirements

Provide devices and equipment for fire alarm service listed by UL Fire Prot Dir or approved by FM APP GUIDE.
1.6.1.1 Compliance

Configure the fire detection and alarm system and the central reporting system in accordance with NFPA 72; exceptions are acceptable as directed by the Contracting Officer. Ensure that the furnished equipment is compatible. Ensure that the equipment is UL-listed, FM approved, or approved or listed by a nationally recognized testing laboratory in accordance with the NFPA standards.

1.6.1.2 Requirements for Fire Protection Service

Provide equipment and material tested by UL and listed in UL Fire Prot Dir or approved by FM and listed in FM APP GUIDE. Where the terms "listed" or "approved" appear in this specification, the terms mean listed in UL Fire Prot Dir or FM APP GUIDE. Do not construe omission of these terms under the description of any item of equipment described as waiving this requirement.

1.6.1.3 Testing Services or Laboratories

Construct fire alarm and fire detection equipment in accordance with UL Fire Prot Dir, UL Electrical Construction, or FM APP GUIDE.

1.6.2 Qualifications

**************************************************************************

NOTE: Since some states require that persons installing fire alarm systems be National Institute for Certification in Engineering Technologies (NICET) certified, the number of NICET-certified fire alarm technicians varies from state to state. The actual number of NICET-certified technicians should be checked with the state fire marshal. If the availability of NICET-technicians is a problem, delete all references to NICET.

NICET level 4 fire alarm technicians should be required for hospitals and large complex systems.

**************************************************************************

1.6.2.1 Engineer and Technician

Provide proof of qualifications for required personnel. Submit proof of experience for the professional engineer (PE), the fire alarm technician, and the installing company.

a. Registered PE with verification of experience and at least 4 years of current experience in the design of the fire protection and detection systems.

b. National Institute for Certification in Engineering Technologies (NICET) qualifications as an engineering technician in fire alarm systems programming with verification of experience and current NICET certificate.

c. The Registered PE is permitted to perform all required actions under this specification. The NICET Fire Alarm Technician is permitted to perform only the actions allowed by the specific category of certification held.
1.6.2.2 Design Services

For design or modification of the fire detection, fire alarm, or fire suppression systems, ensure the services and review of a qualified fire protection engineer. For the purposes of meeting this requirement, a qualified fire protection engineer meeting one of the following conditions:

a. An engineer having a Bachelor of Science or Masters of Science in fire protection engineering from an accredited university engineering program, plus a minimum of 2 years' work experience in fire protection engineering.

b. A registered PE in fire protection engineering.

c. A registered PE in a related engineering discipline and member in the National Society of Fire Protection Engineers.

d. An engineer with a minimum of 10 years' experience in fire protection engineering and member of the National Society of Fire Protection Engineers.

1.6.2.3 Qualifications of Installer

[Ensure that the design is by a NICET Level III or Level IV technician.] Installer has been in existence for at least 3 years[, within a [____] mile radius of the job site]. Submit record of installer's training history for the employees to the Contracting Officer. Accomplish installation by an electrical contractor with a minimum of 5 years' experience in the installation of fire alarm systems. The Contracting Officer may reject any proposed installer who cannot show evidence of such qualifications. Provide the services of a technician furnished by the control equipment manufacturer, to supervise installation, adjustments, and tests of the system. Furnish evidence that the fire alarm equipment supplier has an experienced and effective service organization that carries a stock of repair parts for the system to be furnished. Guarantee labor, materials, and equipment provided under this Contract against defects for one year after the date of final acceptance of this work by the Contracting Officer and the receipt of detailed as-built drawings and schematics of all equipment. Before installation, submit data for approval by the [([____] Division] [EFA [____]], Naval Facilities Engineering Command, Fire Protection Engineer, showing that the Contractor has successfully installed analog or addressable, analog intelligent interior fire alarm systems of the same type as specified herein, or that the Contractor has a firm contractual agreement with a subcontractor having such required experience. Include the names and locations of at least three installations where the Contractor, or the subcontractor referred to above, has installed such systems. Indicate the type and design of each system and certify that each system has performed satisfactorily in the manner intended for not less than 18 months. Submit names and phone numbers of points of contact at each site.

1.6.3 Manufacturer Qualifications

Provide components of current design and in regular and recurrent production at the time of installation. Provide design, materials, and devices for a protected-premises fire alarm systems that are complete, and that conform to NFPA 72, except as otherwise or additionally specified herein.
1.6.4 Standard Products

Provide materials, equipment, and devices that have been tested by a nationally recognized testing laboratory, such as UL or FM, and listed or approved for fire protection service when so required by NFPA 72 or this specification. Select material from one manufacturer, where possible, and not from a combination of manufacturers, for each particular classification of materials.

Submit certified copies of current approvals or listings issued by an independent testing laboratory if not listed by UL, FM, or another nationally recognized testing laboratory, showing compliance with NFPA standards.

1.6.5 Modification of References

In NFPA publications referred to herein, consider advisory provisions to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears; interpret references to "authority having jurisdiction" to mean the [[____] Division] [EFA [____]], Naval Facilities Engineering Command, Fire Protection Engineer.

[ Consider the recommended practices stated in the manufacturer's literature or documentation as mandatory requirements.

1.6.6 Predictive Testing and Inspection Technology (PT&I) Requirements

**************************************************************************
NOTE: The Predictive Testing and Inspection (PT&I) tests prescribed in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS are MANDATORY for all [NASA] [____] assets and systems identified as Critical, Configured, or Mission Essential. If the system is not critical, and not configured, and not mission essential, assess the value of adding these additional test and acceptance requirements. See Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS for additional information regarding cost feasibility of PT&I.
**************************************************************************

This section contains systems and equipment components regulated by NASA's Reliability Centered Building and Equipment Acceptance Program (RCBEA). This program requires the use of PT&I technologies in conformance with RCBEA GUIDE to ensure that the building equipment and systems installed by the Contractor have been installed properly and contain no identifiable defects that shorten the design life of a system or its components. Satisfactory completion of all acceptance requirements is required in order for the Government to approve and accept the Contractor's work.

Perform PT&I and provide submittals as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

1.7 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from weather, humidity, temperature variation, dirt, dust, and other contaminants.
1.8 PROJECT CONDITIONS

1.8.1 Verification of Dimensions

Verify dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Provide 25-percent spare capacity where buildings are protected by sprinklers throughout or where such protection is being provided under this design. Where automatic sprinkler protection will be provided later, use 50-percent spare capacity.
**************************************************************************

2.1.1 Operation

**************************************************************************
NOTE: If a small fire alarm system is required, the specification writer should consider using Section 28 31 00.00 10 FIRE DETECTION AND ALARM SYSTEM, DIRECT CURRENT LOOP.

If an addition to an existing system is required, provide the make, model number, and other pertinent information on existing components that are to operate with the new equipment. Since new interfaces are compatible with the existing system or with the central fire alarm reporting system, the designer may need to delete major items from this specification. A new fire alarm panel must be compatible with the existing central fire alarm reporting system.
**************************************************************************

Provide a complete, supervised fire alarm reporting and detection system. Activate the system into the alarm mode by actuation of any alarm-initiating device. Ensure that the system remains in the alarm mode until the initiating device is reset and the FACP is reset and restored to normal. Connect alarm-initiating devices [to initiating-device circuits (IDCs)], [Style B] [or] [Style D], to signal line circuits (SLCs), Style [5] [6], in accordance with NFPA 72. Connect alarm notification appliances to notification appliance circuits (NACs), Style Z, in accordance with NFPA 72. Provide a looped conduit system so that if the conduit and all conductors within are severed at any point, all IDCs, NACs and SLCs remain functional. The conduit loop requirement is not applicable to the signal transmission link from the local panels (at the protected premises) to the supervising-station (fire station, fire alarm central communication center). Ensure that textual, audible, and visual appliances and systems comply with NFPA 72. Fire alarm system components requiring power, except for the control panel power supply, operate on 24 V dc. Provide an addressable system with the following features:

a. Sufficient memory to perform as specified and as shown for the
addressable system.

b. Individual identity of each addressable device for the following conditions: alarm, trouble, open, short, and appliances missing/failed remote detector - sensitivity adjustment from the panel for smoke detectors.

c. Capability of each addressable device being individually disabled or enabled from the panel.

d. Capability of each SLC to provide 40-percent addressable expansion without hardware modifications to the panel.

2.1.2 Operational Features

**************************************************************************

NOTE: For zoned fire alarm and detection systems, the systems should be zoned by type of device and by floor.

List zones, and indicate the exact wording of the descriptive zone labeling.

Remove item j. below when elevators are not involved.
**************************************************************************

Provide the system with the following operating features:

a. Monitoring of electrical supervision of [IDC,] [SLC,] [and] [NAC]. [Smoke detectors [do not] have combined alarm-initiating and power circuits.]

b. Monitoring of electrical supervision of the primary power ac supply, battery voltage, placement of alarm zone module within the control panel, and the integrity of the transmitter's tripping circuit.

c. A trouble buzzer and light-emitting diode (LED) or liquid crystal diode (LCD) to activate upon a single break, open, or ground fault condition that prevents the required normal operation of the system. Ensure that the trouble signal also operates upon loss of primary power (ac) supply, low battery voltage, removal of alarm zone module and disconnection of the circuit used for transmitting alarm signals off-premises. Provide a trouble alarm silence switch that silences the trouble buzzer, but does not extinguish the trouble indicator LED or LCD. Ensure the subsequent trouble and supervisory alarms sound the trouble signal until silenced. Ensure that, after the system returns to the normal operating conditions, the trouble buzzer sounds again until the silencing switch returns to the normal position, unless an automatic trouble reset is provided.

d. A one-person test mode. Ensure that activating an initiating device in this mode activates an alarm for a short time, and then automatically resets the alarm, without activating the transmitter during the entire process.

e. A transmitter disconnect switch to allow testing and maintenance of the system without activating the transmitter but providing a trouble signal when disconnected and a restoration signal when reconnected.
f. A switch to silence the evacuation alarm, which, when activated, silences alarm devices, but does not affect the zone-indicating LED or LCD or the operation of the transmitter. Over-ride this switch upon activation of a subsequent alarm from an unalarmed device and the NAC devices are activated.

g. Electrical supervision for circuits used for supervisory signal services, such as sprinkler systems, and valves. Ensure that supervision detects any open, short, or ground.

h. Confirmation or verification of all smoke detectors. Ensure that the control panel interrupts the transmission of an alarm signal to the system control panel for a factory-preset period. Ensure that this interruption period is adjustable from 1 to 60 seconds and can be factory-set at [20] [_____] seconds. Ensure that immediately following the interruption period, a confirmation period is in effect during which an alarm signal, if present, is sent immediately to the control panel. Program fire alarm devices, other than smoke detectors without confirmation or verification.

i. An FACP provides supervised addressable relays for HVAC shutdown. Do not provide an override at the HVAC panel.

j. An FACP that provides the monitoring and supervised control outputs needed to accomplish elevator recall.

k. An FACP that monitors [and controls] the fire sprinkler system, or other fire protection extinguishing systems.

l. An FACP and field panels that are software-reprogrammable to enable expansion or modification of the system without replacement of hardware or firmware. Examples of required changes are adding or deleting devices or zones, changing system responses to particular input signals, and programming certain input signals to activate auxiliary devices.

m. Zones for [IDCs] [and] [NACs] are [arranged as indicated on the Contract drawings] [as follows: [______]].

2.1.3 Alarm Functions

*************************************************************************
NOTE: Check with the local fire department to determine which signal or signals are to be transmitted. For zoned fire alarm reporting, the transmitter should be zoned as required by the Authority Having Jurisdiction (AHJ).

List the zones, and indicate the exact wording of the descriptive zone labeling.

Functions e., g., and h. below are optional depending on the job conditions.
*************************************************************************

An alarm condition on a circuit automatically initiates the following functions:

a. Transmission of [a signal] [signals] over the station [telephonic]
[telegraphic] [radio] fire reporting system. The signal is common for any device. The signals are as follows:

b. Visual indications of the alarmed devices on the FACP display [and on the remote audible or visual display].

c. Continuous sounding or operation of alarm notification appliances [only in designated areas] [throughout the building] as required by ASA S3.41.

d. Closure of doors held open by electromagnetic devices.

e. Operation of the smoke control system.

f. Deactivation of the air-handling units [serving the alarmed area] [throughout the building].

g. Shutdown of power to the data processing equipment in the alarmed area.

h. Automatic discharge of the designated fire suppression systems.

Provide a [_____] [15]-second maximum delay for the deluge system, a [_____] [30]-second delay for the wet-pipe system.

2.1.4 Primary Power

Provide operating power as required by Paragraph "Power Supply For The System." Ensure that transfer from normal to emergency power or restoration from emergency to normal power is fully automatic and does not cause a transmission of a false alarm. Ensure the loss of ac power does not prevent transmission of a signal via the fire reporting system upon operation of any initiating circuit.

2.1.5 Battery Backup Power

Provide battery backup power through the use of rechargeable, sealed-type storage batteries and battery charger.

2.1.6 Interface with Existing Fire Alarm Equipment

**************************************************************************

NOTE: If an addition to an existing system is required, provide the make, model number, and other pertinent information on existing components that are to operate with the new equipment. Since new interfaces will have to be compatible with the existing system or with the central fire alarm reporting system, the specification writer may need to delete major items from this specification. A new fire alarm panel must be compatible with the existing central fire alarm reporting system.

Clearly identify the existing Fire Alarm equipment by the fire alarm system designer in the specification and on the drawings.

**************************************************************************

Operate the equipment specified herein as an extension to an existing configuration. Connect the new equipment to [an existing control panel in the existing part of the building] [existing monitoring equipment at the supervising station (Building [______])]. Expand, modify, or supplement
existing [control] [monitoring] equipment to extend the existing [control] [monitoring] functions to the new points or zones. Ensure that the new components are capable of merging with the existing configuration without degrading the performance of either system. The scope of the acceptance tests of the paragraph TESTING includes aspects of operation that involve combined use of both new and existing portions of the final configuration.

2.1.7 Interface with Other Equipment

Furnish interfacing components to connect to subsystems or devices that interact with the fire alarm system, such as supervisory or alarm contacts in suppression systems, operating interfaces for smoke control systems, door releases, and [____].

2.1.8 System Operation

Furnish a complete description of the system operation [in matrix format] on the drawings.

**************************************************************************

NOTE: To ensure system reliability, locate the supply and return portions of the Style 6 loop in separate rooms or shafts, with enough separation that a single fire does not involve both the supply and return portions of the loop.

**************************************************************************

Ensure that the system is a complete, supervised, noncoded, analog or addressable fire alarm system conforming to NFPA 72. Provide the system with an interconnected riser loop or network having Style [6] [____] supervision that is not located in the same room or shaft. Ensure that the return portion of the loop is remote from the supply portion of the loop. Where the building has two stairs for egress from floors above grade, ensure that a single impairment cannot adversely affect more than one floor. Where three or more stairs are provided for egress from floors above grade, ensure that a single impairment cannot adversely affect more than one-half of any floor. Ensure that any single impairment of the system does not affect the system on more than [one] [one-half] of any floor. Operate the system in the alarm mode upon actuation of any alarm initiating device. Ensure that the system remains in the alarm mode until initiating device(s) are reset and the FACP is manually reset and restored to normal. Ensure that the system provides the following functions and operating features:

a. Power, annunciation, supervision, and control for the system.

b. Style [B] [____] IDCs [for conductor lengths of 3050 mm 10 feet or less].

e. Style [Z] [____] NACs that synchronize the flash rates with the visual alarm notification appliances.

f. Electrical supervision of; the primary power (AC) supply, presence of the battery, battery voltage, and placement of system modules within the control panel.
g. An audible and visual trouble signal to activate upon a single break or open condition, or ground fault. Ensure that the trouble signal also operates upon loss of primary power (AC) supply, absence of a battery supply, low battery voltage, or removal of alarm or supervisory panel modules. Provide a trouble alarm silence feature that silences the audible trouble signal, without affecting the visual indicator. After the system returns to normal operating conditions, ensure that the trouble signal again sounds until the trouble is acknowledged. Provide a smoke sensor that does not initiate a trouble condition while its ability to detect smoke is being verified.

h. A notification appliance silencing switch that, when activated, silences the audible signal appliance, but does not affect the visual alarm indicator, the LCD, or the automatic notification of the [fire department] [central station service]. Override this switch upon activation of a subsequent alarm.

j. Programming capability via switches in a locked portion of the FACP to bypass the automatic NACs, [fire reporting system] [air handler shutdown] [smoke control operation] [elevator recall] [door release] [door unlocking] features. Ensure the operation of this programming indicates this action on the FACP display and printer output.

k. Automatic transmission of alarm, supervisory, and trouble signals to [the fire department] [a UL-listed central station].

l. Alarm functions that override trouble or supervisory functions and supervisory functions that override trouble functions.

m. Ability to be programmed from the panel’s keyboard and to store programmed information in nonvolatile memory.

n. Ability to operate, supervise, and monitor both addressable and nonaddressable alarms and supervisory devices.

o. Ability for all addressable devices to be in alarm simultaneously.

p. An addressable fire alarm relay that is within 915 mm 3 feet of each corresponding emergency control device, where the fire alarm system is responsible for initiating an action in another emergency control device or system, such as [an HVAC system] [an atrium exhaust system] [a smoke control system] [an elevator system].

**************************************************************************
NOTE: Show the following in matrix format either in this specification or on the drawings. If a matrix is provided, omit subparagraphs q, r, and s.
**************************************************************************

q. An alarm signal that automatically initiates the following functions:

(1) Transmission of an alarm signal to [the fire department] [a UL-listed central station].

(2) Visual indication of the device operated on the fire alarm control
UFGS panel (FACP), [VDU,] [and graphic annunciator]. [Indication on the graphic annunciator is by floor, zone, or circuit, and by type of device.]

**************************************************************************
NOTE: In high-rise buildings whose fire alarm systems provided full sprinkler protection, the fire alarm notification appliances should operate only on the fire floor, on the one or two floors above and on the floor below. In buildings that have some fire protection or life safety concerns but the building can be evacuated quickly, the fire alarm system should operate all notification appliances in the building upon a fire alarm. In those buildings designed for total evacuation due to fire protection or life safety concerns, the system should be designed so that it can easily be modified when the fire protection or life safety improvements have been made.
**************************************************************************

(3) [Continuous actuation of all alarm notification appliances, except those in stairs or in elevator cabs. ] [Continuous actuation of alarm notification appliances on the floor of fire alarm origin, the floor above the floor of fire alarm origin, and the floor below the floor of fire alarm origin, except those in stairs or in elevator cabs.]

[ (4) Recording of the event via the system printer. ]

[ (5) Release of doors held open by electromagnetic devices. ]

[ (6) Operation of the [smoke control system] [atrium exhaust system]. ]

[ (7) Release of power to electric locks on doors that are part of the means of egress. ]

[ (8) Operation of a smoke sensor that automatically recalls elevators. ]

[ (9) Operation of a duct smoke sensor that shuts down the appropriate air handler in accordance with NFPA 90A. ]

**************************************************************************
NOTE: Use this paragraph only where a sensor or detection system is to release a special fire extinguishing system.
**************************************************************************

[ (10) Operation of [_____] that releases the [_____] fire extinguishing system after a [_____] -second delay. ]

[ (11) In an elevator machinery room, operation of a sprinkler waterflow switch that operates shunt trip circuit breaker(s) to shut down power to the elevators in accordance with ASME A17.1/CSA B44. ]

[ (12) Operation of an interface, that operates vibrating pagers worn by hearing-impaired occupants. ]

r. A supervisory signal that automatically initiates the following
functions:

(1) Visual indication of the device operated on the FACP [VDU,] and on the graphic annunciator, and sound the audible alarm at the respective panel.

(2) Transmission of a supervisory signal to [the fire department] [a UL-listed central station].

(3) Recording of the event via the system printer.

A trouble condition that automatically initiates the following functions:

(1) Visual indication of the system trouble on the FACP [VDU,] and graphic annunciator, and actuation of the audible alarm at the respective panel.

(2) Transmission of a trouble signal to [the fire department] [a UL-listed central station].

(3) Recording of the event via the system printer.

Maximum permissible elapsed time of 15 seconds between the actuation of an initiating device and its indication at the FACP.

The maximum elapsed time of 200 seconds between the occurrence of the trouble condition and its indication at the FACP.

2.1.9 System Monitoring

2.1.9.1 Valves

Electrically monitor each valve affecting the proper operation of a fire protection system, including automatic sprinkler control valves, standpipe control valves, sprinkler service entrance valve, valves at fire pumps, and valves at backflow preventers, whether existing or supplied under this Contract, to verify its proper position. Except where a maximum of [5] [_____] tamper switches within the same room can use the same address, provide each tamper switch with a separate address.

2.1.9.2 Independent Fire Detection System

Monitor each existing independent smoke detection subsystem and kitchen fire extinguishing system for the presence of an alarm condition and a trouble condition. Provide each monitored condition with a separate address.

2.1.10 Detail Drawings

Submit detail drawings consisting of a complete list of equipment and material, including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions. Note that the Contract drawings show layouts based on typical detectors. Check the layout based on the actual detectors to be installed and make any necessary revisions in the detail drawings. Note that the detail drawings also contain complete wiring and schematic diagrams for the equipment furnished, equipment layout, and any other details required to demonstrate that the system has been coordinated and functions properly as a unit. Prepare a detailed
point-to-point wiring diagram signed by a registered PE or a NICET-certified Level [3] [4] fire alarm technician showing points of connection. In the diagram include connections between system devices, appliances, control panels, supervised devices, and equipment that is activated or controlled by the panel.

Furnish point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. In the diagrams show connections from field devices to the FACP and remote fire alarm control units, initiating circuits, switches, relays, and terminals.

Furnish a plan view drawing showing device locations, terminal cabinet locations, junction boxes, other related equipment, conduit routing, wire counts, circuit identification in each conduit, and circuit layouts for all floors.

Furnish complete riser diagrams indicating the wiring sequence of devices and their connections to the control equipment. Include a color code schedule for the wiring. Include floor plans showing the locations of devices and equipment.

Include annotated catalog data, in table format on the drawings, showing manufacturer's name, model, voltage, and catalog numbers for equipment and components.

2.2 EQUIPMENT

2.2.1 Addressable Interface Devices

Provide an addressable input interface to the FACP for monitoring normally open or normally closed contact devices, such as waterflow switches, valve supervisory switches, fire pump monitoring, independent smoke detection systems, and relays for output function actuation.

2.2.2 Fire-Detecting Devices

**************************************************************************
NOTE: Remove last sentence when not applicable.
**************************************************************************

**************************************************************************
NOTE: Provide smoke sensors only in spaces where MIL-HDBK-1008 specifically requires smoke sensors.
**************************************************************************

Ensure that fire-detecting devices comply with the applicable requirements of NFPA 72, NFPA 90A, UL 268, UL 268A, and UL 521. Provide the detectors as indicated. Ensure the detector bases have screw terminals for making connections and no soldered connections. Provide a remotely visible indicator LED or LCD for concealed detectors such as those above ceilings or in raised floors. Ensure that addressable fire-detecting devices, except flame detectors, are dynamically supervised and uniquely identified in the control panel. Ensure that all fire-alarm-initiating devices are individually addressable, except where indicated. Ensure the installed devices conform to NFPA 70 hazard classification of the area where the devices are installed.
2.2.2.1 Heat Detectors

Provide heat detectors for detection of fire by [fixed temperature] [combination fixed-temperature and rate-of-rise principle] [rate-compensating principle]. Rate heat detector spacing in accordance with UL 521. For detectors located in areas subject to moisture, exterior atmospheric conditions, or hazardous locations [as defined by NFPA 70] [and] [as shown on drawings], provide types approved for such locations. Ensure that heat detectors located in attic spaces or in similar concealed spaces below the roof are rated for intermediate temperature.

a. Combination Fixed-Temperature and Rate-of-Rise Detectors

Provide detectors for [surface] [semiflush] outlet box mounting that are supported independently of wiring connections. Provide contacts that are self-resetting after response to rate-of-rise principle. For detectors under fixed temperature actuation, provide a permanent external indication that is readily visible. For detector units located in boiler rooms, showers, or other areas subject to abnormal temperature changes, provide units operating on fixed-temperature principles only. The UL 521 test rating for the fixed-temperature portion is [57.2] [_____] degrees C [135] [_____] degrees F [as shown]. The UL 521 test rating for the rate-of-rise detectors is rated for 15 by 15 m 50 by 50 ft.

b. Rate Compensating Detectors

Provide [surface] [flush]-mounted [vertical] [horizontal]-type detectors, with outlet boxes supported independently of wiring connections. Ensure that detectors are hermetically sealed and automatically resetting. Rate-compensated detectors are rated for 15 by 15 m 50 by 50 ft.

c. Fixed Temperature Detectors

Design detectors for [surface] [semiflush] outlet box mounting and supported independently of wiring connections. Design detectors to detect high heat. Provide detectors with a specific temperature setting of [57.2] [_____] degrees C [135] [_____] degrees F [as shown]. The UL 521 test rating for the fixed-temperature detectors is 15 ft by 15 ft.

2.2.2.2 Photoelectric Smoke Sensors

Provide addressable photoelectric smoke sensors as follows:

a. Provide analog or addressable photoelectric smoke sensors using the photoelectric-light scattering principle for operation in accordance with UL 268. List smoke sensors for use with the FACP.

b. Provide self-restoring-type sensors that do not require any
readjustment after actuation at the FACP to restore them to normal operation. Use sensors that are UL-listed as smoke-automatic fire sensors.

c. Install rust-resistant and corrosion-resistant components. Ensure that vibration has no effect on the sensor's operation. Protect the detection chamber with a fine-mesh metallic screen that prevents the entrance of insects or airborne materials. Ensure that the screen does not inhibit the movement of smoke particles into the chamber.

d. Provide twist-lock bases for the sensors. Ensure that the sensors maintain contact with their bases without the use of springs. Provide a companion mounting base with screw terminals for each conductor. Terminate field wiring on the screw terminals. Provide sensors with a visual indicator to show actuation.

e. Ensure that the sensor address identifies the particular unit, its location within the system, and its sensitivity setting. Provide low voltage sensors rated for use on a 24 V dc system.

f. For each initiating device, ensure that a control panel operator with a proper access level, can manually access the following information.

(1) Primary status

(2) Device type

(3) Present average value

(4) Present sensitivity selected

(5) Sensor range (such as normal, dirty)

2.2.2.3 Combination Smoke-and-Heat Detectors

Provide combination smoke-and heat-detectors with an audible (self-contained) device designed for detection of abnormal smoke densities by the photoelectric principle and abnormal heat by a fixed-temperature sensor. Provide smoke detectors with an LED light source. Ensure that LED failure does not cause an alarm condition and that the sensitivity is factory-set at a nominal [3] percent and requires no field adjustments of any kind. Ensure that the heat detector portion is a fixed-temperature sensor rated at 57 degrees C 135 degrees F. Provide audible appliances that have a minimum sound output of at least [85] dBA at 3.05 m 10 feet. Provide detectors that contain a visible indicator LED that shows when the unit is in alarm condition. Provide detectors that are not adversely affected by vibration or pressure. Provide heat detectors that connect to a control panel [SLC] [IDC] and that are [non-restorable] [self-restorable].

2.2.2.4 Flame Detectors

**************************************************************************
NOTE: Modify these paragraphs as necessary to indicate that detectors placed in an explosive environment are approved for use in the appropriate class, division, and group environment as defined in NFPA 70 and as shown on drawings.
**************************************************************************
Ensure that detectors comply with FM APP GUIDE. Provide detectors sensitive to the micron range best suited for their intended use. Ensure that detectors operate over electrically supervised wiring circuits and that the loss of power to the detector results in a trouble signal. Provide a self-test feature for each detector to be individually tested.

a. Infrared (IR) Single-Frequency Flame Detector

**************************************************************************

NOTE: The single-frequency IR flame detector has the advantage of a fast response and is moderately sensitive. Its disadvantages are being affected by temperature extremes and being subject to false alarms from a myriad of IR sources.
**************************************************************************

Provide a detector sensitive in the range of [_____] to [_____] micrometers only.

b. IR Dual-Frequency Flame Detector

**************************************************************************

NOTE: The IR dual-frequency flame detector has the advantages of a moderately fast response, moderate sensitivity, and a lower false alarm rate. The disadvantage is the detector is affected by temperature extremes.
**************************************************************************

Provide an IR detector that consists of two or more IR sensors, each selected for a different IR frequency. Ensure that the primary sensor is sensitive in the range of [_____] to [_____] micrometers only. Ensure that the secondary sensors are tuned to different IR wavelengths to null out the effect of blackbody radiation to the primary sensor.

c. Ultraviolet (UV) Flame Detectors

**************************************************************************

NOTE: Ultraviolet (UV) flame detectors can be set to respond accurately to UV-wavelength light produced by flame from both indoors and outdoors. UV flame detectors operate on the Geiger-Muller principle. These gas-filled vacuum tubes respond in the UV portion of the spectrum but can ignore UV radiation from the sun because the upper response range of the detector falls below the range of UV radiation that reaches Earth.

Solid-state UV detectors are available, but their spectral response extends into the Sun's UV range and they are not recommended for external use.

UV detectors have an 80 to 90 degree cone of vision. The UV detector has a fast response time and usually is not affected by rain, wind, snow, high humidity, or extreme temperature or pressure. UV units produce false alarms if exposed to arc welding or X-ray and gamma radiation. UV units can
also be blinded by oil film or smoke. UV flame
detectors that are used in dirty and dusty
environments should be equipped with automatic
self-test and self-cleaning devices. The cleaning
device uses a stream of clean air across the lens
surface to minimize the buildup of contaminants.

Provide a UV flame detector that operates on radiated UV energy and is
sensitive in the range of [_____] to [_____] micrometers only. Ensure that the
cone of vision is 80 degrees or greater. Ensure that each detector is
completely insensitive to light sources in the visible frequency range.

d. Combination UV-IR Flame Detector

NOTE: Combination UV-IR flame detectors have been
used both inside and outside to detect fires, but
are slower to react than individual units.

Provide a flame detector that requires both UV and IR flame detection
before an alarm is sent. Ensure that the UV sensor is sensitive in the
range of 0.185 to 0.265 micrometers only. Ensure that the IR sensor is
sensitive in the range of [_____] to [_____] micrometers only. Ensure that the
detectors are completely insensitive to light sources in the visible
frequency range.

[2.2.2.5 Duct Smoke Sensors

Duct smoke sensors are analog or addressable photoelectric type smoke
sensors as described in paragraph "photoelectric Smoke Sensors" in ductwork
in accordance with NFPA 90A and in accordance with manufacturer's
recommendations.

]2.2.3 Electric Power

2.2.3.1 Primary Power

Provide primary power for the FACP from the normal ac service to the
building [where shown on the drawings] [or] [____]. Ensure that power is
120 V ac service. Make the service connection for the FACP at the [main
service switchgear] [emergency distribution panel where shown] [a main
distribution panel where shown]. Provide equipment to protect against
power surges. Provide a separate NEMA 1 "general purpose enclosure" for
the circuit breaker. Paint the circuit breaker enclosure red, and
permanently affix a red and white engraved plastic sign reading "FIRE ALARM
SYSTEM" to the face of the switch. Provide an enclosure with a lockable
handle or cover.

[2.2.3.2 Generator

Where an emergency generator provides a standby power supply for life
safety system circuits, provide a connection from one of the circuits for
the fire alarm system.

]2.2.4 Emergency Power Supply

Provide for system operation in the event of primary power source failure.
Ensure that transfer from normal to auxiliary (secondary) power or restoration from auxiliary to normal power is automatic and does not cause transmission of a false alarm.

2.2.4.1 Storage Batteries

Provide sealed, maintenance-free, [lead-calcium] [sealed lead acid] [gel cell] [nickel-cadmium] [lithium] batteries as the source for emergency power to the FACP. Ensure that batteries contain suspended electrolyte. Maintain the battery system in a fully charged condition by means of a solid-state battery charger. Provide batteries with overcurrent protection in accordance with NFPA 72. Provide separate battery cabinets that have a lockable, hinged cover similar to the fire alarm panel. Key the lock the same as the FACP. Paint cabinets to match the FACP.

Locate batteries [at the bottom of the panel] [in a separate battery cabinet]

2.2.4.2 Capacity

**************************************************************************
NOTE: The fire alarm system may interface with auxiliary systems or subsystems; ensure that adequate battery backup is available, if the fire alarm system provides the power.

NOTE: Use 48 hours if the building has no generator providing standby power to the fire alarm system. If such a generator exists, use 4 hours.
**************************************************************************

Ensure that the batteries have the capacity, with primary power disconnected, to operate the fire alarm system for [48][_____] hours and, after this period, to operate all components of the system, including all alarm signaling devices in the total alarm mode, for a at least [10][15] minutes.

2.2.4.3 Battery Chargers

Provide a solid-state, fully automatic, variable-charging rate battery charger capable of providing 150 percent of the connected system load and maintaining the batteries at full charge. Ensure that when the batteries are fully discharged, the charger recharges the batteries back to 95 percent of full charge within 48 hours. Provide a pilot light to indicate when batteries are manually placed on a high-rate of charge as part of the unit assembly if a high rate switch is provided.

2.2.4.4 Battery Power Calculations

Verify that battery capacity exceeds supervisory and alarm power requirements by furnishing the following:

a. Complete battery calculations for both the alarm and supervisory power requirements. Submit ampere hour requirements for each system component with the calculations.

b. Data on each circuit to indicate that there is sufficient spare capacity for notification appliances and [25] [50]-percent spare capacity for initiating devices. Note data for each circuit on the
[ c. Data to indicate that the amplifiers have sufficient capacity to simultaneously drive fire alarm speakers at their 1/2 watt tap plus 50-percent spare capacity. Note data for each circuit on the drawings.

] d. Voltage drop calculations for NACs to indicate that sufficient voltage is available for required appliance operation.

2.2.5 System Field Wiring

2.2.5.1 Terminal Cabinets

**************************************************************************

NOTE: Provide terminal cabinets on each floor where the fire alarm system supply riser is located and where the fire alarm return riser is located.

**************************************************************************

Provide a terminal cabinet at 200 mm by 200 mm least 8 inches by 8 inches at the base of any circuit riser, on each floor at each riser, and where indicated on the drawings. Select a terminal size appropriate for the size of the wiring to be connected. Label conductor terminations and permanently mount a drawing showing conductors, their labels, their circuits, and their interconnection in the terminal cabinet.

2.2.5.2 Alarm Wiring

**************************************************************************

NOTE: Do not penetrate the perimeters of sensitive compartmented information facilities (SCIFs) with copper signal line circuits. SCIF penetrations should be either fiber-optic cable or IDCs. IDCs that penetrate the SCIF are filtered.

**************************************************************************

Provide wiring that conforms with NFPA 70.

Provide [fiber-optic] [or] [copper] cable for field wiring of SLCs and IDCs in accordance with the manufacturers requirements. for NACs, that contain audible alarm devices, [other than speakers,] provide solid copper No. 14 AWG size conductors at a minimum. [For speaker circuits provide copper No. [16] [_____] AWG size conductors at a minimum.] [For firefighter telephone circuits provide No. [16] [18] [_____] AWG size conductors at a minimum.] Select a wire size sufficient to prevent voltage drop problems. For power wiring operating at 120 V ac minimum, provide No. 12 AWG solid copper having similar insulation. Use shielded wiring where recommended by the manufacturer. For shielded wiring, ground the shield at only one point, which is in or adjacent to the FACP. T-taps are permitted in Style 4 circuits with interconnections occurring on terminal strips or using screw terminal blocks for Style 5 addressable systems.

Color-code circuits, and maintain coding throughout the circuit. Similarly color-code conductors used for the same functions so that code colors remain uniform throughout the circuit.

2.2.5.3 Conduit

Provide conduit and fittings that comply with NFPA 70, UL 6, UL 1242, and
2.2.5.4 Conductor Terminations

Label conductors at terminal blocks in terminal cabinets, FACP, and remote fire alarm control units at each conductor connection. Provide a shrink-wrap label for each conductor or cable for a unique and specific designation. In each terminal cabinet, FACP, and fire alarm control unit mount a laminated drawing in at least 12 point lettering, that indicates each conductor, its label, its circuit, and its terminal, so that the drawing does not interfere with the wiring or terminals. Maintain the existing color code scheme where connecting to existing equipment.

2.2.5.5 Wiring to Station Telegraphic Fire Alarm Circuit

Provide wiring from the master fire alarm box to the station telegraphic fire alarm circuit with a two-conductor No. [12] [10] [_____] AWG-type UF cable [in conduit].

2.2.6 Fire Alarm Control Panel (FACP)

**************************************************************************
NOTE: For high-rise buildings, locate the FACP in an emergency control center having one door opening to the outside.
**************************************************************************

Provide a control panel that complies with the applicable requirements of UL 797.

Provide a complete control panel fully enclosed in a lockable steel enclosure. If more than a single unit is required at a location to form a complete control panel, match the unit enclosures exactly. [If more than a single unit is required, and is located in the lobby or entrance, notify the [_____] Division] [EFA [_____] Fire Protection Engineer, via the Contracting Officer, before installing the equipment.] Ensure that each control unit provides power, supervision, control, and logic for the entire system, using solid-state, modular components, internally mounted and arranged for easy access. Provide visual annunciation for a LED or LCD visual display as an integral part of the control panel and identify with a word description and ID number each device. Ensure that each control unit is suitable for operation on a 120 V, 60 hz, building power supply. Provide each panel with supervisory functions for power failure, internal component placement, and operation. Provide visual indication of alarm, supervisory, or trouble initiation on the FACP is by LED or LCD.

2.2.6.1 Cabinet

Install control panel components in cabinets large enough to accommodate all components. If more than one modular unit is required to form a control panel, install the units in a single cabinet large enough to
accommodate the units. Allow ample gutter space for interconnection of panels, as well as field wiring. Locate the LED or LCD displays on the exterior of the cabinet door or make them visible through the cabinet door. Place the cabinet in a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and surface mounting provisions.

2.2.6.2 Control Modules

Provide power and control modules to perform all functions of the FACP. Provide audible signals to indicate any alarm, supervisory, or trouble condition. Ensure that the alarm signals are different from the trouble signal. Connect circuit conductors entering or leaving the panel to screw-type terminals, and mark each terminal for identification. Locate diodes and relays, if any, on screw terminals in the FACP.

2.2.6.3 Addressable Control Module

Ensure that the control module is capable of operating as a relay (dry-contact form C) for interfacing the control panel with other systems, and to control door holders or initiate elevator fire service. Ensure that the module is UL-listed as compatible with the control panel. Configure the indicating device or the external load being controlled as a Style Y NAC. Ensure that the system is capable of supervising the audible, visual and dry-contact circuits. Ensure that the control module has both an input and output address. Ensure the system can detect a short on the supervised circuit and prevent power from being applied to the circuit. Ensure that the control module's means of address setting is compatible with the control panel's SLC supervision and the control module stores an internal identifying code. Ensure that the control module contains an integral LED that flashes each time the control module is polled. [Connect the existing fire alarm system NACs to a single module to power and supervise the circuit.]

2.2.6.4 Addressable IDC Module

Configure the initiating device being monitored as a [Style D] [Style B] IDCs. The system is capable of defining any module as an alarm module and report alarm trouble, loss of polling, or as a supervisory module, and reporting supervisory short, supervisory open or loss of polling. Ensure that the module is UL-listed as compatible with the control panel. Ensure that the monitor module's means of address setting is compatible with the control panel's SLC supervision and that the monitor module stores an internal identifying code. Ensure that the monitor module contains an integral LED that flashes each time the monitor module is polled. Pull stations with a monitor module in a common backbox are not required to have an LED. [Connect the existing fire alarm system IDCs to a single module to power and supervise the circuit.]

2.2.6.5 Silencing Switches

At the FACP, provide an alarm-silencing switch that silences the audible
signal but does not affect the visual alarm indicator. Override this switch upon activation of a subsequent alarm.

Provide trouble- and supervisory-silencing switch that silences the audible trouble and supervisory signals but does not extinguish the visual indicator. Override this switch upon activation of a subsequent alarm, supervision, or trouble condition.

2.2.6.6 Noninterference

Power and supervise each circuit such that a signal from one device does not prevent the receipt of signals from any other device. Ensure that the circuits can be reset manually by a switch from the FACP after the initiating device or devices have been restored to normal.

2.2.6.7 Fire Alarm Voice Message

**************************************************************************
NOTE: Use the proper bracketed item depending upon whether the fire alarm system is to cause total evacuation upon an alarm.
**************************************************************************

Ensure that a fire alarm activates the NACs. Ensure that textual audible appliances produce a slow whoop tone for three cycles, followed by a voice message that is repeated until the control panel is reset or silenced. Broadcast automatic messages through speakers on appropriate floors, but not in stairs or elevator cabs. Automatically activate the visual strobes, and broadcast audible messages on the floor of fire alarm origin, [the floor] [two floors] immediately above the floor of fire alarm origin, and the floor immediately below the floor of fire alarm origin. Ensure the ability to override the automatic audible output through use of a microphone input at the control panel for a live broadcast message. Ensure that the ability to broadcast live messages from a microphone through speakers in stairs, in elevator cabs, and throughout a selected floor or floors. Ensure the system is capable of operating all speakers at the same time. Ensure that the digitized voice message consists of a nonvolatile (EPROM) microprocessor-based input to the amplifiers. Ensure that the microprocessor actively interrogates the circuitry, field wiring, and digital coding necessary for the immediate and accurate rebroadcasting of the stored voice data into the appropriate amplifier input. Ensure that loss of operating power, loss of supervisory power, or any other malfunction that could render the digitized voice module inoperative automatically causes the slow whoop tone to take over all functions assigned to the failed unit.

Use a [male] [female] voice for messages as follows:

[ "May I have your attention, please. May I have your attention, please. A fire has been reported that may affect your floor. Please walk to the nearest exit and evacuate the building." (Provide a [2] [_____] -second pause.) "May I have your attention, please (repeat the message)."

]["May I have your attention, please. May I have your attention please. A fire emergency has been reported in the building. Please leave the building by the nearest exit or exit stairway. Do not use the elevators." (Provide a [2] [_____] -second pause.) "May I have your attention please (repeat the message)."

SECTION 28 31 13.00 40 Page 33
2.2.6.8  Fire Alarm Signal

Ensure that a fire alarm activates notification appliances throughout the building. Audible devices are fire alarm horns that produce a [three-pulse temporal pattern] [continuous slow whoop tone] [______]. Visual devices are strobes operating in accordance with NFPA 72.

2.2.6.9  Memory

Provide each control unit with nonvolatile memory and logic for all functions. Do not consider the use of long-life batteries, capacitors, or other age-dependent devices as equal to nonvolatile processors, PROMs, or EPROMs.

2.2.6.10  Field Programmability

Provide control units and control panels that are fully field-programmable for control, initiation, notification, supervisory, and trouble functions of both input and output. Ensure that the system program configuration is menu-driven and the system changes are password-protected.

2.2.6.11  Input/Output Modifications

Ensure that the FACP features allow the bypassing of input devices from the system or the modification of system outputs. Provide a panel-mounted keypad [and a keyboard]. Ensure that any bypass of or modification to the system indicates a trouble condition on the FACP,[ and on the VDU] [and a produces a printed output of the trouble condition].

2.2.6.12  Resetting

Provide the controls necessary to prevent the resetting of any alarm, supervisory, or trouble signal while the alarm, supervisory, or trouble condition on the system still exists.

2.2.6.13  Instructions

Provide a typeset or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless-steel or aluminum frame. [Install the instructions on the interior of the FACP.] [Install the frame in a conspicuous location observable from the FACP.] On the card, show those steps to be taken by an operator when a signal is received, as well as the functional operation of the system under all conditions: normal, alarm, supervisory, and trouble. Ensure that the instructions are approved by the Contracting Officer before being posted.

2.2.6.14  Walk Test

Ensure that the FACP has a walk test feature. When this feature is used, ensure that operation of initiating devices results in limited system outputs, so that the notification appliances operate for only a few seconds, that the event is indicated on the system printer, but that no other outputs occur.

2.2.6.15  History Logging

Ensure that the control panel has the ability to store a minimum of 400 events in a log. Ensure that these events are stored in a battery-protected memory and remain in the memory until the memory is
downloaded or cleared manually. Ensure that resetting of the control panel does not clear the memory.

2.2.7 Remote Fire Alarm Control Units

Provide complete remote control units fully enclosed in a lockable steel enclosure. Perform operations required for testing or for normal care and maintenance of the control units from the front of the enclosure. If more than a single unit is required at a location to form a complete control panel, match the unit enclosures exactly. Ensure that each control unit provides power, supervision, control, and logic for its portion of the entire system, using solid-state, modular components, internally mounted and arranged for easy access. Ensure that each control unit is suitable for operation on a 120 V, 60 Hz, normal building power supply. Provide each unit with supervisory functions for power failure, internal component placement, and operation.

2.2.7.1 Cabinet

Install remote control unit components in cabinets large enough to accommodate components and also to allow ample gutter space for interconnection of units as well as field wiring. Provide a rigid plastic phenolic resin, or metal identification sign that reads "Remote Fire Alarm Control Unit" in letters at least 2.5 cm 1 inch high. Provide prominent rigid plastic or metal identification plates for lamps, circuits, meters, fuses, and switches. Place the cabinet in a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and surface mounting provisions.

2.2.7.2 Control Modules

Provide power and control modules to perform all functions of the remote control unit. Provide audible signals to indicate any alarm or trouble condition. Ensure that the alarm signals are different from the trouble signal. Connect circuit conductors entering or leaving the panel to screw-type terminals, and mark each terminal for identification. Locate diodes and relays, if any, on screw terminals in the remote control unit. Ensure that circuits operating at 24 V dc do not operate at less than 21.6 V. Ensure that circuits operating at any other voltage do not have a voltage drop exceeding 10 percent of nominal voltage. Arrange circuits so that there is 25-percent spare capacity for any circuit.

2.2.7.3 Remote System Audible or Visual Display

**************************************************************************
NOTE: Provide a remote audible or visual display when the control panel is located in an area where the control panel's integral signaling normally cannot be heard or seen.
**************************************************************************

Provide audible appliances that have a minimum sound level output rating of [85] [_____] dBA at 3.05 m 10 feet and that operate in conjunction with the panel's integral display. Ensure that a system-silence switch on the remote system can silence the audible device but does not extinguish the visual indication. Ensure that the remote visual appliance located with the audible appliance is not extinguished until the trouble or alarm has been cleared. Ensure that the remote LED or LCD visual display provides identification, consisting of the word description and ID number for each
device as displayed on the control panel. Provide a rigid plastic, phenolic or metal identification sign that reads "Fire Alarm System Remote Display" at the remote audible or visual display.

2.2.7.4 Silencing Switches

At the remote control unit, provide an alarm-silencing switch that silences the audible signal but does not affect the visual alarm indicator. Override this switch upon activation of a subsequent alarm.

Provide a trouble- and supervisory-silencing switch that silences the audible trouble and supervisory signal but does not extinguish the visual indicator. Override this switch upon activation of a subsequent trouble or supervisory signal.

2.2.7.5 Noninterference

Power and supervise each circuit such that a signal from one device does not prevent the receipt of signals from any other device. Ensure that circuits can be reset manually by a switch from the remote control unit after the initiating device or devices have been restored to normal.

2.2.7.6 Memory

Provide each control unit with nonvolatile memory and logic for all functions. Do not consider the use of long-life batteries, capacitors, or other age-dependent devices as equal to nonvolatile processors, PROMs, or EPROMs.

2.2.7.7 Field Programmability

Provide control units that are fully field-programmable for control, initiation, supervisory, and trouble functions of both input and output. Ensure that the system program configuration is menu-driven, and that system changes are password protected. Accomplish changes using personal-computer based equipment.

2.2.7.8 Input/Output Modifications

Each remote control unit contains features that allow the elimination of input devices from the system or the modification of system outputs. Ensure that any such modification indicates a trouble condition on the remote control unit and on the FACP, and produces a printed output of the trouble condition.

2.2.7.9 Resetting

Prevent the resetting of any alarm, supervisory, or trouble signal while the alarm, supervisory, or trouble condition on the system still exists.

2.2.7.10 Instructions

Provide a typeset or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless-steel or aluminum frame. [Install the frame in a conspicuous location observable from the remote fire alarm control unit.] On the card, show those steps to be taken by an operator when a signal is received, as well as the functional operation of the system under all conditions: normal, alarm, supervisory, and trouble. Ensure that the instructions are approved by the Contracting Officer before
being posted.

[2.2.7.11  Walk Test

Provide each remote control unit with a walk test feature. When this feature is used, ensure that operation of initiating devices results in limited system outputs, so that the notification appliances operate for only a few seconds, that the event is indicated on the system printer, but that no other outputs occur.

]2.2.7.12  History Logging

Ensure that the control panel has the ability to store a minimum of 400 events in a log. Ensure that these events are stored in a battery-protected memory and remain in the memory until the memory is downloaded or cleared manually. Ensure that resetting of the control panel does not clear the memory.

[2.2.8  Amplifiers, Preamplifiers, Tone Generators

House any amplifiers, preamplifiers, tone generators, digitized voice generators, and other hardware necessary for a complete, operational, textual audible circuit conforming to NFPA 72 in a fire alarm control unit, in a terminal cabinet, or in the FACP. Ensure that the system automatically operates and controls all building fire alarm speakers except those installed in the stairs and within elevator cabs. Operate the speakers in the stairs and elevator cabs only when the microphone is used to deliver live messages. Provide each amplifier with two channels: one for broadcasting a message and the other for paging.

[2.2.8.1  Construction

Use computer-grade solid state components for amplifiers. Provide output protection devices sufficient to protect the amplifier against any transient up to 10 times the highest rated voltage in the system.

]2.2.8.2  Inputs

Equip each system with separate inputs from the tone generator, digitized voice driver and panel-mounted microphone. Use low-impedance, balanced line microphone. Ensure that both the microphone input and the tone generator input are operational on any amplifier.

]2.2.8.3  Tone Generator

Provide a tone generator of the modular, plug-in type, with attached labels to identify the component as a tone generator and to identify the specific tone that the generator produces. Ensure that the tone generator produces a slow whoop tone, which slowly ascends from low (500 Hz) to high (1200 Hz), and constantly repeats until interrupted by the digitized voice message, the microphone input, or the alarm silence mode. Ensure that each slow whoop cycle lasts approximately 4 seconds. Ensure that the tone generator is single-channel with one automatic backup generator per channel such that failure of the primary tone generator causes the backup generator to automatically take over the functions of the failed unit and also causes transfer of the common trouble relay.
[2.2.8.4] **Protection Circuits**

Constantly supervise each amplifier for any condition that could render the amplifier inoperable at its maximum output. Ensure that failure of any component causes automatic transfer to a designated backup amplifier, illumination of a visual "amplifier trouble" indicator on the control panel, logging of the condition on the system printer.

[2.2.9] **Video Display Unit (VDU)**

**************************************************************************

NOTE: Contact the EFD or Engineering Field Activity (EFA) Fire Protection Engineer to determine if a VDU is to be provided.

**************************************************************************

Provide a VDU as the secondary operator-to-system interface for data retrieval, alarm annunciation, commands, and programming functions. Ensure that the desk mounted VDU consists of a keyboard and a monitor with a [300] [430] mm [12] [17] -inch minimum [touch] screen, capable of displaying 25 lines of 80 characters each. Supervise communications with the FACP. Record faults on the printer. Ensure that power is 120 V ac, 60 Hz from the same source as the FACP.

To eliminate confusion during an alarm situation, provide dedicated areas on the screen for the following functions:

a. Alarms and returns to normal

b. Commands, reports, and programming

c. Time, day, and date

Use English language throughout to describe system activity and instructions. Provide English language descriptors that define system points and that are 100-percent field-programmable by factory-trained personnel and are alterable and user-definable to accurately describe building areas.

Display alarms and other changes of status in the screen area reserved for this information. Provide the follow information in English:

a. Condition of device (alarm, trouble, or supervisory)

b. Type of device (such as manual pull or waterflow)

c. Location of device plus numerical system address

Upon receipt of an alarm, ensure that an audible alarm sounds and the condition and point type flash until they are acknowledged by the operator. Ensure that returns-to-normal is also annunciated and require operator acknowledgment.

Ensure that the system has multiple levels of priority for displaying alarms to conform with UL 864. Priority levels are as follows:

a. Level 1 - Fire Alarms

b. Level 2 - Supervisory Alarms
c. Level 3 - Trouble Signals

Provide the system with sufficient memory to retain all alarms. Ensure that a highlighted message advises the operator when unacknowledged alarms are in the system.

Provide multiple levels of access for operators and supervisors via user-defined passwords. Provide the following functions in each level:

a. Operator-level access functions:
   1. Display system directory, definable by device.
   2. Display status of an individual device.
   3. Manual command (alarm device with an associated command uses the same system address for both functions).
   4. Report generation, definable by device, and output the report on either the VDU or the printer, as desired by the operator.
   5. Activate building notification appliances.

b. Supervisory-level access functions:
   1. Reset time and date.
   2. Enable or disable event-initiated programs, printouts, and initiators.
   3. Enable or disable individual devices and system components.

Ensure that the above supervisory-level functions do not require computer programming skills. Record changes to system programs on the printer and maintain the changes in the control panel as a trouble condition.

]2.2.10 Graphic Annunciator

******************************************************************************
NOTE: Provide the graphic annunciator at a location convenient for fire department. The annunciator should be near the door through which the firefighters enter the building as indicated in the prefire plan.
******************************************************************************

Provide detailed drawings of the graphic annunciator.

[2.2.10.1 Annunciator Panel

Provide a graphic annunciator that indicates the building floor plan, including the locations of stairs and elevators. Identify stairs and elevators by [letter] [number]. Clearly mark alarm circuit boundaries on the floor plan. Ensure that the graphic annunciator includes a north arrow, [location of the FACP], and a "you are here" indicator and is [a minimum size of 915 by 915 mm 3 feet by 3 feet] [as indicated on the Contract drawings].
2.2.10.2 Indicating Lights

Provide the graphic annunciator with individual LEDs indicating each type of alarm and supervisory device. Provide an amber LED for indicating a system trouble condition and a separate amber LED for indicating a supervisory condition. Provide a green LED to indicate the presence of power and a red LED to indicate an alarm condition. Ensure that the actuation of any alarm signal causes the illumination of a boundary LED, a floor LED, and a device LED. Ensure that supervisory or trouble initiates the illumination of a trouble LED. Also provide LEDs indicating normal power and emergency power. Provide a push-button LED test switch. The test switch does not require key operation. Extinguish annunciator LEDs by operation of the system reset switch on the FACP.

2.2.10.3 Material

Construct the graphic annunciator faceplate of smoked Plexiglas. Backlight the LEDs. House control equipment and wiring in a recessed or semirecessed surface-mounted back box. Chrome-plate or Bronze-plate exposed portions of the back box with knockouts.

2.2.10.4 Programming

Where programming for the operation of the required LEDs is accomplished by a software program separate from the software for the FACP, ensure that the software program does not require reprogramming after loss of power. Ensure that the software is reprogrammable in the field.

2.2.11 System Printers

Provide a system printer to record alarm, supervisory, and trouble conditions without loss of any signal or signals. Ensure that the printer has at least 80 characters per line, has a 96 ASCII character set, and operates on a 120 VAC, 60 Hz power supply. Ensure the the printout is by the circuit, device, and function specified in the FACP.

When the FACP receives a signal, print the alarm, supervisory, and trouble condition. Ensure that the printout includes the type of signal, the circuit or device reporting, the date, and the time of the occurrence. Differentiate alarm signals from other printed indications. When the system is reset, ensure that this condition is also printed including the same information concerning device, location, date, and time. Provide a means to automatically print a list of existing alarm, supervisory, and trouble conditions in the system. If a printer is off-line when an alarm is received, ensure that the system buffer retains and prints the data when the printer is restored to service. Provide the printer with an indicator to alert the operator that the paper has run out.

2.2.12 Firefighter Telephone Communication System

**************************************************************************
NOTE: Provide a master control station at the FACP with remote telephone stations in each stair at each floor landing, in each elevator lobby on each floor, and in elevator cabs. In addition, provide them at specific locations containing essential fire protection equipment, such as in the fire pump room and outside the emergency generator room.
**************************************************************************
Provide a firefighter telephone system as follows:

a. Provide a firefighter telephone communication system with complete, common-talk, closed circuits. Ensure that the system includes, but not be limited to, a master control station mounted in the FACP, a power supply and standby battery system, and remote telephone stations.

b. Provide a master control station that provides power, supervision, and control for wiring, components, and circuits.

(1) Provide a master control station hand set that is red in color and equipped with a 5-foot, strain-relieved coiled cord. Ensure that the act of lifting any remote telephone hand set from its cradle causes both a visual and audible signal to annunciate at the master control station. Ensure that the act of removing the hand set at the master control station and depressing a button at the remote telephone hand set causes the automatic silencing of the audible signal. Ensure that communication between the master control station hand set and all remote hand sets requires the pressing of a push-to-talk switch located on remote hand sets. Ensure that while the master control hand set is removed from its cradle, communication between five remote hand sets and the master control station is possible. Ensure that sets are able to monitor any conversation in progress and join the conversation by pressing the push-to-talk button.

(2) Equip the master control station with a silencing switch and ring-back feature such that any audible trouble signal can be silenced and is so indicated by the lighting of an amber LED. Ensure that once any trouble condition has been corrected, the amber LED is extinguished and the silencing switch sounds again until the switch is restored to its original position. Equip the master control station with a separate, LED-annunciated switch for each telephone circuit. In addition, ensure that LEDs provide for the annunciation of operating and supervisory power. Ensure that the loss of operating or supervisory power causes an audible and visual indication at the master control station and also causes the fire alarm trouble signal to sound on the FACP.

(3) Fully label switches, LEDs, and controls.

c. Provide [surface] [flush]-mounted remote telephone stations. Equip each station with a hinged door that is magnetically locked. Permanently wire each hand set in place with a coiled cord. Ensure that each hand set is red, equipped with a push-to-talk switch and a switch-equipped, storage cradle that, when operated, signals the master control station.

d. Provide operating and supervising power from the same supply circuit or circuits used for the FACP.

2.2.13 Manual Stations

Ensure that addressable manual fire alarm stations conform to the applicable requirements of UL 38. Provide metal or plastic, [semiflush mounted] [surface-mounted], addressable manual stations, that are not subject to operation by jarring or vibration. Ensure that stations are [single] [double] action type. Ensure that stations to latch upon operation and remain latched until manually reset. Equip stations with
screw terminals for each conductor. Do not use stations that require the replacement of any portion of the device after activation. Finish stations in fire-engine red with molded raised lettering operating instructions of contrasting color. Require the use of a key or wrench to reset the station. Match and paint surface-mounted boxes the same color as the [fire alarm manual stations] [mounting surface].

2.2.14 Notification Appliances

[2.2.14.1 Fire Alarm Speakers]

**************************************************************************
NOTE: Locate speakers throughout the building with a maximum spacing of 92.9 square meters 1000 square feet per speaker. Where sound has to pass through more than one partition or wall to be heard in a space, provide an additional speaker.
**************************************************************************

Provide fire alarm speakers conforming to UL 464 with a minimum of three tap settings and separate terminations for each in and out connection. Ensure that tap settings include taps of 1/4, 1/2, and 1 watt. Ensure that speakers use the 1/2-watt tap in the system. Ensure that speakers have an output rating of 84 dBA at 3050 mm 10 feet as determined by the reverberant room test and do not have data on peak output as determined in an anechoic chamber. Ensure speakers can be installed on standard 100 mm 4 inch-square electrical boxes. Where speakers and strobes are provided in the same location, they may be combined into a single wall-mounted unit.

Provide speaker mounting plates constructed of cold-rolled steel having a minimum thickness of 16 gage and equipped for a complete installation. Grind and finish fabrication marks and holes to provide a smooth and neat appearance for each plate. Prime and paint each plate.

[2.2.14.2 Visual Alarm Signals]

**************************************************************************
NOTE: Wall mount strobes in corridors no more than 4570 mm 15 feet from the end of a corridor with 30.48 m 100 feet maximum distance between strobes. Where there is an obstruction to the viewing path in the corridors, such as a cross-corridor door or ceiling elevation change, consider the obstruction as defining a new corridor. Provide wall-mounted strobes in rooms accessible to the public, such as conference rooms, restrooms, courtrooms, cafeterias, and auditoriums in accordance with NFPA 72.
**************************************************************************

Provide strobe light visual alarm signals that operate on a supervised 24 V dc circuit. Provide strobe lenses that comply with UL 1971 and conform to the Americans With Disabilities Act. Disburse the light pattern so that the light is visible above and below the strobe and from a 90-degree angle on both sides of the strobe. Ensure that the strobe flash output is a minimum of [15] [_____] candela based on the UL 1971 test. Ensure that the strobe has a xenon flash tube. Visible appliances may be part of an audiovisual assembly. [ Where more than two appliances are located in the same room or corridor, provide synchronized operation.]

SECTION 28 31 13.00 40  Page 42
2.2.14.3 Fire Alarm Horns

NOTE: Where horns or bells are used for fire alarm notification, calculate the proper locations for these devices as detailed in "Designing Fire Alarm Audibility," which is contained in the Society of Fire Protection Engineers (SFPE) Handbook of Fire Protection Engineering. Submit the calculations at the 35-percent design review.

Provide [surface] [semiflush]-mounted electronic, multitone horns that produce a minimum of four distinct sounds, suitable for use in an electrically supervised circuit. Ensure that horns have a rating of 90 dBA at 3050 mm (10 feet) when tested in accordance with UL 464 while emitting a slow whoop tone. Ensure that the output from the horn is a [three-pulse temporal pattern] [the slow whoop tone] [____]. Where horns and strobes are provided in the same location, they may be combined into a single unit.

2.2.14.4 Fire Alarm Bells

NOTE: Where horns or bells are used for fire alarm notification, calculate the proper locations for these devices as detailed in "Designing Fire Alarm Audibility," which is contained in the Society of Fire Protection Engineers (SFPE) Handbook of Fire Protection Engineering. Submit the calculations at the 35-percent design review.

Provide [surface] [flush]-mounted bells suitable for use in an electrically supervised circuit. Provide 250 mm (10 inch) vibrating bells with a sound output rating of at least 90 dBA at 3050 mm (10 feet) when tested in accordance with UL 464.

2.2.14.5 Connections

Provide screw terminals for each notification appliance. Design terminals to accept the size conductors used in this project without modification.

2.2.14.6 Chimes

NOTE: Chimes are normally used only in hospitals to alert the staff about a fire emergency without arousing the patients. Sound output is low and prevents them from being used in areas having even moderately low noise levels.

Provide electrically operated, supervised, electronic, chimes, with an adjustable frequency of 800 to 1200 Hz. Ensure that chimes have a minimum sound rating of [80] [_____] dBA at 3.05 m (10 feet).

2.2.14.7 Combination Audible/Visual Notification Appliances
NOTE: Combination audible-visual notification appliances satisfy the same requirements as individual units except that the combination appliances mount as a unit in standard backboxes.

Provide factory-assembled units. Any other audible notification appliance employed in the fire alarm systems requires approval by the Contracting Officer.

2.2.14.8 Voice Evacuation System

Provide a voice evacuation system for [one-way] [two-way] voice communications, routing and preamplification of digital alarm tones and voice (digital and analog) messages. Zone the system for messages (custom and prerecorded) and tones as indicated on the drawings. Ensure that the following electronic tones are available from the amplifier: Slow whoop, high/low, horn, chime, beep, stutter, wail and bell. Permit either manual operation from a control switch or automatic operation from the FACP. Accomplish reset by the FACP during a panel reset.

2.2.15 Valve Monitor Switches (Tamper Switches)

Provide a tamper switch for each fire protection system control valve. Ensure that tamper switches are UL-listed as "Extinguishing System Attachment" for the location and type of valve supervised. Ensure that the tamper switch contains double-pole, double-throw contacts. Ensure that operation of the switch causes a supervisory signal to be transmitted to the FACP upon not more than two complete turns of the valve wheel or a closure of 10 percent, whichever is less. Equip tamper switches with screw terminals for each conductor.

2.2.16 Waterflow Detectors

Provide vane-type waterflow detectors for wet-pipe sprinkler systems containing double-pole, double-throw contacts. Equip each detector with a pneumatic time delay, field-adjustable from 0 to 90 seconds. Set the time delay initially to [30] [45] [_____] seconds. Ensure that each detector is a UL-listed extinguishing system attachment rated for the particular pressure and location at which the detector is installed. Equip flow switches with screw terminals for each conductor.

Provide pressure-type waterflow detectors for dry-pipe sprinkler systems containing double-pole, double-throw contacts. Ensure that each detector is a UL-listed extinguishing system attachment rated for the particular pressure and location at which the detector is installed. Equip flow switches with screw terminals for each conductor.

2.2.17 Electromagnetic Door Holders

NOTE: Provide electromagnetic door holders only for cross-corridor doors and for doors likely to be propped open once construction is complete.

Where indicated on the drawings, provide electromagnetic devices to hold fire doors open. Design the electromagnetic holding devices to operate on 120 V ac, and require not more than 3 watts of power to develop 172.4 kPa.
25 psi of holding force. Ensure that the initiation of any fire alarm causes the release of the electromagnetic door-holding device and permits the door to be closed by the door closer. Ensure that the device is UL-listed based on UL 228 tests.

2.2.18 Automatic Transmitters

**************************************************************************

NOTE: State the make and model number of existing proprietary supervising-station receiving equipment.

The choice of code transmitter or radio transmitter depends upon the type of existing fire reporting system at the activity. When telegraphic systems exist, use code transmitters. Determine the type of activity reporting system (such as positive noninterfering or shunt). In most cases, a local energy-tripping device is required.

Contact the facility Fire Department or Engineering office to determine the type and amount of data to be supervised (monitored), that is, type: separate or common transmission of alarm, supervisory, and trouble type signals; amount: all points, all zones, or the combined premises. Verify that existing monitoring equipment has sufficient capacity to support the additional premises or that the monitoring equipment can be expanded to accommodate the new fire alarm system. Identify existing components.

**************************************************************************

2.2.18.1 Telegraphic Transmitter

Submit data and include UL or FM listing cards for equipment provided.

Provide electric-motor-driven or prewound spring transmitters that transmit not less than four rounds of code. When motor-driven transmitters are provided, connect the motor to a supervised circuit in a control panel. Provide metallic or rigid plastic code number plates on the exterior face of transmitters. Design transmitters to provide the same features as the fire alarm boxes for electrically supervised, coded, positive, noninterfering transmissions and to transmit signals on grounded or open circuits. Ensure that when a single open fault on an exterior fire alarm circuit activates the box, the box is idle for only one complete round, and then immediately transmits four complete code rounds via the box earth ground connection. Ensure the transmitters have local-energy-type auxiliary tripping devices. Ensure that the wheel is metallic and that the box code is as directed by the Contracting Officer.

2.2.18.2 Radio Transmitter and Interface Panels

Provide a radio transmitter with antenna that is compatible with the existing supervising-station fire alarm system. Ensure that alarm, supervisory, and trouble conditions can be transmitted via a single transmitter. Provide transmitters in accordance with applicable portions of NFPA 72, NFPA 1221, and Federal Communications Commission (FCC) 47 CFR 90. Contain the transmitter electronics module within the physical housing as an integral, removable assembly. UL-listed transmitter may be
housed in the same panel as the FACP. Provide transmitters capable of initiating a test signal daily at any selected time.

2.2.18.3 Transmitter Power Supply

Power each radio alarm transmitter by a combination of locally available 120 V ac power and a sealed, lead-calcium battery.

Operate each transmitter from 120 V ac power. Ensure that if 120 V ac power is lost, the transmitter automatically switches to battery operation. Accomplish switchover with no interruption of protective service, and automatically transmit a trouble message. Upon restoration of ac power, automatically transfer back to the normal ac power supply.

Ensure the transmitter's standby battery capacity provides sufficient power to operate the transmitter in a normal standby status for a minimum of [72][___] hours and to transmit alarms during that period.

2.2.18.4 Radio Alarm Transmitter Housing

Provide NEMA Type 1 transmitter housing with a lock that is keyed [identical to the fire alarm system for the building.] [identically to radio alarm transmitter housings on the base.] Ensure that the radio alarm transmitter housing is Factory-painted with a suitable priming coat and not less than two coats of a hard, durable, weatherproof enamel.

2.2.18.5 Antenna

Provide [omnidirectional, coaxial, halfwave dipole antennas] [___] for radio alarm transmitters with a driving point impedance to match transmitter output. Ensure that the antenna and antenna mounts are corrosion-resistant and designed to withstand wind velocities of 161 km/h 100 mph. Do not mount antennas to any portion of the building roofing system.

2.2.18.6 Digital Alarm Communicator Transmitter (DACT)

Provide a DACT that is compatible with the existing supervising-station fire alarm system. Ensure that alarm, supervisory, and trouble conditions can be transmitted via a single transmitter. Provide a power source for operation conforming to NFPA 72. Ensure that the transmitter is capable of initiating a test signal daily at any selected time. Arrange the transmitter to seize telephone circuits in accordance with NFPA 72.

2.2.18.7 Telephonic Reporting System

Provide transmitters compatible with existing receiving equipment at the supervising-station. Design transmitters to provide the same features as the fire alarm boxes for electrically supervised, coded, [positive,] [shunt,] noninterfering transmissions and to transmit signals on grounded or open circuits. Ensure that the transmitters respond to the actuation of the FACP. Provide electric-motor-driven or pre-wound spring transmitters that transmit not less than four rounds of code. When motor-driven transmitters are provided, connect the motor to a supervised circuit in a control panel. Provide metallic or rigid plastic code number plates on the exterior face of transmitters. Ensure that when a single open fault on an exterior fire alarm circuit activates the box, the box is idle for only one complete round and then immediately transmits four complete code rounds via the box earth ground connection.
Provide a transmitter with a [shunt-] [local-energy-] type auxiliary tripping device. Ensure that the code wheel is metallic and that the box code is as directed. Extend wiring to the indicated telephone terminating location [for future connection by other] [and connected to specific twisted-pair cable identified by the Contracting Officer in the field]. Extend [one new [_____]-pair [shielded] [nonshielded] twisted-pair cable to the supervising-station and connect to the existing terminating equipment.]

2.2.18.8 Signals to be Transmitted to the Base Receiving Station

Send the following signals to the base receiving station:

a. Sprinkler waterflow
b. Manual pull stations
c. Smoke detectors
d. Duct smoke detectors
e. Sleeping-room smoke detectors
f. Heat detectors
g. Sprinkler valve supervision
h. Fire pump running
i. Fire pump loss of power/phase reversal

2.2.19 Nameplates

Permanently affix a new nameplate showing the following information to each major component: the manufacturer's name and address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the Contract number. Major components include the following:

a. FACPs

Provide a rigid plastic, phenolic-resin or metal nameplate that reads "Fire Alarm Control Panel" in letters at least 25 mm 1 inch high. Ensure that nameplates for fuses also include ampere rating. Provide prominent rigid plastic or metal identification plates for lamps, circuits, meters, fuses, and switches.

b. Automatic transmitter
c. Printer

Obtain approval of the nameplates by the Contracting Officer before installation. Obtain approval by the Contracting Officer for installation locations. Ensure that nameplates are either etched metal or plastic and are permanently attached by screws to panels or adjacent walls.

2.2.20 Addressable Manual Fire Alarm Stations

Provide addressable manual fire alarm stations that conform to the
applicable requirements of UL 38. Ensure that stations are [single] [double]-action type. Finish stations in red, with raised-letter operating instructions of contrasting color. Do not provide stations that require the breaking of glass or plastic panels for operation are not acceptable. Stations employing glass rods [are] [are not] acceptable. The use of a key or wrench is required to reset the station. Gravity or mercury switches are not acceptable. Rate switches and contacts for the voltage and current upon which they operate. Provide addressable pull stations capable of being field programmed. Stations to latch upon operation and remain latched until manually reset. Stations have a separate screw terminal for each conductor. Match and paint surface mounted boxes the same color as the [fire alarm manual stations] [mounting surface].

2.2.21 Transmitters

2.2.21.1 Master Fire Alarm Boxes

Ensure that master fire alarm boxes are of the coded, [shunt] [positive] noninterfering type with succession features having a [shunt-] [local energy-] type auxiliary tripping device. [Design boxes for operation at 100 mA dc, but with capability of full operation between 70 to 120 mA.]

Ensure that the boxes are the prewound, open-door, pull-lever type. Install the mechanism in a weatherproof cottage shell housing with a metallic or rigid plastic code number plate mounted on the exterior face of the cottage shell. Ensure that operation of the actuating pull-lever causes the box to transmit four complete rounds of code to gongs, recorders, and other devices on the same circuit. Ensure that driving springs have the capability to transmit not less than eight complete four-round groups of code before being rewound.

Ensure that when a single open fault on an exterior fire alarm circuit activates the box, the box is idle for only one complete round and then immediately transmits four complete code rounds via the box earth ground connection. Equip each box with a manual signaling key, telephone jack, silent test device, and box shunt device. Ensure that each box is [[wall-] [pole-] [pedestal-] mounted] [as indicated], with the center of the box 1525 mm 61 inches above grade, and provide each box with a lighting fixture.

Use copper alloy, cadmium, or zinc-coated steel bolts, brackets, fastenings, and conduit. Ensure that the code wheel is metallic and that the box code is as directed.

2.2.22 Keys

Furnish identical keys and locks for equipment. Provide not less than six keys of each type required. Ensure that keys are CAT [60] [______].

Furnish tags with stamped identification number for keys and locks.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Existing Fire Alarm Equipment

Maintain existing fire alarm equipment fully operational until the new equipment has been tested and accepted by the Contracting Officer. As new equipment is installed, label the new equipment "NOT IN SERVICE" until the new equipment is accepted. Once the new system is completed, tested, and
accepted by the Government, place the new equipment in service and connect the new equipment to the station fire alarm system. Remove tags from the new equipment, and tag the existing equipment "NOT IN SERVICE" until removed from the building.

[3.1.2 Disconnection and Removal of Existing System

Disconnect and remove the existing fire alarm and smoke detection systems where indicated in the specification.

Turn over disconnected and removed FACPs and fire alarm devices to the Contracting Officer.

Properly dispose of fire alarm outlet and junction boxes, wiring, conduit, supports, and other such items.

[3.1.3 Supervising-Station Provisions

The proprietary-type supervising station (PSS) is located [in building [_____] [_____] [The supervising equipment is existing and consists of the following brands and models: [supervising station control panel [_____] [_____], [signal reporting components [_____]],[annunciator [_____] [_____].

3.1.3.1 Revisions to Existing Facilities

Modify existing supervising components as indicated on the drawings, and update programming if required to accommodate the revised configuration. Ensure that acceptance testing includes procedures that would demonstrate that operation of existing equipment has not been degraded and that the revised configuration, plus interfacing components, operates compatibly with the new fire alarm system at the protected premises. Perform work on existing equipment in accordance with the manufacturer's instructions or under supervision of the manufacturer's representative.

3.1.3.2 Additions to Existing Facilities

Add supplemental components to the existing supervising equipment [as required to accommodate the new fire alarm system installed at the protected premises] [as indicated on the drawings]. Extend all present functions, including recording and storage in memory, and update programming if required to accommodate the revised configuration. Ensure that acceptance testing includes procedures that would demonstrate that operation of existing equipment has not been degraded and that the expanded configuration operates compatibly with the new fire alarm system.

3.2 INSTALLATION

3.2.1 Grounding

Provide grounding by connecting to building ground system.

3.2.2 Overvoltage And Surge Protection

3.2.2.1 Power Line Surge Protection

Protect all equipment connected to ac circuits from surges in accordance with IEEE C62.41.1 IEEE C62.41.2 for a B3 combination waveform and NFPA 70. Do not use fuses for surge protection. Rate the surge protector for a
maximum let-through voltage of 350 V ac (line-to-neutral) and 350 V ac (neutral-to-ground).

3.2.2.2 Low-Voltage DC Circuit Surge Protection

For all [IDCs] [IDCs, NACs, and communication cables or conductors], except fiber-optics, install surge protection at each point where the cables or conductors exit or enter a building. Protect equipment from surges in accordance with IEEE C62.41.1 IEEE C62.41.2 for a B3 combination waveform and NFPA 70. Rate the surge protector to protect the 24 Volt dc equipment. The maximum dc clamping voltages is 36 V (line-to-ground) and 72 V dc (line-to-line).

3.2.2.3 Signal Line Circuit Surge Protection

For all SLC cables/conductors, except fiber optics, install surge protection/isolation circuits at each point where it exits or enters a building. Protect the circuit from surges per IEEE C62.41.1/IEEE C62.41.2 for a B3 combination waveform and NFPA 70. Rate the surge protector or isolator to protect the equipment.

3.2.3 Fire-Alarm-Initiating and -Indicating Devices

**************************************************************************
**NOTE: The Americans with Disabilities Act (ADA)**
requires that manual alarm stations be mounted at a maximum of **1.2 m 48 inches** above finished floor (AFF) for forward reach and **1.4 m 54 inches** AFF for side reach.
**************************************************************************

Mount manual stations at [1220] [1370] [_____] mm [48] [54] [_____] inches into SLCs. Install stations on [surface] [semiflush] [flush]-mounted outlet boxes.

Install all work as shown, and in accordance with NFPA 70 and NFPA 72, and in accordance with the manufacturer’s diagrams and recommendations, unless otherwise specified. Do not install smoke detectors until construction is complete and the building has been thoroughly cleaned.

Locate the FACP [where indicated on the drawings] [_____]. [Recess] [Semirecess] [Surface-mount] the enclosure, with the top of the cabinet **1830 mm 6 feet** above the finished floor (AFF) or center the cabinet at **1525 [_____] mm [5] [_____] feet**, whichever is lower.

Locate manual stations [as required by NFPA 101 and NFPA 72] [where shown on the drawings] [_____]. Mount stations so that each station's operating handles are **1220 mm 4 feet** AFF. Mount stations no farther than [1525] [_____] mm [5] [_____] feet from the exit doors that the stations serve, measured horizontally.

Locate notification appliance devices [as required by NFPA 72] [where shown on the drawings]. Mount assemblies on walls, **2030 mm 80 inches** AFF or **150 mm 6 inches** below the ceiling, whichever is lower.[ Conform ceiling-mounted speakers to NFPA 72.]

[ Locate sensors [as required by NFPA 72 and their listings] [as shown on the drawings] on a **100 mm 4 inch** mounting box. Install sensors located on the ceiling not less than **100 mm 4 inches** from a side wall to the near edge.
Ensure that those located on the wall have the top of the sensor at least 100 mm 4 inches below the ceiling, but not more than 300 mm 12 inches below the ceiling. In raised-floor spaces, install the smoke sensors to protect 20.9 square meters 225 square feet per sensor. Install smoke sensors no closer than 1525 mm 5 feet from air-handling supply outlets.

Locate the graphic annunciator as shown on the drawings. Surface-mount the panel, with the top of the panel 1830 mm 6 feet AFF or center the panel at [1525] [_____] mm [5] [_____] feet, whichever is lower.

Locate waterflow detectors and tamper switches [where shown on the drawings] [at each supervised sprinkler valve station].

Locate wall-mounted items in each stair at each floor landing, in each elevator lobby, and in each elevator cab 1220 mm 4 feet AFF.

Comply with the requirements of NFPA 241 for the modification of any fire alarm system.

3.2.4 Connection Of New System

Make the following new-system connections during the last phase of construction, at the beginning of the preliminary tests:

[a. Connection of new control modules to existing magnetically held smoke door (hold-open) devices.

[b. Connection of new elevator recall smoke sensors to existing wiring and conduit.

[c. Connection of new-system transmitter to the existing base fire reporting system.

Once these connections are made, leave the system energized and the new audio or visual devices deactivated. Report immediately to the Contracting Officer the coordination problems and field problems resulting from the connection of the above components.

3.2.5 Power Supply for the System

******************************************************************************
NOTE: Show the power source for the fire alarm system on the drawings.
******************************************************************************

Provide a single dedicated circuit connection for supplying power from a branch circuit to each building fire alarm system. Supply the power as shown on the drawings. Equip the power supply with a locking mechanism and mark the locking mechanism in red with the words "FIRE ALARM CIRCUIT CONTROL."

3.2.6 Wiring

Ensure that the conduit size for wiring is in accordance with NFPA 70. Do not install wiring for the fire alarm system in conduits, junction boxes, or outlet boxes with conductors of lighting and power systems. Install no more than two conductors under any device screw terminal. Ensure that wires under the screw terminal are straight when placed under the terminal, and then clamp them in place under the screw terminal. Break the wires,
and do not twist them around the terminal. Connect circuit conductors entering or leaving any mounting box, outlet box enclosure, or cabinet to screw terminals, with each terminal and conductor marked in accordance with the wiring diagram. Make connections and splices using screw terminal blocks. Do not use wire nut connectors. Ensure that wiring within control equipment is accessible without removing component parts. Ensure that the fire alarm equipment manufacturer's representative is present for the connection of wiring to the control panel.

3.2.6.1 Wiring within Cabinets, Enclosures, Boxes, Junction Boxes, and Fittings

Install wiring parallel with or at right angles to the sides and back of any box, enclosure, or cabinet. Ensure that conductors that are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting, or junction box are connected to terminal blocks. Mark each terminal in accordance with the wiring diagrams of the system. Make connections with approved mounted, pressure-type terminal blocks. Do not use wire nut connectors.

3.2.7 Control Panel

Mount the control panel and its assorted components so that no part of the enclosing cabinet is between 12 inches and 78 inches above the finished floor. Ensure that manually operable controls are between 900 and 1100 mm 36 and 42 inches AFF. Install the panel to comply with the requirements of UL 864.

3.2.8 Detectors

Locate and install detectors in accordance with NFPA 72. Connect detectors into SLCs or IDCs as indicated on the drawings. Install detectors at least 300 mm 12 inches from any part of any lighting fixture. Locate detectors at least 900 mm 3 feet from diffusers of air-handling systems. Provide each detector with the mounting hardware required by its mounting location. In open space, mount detectors directly to the end of the stubbed-down, rigid conduit drop. Secure conduit drops to minimize detector sway. Where the length of conduit drop from ceiling or wall surface exceeds 900 mm 3 feet, provide sway bracing. Ensure that detectors installed in concealed locations (such as above ceilings and in raised floors) have a remote visible indicator LED or LCD [in a finished, visible location] [as indicated] [____].

3.2.9 Notification Appliances

Mount notification appliances 2003 mm 80 inches AFF or 150 mm 6 inches below the ceiling, whichever is lower.

3.2.10 Annunciator Equipment

Mount annunciator equipment where indicated on the drawings.

3.2.11 Addressable IDCs Module

**************************************************************************
NOTE: Remove this paragraph when not required.
**************************************************************************

Use the IDCs module to connect supervised, conventional initiating devices
(waterflow switches, water pressure switches, manual fire alarm stations, high/low air pressure switches, and tamper switches). Mount the module in an electrical box next to or connected to the device that the module is monitoring, and ensure that the module is capable of connecting Style B supervised wiring to the initiating device. Do not use T-taps on Style B lines. Ensure that addressable IDC modules monitor only one initiating device each.

3.2.12 Addressable Control Module

**************************************************************************
NOTE: Remove this paragraph when not required.
**************************************************************************

Install addressable control modules in the outlet box or next to the devices that the modules are controlling. If a supplementary suppression-releasing panel is provided, mount the monitor modules in a common enclosure next to the suppression-releasing panel. Ensure that this enclosure and the suppression-releasing panel are in the same room as the releasing devices. Supervise all interconnecting wires unless an abnormal open-circuit or short-circuit condition does not affect the required operation of the fire alarm system. If control modules are used as interfaces to other systems, such as HVAC or elevator control, ensure that the control modules are within the control panel or immediately next to it. Ensure the control modules that control a group of notification appliances are next to the first notification appliance in the NACs. Ensure the control modules that connect to devices supervise the NACs. Control modules that connect to auxiliary systems or that interface with other systems (non-life safety systems) and where not required by NFPA 72 do not require the secondary circuits to be supervised.

3.2.13 Firestopping

Provide firestopping for holes at conduit penetrations through floor slabs, fire-rated walls, partitions with fire-rated doors, corridor walls, and vertical service shafts in accordance with Section 07 84 00 FIRESTOPPING.

3.2.14 Painting

Paint exposed electrical fire alarm conduit and surface metal raceway to match adjacent finishes in exposed areas. Paint fire cabinets [red] [beige]. Paint [junction boxes] [conduit] [and] [surface metal raceways] red in unfinished areas. Ensure that painting complies with Section 09 90 00 PAINTS AND COATINGS.

3.3 FIELD QUALITY CONTROL

3.3.1 Tests

Upon completion of the installation, subject the system to functional and operational performance tests including tests of each installed initiating and notification appliance, when required. Submit detailed test procedures, prepared and signed by a registered PE or a NICET-certified Level [3] [4] fire alarm technician, for the fire detection and alarm system [60] [_____] days before performing system tests.

Notify the Contracting Officer [10][_____] days before conducting tests. Conduct the following tests:
Ensure that the control panel manufacturer's representative is present to supervise tests. Furnish instruments and personnel required for the tests.

******************************************************************************
NOTE: If the specified system is identified as critical, configured, or mission-essential, use Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS to establish predictive and acceptance testing criteria, above and beyond that listed below.
******************************************************************************

Perform PT&I and submit documentation as specified in Section 01 86 26.07 40 RELIABILITY CENTERED ACCEPTANCE FOR ELECTRICAL SYSTEMS.

a. Megger Tests: After wiring has been installed, and connections to panels or devices, megger test wiring for insulation resistance, grounds, and/or shorts. Test conductors with 300 volt rated insulation at a minimum of 250 V dc. Test conductors with 600 volt rated insulation at a minimum of 500 V dc. Ensure that the tests are witnessed by the Contracting Officer and that test results are recorded for use at the final acceptance test.

b. Loop Resistance Tests: Measure and record the resistance of each circuit with each pair of conductors in the circuit short-circuited at the farthest point from the circuit origin. Ensure that the tests are witnessed by the Contracting Officer and that test results are recorded for use at the final acceptance test.

c. Preliminary Testing: Conduct preliminary tests to ensure that devices and circuits are functioning properly. Ensure that tests meet the requirements of paragraph MINIMUM SYSTEM TESTS.

After completing the preliminary testing, complete and submit the NFPA 72, Certificate of Completion. Ensure that the certificate addresses the control panel and the initiating and indicating devices and that the certificate cites a unique identifier for each device, with an indication of test results and signatures of the equipment installer and factory-trained technician of the control panel manufacturer.

Request for Formal Inspection and Tests: When preliminary tests have been completed and corrections made, submit a signed, dated certificate with a request for formal inspection and tests to the Contracting Officer.

Final Testing: Notify the Contracting Officer in writing when the system is ready for final acceptance testing. Submit a request for test at least [15][_____] calendar days before the test date. A final acceptance test will not be scheduled until the operation and maintenance (O&M) manuals are furnished to the Contracting Officer and the following are present at the job site:

a. The system manufacturer's technical representative
b. Marked-up red-line drawings of the system as actually installed
  c. Megger test results
  d. Loop resistance test results
e. Complete program printout, including input/output addresses

The final tests are witnessed by the Contracting Officer[, and] Fire Protection Engineer, [and _____]. At this time, repeat any and all required tests at their discretion. Following acceptance of the system, deliver as-built drawings and O&M Manuals to the Contracting Officer for review and acceptance. In existing buildings, the transfer of devices from the existing system to the new system and the permission to begin demolition of the old fire alarm system are not granted until the as-built drawings and O&M manuals are received.

3.3.2 Minimum System Tests

Test the system in accordance with the procedures outlined in NFPA 72. The required tests are as follows:

a. Verify the absence of unwanted voltages between circuit conductors and ground. Accomplish tests at the preliminary test, and make results available at the final system test.

b. Verify that the control unit is in the normal condition as detailed in the manufacturer's O&M manual.

c. Test each initiating and indicating device and circuit for proper operation and response at the control unit. Test smoke sensors in accordance with the manufacturer's recommended calibrated test method. Ensure that testing of duct smoke detectors complies with the requirements of NFPA 72.

d. Test the system for specified functions in accordance with the Contract drawings and specifications and the manufacturer's O&M manual.

e. Test both primary power and secondary power. Verify, by test, that the secondary power system is capable of operating the system for the period and in the manner specified.

f. Determine that the system is operable under trouble conditions as specified.

g. Visually inspect wiring.

h. Test the battery charger and batteries.

i. Verify that software control and data files have been entered or programmed into the FACP. Submit hard-copy records of the software to the Contracting Officer.

j. Verify that red-line drawings are accurate.

k. Verify by measurement that the circuits have is the calculated spare capacity.

l. Verify by measurement that voltage drop is not excessive.

m. Disconnect the verification feature for smoke sensors during tests to minimize the amount of smoke needed to activate the sensor. Test smoke sensors with real smoke. Do not use canned smoke.

n. Measure the voltage drop at the most remote appliance on each NAC.
3.3.3 Testing

3.3.3.1 Preliminary Tests

Tests include the meggering of system conductors to determine that the system is free from grounded, shorted, or open circuits. Conduct the megger test before the installation of fire alarm equipment. If deficiencies are found, make corrections and retest the system.

3.3.3.2 Acceptance Test

**************************************************************************
NOTE: Listed tests are the minimum required. If additional tests are required, add such tests to the list.
**************************************************************************

Do not perform acceptance testing until after submitting the Certificate of Completion. Test in accordance with NFPA 72. The recommended tests in NFPA 72 are mandatory and verify that previous deficiencies have been corrected. Complete and submit the NFPA 72, Inspection and Testing Form. The test includes all requirements of NFPA 72 and the following:

a. Test of each function of the control panel
b. Test of each circuit in both trouble and normal modes
c. Tests of each alarm-initiating device, in both normal and trouble conditions
d. Tests of each control circuit and device
e. Tests of each alarm notification appliance
f. Tests of the battery charger and batteries
g. Complete operational tests under emergency power supply
h. Visual inspection of wiring connections
i. Opening of the circuit at each alarm-initiating device and notification appliance to test the wiring supervisory feature
j. Ground fault
k. Short-circuit faults
l. Stray voltage
m. Loop resistance

3.4 CLOSEOUT ACTIVITIES

3.4.1 Operation and Maintenance

Submit Data Package 5 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.
Provide [six] [_____] copies of the operating manual outlining step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, service manual, parts list, and complete description of equipment items and their basic operating features. Provide [six] [_____] copies of the maintenance manual listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. Ensure that the manuals include conduit layout, equipment layout, simplified wiring, and control diagrams of the system as installed. Ensure that the manuals include complete procedures for system revision and expansion, detailing both equipment and software requirements. Provide original and backup copies of all software delivered for this project, on each type of media used. Manuals are approved before training.

3.4.2 As-built Drawings

Prepare and submit to the Contracting Officer [six][_____] sets of detailed as-Built Drawings. Include complete wiring diagrams in the drawings showing connections between devices and equipment, both factory-wired and field-wired. Include a riser diagram and drawings, showing the as-built location of devices and equipment. Show the system as installed, including deviations from both the project drawings and the approved shop drawings. Prepare the drawings on uniform-sized mylar sheets not less than 760 by 1065 mm with 200 by 100 mm 30 by 42 inches, with 8 by 4 inch title block similar to Contract drawings. Submit these drawings within 2 weeks after the final acceptance test of the system. Provide at least one set of as-built (marked-up) drawings at the time of, or before the final acceptance test.

3.4.3 Training

3.4.3.1 Instruction

Ensure that the manufacturer provides 3 days of onsite training [and 5 days of technical training to the Government at the manufacturing facility.] [Include room-and-board costs for two Government employees.] [Factory] training occurs within [6] [12] [_____] months of system acceptance.

a. Instructor

Ensure that each instructor is thoroughly familiar with all parts of this installation. Ensure that each instructor is trained in operating theory, as well as in practical O&M work.

Include in the project the services of an instructor who has received specific training from the manufacturer for the training of other persons regarding the inspection, testing, and maintenance of the system provided. Ensure that this instructor trains the Government employees designated by the Contracting Officer, in the care, adjustment, maintenance, and operation of the fire alarm [and fire detection] system.

b. Required Instruction Time

To accommodate rescheduling for unforeseen maintenance, Fire Department responses, or both, schedule instruction after final acceptance of the system. Give the instruction during regular working hours on dates and at times selected by the Contracting Officer. The instruction may be divided into two or more periods at the discretion of the Contracting Officer.
3.4.3.2 Training Materials and Course

**************************************************************************
NOTE: The operations training familiarizes designated Government employees with proper operation of the fire alarm system. The maintenance training course provides the designated Government employees knowledge necessary to diagnose, repair, maintain, and expand functions inherent in the system.
**************************************************************************

Furnish lesson plans, operating instructions, maintenance procedures, and training data, all in manual format, for the training courses.

Conduct a training course for the operations and maintenance staff. Conduct the course in the building where the system is installed or as designated by the Contracting Officer. Design the training period for systems operation to consist of [1] [_____] training days (8 hours per day) and to start after the system is functionally completed but before final acceptance tests. Design the training period for systems maintenance to consist of [2] [_____] training days (8 hours per day) and to start after the system is functionally completed but before final acceptance tests. Ensure that the instructions cover items contained in the operating and maintenance instructions. In addition, Conduct training on performance of expansions or modifications to the fire detection and alarm system. Design the training period for system expansions and modifications to consist of at least [1] [_____] training days (8 hours per day) and to start after the system is functionally completed but before final acceptance tests.

3.5 MAINTENANCE

3.5.1 Repair Service or Replacement Parts

Ensure that repair services and replacement parts for the system provided under this Contract are available for a period of 10 years after the date of final acceptance of this work by the Contracting Officer. Provide onsite service during the guarantee period within 24 hours after notification. Complete all repairs within 48 hours after notification.

NOTE: This guide specification covers the requirements for radio transmitted fire alarm reporting systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature.
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Fire Alarm Reporting System; G[, [_____]]
**1.3 QUALITY ASSURANCE**

Provide the services of a Registered Professional Engineer with at least 4 years of current experience in the design of fire protection and detection systems. Submit the qualifications, with verification of experience and license number, for this engineer.

**1.4 DELIVERY, STORAGE, AND HANDLING**

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variations, dirt, dust, and other contaminants.

**1.5 SPECIAL TOOLS AND SPARE PARTS**

Furnish special tools necessary for the maintenance of the equipment. Submit certified copies of current applicable approvals or listings issued by UL, FM or other nationally recognized testing laboratory showing compliance with applicable NFPA standards. Submit spare parts data for each different item of material and equipment specified, after approval of detail drawings, and not later than [_____] months prior to the date of beneficial occupancy. Data shall include a complete list of parts and supplies with the current unit prices and source of supply and a list of the parts recommended by the manufacturer to be replaced after [1] [_____] year of service. Provide one spare set of fuses of each type and size required and 5 spare lamps of each type.

**PART 2 PRODUCTS**

**2.1 SYSTEM DESCRIPTION**

**************************************************************************
**NOTE:** Radio link supervision may be by periodic reporting of radio fire alarm transmitters or by periodic polling of all transmitters by the radio fire alarm receiver. The total number of transmitters on any one frequency and their polling rate in a two-way system must be determined and
checked to ensure code compliance. The following definitions are given to help clarify the use of the words transmitter and receiver in this specification.

1. "Fire Alarm Transmitter" refers to any device that transmits a fire alarm message back to the fire alarm receiver at the alarm monitoring station.

2. "Radio Transmitter" is an electronic device that generates a coded RF signal.

3. "Radio Fire Alarm Transmitter" refers to a device that uses radio signals to transmit a fire alarm message back to the alarm monitoring station. The radio fire alarm transmitter may operate with either one-way or two-way data transmission. For one-way data transmission, the radio fire alarm transmitter would incorporate a radio transmitter, antenna, cables, power supply, message encoder, and possibly an interface circuit.

   a. The radio fire alarm transmitter generates and sends a coded alarm when an alarm is received at the transmitter. The signal is received at the radio fire alarm receiver and an alarm is given.

   b. Radio fire alarm transmitters that use two-way data transmissions have all the same components as the one-way system, but, in addition, they have a receiver and controller. They operate by waiting for the radio fire alarm receiver to send them a radio signal to report. The radio fire alarm transmitter then sends back a signal reporting any alarms. Another method involves two-way radio transmission systems which transmit signals as soon as they are received.

4. "Fire Alarm Receivers" refer to equipment that receives fire alarm messages from one or more fire alarm transmitters.

5. "Radio Receiver" is an electronic device that detects radio signals and generates an alarm message.

6. "Radio Fire Alarm Receiver" is a system that receives fire alarm signals, displays, and records the alarm messages. It may simply listen for any alarm messages (one-way data transmission) or it may sequentially transmit a radio signal asking each radio fire alarm transmitter to report any alarms (two-way data transmission).

When an addition to an existing system is required, provide the make, model number, and other pertinent information to the designer. This will eliminate most of this specification because the additional interfaces have to be compatible with the existing central radio fire alarm reporting system.
Provide a central reporting system complying with [NFPA 72] [____]. The equipment furnished shall be listed by Underwriters Laboratories, or Factory Mutual Engineering and Research, or be approved or listed by a nationally recognized testing laboratory.

a. Furnish tags with stamped identification numbers for keys and locks. Locks shall be keyed alike. The radio system shall report alarms to the radio fire alarm monitoring base station. The system shall be a completely supervised radio type fire alarm reporting system.

b. Submit detail drawings, signed by the Registered Professional Engineer, consisting of a complete list of equipment and material, including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions. Note that the contract drawings show layouts based on typical detectors. Check the layout based on the actual detectors to be installed and make any necessary revisions in the detail drawings.

c. Detail drawings shall also contain complete wiring and schematic diagrams for the equipment furnished, equipment layout, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. The system shall indicate the area of alarm. The radio communication link shall be supervised and operated in accordance with NFPA 72. Electrical supervision shall be provided for all circuits and for all positions of interface panel control switches.

d. Submit [6] [____] complete copies of operating instructions outlining step-by-step procedures required for system startup, operation, and shutdown. The instructions shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features.

e. Submit [6] [____] copies of maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The instructions shall include conduit layout, equipment layout and simplified wiring, and control diagrams of the system as installed. Instructions shall be approved prior to training.

2.2 STANDARD PRODUCTS

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment shall be supported by a service organization that can provide service within 24 hours.

2.3 NAMEPLATES

Major components of equipment shall have the manufacturer's name, address, type or style, voltage and current rating, and catalog number on a noncorrosive and nonheat-sensitive plate which is securely attached to the equipment.
2.4 RADIO FIRE ALARM TRANSMITTER (TRANSCEIVER)

**************************************************************************
NOTE: Transceiver is a radio device that receives an interrogating or challenging radio signal and automatically transmits a response on the same or a different frequency.
**************************************************************************

Radio Fire Alarm Transmitter (Transceiver) shall be compatible with the Radio Fire Alarm Monitoring Base Station. The transmitter shall be all solid state and comply with applicable portions of 47 CFR 15 governing type acceptance. All transmitters of a common configuration shall be interchangeable with the other devices furnished by the manufacturer. Each transmitter [and interface device] shall be the manufacturer's current commercial product completely assembled, wired, tested at the factory, and delivered ready for installation and operation.

2.4.1 Frequency Allocation

**************************************************************************
NOTE: Frequency assignment is made by the base's communications Officer. The frequency must be reserved in advance. Multiple frequencies may be needed to meet response time requirements. Polling type systems will need separate polling frequencies.
**************************************************************************

The transmitters shall operate on a frequency of [_____] MHz.

2.4.2 Power Requirements

**************************************************************************
NOTE: Delete requirements for manual street boxes if not applicable.
**************************************************************************

Powe transmitters by a combination of locally available 120 Vac, and sealed [nickel-cadmium] [or] [lead-acid] type batteries requiring no additional water. [Transmitters used in manual street box configuration [as indicated] shall be powered by battery only.] In the event of loss of 120 Vac power, the transmitter shall automatically switch to battery operation. The switchover shall be accomplished with no interruption of protective service, without adversely affecting the battery-powered capabilities, and shall cause the transmission of a trouble message in no less than [_____] seconds. Upon restoration of ac power, transfer back to normal ac power supply shall be automatic and the battery shall be recharged. The converter/battery charger shall be installed within the transmitter housing. Power supply transient filtering shall be provided.

2.4.2.1 Battery Power

The battery package shall be capable of supplying all the power requirements for a given transmitter. Submit substantiating battery calculations for supervisory and alarm power requirements. Ampere-hour requirements for each system component, each panel component and the battery recharging period shall be included.
2.4.2.2   Battery Duration

Radio fire alarm transmitter standby battery capacity shall provide sufficient power to operate the transmitter in a normal standby status for a minimum of 60 hours and shall be capable of transmitting alarms during that period. The capacity for battery-only powered transmitters shall be 6 months before recharging is necessary.

2.4.2.3   Battery Supervision

Each radio fire alarm transmitter shall constantly monitor and supervise its own battery powered supply. A low-battery condition shall be reported when battery voltage falls below 85 percent of the rated voltage.

2.4.3   Functional Requirements

2.4.3.1   Interfacing Indicators and Controls

Transmitters shall incorporate the provisions for auxiliary interconnection to existing interior alarm systems.

2.4.3.2   Generation of Signals

Each transmitter shall be a standard design which allows the immediate transmission of all initiated signals.

2.4.3.3   Power Output

***********************************************************************
NOTE: The designer should provide the necessary data to determined the required RF power level; this may require a site visit.
***********************************************************************

The radio frequency (RF) power output of each transmitter shall be sufficient for reliable alarm reporting. The minimum RF power output shall be [1] [_____] watt.

2.4.3.4   Memory

Transmitters shall have memory capability. Multiple, simultaneous alarms shall not result in the loss of any messages. Messages shall be stored until they are transmitted.

2.4.3.5   Transmission Confirmation

***********************************************************************
NOTE: Use with fire alarm boxes only.
***********************************************************************

When a signal is initiated at a public box (push button or pull lever), the transmitter shall produce an audible or visual indication that the transmitter is operating and that a signal is being sent.

2.4.3.6   Transmitter Identity Code

Each transmitter shall transmit a distinct identity code number as part of all signals emanating from the transmitter. The identity code shall allow for no less than a [_____] digit code selection and be transmitted not less
than three complete rounds (cycles).

2.4.3.7 Message Designations

Each transmitter shall allow as a minimum no less than 10 [_____] distinct and individually identifiable message designations as to the types or causes of transmitter actuation.

2.4.3.7.1 Master Message

Master messages shall be transmitted upon automatic actuation of the transmitter. The building and zone causing actuation shall be individually identified as part of this transmission. The transmitter shall be capable of identifying and transmitting a minimum of [_____] master (zone) messages.

2.4.3.7.2 Test Message

Test message shall be capable of both manual and automatic actuation. When a transceiver method is employed, it shall provide for automatic interrogation at preselected periods or continuous automatic interrogation in accordance with the governing standard. Additionally, transceiver systems shall provide for selective interrogation at times determined by the user. Testing the automatic test actuation shall occur a minimum of once in each [24-] [_____] hour period, at an optionally preselected time. Stability of the electronic actuating device shall be plus or minus 1 minute per month within the temperature range stipulated for system operation. Actuation of the "Test" message designation, regardless of initiating means, shall cause no less than 1 complete message to be sent.

2.4.3.7.3 Tamper Message Designation

The tamper message shall be automatically transmitted when a tamper switch is tripped in the transmitter housing.

2.4.3.7.4 Trouble Message Designation

Trouble message shall be automatically transmitted in the event of a failure in excess of 1 minute of the main operating power source of the transmitter.

2.4.4 Transmitter Housings

The housings on transmitters shall be fabricated from corrosion-resistant cast metal or suitable substitute which has the physical strength sufficient to ward off physical damage normally expected to be received by vandalism. The housing shall be sealed against the entry of moisture, dust, dirt, insects, and other foreign objects. Exterior housings shall be NEMA 4X.

2.4.4.1 Lock

Internal components shall be protected from vandalism by a tamper-proof lock on the transmitter housing. The housing shall allow access to all internal components for testing, servicing, and replacement at the installation site.

2.4.4.2 Mounting

**************************************************************************

SECTION 28 31 33.00 10  Page 11
NOTE: Choose the type of mounting most suited for application of design.

Transmitter housings shall be designed for universal mounting on walls, poles, or pedestals. Mounting shall utilize either lag bolts, anchor bolts, stainless steel banding, mounting brackets, or a shackle/bolt combination, as applicable to the specific installation.

2.4.4.3 Operating Panel

NOTE: Use with manual street boxes only.

Each publicly accessible transmitter shall have an operating panel that incorporates a dedicated signal initiating device (pull hook or push button) clearly identified for the initiation of "FIRE" signals. The device shall be protected with a conventional spring-loaded, "fast-action" break-glass, or similar pull-type door that allows observation of the actuation device when in the closed position. The door shall be fabricated and finished in a manner consistent with that required of the main housing.

2.4.4.4 Labeling

NOTE: Use with manual street boxes only.

Each publicly accessible transmitter shall be labeled on both sides and on the front surface with the word "FIRE." The label shall be white with red lettering.

2.4.5 Environmental Operating Requirements

NOTE: Check local condition for design wind gust and ice loading. Lowest design wind speed is 160 km/hour 100 mph; typical design wind speed is 200 km/hour 125 mph.

The transmitter shall be designed for reliable outside operation in an ambient temperature range of [-30] [_____] to [60] [_____] degrees C [-22] [_____] to [140] [_____] degrees F. Transmitters shall be corrosion-resistant and designed for reliable operation under adverse climatic conditions including [160.9] [_____] km/hour [100] [_____] mph winds, ice, rain, and snow storms.

2.4.6 Painting

Radio fire alarm transmitter [and interface housings] shall be factory painted. The finish color shall be [fire engine red] [______]. Painted surfaces damaged during installation shall be repainted to match existing paint.

2.5 RADIO TRANSMITTER INTERFACE DEVICE
NOTE: If a radio transmitter interface device is not required, delete this paragraph.

The interface device shall provide a means of converting the signals that are available from the local control equipment into a form that is compatible with the transmitter inputs, while still maintaining electrical supervision of the entire system. Interface devices shall be utilized when direct connection between local control equipment and the transmitter is not possible. Interface devices shall be completely assembled, wired, tested at the factory, and delivered ready for installation and operation.

2.5.1 Enclosure

NOTE: Use with manual street boxes only.

When furnished as an independent self-contained device, the interface device shall be incorporated into an enclosure conforming to NEMA ICS 1 or other national standard as required by its location.

2.5.2 Indicators

NOTE: Use with manual street boxes only.

Indicators shall be provided to indicate alarm and trouble conditions and shall consist of a red fire alarm and an amber trouble light. The indicators shall be designed to ensure visibility during daylight hours and to indicate the reporting zone.

2.5.3 Access

Switches and other controls shall not be accessible without the use of a key. Access to controls shall be by unlocking and opening a panel or door.

2.5.4 Mounting

NOTE: Choose the type of mounting most suited for application of design.

Interface housings shall be designed for universal mounting on walls, poles, or pedestals. Mounting shall utilize either lag bolts, anchor bolts, stainless steel banding, mounting brackets, or a shackle/bolt combination, as applicable to the specific installation.

2.5.5 Inputs/Outputs

Each interface panel shall provide, as a minimum, the number of alarm circuit inputs and outputs indicated. Each input circuit shall be arranged so that the alarm signals shall override the trouble signals.

2.6 RADIO FIRE ALARM MONITORING BASE STATION
NOTE: Radio link supervision may be by periodic reporting of radio fire alarm transmitters or by periodic polling of all transmitters by the radio fire alarm receiver. The total number of transmitters on any one frequency and the polling rate of the transmitters in a two-way system must be determined and checked to ensure code compliance.

2.6.1 Receiver (Transceiver) System

[Two identical] [One] master radio fire alarm receiving (transceiver) system compatible with transmitter frequency shall be provided. The system shall be completely assembled, wired, tested at the factory, and delivered ready for installation and operation. Transceivers shall be solid-state design and shall use frequency modulation. The transceiver can be a single integrated unit, or it may consist of separate transmitter and receiver modules with a common power supply, amplifier, and control unit.

2.6.1.1 Transmitter Section

Transmitter shall operate on a frequency of [_____] MHz. Frequency stability shall be within 0.00025 percent over the operating temperature range. Transmitter shall be designed to work into a 50-ohm load. Frequency deviation shall be less than or equal to 5 kHz. Audio response shall be within plus 1 dB and minus 3 dB over the 300 Hz to 3,000 Hz range.

2.6.1.2 Receiver Section

Receiver antenna input impedance shall be 50 ohms. Receiver shall be tuned to a frequency assignment of [_____] mHz. Receiver shall have no more than 5 percent audio distortion measured at 1,000 Hz. Receiver shall have a noise level not greater than minus 50 dB below the signal level. Receiver output shall be compatible with the associated device.

2.6.2 Fire Alarm Console

Console shall contain a complete and independent fire alarm receiving system, consisting of, as a minimum, a radio receiver/transmitter, signal to message decoder, audio alarm signaling devices, audio alarm silence switch, visual display, alarm reset switch(es), alarm recording printer, primary and emergency power supplies, power supply monitors, memory devices, and all necessary interconnecting cables.

2.6.2.1 Audible Fire Alarm

The audible alarm signaling devices used to indicate the receipt of fire alarm messages shall produce a unique sound. The device shall be internally mounted in the console and shall be activated upon receipt of all fire alarm signals. The audible devices used to indicate the receipt of transmitter/interface trouble messages, including tamper and low-battery voltage, shall be separate and distinct from the device used to denote receipt of fire alarm messages.

2.6.2.2 Visual Display

NOTE: Listed displays are minimum requirements, but if additional visual displays are required, such
displays must be added to the list.

**************************************************************************

Console display shall indicate, as a minimum, the originating transmitter identity code number and shall include the following message designations:

a.  Fire
b.  Trouble
c.  Battery
d.  Test
e.  Tamper
f.  Master Zone [_____] thru [_____]  

2.6.2.3 Console Memory

Console shall have a memory buffer capable of retaining a minimum of [500] [_____] transmitter codes, together with the specific message designations associated with each transmitter. The system shall reject any received message not matching the programmed transmitter codes where such message identification code is not stored in the system. Upon command, the console shall display and print a summary of transmitters which have transmitted a low-battery or trouble message, or failed to transmit a message during the previous 24 [_____]-hour test period. Any incoming transmitter signal shall pre-empt the command display and printout function, and be processed, displayed, and printed. The 24-hour memory shall not be purged and shall always be current and available. Transmitter memory data shall not be lost in the event of a total loss of operating or emergency power supplies.

2.6.2.4 Console Supervision

The supervisory system shall provide constant supervision of the operating conditions of the console. Indicators shall be provided for each major component, and an audible signal shall be produced in the event of failure of any major component. A switch shall be provided to silence the audible trouble signal.

2.6.2.5 Receiver Supervision

The supervisory system shall provide constant supervision and display of the operating condition of the radio receivers, and shall indicate an abnormal condition when a radio fire alarm transmitter carrier lasting more than 15 seconds is detected. The receiver's ability to properly receive and decode an incoming signal shall be tested at least once every [_____] minutes.

2.6.2.6 Manual Battery Test

Console shall have a switch to manually place the console on emergency battery power for test purposes.

2.6.2.7 Electrical Connections

Console shall be designed with modular components to allow interchange of components for maintenance purposes. Primary power cables shall incorporate positive twist-lock connections. Interconnecting cables and connectors shall be compatible with computer quality signal data transmission.
2.6.3 Antenna System

The antenna system shall utilize vertical polarization antennas, communication links between transmitters/receivers and antennas, and matching networks as needed for the proper coverage. The antenna system shall be either omni-directional or shaped-coverage as selected by the Contractor based on the topography. The antenna system and cabling shall be furnished to provide adequate system gain. The antennas shall be capable of withstanding the environmental conditions of 200 km per hour wind and 13 mm [_____] ice without failure. Lightning protection shall comply with NFPA 780. Antenna supporting structures shall comply with TIA-222.

2.6.3.1 Grounding Conductors

Antenna grounding conductors shall be minimum 32-strand, No. 17 AWG copper.

2.6.3.2 Communication Links

Transmission line between the transmitter/receiver and the antenna shall be 50-ohm impedance rated for the transmitter output power. As a minimum, cable shall exhibit an attenuation not exceeding 1.1 dB per 30.5 m 100 feet at 200 mHz.

2.7 FIRE ALARM SYSTEM PERIPHERAL EQUIPMENT

Repeaters shall be provided where indicated or required to meet system requirements. The repeater shall receive on [_____] MHz and transmit on [_____] MHz. The receiver and transmitter sections shall conform to the requirements specified for transceivers. Two-way data transmission shall be relayed between the base station and remote stations. Repeater shall utilize a bandpass-type duplexer and one antenna, or multiple-bandpass cavity filters and multiple antennas. The duplexer or filter cavities shall isolate the receiver from transmitter spurious noise and prevent receiver desensitization. The duplexer or filter cavities shall be rated to handle the output power of the transmitter. Repeater shall be keyed with tone-encoded control circuit. A transmitter time-out circuit shall be provided to prevent system lockup.
2.7.2 Radio Fire Alarm Transmitter Box Location Light

NOTE: Use with fire alarm boxes only. Delete paragraph where a light is not required. Do not use for radio fire alarm transmitters that operate on batteries only.

Each indicated transmitter providing publicly accessible actuating functions shall be provided with a vapor-tight, incandescent type light fixture constructed of a flame retardant, nonplastic, polycarbonate material with a threaded ruby globe. The light shall be supported with 13 mm 1/2 inch galvanized steel conduit and located approximately 300 mm 1 foot above the box. The light shall be provided with an incandescent, 50-watt, 120-volt extended service lamp. Transmitters which are powered by battery only shall not be equipped with location lights.

2.7.3 Conduit

Conduit and fittings shall comply with UL 6, UL 1242, and UL 797.

2.7.4 Ground Rods

NOTE: Designer will determine the size, type, and number of ground rods to be used based on local conditions, earth resistivity data, and on the size and type of the electrical installation. Copper-clad steel rods will be specified for normal conditions. Zinc-coated steel or stainless steel rods will be used where low soil resistivities are encountered and galvanic corrosion may occur between adjacent underground metallic masses and the copper-clad rods. Stainless steel rods have a longer life than the zinc-coated steel, but use of zinc-coated steel must be justified based on the higher cost. Rods 16 mm 5/8 inch in diameter and 2.5 m 8 feet in length are generally acceptable; however, in rocky soils 19 mm 3/4 inch rods shall be specified. In high resistivity soils, 3 m 10 foot or sectional rods may be used to obtain the required resistance to ground. Where rock is encountered, additional rods, a counterpoise, or ground grid may be necessary. Coordinate and standardize rod selection for individual facilities with other specification sections.

Ground rods shall be of [copper-clad steel conforming to UL 467] [zinc-coated steel conforming to IEEE C135.30] [solid stainless steel not less than [16] [19] mm [5/8] [3/4] inch in diameter by [2.5] [3] m [8] [10] feet in length] [of the sectional type].

2.7.5 Power Supply

NOTE: Locations with automatic backup power generation will require as a minimum 4 hours backup.
The operating power for the system shall be single phase taken from the building electric service as specified in paragraph Power Supply for the System. Emergency backup power shall be provided by sealed [lead-acid] [or] [nickel-calcium] type batteries requiring no additional water. The charging system shall recharge fully discharged batteries within 12 hours and maintain the batteries in the fully charged state. The battery shall have the capacity to operate the system for not less than 48 hours under maximum normal load with the power supply to the charger disconnected.

2.7.6 Wiring

Wiring shall be in accordance with NFPA 70 and as indicated. Station wiring shall be color coded.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Perform installation as shown and in accordance with the manufacturer's recommendations, unless otherwise specified. Provide all necessary interconnections, services, and adjustments required for a complete and operational system. Electrical work shall be in accordance with NFPA 70.

3.2.1 Power Supply for the System

Provide a single dedicated branch-circuit connection for supplying power to the fire alarm system. The backup power supply shall be automatically energized upon failure of the normal power supply.

3.2.2 Wiring for Systems

Wiring for systems shall be installed in rigid conduit, intermediate metallic conduit, or electric metallic tubing. The conductors for the fire alarm system shall not be installed in conduits, junction boxes, or outlet boxes with conductors of lighting and power systems. The sum of the cross-sectional areas of individual conductors shall not exceed 40 percent of the interior cross-sectional area of the conduit. Conduit shall comply with NFPA 70. Provide ample gutter space to accommodate necessary wiring. Submit detail point-to-point wiring diagram, signed by the Registered Professional Engineer, showing all points of connection. Diagram shall include connections between system devices, appliances, control panels, supervised devices, all equipment that is activated or controlled by the panel.

3.3 OVERVOLTAGE AND SURGE PROTECTION

Equipment connected to alternating current circuits shall be protected from surges in accordance with IEEE C62.41.1, IEEE C62.41.2 and NFPA 70. Cables and conductors which serve as communications links, except fiber optics, shall have surge protection circuits installed at each end. Fuses shall not be used for surge protection.
3.4 GROUNDING

Ground rods shall not protrude more than 150 mm 6 inches above grade. Noncurrent-carrying metallic parts associated with radio fire alarm equipment shall have a maximum resistance to solid "earth" ground not to exceed 25 ohms.

3.5 TRAINING

Conduct a training course for operating staff in the building where the system is installed as designated by the Contracting Officer. The training period shall consist of [1 training day] [_____] training days], [8] [_____] hours per day and shall start after the system is functionally completed but prior to the final acceptance tests. The field instructions shall cover all of the items contained in the approved operating and maintenance instructions.

3.6 TESTING

Submit test reports in booklet form showing field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Each test report shall document all readings, test results, and indicate the final position of controls. Notify the Contracting Officer 30 days before the performance and acceptance tests are to be conducted and submit the test procedures to be used. Submit detailed test procedures for the fire alarm reporting system [30] [_____] days prior to performing system tests. The test procedures shall be signed by the Registered Professional Engineer. Perform the tests in the presence of the Contracting Officer under the supervision of the fire alarm system manufacturer's qualified representative. Furnish all instruments and personnel required for the tests.

3.6.1 Performance Testing

Upon completion of the installation, the system shall be subjected to a complete functional and operational performance test. Test shall determine that the system is free from grounded, shorted, or open circuits. When all corrections have been made, the system shall be retested to assure that it is functional. Copies of performance test reports shall be submitted in accordance with paragraph SUBMITTALS.

3.6.2 Acceptance Test

**************************************************************************
NOTE: Listed tests are minimum required. If additional tests are required such tests must be added to the list.
**************************************************************************

The testing shall be in accordance with NFPA 72. The recommended tests in NFPA 72 shall be considered mandatory and shall verify that all previous deficiencies have been corrected. The tests shall include the following:

a. Tests to indicate there are no grounded, shorted, or open circuits.

b. Tests of each radio fire alarm transmitter/receiver/transceiver/repeater.
c. Tests of radio fire alarm monitoring base station for all required functions.

d. Tests of normal and emergency power supplies.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for a complete base-wide radio fire reporting system which provides reporting of fire alarms to a central processing location through the use of radio transmitters connected to various building interior fire alarm systems and optional manual exterior alarm transmitters "street boxes".

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Interior building fire alarm systems are covered by Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE, Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE, Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE, and Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE.

NOTE: Close coordination by the designer with the
EFD/EFA Fire Protection Engineer, the Federal Fire Chief, and facility fire alarm maintenance personnel is absolutely essential to achieving the goal of an alarm reporting system that meets the needs of the customer.

**************************************************************************

**************************************************************************

NOTE: The following information shall be included in the contract drawings:

1. Complete scale map(s) of the Government facility (or portion thereof) where the system is to be installed, showing building locations and numbers, roads and streets by name and/or number, and significant landmarks such as airfield runways, navigable water, etc. Such map(s) shall show the location of each transmitter to be installed, and location of existing equipment to be reconnected or removed under this contract.

2. Individual building plans of sufficient detail and scale to clearly indicate locations of transmitters and of local alarm systems ("protected premises control units" per NFPA 72), fire extinguishing system control units, and individual initiating devices to be connected to radio alarm transmitters. Show points of connection to AC power for transmitter (and location light for outdoor master boxes and/or manual fire alarm boxes).

3. Table(s) showing: each transmitter location; transmitter code number; the number of zones to be connected and their descriptions; and the make and model of local control unit(s) to be tied into the transmitter. (e.g.: Bldg. 591; transmitter # 0591, Zone 1 - FACU common alarm contact, Zone 2 - carbon dioxide control unit common alarm contact, Zone 3 - fire pump running, Zone 4 - fire pump switch off normal, Zone 5 - fire pump trouble, Zone 6 - Spare; FACU is an XYZ Co. model ABC, carbon dioxide control unit is a UVW Co. model EFG, etc.).

NOTE: WHEN INDICATING CONNECTIONS TO EXISTING CONTROL UNITS, DESIGNERS MUST DETERMINE THAT THERE ARE DRY (Form A or Form C) CONTACTS AVAILABLE WITHIN THE CONTROL UNIT TO PERMIT THE CONNECTION.

Designers must be aware that many older control units may lack the necessary contacts. If necessary to provide additional contacts, the designer must ascertain from the control unit manufacturer whether the necessary parts are available. In cases where the necessary contacts are not available, it will be necessary to indicate replacement of the control unit or other remedial action.

4. A complete layout of the fire/emergency communications center operations room or fire alarm watch office showing locations of all new equipment,
existing equipment that is to remain, and equipment
to be removed. Show points of connection to power
source(s).

5. Mounting details of the base station antennas,
including structural design of antenna supporting
towers if towers are required.

Less) AC Power Circuits

IEEE C62.41.2 (2002) Recommended Practice on
Characterization of Surges in Low-Voltage
(1000 V and Less) AC Power Circuits
1.2 RELATED REQUIREMENTS

Materials and workmanship shall conform to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, with the additions and modifications specified herein. Include provision of all labor, material, tools and equipment necessary for and incidental to the provision of a complete and usable[ base-wide] radio fire alarm reporting system. The system shall be in accordance with NFPA 70, NFPA 72, and as specified herein. Radio transmitting and receiving/decoding equipment furnished under this section shall be the current products of one manufacturer regularly engaged in production of such equipment. All other materials and equipment furnished under this section shall be the current products of one or more manufacturers regularly engaged in production of such materials and equipment. All electronics shall be solid state. Equipment shall be
listed by the Underwriters' Laboratories, Inc. (UL) or approved by the Factory Mutual System (FM) as a Public Fire Reporting system, in accordance with NFPA 72. Equipment used to interconnect the system with protected premises fire alarm system control units and fire suppression / extinguishing system control units [and dry-contact initiating devices] shall be UL listed or FM approved for that service, in accordance with NFPA 72. As an alternate to the above listing requirements, all equipment shall be UL Fire Prot Dir listed or FM APP GUIDE approved as a Supervising Station Fire Alarm System in accordance with NFPA 72. Radio transmitters and receivers shall comply with all requirements for FCC Type Acceptance, except that they shall be capable of operation in the military frequency bandwidths and at the power output specified herein. In the NFPA publications referred to herein, the advisory provisions shall be considered mandatory, as though the word "shall" had been substituted for "should" wherever it appears; reference to the "authority having jurisdiction" shall be interpreted to mean the [[_____] Division] [Engineering Field Activity [_____]], Naval Facilities Engineering Command, Fire Protection Engineer.

1.2.1 Continuity of Protection

During installation of this system, there shall be no loss of function of the existing base fire reporting system, or of the protected premises alarm and suppression / extinguishing systems connected thereto. Transfer of protected premises system connections from the existing base reporting system shall not result in loss of alarm transmitting or receiving capability. Temporary interruption of individual protected premises systems connections, not to exceed 8 hours duration, will be permitted with the approval of the Contracting Officer. No interruption of alarm or communications functions at the central[ fire/emergency communications center] will be permitted.

1.3 SYSTEM DESIGN

**************************************************************************
NOTE: Include all types of fire alarm control panels and fire suppression / extinguishing system control panels and initiating devices to which system transmitters must be connected. A/E must investigate existing systems in each building. For connection to the radio alarm transmitter, each protected premises control unit must have at least one common normally open (closes on alarm) dry alarm contact available for use. If it is desired to transmit protected premises supervisory and/or trouble signals, then the control unit requires additional common trouble or supervisory output dry contacts. In cases where it may be desirable to transmit distinct alarm signals per zone, or per group of initiating devices, the control unit will need individual zone output dry alarm contacts or programmable output dry contacts. In some cases it may be necessary to modify existing control units by installing additional output modules supplied by the manufacturer of the control unit. If modification of existing control units is not possible due to non-availability of the necessary modules or lack of space within the panel, replacement with new control units in order to
provide the necessary dry alarm contacts will be required. For installation of new control units, include Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE, Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE, Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE, or Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE as appropriate. For additional guidance, consult the NAVFAC EFD/EFA Fire Protection Engineer having jurisdiction.

**************************************************************************

Provide a complete and useable standard system, complying with NFPA 70, NFPA 72, and this specification. Provide system connections to protected premises fire alarm system [and fire suppression/extinguishing system] control units[, and dry contact initiating devices] as shown in accordance with NFPA 72.[ New protected premises fire alarm systems are specified in [ 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE]]. Provide system with[ manual alarm ("street") boxes][ and][ master boxes] as defined in NFPA 72 where shown, to allow manual initiation of fire[ and emergency medical][ and police response] alarm transmissions. System shall be permitted to use one-way or two-way (interrogation) communication, or both, to comply with the performance requirements specified herein. If a two-way system is provided, the term "transmitter" as used in this section shall be interpreted to mean "transmitter/receiver".

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required
as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

fire alarm reporting system; G[, [_____]]

SD-02 Shop Drawings

System Layout Drawings; G[, [_____]]

Wiring Diagrams; G[, [_____]]

Mounting Details; G[, [_____]]

SD-03 Product Data

Radio alarm transmitters; G[, [_____]]

Interface Device for Master Box Radio Transmitters; G[, [_____]], unless integral with transmitters

MANUAL FIRE ALARM BOXES; G[, [_____]]

Antennas and Cables; G[, [_____]]

BASE STATION RECEIVING OR CONTROL EQUIPMENT; G[, [_____]]

Emergency Power Source; G[, [_____]]

SAFETY DISCONNECT SWITCH; G[, [_____]]

BOX LOCATION LIGHT; G[, [_____]]

lightning arresters for transmitter antennas; G[, [_____]]

lightning arresters for base station antennas; G[, [_____]]

SURGE SUPPRESSION; G[, [_____]]

COMPUTER-AIDED DISPATCH (CAD) SYSTEM; G[, [_____]]

SD-05 Design Data

ALARM SYSTEM POWER CALCULATIONS; G[, [_____]]
Transmitter Identity Code; G[, [____]]

SD-06 Test Reports

Tests during installation; G[, [____]], NFPA 72 "Inspection and Test Form"

Final Acceptance Test; G[, [_____]]

ADDITIONAL TESTS; G[, [_____]]

SD-07 Certificates

List of Prior Installations; G[, [_____]]

FIRE ALARM SYSTEM UL OR FM LISTING; G[, [_____]]

FCC type acceptance; G[, [_____]]

Manufacturer's Technical Representative; G[, [_____]]

Qualifications of Installer; G[, [_____]]

Qualification of system technician; G[, [_____]]

SD-10 Operation and Maintenance Data

radio fire alarm system, Data Package 5; G[, [_____]]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals

Instruction of Maintenance Personnel; G[, [_____]]

SYSTEM AS-BUILT DRAWINGS; G[, [_____]]

1.5 DRAWINGS

1.5.1 System Layout Drawings

Submit alarm system layout drawings, showing location of all alarm transmitting, receiving, and interfacing equipment and devices relative to building locations. Indicate graphic scale and compass directions on all drawings. Submit plan view and cross-section of emergency communications center operations room, showing all new and retained existing equipment and furnishings, drawn in 1:50 or larger scale.

1.5.2 Wiring Diagrams

Submit wiring diagrams for the complete system showing points of connection and terminals to be used for each field connection. Show wire color coding, wire counts, and end-of line-supervisory devices.

1.5.3 Mounting Details

Submit details of each type of transmitter mounting including antenna...
mounting detail.

1.6 **ALARM SYSTEM POWER CALCULATIONS**

Submit design calculations to substantiate that the battery capacity provided exceeds supervisory and alarm power requirements for radio alarm transmitters[ and interface units] and for receiving, decoding and control equipment.

1.7 **FIRE ALARM SYSTEM UL OR FM LISTING**

Submit copies of current UL Fire Prot Dir listings or FM APP GUIDE approvals for all equipment furnished. Submit UL listing or FM approval for transmitters, interface equipment, and receiving/control equipment showing that such equipment is listed or approved for use together as an integrated system.

1.8 **QUALIFICATIONS**

1.8.1 **List of Prior Installations**

Prior to commencing work, submit data showing that the Contractor has successfully installed radio fire reporting systems, or that he has a firm contractual agreement with a subcontractor having such required experience. The data shall include the names and locations of at least two installations where the Contractor, or the subcontractor referred to above, has installed such systems. Indicate the type and design of these systems and provide written certification from the users that these systems have performed satisfactorily in the manner intended for a period of not less than 18 months.

1.8.2 **Manufacturer's Technical Representative**

Submit names of the manufacturer's technical representative(s) who will supervise installation and testing of the system, and who will provide instruction to government personnel, along with the manufacturer's certification of the qualifications of the named representative(s).

1.9 **SYSTEM AS-BUILT DRAWINGS**

Upon completion, furnish to the Contracting Officer one complete set of reproducible as-built drawings and five copy sets, including system layout drawings and field wiring diagrams. Drawings shall be "D" size 850 by 550 mm 34 by 22 inches, drawn to the same scale as the contract drawings, with title block similar to the contract drawings. Reproducible drawings shall be on mylar film. Furnish as-built drawings in addition to the record drawings required by Division 01.

1.10 **QUALITY ASSURANCE**

1.10.1 **Qualifications of Installer**

Ensure that the installer is UL certified for the installation and testing of the fire alarm systems. Furnish proof of this listing. A list of installer's personnel shall be furnished as part of the submittals package.

1.10.2 **Manufacturer's Technical Representative**

Provide the services of a qualified manufacturer's technical representative
or technician, experienced in the installation and operation of the type of system being provided to supervise the installation, adjustment, preliminary testing and final testing of the system and to provide instruction to Government maintenance and operating personnel.

1.10.3 Qualification of System Technician

Installation drawings, shop drawings and as-built drawings shall be prepared by, or under the supervision of, a qualified technician. Qualified technician shall be an individual who is experienced with the types of work specified herein, and is currently certified by the National Institute for Certification in Engineering Technologies (NICET) as an engineering technician with minimum Level-III certification in fire alarm system program. Contractor shall submit data showing the names and certification of the technician as specified in the paragraph entitled "Submittals".

PART 2 PRODUCTS

2.1 RADIO ALARM TRANSMITTERS

**************************************************************************

NOTE: OPNAV INSTRUCTION 2410.11H requires that funds shall not be obligated for the procurement of radio equipment until frequency allocation authority has been obtained. As soon as possible, but no later than Schematic Design, the designer shall contact the Area Radio Frequency Coordinator (usually the base Communications Officer) to determine the availability of radio frequencies and to ensure that the using activity submits a DD Form 1494, APPLICATION FOR FREQUENCY ALLOCATION, for a Stage 1 ("Conceptual Development") allocation (See DD Form 1494 Preparation Guide). Stage 1 allocation authority (i.e. approval) must be obtained prior to advertisement of the contract.

In order to avoid potential contract delays, the frequency assignment should be included in the specification when possible. In some cases it may be necessary or desirable for the designer to perform a frequency intermodulation analyses or set up radio monitoring and recording equipment on the proposed frequency to verify that the frequency is free from interference.

For additional information, contact the facility Communications Officer or the Naval Electronics System Command, Code 08H at (202) 692-7523.

**************************************************************************

Provide radio alarm transmitters completely assembled, tested at the factory, and delivered ready for installation and operation. The transmitter electronics package shall be contained within the housing as a complete assembly, removable to facilitate servicing and replacement. Transmitters shall operate on any frequency within the [138-150.8 or 162-174 MHz] [406-420 MHz] [_____] band and shall be operable within a 12.5 KHz channel. The specific frequency shall be [_____]MHz [as directed by the
Contracting Officer, within [90] [_____] days following submission of completed application for frequency allocation following contract award. If 2-way transmitter/receivers are provided to fulfill the requirements as specified herein for radio alarm transmitters, they shall transmit and receive on separate frequencies. The second frequency will be as assigned within [90] [_____] days following submission of completed application for frequency allocation following contract award.

2.1.1 Transmitter Identity Code

**************************************************************************
NOTE: For NAVFAC ML and NAVFAC PAC HQ MIDPAC projects, delete the bracketed text in the third sentence and include the bracketed text in the fourth and fifth sentences. For projects in other areas, consult the EFD/EFA Fire Protection Engineer having jurisdiction. It is generally desirable to have the transmitter number the same as the number of the connected or nearest building where this can be done without undue difficulty.
**************************************************************************

Provide transmitters which include a unique identity code as part of each transmission. Setting the code shall be readily accomplishable in the field without the need to exchange or alter circuit boards. [The specific code number for each transmitter shall be as shown on the contract drawings.] [Submit in writing, within 30 calendar days after award, the proposed specific code number for each transmitter.] [Obtain the code numbers from the Federal Fire Department serving the facility.]

2.1.2 Environmental Operating Requirements

**************************************************************************
NOTE: Choose the temperature range most appropriate for the local climate. Avoid specifying minus 40 degrees C unless necessary, as this may add significantly to the cost of the system (special order item from some manufacturers). For areas where lower temperatures can be anticipated, show transmitters indoors, with antennas outdoors.
**************************************************************************

Transmitters not installed within climate-controlled spaces shall be designed for reliable operation in an ambient temperature range of [minus 30 degrees C to plus 60 degrees C minus 22 degrees F to plus 140 degrees F][minus 40 degrees C to plus 60 degrees C minus 40 degrees F to plus 140 degrees F] and under adverse climatic conditions including [161][242] km/h [100][150] mph winds, high humidity, rain, ice, and snow storms.

2.1.3 RF Power Output

Provide Transmitters with power output required for reliable reception, and in no case less than one watt nominal. Power output shall be permitted to be greater than one watt nominal, if required for reliable operation over required distances.

2.1.4 Memory

Provide transmitters with memory capability. Simultaneous or subsequent
actuation of zones, including those actuated during "off air" periods, shall not result in the loss of any messages. All messages shall be stored until they are transmitted.

2.1.5 Transmission Confirmation

Provide transmitters which produce an audible or visual indication that the transmitter is operating and an alarm signal is being sent, whether the transmission is initiated automatically by an alarm condition or manually.

2.1.6 Automatic Test

Provide transmitters which automatically transmit a test signal at least once in each 24 hour period. Transmitters shall also allow manual actuation of test signal by a secured (not publicly accessible) means. Automatic actuation shall be initiated by a solid state programmable electronic device. Stability of the electronic device shall be plus or minus one minute per month or better. Test time(s) shall be programmable without removing the transmitter from the enclosure. For one-way radio systems, the test shall be initiated at the transmitter; for 2-way polling/interrogation systems, the automatic test shall be part of the normal polling/interrogation function.

2.1.7 Battery Monitoring

Provide transmitter with battery monitoring in accordance with NFPA 72.

2.1.8 Inputs/Zone Connections

Except for transmitters shown as "street boxes" on the contract drawings, provide each transmitter with a minimum capacity, including any modules required, of 6 initiating circuit inputs (zones) for connection to protected premises fire alarm and suppression / extinguishing system control units, [and dry-contact initiating devices utilizing Form A dry contacts]. The specific zone connections for each transmitter shall be as shown. When the number of zone connections shown exceeds the maximum zone capacity furnished in a single transmitter, provide additional transmitters at that location to connect to all zones shown.

2.1.8.1 Zone Annunciation

Provide transmitters with separate red alarm and yellow trouble lamps to indicate the status of each initiating zone.

2.1.8.2 Zone Disconnecting Means

Provide transmitters with switches to disconnect individual zone inputs from the transmitter without disconnecting wiring. Disconnecting a zone shall cause a trouble condition which shall initiate transmission of a trouble signal and actuation of local trouble signals as specified in paragraph entitled "Trouble Signals."

2.1.8.3 Monitoring for Integrity

Each transmitter shall monitor the integrity of circuits between the transmitter and the protected premises control unit(s) [and circuits between the transmitter and dry contact initiating devices]. A ground-fault or a break (open condition) in any of the above circuits shall cause a trouble condition at the transmitter which shall initiate
transmission of a trouble message and actuation of local audible and visual trouble signals as specified in paragraph entitled "Trouble Signals."

2.1.9 Trouble Annunciator

Provide transmitters with local audible trouble signal, visual amber trouble lamp(s), and audible signal silencing switch. Lamps shall be light emitting diode (L.E.D.) type. Lamps need not be visible with the access door closed. Upon occurrence of a trouble condition as defined in NFPA 72, transmitter shall transmit a trouble signal, local audible trouble signal shall sound, and trouble lamp shall illuminate. When silencing switch is operated, the audible trouble signal shall silence and the trouble lamp(s) shall remain lit. If the silencing switch is not a momentary-action-self-resetting type, upon correction of the trouble condition(s) the audible signal shall again sound until the silencing switch is returned to its normal position.

2.1.10 Transmitter Power Source

**************************************************************************
NOTE: The available utilization voltage at each building must be verified. If 120-volt service is not available, show transformer on the contract drawings, and include section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.
**************************************************************************

Provide transmitters with power sources which comply with NFPA 72. Provide connection to locally available AC power. Point of connection shall be as shown. [Where indicated, provide manual (street) alarm box transmitters powered by photovoltaic power systems or user power in accordance with NFPA 72.] Provide transmitters with power supply filtering to prevent false message transmissions caused by transient or steady-state electrical disturbances.

2.1.11 Transmitter Enclosure

Provide transmitters with enclosures of corrosion resistant metal, conforming to NEMA ICS 6 classification in accordance with NFPA 70 for the environment in which they are installed [but in no case less than Type 3R] Provide enclosures with conduit entry points (minimum 21 mm 3/4 inch I.D.) at no less than one place near the top of the enclosure and one place near the bottom of the enclosure. Switches and other controls shall not be accessible without the use of a key. Access door(s) shall swing open through at least 2.1 rad 120 degree arc. Enclosure shall be factory painted with a priming coat and not less than two coats of a durable weatherproof gloss enamel. The finish color shall be Fire Engine Red, similar to color number 11105, SAE AMS-STD-595A. except as otherwise specified herein for each individual transmitter configuration. Repaint all surfaces damaged during installation to match existing paint. Securely affix a metallic or rigid plastic engraved code number plate to the front of the enclosure.

2.1.11.1 Security

Switches and internal components shall be protected from tampering by a tamperproof lock on the transmitter enclosure door. Locks for all transmitters of each configuration provided shall be keyed alike.
2.1.12 Antennas and Cables

Provide antennas for radio alarm transmitters of the omnidirectional unity-gain coaxial or directional gain type as required for reliable signal transmission and reception. Provide antennas with driving point impedance matching transmitter output. Antennas and mounting hardware shall be heavy duty, corrosion resistant, and designed to withstand wind velocities of \[161\] \(242\) km/h \(100\) \(150\) mph. Provide RG8U or RG58U, minimum 95 percent shielded coaxial cables utilizing PL-259 connectors. Connectors shall be protected against moisture. No splices will be permitted in any cable. Crimp-type connectors are not permitted. Run cables alone in separate conduit except where enclosed in a master box or street box pedestal.

2.1.13 Lightning Protection

Provide lightning arresters for transmitter antennas that do not have integral protection or do not function at ground potential, and for auxiliary connection and power supply wiring. Lightning protection shall be in accordance with NFPA 70. Transmitters shall not exhibit mis-operation or failure when electrical transients of IEEE C62.41.1 and IEEE C62.41.2 Category B are applied to the AC power line.

2.1.14 Moisture Protection

Provide printed circuit boards in transmitters (and interface panels if provided), with a non-nutrient conformal coating for protection against moisture and fungus. The coating shall be suitable for the climate in which the equipment is to operate and shall be applied at the factory in accordance with the coating manufacturer's specifications.

2.2 RADIO MASTER BOXES

**************************************************************************
NOTE: Delete paragraphs for transmitter configurations and options not required. Master boxes are generally used when both an exterior manual alarm box and transmission of alarms from protected premises systems are required. Consult the EFD/EPA Fire Protection Engineer for further guidance.
**************************************************************************

Provide master boxes where shown, configured for both manual actuation by a publicly-accessible lever or pushbutton on the front of each transmitter and for automatic actuation through wired connections to protected premises alarm control units and fire suppression / extinguishing system control units [and dry-contact initiating devices]. Master box transmitters shall comply with paragraph entitled "RADIO ALARM TRANSMITTERS" and the following requirements:

2.2.1 Signal Designations

Provide master boxes capable of transmitting separate signals, individually identifiable by the base station receiving/control networks as to the specific types or causes of transmitter actuation. Required signals are as follows:
2.2.1.1 Tamper

Signal shall be automatically transmitted when a box is tilted over 0.785 rad 45 degrees from vertical.

2.2.1.2 Fire

Signal shall be transmitted upon operation of the publicly accessible "FIRE" lever or pushbutton on the front of the box.

2.2.1.3 Master

Signal shall be transmitted upon automatic actuation of the transmitter through wired connection(s) to protected premises control unit(s) [or dry-contact initiating device(s)]. The transmitter zone actuated shall be individually identified as part of this transmission.

2.2.1.4 Medical Emergency

Signal shall be transmitted upon operation of the publicly-accessible "MEDICAL" lever or pushbutton on the front of the box. This message shall be permitted to be counted as one of the required number of zones specified in the paragraph entitled "Inputs/Zone Connections.

2.2.1.5 Police Emergency

Signal shall be transmitted upon operation of the publicly-accessible "POLICE" lever or pushbutton on the front of the box. This message shall be permitted to be counted as one of the required number of zones specified in the paragraph entitled "Inputs/Zone Connections.

2.2.2 Housing (Enclosure)

**************************************************************************
NOTE: Finish color shall be red unless requested otherwise by the Activity and approved by the EFD/EPA Fire Protection Engineer.
**************************************************************************

Provide box with cast metal [cottage] [or] [contemporary rectangular] style housing (enclosure), painted [Fire Engine red, similar to color number 11105,] [Lime Yellow, similar to color number 23793,] SAE AMS-STD-595A. Provide reflective, highly visible labels imprinted with the [word "FIRE" in minimum 50-mm two-inch] [words "FIRE" and "EMERGENCY" in minimum 25mm one-inch] block characters on both side surfaces of the box. Housing (enclosure) shall permit mounting on walls, utility poles, or pedestals.

2.2.2.1 Operating Panel

Provide boxes with operating panel located on the front of the box. Box operating panel shall incorporate pushbutton(s) or pull lever(s) or hook(s) clearly labeled as specified in the paragraph entitled "Message Designations". Appropriate operating instructions shall also be clearly visible. Break-glass mechanisms are not permitted. Operating panels shall be identical in operation on all boxes furnished. Mount box with operating panel not more than 1220mm 48 inches above grade.
2.2.2.2  **Interface Device for Master Box Radio Transmitters**

All circuitry, switches, and controls necessary for the functions required for Master Box Radio Transmitters shall be contained in one housing, except that circuitry required for interfacing with protected premises alarm and extinguishing system control units [and dry-contact initiating devices] shall be permitted to be contained in a separate enclosure if required by the UL listing or FM approval of the equipment. If two separate housings are provided, all requirements as specified herein for radio master boxes remain in effect, with the exception that only the housing containing the publicly accessible operating panel is required to be cast metal [cottage] [contemporary rectangular] style and labeled "FIRE". [If a separate housing for interfacing circuitry is provided, it shall be mounted adjacent to its associated protected premises control unit.]

2.3  **RADIO STREET BOXES**

**************************************************************************
NOTE: Delete paragraphs for transmitter configurations and options not required. A street box is generally used where an exterior manual alarm box is required and there are no facilities in the vicinity requiring a master box for transmission of alarms from protected premises systems. Consult the EFD/EFA Fire Protection Engineer for further guidance.
**************************************************************************

Provide radio street boxes configured for manual actuation by a publicly accessible lever or pushbutton on the front of each box. Street boxes shall comply with paragraph entitled "RADIO ALARM TRANSMITTERS," and the following requirements:

2.3.1  **Signal Designations**

Each transmitter shall transmit separate signals, individually identifiable by the base station receiving/control networks as to the specific causes of transmitter actuation. Required signals are as follows:

2.3.1.1  **Tamper**

Signal shall be automatically transmitted when a transmitter is tilted over 0.785 rad 45 degrees from vertical.

2.3.1.2  **Fire**

Signal shall be transmitted upon operation of the publicly accessible "FIRE" lever or pushbutton on the front of the box.

[2.3.1.3  **Medical Emergency**

Signal shall be transmitted upon operation of the publicly-accessible "MEDICAL" lever or pushbutton on the front of the box.

][2.3.1.4  **Police Emergency**

Signal shall be transmitted upon operation of the publicly-accessible "POLICE" lever or pushbutton on the front of the box.
2.3.2 Power Source

NOTE: Since street boxes are often not located on or near a building, obtaining 120 VAC power can sometimes be difficult. One acceptable source is a continuously-energized street lighting circuit, although this may require the use of a transformer. If transformers are required, include section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION or section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION as appropriate. Where connection to an AC power source is impractical, a photovoltaic power system may be specified. Consult the EFD / EFA Fire Protection Engineer for further guidance.

AC power shall be obtained as shown for each box, through a lockable fused disconnect switch. [Where drawings indicate AC power is not available, street boxes shall operate from photovoltaic power system.]

2.3.2.1 Photovoltaic Power System

Provide photovoltaic power system for street boxes without AC power source as shown, in accordance with NFPA 72. System shall include a photovoltaic panel, solid-state voltage regulators, interconnecting cables and necessary supports. Photovoltaic panel shall be capable of sustaining transmitter operation with the battery disconnected, when the light intensity is greater than 50 percent of full sun illumination. Voltage regulator shall prevent overcharging of the battery and reverse current flow from the battery to the charger. Regulator shall be temperature compensated with a control accuracy of plus or minus 0.1 volts and shall provide protection against lightning-induced surges. Mounting supports shall be of the flat plate, fixed tilt angle design, capable of withstanding the same wind loading specified for transmitters and antennas. All materials shall be sealed and weatherproof.

2.3.3 Housing (Enclosure)

NOTE: Finish color shall be red unless requested otherwise by the Activity and approved by the EFD/EFA Fire Protection Engineer.

Provide box with cast metal [cottage] [or] [contemporary rectangular] style NEMA 3R housing (enclosure) per NEMA ICS 6, painted [Fire Engine red, similar to color number 11105,] [Lime Yellow, similar to color number 23793,] SAE AMS-STD-595A. Provide reflective, highly visible labels imprinted with the [word "FIRE" in minimum 50-mm two-inch] [words "FIRE" and "EMERGENCY" in minimum 25mm one-inch] block characters on both side surfaces of the box. block characters on both side surfaces of the box. Housing (enclosure) shall permit mounting on walls, utility poles, or pedestals.

2.3.3.1 Operating Panel

Provide boxes with operating panel located on the front of the box. Box operating panel shall incorporate pushbutton(s) or pull lever(s) or
hook(s) clearly labeled as specified in the paragraph entitled "Signal Designations". Appropriate operating instructions shall also be clearly visible. Break-glass mechanisms are not permitted. Operating panels shall be identical in operation on all boxes furnished. Mount box with operating panel not more than 1220mm 48 inches above grade.

[2.4 MANUAL FIRE ALARM BOXES]

Provide manual fire alarm boxes (pull stations) where shown. Provide box with cast metal [cottage] [or] [contemporary rectangular] style NEMA 3R housing (enclosure), painted [Fire Engine red, similar to color number 11105,] [Lime Yellow, similar to color number 23793,] SAE AMS-STD-595A. Provide reflective, highly visible labels imprinted with the [word "FIRE" in minimum 50-mm two-inch] [words "FIRE" and "EMERGENCY" in minimum 25mm one-inch] block characters on both side surfaces of the box. Housing (enclosure) shall permit mounting on walls, utility poles, or pedestals. Connect box to its own separate zone on the nearest radio alarm transmitter as shown. Mount box with manual operating device not more than 1220mm 48 inches above grade.

[2.5 BOX LOCATION LIGHT]

**************************************************************************
NOTE: Specify box locations lights when master boxes, street boxes, or manual fire alarm boxes are required and AC power is available. Consult the EPD / EFA Fire Protection Engineer for further guidance. Choose the appropriate lamp type and voltage(s).
**************************************************************************

Provide each box with a vapor-tight, light fixture with a cast aluminum housing with screw-on die-cast lens guard, and heat resistant, unbreakable threaded ruby globe. The light shall be supported with minimum 16 mm 1/2 inch galvanized rigid steel conduit, and located approximately 305 mm one foot above the box. Lamp shall be [incandescent, 25 watt, [130] [240] volt AC] [compact fluorescent] extended service type. Power source shall be [the AC power to the box.] [or] [a dedicated circuit as indicated] Mount light fixture with lamp in vertical position.

[2.5.1 Box Location Marker (Non-Electric)]

**************************************************************************
NOTE: Use this paragraph only when street boxes are required and AC power is not available. Otherwise, delete entire paragraph. Choose wall mounting configuration(s) best suited for visibility.
**************************************************************************

For street boxes provided where AC power is not available, provide reflective red and white markers located with the bottom edge a minimum of 244 mm 8 ft above grade. For pole- or pedestal-mounted boxes, provide marker around entire circumference of pole or pedestal. For wall-mounted boxes, provide minimum of 95 mm 24 in. square marker sign with red letters on white reflective background mounted [on] [perpendicular to] wall surface above box [as shown]. Markers/signs shall be minimum2.03 mm 0.080 in. thick aluminum, covered with reflective sheeting, complying with MUTCD.
Provide redundant radio alarm base station receiving or control networks in the emergency communication center operations room as shown. [Also provide single network[s] in [_____] as shown.] Provide component equipment completely assembled, wired, and tested at the factory, and delivered ready for installation and operation. Each base station network shall perform the receipt, processing, and display of emergency and non-emergency signals transmitted by the radio alarm transmitters specified herein, independently of the other network. Provide each network as a complete and independent receiving system consisting of: a receiver (or transmitter and receiver for polling (interrogation) type systems), decoder, audio devices, visual display, digital clock, printer, primary and emergency power supplies, power supply monitors, memory devices, interconnecting cables, and antenna. If the automatic transmitter tests specified under paragraph entitled "Automatic Transmitted Test" are initiated by a polling (interrogation) device located at the base station, then each of the two required networks at the communication center shall have its own polling device. One such device shall always be active, with the other in standby status. Failure of the active device shall automatically cause the other polling device to take over the interrogation (polling) function. Provide equipment in [desk-top console] [vertical rack] configuration.

### 2.6.1 Display

******************************************************************
NOTE: Delete medical and police message designations if these options were not selected under the paragraph entitled "Master Box" or "Street Box".
******************************************************************

Each network shall display incoming signals in alphanumeric message format, using a light emitting diode, illuminated dot matrix, cathode ray tube, or equivalent display. The display shall indicate the identity code number assigned to the originating transmitter, which shall be a minimum of 4 digits, 0001-9999. The display shall also include the following message designations:

- FIRE MASTER(1) (Zone #) [MEDICAL]
- TAMPER SUPERVISORY(2) (Zone #) [POLICE]
- TEST LOW BATTERY / LOW POWER(3)
- TROUBLE POWER FAILURE(3)

Note (1): "Auxiliary" or other wording which clearly distinguishes between automatic remote actuation and manual actuation at the transmitter is acceptable in lieu of "MASTER."

Note (2): "Supervisory" shall be displayed when the automatic remote cause of the transmitter actuation is a supervisory signal as defined by NFPA 72.

Note (3): Low battery, low power, and power failure messages shall be displayed as required by NFPA 72.

Each network shall include a means for the operator to manually reset (clear) its display. If the display is not reset at the time additional alarm(s) or supervisory signal(s) are received, the additional alarm(s) and
supervisory signal(s) shall be retained in the memory and a distinctive audible or visual indication given to the operator that additional messages are waiting to be acknowledged. A minimum of 16 such messages shall be retained for display and acknowledgement. Alarms shall be printed immediately upon receipt. Supervisory signals shall have priority over trouble signals and shall be clearly distinguishable in compliance with NFPA 72 on the visual display and printout.

2.6.2 Memory

Provide each network with a programmable non-volatile memory capable of retaining 500 transmitter codes together with their specific messages, total number of zones possible, and related information associated with each of 500 transmitters. Memory shall be used in comparing received signals with pre-programmed "legitimate" transmitter codes, and shall cause the rejection of any signal containing a code not programmed into memory. Memory shall also maintain an account of automatic transmitter testing and transmitter trouble and low battery/low power/power failure transmissions as required by NFPA 72. Access into the memory for the purpose of making additions or deletions shall be restricted to the system administrator by the use of a key switch or access code to prevent unauthorized changes. Stored information shall not be lost in the event of a total loss of primary and emergency power supplies.

2.6.2.1 Memory Readout

Upon manual activation by the operator, the each network shall print a summary of transmitters which have transmitted a trouble (or low battery/low power/power fall as required by NFPA 72) signal, or which have failed to transmit a signal during the previous 24-hour test period. Any legitimate incoming transmitter signal shall preempt the memory read function, and take control of each network.

2.6.3 Digital Clock

Provide each network with an electronic digital clock. The clock shall display the current time expressed in 24-hour time and date (day and month) and shall transmit to each interconnected decoder and printer the time and date that signals are received. Provide a means for resetting the clock.

2.6.4 Printer

Provide printers of high speed, computer compatible, low noise design, which are capable of printing messages associated with all incoming signals, with no messages being lost. Upon reception of an alarm, each printer shall print the required visually displayed data, including the date and time received. Paper for recording messages shall be standard size, and commercially available printer (computer) or adding machine, continuous feed type. Paper take-up devices for storing print-out shall be included. Alarms shall be printed in a manner to make them readily distinguishable from acknowledgements and routine messages, by use of a different color, typeface, type size, or similar means.

2.6.5 Audible Annunciation

Provide each network with audible device(s) mounted in the console to indicate the receipt of emergency, supervisory, and trouble signals. Devices shall produce a distinct sound to announce emergency signals. The same sound may be used to announce receipt of both supervisory and
trouble signals, as defined by NFPA 72, however supervisory signals shall have priority over trouble signals and shall be clearly distinguishable on the visual display and printout.

2.6.6 Receivers

Provide each network with solid state radio receiver of standard design. Provide both receiver and transmitter for polling (interrogation)-type systems. Provide an audio amplifier with loudspeaker connected to the demodulated output of the receiver. Signal receivers shall be completely solid state, narrow band.

2.6.7 Decoders

Provide signal decoders which are fully solid state, utilizing rack-type construction and plug-in type printed circuit cards, for decoding of incoming messages or signals.

2.6.8 Primary Power Source

**************************************************************************
NOTE: Design power supply circuits to comply with NFPA 1221 Chapter 2 paragraph entitled "Power".
**************************************************************************
Provide primary power for each network [through a connection into the line side of the building's regular AC service circuit] [from the building emergency service circuit as shown] through a lockable fused disconnect switch. Provide a separate disconnect switch for each network.

2.6.9 Emergency Power Source

**************************************************************************
NOTE: Select 24 hours or more unless an emergency generator complying with NFPA 1221 Chapter 2, capable of continuous operation for at least 24 hours is provided.
**************************************************************************
Provide emergency backup battery power supply. Provide batteries of sufficient capacity to operate all functions of the network for [8] [24] [60] hours. Mount batteries on racks designed for that purpose. Provide a termination block for each battery rack. Locate batteries [in the communication center] [where shown]. Do not locate vented wet-cell batteries in normally-occupied rooms. For batteries located remote from the control equipment, provide fuses on positive and negative leads at the battery rack.

2.6.9.1 Emergency Power Switchover

In the event of a primary power supply failure, the network shall automatically without interruption switch to emergency battery power and indicate the failure within 15 seconds. When primary power is restored, transfer back to operation from primary power shall also be automatic.

2.6.10 Network Battery Charger

Battery chargers shall be self-regulating. Each charger shall have the capacity to completely recharge its associated batteries from full
discharge within 48 hours with the network fully operational on primary AC power. The network shall remain operational on AC power with the batteries removed.

2.6.11 Monitoring for Network Integrity

Provide base station receiving/control equipment which continually monitors itself for integrity. Provide individual visual trouble indicators for each major component. An audible signal shall activate in the event of failure of any monitored component. Provide a trouble silencing switch which when operated, will silence the audible signal while the trouble lamp(s) shall remain lit. If the silencing switch is not a momentary-action-self-resetting type, upon correction of the trouble condition(s) the audible signal shall again sound until the silencing switch is returned to its normal position.

2.6.11.1 Receiver Monitoring for Integrity

The base station receiving/control equipment shall provide constant monitoring of the operating condition of the signal receivers, and shall indicate visually and audibly a trouble condition when sustained carrier (RF) in excess of 15 seconds is detected.

2.6.11.2 Power Monitoring for Integrity

Each network shall continuously monitor its primary and emergency power supplies. Any malfunction shall be indicated visually and audibly. An "open" in the battery circuit, or standby battery voltage below the level capable of sustaining network operations shall cause activation of network trouble signals.

2.6.11.3 Meters

Provide voltage and amperage indicators to monitor the status of the emergency DC power supply. When the battery rack is within clear sight of the operator's work station, a voltmeter and ammeter mounted at the battery rack will satisfy this requirement.

2.6.12 Component Connections

Provide receiving/control equipment with modular components to allow interchange of components for maintenance purposes. All interconnecting cables and connectors shall be compatible with computer quality signal data transmission.

2.6.13 Protective Finish

Provide factory finish on chassis, frames, and brackets associated with, or part of, network components.

2.6.14 Base Station Receiving or Control Network Antennas

Provide the required antenna system for each network including grounded lightning-protected, omnidirectional, coaxial antenna, together with all necessary mounting brackets and supports for installation; line static arrester, and interconnecting cable in the necessary length for each receiver. Provide antennas for the dual networks with maximum separation at the emergency communication center. Antenna supporting structures shall comply with TIA-222. Provide antennas tuned to the operating frequency
and designed to withstand destruction by natural elements under normal operating conditions. The complete antenna assemblies shall be corrosion resistant and designed for reliable operation under adverse climatic conditions including [161] [242] km/h [100] [150] mph winds, rain, ice, and snow storms. Antenna cable(s) shall be minimum 95 percent shielded type. Run antenna cables in galvanized rigid steel conduit.

2.6.15 Lightning Protection

Provide lightning arresters for base station antennas in accordance with NFPA 70. Base stations shall not exhibit mis-operation or failure when electrical transients of IEEE C62.41.1 and IEEE C62.41.2 Category B are applied to the AC power line. [Provide Metal Oxide Varistor (MOV) protection on all primary power circuits in accordance with IEEE C62.11.]

2.6.16 Field Programming Capability

Furnish field programming capability, including: Interconnecting cables, software, firmware, hardware, and manufacturer’s licenses and passwords necessary to permit revisions to data stored in memory as follows: Addition or deletion of transmitters, changes in zone numbers and identification, changes in alarm level and displayed message (alarm vs. supervisory), alphanumeric label changes, and password changes, to be made by the Government after contract completion.

2.7 COMPUTER-AIDED DISPATCH (CAD) SYSTEM

******************************************************************************
NOTE: Except for larger consolidated communication centers, select the single CAD system option. If a new CAD system is not desired, delete these paragraphs. Consult the Federal Fire Chief to determine the requirement for a CAD system and the historical and anticipated daily (average and peak) call loading.
******************************************************************************

In the communication center emergency operations room, provide [one] [two] Class 3 CAD system[s] in compliance with NFPA 1221. Provide hardware, firmware, and software required for a complete and useable system. Provide IBMâ-compatible computer[s] with minimum 4 gigabyte hard drive, 100 megabyte or larger removable drive, 3.5" floppy disc drive, CD ROM drive, 56 Kbps modem, monitor, keyboard, and printer. Provide standard, commercially-available software loaded on the computer hard drive, and backed up on CD ROM. System shall be capable of accommodating an average load of [___] calls per 24 hour day and a peak load of [___] calls per hour.

2.7.1 Interconnection to Alarm System

Provide interconnection between CAD system[s] and radio alarm receiving/decoding networks [,and] [existing wired box circuits] [,and Enhanced 9-1-1 telephone system] so that alarms are automatically displayed on the CAD monitor screen and printed on the CAD printer as they are received.

2.7.2 Monitor and Keyboard

Provide color monitor, [___]mm inch or larger with [___] by [___] resolution. Provide ergonomically-designed soft-touch computer keyboard
2.7.3 Printer

Provide color laser printer, capable of printing [6] [_____] pages per minute in text mode. Printer shall use standard 216mm x 279 mm 8.5 in. x 11 in. [tractor-feed] [or][loose-leaf] paper.

2.7.4 Automatic Display

Upon automatic receipt of an alarm, system shall display and print the following:

Box number

Zone number (when applicable)

Type of alarm (fire, medical emergency, water flow, supervisory, etc.)

Building name or number

Street address

Nearest street intersection

Emergency response unit assignments by unit type and number for first, second, third, and subsequent alarms, including substitute unit(s) for normally-assigned unit(s) previously entered into the system by the telecommunicator as being in a status which makes them not available to respond.

Pre-Incident Planning Information/Special instructions for first-arriving units.

2.7.5 Manual Alarm Entry Capability

Provide system with manual alarm entry capability. The system shall enable the telecommunicator to enter alarm locations by any of the following: Building number, phantom box number, street address, nearest street intersection. When an alarm is manually entered, the system shall display and print information specified in paragraph entitled "Automatic Display".

2.7.6 Unit Status Tracking Capability

Provide system with unit status tracking capability. The system shall enable the telecommunicator to record changes in individual unit status (in-station, responding, on-scene, etc.) with no more than two keystrokes (not counting unit number) or mouse clicks.

2.7.7 Pre-Incident Plan Retrieval

Provide system with pre-incident planning storage and retrieval capability. The system shall enable the telecommunicator to access pre-incident plans. For displayed alarm location, access to the pre-incident plan shall not require more than two keystrokes or mouse clicks.
2.7.8 Hazardous Materials Data Retrieval

Provide system with hazardous materials data storage and retrieval capability. The system shall enable the telecommunicator to access stored hazardous material database information.

2.7.9 Power Source

Provide power for CAD system [through a connection into the line side of the building's regular AC service circuit] [from the communication center emergency service circuit] through a dedicated lockable fused disconnect switch.

2.7.9.1 Uninterruptible Power Supply (UPS)

**************************************************************************
NOTE: Specify class of SEPSS based on requirements of NFPA 1221 Chapter 2 and NFPA 72 Chapter 1. A Class 0.25 SEPSS will provide power for 15 minutes, and is the minimum allowable. A Class 4.0 SEPSS will provide power for 4 hours, and is the minimum recommended at locations not provided with emergency generator backup power.
**************************************************************************

Provide a Type U, Level 1, Class [0.25] [4.0] [_____] Stored Emergency Power Supply System (SEPSS) in compliance with NFPA 111. SEPSS shall provide power for operation of CAD computer and monitor, and printer in the event of loss of power on the line side of the SEPSS.

[2.8 INTERCONNECTION WITH EXISTING COMPUTER-AIDED DISPATCH (CAD) SYSTEM

**************************************************************************
NOTE: Use this paragraph if there is an existing CAD system which is to be retained. Describe the existing system as precisely as possible. Otherwise, delete this paragraph.
**************************************************************************

2.8.1 Interconnection to Alarm Reporting System

Provide interconnection of radio alarm receiving/decoding networks with existing CAD system so that alarms are automatically processed by the CAD system, displayed on the CAD monitor screen, and printed on the CAD printer as they are received. Existing CAD system utilizes [_____] software, version [____], and operates on a [_____] computer with [_____] MHz processor, [_____] hard drive, [_____] RAM, [_____] floppy disc drive[, and [_____] CD ROM drive. [[_____] ports are available for this connection.]]

[2.9 SURGE SUPPRESSION

**************************************************************************
NOTE: Specify surge suppression for projects administered by NAVFAC SE and for all areas with high potential for lightning damage. Consult the EFD/EPA Fire Protection Engineer if additional guidance is needed.
**************************************************************************
Provide line voltage [and low voltage] surge suppression devices to suppress all voltage transients which might damage system transmitter[, CAD,] and receiving/control network components. Mount suppressors in separate enclosures adjacent to each transmitter[, computer,] and receiving/control network unless suppressors are specifically UL listed or FM approved for mounting inside the transmitter and receiving /control network enclosures and approved for such use by the radio system manufacturer. Provide line voltage suppressors which are UL 1449 listed having a maximum 330 volt clamping level and a maximum response time of 5 nanoseconds. Suppressors shall also meet IEEE C62.41.1 and IEEE C62.41.2 Category B tests for surge capacity. Suppressors shall be multi-stage type which include inductors and silicon avalanche zener diodes. Provide suppressors with long-life indicating lamp (light emitting diode or neon lamp) which extinguishes upon failure of the protection components. Fuses shall be externally accessible. Wire in series with the incoming power source ahead of the protected equipment, using screw terminations.

[Provide low voltage surge suppressors for all wired circuits which leave the building shell. When circuits connect two or more buildings, provide a suppressor at each circuit entrance to each building. Suppressors shall be UL 497B listed with a maximum 30 volt clamping level and a maximum response time of 5 nanoseconds and multi-stage construction having both differential and common-mode protection.]

2.10 RADIO ALARM TRANSMITTER BATTERY CONDITIONER

Provide a battery conditioner for use in discharging and recharging batteries which have been removed from battery-powered radio alarm transmitters in accordance with the transmitter manufacturer's recommended maintenance procedures. Unit shall be self-regulating.

2.10.1 Capacity

The conditioner shall have the capacity to simultaneously recharge a minimum of five batteries from full discharge to full charge within 72 hours. The unit shall operate from 120 VAC, 60 Hz power.

2.10.2 Meter

The battery conditioner shall include a meter and selector switch for monitoring the voltage of any battery attached.

2.11 RADIO ALARM TRANSMITTER BATTERY LOAD TESTER

Provide a load tester capable of applying a load to a radio alarm transmitter battery sufficient to determine whether or not the battery has the capacity to operate a transmitter. The load tester shall have a receptacle for connecting radio alarm transmitter battery and shall include all meters and controls required. The load tester shall be permitted to be part of the radio alarm transmitter battery conditioner specified above.

2.12 SAFETY DISCONNECT SWITCH

Provide properly fused, safety-type disconnect switch and box with provision for locking the cover and operating handle in the "power on" position. Paint switch box "Fire Engine Red" and locate near the service panel. Affix a permanent label reading "Fire Alarm Power" to each box. Provide padlocks for locking the box cover and operating handle.
provided shall be keyed alike. Switch boxes installed outdoors shall be NEMA 3R type.

2.13 PROTECTED PREMISES CONTROL UNITS

**************************************************************************
NOTE: Survey each control unit to ensure that the necessary "dry" electrical contacts are available for connection to the radio transmitter; if not, the control unit must be modified in accordance with the recommendations of its manufacturer or replaced. Indicate on drawings which units require modification or replacement under this contract and include Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE, Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE, Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE, [and] [or] Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE as appropriate. Consult the EFD/EFA Fire Protection Engineer for additional guidance as needed.

**************************************************************************
**************************************************************************
NOTE: Edit the following section to provide connection to fire alarm control units (panels), suppression system control units, extinguishing system control units, and fire pump controllers, as appropriate. If all suppression and extinguishing system control units are connected to fire alarm systems in compliance with the applicable NFPA standards, separate connections between the suppression/extinguishing system and the radio transmitter are not required. If fire pump controllers are connected to fire alarm systems in such a way that the three separate alarm signals required by NFPA 20 can be transmitted to the fire/emergency communication center, separate connections between the radio transmitter and pump controller are not required.

**************************************************************************
**************************************************************************
NOTE: Indicate on the drawings the location of each control unit, how many separate signals (circuits) are to be connected to the radio transmitter, and the designation of each circuit as it should be annunciated at the communication center.

**************************************************************************
Fire alarm [and fire suppression/extinguishing system] control units [and fire pump controller] alarm and supervisory contacts are [existing] [or] [specified in other sections.]

2.13.1 Fire Alarm Control Units

Provide connection to protected premises fire alarm control units as indicated in accordance with NFPA 72 and as specified herein. Provide separate alarm and supervisory circuits between radio transmitter and
control unit. Actuation of control unit alarm contact shall cause transmission of a distinctly identifiable signal which shall be displayed and annunciated by the receiving networks specified herein as a protected premises alarm. Actuation of control unit common trouble contact shall cause transmission of a distinctly identifiable signal which shall be displayed and annunciated by the receiving networks specified herein as a supervisory signal.

[2.13.2 Fire Suppression/Extinguishing System Control Units]

**************************************************************************
NOTE: Select the NFPA standard(s) applicable to the systems to which direct connections from the radio transmitters are to be made; delete standards not applicable. If all suppression and extinguishing system control units are connected to fire alarm control panels in compliance with the applicable NFPA codes and standards, separate connections between the suppression/extinguishing system and the radio transmitter are not required. If all connections are through building fire alarm systems, delete entire paragraph.
**************************************************************************

Provide connection to protected premises fire suppression/extinguishing system control units as indicated in accordance with [NFPA 12,] [NFPA 12A,] [NFPA 13,] [NFPA 17,] [NFPA 17A,] NFPA 72, [NFPA 2001,] and as specified herein. Provide separate alarm and supervisory circuits between radio transmitter and control unit. Actuation of control unit alarm contact shall cause transmission of a distinctly identifiable signal which shall be displayed and annunciated by the receiving networks specified herein as a protected premises alarm. Actuation of control unit common trouble contact shall cause transmission of a distinctly identifiable signal which shall be displayed and annunciated by the receiving networks specified herein as a supervisory signal.

[2.13.3 Fire Pump Control Units]

**************************************************************************
NOTE: NFPA 20 requires the pump running alarm and two supervisory signals to be transmitted to a "constantly attended" location, which is usually the fire/emergency communication center at Navy and Marine Corps installations. If direct connections are to be provided from pump controller to radio transmitter, consult the controller wiring diagram for availability of "remote alarm" contacts; if all connections are through building fire alarm systems, delete this paragraph.
**************************************************************************

Provide connection to fire pump controllers as indicated in accordance with NFPA 20, NFPA 72, and as specified herein. Provide separate alarm and supervisory circuits between radio transmitter and controller. Actuation of controller "pump running" contact shall cause transmission of a distinctly identifiable signal which shall be displayed and annunciated by the receiving networks specified herein as an alarm. Actuation of other controller remote alarm contacts required by NFPA 20 shall cause transmission of distinctly identifiable signals which shall be displayed
and annunciated by the receiving networks specified herein as supervisory signals.

### 2.14 DRY CONTACT INITIATING DEVICES

**************************************************************************

**NOTE:** Use the following paragraphs when new initiating devices must be provided for direct connection (not through a protected premises control unit) to radio transmitters, and there is no other need for inclusion of extinguishing system technical specification sections in the contract. Edit as appropriate for the project.

**************************************************************************

Provide connections from dry contact initiating devices to radio transmitters as indicated, in accordance with NFPA 72 and as specified herein. As used herein, the term "dry contact initiating device" shall be interpreted to mean a non-powered, contact-transfer initiating device, connected directly to a radio alarm transmitter specified herein in lieu of being connected to a protected premises system control unit. Such devices include, but are not limited to the following: Manual fire alarm boxes, sprinkler waterflow alarm initiating devices, fire extinguishing system discharge alarm initiating devices, valve position supervisory signal initiating devices, pressure supervisory signal initiating devices, water level supervisory signal initiating devices, and temperature supervisory signal initiating devices. Except as indicated, dry contact initiating devices are [existing where shown] [or] [specified in other sections].

#### 2.14.1 Sprinkler Waterflow Alarm Initiating Devices

Provide in accordance with NFPA 13, NFPA 25, NFPA 72, UL 346, and as specified herein. [Provide vane(paddle)-type water flow detectors mounted on wet system risers above system check valves where indicated. Provide device with adjustable mechanical diaphragm-controlled retard device.] [Provide pressure switches without retard device which respond to pressure increase on the water-motor alarm lines of dry pipe, preaction, and deluge valves where indicated; install switch on system side of alarm shutoff valve.] [Provide pressure switches with mechanical diaphragm-controlled retard device which respond to pressure increase on water motor alarm lines of wet pipe alarm check valves; install switch on the system side of the alarm shutoff valve.] Retard devices shall be adjustable from 0-90 seconds, and shall instantly recycle when pressure or flow is removed. Activation of device shall cause transmission of a distinctly identifiable signal which shall be displayed and annunciated by the receiving networks specified herein as an alarm. Provide devices with tamper-resistant covers.

#### 2.14.2 Fire Extinguishing System Discharge Alarm Initiating Devices

[Provide pressure sensing devices without retard mechanism on [gaseous,] [wet chemical,] [dry chemical,] [and] [clean agent] fire extinguishing systems in accordance with [NFPA 12,] [NFPA 12A,] [NFPA 17,] [NFPA 17A,] NFPA 72, [NFPA 2001] and extinguishing system manufacturer's instructions. Actuation of device shall cause transmission of a distinctly identifiable signal which shall be displayed and annunciated by the receiving networks specified herein as an alarm. Provide devices with tamper-resistant covers.]

Provide where indicated in accordance with NFPA 13, NFPA 25, NFPA 72, UL 346, and as specified herein. Device contacts shall transfer from the normal position to the off-normal position during the first two revolutions of the hand wheel or when the valve stem has moved not more than one-fifth the distance from its normal position. Actuation of device shall cause transmission of a distinctly identifiable signal, which shall be displayed by the receiving networks specified herein as a supervisory signal. Provide devices with tamper-resistant covers.

Provide where indicated in accordance with NFPA 13, NFPA 25, NFPA 72, UL 346, and as specified herein. [Provide a combination shutoff/bleeder valve in the line ahead of the device for testing operation of the device. The valve shall be normally open. Closing the valve shall shut off the pressure supply to the device and exhaust the pressure between the switch and the valve. Actuation of device upon decrease of pressure below low set point [and increase of pressure above high set point] shall cause transmission of a distinctly identifiable signal which shall be displayed by the receiving networks specified herein as a supervisory signal. Provide devices with tamper-resistant covers.]

Provide where indicated in accordance with [NFPA 22, NFPA 25] NFPA 72, UL 346, and as specified herein. Provide [air] [and][water] temperature supervisory devices with concealed set point, and tamper-resistant cover. Omit temperature indicator or conceal indicator within cover. Device shall not be adjustable below 8 degrees C 40 degrees F. Device shall be activated by temperature drop below set point. Actuation of device shall cause transmission of a distinctly identifiable signal, which shall be displayed by the receiving networks specified herein as a supervisory signal. [Mount air temperature device 1.5 m 5 feet above finished floor; provide insulating sub-base when mounting on exterior wall.]

Provide where indicated in accordance with NFPA 13, NFPA 22, NFPA 25, NFPA 72, UL 346, and as specified herein. Device shall be activated by decrease in storage tank water level below [90] [_____] percent full. Actuation of device shall cause transmission of a distinctly identifiable signal, which shall be displayed by the receiving networks specified herein as a supervisory signal. Provide devices with tamper resistant covers.

2.15 CONDUIT

2.15.1 Rigid Steel Conduit

ANSI C80.1

2.15.2 Intermediate Metal Conduit (IMC)

UL 1242, zinc-coated steel.

2.15.3 Electrical Metallic Tubing (EMT)

ANSI C80.3, zinc-coated steel.
[2.15.4 Surface Metal Raceway and Fittings

**************************************************************************
NOTE: Specify surface raceway only for retrofit applications where concealment of wire is impractical and raceway will not be subject to abuse or physical damage.
**************************************************************************

UL 5, two-piece painted steel, totally enclosed snap-cover type.

]2.16 OUTLET BOXES

UL 514A, zinc-coated steel.

2.17 FITTINGS FOR CONDUIT AND OUTLET BOXES

UL 514B, zinc-coated steel.

2.18 WIRING

**************************************************************************
NOTE: Do not allow stranded wire for projects under cognizance of Engineering Field Activity Northeast.
**************************************************************************

Provide in accordance with NFPA 70 and NFPA 72, and as specified herein. Wire for 120V circuits shall be No. 12 AWG minimum solid copper. Wire for low voltage DC circuits shall be No. [14] [16] AWG minimum [solid] [or] [stranded] copper. Insulation shall be 75 degrees C 167 degrees F minimum with nylon jacket. Color code all wiring.

2.19 GROUND RODS

UL 467. Provide ground rod for each radio alarm transmitter in accordance with the manufacturer's instructions. Rods shall be the sectional type, copper-encased steel, with a minimum diameter of 19 mm 3/4 inch and a minimum length of 3050 mm 10 feet. The rods shall have a hard, clean, smooth, continuous copper surface, and the proportion of copper shall be uniform throughout the length of the rod. The copper shall have a minimum wall thickness of 0.33 mm 0.013 inch at any point on the rod.

2.20 SPARE PARTS

Furnish the following spare parts:

b. [5] [_____] interface device batteries (if separate interface devices are provided).

c. [2] [_____] transmitter antennas of each type provided.

d. [10] [_____] sets of fuses of each type and size provided.

e. 100 rolls or 16 reams of permanent record printing paper.

f. [2] [_____] radio alarm transmitters of each configuration required by
PART 3   EXECUTION

3.1 RADIO FREQUENCY ASSIGNMENT

**************************************************************************
NOTE: OPNAV INSTRUCTION 2410.11H requires that funds shall not be obligated for procurement of radio equipment until radio frequency allocation authority has been obtained. Contact the Area Radio Frequency Coordinator to determine the availability of radio frequencies and to ensure that the using activity submits a DD Form 1494, APPLICATION FOR FREQUENCY ALLOCATION, for a Stage 1 ("Conceptual Development" allocation (See DD Form 1494 Preparation Guide). Stage 1 allocation authority (i.e. approval) must be obtained prior to advertisement of the contract.

In the U.S., the 138-150.8 band is the preferred range since specific frequencies in this range are reserved for DOD use. Frequencies in the 162-174 MHz and 406-420 MHz bands are shared with other users on a first-come, first-served basis. Also the effectiveness of the 406-420 MHz band is limited to relatively short, line-of-sight transmissions, limiting its practicality at geographically larger installations. In order to avoid potential contract delays, the frequency assignment should be included in the specification when possible. In some cases it may be necessary for the designer to perform the analyses of available frequencies and then monitor the selected frequency using automatic recording equipment to verify that the selected frequency is clear. For additional information, contact the facility Communications Officer or the Naval Electronics System Command Code 08H.

**************************************************************************
NOTE: For installations outside U.S. territory, compliance with host nation's requirements is also required.
**************************************************************************

The Contractor shall provide technical assistance to the Area Radio Frequency Coordinator in completing DD Form 1494, APPLICATION FOR FREQUENCY ALLOCATION, for a Stage 4 allocation. Upon approval of this application by the Naval Electromagnetic Spectrum Center, a permanent operating frequency assignment will be made.

3.2 INSTALLATION

**************************************************************************
NOTE: Do not allow stranded wire for projects under cognizance of Engineering Field Activity Northeast.
Installation shall be in accordance with the requirements of NFPA 70, and NFPA 72. Unless indicated otherwise, provide all wiring and conduit new. Dress out all transmitters, and interface panels where provided, and new wiring in existing panels, in a professional manner with all wires running in a vertical or horizontal plane, cut to exact length, making all turns at 90 degree angles, and tightly bundled and tie wrapped. Make all terminations under screw terminals; pigtail or "T"-tap connections are prohibited. Use of crimped connectors is prohibited[, except where stranded wire is used, use of crimped connectors at termination points is required].

3.2.1 Conductor Identification

Distinctively color code each conductor used for the same specific function; each function color code shall remain consistent throughout. Use colors as directed by the Contracting Officer to match the existing base fire alarm color coding scheme. Identify conductors at every termination, junction, and splice by means of plastic coated self-sticking printed markers or by heat-shrink type sleeves. Attach markers in a manner that will prevent accidental detachment. Furnish a printed schedule of conductor markings identifying each wire marker, and the purpose, the origin, and the termination of each conductor; also include this information on the as-built drawings.

3.2.2 Conduit Installation

Run wiring in rigid steel conduit, steel intermediate metal conduit or steel electrical metallic tubing[, except surface mounted wiring shall be permitted in surface metal raceway in finished areas where indicated].

Do not run alarm circuits in the same conduit with non-alarm circuits. Do not run AC circuits in the same conduit with DC circuits. Run antenna cables alone in separate galvanized rigid steel conduit. Paint all junction box covers red and provide them with permanent rigid engraved labels reading "fire alarm circuit".

3.2.3 Additional Installation Requirements

NOTE: Include this paragraph for all projects under the cognizance of NAVFAC SE.

Pull all conductors splice-free. Provide insulated barrier type terminal strips at junction points. Use of wire nuts, crimped connectors, or twisting of conductors together is prohibited. Conduit shall not enter the top of a transmitter, control panel, or interface panel; provide conduit seals for all conduit terminating at a transmitter, control panel, or interface panel.

3.3 PROGRAMMING

NOTE: Delete references to programming of CAD when no CAD system is specified.

Field program each receiving/control network with all system transmitter
identity code numbers, zones on each transmitter, and appropriate message and audible alerting tone associated with each active zone, e.g. Box 1234; Zone 1 - Water Flow (alarm tone), Zone 2 - Pump Running (alarm tone), Zone 3 - Pump Failure (alarm tone), Zone 4 - Pump Trouble (supervisory tone), Zone 5 - Valve Supervisory (supervisory tone), etc. Program transmitter automatic test times so that at least one test signal is received at the receiving/control network at not exceeding 60-minute intervals. [ Field program each CAD computer with all data required for proper operation of CAD system as specified in the paragraph entitled "Computer-Aided Dispatch (CAD) System; obtain emergency response unit type/number and pre-incident plan information for each location and box number from the Federal Fire Chief.]

3.3.1 Programming Revisions During Preliminary Testing

During preliminary testing, if any programmed information is found to be incorrect, confusing, or misleading, revise programming to the satisfaction of the Fire Chief and the Contracting Officer.

3.3.2 Programming Revisions During the Final Acceptance Stage

During final acceptance testing, if any programmed information is found to be incorrect, confusing, or misleading, revise programming to the satisfaction of the Naval Facilities Engineering Command EPD/EFA Fire Protection Engineer.

3.4 FIELD TESTING

3.4.1 Tests During Installation

Conduct the following tests during installation of wiring and system components. Operational tests of powered system components shall be conducted both with normal power on and with emergency (battery) power on and normal power off. Correct any deficiencies found prior to requesting scheduling of final acceptance test.

a. Ground resistance: The resistance of each connection to ground shall be measured and shall not exceed 5 ohms.

b. Each antenna assembly and cable shall be checked at the transmitter or receiver connection for continuity, shorts, and grounds on the conductor and on the shield prior to connection to equipment. Assemblies failing these tests shall not be connected to equipment.

c. Radio emission frequency and band width of each transmitter shall be tested to ensure proper operation on the assigned frequency.

d. Operation of each radio alarm transmitter function.

e. Operation of each interface panel zone (where interface panels are provided).

f. Operation of each protected premises control unit zone.

g. Operation of each initiating device circuit connected directly to a transmitter.

h. Operation of all supervisory features.
i. Operation of all features of each base receiving/control network.

j. Test all functions of the computer-aided dispatch (CAD) system to verify proper programming and operation.

3.4.2 Final Acceptance Test

The system shall have been in service for at least 30 days prior to the final inspection. Notify the Contracting Officer in writing when the system is ready for final acceptance tests. Notification shall be at least 15 days prior to the requested date of the final acceptance test. The system shall be considered ready for such testing only after all necessary preliminary tests have been made, all deficiencies found have been corrected to the satisfaction of the equipment manufacturer's technical representative, and written certification to that effect from the manufacturer's technical representative has been submitted to the Contracting Officer. The system shall be tested for approval in the presence of representatives of the manufacturer, the Contracting Officer, and the [EFD] [EFA] Fire Protection Engineer. Furnish all instruments, labor, and materials required for the tests. The technician and electrician who supervised the installation shall be present throughout the tests. Any deficiencies found shall be corrected and the system retested at no cost to the Government. All operational tests specified in paragraph entitled "Tests During Installation" shall be repeated as directed by the [EFD] [EFA] Fire Protection Engineer during conduct of final acceptance tests. Furnish all necessary appliances, equipment, instruments, devices, and personnel for this test. Furnish a minimum of three portable two-way radios operating on the same non-Government frequency.

3.5 ADDITIONAL TESTS

When deficiencies, defects or malfunctions develop during the tests required, all further testing of the system shall be suspended until proper adjustments, corrections or revisions have been made to assure proper performance of the system. If these adjustments, corrections or revisions require more than a nominal delay, the Contracting Officer shall be notified when the additional work has been completed to arrange a new final inspection and test of the fire alarm system. All tests required shall be repeated prior to final acceptance, unless directed otherwise. The Contractor shall bear full financial responsibility to the Government for all costs incurred by the Government as a result of reinspection and retesting of the system.

3.6 INSTRUCTION OF GOVERNMENT PERSONNEL

3.6.1 Instruction of Operating Personnel

**************************************************************************
NOTE: Consult the Federal Fire Chief regarding the number of shifts and number of personnel to be trained.
**************************************************************************

Train personnel who receive, process, and retransmit alarms at each communication center and emergency response facility which houses a radio alarm receiving/control network [or computer-aided dispatch system workstation] provided under this contract. This instruction shall be provided for [2] [3] alternating shifts, minimum of [8] [16] hours per
shift, and shall include overview of functions of individual system components and the system as a whole; proper responses to the various types of messages which can be displayed; procedures for startup, operation, and shutdown of receiving/control network and CAD system; procedures for diagnosing and correcting operator-correctable malfunctions; procedures for restarting system after total power (primary and backup) power failure, and procedures for manually initiating system tests. In addition, train supervisory personnel on each shift, as designated by the Contracting Officer, in procedures for adding and deleting transmitters and related information from memory, [and] changing zone-specific messages[, and loading CAD data]. Training shall be performed by the manufacturer's technical representative(s) on-site using the equipment provided under this contract. At the conclusion of this training, certify by name and rank that each operator trained is qualified to operate the radio fire alarm receiving/control equipment[ and the computer-aided dispatch system] provided under this contract.

3.6.2 Instruction of Maintenance Personnel

Instruct Government-designated maintenance personnel for a minimum of 16 total hours in the theory of operation, procedures for start-up, operation, and shutdown of each item of equipment; maintenance instructions; safety precautions; test procedures; field troubleshooting/diagnostic procedures; and repair procedures for field repairs that can be made by replacing plug-in components, covering the following:

a. Radio alarm transmitters

b. Radio alarm transmitter interface units, if not integral with transmitters.

c. Radio alarm receiving/decoding/control equipment.

d. All electronic assemblies which are part of the radio fire alarm system provided by the Contractor but not covered above.

Instruction shall be given by the manufacturer's technical representative using the documents specified in the paragraph entitled "Operation and Maintenance Manuals", and shall take place at the project site.

[3.6.3 Advanced Maintenance Training

Within one year of contract completion, provide [1] [2] Government-designated maintenance personnel assigned to the site a complete technical repair training session of 40 hours covering repair of the radio alarm system equipment. The training shall include an in-depth explanation and review of the theory of operation, function, description, and trouble-shooting of all equipment provided down to the component level. Training shall include a review of manuals, drawings and parts lists, together with any clarifications required. At least one period of eight hours shall be spent trouble-shooting equipment with actual faults being introduced for training purposes. The instructional personnel providing training shall be certified by the related equipment manufacturer to provide technical instruction services. If the training is provided at the manufacturer's premises, the Government will furnish transportation, lodging, and meals for Government personnel.

-- End of Section Table of Contents --
NOTE: This specification covers the requirements for a non-addressable integrated fire detection, fire alarm system.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: For OCONUS projects, this specification section should be edited for specific Host Nation requirements. Coordinate compliance with Host Nation requirements with the Designated Fire Protection Engineer (DFPE).

NOTE: For Family Housing projects at NAVFAC NE use regional guide specification section 28 31 46.00 22
(N-13854N) HOUSEHOLD FIRE WARNING EQUIPMENT to specify residential fire warning systems in lieu of this section.

**************************************************************************

NOTE: This specification section includes requirements from UFC 3-600-01 (change 43, 7 February 2020)

**************************************************************************

NOTE: This guide specification covers carbon monoxide alarm detectors for protection in indoor locations where fuel-burning appliances/equipment are used.

**************************************************************************

PART 1   GENERAL

**************************************************************************

1. On the drawings, show location of control unit, batteries and charger (if remotely mounted), supervising station transmitter, annunciator, primary power supply, remote annunciator, detectors, notification appliances (unless performance requirements are specified), and each alarm initiating device including fire extinguishing system switches.

2. Show single-line fire alarm systems riser diagram. Each device on the riser should be identified by type. Indicate connection of equipment.

**************************************************************************

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 RELATED SECTIONS

Section 25 05 11 Cybersecurity for Facility-Related Control Systems, applies to this section, with the additions and modifications specified herein. In addition, refer to the following sections for related work and coordination:

- Section 21 13 13 WET PIPE SPRINKLER SYSTEM, FIRE PROTECTION
- Section 21 30 00 FIRE PUMPS
- Section 21 23 00.00 20 WET CHEMICAL FIRE EXTINGUISHING for KITCHEN CABINET
- Section 21 13 16 DRY PIPE FIRE SPRINKLER SYSTEMS
- Section 21 13 18 PREACTION FIRE SPRINKLER SYSTEMS
- Section 21 13 19 DELUGE FIRE SPRINKLER SYSTEMS
- Section 23 30 00 HVAC AIR DISTRIBUTION
- Section 21 13 24.00 10 AQUEOUS FILM-FORMING FOAM (AFFF) FIRE PROTECTION SYSTEM
- Section 21 13 25 HIGH-EXPANSION FOAM SYSTEM, FIRE PROTECTION
- Section 21 13 20.00 20 FOAM FIRE EXTINGUISHING FOR AIRCRAFT HANGARS
- Section 21 13 21.00 20 FOAM FIRE EXTINGUISHING FOR FUEL TANK PROTECTION
- Section 21 13 22.00 20 FOAM FIRE EXTINGUISHING FOR HAZ/FLAM MATERIAL FACILITY
- Section 21 21 01.00 20 CARBON DIOXIDE FIRE EXTINGUISHING (HIGH PRESSURE)
- Section 21 21 02.00 20 CARBON DIOXIDE FIRE EXTINGUISHING (LOW PRESSURE)
- Section 21 21 03.00 10 WET CHEMICAL FIRE EXTINGUISHING SYSTEM
- Section 08 71 00 DOOR HARDWARE for [door release][door unlocking] and additional work related to finish hardware.
- Section[s] [14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS] [14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS] [and] [14 24 13 HYDRAULIC FREIGHT ELEVATORS] [14 24 23 HYDRAULIC PASSENGER ELEVATORS] for additional work related to elevators.
- Section 07 84 00 FIRESTOPPING for additional work related to firestopping.

1.3 SUMMARY

1.3.1 Scope

a. This work includes designing and [providing a new, complete,][modifying the existing] fire alarm system as described herein and on the contract drawings[ for the ___________]. Include system wiring, raceways, pull boxes, terminal cabinets, outlet and mounting boxes, control equipment, initiating devices, notification appliances, supervising station fire alarm transmitters, and other accessories and miscellaneous items required for a complete operational system even though each item is not specifically mentioned or described. Provide system[s] complete and ready for operation.[ Existing interior fire alarm system was manufactured by [______].] Design and installation must comply with UFGS 25 05 11, UFC 4-010-06 and AFGM 2019-320-02.

b. Provide equipment, materials, installation, workmanship, inspection, and testing in strict accordance with NFPA 72, except as modified herein. [The system layout on the drawings show the intent of coverage and suggested locations. Final quantity, system layout, and coordination are the responsibility of the Contractor.]

c. Each remote fire alarm control unit must be powered from a wiring riser specifically for that use or from a local emergency power panel.
located on the same floor as the remote fire alarm control unit. Where remote fire control units are provided, equipment for notification appliances may be located in the remote fire alarm control units.)

[d. Where a fire pump is provided, the fire alarm system must monitor and transmit the fire pump controller signals in accordance with the provisions of NFPA 72.]

[e. Where an emergency generator provides standby power supply for life safety system circuits, the generator must be monitored by the Fire Alarm Control Unit (FACU) and transmit emergency generator signals in accordance with NFPA 72.]

f. The fire alarm system must be independent of the building security, building management, and energy/utility monitoring systems other than for control functions.

1.3.2 Qualified Fire Protection Engineer (QFPE)

**************************************************************************
NOTE: UFC 3-600-01 requires that shop drawings must bear the Review Stamp and professional engineering stamp of the QFPE prior to submission to the Government for approval.
**************************************************************************

**************************************************************************
NOTE: The term Qualified Fire Protection Engineer (QFPE) should be considered interchangeable with the terms "Fire Protection Designer of Record (FPDOR)" and/or "Fire Protection QC Specialist" where referred to in other applicable contract documents. The intent of defining the QFPE roles and responsibilities here is NOT to require personnel in addition to the QFPE, FPDOR, and/or FPQC specialist referenced elsewhere in the applicable contract documents.
**************************************************************************

Services of the QFPE must include:

a. Reviewing SD-02, SD-03, and SD-05 submittal packages for completeness and compliance with the provisions of this specification. Construction (shop) drawings and calculations must be prepared by, or prepared under the immediate supervision of, the QFPE. The QFPE must affix their professional engineering stamp with signature to the shop drawings, calculations, and material data sheets, indicating approval prior to submitting the shop drawings to the DPFE.

b. Providing a letter documenting that the SD-02, SD-03, and SD-05 submittal package has been reviewed and noting any outstanding comments.

c. Performing in-progress construction surveillance prior to installation of ceilings (rough-in inspection).

e. Signing applicable certificates under SD-07.
1.4 DEFINITIONS

Wherever mentioned in this specification or on the drawings, the equipment, devices, and functions must be defined as follows:

1.4.1 Terminal Cabinet

A steel cabinet with locking, hinge-mounted door where terminal strips are securely mounted inside the cabinet.

1.4.2 Designated Fire Protection Engineer (DFPE)

The DoD fire protection engineer that oversees that Area of Responsibility for that project. This is sometimes referred to as the "cognizant" fire protection engineer. Interpret reference to "authority having jurisdiction" and/or AHJ in referenced standards to mean the Designated Fire Protection Engineer (DFPE). The DFPE may be responsible for review of the contractor submittals having a "G" designation, and for witnessing final inspection and testing.

1.4.3 Qualified Fire Protection Engineer (QFPE)

A QFPE is an individual who is a licensed professional engineer (P.E.), who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES (or the particular specification section for submittal procedures in this project) and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required
as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.]

Shop drawings (SD-02), product data (SD-03) and calculations (SD-05) must be prepared by the fire alarm designer and combined and submitted as one complete package. The QFPE must review the SD-02/SD-03/SD-05 submittal package for completeness and compliance with the Contract provisions prior to submission to the Government. The QFPE must provide a Letter of Confirmation that they have reviewed the submittal package for compliance with the contract provisions. This letter must include their registered professional engineer stamp and signature. Partial submittals and submittals not reviewed by the QFPE will be returned by the Government disapproved without review.

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Qualified Fire Protection Engineer (QFPE); G[, [____]]

Fire alarm system designer; G[, [____]]

Supervisor; G[, [____]]

Technician; G[, [____]]

Firefighter Telephone; G[, [_____]]
1.6 SYSTEM OPERATION

******************************************************************************
NOTE: Circuit wiring must be Class "B" unless Class "A" is required by the local installation and as permitted by NFPA 72 (IDC and NAC: "A" or "B").
Circuits and pathways must have survivability levels as defined by NFPA 72.
******************************************************************************

Fire alarm system components requiring power, except for the PACU(s) power supply, must operate on 24 volts DC unless noted otherwise in this section. [Provide the system with an interconnected riser loop or network having Class [A][X] supervision. Ensure that the return portion of the loop is remote from the supply portion of the loop.] [Where the building has two stairs for egress from floors above grade or floors below grade, ensure that a single impairment cannot adversely affect more than one floor. Where three or more stairs are provided for egress from floors above grade or below grade, ensure that a single impairment cannot adversely affect more than one-half of any floor.] [Ensure that any single impairment of the system does not affect the system on more than [one][one-half] of any floor.]

******************************************************************************
If an addition to an existing system is required, provide the make, model number, and other pertinent information on existing components that are to

SECTION 28 31 60 Page 14
operate with the new equipment. Since new interfaces will have to be compatible with the existing system or to the central fire alarm reporting system, it may be necessary to edit major items out of this specification. If a new fire alarm unit is required, it has to be compatible with the existing central fire alarm reporting system.

**************************************************************************

Provide a fire alarm system that is a complete, supervised fire alarm reporting system. Activate the system into the alarm mode by actuation of any alarm initiating device. Remain in the alarm mode until the initiating device is reset and the fire alarm control unit is reset and restored to normal. Audible and visual appliances and systems must comply with NFPA 72.

Operate fire alarm system components requiring power, except for the control unit power supply, on 24 Volts dc.

1.6.1 Alarm Initiating Devices and Notification Appliances (Visual, Audible)

a. Connect alarm initiating devices to initiating device circuits (IDC) [Class "A"] [Class "B"] and installed in accordance with NFPA 72.

b. Connect notification appliances to notification appliance circuits (NAC) [Class "A"] [Class "B"].

1.6.2 Functions and Operating Features

The system must provide the following functions and operating features:

a. Power, annunciation, supervision, and control for the system.

b. Visual alarm notification appliances must be synchronized as required by NFPA 72.

c. Electrical supervision of the primary power (AC) supply, presence of the battery, battery voltage, and placement of system modules within the control unit.

d. An audible and visual trouble signal to activate upon a single break or open condition, or ground fault. The trouble signal must also operate upon loss of primary power (AC) supply, absence of a battery supply, low battery voltage, or removal of alarm or supervisory control unit modules. After the system returns to normal operating conditions, the trouble signal must again sound until the trouble is acknowledged.

e. A trouble signal silence feature that must silence the audible trouble signal, without affecting the visual indicator.

f. Switches in a locked portion of the FACU to bypass the automatic notification appliance circuits, [fire reporting system] [air handler shutdown] [smoke control operation] [elevator recall] [door release] [door unlocking] features. Operation of this action must indicate on the FACU display and printer output as a supervisory or trouble condition. [Notification appliance bypass must be selectable by floor.]

g. Alarm functions must override trouble or supervisory functions. Supervisory functions must override trouble functions.

h. There must be no limit, other than maximum system capacity, as to the number of zones that may be in alarm simultaneously.
i. Where the fire alarm system is responsible for initiating an action in another emergency control device or system, such as HVAC, atrium exhaust, smoke control, elevator recall, releasing service, the fire alarm relay must be located in the vicinity of the emergency control device.

j. An alarm signal must automatically initiate the following functions:

(1) Transmission of an alarm signal to the fire department or a remote supervising station.

(2) Visual indication of the device operated on the FACU, Video Display unit (VDU), and on the graphic annunciator. Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.

(3) Record the event on the system printer.

(4) Actuation of alarm notification appliances.

(6) Release of doors held open by electromagnetic devices.

(7) Operation of the smoke control system or atrium exhaust system.

(8) Release of power to electric locks (delayed egress locks) on doors that are part of the means of egress.

(9) Elevator recall as described in this section.

**************************************************************************

NOTE: Use this paragraph only where a detector or detection system is to release a special fire extinguishing system.

**************************************************************************

(10) Operation of [_____] must release the [_____] fire extinguishing system after a [_____] second time delay.

(11) Operation of a sprinkler waterflow switch serving an elevator machinery room or elevator shaft must operate shunt trip circuit breaker(s) to shut down power to the elevators in accordance with ASME A17.1/CSA B44.

(12) Operation of an interface that operates vibrating pagers worn by hearing-impaired occupants.

k. A supervisory signal must automatically initiate the following functions:

(1) Visual indication of the device operated on the FACU, Video Display unit (VDU), and on the graphic annunciator. Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.

(2) Record the event on the system printer.

(3) Transmission of a supervisory signal to the fire department or a remote supervising station.
(4) Operation of a duct smoke detector must shut down the appropriate air handler in accordance with NFPA 90A in addition to other requirements of this paragraph and as allowed by NFPA 72.

1. A trouble condition must automatically initiate the following functions:

   (1) Visual indication of the device operated on the FACU, [Video Display unit (VDU),] [and on the [graphic ][remote ]annunciator].[ Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.]

   [(2) Record the event on the system printer.]

   (3) Transmission of a trouble signal to [the fire department][a remote supervising station].

[m. Activation of a carbon monoxide alarm initiating device must automatically initiate the following functions:

   (1) Visual indication of the device operated on the ,[ LCD, LED Display unit (VDU),][ and on the [graphic ][remote ]annunciator].[ Indication on the graphic annunciator must be by floor and room number, device address, and device type.]

   (2) Transmission of a carbon monoxide alarm signal to [the fire department][a remote supervising station].

   (3) Activation of all strobes and the carbon monoxide alarm signal throughout the building.]

n. System control equipment must be programmed to provide a 60-minute to 180-minute delay in transmission of trouble signals resulting from primary power failure.

[1.6.3 Elevator Recall

**************************************************************************************************
NOTE: Delete this paragraph if no elevator work is included in the project.
**************************************************************************************************

Provide elevator recall in accordance with ASME A17.1/CSA B44, Section [14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS][14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS][14 24 13 HYDRAULIC FREIGHT ELEVATORS][14 24 23 HYDRAULIC PASSENGER ELEVATORS], and as specified herein. Activation of any smoke detector in an elevator shaft, machine room, or lobby (except at designated recall level) must cause all elevators associated with that shaft, machine room, or lobby to return nonstop to the designated level. Activation of a smoke detector in the lobby or machine room at the designated level must cause all elevators associated with that lobby to return nonstop to the assigned alternate level. Activation of a detector in an elevator shaft, machine room, or lobby must also cause illumination of elevator cab warning signal (fire hat) and complete operation of fire alarm system as specified in paragraph titled "Functions and Operating Features".

][1.7 EXISTING EQUIPMENT

**************************************************************************************************
NOTE: If an addition to an existing fire alarm system is required, the contract drawings or this section must include the make, model number, and other pertinent information of existing components that are to operate with the new equipment. Since new interfaces will have to be compatible with the existing system or to the central fire alarm reporting system, it may be necessary to edit major items out of this specification. If a new FACU is required, it has to be compatible with the existing central fire alarm reporting system. When an existing system is to be expanded, show the following information on the contract drawings:

1. Manufacturer and model of existing control unit.

2. Number of existing initiating circuits (zones), notification appliance circuits, and control circuits served by the control unit.

3. Number of existing alarm notification appliances on the system.

4. Total calculated current draw of all devices served by each existing standby battery under both supervisory (standby) and alarm conditions, including NAC/Extender control units and subcontrol units.

5. Ampere-hour rating and type of each existing battery.

=================================================================================

a. Equipment and devices must be compatible and operable with the existing fire alarm mass notification system and must not impair reliability or operational functions of existing supervising station fire alarm system. [The proprietary type supervising station (PSS) is located [in Building [_____].][_____].] The supervising equipment is existing and consists of the following brands and models: [supervising station control unit [_____].][_____][signal reporting components [_____]], [annunciator [_____]][_____].

b. Equipment and devices must be compatible and operable with the existing building fire alarm system. Equipment must not impair reliability or operational functions of the existing system. The existing building system control unit is [_____].]

1.8 QUALITY ASSURANCE

1.8.1 Submittal Documents

1.8.1.1 Preconstruction Submittals

Within 36 days of contract award but not less than [14 days][_____] prior to commencing any work on site, the Contractor must submit the following for review and approval. SD-02, SD-03 and SD-05 submittals received prior to the review and approval of the qualifications of the fire alarm subcontractor and QFPE must be returned disapproved without review. All resultant delays must be the sole responsibility of the Contractor.
1.8.1.2 Shop Drawings

Shop drawings must not be smaller than [ISO A1][ANSI D][the Contract Drawings]. Drawings must comply with the requirements of NFPA 72 and NFPA 170. Minimum scale for floor plans must be 1/8"=1'.

1.8.1.3 Nameplates

Nameplate illustrations and data to obtain approval by the Contracting Officer before installation.

1.8.1.4 Wiring Diagrams

[_____] copies of point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the FACU and remote FACU, initiating circuits, switches, relays and terminals, including pathway diagrams between the control unit and shared communications equipment within the protected premises. Point-to-point wiring diagrams must be job specific and must not indicate connections or circuits not being utilized. Provide complete riser diagrams indicating the wiring sequence of all devices and their connections to the control equipment. Include a color-code schedule for the wiring.

1.8.1.5 System Layout

[_____] copies of plan view drawing showing device locations, terminal cabinet locations, junction boxes, other related equipment, conduit routing, conduit sizes, wire counts, conduit fill calculations, wire color-coding, circuit identification in each conduit, and circuit layouts for all floors. Indicate candela rating of each visual notification appliance. Indicate the addresses of all devices, modules, relays, and similar. Indicate if the environment for the FACU is within its environmental listing (e.g. temperature/humidity).

Provide a complete description of the system operation in matrix format similar to the "Typical Input/Output Matrix" included in the Annex of NFPA 72.

[For air sampling smoke detection systems, provide floor plan layouts indicating location of fire alarm control unit, air sampling piping (lengths of pipe) and sampling ports (sizes and locations). Floor plan must also indicate geographic monitor zone boundaries, location of display control unit, bar level annunciation panels if separate, and all other associated equipment that is required to provide a complete operational system.]

1.8.1.6 Notification Appliances

Calculations and supporting data on each circuit to indicate that there is at least 25 percent spare capacity for notification appliances. Annotate data for each circuit on the drawings.

1.8.1.7 Initiating Devices

Calculations and supporting data on each circuit to indicate that there is
at least [25][_____] percent spare capacity for initiating devices. Annotate data for each circuit on the drawings.

1.8.1.8 Battery Power

Calculations and supporting data as required in paragraph Battery Power Calculations for alarm, alert, and supervisory power requirements. Calculations including ampere-hour requirements for each system component and each control unit component, and the battery recharging period, must be included on the drawings.

1.8.1.9 Voltage Drop Calculations

Voltage drop calculations for each notification circuit indicating that sufficient voltage is available for proper operation of the system and all components, at a minimum rated voltage of the system operating on batteries. Include the calculations on the system layout drawings.

1.8.1.10 Product Data

[_____] copies of annotated descriptive data to show the specific model, type, and size of each item. Catalog cuts must also indicate the NRTL listing. The data must be highlighted to show model, size, and options that are intended for consideration. Data must be adequate to demonstrate compliance with all contract requirements. Product data for all equipment must be combined into a single submittal.

Provide an equipment list identifying the type, quantity, make, and model number of each piece of equipment to be provided under this submittal. The equipment list must include the type, quantity, make and model of spare equipment. Types and quantities of equipment submitted must coincide with the types and quantities of equipment used in the battery calculations and those shown on the shop drawings.

1.8.1.11 Air Sampling Smoke Detection System Calculations

Submit air sampling detection system design analysis calculations consisting of battery capacity, loading calculations, and fan speed and air flow/transport calculations. Include schematic diagrams showing pipe segments, pipe diameters, lengths of pipe, node numbers, and sample port diameters to verify the requirements are met.

1.8.1.12 Operation and Maintenance (O&M) Instructions

[Six][_____] copies of the Operation and Maintenance Instructions. The O&M Instructions must be prepared in a single volume or in multiple volumes, with each volume indexed, and may be submitted as a Technical Data Package. Manuals must be approved prior to training. The Interior Fire Alarm System Operation and Maintenance Instructions must include the following:

a. "Manufacturer Data Package [five][_____]" as specified in [Section 01 78 23 OPERATION AND MAINTENANCE DATA][____].

b. Operating manual outlining step-by-step procedures required for system startup, operation, and shutdown. The manual must include the manufacturer's name, model number, service manual, parts list, and preliminary equipment list complete with description of equipment and their basic operating features.
c. Maintenance manual listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The manuals must include conduit layout, equipment layout and simplified wiring, and control diagrams of the system as installed.

d. Complete procedures for system revision and expansion.

e. Routine maintenance checklist. The routine maintenance checklist must be arranged in a columnar format. The first column must list all installed devices, the second column must state the maintenance activity or state no maintenance required, the third column must state the frequency of the maintenance activity, and the fourth column provided for additional comments or reference. All data (devices, testing frequencies, and similar) must comply with UFC 3-601-02.

f. A final Equipment List must be submitted with the Operating and Maintenance (O&M) manual.

1.8.1.13 As-Built Drawings

The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of the as-built (marked-up) drawings must be provided at the time of, or prior to the final Government test.

1.8.2 Qualifications

**************************************************************************
NOTE: NICET (National Institute for Certification in Engineering Technologies) establishes the qualifications of an individual as an Engineering Technologist with verification of experience by having a current NICET certification.
**************************************************************************

1.8.2.1 Fire Alarm System Designer

The fire alarm system designer must be certified as a Level [III][IV] (minimum) Technician by National Institute for Certification in Engineering Technologies (NICET) in the Fire Alarm Systems subfield of Fire Protection Engineering Technology or meet the qualifications for a QFPE.

1.8.2.2 Supervisor

[A NICET Level [III][ or ][IV] fire alarm technician must supervise the installation of the fire alarm system[, including the air sampling smoke detection system].][A fire alarm technician with a minimum of eight years of experience must supervise the installation of the fire alarm system.] The fire alarm technicians supervising the installation of equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.8.2.3 Technician

Fire alarm technicians with a minimum of four years of experience must be utilized to install and terminate fire alarm devices, cabinets and control units. The fire alarm technicians installing the equipment must be factory
trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings[, and must be thoroughly experienced in the installation of air sampling detection systems].

1.8.2.4 Installer

[Fire alarm installer with a minimum of two years of experience utilized to assist in the installation of fire alarm devices, cabinets and control units] [NICET Level II technician to assist in the installation of fire alarm devices, cabinets and control units]. A licensed electrician must be allowed to install wire, cable, conduit and backboxes for the fire alarm system system. The fire alarm installer must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.8.2.5 Test Technician

Fire alarm technicians with a minimum of eight years of experience and NICET Level [III][ or ][IV] utilized in testing and certification of the installation of the fire alarm devices, cabinets and control units. The fire alarm technicians testing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment installed as part of this project.

1.8.2.6 Manufacturer

Components must be of current design and must be in regular and recurrent production at the time of installation. Provide design, materials, and devices for a protected premises fire alarm system, complete, conforming to NFPA 72, except as specified herein.

1.8.3 Regulatory Requirements

Equipment and material must be listed or approved. Listed or approved, as used in this Section, means listed, labeled or approved by a Nationally Recognized Testing Laboratory (NRTL) such as UL Fire Prot Dir or FM APP GUIDE. The omission of these terms under the description of any item of equipment described must not be construed as waiving this requirement. All listings or approvals by testing laboratories must be from an existing ANSI or UL published standard. The recommended practices stated in the manufacturer's literature or documentation must be considered as mandatory requirements.

1.9 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from the weather, humidity, and temperature variation, dirt and dust, and other contaminants.

1.10 MAINTENANCE

1.10.1 Spare Parts

Furnish the following spare parts in the manufacturers original unopened containers:

a. [Five][_____] complete sets of system keys.

b. [Two][_____] of each type of fuse required by the system.
c. [One][_____] manual stations.

d. [Two][_____] of each type of detector installed.

e. [Two][_____] of each type of detector base and head installed.

f. [One][_____] electromagnetic door holders.

g. One smoke detector manufacturer's test screen, card or magnet for each ten beam smoke detectors, or fraction thereof, installed in the system.

h. Two air sampling smoke detection system filter assemblies.

i. [Two][_____] of each type of audible and visual alarm device installed.

j. [Two][_____] low voltage, [one][_____] [telephone][internet][ethernet], and [one][_____] 120 VAC surge protective device.

k. [Two][_____] spare reams of paper for the system printer, plus sufficient paper for testing.

l. [Two][_____] spare printer ribbons.

m. [_____] spare zone modules for modular type control units in addition to those installed in the control unit.

1.10.2 Special Tools

Software, connecting cables and proprietary equipment, necessary for the maintenance, testing, and reprogramming of the equipment must be furnished to the Contracting Officer, prior to the instruction of Government employees.

PART 2 PRODUCTS

2.1 GENERAL PRODUCT REQUIREMENT

All fire alarm equipment must be listed for use under the applicable reference standards.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials, equipment, and devices that have been tested by a nationally recognized testing laboratory and listed for fire protection service when so required by NFPA 72 or this specification. Select material from one manufacturer, where possible, and not a combination of manufacturers, for any particular classification of materials. Material and equipment must be the standard products of a manufacturer regularly engaged in the manufacture of the products for at least [2][_____] years prior to bid opening.

2.2.2 Nameplates

Major components of equipment must have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new name plate permanently affixed to the item or
equipment. Major components include, but are not limited to, the following:

a. FACU

Nameplates must be etched metal or plastic, permanently attached by screws to control units or adjacent walls.

2.2.3 Keys

Keys and locks for equipment, control units and devices must be identical. [Master all keys and locks to a single key as required by the [Installation Fire Department] [______].] [Keys must be CAT [60] [______].]

2.2.4 Instructions

Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. [Install the instructions on the interior of the FACU.] [Install the frame in a conspicuous location observable from the FACU.] The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions and their mounting location must be approved by the Contracting Officer before being posted.

2.3 FIRE ALARM CONTROL UNIT

Fire Alarm Control Unit (FACU) must comply with the applicable requirements of UL 864. Unit must be modular, installed in a [flush] [surface] [semi-flush] mounted steel cabinet with hinged door and cylinder lock. Control unit must be clean, uncluttered, and orderly assembled containing components and equipment required to provide the specified operating and supervisory functions of the system. The unit must have prominent rigid plastic, phenolic or metal identification plates for LEDs, zones, controls, meters, fuses, and switches.

a. Each control unit must provide power, supervision, control, and logic for the entire system, utilizing solid state, modular components, internally mounted and arranged for easy access. Each control unit must be suitable for operation on a 120 volt, 60 hertz, normal building power supply. Provide each control unit with supervisory functions for power failure, internal component placement, and operation.

b. Visual indication of alarm, supervisory, or trouble initiation on the FACU must be by liquid crystal display or similar means with a minimum of 80 characters.

c. Nameplates for fuses must also include ampere rating. Separate alarm and trouble LEDs must be provided for each zone alarm. These LEDs must be located on the exterior of the cabinet door or be visible through the cabinet door. Control unit switches must be within the locked cabinet.

d. A suitable means (single operation) must be provided for testing the control unit visual indicating devices (meters or LEDs). Meters and LEDs must be plainly visible when the cabinet door is closed. Signals and LEDs must be provided to indicate by zone any alarm, supervisory or trouble condition on the system. Each IDC must be powered and supervised so that a signal on one zone does not prevent the receipt of signals from other zones.
e. Upon restoration of power, startup must be automatic, and must not require any manual operation. The loss of primary power or the sequence of applying primary or emergency power must not affect the transmission of alarm, supervisory or trouble signals. Visual annunciators must be provided for each active zone and spare zone. [_____] spare zones must be provided [as shown on the drawing]. Each LED must provide specific identification of the zone by means of a permanently attached rigid plastic, phenolic, or metal sign with either raised or engraved letters.

f. Zone identification must consist of a word description of the zone.

g. Cabinets must be provided with ample gutter space to allow proper clearance between the cabinet and live parts of the control unit equipment. If more than one modular unit is required to form a control unit, the units must be installed in a single cabinet large enough to accommodate units.

2.3.1 Cabinet

Install control unit components in cabinets large enough to accommodate all components and also to allow ample gutter space for interconnection of control units as well as field wiring. The cabinet must be a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and [surface][semi-recessed] mounting provisions. The enclosure must be identified by an engraved phenolic resin nameplate. Lettering on the nameplate must say "Fire Alarm control unit" and must not be less than 25 mm 1-inch high. Provide prominent rigid plastic or metal identification plates for lamps, circuits, meters, fuses, and switches.

2.3.2 Silencing Switches

2.3.2.1 Alarm Silencing Switch

Provide an alarm silencing switch at the FACU that must silence the audible and visual notification appliances. Subsequent activation of initiating devices must cause the notification appliances to re-activate.

2.3.2.2 Supervisory/Trouble Silencing Switch

Provide supervisory and trouble silencing switch(es) that must silence the audible trouble and supervisory signal(s), but not extinguish the visual indicator. This switch must be overridden upon activation of a subsequent supervisory or trouble condition. Audible trouble indication must resound automatically every 24 hours after the silencing feature has been operated if the supervisory or trouble condition still exists.

2.3.3 Non-Interfering

Power and supervise each circuit such that a signal from one device does not prevent the receipt of signals from any other device. Initiating devices must be manually reset by switch from the FACU after the initiating device or devices have been restored to normal.

2.3.4 Input/Output Modifications

The FACU must contain features that allow the bypassing of input devices from the system or the modification of system outputs. These control
features must consist of a control unit switch/button. Any bypass or modification to the system must indicate a trouble condition on the FACU.

2.3.5 Resetting

Provide the necessary controls to prevent the resetting of any alarm, supervisory, or trouble signal while the alarm, supervisory or trouble condition on the system still exists.

2.4 REMOTE ANNUNCIATOR

******************************************************************************
NOTE: Provide the annunciator at a location in accordance with NFPA 72. A suggested location should be near the door through which the first responders will enter the building as indicated in their pre-fire plan, typically the main entrance.
******************************************************************************

2.4.1 Remote Annunciator

******************************************************************************
NOTE: Locate annunciator at or near the building entrance to allow fire department quick access to the annunciator. When both a remote trouble sounder and remote annunciator are required, specify an annunciator with trouble sounder for dry indoor locations. Where a weatherproof enclosure is required, specify a separate trouble bell.
******************************************************************************

Remote annunciator must duplicate all requirements specified for the control unit annunciator, except that individual zone trouble lamps are not required. Lamps must be LED type, except lamps used in backlit annunciators must be LED or neon type. Annunciator must have a lamp test switch. Zone identification must be by means of [permanently attached rigid plastic or metal plate(s)] or [silk-screened labels attached to the reverse face of backlit viewing window(s)]. Annunciator must be of the [interior][weatherproof] type, [flush][surface][pedestal]-mounted. [Provide annunciator with an integral audible trouble sounder which must operate in conjunction with control unit audible sounder. Provide annunciator with trouble silence switch which must comply with the requirements for a trouble silencing switch as specified for the FACU.]

[2.4.2 Graphic Annunciator

******************************************************************************
NOTE: Graphic annunciators should be provided only when a large number of concealed devices are installed. Normally, exposed devices will be annunciated by zone only on the fire alarm control unit zone annunciator and remote zone annunciator. Edit accordingly. Locate graphic annunciator(s) at or near building entrance to allow fire department quick access to the annunciator.
******************************************************************************

Graphic annunciator must be of the [interior][weatherproof] type, [flush][surface][pedestal]-mounted. Annunciator must be provided with the
[building] [room] floor plan, drawn to scale, with alarm lamps mounted to represent the location of [each concealed detector] [each initiating device]. Annunciator graphic must also show the locations of the annunciator and control unit, and must have a "you are here" arrow showing its location. Orient building floor plan on graphic to location of person viewing the graphic (i.e., the direction the viewer is facing must be toward the top of the graphic display). Provide a North arrow. [Principal rooms and areas shown must be labeled with room numbers or titles.] Detectors mounted above ceilings, [on ceilings, ] and beneath raised floors and different types of initiating devices must have different symbols or lamps of different colors for identification. Lamps must illuminate upon activation of corresponding device and must remain illuminated until the system is reset. Annunciator must have a lamp test switch.

2.4.2.1 Materials

Construct the graphic annunciator face plate of [smoked Plexiglas] [non-glare matte finish] [anodized bronze] [anodized aluminum]. The face plate must be backlit with LEDs. Control equipment and wiring must be housed in a [recessed] [semi-recessed] [surface mounted] back box. The exposed portions of the back box must be [chrome plated] [anodized bronze] [anodized aluminum] without knockouts.

2.4.3 Printer

**************************************************************************
NOTE: If the printer will be located in a SCIF or similar area, specify "no stored memory".
**************************************************************************

a. Provide a system printer [with no stored memory] to record alarm, supervisory, and trouble conditions without loss of any signal or signals. Printout must be by circuit, device, and function as provided in the FACU. Printer must operate on a 120 VAC, 60 Hz power supply.

b. The printer must have at least 80 characters per line and have a 96 ASCII character set. The printer must have a microprocessor-controlled, bi-directional, logic seeking head capable of printing 120 characters per second utilizing a 9 by 7 dot matrix print head. Printer must not contain internal software which is essential for proper operation.

c. When the FACU receives a signal, the alarm, supervisory, and trouble condition must be printed. The printout must include the type of signal, the circuit or device reporting, the date, and the time of the occurrence. The printer must differentiate alarm signals from other printed indications. When the system is reset, this condition must also be printed including the same information concerning device, location, date, and time. Provide a means to automatically print a list of existing alarm, supervisory, and trouble conditions in the system. If a printer is off-line when an alarm is received, the system must have a buffer to retain the data and it must be printed when the printer is restored to service. The printer must have an indicator to alert the operator that the paper has run out.

2.5 MANUAL STATIONS

**************************************************************************
NOTE: Architectural Barriers Act (ABA) requires that manual alarm stations be mounted at a maximum of
1.1 m 44 inches above finished floor (AFF).

Provide metal or plastic, [semi-flush][flush][surface] mounted, [single][double]-action, manual stations, that are not subject to operation by jarring or vibration. Stations must be equipped with screw terminals for each conductor. Stations that require the replacement of any portion of the device after activation are not permitted. Stations must be finished in red with molded raised lettering operating instructions of contrasting color. The use of a key must be required to reset the station.

2.6 SMOKE DETECTORS

NOTE: Provide smoke detectors only in spaces where they are specifically required by UFC 3-600-01, DESIGN: FIRE PROTECTION ENGINEERING FOR FACILITIES.

Smoke detectors provided in elevator machinery rooms are to be provided per requirements of UFC 3-600-01. Coordinate with Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS, Section 14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS and/or Section 14 24 13 HYDRAULIC FREIGHT ELEVATORS, Section 14 24 23 HYDRAULIC PASSENGER ELEVATORS.

2.6.1 Spot Type Detectors

Provide [photoelectric][ionization][laser] smoke detectors as follows:

a. Provide [photoelectric smoke detectors utilizing the photoelectric light scattering principle for operation in accordance with UL 268 ][smoke detectors that operate on the ionization principle and are actuated by the presence of visible or invisible products of combustion][laser smoke detectors utilizing laser diode and patented smoke sensing chamber, designed to amplify signals from smoke but diminish stray internal reflections and must, on command from the FACU, send data to the control unit representing the analog level of smoke density]. Smoke detectors must be listed for use with the FACU.

b. Provide self-restoring type detectors that do not require any readjustment after actuation at the FACU to restore them to normal operation. The detector must have a visual indicator to show actuation.

c. Vibration must have no effect on the detector's operation. Protect the detection chamber with a fine mesh metallic screen that prevents the entrance of insects or airborne materials. The screen must not inhibit the movement of smoke particles into the chamber.

d. Provide twist lock bases [with sounder that produces a minimum of 90 dBA at 3 m 10 feet] with screw terminals for each conductor. The detectors must maintain contact with their bases without the use of springs.

2.6.2 Projected Beam Smoke Detector

Detectors must consist of [combined transmitter and receiver unit][separate transmitter and receiver units]. The transmitter unit must emit an infrared beam to the receiver unit [the use of a supplied reflector is...
required for the combined unit]. When the signal at the receiver falls below a preset threshold, the detector must initiate an alarm. The receiver must contain an LED status indicator that illuminates when an alarm condition exists. Long-term changes to the received signal caused by environmental variations must be automatically compensated. Detectors must incorporate features to assure that they are operational; a trouble signal must be initiated if the beam is obstructed for more than 3 seconds, the limits of the compensation circuit are reached, or the housing cover is removed. Detectors must have multiple sensitivity settings in order to meet UL listings for the different distances covered by the beam.

2.6.3 Duct Smoke Detectors

**************************************************************************
NOTE: The requirements for Duct Detectors will be coordinated with the HVAC requirements and Sections 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. All required duct detectors will be shown on the contract drawings.
**************************************************************************

Duct-mounted photoelectric smoke detectors must consist of a smoke detector, as specified in paragraph Spot Type Detectors, mounted in a special housing fitted with duct sampling tubes. Detector circuitry must be mounted in a metallic or plastic enclosure exterior to the duct. It is not permitted to cut the duct insulation to install the duct detector directly on the duct.] Detectors must be listed for operation over the complete range of air velocities, temperature and humidity expected at the detector when the air-handling system is operating. Detectors must be powered from the FACU.

a. Sampling tubes must run the full width of the duct. The duct detector package must conform to the requirements of NFPA 90A, UL 268A, and must be listed for use in air-handling systems. The control functions, operation, reset, and bypass must be controlled from the FACU.

b. Lights to indicate the operation and alarm condition must be visible and accessible with the unit installed and the cover in place. Remote indicators must be provided where required by NFPA 72. Remote indicators as well as the affected fan units must be properly identified in etched plastic placards.

c. Detectors must provide for control of auxiliary contacts that provide control, interlock, and shutdown functions specified in Section 23 09 00 to INSTRUMENTATION AND CONTROL FOR HVAC. Auxiliary contacts provide for this function must be located within 1 m 3 feet of the controlled circuit or appliance. The auxiliary contacts must be supplied by the fire alarm system manufacturer to ensure complete system compatibility.

[2.7 AIR SAMPLING SMOKE DETECTION SYSTEM

The [addressable] air sampling smoke system must consist of a detector assembly housing an integral aspiration fan, filter, laser-based detection chamber and control, output and supervision circuitry.[ Each sampling point must be capable of being independently addressable.] The system must consist of a piping or tubing distribution network that runs from the detector assembly(s) to the protected area(s) and is supported by air sampling smoke detection system calculations from a computer-based design modeling tool. The system must include configurable alarm and trouble
relay outputs for interface to other systems where required.

a. System must be complete in all ways. It must include all engineering, and electrical installation, all detection and control equipment, auxiliary devices and controls, alarm interface, functional checkout and testing, training and all other operations necessary for a functional system.

b. System base detectors and modules must each accommodate up to [40 addressable] microbore sampling tubes where each tube has a sampling point at the end. Additional modules may be used to provide up to [20 addressable] sampling holes per system.

c. Program alarm thresholds to the following values unless the results of the pre-Government system tests indicate a clear need to change them. In the event that such a need is indicated, notify the Contracting Officer and provide complete documentation concerning the need to deviate from these values. Include within the deviation documentation request, information that complies with the paragraph entitled "Sensitivity Verification Test". Ensure initial threshold levels are approved prior to the Government test.

(1) Alarm Level 1: set ALERT at [_____] 0.0250 percent obscuration/foot
(2) Alarm Level 2: set PRE-ALARM at [_____] 0.0500 percent obscuration/foot
(3) Alarm Level 3: set FIRE 1 at [_____] 0.1000 percent obscuration/foot
(4) Alarm Level 4: set FIRE 2 at [_____] 0.2000 percent obscuration/foot

d. All air sampling smoke detection devices and associated components must be new, standard products or the manufacturer's latest design and suitable to perform the functions intended.

e. The laser detection chamber must be of the mass light scattering type and capable of detecting a wide range of smoke particle types of varying size. A particle counting method must be employed for the purposes of:

(1) Preventing large particles from affecting the true smoke reading.
(2) Monitoring contamination of the filter (for example, dust and dirt) to automatically notify when maintenance is required. The particle counting method must not be used for the purpose of smoke density measurement.

f. Detector(s) must be self-monitoring for filter contamination and provide indication through system fault when replacement is necessary. Detectors which allow automatic reset of filter status upon removal and re-insertion are not permitted.

g. Detector(s) must contain relays for alarm and fault conditions. The relays must be software programmable to the required functions.

h. Detector(s) must permit configuration by programmers that are either
Detector(s) must allow programming of:

1. Smoke threshold alarm levels; ALERT, PRE-ALARM, FIRE 1 and FIRE 2.
2. Time delays. Ensure the display control unit contains individual adjustable alarm time delay features for each of the alarm threshold levels. Provide an adjustment range between 0 and 60 seconds. Program the alarm threshold time delays to 30 seconds for alarm levels 1 and 2, and 15 seconds for alarm levels 3 and 4.
3. Faults, including airflow, detector, power, filter and network, as well as an indication of the urgency of the fault.
4. Configuration of relay outputs for remote indication of alarm and fault conditions.
5. General purpose input functionality.

2.8 HEAT DETECTORS

*******************************************************************************************
NOTE: Heat detectors provided in elevator machinery rooms are strictly for the warning sign in the elevator cab and must not alarm the FACU. Coordinate with Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS, Section 14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS and/or Section 14 24 13 HYDRAULIC FREIGHT ELEVATORS, Section 14 24 23 HYDRAULIC PASSENGER ELEVATORS.
*******************************************************************************************

2.8.1 Heat Detectors

Heat detectors must be designed for detection of fire by [fixed temperature][combination fixed temperature and rate-of-rise principle][rate-compensating principle] in accordance with UL 521. The alarm condition must be determined by comparing detector value with the stored values. Detectors located in areas subject to moisture, exterior atmospheric conditions, or hazardous locations [as defined by NFPA 70][ and ][as indicated], must be types approved for such locations.

[2.8.1.1 Combination Fixed-Temperature and Rate-of-Rise Detectors

Detectors must be [surface][semi-flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-resetting. Detector must operate at [57.2][90] degrees C[135][194] degrees F. Detector must feature rate compensation. [Detectors rated to operate at 57.2 degrees C135 degrees F must not respond to momentary temperature fluctuations less than 16.7 degrees C30 degrees F per minute between 16 and 38 degrees C60 and 100 degrees F].[ Detectors rated to operate at 90 degrees C194 degrees F must not respond to momentary temperature fluctuations less than 27.8 degrees C50 degrees F per minute between 16 and 66 degrees C60 and 150 degrees F.][ The detector assembly must be [weatherproof][ and ][explosionproof].]
[2.8.1.2] Rate Compensating Detectors

Detector backbox must be [surface][flush] mounted in the
[vertical][horizontal] orientation and supported independently of wiring
connections. Detectors must be self-restoring and hermetically sealed.[
The detector assembly must be [weatherproof][ and ][explosionproof].]

[2.8.1.3] Line-Type Fixed Temperature Detectors

**************************************************************************
NOTE: Specify line-type heat detectors only with
approval of the EFD/EFA Fire Protection Engineer.
**************************************************************************

Provide [thermostatic][ or ][thermistor] line-type heat detection cable
[with weather-resistant outer covering] where indicated. Cable must be
nominally rated for a temperature of [68][88][138] degrees C
[155][190][280] degrees F and must operate on fixed temperature principle
only.

[2.8.1.4] Fixed Temperature Detectors

Detectors must be [surface][semi-flush] mounted in the
[vertical][horizontal] orientation and supported independently of wiring
connections. Detectors must be self-restoring. The detectors must have a
specific temperature setting [of [57.2][_____] degrees C [135][_____] degrees F][as shown].[ The detector assembly must be [weatherproof][ and ]
[explosionproof].]

[2.9] FLAME DETECTORS

**************************************************************************
NOTE: Modify these paragraphs as necessary to
indicate that detectors placed in an explosive
environment will be approved for use in the
appropriate class, division, and group environment
as defined in NFPA 70 and as shown on drawings.
**************************************************************************

Detectors must be sensitive to the micron range best suited for their
intended use. Detectors must operate over electrically supervised wiring
circuits and the loss of power to the detector must result in a trouble
signal. A self-test feature must be provided for each detector to be
individually tested.

[2.9.1] Infrared (IR) Single Frequency Flame Detector

**************************************************************************
NOTE: The single frequency IR flame detector has
the advantage of a fast response and is moderately
sensitive. Its disadvantages are being affected by
temperature extremes and being subject to false
alarms from a myriad of IR sources.
**************************************************************************

The detector must be sensitive in the range of [_____] to [_____] micrometers only.
[2.9.2] Infrared (IR) Multi Frequency Flame Detector

******************************************************************************
NOTE: The IR multi frequency flame detector has the advantages of a moderately fast response, moderate sensitivity, and a lower false alarm rate. Its disadvantage is being affected by temperature extremes.
******************************************************************************

The IR detector must consist of three or more IR sensors, each selected for a different IR frequency. The primary sensor must be sensitive in the range of [_____] to [_____] micrometers only. Secondary sensors are tuned to different IR wavelengths to null out the effect of black body radiation to the primary sensor.

[2.9.3] Ultraviolet (UV) Flame Detectors

******************************************************************************
NOTE: Ultraviolet (UV) flame detectors can be set to respond accurately to UV wavelength light produced by flame from both indoors and outdoors. UV flame detectors operate on the Geiger-Muller principle. These gas-filled vacuum tubes respond in the UV portion of the spectrum but can ignore UV radiation from the sun because the upper response range of the detector falls below the range of UV radiation that reaches the earth.

Solid-state UV detectors are available, but their spectral response extends into the sun's UV range and are not recommended for external use.

UV detectors have an 80 to 90 degree cone of vision. The UV detector has a fast response time and usually is not affected by rain, wind, snow, high humidity, or temperature and pressure extremes. UV units will produce false alarms if they are exposed to arc welding or X-ray and gamma radiation. They can also be blinded by oil film or smoke. UV flame detectors that are used in dirty and dusty environments should be equipped with automatic self-test and self-cleaning devices. The cleaning device uses a stream of clean air across the lens surface to minimize the build-up of contaminants.
******************************************************************************

UV flame detector must be of the narrow band response type which operates on radiated ultraviolet energy and must be sensitive in the range of [_____] to [_____] micrometers only. The cone of vision must be 80 degrees or greater. Each detector must be completely insensitive to light sources in the visible frequency range.

[2.9.4] Combination UV/IR Flame Detector

******************************************************************************
NOTE: Combination UV/IR flame detectors have been used both inside and outside to detect fires, but
are slower to react than individual units.

The UV/IR detector must provide discrimination against false alarms by requiring both UV and IR flame detection before an alarm is sent. The UV sensor must be sensitive in the range of 0.185 to 0.265 micrometers only. The IR sensor must be sensitive in the range of [_____] to [_____] micrometers only. Detectors must be completely insensitive to light sources in the visible frequency range.

2.10 MULTI-CRITERIA DETECTORS

The designer must select the sensor required to initiate a fire alarm condition.

Multi-criteria detectors must contain [fixed temperature [_____] degrees C F heat sensor], [rate-of-rise heat sensor], [photoelectric smoke detector], [_____] elements in a single housing.

2.11 CARBON MONOXIDE DETECTOR

Carbon monoxide (CO) detectors must be listed to UL 2075 and set to respond to the sensitivity limits of UL 2034. Carbon monoxide detectors must be listed for use with fire alarm control units. Detectors must be [surface] [semi-flush] mounted in the [vertical] [horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring. For FACU with no listed compatible addressable CO detectors, provide listed 4-wire detectors. [Do not provide CO detectors with local alarms.] Detector must be provided with an LED status indicator.

a. Where 4-wire CO detectors are necessary, each 4-wire CO detector must be individually monitored via addressable interface modules for alarm and off normal/trouble conditions (including loss of power to the individual detector). Power circuits for 4-wire CO detectors must be dedicated to powering the CO detectors only. Battery powered and 120 VAC powered detectors are prohibited.

b. Wiring connections must be made by means of screw terminals and detectors must be equipped with trouble relays. Detectors must be able to mount a single-gang electrical box.

c. A trouble condition at an individual CO detector must not affect any other CO detectors. CO detectors must be powered by the FACU.

d. Detectors must be provided with a means to test CO gas entry into the CO sensing cell.

2.12 NOTIFICATION APPLIANCES

2.12.1 Audible Notification Appliances

NOTE: The designer must layout speakers to achieve both the required dBA levels requires by NFPA 72.

NOTE: Where horns or bells are used for fire alarm notification, calculate the proper locations for
these devices as detailed in "Designing Fire Alarm Audibility," which is contained in the Society of Fire Protection Engineers (SFPE) Handbook of Fire Protection Engineering. Submit the calculations at the 35-percent design review.

Audible appliances must conform to the applicable requirements of UL 464. Appliances must be connected into notification appliance circuits. Surface mounted audible appliances must be painted [red][white][____]. Recessed audible appliances must be installed with a grill that is painted [red][white][____][with a factory finish to match the surface to which it is mounted].

2.12.1.1 Horns

Horns must be [semi-flush mounted][surface-mounted, with the matching mounting backbox surface mounted vibrating type suitable for use in an electrically supervised circuit]. Horns must produce a sound rating of at least 85 dBA at 3.1 meters10 feet. Horns used in exterior locations must be specifically listed or approved for outdoor use and be provided with metal housing and protective grilles. [Horns must be [weatherproof][explosionproof].]

2.12.1.2 Bells

Bells must be surface mounted with the matching mounting backbox [surface mounted][recessed]. Bells must be suitable for use in an electrically supervised circuit. Bells must be the underdome type producing a minimum output rating of [85] [____] dBA at 3.1 m 10 feet. Bells used in exterior locations must be specifically listed or approved for outdoor use and be provided with metal housing and protective grilles. Single stroke, electrically operated, supervised, solenoid bells must be used for coded applications.

2.12.1.3 Chimes

Chimes must be electrically operated, supervised, electronic type, with an adjustable frequency of 800 to 1200 Hertz. Chimes must have a minimum sound rating of [80][____] dBA at 3 m 10 feet. Chimes must ring the bell codes, as indicated.

2.12.2 Visual Notification Appliances

NOTE: ABA requires that Visual Notification Appliances be provided in buildings and facilities in each of the following areas: restrooms, and any general usage area (e.g., meeting rooms), hallways, lobbies,
and any other area for common use and other areas stated at www.access-board.gov. The Visual Notification Appliance must be mounted as required by ABA that directs compliance with NFPA 72. In addition, alarms in guest rooms required to provide communication features must comply with sections 18.5.5.7 of NFPA 72. Shop drawings must indicate location, dimensions, content, details, and other required information to indicate extent of complying with ABA requirements.

2. Currently NFPA 72 requires "clear color" strobes for Fire Alarm Notification. NFPA 72 requires the strobe must be marked "Fire" to clearly identify the function.

Visual notification appliances must conform to the applicable requirements of UL 1638, UL 1971 and conform to the Architectural Barriers Act (ABA). Visual Notification Appliances must have clear high intensity optic lens, xenon flash tubes, or light emitting diode (LED) and be marked "Alert" in letters of contrasting color. The light pattern must be disbursed so that it is visible above and below the strobe and from a 90 degree angle on both sides of the strobe. Strobe flash rate must be 1 flash per second and a minimum of [15][30][75][_____] candela based on the UL 1971 test. Strobe must be [surface][semi-flush] mounted.

2.13 ELECTRIC POWER

2.13.1 Primary Power

Power must be [120][_____] VAC [50][60] Hz service for the FACU from the AC service to the building in accordance with NFPA 72.

2.14 SECONDARY POWER SUPPLY

Provide for system operation in the event of primary power source failure. Transfer from normal to auxiliary (secondary) power or restoration from auxiliary to normal power must be automatic and must not cause transmission of a false alarm.

2.14.1 Batteries

Provide sealed, maintenance-free, [sealed lead acid][lead-calcium][gel cell] batteries as the source for emergency power to the FACU. Batteries must contain suspended electrolyte. The battery system must be maintained in a fully charged condition by means of a solid state battery charger. Provide an automatic transfer switch to transfer the load to the batteries in the event of the failure of primary power.

2.14.1.1 Capacity

Battery size must be the following capacity. This capacity applies to every control unit associated with this system, including supplemental notification appliance circuit panels, auxiliary power supply panels, and fire alarm transmitters.

a. Sufficient capacity to operate the fire alarm system under supervisory and trouble conditions, including audible trouble signal devices for 48
hours and audible and visual signal devices under alarm conditions for an additional 15 minutes.

2.14.1.2 Battery Power Calculations

a. Verify that battery capacity exceeds supervisory and alarm power requirements for the criteria noted in the paragraph "Capacity" above.

(1) Substantiate the battery calculations for alarm and supervisory power requirements. Include ampere-hour requirements for each system component and each control unit component, and compliance with UL 864.

(2) Provide complete battery calculations for both the alarm and supervisory power requirements. Submit ampere-hour requirements for each system component with the calculations.

(3) Provide voltage drop calculations to indicate that sufficient voltage is available for proper operation of the system and all components. Calculations must be performed using the minimum rated voltage of each component.

b. For battery calculations assume a starting voltage of 24 VDC for starting the calculations to size the batteries. Calculate the required Amp-Hours for the specified standby time, and then calculate the required Amp-Hours for the specified alarm time. Using 20.4 VDC as starting voltage, perform a voltage drop calculation for circuits containing device and/or appliances remote from the power sources.

2.14.2 Battery Chargers

Provide a solid state, fully automatic, variable charging rate battery charger. The charger must be capable of providing 120 percent of the connected system load and must maintain the batteries at full charge. In the event the batteries are fully discharged (20.4 Volts dc), the charger must recharge the batteries back to 95 percent of full charge within 48 hours after a single discharge cycle as described in paragraph CAPACITY above. Provide pilot light to indicate when batteries are manually placed on a high rate of charge as part of the unit assembly if a high rate switch is provided.

2.15 SURGE PROTECTIVE DEVICES

Surge protective devices must be provided to suppress all voltage transients which might damage fire alarm control unit components. Systems having circuits located outdoors, communications equipment must be protected against surges induced on any signaling line circuit. Cables and conductors, that serve as communications links, must have surge protection circuits installed at each end. The surge protective device must wire in series to the power supply of the protected equipment with screw terminations. Line voltage surge arrestor must be installed directly adjacent to the power panel where the FACU breaker is located.

a. Surge protective devices for nominal 120 VAC must be UL 1449 listed with a maximum 500 volt suppression level and have a maximum response time of 5 nanoseconds. The surge protective device must also meet IEEE C62.41.1 and IEEE C62.41.2 category B tests for surge capacity. The surge protective device must feature multi-stage construction and be provided with a long-life indicator lamp (either light emitting
diode or neon) which extinguishes upon failure of protected components. Any unit fusing must be externally accessible.

b. Surge protective devices for nominal 24 VAC, fire alarm telephone dialer, or ethernet connection must be UL 497B listed, meet IEEE C62.41.1 and have a maximum response time of 1-nanosecond. The surge protective device must feature multi-stage construction and be self-resetting. The surge protective device must be a base and plug style. The base assembly must have screw terminals for fire alarm wiring. The base assembly must accept "plug-in" surge protective module.

c. All surge protective devices (SPD) must be the standard product of a single manufacturer and be equal or better than the following:

(1) For 120 VAC nominal line voltage: UL 1449 and UL 1283 listed, series connected 120 VAC, 20A rated, surge protective device in a NEMA 4x enclosure. Minimum 50,000 amp surge current rating with EMI/RFI filtering and a dry contact circuit for remote monitoring of surge protection status.

(2) For 24-volt nominal line voltage: UL 497B listed, series connected low voltage, 24-volt, 5A rated, loop circuit protector, base and replaceable module.

(3) For alarm telephone dialers: UL 497A listed, series connected, 130-volt, 150 mA rated with self-resetting fuse, dialer circuit protector with modular plug and play.

(4) For IP-DACTS: UL 497B listed, series connected, 6.4-volt, 1.5A rated with 20 kA/pair surge current, data network protector with modular plug and play.

2.16 WIRING

Provide wiring materials under this section as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM with the additions and modifications specified herein.

2.16.1 Alarm Wiring

IDC wiring must be solid copper cable in accordance with the manufacturers requirements. Copper initiating device circuit field wiring must be No. [14][16][18][_____] AWG size conductors at a minimum. Visual notification appliance circuit conductors, that contain audible alarm appliances, must be copper No. 14 AWG size conductors at a minimum. Wire size must be sufficient to prevent voltage drop problems. Circuits operating at 24 VDC must not operate at less than the listed voltages for the detectors and/or appliances. Power wiring, operating at 120 VAC minimum, must be a minimum No. 12 AWG solid copper having similar insulation. Acceptable power-limited cables are FPL, FPLR or FPLP as appropriate with red colored covering. Nonpower-limited cables must comply with NFPA 70.

2.17 AUTOMATIC FIRE ALARM TRANSMITTERS

******************************************************************************
NOTE: State the make and model number of existing proprietary supervising station receiving equipment. The choice of code transmitter, or radio
The type of existing fire reporting system at the activity. Determine the type of activity reporting system (e.g., positive non interfering or shunt). In most cases a local energy-tripping device will be required. The facility Fire Dept. or Engineering office should be contacted to determine the type and amount of data to be supervised (monitored), e.g., -type: separate or common transmission of alarm, supervisory, and trouble type signals; -amount: all points, all zones, or the combined premises. Verify that existing monitoring equipment has sufficient capacity to support the additional premises or that it can be expanded as necessary to accommodate the new fire alarm system. Identify existing components.

[2.17.1 Radio Transmitter and Interface Panels]

Transmitters must be compatible with proprietary supervising station receiving equipment. Each radio alarm transmitter must be the manufacturer's recognized commercial product, completely assembled, wired, factory tested, and delivered ready for installation and operation. Transmitters must be provided in accordance with applicable portions of NFPA 72, Federal Communications Commission (FCC) 47 CFR 90 and Federal Communications Commission (FCC) 47 CFR 15. Transmitter electronics module must be contained within the physical housing as an integral, removable assembly. The proprietary supervising station receiving equipment is [_____] and the transmitter must be fully compatible with this equipment. At the contractors option, and if listed, the transmitter may be housed in the same control unit as the FACU. The transmitter must be narrowband radio, with FCC certification for narrowband operation and meets the requirements of the NTIA (National Telecommunications and Information Administration) Manual of Regulations and Procedures for Federal Frequency Management.

2.17.1.1 Operation

Operate each transmitter from 120-volt ac power. In the event of 120-volt ac power loss, the transmitter must automatically switch to battery operation. Switchover must be accomplished with no interruption of protective service, and must automatically transmit a trouble message. Upon restoration of ac power, transfer back to normal ac power supply must also be automatic.

2.17.1.2 Battery Power

Transmitter standby battery capacity must provide sufficient power to operate the transmitter in a normal standby status for a minimum of 72 hours and be capable of transmitting alarms during that period.

2.17.1.3 Transmitter Housing

Use NEMA Type 1 for housing. The housing must contain a lock that is keyed [identical to the fire alarm system for the building] [identical to radio alarm transmitter housings on the Installation]. Radio alarm transmitter housing must be factory painted with a suitable priming coat and not less than two coats of a hard, durable weatherproof enamel.
2.17.1.4 Antenna

Antenna must be [omnidirectional, coaxial, halfwave dipole antennas] for radio alarm transmitters with a driving point impedance to match transmitter output. The antenna and antenna mounts must be corrosion resistant and designed to withstand wind velocities of 161 km/hour 100 mph. Do not mount antennas to any portion of the building roofing system. Protect the antenna from physical damage.

2.17.2 Digital Alarm Communicator Transmitter (DACT)

Provide DACT that is compatible with the existing supervising station fire alarm system. Transmitter must have a means to transmit alarm, supervisory, and trouble conditions via a single transmitter. Transmitter must have a source of power for operation that conforms to NFPA 72. Transmitter must be capable of initiating a test signal daily at any selected time. Transmitter must be arranged to seize telephone circuits in accordance with NFPA 72.

2.17.3 Signals to Be Transmitted to the Base Receiving Station

**************************************************************************
NOTE: The following paragraph is applicable only to existing installations for connections to an auxiliary (public) alarm system. Edit this for the installation specific criteria.
**************************************************************************

The following signals must be sent to the base receiving station:

[ a. Sprinkler waterflow]
[ b. Manual pull stations]
[ c. Smoke detectors]
[ d. Duct smoke detectors]
[ e. Sleeping room smoke detectors]
[ f. Carbon monoxide detectors]
[ g. Heat detectors]
[ h. Fire extinguishing system]
[ i. Sprinkler valve supervision]
[ j. Fire pump running]
[ k. Fire pump supervision]
[ l. Water supply level and temperature]
[ m. Combustion engine drive fire pump running
  (1) Selector switch in position than automatic
  (2) Engine over-speed

SECTION 28 31 60 Page 40
(3) Low fuel
(4) Low battery
(5) Engine trouble (for example, low oil, over temp)]

2.18 SYSTEM MONITORING

2.18.1 Valves

Each valve affecting the proper operation of a fire protection system, including automatic sprinkler control valves,[ standpipe control valves,] sprinkler service entrance valve,[ valves at fire pumps,] isolating valves for pressure type waterflow or supervision switches, and valves at backflow preventers, whether supplied under this contract or existing, must be electrically monitored to ensure its proper position. Provide each tamper switch with a separate zone[, unless they are within the same room, then a maximum of five can use the same zone].

2.18.2 High/Low [Air][Nitrogen] Supervisory Switches

Provide monitoring of high and low supervisory [air][nitrogen] for [dry pipe][ and][ preaction] systems. Each air supervisory switch must have a separate address. Switches must be listed extinguishing system attachments. The device must contain double pole, double throw contacts. Operation of the switch must cause a supervisory signal to be transmitted to the PACU when [air][nitrogen] pressure in the system monitored sprinkler system increases more than 34.5 kPa5 psi above the normal system pressure or drops halfway from the normal pressure to the tripping point.

2.18.3 Room Low Temperature Supervisory Switch

Provide [monitoring of the ]listed supervisory air temperature switch for the [fire pump][sprinkler riser] room[s]. Switch must cause a supervisory signal to be transmitted to the FACU whenever the temperature in the room drops to below 4.4 degrees C40 degrees F. Device must reset when temperature rises above 4.4 degrees C40 degrees F.

2.18.4 Electromagnetic Door Holders

Electromagnetic holding devices must operate on [120 VAC][24 VDC], and require not more than [3][_____] watts of power to develop 6.9 kPa25 psi of holding force. Under normal conditions, the magnets must attract and hold the doors open. Operation must be fail safe with no moving parts. Electromagnetic door hold-open devices must not be required to be held open during building power failure. The device must be listed based on UL 228 tests.

2.19 ENVIRONMENTAL ENCLOSURES OR GUARDS

Environmental enclosures must be provided to permit fire alarm components to be used in areas that exceed the environmental limits of the listing. The enclosure must be listed for the device or appliance as either a manufactured part number or as a listed compatible accessory for the component is currently listed. Guards required to deter mechanical damage must be either a listed manufactured part or a listed accessory for the category of the initiating device or notification appliance.
2.20 **FIREFIGHTER TELEPHONE COMMUNICATION SYSTEM**

**************************************************************************

NOTE: Provide a master control station at the FACU with remote telephone stations in each stair at each floor landing, in each elevator lobby on each floor, and in elevator cabs. In addition, provide them at specific locations containing essential fire protection equipment, such as the fire pump room and outside the emergency generator room.

NOTE: In lieu of firefighter telephones radio repeater equipment compatible with responding fire department may be used if approved by the responding fire department.

**************************************************************************

2.20.1 General

Provide a firefighter telephone communication system with complete, common talk, closed circuits. The system must include, but not be limited to, a master control station mounted in the fire alarm control unit, a power supply and standby battery system, and remote telephone stations.

2.20.2 Features

The system must include the following features:

a. A master control station which must provide power, supervision, and control for wiring, components, and circuits. The act of lifting any remote telephone hand set from its cradle must cause both a visual and audible signal to announce at the master control station. Removing the hand set at the master control station and depressing a button at the remote telephone hand set must cause the automatic silencing of the audible signal.

b. Communication between the master control station hand set and any/or all remote hand sets must require the depressing of a push-to-talk switch located on any/all remote hand sets. During the time that the master control hand set is removed from its cradle it must be possible to communicate between five remote hand sets and the master control station.

c. Hand sets must be able to monitor any conversation in progress and join the conversation by pressing the push-to-talk button. It must not be possible to communicate between two or more remote hand sets with the master control station hand set in its cradle.

d. The master control station hand set must be red in color and equipped with a 1.5 m 5-foot long strain-relieved coiled cord.

e. The master control station must monitor wire and connections for any opens, shorts, or grounds which would render the system inoperable or unintelligible.

f. The master control station must be equipped with a silencing switch and ring-back feature such that any audible trouble signal can be silenced and must be so indicated by the lighting of an amber LED. Once any trouble condition has been corrected, the amber LED must be

---

SECTION 28 31 60  Page 42
The master control station must be equipped with a separate, LED annunciated switch for each telephone circuit. In addition, LEDs must provide for the annunciation of operating and supervisory power.

The loss of operating or supervisory power must cause an audible and visual indication at the master control station and must also cause the fire alarm trouble signal to sound on the FACU.

Switches, LEDs, and controls must be fully labeled.

2.20.3 Handsets

Handsets must have the following features:

a. Provide [surface][flush] mounted remote telephone stations.

b. Each station must be equipped with a hinged door that is magnetically locked.

c. Each hand set must be permanently wired in place with a coiled cord.

d. Each hand set must be red high-impact cycolac and must be equipped with a push-to-talk switch which, when operated, must signal the master control station and a switch-equipped, storage cradle.

e. Provide operating and supervising power from the same supply circuit(s) utilized for the FACU.

PART 3 EXECUTION

3.1 VERIFYING ACTUAL FIELD CONDITIONS

Before commencing work, examine all adjoining work on which the contractor's work is in any way dependent for perfect workmanship according to the intent of this specification section, and report to the Contracting Officer's Representative any condition which prevents performance of first class work. No "waiver of responsibility" for incomplete, inadequate or defective adjoining work will be considered unless notice has been filed before submittal of a proposal.

3.2 INSTALLATION

3.2.1 Fire Alarm Control Unit (FACU)

Locate the FACU [where indicated on the drawings][____]. [Recess][Semi-recess][Surface mount] the enclosure with the top of the cabinet 2 m 6 feet above the finished floor or center the cabinet at [1.5][____] m [5][____] feet, whichever is lower. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the FACU. Locate the document storage cabinet adjacent to the FACU unless the Contracting Officer directs otherwise.

3.2.2 Battery Cabinets

When batteries will not fit in the FACU, locate battery cabinets below or adjacent to the FACU. Battery cabinets must be installed at an accessible location.
location when standing at floor level. Battery cabinets must not be installed lower than 300 mm (12 inches) above finished floor, measured to the bottom of the cabinet, nor higher than 900 mm (36 inches) above the floor, measured to the top of the cabinet. Installing batteries above drop ceilings or in inaccessible locations is prohibited. Battery cabinets must be large enough to accommodate batteries and also to allow ample gutter space for interconnection of control units as well as field wiring. The cabinet must be provided in a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and surface mounting provisions. The cabinet must be identified by an engraved phenolic resin nameplate. Lettering on the nameplate must indicate the control unit(s) the batteries power and must not be less than 25 mm (1-inch) high.

3.2.3 Manual Stations

Locate manual stations as required by NFPA 72 and as indicated on the drawings. Mount stations so they are located no farther than 1.5 m (5 feet) from the exit door they serve, measured horizontally. Manual stations must be mounted at 1067 mm (42 inches) measured to the operating handle.

3.2.4 Notification Appliances

**************************************************************************
NOTE: Locate strobes wall mounted in corridors no more than 4.5 m (15 feet) from the end of a corridor with 30 m (100 feet) maximum distance between strobes. Where there is an obstruction to the viewing path in the corridors, such as a cross-corridor door or ceiling elevation change, consider the obstruction as defining a new corridor. Provide ceiling mounted strobes in rooms accessible to the public, such as conference rooms, restrooms, courtrooms, cafeterias, and auditoriums in accordance with NFPA 72. In Child Development Centers only chimes must be used as the pre-alert tone prior to voice messages.
**************************************************************************

a. Locate notification appliance devices [as required by NFPA 72][where indicated] Where more than two visual notification appliances are located in the same room or corridor or field of view, provide synchronized operation. Devices must use screw terminals for all field wiring. [Audible and visual notification appliances mounted in acoustical ceiling tiles must be centered in the tiles plus or minus 50 mm (2 inches).]

b. Audible and visual notification appliances mounted on the exterior of the building, within unconditioned spaces, or in the vicinity of showers must be listed weatherproof appliances installed on weatherproof backboxes.

c. Speakers must not be located in close proximity to the FACU or LOC so as to cause feedback when the microphone is in use.

3.2.5 Smoke and Heat Detectors

Locate detectors [as required by NFPA 72 and their listing][as indicated on the drawings] on a 100 mm (4-inch) mounting box. Install heat detectors not
less than $100 \text{ mm}$ $4 \text{ inches}$ from a side wall to the near edge. Heat detectors located on the wall must have the top of the detector at least $100 \text{ mm}$ $4 \text{ inches}$ below the ceiling, but not more than $300 \text{ mm}$ $12 \text{ inches}$ below the ceiling. Smoke detectors are permitted to be on the wall no lower than $300 \text{ mm}$ $12 \text{ inches}$ from the ceiling with no minimum distance from the ceiling. In raised floor spaces, install the smoke detectors to protect [21 square meters 225 square feet per detector]. Install smoke detectors no closer than $1 \text{ m}$ $3 \text{ feet}$ from air handling supply diffusers. Detectors installed in acoustical ceiling tiles must be centered in the tiles plus or minus $50 \text{ mm}$ $2 \text{ inches}$.

3.2.6 Carbon Monoxide Detectors

Locate detectors [as required by NFPA 72 and their listings] [as indicated on the drawings] on a $100$-$\text{mm}$-$4$-$\text{inch}$ mounting box. Carbon monoxide detectors must be installed separate from smoke and/or heat detectors.

3.2.7 Air Sampling Smoke Detector

Locate air sampling smoke detectors in accordance with the manufacturer's instructions. Air sampling smoke detectors must be installed as follows:

a. Air Sampling Smoke Detector Assembly:

(1) Detector assembly must be mounted to a wall at a height between $48$ to $60 \text{ inches}$ $1200 \text{ mm}$ to $1800 \text{ mm}$ to top of detector measured above the finished floor.

(2) Mounting must be in a fully accessible and visible location.

(3) Mounting or attachment to site equipment, cable trays, movable walls, other equipment or equipment supports is not permitted.

(4) Piping network insertion into the detector inlet must not be glued.

(5) Air sampling smoke detector assembly must be installed in accordance with this specification section and the manufacturer's installation and instruction manuals.

(6) Flexible tubing for termination of the sampling pipe network into detector inlet is not permitted unless allowed by its listing.

(7) Provide red background with white lettering labels that are plastic or phenolic type with a minimum of $0.25$-inch $6.4$ mm block lettering to indicate detector and zone. For example: "AIR SAMPLING SOME DETECTOR No. 1-1 No. 5".

(8) Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. Install the frame in a conspicuous location observable from the ASD panel. The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions must be approved by the Contracting Officer before being posted.

b. Pipe and Sampling Tube Mounting:

(1) The pipe and sampling tubing detection network must be mounted as
per the design and manufacturer's specification. The hardware used for mounting will depend upon the design and site requirements.

(2) To minimize flexing, pipes must be secured every 1.5 m 5 feet.

(3) Pipes must be suspended between 25 mm and 100 mm and 4 inches below the ceiling. In areas with a suspended ceiling, the pipe network must be installed above the ceiling utilizing the manufacturer's capillary sample port supported by the ceiling.

(4) The sampling tubes must be of the same length or use the manufacturer's guidelines to run tubes of the required lengths.

(5) When installing a pipe network in areas subject to high temperature fluctuations allow for the contraction and expansion of pipes.

(6) Where expansion or contraction of pipes is likely either after installation or on a continuous basis, do not place pipe clips adjacent to couplings and socket unions as these may interfere with the movement of the pipe.

(7) No bends are permitted within the first 450 mm 18 inches from the detector inlet.

(8) The routing of the piping and sample tube network must be coordinated with potential obstructions, including cable trays, grounding bars, and HVAC ductwork.

(9) All changes in direction must be made with standard elbows or tees.

(10) All joints must be air-tight and made by using solvent cement, except at the entry to the detector assembly. Refer to ASTM F402.

(11) All pipes must be supported by mechanical hangers attached to the structure of the building. Not more than 300 mm 1-foot of pipe must extend beyond the last hanger of each sampling pipe. The final installation must result in no noticeable deflection in the piping network.

(12) Attachment of air sampling pipes to cable trays, "gray iron", and telecommunications equipment is prohibited.

(13) Clearly label pipe network to distinguish the pipe from other facility pipe work or protective cabling enclosures. For example: "SMOKE DETECTION SAMPLING TUBE - DO NOT DISTURB". In open rooms and exposed areas, provide labels at no greater than 6.1-m 20-foot intervals. Provide labels every 3 m 10 feet where piping is installed above suspended ceilings and every 609 mm 2 feet, centered in the floor panels, where piping is installed within the raised floor cavity.

(14) Placement of the sampling tube must take into consideration appropriate sampling point locations and spacing.

c. Air Sampling Points:

(1) Open area ceiling sampling points must be oriented downward and
must be within 25 mm to 100 mm to 4 inches below the underside of the ceiling above where the ceiling is smooth.

(2) Label all air sampling points with a round red label, each with a center hole to match the diameter of the drilled sampling point. For example: "AIR SAMPLING POINT DIA 3.2 MM0.125 INCHES". Indicate fractional dimensions in decimal format with a minimum of three decimal places.

3.2.8 Graphic Annunciator

Locate the graphic annunciator as shown on the drawings. Mount the annunciator, with the top 1830 mm 6 feet above the finished floor or center the annunciator at [1525][_____] mm [5][_____] feet, whichever is lower. Surface-mount the annunciator, with the top 1830 mm 6 feet AFF or center the annunciator at [1525][_____] mm [5][_____] feet, whichever is lower.

3.2.9 Remote Annunciator

Locate the remote annunciator as shown on the drawings. Mount the annunciator, with the top 2 m 6 feet above the finished floor or center the annunciator at [1.5][_____] m [5][_____] feet, whichever is lower.

3.2.10 Electromagnetic Door Holder Release

Doors must be held open at a minimum of 90 degrees so as not to impede egress from the space. Mount the armature portion on the door and have an adjusting screw for seating the angle of the contact plate. Wall-mount the electromagnetic release, with a total horizontal projection not exceeding 100 mm4 inches. Ensure all doors release to close upon first stage (pre-discharge) alarm. Electrical supervision of wiring external of control unit for magnetic door holding circuits is not required.

3.2.11 Firefighter Telephones

Mount telephone[ hand sets][ jacks] on the wall in each stair at each floor landing, in each emergency generator room, in each fire pump room, in each elevator machine room, in each elevator lobby, and in each elevator cab 1200 mm 4 feet above the finished floor.

3.2.12 Ceiling Bridges

Provide ceiling bridges for ceiling-mounted appliances. Ceiling bridges must be as recommended/required by the manufacturer of the ceiling-mounted notification appliance.

3.3 SYSTEM FIELD WIRING

3.3.1 Wiring within Cabinets, Enclosures, and Boxes

Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of any box, enclosure, or cabinet. Conductors that are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting, or junction box must be connected to screw-type terminal blocks. Mark each terminal in accordance with the wiring diagrams of the system. The use of wire nuts or similar devices is prohibited. Wiring to conform with NFPA 70.
Indicate the following in the wiring diagrams:

a. Point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the FACU and remote fire alarm control units, initiating circuits, switches, relays and terminals.

b. Complete riser diagrams indicating the wiring sequence of devices and their connections to the control equipment. Include a color code schedule for the wiring. Include floor plans showing the locations of devices and equipment.

3.3.2 Terminal Cabinets

**************************************************************************
NOTE: Provide terminal cabinets on each floor where the fire alarm system supply riser is located and where the fire alarm return riser is located.
**************************************************************************

Provide a terminal cabinet at the base of any circuit riser, on each floor at each riser, and where indicated on the drawings. Terminal size must be appropriate for the size of the wiring to be connected. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the terminal cabinet. Minimum size is 200 mm by 200 mm 8 inches by 8 inches. Only screw-type terminals are permitted. Provide an identification label, that displays "FIRE ALARM TERMINAL CABINET" with 50 mm 2-inch lettering, on the front of the terminal cabinet.

3.3.3 Alarm Wiring

**************************************************************************
NOTE: Do not penetrate SCIF perimeters with copper signal line circuits. SCIF penetrations should be either fiber optic cable or IDC. IDC circuits penetrating the SCIF must be filtered.
**************************************************************************

a. Voltages must not be mixed in any junction box, housing or device, except those containing power supplies and control relays.

b. Utilize shielded wiring where recommended by the manufacturer. For shielded wiring, ground the shield at only one point, in or adjacent to the FACU.

c. [Pigtail or T-tap connections to initiating device circuits, supervisory alarm circuits, and notification appliance circuits are prohibited.] [T-tapping using screw terminal blocks is allowed for Class "B" initiating device circuits.]

d. Color coding is required for circuits and must be maintained throughout the circuit. Conductors used for the same functions must be similarly color coded. Conform wiring to NFPA 70.

e. Pull all conductors splice free. The use of wire nuts, crimped connectors, or twisting of conductors is prohibited. Where splices are
unavoidable, the location of the junction box or pull box where they occur must be identified on the as-built drawings. The number and location of splices must be subject to approval by the [_____]
Designated Fire Protection Engineer (DFPE).

3.3.4 Back Boxes and Conduit

In addition to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, provide all wiring in rigid metal conduit or intermediate metal conduit unless specifically indicated otherwise. Minimum conduit size must be 19 mm 3/4-inch in diameter. Do not use electrical non-metallic tubing (ENT) or flexible non-metallic tubing and associated fittings.

a. Galvanized rigid steel (GRS) conduit must be utilized where exposed to weather, where subject to physical damage, and where exposed on exterior of buildings. Intermediate metal conduit (IMC) may be used in lieu of GRS as allowed by NFPA 70.

b. Electrical metallic tubing (EMT) is permitted above suspended ceilings or exposed where not subject to physical damage. Do not use EMT underground, encased in concrete, mortar, or grout, in hazardous locations, where exposed to physical damage, outdoors or in fire pump rooms. Use die-cast compression connectors.

c. For rigid metallic conduit (RMC), only threaded type fitting are permitted for wet or damp locations.

d. Flexible metal conduit is permitted for initiating device circuits [_____]6 feet in length or less. Flexible metal conduit is prohibited for notification appliance circuits and signaling line circuits. Use liquid tight flexible metal conduit in damp and wet locations.

e. Schedule 40 (minimum) polyvinyl chloride (PVC) is permitted where conduit is routed underground or underground below floor slabs. Convert non-metallic conduit, other than PVC Schedule 40 or 80, to plastic-coated rigid, or IMC, steel conduit before turning up through floor slab.

f. Exterior wall penetrations must be weathertight. Conduit must be sealed to prevent the infiltration of moisture.

[g. For Class "A" or "X" circuits with conductor lengths of 10 feet 3 meters or less, the conductors must be permitted to be installed in the same raceway in accordance with NFPA 72.]

3.3.5 Conductor Terminations

Labeling of conductors at terminal blocks in terminal cabinets, FACU, and remote FACU must be provided at each conductor connection. Each conductor or cable must have a shrink-wrap label to provide a unique and specific designation. Each terminal cabinet, FACU, and remote FACU must contain a laminated drawing that indicates each conductor, its label, circuit, and terminal. The laminated drawing must be neat, using 12 point lettering minimum size, and mounted within each cabinet, control unit, or unit so that it does not interfere with the wiring or terminals. Maintain existing color code scheme where connecting to existing equipment.
3.4 DISCONNECTION AND REMOVAL OF EXISTING SYSTEM

**************************************************************************
NOTE: Contact the Contracting Officer, Base Fire Prevention Office, and/or Base Maintenance Personnel to determine what action is appropriate for the salvaging of existing fire alarm equipment.
**************************************************************************

Maintain existing fire alarm equipment fully operational until the new equipment has been tested and accepted by the Contracting Officer. As new equipment is installed, label it "NOT IN SERVICE" until the new equipment is accepted. Once the new system is completed, tested, and accepted by the Government, it must be placed in service and connected to the supervising station. Remove tags from new equipment and tag the existing equipment "NOT IN SERVICE" until removed from the building.

a. After acceptance of the new system by the Contracting Officer, remove existing equipment not connected to the new system, remove unused exposed conduit, and restore damaged surfaces. Remove the material from the site and dispose.

b. Disconnect and remove the existing fire alarm and smoke detection systems where indicated and elsewhere in the specification.

c. Control units and fire alarm devices and appliances disconnected and removed must be turned over to the Contracting Officer.

d. Properly dispose of fire alarm outlet and junction boxes, wiring, conduit, supports, and other such items.

3.5 CONNECTION OF NEW SYSTEM

The following new system connections must be made during the last phase of construction, at the beginning of the pre-Government tests. New system connections must include:

a. Connection of new relays to existing magnetic door hold-open devices.

b. Connection of new elevator recall relays to existing wiring and conduit.

c. Connection of new system transmitter to existing installation fire reporting system.

Once these connections are made, system must be left energized. Report immediately to the Contracting Officer, coordination and field problems resulting from the connection of the above components.

3.6 FIRESTOPPING

Provide firestopping for holes at conduit penetrations through floor slabs, fire-rated walls, partitions with fire-rated doors, corridor walls, and vertical service shafts in accordance with Section 07 84 00 FIRESTOPPING.

3.7 PAINTING

a. In unfinished areas (including areas above drop ceilings), paint all exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceway, junction boxes and covers red. In lieu
of painting conduit, the contractor may utilize red conduit with a factory applied finish.

b. In finished areas, paint exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceways, junction boxes, and electrical boxes to match adjacent finishes. The inside cover of the junction box must be identified as "Fire Alarm" and the conduit must have painted red bands 19 mm/3/4-inch wide at 3-meter/10-foot centers and at each side of a floor, wall, or ceiling penetration.

c. Painting must comply with Section 09 90 00 PAINTS AND COATINGS.

3.8 FIELD QUALITY CONTROL

**************************************************************************
NOTE: Listed tests are minimum required. Coordinate with the local Authority Having Jurisdiction (AHJ) for minimum requirements in excess of the NFPA 72 minimums or those recommend below. If additional tests are required, such tests must be added to the list.
**************************************************************************

3.8.1 Test Procedures

Submit detailed test procedures, prepared and signed by the NICET Level [III][ or ][IV] Fire Alarm Technician, and the representative of the installing company, [and reviewed by the QFPE] [60][_____] days prior to performing system tests. Detailed test procedures must list all components of the installed system such as initiating devices and circuits, notification appliances and circuits, control devices/equipment, batteries, transmitting and receiving equipment, power sources/supply, annunciators, special hazard equipment, emergency communication equipment, interface equipment, and surge protective devices. Test procedures must include sequence of testing, time estimate for each test, and sample test data forms. The test data forms must be in a check-off format (pass/fail with space to add applicable test data; similar to the form in NFPA 72 and NFPA 4.) The test procedures and accompanying test data forms must be used for the pre-Government testing and the Government testing. The test data forms must record the test results and must:

a. Identify the NFPA Class of all Initiating Device Circuits (IDC), and Notification Appliance Circuits (NAC).

b. Identify each test required by NFPA 72 Test Methods and required test herein to be performed on each component, and describe how these tests must be performed.

c. Identify each component and circuit as to type, location within the facility, and unique identity within the installed system. Provide necessary floor plan sheets showing each component location, test location, and alphanumeric identity.

d. Identify all test equipment and personnel required to perform each test (including equipment necessary for smoke detector testing. The use of magnets is not permitted.

e. Provide space to identify the date and time of each test. Provide space to identify the names and signatures of the individuals.
3.8.2 Pre-Government Testing

3.8.2.1 Verification of Compliant Installation

Conduct inspections and tests to ensure that devices and circuits are functioning properly. Tests must meet the requirements of paragraph entitled "Minimum System Tests" as required by NFPA 72. The contractor and an authorized representative from each supplier of equipment must be in attendance at the pre-Government testing to make necessary adjustments. After inspection and testing is complete, provide a signed Verification of Compliant Installation letter by the QFPE that the installation is complete, compliant with the specification and fully operable. The letter must include the names and titles of the witnesses to the pre-Government tests. Provide all completion documentation as required by NFPA 72 including all referenced annex sections and the test reports noted below.

a. NFPA 72 Record of Completion.

b. NFPA 72 Record of Inspection and Testing.

d. Audibility test results with marked-up test floor plans.

e. Documentation that all tests identified in the paragraph "Minimum System Tests" are complete.

3.8.2.2 Request for Government Final Test

When the verification of compliant installation has been completed, submit a formal request for Government final test to the [Designated Fire Protection Engineer (DFPE)][Contracting Officer's Representative (COR)]. Government final testing will not be scheduled until the DFPE has received copies of the request for Government final testing and Verification of Compliant Installation letter with all required reports. Government final testing will not be performed until after the connections to the installation-wide fire reporting system has been completed and tested to confirm communications are fully functional. Submit request for test at least [15] calendar days prior to the requested test date.

3.8.3 Correction of Deficiencies

If equipment was found to be defective or non-compliant with contract requirements, perform corrective actions and repeat the tests. Tests must be conducted and repeated if necessary until the system has been demonstrated to comply with all contract requirements.

3.8.4 Government Final Tests

The tests must be performed in accordance with the approved test procedures in the presence of the DFPE. Furnish instruments and personnel required for the tests. The following must be provided at the job site for Government Final Testing:

a. The manufacturer's technical representative.
[b. The contractor's Qualified Fire Protection Engineer (QFPE).]

c. Marked-up red line drawings of the system as actually installed.

d. Loop resistance test results

e. Copy of pre-Government Test Certificate, test procedures and completed test data forms.

f. Audibility test results with marked-up floor plans.

Government Final Tests will be witnessed by the ________, [Designated Fire Protection Engineer][Contracting Officer's Representative (COR)][, Qualified Fire Protection Engineer (QFPE)]. At this time, any and all required tests noted in the paragraph "Minimum System Tests" must be repeated at their discretion.

3.9 MINIMUM SYSTEM TESTS

3.9.1 System Tests

Test the system in accordance with the procedures outlined in NFPA 72. The required tests are as follows:

a. Loop Resistance Tests: Measure and record the resistance of each circuit with each pair of conductors in the circuit short-circuited at the farthest point from the circuit origin. The tests must be witnessed by the Contracting Officer and test results recorded for use at the final Government test.

b. Verify the absence of unwanted voltages between circuit conductors and ground. The tests must be accomplished at the pre-Government test with results available at the final system test.

c. Verify that the control unit is in the normal condition as detailed in the manufacturer's O&M manual.

d. Test each initiating device and notification appliance and circuit for proper operation and response at the control unit. Smoke detectors must be tested in accordance with manufacturer's recommended calibrated test method. Use of magnets is prohibited. Testing of duct smoke detectors must comply with the requirements of NFPA 72 except disconnect at least 20 percent of devices. If there is a failure at these devices, then supervision must be tested at each device.

e. Carbon Monoxide Detector Tests: Carbon monoxide detectors must be tested in accordance with NFPA 72 and the manufacturer's recommended calibrated test method.

f. Test the system for specified functions in accordance with the contract drawings and specifications and the manufacturer's O&M manual.

g. Test both primary power and secondary power. Verify, by test, the secondary power system is capable of operating the system for the time period and in the manner specified.

h. Determine that the system is operable under trouble conditions as specified.
i. Visually inspect wiring.

j. Test the battery charger and batteries.

k. Verify that red-line drawings are accurate.

l. Measure the current in circuits to ensure there is the calculated spare capacity for the circuits.

m. Measure voltage readings for circuits to ensure that voltage drop is not excessive.

n. Measure the voltage drop at the most remote appliance (based on wire length) on each notification appliance circuit.

o. Verify the documentation cabinet is installed and contains all as-built shop drawings, product data sheets, design calculations, site-specific software data package, and all documentation required by paragraph titled "Test Reports".

3.9.2 Audibility Tests

Sound pressure levels from audible notification appliances must be a minimum of 15 dBa over ambient with a maximum of 110 dBa in any occupiable area. The provisions for audible notification (audibility and intelligibility) must be met with doors, fire shutters, movable partitions, and similar devices closed.

3.10 SYSTEM ACCEPTANCE

Following acceptance of the system, as-built drawings and O&M manuals must be delivered to the Contracting Officer for review and acceptance. The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of as-built (marked-up) drawings must be provided at the time of, or prior to the Final Government Test.

[a. The drawings must be prepared electronically and sized no less than the contract drawings.][ Furnish one set of CDs or DVDs containing software back-up and CAD based drawings in latest version of [MicroStation] [AutoCAD, ]DXF and portable document formats of as-built drawings and schematics.]

b. Include complete wiring diagrams showing connections between devices and equipment, both factory and field wired.

c. Include a riser diagram and drawings showing the as-built location of devices and equipment.

d. Provide Operation and Maintenance (O&M) Instructions.

[In existing buildings, the transfer of devices from the existing system to the new system and the permission to begin demolition of the old fire alarm system will not be permitted until the as-built drawings and O&M manuals are received.]
3.11 INSTRUCTION OF GOVERNMENT EMPLOYEES

3.11.1 Instructor

Provide the services of an instructor, who has received specific training from the manufacturer for the training of other persons regarding the operation, inspection, testing, and maintenance of the system provided. The instructor must train the Government employees designated by the Contracting Officer, in the care, adjustment, maintenance, and operation of the fire alarm system. The instructor must be thoroughly familiar with all parts of this installation. The instructor must be trained in operating theory as well as in practical O&M work. Submit the instructors information and qualifications including the training history.

3.11.2 Required Instruction Time

Provide [8][16][_____] hours of instruction after final acceptance of the system. The instruction must be given during regular working hours on such dates and times selected by the Contracting Officer. The instruction may be divided into two or more periods at the discretion of the Contracting Officer. The training must allow for rescheduling for unforeseen maintenance and/or fire department responses.

3.11.2.1 Technical Training

Equipment manufacturer or a factory representative must provide [1][3][_____] days of on site[ and 5 days of technical training to the Government at the manufacturing facility]. Training must allow for classroom instruction as well as individual hands on troubleshooting and diagnostics exercises.[ Factory training must occur within [6][12][_____] months of system acceptance.]

3.11.3 Technical Training Manual

Provide, in manual format, lesson plans, operating instructions, maintenance procedures, and training data for the training courses. The operations training must familiarize designated government personnel with proper operation of the installed system. The maintenance training course must provide the designated government personnel adequate knowledge required to diagnose, repair, maintain, and expand functions inherent to the system.

3.12 EXTRA MATERIALS

3.12.1 Repair Service/Replacement Parts

Repair services and replacement parts for the system must be available for a period of 10 years after the date of final acceptance of this work by the Contracting Officer. During the warranty period, the service technician must be on-site within 24 hours after notification. All repairs must be completed within 24 hours of arrival on-site.

During the warranty period, the installing fire alarm contractor is responsible for conducting all required testing and maintenance in accordance with the requirements and recommended practices of NFPA 72 and the system manufacturer[s]. Installing fire alarm contractor is NOT responsible for any damage resulting from abuse, misuse, or neglect of equipment by the end user.
3.12.2  **Spare Parts**

Spare parts furnished must be directly interchangeable with the corresponding components of the installed system(s). Spare parts must be suitably packaged and identified by nameplate, tagging, or stamping. Spare parts must be delivered to the Contracting Officer at the time of the Government testing and must be accompanied by an inventory list.

3.12.3  **Document Storage Cabinet**

Upon completion of the project, but prior to project close-out, place in the document storage cabinet copies of the following record documentation:

a.  As-built shop drawings
b.  Product data sheets
c.  Design calculations
d.  All documentation required by SD-06.

SECTION 28 31 66
INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE
08/20

NOTE: This specification covers the requirements for a non-addressable integrated fire detection, fire alarm evacuation and mass notification system.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: For OCONUS projects, this specification section should be edited for specific Host Nation requirements. Coordinate compliance with Host Nation requirements with the Designated Fire Protection Engineer (DFPE).

NOTE: For Family Housing projects at NAVFAC NE use regional guide specification section 28 31 46.00 22
(N-13854N) HOUSEHOLD FIRE WARNING EQUIPMENT to specify residential fire warning systems in lieu of this section.

**************************************************************************
NOTE: This specification section includes requirements from UFC 3-600-01 (change 43, 7 February 2020)
**************************************************************************

**************************************************************************
NOTE: This guide specification covers carbon monoxide alarm detectors for protection in indoor locations where fuel-burning appliances/equipment are used.
**************************************************************************

PART 1   GENERAL

**************************************************************************
1. On the drawings, show location of control unit, batteries and charger (if remotely mounted), supervising station transceiver, annunciator, primary power supply, remote annunciator, detectors, notification appliances (unless performance requirements are specified), and each alarm initiating device including fire extinguishing system switches.

2. Show single-line fire alarm/mass notification systems riser diagram. Each device on the riser should be identified by type. Indicate connection of equipment.

**************************************************************************
1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 RELATED SECTIONS

Section 25 05 11 Cybersecurity for Facility-Related Control Systems, applies to this section, with the additions and modifications specified herein. In addition, refer to the following sections for related work and coordination:

- Section 21 13 13 WET PIPE SPRINKLER SYSTEM, FIRE PROTECTION
- Section 21 20 00 FIRE PUMPS
- Section 21 23 00.00 20 WET CHEMICAL FIRE EXTINGUISHING for KITCHEN CABINET
- Section 21 13 16 DRY PIPE FIRE SPRINKLER SYSTEMS
- Section 21 13 18 PREACTION FIRE SPRINKLER SYSTEMS
- Section 21 13 19 DELUGE FIRE SPRINKLER SYSTEMS
- Section 23 00 20 HVAC AIR DISTRIBUTION
- Section 21 13 24.00 10 AQUEOUS FILM-FORMING FOAM (AFFF) FIRE PROTECTION SYSTEM
- Section 21 13 25 HIGH-EXPANSION FOAM SYSTEM, FIRE PROTECTION
- Section 21 13 21.00 20 FOAM FIRE EXTINGUISHING FOR AIRCRAFT HANGARS
- Section 21 13 22.00 20 FOAM FIRE EXTINGUISHING FOR HAZ/FLAM MATERIAL FACILITY
- Section 21 21 01.00 20 CARBON DIOXIDE FIRE EXTINGUISHING (HIGH PRESSURE)
- Section 21 21 02.00 20 CARBON DIOXIDE FIRE EXTINGUISHING (LOW PRESSURE)
- Section 21 21 03.00 10 WET CHEMICAL FIRE EXTINGUISHING SYSTEM
- Section 08 71 00 DOOR HARDWARE for [door release][door unlocking] and additional work related to finish hardware.
- Section[s] [14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS] [14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS] [and] [14 24 13 HYDRAULIC FREIGHT ELEVATORS] [14 24 23 HYDRAULIC PASSENGER ELEVATORS] for additional work related to elevators.
- Section 07 84 00 FIRESTOPPING for additional work related to firestopping.

1.3 SUMMARY

1.3.1 Scope

a. This work includes designing and [providing a new, complete,][modifying the existing] fire alarm and mass notification (MNS) system as described herein and on the contract drawings[ for the ____________]. Include system wiring, raceways, pull boxes, terminal cabinets, outlet and mounting boxes, control equipment, initiating devices, notification
appliances, supervising station fire alarm transmitters/mass notification transceiver, and other accessories and miscellaneous items required for a complete operational system even though each item is not specifically mentioned or described. Provide system[s] complete and ready for operation. [Existing interior fire alarm system was manufactured by [____].] Design and installation must comply with UFGS 25 05 11, UFC 4-010-06 and AFGM 2019-320-02.

b. Provide equipment, materials, installation, workmanship, inspection, and testing in strict accordance with NFPA 72, except as modified herein. [The system layout on the drawings show the intent of coverage and suggested locations. Final quantity, system layout, and coordination are the responsibility of the Contractor.]

c. Each remote fire alarm control unit must be powered from a wiring riser specifically for that use or from a local emergency power panel located on the same floor as the remote fire alarm control unit. Where remote fire control units are provided, equipment for notification appliances may be located in the remote fire alarm control units.

d. Where a fire pump is provided, the fire alarm and mass notification system must monitor and transmit the fire pump controller signals in accordance with the provisions of NFPA 72.

e. Where an emergency generator provides standby power supply for life safety system circuits, the generator must be monitored by the FMCU and transmit emergency generator signals in accordance with NFPA 72.

f. The fire alarm and mass notification system must be independent of the building security, building management, and energy/utility monitoring systems other than for control functions.

1.3.2 Qualified Fire Protection Engineer (QFPE)

**************************************************************************
NOTE: UFC 3-600-01 requires that shop drawings must bear the Review Stamp and professional engineering stamp of the QFPE prior to submission to the Government for approval.
**************************************************************************

**************************************************************************
NOTE: The term Qualified Fire Protection Engineer (QFPE) should be considered interchangeable with the terms "Fire Protection Designer of Record (FPDOR)" and/or "Fire Protection QC Specialist" where referred to in other applicable contract documents. The intent of defining the QFPE roles and responsibilities here is NOT to require personnel in addition to the QFPE, FPDOR, and/or FPQC specialist referenced elsewhere in the applicable contract documents.
**************************************************************************

Services of the QFPE must include:

a. Reviewing SD-02, SD-03, and SD-05 submittal packages for completeness and compliance with the provisions of this specification. Construction (shop) drawings and calculations must be prepared by, or prepared under
the immediate supervision of, the QFPE. The QFPE must affix their professional engineering stamp with signature to the shop drawings, calculations, and material data sheets, indicating approval prior to submitting the shop drawings to the DFPE.

b. Providing a letter documenting that the SD-02, SD-03, and SD-05 submittal package has been reviewed and noting any outstanding comments.

c. Performing in-progress construction surveillance prior to installation of ceilings (rough-in inspection).

e. Signing applicable certificates under SD-07.

1.4 DEFINITIONS

Wherever mentioned in this specification or on the drawings, the equipment, devices, and functions must be defined as follows:

1.4.1 Local Operating Console (LOC)

A unit designed to allow emergency responders and/or building occupants to operate the MNS including delivery of recorded messages and/or live voice announcements, initiate visual, textual visual, and audible appliance operation and other relayed functions.

1.4.2 Terminal Cabinet

A steel cabinet with locking, hinge-mounted door where terminal strips are securely mounted inside the cabinet.

1.4.3 Designated Fire Protection Engineer (DFPE)

The DoD fire protection engineer that oversees that Area of Responsibility for that project. This is sometimes referred to as the "cognizant" fire protection engineer. Interpret reference to "authority having jurisdiction" and/or AHJ in referenced standards to mean the Designated Fire Protection Engineer (DFPE). The DFPE may be responsible for review of the contractor submittals having a "G" designation, and for witnessing final inspection and testing.

1.4.4 Qualified Fire Protection Engineer (QFPE)

A QFPE is an individual who is a licensed professional engineer (P.E.), who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES (or the particular specification section for submittal procedures in this project) and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the
The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval.[for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.]

Shop drawings (SD-02), product data (SD-03) and calculations (SD-05) must be prepared by the fire alarm designer and combined and submitted as one complete package. The QFPE must review the SD-02/SD-03/SD-05 submittal package for completeness and compliance with the Contract provisions prior to submission to the Government. The QFPE must provide a Letter of Confirmation that they have reviewed the submittal package for compliance with the contract provisions. This letter must include their registered professional engineer stamp and signature. Partial submittals and submittals not reviewed by the QFPE will be returned by the Government disapproved without review.

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Qualified Fire Protection Engineer (QFPE); G[, [____]]

Fire alarm system designer; G[, [____]]

Supervisor; G[, [____]]

SD-10 Operation and Maintenance Data
1.6 SYSTEM OPERATION

**************************************************************************
NOTE: Circuit wiring must be Class "B" unless Class "A" is required by the local installation and as permitted by NFPA 72 (IDC and NAC: "A" or "B").

Circuits and pathways must have survivability levels as defined by NFPA 72.
**************************************************************************

Fire alarm system/mass notification system including textual display sign control panel(s), components requiring power, except for the FMCU(s) power supply, must operate on 24 volts DC unless noted otherwise in this section.

[Provide the system with an interconnected riser loop or network having Class [A][X] supervision. Ensure that the return portion of the loop is remote from the supply portion of the loop.]

Where the building has two stairs for egress from floors above grade or floors below grade, ensure that a single impairment cannot adversely affect more than one floor. Where three or more stairs are provided for egress from floors above grade or below grade, ensure that a single impairment cannot adversely affect more than one-half of any floor.]

[Ensure that any single impairment of the system does not affect the system on more than [one][one-half] of any floor.]

**************************************************************************

If an addition to an existing system is required, provide the make, model number, and other pertinent information on existing components that are to operate with the new equipment. Since new interfaces will have to be compatible with the existing system or to the central fire alarm reporting system, it may be necessary to edit major items out of this specification. If a new fire alarm unit is required, it has to be compatible with the existing central fire alarm reporting system.

**************************************************************************

Provide a fire alarm system that is a complete, supervised fire alarm reporting system. Activate the system into the alarm mode by actuation of any alarm initiating device. Remain in the alarm mode until the initiating device is reset and the fire alarm control unit is reset and restored to normal. Audible and visual appliances and systems must comply with NFPA 72. Operate fire alarm system components requiring power, except for the control unit power supply, on 24 Volts dc.

1.6.1 Alarm Initiating Devices and Notification Appliances (Visual, Voice, Textual)

a. Connect alarm initiating devices to initiating device circuits (IDC)
b. Connect notification appliances to notification appliance circuits (NAC) [Class "A"] [Class "B"].

1.6.2 Functions and Operating Features

The system must provide the following functions and operating features:

a. Power, annunciation, supervision, and control for the system.

b. Visual alarm notification appliances must be synchronized as required by NFPA 72.

c. Electrical supervision of the primary power (AC) supply, presence of the battery, battery voltage, and placement of system modules within the control unit.

d. An audible and visual trouble signal to activate upon a single break or open condition, or ground fault. The trouble signal must also operate upon loss of primary power (AC) supply, absence of a battery supply, low battery voltage, or removal of alarm or supervisory control unit modules. After the system returns to normal operating conditions, the trouble signal must again sound until the trouble is acknowledged.

e. A trouble signal silence feature that must silence the audible trouble signal, without affecting the visual indicator.

f. Switches in a locked portion of the FMCU to bypass the automatic notification appliance circuits, [fire reporting system] [air handler shutdown] [smoke control operation] [elevator recall] [door release] [door unlocking] features. Operation of this action must indicate on the FMCU display [and printer output] as a supervisory or trouble condition. [Notification appliance bypass must be selectable by floor.]

g. Alarm functions must override trouble or supervisory functions. Supervisory functions must override trouble functions.

h. There must be no limit, other than maximum system capacity, as to the number of zones that may be in alarm simultaneously.

i. Where the fire alarm/mass notification system is responsible for initiating an action in another emergency control device or system, such as [HVAC,] [atrium exhaust,] [smoke control,] [elevator recall,] [releasing service,] the fire alarm relay must be located in the vicinity of the emergency control device.

j. An alarm signal must automatically initiate the following functions:

   (1) Transmission of an alarm signal to [the fire department] [a remote supervising station].

   (2) Visual indication of the device operated on the FMCU, [Video Display unit (VDU),] [and on the [graphic] [remote annunciator]. [Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.]

   [(3) Record the event on the system printer.]
(4) Actuation of alarm notification appliances.

[(6) Release of doors held open by electromagnetic devices.]

[(7) Operation of the [smoke control system][atrium exhaust system].]

[(8) Release of power to electric locks (delayed egress locks) on doors that are part of the means of egress.]

[(9) Elevator recall as described in this section.]

**************************************************************************
NOTE: Use this paragraph only where a detector or detection system is to release a special fire extinguishing system.
**************************************************************************

[(10) Operation of [_____] must release the [_____] fire extinguishing system after a [_____] second time delay.]

[(11) Operation of a sprinkler waterflow switch serving an elevator machinery room or elevator shaft must operate shunt trip circuit breaker(s) to shut down power to the elevators in accordance with ASME A17.1/CSA B44.]

[(12) Operation of an interface that operates vibrating pagers worn by hearing-impaired occupants.]

k. A supervisory signal must automatically initiate the following functions:

(1) Visual indication of the device operated on the FMCU, [Video Display unit (VDU),] [and on the [graphic ] [remote annunciator]. [ Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.]

[(2) Record the event on the system printer.]

(3) Transmission of a supervisory signal to [the fire department] [a remote supervising station].

(4) Operation of a duct smoke detector must shut down the appropriate air handler in accordance with NFPA 90A in addition to other requirements of this paragraph and as allowed by NFPA 72.

l. A trouble condition must automatically initiate the following functions:

(1) Visual indication of the device operated on the FMCU, [Video Display unit (VDU),] [and on the [graphic ] [remote annunciator]. [ Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.]

[(2) Record the event on the system printer.]

(3) Transmission of a trouble signal to [the fire department] [a remote supervising station].

[m. Activation of a carbon monoxide alarm initiating device must automatically initiate the following functions:}
(1) Visual indication of the device operated on the FMCU, LCD, LED Display unit (VDU), and on the graphic annunciator. Indication on the graphic annunciator must be by floor and room number, device address, and device type.

(2) Transmission of a carbon monoxide alarm signal to the fire department or a remote supervising station.

(3) Activation of all strobes and the audible carbon monoxide message throughout the building.

n. System control equipment must be programmed to provide a 60-minute to 180-minute delay in transmission of trouble signals resulting from primary power failure.

o. Activation of a LOC pushbutton must activate the audible and visual alarms in the facility. The audible message must be the one associated with the pushbutton activated.

[1.6.3 Elevator Recall]

******************************************************************************
NOTE: Delete this paragraph if no elevator work is included in the project.
******************************************************************************

Provide elevator recall in accordance with ASME A17.1/CSA B44, Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS, 14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS, 14 24 13 HYDRAULIC FREIGHT ELEVATORS, 14 24 23 HYDRAULIC PASSENGER ELEVATORS, and as specified herein. Activation of any smoke detector in an elevator shaft, machine room, or lobby (except at designated recall level) must cause all elevators associated with that shaft, machine room, or lobby to return nonstop to the designated level. Activation of a smoke detector in the lobby or machine room at the designated level must cause all elevators associated with that lobby to return nonstop to the assigned alternate level. Activation of a detector in an elevator shaft, machine room, or lobby must also cause illumination of elevator cab warning signal (fire hat) and complete operation of fire alarm system as specified in paragraph titled "Functions and Operating Features".

[1.7 EXISTING EQUIPMENT]

******************************************************************************
NOTE: If an addition to an existing fire alarm/mass notification system is required, the contract drawings or this section must include the make, model number, and other pertinent information of existing components that are to operate with the new equipment. Since new interfaces will have to be compatible with the existing system or to the central fire alarm reporting system, it may be necessary to edit major items out of this specification. If a new FMCU is required, it has to be compatible with the existing central fire alarm reporting system. When an existing system is to be expanded, show the following information on the contract drawings:
1. Manufacturer and model of existing control unit.

2. Number of existing initiating circuits (zones), notification appliance circuits, and control circuits served by the control unit.

3. Number of existing alarm notification appliances on the system.

4. Total calculated current draw of all devices served by each existing standby battery under both supervisory (standby) and alarm conditions, including NAC/extender control units and subcontrol units.

5. Ampere-hour rating and type of each existing battery.

a. Equipment and devices must be compatible and operable with the existing fire alarm/mass notification system and must not impair reliability or operational functions of existing supervising station fire alarm system. The proprietary type supervising station (PSS) is located in Building [____]. The supervising equipment is existing and consists of the following brands and models: [supervising station control unit [____].] [signal reporting components [____]]. [annunciator [____]].

b. Equipment and devices must be compatible and operable with the existing building fire alarm/mass notification system. Equipment must not impair reliability or operational functions of the existing system. The existing building system control unit is [____].

c. Equipment and devices must be compatible and operable with the existing installation-wide mass notification system and must not impair reliability or operational functions of the existing system. The installation-wide mass notification system utilizes [____] transceivers.

1.8 QUALITY ASSURANCE

1.8.1 Submittal Documents

1.8.1.1 Preconstruction Submittals

Within 36 days of contract award but not less than [14 days] prior to commencing any work on site, the Contractor must submit the following for review and approval. SD-02, SD-03 and SD-05 submittals received prior to the review and approval of the qualifications of the fire alarm subcontractor and QFPE must be returned disapproved without review. All resultant delays must be the sole responsibility of the Contractor.

1.8.1.2 Shop Drawings

Shop drawings must not be smaller than [ISO A1] [ANSI D] [the Contract Drawings]. Drawings must comply with the requirements of NFPA 72 and NFPA 170. Minimum scale for floor plans must be 1/8"=1'.

SECTION 28 31 66 Page 19
1.8.1.3  Nameplates

Nameplate illustrations and data to obtain approval by the Contracting Officer before installation.

1.8.1.4  Wiring Diagrams

[_____] copies of point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the FMCU and remote FMCU, initiating circuits, switches, relays and terminals, including pathway diagrams between the control unit and shared communications equipment within the protected premises. Point-to-point wiring diagrams must be job specific and must not indicate connections or circuits not being utilized. Provide complete riser diagrams indicating the wiring sequence of all devices and their connections to the control equipment. Include a color-code schedule for the wiring.

1.8.1.5  System Layout

[_____] copies of plan view drawing showing device locations, terminal cabinet locations, junction boxes, other related equipment, conduit routing, conduit sizes, wire counts, conduit fill calculations, wire color-coding, circuit identification in each conduit, and circuit layouts for all floors. Indicate candela rating of each visual notification appliance. Indicate the wattage of each speaker. Indicate the addresses of all devices, modules, relays, and similar. Show/identify all acoustically similar spaces. Indicate if the environment for the FMCU is within its environmental listing (e.g. temperature/humidity).

Provide a complete description of the system operation in matrix format similar to the "Typical Input/Output Matrix" included in the Annex of NFPA 72.

[For air sampling smoke detection systems, provide floor plan layouts indicating location of fire alarm control unit, air sampling piping (lengths of pipe) and sampling ports (sizes and locations). Floor plan must also indicate geographic monitor zone boundaries, location of display control unit, bar level annunciation panels if separate, and all other associated equipment that is required to provide a complete operational system.]

1.8.1.6  Notification Appliances

Calculations and supporting data on each circuit to indicate that there is at least 25 percent spare capacity for notification appliances. Annotate data for each circuit on the drawings.

1.8.1.7  Initiating Devices

Calculations and supporting data on each circuit to indicate that there is at least [25][_____] percent spare capacity for initiating devices. Annotate data for each circuit on the drawings.

1.8.1.8  Amplifiers

Calculations and supporting data to indicate that amplifiers have
sufficient capacity to simultaneously drive all notification speakers at tapped settings plus [25][_____] percent spare capacity. Annotate data for each circuit on the drawings.

1.8.1.9 Battery Power

Calculations and supporting data as required in paragraph Battery Power Calculations for alarm, alert, and supervisory power requirements. Calculations including ampere-hour requirements for each system component and each control unit component, and the battery recharging period, must be included on the drawings.

1.8.1.10 Voltage Drop Calculations

Voltage drop calculations for each notification circuit indicating that sufficient voltage is available for proper operation of the system and all components, at a minimum rated voltage of the system operating on batteries. Include the calculations on the system layout drawings.

1.8.1.11 Product Data

[_____] copies of annotated descriptive data to show the specific model, type, and size of each item. Catalog cuts must also indicate the NRTL listing. The data must be highlighted to show model, size, and options that are intended for consideration. Data must be adequate to demonstrate compliance with all contract requirements. Product data for all equipment must be combined into a single submittal.

Provide an equipment list identifying the type, quantity, make, and model number of each piece of equipment to be provided under this submittal. The equipment list must include the type, quantity, make and model of spare equipment. Types and quantities of equipment submitted must coincide with the types and quantities of equipment used in the battery calculations and those shown on the shop drawings.

1.8.1.12 Air Sampling Smoke Detection System Calculations

Submit air sampling detection system design analysis calculations consisting of battery capacity, loading calculations, and fan speed and air flow/transport calculations. Include schematic diagrams showing pipe segments, pipe diameters, lengths of pipe, node numbers, and sample port diameters to verify the requirements are met.

1.8.1.13 Operation and Maintenance (O&M) Instructions

[Six][_____] copies of the Operation and Maintenance Instructions. The O&M Instructions must be prepared in a single volume or in multiple volumes, with each volume indexed, and may be submitted as a Technical Data Package. Manuals must be approved prior to training. The Interior Fire Alarm And Mass Notification System Operation and Maintenance Instructions must include the following:

a. "Manufacturer Data Package [five][____]" as specified in [Section 01 78 23 OPERATION AND MAINTENANCE DATA][____].

b. Operating manual outlining step-by-step procedures required for system startup, operation, and shutdown. The manual must include the manufacturer's name, model number, service manual, parts list, and preliminary equipment list complete with description of equipment and
their basic operating features.

c. Maintenance manual listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The manuals must include conduit layout, equipment layout and simplified wiring, and control diagrams of the system as installed.

d. Complete procedures for system revision and expansion.

e. Routine maintenance checklist. The routine maintenance checklist must be arranged in a columnar format. The first column must list all installed devices, the second column must state the maintenance activity or state no maintenance required, the third column must state the frequency of the maintenance activity, and the fourth column provided for additional comments or reference. All data (devices, testing frequencies, and similar) must comply with UFC 3-601-02.

f. A final Equipment List must be submitted with the Operating and Maintenance (O&M) manual.

1.8.1.14 As-Built Drawings

The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of the as-built (marked-up) drawings must be provided at the time of, or prior to the final Government test.

1.8.2 Qualifications

**************************************************************************
NOTE: NICET (National Institute for Certification in Engineering Technologies) establishes the qualifications of an individual as an Engineering Technologist with verification of experience by having a current NICET certification.
**************************************************************************

1.8.2.1 Fire Alarm System Designer

The fire alarm system designer must be certified as a Level [III][IV] (minimum) Technician by National Institute for Certification in Engineering Technologies (NICET) in the Fire Alarm Systems subfield of Fire Protection Engineering Technology or meet the qualifications for a QFPE.

1.8.2.2 Supervisor

[A NICET Level [III][ or ][IV] fire alarm technician must supervise the installation of the fire alarm/mass notification system[, including the air sampling smoke detection system].] [A fire alarm technician with a minimum of eight years of experience must supervise the installation of the fire alarm/mass notification system.] The fire alarm technicians supervising the installation of equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.8.2.3 Technician

Fire alarm technicians with a minimum of four years of experience must be
utilized to install and terminate fire alarm/mass notification devices, cabinets and control units. The fire alarm technicians installing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings[, and must be thoroughly experienced in the installation of air sampling detection systems].

1.8.2.4 Installer

[Fire alarm installer with a minimum of two years of experience utilized to assist in the installation of fire alarm/mass notification devices, cabinets and control units] [NICET Level II technician to assist in the installation of fire alarm/mass notification devices, cabinets and control units]. A licensed electrician must be allowed to install wire, cable, conduit and backboxes for the fire alarm system/mass notification system. The fire alarm installer must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.8.2.5 Test Technician

Fire alarm technicians with a minimum of eight years of experience and NICET Level [III][ or ][IV] utilized in testing and certification of the installation of the fire alarm/mass notification devices, cabinets and control units. The fire alarm technicians testing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment installed as part of this project.

1.8.2.6 Manufacturer

Components must be of current design and must be in regular and recurrent production at the time of installation. Provide design, materials, and devices for a protected premises fire alarm system, complete, conforming to NFPA 72, except as specified herein.

1.8.3 Regulatory Requirements

Equipment and material must be listed or approved. Listed or approved, as used in this Section, means listed, labeled or approved by a Nationally Recognized Testing Laboratory (NRTL) such as UL Fire Prot Dir or FM APP GUIDE. The omission of these terms under the description of any item of equipment described must not be construed as waiving this requirement. All listings or approvals by testing laboratories must be from an existing ANSI or UL published standard. The recommended practices stated in the manufacturer's literature or documentation must be considered as mandatory requirements.

1.9 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from the weather, humidity, and temperature variation, dirt and dust, and other contaminants.

1.10 MAINTENANCE

1.10.1 Spare Parts

Furnish the following spare parts in the manufacturers original unopened containers:
a. [Five][_____] complete sets of system keys.
b. [Two][_____] of each type of fuse required by the system.
c. [One][_____] manual stations.

d. [Two][_____] of each type of detector installed.
e. [Two][_____] of each type of detector base and head installed.

f. [One][_____] electromagnetic door holders.

g. One smoke detector manufacturer's test screen, card or magnet for each
ten beam smoke detectors, or fraction thereof, installed in the system.

h. Two air sampling smoke detection system filter assemblies.
i. [Two][_____] of each type of audible and visual alarm device installed.
j. [One][_____] textual visual notification appliance.

k. [Two][_____] low voltage, [one][_____] [telephone][internet][ethernet], and [one][_____] 120 VAC surge protective device.

l. [Two][_____] spare reams of paper for the system printer, plus
sufficient paper for testing.

m. [Two][_____] spare printer ribbons.

n. [_____] spare zone modules for modular type control units in addition
to those installed in the control unit.

1.10.2 Special Tools

Software, connecting cables and proprietary equipment, necessary for the
maintenance, testing, and reprogramming of the equipment must be furnished
to the Contracting Officer, prior to the instruction of Government
employees.

PART 2 PRODUCTS

2.1 GENERAL PRODUCT REQUIREMENT

All fire alarm and mass notification equipment must be listed for use under
the applicable reference standards. Interfacing of UL 864 or similar
approved industry listing with Mass Notification equipment listed to UL 2572
must be done in a laboratory listed configuration, if the software
programming features cannot provide a listed interface control.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials, equipment, and devices that have been tested by a
nationally recognized testing laboratory and listed for fire protection
service when so required by NFPA 72 or this specification. Select material
from one manufacturer, where possible, and not a combination of
manufacturers, for any particular classification of materials. Material
and equipment must be the standard products of a manufacturer regularly
engaged in the manufacture of the products for at least [2][_____] years prior to bid opening.

2.2.2 Nameplates

Major components of equipment must have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new name plate permanently affixed to the item or equipment. Major components include, but are not limited to, the following:

a. FMCU

Nameplates must be etched metal or plastic, permanently attached by screws to control units or adjacent walls.

2.2.3 Keys

Keys and locks for equipment, control units and devices must be identical. [Master all keys and locks to a single key as required by the [Installation Fire Department][_____]]. [Keys must be CAT [60][_____]].

2.2.4 Instructions

Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. [Install the instructions on the interior of the FMCU.] [Install the frame in a conspicuous location observable from the FMCU.] The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions must also include procedures for operating live voice microphones. The instructions and their mounting location must be approved by the Contracting Officer before being posted.

2.3 FIRE ALARM AND MASS NOTIFICATION CONTROL UNIT

Fire Alarm and Mass Notification Control Unit (FMCU) must comply with the applicable requirements of UL 864. Unit must be modular, installed in a [flush][surface][semi-flush] mounted steel cabinet with hinged door and cylinder lock. Control unit must be clean, uncluttered, and orderly assembled containing components and equipment required to provide the specified operating and supervisory functions of the system. The unit must have prominent rigid plastic, phenolic or metal identification plates for LEDs, zones, controls, meters, fuses, and switches.

a. Each control unit must provide power, supervision, control, and logic for the entire system, utilizing solid state, modular components, internally mounted and arranged for easy access. Each control unit must be suitable for operation on a 120 volt, 60 hertz, normal building power supply. Provide each control unit with supervisory functions for power failure, internal component placement, and operation.

b. Visual indication of alarm, supervisory, or trouble initiation on the FMCU must be by liquid crystal display or similar means with a minimum of 80 characters. The mass notification control unit must have the capability of temporarily deactivate the fire alarm audible notification messages while delivering voice messages.

c. Nameplates for fuses must also include ampere rating. Separate alarm
and trouble LEDs must be provided for each zone alarm. These LEDs must be located on the exterior of the cabinet door or be visible through the cabinet door. Control unit switches must be within the locked cabinet.

d. A suitable means (single operation) must be provided for testing the control unit visual indicating devices (meters or LEDs). Meters and LEDs must be plainly visible when the cabinet door is closed. Signals and LEDs must be provided to indicate by zone any alarm, supervisory or trouble condition on the system. Each IDC must be powered and supervised so that a signal on one zone does not prevent the receipt of signals from other zones.

e. Upon restoration of power, startup must be automatic, and must not require any manual operation. The loss of primary power or the sequence of applying primary or emergency power must not affect the transmission of alarm, supervisory or trouble signals. Visual annunciators must be provided for each active zone and spare zone. [_____] spare zones must be provided [as shown on the drawing]. Each LED must provide specific identification of the zone by means of a permanently attached rigid plastic, phenolic, or metal sign with either raised or engraved letters.

f. Zone identification must consist of a word description of the zone.

g. Cabinets must be provided with ample gutter space to allow proper clearance between the cabinet and live parts of the control unit equipment. If more than one modular unit is required to form a control unit, the units must be installed in a single cabinet large enough to accommodate units.

2.3.1 Cabinet

Install control unit components in cabinets large enough to accommodate all components and also to allow ample gutter space for interconnection of control units as well as field wiring. The cabinet must be a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and [surface][semi-recessed] mounting provisions. The enclosure must be identified by an engraved phenolic resin nameplate. Lettering on the nameplate must say "Fire Alarm and Mass Notification control unit" and must not be less than 25 mm 1-inch high. Provide prominent rigid plastic or metal identification plates for lamps, circuits, meters, fuses, and switches.

2.3.2 Silencing Switches

2.3.2.1 Alarm Silencing Switch

Provide an alarm silencing switch at the FMCU that must silence the audible and visual notification appliances. Subsequent activation of initiating devices must cause the notification appliances to re-activate.

2.3.2.2 Supervisory/Trouble Silencing Switch

Provide supervisory and trouble silencing switch(es) that must silence the audible trouble and supervisory signal(s), but not extinguish the visual indicator. This switch must be overridden upon activation of a subsequent supervisory or trouble condition. Audible trouble indication must resound automatically every 24 hours after the silencing feature has been operated.
if the supervisory or trouble condition still exists.

2.3.3 Non-Interfering

Power and supervise each circuit such that a signal from one device does not prevent the receipt of signals from any other device. Initiating devices must be manually reset by switch from the FMCU after the initiating device or devices have been restored to normal.

2.3.4 Input/Output Modifications

The FMCU must contain features that allow the bypassing of input devices from the system or the modification of system outputs. These control features must consist of a control unit switch/button. Any bypass or modification to the system must indicate a trouble condition on the FMCU.

2.3.5 Resetting

Provide the necessary controls to prevent the resetting of any alarm, supervisory, or trouble signal while the alarm, supervisory or trouble condition on the system still exists.

2.4 AMPLIFIERS, PREAMPLIFIERS, TONE GENERATORS

Any amplifiers, preamplifiers, tone generators, digitalized voice generators, and other hardware necessary for a complete, operational, textual audible circuit conforming to NFPA 72 must be housed in a remote FMCU, terminal cabinet, or in the FMCU. Individual amplifiers must be 100 watts maximum.

2.4.1 Operation

The system must automatically operate and control all building speakers (except those installed in the stairs and within elevator cabs). The speakers in the stairs and elevator cabs must operate only when the microphone is used to deliver live messages.

2.4.2 Construction

Amplifiers must utilize computer grade solid state components and must be provided with output protection devices sufficient to protect the amplifier against any transient up to 10 times the highest rated voltage in the system.

2.4.3 Inputs

Equip each system with separate inputs for the tone generator, digitalized voice driver and control unit mounted microphone [Public Address Paging Function]. Microphone inputs must be of the low impedance, balanced line type. Both microphone and tone generator input must be operational on any amplifier.

2.4.4 Tone Generator

The tone generator must produce a three-pulse temporal pattern and must be constantly repeated until interrupted by either the digitalized voice message, the microphone input, or the alarm silence mode as specified. The tone generator must be single channel with an automatic backup generator per channel such that failure of the primary tone generator causes the backup generator to automatically take over the functions of the failed
unit and also causes transfer of the common trouble relay. The tone generator must be provided with securely attached labels to identify the component as a tone generator and to identify the specific tone it produces.

2.4.5 Protection Circuits

Each amplifier must be constantly supervised for any condition that could render the amplifier inoperable at its maximum output. Failure of any component must cause illumination of a visual "amplifier trouble" indicator on the control unit, appropriate logging of the condition in the history log[ and on the system printer], and other actions for trouble conditions as specified.

2.5 REMOTE ANNUNCIATOR

**************************************************************************
NOTE: Provide the annunciator at a location in accordance with NFPA 72. A suggested location should be near the door through which the first responders will enter the building as indicated in their pre-fire plan, typically the main entrance.
**************************************************************************

2.5.1 Remote Annunciator

**************************************************************************
NOTE: Locate annunciator at or near the building entrance to allow fire department quick access to the annunciator. When both a remote trouble sounder and remote annunciator are required, specify an annunciator with trouble sounder for dry indoor locations. Where a weatherproof enclosure is required, specify a separate trouble bell.
**************************************************************************

Remote annunciator must duplicate all requirements specified for the control unit annunciator, except that individual zone trouble lamps are not required. Lamps must be LED type, except lamps used in backlighted annunciators must be LED or neon type. Annunciator must have a lamp test switch. Zone identification must be by means of [permanently attached rigid plastic or metal plate(s)][ or ][silk-screened labels attached to the reverse face of backlighted viewing window(s)]. Annunciator must be of the [interior][weatherproof] type, [flush][surface][pedestal]-mounted. [Provide annunciator with an integral audible trouble sounder which must operate in conjunction with control unit audible sounder. Provide annunciator with trouble silence switch which must comply with the requirements for a trouble silencing switch as specified for the FMCU.]

[2.5.2 Graphic Annunciator

**************************************************************************
NOTE: Graphic annunciators should be provided only when a large number of concealed devices are installed. Normally, exposed devices will be annunciated by zone only on the fire alarm control unit zone annunciator and remote zone annunciator. Edit accordingly. Locate graphic annunciator(s) at or near building entrance to allow fire department quick access to the annunciator.

SECTION 28 31 66 Page 28
Graphic annunciator must be of the [interior][weatherproof] type, [flush][surface][pedestal]-mounted. Annunciator must be provided with the [building][room] floor plan, drawn to scale, with alarm lamps mounted to represent the location of [each concealed detector][each initiating device]. Annunciator graphic must also show the locations of the annunciator and control unit, and must have a "you are here" arrow showing its location. Orient building floor plan on graphic to location of person viewing the graphic (i.e., the direction the viewer is facing must be toward the top of the graphic display). Provide a North arrow. [Principal rooms and areas shown must be labeled with room numbers or titles.] Detectors mounted above ceilings, [on ceilings, ]and beneath raised floors and different types of initiating devices must have different symbols or lamps of different colors for identification. Lamps must illuminate upon activation of corresponding device and must remain illuminated until the system is reset. Annunciator must have a lamp test switch.

2.5.2.1 Materials

Construct the graphic annunciator face plate of [smoked Plexiglas][non-glare matte finish][anodized bronze][anodized aluminum]. The face plate must be backlit with LEDs. Control equipment and wiring must be housed in a [recessed][semi-recessed][surface mounted] back box. The exposed portions of the back box must be [chrome plated][anodized bronze][anodized aluminum] without knockouts.

2.5.3 Printer

NOTE: If the printer will be located in a SCIF or similar area, specify "no stored memory".

a. Provide a system printer [with no stored memory] to record alarm, supervisory, and trouble conditions without loss of any signal or signals. Printout must be by circuit, device, and function as provided in the FMCU. Printer must operate on a 120 VAC, 60 Hz power supply.

b. The printer must have at least 80 characters per line and have a 96 ASCII character set. The printer must have a microprocessor-controlled, bi-directional, logic seeking head capable of printing 120 characters per second utilizing a 9 by 7 dot matrix print head. Printer must not contain internal software which is essential for proper operation.

c. When the FMCU receives a signal, the alarm, supervisory, and trouble condition must be printed. The printout must include the type of signal, the circuit or device reporting, the date, and the time of the occurrence. The printer must differentiate alarm signals from other printed indications. When the system is reset, this condition must also be printed including the same information concerning device, location, date, and time. Provide a means to automatically print a list of existing alarm, supervisory, and trouble conditions in the system. If a printer is off-line when an alarm is received, the system must have a buffer to retain the data and it must be printed when the printer is restored to service. The printer must have an indicator to alert the operator that the paper has run out.
2.6 MANUAL STATIONS

NOTE: Architectural Barriers Act (ABA) requires that manual alarm stations be mounted at a maximum of 1.1 m (44 inches) above finished floor (AFF).

Provide metal or plastic, [semi-flush][flush][surface] mounted, [single][double]-action, manual stations, that are not subject to operation by jarring or vibration. Stations must be equipped with screw terminals for each conductor. Stations that require the replacement of any portion of the device after activation are not permitted. Stations must be finished in red with molded raised lettering operating instructions of contrasting color. The use of a key must be required to reset the station.

2.7 SMOKE DETECTORS

NOTE: Provide smoke detectors only in spaces where they are specifically required by UFC 3-600-01, DESIGN: FIRE PROTECTION ENGINEERING FOR FACILITIES.

Smoke detectors provided in elevator machinery rooms are to be provided per requirements of UFC 3-600-01. Coordinate with Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS, Section 14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS and/or Section 14 24 13 HYDRAULIC FREIGHT ELEVATORS, Section 14 24 23 HYDRAULIC PASSENGER ELEVATORS.

2.7.1 Spot Type Detectors

Provide [photoelectric][ionization][laser] smoke detectors as follows:

a. Provide [photoelectric smoke detectors utilizing the photoelectric light scattering principle for operation in accordance with UL 268 ][smoke detectors that operate on the ionization principle and are actuated by the presence of visible or invisible products of combustion][laser smoke detectors utilizing laser diode and patented smoke sensing chamber, designed to amplify signals from smoke but diminish stray internal reflections and must, on command from the FMCU, send data to the control unit representing the analog level of smoke density]. Smoke detectors must be listed for use with the FMCU.

b. Provide self-restoring type detectors that do not require any readjustment after actuation at the FMCU to restore them to normal operation. The detector must have a visual indicator to show actuation.

c. Vibration must have no effect on the detector's operation. Protect the detection chamber with a fine mesh metallic screen that prevents the entrance of insects or airborne materials. The screen must not inhibit the movement of smoke particles into the chamber.

d. Provide twist lock bases [with sounder that produces a minimum of 90 dBA at 3 m 10 feet] with screw terminals for each conductor. The detectors must maintain contact with their bases without the use of springs.
2.7.2 **Projected Beam Smoke Detector**

Detectors must consist of [combined transmitter and receiver unit] [separate transmitter and receiver units]. The transmitter unit must emit an infrared beam to the receiver unit [the use of a supplied reflector is required for the combined unit]. When the signal at the receiver falls below a preset threshold, the detector must initiate an alarm. The receiver must contain an LED status indicator that illuminates when an alarm condition exists. Long-term changes to the received signal caused by environmental variations must be automatically compensated. Detectors must incorporate features to assure that they are operational; a trouble signal must be initiated if the beam is obstructed for more than 3 seconds, the limits of the compensation circuit are reached, or the housing cover is removed. Detectors must have multiple sensitivity settings in order to meet UL listings for the different distances covered by the beam.

2.7.3 **Duct Smoke Detectors**

**************************************************************************
NOTE: The requirements for Duct Detectors will be coordinated with the HVAC requirements and Sections 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. All required duct detectors will be shown on the contract drawings.
**************************************************************************

Duct-mounted photoelectric smoke detectors must consist of a smoke detector, as specified in paragraph Spot Type Detectors, mounted in a special housing fitted with duct sampling tubes. Detector circuitry must be mounted in a metallic or plastic enclosure exterior to the duct.[ It is not permitted to cut the duct insulation to install the duct detector directly on the duct.] Detectors must be listed for operation over the complete range of air velocities, temperature and humidity expected at the detector when the air-handling system is operating. Detectors must be powered from the FMCU.

a. Sampling tubes must run the full width of the duct. The duct detector package must conform to the requirements of NFFA 90A, UL 268A, and must be listed for use in air-handling systems. The control functions, operation, reset, and bypass must be controlled from the FMCU.

b. Lights to indicate the operation and alarm condition must be visible and accessible with the unit installed and the cover in place. Remote indicators must be provided where required by NFPA 72. Remote indicators as well as the affected fan units must be properly identified in etched plastic placards.

c. Detectors must provide for control of auxiliary contacts that provide control, interlock, and shutdown functions specified in Section 23 09 00 to INSTRUMENTATION AND CONTROL FOR HVAC. Auxiliary contacts provide for this function must be located within 1 m 3 feet of the controlled circuit or appliance. The auxiliary contacts must be supplied by the fire alarm system manufacturer to ensure complete system compatibility.

[2.8 **AIR SAMPLING SMOKE DETECTION SYSTEM**

The [addressable ]air sampling smoke system must consist of a detector assembly housing an integral aspiration fan, filter, laser-based detection chamber and control, output and supervision circuitry.[ Each sampling
point must be capable of being independently addressable.] The system must consist of a piping or tubing distribution network that runs from the detector assembly(s) to the protected area(s) and is supported by air sampling smoke detection system calculations from a computer-based design modeling tool. The system must include configurable alarm and trouble relay outputs for interface to other systems where required.

a. System must be complete in all ways. It must include all engineering, and electrical installation, all detection and control equipment, auxiliary devices and controls, alarm interface, functional checkout and testing, training and all other operations necessary for a functional system.

b. System base detectors and modules must each accommodate up to [40 addressable][_____] microbore sampling tubes where each tube has a sampling point at the end. Additional modules may be used to provide up to [20 addressable][_____] sampling holes per system.

c. Program alarm thresholds to the following values unless the results of the pre-Government system tests indicate a clear need to change them. In the event that such a need is indicated, notify the Contracting Officer and provide complete documentation concerning the need to deviate from these values. Include within the deviation documentation request, information that complies with the paragraph entitled "Sensitivity Verification Test". Ensure initial threshold levels are approved prior to the Government test.

(1) Alarm Level 1: set ALERT at [_____] [0.0250] percent obscuration/foot

(2) Alarm Level 2: set PRE-ALARM at [_____] [0.0500] percent obscuration/foot

(3) Alarm Level 3: set FIRE 1 at [_____] [0.1000] percent obscuration/foot

(4) Alarm Level 4: set FIRE 2 at [_____] [0.2000] percent obscuration/foot

d. All air sampling smoke detection devices and associated components must be new, standard products or the manufacturer's latest design and suitable to perform the functions intended.

e. The laser detection chamber must be of the mass light scattering type and capable of detecting a wide range of smoke particle types of varying size. A particle counting method must be employed for the purposes of:

(1) Preventing large particles from affecting the true smoke reading.

(2) Monitoring contamination of the filter (for example, dust and dirt) to automatically notify when maintenance is required. The particle counting method must not be used for the purpose of smoke density measurement.

f. Detector(s) must be self-monitoring for filter contamination and provide indication through system fault when replacement is necessary. Detectors which allow automatic reset of filter status upon removal and re-insertion are not permitted.
g. Detector(s) must contain relays for alarm and fault conditions. The relays must be software programmable to the required functions.

h. Detector(s) must permit configuration by programmers that are either integral to the system, portable or PC based.

i. Detector(s) must allow programming of:

1. Smoke threshold alarm levels; ALERT, PRE-ALARM, FIRE 1 and FIRE 2.

2. Time delays. Ensure the display control unit contains individual adjustable alarm time delay features for each of the alarm threshold levels. Provide an adjustment range between 0 and 60 seconds. Program the alarm threshold time delays to 30 seconds for alarm levels 1 and 2, and 15 seconds for alarm levels 3 and 4.

3. Faults, including airflow, detector, power, filter and network, as well as an indication of the urgency of the fault.

4. Configuration of relay outputs for remote indication of alarm and fault conditions.

5. General purpose input functionality.

2.9 HEAT DETECTORS

NOTE: Heat detectors provided in elevator machinery rooms are strictly for the warning sign in the elevator cab and must not alarm the FMCU. Coordinate with Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS, Section 14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS and/or Section 14 24 13 HYDRAULIC FREIGHT ELEVATORS, Section 14 24 23 HYDRAULIC PASSENGER ELEVATORS.

2.9.1 Heat Detectors

Heat detectors must be designed for detection of fire by [fixed temperature][combination fixed temperature and rate-of-rise principle][rate-compensating principle] in accordance with UL 521. The alarm condition must be determined by comparing detector value with the stored values. Detectors located in areas subject to moisture, exterior atmospheric conditions, or hazardous locations [as defined by NFPA 70][and ] [as indicated], must be types approved for such locations.

[2.9.1.1 Combination Fixed-Temperature and Rate-of-Rise Detectors

Detectors must be [surface][semi-flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-resetting. Detector must operate at [57.2][90] degrees C[135][194] degrees F. Detector must feature rate compensation. [Detectors rated to operate at 57.2 degrees C135 degrees F must not respond to momentary temperature fluctuations less than 16.7 degrees C30 degrees F per minute between 16 and 38 degrees C60 and 100 degrees F].[ Detectors rated to operate at 90 degrees C194 degrees F must not respond to momentary temperature fluctuations less than 27.8 degrees C.
50 degrees F per minute between 16 and 66 degrees C. The detector assembly must be weatherproof and explosionproof.

2.9.1.2 Rate Compensating Detectors

Detector backbox must be surface mounted in the vertical orientation and supported independently of wiring connections. Detectors must be self-restoring and hermetically sealed. The detector assembly must be weatherproof and explosionproof.

2.9.1.3 Line-Type Fixed Temperature Detectors

NOTE: Specify line-type heat detectors only with approval of the EFD/EFA Fire Protection Engineer.

Provide thermostatic or thermistor line-type heat detection cable with weather-resistant outer covering where indicated. Cable must be nominally rated for a temperature of 68, 88, 138 degrees C and 155, 190, 280 degrees F and must operate on fixed temperature principle only.

2.9.1.4 Fixed Temperature Detectors

Detectors must be surface mounted in the vertical orientation and supported independently of wiring connections. Detectors must be self-restoring. The detectors must have a specific temperature setting of 57.2, 135 degrees C as shown. The detector assembly must be weatherproof and explosionproof.

2.10 FLAME DETECTORS

NOTE: Modify these paragraphs as necessary to indicate that detectors placed in an explosive environment will be approved for use in the appropriate class, division, and group environment as defined in NFPA 70 and as shown on drawings.

Detectors must be sensitive to the micron range best suited for their intended use. Detectors must operate over electrically supervised wiring circuits and the loss of power to the detector must result in a trouble signal. A self-test feature must be provided for each detector to be individually tested.

2.10.1 Infrared (IR) Single Frequency Flame Detector

NOTE: The single frequency IR flame detector has the advantage of a fast response and is moderately sensitive. Its disadvantages are being affected by temperature extremes and being subject to false alarms from a myriad of IR sources.

The detector must be sensitive in the range of [_____] to [_____].
2.10.2 Infrared (IR) Multi Frequency Flame Detector

NOTE: The IR multi frequency flame detector has the advantages of a moderately fast response, moderate sensitivity, and a lower false alarm rate. Its disadvantage is being affected by temperature extremes.

The IR detector must consist of three or more IR sensors, each selected for a different IR frequency. The primary sensor must be sensitive in the range of [_____] to [_____] micrometers only. Secondary sensors are tuned to different IR wavelengths to null out the effect of black body radiation to the primary sensor.

2.10.3 Ultraviolet (UV) Flame Detectors

NOTE: Ultraviolet (UV) flame detectors can be set to respond accurately to UV wavelength light produced by flame from both indoors and outdoors. UV flame detectors operate on the Geiger-Muller principle. These gas-filled vacuum tubes respond in the UV portion of the spectrum but can ignore UV radiation from the sun because the upper response range of the detector falls below the range of UV radiation that reaches the earth.

Solid-state UV detectors are available, but their spectral response extends into the sun's UV range and are not recommended for external use.

UV detectors have an 80 to 90 degree cone of vision. The UV detector has a fast response time and usually is not affected by rain, wind, snow, high humidity, or temperature and pressure extremes. UV units will produce false alarms if they are exposed to arc welding or X-ray and gamma radiation. They can also be blinded by oil film or smoke. UV flame detectors that are used in dirty and dusty environments should be equipped with automatic self-test and self-cleaning devices. The cleaning device uses a stream of clean air across the lens surface to minimize the build-up of contaminants.

UV flame detector must be of the narrow band response type which operates on radiated ultraviolet energy and must be sensitive in the range of [_____] to [_____] micrometers only. The cone of vision must be 80 degrees or greater. Each detector must be completely insensitive to light sources in the visible frequency range.

2.10.4 Combination UV/IR Flame Detector

**************************************************************************
NOTE: Combination UV/IR flame detectors have been used both inside and outside to detect fires, but are slower to react than individual units.

The UV/IR detector must provide discrimination against false alarms by requiring both UV and IR flame detection before an alarm is sent. The UV sensor must be sensitive in the range of 0.185 to 0.265 micrometers only. The IR sensor must be sensitive in the range of [_____] to [_____] micrometers only. Detectors must be completely insensitive to light sources in the visible frequency range.

2.11 MULTI-CRITERIA DETECTORS

The designer must select the sensor required to initiate a fire alarm condition.

Multi-criteria detectors must contain [fixed temperature [_____] degrees C F heat sensor], [rate-of-rise heat sensor], [photoelectric smoke detector], [_____] elements in a single housing.

2.12 CARBON MONOXIDE DETECTOR

Carbon monoxide (CO) detectors must be listed to UL 2075 and set to respond to the sensitivity limits of UL 2034. Carbon monoxide detectors must be listed for use with fire alarm control units. Detectors must be [surface] [semi-flush] mounted in the [vertical] [horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring. For FMCU with no listed compatible addressable CO detectors, provide listed 4-wire detectors. Do not provide CO detectors with local alarms. Detector must be provided with an LED status indicator.

a. Where 4-wire CO detectors are necessary, each 4-wire CO detector must be individually monitored via addressable interface modules for alarm and off normal/trouble conditions (including loss of power to the individual detector). Power circuits for 4-wire CO detectors must be dedicated to powering the CO detectors only. Battery powered and 120 VAC powered detectors are prohibited.

b. Wiring connections must be made by means of screw terminals and detectors must be equipped with trouble relays. Detectors must be able to mount a single-gang electrical box.

c. A trouble condition at an individual CO detector must not affect any other CO detectors. CO detectors must be powered by the FMCU.

d. Detectors must be provided with a means to test CO gas entry into the CO sensing cell.

2.13 NOTIFICATION APPLIANCES

2.13.1 Audible Notification Appliances

NOTE: The designer must layout speakers to achieve both the required dBA levels requires by NFPA 72 and also the required intelligibility required. See 3.7
Audible appliances must conform to the applicable requirements of UL 464. Appliances must be connected into notification appliance circuits. Surface mounted audible appliances must be painted [red][white][____]. Recessed audible appliances must be installed with a grill that is painted [red][white][____][with a factory finish to match the surface to which it is mounted].

2.13.1.1 Speakers

a. Speakers must conform to the applicable requirements of UL 1480. Speakers must have six different sound output levels and operate with audio line input levels of 70.7 VRMs and 25 VRMs, by means of selectable tap settings. Interior speaker tap settings must include taps of 1/4, 1/2, 1, and 2 watt, at a minimum. Exterior speakers must also be multi-tapped with no more than 15 watt maximum setting. Speakers must incorporate a high efficiency speaker for maximum output at minimum power across a frequency range of 400 Hz to 4,000 Hz, and must have a sealed back construction. Speakers must be capable of installation on standard 100 mm 4-inch square electrical boxes. Where speakers and strobes are provided in the same location, they may be combined into a single [wall mounted] unit. All inputs must be polarized for compatibility with standard reverse polarity supervision of circuit wiring via the FM CU.

b. Provide speaker mounting plates constructed of cold rolled steel having a minimum thickness of 1.519 mm 16 gage or molded high impact plastic and equipped with mounting holes and other openings as needed for a complete installation. Fabrication marks and holes must be ground and finished to provide a smooth and neat appearance for each plate. Each plate must be primed and painted.

c. Speakers must utilize screw terminals for termination of all field wiring.

2.13.2 Visual Notification Appliances

NOTE:
1. ABA requires that Visual Notification Appliances be provided in buildings and facilities in each of the following areas: restrooms, and any general usage area (e.g., meeting rooms), hallways, lobbies, and any other area for common use and other areas stated at www.access-board.gov. The Visual Notification Appliance must be mounted as required by ABA that directs compliance with NFPA 72. In addition, alarms in guest rooms required to provide communication features must comply with sections 18.5.5.7 of NFPA 72. Shop drawings must indicate location, dimensions, content, details, and other required information to indicate extent of complying with ABA requirements.
2. Currently NFPA 72 requires "clear color" strobes for Fire Alarm Notification. NFPA 72 requires the strobe must be marked "Fire" to clear identify the function.

Visual notification appliances must conform to the applicable requirements of UL 1638, UL 1971 and conform to the Architectural Barriers Act (ABA). Visual Notification Appliances must have clear high intensity optic lens, xenon flash tubes, or light emitting diode (LED) and be marked "Alert" in letters of contrasting color. The light pattern must be disbursed so that it is visible above and below the strobe and from a 90 degree angle on both sides of the strobe. Strobe flash rate must be 1 flash per second and a minimum of [15][30][75][_____] candela based on the UL 1971 test. Strobe must be [surface][semi-flush] mounted.

2.13.3 Textual Display Signs

NOTE: Provide remote LED Text display in locations where Hearing Impaired personnel might read instructions on the emergency. For Navy projects, the Text displays will be located over stairwell doors and major egress doors at the level of discharge.

Textual display signs must be [LED][LCD flat panel][LED scrolling] and must not exceed 400 mm long by 150 mm high by 75 mm deep 16 inches long by 6 inches high by 3 inches deep with a height necessary to meet the requirements of NFPA 72). The text display must spell out the word "EVACUATE" or "ANNOUNCEMENT" [and the remainder of the emergency instructions] as appropriate. The design of text display must be such that it cannot be read when not illuminated.

[LCD or LED scrolling text displays must meet the following requirements at a minimum:

a. Two lines of information for high priority messaging.

b. Minimum of 20 characters per line (40 total) displayed.

c. Text must be no less than height requirements and color/contrast requirements of NFPA 72.

d. 32K character memory.

e. Display must be wall or ceiling mounted.

f. Mounting brackets for a convenient wall/cubicle mount.

[g. During non-emergency periods, display date and time.]

h. The system must interface with the textual display sign control panel to activate the proper message.]
2.14 ELECTRIC POWER

2.14.1 Primary Power

Power must be [120] VAC [50][60] Hz service for the FMCU from the AC service to the building in accordance with NFPA 72.

2.15 SECONDARY POWER SUPPLY

Provide for system operation in the event of primary power source failure. Transfer from normal to auxiliary (secondary) power or restoration from auxiliary to normal power must be automatic and must not cause transmission of a false alarm.

2.15.1 Batteries

Provide sealed, maintenance-free, [sealed lead acid][lead-calcium][gel cell] batteries as the source for emergency power to the FMCU. Batteries must contain suspended electrolyte. The battery system must be maintained in a fully charged condition by means of a solid state battery charger. Provide an automatic transfer switch to transfer the load to the batteries in the event of the failure of primary power.

2.15.1.1 Capacity

Battery size must be the greater of the following two capacities. This capacity applies to every control unit associated with this system, including supplemental notification appliance circuit panels, auxiliary power supply panels, fire alarm transmitters, and Base-wide mass notification transceivers. When determining the required capacity under alarm condition, visual notification appliances must include both textual and non-textual type appliances.

a. Sufficient capacity to operate the fire alarm system under supervisory and trouble conditions, including audible trouble signal devices for 48 hours and audible and visual signal devices under alarm conditions for an additional 15 minutes.

b. Sufficient capacity to operate the mass notification for 60 minutes after loss of AC power.

2.15.1.2 Battery Power Calculations

a. Verify that battery capacity exceeds supervisory and alarm power requirements for the criteria noted in the paragraph "Capacity" above.

(1) Substantiate the battery calculations for alarm and supervisory power requirements. Include ampere-hour requirements for each system component and each control unit component, and compliance with UL 864.

(2) Provide complete battery calculations for both the alarm and supervisory power requirements. Submit ampere-hour requirements for each system component with the calculations.

(3) Provide voltage drop calculations to indicate that sufficient voltage is available for proper operation of the system and all components. Calculations must be performed using the minimum rated voltage of each component.
b. For battery calculations assume a starting voltage of 24 VDC for starting the calculations to size the batteries. Calculate the required Amp-Hours for the specified standby time, and then calculate the required Amp-Hours for the specified alarm time. Using 20.4 VDC as starting voltage, perform a voltage drop calculation for circuits containing device and/or appliances remote from the power sources.

2.15.2 Battery Chargers

Provide a solid state, fully automatic, variable charging rate battery charger. The charger must be capable of providing 120 percent of the connected system load and must maintain the batteries at full charge. In the event the batteries are fully discharged (20.4 Volts dc), the charger must recharge the batteries back to 95 percent of full charge within 48 hours after a single discharge cycle as described in paragraph CAPACITY above. Provide pilot light to indicate when batteries are manually placed on a high rate of charge as part of the unit assembly if a high rate switch is provided.

2.16 SURGE PROTECTIVE DEVICES

Surge protective devices must be provided to suppress all voltage transients which might damage fire alarm control unit components. Systems having circuits located outdoors, communications equipment must be protected against surges induced on any signaling line circuit. Cables and conductors, that serve as communications links, must have surge protection circuits installed at each end. The surge protective device must wire in series to the power supply of the protected equipment with screw terminations. Line voltage surge arrester must be installed directly adjacent to the power panel where the FMCU breaker is located.

a. Surge protective devices for nominal 120 VAC must be UL 1449 listed with a maximum 500 volt suppression level and have a maximum response time of 5 nanoseconds. The surge protective device must also meet IEEE C62.41.1 and IEEE C62.41.2 category B tests for surge capacity. The surge protective device must feature multi-stage construction and be provided with a long-life indicator lamp (either light emitting diode or neon) which extinguishes upon failure of protected components. Any unit fusing must be externally accessible.

b. Surge protective devices for nominal 24 VAC, fire alarm telephone dialer, or ethernet connection must be UL 497B listed, meet IEEE C62.41.1 and have a maximum response time of 1-nanosecond. The surge protective device must feature multi-stage construction and be self-resetting. The surge protective device must be a base and plug style. The base assembly must have screw terminals for fire alarm wiring. The base assembly must accept "plug-in" surge protective module.

c. All surge protective devices (SPD) must be the standard product of a single manufacturer and be equal or better than the following:

(1) For 120 VAC nominal line voltage: UL 1449 and UL 1283 listed, series connected 120 VAC, 20A rated, surge protective device in a NEMA 4x enclosure. Minimum 50,000 amp surge current rating with EMI/RFI filtering and a dry contact circuit for remote monitoring of surge protection status.
(2) For 24-volt nominal line voltage: UL 497B listed, series connected low voltage, 24-volt, 5A rated, loop circuit protector, base and replaceable module.

(3) For alarm telephone dialers: UL 497A listed, series connected, 130-volt, 150 mA rated with self-resetting fuse, dialer circuit protector with modular plug and play.

(4) For IP-DACTS: UL 497B listed, series connected, 6.4-volt, 1.5A rated with 20 kA/pair surge current, data network protector with modular plug and play.

2.17 WIRING

Provide wiring materials under this section as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM with the additions and modifications specified herein.

2.17.1 Alarm Wiring

IDC wiring must be solid copper cable in accordance with the manufacturers requirements. Copper initiating device circuit field wiring must be No. [14][16][18][_____] AWG size conductors at a minimum. Visual notification appliance circuit conductors, that contain audible alarm appliances, must be copper No. 14 AWG size conductors at a minimum. Speaker circuits must be copper No. [16][_____] AWG size twisted and shielded conductors at a minimum.[ Wiring for textual notification appliance circuits must be in accordance with manufacturer's requirements but must be supervised by the FMCU.] Wire size must be sufficient to prevent voltage drop problems. Circuits operating at 24 VDC must not operate at less than the listed voltages for the detectors and/or appliances. Power wiring, operating at 120 VAC minimum, must be a minimum No. 12 AWG solid copper having similar insulation. Acceptable power-limited cables are FPL, FPLR or FPLP as appropriate with red colored covering. Nonpower-limited cables must comply with NFPA 70.

2.18 INTERFACE TO THE BASE-WIDE MASS NOTIFICATION NETWORK

**************************************************************************
NOTE: Provide as required for connection to a remote Central Control/Monitoring Mass Notification System Command Center.
**************************************************************************

[2.18.1 Fiber Optic]

The fiber optic transceiver must be fully compatible with EIA standards for RS-232, RS-422 and RS-485 at data rates from 0 (DC) to 2.1 mbps (200 kbps for RS-232) in the low speed mode or from 10 kbps to 10 mbps in the high-speed mode. The fiber optic transceiver must be capable of simplex or full duplex asynchronous transmissions in both point-to-point systems and drop-and-repeat data networks. The fiber optic transceiver must be user configurable for the protocol, speed and mode of operation required. The fiber optic transceiver must be installed as a [stand-alone][card-cage] unit. The fiber optic transceiver must operate on [Multi-mode][Single-mode] fiber optic cable. The fiber optic transceiver must be supplied with [ST][ or ][FCPC] type optical connectors. Cabling: as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM.
[2.18.2 Radio

**************************************************************************

Note: Receiving a new radio frequency assignment often takes a relatively long period of time. Be sure to request the frequency assignment early in the design process.
**************************************************************************

The mass notification transceiver must be bi-direction and meet all the requirements of paragraph, RADIO TRANSMITTER AND INTERFACE PANELS as specified in this Specification Section. The transceiver utilized in the mass notification system must be capable of the following:

a. Communication with the central control/monitoring system to provide supervision of communication link and status changes are reported by automatic and manual poll/reply/acknowledge routines.

b. All monitored points/status changes are transmitted immediately and at programmed intervals until acknowledged by the central control/monitoring system.

c. Each transceiver must transmits a unique identity code as part of all messages; the code is set by the user at the transceiver.

[2.18.3 Telephone

A modem must be provided for communication with the central control/monitoring system. The modem must be 56k, compatible with data mode V.90, utilizing Hayes compatible command codes. The modem must be capable of auto dialing a preset number based on preprogrammed events. The modem must auto answer and provide a secure password protection system. Cabling: as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLEING SYSTEM.

[2.18.4 Secure Radio System

**************************************************************************

Note: Receiving a new radio frequency assignment often takes a relatively long period of time. Be sure to request the frequency assignment early in the design process.
**************************************************************************

2.18.4.1 Communications Network

The communications network provides two-way signals between central control units and autonomous control units (in individual building systems), and should include redundant (primary and backup) communication links. The system must incorporate technology to prevent easy interruption of the radio traffic for MNS alerting.

2.18.4.2 Radio Frequency Communications

Use of radio frequency-type communications systems must comply with National Telecommunications and Information Administration (NTIA) requirements. The systems must be designed to minimize the potential for interference, jamming, eavesdropping, and spoofing.
2.18.4.3 Licensed Radio Frequency Systems

An approved DD Form 1494 for the system is required prior to operation.

2.19 AUTOMATIC FIRE ALARM TRANSMITTERS

**************************************************************************

NOTE: State the make and model number of existing proprietary supervising station receiving equipment. The choice of code transmitter, or radio transmitter depends upon the type of existing fire reporting system at the activity. Determine the type of activity reporting system (e.g., positive non interfering or shunt). In most cases a local energy-tripping device will be required. The facility Fire Dept. or Engineering office should be contacted to determine the type and amount of data to be supervised (monitored), e.g., -type: separate or common transmission of alarm, supervisory, and trouble type signals; -amount: all points, all zones, or the combined premises. Verify that existing monitoring equipment has sufficient capacity to support the additional premises or that it can be expanded as necessary to accommodate the new fire alarm system. Identify existing components.

**************************************************************************

2.19.1 Radio Transmitter and Interface Panels

Transmitters must be compatible with proprietary supervising station receiving equipment. Each radio alarm transmitter must be the manufacturer's recognized commercial product, completely assembled, wired, factory tested, and delivered ready for installation and operation. Transmitters must be provided in accordance with applicable portions of NFPA 72, Federal Communications Commission (FCC) 47 CFR 90 and Federal Communications Commission (FCC) 47 CFR 15. Transmitter electronics module must be contained within the physical housing as an integral, removable assembly. The proprietary supervising station receiving equipment is [_____] and the transmitter must be fully compatible with this equipment. At the contractors option, and if listed, the transmitter may be housed in the same control unit as the FMCU. The transmitter must be narrowband radio, with FCC certification for narrowband operation and meets the requirements of the NTIA (National Telecommunications and Information Administration) Manual of Regulations and Procedures for Federal Frequency Management.

2.19.1.1 Operation

Operate each transmitter from 120-volt ac power. In the event of 120-volt ac power loss, the transmitter must automatically switch to battery operation. Switchover must be accomplished with no interruption of protective service, and must automatically transmit a trouble message. Upon restoration of ac power, transfer back to normal ac power supply must also be automatic.

2.19.1.2 Battery Power

Transmitter standby battery capacity must provide sufficient power to operate the transmitter in a normal standby status for a minimum of 72
hours and be capable of transmitting alarms during that period.

2.19.1.3 Transmitter Housing

Use NEMA Type 1 for housing. The housing must contain a lock that is keyed [identical to the fire alarm system for the building][identical to radio alarm transmitter housings on the Installation]. Radio alarm transmitter housing must be factory painted with a suitable priming coat and not less than two coats of a hard, durable weatherproof enamel.

2.19.1.4 Antenna

Antenna must be [omnidirectional, coaxial, halfwave dipole antennas][_____] for radio alarm transmitters with a driving point impedance to match transmitter output. The antenna and antenna mounts must be corrosion resistant and designed to withstand wind velocities of 161 km/hour 100 mph. Do not mount antennas to any portion of the building roofing system. Protect the antenna from physical damage.

2.19.2 Digital Alarm Communicator Transmitter (DACT)

Provide DACT that is compatible with the existing supervising station fire alarm system. Transmitter must have a means to transmit alarm, supervisory, and trouble conditions via a single transmitter. Transmitter must have a source of power for operation that conforms to NFPA 72. Transmitter must be capable of initiating a test signal daily at any selected time. Transmitter must be arranged to seize telephone circuits in accordance with NFPA 72.

2.19.3 Signals to Be Transmitted to the Base Receiving Station

**************************************************************************
NOTE: The following paragraph is applicable only to existing installations for connections to an auxiliary (public) alarm system. Edit this for the installation specific criteria.
**************************************************************************

The following signals must be sent to the base receiving station:

[ a. Sprinkler waterflow]
[ b. Manual pull stations]
[ c. Smoke detectors]
[ d. Duct smoke detectors]
[ e. Sleeping room smoke detectors]
[ f. Carbon monoxide detectors]
[ g. Heat detectors]
[ h. Fire extinguishing system]
[ i. Sprinkler valve supervision]
[ j. Fire pump running]
[ k. Fire pump supervision]
[ l. Water supply level and temperature]
[ m. Combustion engine drive fire pump running
  (1) Selector switch in position than automatic
  (2) Engine over-speed
  (3) Low fuel
  (4) Low battery
  (5) Engine trouble (for example, low oil, over temp)]

2.20 SYSTEM MONITORING

2.20.1 Valves

Each valve affecting the proper operation of a fire protection system, including automatic sprinkler control valves, standpipe control valves, sprinkler service entrance valve, valves at fire pumps, isolating valves for pressure type waterflow or supervision switches, and valves at backflow preventers, whether supplied under this contract or existing, must be electrically monitored to ensure its proper position. Provide each tamper switch with a separate zone[, unless they are within the same room, then a maximum of five can use the same zone].

2.20.2 High/Low [Air][Nitrogen] Supervisory Switches

Provide monitoring of high and low supervisory [air][nitrogen] for [dry pipe][ and][ preaction] systems. Each air supervisory switch must have a separate address. Switches must be listed extinguishing system attachments. The device must contain double pole, double throw contacts. Operation of the switch must cause a supervisory signal to be transmitted to the FMCU when [air][nitrogen] pressure in the system monitored sprinkler system increases more than 34.5 kPa 5 psi above the normal system pressure or drops halfway from the normal pressure to the tripping point.

2.20.3 Room Low Temperature Supervisory Switch

Provide [monitoring of the ]listed supervisory air temperature switch for the [fire pump][sprinkler riser] room[s]. Switch must cause a supervisory signal to be transmitted to the FMCU whenever the temperature in the room drops to below 4.4 degrees C 40 degrees F. Device must reset when temperature rises above 4.4 degrees C 40 degrees F.

2.20.4 Electromagnetic Door Holders

Electromagnetic holding devices must operate on [120 VAC][24 VDC], and require not more than [3][_____] watts of power to develop 6.9 kPa25 psi of holding force. Under normal conditions, the magnets must attract and hold the doors open. Operation must be fail safe with no moving parts. Electromagnetic door hold-open devices must not be required to be held open during building power failure. The device must be listed based on UL 228 tests.
2.21  ENVIRONMENTAL ENCLOSURES OR GUARDS

Environmental enclosures must be provided to permit fire alarm/mass notification components to be used in areas that exceed the environmental limits of the listing. The enclosure must be listed for the device or appliance as either a manufactured part number or as a listed compatible accessory for the component is currently listed. Guards required to deter mechanical damage must be either a listed manufactured part or a listed accessory for the category of the initiating device or notification appliance.

2.22  FIREFIGHTER TELEPHONE COMMUNICATION SYSTEM

**************************************************************************
NOTE: Provide a master control station at the FMCU with remote telephone stations in each stair at each floor landing, in each elevator lobby on each floor, and in elevator cabs. In addition, provide them at specific locations containing essential fire protection equipment, such as the fire pump room and outside the emergency generator room.

NOTE: In lieu of firefighter telephones radio repeater equipment compatible with responding fire department may be used if approved by the responding fire department.
**************************************************************************

2.22.1 General

Provide a firefighter telephone communication system with complete, common talk, closed circuits. The system must include, but not be limited to, a master control station mounted in the fire alarm control unit, a power supply and standby battery system, and remote telephone stations.

2.22.2 Features

The system must include the following features:

a. A master control station which must provide power, supervision, and control for wiring, components, and circuits. The act of lifting any remote telephone hand set from its cradle must cause both a visual and audible signal to annunciate at the master control station. Removing the hand set at the master control station and depressing a button at the remote telephone hand set must cause the automatic silencing of the audible signal.

b. Communication between the master control station hand set and any/or all remote hand sets must require the depressing of a push-to-talk switch located on any/all remote hand sets. During the time that the master control hand set is removed from its cradle it must be possible to communicate between five remote hand sets and the master control station.

c. Hand sets must be able to monitor any conversation in progress and join the conversation by pressing the push-to-talk button. It must not be possible to communicate between two or more remote hand sets with the master control station hand set in its cradle.
d. The master control station hand set must be red in color and equipped with a 1.5 m long strain-relieved coiled cord.

e. The master control station must monitor wire and connections for any opens, shorts, or grounds which would render the system inoperable or unintelligible.

f. The master control station must be equipped with a silencing switch and ring-back feature such that any audible trouble signal can be silenced and must be so indicated by the lighting of an amber LED. Once any trouble condition has been corrected, the amber LED must be extinguished.

g. The master control station must be equipped with a separate, LED annunciated switch for each telephone circuit. In addition, LEDs must provide for the annunciation of operating and supervisory power.

h. The loss of operating or supervisory power must cause an audible and visual indication at the master control station and must also cause the fire alarm trouble signal to sound on the FMCU.

i. Switches, LEDs, and controls must be fully labeled.

2.22.3 Handsets

Handsets must have the following features:

a. Provide [surface][flush] mounted remote telephone stations.

b. Each station must be equipped with a hinged door that is magnetically locked.

c. Each hand set must be permanently wired in place with a coiled cord.

d. Each hand set must be red high-impact cycolac and must be equipped with a push-to-talk switch which, when operated, must signal the master control station and a switch-equipped, storage cradle.

e. Provide operating and supervising power from the same supply circuit(s) utilized for the FMCU.
3.2.2 Battery Cabinets

When batteries will not fit in the FMCU, locate battery cabinets below or adjacent to the FMCU. Battery cabinets must be installed at an accessible location when standing at floor level. Battery cabinets must not be installed lower than 300 mm 12 inches above finished floor, measured to the bottom of the cabinet, nor higher than 900 mm 36 inches above the floor, measured to the top of the cabinet. Installing batteries above drop ceilings or in inaccessible locations is prohibited. Battery cabinets must be large enough to accommodate batteries and also to allow ample gutter space for interconnection of control units as well as field wiring. The cabinet must be provided in a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and surface mounting provisions. The cabinet must be identified by an engraved phenolic resin nameplate. Lettering on the nameplate must indicate the control unit(s) the batteries power and must not be less than 25 mm 1-inch high.

3.2.3 Manual Stations

Locate manual stations as required by NFPA 72 and as indicated on the drawings. Mount stations so they are located no farther than 1.5 m 5 feet from the exit door they serve, measured horizontally. Manual stations must be mounted at 1067 mm 42 inches measured to the operating handle.

3.2.4 Notification Appliances

******************************************************************************
NOTE: Locate strobes wall mounted in corridors no more than 4.5 m 15 feet from the end of a corridor with 30 m 100 feet maximum distance between strobes. Where there is an obstruction to the viewing path in the corridors, such as a cross-corridor door or ceiling elevation change, consider the obstruction as defining a new corridor. Provide ceiling mounted strobes in rooms accessible to the public, such as conference rooms, restrooms, courtrooms, cafeterias, and auditoriums in accordance with NFPA 72. In Child Development Centers only chimes must be used as the pre-alert tone prior to voice messages.
******************************************************************************

a. Locate notification appliance devices [as required by NFPA 72][where indicated][ and to meet the intelligibility requirements]. Where more than two visual notification appliances are located in the same room or corridor or field of view, provide synchronized operation. Devices must use screw terminals for all field wiring. [ Audible and visual notification appliances mounted in acoustical ceiling tiles must be centered in the tiles plus or minus 50 mm 2 inches.].

b. Audible and visual notification appliances mounted on the exterior of
the building, within unconditioned spaces, or in the vicinity of showers must be listed weatherproof appliances installed on weatherproof backboxes.

c. Speakers must not be located in close proximity to the FMCU or LOC so as to cause feedback when the microphone is in use.

3.2.5 Smoke and Heat Detectors

Locate detectors [as required by NFPA 72 and their listing][as indicated on the drawings] on a 100 mm 4-inch mounting box. Install heat detectors not less than 100 mm 4 inches from a side wall to the near edge. Heat detectors located on the wall must have the top of the detector at least 100 mm 4 inches below the ceiling, but not more than 300 mm 12 inches below the ceiling. Smoke detectors are permitted to be on the wall no lower than 300 mm 12 inches from the ceiling with no minimum distance from the ceiling.[ In raised floor spaces, install the smoke detectors to protect[ 21 square meters 225 square feet per detector] [_____] .] Install smoke detectors no closer than 1 m 3 feet from air handling supply diffusers. Detectors installed in acoustical ceiling tiles must be centered in the tiles plus or minus 50 mm2 inches.

3.2.6 Carbon Monoxide Detectors

Locate detectors [as required by NFPA 72 and their listings][as indicated on the drawings] on a 100-mm 4-inch mounting box.[ Carbon monoxide detectors must be installed separate from smoke and/or heat detectors.]

3.2.7 Air Sampling Smoke Detector

Locate air sampling smoke detectors in accordance with the manufacturer's instructions. Air sampling smoke detectors must be installed as follows:

a. Air Sampling Smoke Detector Assembly:

   (1) Detector assembly must be mounted to a wall at a height between 48 to 60 inches1200 mm to 1800 mm to top of detector measured above the finished floor.

   (2) Mounting must be in a fully accessible and visible location.

   (3) Mounting or attachment to site equipment, cable trays, movable walls, other equipment or equipment supports is not permitted.

   (4) Piping network insertion into the detector inlet must not be glued.

   (5) Air sampling smoke detector assembly must be installed in accordance with this specification section and the manufacturer's installation and instruction manuals.

   (6) Flexible tubing for termination of the sampling pipe network into detector inlet is not permitted unless allowed by its listing.

   (7) Provide red background with white lettering labels that are plastic or phenolic type with a minimum of 0.25-inch6.4 mm block lettering to indicate detector and zone. For example: "AIR SAMPLING SOME DETECTOR No. 1-1 No. 5".

   (8) Provide a typeset printed or typewritten instruction card mounted
behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. Install the frame in a conspicuous location observable from the ASD panel. The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions must be approved by the Contracting Officer before being posted.

b. Pipe and Sampling Tube Mounting:

(1) The pipe and sampling tubing detection network must be mounted as per the design and manufacturer's specification. The hardware used for mounting will depend upon the design and site requirements.

(2) To minimize flexing, pipes must be secured every 1.5 m (5 feet).

(3) Pipes must be suspended between 25 mm and 100 mm (1 and 4 inches) below the ceiling. In areas with a suspended ceiling, the pipe network must be installed above the ceiling utilizing the manufacturer's capillary sample port supported by the ceiling.

(4) The sampling tubes must be of the same length or use the manufacturer's guidelines to run tubes of the required lengths.

(5) When installing a pipe network in areas subject to high temperature fluctuations allow for the contraction and expansion of pipes.

(6) Where expansion or contraction of pipes is likely either after installation or on a continuous basis, do not place pipe clips adjacent to couplings and socket unions as these may interfere with the movement of the pipe.

(7) No bends are permitted within the first 450 mm (18 inches) from the detector inlet.

(8) The routing of the piping and sample tube network must be coordinated with potential obstructions, including cable trays, grounding bars, and HVAC ductwork.

(9) All changes in direction must be made with standard elbows or tees.

(10) All joints must be air-tight and made by using solvent cement, except at the entry to the detector assembly. Refer to ASTM F402.

(11) All pipes must be supported by mechanical hangers attached to the structure of the building. Not more than 300 mm (1-foot) of pipe must extend beyond the last hanger of each sampling pipe. The final installation must result in no noticeable deflection in the piping network.

(12) Attachment of air sampling pipes to cable trays, "gray iron", and telecommunications equipment is prohibited.

(13) Clearly label pipe network to distinguish the pipe from other facility pipe work or protective cabling enclosures. For example: "SMOKE DETECTION SAMPLING TUBE - DO NOT DISTURB". In open rooms and exposed areas, provide labels at no greater than 6.1-m (20-foot)
intervals. Provide labels every 3 m 10 feet where piping is installed above suspended ceilings and every 609 mm 2 feet, centered in the floor panels, where piping is installed within the raised floor cavity.

(14) Placement of the sampling tube must take into consideration appropriate sampling point locations and spacing.

c. Air Sampling Points:

(1) Open area ceiling sampling points must be oriented downward and must be within 25 mm to 100 mm 1 to 4 inches below the underside of the ceiling above where the ceiling is smooth.

(2) Label all air sampling points with a round red label, each with a center hole to match the diameter of the drilled sampling point. For example: "AIR SAMPLING POINT DIA 3.2 MM 0.125 INCHES". Indicate fractional dimensions in decimal format with a minimum of three decimal places.

][3.2.8 Graphic Annunciator

Locate the graphic annunciator as shown on the drawings. Mount the annunciator, with the top 1830 mm 6 feet above the finished floor or center the annunciator at [1525] [_____] mm [5] [_____] feet, whichever is lower. Surface-mount the annunciator, with the top 1830 mm 6 feet AFP or center the annunciator at [1525] [_____] mm [5] [_____] feet, whichever is lower.

][3.2.9 Remote REMOTE Annunciator

Locate the remote annunciator as shown on the drawings. Mount the annunciator, with the top 2 m 6 feet above the finished floor or center the annunciator at 1.5 m [_____] m [5] [_____] feet, whichever is lower.

][3.2.10 Electromagnetic Door Holder Release

Doors must be held open at a minimum of 90 degrees so as not to impede egress from the space. Mount the armature portion on the door and have an adjusting screw for seating the angle of the contact plate. Wall-mount the electromagnetic release, with a total horizontal projection not exceeding 100 mm 4 inches. Ensure all doors release to close upon first stage (pre-discharge) alarm. Electrical supervision of wiring external of control unit for magnetic door holding circuits is not required.

][3.2.11 Firefighter Telephones

Mount telephone hand sets jacks on the wall in each stair at each floor landing, in each emergency generator room, in each fire pump room, in each elevator machine room, in each elevator lobby, and in each elevator cab 1200 mm 4 feet above the finished floor.

][3.2.12 Local Operating Console (LOC)

Locate the LOC(s) as required by NFPA 72 and as indicated. Mount the console so that the top message button and microphone is no higher than 1200 mm 4 feet above the floor and the bottom (lowest) message button and microphone is at least 1-meter 3 feet above the finished floor.
3.2.13 Ceiling Bridges

Provide ceiling bridges for ceiling-mounted appliances. Ceiling bridges must be as recommended/required by the manufacturer of the ceiling-mounted notification appliance.

3.3 SYSTEM FIELD WIRING

3.3.1 Wiring within Cabinets, Enclosures, and Boxes

Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of any box, enclosure, or cabinet. Conductors that are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting, or junction box must be connected to screw-type terminal blocks. Mark each terminal in accordance with the wiring diagrams of the system. The use of wire nuts or similar devices is prohibited. Wiring to conform with NFPA 70.

Indicate the following in the wiring diagrams:

a. Point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the FMCU and remote fire alarm/mass notification control units, initiating circuits, switches, relays and terminals.

b. Complete riser diagrams indicating the wiring sequence of devices and their connections to the control equipment. Include a color code schedule for the wiring. Include floor plans showing the locations of devices and equipment.

3.3.2 Terminal Cabinets

**************************************************************************
NOTE: Provide terminal cabinets on each floor where the fire alarm system supply riser is located and where the fire alarm return riser is located.
**************************************************************************

Provide a terminal cabinet at the base of any circuit riser, on each floor at each riser, and where indicated on the drawings. Terminal size must be appropriate for the size of the wiring to be connected. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the terminal cabinet. Minimum size is 200 mm by 200 mm 8 inches by 8 inches. Only screw-type terminals are permitted. Provide an identification label, that displays "FIRE ALARM TERMINAL CABINET" with 50 mm 2-inch lettering, on the front of the terminal cabinet.

3.3.3 Alarm Wiring

**************************************************************************
NOTE: Do not penetrate SCIF perimeters with copper signal line circuits. SCIF penetrations should be either fiber optic cable or IDC. IDC circuits penetrating the SCIF must be filtered.
**************************************************************************
a. Voltages must not be mixed in any junction box, housing or device, except those containing power supplies and control relays.

b. Utilize shielded wiring where recommended by the manufacturer. For shielded wiring, ground the shield at only one point, in or adjacent to the FMCU.

c. [Pigtail or T-tap connections to initiating device circuits, supervisory alarm circuits, and notification appliance circuits are prohibited.][ T-tapping using screw terminal blocks is allowed for Class "B" initiating device circuits.]

d. Color coding is required for circuits and must be maintained throughout the circuit. Conductors used for the same functions must be similarly color coded. Conform wiring to NFPA 70.

e. Pull all conductors splice free. The use of wire nuts, crimped connectors, or twisting of conductors is prohibited. Where splices are unavoidable, the location of the junction box or pull box where they occur must be identified on the as-built drawings. The number and location of splices must be subject to approval by the [_____] Designated Fire Protection Engineer (DFPE).

3.3.4 Back Boxes and Conduit

In addition to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, provide all wiring in rigid metal conduit or intermediate metal conduit unless specifically indicated otherwise. Minimum conduit size must be 19 mm3/4-inch in diameter. Do not use electrical non-metallic tubing (ENT) or flexible non-metallic tubing and associated fittings.

a. Galvanized rigid steel (GRS) conduit must be utilized where exposed to weather, where subject to physical damage, and where exposed on exterior of buildings. Intermediate metal conduit (IMC) may be used in lieu of GRS as allowed by NFPA 70.

b. Electrical metallic tubing (EMT) is permitted above suspended ceilings or exposed where not subject to physical damage. Do not use EMT underground, encased in concrete, mortar, or grout, in hazardous locations, where exposed to physical damage, outdoors or in fire pump rooms. Use die-cast compression connectors.

c. For rigid metallic conduit (RMC), only threaded type fitting are permitted for wet or damp locations.

d. Flexible metal conduit is permitted for initiating device circuits [_____]6 feet in length or less. Flexible metal conduit is prohibited for notification appliance circuits and signaling line circuits. Use liquid tight flexible metal conduit in damp and wet locations.

e. Schedule 40 (minimum) polyvinyl chloride (PVC) is permitted where conduit is routed underground or underground below floor slabs. Convert non-metallic conduit, other than PVC Schedule 40 or 80, to plastic-coated rigid, or IMC, steel conduit before turning up through floor slab.

f. Exterior wall penetrations must be weathertight. Conduit must be sealed to prevent the infiltration of moisture.
UFGS

[g. For Class "A" or "X" circuits with conductor lengths of 10 feet 3 meters or less, the conductors must be permitted to be installed in the same raceway in accordance with NFPA 72.]

3.3.5 Conductor Terminations

Labeling of conductors at terminal blocks in terminal cabinets, FMCU[, and remote FMCU] and the LOC must be provided at each conductor connection. Each conductor or cable must have a shrink-wrap label to provide a unique and specific designation. Each terminal cabinet, FMCU, and remote FMCU must contain a laminated drawing that indicates each conductor, its label, circuit, and terminal. The laminated drawing must be neat, using 12 point lettering minimum size, and mounted within each cabinet, control unit, or unit so that it does not interfere with the wiring or terminals. Maintain existing color code scheme where connecting to existing equipment.

[3.4 DISCONNECTION AND REMOVAL OF EXISTING SYSTEM

**************************************************************************
NOTE: Contact the Contracting Officer, Base Fire Prevention Office, and/or Base Maintenance Personnel to determine what action is appropriate for the salvaging of existing fire alarm equipment.
**************************************************************************

Maintain existing fire alarm/mass notification equipment fully operational until the new equipment has been tested and accepted by the Contracting Officer. As new equipment is installed, label it "NOT IN SERVICE" until the new equipment is accepted. Once the new system is completed, tested, and accepted by the Government, it must be placed in service and connected to the supervising station. Remove tags from new equipment and tag the existing equipment "NOT IN SERVICE" until removed from the building.

a. After acceptance of the new system by the Contracting Officer, remove existing equipment not connected to the new system, remove unused exposed conduit, and restore damaged surfaces. Remove the material from the site and dispose.

b. Disconnect and remove the existing fire alarm/mass notification and smoke detection systems where indicated and elsewhere in the specification.

c. Control units and fire alarm devices and appliances disconnected and removed must be turned over to the Contracting Officer.

d. Properly dispose of fire alarm outlet and junction boxes, wiring, conduit, supports, and other such items.

3.5 CONNECTION OF NEW SYSTEM

The following new system connections must be made during the last phase of construction, at the beginning of the pre-Government tests. New system connections must include:

a. Connection of new relays to existing magnetic door hold-open devices.

b. Connection of new elevator recall relays to existing wiring and conduit.

c. Connection of new system transmitter to existing installation fire
reporting system.

Once these connections are made, system must be left energized. Report immediately to the Contracting Officer, coordination and field problems resulting from the connection of the above components.

3.6 FIRESTOPPING

Provide firestopping for holes at conduit penetrations through floor slabs, fire-rated walls, partitions with fire-rated doors, corridor walls, and vertical service shafts in accordance with Section 07 84 00 FIRESTOPPING.

3.7 PAINTING

a. In unfinished areas (including areas above drop ceilings), paint all exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceway, junction boxes and covers red. In lieu of painting conduit, the contractor may utilize red conduit with a factory applied finish.

b. In finished areas, paint exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceways, junction boxes, and electrical boxes to match adjacent finishes. The inside cover of the junction box must be identified as "Fire Alarm" and the conduit must have painted red bands 19 mm/3/4-inch wide at 3-meter/10-foot centers and at each side of a floor, wall, or ceiling penetration.

c. Painting must comply with Section 09 90 00 PAINTS AND COATINGS.

3.8 FIELD QUALITY CONTROL

**************************************************************************
NOTE: Listed tests are minimum required.
Coordinate with the local Authority Having Jurisdiction (AHJ) for minimum requirements in excess of the NFPA 72 minimums or those recommend below. If additional tests are required, such tests must be added to the list.
**************************************************************************

3.8.1 Test Procedures

Submit detailed test procedures, prepared and signed by the NICET Level [III] or [IV] Fire Alarm Technician, and the representative of the installing company, [and reviewed by the QPPE] [60] days prior to performing system tests. Detailed test procedures must list all components of the installed system such as initiating devices and circuits, notification appliances and circuits, control devices/equipment, batteries, transmitting and receiving equipment, power sources/supply, annunciators, special hazard equipment, emergency communication equipment, interface equipment, and surge protective devices. Test procedures must include sequence of testing, time estimate for each test, and sample test data forms. The test data forms must be in a check-off format (pass/fail with space to add applicable test data; similar to the form in NFPA 72 and NFPA 4.) The test procedures and accompanying test data forms must be used for the pre-Government testing and the Government testing. The test data forms must record the test results and must:

a. Identify the NFPA Class of all Initiating Device Circuits (IDC), and
Notification Appliance Circuits (NAC), Voice Notification System Circuits (NAC Audio).

b. Identify each test required by NFPA 72 Test Methods and required test herein to be performed on each component, and describe how these tests must be performed.

c. Identify each component and circuit as to type, location within the facility, and unique identity within the installed system. Provide necessary floor plan sheets showing each component location, test location, and alphanumeric identity.

d. Identify all test equipment and personnel required to perform each test (including equipment necessary for smoke detector testing. The use of magnets is not permitted.

e. Provide space to identify the date and time of each test. Provide space to identify the names and signatures of the individuals conducting and witnessing each test.

3.8.2 Pre-Government Testing

3.8.2.1 Verification of Compliant Installation

Conduct inspections and tests to ensure that devices and circuits are functioning properly. Tests must meet the requirements of paragraph entitled "Minimum System Tests" as required by NFPA 72. The contractor and an authorized representative from each supplier of equipment must be in attendance at the pre-Government testing to make necessary adjustments. After inspection and testing is complete, provide a signed Verification of Compliant Installation letter by the QFPE that the installation is complete, compliant with the specification and fully operable. The letter must include the names and titles of the witnesses to the pre-Government tests. Provide all completion documentation as required by NFPA 72 including all referenced annex sections and the test reports noted below.

a. NFPA 72 Record of Completion.

b. NFPA 72 Record of Inspection and Testing.

d. Audibility test results with marked-up test floor plans.

e. Intelligibility test results with marked-up floor plans.

f. Documentation that all tests identified in the paragraph "Minimum System Tests" are complete.

3.8.2.2 Request for Government Final Test

When the verification of compliant installation has been completed, submit a formal request for Government final test to the [_____][Designated Fire Protection Engineer (DPFE)][Contracting Officer's Representative (COR)]. Government final testing will not be scheduled until the DPFE has received copies of the request for Government final testing and Verification of Compliant Installation letter with all required reports. Government final testing will not be performed until after the connections to the
installation-wide fire reporting system[ and the installation-wide mass notification system have] been completed and tested to confirm communications are fully functional. Submit request for test at least [15][_____] calendar days prior to the requested test date.

3.8.3 Correction of Deficiencies

If equipment was found to be defective or non-compliant with contract requirements, perform corrective actions and repeat the tests. Tests must be conducted and repeated if necessary until the system has been demonstrated to comply with all contract requirements.

3.8.4 Government Final Tests

The tests must be performed in accordance with the approved test procedures in the presence of the DFPE. Furnish instruments and personnel required for the tests. The following must be provided at the job site for Government Final Testing:

a. The manufacturer's technical representative.

[b. The contractor's Qualified Fire Protection Engineer (QFPE).]

c. Marked-up red line drawings of the system as actually installed.

d. Loop resistance test results

e. Copy of pre-Government Test Certificate, test procedures and completed test data forms.

f. Audibility test results with marked-up floor plans.

g. Intelligibility test results with marked-up floor plans.

Government Final Tests will be witnessed by the [____], [Designated Fire Protection Engineer][Contracting Officer's Representative (COR)][, Qualified Fire Protection Engineer (QFPE)]. At this time, any and all required tests noted in the paragraph "Minimum System Tests" must be repeated at their discretion.

3.9 MINIMUM SYSTEM TESTS

3.9.1 System Tests

Test the system in accordance with the procedures outlined in NFPA 72. The required tests are as follows:

a. Loop Resistance Tests: Measure and record the resistance of each circuit with each pair of conductors in the circuit short-circuited at the farthest point from the circuit origin. The tests must be witnessed by the Contracting Officer and test results recorded for use at the final Government test.

b. Verify the absence of unwanted voltages between circuit conductors and ground. The tests must be accomplished at the pre-Government test with results available at the final system test.

c. Verify that the control unit is in the normal condition as detailed in the manufacturer's O&M manual.
d. Test each initiating device and notification appliance and circuit for proper operation and response at the control unit. Smoke detectors must be tested in accordance with manufacturer's recommended calibrated test method. Use of magnets is prohibited. Testing of duct smoke detectors must comply with the requirements of NFPA 72 except disconnect at least 20 percent of devices. If there is a failure at these devices, then supervision must be tested at each device.

e. Carbon Monoxide Detector Tests: Carbon monoxide detectors must be tested in accordance with NFPA 72 and the manufacturer's recommended calibrated test method.

f. Test the system for specified functions in accordance with the contract drawings and specifications and the manufacturer's O&M manual.

g. Test both primary power and secondary power. Verify, by test, the secondary power system is capable of operating the system for the time period and in the manner specified.

h. Determine that the system is operable under trouble conditions as specified.

i. Visually inspect wiring.

j. Test the battery charger and batteries.

k. Verify that red-line drawings are accurate.

l. Measure the current in circuits to ensure there is the calculated spare capacity for the circuits.

m. Measure voltage readings for circuits to ensure that voltage drop is not excessive.

n. Measure the voltage drop at the most remote appliance (based on wire length) on each notification appliance circuit.

o. Verify the documentation cabinet is installed and contains all as-built shop drawings, product data sheets, design calculations, site-specific software data package, and all documentation required by paragraph titled "Test Reports".

3.9.2 Audibility Tests

Sound pressure levels from audible notification appliances must be a minimum of 15 dBA over ambient with a maximum of 110 dBA in any occupiable area. The provisions for audible notification (audibility and intelligibility) must be met with doors, fire shutters, movable partitions, and similar devices closed.

3.9.3 Intelligibility Tests

**************************************************************************
NOTE: Occasionally, large DoD buildings are designed to provide cavernous-type open areas to meet unique operational requirements. Such areas are typically designed with hard wall and ceiling surfaces (such as metal or concrete) without acoustical treatments,
and this has been found to cause excessive sound reflections that prevent obtaining the normal, minimum required CIS value. In such facilities, the cavernous-type open area is permitted to have locations with a CIS value lower than the normal, minimum required CIS value when the following conditions are met:

The requirement for a deviation from the normal, minimum CIS criteria identified in the design phase.

Justification for the deviation from the normal, minimum CIS criteria is provided to the approving authority (i.e., the AHJ for the Navy and Marine Corps; the DoD installation in conjunction with the contracting officer for the Army and Air Force). The justification must address all factors relevant to the request for deviation from normal, minimum CIS criteria, including, but not limited to: the operational requirements that restrict the installation of acoustical wall and ceiling treatments; the potential use of special speaker technologies such as directional speakers or stacked speaker systems; and, the availability of physically larger or higher-fidelity speakers even though such speakers might not be listed for fire alarm use.

Note: Deviation from normal, minimum CIS criteria should not be requested for the design of normal, large, open areas that are typically found in permanent DoD buildings, such as dining halls, theaters, and gymnasiums. The potential for deviation from normal criteria is intended to address the rare exception to normal criteria that is sometimes needed for DoD buildings with unique operational requirements.

Building occupants located in the large, cavernous area can adequately understand the message content in the voice signal being broadcast. Whether the voice message is adequately understood must be determined by the approving authority (i.e., the AHJ for the Navy and Marine Corps; the DoD installation in conjunction with the contracting officer for the Army and Air Force).

The CIS value is not less than 0.6 at any location within the large, cavernous area.

The building occupants in the large, cavernous area must walk no more than 30 m98 feet to find another location within the large, cavernous area having at least the normal, minimum required CIS value. Note: An STI score of 0.5 is considered equivalent to a CIS score of 0.7. An STI value of 0.7 is considered equivalent to a CIS value of 0.8.

All readings for Sound Pressure Level (SPL) and Intelligibility score must be recorded on the
installation drawings next to the speaker symbol. The readings must then be added on the "as-Built" drawings to be submitted at the conclusion of the Final Government test.

Intelligibility testing of the System must be accomplished in accordance with NFPA 72 for Voice Evacuation Systems, and ASA S3.2. Following are the specific requirements for intelligibility tests:

a. Intelligibility Requirements: Verify intelligibility by measurement after installation.

b. Ensure that a CIS value greater than the required minimum value is provided in each area where building occupants typically could be found. The minimum required value for CIS is \[0.7, 0.8\]. Rounding of values is permitted.

c. Areas of the building provided with hard wall and ceiling surfaces (such as metal or concrete) that are found to cause excessive sound reflections may be permitted to have a CIS score less than the minimum required value if approved by the DFPE, and if building occupants in these areas can determine that a voice signal is being broadcast and they must walk no more than \(10 \text{ m} 33 \text{ feet}\) to find a location with at least the minimum required CIS value within the same area.

d. Areas of the building where occupants are not expected to be normally present are permitted to have a CIS score less than the minimum required value if personnel can determine that a voice signal is being broadcast and they must walk no more than \(15 \text{ m} 50 \text{ feet}\) to a location with at least the minimum required CIS value within the same area.

e. Take measurements near the head level applicable for most personnel in the space under normal conditions (e.g., standing, sitting, sleeping, as appropriate).

f. The distance the occupant must walk to the location meeting the minimum required CIS value must be measured on the floor or other walking surface as follows:

(1) Along the centerline of the natural path of travel, starting from
any point subject to occupancy with less than the minimum required CIS value.

(2) Curving around any corners or obstructions, with a 300 mm 12 inches clearance there from.

(3) Terminating directly below the location where the minimum required CIS value has been obtained.

Use commercially available test instrumentation to measure intelligibility as specified by NFPA 72 as applicable. Use the mean value of at least three readings to compute the intelligibility score at each test location.

3.10 SYSTEM ACCEPTANCE

Following acceptance of the system, as-built drawings and O&M manuals must be delivered to the Contracting Officer for review and acceptance. The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of as-built (marked-up) drawings must be provided at the time of, or prior to the Final Government Test.

[a. The drawings must be prepared electronically and sized no less than the contract drawings.]

[b. Include complete wiring diagrams showing connections between devices and equipment, both factory and field wired.

[c. Include a riser diagram and drawings showing the as-built location of devices and equipment.

[d. Provide Operation and Maintenance (O&M) Instructions.

[In existing buildings, the transfer of devices from the existing system to the new system and the permission to begin demolition of the old fire alarm system will not be permitted until the as-built drawings and O&M manuals are received.]}

3.11 INSTRUCTION OF GOVERNMENT EMPLOYEES

3.11.1 Instructor

Provide the services of an instructor, who has received specific training from the manufacturer for the training of other persons regarding the operation, inspection, testing, and maintenance of the system provided. The instructor must train the Government employees designated by the Contracting Officer, in the care, adjustment, maintenance, and operation of the fire alarm system. The instructor must be thoroughly familiar with all parts of this installation. The instructor must be trained in operating theory as well as in practical O&M work. Submit the instructors information and qualifications including the training history.

3.11.2 Required Instruction Time

Provide [8][16][_____] hours of instruction after final acceptance of the
system. The instruction must be given during regular working hours on such dates and times selected by the Contracting Officer. The instruction may be divided into two or more periods at the discretion of the Contracting Officer. The training must allow for rescheduling for unforeseen maintenance and/or fire department responses.

[3.11.2.1 Technical Training]

Equipment manufacturer or a factory representative must provide [1][3][_____] days of on-site and 5 days of technical training to the Government at the manufacturing facility. Training must allow for classroom instruction as well as individual hands-on troubleshooting and diagnostics exercises. Factory training must occur within [6][12][_____] months of system acceptance.

[3.11.3 Technical Training Manual]

Provide, in manual format, lesson plans, operating instructions, maintenance procedures, and training data for the training courses. The operations training must familiarize designated government personnel with proper operation of the installed system. The maintenance training course must provide the designated government personnel adequate knowledge required to diagnose, repair, maintain, and expand functions inherent to the system.

3.12 EXTRA MATERIALS

3.12.1 Repair Service/Replacement Parts

Repair services and replacement parts for the system must be available for a period of 10 years after the date of final acceptance of this work by the Contracting Officer. During the warranty period, the service technician must be on-site within 24 hours after notification. All repairs must be completed within 24 hours of arrival on-site.

During the warranty period, the installing fire alarm contractor is responsible for conducting all required testing and maintenance in accordance with the requirements and recommended practices of NFPA 72 and the system manufacturer[s]. Installing fire alarm contractor is NOT responsible for any damage resulting from abuse, misuse, or neglect of equipment by the end user.

3.12.2 Spare Parts

Spare parts furnished must be directly interchangeable with the corresponding components of the installed system[s]. Spare parts must be suitably packaged and identified by nameplate, tagging, or stamping. Spare parts must be delivered to the Contracting Officer at the time of the Government testing and must be accompanied by an inventory list.

3.12.3 Document Storage Cabinet

Upon completion of the project, but prior to project close-out, place in the document storage cabinet copies of the following record documentation:

a. As-built shop drawings

b. Product data sheets
c. Design calculations

d. All documentation required by SD-06.

-- End of Section Table of Contents --
NOTE: This specification covers the requirements for an addressable integrated fire detection, fire alarm system.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com).

**NOTE:** For OCONUS projects, this specification section should be edited for specific Host Nation requirements. Coordinate compliance with Host Nation requirements with the Designated Fire Protection Engineer (DFPE).
NOTE: For Family Housing projects at NAVFAC NE use regional guide specification section 28 31 46.00 22 (N-13854N) HOUSEHOLD FIRE WARNING EQUIPMENT to specify residential fire warning systems in lieu of this section.

**************************************************************************

NOTE: This specification section includes requirements from UFC 3-600-01 (change 43, 7 February 2020)

**************************************************************************

NOTE: This guide specification covers carbon monoxide alarm detectors for protection in indoor locations where fuel-burning appliances/equipment are used.

**************************************************************************

PART 1  GENERAL

**************************************************************************

1. On the drawings, show location of control unit, batteries and charger (if remotely mounted), supervising station transmitter, annunciator, primary power supply, remote annunciator, detectors, notification appliances (unless performance requirements are specified), and each alarm initiating device including fire extinguishing system switches.

2. Show single-line fire alarm systems riser diagram. Each device on the riser should be identified by type. Indicate connection of equipment.

3. A fire alarm operating matrix must be placed on the drawings. Show actions of input devices such as detectors, manual stations, waterflow switches, initiating devices, etc. on one axis and output functions such as door releases, smoke control fans, elevator relays, indicating/notification appliances etc. on the other. Entries which require descriptions, explanation of processes, sequences, interfaces, etc. can be flagged by symbols keyed to supplementary notes. Alternately provide a zone-by-zone sequence of operation or a schedule identifying all initiators, outputs, and interfaces.

4. Addressable Fire Alarm Systems generally utilize Signal Line Circuits (SLC) for communication between devices. Normally all devices are addressable or will have an addressable interface device installed integrally with the device. Initiating Device Circuits (IDC) should be provided for interfacing to existing IDC loops or connection between non-addressable devices and the SLC.

**************************************************************************
1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

[ Section 07 84 00 FIRESTOPPING for additional work related to firestopping.]
1.3 SUMMARY

1.3.1 Scope

a. This work includes designing and providing a new, complete, fire alarm system as described herein and on the contract drawings for the _____________. Include system wiring, raceways, pull boxes, terminal cabinets, outlet and mounting boxes, control equipment, initiating devices, notification appliances, supervising station fire alarm transmitters, and other accessories and miscellaneous items required for a complete operational system even though each item is not specifically mentioned or described. Provide system[s] complete and ready for operation. [Existing interior fire alarm system was manufactured by [_____.] Design and installation must comply with UFGS 25 05 11, UFC 4-010-06 and AFGM 2019-320-02.

b. Provide equipment, materials, installation, workmanship, inspection, and testing in strict accordance with NFPA 72, except as modified herein. [The system layout on the drawings show the intent of coverage and suggested locations. Final quantity, system layout, and coordination are the responsibility of the Contractor.]

c. Each remote fire alarm control unit must be powered from a wiring riser specifically for that use or from a local emergency power panel located on the same floor as the remote fire alarm control unit. Where remote fire control units are provided, equipment for notification appliances may be located in the remote fire alarm control units.

d. Where a fire pump is provided, the fire alarm system must monitor and transmit the fire pump controller signals in accordance with the provisions of NFPA 72.

e. Where an emergency generator provides standby power supply for life safety system circuits, the generator must be monitored by the Fire Alarm Control Unit (FACU) and transmit emergency generator signals in accordance with NFPA 72.

f. The fire alarm system must be independent of the building security, building management, and energy/utility monitoring systems other than for control functions.

1.3.2 Qualified Fire Protection Engineer (QFPE)

******************************************************************************
NOTE: UFC 3-600-01 requires that shop drawings must bear the Review Stamp and professional engineering stamp of the QFPE prior to submission to the Government for approval.
******************************************************************************

******************************************************************************
NOTE: The term Qualified Fire Protection Engineer (QFPE) should be considered interchangeable with the terms "Fire Protection Designer of Record (FPDOR)" and/or "Fire Protection QC Specialist" where referred to in other applicable contract documents. The intent of defining the QFPE roles and responsibilities here is NOT to require personnel in addition to the QFPE, FPDOR, and/or FPQC specialist
Services of the QFPE must include:

a. Reviewing SD-02, SD-03, and SD-05 submittal packages for completeness and compliance with the provisions of this specification. Construction (shop) drawings and calculations must be prepared by, or prepared under the immediate supervision of, the QFPE. The QFPE must affix their professional engineering stamp with signature to the shop drawings, calculations, and material data sheets, indicating approval prior to submitting the shop drawings to the DFPE.

b. Providing a letter documenting that the SD-02, SD-03, and SD-05 submittal package has been reviewed and noting any outstanding comments.

c. Performing in-progress construction surveillance prior to installation of ceilings (rough-in inspection).

e. Signing applicable certificates under SD-07.

1.4 DEFINITIONS

Wherever mentioned in this specification or on the drawings, the equipment, devices, and functions must be defined as follows:

1.4.1 Interface Device

An addressable device that interconnects hard wired systems or devices to an analog/addressable system.

1.4.2 Fire Alarm Control Unit (FACU)

A master control unit having the features of a fire alarm control unit (FACU).

1.4.3 Remote Fire Alarm Control Unit

A control unit, physically remote from the fire alarm control unit, that receives inputs from automatic and manual fire alarm devices; may supply power to detection devices and interface devices; may provide transfer of power to the notification appliances; may provide transfer of condition to relays or devices connected to the control unit; and reports to and receives signals from the fire alarm and mass notification control unit.

1.4.4 Terminal Cabinet

A steel cabinet with locking, hinge-mounted door where terminal strips are securely mounted inside the cabinet.

1.4.5 Control Module and Relay Module

Terms utilized to describe emergency control function interface devices as defined by NFPA 72.
1.4.6 Designated Fire Protection Engineer (DFPE)

The DoD fire protection engineer that oversees that Area of Responsibility for that project. This is sometimes referred to as the "cognizant" fire protection engineer. Interpret reference to "authority having jurisdiction" and/or AHJ in referenced standards to mean the Designated Fire Protection Engineer (DFPE). The DFPE may be responsible for review of the contractor submittals having a "G" designation, and for witnessing final inspection and testing.

1.4.7 Qualified Fire Protection Engineer (QFPE)

A QFPE is an individual who is a licensed professional engineer (P.E.), who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience.

1.5 SUBMITTALS

******************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES (or the particular specification section for submittal procedures in this project) and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S"
classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.]

Shop drawings (SD-02), product data (SD-03) and calculations (SD-05) must be prepared by the fire alarm designer and combined and submitted as one complete package. The QFPE must review the SD-02/SD-03/SD-05 submittal package for completeness and compliance with the Contract provisions prior to submission to the Government. The QFPE must provide a Letter of Confirmation that they have reviewed the submittal package for compliance with the contract provisions. This letter must include their registered professional engineer stamp and signature. Partial submittals and submittals not reviewed by the QFPE will be returned by the Government disapproved without review.

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Qualified Fire Protection Engineer (QFPE); G[, [____]]
Fire alarm system designer; G[, [____]]
Supervisor; G[, [____]]
Technician; G[, [____]]
Installer; G[, [____]]
Test Technician; G[, [____]]

Firefighter Telephone; G[, [____]]
1.6 SYSTEM OPERATION

**************************************************************
NOTE: Circuit wiring must be Class "B" unless Class "A" or "X" is required by the local installation and as permitted by NFPA 72 (SLC: "A", "B", or "X"; IDC and NAC: "A" or "B").

Circuits and pathways must have survivability levels as defined by NFPA 72.
**************************************************************

Fire alarm system components requiring power, except for the FACU(s) power supply, must operate on 24 volts DC unless noted otherwise in this section.

The interior fire alarm system must be a complete, supervised, noncoded, analog/addressable fire alarm system conforming to NFPA 72, and UL 864. Systems meeting UL 2017 only are not acceptable. The system must be activated into the alarm mode by actuation of an alarm initiating device. The system must remain in the alarm mode until the initiating device is reset and the control unit is reset and restored to normal.

[Provide the system with an interconnected riser loop or network having Class [A][X] supervision. Ensure that the return portion of the loop is remote from the supply portion of the loop.][ Where the building has two stairs for egress from floors above grade or floors below grade, ensure that a single impairment cannot adversely affect more than one floor. Where three or more stairs are provided for egress from floors above grade

SECTION 28 31 70  Page 15
or below grade, ensure that a single impairment cannot adversely affect more than one-half of any floor. [Ensure that any single impairment of the system does not affect the system on more than [one][one-half] of any floor.]

1.6.1 Alarm Initiating Devices and Notification Appliances (Visual, Audible)

a. Connect alarm initiating devices to initiating device circuits (IDC) [Class "A"] [Class "B"], or to signaling line circuits (SLC) Class ["A"] ["B"] ["X"] and installed in accordance with NFPA 72.

b. Connect notification appliances to notification appliance circuits (NAC) [Class "A"] [Class "B"].

1.6.2 Functions and Operating Features

The system must provide the following functions and operating features:

a. Power, annunciation, supervision, and control for the system. Addressable systems must be microcomputer (microprocessor or microcontroller) based with a minimum word size of eight bits with sufficient memory to perform as specified.

b. Visual alarm notification appliances must be synchronized as required by NFPA 72.

c. Electrical supervision of the primary power (AC) supply, presence of the battery, battery voltage, and placement of system modules within the control unit.

d. An audible and visual trouble signal to activate upon a single break or open condition, or ground fault. The trouble signal must also operate upon loss of primary power (AC) supply, absence of a battery supply, low battery voltage, or removal of alarm or supervisory control unit modules. After the system returns to normal operating conditions, the trouble signal must again sound until the trouble is acknowledged. A smoke detector in the process of being verified for the actual presence of smoke must not initiate a trouble condition.

e. A trouble signal silence feature that must silence the audible trouble signal, without affecting the visual indicator.

f. Program capability via switches in a locked portion of the FACU to bypass the automatic notification appliance circuits, [fire reporting system] [air handler shutdown] [smoke control operation] [elevator recall] [door release] [door unlocking] features. Operation of this programmed action must indicate on the FACU display [and printer output] as a supervisory or trouble condition. [Notification appliance bypass must be selectable by floor.]

g. Alarm functions must override trouble or supervisory functions. Supervisory functions must override trouble functions.

h. The system must be capable of being programmed from the control unit keyboard. Programmed information must be stored in non-volatile memory.

i. The system must be capable of operating, supervising, and/or monitoring non-addressable alarm and supervisory devices.
j. There must be no limit, other than maximum system capacity, as to the number of addressable devices that may be in alarm simultaneously.

k. Where the fire alarm system is responsible for initiating an action in another emergency control device or system, such as [HVAC, atrium exhaust, smoke control, elevator recall, releasing service,] the addressable fire alarm relay must be located in the vicinity of the emergency control device.

l. An alarm signal must automatically initiate the following functions:

(1) Transmission of an alarm signal to [the fire department][a remote supervising station].

(2) Visual indication of the device operated on the FACU, [Video Display unit (VDU),] [and on the [graphic] [remote] annunciator]. [Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.]

(3) Record the event on the system printer.

(4) Actuation of alarm notification appliances.

(5) Recording of the event electronically in the history log of the FACU.

(6) Release of doors held open by electromagnetic devices.

(7) Operation of the [smoke control system][atrium exhaust system].

(8) Release of power to electric locks (delayed egress locks) on doors that are part of the means of egress.

(9) Elevator recall as described in this section.

**************************************************************************
NOTE: Use this paragraph only where a detector or detection system is to release a special fire extinguishing system.
**************************************************************************

(10) Operation of [_____] must release the [_____] fire extinguishing system after a [_____] second time delay.

(11) Operation of a sprinkler waterflow switch serving an elevator machinery room or elevator shaft must operate shunt trip circuit breaker(s) to shut down power to the elevators in accordance with ASME A17.1/CSA B44.

(12) Operation of an interface that operates vibrating pagers worn by hearing-impaired occupants.

m. A supervisory signal must automatically initiate the following functions:

(1) Visual indication of the device operated on the FACU, [Video Display unit (VDU),] [and on the [graphic] [remote] annunciator]. [Indication on the graphic annunciator must be by
floor, zone or circuit, and type of device.]

[(2) Record the event on the system printer.]

(3) Transmission of a supervisory signal to [the fire department][a remote supervising station].

(4) Operation of a duct smoke detector must shut down the appropriate air handler in accordance with NFPA 90A in addition to other requirements of this paragraph and as allowed by NFPA 72.

(5) Recording of the event electronically in the history log of the FACU.

n. A trouble condition must automatically initiate the following functions:

(1) Visual indication of the device operated on the FACU, [Video Display unit (VDU),] [and on the [graphic ][remote annunciator]. [Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.]

[(2) Record the event on the system printer.]

(3) Transmission of a trouble signal to [the fire department][a remote supervising station].

(4) Recording of the event electronically in the history log of the FACU.

o. Activation of a carbon monoxide alarm initiating device must automatically initiate the following functions:

(1) Visual indication of the device operated on the , [LCD, LED Display unit (VDU),][ and on the [graphic ][remote annunciator].[Indication on the graphic annunciator must be by floor and room number, device address, and device type.]

[(2) Record the event on the system printer.]

(3) Transmission of a carbon monoxide alarm signal to [the fire department][a remote supervising station].

(4) Activation of all strobes and the carbon monoxide alarm signal throughout the building.

(4) Recording of the event electronically in the history log of the FACU.

p. System control equipment must be programmed to provide a 60-minute to 180-minute delay in transmission of trouble signals resulting from primary power failure.

[1.6.3 Elevator Recall

************************************************************************************************
NOTE: Delete this paragraph if no elevator work is included in the project.
************************************************************************************************

Provide elevator recall in accordance with ASME A17.1/CSA B44, Section [14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS][14 21 23 ELECTRIC TRACTION
PASSENGER ELEVATORS][HYDRAULIC FREIGHT ELEVATORS][HYDRAULIC PASSENGER ELEVATORS], and as specified herein. Activation of any smoke detector in an elevator shaft, machine room, or lobby (except at designated recall level) must cause all elevators associated with that shaft, machine room, or lobby to return nonstop to the designated level. Activation of a smoke detector in the lobby or machine room at the designated level must cause all elevators associated with that lobby to return nonstop to the assigned alternate level. Activation of a detector in an elevator shaft, machine room, or lobby must also cause illumination of elevator cab warning signal (fire hat) and complete operation of fire alarm system as specified in paragraph titled "Functions and Operating Features".

1.7 TECHNICAL DATA AND SITE-SPECIFIC SOFTWARE

Technical data and site-specific software (meaning technical data that relates to computer software) that are specifically identified in this project, and may be required in other specifications, must be delivered, strictly in accordance with the CONTRACT CLAUSES. The fire alarm system manufacturer must submit written confirmation of this contract provision as "Fire Alarm System Site-Specific Software Acknowledgement". Identify data delivered by reference to the specification paragraph against which it is furnished. Data to be submitted must include complete system, equipment, and software descriptions. Descriptions must show how the equipment will operate as a system to meet the performance requirements of this contract. The site-specific software data package must also include the following:

a. Items identified in NPPA 72, titled "Site-Specific Software".

b. Identification of programmable portions of the system equipment and capabilities.

c. Description of system revision and expansion capabilities and methods of implementation detailing both equipment and software requirements.

d. Provision of operational software data on all modes of programmable portions for fire alarm.

e. Description of Fire Alarm Control Unit equipment operation.

f. Description of auxiliary and remote equipment operations.

g. Library of application software.

h. Operation and maintenance manuals.

1.8 EXISTING EQUIPMENT

**************************************************************************
NOTE: If an addition to an existing fire alarm system is required, the contract drawings or this section must include the make, model number, and other pertinent information of existing components that are to operate with the new equipment. Since new interfaces will have to be compatible with the existing system or to the central fire alarm reporting system, it may be necessary to edit major items out of this specification. If a new FACU is required, it has to be compatible with the existing

SECTION 28 31 70  Page 19
central fire alarm reporting system. When an existing system is to be expanded, show the following information on the contract drawings:

1. Manufacturer and model of existing control unit.

2. Number of existing initiating circuits (zones), notification appliance circuits, and control circuits served by the control unit.

3. Number of existing alarm notification appliances on the system.

4. Total calculated current draw of all devices served by each existing standby battery under both supervisory (standby) and alarm conditions, including NAC/extender control units and subcontrol units.

5. Ampere-hour rating and type of each existing battery.

**************************************************************************
a. Equipment and devices must be compatible and operable with the existing fire alarm mass notification system and must not impair reliability or operational functions of existing supervising station fire alarm system. [The proprietary type supervising station (PSS) is located in Building [______.][______.] The supervising equipment is existing and consists of the following brands and models: [supervising station control unit [______.][______.][signal reporting components [______.]], [annunciator [______.]]].]

b. Equipment and devices must be compatible and operable with the existing building fire alarm system. Equipment must not impair reliability or operational functions of the existing system. The existing building system control unit is [______.]

1.9 QUALITY ASSURANCE

1.9.1 Submittal Documents

1.9.1.1 Preconstruction Submittals

Within 36 days of contract award but not less than [14 days][______.] prior to commencing any work on site, the Contractor must submit the following for review and approval. SD-02, SD-03 and SD-05 submittals received prior to the review and approval of the qualifications of the fire alarm subcontractor and QFPE must be returned disapproved without review. All resultant delays must be the sole responsibility of the Contractor.

1.9.1.2 Shop Drawings

Shop drawings must not be smaller than [ISO A1][ANSI D][the Contract Drawings]. Drawings must comply with the requirements of NFPA 72 and NFPA 170. Minimum scale for floor plans must be 1/8"=1'.

1.9.1.3 Nameplates

Nameplate illustrations and data to obtain approval by the Contracting
1.9.1.4  **Wiring Diagrams**

[_____] copies of point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the FACU and remote FACU, initiating circuits, switches, relays and terminals, including pathway diagrams between the control unit and shared communications equipment within the protected premises. Point-to-point wiring diagrams must be job specific and must not indicate connections or circuits not being utilized. Provide complete riser diagrams indicating the wiring sequence of all devices and their connections to the control equipment. Include a color-code schedule for the wiring.

1.9.1.5  **System Layout**

[_____] copies of plan view drawing showing device locations, terminal cabinet locations, junction boxes, other related equipment, conduit routing, conduit sizes, wire counts, conduit fill calculations, wire color-coding, circuit identification in each conduit, and circuit layouts for all floors. Indicate candela rating of each visual notification appliance. Clearly identify the locations of isolation modules. Indicate the addresses of all devices, modules, relays, and similar. Indicate if the environment for the FACU is within its environmental listing (e.g. temperature/humidity).

Provide a complete description of the system operation in matrix format similar to the "Typical Input/Output Matrix" included in the Annex of NFPA 72.

[For air sampling smoke detection systems, provide floor plan layouts indicating location of fire alarm control unit, air sampling piping (lengths of pipe) and sampling ports (sizes and locations). Floor plan must also indicate geographic monitor zone boundaries, location of display control unit, bar level annunciation panels if separate, and all other associated equipment that is required to provide a complete operational system.]

1.9.1.6  **Notification Appliances**

Calculations and supporting data on each circuit to indicate that there is at least 25 percent spare capacity for notification appliances. Annotate data for each circuit on the drawings.

1.9.1.7  **Initiating Devices**

Calculations and supporting data on each circuit to indicate that there is at least [25][_____] percent spare capacity for initiating devices. Annotate data for each circuit on the drawings.

1.9.1.8  **Battery Power**

Calculations and supporting data as required in paragraph Battery Power Calculations for alarm, alert, and supervisory power requirements. Calculations including ampere-hour requirements for each system component and each control unit component, and the battery recharging period, must be
1.9.1.9 Voltage Drop Calculations

Voltage drop calculations for each notification circuit indicating that sufficient voltage is available for proper operation of the system and all components, at a minimum rated voltage of the system operating on batteries. Include the calculations on the system layout drawings.

1.9.1.10 Product Data

[_____] copies of annotated descriptive data to show the specific model, type, and size of each item. Catalog cuts must also indicate the NRTL listing. The data must be highlighted to show model, size, and options that are intended for consideration. Data must be adequate to demonstrate compliance with all contract requirements. Product data for all equipment must be combined into a single submittal.

Provide an equipment list identifying the type, quantity, make, and model number of each piece of equipment to be provided under this submittal. The equipment list must include the type, quantity, make and model of spare equipment. Types and quantities of equipment submitted must coincide with the types and quantities of equipment used in the battery calculations and those shown on the shop drawings.

1.9.1.11 Air Sampling Smoke Detection System Calculations

Submit air sampling detection system design analysis calculations consisting of battery capacity, loading calculations, and fan speed and air flow/transport calculations. Include schematic diagrams showing pipe segments, pipe diameters, lengths of pipe, node numbers, and sample port diameters to verify the requirements are met.

1.9.1.12 Operation and Maintenance (O&M) Instructions

[Six][_____] copies of the Operation and Maintenance Instructions. The O&M Instructions must be prepared in a single volume or in multiple volumes, with each volume indexed, and may be submitted as a Technical Data Package. Manuals must be approved prior to training. The Interior Fire Alarm System Operation and Maintenance Instructions must include the following:

a. "Manufacturer Data Package [five][____]" as specified in [Section 01 78 23 OPERATION AND MAINTENANCE DATA][____].

b. Operating manual outlining step-by-step procedures required for system startup, operation, and shutdown. The manual must include the manufacturer's name, model number, service manual, parts list, and preliminary equipment list complete with description of equipment and their basic operating features.

c. Maintenance manual listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The manuals must include conduit layout, equipment layout and simplified wiring, and control diagrams of the system as installed.

d. Complete procedures for system revision and expansion, detailing both equipment and software requirements.
e. Software submitted for this project on CD/DVD media utilized.

f. Printouts of configuration settings for all devices.

g. Routine maintenance checklist. The routine maintenance checklist must be arranged in a columnar format. The first column must list all installed devices, the second column must state the maintenance activity or state no maintenance required, the third column must state the frequency of the maintenance activity, and the fourth column provided for additional comments or reference. All data (devices, testing frequencies, and similar) must comply with UFC 3-601-02.

h. A final Equipment List must be submitted with the Operating and Maintenance (O&M) manual.

1.9.1.13 As-Built Drawings

The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of the as-built (marked-up) drawings must be provided at the time of, or prior to the final Government test.

1.9.2 Qualifications

**************************************************************************
NOTE: NICET (National Institute for Certification in Engineering Technologies) establishes the qualifications of an individual as an Engineering Technologist with verification of experience by having a current NICET certification.
**************************************************************************

1.9.2.1 Fire Alarm System Designer

The fire alarm system designer must be certified as a Level [III][IV] (minimum) Technician by National Institute for Certification in Engineering Technologies (NICET) in the Fire Alarm Systems subfield of Fire Protection Engineering Technology or meet the qualifications for a QFPE.

1.9.2.2 Supervisor

[A NICET Level [III][ or ][IV] fire alarm technician must supervise the installation of the fire alarm system[, including the air sampling smoke detection system].][A fire alarm technician with a minimum of eight years of experience must supervise the installation of the fire alarm system.] The fire alarm technicians supervising the installation of equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.9.2.3 Technician

Fire alarm technicians with a minimum of four years of experience must be utilized to install and terminate fire alarm devices, cabinets and control units. The fire alarm technicians installing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings[, and must be thoroughly experienced in the installation of air sampling detection systems].
1.9.2.4 Installer

[Fire alarm installer with a minimum of two years of experience utilized to assist in the installation of fire alarm devices, cabinets and control units] [NICET Level II technician to assist in the installation of fire alarm devices, cabinets and control units]. A licensed electrician must be allowed to install wire, cable, conduit and backboxes for the fire alarm system system. The fire alarm installer must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.9.2.5 Test Technician

Fire alarm technicians with a minimum of eight years of experience and NICET Level [III][ or ][IV] utilized in testing and certification of the installation of the fire alarm devices, cabinets and control units. The fire alarm technicians testing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment installed as part of this project.

1.9.2.6 Manufacturer

Components must be of current design and must be in regular and recurrent production at the time of installation. Provide design, materials, and devices for a protected premises fire alarm system, complete, conforming to NFPA 72, except as specified herein.

1.9.3 Regulatory Requirements

Equipment and material must be listed or approved. Listed or approved, as used in this Section, means listed, labeled or approved by a Nationally Recognized Testing Laboratory (NRTL) such as UL Fire Prot Dir or FM APP GUIDE. The omission of these terms under the description of any item of equipment described must not be construed as waiving this requirement. All listings or approvals by testing laboratories must be from an existing ANSI or UL published standard. The recommended practices stated in the manufacturer's literature or documentation must be considered as mandatory requirements.

1.10 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from the weather, humidity, and temperature variation, dirt and dust, and other contaminants.

1.11 MAINTENANCE

1.11.1 Spare Parts

Furnish the following spare parts in the manufacturer's original unopened containers:

a. [Five][_____] complete sets of system keys.

b. [Two][_____] of each type of fuse required by the system.

c. [One][_____] manual stations.

d. [Two][_____] of each type of detector installed.]
e. [Two][_____] of each type of detector base and head installed.

f. [One][_____] electromagnetic door holders.]

g. One smoke detector manufacturer's test screen, card or magnet for each ten beam smoke detectors, or fraction thereof, installed in the system.

h. Two air sampling smoke detection system filter assemblies.

i. [Two][_____] of each type of audible and visual alarm device installed.

j. [Two][_____] of each type of addressable monitor module installed.

k. [Two][_____] of each type of addressable control module installed.

l. [Two][_____] low voltage, [one][_____] [telephone][internet][ethernet], and [one][_____] 120 VAC surge protective device.

m. [Two][_____] spare reams of paper for the system printer, plus sufficient paper for testing.]

n. [Two][_____] spare printer ribbons.]

1.11.2 Special Tools

Software, connecting cables and proprietary equipment, necessary for the maintenance, testing, and reprogramming of the equipment must be furnished to the Contracting Officer, prior to the instruction of Government employees.

PART 2 PRODUCTS

2.1 GENERAL PRODUCT REQUIREMENT

All fire alarm equipment must be listed for use under the applicable reference standards.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials, equipment, and devices that have been tested by a nationally recognized testing laboratory and listed for fire protection service when so required by NFPA 72 or this specification. Select material from one manufacturer, where possible, and not a combination of manufacturers, for any particular classification of materials. Material and equipment must be the standard products of a manufacturer regularly engaged in the manufacture of the products for at least [2][_____] years prior to bid opening.

2.2.2 Nameplates

Major components of equipment must have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new name plate permanently affixed to the item or equipment. Major components include, but are not limited to, the following:
a. FACU

Nameplates must be etched metal or plastic, permanently attached by screws to control units or adjacent walls.

2.2.3 Keys

Keys and locks for equipment, control units and devices must be identical. [Master all keys and locks to a single key as required by the [Installation Fire Department][_____]]. [Keys must be CAT [60][_____]].

2.2.4 Instructions

Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. [Install the instructions on the interior of the FACU.] [Install the frame in a conspicuous location observable from the FACU.] The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions and their mounting location must be approved by the Contracting Officer before being posted.

2.3 FIRE ALARM CONTROL UNIT

**************************************************************************
NOTE: The control unit must be located in an air conditioned space where the ambient temperature is maintained between 15 and 27 degrees C 60 and 80 degrees F.
**************************************************************************

Provide a complete fire alarm control unit (FACU) fully enclosed in a lockable steel cabinet as specified herein. Operations required for testing or for normal care, maintenance, and use of the system must be performed from the front of the enclosure. If more than a single unit is required at a location to form a complete control unit, the unit cabinets must match exactly. [If more than a single unit is required, and is located in the lobby/entrance, notify the Contracting Officer's Designated Representative (COR), prior to installing the equipment.] The system must be capable of defining any module as an alarm module and report alarm trouble, loss of polling, or as a supervisory module, and reporting supervisory short, supervisory open or loss of polling such as waterflow switches, valve supervisory switches, fire pump monitoring, independent smoke detection systems, relays for output function actuation.

a. Each control unit must provide power, supervision, control, and logic for the entire system, utilizing solid state, modular components, internally mounted and arranged for easy access. Each control unit must be suitable for operation on a 120 volt, 60 hertz, normal building power supply. Provide each control unit with supervisory functions for power failure, internal component placement, and operation.

b. Visual indication of alarm, supervisory, or trouble initiation on the FACU must be by liquid crystal display or similar means with a minimum of 80 characters.

2.3.1 Cabinet

Install control unit components in cabinets large enough to accommodate all
components and also to allow ample gutter space for interconnection of control units as well as field wiring. The cabinet must be a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and [surface][semi-recessed] mounting provisions. The enclosure must be identified by an engraved phenolic resin nameplate. Lettering on the nameplate must say "Fire Alarm control unit" and must not be less than 25 mm 1-inch high. Provide prominent rigid plastic or metal identification plates for lamps, circuits, meters, fuses, and switches.

2.3.2 Silencing Switches

2.3.2.1 Alarm Silencing Switch

Provide an alarm silencing switch at the FACU that must silence the audible and visual notification appliances. Subsequent activation of initiating devices must cause the notification appliances to re-activate.

2.3.2.2 Supervisory/Trouble Silencing Switch

Provide supervisory and trouble silencing switch(es) that must silence the audible trouble and supervisory signal(s), but not extinguish the visual indicator. This switch must be overridden upon activation of a subsequent supervisory or trouble condition. Audible trouble indication must resound automatically every 24 hours after the silencing feature has been operated if the supervisory or trouble condition still exists.

2.3.3 Non-Interfering

Power and supervise each circuit such that a signal from one device does not prevent the receipt of signals from any other device. Initiating devices must be manually reset by switch from the FACU after the initiating device or devices have been restored to normal.

2.3.4 Memory

Provide each control unit with non-volatile memory and logic for all functions. The use of long life batteries, capacitors, or other age-dependent devices must not be considered as equal to non-volatile processors, PROMS, or EPROMS.

2.3.5 Field Programmability

Provide control units and control units that are fully field programmable for both input and output of control, initiation, notification, supervisory, and trouble functions. The system program configuration must be menu driven. System changes must be password protected. Any proprietary equipment and proprietary software needed by qualified technicians to implement future changes to the fire alarm system must be provided as part of this contract.

2.3.6 Input/Output Modifications

The FACU must contain features that allow the bypassing of input devices from the system or the modification of system outputs. These control features must consist of a control unit mounted keypad[ and a keyboard]. Any bypass or modification to the system must indicate a trouble condition on the FACU.
2.3.7 Resetting

Provide the necessary controls to prevent the resetting of any alarm, supervisory, or trouble signal while the alarm, supervisory or trouble condition on the system still exists.

2.3.8 Walk Test

The FACU must have a walk test feature. When using this feature, operation of initiating devices must result in limited system outputs, so that the notification appliances operate for only a few seconds and the event is indicated in the history log[ and on the system printer], but no other outputs occur.

2.3.9 History Logging

The control unit must have the ability to store a minimum of 400 events in a log. These events must be stored in a battery-protected memory and must remain in the memory until the memory is downloaded or cleared manually. Resetting of the control unit must not clear the memory.

2.3.10 Manual Access

An operator at the control unit, having a proper access level, must have the capability to manually access the following information for each initiating device.

a. Primary status.

b. Device type.

c. Present average value.

d. Present sensitivity selected.

e. Detector range (normal, dirty).

2.3.11 Heat Detector Self-Test Routines

Automatic self-test routines must be performed on each detector that will functionally check detector sensitivity electronics and ensure the accuracy of the value being transmitted. Any detector that fails this test must indicate a trouble condition with the detector location at the control unit.

[2.4 VIDEO DISPLAY UNIT (VDU)]

***********************************************************************

NOTE: Contact the DFPE to determine if a VDU is to be provided.

***********************************************************************

a. The VDU must be the secondary operator-to-system interface for data retrieval, alarm annunciation, commands, and programming functions. The desk mounted VDU must consist of a LCD monitor and a keyboard. The VDU must have a [300][430][____] -mm [12][17][____] -inch minimum [touch ]screen, capable of displaying 25 lines of 80 characters each. Communications with the FACU must be supervised. Faults must be recorded in the history log[ and on the printer]. Power required must be 120 VAC, 60 Hz from the same source as the FACU.
b. To eliminate confusion during an alarm situation, the screen must have dedicated areas for the following functions:

(1) Alarm and return to normal.

(2) Commands, reports, and programming.

(3) Time, day, and date.

c. Use full English language throughout to describe system activity and instructions. Full English language descriptors defining system points must be 100 percent field programmable by factory trained personnel, alterable and user definable to accurately describe building areas.

d. Alarms and other changes of status must be displayed in the screen area reserved for this information. Upon receipt of alarm, an audible alarm must sound and the condition and point type must flash until acknowledged by the operator. Return to normal must also be annunciator and must require operator acknowledgment. The following information must be provided in full English:

(1) Condition of device (alarm, trouble, or supervisory).

(2) Type of device (for example, manual pull, waterflow)

(3) Location of device plus numerical system address.

e. The system must have multiple levels of priority for displaying alarms to conform with UL 864. Priority levels must be as follows:

(1) Level 1 - Fire Alarms Signals

(2) Level 2 - Supervisory Signals

(3) Level 3 - Carbon Monoxide Alarm Signals

(4) Level 4 - Trouble Signals

f. Provide the system with memory so that no alarm is lost. A highlighted message must advise the operator when unacknowledged alarms are in the system.

g. Multiple levels of access must be provided for operators and supervisors via user-defined passwords. Provide the following functions for each level:

(1) Operator level access functions:

(a) Display system directory, definable by device.

(b) Display status of an individual device.

(c) Manual command (alarm device with an associated command must use the same system address for both functions).

(d) Report generation, definable by device, output on the VDU[ or printer], as desired by the operator.
(e) Activate building notification appliances.

(2) Supervisor level access functions:

(a) Reset time and date.

(b) Enable or disable event initiated programs[, printouts,] and initiators.

(c) Enable or disable individual devices and system components.

h. The above supervisor level functions must not require computer programming skills. Changes to system programs must be [recorded on the printer and ]maintained in the control unit as a trouble condition.

2.5 REMOTE ANNUNCIATOR

**************************************************************************

NOTE: Provide the annunciator at a location in accordance with NFPA 72. A suggested location should be near the door through which the first responders will enter the building as indicated in their pre-fire plan, typically the main entrance.

**************************************************************************

[2.5.1 LCD Annunciator]

Provide a [semi-recessed][flush] mounted annunciator that includes an LCD display. The display must indicate the device in trouble/alarm or any supervisory device. Display the device name, address[, and actual building location].

A building floor plan must be provided and mounted (behind Plexiglass or similar protective material) at the annunciator location. The floor plan must indicate all rooms by name and number including the locations of stairs and elevators. The floor plan must show all devices and their programmed address to facilitate identification of their physical location from the LCD display information.

[2.5.2 Graphic Annunciator]

**************************************************************************

NOTE: Graphic annunciators should be provided only when a large number of concealed devices are installed. Normally, exposed devices will be annunciated by zone only on the fire alarm control unit zone annunciator and remote zone annunciator. Edit accordingly. Locate graphic annunciator(s) at or near building entrance to allow fire department quick access to the annunciator.

**************************************************************************

Graphic annunciator must be of the [interior][weatherproof] type, [flush][surface][pedestal]-mounted. Annunciator must be provided with the [building][room] floor plan, drawn to scale, with alarm lamps mounted to represent the location of [each concealed detector][each initiating device]. Annunciator graphic must also show the locations of the annunciator and control unit, and must have a "you are here" arrow showing its location. Orient building floor plan on graphic to location of person
viewing the graphic (i.e., the direction the viewer is facing must be toward the top of the graphic display). Provide a North arrow. [Principal rooms and areas shown must be labeled with room numbers or titles.] Detectors mounted above ceilings, [on ceilings, ] and beneath raised floors and different types of initiating devices must have different symbols or lamps of different colors for identification. Lamps must illuminate upon activation of corresponding device and must remain illuminated until the system is reset. Annunciator must have a lamp test switch.

2.5.2.1 Materials

Construct the graphic annunciator face plate of [smoked Plexiglas] [non-glare matte finish] [anodized bronze] [anodized aluminum]. The face plate must be backlit with LEDs. Control equipment and wiring must be housed in a [recessed] [semi-recessed] [surface mounted] back box. The exposed portions of the back box must be [chrome plated] [anodized bronze] [anodized aluminum] without knockouts.

2.5.2.2 Programming

Where programming for the operation of the graphic annunciator is accomplished by a separate software program other than the software for the FACU, the software program must not require reprogramming after loss of power. The software must be reprogrammable in the field.

2.5.3 Printer

**************************************************************************
NOTE: If the printer will be located in a SCIF or similar area, specify "no stored memory".
**************************************************************************

a. Provide a system printer [with no stored memory] to record alarm, supervisory, and trouble conditions without loss of any signal or signals. Printout must be by circuit, device, and function as provided in the FACU. Printer must operate on a 120 VAC, 60 Hz power supply.

b. The printer must have at least 80 characters per line and have a 96 ASCII character set. The printer must have a microprocessor-controlled, bi-directional, logic seeking head capable of printing 120 characters per second utilizing a 9 by 7 dot matrix print head. Printer must not contain internal software which is essential for proper operation.

c. When the FACU receives a signal, the alarm, supervisory, and trouble condition must be printed. The printout must include the type of signal, the circuit or device reporting, the date, and the time of the occurrence. The printer must differentiate alarm signals from other printed indications. When the system is reset, this condition must also be printed including the same information concerning device, location, date, and time. Provide a means to automatically print a list of existing alarm, supervisory, and trouble conditions in the system. If a printer is off-line when an alarm is received, the system must have a buffer to retain the data and it must be printed when the printer is restored to service. The printer must have an indicator to alert the operator that the paper has run out.

2.6 MANUAL STATIONS

**************************************************************************
NOTE: Architectural Barriers Act (ABA) requires that manual alarm stations be mounted at a maximum of 1.1 m \(44\) inches above finished floor (AFF).

Provide metal or plastic, [semi-flush][flush][surface] mounted, [single][double]-action, addressable manual stations, that are not subject to operation by jarring or vibration. Stations must be equipped with screw terminals for each conductor. Stations that require the replacement of any portion of the device after activation are not permitted. Stations must be finished in red with molded raised lettering operating instructions of contrasting color. The use of a key must be required to reset the station.

2.7 SMOKE DETECTORS

NOTE: Provide smoke detectors only in spaces where they are specifically required by UFC 3-600-01, DESIGN: FIRE PROTECTION ENGINEERING FOR FACILITIES.

Smoke detectors provided in elevator machinery rooms are to be provided per requirements of UFC 3-600-01. Coordinate with Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS, Section 14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS and/or Section 14 24 13 HYDRAULIC FREIGHT ELEVATORS, Section 14 24 23 HYDRAULIC PASSENGER ELEVATORS.

2.7.1 Spot Type Detectors

Provide addressable [photoelectric][ionization][laser] smoke detectors as follows:

a. Provide analog/addressable [photoelectric smoke detectors utilizing the photoelectric light scattering principle for operation in accordance with UL 268][smoke detectors that operate on the ionization principle and are actuated by the presence of visible or invisible products of combustion][laser smoke detectors utilizing laser diode and patented smoke sensing chamber, designed to amplify signals from smoke but diminish stray internal reflections and must, on command from the FACU, send data to the control unit representing the analog level of smoke density]. Smoke detectors must be listed for use with the FACU.

b. Provide self-restoring type detectors that do not require any readjustment after actuation at the FACU to restore them to normal operation. The detector must have a visual indicator to show actuation.

c. Vibration must have no effect on the detector's operation. Protect the detection chamber with a fine mesh metallic screen that prevents the entrance of insects or airborne materials. The screen must not inhibit the movement of smoke particles into the chamber.

d. Provide twist lock bases [with sounder that produces a minimum of 90 dBA at 3 m 10 feet] with screw terminals for each conductor. The detectors must maintain contact with their bases without the use of springs.

e. The detector address must identify the particular unit, its location.
within the system[, and its sensitivity setting]. Detectors must be of the low voltage type rated for use on a 24 VDC system.

[f. Laser smoke detector must be listed for use with the FACU. Detector must be able to achieve sensitivities from 0.02 percent-per-foot to 2 percent-per-foot obscuration.

g. Laser smoke detector must provide point identification of the fire location through addressability, must experience no delay in response time due to smoke dilution or smoke transportation time, and must offer complete supervision of wiring and detector.]

[2.7.2 Projected Beam Smoke Detector

Detectors must consist of [combined transmitter and receiver unit] [separate transmitter and receiver units]. The transmitter unit must emit an infrared beam to the receiver unit [the use of a supplied reflector is required for the combined unit]. When the signal at the receiver falls below a preset threshold, the detector must initiate an alarm. The receiver must contain an LED status indicator that illuminates when an alarm condition exists. Long-term changes to the received signal caused by environmental variations must be automatically compensated. Detectors must incorporate features to assure that they are operational; a trouble signal must be initiated if the beam is obstructed for more than 3 seconds, the limits of the compensation circuit are reached, or the housing cover is removed. Detectors must have multiple sensitivity settings in order to meet UL listings for the different distances covered by the beam.

]2.7.3 Duct Smoke Detectors

**************************************************************************

NOTE: The requirements for Duct Detectors will be coordinated with the HVAC requirements and Sections 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. All required duct detectors will be shown on the contract drawings.

**************************************************************************

Duct-mounted addressable photoelectric smoke detectors must consist of a smoke detector, as specified in paragraph Spot Type Detectors, mounted in a special housing fitted with duct sampling tubes. Detector circuitry must be mounted in a metallic or plastic enclosure exterior to the duct.[ It is not permitted to cut the duct insulation to install the duct detector directly on the duct.] Detectors must be listed for operation over the complete range of air velocities, temperature and humidity expected at the detector when the air-handling system is operating. Detectors must be powered from the FACU.

a. Sampling tubes must run the full width of the duct. The duct detector package must conform to the requirements of NFPA 90A, UL 268A, and must be listed for use in air-handling systems. The control functions, operation, reset, and bypass must be controlled from the FACU.

b. Lights to indicate the operation and alarm condition must be visible and accessible with the unit installed and the cover in place. Remote indicators must be provided where required by NFPA 72. Remote indicators as well as the affected fan units must be properly identified in etched plastic placards.
c. Detectors must provide for control of auxiliary contacts that provide control, interlock, and shutdown functions specified in Section 23 09 00 to INSTRUMENTATION AND CONTROL FOR HVAC. Auxiliary contacts provide for this function must be located within 1 m 3 feet of the controlled circuit or appliance. The auxiliary contacts must be supplied by the fire alarm system manufacturer to ensure complete system compatibility.

[2.8 AIR SAMPLING SMOKE DETECTION SYSTEM]

The [addressable] air sampling smoke system must consist of a detector assembly housing an integral aspiration fan, filter, laser-based detection chamber and control, output and supervision circuitry.[ Each sampling point must be capable of being independently addressable.] The system must consist of a piping or tubing distribution network that runs from the detector assembly(s) to the protected area(s) and is supported by air sampling smoke detection system calculations from a computer-based design modeling tool. The system must include configurable alarm and trouble relay outputs for interface to other systems where required.

a. System must be complete in all ways. It must include all engineering, and electrical installation, all detection and control equipment, auxiliary devices and controls, alarm interface, functional checkout and testing, training and all other operations necessary for a functional system.

b. System base detectors and modules must each accommodate up to [40 addressable][_____] microbore sampling tubes where each tube has a sampling point at the end. Additional modules may be used to provide up to [20 addressable][_____] sampling holes per system.

c. Program alarm thresholds to the following values unless the results of the pre-Government system tests indicate a clear need to change them. In the event that such a need is indicated, notify the Contracting Officer and provide complete documentation concerning the need to deviate from these values. Include within the deviation documentation request, information that complies with the paragraph entitled "Sensitivity Verification Test". Ensure initial threshold levels are approved prior to the Government test.

(1) Alarm Level 1: set ALERT at [_____] [0.0250] percent obscuration/foot

(2) Alarm Level 2: set PRE-ALARM at [_____] [0.0500] percent obscuration/foot

(3) Alarm Level 3: set FIRE 1 at [_____] [0.1000] percent obscuration/foot

(4) Alarm Level 4: set FIRE 2 at [_____] [0.2000] percent obscuration/foot

d. All air sampling smoke detection devices and associated components must be new, standard products or the manufacturer's latest design and suitable to perform the functions intended.

e. The laser detection chamber must be of the mass light scattering type and capable of detecting a wide range of smoke particle types of varying size. A particle counting method must be employed for the purposes of:
(1) Preventing large particles from affecting the true smoke reading.

(2) Monitoring contamination of the filter (for example, dust and dirt) to automatically notify when maintenance is required. The particle counting method must not be used for the purpose of smoke density measurement.

f. Detector(s) must be self-monitoring for filter contamination and provide indication through system fault when replacement is necessary. Detectors which allow automatic reset of filter status upon removal and re-insertion are not permitted.

g. Detector(s) must contain relays for alarm and fault conditions. The relays must be software programmable to the required functions.

h. Detector(s) must permit configuration by programmers that are either integral to the system, portable or PC based.

i. Detector(s) must allow programming of:

(1) Smoke threshold alarm levels; ALERT, PRE-ALARM, FIRE 1 and FIRE 2.

(2) Time delays. Ensure the display control unit contains individual adjustable alarm time delay features for each of the alarm threshold levels. Provide an adjustment range between 0 and 60 seconds. Program the alarm threshold time delays to 30 seconds for alarm levels 1 and 2, and 15 seconds for alarm levels 3 and 4.

(3) Faults, including airflow, detector, power, filter and network, as well as an indication of the urgency of the fault.

(4) Configuration of relay outputs for remote indication of alarm and fault conditions.

(5) General purpose input functionality.

2.9 HEAT DETECTORS

**************************************************************************
NOTE: Heat detectors provided in elevator machinery rooms are strictly for the warning sign in the elevator cab and must not alarm the FACU. Coordinate with Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS, Section 14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS and/or Section 14 24 13 HYDRAULIC FREIGHT ELEVATORS, Section 14 24 23 HYDRAULIC PASSENGER ELEVATORS.
**************************************************************************

2.9.1 Heat Detectors

Heat detectors must be analog/addressable and designed for detection of fire by [fixed temperature][combination fixed temperature and rate-of-rise principle][rate-compensating principle] in accordance with UL 521. The alarm condition must be determined by comparing detector value with the stored values. Detectors located in areas subject to moisture, exterior atmospheric conditions, or hazardous locations [as defined by NFPA 70][ and ][as indicated], must be types approved for such locations.
[2.9.1.1  Combination Fixed-Temperature and Rate-of-Rise Detectors]

Detectors must be [surface][semi-flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-resetting. Detector must operate at [57.2][90] degrees C[135][194] degrees F. Detector must feature rate compensation. [Detectors rated to operate at 57.2 degrees C135 degrees F must not respond to momentary temperature fluctuations less than 16.7 degrees C30 degrees F per minute between 16 and 38 degrees C60 and 100 degrees F].[  Detectors rated to operate at 90 degrees C194 degrees F must not respond to momentary temperature fluctuations less than 27.8 degrees C50 degrees F per minute between 16 and 66 degrees C60 and 150 degrees F.][ The detector assembly must be [weatherproof][ and ] [explosionproof].]

[2.9.1.2  Rate Compensating Detectors]

Detector backbox must be [surface][flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring and hermetically sealed.[ The detector assembly must be [weatherproof][ and ] [explosionproof].]

[2.9.1.3  Line-Type Fixed Temperature Detectors]

**************************************************************************
NOTE: Specify line-type heat detectors only with approval of the EFD/EFA Fire Protection Engineer.
**************************************************************************

Provide [thermostatic][ or ][thermistor] line-type heat detection cable [with weather-resistant outer covering] where indicated. Cable must be nominally rated for a temperature of [68][88][138] degrees C [155][190][280] degrees F and must operate on fixed temperature principle only.

[2.9.1.4  Fixed Temperature Detectors]

Detectors must be [surface][semi-flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring. The detectors must have a specific temperature setting [of [57.2][_____] degrees C [135][_____] degrees F][as shown].[  The detector assembly must be [weatherproof][ and ] [explosionproof].]

[2.10  FLAME DETECTORS]

**************************************************************************
NOTE: Modify these paragraphs as necessary to indicate that detectors placed in an explosive environment will be approved for use in the appropriate class, division, and group environment as defined in NFPA 70 and as shown on drawings.
**************************************************************************

Detectors must be sensitive to the micron range best suited for their intended use. Detectors must operate over electrically supervised wiring circuits and the loss of power to the detector must result in a trouble signal. A self-test feature must be provided for each detector to be individually tested.
**2.10.1 Infrared (IR) Single Frequency Flame Detector**

**************************************************************************
NOTE: The single frequency IR flame detector has the advantage of a fast response and is moderately sensitive. Its disadvantages are being affected by temperature extremes and being subject to false alarms from a myriad of IR sources.
**************************************************************************

The detector must be sensitive in the range of [_____] to [_____] micrometers only.

**2.10.2 Infrared (IR) Multi Frequency Flame Detector**

**************************************************************************
NOTE: The IR multi frequency flame detector has the advantages of a moderately fast response, moderate sensitivity, and a lower false alarm rate. Its disadvantage is being affected by temperature extremes.
**************************************************************************

The IR detector must consist of three or more IR sensors, each selected for a different IR frequency. The primary sensor must be sensitive in the range of [_____] to [_____] micrometers only. Secondary sensors are tuned to different IR wavelengths to null out the effect of black body radiation to the primary sensor.

**2.10.3 Ultraviolet (UV) Flame Detectors**

**************************************************************************
NOTE: Ultraviolet (UV) flame detectors can be set to respond accurately to UV wavelength light produced by flame from both indoors and outdoors. UV flame detectors operate on the Geiger-Muller principle. These gas-filled vacuum tubes respond in the UV portion of the spectrum but can ignore UV radiation from the sun because the upper response range of the detector falls below the range of UV radiation that reaches the earth.

Solid-state UV detectors are available, but their spectral response extends into the sun's UV range and are not recommended for external use.

UV detectors have an 80 to 90 degree cone of vision. The UV detector has a fast response time and usually is not affected by rain, wind, snow, high humidity, or temperature and pressure extremes. UV units will produce false alarms if they are exposed to arc welding or X-ray and gamma radiation. They can also be blinded by oil film or smoke. UV flame detectors that are used in dirty and dusty environments should be equipped with automatic self-test and self-cleaning devices. The cleaning device uses a stream of clean air across the lens surface to minimize the build-up of
contaminants.

UV flame detector must be of the narrow band response type which operates on radiated ultraviolet energy and must be sensitive in the range of [_____] to [_____] micrometers only. The cone of vision must be 80 degrees or greater. Each detector must be completely insensitive to light sources in the visible frequency range.

][2.10.4 Combination UV/IR Flame Detector

NOTE: Combination UV/IR flame detectors have been used both inside and outside to detect fires, but are slower to react than individual units.

The UV/IR detector must provide discrimination against false alarms by requiring both UV and IR flame detection before an alarm is sent. The UV sensor must be sensitive in the range of 0.185 to 0.265 micrometers only. The IR sensor must be sensitive in the range of [_____] to [_____] micrometers only. Detectors must be completely insensitive to light sources in the visible frequency range.

][2.11 MULTI-CRITERIA DETECTORS

The designer must select the sensor required to initiate a fire alarm condition.

Multi-criteria detectors must contain [fixed temperature [_____] degrees C F heat sensor], [rate-of-rise heat sensor], [photoelectric smoke detector], [_____] elements in a single housing.

][2.12 CARBON MONOXIDE DETECTOR

Analog/addressable carbon monoxide (CO) detectors must be listed to UL 2075 and set to respond to the sensitivity limits of UL 2034. Carbon monoxide detectors must be listed for use with fire alarm control units. Detectors must be [surface] [semi-flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring. For FACU with no listed compatible addressable CO detectors, provide listed 4-wire detectors. Do not provide CO detectors with local alarms. Detector must be provided with an LED status indicator.

a. Where 4-wire CO detectors are necessary, each 4-wire CO detector must be individually monitored via addressable interface modules for alarm and off normal/trouble conditions (including loss of power to the individual detector). Power circuits for 4-wire CO detectors must be dedicated to powering the CO detectors only. Battery powered and 120 VAC powered detectors are prohibited.

b. Wiring connections must be made by means of screw terminals and detectors must be equipped with trouble relays. Detectors must be able to mount a single-gang electrical box.

c. A trouble condition at an individual CO detector must not affect any other CO detectors. CO detectors must be powered by the FACU.
d. Detectors must be provided with a means to test CO gas entry into the CO sensing cell.

2.13 ADDRESSABLE INTERFACE DEVICES

The initiating device being monitored must be configured as a [Class "A"] [Class "B"] initiating device circuits. The module must be listed as compatible with the control unit. The module must provide address setting means compatible with the control unit's SLC supervision and store an internal identifying code. Monitor module must contain an integral LED that flashes each time the monitor module is polled and is visible through the device cover plate. Pull stations with a monitor module in a common backbox are not required to have an LED. [Existing fire alarm system initiating device circuits must be connected to a single module to supervise the circuit.] Modules must be listed for the environmental conditions in which they will be installed.

2.14 ADDRESSABLE CONTROL MODULES

The control module must be capable of operating as a relay (dry contact form C) for interfacing the control unit with other systems, and to control door holders or initiate elevator fire service. The module must be listed as compatible with the control unit. The indicating device or the external load being controlled must be configured as [Class B] [Class A] notification appliance circuits. The system must be capable of supervising, audible, visual and dry contact circuits. The control module must have both an input and output address. The supervision must detect a short on the supervised circuit and must prevent power from being applied to the circuit. The control model must provide address setting means compatible with the control unit's SLC supervision and store an internal identifying code. The control module must contain an integral LED that flashes each time the control module is polled and is visible through the device cover plate. Control Modules must be listed for the environmental conditions in which they will be installed.

2.15 ISOLATION MODULES

a. Provide isolation modules to subdivide each signaling line circuit [into groups of not more than 20 addressable devices][_____] [each floor][in accordance with NFPA 72] between adjacent isolation modules.

b. Isolation modules must provide short circuit isolation for signaling line circuit wiring.

c. Power and communications must be supplied by the SLC and must report faults to the FACU.

d. After the wiring fault is repaired, the fault isolation modules must test the lines and automatically restore the connection.

2.16 NOTIFICATION APPLIANCES

2.16.1 Audible Notification Appliances

******************************************************************************
NOTE: The designer must layout speakers to achieve both the required dBA levels requires by NFPA 72.
NOTE: Where horns or bells are used for fire alarm notification, calculate the proper locations for these devices as detailed in "Designing Fire Alarm Audibility," which is contained in the Society of Fire Protection Engineers (SFPE) Handbook of Fire Protection Engineering. Submit the calculations at the 35-percent design review.

**************************************************************************

Audible appliances must conform to the applicable requirements of UL 464. Appliances must be connected into notification appliance circuits. Surface mounted audible appliances must be painted [red][white][_____] Recessed audible appliances must be installed with a grill that is painted [red][white][_____] [with a factory finish to match the surface to which it is mounted].

2.16.1.1 Horns

Horns must be [semi-flush mounted][surface-mounted, with the matching mounting backbox surface mounted vibrating type suitable for use in an electrically supervised circuit]. Horns must produce a sound rating of at least 85 dBA at 3.1 meters [10 feet]. Horns used in exterior locations must be specifically listed or approved for outdoor use and be provided with metal housing and protective grilles.[ Horns must be [weatherproof][explosionproof].]

2.16.1.2 Bells

Bells must be surface mounted with the matching mounting backbox [surface mounted][recessed]. Bells must be suitable for use in an electrically supervised circuit. Bells must be the underdome type producing a minimum output rating of [85] [_____] dBA at 3.1 m [10 feet]. Bells used in exterior locations must be specifically listed or approved for outdoor use and be provided with metal housing and protective grilles. Single stroke, electrically operated, supervised, solenoid bells must be used for coded applications.

2.16.1.3 Chimes

**************************************************************************

NOTE: Chimes are normally only used in hospitals and child development centers to alert the staff about a fire emergency without arousing the patients. Sound output is low and prevents them from being used in areas having even moderately low noise levels.

**************************************************************************

Chimes must be electrically operated, supervised, electronic type, with an adjustable frequency of 800 to 1200 Hertz. Chimes must have a minimum sound rating of [80] [_____] dBA at 3 m [10 feet]. Chimes must ring the bell codes, as indicated.

2.16.2 Visual Notification Appliances

**************************************************************************

NOTE:
1. ABA requires that Visual Notification Appliances be provided in buildings and facilities in each of
the following areas: restrooms, and any general usage area (e.g., meeting rooms), hallways, lobbies, and any other area for common use and other areas stated at www.access-board.gov. The Visual Notification Appliance must be mounted as required by ABA that directs compliance with NFPA 72. In addition, alarms in guest rooms required to provide communication features must comply with sections 18.5.5.7 of NFPA 72. Shop drawings must indicate location, dimensions, content, details, and other required information to indicate extent of complying with ABA requirements.

2. Currently NFPA 72 requires "clear color" strobes for Fire Alarm Notification. NFPA 72 requires the strobe must be marked "Fire" to clear identify the function.

Visual notification appliances must conform to the applicable requirements of UL 1638, UL 1971 and conform to the Architectural Barriers Act (ABA). Visual Notification Appliances must have clear high intensity optic lens, xenon flash tubes, or light emitting diode (LED) and be marked "Alert" in letters of contrasting color. The light pattern must be disbursed so that it is visible above and below the strobe and from a 90 degree angle on both sides of the strobe. Strobe flash rate must be 1 flash per second and a minimum of [15][30][75][_____] candela based on the UL 1971 test. Strobe must be [surface][semi-flush] mounted.

2.17 ELECTRIC POWER

2.17.1 Primary Power

Power must be [120][_____] VAC [50][60] Hz service for the FACU from the AC service to the building in accordance with NFPA 72.

2.18 SECONDARY POWER SUPPLY

Provide for system operation in the event of primary power source failure. Transfer from normal to auxiliary (secondary) power or restoration from auxiliary to normal power must be automatic and must not cause transmission of a false alarm.

2.18.1 Batteries

Provide sealed, maintenance-free, [sealed lead acid][lead-calcium][gel cell] batteries as the source for emergency power to the FACU. Batteries must contain suspended electrolyte. The battery system must be maintained in a fully charged condition by means of a solid state battery charger. Provide an automatic transfer switch to transfer the load to the batteries in the event of the failure of primary power.

2.18.1.1 Capacity

Battery size must be the following capacity. This capacity applies to every control unit associated with this system, including supplemental notification appliance circuit panels, auxiliary power supply panels, and fire alarm transmitters.
a. Sufficient capacity to operate the fire alarm system under supervisory and trouble conditions, including audible trouble signal devices for 48 hours and audible and visual signal devices under alarm conditions for an additional 15 minutes.

2.18.1.2 Battery Power Calculations

a. Verify that battery capacity exceeds supervisory and alarm power requirements for the criteria noted in the paragraph "Capacity" above.

(1) Substantiate the battery calculations for alarm and supervisory power requirements. Include ampere-hour requirements for each system component and each control unit component, and compliance with UL 864.

(2) Provide complete battery calculations for both the alarm and supervisory power requirements. Submit ampere-hour requirements for each system component with the calculations.

(3) Provide voltage drop calculations to indicate that sufficient voltage is available for proper operation of the system and all components. Calculations must be performed using the minimum rated voltage of each component.

b. For battery calculations assume a starting voltage of 24 VDC for starting the calculations to size the batteries. Calculate the required Amp-Hours for the specified standby time, and then calculate the required Amp-Hours for the specified alarm time. Using 20.4 VDC as starting voltage, perform a voltage drop calculation for circuits containing device and/or appliances remote from the power sources.

2.18.2 Battery Chargers

Provide a solid state, fully automatic, variable charging rate battery charger. The charger must be capable of providing 120 percent of the connected system load and must maintain the batteries at full charge. In the event the batteries are fully discharged (20.4 Volts dc), the charger must recharge the batteries back to 95 percent of full charge within 48 hours after a single discharge cycle as described in paragraph CAPACITY above. Provide pilot light to indicate when batteries are manually placed on a high rate of charge as part of the unit assembly if a high rate switch is provided.

2.19 SURGE PROTECTIVE DEVICES

Surge protective devices must be provided to suppress all voltage transients which might damage fire alarm control unit components. Systems having circuits located outdoors, communications equipment must be protected against surges induced on any signaling line circuit. Cables and conductors, that serve as communications links, must have surge protection circuits installed at each end. The surge protective device must wire in series to the power supply of the protected equipment with screw terminations. Line voltage surge arrestor must be installed directly adjacent to the power panel where the FACU breaker is located.

a. Surge protective devices for nominal 120 VAC must be UL 1449 listed with a maximum 500 volt suppression level and have a maximum response time of 5 nanoseconds. The surge protective device must also meet IEEE C62.41.1 and IEEE C62.41.2 category B tests for surge capacity.
The surge protective device must feature multi-stage construction and be provided with a long-life indicator lamp (either light emitting diode or neon) which extinguishes upon failure of protected components. Any unit fusing must be externally accessible.

b. Surge protective devices for nominal 24 VAC, fire alarm telephone dialer, or ethernet connection must be UL 497B listed, meet IEEE C62.41.1 and have a maximum response time of 1-nanosecond. The surge protective device must feature multi-stage construction and be self-resetting. The surge protective device must be a base and plug style. The base assembly must have screw terminals for fire alarm wiring. The base assembly must accept "plug-in" surge protective module.

c. All surge protective devices (SPD) must be the standard product of a single manufacturer and be equal or better than the following:

1. For 120 VAC nominal line voltage: UL 1449 and UL 1283 listed, series connected 120 VAC, 20A rated, surge protective device in a NEMA 4x enclosure. Minimum 50,000 amp surge current rating with EMI/RFI filtering and a dry contact circuit for remote monitoring of surge protection status.

2. For 24-volt nominal line voltage: UL 497B listed, series connected low voltage, 24-volt, 5A rated, loop circuit protector, base and replaceable module.

3. For alarm telephone dialers: UL 497A listed, series connected, 130-volt, 150 mA rated with self-resetting fuse, dialer circuit protector with modular plug and play.

4. For IP-DACTS: UL 497B listed, series connected, 6.4-volt, 1.5A rated with 20 kA/pair surge current, data network protector with modular plug and play.

2.20 WIRING

Provide wiring materials under this section as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM with the additions and modifications specified herein.

2.20.1 Alarm Wiring

IDC and SLC wiring must be [fiber optic][ or ][solid copper] cable in accordance with the manufacturers requirements. Copper signaling line circuits and initiating device circuit field wiring must be No. [14][16][18][_____] AWG size conductors at a minimum. Visual notification appliance circuit conductors, that contain audible alarm appliances, must be copper No. 14 AWG size conductors at a minimum. Wire size must be sufficient to prevent voltage drop problems. Circuits operating at 24 VDC must not operate at less than the listed voltages for the detectors and/or appliances. Power wiring, operating at 120 VAC minimum, must be a minimum No. 12 AWG solid copper having similar insulation. Acceptable power-limited cables are FPL, FPLR or FPLP as appropriate with red colored covering. Nonpower-limited cables must comply with NFPA 70.

2.21 AUTOMATIC FIRE ALARM TRANSMITTERS

**************************************************************************

SECTION 28 31 70 Page 43
NOTE: State the make and model number of existing proprietary supervising station receiving equipment. The choice of code transmitter, or radio transmitter depends upon the type of existing fire reporting system at the activity. Determine the type of activity reporting system (e.g., positive non interfering or shunt). In most cases a local energy-tripping device will be required. The facility Fire Dept. or Engineering office should be contacted to determine the type and amount of data to be supervised (monitored), e.g., -type: separate or common transmission of alarm, supervisory, and trouble type signals; -amount: all points, all zones, or the combined premises. Verify that existing monitoring equipment has sufficient capacity to support the additional premises or that it can be expanded as necessary to accommodate the new fire alarm system. Identify existing components.

**************************************************************************

2.21.1 Radio Transmitter and Interface Panels

Transmitters must be compatible with proprietary supervising station receiving equipment. Each radio alarm transmitter must be the manufacturer's recognized commercial product, completely assembled, wired, factory tested, and delivered ready for installation and operation. Transmitters must be provided in accordance with applicable portions of NFPA 72, Federal Communications Commission (FCC) 47 CFR 90 and Federal Communications Commission (FCC) 47 CFR 15. Transmitter electronics module must be contained within the physical housing as an integral, removable assembly. The proprietary supervising station receiving equipment is [_____] and the transmitter must be fully compatible with this equipment. At the contractors option, and if listed, the transmitter may be housed in the same control unit as the FAC. The transmitter must be narrowband radio, with FCC certification for narrowband operation and meets the requirements of the NTIA (National Telecommunications and Information Administration) Manual of Regulations and Procedures for Federal Frequency Management.

2.21.1.1 Operation

Operate each transmitter from 120-volt ac power. In the event of 120-volt ac power loss, the transmitter must automatically switch to battery operation. Switchover must be accomplished with no interruption of protective service, and must automatically transmit a trouble message. Upon restoration of ac power, transfer back to normal ac power supply must also be automatic.

2.21.1.2 Battery Power

Transmitter standby battery capacity must provide sufficient power to operate the transmitter in a normal standby status for a minimum of 72 hours and be capable of transmitting alarms during that period.

2.21.1.3 Transmitter Housing

Use NEMA Type 1 for housing. The housing must contain a lock that is keyed [identical to the fire alarm system for the building][identical to radio alarm transmitter housings on the Installation].
housing must be factory painted with a suitable priming coat and not less than two coats of a hard, durable weatherproof enamel.

2.21.1.4 Antenna

Antenna must be [omnidirectional, coaxial, halfwave dipole antennas][_____] for radio alarm transmitters with a driving point impedance to match transmitter output. The antenna and antenna mounts must be corrosion resistant and designed to withstand wind velocities of 161 km/hour 100 mph. Do not mount antennas to any portion of the building roofing system. Protect the antenna from physical damage.

][2.21.2 Digital Alarm Communicator Transmitter (DACT)

Provide DACT that is compatible with the existing supervising station fire alarm system. Transmitter must have a means to transmit alarm, supervisory, and trouble conditions via a single transmitter. Transmitter must have a source of power for operation that conforms to NFPA 72. Transmitter must be capable of initiating a test signal daily at any selected time. Transmitter must be arranged to seize telephone circuits in accordance with NFPA 72.

]2.21.3 Signals to Be Transmitted to the Base Receiving Station

**************************************************************************

NOTE: The following paragraph is applicable only to existing installations for connections to an auxiliary (public) alarm system. Edit this for the installation specific criteria.
**************************************************************************

The following signals must be sent to the base receiving station:

[ a. Sprinkler waterflow]
[ b. Manual pull stations]
[ c. Smoke detectors]
[ d. Duct smoke detectors]
[ e. Sleeping room smoke detectors]
[ f. Carbon monoxide detectors]
[ g. Heat detectors]
[ h. Fire extinguishing system]
[ i. Sprinkler valve supervision]
[ j. Fire pump running]
[ k. Fire pump supervision]
[ l. Water supply level and temperature]
[ m. Combustion engine drive fire pump running]
1. Selector switch in position than automatic
2. Engine over-speed
3. Low fuel
4. Low battery
5. Engine trouble (for example, low oil, over temp)

2.22 SYSTEM MONITORING

2.22.1 Valves

Each valve affecting the proper operation of a fire protection system, including automatic sprinkler control valves, standpipe control valves, sprinkler service entrance valve, valves at fire pumps, isolating valves for pressure type waterflow or supervision switches, and valves at backflow preventers, whether supplied under this contract or existing, must be electrically monitored to ensure its proper position. Provide each tamper switch with a separate address, unless they are within the same room, then a maximum of five can use the same address.

2.22.2 High/Low [Air][Nitrogen] Supervisory Switches

Provide monitoring of high and low supervisory [air][nitrogen] for [dry pipe][and][preaction] systems. Each air supervisory switch must have a separate address. Switches must be listed extinguishing system attachments. The device must contain double pole, double throw contacts. Operation of the switch must cause a supervisory signal to be transmitted to the FACU when [air][nitrogen] pressure in the system monitored sprinkler system increases more than 34.5 kPa5 psi above the normal system pressure or drops halfway from the normal pressure to the tripping point.

2.22.3 Room Low Temperature Supervisory Switch

Provide [monitoring of the ]listed supervisory air temperature switch for the [fire pump][sprinkler riser] room[s]. Switch must cause a supervisory signal to be transmitted to the FACU whenever the temperature in the room drops to below 4.4 degrees C40 degrees F. Device must reset when temperature rises above 4.4 degrees C40 degrees F.

2.22.4 Electromagnetic Door Holders

Electromagnetic holding devices must operate on [120 VAC][24 VDC], and require not more than [3][_____] watts of power to develop 6.9 kPa25 psi of holding force. Under normal conditions, the magnets must attract and hold the doors open. Operation must be fail safe with no moving parts. Electromagnetic door hold-open devices must not be required to be held open during building power failure. The device must be listed based on UL 228 tests.

2.23 ENVIRONMENTAL ENCLOSURES OR GUARDS

Environmental enclosures must be provided to permit fire alarm components to be used in areas that exceed the environmental limits of the listing. The enclosure must be listed for the device or appliance as either a manufactured part number or as a listed compatible accessory for the component is currently listed. Guards required to deter mechanical damage
must be either a listed manufactured part or a listed accessory for the category of the initiating device or notification appliance.

[2.24] FIREFIGHTER TELEPHONE COMMUNICATION SYSTEM

**************************************************************************
NOTE: Provide a master control station at the FACU with remote telephone stations in each stair at each floor landing, in each elevator lobby on each floor, and in elevator cabs. In addition, provide them at specific locations containing essential fire protection equipment, such as the fire pump room and outside the emergency generator room.

NOTE: In lieu of firefighter telephones radio repeater equipment compatible with responding fire department may be used if approved by the responding fire department.
**************************************************************************

2.24.1 General

Provide a firefighter telephone communication system with complete, common talk, closed circuits. The system must include, but not be limited to, a master control station mounted in the fire alarm control unit, a power supply and standby battery system, and remote telephone stations.

2.24.2 Features

The system must include the following features:

a. A master control station which must provide power, supervision, and control for wiring, components, and circuits. The act of lifting any remote telephone hand set from its cradle must cause both a visual and audible signal to annunciate at the master control station. Removing the hand set at the master control station and depressing a button at the remote telephone hand set must cause the automatic silencing of the audible signal.

b. Communication between the master control station hand set and any/or all remote hand sets must require the depressing of a push-to-talk switch located on any/all remote hand sets. During the time that the master control hand set is removed from its cradle it must be possible to communicate between five remote hand sets and the master control station.

c. Hand sets must be able to monitor any conversation in progress and join the conversation by pressing the push-to-talk button. It must not be possible to communicate between two or more remote hand sets with the master control station hand set in its cradle.

d. The master control station hand set must be red in color and equipped with a 1.5 m 5-foot long strain-relieved coiled cord.

e. The master control station must monitor wire and connections for any opens, shorts, or grounds which would render the system inoperable or unintelligible.

f. The master control station must be equipped with a silencing switch and
ring-back feature such that any audible trouble signal can be silenced and must be so indicated by the lighting of an amber LED. Once any trouble condition has been corrected, the amber LED must be extinguished.

g. The master control station must be equipped with a separate, LED annunciated switch for each telephone circuit. In addition, LEDs must provide for the annunciation of operating and supervisory power.

h. The loss of operating or supervisory power must cause an audible and visual indication at the master control station and must also cause the fire alarm trouble signal to sound on the FACU.

i. Switches, LEDs, and controls must be fully labeled.

2.24.3 Handsets

Handsets must have the following features:

a. Provide [surface][flush] mounted remote telephone stations.

b. Each station must be equipped with a hinged door that is magnetically locked.

c. Each hand set must be permanently wired in place with a coiled cord.

d. Each hand set must be red high-impact cycolac and must be equipped with a push-to-talk switch which, when operated, must signal the master control station and a switch-equipped, storage cradle.

e. Provide operating and supervising power from the same supply circuit(s) utilized for the FACU.

PART 3   EXECUTION

3.1 VERIFYING ACTUAL FIELD CONDITIONS

Before commencing work, examine all adjoining work on which the contractor's work is in any way dependent for perfect workmanship according to the intent of this specification section, and report to the Contracting Officer's Representative any condition which prevents performance of first class work. No "waiver of responsibility" for incomplete, inadequate or defective adjoining work will be considered unless notice has been filed before submittal of a proposal.

3.2 INSTALLATION

3.2.1 Fire Alarm Control Unit (FACU)

Locate the FACU [where indicated on the drawings][_____.] [Recess][Semi-recess][Surface mount] the enclosure with the top of the cabinet 2 m 6 feet above the finished floor or center the cabinet at [1.5][_____] m [5][_____] feet, whichever is lower. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the FACU. Locate the document storage cabinet adjacent to the FACU unless the Contracting Officer directs otherwise.
3.2.2 Battery Cabinets

When batteries will not fit in the FACU, locate battery cabinets below or adjacent to the FACU. Battery cabinets must be installed at an accessible location when standing at floor level. Battery cabinets must not be installed lower than 300 mm (12 inches) above finished floor, measured to the bottom of the cabinet, nor higher than 900 mm (36 inches) above the floor, measured to the top of the cabinet. Installing batteries above drop ceilings or in inaccessible locations is prohibited. Battery cabinets must be large enough to accommodate batteries and also to allow ample gutter space for interconnection of control units as well as field wiring. The cabinet must be provided in a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and surface mounting provisions. The cabinet must be identified by an engraved phenolic resin nameplate. Lettering on the nameplate must indicate the control unit(s) the batteries power and must not be less than 25 mm (1-inch) high.

3.2.3 Manual Stations

Locate manual stations as required by NFPA 72[ and as indicated on the drawings]. Mount stations so they are located no farther than [1.5][_____] m [5][_____] feet from the exit door they serve, measured horizontally. Manual stations must be mounted at [1067][1117][_____] mm [42][44][_____] inches measured to the operating handle.

3.2.4 Notification Appliances

**************************************************************************
NOTE: Locate strobes wall mounted in corridors no more than 4.5 m (15 feet) from the end of a corridor with 30 m (100 feet) maximum distance between strobes. Where there is an obstruction to the viewing path in the corridors, such as a cross-corridor door or ceiling elevation change, consider the obstruction as defining a new corridor. Provide ceiling mounted strobes in rooms accessible to the public, such as conference rooms, restrooms, courtrooms, cafeterias, and auditoriums in accordance with NFPA 72. In Child Development Centers only chimes must be used as the pre-alert tone prior to voice messages.
**************************************************************************

a. Locate notification appliance devices [as required by NFPA 72][where indicated] Where more than two visual notification appliances are located in the same room or corridor or field of view, provide synchronized operation. Devices must use screw terminals for all field wiring.[ Audible and visual notification appliances mounted in acoustical ceiling tiles must be centered in the tiles plus or minus 50 mm2 inches.].

b. Audible and visual notification appliances mounted on the exterior of the building, within unconditioned spaces, or in the vicinity of showers must be listed weatherproof appliances installed on weatherproof backboxes.

c. Speakers must not be located in close proximity to the FACU or LOC so as to cause feedback when the microphone is in use.
3.2.5 Smoke and Heat Detectors

Locate detectors [as required by NFPA 72 and their listing][as indicated on the drawings] on a 100 mm 4-inch mounting box. Install heat detectors not less than 100 mm 4 inches from a side wall to the near edge. Heat detectors located on the wall must have the top of the detector at least 100 mm 4 inches below the ceiling, but not more than 300 mm 12 inches below the ceiling. Smoke detectors are permitted to be on the wall no lower than 300 mm 12 inches from the ceiling with no minimum distance from the ceiling.[ In raised floor spaces, install the smoke detectors to protect[ 21 square meters 225 square feet per detector][_____.] ] Install smoke detectors no closer than 1 m 3 feet from air handling supply diffusers. Detectors installed in acoustical ceiling tiles must be centered in the tiles plus or minus 50 mm2 inches.

3.2.6 Carbon Monoxide Detectors

Locate detectors [as required by NFPA 72 and their listings][as indicated on the drawings] on a 100-mm4-inch mounting box.[ Carbon monoxide detectors must be installed separate from smoke and/or heat detectors.]

3.2.7 Air Sampling Smoke Detector

Locate air sampling smoke detectors in accordance with the manufacturer's instructions. Air sampling smoke detectors must be installed as follows:

a. Air Sampling Smoke Detector Assembly:

(1) Detector assembly must be mounted to a wall at a height between 48 to 60 inches1200 mm to 1800 mm to top of detector measured above the finished floor.

(2) Mounting must be in a fully accessible and visible location.

(3) Mounting or attachment to site equipment, cable trays, movable walls, other equipment or equipment supports is not permitted.

(4) Piping network insertion into the detector inlet must not be glued.

(5) Air sampling smoke detector assembly must be installed in accordance with this specification section and the manufacturer's installation and instruction manuals.

(6) Flexible tubing for termination of the sampling pipe network into detector inlet is not permitted unless allowed by its listing.

(7) Provide red background with white lettering labels that are plastic or phenolic type with a minimum of 0.25-inch6.4 mm block lettering to indicate detector and zone. For example: "AIR SAMPLING SOME DETECTOR No. 1-1 No. 5".

(8) Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. Install the frame in a conspicuous location observable from the ASD panel. The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions must be approved by the Contracting Officer before being posted.
b. Pipe and Sampling Tube Mounting:

(1) The pipe and sampling tubing detection network must be mounted as per the design and manufacturer's specification. The hardware used for mounting will depend upon the design and site requirements.

(2) To minimize flexing, pipes must be secured every 1.5 m (5 feet).

(3) Pipes must be suspended between 25 mm and 100 mm (1 and 4 inches) below the ceiling. In areas with a suspended ceiling, the pipe network must be installed above the ceiling utilizing the manufacturer's capillary sample port supported by the ceiling.

(4) The sampling tubes must be of the same length or use the manufacturer's guidelines to run tubes of the required lengths.

(5) When installing a pipe network in areas subject to high temperature fluctuations allow for the contraction and expansion of pipes.

(6) Where expansion or contraction of pipes is likely either after installation or on a continuous basis, do not place pipe clips adjacent to couplings and socket unions as these may interfere with the movement of the pipe.

(7) No bends are permitted within the first 450 mm (18 inches) from the detector inlet.

(8) The routing of the piping and sample tube network must be coordinated with potential obstructions, including cable trays, grounding bars, and HVAC ductwork.

(9) All changes in direction must be made with standard elbows or tees.

(10) All joints must be air-tight and made by using solvent cement, except at the entry to the detector assembly. Refer to ASTM F402.

(11) All pipes must be supported by mechanical hangers attached to the structure of the building. Not more than 300 mm (1-foot) of pipe must extend beyond the last hanger of each sampling pipe. The final installation must result in no noticeable deflection in the piping network.

(12) Attachment of air sampling pipes to cable trays, "gray iron", and telecommunications equipment is prohibited.

(13) Clearly label pipe network to distinguish the pipe from other facility pipe work or protective cabling enclosures. For example: "SMOKE DETECTION SAMPLING TUBE - DO NOT DISTURB". In open rooms and exposed areas, provide labels at no greater than 6.1-m (20-foot) intervals. Provide labels every 3 m (10 feet) where piping is installed above suspended ceilings and every 609 mm (2 feet), centered in the floor panels, where piping is installed within the raised floor cavity.

(14) Placement of the sampling tube must take into consideration appropriate sampling point locations and spacing.
c. Air Sampling Points:

(1) Open area ceiling sampling points must be oriented downward and must be within 25 mm to 100 mm (1 to 4 inches) below the underside of the ceiling above where the ceiling is smooth.

(2) Label all air sampling points with a round red label, each with a center hole to match the diameter of the drilled sampling point. For example: "AIR SAMPLING POINT DIA 3.2 MM 0.125 INCHES". Indicate fractional dimensions in decimal format with a minimum of three decimal places.

3.2.8 Graphic Annunciator

Locate the graphic annunciator as shown on the drawings. Mount the annunciator, with the top 1830 mm (6 feet) above the finished floor or center the annunciator at [1525][_____] mm [5][_____] feet, whichever is lower.

3.2.9 LCD REMOTE Annunciator

Locate the LCD annunciator as shown on the drawings. Mount the annunciator, with the top 2 m (6 feet) above the finished floor or center the annunciator at [1.5][_____] m [5][_____] feet, whichever is lower.

3.2.10 Electromagnetic Door Holder Release

Doors must be held open at a minimum of 90 degrees so as not to impede egress from the space. Mount the armature portion on the door and have an adjusting screw for seating the angle of the contact plate. Wall-mount the electromagnetic release, with a total horizontal projection not exceeding 100 mm (4 inches). Ensure all doors release to close upon first stage (pre-discharge) alarm. Electrical supervision of wiring external of control unit for magnetic door holding circuits is not required.

3.2.11 Firefighter Telephones

Mount telephone[ hand sets][ jacks] on the wall in each stair at each floor landing, in each emergency generator room, in each fire pump room, in each elevator machine room, in each elevator lobby, and in each elevator cab 1200 mm (4 feet) above the finished floor.

3.2.12 Ceiling Bridges

Provide ceiling bridges for ceiling-mounted appliances. Ceiling bridges must be as recommended/required by the manufacturer of the ceiling-mounted notification appliance.

3.3 SYSTEM FIELD WIRING

3.3.1 Wiring within Cabinets, Enclosures, and Boxes

Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of any box, enclosure, or cabinet. Conductors that are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting, or junction box must be connected to screw-type terminal blocks. Mark each terminal in accordance with the wiring diagrams of the system. The use of wire nuts or similar devices is prohibited. Wiring to conform with NFPA 70.
Indicate the following in the wiring diagrams:

a. Point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the FACU and remote fire alarm control units, initiating circuits, switches, relays and terminals.

b. Complete riser diagrams indicating the wiring sequence of devices and their connections to the control equipment. Include a color code schedule for the wiring. Include floor plans showing the locations of devices and equipment.

3.3.2 Terminal Cabinets

**************************************************************************
NOTE: Provide terminal cabinets on each floor where the fire alarm system supply riser is located and where the fire alarm return riser is located.
**************************************************************************

Provide a terminal cabinet at the base of any circuit riser, on each floor at each riser, and where indicated on the drawings. Terminal size must be appropriate for the size of the wiring to be connected. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the terminal cabinet. Minimum size is 200 mm by 200 mm 8 inches by 8 inches. Only screw-type terminals are permitted. Provide an identification label, that displays "FIRE ALARM TERMINAL CABINET" with 50 mm 2-inch lettering, on the front of the terminal cabinet.

3.3.3 Alarm Wiring

**************************************************************************
NOTE: Do not penetrate SCIF perimeters with copper signal line circuits. SCIF penetrations should be either fiber optic cable or IDC. IDC circuits penetrating the SCIF must be filtered.
**************************************************************************

a. Voltages must not be mixed in any junction box, housing or device, except those containing power supplies and control relays.

b. Utilize shielded wiring where recommended by the manufacturer. For shielded wiring, ground the shield at only one point, in or adjacent to the FACU.

c. [Pigtail or T-tap connections to signal line circuits, initiating device circuits, supervisory alarm circuits, and notification appliance circuits are prohibited.][ T-tapping using screw terminal blocks is allowed for Class "B" signaling line circuits.]

d. Color coding is required for circuits and must be maintained throughout the circuit. Conductors used for the same functions must be similarly color coded. Conform wiring to NFPA 70.

e. Pull all conductors splice free. The use of wire nuts, crimped
connectors, or twisting of conductors is prohibited. Where splices are unavoidable, the location of the junction box or pull box where they occur must be identified on the as-built drawings. The number and location of splices must be subject to approval by the _____ Designated Fire Protection Engineer (DFPE).

3.3.4 Back Boxes and Conduit

In addition to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, provide all wiring in rigid metal conduit or intermediate metal conduit unless specifically indicated otherwise. Minimum conduit size must be 19 mm3/4-inch in diameter. Do not use electrical non-metallic tubing (ENT) or flexible non-metallic tubing and associated fittings.

a. Galvanized rigid steel (GRS) conduit must be utilized where exposed to weather, where subject to physical damage, and where exposed on exterior of buildings. Intermediate metal conduit (IMC) may be used in lieu of GRS as allowed by NFPA 70.

b. Electrical metallic tubing (EMT) is permitted above suspended ceilings or exposed where not subject to physical damage. Do not use EMT underground, encased in concrete, mortar, or grout, in hazardous locations, where exposed to physical damage, outdoors or in fire pump rooms. Use die-cast compression connectors.

c. For rigid metallic conduit (RMC), only threaded type fitting are permitted for wet or damp locations.

d. Flexible metal conduit is permitted for initiating device circuits [_____]6 feet in length or less. Flexible metal conduit is prohibited for notification appliance circuits and signaling line circuits. Use liquid tight flexible metal conduit in damp and wet locations.

e. Schedule 40 (minimum) polyvinyl chloride (PVC) is permitted where conduit is routed underground or underground below floor slabs. Convert non-metallic conduit, other than PVC Schedule 40 or 80, to plastic-coated rigid, or IMC, steel conduit before turning up through floor slab.

f. Exterior wall penetrations must be weathertight. Conduit must be sealed to prevent the infiltration of moisture.

[g. For Class "A" or "X" circuits with conductor lengths of 10 feet3 meters or less, the conductors must be permitted to be installed in the same raceway in accordance with NFPA 72.]

3.3.5 Conductor Terminations

Labeling of conductors at terminal blocks in terminal cabinets, FACU, and remote FACU must be provided at each conductor connection. Each conductor or cable must have a shrink-wrap label to provide a unique and specific designation. Each terminal cabinet, FACU, and remote FACU must contain a laminated drawing that indicates each conductor, its label, circuit, and terminal. The laminated drawing must be neat, using 12 point lettering minimum size, and mounted within each cabinet, control unit, or unit so that it does not interfere with the wiring or terminals. Maintain existing color code scheme where connecting to existing equipment.
[3.4 DISCONNECTION AND REMOVAL OF EXISTING SYSTEM

**************************************************************************
NOTE: Contact the Contracting Officer, Base Fire Prevention Office, and/or Base Maintenance Personnel to determine what action is appropriate for the salvaging of existing fire alarm equipment.
**************************************************************************

Maintain existing fire alarm equipment fully operational until the new equipment has been tested and accepted by the Contracting Officer. As new equipment is installed, label it "NOT IN SERVICE" until the new equipment is accepted. Once the new system is completed, tested, and accepted by the Government, it must be placed in service and connected to the supervising station. Remove tags from new equipment and tag the existing equipment "NOT IN SERVICE" until removed from the building.

a. After acceptance of the new system by the Contracting Officer, remove existing equipment not connected to the new system, remove unused exposed conduit, and restore damaged surfaces. Remove the material from the site and dispose.

b. Disconnect and remove the existing fire alarm and smoke detection systems where indicated and elsewhere in the specification.

c. Control units and fire alarm devices and appliances disconnected and removed must be turned over to the Contracting Officer.

d. Properly dispose of fire alarm outlet and junction boxes, wiring, conduit, supports, and other such items.

3.5 CONNECTION OF NEW SYSTEM

The following new system connections must be made during the last phase of construction, at the beginning of the pre-Government tests. New system connections must include:

a. Connection of new relays to existing magnetic door hold-open devices.

b. Connection of new elevator recall relays to existing wiring and conduit.

c. Connection of new system transmitter to existing installation fire reporting system.

Once these connections are made, system must be left energized. Report immediately to the Contracting Officer, coordination and field problems resulting from the connection of the above components.

3.6 FIRESTOPPING

Provide firestopping for holes at conduit penetrations through floor slabs, fire-rated walls, partitions with fire-rated doors, corridor walls, and vertical service shafts in accordance with Section 07 84 00 FIRESTOPPING.

3.7 PAINTING

a. In unfinished areas (including areas above drop ceilings), paint all exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceway, junction boxes and covers red. In lieu
of painting conduit, the contractor may utilize red conduit with a factory applied finish.

b. In finished areas, paint exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceways, junction boxes, and electrical boxes to match adjacent finishes. The inside cover of the junction box must be identified as "Fire Alarm" and the conduit must have painted red bands 19 mm 3/4-inch wide at 3-meter 10-foot centers and at each side of a floor, wall, or ceiling penetration.

c. Painting must comply with Section 09 90 00 PAINTS AND COATINGS.

3.8 FIELD QUALITY CONTROL

******************************************************************************
NOTE: Listed tests are minimum required. Coordinate with the local Authority Having Jurisdiction (AHJ) for minimum requirements in excess of the NFPA 72 minimums or those recommend below. If additional tests are required, such tests must be added to the list.
******************************************************************************

3.8.1 Test Procedures

Submit detailed test procedures, prepared and signed by the NICET Level [III][ or ][IV] Fire Alarm Technician, and the representative of the installing company, [and reviewed by the QFPE] [60][_____] days prior to performing system tests. Detailed test procedures must list all components of the installed system such as initiating devices and circuits, notification appliances and circuits, signaling line devices and circuits, control devices/equipment, batteries, transmitting and receiving equipment, power sources/supply, annunciators, special hazard equipment, emergency communication equipment, interface equipment, and surge protective devices. Test procedures must include sequence of testing, time estimate for each test, and sample test data forms. The test data forms must be in a check-off format (pass/fail with space to add applicable test data; similar to the form in NFPA 72 and NFPA 4.) The test procedures and accompanying test data forms must be used for the pre-Government testing and the Government testing. The test data forms must record the test results and must:

a. Identify the NFPA Class of all Initiating Device Circuits (IDC), and Notification Appliance Circuits (NAC), and Signaling Line Circuits (SLC).

b. Identify each test required by NFPA 72 Test Methods and required test herein to be performed on each component, and describe how these tests must be performed.

c. Identify each component and circuit as to type, location within the facility, and unique identity within the installed system. Provide necessary floor plan sheets showing each component location, test location, and alphanumeric identity.

d. Identify all test equipment and personnel required to perform each test (including equipment necessary for smoke detector testing. The use of magnets is not permitted.
3.8.2 Pre-Government Testing

3.8.2.1 Verification of Compliant Installation

Conduct inspections and tests to ensure that devices and circuits are functioning properly. Tests must meet the requirements of paragraph entitled "Minimum System Tests" as required by NFPA 72. The contractor and an authorized representative from each supplier of equipment must be in attendance at the pre-Government testing to make necessary adjustments. After inspection and testing is complete, provide a signed Verification of Compliant Installation letter by the QFPE that the installation is complete, compliant with the specification and fully operable. The letter must include the names and titles of the witnesses to the pre-Government tests. Provide all completion documentation as required by NFPA 72 including all referenced annex sections and the test reports noted below.

a. NFPA 72 Record of Completion.
b. NFPA 72 Record of Inspection and Testing.
d. Audibility test results with marked-up test floor plans.
e. Documentation that all tests identified in the paragraph "Minimum System Tests" are complete.

3.8.2.2 Request for Government Final Test

When the verification of compliant installation has been completed, submit a formal request for Government final test to the [_____][Designated Fire Protection Engineer (DFPE)][Contracting Officer's Representative (COR)]. Government final testing will not be scheduled until the DFPE has received copies of the request for Government final testing and Verification of Compliant Installation letter with all required reports. Government final testing will not be performed until after the connections to the installation-wide fire reporting system has been completed and tested to confirm communications are fully functional. Submit request for test at least [15][_____] calendar days prior to the requested test date.

3.8.3 Correction of Deficiencies

If equipment was found to be defective or non-compliant with contract requirements, perform corrective actions and repeat the tests. Tests must be conducted and repeated if necessary until the system has been demonstrated to comply with all contract requirements.

3.8.4 Government Final Tests

The tests must be performed in accordance with the approved test procedures in the presence of the DFPE. Furnish instruments and personnel required for the tests. The following must be provided at the job site for Government Final Testing:
a. The manufacturer's technical representative.

[b. The contractor's Qualified Fire Protection Engineer (QFPE).]

c. Marked-up red line drawings of the system as actually installed.

d. Loop resistance test results.

e. Complete program printout including input/output addresses.

f. Copy of pre-Government Test Certificate, test procedures and completed test data forms.

g. Audibility test results with marked-up floor plans.

Government Final Tests will be witnessed by the [____], [Designated Fire Protection Engineer][Contracting Officer's Representative (COR)][, Qualified Fire Protection Engineer (QFPE)]. At this time, any and all required tests noted in the paragraph "Minimum System Tests" must be repeated at their discretion.

3.9 MINIMUM SYSTEM TESTS

3.9.1 System Tests

Test the system in accordance with the procedures outlined in NFPA 72. The required tests are as follows:

a. Loop Resistance Tests: Measure and record the resistance of each circuit with each pair of conductors in the circuit short-circuited at the farthest point from the circuit origin. The tests must be witnessed by the Contracting Officer and test results recorded for use at the final Government test.

b. Verify the absence of unwanted voltages between circuit conductors and ground. The tests must be accomplished at the pre-Government test with results available at the final system test.

c. Verify that the control unit is in the normal condition as detailed in the manufacturer's O&M manual.

d. Test each initiating device and notification appliance and circuit for proper operation and response at the control unit. Smoke detectors must be tested in accordance with manufacturer's recommended calibrated test method. Use of magnets is prohibited. Testing of duct smoke detectors must comply with the requirements of NFPA 72 except disconnect at least 20 percent of devices. If there is a failure at these devices, then supervision must be tested at each device.

e. Carbon Monoxide Detector Tests: Carbon monoxide detectors must be tested in accordance with NFPA 72 and the manufacturer's recommended calibrated test method.

f. Test the system for specified functions in accordance with the contract drawings and specifications and the manufacturer's O&M manual.

g. Test both primary power and secondary power. Verify, by test, the secondary power system is capable of operating the system for the time
period and in the manner specified.

h. Determine that the system is operable under trouble conditions as specified.

i. Visually inspect wiring.

j. Test the battery charger and batteries.

k. Verify that software control and data files have been entered or programmed into the FACU. Hard copy records of the software must be provided to the Contracting Officer.

l. Verify that red-line drawings are accurate.

m. Measure the current in circuits to ensure there is the calculated spare capacity for the circuits.

n. Measure voltage readings for circuits to ensure that voltage drop is not excessive.

o. Disconnect the verification feature for smoke detectors during tests to minimize the amount of smoke needed to activate the sensor. Testing of smoke detectors must be conducted using real smoke or the use of canned smoke which is permitted.

p. Measure the voltage drop at the most remote appliance (based on wire length) on each notification appliance circuit.

q. Verify the documentation cabinet is installed and contains all as-built shop drawings, product data sheets, design calculations, site-specific software data package, and all documentation required by paragraph titled "Test Reports".

3.9.2 Audibility Tests

Sound pressure levels from audible notification appliances must be a minimum of 15 dBA over ambient with a maximum of 110 dBA in any occupiable area. The provisions for audible notification (audibility and intelligibility) must be met with doors, fire shutters, movable partitions, and similar devices closed.

3.10 SYSTEM ACCEPTANCE

Following acceptance of the system, as-built drawings and O&M manuals must be delivered to the Contracting Officer for review and acceptance. The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of as-built (marked-up) drawings must be provided at the time of, or prior to the Final Government Test.

[a. The drawings must be prepared electronically and sized no less than the contract drawings.] [Furnish one set of CDs or DVDs containing software back-up and CAD based drawings in latest version of [MicroStation] [AutoCAD, ]DXF and portable document formats of as-built drawings and schematics.]

b. Include complete wiring diagrams showing connections between devices
and equipment, both factory and field wired.

c. Include a riser diagram and drawings showing the as-built location of devices and equipment.

d. Provide Operation and Maintenance (O&M) Instructions.

[In existing buildings, the transfer of devices from the existing system to the new system and the permission to begin demolition of the old fire alarm system will not be permitted until the as-built drawings and O&M manuals are received.]

3.11 INSTRUCTION OF GOVERNMENT EMPLOYEES

3.11.1 Instructor

Provide the services of an instructor, who has received specific training from the manufacturer for the training of other persons regarding the operation, inspection, testing, and maintenance of the system provided. The instructor must train the Government employees designated by the Contracting Officer, in the care, adjustment, maintenance, and operation of the fire alarm system. The instructor must be thoroughly familiar with all parts of this installation. The instructor must be trained in operating theory as well as in practical O&M work. Submit the instructors information and qualifications including the training history.

3.11.2 Required Instruction Time

Provide [8][16][_____] hours of instruction after final acceptance of the system. The instruction must be given during regular working hours on such dates and times selected by the Contracting Officer. The instruction may be divided into two or more periods at the discretion of the Contracting Officer. The training must allow for rescheduling for unforeseen maintenance and/or fire department responses.

3.11.2.1 Technical Training

Equipment manufacturer or a factory representative must provide [1][3][_____] days of on site[ and 5 days of technical training to the Government at the manufacturing facility]. Training must allow for classroom instruction as well as individual hands on programming, troubleshooting and diagnostics exercises.[ Factory training must occur within [6][12][_____] months of system acceptance.]

3.11.3 Technical Training Manual

Provide, in manual format, lesson plans, operating instructions, maintenance procedures, and training data for the training courses. The operations training must familiarize designated government personnel with proper operation of the installed system. The maintenance training course must provide the designated government personnel adequate knowledge required to diagnose, repair, maintain, and expand functions inherent to the system.

3.12 EXTRA MATERIALS

3.12.1 Repair Service/Replacement Parts

Repair services and replacement parts for the system must be available for
a period of 10 years after the date of final acceptance of this work by the Contracting Officer. During the warranty period, the service technician must be on-site within 24 hours after notification. All repairs must be completed within 24 hours of arrival on-site.

During the warranty period, the installing fire alarm contractor is responsible for conducting all required testing and maintenance in accordance with the requirements and recommended practices of NFPA 72 and the system manufacturer[s]. Installing fire alarm contractor is NOT responsible for any damage resulting from abuse, misuse, or neglect of equipment by the end user.

3.12.2 Spare Parts

Spare parts furnished must be directly interchangeable with the corresponding components of the installed system[s]. Spare parts must be suitably packaged and identified by nameplate, tagging, or stamping. Spare parts must be delivered to the Contracting Officer at the time of the Government testing and must be accompanied by an inventory list.

3.12.3 Document Storage Cabinet

Upon completion of the project, but prior to project close-out, place in the document storage cabinet copies of the following record documentation:

a. As-built shop drawings
b. Product data sheets
c. Design calculations
d. Site-specific software data package
e. All documentation required by SD-06.

PART 2   PRODUCTS

2.1   ALARM RECEIVING AND DECODING CONSOLE
   2.1.1   Display
   2.1.2   Memory
   2.1.3   Digital Clock
2.1.4 Printers
2.1.5 Audible Trouble and Alarm Devices
2.1.6 Power Supply
2.1.7 Emergency Power
  2.1.7.1 Emergency Power Switchover
  2.1.7.2 Console Battery Charger
2.1.8 Console Supervision
2.1.9 Tie-Line Repeater
2.1.10 Variable Code Transmitter
2.2 AUDIBLE ALARM
2.3 Sounding Devices
2.4 Circuit Protection Devices
2.5 Standard Fire Alarm Boxes
  2.5.1 Master Fire Alarm Boxes
  2.5.2 Fire Alarm Box Mounting
  2.5.3 Fire Alarm Box Grounding
  2.5.4 Auxiliary Transmitter
2.6 Overvoltage and Surge Protection
  2.6.1 Power Line Surge Protection
  2.6.2 Communications Link Surge Protection
  2.6.3 Sensor Wiring Surge Protection
2.7 Fire Alarm System Power Supply
  2.7.1 AC Power
  2.7.2 Rectifier/Charger
  2.7.3 Batteries
  2.7.4 Electronic Inverters
  2.7.5 Transformers
2.8 Wiring
  2.8.1 Wiring Within Buildings
  2.8.2 Cables for Fire Alarm Service
    2.8.2.1 Underground Cables
    2.8.2.2 Cables Provided in an Exterior Overhead System
    2.8.2.3 Identification Slabs (Markers)
  2.8.3 Wire Markers
2.9 Conduit
  2.9.1 Rigid Steel Conduit Zinc-Coated
  2.9.2 Intermediate Metal Conduit (IMC)
  2.9.3 Electrical Metallic Tubing (EMT)
2.10 Outlet Boxes
2.11 Fittings for Conduit and Outlet Boxes
2.12 Ground Rods
2.13 Keys and Locks
2.14 Nameplates
2.15 Painting

Part 3 Execution

3.1 Installation
3.2 Verification of Conditions
3.3 Wiring
3.4 Grounding
3.5 Cable Splices
3.6 Special Connections
  3.6.1 Branch or "Y" Connections for Cables
  3.6.2 Welded and Brazed Connections
3.7 Corrosion and Fungus Prevention
3.8 Field Quality Control
  3.8.1 Tests During Installation
    3.8.1.1 Ground Resistance Tests
3.8.1.2  Dielectric Strength and Insulation Resistance Tests
3.8.1.3  Power Supply Tests
3.8.1.4  Supervisory Features and Trouble Alarm Circuit Test
3.8.1.5  Box and Transmitter Tests
3.8.1.6  Signal Transmission and Recording Tests
3.8.1.7  Trouble Line Operation Tests
3.8.2   Complete Printout Documentation
3.8.3   Final Performance and Acceptance Tests
  3.8.3.1  Acceptance Testing
3.8.4   Additional Tests
3.8.5   Manufacturer's Field Service
  3.8.5.1  Manufacturer's Representative
  3.8.5.2  Instruction for Government Personnel
3.9    CONTINUITY OF PROTECTION

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for exterior fire alarm reporting and receiving system of the closed circuit telegraphic type.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: System requirements must conform to UFC 3-600-01, "Fire Protection Engineering for Facilities."

NOTE: The following information shall be shown on the project drawings:

1. Location of Decoding/receiving console.

2. Locations where recording equipment should be installed.

3. Dimensions of cabinets and whether flush or
surface mounted.

4. Location of the panel, bells, and other equipment.

5. Location of the alarm gongs and bells.

6. Location of all boxes.

7. All portions of the system that will be underground and any portion that will be installed in an outside overhead system.

8. Cables that are to be installed in the duct-and-manhole system, the design of the system, the location of the cables, and the number of conductors in each cable.

9. Cables that are to be installed in outside overhead systems, the design of the system, the location of the cables, and the number of conductors in each cable.

10. Cables that are to be buried directly in earth, their location, where cables pass under roadways or paved areas, and the ducts or conduits used, and the number and AWG size of conductors in each cable.

11. Locations of the branch or "Y" connections and the necessary related details.

12. Ground connections that should be welded or brazed, if any.

13. Lightning arrester locations and detail arrangement.

15. Code Numbers of Fire Alarm Boxes: Coding shall be an integrated four-digit code. Code numbers should not contain any digit larger than 6, shall not have succeeding digits of the number "1" or "0." (Example: 1-1-3-4.) A table should indicate location of all boxes with respective code numbers.

PART 1   GENERAL

1.1 REFERENCES
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

FM GLOBAL (FM)

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

INTERNATIONAL MUNICIPAL SIGNAL ASSOCIATION (IMSA)

IMSA 32 (1997) Copper-Covered Steel Messenger Strand, 30 Percent or 40 Percent Conductivity

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

ANSI C80.1 (2020) American National Standard for Electrical Rigid Steel Conduit (ERSC)

ANSI C80.3 (2020) American National Standard for Electrical Metallic Tubing (EMT)

1.2 RELATED REQUIREMENTS

[Sections 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION; 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION; and 26 20 00 INTERIOR DISTRIBUTION SYSTEM] [applies] [apply] to this section, with the additions and modifications specified herein.

1.3 DEFINITIONS

1.3.1 Installer

The installer of the exterior fire alarm system; either the Contractor or subcontractor proposed by the Contractor to perform the work and with whom the Contractor has a firm contractual agreement.
1.4 SYSTEM DESCRIPTION

**************************************************************
NOTE: The manufacturer and type of station fire alarm system should be indicated.
**************************************************************

**************************************************************
NOTE: Design and specify emergency lighting system where required.
**************************************************************

Equipment, materials, installation, workmanship, fabrication, assembly, erection, examination, inspection, and testing shall be in accordance with [NFPA 72] [and] [NFPA 1221], except as modified herein. Except as modified herein, the exterior fire alarm reporting and receiving system shall comply with [NFPA 72 Style B for initiating circuits, Style 2 for signaling circuit] [and] [NFPA 1221 for a [Type A] [Type B] system]. Design the system to operate on direct current supplied from a rectifier and storage batteries. The exterior fire alarm reporting and receiving system shall include the following features:

a. A complete, electrically supervised, normally-closed series, coded, positive noninterfering type of circuit.

b. Succession features, whereby alarms from coded boxes [and transmitters] are transmitted over box circuits to [the central fire station] [fire alarm headquarters].

   (1) Alarms that are [manually] [automatically] retransmitted to each branch fire station and to recording and sounding devices in the system.

   (2) Regardless of location, the first coded box operated shall transmit four complete rounds of code without interference from any other box.

   (3) Other coded boxes that may have been operated during this period and that shall then transmit one at a time as the circuit becomes available until all boxes in an alarm condition have completed four rounds of code.

c. [_____] box circuits terminating in box circuit panels and alarm panels arranged to automatically sound and record alarms from each box circuit.

The central [fire station] [fire alarm headquarters] watch position shall include [a desk and table,] receiving console with all associated switches, printer, coupling units, alarm gongs, and other equipment.

1.4.1 Design Requirements

1.4.1.1 Supervisory and Alarm Power Requirements

Submit calculations substantiating battery capacity. Include ampere-hour requirements for each system component and each panel component with the calculations. Include battery recharging period with the calculations.
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

The fire protection engineer, [_____] Division, Naval Facilities Engineering Command will review and approve all submittals in this section requiring Government approval.

NOTE: For projects administered by Pacific Division, NAVFACENGCOM, use the submittal paragraph below in lieu of the above paragraph. Delete the "G" after each submittal item, except under "SD-08 Statement."

The Pacific Division, Naval Facilities Engineer delegates the authority for
review and approval of all submittals required by this section to the U.S. Registered Fire Protection Engineer employed in the Quality Control (QC) Organization, specified under Section 01 45 00.00 20 QUALITY CONTROL. Submit to the Pacific Division, Naval Facilities Engineering Command, Fire Protection Engineer two sets of all approved submittals and drawings immediately after approval but no later than 15 working days prior to final inspection.

SD-02 Shop Drawings

[ Fire station; G[, [_____]]]
[ Fire alarm headquarters; G[, [_____]]]
[ Exterior fire alarm reporting and receiving system; G[, [_____]]]

Submit detail plan showing the location of fire alarm equipment and devices with complete point to point wiring diagrams. Wiring diagrams shall show points of connection and terminals to be used, and interior wiring diagrams of each component. Clearly and completely indicate the function of the control panel and devices connected thereto. Drawings should be [1189 by 841 mm] [30 by 42 inches] [____].

SD-03 Product Data

**************************************************************************
NOTE: Delete equipment which is not applicable. Letter-designate, in alphabetical order, items required.
**************************************************************************

Record wiring diagrams; G[ [____] ]
1.6 QUALITY ASSURANCE

1.6.1 Qualifications

1.6.1.1 Installer Qualifications

Prior to installation, submit evidence including system type and design showing that the installer has successfully installed at least two exterior fire reporting and receiving alarm systems conforming to the requirements of the NFPA and of the same type and design specified herein. Include the names and locations of the installations and written certification from the users that the systems have performed satisfactorily for a period of not less than 18 months. Ensure the installer is UL certified for the installation and testing of Fire Alarm Systems. Provide proof of this listing. A list of installer's personnel shall be provided as part of the submittal package.

1.6.1.2 Installation Personnel

Submit names of personnel who will supervise installation and testing of the system, and who will furnish instruction to Government personnel, along with the manufacturer's certification of the qualifications of the named individuals.

1.6.1.3 Fire Alarm System Technician or Engineer

Make installation, adjustments, and tests under the supervision of a technician or engineer retained by the Contractor who is qualified with at least 2 years' experience in the installation and operation of exterior fire alarm systems of the type specified.

**************************************************************************
NOTE: For projects administered by NAVFAC PAC, include the following paragraph requiring the minimum qualification of a NICET Level-III technician for preparation of all fire protection system drawings. Delete for projects administered by NAVFAC ML. For projects administered by other EFDs, consult with the EFD's Fire Protection Engineer for further guidance before using the paragraph.
**************************************************************************

Qualification of technician:

Installation drawings, shop drawings and as-built drawings shall be prepared by, or under the supervision of, a qualified technician. Qualified technician shall be an individual who is experienced with the types of works specified herein, and is certified by the National Institute for Certification in Engineering Technologies (NICET) as an engineering technician with minimum Level-III certification in fire alarm system program. Contractor shall submit data showing the names and certification of the technician at or prior to submittal of drawings.

1.6.2 Modification of References

In the NFPA publications referred to herein, the advisory provisions shall be considered to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears; reference to the "authority
having jurisdiction" shall be interpreted to mean the Engineering Field Division Fire Protection Engineer.

1.6.3 Regulatory Requirements

Materials and equipment for fire alarm service shall be listed by UL Fire Prot Dir or approved by FM APP GUIDE. Provide current materials and equipment of one manufacturer regularly engaged in production of such equipment, and provide items that have performed satisfactorily for at least 2 years prior to bid opening.

1.6.3.1 Installation Certificate

Upon completion of construction, submit an installation certificate issued by a service company listed in UL Fire Prot Dir, under "Protection Signaling Services - Local, Auxiliary, Remote Station Proprietary."

1.6.3.2 UL Listings/FM Approvals

Submit copies of current UL listings or FM approvals for the system in configurations offered, with copies of the actual UL or FM test results.

1.6.4 Parts Reliability

Certify that materials and equipment furnished are identical to items that have been in satisfactory use for at least two years prior to bid opening.

1.6.5 Test Procedures

Submit detailed test procedures for the fire alarm system 60 [_____] calendar days prior to performing system tests.

1.7 DELIVERY, STORAGE AND HANDLING

Store and protect equipment from the weather, humidity and temperature variation, dirt and dust, and other contaminants.

1.8 [EXISTING CONDITIONS

Existing system was manufactured by [____:], and new equipment shall be compatible with and not reduce existing system operations and reliability.]

1.9 MAINTENANCE

1.9.1 Special Tools

Furnish a suitable testing instruments, metal tool box and special tools required for the maintenance of the equipment to the Contracting Officer.

1.9.2 Spare Parts

**************************************************************************
NOTE: Delete equipment which is not applicable.
Letter-designate, in alphabetical order, items required.
**************************************************************************

a. Three sets of fuses of each type and size;
b. Five spare lamps of each type;

c. Two fire alarm box mechanisms;

d. Two complete printed circuit modules for each recording device console control unit;

e. One suitable metal storage cabinet unless the fire alarm control console is suitable;

f. Five boxes of continuous feed printout paper;

g. Two ink ribbons or cartridges for the printer; and

h. One rectifier/charger at each location indicated.

1.9.3 Record Wiring Diagrams

Submit diagrams prior to final testing of the system.

PART 2 PRODUCTS

2.1 ALARM RECEIVING AND DECODING CONSOLE

**************************************************************************
NOTE: Wherever there are five or more box circuits, a reserve recorder, or recorders as necessary, shall be provided at the alarm receiving center. One or more recorders (depending upon number of box circuits and recorder capacity) shall be provided in each fire station whenever signals are to be transmitted to fire stations either automatically or manually. Provide illumination of console where lighting is inadequate.
**************************************************************************

Provide console in the main fire alarm watch office that conforms with the applicable requirements of UL 864 and includes the following features:

a. Completely assembled, wired, and tested at the factory, and delivered ready for installation and operation.

b. Performs the receipt, processing, and display of alarms transmitted by the transmitters specified herein.

c. A complete receiving system consisting of a decoder, audio devices, visual display, digital clock, printer, primary and emergency power supplies, power supply monitors, memory device, and necessary interconnecting cables.

d. Cabinet storage space of at least three shelves unless a separate metal storage cabinet with door, tumbler-type lock, and two keys are provided for storage of repair parts.

e. Powers and supervises each initiating circuit so that a signal on one zone does not prevent receipt of signals from other zones.

f. Mounts so that no part of the enclosing cabinet is less than 305 mm 12 inches above the finished floor nor more than 1980 mm 78 inches above
the finished floor. Mount manually operated controls at least 915 mm 3 feet and less than 1525 mm 5 feet above the finished floor.

2.1.1 Display

Each console shall conform to the following:

a. Display incoming alarms in alphanumeric format, by means of a light emitting diode, illuminated dot matrix, or cathode ray tube.

(1) Indicate the identity with a minimum of four digit 0002-9999, time, date, and type of signal (alarm, trouble) code number assigned to the originating transmitter.

(2) Include a message of a minimum of 3 lines of 20 characters each for each transmission (minimum 500 transmitter capacity). The message shall be [pre-programmed into the memory as directed by the Contracting Officer] [operator-programmable into the memory through a keyboard which shall be provided].

b. Include a means to manually clear and reset the display. If the display is not reset at the time additional alarms are received, the additional alarms shall be retained in memory and a distinctive audible or visual indication given to the operator that additional alarms are waiting to be acknowledged.

(1) A minimum of 16 such alarms shall be retained for display and acknowledgement.

(2) Alarms shall be printed immediately upon receipt.

2.1.2 Memory

Provide each console with a [programmable] memory capable of retaining at least [_____] [500] transmitter codes, together with specific messages, total number of zones possible, and related information associated with each of the [_____] [500] transmitters. If memory is operator-programmable, restrict access into the memory for the purpose of making additions or deletions by the use of a key switch or access code to prevent unauthorized changes. Memory shall not be lost in the event of a total loss of primary and emergency power supplies.

2.1.3 Digital Clock

Each console shall incorporate an electronic digital clock. Clock shall display the current time expressed in 24-hour time and date (day and month) and shall transmit to each interconnected printer the time and date that signals are received. Provide manual means of resetting the clock.

2.1.4 Printers

Provide printers of high speed, computer compatible, low noise design, capable of printing incoming messages with no messages being lost. Upon reception of an alarm, each printer shall print on paper the required visually displayed data, including the date and time received. Provide standard size paper for recording messages, commercially available from three or more manufacturers, usable on a computer printer or adding machine, and continuous feed. Include paper take-up devices for storing printouts. Print alarms in a manner to make them readily distinguishable.
from acknowledgements and routine messages, by use of a different color, typeface, type size, or other distinguishable means.

2.1.5 Audible Trouble and Alarm Devices

The audible alarm device used to indicate the receipt of alarms shall produce a sound distinct from other audible trouble signals. The device shall be internally mounted in the console, and activated upon receipt of an alarm. The audible sounds used to indicate trouble messages, shall be separate and distinct from the sound used to denote receipt of alarm messages.

2.1.6 Power Supply

Provide 120-volt, 60 Hz ac primary power for each console. Supply emergency backup power by batteries capable of powering the system for a minimum of 24 hours. Obtain the 120-volt, 60 Hz ac power supply for each console through a single connection into the line side of the building's regular ac service circuit through a lockable fused disconnect switch. Provide a separate disconnect switch for each console.

2.1.7 Emergency Power

Supply emergency power by [lead acid] type batteries having plastic cases and explosion-proof vents. Provide batteries of sufficient capacity to operate functions of the console for no less than 24 continuous hours, in the event of loss of ac power. Following 24 continuous hours of operation by batteries, batteries shall have ample capacity to operate all components of the system, including alarm signaling devices in the total alarm mode for a period of 10 minutes. Size batteries to deliver 50 percent more ampere/hour than required for the calculated capacities. Mount batteries on racks designed for mounting batteries. Provide a termination cabinet as part of the required rack. Locate battery racks where shown.

2.1.7.1 Emergency Power Switchover

In the event of loss of normal ac power, provide automatic transfer to the emergency power mode, without interruption or loss of console memory. When ac power is restored, provide automatic transfer back to normal mode.

2.1.7.2 Console Battery Charger

Each self-regulating charger shall have the capacity to completely recharge its associated batteries from full discharge within 24 hours with the console fully operational on primary ac power. The console shall remain operational on ac power with the batteries removed.

2.1.8 Console Supervision

The supervisory controls shall provide constant supervision of the operating condition of the console. Provide individual indicators for each major component, and produce an audible signal in the event of failure of a major component. Provide an audible signal distinctly different from the signal used to annunciate alarms. Provide a switch to silence the audible trouble signal. Provide separate alarm trouble lamps for each zone alarm initiating circuit, located on exterior of cabinet door or visible through the door. Provide a suitable means for testing the control panel meter or lamp visual indicating devices.
2.1.9 Tie-Line Repeater

**************************************************************************
NOTE: Tie-line repeaters are required only where signals are to be repeated or retransmitted to other fire stations. Where Type A central system is provided, a one-way repeater is required. Type B systems require a two-way repeater.
**************************************************************************

Provide a [one-way] [two-way] tie-line repeater with the control unit.

2.1.10 Variable Code Transmitter

**************************************************************************
NOTE: This device is required in only Type A systems where a telegraphic (coded) circuit is one of the two dispatch circuits required by NFPA 1221, but may be provided on Type B systems. Wherever more than five circuits are provided on a Type A system a reserve variable code transmitter shall also be provided.
**************************************************************************

Provide for transmitting a manually selected code to fire stations from alarm receiving headquarters. Provide a momentary-contact "Start" push button on the face of the transmitter to set the transmitter into operation. Provide a separate push button "Restore" switch to permit the operator to instantly clear the transmitter for another alarm and to restore all numerical selectors to the unset position. Provide transmitter capable of the following:

a. Being set to transmit any combination of codes up to and including 9-9-9-9.

b. Transmitting from one to four complete rounds of the selected code number.

c. Transmitting signal at rates varying from 1/4 second to 3 1/4 second impulses.

2.2 AUDIBLE ALARM

**************************************************************************
NOTE: Provide a remote trouble device when the control panel is located in an area where the control panel integral trouble signal normally cannot be heard.
**************************************************************************

Provide an audible alarm device arranged to sound whenever an abnormal condition exists, such as box or alarm circuit trouble, low battery voltage, or low supervisory current. Provide distinctive trouble indication for each type of trouble condition and an audible alarm silencing switch. Operation of the silencing switch shall not delete the activated trouble indicator. With the switch in the "silence" position, the audible signal shall re-sound when the trouble condition is corrected. The control unit shall automatically prevent interference between circuits.
to the same degree as the noninterference feature between boxes on the same circuit. Mount unit in a compact [free-standing floor] [desk-top] cabinet. Provide voltmeters and millimeters on the face of each unit. Provide a rigid plastic or metal identification sign which reads "Fire Alarm System Trouble" at the device.

2.3 SOUNDRING DEVICES

**************************************************************************
NOTE: In a Type B system a single gong located in the alarm receiving center is permitted as a common sounding device for more than one circuit. In a Type A system a separate sounding device shall be provided on each box circuit and shall be installed at the same location as the recording device for that circuit.
**************************************************************************

Provide a 255 mm 10 inch diameter single-stroke [electric] [mechanical] operated gong at locations indicated. Connect gong to the control unit so that gong sounds the code of each operated fire alarm box.

2.4 CIRCUIT PROTECTION DEVICES

**************************************************************************
NOTE: The one-half ampere protection on tie-line circuits shall be omitted at all stations other than the alarm control center.
**************************************************************************

Protect box circuit and tie-line conductors entering the alarm control center by the following devices, in the order named, starting from the exterior circuit. Provide lightning arresters at locations on the system [as required by NFPA 1221.] [and as indicated.]

a. A fuse rated at 7 amperes and not less than 2000 volts.
b. A lightning arrestor.
c. A fuse, or circuit breaker, rated at one-half ampere, fast-blow for solid state circuits.

2.5 STANDARD FIRE ALARM BOXES

Connect manual stations into alarm initiating circuit. Provide coded, positive, noninterfering type with succession features. Provide boxes capable of transmitting through ground in the event of a single open in the circuit. Provide pre-wound, open-door-pull-lever type boxes that conform to applicable requirements of UL 38. The house mechanism shall be in a weatherproof cottage-shell type of housing with metallic bronze or nickel-alloy or rigid plastic code number plate mounted on the exterior face of the cottage shell. Stations requiring breaking of glass or plastic panels for operation are not acceptable; however, stations employing glass rods are acceptable. Gravity or mercury switches are not acceptable. Finish the housing in gloss [red] [yellow] enamel with a reflective, highly visible label imprinted with the word "FIRE" in minimum 50 mm 2 inch block characters on both sides of the box. Code wheel shall be metallic [or nylon derivative] and code shall be as developed by the coding plan for the code wheel location. Operation of the actuating pull lever shall cause the
box to transmit 4 complete round groups of code to all gongs, recorders, and other devices on the circuit to which the pull lever is connected. Driving springs shall have the capability to transmit not less than 8 complete 4-round groups of code before being rewound. Design boxes for operation on 100 milliamperes dc, but with capability of full operation at 70 milliamperes and up to 120 milliamperes. Box mechanism shall be capable of transmitting signals at varying rates of speed ranging from electrical impulses at 3 1/4 second intervals to 1/4 second intervals and shall be field adjustable to any speed within this range. Equip each box with manual signaling key, silent test device, and box shunt device.

2.5.1 Master Fire Alarm Boxes

Provide type identical to standard boxes except that, in addition, equip each master box with a [shunt] [local-energy] type auxiliary tripping coil for connection to building protective or alarm system devices.

2.5.2 Fire Alarm Box Mounting

Provide [wall] [pole] [or] [pedestal] mounting [as indicated] with box center 1525 mm 5 feet above grade. Mounting bolts, brackets, fastenings, and conduit shall be copper-alloy, cadmium, or zinc-coated steel. Provide a ruby-globe marker lamp in a weatherproof gasketed cast aluminum housing at each fire alarm box. Locate marker lamp housing above the box, and arranged so that moisture cannot collect at the junction of globe and fixture. Marker lamp shall be a 130 volt, 25 watt, extended service lamp. Provide zinc-coated steel pedestal and finished in at least two coats of red enamel. Pedestal shall include box mounting assembly, terminal strip, and terminal strip access door.

2.5.3 Fire Alarm Box Grounding

Provide connection from the grounding terminal connection of the box to either a driven ground rod or a buried, metallic water pipe. Resistance to ground shall not exceed 5 ohms. Do not consider the grounded neutral connection of a three-phase or single-phase power supply as an adequate ground for the fire alarm box ground.

2.5.4 Auxiliary Transmitter

Configure auxiliary transmitter for automatic actuation through auxiliary connections to local protective signaling systems [and initiating devices]. Auxiliary transmitters shall comply with the paragraph entitled "Master Fire Alarm Boxes" but are not fitted with a pull lever [and may be housed in noncottage-shells type enclosures].

2.6 OVERVOLTAGE AND SURGE PROTECTION

2.6.1 Power Line Surge Protection

Protect equipment connected to ac circuits from power line surges. Equipment shall meet requirements of IEEE C62.41.1 and IEEE C62.41.2. Do not use fuses for surge protection.

2.6.2 Communications Link Surge Protection

Protect communications equipment against surges induced on communications links. Install surge protection circuits at each end of cables and conductors, except fiber optics, which serve as communications links, to
meet the following two waveforms:

a. A 10 microsecond by 1000 microsecond waveform with a peak voltage of 1500 volts and a peak current of 60 amperes.

b. An 8 microsecond by 20 microsecond waveform with a peak voltage of 1000 volts and a peak current of 500 amperes. Provide protection at the equipment. Install additional triple electrode gas surge protectors, rated for the applications, on each wireline circuit within three feet of the building entrance. Do not use fuses for surge protection.

2.6.3 Sensor Wiring Surge Protection

Protect digital and analog inputs and outputs against surges induced by sensor wiring installed outdoors and as shown. Test inputs and outputs with the following two waveforms:

a. A 10 microsecond by 1000 microsecond waveform with a peak voltage of 1500 volts and a peak current of 60 amperes.

b. An 8 microsecond by 20 microsecond waveform with a peak voltage of 1000 volts and a peak current of 500 amperes. Do not use fuses for surge protection.

2.7 FIRE ALARM SYSTEM POWER SUPPLY

Provide dc power supply consisting of rectifier/battery charger, battery power supply, necessary transformers, and inverters, in the central alarm receiving location [and in each fire station] as indicated. Provide two sources of electrical power for each box circuit, [dispatch circuit,] and alarm transmitting or receiving device, including fire station equipment requiring local power for operation. Power supply shall conform to [NFPA 1221 for Form 4A] [NFPA 72 for primary and secondary power supplies for Central Supervising Station].

2.7.1 AC Power

Obtain power from the line side of the main electrical service to each building. At the location indicated, provide a circuit disconnecting means in a locked cabinet with the function clearly and permanently identified. Provide circuit protection in each ungrounded conductor located in a locked cabinet immediately adjacent to the point of connection to light and power conductors.

2.7.2 Rectifier/Charger

Supply each rectifier/charger through an isolating transformer taking energy from a circuit not exceeding 240 volts. Rectifier/charger leads shall fuse at not less than one ampere and at not more than 200 percent of the maximum connected load. Rectifier/charger shall be a fully automatic, variable rate, filtered battery charger capable of providing 150 percent of the connected battery load. Adjust charger in accordance with the battery manufacturer's recommendations to provide full "float" voltage to compensate for the load and maintain the batteries at full voltage. Charger shall be properly fused and shall incorporate a dc voltmeter and dc ammeter. [Provide a manual high-rate-of-charge switch together with a red pilot light to indicate when batteries have been manually placed on high charging rate.]
2.7.3 Batteries

NOTE: Nickel-cadmium batteries should not be specified over lead-calcium type unless some unusual environmental or operational condition warrants the additional cost of nickel-cadmium. For normal installations, battery selection may be left as a contractor's option. Ensure battery room or location has adequate ventilation to keep hydrogen concentrations below 3 percent.

Provide [sealed,] wet-cell, [lead-acid (lead antimony)] [or] [lead-calcium] type, adequate to provide each transmitter with a minimum of 24-hour standby capacity. Mount batteries [on racks] [in cabinets] designed for mounting batteries. Provide reliable separation between cells and from ground. Connect batteries to "float" on the exterior fire alarm reporting and receiving system circuits.

2.7.4 Electronic Inverters

NOTE: Nickel-cadmium batteries should not be specified over lead-calcium type unless some unusual environmental or operational condition warrants the additional cost of nickel-cadmium. For normal installations, battery selection may be left as a contractor's option. Ensure battery room or location has adequate ventilation to keep hydrogen concentrations below 3 percent.

Provide units capable of 115-volt 60-Hz ac output in alarm receiving headquarters [and in each fire station] for operating alarm receiving, alarm transmitting, recording and signaling devices, or components requiring 115 Vac. Inverters shall be battery powered and arranged to operate automatically in the event of loss of normal ac power. Provide battery power supply from either the main alarm system standby battery or from separate [sealed,] wet-cell, [lead-acid (lead antimony)] [or] [lead-calcium] batteries and charger. Provide battery power supply to sustain the connected devices under normal operating load for a minimum of 24 hours. If supplied from the main alarm system, provide alarm system batteries to sustain connected loads for the full 24-hour period.

2.7.5 Transformers

NOTE: Detail transformers on drawings.

Provide isolation and step-down transformers for proper operation of the various components of the system.

2.8 WIRING

Provide color coded wires and cables.
2.8.1 Wiring Within Buildings

**************************************************************************
NOTE: Type THW insulation can only be obtained in large quantity. Use of this type insulation is not recommended for small projects.
**************************************************************************

Provide in conduit or electrical metallic tubing, except wiring within cabinets and other components of the system. Wiring for 120-volt circuits shall be not less than No. [12] AWG. Wiring shall comply with NFPA 70 and NFPA 1221. Conductors shall be copper, Type [THW] or [THWN] conforming to UL 83. Color code conductors. Distinctly color code conductors used for the same functions. Use two different color codes for each alarm circuit; one for each loop. Wiring color code shall remain uniform throughout the circuit.

2.8.2 Cables for Fire Alarm Service

**************************************************************************
NOTE: Whenever cables enter the fire station or fire alarm headquarters or emerge from direct burial or underground duct locations and continue aboveground as aerial messenger cables or open wire aerial loops they shall be protected by lightning arresters. These must be indicated on the drawings.
**************************************************************************

2.8.2.1 Underground Cables

Cables [provided in duct-and-manhole systems] [buried directly in earth] shall be in accordance with Sections 31 00 00 EARTHWORK and 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Concrete work for underground distribution system and appurtenances shall be in accordance with Sections [03 30 00 CAST-IN-PLACE CONCRETE] [33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION]. Power wiring shall be copper Type USE conductors not less than No. [_____] AWG in size conforming to NFPA 70. Exterior fire alarm reporting and receiving system cable shall consist of individually insulated conductors and double polyethylene outer jacket [and copper tape shield between jackets for direct burial] not less than No. [_____] AWG in size. Wires and cables shall be one piece without splices between connections except where the distance exceeds the lengths in which cable is manufactured. Make splices only in manholes, handholes, or other protected and accessible space.

2.8.2.2 Cables Provided in an Exterior Overhead System

Cables shall be in accordance with Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION. Cables shall be copper not less than No. [_____] AWG in size and shall conform to NEMA WC 3 or NEMA WC 70 or ANSI/NEMA WC 71/ICEA S-96-659. Cables shall be in one piece without splices between connections except where the distance exceeds the lengths in which the cable is manufactured. Support cables from copper-encased steel or galvanized messenger wire or strand by a continuous spirally wrapped lashing wire of copper-encased steel, galvanized steel, or stainless steel. Messenger wire or strand shall conform to IMSA 32, [30] [40] percent conductivity or ASTM A475, Siemens-Martin Utilities or HIGH Strength with Class A or B galvanizing.
2.8.2.3 Identification Slabs (Markers)

Provide markers in accordance with Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION, and provide at each change of direction of cable, over the ends of ducts or conduits that are provided under paved areas and roadways, and over each splice.

2.8.3 Wire Markers

Provide markers at both ends of each wire connected to the control board. Provide taped-band type markers, of permanent material, permanently stamped with the proper identification. The taped band shall be white and the markings black in color so that the identification can be easily read. Attach the markers to the wires in a manner that will not permit accidental detachment.

2.9 CONDUIT

2.9.1 Rigid Steel Conduit Zinc-Coated

ANSI C80.1.

2.9.2 Intermediate Metal Conduit (IMC)

UL 1242, zinc-coated steel only.

2.9.3 Electrical Metallic Tubing (EMT)

ANSI C80.3.

2.10 OUTLET BOXES

UL 514A, zinc-coated steel.

2.11 FITTINGS FOR CONDUIT AND OUTLET BOXES

UL 514B, zinc-coated steel.

2.12 GROUND RODS

Rods shall be the sectional type, copper-encased steel, with a minimum diameter of 19 mm 3/4 inch and a minimum length of 3045 mm 10 feet. The rods shall have a hard, clean, smooth, continuous copper surface, and the proportion of copper shall be uniform throughout the length of the rod. Copper shall have a minimum wall thickness of 0.33 mm 0.013 inch at any point on the rod. Rods shall comply with the UL 467 requirements.

2.13 KEYS AND LOCKS

Key locks alike. Furnish tags with stamped identification number for keys and locks.

2.14 NAMEPLATES

Securely attach to each major component of equipment a noncorrosive and nonheat sensitive plate indicating the manufacturer's name, address, type or style, voltage and current and current rating, and catalog number.
2.15 PAINTING

Factory paint switch boxes, fire alarm boxes, transmitters, and gongs with a priming coat and not less than two coats of a hard, durable weatherproof enamel. The finish color shall be [red] [_____] gloss. Treat and paint control boards in accordance with the manufacturer's standard practice. Steel pedestals and other exterior work shall have a suitable priming coat and not less than two coats of approved enamel with finish color as selected by the Contracting Officer. Repaint painted surfaces damaged during installation of the exterior fire alarm reporting and receiving system with color to match existing paint.

PART 3 EXECUTION

3.1 INSTALLATION

Install the exterior fire alarm reporting and receiving system in accordance with NFPA requirements, the manufacturer's diagrams and recommendations, and this section.

3.2 VERIFICATION OF CONDITIONS

Become familiar with details of the work, verify dimensions in the field, and advise the Contracting Officer of discrepancies before performing the work.

3.3 WIRING

Wiring shall be in rigid steel conduit, intermediate metal conduit or electrical metallic tubing. Identify circuit conductors within each enclosure where a tap, splice, or termination is made. Attach markers in a manner that will not permit accidental detachment. Identify control circuit terminations. Unless otherwise indicated, wiring and conduit will be new. Do not run fire alarm circuits in the same conduit with non-fire alarm circuits. Do not run ac circuits in the same conduit with dc circuits.

3.4 GROUNDING

**************************************************************************
NOTE: Connections subject to moisture or corrosive influences should be welded or brazed.
**************************************************************************

Ground equipment in accordance with NFPA 70. Measure the resistance of each connection to ground. Ground resistance shall not exceed 5 ohms.

3.5 CABLE SPLICES

Make splices only where the distance between connections exceeds the length in which the cable is manufactured. Splices shall conform to Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION, and the cable manufacturer's recommendations.

3.6 SPECIAL CONNECTIONS

3.6.1 Branch or "Y" Connections for Cables

Make these connections only aboveground at fire alarm stations, on
structures, or in manholes and handholes as approved. Provide cable terminations in fire alarm station enclosures or in boxes or cabinets equipped with telephone-type terminal boards. Provide weatherproof enclosures in exterior or wet locations and watertight in manholes and handholes.

3.6.2 Welded and Brazed Connections

********************************************************************************

NOTE: When welded or brazed connections are not indicated or specified, delete this paragraph.

********************************************************************************

Welding or brazing process shall not weaken the parts joined and shall join strands. Provide welding process so that the completed joint or connection will be one homogeneous mass equal to or larger in size than the cables and wires joined. An exothermic type welding method may be used, employing a measured heat supply and molds designed for the conductors joined. Perform brazing process with operators experienced in work of a similar character and in a manner that will not damage the parts joined. [Approved splice cap swaged spike terminations, insulation wrapped and epoxy potted, may be substituted for welded and brazed connections.]

3.7 CORROSION AND FUNGUS PREVENTION

Protect metallic materials against corrosion. Coat outdoor equipment with a rust inhibiting treatment and standard finish by the manufacturer. Do not use aluminum in contact with the earth. Protect dissimilar metals with approved fittings and treatment. Coat steel conduits installed underground with an approved asphaltic paint or plastic coating, or wrap with a single layer of a pressure sensitive plastic tape, half-lapped. Protect components against corrosion and fungus. Coat printed circuit board with epoxy.

3.8 FIELD QUALITY CONTROL

3.8.1 Tests During Installation

Conduct the following tests during installation of wiring and system components. Correct deficiencies prior to formal functional and operational tests of the system. Tests shall include meggering system conductors to determine that system is free from grounded or open circuits. Complete the megger test prior to installation of fire alarm equipment.

3.8.1.1 Ground Resistance Tests

Resistance of each connection to ground shall be measured and not exceed 5 ohms.

3.8.1.2 Dielectric Strength and Insulation Resistance Tests

Test dielectric strength and insulation resistance of the system interconnecting wiring by means of an instrument capable of generating 500 V dc and equipped to indicate leakage current in terms of resistance. Provide test instrument capable of indicating 1000 megohms. For the purpose of this test, connect the instrument between each conductor on the line and between each conductor and ground at the control panel end of the line, with the other extremity open-circuited and series-connected devices in place. The system shall withstand the test without breakdown and
3.8.1.3 Power Supply Tests

Conduct a complete test of the power supply including rectifier, charging rates, and automatic controls. Record operating input and output line voltages and current (load) at the time of the tests.

3.8.1.4 Supervisory Features and Trouble Alarm Circuit Test

Make detailed tests of supervisory features and trouble alarm circuits and relays.

3.8.1.5 Box and Transmitter Tests

Prior to commencement of tests, prepare sketches on letter-size sheets indicating electrical sequence from the control panel of manual boxes and transmitters. Test each box on each box circuit as follows: Electrically operate the farthest box from the fire station first. Examine the printout to determine if the code contacts cause a uniform signal to be transmitted through each of the four rounds. This test will provide a check on the box operation and code contacts. Test the succeeding boxes or transmitters successively until each box in the box circuit has been tested as specified. Test each box circuit separately to determine that, should two or more devices be operated at or near the same time, the device first securing the line shall continue to transmit its code without interference from other devices [and that the remaining actuated devices shall similarly and subsequently transmit their codes without interference as the line becomes available].

3.8.1.6 Signal Transmission and Recording Tests

Test each fire alarm box for signal transmission and recording, including fidelity of repeated signals on gong circuits under normal circuit conditions with the maximum allowable current. Repeat test at 70 milliamperes. Test alarm relays at the same time at upper and lower current limits.

3.8.1.7 Trouble Line Operation Tests

Repeat the foregoing operational test for the conditions of trouble line operation, except test relays only at minimum current flow. Accomplish test for box circuit relays by adjusting the normal line current to 100 milliamperes before simulating trouble line condition.

Simulating line trouble: Simulate line trouble by removing circuit wires from terminals or applying grounds to these terminals in each fire alarm box. Subject each box on each circuit to the following tests.

a. First test for trouble line operation: Remove one or the other of the circuit wires from the terminal of the box being tested. After waiting for the timing interval of the automatic conditioning relay, operate the box. The signal shall be received and recorded by the recorder and repeated in each of the gong circuits. Following this test replace the removed conductor, remove the remaining conductor, and repeat the test.

b. Manual-set transmitter test: Set up the complete four-digit numbers
(1-1-1-1, 2-2-2-2, through 9-9-9-9) operating the transmitter each time for full four rounds.

3.8.2 Complete Printout Documentation

Mark printouts for operational tests to identify each test.

3.8.3 Final Performance and Acceptance Tests

After the system has been in service for at least 30 calendar days, notify the Contracting Officer in writing that the system is ready for final acceptance tests. Provide notification at least 15 calendar days prior to the date of the final acceptance test. Submit with this notification a certificate from a service company listed in the UL Fire Prot Dir, under "Protective Signaling - Local, Auxiliary-Remote Station and Proprietary," which includes tests specified in paragraphs entitled "Ground Resistance," "Dielectric Strength and Insulation Resistance," "Power Supply," "Supervisory Features and Trouble Alarm Circuits," "Box and Transmitter Test," "Signal Transmission and Recording," and " Trouble Line Operation." Consider the system ready for testing after necessary preliminary tests have been made and deficiencies have been corrected to the satisfaction of the equipment manufacturer's technical representative and the Engineering Field Division Fire Protection Engineer.

3.8.3.1 Acceptance Testing

Furnish proposed test procedures for approval at least 60 calendar days prior to commencement of acceptance testing. Perform the tests in the presence of the [Engineering Field Division Fire Protection Engineer] [Contracting Officer] or authorized representative under the supervision of the fire alarm reporting system manufacturer's qualified representative. Furnish instruments, labor, and materials required for the tests. Arrange for the technician who supervised the installation to conduct the tests. Correct deficiencies found and retest the system. Repeat tests specified in paragraph entitled "Tests During Installation" as directed by the Engineering Field Division Fire Protection Engineer during final acceptance tests.

3.8.4 Additional Tests

When deficiencies, defects, or malfunctions develop during the tests required, suspend further testing of the system until proper adjustments, corrections, or revisions have been made to ensure proper performance of the system. If these revisions require more than a nominal delay, notify the Contracting Officer when the additional work has been completed to arrange a new inspection and test of the exterior fire alarm reporting and receiving system. Repeat tests required prior to final acceptance, unless directed otherwise.

3.8.5 Manufacturer's Field Service

3.8.5.1 Manufacturer's Representative

Furnish the services of a qualified representative or technician of the system manufacturer, experienced in the installation and operation of the type of system being provided to supervise testing, including final testing, and adjustment of the system.
3.8.5.2 Instruction for Government Personnel

Conduct a training course for operating staff as designated by the Contracting Officer. The training period shall consist of [3] [_____] training days, 8 hours per day, and shall start after the system is functionally complete but prior to final acceptance tests. The field instructions shall cover items contained in the operating and maintenance instructions.

3.9 CONTINUITY OF PROTECTION

During installation of the system, there shall be no loss of function of the existing base fire alarm system, or of the local building alarm systems connected thereto. Transfer of local alarm system connections from the existing base alarm system shall not result in loss of alarm transmitting or receiving capability. Temporary interruption of individual building alarm connections, not to exceed 8 hours duration, will be permitted at the discretion of the Contracting Officer. Interruption of alarm or communications functions at the fire alarm watch office is prohibited.

NOTE: This guide specification covers the requirements for digital alarm communicator type central fire alarm systems.

Adhere to [UFC 1-300-02](https://www.current.uas.dla.mil/standardization/ufc/1-300-02/Unified-Facilities-Guide-Specifications-(UFGS)/) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://www.current.uas.dla.mil/standardization/usc/CCRs/).

### PART 1  GENERAL

NOTE: This Section is to be used for the installation of a central monitoring system which will monitor the status of individual building fire alarm systems and transmit indication of abnormal conditions via dial-up telephone lines to a monitoring center. The specification may be used for new installations or replacement of existing systems.

The following information, if relevant, should be on the project drawings:

1. On electrical floor plans, show location of source of power to the monitoring center location,
2. Show single-line system riser diagram. Each device on the riser should be provided with a device number indicating building number. Indicate connection of equipment by circuit runs, or conduit runs.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

NFPA 72 (2022) National Fire Alarm and Signaling Code
1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE

1.3.1 Qualifications

1.3.1.1 Registered Professional Engineer

Provide the services of a Registered Professional Engineer with at least 4 years of current experience in the design of fire protection and detection systems. Submit the qualifications, with verification of experience and license number, for this engineer.

1.3.1.2 Installer

Submit written certificate demonstrating that the central fire alarm system installer has been regularly engaged in the installation of fire detection and alarm systems meeting NFPA standards for a minimum of 3 years immediately preceding commencement of this contract. Documentation shall include proof of satisfactory performance on at least three projects similar to that required by these specifications, including the names and
telephone numbers of using agency points of contact for each of these projects. Documentation shall indicate the type of each system installed and include a written certificate that each system has performed satisfactorily in the manner specified for a period of not less than 12 months following completion. Data shall be submitted 30 days prior to commencement of installation. Listing of the installer under "Protective Signaling Services - Local, Auxiliary, Remote Station Proprietary (UUJS)" or under "Protective Signaling Services - Central Station (UUFX)" of the UL Fire Protection Equipment Directory will be accepted as equivalent proof of compliance with the foregoing experience requirements.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, and any other contaminants.

1.5 SPECIAL TOOLS AND SPARE PARTS

Furnish special tools necessary for the maintenance of the equipment. Submit spare parts data for each different item of material and equipment specified, not later than [_____] months prior to the date of beneficial use. Data shall include a complete list of parts and supplies with the current unit prices and source of supply and a list of the parts recommended by the manufacturer to be replaced after [1] [_____] years of service. Provide spare parts as follows: One spare set of fuses of each type and size required and five spare lamps of each for each transmitter location and for the receiver location. Spare fuses and lamps shall be mounted in the equipment cabinets at each location.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Operation

Provide a central fire alarm system which is a complete, supervised system consisting of remote digital transmitters connected to building fire alarm panels and a digital receiver system at a central monitoring location. The system shall be activated into the alarm mode when an abnormal condition occurs in any building fire alarm system. The system shall remain in the alarm mode until the alarm is acknowledged and reset by the operator. Configure he central fire alarm system in accordance with NFPA 72. The transmitting equipment shall be compatible with receiving equipment and shall be UL listed or FM approved or shall be approved or listed by a nationally recognized testing laboratory, in accordance with the applicable NFPA standards. Tags with stamped identification number shall be furnished for keys and locks. Locks shall be keyed alike.

2.1.2 Alarm Functions

**************************************************************************
NOTE: Coordinate with the local fire department or other authority responsible for the central fire alarm system to determine which signal or signals are required to be transmitted to the fire alarm monitoring center.
**************************************************************************
An alarm, trouble or supervisory condition in any building which reports to the fire alarm monitoring center shall automatically initiate the following functions:

a. Transmission of a signal by the digital alarm communicator transmitter (DACT). The DACT shall dial the programmed telephone number of the digital alarm communicator receiver (DACR) at the fire alarm monitoring center, and upon completion of the connection shall transmit the abnormal condition information. Upon failure to connect with the DACR, the DACT shall attempt to connect via the secondary telephone line.

b. Upon receipt of the signal at the fire alarm monitoring center the signal shall be decoded and status information shall be displayed on the monitoring center visual display indicating the nature of the status change.

c. An audible signal shall sound at the monitoring center until the alarm is acknowledged.

d. The alarm information shall be printed on the system printer at the monitoring center.

2.1.3 Supervisory Functions

Each DACT shall transmit a test signal a minimum of once every 24 hours. A trouble signal indicating that the test signal from any DACT is delinquent shall be annunciated at the monitoring center for any DACT test signal which is not received within 24 hours of its previous signal.

2.1.4 Primary Power

******************************************************************************
NOTE: Verify the existence of emergency power at the monitoring center location. Emergency power is mandatory at the monitoring center location but not required at transmitter locations.
******************************************************************************

Provide operating power as required by paragraph Power Supply for the System. Where emergency power is available at transmitter locations, transfer from normal to emergency power or restoration from emergency to normal power shall be fully automatic and shall not cause transmission of a false alarm. Loss of ac power at transmitter locations shall not prevent transmission of a signal to the monitoring center upon alarm from any building fire alarm system. Loss of ac power at the monitoring center shall not prevent reception and annunciation of received signals.

2.1.5 Battery Backup Power

Battery backup power for transmitting equipment and receiving equipment shall be through use of rechargeable, sealed-type storage batteries and battery charger.

2.2 STANDARD PRODUCTS

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of digital alarm communicator systems and that have been in satisfactory use for at least 2 years prior to bid opening. Equipment shall be supported by a service
organization that can provide service within 24 hours.

2.3 NAMEPLATES

Major components of equipment shall have the manufacturer's name, address, type or style, voltage and current rating, and catalog number on a noncorrosive and nonheat-sensitive plate which is securely attached to the equipment.

2.4 FIRE ALARM MONITORING CENTER

2.4.1 Digital Alarm Communicator Receiver (DACR)

Provide two identical DACR systems. Each system shall be completely assembled, wired and tested at the factory, and delivered ready for installation. The DACR shall be solid state design with receiver, signal to message decoder, audio alarm signaling devices, audio alarm silence switch, visual display, alarm reset switch, alarm recording printer, primary and emergency power supplies, power supply monitors, memory devices and necessary interconnecting cables. The DACRs shall be configured as one active unit and one backup unit. Provide programming, connections and switching such that the backup unit may be switched into service within 30 seconds of detection of failure of the active unit.

2.4.2 Audible Alarm

The audible alarm signaling devices used to indicate the receipt of fire alarm messages shall produce a unique sound. The device shall be internally mounted in the DACR and shall be activated upon receipt of all fire alarm signals. The audible device shall also be used to indicate the receipt of DACT trouble messages, including fire alarm system trouble and supervisor signals. The audible device shall continue to sound until acknowledged with the silence switch by the operator.

2.4.3 Receiver Code Format

The DACR shall be capable of receiving and decoding any of the following code formats:

<table>
<thead>
<tr>
<th>Code Format</th>
<th>Speed (pulses per second)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 X 1</td>
<td>20</td>
</tr>
<tr>
<td>4 X 1</td>
<td>20</td>
</tr>
<tr>
<td>4 X 2</td>
<td>20</td>
</tr>
<tr>
<td>3 X 1</td>
<td>10</td>
</tr>
<tr>
<td>3 X 1</td>
<td>40</td>
</tr>
</tbody>
</table>

2.4.4 Visual Display

**************************************************************************
NOTE: Listed displays are minimum requirements; if additional visual displays are required, they must be added to the list.

SECTION 28 31 75.00 10 Page 9
Visual display shall be alphanumeric [LED or LCD] [cathode ray tube (CRT)] type. Display shall indicate as a minimum the originating transmitter identity code number and shall include the following message designations:

1. Fire
2. Trouble
3. Battery
4. Test
5. Tamper
6. Zone [_____] thru [____]

2.4.5 Receiver Memory

Receiver shall have a history buffer capable of retaining a minimum of [64] [_____] Digital Alarm Communicator Transmitter (DACT) codes, together with the specific message designations associated with each DACT. The system shall annunciate any received message not matching the programmed DACT codes where such message identification code is not stored in the system. Upon command, the console shall display and print a summary of DACT which have transmitted a low-battery or trouble message, or failed to transmit a message during the previous 24 hour test period. Submit substantiating battery calculations for supervisory and alarm power requirements. Ampere-hour requirements for each monitoring center system component and each transmitter panel component; and the battery recharging periods shall be included. Battery calculations shall substantiate both NFPA 72 and specification requirements. Any incoming DACT signal shall pre-empt the command display and printout function, and shall be processed, displayed, and printed. The memory shall not be purged and shall always be current and available. Transmitter data memory shall not be lost in the event of a total loss of operating or emergency power supplies.

2.4.6 Receiver Supervision

The supervisory system shall provide constant supervision of the operating conditions of the DACR. Indicators shall be provided for each major component, and an audible signal shall be produced in the event of failure of any major component. A switch shall be provided to silence the audible trouble signal.

2.4.7 Manual Battery Test

A self-contained or externally-mounted switch shall manually place the receiver on emergency battery power for test purposes.

2.4.8 Telephone Line Connection

The DACR shall have connections for a minimum of 2 incoming telephone lines. Connections shall be 6-position, 4-conductor modular jacks as described in TIA-570.

2.4.9 Power Supply

**************************************************************************

NOTE: Locations with automatic backup power generation shall require as a minimum 4 hours battery backup. Other locations shall require 48 hours.

**************************************************************************
The operating power for the DACR shall be single phase taken from the building electric service as specified in paragraph Power Supply for the System. Emergency backup power shall be provided by sealed lead-calcium type batteries requiring no additional water. The charging system shall recharge fully discharged batteries within 12 hours and maintain the batteries in the fully charged state. The battery shall have the capacity to operate the system for not less than 48 hours under maximum normal load with the power supply to the charger disconnected.

2.4.10 External Connections

The DACR shall be provided with connections for an external printer and CRT terminal or personal computer (PC).

2.4.11 Self-Contained Printer

The DACR shall include a self-contained printer. Printer shall output a minimum of 32 characters per line and shall record all displayed transaction information including time and date.

2.5 MONITORING CENTER TERMINAL

NOTE: Monitoring center terminal should be used with large systems only.

The monitoring center terminal shall be PC based and shall be provided with an applications program to allow it to be connected to the DACR. The terminal shall display additional information about the building from which an alarm is received, detailed description of the current alarm, and alarm histories. The terminal shall provide operator interface with the Central Fire Alarm System. The terminal shall include a central processing unit with minimum 32 bit processor, 2 megabytes of Random Access memory, 355 mm 14 inch color monitor, 101 key keyboard, 89 mm 3-1/2 inch floppy disk drive and hard disk drive with sufficient capacity to store 6 months of transaction information.

2.6 MONITORING CENTER PRINTER

NOTE: Monitoring center printer should be used with large systems only.

The monitoring center printer shall be compatible with the monitoring center terminal and shall be used to record all transaction information and history reports. Printer shall be dot matrix type with minimum 9 pin printhead, shall use 216 mm 8-1/2 inch wide pin feed paper and shall print a minimum of 80 characters per line. Print speed shall be minimum 120 characters per second.

2.7 MONITORING CENTER POWER SUPPLIES

NOTE: Ensure that the monitoring center is provided with emergency backup power.
Each component of monitoring center equipment shall be provided with a self-contained power supply. An uninterruptible power supply (UPS) shall be provided for equipment which does not have a self-contained battery backup, such as the terminal and printer. The UPS shall provide all power requirements for the connected equipment for a period of 15 minutes. The UPS shall be in accordance with Section 26 33 53 STATIC UNINTERRUPTIBLE POWER SUPPLY (UPS).

2.8 DIGITAL ALARM COMMUNICATOR TRANSMITTER (DACT)

The DACT shall be compatible with the DACR, and shall comply with all requirements of NFPA 72. Each DACT shall be the manufacturer's current commercial product completely assembled, wired, tested at the factory, and delivered ready for installation and operation.

2.8.1 Functional Requirements

2.8.1.1 Interfacing Indicators and Controls

The DACT shall incorporate the provisions for auxiliary interconnection to existing building fire alarm systems. Connections shall be via screw terminals.

2.8.1.2 Signal Transmission

NOTE: Determine the availability and applicability of public switched telephone network lines or local PBX service for use in each project. Local PBX must be loop-start configuration to allow the DACT to operate properly. Telephone lines connected to the DACR must be configured for sequential hunting. Show the telephone lines to be used, on the Drawings.

The DACT shall initiate transmission using a loop-start format. The DACT shall connect to 2 telephone lines, shown on the Contract Drawings. To initiate a transmission, the DACT shall seize the primary telephone line, disconnecting any telephones, obtain a dial tone and dial the DACR. The DACT shall make a minimum of five attempts to connect to the DACR. If a connection is not made, the DACT shall attempt to connect to the DACR via the second telephone line. A failure of one telephone line shall report a trouble condition at the building fire alarm panel and at the monitoring center via the secondary telephone line. When the DACT makes a connection to the DACR, the required alarm or test information shall be transmitted. Confirmation of the signal shall be accomplished by repetition of the signal, parity checks or equivalent checksum-type transmission. Each DACT shall transmit a test signal a minimum of once every 24 hours. The DACT shall provide a minimum of 4 alarm input connections from the building fire alarm control panel.

2.8.2 Enclosure

NOTE: Show on the Contract Drawings specific locations where a NEMA 4 (weatherproof) enclosure is to be used in lieu of NEMA 1.
A locking enclosure shall be provided for each DACT. The enclosure shall be of the NEMA type indicated on the Contract Drawings, or NEMA 1 where not indicated. The enclosure shall provide sufficient space for mounting the DACT, interfaces, power supply and backup batteries, wiring and terminal strips, including adequate space for maintenance access.

2.8.3 Digital Alarm Communicator Transmitter Interface Device

**NOTE:** If a DACT interface device is not required, delete this paragraph.

The DACT interface device shall provide a means of converting the signals available from the local control equipment into a form that is compatible with the DACT inputs, while still maintaining electrical supervision of the entire system. Interface devices shall be utilized when direct connection between local fire alarm control equipment and the DACT is not possible.

2.9 DIGITAL ALARM COMMUNICATOR TRANSMITTER POWER SUPPLY

Digital alarm communicator transmitters shall be powered by a combination of locally available 120 Vac, and sealed lead-calcium type batteries requiring no additional water. In the event of loss of 120 Vac power, the transmitter shall automatically switch to battery operation. The switchover shall be accomplished with no interruption of protective service, without adversely affecting the battery-powered capabilities, and shall cause the transmission of a trouble message in no less than [30] [_____] seconds. Upon restoration of ac power, transfer back to normal ac power supply shall be automatic and the battery shall be recharged. The battery charger shall be capable of restoring the batteries from full discharge to full charge within 12 hours. The converter/battery charger shall be installed within the transmitter enclosure. Power supply transient voltage surge suppression shall be provided.

2.9.1 Battery Power

The battery package shall be capable of supplying all the power requirements for a given DACT and DACT interface device.

2.9.2 Battery Duration

Digital alarm communicator transmitter standby battery capacity shall provide sufficient power to operate the transmitter in a normal standby status for a minimum of 48 hours and shall be capable of transmitting alarms during that period.

2.9.3 Battery Supervision

Each DACT shall constantly monitor and supervise its own battery-powered supply. A low-battery condition shall be reported when battery voltage falls below 75 percent of the rated voltage.
2.10 PERIPHERAL EQUIPMENT

2.10.1 Conduit

Conduit and fittings shall comply with UL 6, UL 1242, and UL 797.

2.10.2 Ground Rods

**************************************************************************

NOTE: Determine the size, type and number of ground rods to be used based on local conditions, earth resistivity data, and on the size and type of the electrical installation. Copper-clad steel rods will be specified for normal conditions. Zinc-coated steel or stainless steel rods will be used where low soil resistivities are encountered and galvanic corrosion may occur between adjacent underground metallic masses and the copper-clad rods. Stainless steel rods have a longer life than the zinc coated steel, but their use must be justified due to higher cost. Rods 16 mm 5/8 inch in diameter and 2.4 meters 8 feet in length are generally acceptable; however, in rocky soils 19 mm 3/4 inch rods must be specified. In high resistivity soils, 3 meter 10 foot or sectional rods should be used to obtain the required resistance to ground. Where rock is encountered, additional rods, a counterpoise, or ground grid may be necessary. Coordinate and standardize rod selection for individual facilities with other specification sections.

**************************************************************************

Ground rods shall be of [copper-clad steel conforming to UL 467] [zinc-coated steel conforming to IEEE C135.30] [solid stainless steel not less than [16] [19] mm [5/8] [3/4] inch in diameter by [2] [2.5] m [8] [10] feet in length] [of the sectional type].

2.10.3 Wiring

Wiring for 120 Vac power shall be No. 12 AWG minimum. Wiring for low voltage dc circuits shall be No. [16] [14] AWG minimum. Power wiring (over 28 volts) and control wiring shall be isolated. All wiring shall conform to NFPA 70. System field wiring shall be solid copper and installed in metallic conduit or electrical metallic tubing. Conductors shall be color coded. Conductors used for the same functions shall be similarly color coded. Wiring code color shall remain uniform throughout the circuit.

2.10.4 DACT Programmer

A programming device shall be provided for programming the required information in each DACT, if programming capability is not an integral part of the DACT. Required programming equipment, including the programmer, interconnect cables and adaptors, and power supply shall be provided. [Six] [_____] spare program chips shall be provided if removable program chips are used.
PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Work shall be installed as shown and in accordance with the manufacturer's recommendations. Necessary interconnections, services, and adjustments required for a complete and operational system shall be provided. Electrical work shall be in accordance with NFPA 70 and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.2.1 Power Supply for the System

A single dedicated 120 volt, single phase branch-circuit connection for supplying power to the monitoring center equipment shall be provided as shown on the Contract Drawings. The backup power supply shall be automatically energized upon failure of the normal power supply. The primary power shall be supplied from a panelboard circuit breaker or disconnect switch which shall be red in color and locked in the energized position. Panel shall be marked "FIRE ALARM CIRCUIT CONTROL" with a rigid plastic nameplate. Transmitter 120 Vac power shall be extended from each building's fire alarm panel.

3.2.2 Wiring for Systems

Submit detailed point-to-point wiring diagram, signed by the registered professional engineer, showing all points of connection. Diagram shall include connections between monitoring center devices, transmitter location appliances, control panels, supervised devices, interfaces between building fire alarm equipment and transmitting equipment, and all equipment that is activated or controlled by the monitoring center equipment. Wiring for systems shall be installed in rigid conduit, intermediate metallic conduit, or electric metallic tubing. The conductors for central station alarm system shall not be installed in conduits, junction boxes, or outlet boxes with conductors of lighting and power systems. Conduit shall be 13 mm 1/2 inch minimum in accordance with NFPA 70. No more than one conductor shall be installed under any screw terminal. Circuit conductors entering or leaving any mounting box, outlet box enclosure or cabinet shall be connected to screw terminals with each terminal marked in accordance with the wiring diagram. Connections and splices shall be made using screw terminal blocks. Wire nut type connectors shall not be used in the system. Wiring within control equipment shall be readily accessible without removing component parts. Submit wiring diagrams as specified in the Submittals paragraph.

3.3 OVERVOLTAGE AND SURGE PROTECTION

Submit certified copies of current applicable approvals or listings issued by UL, FM or other nationally recognized testing laboratory showing compliance with specified NFPA standards. Equipment connected to alternating current circuits shall be protected from surges in accordance with IEEE C62.41.1, IEEE C62.41.2 and NFPA 70. Cables and conductors which serve as communications links, except fiber optics, shall have surge protection circuits installed at each end. Fuses shall not be used for
surge protection.

3.4 GROUNDING

Grounding shall be provided to building ground. Maximum impedance to ground shall be 25 ohms. If the maximum impedance to ground exceeds 25 ohms, ground rods shall be driven. Ground rods shall not protrude more than 150 mm (6 inches) below grade and shall be bonded to building ground.

3.5 TRAINING

Provide training course for the operations and maintenance staff. Conduct the course in the building where the monitoring center is installed or as designated by the Contracting Officer. Submit lesson plans and training data, in manual format, for the training course. The operations training shall familiarize designated Government personnel with proper operation of the system. The maintenance training course shall provide the designated Government personnel adequate knowledge required to diagnose, repair, maintain, and expand functions inherent to the system. The training period shall consist of [3] training days (8 hours per day) and shall start after the system is functionally completed but prior to final acceptance tests. Training shall be provided for [_____] personnel. The instructions shall cover all of the items contained in the operating and maintenance instructions.

3.6 TESTING

Notify the Contracting Officer 30 days before the performance and acceptance tests are to be conducted and submit the detailed test procedures to be used, signed by the registered professional engineer for the central fire alarm system [30] days prior to performing system tests. The test procedures shall be signed by the Registered Professional Engineer. Perform the tests in the presence of the Contracting Officer under the supervision of the central fire alarm system manufacturer's qualified representative. Furnish all instruments and personnel required for the tests.

a. Submit detail drawings, signed by the registered professional engineer, consisting of a complete list of transmitting and receiving equipment, auxiliary equipment and material, including manufacturer's descriptive and technical literature, catalog cuts, description of the procedure for switching from the primary DACR to the backup DACR, and installation instructions. The detail drawings shall also contain transmitting equipment panel layout, monitoring center equipment layout, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit.

b. Submit [6] copies of operating instructions outlining step-by-step procedures required for system startup, operation, and shutdown. The instructions shall include the manufacturer's name, model number, service manual, parts list, and brief description of the equipment and basic operating features.

c. Submit [6] copies of maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs and troubleshooting guide. The instructions shall include conduit layout, equipment layout, simplified wiring control diagrams of the system as installed, and programming of DACT and DACR equipment. Instructions shall be approved prior to training.
d. Submit test reports in booklet form showing field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Each test report shall document readings, test results, and indicate the final position of controls.

3.6.1 Performance Testing

Upon completion of the installation, subject the system to a complete functional and operational performance test to determine that the system is free from grounded, shorted, or open circuits. When all corrections have been made, the system shall be retested to assure that it is functional. Submit copies of performance test reports in accordance with paragraph SUBMITTALS.

3.6.2 Acceptance Test

**************************************************************************
NOTE: Listed tests are minimum required. If additional tests are required such tests must be added to the list.
**************************************************************************

Testing shall be in accordance with NFPA 72. The recommended tests in NFPA 72 shall be considered mandatory and shall verify that all previous deficiencies have been corrected. The tests shall include the following:

a. Tests to indicate there are no grounded, shorted, or open circuits.

b. Tests of each input to each digital alarm communicator transmitter, including transmission of trouble and alarm signals across both the first and second telephone lines at each location and proper reception at the monitoring center.

c. Tests of DACR, terminal and printer for all required functions.

d. Tests of normal and emergency power supplies, including batteries. Tests shall include verification of complete system operation at extreme end of the required emergency power duration, and verification of recharging time.

NOTE: This specification covers the requirements for an addressable integrated fire detection, fire alarm evacuation and mass notification system.

Adhere to [UPC 1-300-02](#) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](#).

NOTE: For OCONUS projects, this specification section should be edited for specific Host Nation requirements. Coordinate compliance with Host Nation requirements with the Designated Fire Protection Engineer (DFPE).
NOTE: For Family Housing projects at NAVFAC NE use regional guide specification section 28 31 46.00 22 (N-13854N) HOUSEHOLD FIRE WARNING EQUIPMENT to specify residential fire warning systems in lieu of this section.

**************************************************************************

NOTE: This specification section includes requirements from UFC 3-600-01 (change 43, 7 February 2020)

**************************************************************************

NOTE: This guide specification covers carbon monoxide alarm detectors for protection in indoor locations where fuel-burning appliances/equipment are used.

**************************************************************************

PART 1 GENERAL

**************************************************************************

1. On the drawings, show location of control unit, batteries and charger (if remotely mounted), supervising station transceiver, annunciator, primary power supply, remote annunciator, detectors, notification appliances (unless performance requirements are specified), and each alarm initiating device including fire extinguishing system switches.

2. Show single-line fire alarm/mass notification systems riser diagram. Each device on the riser should be identified by type. Indicate connection of equipment.

3. A fire alarm operating matrix/mass notification system must be placed on the drawings. Show actions of input devices such as detectors, manual stations, waterflow switches, initiating devices, etc. on one axis and output functions such as door releases, smoke control fans, elevator relays, indicating/notification appliances etc. on the other. Entries which require descriptions, explanation of processes, sequences, interfaces, etc. can be flagged by symbols keyed to supplementary notes. Alternately provide a zone-by-zone sequence of operation or a schedule identifying all initiators, outputs, and interfaces.

4. Addressable Fire Alarm Systems generally utilize Signal Line Circuits (SLC) for communication between devices. Normally all devices are addressable or will have an addressable interface device installed integrally with the device. Initiating Device Circuits (IDC) should be provided for interfacing to existing IDC loops or connection between non-addressable devices and the SLC.
1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 RELATED SECTIONS

Section 25 05 11 Cybersecurity for Facility-Related Control Systems, applies to this section, with the additions and modifications specified herein. In addition, refer to the following sections for related work and coordination:

[ Section 21 13 13 WET PIPE SPRINKLER SYSTEM, FIRE PROTECTION ]
[ Section 21 13 16 DRY PIPE FIRE SPRINKLER SYSTEMS ]
[ Section 21 13 18 PREACTION FIRE SPRINKLER SYSTEMS ]
[ Section 21 13 19 DELUGE FIRE SPRINKLER SYSTEMS ]
[ Section 23 30 00 HVAC AIR DISTRIBUTION ]
[ Section 21 13 24.00 10 AQUEOUS FILM-FORMING FOAM (AFFF) FIRE PROTECTION ]
1.3 SUMMARY

1.3.1 Scope

a. This work includes designing and [providing a new, complete,] [modifying the existing] fire alarm and mass notification (MNS) system as described herein and on the contract drawings [for the ____________]. Include system wiring, raceways, pull boxes, terminal cabinets, outlet and mounting boxes, control equipment, initiating devices, notification appliances, supervising station fire alarm transmitters/mass notification transceiver, and other accessories and miscellaneous items required for a complete operational system even though each item is not specifically mentioned or described. Provide system[s] complete and ready for operation. [Existing interior fire alarm system was manufactured by [_____]]. Design and installation must comply with UFGS 25 05 11, UFC 4-010-06 and AFGM 2019-320-02.

b. Provide equipment, materials, installation, workmanship, inspection, and testing in strict accordance with NFPA 72, except as modified herein. [The system layout on the drawings show the intent of coverage and suggested locations. Final quantity, system layout, and coordination are the responsibility of the Contractor.]

c. Each remote fire alarm control unit must be powered from a wiring riser specifically for that use or from a local emergency power panel located on the same floor as the remote fire alarm control unit. Where remote fire control units are provided, equipment for notification appliances may be located in the remote fire alarm control units.

d. Where a fire pump is provided, the fire alarm and mass notification system must monitor and transmit the fire pump controller signals in accordance with the provisions of NFPA 72.

e. Where an emergency generator provides standby power supply for life safety system circuits, the generator must be monitored by the FMCU and transmit emergency generator signals in accordance with NFPA 72.

f. The fire alarm and mass notification system must be independent of the building security, building management, and energy/utility monitoring systems other than for control functions.
1.3.2 **Qualified Fire Protection Engineer (QFPE)**

**************************************************************************

NOTE: UFC 3-600-01 requires that shop drawings must bear the Review Stamp and professional engineering stamp of the QFPE prior to submission to the Government for approval.

**************************************************************************

**************************************************************************

NOTE: The term Qualified Fire Protection Engineer (QFPE) should be considered interchangeable with the terms "Fire Protection Designer of Record (FPDOR)" and/or "Fire Protection QC Specialist" where referred to in other applicable contract documents. The intent of defining the QFPE roles and responsibilities here is NOT to require personnel in addition to the QFPE, FPDOR, and/or FPQC specialist referenced elsewhere in the applicable contract documents.

**************************************************************************

Services of the QFPE must include:

a. Reviewing SD-02, SD-03, and SD-05 submittal packages for completeness and compliance with the provisions of this specification. Construction (shop) drawings and calculations must be prepared by, or prepared under the immediate supervision of, the QFPE. The QFPE must affix their professional engineering stamp with signature to the shop drawings, calculations, and material data sheets, indicating approval prior to submitting the shop drawings to the DFPE.

b. Providing a letter documenting that the SD-02, SD-03, and SD-05 submittal package has been reviewed and noting any outstanding comments.

c. Performing in-progress construction surveillance prior to installation of ceilings (rough-in inspection).

e. Signing applicable certificates under SD-07.

1.4 **DEFINITIONS**

Wherever mentioned in this specification or on the drawings, the equipment, devices, and functions must be defined as follows:

1.4.1 **Interface Device**

An addressable device that interconnects hard wired systems or devices to an analog/addressable system.

1.4.2 **Fire Alarm and Mass Notification Control Unit (FMCU)**

A master control unit having the features of a fire alarm control unit (FACU) and an autonomous control unit (ACU) where these units are interconnected to function as a combined fire alarm/mass notification system. The FACU and ACU functions may be contained in a single cabinet or...
in independent, interconnected, and co-located cabinets.

1.4.3 Remote Fire Alarm and Mass Notification Control Unit

A control unit, physically remote from the fire alarm and mass notification control unit, that receives inputs from automatic and manual fire alarm devices; may supply power to detection devices and interface devices; may provide transfer of power to the notification appliances; may provide transfer of condition to relays or devices connected to the control unit; and reports to and receives signals from the fire alarm and mass notification control unit.

1.4.4 Local Operating Console (LOC)

A unit designed to allow emergency responders and/or building occupants to operate the MNS including delivery of recorded messages and/or live voice announcements, initiate visual, textual visual, and audible appliance operation and other relayed functions.

1.4.5 Terminal Cabinet

A steel cabinet with locking, hinge-mounted door where terminal strips are securely mounted inside the cabinet.

1.4.6 Control Module and Relay Module

Terms utilized to describe emergency control function interface devices as defined by NFPA 72.

1.4.7 Designated Fire Protection Engineer (DFPE)

The DoD fire protection engineer that oversees that Area of Responsibility for that project. This is sometimes referred to as the "cognizant" fire protection engineer. Interpret reference to "authority having jurisdiction" and/or AHJ in referenced standards to mean the Designated Fire Protection Engineer (DFPE). The DFPE may be responsible for review of the contractor submittals having a "G" designation, and for witnessing final inspection and testing.

1.4.8 Qualified Fire Protection Engineer (QFPE)

A QFPE is an individual who is a licensed professional engineer (P.E.), who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience.

1.5 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES (or the particular specification section for submittal procedures in this project) and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be
reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.]

Shop drawings (SD-02), product data (SD-03) and calculations (SD-05) must be prepared by the fire alarm designer and combined and submitted as one complete package. The QFPE must review the SD-02/SD-03/SD-05 submittal package for completeness and compliance with the Contract provisions prior to submission to the Government. The QFPE must provide a Letter of Confirmation that they have reviewed the submittal package for compliance with the contract provisions. This letter must include their registered professional engineer stamp and signature. Partial submittals and submittals not reviewed by the QFPE will be returned by the Government disapproved without review.

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 SYSTEM OPERATION

**************************************************************************
NOTE:  Circuit wiring must be Class "B" unless Class "A" or "X" is required by the local installation and as permitted by NFPA 72 (SLC: "A", "B", or "X"; IDC and NAC: "A" or "B").

Circuits and pathways must have survivability levels as defined by NFPA 72.
**************************************************************************

Fire alarm system/mass notification system including textual display sign control panel(s), components requiring power, except for the FMCU(s) power supply, must operate on 24 volts DC unless noted otherwise in this section.

The interior fire alarm and mass notification system must be a complete, supervised, noncoded, analog/addressable fire alarm and mass notification system conforming to NFPA 72, UL 864, and UL 2572. Systems meeting UL 2017 only are not acceptable. The system must be activated into the alarm mode by actuation of an alarm initiating device. The system must remain in the alarm mode until the initiating device is reset and the control unit is reset and restored to normal. The system may be placed in the alarm mode by local microphones, LOC, FMCU, or remotely from authorized locations/users.

[Provide the system with an interconnected riser loop or network having Class [A][X] supervision. Ensure that the return portion of the loop is remote from the supply portion of the loop.][Where the building has two stairs for egress from floors above grade or floors below grade, ensure that a single impairment cannot adversely affect more than one floor.][Where three or more stairs are provided for egress from floors above grade or below grade, ensure that a single impairment cannot adversely affect more than one-half of any floor.][Ensure that any single impairment of the system does not affect the system on more than [one][one-half] of any floor.]

1.6.1 Alarm Initiating Devices and Notification Appliances (Visual, Voice, Textual)

a. Connect alarm initiating devices to initiating device circuits (IDC) [Class "A"] [Class "B"], or to signaling line circuits (SLC) Class ["A"] ["B"] ["X"] and installed in accordance with NFPA 72.
b. Connect notification appliances to notification appliance circuits (NAC) [Class "A"][Class "B"].

1.6.2 Functions and Operating Features

The system must provide the following functions and operating features:

a. Power, annunciation, supervision, and control for the system. Addressable systems must be microcomputer (microprocessor or microcontroller) based with a minimum word size of eight bits with sufficient memory to perform as specified.

b. Visual alarm notification appliances must be synchronized as required by NFPA 72.

c. Electrical supervision of the primary power (AC) supply, presence of the battery, battery voltage, and placement of system modules within the control unit.

d. An audible and visual trouble signal to activate upon a single break or open condition, or ground fault[ (or short circuit for Class "X")]. The trouble signal must also operate upon loss of primary power (AC) supply, absence of a battery supply, low battery voltage, or removal of alarm or supervisory control unit modules. After the system returns to normal operating conditions, the trouble signal must again sound until the trouble is acknowledged. A smoke detector in the process of being verified for the actual presence of smoke must not initiate a trouble condition.

e. A trouble signal silence feature that must silence the audible trouble signal, without affecting the visual indicator.

f. Program capability via switches in a locked portion of the FMCU to bypass the automatic notification appliance circuits, [fire reporting system][air handler shutdown][smoke control operation][elevator recall][door release][door unlocking] features. Operation of this programmed action must indicate on the FMCU display[ and printer output] as a supervisory or trouble condition.[ Notification appliance bypass must be selectable by floor.]

g. Alarm functions must override trouble or supervisory functions. Supervisory functions must override trouble functions.

h. The system must be capable of being programmed from the control unit keyboard. Programmed information must be stored in non-volatile memory.

i. The system must be capable of operating, supervising, and/or monitoring non-addressable alarm and supervisory devices.

j. There must be no limit, other than maximum system capacity, as to the number of addressable devices that may be in alarm simultaneously.

k. Where the fire alarm/mass notification system is responsible for initiating an action in another emergency control device or system, such as [HVAC, ][atrium exhaust, ][smoke control, ][elevator recall, ][releasing service, ]the addressable fire alarm relay must be located in the vicinity of the emergency control device.
1. An alarm signal must automatically initiate the following functions:

   (1) Transmission of an alarm signal to [the fire department][a remote supervising station].

   (2) Visual indication of the device operated on the FMCU, [Video Display unit (VDU)], [and on the [graphic ][remote ]annunciator]. [Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.]

   [ (3) Record the event on the system printer.]

   (4) Actuation of alarm notification appliances.

   (5) Recording of the event electronically in the history log of the FMCU.

   [ (6) Release of doors held open by electromagnetic devices.]

   [ (7) Operation of the [smoke control system][atrium exhaust system].]

   [ (8) Release of power to electric locks (delayed egress locks) on doors that are part of the means of egress.]

   [ (9) Elevator recall as described in this section.]

   **************************************************************************

   NOTE: Use this paragraph only where a detector or detection system is to release a special fire extinguishing system.

   **************************************************************************

   [ (10) Operation of [_____] must release the [_____] fire extinguishing system after a [_____] second time delay.]

   [ (11) Operation of a sprinkler waterflow switch serving an elevator machinery room or elevator shaft must operate shunt trip circuit breaker(s) to shut down power to the elevators in accordance with ASME A17.1/CSA B44.

   [ (12) Operation of an interface that operates vibrating pagers worn by hearing-impaired occupants.]

   ] m. A supervisory signal must automatically initiate the following functions:

   (1) Visual indication of the device operated on the FMCU, [Video Display unit (VDU)], [and on the [graphic ][remote ]annunciator]. [Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.]

   [ (2) Record the event on the system printer.]

   [ (3) Transmission of a supervisory signal to [the fire department][a remote supervising station].

   (4) Operation of a duct smoke detector must shut down the appropriate air handler in accordance with NFPA 90A in addition to other requirements of this paragraph and as allowed by NFPA 72.
(5) Recording of the event electronically in the history log of the FMCU.

n. A trouble condition must automatically initiate the following functions:

(1) Visual indication of the device operated on the FMCU, [Video Display unit (VDU),] [and on the [graphic ] [remote annunciator]. [Indication on the graphic annunciator must be by floor, zone or circuit, and type of device.]

(2) Record the event on the system printer.

(3) Transmission of a trouble signal to [the fire department] [a remote supervising station].

(4) Recording of the event electronically in the history log of the FMCU.

o. Activation of a carbon monoxide alarm initiating device must automatically initiate the following functions:

(1) Visual indication of the device operated on the FMCU, [LCD, LED Display unit (VDU),] [and on the [graphic ] [remote annunciator]. [Indication on the graphic annunciator must be by floor and room number, device address, and device type.]

(2) Transmission of a carbon monoxide alarm signal to [the fire department] [a remote supervising station].

(3) Activation of all strobes and the audible carbon monoxide message throughout the building.

(4) Recording of the event electronically in the history log of the FMCU.

p. System control equipment must be programmed to provide a 60-minute to 180-minute delay in transmission of trouble signals resulting from primary power failure.

q. Activation of a LOC pushbutton must activate the audible and visual alarms in the facility. The audible message must be the one associated with the pushbutton activated.

1.6.3 Elevator Recall

**************************************************************************
NOTE: Delete this paragraph if no elevator work is included in the project.
**************************************************************************

Provide elevator recall in accordance with ASME A17.1/CSA B44, Section [14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS][14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS][14 24 13 HYDRAULIC FREIGHT ELEVATORS][14 24 23 HYDRAULIC PASSENGER ELEVATORS], and as specified herein. Activation of any smoke detector in an elevator shaft, machine room, or lobby (except at designated recall level) must cause all elevators associated with that shaft, machine room, or lobby to return nonstop to the designated level. Activation of a smoke detector in the lobby or machine room at the
designated level must cause all elevators associated with that lobby to
return nonstop to the assigned alternate level. Activation of a detector
in an elevator shaft, machine room, or lobby must also cause illumination
of elevator cab warning signal (fire hat) and complete operation of fire
alarm system as specified in paragraph titled "Functions and Operating
Features".

1.7 TECHNICAL DATA AND SITE-SPECIFIC SOFTWARE

Technical data and site-specific software (meaning technical data that
relates to computer software) that are specifically identified in this
project, and may be required in other specifications, must be delivered,
strictly in accordance with the CONTRACT CLAUSES. The fire alarm system
manufacturer must submit written confirmation of this contract provision as
"Fire Alarm System Site-Specific Software Acknowledgement". Identify data
delivered by reference to the specification paragraph against which it is
furnished. Data to be submitted must include complete system, equipment,
and software descriptions. Descriptions must show how the equipment will
operate as a system to meet the performance requirements of this contract.
The site-specific software data package must also include the following:

a. Items identified in NFPA 72, titled "Site-Specific Software".
b. Identification of programmable portions of the system equipment and
capabilities.
c. Description of system revision and expansion capabilities and methods
of implementation detailing both equipment and software requirements.
d. Provision of operational software data on all modes of programmable
portions for fire alarm and mass notification.
e. Description of Fire Alarm and Mass Notification Control Unit equipment
operation.
f. Description of auxiliary and remote equipment operations.
g. Library of application software.
h. Operation and maintenance manuals.

1.8 EXISTING EQUIPMENT

**************************************************************************
NOTE: If an addition to an existing fire alarm/mass
notification system is required, the contract
drawings or this section must include the make,
model number, and other pertinent information of
existing components that are to operate with the new
equipment. Since new interfaces will have to be
compatible with the existing system or to the
central fire alarm reporting system, it may be
necessary to edit major items out of this
specification. If a new FMCU is required, it has to
be compatible with the existing central fire alarm
reporting system. When an existing system is to be expanded, show the following information on the
contract drawings:
1. Manufacturer and model of existing control unit.

2. Number of existing initiating circuits (zones), notification appliance circuits, and control circuits served by the control unit.

3. Number of existing alarm notification appliances on the system.

4. Total calculated current draw of all devices served by each existing standby battery under both supervisory (standby) and alarm conditions, including NAC/extender control units and subcontrol units.

5. Ampere-hour rating and type of each existing battery.

**************************************************************************

a. Equipment and devices must be compatible and operable with the existing fire alarm/mass notification system and must not impair reliability or operational functions of existing supervising station fire alarm system. The proprietary type supervising station (PSS) is located in Building [_____] [_____.] The supervising equipment is existing and consists of the following brands and models: [supervising station control unit [_____] [_____] [signal reporting components [_____] [annunciator [_____] [_____.]]].

b. Equipment and devices must be compatible and operable with the existing building fire alarm/mass notification system. Equipment must not impair reliability or operational functions of the existing system. The existing building system control unit is [_____.]

c. Equipment and devices must be compatible and operable with the existing installation-wide mass notification system and must not impair reliability or operational functions of the existing system. The installation-wide mass notification system utilizes [_____] transceivers.

1.9 QUALITY ASSURANCE

1.9.1 Submittal Documents

1.9.1.1 Preconstruction Submittals

Within 36 days of contract award but not less than [14 days] [_____] prior to commencing any work on site, the Contractor must submit the following for review and approval. SD-02, SD-03 and SD-05 submittals received prior to the review and approval of the qualifications of the fire alarm subcontractor and QFPE must be returned disapproved without review. All resultant delays must be the sole responsibility of the Contractor.

1.9.1.2 Shop Drawings

Shop drawings must not be smaller than [ISO A1] [ANSI D] [the Contract Drawings]. Drawings must comply with the requirements of NFPA 72 and NFPA 170. Minimum scale for floor plans must be 1/8" = 1'.

SECTION 28 31 76 Page 22
1.9.1.3 **Nameplates**

Nameplate illustrations and data to obtain approval by the Contracting Officer before installation.

1.9.1.4 **Wiring Diagrams**

[_____] copies of point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the FMCU and remote FM CU, initiating circuits, switches, relays and terminals, including pathway diagrams between the control unit and shared communications equipment within the protected premises. Point-to-point wiring diagrams must be job specific and must not indicate connections or circuits not being utilized. Provide complete riser diagrams indicating the wiring sequence of all devices and their connections to the control equipment. Include a color-code schedule for the wiring.

1.9.1.5 **System Layout**

[_____] copies of plan view drawing showing device locations, terminal cabinet locations, junction boxes, other related equipment, conduit routing, conduit sizes, wire counts, conduit fill calculations, wire color-coding, circuit identification in each conduit, and circuit layouts for all floors. Indicate candela rating of each visual notification appliance. Indicate the wattage of each speaker. Clearly identify the locations of isolation modules. Indicate the addresses of all devices, modules, relays, and similar. Show/identify all acoustically similar spaces. Indicate if the environment for the FM CU is within its environmental listing (e.g. temperature/humidity).

Provide a complete description of the system operation in matrix format similar to the "Typical Input/Output Matrix" included in the Annex of NFPA 72.

[For air sampling smoke detection systems, provide floor plan layouts indicating location of fire alarm control unit, air sampling piping (lengths of pipe) and sampling ports (sizes and locations). Floor plan must also indicate geographic monitor zone boundaries, location of display control unit, bar level annunciation panels if separate, and all other associated equipment that is required to provide a complete operational system.

]1.9.1.6 **Notification Appliances**

Calculations and supporting data on each circuit to indicate that there is at least 25 percent spare capacity for notification appliances. Annotate data for each circuit on the drawings.

1.9.1.7 **Initiating Devices**

Calculations and supporting data on each circuit to indicate that there is at least [25][_____] percent spare capacity for initiating devices. Annotate data for each circuit on the drawings.
1.9.1.8 Amplifiers

Calculations and supporting data to indicate that amplifiers have sufficient capacity to simultaneously drive all notification speakers at tapped settings plus [25][_____] percent spare capacity. Annotate data for each circuit on the drawings.

1.9.1.9 Battery Power

Calculations and supporting data as required in paragraph Battery Power Calculations for alarm, alert, and supervisory power requirements. Calculations including ampere-hour requirements for each system component and each control unit component, and the battery recharging period, must be included on the drawings.

1.9.1.10 Voltage Drop Calculations

Voltage drop calculations for each notification circuit indicating that sufficient voltage is available for proper operation of the system and all components, at a minimum rated voltage of the system operating on batteries. Include the calculations on the system layout drawings.

1.9.1.11 Product Data

[_____] copies of annotated descriptive data to show the specific model, type, and size of each item. Catalog cuts must also indicate the NRTL listing. The data must be highlighted to show model, size, and options that are intended for consideration. Data must be adequate to demonstrate compliance with all contract requirements. Product data for all equipment must be combined into a single submittal.

Provide an equipment list identifying the type, quantity, make, and model number of each piece of equipment to be provided under this submittal. The equipment list must include the type, quantity, make and model of spare equipment. Types and quantities of equipment submitted must coincide with the types and quantities of equipment used in the battery calculations and those shown on the shop drawings.

1.9.1.12 Air Sampling Smoke Detection System Calculations

Submit air sampling detection system design analysis calculations consisting of battery capacity, loading calculations, and fan speed and air flow/transport calculations. Include schematic diagrams showing pipe segments, pipe diameters, lengths of pipe, node numbers, and sample port diameters to verify the requirements are met.

1.9.1.13 Operation and Maintenance (O&M) Instructions

[Six][_____] copies of the Operation and Maintenance Instructions. The O&M Instructions must be prepared in a single volume or in multiple volumes, with each volume indexed, and may be submitted as a Technical Data Package. Manuals must be approved prior to training. The Interior Fire Alarm And Mass Notification System Operation and Maintenance Instructions must include the following:

a. "Manufacturer Data Package [five][_____]" as specified in [Section 01 78 23 OPERATION AND MAINTENANCE DATA][____].

b. Operating manual outlining step-by-step procedures required for system
startup, operation, and shutdown. The manual must include the manufacturer's name, model number, service manual, parts list, and preliminary equipment list complete with description of equipment and their basic operating features.

c. Maintenance manual listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The manuals must include conduit layout, equipment layout and simplified wiring, and control diagrams of the system as installed.

d. Complete procedures for system revision and expansion, detailing both equipment and software requirements.

e. Software submitted for this project on CD/DVD media utilized.

f. Printouts of configuration settings for all devices.

g. Routine maintenance checklist. The routine maintenance checklist must be arranged in a columnar format. The first column must list all installed devices, the second column must state the maintenance activity or state no maintenance required, the third column must state the frequency of the maintenance activity, and the fourth column provided for additional comments or reference. All data (devices, testing frequencies, and similar) must comply with UFC 3-601-02.

h. A final Equipment List must be submitted with the Operating and Maintenance (O&M) manual.

1.9.1.14 As-Built Drawings

The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of the as-built (marked-up) drawings must be provided at the time of, or prior to the final Government test.

1.9.2 Qualifications

**************************************************************************
NOTE: NICET (National Institute for Certification in Engineering Technologies) establishes the qualifications of an individual as an Engineering Technologist with verification of experience by having a current NICET certification.
**************************************************************************

1.9.2.1 Fire Alarm System Designer

The fire alarm system designer must be certified as a Level [III][IV] (minimum) Technician by National Institute for Certification in Engineering Technologies (NICET) in the Fire Alarm Systems subfield of Fire Protection Engineering Technology or meet the qualifications for a QFPE.

1.9.2.2 Supervisor

[A NICET Level [III][ or ] [IV] fire alarm technician must supervise the installation of the fire alarm/mass notification system[, including the air sampling smoke detection system].] [A fire alarm technician with a minimum of eight years of experience must supervise the installation of the fire
alarm/mass notification system.) The fire alarm technicians supervising the installation of equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.9.2.3 Technician

Fire alarm technicians with a minimum of four years of experience must be utilized to install and terminate fire alarm/mass notification devices, cabinets and control units. The fire alarm technicians installing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings[, and must be thoroughly experienced in the installation of air sampling detection systems].

1.9.2.4 Installer

[Fire alarm installer with a minimum of two years of experience utilized to assist in the installation of fire alarm/mass notification devices, cabinets and control units] [NICET Level II technician to assist in the installation of fire alarm/mass notification devices, cabinets and control units]. A licensed electrician must be allowed to install wire, cable, conduit and backboxes for the fire alarm system/mass notification system. The fire alarm installer must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

1.9.2.5 Test Technician

Fire alarm technicians with a minimum of eight years of experience and NICET Level [III][ or ][IV] utilized in testing and certification of the installation of the fire alarm/mass notification devices, cabinets and control units. The fire alarm technicians testing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment installed as part of this project.

1.9.2.6 Manufacturer

Components must be of current design and must be in regular and recurrent production at the time of installation. Provide design, materials, and devices for a protected premises fire alarm system, complete, conforming to NFPA 72, except as specified herein.

1.9.3 Regulatory Requirements

Equipment and material must be listed or approved. Listed or approved, as used in this section, means listed, labeled or approved by a Nationally Recognized Testing Laboratory (NRTL) such as UL Fire Prot Dir or FM APP GUIDE. The omission of these terms under the description of any item of equipment described must not be construed as waiving this requirement. All listings or approvals by testing laboratories must be from an existing ANSI or UL published standard. The recommended practices stated in the manufacturer's literature or documentation must be considered as mandatory requirements.

1.10 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from the weather, humidity, and temperature variation, dirt and dust, and other contaminants.
1.11 MAINTENANCE

1.11.1 Spare Parts

Furnish the following spare parts in the manufacturers original unopened containers:

a. [Five] complete sets of system keys.

b. [Two] of each type of fuse required by the system.

[ d. [Two] of each type of detector installed.

] e. [Two] of each type of detector base and head installed.

][g. One smoke detector manufacturer's test screen, card or magnet for each ten beam smoke detectors, or fraction thereof, installed in the system.

][h. Two air sampling smoke detection system filter assemblies.

] i. [Two] of each type of audible and visual alarm device installed.

k. [Two] of each type of addressable monitor module installed.

l. [Two] of each type of addressable control module installed.

m. [Two] low voltage, [one] telephone[internet][ethernet], and [one] 120 VAC surge protective device.

[ n. [Two] spare reams of paper for the system printer, plus sufficient paper for testing.

][o. [Two] spare printer ribbons.

]1.11.2 Special Tools

Software, connecting cables and proprietary equipment, necessary for the maintenance, testing, and reprogramming of the equipment must be furnished to the Contracting Officer, prior to the instruction of Government employees.

PART 2 PRODUCTS

2.1 GENERAL PRODUCT REQUIREMENT

All fire alarm and mass notification equipment must be listed for use under the applicable reference standards. Interfacing of UL 864 or similar approved industry listing with Mass Notification equipment listed to UL 2572 must be done in a laboratory listed configuration, if the software programming features cannot provide a listed interface control.
2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials, equipment, and devices that have been tested by a nationally recognized testing laboratory and listed for fire protection service when so required by NFPA 72 or this specification. Select material from one manufacturer, where possible, and not a combination of manufacturers, for any particular classification of materials. Material and equipment must be the standard products of a manufacturer regularly engaged in the manufacture of the products for at least [2][_____] years prior to bid opening.

2.2.2 Nameplates

Major components of equipment must have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new name plate permanently affixed to the item or equipment. Major components include, but are not limited to, the following:

a. FMCU

Nameplates must be etched metal or plastic, permanently attached by screws to control units or adjacent walls.

2.2.3 Keys

Keys and locks for equipment, control units and devices must be identical. [Master all keys and locks to a single key as required by the [Installation Fire Department][_____]]. [Keys must be CAT [60][_____]].

2.2.4 Instructions

Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. [Install the instructions on the interior of the FMCU.] [Install the frame in a conspicuous location observable from the FMCU.] The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions must also include procedures for operating live voice microphones. The instructions and their mounting location must be approved by the Contracting Officer before being posted.

2.3 FIRE ALARM AND MASS NOTIFICATION CONTROL UNIT

**************************************************************************
NOTE: The control unit must be located in an air conditioned space where the ambient temperature is maintained between 15 and 27 degrees C 60 and 80 degrees F.
**************************************************************************

Provide a complete fire alarm and mass notification control unit (FMCU) fully enclosed in a lockable steel cabinet as specified herein. Operations required for testing or for normal care, maintenance, and use of the system must be performed from the front of the enclosure. If more than a single unit is required at a location to form a complete control unit, the unit cabinets must match exactly.[ If more than a single unit is required,
and is located in the lobby/entrance, notify the Contracting Officer's Designated Representative (COR), prior to installing the equipment.] The system must be capable of defining any module as an alarm module and report alarm trouble, loss of polling, or as a supervisory module, and reporting supervisory short, supervisory open or loss of polling such as waterflow switches, valve supervisory switches, fire pump monitoring, independent smoke detection systems, relays for output function actuation.

a. Each control unit must provide power, supervision, control, and logic for the entire system, utilizing solid state, modular components, internally mounted and arranged for easy access. Each control unit must be suitable for operation on a 120 volt, 60 hertz, normal building power supply. Provide each control unit with supervisory functions for power failure, internal component placement, and operation.

b. Visual indication of alarm, supervisory, or trouble initiation on the FMCU must be by liquid crystal display or similar means with a minimum of 80 characters. The mass notification control unit must have the capability of temporarily deactivate the fire alarm audible notification appliances while delivering voice messages.

c. Provide secure operator console for initiating recorded messages, strobes and displays; and for delivering live voice messages. Provide capacity for at least eight prerecorded messages. Provide the ability to automatically repeat prerecorded messages. Provide a secure microphone for delivering live messages. Provide adequate discrete outputs to temporarily deactivate fire alarm audible notification, initiate/synchronize strobes and initiate textual visual notification appliances. Provide a complete set of self-diagnostics for controller and appliance network. Provide local diagnostic information display and local diagnostic information and system event log file.

2.3.1 Cabinet

Install control unit components in cabinets large enough to accommodate all components and also to allow ample gutter space for interconnection of control units as well as field wiring. The cabinet must be a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and [surface][semi-recessed] mounting provisions. The enclosure must be identified by an engraved phenolic resin nameplate. Lettering on the nameplate must say "Fire Alarm and Mass Notification control unit" and must not be less than 25 mm 1-inch high. Provide prominent rigid plastic or metal identification plates for lamps, circuits, meters, fuses, and switches.

2.3.2 Silencing Switches

2.3.2.1 Alarm Silencing Switch

Provide an alarm silencing switch at the FMCU that must silence the audible and visual notification appliances. Subsequent activation of initiating devices must cause the notification appliances to re-activate.

2.3.2.2 Supervisory/Trouble Silencing Switch

Provide supervisory and trouble silencing switch(es) that must silence the audible trouble and supervisory signal(s), but not extinguish the visual indicator. This switch must be overridden upon activation of a subsequent supervisory or trouble condition. Audible trouble indication must resound...
automatically every 24 hours after the silencing feature has been operated if the supervisory or trouble condition still exists.

2.3.3 Non-Interfering

Power and supervise each circuit such that a signal from one device does not prevent the receipt of signals from any other device. Initiating devices must be manually reset by switch from the FMCU after the initiating device or devices have been restored to normal.

2.3.4 Audible Notification System

**************************************************************************
NOTE: Use the proper bracketed item depending upon whether the fire alarm system is to cause total evacuation upon an alarm.
**************************************************************************

The Audible Notification System must comply with the requirements of NFPA 72 for Emergency Voice/Alarm Communications System requirements, except as specified herein. The system must be a one-way, multi-channel voice notification system incorporating user selectability of a minimum eight distinct sounds for tone signaling, and the incorporation of a voice module for delivery of recorded messages. Audible appliances must produce a three-pulse temporal pattern for three cycles followed by a voice message that is repeated until the control unit is reset or silenced. For carbon monoxide detector activation, audible appliances must produce a four-pulse temporal pattern for three cycles followed by a voice message that is repeated until the control unit is reset or silenced. Automatic messages must be broadcast through speakers throughout the building/facility but not in stairs or elevator cabs. A live voice message must override the automatic audible output through use of a microphone input at the control unit or the LOC.

a. When using the microphone, live messages must be broadcast [throughout a selected floor or floors, ][selectable by zone, ] or all call. The system must be capable of operating all speakers at the same time. [The Audible Notification System must support Public Address (PA) paging for the facility.] [This must be accomplished with the provision of a separate microphone with a head unit that interfaces with the FMCU. The public address paging function must not override any fire alarm or mass notification functions. The microphone must be [desktop][hand-held][_____] style. Hand-held microphones must be housed in a separate protective cabinet. The cabinet must be accessible without the use of a key. The location of the microphone(s) must be approved by the [_____] Designated Fire Protection Engineer (DFPE).] Activation of the public address microphone must not initiate activation of visual notification appliances or LED text displays.

b. The microprocessor must actively interrogate circuitry, field wiring, and digital coding necessary for the immediate and accurate rebroadcasting of the stored voice data into the appropriate amplifier input. Loss of operating power, supervisory power, or any other malfunction that could render the digitalized voice module inoperative must automatically cause the three-pulse temporal pattern to take over all functions assigned to the failed unit in the event an alarm is activated.
2.3.4.1 Outputs and Operational Modules

All outputs and operational modules must be fully supervised with on-board diagnostics and trouble reporting circuits. Provide form "C" contacts for system alarm and trouble conditions. Provide circuits for operation of auxiliary appliance during trouble conditions. During a Mass Notification event, the control unit must not generate nor cause any trouble alarms to be generated with the Fire Alarm system.

2.3.4.2 Mass Notification

******************************************************************************
NOTE: The specification writer must comply with the requirements of UFC 4-021-01 and must use messages approved for each specific installation since risks are different at each and every installation.

These message that follow are suggestions for use in the event that installation specific messages are not available.
******************************************************************************

a. The system must have the capability of utilizing an LOC with redundant controls of the PMCU. Notification Appliance Circuits (NAC) must be provided for the activation of strobe appliances. Audio output must be selectable for line level. A hand-held microphone must be provided and, upon activation, must take priority over any tone signal, recorded message or PA microphone operation in progress, while maintaining the strobe NAC circuit activation.

b. The Mass Notification functions must override the manual or automatic fire alarm notification, and public address (PA) functions. Other fire alarm functions including transmission of a signal(s) to the fire department must remain operational. When a mass notification announcement is disengaged and a fire alarm condition still exists, the audible and visual notification appliances must resume activation for alarm conditions. The fire alarm message must be of lower priority that all other messages (except any "test" messages) and must not override any other messages.

******************************************************************************
NOTE: Include ALL installation specific messages in this section.
******************************************************************************

[ c. Messages must be recorded professionally utilizing standard industry methods, in a professional [male][female] voice. Message and tone volumes must both be at the same decibel level. Messages recorded from the system microphone must not be accepted. A 1000 Hz tone (as required by NFPA 72) must precede messages and be similar to the following unless Installation or Facility specific messages are required:

(1) "May I have your attention please. May I have your attention please. [Insert installation specific message here.]") (Provide a [2][_____] second pause.) "May I have your attention please, (repeat the tones and message [on a continuous loop][[_____] times]).

(2) Carbon Monoxide: "May I have your attention please. May I have your attention please. Carbon monoxide has been detected in the
building. Please walk to the nearest exit and leave the building."
(Provide a [2][_____] second pause.) "May I have your attention please,
(repeat the tones and message [on a continuous loop][_____] times))."

(3) Fire: "May I have your attention please. May I have your attention please. A fire emergency has been reported in the building. Please leave the building by the nearest exit[ or exit stairway].[ Do not use the elevators.]" (Provide a [2][_____] second pause.) "May I have your attention please, (repeat the tones and message on a continuous loop)."

(4) Test: "May I have your attention please. May I have your attention please. This is a test of the building mass notification system. Please continue your normal duties. This is only a test." (Provide a [2][_____] second pause.)

(5) All Clear: "May I have your attention please. May I have your attention please. An all clear has been issued, resume normal activities." (Provide a [2][_____] second pause.)

d. Auxiliary Input Module must be designed to be an outboard expansion module to either expand the number of optional LOC's, or allow a telephone interface.

[2.3.4.3 Installation-Wide Control

******************************************************************************
NOTE: Show on the contract drawings the manufacturer make and model number of any existing installation-wide control system to facilitate communications with the system being specified in this section.
******************************************************************************

If an installation-wide control system for mass notification exists on the Base, the autonomous control unit must communicate with the central control unit of the Installation-wide system. The autonomous control unit must receive commands/messages from the central control unit and provide status information.

]2.3.5 Memory

Provide each control unit with non-volatile memory and logic for all functions. The use of long life batteries, capacitors, or other age-dependent devices must not be considered as equal to non-volatile processors, PROMS, or EPROMS.

2.3.6 Field Programmability

Provide control units and control units that are fully field programmable for both input and output of control, initiation, notification, supervisory, and trouble functions. The system program configuration must be menu driven. System changes must be password protected. Any proprietary equipment and proprietary software needed by qualified technicians to implement future changes to the fire alarm system must be provided as part of this contract.
2.3.7 Input/Output Modifications

The FMCU must contain features that allow the bypassing of input devices from the system or the modification of system outputs. These control features must consist of a control unit mounted keypad[ and a keyboard]. Any bypass or modification to the system must indicate a trouble condition on the FMCU.

2.3.8 Resetting

Provide the necessary controls to prevent the resetting of any alarm, supervisory, or trouble signal while the alarm, supervisory or trouble condition on the system still exists.

2.3.9 Walk Test

The FMCU must have a walk test feature. When using this feature, operation of initiating devices must result in limited system outputs, so that the notification appliances operate for only a few seconds and the event is indicated in the history log[ and on the system printer], but no other outputs occur.

2.3.10 History Logging

The control unit must have the ability to store a minimum of 400 events in a log. These events must be stored in a battery-protected memory and must remain in the memory until the memory is downloaded or cleared manually. Resetting of the control unit must not clear the memory.

2.3.11 Manual Access

An operator at the control unit, having a proper access level, must have the capability to manually access the following information for each initiating device.

a. Primary status.

b. Device type.

c. Present average value.

d. Present sensitivity selected.

e. Detector range (normal, dirty).

[2.3.12 Heat Detector Self-Test Routines

Automatic self-test routines must be performed on each detector that will functionally check detector sensitivity electronics and ensure the accuracy of the value being transmitted. Any detector that fails this test must indicate a trouble condition with the detector location at the control unit.

]2.4 LOCAL OPERATING CONSOLES (LOC)

2.4.1 General

The LOC must consist of a remote microphone station incorporating a push-to-talk (PTT) hand-held microphone and system status indicators. The LOC must have the capability of being utilized to activate pr prerecorded
messages. The unit must incorporate microphone override of any tone generation or recorded messages. The unit must be fully supervised from the FMCU. The housing for the LOC must not be lockable. The LOC must have public address capability with the provision of a separate microphone. The PA paging function must not override any alarm or notification functions. The PA microphone must be [desktop][hand-held][_____] style. Hand-held microphones must be housed in a separate protective cabinet. The cabinet must be accessible without the use of a key. The location of the microphone[s] must be approved by the [_____] Designated Fire Protection Engineer (DFPE). Activation of the PA microphone must not initiate activation of visual notification appliances or LED text displays. The PA paging function must not override any alarm or notification functions.]

2.4.2 Multiple LOCs

When an installation has more than one LOC, the LOCs must be programmed to allow only one LOC to be available for paging or messaging at a time. Once one LOC becomes active, all other LOC's will have an indication that the system is busy (Amber Busy Light) and cannot be used at that time. This is to avoid two messages being given at the same time. It must be possible to override or lockout the LOC's from the FMCU.

2.5 AMPLIFIERS, PREAMPLIFIERS, TONE GENERATORS

Any amplifiers, preamplifiers, tone generators, digitalized voice generators, and other hardware necessary for a complete, operational, textual audible circuit conforming to NFPA 72 must be housed in a remote FMCU, terminal cabinet, or in the FMCU. Individual amplifiers must be 100 watts maximum.

2.5.1 Operation

The system must automatically operate and control all building speakers[except those installed in the stairs][ and within elevator cabs]. [ The speakers in the stairs[and elevator cabs] must operate only when the microphone is used to deliver live messages.]

2.5.2 Construction

Amplifiers must utilize computer grade solid state components and must be provided with output protection devices sufficient to protect the amplifier against any transient up to 10 times the highest rated voltage in the system.

2.5.3 Inputs

Equip each system with separate inputs for the tone generator, digitalized voice driver and control unit mounted microphone [Public Address Paging Function]. Microphone inputs must be of the low impedance, balanced line type. Both microphone and tone generator input must be operational on any amplifier.

2.5.4 Tone Generator

The tone generator must produce a three-pulse temporal pattern and must be constantly repeated until interrupted by either the digitalized voice message, the microphone input, or the alarm silence mode as specified. The tone generator must be single channel with an automatic backup generator per channel such that failure of the primary tone generator causes the
backup generator to automatically take over the functions of the failed unit and also causes transfer of the common trouble relay. The tone generator must be provided with securely attached labels to identify the component as a tone generator and to identify the specific tone it produces.

2.5.5 Protection Circuits

Each amplifier must be constantly supervised for any condition that could render the amplifier inoperable at its maximum output. Failure of any component must cause illumination of a visual "amplifier trouble" indicator on the control unit, appropriate logging of the condition in the history log[ and on the system printer], and other actions for trouble conditions as specified.

2.6 VIDEO DISPLAY UNIT (VDU)

**************************************************************************
NOTE: Contact the DFPE to determine if a VDU is to be provided.
**************************************************************************

a. The VDU must be the secondary operator-to-system interface for data retrieval, alarm annunciation, commands, and programming functions. The desk mounted VDU must consist of a LCD monitor and a keyboard. The VDU must have a [300][430][-]-mm [12][17]-inch minimum [touch] screen, capable of displaying 25 lines of 80 characters each. Communications with the FMCU must be supervised. Faults must be recorded in the history log[ and on the printer]. Power required must be 120 VAC, 60 Hz from the same source as the FMCU.

b. To eliminate confusion during an alarm situation, the screen must have dedicated areas for the following functions:

(1) Alarm and return to normal.

(2) Commands, reports, and programming.

(3) Time, day, and date.

c. Use full English language throughout to describe system activity and instructions. Full English language descriptors defining system points must be 100 percent field programmable by factory trained personnel, alterable and user definable to accurately describe building areas.

d. Alarms and other changes of status must be displayed in the screen area reserved for this information. Upon receipt of alarm, an audible alarm must sound and the condition and point type must flash until acknowledged by the operator. Return to normal must also be annunciated and must require operator acknowledgment. The following information must be provided in full English:

(1) Condition of device (alarm, trouble, or supervisory).

(2) Type of device (for example, manual pull, waterflow)

(3) Location of device plus numerical system address.

e. The system must have multiple levels of priority for displaying alarms to conform with UL 864. Priority levels must be as follows:
(1) Level 1 - Mass Notification Signals
(2) Level 2 - Fire Alarm Signals
(3) Level 3 - Carbon Monoxide Alarm Signals
(4) Level 4 - Supervisory Signals
(5) Level 5 - Trouble Signals

f. Provide the system with memory so that no alarm is lost. A highlighted message must advise the operator when unacknowledged alarms are in the system.

g. Multiple levels of access must be provided for operators and supervisors via user-defined passwords. Provide the following functions for each level:

(1) Operator level access functions:
   (a) Display system directory, definable by device.
   (b) Display status of an individual device.
   (c) Manual command (alarm device with an associated command must use the same system address for both functions).
   (d) Report generation, definable by device, output on the VDU or printer as desired by the operator.
   (e) Activate building notification appliances.

(2) Supervisor level access functions:
   (a) Reset time and date.
   (b) Enable or disable event initiated programs[, printouts,] and initiators.
   (c) Enable or disable individual devices and system components.

h. The above supervisor level functions must not require computer programming skills. Changes to system programs must be recorded on the printer and maintained in the control unit as a trouble condition.

]2.7 REMOTE ANNUNCIATOR

**************************************************************************
NOTE: Provide the annunciator at a location in accordance with NFPA 72. A suggested location should be near the door through which the first responders will enter the building as indicated in their pre-fire plan, typically the main entrance.
**************************************************************************

[2.7.1 LCD Annunciator

Provide a [semi-recessed][flush] mounted annunciator that includes an LCD
display. The display must indicate the device in trouble/alarm or any supervisory device. Display the device name, address[, and actual building location]. The remote annunciator must duplicate functions of the FMCU for message display, fire alarm, supervisory alarm, and trouble conditions, visual and audible notification, and system reset functions. Remote annunciator must require the use of a key for accessing the reset, control and other functions.

A building floor plan must be provided and mounted (behind Plexiglass or similar protective material) at the annunciator location. The floor plan must indicate all rooms by name and number including the locations of stairs and elevators. The floor plan must show all devices and their programmed address to facilitate identification of their physical location from the LCD display information.

][2.7.2  Graphic Annunciator

**************************************************************************
NOTE: Graphic annunciators should be provided only when a large number of concealed devices are installed. Normally, exposed devices will be annunciated by zone only on the fire alarm control unit zone annunciator and remote zone annunciator. Locate graphic annunciator(s) at or near building entrance to allow fire department quick access to the annunciator.
**************************************************************************

Graphic annunciator must be of the [interior][weatherproof] type, [flush][surface][pedestal]-mounted. Annunciator must be provided with the [building][room] floor plan, drawn to scale, with alarm lamps mounted to represent the location of [each concealed detector][each initiating device]. Annunciator graphic must also show the locations of the annunciator and control unit, and must have a "you are here" arrow showing its location. Orient building floor plan on graphic to location of person viewing the graphic(i.e., the direction the viewer is facing must be toward the top of the graphic display). Provide a North arrow.[ Principal rooms and areas shown must be labeled with room numbers or titles.] Detectors mounted above ceilings, [on ceilings, ]and beneath raised floors and different types of initiating devices must have different symbols or lamps of different colors for identification. Lamps must illuminate upon activation of corresponding device and must remain illuminated until the system is reset. Annunciator must have a lamp test switch.

2.7.2.1  Materials

Construct the graphic annunciator face plate of [smoked Plexiglas][non-glare matte finish][anodized bronze][anodized aluminum]. The face plate must be backlit with LEDs. Control equipment and wiring must be housed in a [recessed][semi-recessed][surface mounted] back box. The exposed portions of the back box must be [chrome plated][anodized bronze][anodized aluminum] without knockouts.

2.7.2.2  Programming

Where programming for the operation of the graphic annunciator is accomplished by a separate software program other than the software for the FMCU, the software program must not require reprogramming after loss of power. The software must be reprogrammable in the field.
[2.7.3] Printer

NOTE: If the printer will be located in a SCIF or similar area, specify "no stored memory".

2.7.3 Printer

a. Provide a system printer [with no stored memory] to record alarm, supervisory, and trouble conditions without loss of any signal or signals. Printout must be by circuit, device, and function as provided in the FMCU. Printer must operate on a 120 VAC, 60 Hz power supply.

b. The printer must have at least 80 characters per line and have a 96 ASCII character set. The printer must have a microprocessor-controlled, bi-directional, logic seeking head capable of printing 120 characters per second utilizing a 9 by 7 dot matrix print head. Printer must not contain internal software which is essential for proper operation.

c. When the FMCU receives a signal, the alarm, supervisory, and trouble condition must be printed. The printout must include the type of signal, the circuit or device reporting, the date, and the time of the occurrence. The printer must differentiate alarm signals from other printed indications. When the system is reset, this condition must also be printed including the same information concerning device, location, date, and time. Provide a means to automatically print a list of existing alarm, supervisory, and trouble conditions in the system. If a printer is off-line when an alarm is received, the system must have a buffer to retain the data and it must be printed when the printer is restored to service. The printer must have an indicator to alert the operator that the paper has run out.

2.8 MANUAL STATIONS

NOTE: Architectural Barriers Act (ABA) requires that manual alarm stations be mounted at a maximum of 1.1 m 44 inches above finished floor (AFF).

Provide metal or plastic, [semi-flush][flush][surface] mounted, [single][double]-action, addressable manual stations, that are not subject to operation by jarring or vibration. Stations must be equipped with screw terminals for each conductor. Stations that require the replacement of any portion of the device after activation are not permitted. Stations must be finished in red with molded raised lettering operating instructions of contrasting color. The use of a key must be required to reset the station.

2.9 SMOKE DETECTORS

NOTE: Provide smoke detectors only in spaces where they are specifically required by UFC 3-600-01, DESIGN: FIRE PROTECTION ENGINEERING FOR FACILITIES.

Smoke detectors provided in elevator machinery rooms are to be provided per requirements of UFC 3-600-01. Coordinate with Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS, Section 14 21 23
2.9.1 Spot Type Detectors

Provide addressable [photoelectric][ionization][laser] smoke detectors as follows:

a. Provide analog/addressable [photoelectric smoke detectors utilizing the photoelectric light scattering principle for operation in accordance with UL 268][smoke detectors that operate on the ionization principle and are actuated by the presence of visible or invisible products of combustion][laser smoke detectors utilizing laser diode and patented smoke sensing chamber, designed to amplify signals from smoke but diminish stray internal reflections and must, on command from the FMCU, send data to the control unit representing the analog level of smoke density]. Smoke detectors must be listed for use with the FMCU.

b. Provide self-restoring type detectors that do not require any readjustment after actuation at the FMCU to restore them to normal operation. The detector must have a visual indicator to show actuation.

c. Vibration must have no effect on the detector's operation. Protect the detection chamber with a fine mesh metallic screen that prevents the entrance of insects or airborne materials. The screen must not inhibit the movement of smoke particles into the chamber.

d. Provide twist lock bases [with sounder that produces a minimum of 90 dBA at 3 m 10 feet] with screw terminals for each conductor. The detectors must maintain contact with their bases without the use of springs.

e. The detector address must identify the particular unit, its location within the system[, and its sensitivity setting]. Detectors must be of the low voltage type rated for use on a 24 VDC system.

f. Laser smoke detector must be listed for use with the FMCU. Detector must be able to achieve sensitivities from 0.02 percent-per-foot to 2 percent-per-foot obscuration.

g. Laser smoke detector must provide point identification of the fire location through addressability, must experience no delay in response time due to smoke dilution or smoke transportation time, and must offer complete supervision of wiring and detector.

2.9.2 Projected Beam Smoke Detector

Detectors must consist of [combined transmitter and receiver unit][separate transmitter and receiver units]. The transmitter unit must emit an infrared beam to the receiver unit [the use of a supplied reflector is required for the combined unit]. When the signal at the receiver falls below a preset threshold, the detector must initiate an alarm. The receiver must contain an LED status indicator that illuminates when an alarm condition exists. Long-term changes to the received signal caused by environmental variations must be automatically compensated. Detectors must incorporate features to assure that they are operational; a trouble signal must be initiated if the beam is obstructed for more than 3 seconds, the
limits of the compensation circuit are reached, or the housing cover is removed. Detectors must have multiple sensitivity settings in order to meet UL listings for the different distances covered by the beam.

2.9.3 Duct Smoke Detectors

NOTE: The requirements for Duct Detectors will be coordinated with the HVAC requirements and Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. All required duct detectors will be shown on the contract drawings.

Duct-mounted addressable photoelectric smoke detectors must consist of a smoke detector, as specified in paragraph Spot Type Detectors, mounted in a special housing fitted with duct sampling tubes. Detector circuitry must be mounted in a metallic or plastic enclosure exterior to the duct. It is not permitted to cut the duct insulation to install the duct detector directly on the duct. Detectors must be listed for operation over the complete range of air velocities, temperature and humidity expected at the detector when the air-handling system is operating. Detectors must be powered from the FMCU.

a. Sampling tubes must run the full width of the duct. The duct detector package must conform to the requirements of NFPA 90A, UL 268A, and must be listed for use in air-handling systems. The control functions, operation, reset, and bypass must be controlled from the FMCU.

b. Lights to indicate the operation and alarm condition must be visible and accessible with the unit installed and the cover in place. Remote indicators must be provided where required by NFPA 72. Remote indicators as well as the affected fan units must be properly identified in etched plastic placards.

c. Detectors must provide for control of auxiliary contacts that provide control, interlock, and shutdown functions specified in Section 23 09 00 to INSTRUMENTATION AND CONTROL FOR HVAC. Auxiliary contacts provide for this function must be located within 1 m 3 feet of the controlled circuit or appliance. The auxiliary contacts must be supplied by the fire alarm system manufacturer to ensure complete system compatibility.

2.10 AIR SAMPLING SMOKE DETECTION SYSTEM

The [addressable] air sampling smoke system must consist of a detector assembly housing an integral aspiration fan, filter, laser-based detection chamber and control, output and supervision circuitry. Each sampling point must be capable of being independently addressable. The system must consist of a piping or tubing distribution network that runs from the detector assembly(s) to the protected area(s) and is supported by air sampling smoke detection system calculations from a computer-based design modeling tool. The system must include configurable alarm and trouble relay outputs for interface to other systems where required.

a. System must be complete in all ways. It must include all engineering, and electrical installation, all detection and control equipment, auxiliary devices and controls, alarm interface, functional checkout and testing, training and all other operations necessary for a functional system.
b. System base detectors and modules must each accommodate up to [40 addressable] microbore sampling tubes where each tube has a sampling point at the end. Additional modules may be used to provide up to [20 addressable] sampling holes per system.

c. Program alarm thresholds to the following values unless the results of the pre-Government system tests indicate a clear need to change them. In the event that such a need is indicated, notify the Contracting Officer and provide complete documentation concerning the need to deviate from these values. Include within the deviation documentation request, information that complies with the paragraph entitled "Sensitivity Verification Test". Ensure initial threshold levels are approved prior to the Government test.

(1) Alarm Level 1: set ALERT at [_____][0.0250] percent obscuration/foot

(2) Alarm Level 2: set PRE-ALARM at [_____][0.0500] percent obscuration/foot

(3) Alarm Level 3: set FIRE 1 at [_____][0.1000] percent obscuration/foot

(4) Alarm Level 4: set FIRE 2 at [_____][0.2000] percent obscuration/foot

d. All air sampling smoke detection devices and associated components must be new, standard products or the manufacturer's latest design and suitable to perform the functions intended.

e. The laser detection chamber must be of the mass light scattering type and capable of detecting a wide range of smoke particle types of varying size. A particle counting method must be employed for the purposes of:

(1) Preventing large particles from affecting the true smoke reading.

(2) Monitoring contamination of the filter (for example, dust and dirt) to automatically notify when maintenance is required. The particle counting method must not be used for the purpose of smoke density measurement.

f. Detector(s) must be self-monitoring for filter contamination and provide indication through system fault when replacement is necessary. Detectors which allow automatic reset of filter status upon removal and re-insertion are not permitted.

g. Detector(s) must contain relays for alarm and fault conditions. The relays must be software programmable to the required functions.

h. Detector(s) must permit configuration by programmers that are either integral to the system, portable or PC based.

i. Detector(s) must allow programming of:

(1) Smoke threshold alarm levels; ALERT, PRE-ALARM, FIRE 1 and FIRE 2.

(2) Time delays. Ensure the display control unit contains individual
adjustable alarm time delay features for each of the alarm threshold levels. Provide an adjustment range between 0 and 60 seconds. Program the alarm threshold time delays to 30 seconds for alarm levels 1 and 2, and 15 seconds for alarm levels 3 and 4.

(3) Faults, including airflow, detector, power, filter and network, as well as an indication of the urgency of the fault.

(4) Configuration of relay outputs for remote indication of alarm and fault conditions.

(5) General purpose input functionality.

2.11 HEAT DETECTORS

**************************************************************************

NOTE: Heat detectors provided in elevator machinery rooms are strictly for the warning sign in the elevator cab and must not alarm the FMCU.

Coordinate with Section 14 21 13 ELECTRIC TRACTION FREIGHT ELEVATORS, Section 14 21 23 ELECTRIC TRACTION PASSENGER ELEVATORS and/or Section 14 24 13 HYDRAULIC FREIGHT ELEVATORS, Section 14 24 23 HYDRAULIC PASSENGER ELEVATORS.

**************************************************************************

2.11.1 Heat Detectors

Heat detectors must be analog/addressable and designed for detection of fire by [fixed temperature][combination fixed temperature and rate-of-rise principle][rate-compensating principle] in accordance with UL 521. The alarm condition must be determined by comparing detector value with the stored values. Detectors located in areas subject to moisture, exterior atmospheric conditions, or hazardous locations [as defined by NFPA 70][ as indicated], must be types approved for such locations.

2.11.1.1 Combination Fixed-Temperature and Rate-of-Rise Detectors

Detectors must be [surface][semi-flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-resetting. Detector must operate at [57.2][90] degrees C[135][194] degrees F. Detector must feature rate compensation. [Detectors rated to operate at 57.2 degrees C135 degrees F must not respond to momentary temperature fluctuations less than 16.7 degrees C30 degrees F per minute between 16 and 38 degrees C60 and 100 degrees F].[ Detectors rated to operate at 90 degrees C194 degrees F must not respond to momentary temperature fluctuations less than 27.8 degrees C50 degrees F per minute between 16 and 66 degrees C60 and 150 degrees F.][ The detector assembly must be [weatherproof][ and ][explosionproof].]

2.11.1.2 Rate Compensating Detectors

Detector backbox must be [surface][flush] mounted in the [vertical][horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring and hermetically sealed.[ The detector assembly must be [weatherproof][ and ][explosionproof].]
[2.11.1.3] Line-Type Fixed Temperature Detectors

**************************************************************************
NOTE: Specify line-type heat detectors only with approval of the EFD/EFA Fire Protection Engineer.
**************************************************************************

Provide [thermostatic] or [thermistor] line-type heat detection cable with weather-resistant outer covering where indicated. Cable must be nominally rated for a temperature of [68] [88] [138] degrees C [155] [190] [280] degrees F and must operate on fixed temperature principle only.

[2.11.1.4] Fixed Temperature Detectors

Detectors must be [surface] [semi-flush] mounted in the [vertical] [horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring. The detectors must have a specific temperature setting [of [57.2] [_____] degrees C [135] [_____] degrees F] as shown. The detector assembly must be [weatherproof] [and] [explosionproof].

[2.12] FLAME DETECTORS

**************************************************************************
NOTE: Modify these paragraphs as necessary to indicate that detectors placed in an explosive environment will be approved for use in the appropriate class, division, and group environment as defined in NFPA 70 and as shown on drawings.
**************************************************************************

Detectors must be sensitive to the micron range best suited for their intended use. Detectors must operate over electrically supervised wiring circuits and the loss of power to the detector must result in a trouble signal. A self-test feature must be provided for each detector to be individually tested.

[2.12.1] Infrared (IR) Single Frequency Flame Detector

**************************************************************************
NOTE: The single frequency IR flame detector has the advantage of a fast response and is moderately sensitive. Its disadvantages are being affected by temperature extremes and being subject to false alarms from a myriad of IR sources.
**************************************************************************

The detector must be sensitive in the range of [_____] to [_____] micrometers only.

[2.12.2] Infrared (IR) Multi Frequency Flame Detector

**************************************************************************
NOTE: The IR multi frequency flame detector has the advantages of a moderately fast response, moderate sensitivity, and a lower false alarm rate. Its disadvantage is being affected by temperature extremes.
The IR detector must consist of three or more IR sensors, each selected for a different IR frequency. The primary sensor must be sensitive in the range of \( [_____] \) to \([_____] \) micrometers only. Secondary sensors are tuned to different IR wavelengths to null out the effect of black body radiation to the primary sensor.

[2.12.3 Ultrasound (UV) Flame Detectors]

******************************************************************************

NOTE: Ultraviolet (UV) flame detectors can be set to respond accurately to UV wavelength light produced by flame from both indoors and outdoors. UV flame detectors operate on the Geiger-Muller principle. These gas-filled vacuum tubes respond in the UV portion of the spectrum but can ignore UV radiation from the sun because the upper response range of the detector falls below the range of UV radiation that reaches the earth.

Solid-state UV detectors are available, but their spectral response extends into the sun's UV range and are not recommended for external use.

UV detectors have an 80 to 90 degree cone of vision. The UV detector has a fast response time and usually is not affected by rain, wind, snow, high humidity, or temperature and pressure extremes. UV units will produce false alarms if they are exposed to arc welding or X-ray and gamma radiation. They can also be blinded by oil film or smoke. UV flame detectors that are used in dirty and dusty environments should be equipped with automatic self-test and self-cleaning devices. The cleaning device uses a stream of clean air across the lens surface to minimize the build-up of contaminants.

******************************************************************************

UV flame detector must be of the narrow band response type which operates on radiated ultraviolet energy and must be sensitive in the range of \( [_____] \) to \([_____] \) micrometers only. The cone of vision must be 80 degrees or greater. Each detector must be completely insensitive to light sources in the visible frequency range.

[2.12.4 Combination UV/IR Flame Detector]

******************************************************************************

NOTE: Combination UV/IR flame detectors have been used both inside and outside to detect fires, but are slower to react than individual units.

******************************************************************************

The UV/IR detector must provide discrimination against false alarms by requiring both UV and IR flame detection before an alarm is sent. The UV sensor must be sensitive in the range of 0.185 to 0.265 micrometers only. The IR sensor must be sensitive in the range of \( [_____] \) to \([_____] \) micrometers only. Detectors must be completely insensitive to light
sources in the visible frequency range.

]2.13 MULTI-CRITERIA DETECTORS

**************************************************************************
The designer must select the sensor required to initiate a fire alarm condition.
**************************************************************************

Multi-criteria detectors must contain [fixed temperature [_____] degrees C F heat sensor], [rate-of-rise heat sensor], [photoelectric smoke detector], [_____] elements in a single housing.

]2.14 CARBON MONOXIDE DETECTOR

Analog/addressable carbon monoxide (CO) detectors must be listed to UL 2075 and set to respond to the sensitivity limits of UL 2034. Carbon monoxide detectors must be listed for use with fire alarm control units. Detectors must be [surface] [semi-flush] mounted in the [vertical] [horizontal] orientation and supported independently of wiring connections. Detectors must be self-restoring. For FMCU with no listed compatible addressable CO detectors, provide listed 4-wire detectors.[ Do not provide CO detectors with local alarms.] Detector must be provided with an LED status indicator.

a. Where 4-wire CO detectors are necessary, each 4-wire CO detector must be individually monitored via addressable interface modules for alarm and off normal/trouble conditions (including loss of power to the individual detector). Power circuits for 4-wire CO detectors must be dedicated to powering the CO detectors only. Battery powered and 120 VAC powered detectors are prohibited.

b. Wiring connections must be made by means of screw terminals and detectors must be equipped with trouble relays. Detectors must be able to mount a single-gang electrical box.

c. A trouble condition at an individual CO detector must not affect any other CO detectors. CO detectors must be powered by the FMCU.

d. Detectors must be provided with a means to test CO gas entry into the CO sensing cell.

2.15 ADDRESSABLE INTERFACE DEVICES

The initiating device being monitored must be configured as a [Class "A"] [Class "B"] initiating device circuits. The module must be listed as compatible with the control unit. The module must provide address setting means compatible with the control unit's SLC supervision and store an internal identifying code. Monitor module must contain an integral LED that flashes each time the monitor module is polled and is visible through the device cover plate. Pull stations with a monitor module in a common backbox are not required to have an LED.[ Existing fire alarm system initiating device circuits must be connected to a single module to supervise the circuit.] Modules must be listed for the environmental conditions in which they will be installed.

2.16 ADDRESSABLE CONTROL MODULES

The control module must be capable of operating as a relay (dry contact form C) for interfacing the control unit with other systems, and to control...
door holders or initiate elevator fire service. The module must be listed as compatible with the control unit. The indicating device or the external load being controlled must be configured as [Class B][Class A] notification appliance circuits. The system must be capable of supervising, audible, visual and dry contact circuits. The control module must have both an input and output address. The supervision must detect a short on the supervised circuit and must prevent power from being applied to the circuit. The control module must provide address setting means compatible with the control unit's SLC supervision and store an internal identifying code. The control module must contain an integral LED that flashes each time the control module is polled and is visible through the device cover plate. Control Modules must be listed for the environmental conditions in which they will be installed.

2.17 ISOLATION MODULES

a. Provide isolation modules to subdivide each signaling line circuit into groups of not more than [20 addressable devices][_____] [each floor] [in accordance with NFPA 72] between adjacent isolation modules.

b. Isolation modules must provide short circuit isolation for signaling line circuit wiring.

c. Power and communications must be supplied by the SLC and must report faults to the FMCU.

d. After the wiring fault is repaired, the fault isolation modules must test the lines and automatically restore the connection.

2.18 NOTIFICATION APPLIANCES

2.18.1 Audible Notification Appliances

**************************************************************************
NOTE: The designer must layout speakers to achieve both the required dBA levels requires by NFPA 72 and also the required intelligibility required. See 3.7 for testing for intelligibility requirements that must be incorporated into the design.
**************************************************************************

Audible appliances must conform to the applicable requirements of UL 464. Appliances must be connected into notification appliance circuits. Surface mounted audible appliances must be painted [red][white][____]. Recessed audible appliances must be installed with a grill that is painted [red][white][____] [with a factory finish to match the surface to which it is mounted].

2.18.1.1 Speakers

a. Speakers must conform to the applicable requirements of UL 1480. Speakers must have six different sound output levels and operate with audio line input levels of 70.7 VRMs and 25 VRMs, by means of selectable tap settings. Interior speaker tap settings must include taps of 1/4, 1/2, 1, and 2 watt, at a minimum. Exterior speakers must also be multi-tapped with no more than 15 watt maximum setting. Speakers must incorporate a high efficiency speaker for maximum output.
at minimum power across a frequency range of 400 Hz to 4,000 Hz, and must have a sealed back construction. Speakers must be capable of installation on standard 100 mm 4-inch square electrical boxes. Where speakers and strobes are provided in the same location, they may be combined into a single [wall mounted] unit. All inputs must be polarized for compatibility with standard reverse polarity supervision of circuit wiring via the FMCU.

b. Provide speaker mounting plates constructed of cold rolled steel having a minimum thickness of 1.519 mm 16 gage or molded high impact plastic and equipped with mounting holes and other openings as needed for a complete installation. Fabrication marks and holes must be ground and finished to provide a smooth and neat appearance for each plate. Each plate must be primed and painted.

c. Speakers must utilize screw terminals for termination of all field wiring.

2.18.2 Visual Notification Appliances

**************************************************************************

NOTE: 1. ABA requires that Visual Notification Appliances be provided in buildings and facilities in each of the following areas: restrooms, and any general usage area (e.g., meeting rooms), hallways, lobbies, and any other area for common use and other areas stated at www.access-board.gov. The Visual Notification Appliance must be mounted as required by ABA that directs compliance with NFPA 72. In addition, alarms in guest rooms required to provide communication features must comply with sections 18.5.5.7 of NFPA 72. Shop drawings must indicate location, dimensions, content, details, and other required information to indicate extent of complying with ABA requirements.

2. Currently NFPA 72 requires "clear color" strobes for Fire Alarm Notification. NFPA 72 requires the strobe must be marked "Fire" to clearly identify the function.

**************************************************************************

Visual notification appliances must conform to the applicable requirements of UL 1638, UL 1971 and conform to the Architectural Barriers Act (ABA). Visual Notification Appliances must have clear high intensity optic lens, xenon flash tubes, or light emitting diode (LED) and be marked "Alert" in letters of contrasting color. The light pattern must be dispersed so that it is visible above and below the strobe and from a 90 degree angle on both sides of the strobe. Strobe flash rate must be 1 flash per second and a minimum of [15][30][75][_____] candela based on the UL 1971 test. Strobe must be [surface][semi-flush] mounted.

2.18.3 Textual Display Signs

**************************************************************************

NOTE: Provide remote LED Text display in locations where Hearing Impaired personnel might read instructions on the emergency. For Navy projects, the Text displays will be located over stairwell
doors and major egress doors at the level of discharge.

Textual display signs must be [LED][LCD flat panel][LED scrolling] and must not exceed 400 mm long by 150 mm high by 75 mm deep 16 inches long by 6 inches high by 3 inches deep with a height necessary to meet the requirements of NFPA 72. The text display must spell out the word "EVACUATE" or "ANNOUNCEMENT" [and the remainder of the emergency instructions] as appropriate. The design of text display must be such that it cannot be read when not illuminated.

[LCD or LED scrolling text displays must meet the following requirements at a minimum:

a. Two lines of information for high priority messaging.

b. Minimum of 20 characters per line (40 total) displayed.

c. Text must be no less than height requirements and color/contrast requirements of NFPA 72.

d. 32K character memory.

e. Display must be wall or ceiling mounted.

f. Mounting brackets for a convenient wall/cubicle mount.

[g. During non-emergency periods, display date and time.]

h. The system must interface with the textual display sign control panel to activate the proper message.]

2.19 ELECTRIC POWER

2.19.1 Primary Power

Power must be [120][_____] VAC [50][60] Hz service for the FMCU from the AC service to the building in accordance with NFPA 72.

2.20 SECONDARY POWER SUPPLY

Provide for system operation in the event of primary power source failure. Transfer from normal to auxiliary (secondary) power or restoration from auxiliary to normal power must be automatic and must not cause transmission of a false alarm.

2.20.1 Batteries

Provide sealed, maintenance-free, [sealed lead acid][lead-calcium][gel cell] batteries as the source for emergency power to the FMCU. Batteries must contain suspended electrolyte. The battery system must be maintained in a fully charged condition by means of a solid state battery charger. Provide an automatic transfer switch to transfer the load to the batteries in the event of the failure of primary power.

2.20.1.1 Capacity

Battery size must be the greater of the following two capacities. This
capacity applies to every control unit associated with this system, including supplemental notification appliance circuit panels, auxiliary power supply panels, fire alarm transmitters, and Base-wide mass notification transceivers. When determining the required capacity under alarm condition, visual notification appliances must include both textual and non-textual type appliances.

a. Sufficient capacity to operate the fire alarm system under supervisory and trouble conditions, including audible trouble signal devices for 48 hours and audible and visual signal devices under alarm conditions for an additional 15 minutes.

b. Sufficient capacity to operate the mass notification for 60 minutes after loss of AC power.

2.20.1.2 Battery Power Calculations

a. Verify that battery capacity exceeds supervisory and alarm power requirements for the criteria noted in the paragraph "Capacity" above.

(1) Substantiate the battery calculations for alarm and supervisory power requirements. Include ampere-hour requirements for each system component and each control unit component, and compliance with UL 864.

(2) Provide complete battery calculations for both the alarm and supervisory power requirements. Submit ampere-hour requirements for each system component with the calculations.

(3) Provide voltage drop calculations to indicate that sufficient voltage is available for proper operation of the system and all components. Calculations must be performed using the minimum rated voltage of each component.

b. For battery calculations assume a starting voltage of 24 VDC for starting the calculations to size the batteries. Calculate the required Amp-Hours for the specified standby time, and then calculate the required Amp-Hours for the specified alarm time. Using 20.4 VDC as starting voltage, perform a voltage drop calculation for circuits containing device and/or appliances remote from the power sources.

2.20.2 Battery Chargers

Provide a solid state, fully automatic, variable charging rate battery charger. The charger must be capable of providing 120 percent of the connected system load and must maintain the batteries at full charge. In the event the batteries are fully discharged (20.4 Volts dc), the charger must recharge the batteries back to 95 percent of full charge within 48 hours after a single discharge cycle as described in paragraph CAPACITY above. Provide pilot light to indicate when batteries are manually placed on a high rate of charge as part of the unit assembly if a high rate switch is provided.

2.21 SURGE PROTECTIVE DEVICES

Surge protective devices must be provided to suppress all voltage transients which might damage fire alarm control unit components. Systems having circuits located outdoors, communications equipment must be protected against surges induced on any signaling line circuit. Cables and
conductors, that serve as communications links, must have surge protection circuits installed at each end. The surge protective device must wire in series to the power supply of the protected equipment with screw terminations. Line voltage surge arrestor must be installed directly adjacent to the power panel where the FMCU breaker is located.

a. Surge protective devices for nominal 120 VAC must be UL 1449 listed with a maximum 500 volt suppression level and have a maximum response time of 5 nanoseconds. The surge protective device must also meet IEEE C62.41.1 and IEEE C62.41.2 category B tests for surge capacity. The surge protective device must feature multi-stage construction and be provided with a long-life indicator lamp (either light emitting diode or neon) which extinguishes upon failure of protected components. Any unit fusing must be externally accessible.

b. Surge protective devices for nominal 24 VAC, fire alarm telephone dialer, or ethernet connection must be UL 497B listed, meet IEEE C62.41.1 and have a maximum response time of 1-nanosecond. The surge protective device must feature multi-stage construction and be self-resetting. The surge protective device must be a base and plug style. The base assembly must have screw terminals for fire alarm wiring. The base assembly must accept "plug-in" surge protective module.

c. All surge protective devices (SPD) must be the standard product of a single manufacturer and be equal or better than the following:

(1) For 120 VAC nominal line voltage: UL 1449 and UL 1283 listed, series connected 120 VAC, 20A rated, surge protective device in a NEMA 4x enclosure. Minimum 50,000 amp surge current rating with EMI/RFI filtering and a dry contact circuit for remote monitoring of surge protection status.

(2) For 24-volt nominal line voltage: UL 497B listed, series connected low voltage, 24-volt, 5A rated, loop circuit protector, base and replaceable module.

(3) For alarm telephone dialers: UL 497A listed, series connected, 130-volt, 150 mA rated with self-resetting fuse, dialer circuit protector with modular plug and play.

(4) For IP-DACTS: UL 497B listed, series connected, 6.4-volt, 1.5A rated with 20 kA/pair surge current, data network protector with modular plug and play.

2.22 WIRING

Provide wiring materials under this section as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM with the additions and modifications specified herein.

2.22.1 Alarm Wiring

IDC and SLC wiring must be [fiber optic][ or ][solid copper] cable in accordance with the manufacturers requirements. Copper signaling line circuits and initiating device circuit field wiring must be No. [14][16][18][_____] AWG size conductors at a minimum. Visual notification appliance circuit conductors, that contain audible alarm appliances, must be copper No. 14 AWG size conductors at a minimum. Speaker circuits must
be copper No. [16] AWG size twisted and shielded conductors at a minimum.[ Wiring for textual notification appliance circuits must be in accordance with manufacturer’s requirements but must be supervised by the FMCU.] Wire size must be sufficient to prevent voltage drop problems. Circuits operating at 24 VDC must not operate at less than the listed voltages for the detectors and/or appliances. Power wiring, operating at 120 VAC minimum, must be a minimum No. 12 AWG solid copper having similar insulation. Acceptable power-limited cables are FPL, FPLR or FPLP as appropriate with red colored covering. Nonpower-limited cables must comply with NFPA 70.

2.23 INTERFACE TO THE BASE-WIDE MASS NOTIFICATION NETWORK

**************************************************************************
NOTE: Provide as required for connection to a remote Central Control/Monitoring Mass Notification System Command Center.
**************************************************************************

[2.23.1 Fiber Optic]

The fiber optic transceiver must be fully compatible with EIA standards for RS-232, RS-422 and RS-485 at data rates from 0 (DC) to 2.1 mbps (200 kbps for RS-232) in the low speed mode or from 10 kbps to 10 mbps in the high-speed mode. The fiber optic transceiver must be capable of simplex or full duplex asynchronous transmissions in both point-to-point systems and drop-and-repeat data networks. The fiber optic transceiver must be user configurable for the protocol, speed and mode of operation required. The fiber optic transceiver must be installed as a [stand-alone][card-cage] unit. The fiber optic transceiver must operate on [Multi-mode][Single-mode] fiber optic cable. The fiber optic transceiver must be supplied with [ST][ or ][FCPC] type optical connectors. Cabling: as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM.

[2.23.2 Radio]

**************************************************************************
Note: Receiving a new radio frequency assignment often takes a relatively long period of time. Be sure to request the frequency assignment early in the design process.
**************************************************************************

The mass notification transceiver must be bi-direction and meet all the requirements of paragraph, RADIO TRANSMITTER AND INTERFACE PANELS as specified in this specification section. The transceiver utilized in the mass notification system must be capable of the following:

a. Communication with the central control/monitoring system to provide supervision of communication link and status changes are reported by automatic and manual poll/reply/acknowledge routines.

b. All monitored points/status changes are transmitted immediately and at programmed intervals until acknowledged by the central control/monitoring system.

c. Each transceiver must transmits a unique identity code as part of all messages; the code is set by the user at the transceiver.
2.23.3 Telephone

A modem must be provided for communication with the central control/monitoring system. The modem must be 56k, compatible with data mode V.90, utilizing Hayes compatible command codes. The modem must be capable of auto dialing a preset number based on preprogrammed events. The modem must auto answer and provide a secure password protection system. Cabling: as specified in Section 27 10 00 BUILDING TELECOMMUNICATIONS CABELING SYSTEM.

2.23.4 Secure Radio System

**************************************************************************
Note: Receiving a new radio frequency assignment often takes a relatively long period of time. Be sure to request the frequency assignment early in the design process.
**************************************************************************

2.23.4.1 Communications Network

The communications network provides two-way signals between central control units and autonomous control units (in individual building systems), and should include redundant (primary and backup) communication links. The system must incorporate technology to prevent easy interruption of the radio traffic for MNS alerting.

2.23.4.2 Radio Frequency Communications

Use of radio frequency-type communications systems must comply with National Telecommunications and Information Administration (NTIA) requirements. The systems must be designed to minimize the potential for interference, jamming, eavesdropping, and spoofing.

2.23.4.3 Licensed Radio Frequency Systems

An approved DD Form 1494 for the system is required prior to operation.

2.24 AUTOMATIC FIRE ALARM TRANSMITTERS

**************************************************************************
NOTE: State the make and model number of existing proprietary supervising station receiving equipment. The choice of code transmitter, or radio transmitter depends upon the type of existing fire reporting system at the activity. Determine the type of activity reporting system (e.g., positive non interfering or shunt). In most cases a local energy-tripping device will be required. The facility Fire Dept. or Engineering office should be contacted to determine the type and amount of data to be supervised (monitored), e.g., -type: separate or common transmission of alarm, supervisory, and trouble type signals; -amount: all points, all zones, or the combined premises. Verify that existing monitoring equipment has sufficient capacity to support the additional premises or that it can be expanded as necessary to accommodate the new fire alarm system. Identify existing components.
[2.24.1  Radio Transmitter and Interface Panels]

Transmitters must be compatible with proprietary supervising station receiving equipment. Each radio alarm transmitter must be the manufacturer's recognized commercial product, completely assembled, wired, factory tested, and delivered ready for installation and operation. Transmitters must be provided in accordance with applicable portions of NFPA 72, Federal Communications Commission (FCC) 47 CFR 90 and Federal Communications Commission (FCC) 47 CFR 15. Transmitter electronics module must be contained within the physical housing as an integral, removable assembly. The proprietary supervising station receiving equipment is [_____] and the transmitter must be fully compatible with this equipment. At the contractors option, and if listed, the transmitter may be housed in the same control unit as the FMCU. The transmitter must be narrowband radio, with FCC certification for narrowband operation and meets the requirements of the NTIA (National Telecommunications and Information Administration) Manual of Regulations and Procedures for Federal Frequency Management.

2.24.1.1 Operation

Operate each transmitter from 120-volt ac power. In the event of 120-volt ac power loss, the transmitter must automatically switch to battery operation. Switchover must be accomplished with no interruption of protective service, and must automatically transmit a trouble message. Upon restoration of ac power, transfer back to normal ac power supply must also be automatic.

2.24.1.2 Battery Power

Transmitter standby battery capacity must provide sufficient power to operate the transmitter in a normal standby status for a minimum of 72 hours and be capable of transmitting alarms during that period.

2.24.1.3 Transmitter Housing

Use NEMA Type 1 for housing. The housing must contain a lock that is keyed [identical to the fire alarm system for the building][identical to radio alarm transmitter housings on the Installation]. Radio alarm transmitter housing must be factory painted with a suitable priming coat and not less than two coats of a hard, durable weatherproof enamel.

2.24.1.4 Antenna

Antenna must be [omnidirectional, coaxial, halfwave dipole antennas][_____] for radio alarm transmitters with a driving point impedance to match transmitter output. The antenna and antenna mounts must be corrosion resistant and designed to withstand wind velocities of 161 km/hour 100 mph. Do not mount antennas to any portion of the building roofing system. Protect the antenna from physical damage.

[2.24.2  Digital Alarm Communicator Transmitter (DACT)]

Provide DACT that is compatible with the existing supervising station fire alarm system. Transmitter must have a means to transmit alarm, supervisory, and trouble conditions via a single transmitter. Transmitter must have a source of power for operation that conforms to NFPA 72.
Transmitter must be capable of initiating a test signal daily at any selected time. Transmitter must be arranged to seize telephone circuits in accordance with NFPA 72.

2.24.3 Signals to Be Transmitted to the Base Receiving Station

**************************************************************************
NOTE: The following paragraph is applicable only to existing installations for connections to an auxiliary (public) alarm system. Edit this for the installation specific criteria.
**************************************************************************

The following signals must be sent to the base receiving station:

- a. Sprinkler waterflow
- b. Manual pull stations
- c. Smoke detectors
- d. Duct smoke detectors
- e. Sleeping room smoke detectors
- f. Carbon monoxide detectors
- g. Heat detectors
- h. Fire extinguishing system
- i. Sprinkler valve supervision
- j. Fire pump running
- k. Fire pump supervision
- l. Water supply level and temperature
- m. Combustion engine drive fire pump running
  - 1. Selector switch in position than automatic
  - 2. Engine over-speed
  - 3. Low fuel
  - 4. Low battery
  - 5. Engine trouble (for example, low oil, over temp)

2.25 SYSTEM MONITORING

2.25.1 Valves

Each valve affecting the proper operation of a fire protection system, including automatic sprinkler control valves, standpipe control valves, sprinkler service entrance valve, valves at fire pumps, isolating valves for pressure type waterflow or supervision switches, and valves at backflow...
preventers, whether supplied under this contract or existing, must be electrically monitored to ensure its proper position. Provide each tamper switch with a separate address, unless they are within the same room, then a maximum of five can use the same address.

2.25.2 High/Low [Air][Nitrogen] Supervisory Switches

Provide monitoring of high and low supervisory [air][nitrogen] for [dry pipe][preaction] systems. Each air supervisory switch must have a separate address. Switches must be listed extinguishing system attachments. The device must contain double pole, double throw contacts. Operation of the switch must cause a supervisory signal to be transmitted to the FMCU when [air][nitrogen] pressure in the system monitored sprinkler system increases more than 34.5 kPa5 psi above the normal system pressure or drops halfway from the normal pressure to the tripping point.

2.25.3 Room Low Temperature Supervisory Switch

Provide [monitoring of the ]listed supervisory air temperature switch for the [fire pump][sprinkler riser] room[s]. Switch must cause a supervisory signal to be transmitted to the FMCU whenever the temperature in the room drops to below 4.4 degrees C40 degrees F. Device must reset when temperature rises above 4.4 degrees C40 degrees F.

2.25.4 Electromagnetic Door Holders

Electromagnetic holding devices must operate on [120 VAC][24 VDC], and require not more than [3][_____] watts of power to develop 6.9 kPa25 psi of holding force. Under normal conditions, the magnets must attract and hold the doors open. Operation must be fail safe with no moving parts. Electromagnetic door hold-open devices must not be required to be held open during building power failure. The device must be listed based on UL 228 tests.

2.26 ENVIRONMENTAL ENCLOSURES OR GUARDS

Environmental enclosures must be provided to permit fire alarm/mass notification components to be used in areas that exceed the environmental limits of the listing. The enclosure must be listed for the device or appliance as either a manufactured part number or as a listed compatible accessory for the component is currently listed. Guards required to deter mechanical damage must be either a listed manufactured part or a listed accessory for the category of the initiating device or notification appliance.

2.27 FIREFIGHTER TELEPHONE COMMUNICATION SYSTEM

**************************************************************************
NOTE: Provide a master control station at the FMCU with remote telephone stations in each stair at each floor landing, in each elevator lobby on each floor, and in elevator cabs. In addition, provide them at specific locations containing essential fire protection equipment, such as the fire pump room and outside the emergency generator room.

NOTE: In lieu of firefighter telephones radio repeater equipment compatible with responding fire department may be used if approved by the responding
2.27.1 General

Provide a firefighter telephone communication system with complete, common talk, closed circuits. The system must include, but not be limited to, a master control station mounted in the fire alarm control unit, a power supply and standby battery system, and remote telephone stations.

2.27.2 Features

The system must include the following features:

a. A master control station which must provide power, supervision, and control for wiring, components, and circuits. The act of lifting any remote telephone hand set from its cradle must cause both a visual and audible signal to annunciate at the master control station. Removing the hand set at the master control station and depressing a button at the remote telephone hand set must cause the automatic silencing of the audible signal.

b. Communication between the master control station hand set and any/or all remote hand sets must require the depressing of a push-to-talk switch located on any/all remote hand sets. During the time that the master control hand set is removed from its cradle it must be possible to communicate between five remote hand sets and the master control station.

c. Hand sets must be able to monitor any conversation in progress and join the conversation by pressing the push-to-talk button. It must not be possible to communicate between two or more remote hand sets with the master control station hand set in its cradle.

d. The master control station hand set must be red in color and equipped with a 1.5 m 5-foot long strain-relieved coiled cord.

e. The master control station must monitor wire and connections for any opens, shorts, or grounds which would render the system inoperable or unintelligible.

f. The master control station must be equipped with a silencing switch and ring-back feature such that any audible trouble signal can be silenced and must be so indicated by the lighting of an amber LED. Once any trouble condition has been corrected, the amber LED must be extinguished.

g. The master control station must be equipped with a separate, LED annunciated switch for each telephone circuit. In addition, LEDs must provide for the annunciation of operating and supervisory power.

h. The loss of operating or supervisory power must cause an audible and visual indication at the master control station and must also cause the fire alarm trouble signal to sound on the FMCU.

i. Switches, LEDs, and controls must be fully labeled.
2.27.3 Handsets

Handsets must have the following features:

a. Provide [surface][flush] mounted remote telephone stations.

b. Each station must be equipped with a hinged door that is magnetically locked.

c. Each hand set must be permanently wired in place with a coiled cord.

d. Each hand set must be red high-impact cycolac and must be equipped with a push-to-talk switch which, when operated, must signal the master control station and a switch-equipped, storage cradle.

e. Provide operating and supervising power from the same supply circuit(s) utilized for the FMCU.

PART 3 EXECUTION

3.1 VERIFYING ACTUAL FIELD CONDITIONS

Before commencing work, examine all adjoining work on which the contractor's work is in any way dependent for perfect workmanship according to the intent of this specification section, and report to the Contracting Officer's Representative any condition which prevents performance of first class work. No "waiver of responsibility" for incomplete, inadequate or defective adjoining work will be considered unless notice has been filed before submittal of a proposal.

3.2 INSTALLATION

3.2.1 Fire Alarm and Mass Notification Control Unit (FMCU)

Locate the FMCU [where indicated on the drawings][______]. [Recess][Semi-recess][Surface mount] the enclosure with the top of the cabinet 2 m 6 feet above the finished floor or center the cabinet at [1.5][_____] m [5][_____] feet, whichever is lower. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the FMCU. Locate the document storage cabinet adjacent to the FMCU unless the Contracting Officer directs otherwise.

3.2.2 Battery Cabinets

When batteries will not fit in the FMCU, locate battery cabinets below or adjacent to the FMCU. Battery cabinets must be installed at an accessible location when standing at floor level. Battery cabinets must not be installed lower than 300 mm 12 inches above finished floor, measured to the bottom of the cabinet, nor higher than 900 mm 36 inches above the floor, measured to the top of the cabinet. Installing batteries above drop ceilings or in inaccessible locations is prohibited. Battery cabinets must be large enough to accommodate batteries and also to allow ample gutter space for interconnection of control units as well as field wiring. The cabinet must be provided in a sturdy steel housing, complete with back box, hinged steel door with cylinder lock, and surface mounting provisions. The cabinet must be identified by an engraved phenolic resin nameplate. Lettering on the nameplate must indicate the control unit(s) the batteries power and must not be less than 25 mm 1-inch high.
3.2.3 Manual Stations

Locate manual stations as required by NFPA 72[ and as indicated on the drawings]. Mount stations so they are located no farther than [1.5][_____] m [5][_____] feet from the exit door they serve, measured horizontally. Manual stations must be mounted at [1067][1117][_____] mm [42][44][_____] inches measured to the operating handle.

3.2.4 Notification Appliances

**************************************************************************
NOTE: Locate strobes wall mounted in corridors no more than [4.5 m][15 feet] from the end of a corridor with [30 m][100 feet] maximum distance between strobes. Where there is an obstruction to the viewing path in the corridors, such as a cross-corridor door or ceiling elevation change, consider the obstruction as defining a new corridor. Provide ceiling mounted strobes in rooms accessible to the public, such as conference rooms, restrooms, courtrooms, cafeterias, and auditoriums in accordance with NFPA 72. In Child Development Centers only chimes must be used as the pre-alert tone prior to voice messages.
**************************************************************************

a. Locate notification appliance devices[ as required by NFPA 72][ where indicated][ and to meet the intelligibility requirements]. Where two or more visual notification appliances are located in the same room or corridor or field of view, provide synchronized operation. Devices must use screw terminals for all field wiring.[ Audible and visual notification appliances mounted in acoustical ceiling tiles must be centered in the tiles plus or minus 50 mm2 inches.]

b. Audible and visual notification appliances mounted on the exterior of the building, within unconditioned spaces, or in the vicinity of showers must be listed weatherproof appliances installed on weatherproof backboxes.

c. Speakers must not be located in close proximity to the FMCU or LOC so as to cause feedback when the microphone is in use.

3.2.5 Smoke and Heat Detectors

Locate detectors[ as required by NFPA 72 and their listing][ as indicated on the drawings] on a 100 mm 4-inch mounting box. Install heat detectors not less than 100 mm 4 inches from a side wall to the near edge. Heat detectors located on the wall must have the top of the detector at least 100 mm 4 inches below the ceiling, but not more than 300 mm 12 inches below the ceiling. Smoke detectors are permitted to be on the wall no lower than 300 mm 12 inches from the ceiling with no minimum distance from the ceiling.[ In raised floor spaces, install the smoke detectors to protect[ 21 square meters 225 square feet per detector][______].] Install smoke detectors no closer than 1 m 3 feet from air handling supply diffusers. Detectors installed in acoustical ceiling tiles must be centered in the tiles plus or minus 50 mm2 inches.

SECTION 28 31 76 Page 58
3.2.6 Carbon Monoxide Detectors

Locate detectors[ as required by NFPA 72 and their listings][ as indicated on the drawings] on a 100-mm4-inch mounting box.[ Carbon monoxide detectors must be installed separate from smoke and/or heat detectors.]

[3.2.7 Air Sampling Smoke Detector

Locate air sampling smoke detectors in accordance with the manufacturer's instructions. Air sampling smoke detectors must be installed as follows:

a. Air Sampling Smoke Detector Assembly:

(1) Detector assembly must be mounted to a wall at a height between 48 to 60 inches1200 mm to 1800 mm to top of detector measured above the finished floor.

(2) Mounting must be in a fully accessible and visible location.

(3) Mounting or attachment to site equipment, cable trays, movable walls, other equipment or equipment supports is not permitted.

(4) Piping network insertion into the detector inlet must not be glued.

(5) Air sampling smoke detector assembly must be installed in accordance with this specification section and the manufacturer's installation and instruction manuals.

(6) Flexible tubing for termination of the sampling pipe network into detector inlet is not permitted unless allowed by its listing.

(7) Provide red background with white lettering labels that are plastic or phenolic type with a minimum of 0.25-inch6.4 mm block lettering to indicate detector and zone. For example: "AIR SAMPLING SOME DETECTOR No. 1-1 No. 5".

(8) Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. Install the frame in a conspicuous location observable from the ASD panel. The card must show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions, normal, alarm, supervisory, and trouble. The instructions must be approved by the Contracting Officer before being posted.

b. Pipe and Sampling Tube Mounting:

(1) The pipe and sampling tubing detection network must be mounted as per the design and manufacturer's specification. The hardware used for mounting will depend upon the design and site requirements.

(2) To minimize flexing, pipes must be secured every 1.5 m5 feet.

(3) Pipes must be suspended between 25 mm and 100 mm1 and 4 inches below the ceiling. In areas with a suspended ceiling, the pipe network must be installed above the ceiling utilizing the manufacturer's capillary sample port supported by the ceiling.
(4) The sampling tubes must be of the same length or use the manufacturer's guidelines to run tubes of the required lengths.

(5) When installing a pipe network in areas subject to high temperature fluctuations allow for the contraction and expansion of pipes.

(6) Where expansion or contraction of pipes is likely either after installation or on a continuous basis, do not place pipe clips adjacent to couplings and socket unions as these may interfere with the movement of the pipe.

(7) No bends are permitted within the first 450 mm 18 inches from the detector inlet.

(8) The routing of the piping and sample tube network must be coordinated with potential obstructions, including cable trays, grounding bars, and HVAC ductwork.

(9) All changes in direction must be made with standard elbows or tees.

(10) All joints must be air-tight and made by using solvent cement, except at the entry to the detector assembly. Refer to ASTM F402.

(11) All pipes must be supported by mechanical hangers attached to the structure of the building. Not more than 300 mm 1-foot of pipe must extend beyond the last hanger of each sampling pipe. The final installation must result in no noticeable deflection in the piping network.

(12) Attachment of air sampling pipes to cable trays, "gray iron", and telecommunications equipment is prohibited.

(13) Clearly label pipe network to distinguish the pipe from other facility pipe work or protective cabling enclosures. For example: "SMOKE DETECTION SAMPLING TUBE - DO NOT DISTURB". In open rooms and exposed areas, provide labels at no greater than 6.1-m20-foot intervals. Provide labels every 3 m10 feet where piping is installed above suspended ceilings and every 609 mm2 feet, centered in the floor panels, where piping is installed within the raised floor cavity.

(14) Placement of the sampling tube must take into consideration appropriate sampling point locations and spacing.

c. Air Sampling Points:

(1) Open area ceiling sampling points must be oriented downward and must be within 25 mm to 100 mm 1 to 4 inches below the underside of the ceiling above where the ceiling is smooth.

(2) Label all air sampling points with a round red label, each with a center hole to match the diameter of the drilled sampling point. For example: "AIR SAMPLING POINT DIA 3.2 MM0.125 INCHES". Indicate fractional dimensions in decimal format with a minimum of three decimal places.
3.2.8 Graphic Annunciator

Locate the graphic annunciator as shown on the drawings. Mount the annunciator, with the top 1830 mm (6 feet) above the finished floor or center the annunciator at [1525][_____] mm (5[_____] feet), whichever is lower.

3.2.9 LCD REMOTE Annunciator

Locate the LCD annunciator as shown on the drawings. Mount the annunciator, with the top 2 m (6 feet) above the finished floor or center the annunciator at [1.5][_____] m (5[_____] feet), whichever is lower.

3.2.10 Electromagnetic Door Holder Release

Doors must be held open at a minimum of 90 degrees so as not to impede egress from the space. Mount the armature portion on the door and have an adjusting screw for seating the angle of the contact plate. Wall-mount the electromagnetic release, with a total horizontal projection not exceeding 100 mm (4 inches). Ensure all doors release to close upon first stage (pre-discharge) alarm. Electrical supervision of wiring external of control unit for magnetic door holding circuits is not required.

3.2.11 Firefighter Telephones

Mount telephone[ hand sets][ jacks] on the wall in each stair at each floor landing, in each emergency generator room, in each fire pump room, in each elevator machine room, in each elevator lobby, and in each elevator cab 1200 mm (4 feet) above the finished floor.

3.2.12 Local Operating Console (LOC)

Locate the LOC(s) as required by NFPA 72 and as indicated. Mount the console so that the top message button and microphone is no higher than 1200 mm (4 feet) above the floor and the bottom (lowest) message button and microphone is at least 1-meter (3 feet) above the finished floor.

3.2.13 Ceiling Bridges

Provide ceiling bridges for ceiling-mounted appliances. Ceiling bridges must be as recommended/required by the manufacturer of the ceiling-mounted notification appliance.

3.3 SYSTEM FIELD WIRING

3.3.1 Wiring within Cabinets, Enclosures, and Boxes

Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of any box, enclosure, or cabinet. Conductors that are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting, or junction box must be connected to screw-type terminal blocks. Mark each terminal in accordance with the wiring diagrams of the system. The use of wire nuts or similar devices is prohibited. Wiring to conform with NFPA 70.

Indicate the following in the wiring diagrams:

a. Point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are
supervised or controlled by the system. Diagrams must show connections from field devices to the FMCU and remote fire alarm/mass notification control units, initiating circuits, switches, relays and terminals.

b. Complete riser diagrams indicating the wiring sequence of devices and their connections to the control equipment. Include a color code schedule for the wiring. Include floor plans showing the locations of devices and equipment.

3.3.2 Terminal Cabinets

**************************************************************************
NOTE: Provide terminal cabinets on each floor where the fire alarm system supply riser is located and where the fire alarm return riser is located.
**************************************************************************

Provide a terminal cabinet at the base of any circuit riser, on each floor at each riser, and where indicated on the drawings. Terminal size must be appropriate for the size of the wiring to be connected. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the terminal cabinet. Minimum size is 200 mm by 200 mm 8 inches by 8 inches. Only screw-type terminals are permitted. Provide an identification label, that displays "FIRE ALARM TERMINAL CABINET" with 50 mm 2-inch lettering, on the front of the terminal cabinet.

3.3.3 Alarm Wiring

**************************************************************************
NOTE: Do not penetrate SCIF perimeters with copper signal line circuits. SCIF penetrations should be either fiber optic cable or IDC. IDC circuits penetrating the SCIF must be filtered.
**************************************************************************

a. Voltages must not be mixed in any junction box, housing or device, except those containing power supplies and control relays.

b. Utilize shielded wiring where recommended by the manufacturer. For shielded wiring, ground the shield at only one point, in or adjacent to the FMCU.

c. [Pigtail or T-tap connections to signal line circuits, initiating device circuits, supervisory alarm circuits, and notification appliance circuits are prohibited.][ T-tapping using screw terminal blocks is allowed for Class "B" signaling line circuits.]

d. Color coding is required for circuits and must be maintained throughout the circuit. Conductors used for the same functions must be similarly color coded. Conform wiring to NFPA 70.

e. Pull all conductors splice free. The use of wire nuts, crimped connectors, or twisting of conductors is prohibited. Where splices are unavoidable, the location of the junction box or pull box where they occur must be identified on the as-built drawings. The number and location of splices must be subject to approval by the [_____] Designated Fire Protection Engineer (DFPE).
3.3.4 Back Boxes and Conduit

In addition to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, provide all wiring in rigid metal conduit or intermediate metal conduit unless specifically indicated otherwise. Minimum conduit size must be 19 mm/3/4-inch in diameter. Do not use electrical non-metallic tubing (ENT) or flexible non-metallic tubing and associated fittings.

a. Galvanized rigid steel (GRS) conduit must be utilized where exposed to weather, where subject to physical damage, and where exposed on exterior of buildings. Intermediate metal conduit (IMC) may be used in lieu of GRS as allowed by NFPA 70.

b. Electrical metallic tubing (EMT) is permitted above suspended ceilings or exposed where not subject to physical damage. Do not use EMT underground, encased in concrete, mortar, or grout, in hazardous locations, where exposed to physical damage, outdoors or in fire pump rooms. Use die-cast compression connectors.

c. For rigid metallic conduit (RMC), only threaded type fitting are permitted for wet or damp locations.

d. Flexible metal conduit is permitted for initiating device circuits in length or less. Flexible metal conduit is prohibited for notification appliance circuits and signaling line circuits. Use liquid tight flexible metal conduit in damp and wet locations.

e. Schedule 40 (minimum) polyvinyl chloride (PVC) is permitted where conduit is routed underground or underground below floor slabs. Convert non-metallic conduit, other than PVC Schedule 40 or 80, to plastic-coated rigid, or IMC, steel conduit before turning up through floor slab.

f. Exterior wall penetrations must be weathertight. Conduit must be sealed to prevent the infiltration of moisture.

[g. For Class "A" or "X" circuits with conductor lengths of 10 feet3 meters or less, the conductors must be permitted to be installed in the same raceway in accordance with NFPA 72.

3.3.5 Conductor Terminations

Labeling of conductors at terminal blocks in terminal cabinets, FMCU[, and remote FMCU] and the LOC must be provided at each conductor connection. Each conductor or cable must have a shrink-wrap label to provide a unique and specific designation. Each terminal cabinet, FMCU, and remote FMCU must contain a laminated drawing that indicates each conductor, its label, circuit, and terminal. The laminated drawing must be neat, using 12 point lettering minimum size, and mounted within each cabinet, control unit, or unit so that it does not interfere with the wiring or terminals. Maintain existing color code scheme where connecting to existing equipment.

[3.4 DISCONNECTION AND REMOVAL OF EXISTING SYSTEM

************************************************************************************************************
NOTE: Contact the Contracting Officer, Base Fire Prevention Office, and/or Base Maintenance Personnel to determine what action is appropriate for the salvaging of existing fire alarm equipment.

SECTION 28 31 76 Page 63
Maintain existing fire alarm/mass notification equipment fully operational until the new equipment has been tested and accepted by the Contracting Officer. As new equipment is installed, label it "NOT IN SERVICE" until the new equipment is accepted. Once the new system is completed, tested, and accepted by the Government, it must be placed in service and connected to the supervising station. Remove tags from new equipment and tag the existing equipment "NOT IN SERVICE" until removed from the building.

a. After acceptance of the new system by the Contracting Officer, remove existing equipment not connected to the new system, remove unused exposed conduit, and restore damaged surfaces. Remove the material from the site and dispose.

b. Disconnect and remove the existing fire alarm/mass notification and smoke detection systems where indicated and elsewhere in the specification.

c. Control units and fire alarm devices and appliances disconnected and removed must be turned over to the Contracting Officer.

d. Properly dispose of fire alarm outlet and junction boxes, wiring, conduit, supports, and other such items.

3.5 CONNECTION OF NEW SYSTEM

The following new system connections must be made during the last phase of construction, at the beginning of the pre-Government tests. New system connections must include:

a. Connection of new relays to existing magnetic door hold-open devices.

b. Connection of new elevator recall relays to existing wiring and conduit.

c. Connection of new system transmitter to existing installation fire reporting system.

Once these connections are made, system must be left energized. Report immediately to the Contracting Officer, coordination and field problems resulting from the connection of the above components.

3.6 FIRESTOPPING

Provide firestopping for holes at conduit penetrations through floor slabs, fire-rated walls, partitions with fire-rated doors, corridor walls, and vertical service shafts in accordance with Section 07 84 00 FIRESTOPPING.

3.7 PAINTING

a. In unfinished areas (including areas above drop ceilings), paint all exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceway, junction boxes and covers red. In lieu of painting conduit, the contractor may utilize red conduit with a factory applied finish.

b. In finished areas, paint exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceways, junction boxes, and electrical boxes to match adjacent finishes. The inside cover of
the junction box must be identified as "Fire Alarm" and the conduit must have painted red bands 19 mm 3/4-inch wide at 3-meter 10-foot centers and at each side of a floor, wall, or ceiling penetration.

c. Painting must comply with Section 09 90 00 PAINTS AND COATINGS.

3.8 FIELD QUALITY CONTROL

**************************************************************************
NOTE: Listed tests are minimum required.
Coordinate with the local Authority Having Jurisdiction (AHJ) for minimum requirements in excess of the NFPA 72 minimums or those recommend below. If additional tests are required, such tests must be added to the list.
**************************************************************************

3.8.1 Test Procedures

Submit detailed test procedures, prepared and signed by the NICET Level [III] [or ] [IV] Fire Alarm Technician, and the representative of the installing company, [and reviewed by the QPPE] 60 days prior to performing system tests. Detailed test procedures must list all components of the installed system such as initiating devices and circuits, notification appliances and circuits, signaling line devices and circuits, control devices/equipment, batteries, transmitting and receiving equipment, power sources/supply, annunciators, special hazard equipment, emergency communication equipment, interface equipment, and surge protective devices. Test procedures must include sequence of testing, time estimate for each test, and sample test data forms. The test data forms must be in a check-off format (pass/fail with space to add applicable test data; similar to the forms in NFPA 72 and NFPA 4.) The test procedures and accompanying test data forms must be used for the pre-Government testing and the Government testing. The test data forms must record the test results and must:

a. Identify the NFPA Class of all Initiating Device Circuits (IDC), and Notification Appliance Circuits (NAC), Voice Notification System Circuits (NAC Audio), and Signaling Line Circuits (SLC).

b. Identify each test required by NFPA 72 Test Methods and required test herein to be performed on each component, and describe how these tests must be performed.

c. Identify each component and circuit as to type, location within the facility, and unique identity within the installed system. Provide necessary floor plan sheets showing each component location, test location, and alphanumeric identity.

d. Identify all test equipment and personnel required to perform each test (including equipment necessary for smoke detector testing. The use of magnets is not permitted.

e. Provide space to identify the date and time of each test. Provide space to identify the names and signatures of the individuals conducting and witnessing each test.
3.8.2  Pre-Government Testing

3.8.2.1  Verification of Compliant Installation

Conduct inspections and tests to ensure that devices and circuits are functioning properly. Tests must meet the requirements of paragraph entitled "Minimum System Tests" as required by NFPA 72. The contractor and an authorized representative from each supplier of equipment must be in attendance at the pre-Government testing to make necessary adjustments. After inspection and testing is complete, provide a signed Verification of Compliant Installation letter by the QFPE that the installation is complete, compliant with the specification and fully operable. The letter must include the names and titles of the witnesses to the pre-Government tests. Provide all completion documentation as required by NFPA 72 including all referenced annex sections and the test reports noted below.

a.  NFPA 72 Record of Completion.
b.  NFPA 72 Record of Inspection and Testing.
d.  Audibility test results with marked-up test floor plans.
e.  Intelligibility test results with marked-up floor plans.
f.  Documentation that all tests identified in the paragraph "Minimum System Tests" are complete.

3.8.2.2  Request for Government Final Test

When the verification of compliant installation has been completed, submit a formal request for Government final test to the [_____][Designated Fire Protection Engineer (DFPE)][Contracting Officer's Representative (COR)]. Government final testing will not be scheduled until the DFPE has received copies of the request for Government final testing and Verification of Compliant Installation letter with all required reports. Government final testing will not be performed until after the connections to the installation-wide fire reporting system[ and the installation-wide mass notification system have] been completed and tested to confirm communications are fully functional. Submit request for test at least [15][_____] calendar days prior to the requested test date.

3.8.3  Correction of Deficiencies

If equipment was found to be defective or non-compliant with contract requirements, perform corrective actions and repeat the tests. Tests must be conducted and repeated if necessary until the system has been demonstrated to comply with all contract requirements.

3.8.4  Government Final Tests

The tests must be performed in accordance with the approved test procedures in the presence of the DFPE. Furnish instruments and personnel required for the tests. The following must be provided at the job site for Government Final Testing:

a.  The manufacturer's technical representative.
c. Marked-up red line drawings of the system as actually installed.

d. Loop resistance test results.

e. Complete program printout including input/output addresses.

f. Copy of pre-Government Test Certificate, test procedures and completed test data forms.

g. Audibility test results with marked-up floor plans.

h. Intelligibility test results with marked-up floor plans.

Government Final Tests will be witnessed by the [____], [Designated Fire Protection Engineer][Contracting Officer's Representative (COR)][, Qualified Fire Protection Engineer (QFPE)]. At this time, any and all required tests noted in the paragraph "Minimum System Tests" must be repeated at their discretion.

3.9 MINIMUM SYSTEM TESTS

3.9.1 System Tests

Test the system in accordance with the procedures outlined in NFPA 72. The required tests are as follows:

a. Loop Resistance Tests: Measure and record the resistance of each circuit with each pair of conductors in the circuit short-circuited at the farthest point from the circuit origin. The tests must be witnessed by the Contracting Officer and test results recorded for use at the final Government test.

b. Verify the absence of unwanted voltages between circuit conductors and ground. The tests must be accomplished at the pre-Government test with results available at the final system test.

c. Verify that the control unit is in the normal condition as detailed in the manufacturer's O&M manual.

d. Test each initiating device and notification appliance and circuit for proper operation and response at the control unit. Smoke detectors must be tested in accordance with manufacturer's recommended calibrated test method. Use of magnets is prohibited. Testing of duct smoke detectors must comply with the requirements of NFPA 72 except disconnect at least 20 percent of devices. If there is a failure at these devices, then supervision must be tested at each device.

e. Carbon Monoxide Detector Tests: Carbon monoxide detectors must be tested in accordance with NFPA 72 and the manufacturer's recommended calibrated test method.

f. Test the system for specified functions in accordance with the contract drawings and specifications and the manufacturer's O&M manual.

g. Test both primary power and secondary power. Verify, by test, the secondary power system is capable of operating the system for the time
period and in the manner specified.

h. Determine that the system is operable under trouble conditions as specified.

i. Visually inspect wiring.

j. Test the battery charger and batteries.

k. Verify that software control and data files have been entered or programmed into the FMCU. Hard copy records of the software must be provided to the Contracting Officer.

l. Verify that red-line drawings are accurate.

m. Measure the current in circuits to ensure there is the calculated spare capacity for the circuits.

n. Measure voltage readings for circuits to ensure that voltage drop is not excessive.

o. Disconnect the verification feature for smoke detectors during tests to minimize the amount of smoke needed to activate the sensor. Testing of smoke detectors must be conducted using real smoke or the use of canned smoke which is permitted.

p. Measure the voltage drop at the most remote appliance (based on wire length) on each notification appliance circuit.

q. Verify the documentation cabinet is installed and contains all as-built shop drawings, product data sheets, design calculations, site-specific software data package, and all documentation required by paragraph titled "Test Reports".

3.9.2 Audibility Tests

Sound pressure levels from audible notification appliances must be a minimum of 15 dBA over ambient with a maximum of 110 dBA in any occupiable area. The provisions for audible notification (audibility and intelligibility) must be met with doors, fire shutters, movable partitions, and similar devices closed.

3.9.3 Intelligibility Tests

**************************************************************************
NOTE: Occasionally, large DoD buildings are designed to provide cavernous-type open areas to meet unique operational requirements. Such areas are typically designed with hard wall and ceiling surfaces (such as metal or concrete) without acoustical treatments, and this has been found to cause excessive sound reflections that prevent obtaining the normal, minimum required CIS value. In such facilities, the cavernous-type open area is permitted to have locations with a CIS value lower than the normal, minimum required CIS value when the following conditions are met:

The requirement for a deviation from the normal,
minimum CIS criteria identified in the design phase.

Justification for the deviation from the normal, minimum CIS criteria is provided to the approving authority (i.e., the AHJ for the Navy and Marine Corps; the DoD installation in conjunction with the contracting officer for the Army and Air Force). The justification must address all factors relevant to the request for deviation from normal, minimum CIS criteria, including, but not limited to: the operational requirements that restrict the installation of acoustical wall and ceiling treatments; the potential use of special speaker technologies such as directional speakers or stacked speaker systems; and, the availability of physically larger or higher-fidelity speakers even though such speakers might not be listed for fire alarm use.

Note: Deviation from normal, minimum CIS criteria should not be requested for the design of normal, large, open areas that are typically found in permanent DoD buildings, such as dining halls, theaters, and gymnasiums. The potential for deviation from normal criteria is intended to address the rare exception to normal criteria that is sometimes needed for DoD buildings with unique operational requirements.

Building occupants located in the large, cavernous area can adequately understand the message content in the voice signal being broadcast. Whether the voice message is adequately understood must be determined by the approving authority (i.e., the AHJ for the Navy and Marine Corps; the DoD installation in conjunction with the contracting officer for the Army and Air Force).

The CIS value is not less than 0.6 at any location within the large, cavernous area.

The building occupants in the large, cavernous area must walk no more than 30 m (98 feet) to find another location within the large, cavernous area having at least the normal, minimum required CIS value. Note: An STI score of 0.5 is considered equivalent to a CIS score of 0.7. An STI value of 0.7 is considered equivalent to a CIS value of 0.8.

All readings for Sound Pressure Level (SPL) and Intelligibility score must be recorded on the installation drawings next to the speaker symbol. The readings must then be added on the "as-Built" drawings to be submitted at the conclusion of the Final Government test.

Intelligibility testing of the System must be accomplished in accordance with NFPA 72 for Voice Evacuation Systems, and ASA S3.2. Following are the specific requirements for intelligibility tests:
a. Intelligibility Requirements: Verify intelligibility by measurement after installation.

******************************************************************************
NOTE: The minimum required value for Navy and Marine Corps is 0.7 CIS. The minimum required value for Army and Air Force is 0.8 CIS, although rounding is permitted such that a value of 0.75 may be rounded to 0.8.
******************************************************************************

b. Ensure that a CIS value greater than the required minimum value is provided in each area where building occupants typically could be found. The minimum required value for CIS is [.7][.8]. Rounding of values is permitted.

******************************************************************************
NOTE: Edit the following paragraph as required for each specific project.
******************************************************************************

c. Areas of the building provided with hard wall and ceiling surfaces (such as metal or concrete) that are found to cause excessive sound reflections may be permitted to have a CIS score less than the minimum required value if approved by the DFPE, and if building occupants in these areas can determine that a voice signal is being broadcast and they must walk no more than 10 m 33 feet to find a location with at least the minimum required CIS value within the same area.

******************************************************************************
NOTE: Edit the following paragraph as required for each specific project.
******************************************************************************

d. Areas of the building where occupants are not expected to be normally present are permitted to have a CIS score less than the minimum required value if personnel can determine that a voice signal is being broadcast and they must walk no more than 15 m 50 feet to a location with at least the minimum required CIS value within the same area.

e. Take measurements near the head level applicable for most personnel in the space under normal conditions (e.g., standing, sitting, sleeping, as appropriate).

f. The distance the occupant must walk to the location meeting the minimum required CIS value must be measured on the floor or other walking surface as follows:

(1) Along the centerline of the natural path of travel, starting from any point subject to occupancy with less than the minimum required CIS value.

(2) Curving around any corners or obstructions, with a 300 mm 12 inches clearance there from.

(3) Terminating directly below the location where the minimum required CIS value has been obtained.
Use commercially available test instrumentation to measure intelligibility as specified by NFPA 72 as applicable. Use the mean value of at least three readings to compute the intelligibility score at each test location.

3.10 SYSTEM ACCEPTANCE

Following acceptance of the system, as-built drawings and O&M manuals must be delivered to the Contracting Officer for review and acceptance. The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of as-built (marked-up) drawings must be provided at the time of, or prior to the Final Government Test.

a. The drawings must be prepared electronically and sized no less than the contract drawings. Furnish one set of CDs or DVDs containing software back-up and CAD based drawings in latest version of MicroStation, AutoCAD, DXF and portable document formats of as-built drawings and schematics.

b. Include complete wiring diagrams showing connections between devices and equipment, both factory and field wired.

c. Include a riser diagram and drawings showing the as-built location of devices and equipment.

d. Provide Operation and Maintenance (O&M) Instructions.

[In existing buildings, the transfer of devices from the existing system to the new system and the permission to begin demolition of the old fire alarm system will not be permitted until the as-built drawings and O&M manuals are received.]

3.11 INSTRUCTION OF GOVERNMENT EMPLOYEES

3.11.1 Instructor

Provide the services of an instructor, who has received specific training from the manufacturer for the training of other persons regarding the operation, inspection, testing, and maintenance of the system provided. The instructor must train the Government employees designated by the Contracting Officer, in the care, adjustment, maintenance, and operation of the fire alarm system. The instructor must be thoroughly familiar with all parts of this installation. The instructor must be trained in operating theory as well as in practical O&M work. Submit the instructors information and qualifications including the training history.

3.11.2 Required Instruction Time

Provide 8 hours of instruction after final acceptance of the system. The instruction must be given during regular working hours on such dates and times selected by the Contracting Officer. The instruction may be divided into two or more periods at the discretion of the Contracting Officer. The training must allow for rescheduling for unforeseen maintenance and/or fire department responses.

3.11.2.1 Technical Training

Equipment manufacturer or a factory representative must provide
[1][3][_____] days of on site[ and 5 days of technical training to the Government at the manufacturing facility]. Training must allow for classroom instruction as well as individual hands on programming, troubleshooting and diagnostics exercises.[ Factory training must occur within [6][12][_____] months of system acceptance.]

3.11.3 Technical Training Manual

Provide, in manual format, lesson plans, operating instructions, maintenance procedures, and training data for the training courses. The operations training must familiarize designated government personnel with proper operation of the installed system. The maintenance training course must provide the designated government personnel adequate knowledge required to diagnose, repair, maintain, and expand functions inherent to the system.

3.12 EXTRA MATERIALS

3.12.1 Repair Service/Replacement Parts

Repair services and replacement parts for the system must be available for a period of 10 years after the date of final acceptance of this work by the Contracting Officer. During the warranty period, the service technician must be on-site within 24 hours after notification. All repairs must be completed within 24 hours of arrival on-site.

During the warranty period, the installing fire alarm contractor is responsible for conducting all required testing and maintenance in accordance with the requirements and recommended practices of NFPA 72 and the system manufacturer[s]. Installing fire alarm contractor is NOT responsible for any damage resulting from abuse, misuse, or neglect of equipment by the end user.

3.12.2 Spare Parts

Spare parts furnished must be directly interchangeable with the corresponding components of the installed system[s]. Spare parts must be suitably packaged and identified by nameplate, tagging, or stamping. Spare parts must be delivered to the Contracting Officer at the time of the Government testing and must be accompanied by an inventory list.

3.12.3 Document Storage Cabinet

Upon completion of the project, but prior to project close-out, place in the document storage cabinet copies of the following record documentation:

a. As-built shop drawings
b. Product data sheets
c. Design calculations
d. Site-specific software data package
e. All documentation required by SD-06.

NOTE: This guide specification covers the requirements for equipment, performance, and testing of stationary electrical instruments used for sensing the presence of combustible gases, or the deficiency of oxygen, in ambient air.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**COMPRESSED GAS ASSOCIATION (CGA)**

**ELECTRONIC COMPONENTS INDUSTRY ASSOCIATION (ECIA)**

**INTERNATIONAL SOCIETY OF AUTOMATION (ISA)**

**NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)**

NFPA 70 (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

NFPA 72 (2022) National Fire Alarm and Signaling Code

**U.S. DEPARTMENT OF DEFENSE (DOD)**

MIL-STD-461 (2015; Rev G) Requirements for the Control of Electromagnetic Interference Characteristics of Subsystems and Equipment

1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Preinstallation Meetings

Within [30] [_____] days of Contract Award submit the following to the Contracting Officer for review:

a. Material, equipment, and fixture lists

b. List of product installations

c. Manufacturer's sample warranty
d. Manufacturer's catalog data

e. Connection diagrams

f. Spare parts data

When submitting the list of product installations for combustible-gas detection systems, include identification of at least five units, similar to those proposed for use, that have been in successful service for a minimum period of 5 years. Also include such data as the number of false alarms and malfunctions experienced while in service over a period of [_____] [2] years.

1.3 SUBMITTALS

******************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SECTION 28 33 00.00 40 Page 5
WARRANTY

Submit a sample warranty for approval by the Contracting Officer.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Local policies may dictate more elaborate procedures for qualification or approval of detector samples.
**************************************************************************

2.1.1 Design Requirements

2.1.1.1 Schematics

Submit schematic drawings showing the specific equipment to be furnished; no "typicals."

2.1.1.2 Combustible-Gas Environments

Provide a system with electrically supervised detection and [____]
[noncoded] alarm of combustible gas in Class I, Division 1, Group [_____] [C and D] locations, conforming to the applicable requirements of NFPA 70, NFPA 72[, and [_____]].

2.1.1.3 Oxygen-Deficient Atmospheres

Provide a system with electrically supervised detection and [_____] [noncoded] alarm of oxygen-deficient atmospheres[, conforming to the applicable requirements of [_____]].

2.1.2 Performance Requirements

Provide a system with performance conforming to the requirements of FM Approval Standard for Combustible Gas Detectors (Class Number 6310 and 6320), and [_____] [ANSI/ISA 60079-29-1]. Ensure that the operation of any detection device automatically activates control unit relays [remote alarms] [, and lights].

Ensure that the name of the manufacturer and the serial numbers appear on all major components. Submit the following:

a. **Connection diagrams** showing a complete conduit and wiring layout for the equipment to be furnished, including AWG size and type of wire, and the number of conductors and connections to the equipment.

b. **Manufacturer's catalog data** for the [combustible-gas] [oxygen-deficient-atmosphere] detection systems, including special tools necessary for the maintenance of the equipment.

c. **Material, equipment, and fixture lists** including manufacturer's style or catalog numbers, specification and drawing reference numbers, reports from independent testing laboratories, and related descriptive matter on the devices to be installed.

2.1.3 Electromagnetic-Compatibility Requirements

Ensure that electrical and electronic systems operate without causing electromagnetic interference to, or malfunctioning due to electromagnetic interference from, other systems or equipment, and in accordance with applicable requirements of [ANSI/ISA 60079-29-1] [_____] [MIL-STD-461].

2.2 EQUIPMENT

Furnish fuses of each type and size required, and a [_____] [hydrogen] gas calibration kit.

2.3 COMPONENTS

2.3.1 Control Unit

Provide a [_____] [dual] channel control unit, operating over a temperature range of [_____] [0 to 51] degrees C [32 to 125] degrees F, capable of monitoring [_____] [two] detectors.

Provide a control unit housed in a [_____] [weatherproof] cabinet suitable for [_____] [wall] mounting [in a Class I, Division 1, Group [_____] location] with [_____] [solid-state] [plug-in]-type relays and solid-state rectifiers.
2.3.1.1 Control Circuits

Provide the control unit with plug-in-type circuit boards, in a housing [conforming to ECIA EIA/ECA 310-E,] suitable for [Class 1, Group [______]] [nonhazardous] locations.

2.3.1.2 Power Supply Component

Provide [a control unit with transformer, rectifier, resistors, charger, batteries, and other required power supply components incorporated] [a separate power supply unit as approved for the application].

2.3.1.3 Indicator Light and Reset

Provide the control unit with [buttons for test, and] indicator lights for Power, [Malfunction,] and Alarm. Color-code indicator lamps as follows: Power (green), [Malfunction [(yellow)] [[______],] and Alarm [[______]] [[red]]. Zero the alarm with adjustable calibration settings.

2.3.1.4 Malfunction Circuits

Ensure that sensing circuits are monitored by individual malfunction circuits. Ensure that an open circuit will activate a malfunction light and operate relays for a [remote] warning signal [and lights].

2.3.1.5 Alarm

**************************************************************************
NOTE: Exercise care to ensure that the options selected properly satisfy project requirements.
**************************************************************************

Arrange the unit to operate alarm relays, activating audible and visible alarms, and to continue operation until [[reset by a keyed switch] [silenced by a switch] [in] [on] the unit cabinet] [or] [the atmosphere returns to set conditions].

[Ensure that the reset key cannot be removed until conditions have returned to normal.] [Ensure that the cabinet is locked by the same key used to reset the alarm relays.] [Ensure that operation of the silencing switch illuminates an indicator lamp, which is plainly visible when the cabinet is closed.]

Provide an audible alarm and a [_____] [red] rotating alarm beacon [as indicated].

Provide an alarm system that can transmit individual alarms [to the basewide fire reporting system] [to security] and [to the basewide utility monitoring system].

2.3.2 Detectors

If detectors have not been previously qualified and approved for installation at this project location, submit samples of detectors for approval by the Contracting Officer.

2.3.2.1 Circuit Design

Ensure that the detector circuit design is suitable for the types and
numbers of detectors, as approved, and that the detector circuit current does not exceed ratings of the individual detectors and associated relays.

Electrically supervise the circuits to the detectors for [grounds] [opens] and [shorts].

2.3.2.2 Combustible-Gas Detector (CGD)

Provide a [_____] [diffusion] [sample draw]-type CGD [with a [_____] [catalytic] sensor] [meeting the requirements of ANSI/ISA 60079-29-1,] in a housing suitable for the environment, and intrinsically safe for use in Class I, Division 1, Group [_____] locations.

Provide a CGD that detects combustible vapors that are produced from flammable liquids such as gasoline or ethanol.

Provide a CGD with [_____] [4 to 20 mA] output signal, with an operating range of [_____] [minus 40 to 74] degrees C [minus 40 to 165] degrees F.

Provide a CGD with a visible and audible alarm that actuates at [_____] percent of lower explosive limit (LEL). [Provide a CGD that includes a prealarm that actuates at [_____] percent.]

2.3.2.3 Oxygen Detector (OD)

Provide [_____] [a paramagnetic] [an electrochemical] cell OD [meeting the requirements of CGA P-39], with a minimum shelf life of [_____] [6] months, and the following characteristics:

a. Output signal: [_____] [4 to 20 mA]

b. Operating range: [_____] [4 to 33] degrees C [40 to 90] degrees F, [_____] [10 to 100] percent relative humidity

c. Measurement: adjustable through a range of [_____] [0 to 25] percent oxygen-in-air

d. Actuation level: set at 19.5 percent oxygen

2.3.3 Power Supply

Provide a [_____] [120]-volt, 60 Hz source power supply, and an alternate source of power, arranged to become energized automatically within at least [10] [_____] seconds upon loss of normal power, in accordance with NFPA 110.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Combustible-Gas Systems

Ensure that the installation of combustible-gas detection and alarm systems complies with NFPA 70 and applicable requirements of NFPA 72 [, and [____]].

3.1.2 Oxygen Deficiency Systems

Ensure that the installation of oxygen detection and alarm systems complies with NFPA 70[ and [____]].
3.1.3  Grounding

Install grounding in accordance with NFPA 70.

3.2  FIELD QUALITY CONTROL

Conduct performance tests in accordance with ANSI/ISA 60079-29-1 [____].

Test operation of the entire system in operational and alarm modes. Activate each detector by [____] [a hydrogen gas bottle representing the adjusted Lower Flammable Limit (LFL)]. Test the malfunction feature for each control unit.

3.3  CLOSEOUT ACTIVITIES

3.3.1  Operation And Maintenance Manual

Submit [____] [four] copies of an operation and maintenance manual, giving complete instructions for the operation, inspection, testing, and maintenance of the system, including wiring diagrams and equipment malfunction checklist.

3.3.2  Warranty

Submit [3] [____] signed original warranties to the Contracting Officer.

3.3.3  Record drawings

Provide record drawings that include deviations, amendments, and concealed and visible changes in the work. When spot-type detectors are used, show by number the detectors in the exact sequence in which they are installed in the circuit.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for earthwork activities for buildings, utilities, roadways, railroads, and airfields.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Consult with a soils engineer while editing this section to determine specific requirements for each job.

The following information will be indicated on the project drawings:

1. Surface elevations, existing and new;

2. Location of underground obstructions and existing utilities;

3. Location and record of soil borings and test pits. Include ground water observations and topsoil
thickness encountered in boring, soil classifications, and properties such as moisture content and Atterberg limit determinations;

4. Location of borrow and disposal area if located on Government property;

5. Clearing stripping and grubbing limits, if different from clearing limits;

6. Areas to be seeded;

7. Hydrological data where available;

8. Shoring and sheeting required (trench protection is specified in Corps of Engineers Manual EM 385-1-1); and

10. Location and limits of hard material (rocks);

11. Details of special construction such as under railroad and highways right-of-way requirements for jacking and boring;

12. Details of sewage absorption trenches, absorption pits, and subsurface drains.

1.1 MEASUREMENT PROCEDURES

NOTE: These paragraphs will be deleted when lump sum payment for work under this section is desired and when the work covered by this section is included in one lump sum contract price for the entire work covered by the Invitation for Bids.

1.1.1 Excavation

The unit of measurement for excavation and borrow will be the cubic meter, computed by the average end area method from cross sections taken before and after the excavation and borrow operations, including the excavation for ditches, gutters, and channel changes, when the material is acceptably utilized or disposed of as herein specified. The measurements will include authorized excavation of rock (except for piping trenches that is covered below), authorized excavation of unsatisfactory subgrade soil, and the volume of loose, scattered rocks and boulders collected within the limits of the work; allowance will be made on the same basis for selected backfill ordered as replacement. The measurement will not include the volume of subgrade material or other material that is scarified or plowed and reused in-place, and will not include the volume excavated without authorization or the volume of any material used for purposes other than directed. The volume of overburden stripped from borrow pits and the volume of excavation for ditches to drain borrow pits, unless used as borrow material, will not be measured for payment. The measurement will not include the volume of any excavation performed prior to the taking of
elevations and measurements of the undisturbed grade.

1.1.2 Piping Trench Excavation

**************************************************************************
NOTE: This paragraph will be coordinated with the payment paragraphs of appropriate contract sections to ensure that there are no dual payments or omission of payment for trench excavation. There should be separate payment items established for trench excavation for each different size of pipe in the contract. Payment for trench excavation for heat-distribution system and for underground electrical-distribution system may be excluded for payment from this paragraph, and included in payment under the appropriate utility section, when the work is of such a nature and extent and so clearly indicated that the excavation quantities involved can be estimated with reasonable accuracy.
**************************************************************************

Measure trench excavation by the number of linear meters feet along the centerline of the trench and excavate to the depths and widths specified for the particular size of pipe. Replace unstable trench bottoms with a selected granular material. Include the additional width at manholes and similar structures, the furnishing, placing and removal of sheeting and bracing, pumping and bailing, and all incidentals necessary to complete the work required by this section.

1.1.3 Rock Excavation for Trenches

**************************************************************************
NOTE: Delete this paragraph when not required in the project.
**************************************************************************

Measure and pay for rock excavation by the number of cubic meters yards of acceptably excavated rock material. Measure the material in place, but base volume on a maximum 750 mm 30 inches width for pipes 300 mm 12 inches in diameter or less, and a maximum width of 400 mm 16 inches greater than the outside diameter of the pipe for pipes over 300 mm 12 inches in diameter. Provide the measurement to include all authorized overdepth rock excavation as determined by the Contracting Officer. For manholes and other appurtenances, compute volumes of rock excavation on the basis of 300 mm 1 foot outside of the wall lines of the structures.

1.1.4 Topsoil Requirements

Separate excavation, hauling, and spreading or piling of topsoil and related miscellaneous operations will be considered subsidiary obligations of the Contractor, covered under the contract unit price for excavation.

1.1.5 Overhaul Requirements

Allow the unit of measurement for overhaul to be the station-meter station-yard. The overhaul distance will be the distance in stations between the center of volume of the overhaul material in its original position and the center of volume after placing, minus the free-haul distance in stations. The haul distance will be measured along the
shortest route determined by the Contracting Officer as feasible and satisfactory. Do no measure or waste unsatisfactory materials for overhaul where the length of haul for borrow is within the free-haul limits.

1.1.6 Select Granular Material

Measure select granular material in place as the actual cubic meters yards replacing wet or unstable material in trench bottoms [within the limits shown] [in authorized overdepth areas]. Provide unit prices which include furnishing and placing the granular material, excavation and disposal of unsatisfactory material, and additional requirements for sheeting and bracing, pumping, bailing, cleaning, and other incidentals necessary to complete the work.

1.2 PAYMENT PROCEDURES

**************************************************************************

NOTE: When lump sum payment for work under this section is desired, these paragraphs will be revised accordingly. These paragraphs will be deleted when the work covered by this section is included in one lump sum contract price for the entire work covered by the Invitation for Bids. Payment for overhaul will be separate from excavation and borrow.

**************************************************************************

Payment will constitute full compensation for all labor, equipment, tools, supplies, and incidentals necessary to complete the work.

1.2.1 Classified Excavation

Classified excavation will be paid for at the contract unit prices per cubic meter yard for common or rock excavation.

1.2.2 Piping Trench Excavation

Payment for trench excavation will constitute full payment for excavation and backfilling, [including specified overdepth] except in rock or unstable trench bottoms.

1.2.3 Rock Excavation for Trenches

**************************************************************************

NOTE: Delete this paragraph when not required in the project.
**************************************************************************

Payment for rock excavation will be made in addition to the price bid for the trench excavation, and will include all necessary drilling and blasting and all incidentals necessary to excavate and dispose of the rock. Select granular material, used as backfill replacing rock excavation, will not be paid for separately, but will be included in the unit price for rock excavation.

1.2.4 Unclassified Excavation

Unclassified excavation will be paid for at the contract unit price per cubic meter yard for unclassified excavation.
1.2.5 Classified Borrow

Classified borrow will be paid for at the contract unit prices per cubic meter yard for common or rock borrow.

1.2.6 Unclassified Borrow

Unclassified borrow will be paid for at the contract unit price per cubic meter yard for unclassified borrow.

1.2.7 Authorized Overhaul

The number of station-meters station-yards of overhaul to be paid for will be the product of number of cubic meters yards of overhaul material measured in the original position, multiplied by the overhaul distance measured in stations of 100 meters feet and will be paid for at the contract unit price per station-meter station-yard for overhaul in excess of the free-haul limit as designated in paragraph DEFINITIONS.

1.2.8 Sheeting and Bracing

*************************************************************************
NOTE: Delete subparagraphs or items not required in the project.
*************************************************************************

Sheeting and bracing, when shown or authorized by the Contracting Officer to be left in place, will be paid for as follows: [____].

1.2.8.1 Timber Sheeting

Timber sheeting will be paid for as the number of board feet of lumber below finish grade measured in place prior to backfilling. Include in the measurement sheeting wasted when cut off between the finished grade and 300 mm 1 foot below the finished grade.

1.2.8.2 Steel Sheeting and Soldier Piles

*************************************************************************
NOTE: The blank will be filled with an appropriate number not greater than 1 m 3 feet. However, if the quantities of sheeting involved are anticipated to be substantial, and since the cut off steel can be sold by the Contractor as scrap, the whole part in brackets can be deleted and no payment provided for wasted cut off ends.
*************************************************************************

Steel sheeting, soldier piles, and steel bracing will be paid for according to the number of pounds of steel calculated. Calculate the steel by multiplying the measured in-place length in meters feet below finish grade by the unit weight of the section in kg per meter pounds per foot. Obtain unit weight of rolled steel sections from recognized steel manuals. [Included in the measurement sheeting wasted when cut off between the finished grade and a distance of up to [____] meters feet below the finished grade.]
1.3 CRITERIA FOR BIDDING

**************************************************************************

NOTE: For most projects, the scope of earthwork can accurately be determined. However, if earthwork is approximately known, a unit price for earth work should be provided in the Bid Schedule.

Unit-price items are multiplied by the approximated and stated quantity giving a sum that is then added to the price for the rest of the work. The result is a lump sum bid with automatic provision for payment or credit due to variations in earthwork within 15 percent of that shown and bid upon. Variations exceeding 15 percent of that shown and bid upon will become the subject of negotiations in accordance with FAR 52.211-18 Variation in Estimated Quantity.

**************************************************************************

Base bids on the following criteria:

a. Surface elevations are as indicated.

b. Pipes or other artificial obstructions, except those indicated, will not be encountered.

c. [Ground water elevations indicated by the boring log were those existing at the time subsurface investigations were made and do not necessarily represent ground water elevation at the time of construction.] [Ground water elevation is [_____] meters feet below existing surface elevation.]

d. [Ground water elevation is [_____] meters feet below existing surface elevation.]

e. [Material character is indicated by the boring logs.]

**************************************************************************

NOTE: Choose the following option if no boring information is available, or if the boring information is insufficient to permit a bidder to develop an accurate estimate of hard material or rock to be encountered. If hard material or rock is to be encountered, the following option should be modified to include a percent figure or an approximate depth at which hard material or rock will be encountered.

**************************************************************************

f. [Hard materials [and rock] [will not] [will] be encountered [in [_____] percent of the excavations] [at [_____] meter feet below existing surface elevations]].

1.4 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide
specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.5 DEFINITIONS

**************************************************************************
NOTE: Delete definitions that will not be used in
the specification text for a specific project.
**************************************************************************

1.5.1 Satisfactory Materials

**************************************************************************
NOTE: Satisfactory material will be defined in
accordance with locally available materials, design
slopes, etc., and suitable classes, based on the
gotechnical report, will be listed in the project
specification in accordance with the Unified Soil
Classification System, ASTM D2487. Maximum rock
size will be determined based on how thick the fill
is and how it is going to be accomplished. As a
rule of thumb, it should be no larger than 1/2 the
allowable lift thickness. Clay material should be
checked for expansive characteristics and this
section should be edited accordingly.
**************************************************************************

Satisfactory materials comprise any materials classified by ASTM D2487 as
GW, GP, GM, GP-GM, GW-GM, GC, GP-GC, GM-GC, SW, SP, [SM], [SW-SM], [SC],
[SW-SC], [SP-SM], [SP-SC], [CL], [ML], [CL-ML], [CH], [MH]. Satisfactory
materials for grading comprise stones less than 200 mm 8 inches, except for
fill material for pavements and railroads which comprise stones less than
75 mm 3 inches in any dimension.

1.5.2 Unsatisfactory Materials

**************************************************************************
NOTE: Unsatisfactory material will be defined in
accordance with locally available materials, design
slopes, etc., and unsuitable classes will be listed
in the project specifications in accordance with
ASTM D2487. This paragraph should be edited to
delete inapplicable materials.
**************************************************************************

Materials which do not comply with the requirements for satisfactory
materials are unsatisfactory. Unsatisfactory materials also include
man-made fills; trash; refuse; backfills from previous construction; and
material classified as satisfactory which contains root and other organic
matter or frozen material. Notify the Contracting Officer when encountering any contaminated materials.

1.5.3 Cohesionless and Cohesive Materials

**************************************************************************
NOTE: When classification will be necessary during construction, determination of grain size for classification will be specified to be made in conformance with ASTM C117 and ASTM C136/C136M.
**************************************************************************

Cohesionless materials include materials classified in ASTM D2487 as GW, GP, SW, and SP. Cohesive materials include materials classified as GC, SC, ML, CL, MH, and CH. Materials classified as GM and SM will be identified as cohesionless only when the fines are nonplastic. Perform testing, required for classifying materials, in accordance with ASTM D4318, ASTM C136/C136M and ASTM D1140.

1.5.4 Degree of Compaction

**************************************************************************
NOTE: ASTM D1557 will be used for maximum density determinations, unless soil borings indicate a gradation that may include coarse material where more than 30 percent is retained on the 19 mm 3/4 inch sieve; in that case, the Contractor will be required to use AASHTO T 180, Method D and corrected with ASTM D4718/D4718M for the maximum density determinations. The designer should determine if AASHTO T 180 is appropriate for the existing soil gradation. If maximum density cannot be determined by either method, the specification may need to require a test section and the COR to determine the number of compaction coverages and equipment type.
**************************************************************************

Degree of compaction required, except as noted in the second sentence, is expressed as a percentage of the maximum density obtained by the test procedure presented in ASTM D1557 [ASTM D698] abbreviated as a percent of laboratory maximum density. Since ASTM D1557 applies only to soils that have 30 percent or less by weight of their particles retained on the 19.0 mm 3/4 inch sieve, express the degree of compaction for material having more than 30 percent by weight of their particles retained on the 19.0 mm 3/4 inch sieve as a percentage of the maximum density in accordance with AASHTO T 180 and corrected with ASTM D4718/D4718M. To maintain the same percentage of coarse material, use the "remove and replace" procedure as described in NOTE 8 of Paragraph 7.2 in AASHTO T 180.

1.5.5 Overhaul

**************************************************************************
NOTE: This paragraph is to be deleted when the earthwork is to be paid for under a lump sum contract. The blank will be filled with the appropriate number of stations.
**************************************************************************

Overhaul is the authorized transportation of satisfactory excavation or
borrow materials in excess of the free-haul limit of [_____] stations. Overhaul is the product of the quantity of materials hauled beyond the free-haul limit, and the distance such materials are hauled beyond the free-haul limit, expressed in station meters yards.

1.5.6 Topsoil

**************************************************************************
NOTE: Additional requirements such as pH value and necessary soil conditioning, according to applicable provisions of Sections 32 92 19 through 32 92 26, should be inserted in this paragraph. The depth of the topsoil should be given in the text of the specification, preferably in this paragraph.
**************************************************************************

Material suitable for topsoils obtained from [offsite areas] [excavations] [areas indicated on the drawings] is defined as: Natural, friable soil representative of productive, well-drained soils in the area, free of subsoil, stumps, rocks larger than 25 mm one inch diameter, brush, weeds, toxic substances, and other material detrimental to plant growth. Amend topsoil pH range to obtain a pH of 5.5 to 7.

1.5.7 Hard/Unyielding Materials

**************************************************************************
NOTE: Stones should generally not exceed 75 mm 3 inches in diameter. However, pipe manufacturer's criteria, if any, should be used.
**************************************************************************

Hard/Unyielding materials comprise weathered rock, dense consolidated deposits, or conglomerate materials which are not included in the definition of "rock" with stones greater than [_____] mm inch in any dimension or as defined by the pipe manufacturer, whichever is smaller. These materials usually require the use of heavy excavation equipment, ripper teeth, or jack hammers for removal.

1.5.8 Rock

Solid homogeneous interlocking crystalline material with firmly cemented, laminated, or foliated masses or conglomerate deposits, neither of which can be removed without systematic drilling and blasting, drilling and the use of expansion jacks or feather wedges, or the use of backhoe-mounted pneumatic hole punchers or rock breakers; also large boulders, buried masonry, or concrete other than pavement exceeding [0.375] [_____] cubic meter [1/2] [_____] cubic yard in volume. Removal of hard material will not be considered rock excavation because of intermittent drilling and blasting that is performed merely to increase production.

1.5.9 Unstable Material

Unstable materials are too wet to properly support the utility pipe, conduit, or appurtenant structure.

1.5.10 Select Granular Material

**************************************************************************
NOTE: It is important to specify select material
**************************************************************************
under footings and slabs to minimize settlement and to ensure stability of a structure. Consideration should be made of the sensitivity of the structure to total and/or differential settlements related to the structural design. This is particularly true of add-on structures and structures to be founded partly on fill and partly on natural ground. For crib retaining wall, not more than 10 percent by weight of the fill material should be finer than 75 micrometers No. 200 sieve. Also, specify coefficient of permeability within the range of 0.01 to 1.0 mm per second 0.002 to 0.20 feet per minute and soil classification GW, GP, SW and SP. Indicate with cross sections or section details on the contract drawings the limits or extents of any controlled fills or backfills. Specify class of material that is acceptable in the fill or backfill giving preference to any types available at or near the site. Select appropriate values for Atterberg limits and percentage of fines and specify maximum thickness of lifts for compaction.

For piping bedding the maximum size of aggregate should be not more than 8 mm per 100 mm 1 inch per foot of pipe diameter, or 75 mm 3 inches maximum. Refer to pipe manufacturer's criteria for more stringent requirements, if any, on aggregate size and gradation.

If suitable materials for this project are limited to materials classified as GW, GP, SW, or SP, delete the bracketed sentences of this paragraph. Coordinate requirements with a geotechnical engineer. Select fill used for structures should extend a minimum of 1.5 m 5 feet outside the building foundation lines or other building elements gaining support from the fill.

1.5.10.1 General Requirements

Select granular material consist of materials classified as [GW,] [GP,] [SW,] [SP,] or [_____] by ASTM D2487 where indicated. [The liquid limit of such material must not exceed [35] [_____] percent when tested in accordance with ASTM D4318. The plasticity index must not be greater than [12] [_____] percent when tested in accordance with ASTM D4318, and not more than [35] [_____] percent by weight may be finer than 75 micrometers No. 200 sieve when tested in accordance with ASTM D1140.] [Provide a minimum coefficient of permeability of [0.01] [_____] mm per second [0.002] [_____] feet per minute when tested in accordance with ASTM D2434.]

1.5.10.2 California Bearing Ratio Values

**************************************************************************
NOTE: Where California Bearing Ratio values are needed include the following paragraph:
**************************************************************************

[Bearing Ratio: At 2.5 mm 0.1 inch penetration, provide a bearing ratio of]
[____] percent at 95 percent ASTM D1557 maximum density as determined in accordance with ASTM D1883 for a laboratory soaking period of not less than 4 days. [Provide [____] percent maximum expansion.] [Conform the combined material to the following sieve analysis:]

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 mm2-1/2 inches</td>
<td>100</td>
</tr>
<tr>
<td>4.75 mm No. 4</td>
<td>40 - 85</td>
</tr>
<tr>
<td>2.00 mm No. 10</td>
<td>20 - 80</td>
</tr>
<tr>
<td>425 µm No. 40</td>
<td>10 - 60</td>
</tr>
<tr>
<td>75 µm No. 200</td>
<td>5 - 25</td>
</tr>
</tbody>
</table>

1.5.11 Initial Backfill Material

Initial backfill consists of select granular material or satisfactory materials free from rocks [____] mm inches or larger in any dimension or free from rocks of such size as recommended by the pipe manufacturer, whichever is smaller. When the pipe is coated or wrapped for corrosion protection, free the initial backfill material of stones larger than [____] mm inches in any dimension or as recommended by the pipe manufacturer, whichever is smaller.

1.5.12 Expansive Soils

NOTE: Additional laboratory testing and analysis might be needed to better define site specific expansive soils. If expansive soils are anticipated at the construction site, this specification should be edited to ensure proper construction techniques are undertaken per UFC 3-220-01.

Expansive soils are defined as soils that have a plasticity index equal to or greater than [____] when tested in accordance with ASTM D4318.

1.5.13 Nonfrost Susceptible (NFS) Material

NOTE: Contract specifications for nonfrost-susceptible fill and backfill will follow the gradation requirements recommended in UFC 3-250-01. For fill under critical structures, materials with ML, MH, and CH classification will be specified as unsatisfactory (if at all feasible from an economic or material-availability standpoint). If such materials must be used, the specification will point out the critical nature of the materials and the control difficulties to be anticipated. Organic materials and topsoil having OL, OH, and Pt classification will not be used in fill or backfill.
Nonfrost susceptible material are a uniformly graded washed sand with a maximum particle size of [_____] mm and less than 5 percent passing the 0.075 mm No. 200 size sieve, and with not more than 3 percent by weight finer than 0.02 mm grain size.

1.5.14 Pile Supported Structure

As used herein, a structure where both the foundation and floor slab are pile supported.

1.6 SYSTEM DESCRIPTION

Subsurface soil boring logs are [shown on the drawings] [appended to the SPECIAL CONTRACT REQUIREMENTS]. The subsoil investigation report and samples of materials taken from subsurface investigations may be examined at [______]. These data represent the best subsurface information available; however, variations may exist in the subsurface between boring locations.

1.6.1 Classification of Excavation

**************************************************************************
NOTE: Inapplicable portions will be deleted. Other classifications of excavation may be utilized as required.
**************************************************************************

[No consideration will be given to the nature of the materials, and all excavation will be designated as unclassified excavation.] [Finish the specified excavation on a classified basis, in accordance with the following designations and classifications.]

1.6.1.1 Common Excavation

Include common excavation with the satisfactory removal and disposal of all materials not classified as rock excavation.

1.6.1.2 Rock Excavation

Submit notification of encountering rock in the project. Include rock excavation with blasting, excavating, grading, disposing of material classified as rock, and the satisfactory removal and disposal of boulders 1/2 cubic meter or more in volume; solid rock; rock material that is in ledges, bedded deposits, and unstratified masses, which cannot be removed without systematic drilling and blasting; firmly cemented conglomerate deposits possessing the characteristics of solid rock impossible to remove without systematic drilling and blasting; and hard materials (see Definitions). Include the removal of any concrete or masonry structures, except pavements, exceeding 1/2 cubic meter in volume that may be encountered in the work in this classification. If at any time during excavation, including excavation from borrow areas, the Contractor encounters material that may be classified as rock excavation, uncover such material and notify the Contracting Officer. Do not proceed with the excavation of this material until the Contracting Officer has classified the materials as common excavation or rock excavation and has taken cross sections as required. Failure on the part of the Contractor to uncover such material, notify the Contracting Officer, and allow ample time for classification and cross sectioning of the undisturbed surface of such material will cause the forfeiture of the Contractor's right of claim to

SECTION 31 00 00 Page 17
any classification or volume of material to be paid for other than that
allowed by the Contracting Officer for the areas of work in which such
deposits occur.

1.6.2 Blasting

[Perform blasting in accordance with EM 385-1-1 and in conformance with
Federal, State, and local safety regulations. Submit notice 15 days prior
to starting work. Submit a Blasting Plan, prepared and sealed by a
registered professional engineer that includes calculations for
overpressure and debris hazard. Provide blasting mats and use the
non-electric blasting caps. Obtain written approval prior to performing
any blasting and notify the Contracting Officer 24 hours prior to
blasting. Include provisions for storing, handling and transporting
explosives as well as for the blasting operations in the plan. The
Contractor is responsible for damage caused by blasting operations.]
[Blasting will not be permitted.]

1.6.3 Dewatering Work Plan

**************************************************************************
NOTE: Include this paragraph where water levels
will impact excavation operations.
**************************************************************************

Submit procedures for accomplishing dewatering work.

1.7 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions
in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list, and corresponding submittal
items in the text, to reflect only the submittals
required for the project. The Guide Specification
technical editors have classified those items that
require Government approval, due to their complexity
or criticality, with a "G." Generally, other
submittal items can be reviewed by the Contractor's
Quality Control System. Only add a "G" to an item,
if the submittal is sufficiently important or
complex in context of the project.

For Army projects, fill in the empty brackets
following the "G" classification, with a code of up
to three characters to indicate the approving
authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office
(Engineering Division or other organization in the
District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes
following the "G" typically are not used for Navy,
Air Force, and NASA projects.

The "S" classification indicates submittals required
as proof of compliance for sustainability Guiding
Principles Validation or Third Party Certification
and as described in Section 01 33 00 SUBMITTAL
PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
   Shoring; G[, [____]]
   Dewatering Work Plan; G[, [____]]
   Blasting; G[, [____]]

SD-03 Product Data
   Utilization of Excavated Materials; G[, [____]]

   Rock Excavation
   Opening of any Excavation or Borrow Pit
   Shoulder Construction

SD-06 Test Reports
   Testing
   Borrow Site Testing
      Within 24 hours of conclusion of physical tests, submit [____] copies of test results, including calibration curves and results of calibration tests.

SD-07 Certificates
   Testing

PART 2   PRODUCTS

2.1 REQUIREMENTS FOR OFFSITE SOILS

NOTE: Check with regional and local authorities as well as the activity to determine actual requirements of bracketed items; values shown come from the Commonwealth of Virginia. Remove this paragraph if not required by the project.

Test offsite soils brought in for use as backfill for Total Petroleum
Hydrocarbons (TPH), Benzene, Toluene, Ethyl Benzene, and Xylene (BTEX) and full Toxicity Characteristic Leaching Procedure (TCLP) including ignitability, corrosivity and reactivity. Backfill shall contain a maximum of [100] ppm of total petroleum hydrocarbons (TPH) and a maximum of [10] ppm of the sum of Benzene, Toluene, Ethyl Benzene, and Xylene (BTEX) and shall pass the TCLP test. Determine TPH concentrations by using EPA 600/4-79/020 Method 418.1. Determine BTEX concentrations by using EPA SW-846.3-3 Method 5030/8020. Perform TCLP in accordance with EPA SW-846.3-3 Method 1311. Provide Borrow Site Testing for TPH, BTEX and TCLP from a composite sample of material from the borrow site, with at least one test from each borrow site. Do not bring material onsite until tests have been approved by the Contracting Officer.

2.2 BURIED WARNING AND IDENTIFICATION TAPE

**************************************************************************
NOTE: Delete paragraph if tape is not required in the project. The use of a plastic warning tape for identification is mandatory for buried hazardous utilities such as electrical conduit, gas lines, fuel lines, high pressure nitrogen, high pressure water and steam lines, domestic sewage force mains, industrial waste force mains and industrial sewers carrying hazardous, explosive, or toxic waste. Coordinate color codes with other specification sections and conform, if possible, to local practice for identifying buried utilities.
**************************************************************************

Provide [polyethylene plastic] [and] [metallic core or metallic-faced, acid- and alkali-resistant, polyethylene plastic] warning tape manufactured specifically for warning and identification of buried utility lines. Provide tape on rolls, 75 mm 3 inches minimum width, color coded as specified below for the intended utility with warning and identification imprinted in bold black letters continuously over the entire tape length. Warning and identification to read, "CAUTION, BURIED (intended service) LINE BELOW" or similar wording. Provide permanent color and printing, unaffected by moisture or soil.

2.2.1 Warning Tape for Metallic Piping

Provide acid and alkali-resistant polyethylene plastic tape conforming to the width, color, and printing requirements specified above, with a minimum thickness of 0.08 mm 0.003 inch and a minimum strength of 10.3 MPa 1500 psi lengthwise, and 8.6 MPa 1250 psi crosswise, with a maximum 350 percent elongation.

2.2.2 Detectable Warning Tape for Non-Metallic Piping

Provide polyethylene plastic tape conforming to the width, color, and printing requirements specified above, with a minimum thickness of 0.10 mm 0.004 inch, and a minimum strength of 10.3 MPa 1500 psi lengthwise and 8.6 MPa 1250 psi crosswise. Manufacture tape with integral wires, foil backing, or other means of enabling detection by a metal detector when tape is buried up to 920 mm 3 feet deep. Encase metallic element of the tape in a protective jacket or provide with other means of corrosion protection.

2.3 DETECTION WIRE FOR NON-METALLIC PIPING

Insulate a single strand, solid copper detection wire with a minimum of 12 AWG.

2.4 MATERIAL FOR RIP-RAP

**************************************************************************
NOTE: Make sure there is no duplication of rip-rap requirements between this and other specification sections. In this paragraph refer to standard specifications for rip-rap if local specifications are satisfactory and available. Delete this paragraph or subparagraphs not required in the project.
**************************************************************************

Provide [Bedding material] [Grout] [Filter fabric] and rock conforming to [these requirements] [DOT] [SSS-[_____] State Standard] for construction indicated.

2.4.1 Bedding Material

Provide bedding material consisting of sand, gravel, or crushed rock, well graded, [or poorly graded] with a maximum particle size of 50 mm 2 inches. Compose material of tough, durable particles. Allow fines passing the 75 micrometers No. 200 standard sieve with a plasticity index less than six.

2.4.2 Grout

Provide durable grout composed of cement, water, an air-entraining admixture, and sand mixed in proportions of one part portland cement to [two] [_____] parts of sand, sufficient water to produce a workable mixture, and an amount of admixture which will entrain sufficient air, as determined by the Contracting Officer. Mix grout in a concrete mixer. Allow a sufficient mixing time to produce a mixture having a consistency permitting gravity flow into the interstices of the rip-rap with limited spading and brooming.
2.4.3  Rock

**************************************************************************
NOTE: Adjust weights in brackets to fit application. Take local practice into consideration.
**************************************************************************

Provide rock fragments sufficiently durable to ensure permanence in the structure and the environment in which it is to be used. Use rock fragments free from cracks, seams, and other defects that would increase the risk of deterioration from natural causes. Provide fragments sized so that no individual fragment exceeds a weight of [68] [_____] kg [150] [_____] pounds and that no more than 10 percent of the mixture, by weight, consists of fragments weighing 0.91 kg 2 pounds or less each. Provide rock with a minimum specific gravity of [2.50] [_____] . Do not permit the inclusion of more than trace [1 percent] [_____] quantities of dirt, sand, clay, and rock fines.

2.5  CAPILLARY WATER BARRIER

Provide capillary water barrier of clean, poorly graded crushed rock, crushed gravel, or uncrushed gravel placed beneath a building slab with or without a vapor barrier to cut off the capillary flow of pore water to the area immediately below. Conform to ASTM C33/C33M for fine aggregate grading with a maximum of 3 percent by weight passing ASTM D1140, 75 micrometers No. 200 sieve, [or] [37.5 mm 1-1/2 inch and no more than 2 percent by weight passing the 4.75 mm No. 4 size sieve] [or coarse aggregate Size 57, 67, or 77].

2.6  PIPE CASING

**************************************************************************
NOTE: Indicate, on the contract drawings, limits of right-of-way and any other site requirements or dimensions conforming to the standards of the railroad or highway owner. Where traffic can be interrupted, trenching in a pipeline casing is more economical with the same advantages of allowing future work without interruption of traffic.
**************************************************************************

2.6.1  Casing Pipe

ASTM A139/A139M, Grade B, or ASTM A252, Grade 2, smooth wall pipe. Match casing size to the outside diameter and wall thickness as indicated on Drawing Sheet No. [____]. Protective coating is not required on casing pipe.

2.6.2  Wood Supports

[Treated Yellow Pine or Douglas Fir][Locally available], rough, structural grade. Provide wood with nonleaching water-borne pressure preservative (ACA or CCA) and treatment conforming to AWPA P5. Secure wood supports to carrier pipe with stainless steel or zinc-coated steel bands.

PART 3  EXECUTION

**************************************************************************
NOTE: Coordinate requirements with Section 31 11 00
**************************************************************************
3.1 STRIPPING OF TOPSOIL

NOTE: Topsoil will be separately excavated, stored, and used for surface finish in preparation for seeding, sodding, or other planting, only where topsoil is definitely superior for grass and plant growth as compared with the remainder of the excavated material. Surface soil that is a heavy clay, predominantly sandy, or is lean in grass- and plant-growth qualities, will not be saved. The hauling, spreading, smoothing, and maintenance of the topsoil in preparation for the seeding and planting operations are generally considered under a separate section, and therefore are not considered in this specification. The blank will be filled with the appropriate depth dimension.

Where indicated or directed, strip topsoil to a depth of [100] [_____] mm [4] [_____] inches. Spread topsoil on areas already graded and prepared for topsoil, or transported and deposited in stockpiles convenient to areas that are to receive application of the topsoil later, or at locations indicated or specified. Keep topsoil separate from other excavated materials, brush, litter, objectionable weeds, roots, stones larger than 50 mm 2 inches in diameter, and other materials that would interfere with planting and maintenance operations. [Stockpile in locations indicated] [Remove from the site] any surplus of topsoil from excavations and gradings.

3.2 GENERAL EXCAVATION

Perform excavation of every type of material encountered within the limits of the project to the lines, grades, and elevations indicated and as specified. Perform the grading in accordance with the typical sections shown and the tolerances specified in paragraph FINISHING. Transport satisfactory excavated materials and place in fill or embankment within the limits of the work. Excavate unsatisfactory materials encountered within the limits of the work below grade and replace with satisfactory materials as directed. Include such excavated material and the satisfactory material ordered as replacement in excavation. Dispose surplus satisfactory excavated material not required for fill and unsatisfactory excavated material as specified in paragraph DISPOSITION OF SURPLUS MATERIAL. During construction, perform excavation and fill in a manner and sequence that will provide proper drainage at all times. Excavate material required for fill or embankment in excess of that produced by excavation within the grading limits [from the borrow areas indicated or] from other approved areas selected by the Contractor as specified.

3.2.1 Ditches, Gutters, and Channel Changes

Finish excavation of ditches, gutters, and channel changes by cutting accurately to the cross sections, grades, and elevations shown on Drawing Sheet No. [______]. Do not excavate ditches and gutters below grades shown. Backfill the excessive open ditch or gutter excavation with satisfactory, thoroughly compacted, material or with suitable stone or cobble to grades shown. Dispose excavated material as shown or as
directed, except in no case allow material be deposited a maximum 1 meter 4 feet from edge of a ditch. Maintain excavations free from detrimental quantities of leaves, brush, sticks, trash, and other debris until final acceptance of the work.

3.2.2 Drainage Structures

**************************************************************************
NOTE: The last two sentences will be removed except when pile foundations are to be used.
**************************************************************************

Make excavations to the lines, grades, and elevations shown, or as directed. Provide trenches and foundation pits of sufficient size to permit the placement and removal of forms for the full length and width of structure footings and foundations as shown. Clean rock or other hard foundation material of loose debris and cut to a firm, level, stepped, or serrated surface. Remove loose disintegrated rock and thin strata. Do not disturb the bottom of the excavation when concrete or masonry is to be placed in an excavated area. Do not excavate to the final grade level until just before the concrete or masonry is to be placed. Where pile foundations are to be used, stop the excavation of each pit at an elevation 300 mm 1 foot above the base of the footing, as specified, before piles are driven. After the pile driving has been completed, remove loose and displaced material and complete excavation, leaving a smooth, solid, undisturbed surface to receive the concrete or masonry.

3.2.3 Drainage

Provide for the collection and disposal of surface and subsurface water encountered during construction. Completely drain construction site during periods of construction to keep soil materials sufficiently dry. Construct storm drainage features (ponds/basins) at the earliest stages of site development, and throughout construction grade the construction area to provide positive surface water runoff away from the construction activity [and] [or] provide temporary ditches, swales, and other drainage features and equipment as required to maintain dry soils. When unsuitable working platforms for equipment operation and unsuitable soil support for subsequent construction features develop, remove unsuitable material and provide new soil material as specified herein. It is the responsibility of the Contractor to assess the soil and ground water conditions presented by the plans and specifications and to employ necessary measures to permit construction to proceed.

3.2.4 Dewatering

**************************************************************************
NOTE: Check depth of proposed utilities and foundations relative to the existing ground water elevation prior to editing.
**************************************************************************

Control groundwater flowing toward or into excavations to prevent sloughing of excavation slopes and walls, boils, uplift and heave in the excavation and to eliminate interference with orderly progress of construction. Do not permit French drains, sumps, ditches or trenches within 0.9 m 3 feet of the foundation of any structure, except with specific written approval, and after specific contractual provisions for restoration of the foundation area have been made. Take control measures by the time the excavation
reaches the water level in order to maintain the integrity of the in situ material. While the excavation is open, maintain the water level continuously, at least \( \text{[_____] m feet} \) below the working level. [Operate dewatering system continuously until construction work below existing water levels is complete. Submit performance records weekly.] [Measure and record performance of dewatering system at same time each day by use of observation wells or piezometers installed in conjunction with the dewatering system.] [Relieve hydrostatic head in previous zones below subgrade elevation in layered soils to prevent uplift.]

3.2.5 Trench Excavation Requirements

**************************************************************************
NOTE: The width of the trench below the top of the pipe will depend on the type of pipe used and soil conditions. The pipe manufacturer's installation manual should provide this information, and if so, it will be followed. In general, the width of trench will be 300 mm 12 inches to 600 mm 24 inches, plus pipe O.D. for smaller pipe sizes, and 600 mm 24 inches to 900 mm 36 inches plus pipe O.D. for larger pipe sizes. Sloping walls below the top of the pipe are allowed for certain types of pipe in special ground conditions.
**************************************************************************

Excavate the trench as recommended by the manufacturer of the pipe to be installed. Slope trench walls below the top of the pipe, or make vertical, and of such width as recommended in the manufacturer's printed installation manual. Provide vertical trench walls where no manufacturer's printed installation manual is available. Shore trench walls, cut back to a stable slope, or provide with equivalent means of protection for employees who may be exposed to moving ground or cave in, as determined by the Contractor's Safety Engineer or other competent person; refer to USACE publication EM 385-1-1. Excavate trench walls which are cut back to at least the angle of repose of the soil. Give special attention to slopes which may be adversely affected by weather or moisture content. Do not exceed the trench width below the pipe top of 600 mm 24 inches plus pipe outside diameter (O.D.) for pipes of less than 600 mm 24 inches inside diameter, and do not exceed 900 mm 36 inches plus pipe outside diameter for sizes larger than 600 mm 24 inches inside diameter. Where recommended trench widths are exceeded, provide redesign, stronger pipe, or special installation procedures by the Contractor. The Contractor is responsible for the cost of redesign, stronger pipe, or special installation procedures without any additional cost to the Government.

3.2.5.1 Bottom Preparation

**************************************************************************
NOTE: Stones 75 mm 3 inches or greater should be removed. However, pipe manufacturer's criteria, if any, should be used.
**************************************************************************

Grade the bottoms of trenches accurately to provide uniform bearing and support for the bottom quadrant of each section of the pipe. Excavate bell holes to the necessary size at each joint or coupling to eliminate point bearing. Remove stones of \( \text{[_____] mm inch} \) or greater in any dimension, or as recommended by the pipe manufacturer, whichever is smaller, to avoid
point bearing.

### 3.2.5.2 Removal of Unyielding Material

**NOTE:** Minimum of 100 mm 4 inches should be removed to produce a suitable cushion for the pipe.

Where [overdepth is not indicated and] unyielding material is encountered in the bottom of the trench, remove such material [_____ mm inch below the required grade and replaced with suitable materials as provided in paragraph BACKFILLING AND COMPACTION.

### 3.2.5.3 Removal of Unstable Material

Where unstable material is encountered in the bottom of the trench, remove such material to the depth directed and replace it to the proper grade with select granular material as provided in paragraph BACKFILLING AND COMPACTION. When removal of unstable material is required due to the Contractor's fault or neglect in performing the work, the Contractor is responsible for excavating the resulting material and replacing it without additional cost to the Government.

### 3.2.5.4 Excavation for Appurtenances

Provide excavation for manholes, catch-basins, inlets, or similar structures [sufficient to leave at least 300 mm 12 inches clear between the outer structure surfaces and the face of the excavation or support members.] [of sufficient size to permit the placement and removal of forms for the full length and width of structure footings and foundations as shown.] Clean rock or loose debris and cut to a firm surface either level, stepped, or serrated, as shown or as directed. Remove loose disintegrated rock and thin strata. Specify removal of unstable material. When concrete or masonry is to be placed in an excavated area, take special care not to disturb the bottom of the excavation. Do not excavate to the final grade level until just before the concrete or masonry is to be placed.

### 3.2.5.5 Jacking, Boring, and Tunneling

**NOTE:** In situations where utility lines must be installed more than 5 to 7 meters 15 to 20 feet below ground surface, through embankments, under minor roads or parking areas, or where surface conditions make it difficult or impractical to excavate open trenches, utility lines may be installed by jacking, boring, or tunneling as a Contractor option. Where operational requirements preclude installation by trenching, the use of jacking, boring, or tunneling should be specified as mandatory alternatives. This requirement will normally exist where utilities must cross railroads, highways, primary access roads and airfield pavements. Pipe and conduit smaller than 900 mm (36 inches) in diameter will normally be installed in smooth steel pipe casing. Designing engineers must coordinate with installation facility engineers to identify and validate utility crossings where
Jacking, boring, or tunneling will be specified as mandatory.

Unless otherwise indicated, provide excavation by open cut except that sections of a trench may be jacked, bored, or tunneled if, in the opinion of the Contracting Officer, the pipe, cable, or duct can be safely and properly installed and backfill can be properly compacted in such sections.

3.2.6 Underground Utilities

**NOTE: Delete this paragraph in its entirety if no known utilities or subsurface construction is located below or adjacent to work covered in this specification.**

The Contractor is responsible for movement of construction machinery and equipment over pipes and utilities during construction. [Perform work adjacent to non-Government utilities as indicated in accordance with procedures outlined by utility company.] [Excavation made with power-driven equipment is not permitted within 600 mm (2 feet) feet of known Government-owned utility or subsurface construction. For work immediately adjacent to or for excavations exposing a utility or other buried obstruction, excavate by hand. Start hand excavation on each side of the indicated obstruction and continue until the obstruction is uncovered or until clearance for the new grade is assured. Support uncovered lines or other existing work affected by the contract excavation until approval for backfill is granted by the Contracting Officer.] Report damage to utility lines or subsurface construction immediately to the Contracting Officer.

3.2.7 Structural Excavation

Ensure that footing subgrades have been inspected and approved by the Contracting Officer prior to concrete placement. Excavate to bottom of pile cap prior to placing or driving piles, unless authorized otherwise by the Contracting Officer. Backfill and compact over excavations and changes in grade due to pile driving operations to 95 percent of ASTM D698 maximum density.

3.3 SELECTION OF BORROW MATERIAL

**NOTE: Where a substantial quantity of borrow excavation is anticipated, the drawings and specifications will indicate the location or locations within the project site, and the conditions under which borrow may be obtained.**

Select borrow material to meet the requirements and conditions of the particular fill or embankment for which it is to be used. Obtain borrow material from the borrow areas [shown on Drawing Sheet No. [____]] [within the limits of the project site, selected by the Contractor] [or] [from approved private sources]. Unless otherwise provided in the contract, the Contractor is responsible for obtaining the right to procure material, pay royalties and other charges involved, and bear the expense of developing...
the sources, including rights-of-way for hauling from the owners. Borrow material from approved sources on Government-controlled land may be obtained without payment of royalties. Unless specifically provided, do not obtain borrow within the limits of the project site without prior written approval. Consider necessary clearing, grubbing, and satisfactory drainage of borrow pits and the disposal of debris thereon related operations to the borrow excavation.

3.4 OPENING AND DRAINAGE OF EXCAVATION AND BORROW PITS

**************************************************************************
Note: The first sentence will be deleted when all work covered by Invitation for Bids is to be included in one lump sum contract price.
**************************************************************************

Notify the Contracting Officer sufficiently in advance of the opening of any excavation or borrow pit or borrow areas to permit elevations and measurements of the undisturbed ground surface to be taken. Except as otherwise permitted, excavate borrow pits and other excavation areas providing adequate drainage. Transport overburden and other spoil material to designated spoil areas or otherwise dispose of as directed. Provide neatly trimmed and drained borrow pits after the excavation is completed. Ensure that excavation of any area, operation of borrow pits, or dumping of spoil material results in minimum detrimental effects on natural environmental conditions.

3.5 SHORING

3.5.1 General Requirements

**************************************************************************
Note: Include this paragraph when scope of work requires excavations which are greater than 1.5 m 5 feet or where it is known that in-situ soils lack the stability to hold near vertical faces. Where sufficient room is available, the Contractor may slope back trench walls rather than having to use a shoring system. However, the Contractor should not be given the opportunity to slope the faces of excavations in lieu of providing shoring unless all the following conditions are met:

1. The excavation is less than 6 m 20 feet in depth.

2. There are no adjacent structures, roads, or pavements that will affect the excavation.

3. No equipment, stored material, or overlying material will affect the excavation.

4. Vibration from equipment, traffic, or blasting will not affect the excavation.

5. There will be no ground water problems.

6. Surcharges will not affect the excavation.

7. Station operational considerations permit laying
back the slopes of the excavation.

Submit a Shoring and Sheetin g plan for approval 15 days prior to starting work. Submit drawings and calculations, certified by a registered professional engineer, describing the methods for shoring and sheeting of excavations. Finish shoring, including sheet piling, and install as necessary to protect workmen, banks, adjacent paving, structures, and utilities. Remove shoring, bracing, and sheeting as excavations are backfilled, in a manner to prevent caving.

3.5.2 Geotechnical Engineer

NOTE: Where site conditions require extensive monitoring of excavations and water levels include the following requirement.

Hire a Professional Geotechnical Engineer to provide inspection of excavations and soil/groundwater conditions throughout construction. The Geotechnical Engineer is responsible for performing pre-construction and periodic site visits throughout construction to assess site conditions. The Geotechnical Engineer is responsible for updating the excavation, sheeting and dewatering plans as construction progresses to reflect changing conditions and submit an updated plan if necessary. Submit a monthly written report, informing the Contractor and Contracting Officer of the status of the plan and an accounting of the Contractor's adherence to the plan addressing any present or potential problems. The Contracting Officer is responsible for arranging meetings with the Geotechnical Engineer at any time throughout the contract duration.

3.6 GRADING AREAS

NOTE: When spoil areas or borrow areas are within the limits of Government-controlled land, additional requirements based on the following, and as appropriate for the project, will be included in the contract document. Locations of areas will be indicated, or the approximate distances from the project site will be specified. Generally, unburned vegetative material and surplus excavated material will be disposed of in inconspicuous spoil areas where no future construction is planned. If economically justifiable, surplus suitable excavated material may be stockpiled or may be disposed of in areas where future construction is planned and where fill will be required. Spoil materials will be so placed and the worked portions of spoil areas and borrow areas will be so graded and shaped as to minimize soil erosion, siltation of drainage channels, and damage to existing vegetation. The degree of compaction will be specified.

Where indicated, divide work into grading areas within which satisfactory excavated material will be placed in embankments, fills, and required backfills. Do not haul satisfactory material excavated in one grading area.
to another grading area except when so directed in writing. Place and grade stockpiles of satisfactory [and unsatisfactory] [and wasted materials] as specified. Keep stockpiles in a neat and well drained condition, giving due consideration to drainage at all times. Clear, grub, and seal by rubber-tired equipment, the ground surface at stockpile locations; separately stockpile excavated satisfactory and unsatisfactory materials. Protect stockpiles of satisfactory materials from contamination which may destroy the quality and fitness of the stockpiled material. If the Contractor fails to protect the stockpiles, and any material becomes unsatisfactory, remove and replace such material with satisfactory material from approved sources.

3.7 FINAL GRADE OF SURFACES TO SUPPORT CONCRETE

Do not excavate to final grade until just before concrete is to be placed. [For pile foundations, stop the excavation at an elevation of from 150 to 300 mm 6 to 12 inches above the bottom of the footing before driving piles. After pile driving has been completed, complete the remainder of the excavation to the elevations shown.] Only use excavation methods that will leave the foundation rock in a solid and unshattered condition. Roughen the level surfaces, and cut the sloped surfaces, as indicated, into rough steps or benches to provide a satisfactory bond. Protect shales from slaking and all surfaces from erosion resulting from ponding or water flow.

3.8 GROUND SURFACE PREPARATION

3.8.1 General Requirements

Remove and replace unsatisfactory material with satisfactory materials, as directed by the Contracting Officer, in surfaces to receive fill or in excavated areas. Scarify the surface to a depth of 150 mm 6 inches before the fill is started. Plow, step, bench, or break up sloped surfaces steeper than 1 vertical to 4 horizontal so that the fill material will bond with the existing material. When subgrades are less than the specified density, break up the ground surface to a minimum depth of 150 mm 6 inches, pulverizing, and compacting to the specified density. When the subgrade is part fill and part excavation or natural ground, scarify the excavated or natural ground portion to a depth of 300 mm 12 inches and compact it as specified for the adjacent fill.

3.8.2 Frozen Material

Do not place material on surfaces that are muddy, frozen, or contain frost. Finish compaction by sheepfoot rollers, pneumatic-tired rollers, steel-wheeled rollers, or other approved equipment well suited to the soil being compacted. Moisten material as necessary [to plus or minus [_____] percent of optimum moisture] [to provide the moisture content that will readily facilitate obtaining the specified compaction with the equipment used].

3.9 UTILIZATION OF EXCAVATED MATERIALS

**************************************************************************
NOTE: Specifications covering excavated materials authorized to be wasted will usually include the provision that the surface and side slopes formed from such material be shaped and sloped so as to provide for drainage and for later seeding and mowing operations.

SECTION 31 00 00  Page 30
Use satisfactory material removed from excavations, insofar as practicable, in the construction of fills, embankments, subgrades, shoulders, bedding (as backfill), and for similar purposes. Submit procedure and location for disposal of unused satisfactory material. Dispose surplus satisfactory excavated material not required for fill and unsatisfactory excavated material as specified in paragraph DISPOSITION OF SURPLUS MATERIAL. Stockpile and use coarse rock from excavations for constructing slopes or embankments adjacent to streams, or sides and bottoms of channels and for protecting against erosion. Do not dispose excavated material to obstruct the flow of any stream, endanger a partly finished structure, impair the efficiency or appearance of any structure, or be detrimental to the completed work in any way.

3.10 BURIED TAPE AND DETECTION WIRE

3.10.1 Buried Warning and Identification Tape

Provide buried utility lines with utility identification tape. Bury tape 300 mm 12 inches below finished grade; under pavements and slabs, bury tape 150 mm 6 inches below top of subgrade.

3.10.2 Buried Detection Wire

Bury detection wire directly above non-metallic piping at a distance not to exceed 300 mm 12 inches above the top of pipe. Extend the wire continuously and unbroken, from manhole to manhole. Terminate the ends of the wire inside the manholes at each end of the pipe, with a minimum of 0.9 m 3 feet of wire, coiled, remaining accessible in each manhole. Furnish insulated wire over its entire length. Install wires at manholes between the top of the corbel and the frame, and extend up through the chimney seal between the frame and the chimney seal. For force mains, terminate the wire in the valve pit at the pump station end of the pipe.

3.11 FILLING, BACKFILLING AND COMPACTION

NOTE: It is imperative to specify a high degree of compaction in fills under structures to minimize settlement and to insure stability of a structure. In addition to the criteria set forth in UFC 3-220-01, the following factors will be considered in establishing the specific requirements:

a. The sensitivity of the structure to total and/or differential settlement as related to the structural design. This is particularly true of structures to be founded partly on fill and partly on natural ground.

b. The ability of normal compaction equipment to produce the desired densities in existing or locally available materials within a reasonable range of molding moisture content. If considered essential, special equipment will be specified.

c. The compaction requirements for clean, cohesionless, granular materials will be generally
higher than those for cohesive materials because cohesionless materials readily consolidate when subjected to vibration. For structures with critical stability requirements and settlement limitations, the minimum density requirements may be altered. If only a cohesionless soil or only a cohesive soil is used, the inapplicable values will be deleted.

d. The exception to required high degree of compaction in fills and backfills is in expansive soils (see UFC 3-220-01). Where it is necessary to use materials having swelling characteristics, usually CL or CH classifications, the specified degree of compaction will be related to laboratory test results for swelling under a considerable range of molding moisture and compactive effort. In swelling soils, it is important to specify a density and molding moisture range that will enable the soil to stay stable, striking a reasonable balance between potential swell and excessive settlement under load, even at the expense of accepting a reduced bearing capacity. A maximum permissible density should be established to minimize swelling. If possible, soils with swelling characteristics will be classified as unsatisfactory material, particularly under critical stability structures.

e. ASTM D1557 is satisfactory for establishing moisture density characteristics of a material in most cases. However, other modifications may be necessary as discussed in this ASTM and under soil tests in DM 21.3/ UFC 3-260-02. The procedures and precautions in the subgrade compaction paragraphs of DM 21.3/UFC 3-260-02, will be considered in establishing minimum density requirements for a particular project.

Modifications will be made to meet the backfill requirements for deep-seated or subsurface structures as discussed in UFC 3-220-04FA.

Place fill and backfill beneath and adjacent to any and all type of structures, in successive horizontal layers of loose material not more than 200 mm 8 inches in depth, or in loose layers not more than 125 mm 5 inches in depth when using hand-operated compaction equipment. Compact to at least 90 percent of laboratory maximum density for cohesive materials or 95 percent of laboratory maximum density for cohesionless materials, except as otherwise specified. Perform compaction in such a manner as to prevent wedging action or eccentric loading upon or against the structure. Moisture condition fill and backfill material to [a moisture content that will readily facilitate obtaining the specified compaction] [within range of +2 or -2 percent of optimum moisture content at the time of compaction].

Prepare ground surface on which backfill is to be placed and provide compaction requirements for backfill materials in conformance with the applicable portions of paragraphs GROUND SURFACE PREPARATION. Finish compaction by sheepsfoot rollers, pneumatic-tired rollers, steel-wheeled
rollers, vibratory compactors, or other approved equipment.

3.11.1 Trench Backfill

**************************************************************************
NOTE: Most pressure tests require backfilling to at least 600 mm 2 feet over the pipe with the joints and couplings left open for inspection.
**************************************************************************

Backfill trenches to the grade shown. [Backfill the trench to [_____] meters feet above the top of pipe prior to performing the required pressure tests. Leave the joints and couplings uncovered during the pressure test.] [Do not backfill the trench until all specified tests are performed.]

3.11.1.1 Replacement of Unyielding Material

Replace unyielding material removed from the bottom of the trench with select granular material or initial backfill material.

3.11.1.2 Replacement of Unstable Material

Replace unstable material removed from the bottom of the trench or excavation with select granular material placed in layers not exceeding 150 mm 6 inches loose thickness.

3.11.1.3 Bedding and Initial Backfill

**************************************************************************
NOTE: Bedding is provided to level out any irregularities in the foundation and to assure uniform support along the barrel of each pipe section. Bedding is also constructed to distribute the load bearing reaction, due to the weight of the backfill material, around the lower portion of the pipe. If the pipe or conduit is placed directly on a flat or shaped foundation, delete "bedding" from the title and from any reference in the paragraph. If bedding will be specified, determine type and thickness and show on the plans. Specify compaction to 95 percent maximum density for cohesionless soils, and 90 percent maximum density for cohesive soils.

Any locally available fine aggregate for concrete or asphalt mixtures will qualify as sand and may be specified by local gradation and specification number in lieu of "SW" or "SP." Drawings (details) should clearly show where sand backfill or bedding is required.

Locally available coarse aggregate for concrete will suffice and may be specified by local gradation and specification number in lieu of "GW" or "GP." Maximum size of aggregate should not be more than 25 mm per 300 mm one inch per foot of pipe diameter or 75 mm 3 inches maximum. Refer to pipe manufacturer's criteria for more stringent requirements, if any, on aggregate size and density.
gradation. On drawings (details), clearly show where gravel backfill or bedding is required.

[Provide bedding of the type and thickness shown.] Place initial backfill material and compact it with approved tampers to a height of at least 300 mm one foot above the utility pipe or conduit. Bring up the backfill evenly on both sides of the pipe for the full length of the pipe. Take care to ensure thorough compaction of the fill under the haunches of the pipe. Except as specified otherwise in the individual piping section, provide bedding for buried piping in accordance with AWWA C600, Type 4, except as specified herein. Compact backfill to top of pipe to 95 percent of ASTM D698 maximum density. Provide plastic piping with bedding to spring line of pipe. Provide materials as follows:

3.11.1.3.1 Class I

Angular, 6 to 40 mm 0.25 to 1.5 inch, graded stone, including a number of fill materials that have regional significance such as coral, slag, cinders, crushed stone, and crushed shells.

3.11.1.3.2 Class II

Coarse sands and gravels with maximum particle size of 40 mm 1.5 inch, including various graded sands and gravels containing small percentages of fines, generally granular and noncohesive, either wet or dry. Soil Types GW, GP, SW, and SP are included in this class as specified in ASTM D2487.

3.11.1.3.3 Sand

Clean, coarse-grained sand classified as [_____] in accordance with Section 31 23 00.00 20 EXCAVATION AND FILL, [gradation [_____] of the [DOT] [State Standard] or [SW] [or] [SP] by ASTM D2487 for [bedding] [and] [backfill] [as indicated]].

3.11.1.3.4 Gravel and Crushed Stone

Clean, coarsely graded natural gravel, crushed stone or a combination thereof identified as [_____] in accordance with Section 31 23 00.00 20 EXCAVATION AND FILL, [gradation [_____] of the [DOT] [State Standard] or having a classification of [GW] [GP] in accordance with ASTM D2487 for [bedding] [and] [backfill] [as indicated]. [Do not exceed maximum particle size of [75] [_____] mm [3] [_____] inches.]

3.11.1.4 Final Backfill

Fill the remainder of the trench, except for special materials for roadways, railroads and airfields, with satisfactory material. Place backfill material and compact as follows:

3.11.1.4.1 Roadways, Railroads, and Airfields

Place backfill up to the required elevation as specified. Do not permit water flooding or jetting methods of compaction.

3.11.1.4.2 Sidewalks, Turfed or Seeded Areas and Miscellaneous Areas

Deposit backfill in layers of a maximum of 300 mm 12 inches loose thickness, and compact it to 85 percent maximum density for cohesive soils.
and 90 percent maximum density for cohesionless soils. [Allow water flooding or jetting methods of compaction for granular noncohesive backfill material. Do not allow water jetting to penetrate the initial backfill.] [Do not permit compaction by water flooding or jetting.] Apply this requirement to all other areas not specifically designated above.

3.11.2 Backfill for Appurtenances

**************************************************************************
NOTE: The number of days the concrete is allowed to cure before backfilling the structure will depend on the type of mix and the concrete strength requirements specified. Three days would be considered as a minimum.
**************************************************************************

After the manhole, catchbasin, inlet, or similar structure has been constructed [and the concrete has been allowed to cure for [_____] days], place backfill in such a manner that the structure is not be damaged by the shock of falling earth. Deposit the backfill material, compact it as specified for final backfill, and bring up the backfill evenly on all sides of the structure to prevent eccentric loading and excessive stress.

3.12 SPECIAL REQUIREMENTS

Special requirements for both excavation and backfill relating to the specific utilities are as follows:

3.12.1 Gas Distribution

Excavate trenches to a depth that will provide a minimum 450 mm 18 inches of cover in rock excavation and a minimum 600 mm 24 inch of cover in other excavation.

3.12.2 Water Lines

**************************************************************************
NOTE: Minimum depth of cover will be that required for frost penetration in the region and for safe operation of the utility. For fire protection yard mains, reference is made to NFPA 24 for recommended depth of cover.
**************************************************************************

Excavate trenches to a depth that provides a minimum cover of [_____] meters feet from the existing ground surface, or from the indicated finished grade, whichever is lower, to the top of the pipe. [For fire protection yard mains or piping, an additional [_____] mm inch of cover is required.]

3.12.3 Heat Distribution System

Free initial backfill material of stones larger than 6.3 mm 1/4 inch in any dimension.

3.12.4 Electrical Distribution System

Provide a minimum cover of 600 mm 24 inches from the finished grade to direct burial cable and conduit or duct line, unless otherwise indicated.
3.12.5 Sewage Absorption Trenches or Pits

NOTE: Delete these paragraphs when sewage absorption trenches or pits are not included in the project. Consult a geotechnical engineer and local standards in selecting bracketed information.

3.12.5.1 Porous Fill

Provide backfill material consisting of clean crushed rock or gravel having a gradation (such that 100 percent passes the 50 mm 2 inch sieve and zero percent passes the 12.5 mm 1/2 inch sieve) (conforming to the requirements of gradation [4.75 mm] [No. 4] [_____] for coarse aggregate in ASTM C33/C33M.)

3.12.5.2 Cover

NOTE: Select appropriate bracketed information to correspond to the design indicated on the drawings.

[Filter fabric] [Concrete] [Kraft paper conforming to CID A-A-203, Grade B, No. 2, 22.7 kg 50 pound weight] [or a layer of straw at least 50 mm 2 inches thick] as indicated.

3.12.6 Pipeline Casing

Provide new smooth wall steel pipeline casing under [new] [existing] [railroad] [and] [pavement] [in a trench] [by the boring and jacking method of installation]. Provide each new pipeline casing, where indicated and to the lengths and dimensions shown, complete and suitable for use with the new piped utility as indicated. [Install pipeline casing by dry boring and jacking method as follows:]

3.12.6.1 Bore Holes

Mechanically bore holes and case through the soil with a cutting head on a continuous auger mounted inside the casing pipe. Weld lengths of pipe together in accordance with AWS D1.1/D1.1M. Do not use water or other fluids in connection with the boring operation.

3.12.6.2 Cleaning

Clean inside of the pipeline casing of dirt, weld splatters, and other foreign matter which would interfere with insertion of the piped utilities by attaching a pipe cleaning plug to the boring rig and passing it through the pipe.

3.12.6.3 End Seals

After installation of piped utilities in pipeline casing, provide watertight end seals at each end of pipeline casing between pipeline casing and piping utilities. Provide watertight [end seals as indicated.] [segmented elastomeric end seals.]
3.12.7 Rip-Rap Construction

**************************************************************************
NOTE: Select information in brackets to best describe rip-rap construction. Provide detail or typical section through rip-rap on drawings as well as all dimensions necessary for estimating and construction. If DOT standard specifications are referenced for rip-rap construction, paragraphs entitled "Preparation" through "Grouting" may be deleted.
**************************************************************************

Construct rip-rap [on bedding material] [on filter fabric] [with grout] [in accordance with [DOT] [_____] State Standard, paragraph [_____] in the areas indicated. Trim and dress indicated areas to conform to cross sections, lines and grades shown within a tolerance of 30 mm 0.1 foot.

3.12.7.1 Bedding Placement

Spread [filter fabric] bedding material uniformly to a thickness of at least [75] [_____] mm [3] [_____] inches on prepared subgrade as indicated. [Compaction of bedding is not required. Finish bedding to present even surface free from mounds and windrows.]

3.12.7.2 Stone Placement

Place rock for rip-rap on prepared bedding material to produce a well graded mass with the minimum practicable percentage of voids in conformance with lines and grades indicated. Distribute larger rock fragments, with dimensions extending the full depth of the rip-rap throughout the entire mass and eliminate "pockets" of small rock fragments. Rearrange individual pieces by mechanical equipment or by hand as necessary to obtain the distribution of fragment sizes specified above. [For grouted rip-rap, hand-place surface rock with open joints to facilitate grouting and do not fill smaller spaces between surface rock with finer material. Provide at least one "weep hole" through grouted rip-rap for every 4.65 square meters 50 square feet of finished surface. Provide weep holes with columns of bedding material, 100 mm 4 inches in diameter, extending up to the rip-rap surface without grout.]

3.12.7.3 Grouting

[Prior to grouting, wet rip-rap surfaces. Grout rip-rap in successive longitudinal strips, approximately 3 m 10 feet in width, commencing at the lowest strip and working up the slope. Distribute grout to place of final deposit and work into place between stones with brooms, spades, trowels, or vibrating equipment. Take precautions to prevent grout from penetrating bedding layer. Protect and cure surface for a minimum of 7 days.]

3.13 EMBANKMENTS

3.13.1 Earth Embankments

**************************************************************************
NOTE: Moisture content limits for compaction should be included in these paragraphs when necessary for obtaining strength and stability in embankments and fill, for controlling movement of expansive soils
**************************************************************************
and when, in the opinion of the project geotechnical engineer, moisture control is required for the soils being used.

Construct earth embankments from satisfactory materials free of organic or frozen material and rocks with any dimension greater than 75 mm 3 inches. Place the material in successive horizontal layers of loose material not more than 200 mm 8 inches in depth. Spread each layer uniformly on a soil surface that has been moistened or aerated as necessary, and scarified or otherwise broken up so that the fill will bond with the surface on which it is placed. After spreading, plow, disk, or otherwise break up each layer; moisten or aerate as necessary; thoroughly mix; and compact to at least 90 percent laboratory maximum density for cohesive materials or 95 percent laboratory maximum density for cohesionless materials. Backfill and fill material must be [within the range of -2 to +2 percent of optimum moisture] to a moisture content that will readily facilitate obtaining the specified compaction.

Compaction requirements for the upper portion of earth embankments forming subgrade for pavements are identical with those requirements specified in paragraph SUBGRADE PREPARATION. Finish compaction by sheepsfoot rollers, pneumatic-tired rollers, steel-wheeled rollers, vibratory compactors, or other approved equipment.

3.13.2 Rock Embankments

NOTE: The designer will determine the appropriate values for all blank spaces, except the last one, on the basis of recent experience on similar construction or of test results obtained from construction and testing of a test section. The specific method by which density will be determined in the laboratory and measured in the field will be described in the project specification. The total thickness of the pavement structure, including select material subbase, base, and pavement will be placed in the last blank space in this paragraph.

The first blank space applies to rock fill of small maximum dimension and maximum lift placement of 200 to 250 mm 8 to 10 inches. Coordinate maximum size with satisfactory material definition. If it is necessary to use larger rock and thicker lifts, the second expression in brackets is applicable. When thicker lifts are used, it may be necessary to specify a minimum number of passes of the compactor. Delete last sentence, unless the rock excavation is engineered to be used under pavements with sufficient fines to prevent consolidation of the embankment.

Construct rock embankments from material classified as rock excavation, as defined above, placed in successive horizontal layers of loose material not more than [_____] mm inch in depth. Do not use pieces of rock larger than [_____] mm inch in the greatest dimension. Spread each layer of material uniformly, completely saturate, and compact to a minimum density of [_____]
Adequately bond each successive layer of material to the material on which it is placed. Finish compaction with vibratory compactors weighing at least [_____] metric tons, heavy rubber-tired rollers weighing at least [_____] metric tons, or steel-wheeled rollers weighing at least [_____] metric tons. [Do not use rock excavation as fill material for the construction of pavements.] [In embankments on which pavements are to be constructed, do not use rock above a point [_____] mm inch below the surface of the pavement.]

3.14 SUBGRADE PREPARATION

3.14.1 Proof Rolling

**************************************************************************
NOTE: Specify proof rolling when the quality of the existing subgrade is questionable. Proof rolling can be used to verify that no unsatisfactory material is present (no bid quantity required, location shown or specified) or to locate suspected unsatisfactory material (indicate a bid quantity to be removed). Remove this paragraph if not required in the project.
**************************************************************************

Finish proof rolling on an exposed subgrade free of surface water (wet conditions resulting from rainfall) which would promote degradation of an otherwise acceptable subgrade. [After stripping,] proof roll the existing subgrade of the [_____] with six passes of a [dump truck loaded with 6 cubic meters 4 cubic yards of soil] [13.6 meter tons 15 ton, pneumatic-tired roller.] Operate the [roller] [truck] in a systematic manner to ensure the number of passes over all areas, and at speeds between 4 to 5.5 km/hour 2-1/2 to 3-1/2 mph. [When proof rolling, provide one-half of the passes made with the roller in a direction perpendicular to the other passes.] Notify the Contracting Officer a minimum of 3 days prior to proof rolling. Perform proof rolling in the presence of the Contracting Officer. Undercut rutting or pumping of material [as directed by the Contracting Officer] [to a depth of [_____] mm inch] and replace with [fill and backfill] [select] material. [Prepare bids based on replacing approximately [_____] square meters square yards, with an average depth of [_____] mm inch at various locations.]

3.14.2 Construction

**************************************************************************
NOTE: Moisture content limits for compaction should be included in these paragraphs when necessary for obtaining strength and stability in embankments and fill, for controlling movement of expansive soils and when, in the opinion of the project geotechnical engineer, moisture control is required for the soils being used.

Special smoothness tolerances are not required for subgrades for railroads; therefore, both sets of brackets will be removed when writing specifications for preparation of railroad subgrade only. When writing specifications for preparation of roadway and/or airfield pavement subgrade, the brackets will be removed from the applicable sentences and the
smoothness tolerances showing permissible deviations in fractions of a millimeter inch and the length of straightedge in meters feet will be inserted in the blanks as appropriate.

Shape subgrade to line, grade, and cross section, and compact as specified. Include plowing, disk ing, and any moistening or aerating required to obtain specified compaction for this operation. Remove soft or otherwise unsatisfactory material and replace with satisfactory excavated material or other approved material as directed. Excavate rock encountered in the cut section to a depth of 150 mm 6 inches below finished grade for the subgrade. Bring up low areas resulting from removal of unsatisfactory material or excavation of rock to required grade with satisfactory materials, and shape the entire subgrade to line, grade, and cross section and compact as specified. [After rolling, the surface of the subgrade for roadways shall not show deviations greater than 13 mm 1/2 inch when tested with a 4 m 12-foot straightedge applied both parallel and at right angles to the centerline of the area.] [After rolling, do not show deviations for the surface of the subgrade for airfields greater than [_____] mm inch when tested with a [_____] meter foot straightedge applied both parallel and at right angles to the centerline of the area.] Do not vary the elevation of the finish subgrade more than 15 mm 0.05 foot from the established grade and cross section.

3.14.3 Compaction

NOTE: Use 90 percent of ASTM D698 or ASTM D1557 for General Site Compaction of cohesionless materials on Army projects and 85 percent of same for Navy projects. For Army projects see UFC 3-220-01, UFC 3-260-02 and DM 21.3 for criteria and design guidelines. Specify most jobs using ASTM D698 compaction, except for roads, airfields, and other heavily loaded areas, which should use ASTM D1557 compaction. Specify compaction in terms of one compaction effort (ASTM D698 or ASTM D1557), if possible.

Finish compaction by sheep'sfoot rollers, pneumatic-tired rollers, steel-wheeled rollers, vibratory compactors, or other approved equipment. Except for paved areas and railroads, compact each layer of the embankment to at least [_____] percent of laboratory maximum density.

3.14.3.1 Subgrade for Railroads

Compact subgrade for railroads to at least 90 percent laboratory maximum density for cohesive materials or 95 percent laboratory maximum density for cohesionless materials.

3.14.3.2 Subgrade for Pavements

NOTE: If the compaction requirements are not shown in tabular form on the drawings, and the paragraphs as written are not adequate, paragraphs Subgrade for Pavements and Subgrade for Shoulders will be
rewritten as follows:

Subgrade for [pavements] [and] [shoulders] shall be compacted to at least the percentage of laboratory maximum density in the following table for the specific depths below the surface of the [pavement] [or] [shoulders] shown.

<table>
<thead>
<tr>
<th>Depth Below Pavement or Shoulder Surface (mm Inch)</th>
<th>Fill</th>
<th>Cut</th>
</tr>
</thead>
<tbody>
<tr>
<td>From To Cohesive Materials Cohesionless Materials</td>
<td>Cohesive Materials Cohesionless Materials</td>
<td></td>
</tr>
</tbody>
</table>

The desired depths and density percentages will be entered in the table in accordance with applicable data from the following manuals, as appropriate: UFC 3-250-01 and UFC-3-260-02.

Compact subgrade for pavements to at least [_____] percentage laboratory maximum density for the depth below the surface of the pavement shown. When more than one soil classification is present in the subgrade, thoroughly blend, reshape, and compact the top [_____] mm inch of subgrade.

3.14.3.3 Subgrade for Shoulders

Compact subgrade for shoulders to at least [_____] percentage laboratory maximum density for the [depth below the surface of shoulder shown] [full depth of the shoulder].

3.14.3.4 Subgrade for Airfield Pavements

Compact top 600 mm 24 inches below finished pavement or top 300 mm 12 inches of subgrades, whichever is greater, to [100] [_____] percent of ASTM D1557; compact fill and backfill material to [100] [_____] percent of ASTM D1557.

3.15 SHOULDER CONSTRUCTION

NOTE: Shoulder construction will form a part of the work to be performed under this section of the specifications except when shoulder construction is specified under the subbase, base-course, wearing course, or pavement sections of the specifications and is designated in the contract to be performed and paid for under one of these sections.

Construct shoulders of satisfactory excavated or borrow material or as otherwise shown or specified. Submit advanced notice on shoulder construction for rigid pavements. Construct shoulders immediately after adjacent paving is complete. In the case of rigid pavements, do not construct shoulders until permission of the Contracting Officer has been obtained. Compact the entire shoulder area to at least the percentage of
maximum density as specified in paragraph SUBGRADE PREPARATION above, for specific ranges of depth below the surface of the shoulder. Finish compaction by sheepsfoot rollers, pneumatic-tired rollers, steel-wheeled rollers, vibratory compactors, or other approved equipment. Finish shoulder construction in proper sequence in such a manner that adjacent ditches will be drained effectively and that no damage of any kind is done to the adjacent completed pavement. Align the completed shoulders true to grade and shaped to drain in conformity with the cross section shown.

3.16 FINISHING

Finish the surface of excavations, embankments, and subgrades to a smooth and compact surface in accordance with the lines, grades, and cross sections or elevations shown. Provide the degree of finish for graded areas within 30 mm 0.1 foot of the grades and elevations indicated except that the degree of finish for subgrades specified in paragraph SUBGRADE PREPARATION. Finish gutters and ditches in a manner that will result in effective drainage. Finish the surface of areas to be turfed to a smoothness suitable for the application of turfing materials. Repair graded, topsoiled, or backfilled areas prior to acceptance of the work, and re-established grades to the required elevations and slopes.

3.16.1 Subgrade and Embankments

During construction, keep embankments and excavations shaped and drained. Maintain ditches and drains along subgrade to drain effectively at all times. Do not disturb the finished subgrade by traffic or other operation. Protect and maintain the finished subgrade in a satisfactory condition until ballast, subbase, base, or pavement is placed. Do not permit the storage or stockpiling of materials on the finished subgrade. Do not lay subbase, base course, ballast, or pavement until the subgrade has been checked and approved, and in no case place subbase, base, surfacing, pavement, or ballast on a muddy, spongy, or frozen subgrade.

3.16.2 Capillary Water Barrier

************************************************************************************
NOTE: The compacted thickness of capillary water barrier will be indicated and will not be less than 100 mm 4 inches. The paragraph will be deleted where site conditions make the barrier unnecessary.
************************************************************************************

Place a capillary water barrier under concrete floor and area-way slabs grade directly on the subgrade and compact with a minimum of two passes of a hand-operated plate-type vibratory compactor.

3.16.3 Grading Around Structures

Construct areas within 1.5 m 5 feet outside of each building and structure line true-to-grade, shape to drain, and maintain free of trash and debris until final inspection has been completed and the work has been accepted.

3.17 PLACING TOPSOIL

************************************************************************************
NOTE: Topsoil will be separated, excavated, stored, and used for surface finish in preparation for seeding, sodding, or other planting only where the

SECTION 31 00 00 Page 42
Topsoil is definitely superior for grass and other plant growth as compared to the balance of the excavated materials. Generally, topsoil will be spread after other operations have been completed. When topsoil spreading is covered under a separate section of the specifications, this paragraph will be deleted.

On areas to receive topsoil, prepare the compacted subgrade soil to a depth of 50 mm (2 inches) for bonding of topsoil with subsoil. Spread topsoil evenly to a thickness of [_____] mm inch and grade to the elevations and slopes shown. Do not spread topsoil when frozen or excessively wet or dry. Obtain material required for topsoil in excess of that produced by excavation within the grading limits from [offsite areas] [areas indicated].

3.18 TESTING

NOTE: Density tests other than those specified in this paragraph may be required for certain types of soil, in which case paragraph "Degree of Compaction" will be edited accordingly and the laboratory compaction requirement applicable to the soil encountered will be specified. See UFC 3-250-02 for a discussion of conditions requiring nonstandard compaction control tests.

Perform testing by a Corps validated commercial testing laboratory or the Contractor's validated testing facility. Submit qualifications of the Corps validated commercial testing laboratory or the Contractor's validated testing facilities. If the Contractor elects to establish testing facilities, do not permit work requiring testing until the Contractor's facilities have been inspected, Corps validated and approved by the Contracting Officer.

a. Determine field in-place density in accordance with [ASTM D1556/D1556M] [ASTM D2167] [ASTM D6938]. [When ASTM D6938 is used, check the calibration curves and adjust using only the sand cone method as described in ASTM D1556/D1556M. ASTM D6938 results in a wet unit weight of soil in determining the moisture content of the soil when using this method.]

b. Check the calibration curves furnished with the moisture gauges along with density calibration checks as described in ASTM D6938; check the calibration of both the density and moisture gauges at the beginning of a job on each different type of material encountered and at intervals as directed by the Contracting Officer.] [ASTM D2937, use the Drive Cylinder Method only for soft, fine-grained, cohesive soils.] When test results indicate, as determined by the Contracting Officer, that compaction is not as specified, remove the material, replace and recompact to meet specification requirements.

c. Perform tests on recompacted areas to determine conformance with specification requirements. Appoint a registered professional civil engineer to certify inspections and test results. These certifications shall state that the tests and observations were performed by or under the direct supervision of the engineer and that the results are
representative of the materials or conditions being certified by the tests. The following number of tests, if performed at the appropriate time, will be the minimum acceptable for each type operation.

3.18.1 Fill and Backfill Material Gradation

One test per [_____] cubic meters yards stockpiled or in-place source material. Determine gradation of fill and backfill material in accordance with [ASTM C136/C136M] [ASTM D1140].

3.18.2 In-Place Densities

******************************************************************************

NOTE: Density test frequency can vary from one test per 10 square meter 100 square feet for small areas up to one test per 900 square meter 10,000 square feet. The following table will also help establish test frequency for various situations:

<table>
<thead>
<tr>
<th>Material Type</th>
<th>Location of Material</th>
<th>Test Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Undisturbed native soil</td>
<td>Structures</td>
<td>Two random tests in building footings and two tests on subgrade within building line</td>
</tr>
<tr>
<td>Fills and backfills</td>
<td>Structures (adjacent to)</td>
<td>One test per structure per 200 sq m 2000 sq ft taken 300 mm 1 foot below finished grade</td>
</tr>
<tr>
<td>Subgrades</td>
<td>Site (except airfields)</td>
<td>One test per 250 sq m 2500 sq ft</td>
</tr>
<tr>
<td>Embankments or borrow</td>
<td>Any</td>
<td>One test per lift per 400 cubic m 500 cubic yds placed</td>
</tr>
<tr>
<td>Native soil subgrade other than structures and parking</td>
<td>Any</td>
<td>One test or one test per 900 sq m 10,000 sq ft whichever is greater</td>
</tr>
<tr>
<td>Borrow</td>
<td>Any</td>
<td>One test per lift per 400 cubic m 500 cubic yds placed</td>
</tr>
</tbody>
</table>

******************************************************************************

a. One test per [_____] square meters feet, or fraction thereof, of each lift of fill or backfill areas compacted by other than hand-operated machines.

b. One test per [_____] square meters feet, or fraction thereof, of each lift of fill or backfill areas compacted by hand-operated machines.

c. One test per [_____] linear meters feet, or fraction thereof, of each lift of embankment or backfill for [roads] [airfields].

d. One test per [_____] linear meters feet, or fraction thereof, of each lift of embankment or backfill for railroads.

3.18.3 Check Tests on In-Place Densities

If ASTM D6938 is used, check in-place densities by ASTM D1556/D1556M as
follows:

a. One check test per lift for each [_____] square meters feet, or fraction thereof, of each lift of fill or backfill compacted by other than hand-operated machines.

b. One check test per lift for each [_____] square meters feet, of fill or backfill areas compacted by hand-operated machines.

c. One check test per lift for each [_____] linear meters feet, or fraction thereof, of embankment or backfill for [roads] [airfields].

d. One check test per lift for each [_____] linear meters feet, or fraction thereof, of embankment or backfill for railroads.

3.18.4 Moisture Contents

In the stockpile, excavation, or borrow areas, perform a minimum of two tests per day per type of material or source of material being placed during stable weather conditions. During unstable weather, perform tests as dictated by local conditions and approved by the Contracting Officer.

3.18.5 Optimum Moisture and Laboratory Maximum Density

Perform tests for each type material or source of material including borrow material to determine the optimum moisture and laboratory maximum density values. One representative test per [_____] cubic meters yards of fill and backfill, or when any change in material occurs which may affect the optimum moisture content or laboratory maximum density.

3.18.6 Tolerance Tests for Subgrades

Perform continuous checks on the degree of finish specified in paragraph SUBGRADE PREPARATION during construction of the subgrades.

3.18.7 Displacement of Sewers

**************************************************************************
NOTE: The trench should be backfilled to at least 600 mm 2 feet.
**************************************************************************

After other required tests have been performed and the trench backfill compacted to [(_____), meters, feet above the top of the pipe] [the finished grade surface], inspect the pipe to determine whether significant displacement has occurred. Conduct this inspection in the presence of the Contracting Officer. Inspect pipe sizes larger than 900 mm 36 inches, while inspecting smaller diameter pipe by shining a light or laser between manholes or manhole locations, or by the use of television cameras passed through the pipe. If, in the judgment of the Contracting Officer, the interior of the pipe shows poor alignment or any other defects that would cause improper functioning of the system, replace or repair the defects as directed at no additional cost to the Government.

3.19 DISPOSITION OF SURPLUS MATERIAL

Surplus material and excavated unsatisfactory material not required or suitable for filling or backfilling, and brush, refuse, stumps, roots, and timber shall be removed from Government property and properly disposed of.
in accordance with all applicable laws and regulations.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing, hauling, and placing the geotextile, complete, as specified and shown, and maintaining the geotextile until placement of the granular filter material, bedding material, and/or riprap cover is completed and accepted. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard** when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com).

**PART 1  GENERAL**

NOTE: This guide specification is to facilitate the preparation and review of specifications for procurement and installation of woven and nonwoven geotextiles as filter material. It is based on field performance and the laboratory testing of a limited number of geotextiles. Geotextiles possess greatly varying engineering properties and physical characteristics. Such variations require the designer to decide which testing method and what
test criteria are necessary for each application. The apparent opening size (AOS), percent open area (POA), geotextile permeability (Kg), and strength test described in the specifications that follow are physical property tests. While it is acceptable to specify minimum thickness value where it governs performance, it is inappropriate to use thickness to identify a geotextile. Result of these tests are used to judge the acceptability of a geotextile for a particular use. Prospective geotextile suppliers should furnish these test results before their geotextile will be considered for use, or before contract specifications are adjusted to permit the use of geotextiles whose properties are outside the limits imposed by this guide. For severe soil conditions and/or for a project using a large amount of geotextiles, the specifications should require that the applicable tests be run during construction, either at a specific frequency or upon demand of the Contracting Officer. For projects requiring small amounts of geotextiles under normal soil conditions the physical properties of the geotextile supported by written authentication from an authorized representative of the manufacturers may be accepted.

The actual life of geotextiles is not known, and their use in inaccessible areas must be considered carefully. Therefore geotextiles should not be used as filter material in toe drains, buried collector system, relief wells, or within any portions of embankments. Caution is advised in using geotextiles on the upstream face of earth dams or to wrap permanent piezometers.

Geotextiles are basically inert materials for typical civil engineering applications. However certain applications may expose the geotextile to chemical or biological activities that could drastically influence the filtration properties of the geotextile. Specific site conditions should be reviewed, and if such conditions exist, testing and specifications should be written to overcome it.

Geotextile strength requirements vary with intended use and construction procedures. Experience has shown that when a heavier non-woven geotextile is used, the bedding material can often be reduced in thickness or be completely eliminated. TABLE I in SI ENGLISH UNITS (1) presents the most important geotextile strength properties. It should be noted that the strength requirements listed are only a guideline to the minimum values required for survivability. Specific applications may require additional testing.

Filter design criteria for geotextiles are based on the apparent opening size (AOS, which is designated as EOS in the previous guide specification), percent
open area (POA, for woven only), geotextile permeability (Kg), and an appropriate percent passing size of the soil. For piping analysis computations, AOS must be expressed as an equivalent U.S. standard sieve opening in millimeters. To assure adequate resistance to reduction in permeability over time (clogging) and sufficient long term flow through the soil/woven geotextile system, POA criteria, as expressed in the next note, can be used.

</table>

(1) Strength values are for the weaker principal direction.

The designer must specify geotextile properties which will allow retention of the soil being protected, permit sufficient flow through the textile, and prevent clogging. The designer should select the AOS, POA, and Kg, based on criteria in TABLE II. The AOS requirement should be specified as a range, to allow for manufacturing tolerance. It is preferable to specify a geotextile with opening as large as allowed by the design criteria. The smallest sieve opening size of the AOS range should not be smaller than the 0.125 mm sieve U.S. Standard sieve size No. 120.

<td>0.95 ≤ 0.212 mm No. 70 U.S. sieve)</td>
<td>Kg 5Ks</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(1) Recent experiences have indicated that 0.95 (i.e. AOS) increased with increasing relative density, Dr, and it is higher for uniform soil than well graded soil of similar density and average particle size.

(2) If the protected soil contains appreciable quantities of material retained on the 4.75 mm No. 4 U.S. sieve use only the soil passing the 4.75 mm No. 4 U.S. sieve in selecting the 0.95 of the geotextile.

(3) Kg is the permeability of the geotextile and Ks is the permeability of the protected soil.

Satisfactory geotextile performance is greatly dependent on the field preparation of the surface of the protected soil and the installation procedure.

The following information is related to TABLE 1. Geotextile calculations should be based on procedure from an accepted reference. Worst placement conditions should be considered since stresses generated during installation often exceed post construction stresses.

(1) The requirement of permittivity (as defined in ASTM D4491/D4491M) should be chosen in such a manner that the permeability of the geotextile should always be at least five times greater than the permeability of the adjacent soil during the life of the protected earth structure.

(2) The minimum seam strength listed in TABLE 1 is based on the tensile strength of the parent geotextile material. Seam strength can also be considered as not less than 90 percent of the unaged grab tensile strength of the geotextile in the applicable direction.

NOTE: TO DOWNLOAD UFGS GRAPHICS
Figures described below are available on-line for download. Go to http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms

Figure 1. Correct geotextile placement for current acting parallel to bank or for wave attack on the bank.

Figure 2. Placement of geotextile on bank subject to streamflow action. Revetment materials have not yet been placed on the geotextile.

Figure 3. Geotextile on bank subject to wave attack showing placement of vertical-wall key trench at toe and top bank. Revetment materials have not yet been placed on geotextile.

Figure 4. Key trench design used when soil conditions do not permit construction of vertical walls.

The Designer must comply with the requirements of the following Regulatory Requirements:

U.S. DEPARTMENT OF INTERIOR, BUREAU OF RECLAMATION:

**************************************************************************
1.1 UNIT PRICES
**************************************************************************

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.

1.1.1 Payment

Payment will be made at the contract unit price and will constitute full compensation to the Contractor for providing all plant, labor, material, and equipment and performing all operations necessary for the complete and satisfactory installation of the geotextile. The following items are included in the contract unit price for Geotextiles and will not be counted a second time in the process of determining the extent of geotextile placed: Material and associated equipment and operation used in laps,
seams, or extra length; securing pins and associated material, equipment, and operations; and material and associated equipment and operations used to provide cushioning layer of sand or gravel or both to permit increase in allowable drop height of stone. No payment will be made for geotextiles replaced because of waste, contamination, damage, repair, or due to Contractor fault or negligence.

1.1.2 Measurement

Installed geotextiles will be measured for payment in place to the nearest [_____] square meter feet of protected area as delineated in the drawings.

1.1.3 Unit of Measure

Unit of measure: [_____] square meter feet.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D4354 (2012; R 2020) Sampling of Geosynthetics for Testing

ASTM D4355/D4355M (2014) Deterioration of Geotextiles from Exposure to Light, Moisture and Heat in a Xenon-Arc Type Apparatus

1.3 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL
PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

2.1.2 Geotextile Fiber

Fibers used in the manufacturing of the geotextile shall consist of a long-chain synthetic polymer composed of at least 85 percent by weight of polyolefins, polyesters, or polyamides. Add stabilizers and/or inhibitors to the base polymer, if necessary to make the filaments resistant to deterioration caused by ultraviolet light and heat exposure. Reclaimed or recycled fibers or polymer shall not be added to the formulation. Geotextile shall be formed into a network such that the filaments or yarns retain dimensional stability relative to each other, including the edges. Finish the edges of the geotextile to prevent the outer fiber from pulling away from the geotextile.

2.1.3 Seams

**************************************************************************
NOTE: Most geotextiles are manufactured in widths of 1.8 to 5.5 m 6 to 18 feet, but to reduce the number of overlaps, wider sections may be produced by attaching narrow sections together. Pre-assembled sections of 11-m 36-foot widths or more are preferred to keep the number of overlaps to a minimum.
**************************************************************************

Sew the seams of the geotextile with thread of a material meeting the chemical requirements given above for geotextile yarn or bond the seams by cementing or by heat. Attach the sheets of geotextile at the factory or another approved location, if necessary, to form sections not less than [_____] meter [_____] feet wide. Test seams in accordance with method ASTM D4884/D4884M. The strength of the seam shall be not less than 90 percent of the required grab tensile strength of the unaged geotextile in any principal direction.

2.1.4 Securing Pins

**************************************************************************
NOTE: The use of security pins should be restricted
**************************************************************************

SECTION 31 05 19.13 Page 11
as much as possible since holes in geotextile allow pin boils to form and remove material from beneath geotextile and cause failure of system.

Secure the geotextile to the embankment or foundation soil by pins to prevent movement prior to placement of revetment materials. Other appropriate means to prevent movement such as staples, sand bags, and stone could also be used. Insert securing pins through both strips of overlapped geotextile along the line passing through midpoints of the overlap. Remove securing pins as placement of revetment materials are placed to prevent tearing of geotextile or enlarging holes. Maximum spacing between securing pins depends on the steepness of the embankment slope. The maximum pins spacing shall be equal to or less than the values listed in TABLE 2. When windy conditions prevail at the construction site, increase the number of pins upon the demand of the Contracting Officer. Anchor terminal ends of the geotextile with key trench or apron at crest, toe of the slope and upstream and downstream limits of installation.

2.2 INSPECTIONS, VERIFICATIONS, AND TESTING

2.2.1 Manufacturing and Sampling

Geotextiles and factory seams shall meet the requirements specified in TABLE 1.

2.2.1.1 Conformance Testing

Perform conformance testing in accordance with the manufacturers approved quality control manual. Submit manufacturer's quality control conformance test results.

2.2.1.2 Factory Sampling

Randomly sample geotextiles in accordance with ASTM D4354 (Procedure Method A). Sample factory seams at the frequency specified in ASTM D4884/D4884M. Provide all samples from the same production lot as will be supplied for the contract, of the full manufactured width of the geotextile by at least 3 m 10 feet long, except that samples for seam strength may be a full width sample folded over and the edges stitched for a length of at least 1.5 m 5 feet. Samples submitted for testing shall be identified by manufacturers lot designation.

2.2.1.3 Needle Punched Geotextile

For needle punched geotextile, provide manufacturer certification that the geotextile has been inspected using permanent on-line metal detectors and
does not contain any needles.

2.2.1.4 Manufacturer Certification

[Upon delivery of the geotextile, submit duplicate copies of the written certificate of compliance signed by a legally authorized official of the manufacturer. The certificate shall state that the geotextile shipped to the site meets the chemical requirements and exceeds the minimum average roll value listed in TABLE 1.] [All brands of geotextile and all seams to be used will be accepted on the basis of mill certificates or affidavits. Submit duplicate copies of the mill certificate or affidavit signed by a legally authorized official from the company manufacturing the geotextile. The mill certificate or affidavit shall attest that the geotextile meets the chemical, physical and manufacturing requirements stated in this specification.]

2.2.2 Site Verification and Testing

**************************************************************************
NOTE: The need for, and amount of, site verification testing should be based on the severity of site conditions and the amount of textile being placed.
**************************************************************************

Collect samples at approved locations upon delivery to the site [at the request of the Contracting Officer] [in accordance with ASTM D4354 (Procedure Method B)] [at a frequency of once per 9290 square meters 100,000 square feet]. Test samples to verify that the geotextile meets the requirements specified in TABLE 1. Identify samples by manufacturers name, type of geotextile, lot number, roll number, and machine direction. Perform testing at an approved laboratory. Submit test results from the lot under review for approval prior to deployment of that lot of geotextile. Rolls which are sampled shall be immediately rewrapped in their protective covering.

PART 3 EXECUTION

3.1 SURFACE PREPARATION

Prepare surface, on which the geotextile will be placed, to a relatively smooth surface condition in accordance with the applicable portion of this specification and shall be free from obstruction, debris, depressions, erosion feature, or vegetation. Remove any irregularities so as to ensure continuous, intimate contact of the geotextile with all the surface. Any loose material, soft or low density pockets of material, shall be removed; erosion features such as rills, gullies etc. shall be graded out of the surface before geotextile placement.

3.2 INSTALLATION OF THE GEOTEXTILE

**************************************************************************
NOTE: This paragraph describes installation in an open area and on generally planar surfaces. For installation of geotextiles in drainage systems or about collector pipes, additional specification requirements may need to be added. The use of geotextiles to wrap collector pipes should be avoided whenever possible.
**************************************************************************
Minimum overlaps should be specified at 300 to 450 mm
12 to 18 inches depending on the specified
orientation of the overlap to the direction of wave
attack, velocity, or seepage. For under-water
placement, minimum overlap should be 900 mm 3 feet.

Geotextiles will bridge small surface features in
the slope and allow erosion to occur beneath the
gextile. Surface drainage should be directed
away from the top of slope to prevent erosion under
the geotextile. Surface flow should be brought
downslope at controlled points such as lined ditches.

3.2.1 General

Place the geotextile in the manner and at the locations shown. At the time
of installation, reject the geotextile if it has defects, rips, holes,
flaws, deterioration or damage incurred during manufacture, transportation
or storage.

3.2.2 Placement

NOTE: The placement of the geotextile relative to
this paragraph may follow the following general
procedures. (FIGURES referenced in this note are
available on-line, see the note above).

(1) For current acting parallel to the bank the
gotextile will be placed with the long dimension
parallel to the current (Fig. 1a). Geotextile
placement must be started from the bottom up with
upper strips overlapping lower strips, and the
upstream strips must overlap the downstream strips.
The overlaps at the end of strips will be staggered
at least 1.5 m 5 feet. Revetment and geotextile
materials should be extended at least below the mean
low water to minimize erosion at the toe (Fig. 2).
If construction schedule permits, a period of low
streamflow should be selected for the geotextile
installation.

(2) When revetment material and geotextile filter
are selected to protect against wave attack, the
gotextile strips must be placed vertical to the
slope of the bank with the upper strips overlapping
the lower strips (Fig. 1b). The geotextile must be
keyed at the toe to prevent uplift or undermining
(Fig. 3). The key trench should be located below
the mean low water to prevent erosion of the soil
adjacent to the trench. When it is not possible to
maintain vertical trench walls, the geotextile must
be keyed to an excavated trench with stable slopes
(Fig. 4). A key at the top of the bank will be
installed where there is an overbank drainage
problem.
Allowing the geotextile to drape or be free of high tensile stress during placement will require larger quantities of geotextiles than the actual slope length.

Place the geotextile with the long dimension parallel to the centerline of the channel, shoreline, or trench and laid smooth and free of tension, stress, folds, wrinkles, or creases. Place the strips to provide a minimum width of [_____] mm inches of overlap for each joint. The placement procedure requires that the length of the geotextile be approximately [_____] percent greater than the slope length. Adjust the actual length of the geotextile used based on initial installation experience. Temporary pinning of the geotextile to help hold it in place until the bedding layer is placed will be allowed. Remove the temporary pins as the granular material is placed to relieve high tensile stress which may occur during placement of material on the geotextile. Design protection of riprap in compliance with EM 1110-2-1601. Perform trimming in such a manner that the geotextile is not damaged in any way.

3.3 PROTECTION

NOTE: All geotextiles can be damaged if stone is dropped on it from a height greater than 900 mm 3 feet. Some geotextiles can be damaged with lesser drop heights. When stone is heavy and angular it may cause punctures in the geotextile even if dropped from a height of 300 mm 1 foot. Tension in the geotextile must be minimized to prevent puncture.

Protect the geotextile at all times during construction from contamination by surface runoff; remove any geotextile so contaminated and replaced with uncontaminated geotextile. Replace any geotextile damaged during its installation or during placement of granular filter materials, bedding materials, or riprap at no cost to the Government. Schedule the work so that the covering of the geotextile with a layer of the specified material is accomplished within [_____] calendar days after placement of the geotextile. Failure to comply shall require replacement of geotextile. Protect the geotextile from damage prior to and during the placement of riprap or other materials. This may be accomplished by limiting the height of drop to less than 300 mm 1 foot, by placing a cushioning layer of sand or gravel on top of the geotextile before placing the material, or other methods deemed necessary. Care should be taken to ensure that the utilized cushioning materials will not impede the flow of water.) Before placement of riprap or other materials, demonstrate that the placement technique will not cause damage to the geotextile. In no case shall any type of equipment be allowed on the unprotected geotextile.

3.4 PLACEMENT OF CUSHIONING MATERIAL

Perform placing of cushioning material in a manner to ensure intimate contact of the geotextile with the prepared surface and with the cushioning material. The placement shall also be performed in a manner that will not damage the geotextile including tear, puncture, or abrasion. On sloping surfaces place the cushioning material from the bottom of the slopes upward. During placement, the height of the drop of riprap material shall
not be greater than 300 mm 12 inches. Uncover any geotextile damaged beneath the cushioning material, as necessary, and replaced at no cost to the Government.

3.5 OVERLAPPING AND SEAMING

3.5.1 Overlapping

**************************************************************************
NOTE: In general, overlapping is sufficient where the primary purpose is to hold the material in place during installation. However, where the design requires the geotextile to resist tensile stresses, seams should be sewn. A 300-mm 12-inch overlap specified in this section is considered minimum for all cases. The Contractor has the option of field sewing instead of overlapping.
**************************************************************************

The overlap of geotextile [rolls] [panels] [_____] shall be [300] [600] [900] [_____] mm [12] [24] [36] [_____] inches. Appropriate measures will be taken to ensure required overlap exists after cushion placement.

3.5.2 Sewn Seams

**************************************************************************
NOTE: The Designer must specify appropriate seam test requirements. ASTM D1683, the previously used test standard, has been discontinued with no replacement designated.
**************************************************************************

High strength thread should be used so that seam test conforms to ASTM D4884/D4884M. The thread shall meet the chemical, ultraviolet, and physical requirements of the geotextile, and the color shall be different from that of the geotextile. The seam strength shall be equal to the strength required for the geotextile in the direction across the seam. Overlapping J-type seams are preferable over prayer-type seams as the overlapping geotextile reduces the chance of openings to occur at the seam. Use double sewing, specially for field seams, to provide a safety factor against undetected missed stitches.

3.6 FIELD TESTING

**************************************************************************
NOTE: The need for field testing should be based on the size and importance of the project. Field testing should be performed if the geotextile will be in tension.
**************************************************************************

Field test geotextile[ in tension].

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing all labor and equipment and performing all work required for clearing and disposal of trees, stumps, clearing fences, buildings, and other structures and disposal of debris, trash, and materials resulting from clearing operations. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
1.1 UNIT PRICES

******************************************************************************
NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.

No paragraph covering partial payment has been included in this guide specification. If partial payment is to be made, it should be addressed in the contract at the appropriate place (e.g., Section 01 20 00 PRICE AND PAYMENT PROCEDURES). One method, which has been used, is described here in general terms and may be incorporated when necessary. To estimate the value of work completed during each period, the zones are divided into the class of clearing involved. Class A clearing includes, as nearly as can be determined from aerial photographs or other means, all the wooded area with the exception of scattered trees, fringe growth along roads and fences, etc. Class B clearing contains all of the open, cultivated or pasture lands and those relatively open areas containing scattered trees, fringe growth along roads and fences, etc.

The numbers of hectares/acreages in each class should be estimated in advance and tabulated under the partial payment clause of the specification and thereafter not be subject to change even if it is discovered that the original classification may have been in error. The most difficult class is arbitrarily assigned ninety work units for clearing, disposal, and clean-up. The number of work units in the other classes are estimated by comparison with the base class. The final estimate might be as follows:

<table>
<thead>
<tr>
<th>Class</th>
<th>Zone</th>
<th>Areas (hectares/acre)</th>
<th>Multiplication Factor</th>
<th>Work Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>A 1</td>
<td></td>
<td></td>
<td>60</td>
<td></td>
</tr>
<tr>
<td>B 1</td>
<td></td>
<td></td>
<td>15</td>
<td></td>
</tr>
<tr>
<td>A 2</td>
<td></td>
<td></td>
<td>90</td>
<td></td>
</tr>
<tr>
<td>B 2</td>
<td></td>
<td></td>
<td>25</td>
<td></td>
</tr>
</tbody>
</table>

| Total work units |

The value of a work unit is determined by dividing the contract price by the above total. The value of the work completed during any period will be determined by multiplying the number of hectares/acre of the various classes completed in each zone,
as estimated by the Contracting Officer by planimetering areas from Government progress maps, by the work units in that class, totaling these figures and multiplying this total by the value of an individual unit as determined above. The estimate of the Contracting Officer will be final. For the purpose of apportioning the classes of work completed during any period, the felling and decking ready for burning or removal is considered as 50 percent of the work required and the removal and/or burning and clean-up will be considered as the remaining 50 percent.

1.1.1 Clearing (Timber and Structure)

1.1.1.1 Payment

Payment will be made for costs associated with furnishing plant, labor, materials and equipments, and performing all operations necessary for clearing (timber and structures) as specified.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.2 DEFINITIONS

1.2.1 Trees

**NOTE: Alternate 1.**

The line of demarcation between brush and trees, for the purpose of distinguishing clearing requirements, is that trees, as used, will be considered as that woody growth not falling within the limits of brush as defined below.

1.2.2 Brush

**NOTE: Alternate 1.**

Brush is that growth which is less than 50 mm 2 inches in diameter measured 150 mm6 inches from the ground on the uphill side and is less than 2 m 6 feet in height measured from the ground on the uphill side.

1.2.3 Structures

**NOTE: Alternate 2.**

The term "structures" includes buildings or portions thereof, walls, silos, storm or root cellars, cisterns, wells, windmills, pit silos, water towers, etc. Structures shall be removed or filled to the ground surface.
1.3 PROJECT/SITE CONDITIONS

1.3.1 Aesthetics and Pollution Control

******************************************************************************
NOTE: Alternate 1.
******************************************************************************

1.3.1.1 Ground Areas

All ground areas in the zone of normal pool level fluctuations which are
disturbed by clearing operations and which would become subject to erosion
will be protected or restored.

1.3.1.2 Construction Roads

******************************************************************************
NOTE: Insert type of cover crop and seeding rate, if applicable.
******************************************************************************

All construction roads proposed for use by the Contractor for removing
salvaged timber or for access to the work area shall be approved, as to
location and alignment, prior to construction. Where such roads are
determined to be of no value to project operation or will not serve
recreational access needs after project construction, the areas occupied by
these roads will be restored as nearly as possible to pre-construction
conditions by reasonable grading and seeding [_____] [of a native cover
crop] along with the planting of seedling trees if in a tree cover area.

1.3.2 Existing Conditions

******************************************************************************
NOTE: Paragraphs of Alternate 1 and 2 should be deleted if not applicable.
******************************************************************************

1.3.2.1 Boundaries

******************************************************************************
NOTE: Alternate 1.
******************************************************************************

When land lines or identifiable topographic features, such as roads, railroads, streams, etc.,
are used in place of or in addition to contours to designate zone boundaries, the descriptions
indicated below should be so modified.

The area to be cleared under this [section] [contract] is divided into two (2) zones having the general limits as defined below and as indicated on
the [drawings] [and] [maps] and [aerial photographs], which form a part of
this contract.

1.3.2.1.1 Zone 1

Included in this zone is that portion of the reservoir area [bounded by][at
a lower elevation than] the [_____] meter foot msl contour line.
1.3.2.1.2  Zone 2

**************************************************************************
NOTE: Use the contour elevation of Zone 1.
**************************************************************************

Included in this zone is that portion of the reservoir area above the 
[_____] meter foot msl contour line and below the [_____] meter foot msl 
contour line.

[1.3.2.2  Cemeteries

**************************************************************************
NOTE: Alternate 1.
**************************************************************************

Cemeteries are in the area to be cleared. Do not disturb or destroy any 
grave marker, or allow any vehicle to pass over a grave, or otherwise 
disturb the surface of the ground over any grave. Adequately mark the 
graves to insure that equipment does not work over the areas. Graves and 
headstones or markers will be relocated by others.

]1.3.2.3  Markings of Zones

**************************************************************************
NOTE: Alternate 1.
**************************************************************************

The [_____] and [_____] contour lines have been established in the field by 
the Government. The contour lines are identified by stakes on the lines or 
by painted bands on trees near the lines. The [_____] contour is marked 
with [_____] paint and the [_____] contour is marked with [_____] paint. 
[Other boundaries are marked by identifiable topographical features or by 
section or fractional section lines.]

1.3.2.4  Zones

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

When Alternate 2 is used independently of Alternate 
1, the boundaries should be completely described. 
Similarly, this section should be further modified 
to include all other applicable portions of 
Alternate 1.

**************************************************************************

The boundaries of the zones are as described in paragraph BOUNDARIES, 
subparagraphs ZONE 1 and ZONE 2.

1.3.2.5  Fences

1.3.2.5.1  Zone 1

No clearing of fences is required in Zone 1; however, the Contractor may, 
as an option, remove any or all fence materials from the area and dispose 
of such materials off the reservoir area.
1.3.2.5.2 Zone 2

All fences in Zone 2, except in those areas where no timber clearing is required, shall be cleared.

1.3.2.6 Structures

Burn combustible materials obtained from removal of structures in accordance with paragraph DISPOSAL OF MATERIAL or dispose of them off the reservoir area. Where filling of structures is required, fill to within 450 mm 18 inches of the ground surface and made with noncombustible materials such as masonry rubble, and other debris. When all available debris has been used in filling, all remaining unfilled portions, together with the above 450 mm 18 inches shall be completely filled to the ground surface with earth, borrowed as directed by the Contracting Officer. The top surfaces of fills shall be neat in appearance and smooth enough not to constitute a hazard to persons or livestock.

PART 2 PRODUCTS

Not used

PART 3 EXECUTION

3.1 CLEARING REQUIREMENTS

*******************************************************************************
*********** Alternate 1. **************************************************************************
*******************************************************************************

3.1.1 Brush

The cutting of brush in either zone is not required.

3.1.2 Zone 1

*******************************************************************************
*********** Use the same elevation which determines the contour bounding Zone 1.*******************************************************************************

Remove all trees and stumps, not defined as brush, that extend above elevation [____], except that no material will be required to be removed any nearer to the ground surface than is specified for Zone 2. Topping of trees and stumps to elevation [____] will be permitted as a Contractor's option.

3.1.3 Zone 2

Remove all trees and stumps, not falling within the classification of brush, to a height not exceeding 150 mm 6 inches above the ground surface measured on the uphill side.

3.1.4 Equipment

A tree crushing machine may be used at the option of the Contractor in all clearing operations.
3.2 DISPOSAL OF MATERIAL

NOTES: This paragraph makes general provisions for the Contractors' responsibility for fire damage beyond the clearing area. Notwithstanding these requirements, substantial damage has occurred in reservoir areas above the clearing line, due to fire escaping from areas being cleared. Fires originating in this manner have destroyed timber, ruined choice public use areas, destroyed wildlife habitat, and adversely affected public relations in the areas. Every effort should be made to avoid unnecessary destruction of the natural resources of reservoir areas, including the following actions:

1. The Contracting Officer or the Contractor or both should maintain constant knowledge, by appropriate telephone or radio liaison with personnel of the State forest protection service, relative to the degree of fire hazard and promptly disseminate by appropriate means this information to all others concerned.

2. The Contractor should be required to patrol firebreaks around clearing operations during all periods when there is danger of fire spreading beyond the clearing areas.

3. The Contractor should be required to halt all burning during periods of high fire danger.

It is considered that the provisions of the guide specifications and contract documents give the Contracting Officer the authority to enforce the required safety precautions.

3.2.1 General

The material cleared from the areas shall be completely removed by transporting from the Government property or burned within the cleared areas unless otherwise approved by the Contracting Officer. All timber from which saw logs, posts, ties or cordwood can be produced will become the property of the Contractor and in the interest of conservation it is required that the Contractor make a reasonable effort to dispose of material for these purposes. The Contractor may cut timber into convenient lengths at the site but approval must be secured prior to the operation of saw mills within the Government lands. In no case shall cleared material be thrown into or left in the creeks or river. After the felling operation has been completed, the timber to be burned must be decked for burning within [_____] days. All felled timber shall be completely removed. However, it is intended that all existing down timber in zones one (1) and two (2) will remain in place except solid, floatable material that is larger than 100 mm 4 inches in diameter (regardless of length) and/or over 2.5 m 8 feet in length (regardless of diameter) shall be disposed of in the manner prescribed for cleared material. Clean-up of floatable debris shall be accomplished by any practical means. The cutting of branches and debris remaining after clean-up, to reduce their length in order to avoid removal,
will not be permitted.

3.2.2 Burning

**************************************************************************
NOTE: Specification provisions for burning of material from cleared areas should be written to comply with applicable statutory and regulatory requirements for Prevention, Control, and Abatement of Air Pollution by Federal Activities.
**************************************************************************

a. The material cleared may be burned within the contract area, and at any time within the contract period provided such burning does not interfere with inhabitants of the area by drastic changes in their accustomed environment, such as addition to air pollution or danger of fire. However, the specific time, location and manner of burning shall be subject to approval from the viewpoints of air pollution, governing fire laws and safety.

b. In the interest of conservation, as an option, make available to the general public without charge, the material scheduled for burning. No burning operations shall be conducted within 30 m 100 feet of any standing timber or flammable growth. The burning operations shall be subject to all public law governing such operations and the Contractor will be responsible for any damage to life and/or property resulting from fires that are started by its employees or as a result of its operations.

c. Furnish at the site adequate fire fighting equipment, such as back tanks, flaps, shovels, rakes, etc., to properly equip his personnel for fighting fires. Fires shall be guarded at all times and shall be under constant surveillance until they have burned out or have been extinguished.

d. Burn so thorough that the materials is reduced to ashes, except that occasional charred pieces of logs or branches not exceeding 100 mm 4 inches in diameter and/or 2.5 m 8 feet in length will be permitted to remain. Upon approval, charred material will be buried after it is determined that it could not be disposed of by methods used in the normal burning operation. All material disposed of in such manner shall be at approved locations and shall be covered within a minimum of 450 mm 18 inches of earth.

3.2.3 Burial

In certain cases, such as along drainage channels in remote areas, cleared material may be disposed of by burial in areas designated for disposal of excess excavation or spoil. When this option is used, care will be taken to insure that all such cleared material will be buried under not less than 450 mm 18 inches of earth. Approval will be obtained for each area selected for debris disposal for burial prior to beginning such operations. Areas to be used for permanent roadways, levees or embankments will not be used for disposal of material from clearing operations. Areas for disposal of cleared materials by burial will not be located within 92 m 300 feet of public road crossings or of project areas to be regularly visited by the public.
3.2.4 Removal from Site

Except as otherwise provided, the Contractor will be permitted to remove felled and trimmed timber from the site of the work. The Contractor will be allowed to stockpile salvaged timber near contour line [_____] at approved locations. The Government will assume no responsibility for the protection and safekeeping of such material. All stockpiled timber must be removed from Government lands before final acceptance of the work will be made.

3.3 DEBRIS

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

Burn combustible debris in accordance with paragraph DISPOSAL OF MATERIAL. Noncombustible debris in excess of that disposed of as set forth in paragraph STRUCTURES shall be disposed of at such locations below elevation [_____] as may be designated by the Contracting Officer. Debris shall include trash of all kinds.

3.4 MARKETABLE MATERIALS

Any of the cleared materials which the Contractor considers marketable shall become its property and shall be removed from the reservoir area.

3.5 LOCATIONS

The locations of structures and debris to be cleared are tabulated below.

NOTE: This guide specification covers the requirements for clearing and grubbing.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: When this specification is used for hazardous waste site remediations, define what materials generated from clearing, grubbing, and tree removal are contaminated and what materials are non-contaminated. The decision on how to define contaminated and non-contaminated materials must be made by the appropriate regulatory authorities and documented in the design analysis.

The following information must be shown on the project drawings:

1. Limits of clearing
2. Limits of grubbing
3. Trees and shrubs to remain in area to be cleared

4. Trees to be removed in areas which are not to be cleared

5. Describe size, density, and type of trees to be cleared and grubbed.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. DEPARTMENT OF DEFENSE (DOD)

DODI 4150.07 (2019) DOD Pest Management Program

1.2 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up...
to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
  Herbicide Application Plan
SD-03 Product Data
  Tree Wound Paint
  Herbicides; G[, [_____]]
SD-07 Certificates
  Qualifications; G[, [_____]]
SD-11 Closeout Submittals
  Pest Management Report

1.3 QUALITY CONTROL

1.3.1 Regulatory Requirements

**************************************************************************

NOTE: Herbicides are a type of pesticide. Contact regional pest management consultant to obtain service specific reporting requirements for the use of herbicides.

For Navy projects, contact the cognizant NAVFAC Applied Biologist. Contact information can be found at

SECTION 31 11 00 Page 5
For Army projects, contact the cognizant Army Applied Biologist. Contact information can be found at http://www.aec.army.mil/services/conserve/pestmanagement.aspx.

**************************************************************************

Comply with DODI 4150.07 for requirements on Contractor's licensing, certification, and record keeping. Maintain daily records using the Pest Management Maintenance Record, DD Form 1532-1, or a computer generated equivalent. These forms may be obtained from the main web site: https://www.acq.osd.mil/eie/afpmb/docs/standardlists/dd1532-1.xlsm.

1.3.2 Qualifications

For the application of herbicides, use the services of an applicator who is commercially certified in the state where the work is to be performed as required by DODI 4150.07. Submit a copy of the pesticide applicator certificates.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the site, and handle in a manner which will maintain the materials in their original manufactured or fabricated condition until ready for use.

1.4.1 Storage

Storage of herbicides on the installation will not be permitted unless it is written into the contract.

1.4.2 Handling

Handle herbicides in accordance with the manufacturer's label and Safety Data Sheet (SDS), preventing contamination by dirt, water, and organic material. Protect herbicides from weather elements as recommended by the manufacturer's label and SDS. Spill kits must be maintained on herbicide control vehicles. Mixing of herbicides on the installation will not be permitted unless it is written into the contract.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Tree Wound Paint

Use bituminous based paint from standard manufacture specially formulated for tree wounds.

2.1.2 Herbicide

**************************************************************************

NOTE: The herbicide must be pre-approved by regional pest management consultant.

**************************************************************************

Provide herbicides currently registered by the EPA or approved for such use by the appropriate agency of the host county and approved by the
Contracting Officer. Select a herbicide that is suitable for the climatic conditions at the project site. Submit manufacturer's label and SDS for herbicides proposed for use.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Herbicide Application Plan

Prior to commencing application of herbicide, submit a herbicide application plan with proposed sequence of treatment work including dates and times of application. Include the herbicide trade name, EPA registration number, chemical composition, formulation, application rate of active ingredients, method of application, area or volume treated, and amount applied. Include a copy of the pesticide applicator certificates.

3.1.2 Protection

3.1.2.1 Roads and Walks

Keep roads and walks free of dirt and debris at all times.

3.1.2.2 Trees, Shrubs, and Existing Facilities

[Provide protection in accordance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.] [Protect trees and vegetation to be left standing from damage incident to clearing, grubbing, and construction operations by the erection of barriers or by such other means as the circumstances require.]

3.1.2.3 Utility Lines

Protect existing utility lines that are indicated to remain from damage. Notify the Contracting Officer immediately of damage to or an encounter with an unknown existing utility line. The Contractor is responsible for the repair of damage to existing utility lines that are indicated or made known to the Contractor prior to start of clearing and grubbing operations. When utility lines which are to be removed are encountered within the area of operations, notify the Contracting Officer in ample time to minimize interruption of the service. Refer to Section 01 30 00 ADMINISTRATIVE REQUIREMENTS and Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS for additional utility protection.

3.2 APPLICATION

3.2.1 Herbicide Application

Adhere to safety precautions as recommended by the manufacturer concerning handling and application of the herbicide.

3.2.1.1 Clean Up, Disposal, And Protection

Once application has been completed, proceed with clean up and protection of the site without delay. Clean the site of all material associated with the treatment measures, according to label instructions, and as indicated. Remove and dispose of excess and waste material off Government property.
3.2.1.1 Disposal of Herbicide

Dispose of residual herbicides and containers off Government property, and in accordance with the approved disposal plan, label instructions and EPA requirements.

3.3 CLEARING

***********************************************************************************************************************************************
NOTE: Any clearing which requires the removal and disposal of structures that obtrude, encroach upon, or otherwise obstruct the work should be indicated and specified in the Section 02 41 00 {DEMOLITION} {AND} {DECONSTRUCTION}.

When grubbing is included as part of the contract, delete requirements for herbicides.

Where loose rocks, boulders, or rock piles are present on the surface of the areas designated to be cleared, appropriate provisions will be inserted to provide for the disposal of such material. Where stone occurs that can be economically used in the project, provision will be made for the proper stockpiling of such stone in a designated area adjacent to the location of its intended use.

If only minor structures will be encountered, such work may be included. Where large structures are to be demolished, the requirements of this work will be covered in Section 02 41 00 {DEMOLITION} {AND} {DECONSTRUCTION}.

Herbicides intended for controlling vegetative growth should be specified and used with caution on hazardous waste sites to avoid contributing to site contamination.

***********************************************************************************************************************************************

Clearing consists of the felling, trimming, and cutting of trees into sections and the satisfactory disposal of the trees and other vegetation designated for removal, including downed timber, snags, brush, and rubbish occurring within the areas to be cleared. [Clearing also includes the removal and disposal of structures that obtrude, encroach upon, or otherwise obstruct the work.] Cut off flush with or below the original ground surface trees, stumps, roots, brush, and other vegetation in areas to be cleared, except such trees and vegetation as may be indicated or directed to be left standing. Trim dead branches that are 40 mm 1-1/2 inches or more in diameter on trees designated to be left standing within the cleared areas and trim all branches to the heights indicated or directed. Neatly cut close to the bole of the tree or main branches, limbs and branches to be trimmed. Paint, with an approved tree-wound paint, cuts more than 40 mm 1-1/2 inches in diameter. Apply herbicide [at the rate of [_____] [in accordance with the manufacturer's label] to the top surface of stumps designated not to be removed.

3.3.1 Tree Removal

Where indicated or directed, trees and stumps that are designated as trees
shall be removed from areas outside those areas designated for clearing and grubbing. This work includes the felling of such trees and the removal of their stumps and roots as specified in paragraph GRUBBING. Dispose of trees as specified in paragraph DISPOSAL OF MATERIALS.

[3.3.2 Pruning]

[Prune] [Trim] trees designated to be left standing within the cleared areas of dead branches 38 mm 1-1/2 inches or more in diameter; and trim branches to heights and in a manner as indicated. Neatly cut limbs and branches to be trimmed close to the bole of the tree or main branches. Paint cuts more than 32 mm 1-1/4 inches in diameter with an approved tree wound paint.

[3.3.3 Grubbing]

**************************************************************************
NOTE: Delete the second sentence when this work is included under another section or sections of the project specification.

For hazardous waste sites, the amount of grubbing performed in contaminated areas should be minimized due to potential added costs for disposal of contaminated materials and health and safety concerns.
**************************************************************************

Grubbing consists of the removal and disposal of stumps, roots larger than 75 mm 3 inches in diameter, and matted roots from the designated grubbing areas. Remove material to be grubbed, together with logs and other organic or metallic debris not suitable for foundation purposes, to a depth of not less than 455 mm 18 inches below the original surface level of the ground in areas indicated to be grubbed and in areas indicated as construction areas under this contract, such as areas for buildings, and areas to be paved. Fill depressions made by grubbing with suitable material and compact to make the surface conform with the original adjacent surface of the ground.

3.4 DISPOSAL OF MATERIALS

**************************************************************************
NOTE: Coordinate disposal requirements with 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.
**************************************************************************

Dispose of excess materials in accordance with the approved solid waste management permit and include those materials in the solid waste management report.

All wood or wood like materials, except for salable timber, remaining from clearing, pruning or grubbing such as limbs, tree tops, roots, stumps, logs, rotten wood, and other similar materials shall become the property of the Contractor and disposed of as specified. All non-saleable timber and wood or wood like materials remaining from timber harvesting such as limbs, tree tops, roots, stumps, logs, rotten wood, and other similar materials shall become the property of the Contractor and disposed as specified.
NOTE: Verify the most appropriate option with the natural resources office for the Installation.

When this specification is being used for the remediation of hazardous waste sites or when soil or groundwater are contaminated by hazardous materials, timber removed from these areas is not normally harvested due to liability concerns. When timber is harvested in areas where hazardous materials are present, this paragraph should define how both contaminated and non-contaminated materials will be disposed of. Include requirements describing how both contaminated and non-contaminated materials will be handled, stored and disposed of. These requirements must be coordinated with the Government Forester and Installation environmental staff.

NOTE: Use this paragraph when regional forestry program has a way of hauling or selling stockpiled harvested timber and the Contractor will be required to cut and stack saleable timber for the Government.

Applicable lengths for each class of forest products will vary by geographic region. Consult with the Government forester for the correct log lengths in a particular area. Coordinate with the Government regional forestry program to determine for the correct log lengths in a particular area.

Consider felled timber from which saw logs, pulpwood, posts, poles, ties, or fuelwood can be produced as saleable timber. Trim limbs and tops, and saw into saleable lengths of [_____] meters feet for saw logs, [_____] meters feet for pulpwood, [_____] meters feet for poles, [_____] meters feet for ties, and [_____] meters feet for fuelwood, and stockpile adjacent to the site. The stockpile timber will remain the property of the Government.

NOTE: Use this paragraph when the Government will harvest saleable timber prior to award of the contract.

The Government will, by separate contract, harvest all saleable timber from the project site.

NOTE: For Navy only, this option must be approved by NAVFAC legal counsel for NAVFAC projects.

NOTE: Use this paragraph when the Contractor will be required to pay the Government an appraised fair
market value for the saleable timber on the project site. The fair market value must be determined by the Government forester.

Describe the boundaries for the tract of land.

**************************************************************************
All timber removed from the project site shall become the property of the Contractor. Reimburse the Government for the fair market value of the timber which the Government has appraised at $[____] on the tract of land described as follows [____]. Submit payment to the Contracting Officer by cashier's or certified check in the amount of the appraised value, made payable to [the U.S. Treasury] [____] for deposit into the [Navy Forestry] or [____] account. Payment shall be made within 30 days of the Notice to Proceed.

**************************************************************************

NOTE: Use this paragraph when the fair market value of the harvested timber does not exceed a nominal value. The fair market value must be determined by the Government forester. The timber will become the property of the contractor. The Contractor permitted to make use of the nonsaleable timber or to dispose of such timber in an approved manner.

**************************************************************************

All timber removed from the project site shall become the property of the Contractor.]

3.5 CLOSEOUT ACTIVITIES

3.5.1 Herbicides

Upon completion of this work, submit the Pest Management Report DD Form 1532, or an equivalent computer product, to the Integrated Pest Management Coordinator. This form identifies the type of operation, brand name and manufacturer of herbicide, formulation, concentration or rate of application used.

NOTE: This guide specification covers the requirements for pipe systems for the transmission of gases and vapors.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

1.1  UNIT PRICES

NOTE: When it is determined that lump sum contract is advisable this paragraph will be deleted.

Measurement and payment will be based on completed work performed in accordance with the drawings, specifications, and the contract payment schedules. No payment will be made under this section for excavation, trenching, or backfilling. Payment for such work will be made under Section 31 00 00 EARTHWORK.
1.1.1 Measurement

The length of pipe lines to be paid for will be determined by measuring along the centerline of the various sizes of pipe furnished and installed. Pipe will be measured from center of fitting to center of fitting and from connection to connection to wells or treatment units. No deduction will be made for the space occupied by valves or fittings.

1.1.2 Payment

Payment will be made for off-gas piping at the contract unit price per linear meter or linear foot for the various types and sizes of piping, and will be full compensation for pipes, joints, specials, and fittings, complete in place. Payment for valves, valve boxes, and standard valve manholes will be made at the respective contract unit price each for such items complete in place. Payment will include the furnishing of testing, plant, labor, and material and incidentals necessary to complete the work, as specified and as shown.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SYSTEM DESCRIPTION

The off-gas piping system shall consist of buried and above ground pipe, pipe supports, fittings, equipment and accessories. Submit Drawings containing graphical relationship of various components of the work, schematic diagrams of the systems, details of fabrication, layouts of particular elements, connections, clearance required for maintenance and operation, and other aspects of the work to demonstrate that the system has been coordinated and will properly function as a unit. Drawings to demonstrate that thermal expansion of plastic pipe exposed to ambient conditions has been incorporated into the design. Submit a written certificate from the testing agency stating that the items have been tested and that they conform to the applicable requirements of the specifications. The certificate shall indicate the methods of testing used by the testing agency. In lieu of a certificate from a testing agency, published catalog specification data, accompanied by the manufacturer's certified statement that the items are in accordance with the applicable requirements of the specifications will be acceptable as evidence that the items conform with agency requirements.

1.3.1 Design Requirements

**************************************************************************
NOTE: Determine design wind speed from ASCE 7-16, and/or UFC 3-301-01 STRUCTURAL LOAD DATA. Use 161 km/h 100 miles per hour minimum. Use 1.2 kPa 25 psf snow load for most heavy snow climates; delete snow load where maximum snow is insignificant. In some cases, local climates and topography will dictate that a value greater than 197 Pa 25 psf be used for snow loading. This may be determined from ANSI A58.1, local codes, or by research and analysis of the effect of local climate and topography.

Provide seismic requirements, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if seismic details are not included. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.
**************************************************************************

Provide piping in accordance with 49 CFR 192. Design for installation of plastic pipe above grade shall have provisions for movement due to thermal expansion and contraction. Seismic details shall be in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC [as shown on the drawings].

a. Soil bearing capacity: [_____] MPa psf.
b. Seismic parameters: [_____].
c. Wind speed (maximum): [_____] km/h mph.
d. Ground snow load: [_____] kPa psf.
e. Ambient air temperature (maximum): [_____] degrees C F.
1.3.2 Performance Requirements

NOTE: Enter names and concentrations of organic chemicals in the blank provided and additional lines or provide a reference to another section of the specification as necessary to provide complete information. Conditions encountered during construction frequently differ from the design conditions and/or worst conditions. Plume migration affects the concentrations that will be encountered during startup and testing. Design velocity range for vapors, gases, and smoke is between 5.1 and 10 m/sec, 1,004 and 1,970 ft/min in NFPA 91 Exhaust Systems for Air Conveying of Materials. Consider the requirements of ASTM D543 in selection of pipe materials.

Identify pipe runs on the drawings and fill in the blanks with the maximum positive and negative anticipated gauge pressures.

Capacity and design of the piping and accessories shall be suitable for 24-hour full load service in an outdoor location. Calculate expansion of plastic pipe exposed to ambient conditions. Pipe materials shall be compatible with each of the following off-gas properties.

a. Pipe segment [A-B] [B-C] [C-D] [D-E] [______]:

<table>
<thead>
<tr>
<th></th>

</tbody>
</table>

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Off-Gas Piping System
1.5 QUALITY ASSURANCE

1.5.1 Contractor Qualifications

Have a minimum of [2] [3] [5] [_____] years of experience in the construction of piping systems for sour gas, condensable gas, off-gas or vapor.

1.5.2 Single Source Supplier

Assign to a single supplier full responsibility for the furnishing of the off-gas piping system. The designated single supplier, however, need not manufacture the system but shall coordinate the selection, assembly, installation, and testing of the entire system as specified herein.

1.5.3 Welding

Qualifications of welding procedures, welders, and welding operators shall be in accordance with welding and nondestructive testing procedures for pressure piping specified in Section 40 05 13.96 WELDING PROCESS PIPING. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.

1.5.4 Jointing Plastic and Fiberglass Reinforced Pipe

Use manufacturer's prequalified joining procedures. Joints shall be inspected by an inspector qualified in the joining procedures being used and in accordance with AGA XR0603. Joiners and inspectors shall be qualified at the job site by a person who has been trained and certified by the manufacturer of the pipe, to train and qualify joiners and inspectors in each joining procedure to be used on the job. Training shall include use of equipment, explanation of the procedure, and successfully making joints which pass tests specified in AGA XR0603. Notify the Contracting Officer at least 24 hours in advance of the date to qualify joiners and
inspectors.

1.5.5 Pre-Installation Meeting

**************************************************************************
NOTE: Remove this paragraph when conference is not required.
**************************************************************************

[Partnering] [Pre-installation] meeting will be required. Ensure that involved subContractors, suppliers, and manufacturers are [notified] [represented]. The date and time of the conference shall be furnished to the Contracting Officer for approval.

1.6 DELIVERY, STORAGE, AND HANDLING

1.6.1 Packaging

Plastic pipe shall be packed, packaged and marked in accordance with ASTM D3892.

1.6.2 Cleaners, Solvents and Glues

A safety data sheet in conformance with ANSI Z400.1/Z129.1 must accompany each chemical delivered for solvents, solvent cements, or glues used in pipe connections or pipe installation. Handling must be in accordance with ASTM F402.

1.6.3 Storage

Classify and mark storage facilities in accordance with NFPA 704. Store materials with protection from puncture, dirt, grease, moisture, mechanical abrasions, excessive heat, ultraviolet (UV) damage, or other damage. Pipe and fittings shall be handled and stored in accordance with the manufacturer's recommendations. Piping bundles shall be stored on a prepared surface and should not be stacked more than two bundles high.

1.7 SEQUENCING AND SCHEDULING

**************************************************************************
NOTE: Coordinate with Section Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM or Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM if steel pipe is allowed. Blowers and control valves are specified in Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS.
**************************************************************************

Installation shall be as specified in Section 31 00 00 EARTHWORK, except as modified herein or required by ASTM D2774, ASTM D2855, ASTM D3839, or ASTM F402, as appropriate for the pipe material.

1.8 EXTRA MATERIALS

**************************************************************************
NOTE: This paragraph covers items to be furnished to the Government by the Contractor for future maintenance and repair. Insert text as required.
**************************************************************************
Extra material consisting of [_____] shall be provided. A special wrench for removal of locking covers shall be provided for each valve box and for each pressure regulator box.

### 1.9 MAINTENANCE SERVICE

NOTE: This paragraph covers provisions for maintenance service as applicable to critical systems, equipment, and landscaping. Insert text as required or omit.

Maintenance service shall include [____].

### PART 2 PRODUCTS

NOTE: If thermoplastic pipe is specified for above ground use, verify that the referenced standards allow use of the specified materials for vapor transport or note the exceptions. Thermoplastic pipe is specified and installed above grade for vacuum applications. The ASME B31.3 advises that "special precautions should be observed" when using thermoplastic pipe to transport compressed gases above ground. Recommendation B of the Plastic Pipe Institute recommends against the use of thermoplastic pipe to transport air or other compressed gases in exposed above ground locations, e.g. in exposed plant piping." The industry standards for use of thermoplastic pipe for transmission of gas, ASTM D2513 and ASTM D3839, both recommend only underground use.

Combustible and explosive properties of the vapor, accumulation of static electrical charge and changes in strength characteristics due to elevated temperatures should be considered in material selection. Consideration should be given to compatibility of the construction materials with the condensate that will accumulate in the system. Select materials to avoid softening and loss of physical properties due to polymer degradation by depolymerization; stiffening or embrittlement due to loss of plasticizers resulting from repeated usage; deterioration of mechanical properties due to swelling; and failure of adhesive or heat fused joints due to interaction with condensate or leachate and physical stress.

See EM 1110-1-4008 Liquid Process Piping for chemical resistivity information.

Delete inapplicable materials or equipment. Options for other material, such as ductile iron in iron pipe sizes, may be added for noncorrosive gases.
2.1 MATERIALS AND EQUIPMENT

Provide materials and equipment that are new and unused, except for testing equipment. Components that serve the same function and are the same size shall be identical products of the same manufacturer. Piping material and appurtenances shall be as specified and as shown on the drawings, and shall be suitable for the service intended. Submit manufacturer's descriptive data and technical literature for each piping system, including design recommendations, pressure and temperature ratings, dimensions, type, grade and strength of pipe and fittings, thermal characteristics (coefficient of expansion and thermal conductivity) and chemical resistivity for each chemical constituent in the off-gas stream. Manufacturer's recommended installation procedures including materials preparation, and installations.

2.1.1 Standard Products

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Pipe, valves, fittings and appurtenances shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.1.2 Identification

Each piece of pipe shall bear the ASTM designation and the ASTM markings required for that designation. Each valve shall be marked in accordance with MSS SP-25 to identify the manufacturer, size, pressure rating, body disc and seat material. Securely attach a tag with the manufacturer's name, catalog number and valve identification.

2.2 DESIGN STRENGTH

Design strength of piping shall be suitable for the operating pressure and temperature ranges indicated and/or shown. With the exception of vacuum pipe segments [A-B] [B-C] [D-E] [_____] , thermoplastic pipe shall not be used to transport air or vapors in exposed above ground locations.

2.3 STEEL PIPE

**************************************************************************

NOTE: Verify that pipe wall thickness conforms to ASME B31.8 for larger sizes and high pressures.

For exposure potential to pressures less than 70 kPa
10 psig and temperatures less than 100 degrees C 212 degrees F and mild chemical exposure surface shall be blasted in accordance with SSPC SP 6/NACE No.3.

For exposure potential to pressures greater than 70 kPa 10 psig and temperatures greater than 100 degrees C 212 degrees F and mild chemical exposure intermediate options may be appropriate.

For severe chemical exposure, the baked phenolic system should be used.
**************************************************************************
Steel pipe shall be Schedule 40 conforming to [Grade A or B, Type E or S of ASTM A53/A53M,] [API Spec 5L,] [ASME B31.8,] [or] [NFPA 58]. Pipe threads shall conform to ASME B1.20.2MASME B1.20.1. Fittings for pipe 40 mm 1-1/2 inches and smaller shall conform to ASME B16.11. Butt weld fittings for pipe 40 mm 1-1/2 inches or less shall conform to ASME B16.9. Joint sealing compound shall conform to UL FLAMMABLE & COMBUSTIBLE, Class 20 or less. Polytetrafluoroethylene tape shall conform to ASTM D3308. Weld neck flanges shall be used. Connections shall conform to ASTM A181/A181M, Class 60, carbon steel. Carbon steel components shall be coated with corrosion resistant [materials.] [materials suitable for exposure to condensates.] Coatings and finishes shall be 100 percent holiday free.

2.3.1 Carbon Steel Located Above Grade

**************************************************************************
NOTE: Color must be specified only for the "-S" systems. The color is automatic (-A, Aluminum; -B, Black; -W, white) for the other systems.
**************************************************************************

Surfaces of aboveground carbon steel components shall be [_____] coated in accordance with AWWA C218 [three-coat alkyd system 1-91-A] [three-coat alkyd system 1-91-W] [three-coat alkyd system 1-91-S] [four-coat alkyd system 2-91-A] [four-coat alkyd system 2-91-W] [four-coat alkyd system 2-91-S] [three-coat alkyd/silicone alkyd system 3-91-W] [three-coat alkyd/silicone alkyd system 3-91-S] [three-coat epoxy/urethane system 4-91-W] [three-coat epoxy/urethane 4-91-S] [three-coat inorganic or organic zinc/epoxy/urethane 5-91-W] [three-coat inorganic or organic zinc/epoxy/urethane 5-91-S] [two- or three-coat epoxy/coal tar epoxy 6-91-B] [two or three- coat water reducible epoxy-polyamid 7-91-W] [two- or three-coat water reducible epoxy-polyamid 7-91-S] [three-coat water reducible acrylic or alkyl-modified acrylic emulsion 8-91-W] [three-coat water reducible acrylic or alkyl-modified acrylic emulsion 8-91-S] [two- or three-coat epoxy/high-build aliphatic polyurethane over existing coated substrates 9-95-W] [two- or three-coat epoxy/high-build aliphatic polyurethane over existing coated substrates 9-95-S].

2.3.2 Silicone Coating

Surfaces of carbon steel components shall be blasted in accordance with SSPC SP 6/NACE No.3. Surface shall have an alkyd primer 62.5 micrometers 2.5 mils dry film thickness followed by two alkyd modified silicone final coats.

2.3.3 Zinc Coating

Surfaces of carbon steel components shall be coated with zinc in accordance with ASTM A123/A123M or ASTM A153/A153M.

2.3.4 Thermoplastic Resin Coating System

[Surfaces of carbon steel components shall have a minimum of [4] [5] [6] coats of phenolic type coatings applied [40] [50] micrometers [1.6] [2] mils minimum dry film thickness per coat. Each coat shall be baked at 149 degrees C 300 degrees F for 10 minutes. Full coating system shall be cured in oven at [190] [232] degrees C [375] [450] degrees F for 30 minutes.] [Continuously extruded polyethylene and adhesive coating system materials]
shall conform to NACE SP0185 Type A.

2.3.5 Cathodic Protection

Buried ferrous pipe systems shall have cathodic protection.

2.4 COPPER TUBING

Copper tubing shall conform to ASTM B837.

2.5 POLYVINYL CHLORIDE (PVC) PIPING

Design and fabrication of below grade components of the off-gas piping system shall be in accordance with ASTM D2513 except as modified herein.

2.5.1 PVC Pipe

******************************************************************************
NOTE: CPVC in accordance with ASTM F422 provides a heat protection factor that is important near blowers but is not generally necessary for buried piping.
******************************************************************************

Pipe shall be in accordance with ASTM F442/F442M, ASTM D2241, SDR [26] [21] [17] [_____] . Materials shall conform to ASTM D1784, Type IV, Grade 1, rigid (23447-B). The maximum eccentricity of the inside and outside circumferences of the pipe walls shall be 12 percent. Pipe shall be provided which does not fail, balloon, burst, or weep as defined in ASTM D1598.

2.5.2 PVC Joints

Joints shall be pressure rated solvent cemented bell joints in accordance with ASTM D2672 except where flanged or threaded fittings are required at expansion joints, valves, flowmeter, equipment connections or otherwise shown. Flanges shall be joined to pipe by solvent cementing. Primer shall conform to ASTM F656. Solvent cement shall conform to ASTM D2564.

2.5.3 PVC Fittings

Fittings shall be in accordance with [ASTM D2466] [ASTM D2467].

2.6 POLYETHYLENE (PE) PIPING

Design and fabrication of below grade components of the off-gas piping system shall be in accordance with ASTM D2513 except as modified herein.

2.6.1 PE Pipe

Pipe shall be in accordance with ASTM D3035, Schedule [40] [80]. Wall thickness shall be SDR [11] [_____] . Melt flow shall be less than 1.5 g/10 min. with method ASTM D1248, Condition F. Environmental stress crack resistance shall exceed 1000 hours, ASTM D1693, Condition C.

2.6.2 PE Joints and Fittings

Fittings shall be pressure rated electrofusion fittings in accordance with
2.7 REINFORCED EPOXY RESIN PIPING

Design and fabrication of below grade components of the off-gas piping system shall be in accordance with ASTM D2992 except as modified herein.

2.7.1 Epoxy Resin Pipe

Pipe shall be in accordance with ASTM D2517. Resin shall be chemically resistant to condensates as determined by ASTM C581.

2.7.2 Epoxy Resin Joints and Fittings

Joints and fittings shall be in accordance with ASTM D2517.

2.8 DUCT SYSTEMS

**************************************************************************
NOTE: Consult Sheet Metal and Air Conditioning Contractors' National Association (SMACNA) for metal and PVC duct design and construction recommendations. Consult Thermal Insulation Manufacturers' Association (TIMA) for design and construction standards for fiberglass ducts.
**************************************************************************

Ductwork shall comply with Section 23 54 19 BUILDING HEATING SYSTEMS, WARM AIR.

2.9 FLANGED CONNECTIONS

2.9.1 Flanges

Flanges shall be Class [150] [____], socket weld, flat face in accordance with ASME B16.5. Drilling and dimensions of flanges, bolts, nuts, and bolt patterns shall be in accordance with ASME B16.5, Class [150] [____]. Bolts and nuts shall [conform to ASTM A307] [be 304 stainless steel].

2.9.2 Gaskets

**************************************************************************
NOTE: Use gasket materials compatible with condensates. High temperature gaskets for above 160 degrees C 320 degrees F should be aramid fibers bonded with nitrile butadiene rubber (NBR) or glass fibers bonded with polytetrafluoroethylene. EPDM is suitable for 100 degrees C 212 degrees F or less. Chloroprene rubber is suitable for 80 degrees C 176 degrees F or less. Florin rubber (i.e. Viton) and nitrile are suitable for 160 degrees C 320 degrees F or less.
**************************************************************************

Gaskets shall be full face, non-asbestos compressed material compatible
with the expected condensates in accordance with ASME B16.21, [3] [1.6] mm [1/8] [1/16] inch minimum thickness, full face or self-centering flat ring type. Gaskets shall be aramid fibers bonded with nitrile butadiene rubber (NBR) or glass fibers bonded with polytetrafluoroethylene suitable for [315] [_____] degrees C [600] [_____] degrees F service and meeting applicable requirements of [ASME B31.8] [NFPA 58]. [High temperature gaskets shall be suitable for above 160 degrees C 320 degrees F.] [Chloroprene rubber shall be suitable for above 100 degrees C 212 degrees F service.] [EPDM shall be suitable for 100 degrees C 212 degrees F service.] [Florin rubber (i.e. Viton) or nitrile rubber shall be suitable for 160 degrees C 320 degrees F service.]

2.9.3 Sealants

Seals shall conform to ASTM C920.

2.10 EQUIPMENT AND APPURTENANCES

2.10.1 Manually Operated Valves

Ball valves shall be in accordance with MSS SP-72. Gate, plug, ball, and check valves shall be in accordance with API Spec 6D. Thermoplastic gas shutoffs and valves shall be in accordance with ASME B16.40.

2.10.2 Relief Valves

Relief valve with manually adjustable pressure differential shall be provided for each blower or vacuum pump. Relief valve shall be [weighted] [spring] [pilot-operated diaphragm type] with a [_____] percent accumulation. Relief valve diameter shall be line sized or as otherwise indicated and shall be rated to relieve [_____] cubic meters/s cubic feet per minute at a set pressure of [_____] kPa psi or a vacuum of [_____] kPa inches Hg. Materials shall be [aluminum] [bronze] [cast iron] [stainless steel] [_____] body, [bronze] [316 stainless steel] [_____] trim, and [Buna-N] [EPR] [nitrile] [Viton] [Teflon] [_____] elastomers. Maximum operating temperature and pressure shall be [_____] degrees C F and [_____] kPa psi.

2.10.3 Unloading Valves

Unloading valves shall be included to minimize pump/motor overloading during start and stop operations. Unloading valves shall be [pilot-operated diaphragm type with auxiliary solenoid operator] [actuated butterfly valve control by blower system controls]. Unloading valve shall be rated to relieve [_____] cubic meters/s cubic feet/minute at a set pressure of [_____] kPa psi or a vacuum of [_____] mm Hg inches Hg. Materials shall be [aluminum] [bronze] [stainless steel] body, [bronze] [316 stainless steel] trim, and [Buna-N] [EPR] [Viton] [Teflon] elastomers. Maximum operating temperature and pressure shall be [_____] degrees C F and [_____] kPa psi respectively.

2.10.4 Vacuum Breakers

Vacuum breakers shall be provided to protect blowers and vacuum pumps from damage due to excessive vacuum surges. Vacuum Breakers shall be [pilot-operated diaphragm type with auxiliary solenoid operator] [actuated butterfly valve control by blower system controls]. Valve shall be rated to relieve [_____] cubic m/s cfm at a set pressure of [_____] kPa psi or a vacuum of [_____] kPa inches Hg. Materials shall be [aluminum] [bronze] [316 stainless steel] [_____] trim.
[stainless steel] body, [bronze] [316 stainless steel] trim, and [Buna-N] [EPR] [Viton] [Teflon] elastomers. Maximum operating temperature and pressure shall be [_____] degrees C F and [_____] kPa psi.

2.10.5 Dielectric Fittings

Dielectric fittings shall be installed between threaded ferrous and nonferrous metallic pipe, fittings and valves, except where corporation stops join mains. Dielectric fittings shall prevent metal-to-metal contact of dissimilar metallic piping elements and shall be suitable for the required working pressure.

2.10.6 Meters

Gas meters conforming to AGA ANSI B109.2.

2.10.7 Insulation

Provide insulation of above grade exterior pipe, fittings and valves as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.10.8 Supports for Aboveground Piping

**************************************************************************

NOTE: Pipe materials differ greatly in their respective changes in size as temperature changes. The thermal expansion coefficient of PE is three times that of PVC pipe. In a buried environment, where the temperature fluctuations should be minimal and the pipe is supported on all sides by soil, thermal expansion is of less concern. However, in systems where the collector pipes are above ground, thermal expansion and contraction must be considered.

**************************************************************************

Furnish pipe hangers and supports complete with necessary inserts, bolts, nuts, rods, washers, and accessories. Design and construction shall be in accordance with MSS SP-58. Specific application shall be in accordance with MSS SP-58. Hanger and supports shall be capable of adjustment after placement of piping. Hangers and supports shall be the product of one manufacturer. Hangers, supports and accessories shall be hot dip galvanized in accordance with ASTM A123/A123M unless copper or plastic coated. Restrained joints and thrust protection shall be provided. Concrete and metal cradles, collars, floor stands, supports, kickers, and block shall be provided as recommended by manufacturer. Pipe cradle cushion material shall be elastomer sheet strapped to pipe to prevent chafing at pipe support. Elastomer sheet shall be utilized around top of pipe to prevent chafing of pipe strap.

2.10.9 Valve Boxes

Valve boxes shall be adjustable extension type with screw or slide-type adjustments constructed of cast iron not less than 5 mm 3/16 inch thick. Valve boxes shall be provided with locking covers that require a special wrench for removal and the word "gas" cast in the box cover.

2.11 FACTORY TESTS

Test [steel piping] [a representative unit of each diameter of steel
piping] by the manufacturer or a nationally recognized testing agency in compliance with NACE SP0274.

PART 3 EXECUTION

**************************************************************************
NOTE: Operations required to accomplish construction of plastic piping systems will conform to the requirements of ASTM F402.
**************************************************************************

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 MANUFACTURER'S REPRESENTATIVE

Provide the services of a manufacturer's field service representative who is experienced in the installation of the materials and equipment furnished and who has complete knowledge of the proper operation and maintenance of the system. Submit the name and qualifications of the manufacturer's representative and written certification from the manufacturer that the representative is technically qualified.

3.3 CONDENSATE CONTROL

Slope off-gas piping uniformly between control elevations to enhance the removal of liquids. Make provisions to collect and drain liquids from [condensation] [mist accumulation] [_____] in each pipe run. Liquid removal sumps and traps shall be located in the piping systems.

3.4 PRESSURE REGULATOR AND METER INSTALLATION

Install a valve on each side of each meter or regulator for isolating the regulator for calibration, maintenance, and removal. An insulating joint constructed to prevent flow of electrical current shall be installed between metallic pipe and the meter or regulator.

3.4.1 Pressure Regulators

**************************************************************************
NOTE: Delete inapplicable requirements. Remove reference to bypasses around pressure regulators unless continuity is imperative and the bypass is regulated to prevent possible over pressure of downstream lines.
**************************************************************************

Install pressure regulators [450 mm 18 inches above the ground on the riser] [where shown]. Provide a 10 mm 3/8 inch tapped fitting equipped with a plug on both sides of the regulator for installation of pressure gauges for adjusting the regulator. Regulators and valves shall be installed in rectangular reinforced concrete boxes. Boxes shall be large enough so that required equipment can be properly installed, operated, and maintained. Extend sidewalls above ground line. The boxes shall be provided with [steel door] [cast iron manhole] covers with locking provisions and 100 mm 4 inch diameter vents.
3.4.2 Meters

Install meters in accordance with ASME B31.8.

3.4.3 Vents

Locate discharge stacks, vents, or outlet ports of devices where gas can be discharged into the atmosphere without undue hazard. Vents shall terminate in the outside air in rain and insect resistant fittings. [Locate the open end of the vent where gas can escape freely into the atmosphere, away from any openings into the building and above areas subject to flooding.] [Stacks and vents shall be provided with fittings to preclude entry of water.]

3.5 INSTALLING PIPE UNDERGROUND

******************************************************************************

NOTE: Coordinate Section 31 00 00 EARTHWORK and details on the drawings to assure that pipe bedding materials are appropriate for the allowed pipe.

******************************************************************************

Installation shall be as specified in Section 31 00 00 EARTHWORK, except as modified herein; and as required by ASTM F402 and ASTM D2855 for using solvents and cleaners, ASTM D2774 for polyvinyl chloride and polyethylene pipe, and ASTM D3839 for fiberglass pipe.

3.5.1 Cathodic Protection

******************************************************************************

NOTE: Cathodic protection is mandatory for underground ferrous pipelines. The type and design of cathodic protection will be in accordance with UFC 3-570-02A. Stations will be provided for testing the cathodic protection system.

******************************************************************************

Provide cathodic protection for ferrous piping installed underground as specified in [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM].

3.5.2 Valve Boxes

Install valve boxes at each underground valve except where concrete or other type of housing is indicated. When the valve is located in a roadway, protect the valve box by a suitable concrete slab at least 1 square meter 3 square feet. When in a sidewalk, the top of the box shall be in a concrete slab 600 mm 2 feet square and set flush with the sidewalk. Valve boxes shall be separately supported, not resting on the pipe, so that traffic loads cannot be transmitted to the pipe.

3.5.3 Magnetic Tape

When non-metallic piping is installed underground, place foil backed magnetic tape above the pipe to permit locating with a magnetic detector.
3.5.4 Pipe Coatings

Repair any damage to the protective covering during transit and handling before installation.

3.6 INSTALLING PIPE ABOVEGROUND

With the exception of vacuum pipe segments [A-B] [B-C] [D-E] [_____] as indicated and/or shown, thermoplastic pipe shall not be installed aboveground. Install vertical pipe plumb in all directions. Perpendicular piping shall be installed parallel to building walls. Piping at angles and 45 degree runs across corners will not be accepted unless specifically shown. Install small diameter piping generally as shown when specific locations and elevations are not indicated. Piping shall be located to avoid ducts, equipment, and beams. Piping shall be installed to avoid obstructing corridors, walkways, work areas, and like spaces. Provide a minimum headroom clearance of \(2.2 \text{ m } 7 \text{ feet}\) under piping, unless otherwise indicated. Temporary caps or plugs shall be provided at pipe openings at the end of each day's work. Run piping in groups where practicable. Minimum clearance shall be \(25 \text{ mm } 1 \text{ inch}\) between pipe and other work.

3.6.1 Hangers and Supports

Install pipe hangers and supports in accordance with MSS SP-58 at locations where pipe changes direction. Hanger rods shall be installed straight and vertical. Chain, wire, strap or perforated bar hangers will not be permitted. Hangers shall not be suspended from piping. Where proper hanger or support spacing does not correspond with joist or rib spacing, suspend pipe from structural steel channels attached to joists or ribs. Contact between dissimilar metals shall be prevented when supporting copper tubing, by use of copper plated, rubber or vinyl coated, or stainless steel hangers or supports. Isolate thin walled stainless steel piping from carbon steel by use of plastic coated hangers or supports or by taping at points of contact with PVC or vinyl. Use galvanized or stainless steel hangers and supports in basins or submerged locations. Maximum support spacing, unless otherwise shown or approved for standard weight steel pipe, shall be as follows:

<table>
<thead>
<tr>
<th>Pipe Size</th>
<th>Spacing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 50 mm 2 inches</td>
<td>2 m 6 feet</td>
</tr>
<tr>
<td>50 to 75 mm 2 to 3 inches</td>
<td>3 m 10 feet</td>
</tr>
<tr>
<td>Greater than 75 mm 3 inches</td>
<td>4 m 12 feet</td>
</tr>
</tbody>
</table>

Maximum support spacing for pipe other than standard weight steel shall be two-thirds of the corresponding spacing for steel pipe unless otherwise shown or approved.

3.6.2 Insulation

Insulation shall be furnished and installed in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.
3.6.3 Coatings or Finishes

NOTE: Where the using service has specific requirements for color coding differing from the color specified, this paragraph will be modified accordingly and coordinated with paragraph, Identification and UFGS 09 97 02 PAINTING: HYDRAULIC STRUCTURES. Off-gases from landfills often consist of large quantities of Methane (CH4), Hydrogen Sulfide (H2S) and Carbon Dioxide (CO2) with a lesser amount of other organic compounds present. Phenolic or epoxy type coatings are generally recommended for this type of service.

Coatings and finishes shall be in accordance with Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES. Repair damage to the factory covering during transit and handling before installation. Painting is not required where piping is insulated, stainless steel, galvanized steel or nonferrous. Factory painted items requiring touching-up in the field shall be cleaned of foreign material and shall be primed and top coated with the manufacturer's standard factory finish. Paint exposed ferrous surfaces with two coats of enamel paint. Factory primed surfaces shall be solvent cleaned before painting. Prepare and prime surfaces that have not been factory primed in accordance with the enamel paint manufacturer's recommendations.

3.7 JOINTING PIPE

Join non-metallic piping by performance qualified joiners using qualified procedures in accordance with AGA XR0603. Joints shall be inspected by an inspector qualified in the joining procedures being used and in accordance with AGA XR0603.

3.7.1 O-Ring Joints

Clean jointing surfaces and adjacent areas before making joint. Gaskets and "O"-rings shall be lubricated and adjusted in accordance with manufacturer's recommendations. Check each gasket for proper position around full circumference of the joint after "O"-rings are compressed and before pipe is brought fully home. Jointing pipe shall be done in accordance with ASTM D3139 and manufacturer's recommendations.

3.7.2 Mechanical Joints

The plain end shall be centered and pushed into the bell. The gasket shall be firmly pressed evenly into the bell. The gland shall be slipped to the bell for bolting. The bolt threads shall be oiled. Bolts shall be tightened alternately 180 degrees opposite to each other to seat the gasket evenly. Apply bituminous coating to ferrous bolts and nuts before assembly. The maximum torque on bolts shall be as follows:

<table>
<thead>
<tr>
<th>Bolt Size (mminch)</th>
<th>Applied Torque (Nmft-lb)</th>
</tr>
</thead>
<tbody>
<tr>
<td>165/8</td>
<td>6850</td>
</tr>
<tr>
<td>Bolt Size (mm/inch)</td>
<td>Applied Torque (Nm/ft-lb)</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td>193/4</td>
<td>10880</td>
</tr>
<tr>
<td>251 inch</td>
<td>12290</td>
</tr>
<tr>
<td>321-1/4</td>
<td>149110</td>
</tr>
</tbody>
</table>

3.7.3 Flanged Joints

Use hexagon head nuts and bolts. Bolt projection through the end of the nut shall be limited to [6] [_____] mm [1/4] [_____] inch maximum. Manufacturer's rating and instructions for specified service shall be followed.

3.7.4 Expansion Couplings

Provide expansion couplings in tension to facilitate their removal. Stretcher bolts shall be set for maximum allowable elongation of expansion coupling as recommended by the manufacturer. Expansion couplings shall be provided as shown and as recommended by the manufacturer.

3.7.5 Destructive Joint Tests

**************************************************************************
NOTE: Destructive tests are provided as a designer option. Destructive tests are considered useful in assuring that good joints will be made. Delete the paragraph if this option is not exercised.
**************************************************************************

Each day, prior to making [heat fusion] [adhesive] [or] [solvent welded] joints, a joint of each size and type to be installed that day shall be made by each person assembling these joints that day and shall be destructively tested. Cut at least 3 longitudinal straps from each joint. Each strap shall be visually examined, shall not contain voids or discontinuities on the cut surfaces of the joint area, and shall be deformed by bending, torque, or impact, and if failure occurs, it must not initiate in the joint area. If a joint fails the visual or deformation test, the qualified joiner who made that joint shall not make further field joints in plastic pipe on this job until that person has been retrained and requalified. The results of the destructive tests shall be recorded to include the date and time of the tests, size and type of the joints, ambient conditions, fusion iron temperature and names of inspectors and joiners.

3.8 CONNECTIONS

3.8.1 Transitions Between Types of Pipe

Provide necessary adapters, specials and connector pieces when connecting different types and sizes of pipe or pipe furnished by different manufacturers. Underground connecting joints shall be encased with 150 [_____] mm [6] [_____] inches minimum, Class B concrete unless otherwise shown, or recommended by manufacturer. Connections between piping and equipment, where required, shall be made using [approved] [proper] fittings to suit the actual conditions.
3.8.2 Connections to Off-Gas Source and Discharge Points

Connect the off-gas pipelines to the source and discharge locations. Notify the Contracting Officer, in writing, 10 days before final connections and activation of the system.

3.8.3 Connection to Equipment

**************************************************************************
NOTE: Coordinate the drawings and specifications for blowers and treatment equipment.
**************************************************************************

Provide connections to the equipment in accordance with approved procedures. Isolation of equipment shall only be done [immediately on each side of the equipment] [at the valve location shown on the drawings].

3.8.4 Location of Existing Piping

Locations of existing piping shown should be considered approximate. Contractor is responsible for determining exact location of existing piping which may be affected by the work during earth moving operations.

3.8.5 Removing Existing Pipelines from Service

Pipelines shall not be removed from service unless specifically listed or approved by Contracting Officer. Notify the Contracting Officer at least [48] [_____] hours prior to removing each pipeline from service.

3.9 PRESSURE AND LEAKAGE TESTS

Perform tests on [pipe segments as shown] [the system as a whole] [sections that can be isolated]. Joints shall be tested in sections prior to backfilling when trenches have to be backfilled before the completion of other pipeline sections. Labor, materials and equipment for conducting the tests shall be furnished by the Contractor and shall be subject to inspection during the tests. The Contractor shall be responsible for the cost of repair, replacement, and retesting required because of failure to meet testing requirements. Prior to testing the system, the interior shall be blown out, cleaned and cleared of foreign materials. Meters, regulators, and controls shall be removed before blowing out and cleaning and reinstalled after clearing of foreign materials. Maintain safety precautions for pressure testing during the tests. Notify Contracting Officer [_____] [48] hours in advance of pressure, leakage and/or vacuum testing. Conduct tests in the presence of the Contracting Officer unless otherwise directed. During the test, the entire system shall be completely isolated from compressors and other sources of pressure. Perform testing with due regard for the safety of employees and the public during the test. Persons not working on the test operations shall be kept out of the testing area while testing is proceeding. Leakage test shall be conducted only after satisfactory completion of pressure test.

3.9.1 Bubble Tests

Test each joint in accordance with ASTM E515 prior to backfilling or concealing any work.
### 3.9.2 Pressure Testing

**NOTE:** Thermoplastic piping should not be pressure tested with air. Specify test pressure (including Class Location) to be used in accordance with ASME B31.8. Test pressure will not be less than 1.5 times the design pressure, but not exceeding 1.5 times the maximum rated pressure of the lowest-rated component in the system. Test pressures should recognize the weakest component of each segment tested for the design pressure and the maximum allowable operating pressure.

Backfill shall be placed and compacted to at least the pipe centerline before testing. Allow concrete for blocking to reach design strength and shall be backfilled and compacted to assure restraint by harnessed joints before testing. Section to be tested shall be slowly filled with [air] [water, and air shall be expelled. Corporation cocks shall be installed as necessary to remove air.] Test pressure shall be applied for one hour and gauge pressure shall be observed. Leaks shall be continuously checked while test pressure is being maintained. The off-gas piping system shall be tested after construction and before being placed in service using [water] [air] as the test medium. The pressure test shall continue for at least [24] [36] [48] hours from the time of the initial readings to the final readings of pressure and temperature. The initial test readings of the instrument shall not be made for at least 1 hour after the pipe has been subjected to the full test pressure, and neither the initial nor final readings shall be made at times of rapid changes in atmospheric conditions. The temperatures shall be representative of the actual trench conditions. There shall be no indication of reduction of the test pressure, [_____] kPa psig, applied at the lowest elevation of the pipeline section, during the test after corrections have been made for changes in atmospheric conditions in conformity with the relationship $T(1)P(2)=T(2)P(1)$, in which $T$ and $P$ denote absolute temperature and pressure, respectively, and the numbers denote initial and final readings. Lines which fail to hold specified test pressure or which exceed the allowable leakage rate shall be repaired and retested.

### 3.9.3 Leakage Testing

 Allow pipe to stand full of water at least 12 hours prior to starting leakage test. Exposed pipe, joints, fittings and valves shall be examined. Visible leakage shall be stopped, and the defective pipe, fitting or valve shall be replaced. The line under test shall be refilled to reach the required test pressure. The amount of water permitted as leakage shall be placed in a container attached to the supply side of the test pump. Container shall be sealed. No other source of supply to the pump or line under test shall be attached. Water shall be pumped into the line with the test pump to hold [_____] kPa psig for [2] [4] [8] hours. Water remaining in the container and the amount used during the test shall be measured and recorded on the test report. Test shall be considered as failed upon exhaustion of supply and/or inability to maintain the required pressure.

### 3.9.4 Vacuum Testing

 Test shall be performed on [the entire system] [individual sections] as
approved by the Contracting Officer. Openings shall be sealed in system or section to be tested. Vacuum [_____] kPa psig shall be pulled for one hour (isolating system from vacuum by closing valves). System shall be allowed to normalize and then the initial vacuum readings shall be recorded. The vacuum shall be recorded at intervals of [15 minutes] [1 hour] [_____] for the duration of the [8] [_____] hour test. Measurable leakage (loss of vacuum) after corrections have been made for changes in atmospheric conditions in conformity with the relationship $T(1)P(2) = T(2)P(1)$, in which $T$ and $P$ denote absolute temperature and total pressure, respectively, and the numbers denote initial and final readings, shall be repaired and retested.

3.9.5 Hanger Acceptance Testing

Bring pipe systems up to operating pressures and temperatures. Recycle systems to duplicate operating conditions. Submit reports of all inspections or tests, including analysis and interpretation of test results. Identify each report and test methods used, and record test results.

3.9.6 Demonstration

Upon completion of the work and before final acceptance, submit a Statement of Satisfactory Installation signed by the principal officer of the contracting firm stating that: the installation is satisfactory and in accordance with the contract plans and specifications; the manufacturer's prescribed procedures and techniques have been followed; and at a time designated by the Contracting Officer. The services of a qualified engineer shall be provided for a period of not less than [8] [_____] hours to instruct a representative of the Government in the contents of the operation and maintenance manuals for the equipment furnished under this Section. Submit [6] [_____] copies, in indexed booklet form, of site specific operation and maintenance manual for the piping system including system operation, system maintenance, equipment operation, and equipment maintenance manuals described below. If operation and maintenance manuals are provided in a common volume, they shall be clearly differentiated and separately indexed. The field instructions shall cover the items contained in the bound instructions.

a. The System Operation Manual shall include but not be limited to the following:

(1) Maps showing piping layout and locations of system valves and line markers.

(2) Step-by-step procedures required for system startup, operation, and shutdown. System components and equipment shall be indexed to the maps.

(3) Isolation procedures and valve operations to shut down or isolate each section of the system. Valves and other system components shall be indexed to the maps.

(4) Descriptions of Site Specific Standard Operation Procedures including permanent and temporary pipe repair procedures, system restart and test procedures for placing repaired lines back in service, and procedures for abandoning piping and system components.
(5) Descriptions of Emergency Procedures including: isolation procedures including required valve operations with valve locations indexed to the map, recommended emergency equipment, and checklist for major emergencies.

b. The Equipment Operation Manual shall include but not be limited to detail drawings, equipment data, and manufacturer supplied operation manuals for equipment, valves and system components.

c. The System Maintenance Manuals shall include but not be limited to:

(1) Maintenance check list for entire system.

(2) Descriptions of site specific standard maintenance procedures.

(3) Maintenance procedures for installed cathodic protection systems.

(4) Piping layout, equipment layout, and control diagrams of the systems as installed.

(5) Identification of pipe materials and manufacturer by location, pipe repair procedures, and jointing procedures at transitions to other piping materials or piping from different manufacturer.

d. The Equipment Maintenance Manuals shall include but not be limited to the following:

(1) Identification of valves and other equipment by materials, manufacturer, vendor identification and location.

(2) Maintenance procedures and recommended maintenance tool kits for valves and equipment.

(3) Recommended repair methods, either field repair, factory repair, or whole-item replacement for each valve component or piece of equipment or component item.

(4) Routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for constructing radon mitigation systems in new buildings, existing buildings and facilities, including constructing radon mitigation systems enclosures, when required.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

RADON MITIGATION FOR NEW CONSTRUCTION

NOTE: Consult the current EPA radon map and EPA documents for each state for additional information concerning radon zones.

For new construction in Zone 1 areas as defined on "EPA Map of Radon Zones", or when testing identifies radon concentrations equal to or greater than 4 pCi/L, passive radon mitigation systems should be incorporated into the original building design. The design should include provisions to permit installation of exhaust fans, if necessary, after testing the building under occupied conditions.
Criteria for radon mitigation in new construction is specified in EPA 625-R-92-016, (1994, Third Printing with Addenda) and the current version of "Radon Mitigation Standards for Schools and Large Buildings."

Materials (aggregate for capillary water barrier and poly(vinyl chloride) (PVC) pipe) currently in use for constructing new buildings, when properly arranged as indicated and specified in EPA 625-R-92-016, will provide a passive radon mitigation system. A separate specification section on radon mitigation for new construction seems unnecessary considering the materials are addressed in Division 02 and Division 15 sections and the installation will be shown on the drawings.

**************************************************************************

NOTE: A simple, effective, efficient, and economical radon mitigation system is little more than a PVC vent pipe (one suction point) exhausted to the atmosphere without a fan (passive system). For large areas requiring mitigation, the system could include several vent pipes connected to a single outlet with an appropriately sized in-line fan (active system). Depending on the distances between suction points, several individual vent pipes with or without in-line fans may be more practical.

This guide specification provides criteria and material requirements for constructing radon mitigation systems, post mitigation testing and constructing gypsum wallboard enclosures to conceal the radon mitigation systems in occupied spaces.

**************************************************************************

NOTE: The Designer should include unit price items to address post mitigation radon testing. Estimate the quantity and specify as unit price items in Section 00 21 13, INSTRUCTIONS TO BIDDERS or Section 01 20 00 Price and Payment Procedures per standard practice of the activity preparing the contract.

**************************************************************************

NOTE: The work may involve a historic property. The designer must coordinate review of the proposed work with the appropriate cultural resources manager (CRM) and cultural resource laws and regulations, as part of the environmental review and permitting process. Consultation with stakeholders, including the state historic preservation office, may be required, and work involving historic properties will likely be required to confirm to the Secretary of the Interior's Standards for the Treatment of Historic Properties (usually at the REHABILITATION
level). See https://www.nps.gov/tps/standards/four-treatments/treatment-rehabilitation.htm

PART 1 GENERAL

1.1 SUMMARY

NOTE: For work in the continental United States, Alaska and Hawaii select picoCuries per liter (pCi/L) as the unit of measure. For work elsewhere in the world Bequerels per cubic meter (Bq/cu m) may be the required unit of measurement. Consult with the Contracting Officer and use the unit of measure familiar to the prospective Contractors.

Provide all work necessary to reduce and maintain radon concentration levels below [148 Bequerels per cubic meter (Bq/cu m)] [4.0 picoCuries per liter (pCi/L)] in various buildings specified herein. Perform mitigation system installation, and perform post-mitigation testing and monitoring for radon.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 DEFINITIONS

1.3.1 Active Soil Depressurization (ASD)

A family of radon mitigation systems involving mechanically-driven soil depressurization, including sub-slab depressurization (SSD), sub-membrane depressurization (SMD), block wall depressurization (BWD) and crawl space depressurization (CSD).
1.3.2 Contract Documents

Documents furnished to prospective bidders/proposers containing information and specifying criteria and project requirements for diagnostic testing, design, construction and monitoring of multiple radon mitigation systems. The documents include this specification and the drawings listed in and accompanying this specification.

1.3.3 Long Term Radon Detectors

************************************************************************************
NOTE: For work in the continental United States, Alaska and Hawaii select pCi/L as the unit of measure. For work elsewhere in the world Bq/cu m may be the required unit of measurement. Consult with the Contracting Officer and use the unit of measure familiar to the prospective Contractors.
************************************************************************************

Alpha track, electret ion chamber, or approved equivalent. Devices capable of sensing and recording the presences of radon during a time period of 91 days to 12 months which when analyzed provide a numeric value, measured in [Bq/cu m][pCi/L], for radon concentrations during the time exposed.

1.3.4 Pressure Differential Gauge

A tool used to measure the PFE created by an ASD system. Calibrate the gauge in accordance with national standards and the manufacturer's recommendations. The gauge must be capable of readings to 0.25 Pa 1/1000 in water column

1.3.5 Pressure Field Extension (PFE)

The distance that a pressure change, created by drawing soil-gas through a suction point, extends outward in a sub-slab gas permeable layer, under a membrane, behind a solid wall or in a hollow wall.

1.3.6 Qualified Mitigation Professional

Regardless of team composition, a "Qualified Mitigation Professional" for the purposes of this document is defined as: "An individual that has demonstrated a minimum degree of appropriate technical knowledge and skills specific to radon mitigation of schools and large buildings: a) as established in certification requirements of the National Radon Proficiency Program (NRPP) or the National Radon Safety Board (NRSB); and b) as required by statute, state licensure or certification program, where applicable."

1.3.7 Short Term Radon Detectors

************************************************************************************
NOTE: For work in the continental United States, Alaska and Hawaii select pCi/L as the unit of measure. For work elsewhere in the world Bq/cu m may be the required unit of measurement. Consult with the Contracting Officer and use the unit of measure familiar to the prospective Contractors.
************************************************************************************
Charcoal, electret ion chamber, or approved equivalent. Devices capable of sensing and recording the presences of radon during a time period of 48-hours to 90 days which when analyzed provide a numeric value, measured in [Bq/cu m][pCi/L], for radon concentrations during the time exposed.

1.3.8 Suction Hole

Location at which vacuum is created for sub-slab communication testing.

1.3.9 Suction Point

Vertical standpipe penetrating into the soil gas environment containing radon and serving as the conduit to exhaust radon gas to the atmosphere.

1.3.10 Test Hole

Location at which pressure readings are taken during sub-slab communication testing. Readings are used to evaluate potential effectiveness of a sub-slab depressurization system.

1.4 SYSTEM DESCRIPTION AND REQUIREMENTS

1.4.1 Performance Requirements

**************************************************************************

NOTE: For work in the continental United States, Alaska and Hawaii select pCi/L as the unit of measure. For work elsewhere in the world Bq/cu m may be the required unit of measurement. Consult with the Contracting Officer and use the unit of measure familiar to the prospective Contractors.

**************************************************************************

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up
to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-03 Product Data**
- Respirators; G[, [____]]
- Radon Mitigation Systems Components
- Radon Mitigation Systems Enclosure Components

**SD-06 Test Reports**
- Post Mitigation Testing; G[, [____]]

- Contractor Experience; G[, [____]]
- Testing Laboratory Certification; G[, [____]]
- Proof Of Current Calibration For Testing Devices; G[, [____]]
- Radon Mitigation System Inspection; G[, [____]]
SD-08 Manufacturer's Instructions

Radon Mitigation Systems Components

Radon Mitigation Systems Enclosure Components

SD-10 Operation and Maintenance Data

Radon Mitigation Systems, Data Package 2; G[, [____]]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals

Radon Detector Location Log; G[, [____]]

Respirator Program Records; G[, [____]]

1.6 RADON DETECTOR LOCATION LOG

Prepare and provide to the Contracting Officer a Radon Detector Location Log for each building detailing the identity and location of each short term and long term radon detector. Prepare the log using copies of the "Device Placement Log" contained in EPA 402-R-92-014, and provide the appropriate information as line items. In addition to the log, on a copy of the building floor plans, locate and identify each short term and long term detector.

1.7 WORKER HEALTH AND SAFETY

Comply with OSHA, state and local standards or regulations relating to worker safety and occupational radon exposure. Prepare a worker protection plan in accordance with 29 CFR 1910.1096,[ OPNAV M-5090.1],[ EM 385-1-1,] and EPA 402-R-93-078.

1.7.1 Worker Protection Plan

The worker protection plan must address, at a minimum occupational radon exposure, safe use of all job site equipment including safe practices when using ladders or scaffolding; safe procedures for crawl space work and avoidance of job site hazards; discussion of hantavirus symptoms; fire and life safety issues; confined space access; handling caustic solvents and bonding chemicals; appropriate use of personal protective equipment; respiratory protection program; suspected contaminants such as asbestos, lead paint, mold or other toxins that may exist; safety data sheets (SDS); ventilated work areas as required to reduce occupational radon exposure. Adhere to 29 CFR 1926.59 and provide the Contracting Officer with a copy of the SDS for all materials brought to the site.

1.7.2 Worker Exposure Records

Maintain records of worker exposure to radon sufficient to verify that workers are exposed to less than four working level months (WLM) in any 12-month period.
1.7.3  **Medical Certification**

Provide a written certification for each worker and supervisor, signed by a licensed physician indicating that the worker and supervisor has met or exceeded all of the medical prerequisites listed herein and in 29 CFR 1910.1096 and 29 CFR 1926.103 as prescribed by law. Submit certificates prior to the start of work.

1.7.4  **Worker Notification**

Train workers exposed to radon about the hazards of exposure to radon and the need to apply protective measures when working in areas with elevated radon concentrations. Training must comply with 29 CFR 1910.1096. Submit a notification signed by each worker acknowledging they have been properly trained regarding the hazards of radon exposure.

1.8  **RESPIRATORY PROTECTION PROGRAM**

Establish and implement a respirator program as required by 29 CFR 1910.1096, and 29 CFR 1926.103. Submit a written description of the program to the Contracting Officer. Submit a written program manual or operating procedure including methods of compliance with regulatory statutes.

1.8.1  **Respirator Program Records**

1.8.2  **Respirator Fit Testing**

Conduct a qualitative or quantitative fit test conforming to 29 CFR 1926.103 for each worker required to wear a respirator, and any authorized visitors who enter a regulated area where respirators are required to be worn. A respirator fit test must be performed prior to initially wearing a respirator and every 12 months thereafter. If physical changes develop that will affect the fit, a new fit test must be performed. Functional fit checks must be performed each time a respirator is put on and in accordance with the manufacturer's recommendation.

1.8.3  **Respirator Selection and Use Requirements**

Provide respirators, and ensure that they are used as required by 29 CFR 1910.1096, 29 CFR 1926.103 and in accordance with CGA G-7 and the manufacturer's recommendations. Respirators must be approved by the National Institute for Occupational Safety and Health NIOSH, under the provisions of 42 CFR 84, for use in environments containing radon. For air-purifying respirators, the particulate filter must be high-efficiency particulate air (HEPA)/(N-,R-,P-100). The initial respirator selection and the decisions regarding the upgrading or downgrading of respirator type must be made by the Contractor's Designated IH based on the measured or anticipated airborne radon concentrations to be encountered.

1.8.3.1  **Respirators**

Provide personnel with respiratory protection as indicated in 29 CFR 1926.103. Breathing air must comply with CGA G-7.
1.9 QUALITY ASSURANCE

**************************************************************************
NOTE: Some states require only State listed mitigation contractors to perform radon mitigation work in their State. Determine the requirements for the State in which the work will be performed, and include the bracketed text if such is the case, otherwise delete.
**************************************************************************

1.9.1 Contractor Qualifications and Experience

Within 15 days after award, submit written evidence or data demonstrating that the Contractor and one or more subcontractors employed by the Contractor possess the qualifications and experience specified below.

1.9.1.1 Contractor Qualifications

The person responsible for diagnostic testing, construction and on-site supervision, as required by the specifications, must have successfully completed the requirements of and maintaining a current certification issued by either the National Radon Proficiency Program (NRPP) or the National Radon Safety Board (NRSB) as a qualified mitigation professional. Alternatively, in a State with legislation requiring mandatory credentialing for this work, compliance with the State legislation is acceptable. Evidence showing successful completion of the requirements of the NRPP or the NRSB must include copy of current certification document and documentation issued by the State.[ Listing in the State of [_____] is required.]

1.9.1.2 Contractor Experience

Submit written evidence demonstrating that the Contractor has successfully designed and installed at least [two] [_____] radon mitigation systems of the same or similar to the type required herein. The Contractor must have [3][5][_____] years of experience installing radon mitigation systems. Experience proof must include but not be limited to:

a. The contract name and number, completion dates of the project and the total cost of the project;

b. The names, telephone numbers and fax number of the facility or installation for whom the radon mitigation system design, construction and testing were performed;

c. The name, telephone number and fax number of a supervisory level point of contact at each facility or installation who has knowledge of the Contractor's performance.

1.9.1.3 Qualified Mitigation Professional

A Qualified Mitigation Professional must be physically present or ensure a responsible person is present during onsite activities and immediately available to direct, instruct and oversee activities of other individuals, mitigation installers and other professionals engaged in installation activities for the mitigation system(s). The qualified mitigation professional must have [3][5][_____] years of experience installing radon mitigation systems.
1.9.2 Testing Laboratory

Submit testing laboratory certification as proof that the testing laboratory performing radon detector analysis has successfully completed the requirements of the National Radon Safety Board (NRSB) or the National Radon Proficiency Program, (NRPP) and is qualified and authorized to perform such analysis. Alternatively, in a State with legislation requiring mandatory credentialing for this work, compliance with the State legislation is acceptable. [Listing in the State of [_____] is required.]

1.9.3 Diagnostic Testing Equipment

Submit proof of current calibration for testing devices used in performing diagnostic testing.

1.9.4 On-Site Supervision

No work at the site will be permitted without the presence of a person possessing the qualifications specified elsewhere in this section, namely certification issued by either the National Radon Proficiency Program, (NRPP) or the National Radon Safety Board (NRSB) as a qualified mitigation professional, or the State equivalent, where applicable.

1.9.5 Preconstruction Conference

******************************************************************************
NOTE: Specify additional or modified requirements to be addressed in the preconstruction safety conference within the bracket if different from that described. Confer with the appropriate Construction Office and Safety and Occupational Health Office representatives to make this determination. For Army projects refer to EP 415-1-260, Chapter 9, Resident Engineers Management Guide. If this conference is addressed in another specification section, reference the appropriate section.
******************************************************************************

Conduct a safety preconstruction conference to discuss the details of the Worker Protection Plan, Accident Prevention Plan (APP) including the AHAs required in specification section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS [______]. The safety preconstruction conference must include the Contractor and their Qualified Mitigation Professional, Designated IH and Project Supervisor and the Contracting Officer. Deficiencies in the APP will be discussed. Onsite work must not begin until the APP has been accepted. [______]

1.10 DELIVERY, STORAGE AND HANDLING

1.10.1 Delivery of Products

Deliver materials to the site in an undamaged condition. Deliver proprietary items in manufacturer's original unopened and undamaged containers of packages with manufacturer's name and brand and other pertinent data such as specification number, type, and class, date of manufacture. Schedule deliveries of materials to coincide with scheduled installation.
1.10.2 Storage and Handling

Carefully store materials off the ground to provide proper ventilation, drainage and protection against weather and dampness. Protect materials from marring, staining, rust, damage and overload and from contaminants such as grease, oil and dirt. Store materials at temperatures recommended by the manufacturer. Handle material to avoid damage such as chipping and breaking. Replace damaged material.

1.11 PROJECT CONDITIONS

1.11.1 Building Descriptions

**************************************************************
NOTE: Provide a general description for each building and address conditions which may affect the work or the cost of accomplishing the work. For each building, address the following as appropriate for the areas in which work is to be accomplished:

1. Type of construction for the exterior walls, interior walls and partitions and the floor in contact with or above soil containing radon gas. Indicate thickness of concrete slab and aggregate beneath the concrete slab.

2. Number of floors.

3. Type of roof, flat or pitched. If pitched roof, overhang size. Type of roof covering.

4. Do rooms/spaces have suspended ceilings? This could be shown on the drawings if not consistent throughout the building.

5. Will the building and individual rooms or spaces be occupied or unoccupied during construction? Will access to the building or individual room or spaces be restricted in any way which would delay the start of work each day?

6. Restrictions with respect to penetrations to the building exterior, such as no roof penetrations, if any.

7. Restrictions on penetrating the concrete floor slab with respect to what may be embedded in the concrete slab (i.e. rebar spacing, electrical grounding grid embedded in the concrete slab).

8. Restrictions with respect to routing vent pipe on the building interior or exterior, if any. Vents may not be desired on the exterior of a particular side of the building.

The sample paragraph below may be used as a starting point for each building description.

**************************************************************
[Building No. [_____] is a three story, brick faced (CMU backed), slab-on-grade structure with a partial basement on the southeast corner of the building. Concrete slab is approximately [_____] mm inches thick and the aggregate beneath the concrete slab is approximately [_____] mm inches thick. Interior partitions are gypsum wallboard on metal studs except where indicated otherwise on the drawings. The roof is flat and covered with single ply rubber membrane. Except for the basement, mechanical rooms and closets, all rooms have suspended acoustical ceilings located approximately 450 mm 18 inches below the structural floor or roof above. The building will[ not] be occupied during the contract period.[ Roof penetrations are not permitted and the south elevation must remain unchanged as a result of the work.][ Penetrations to the building exterior must be through the roof only. All elevations must remain unchanged as a result of the work.]

]PART 2  PRODUCTS

2.1  RADON MITIGATION SYSTEMS

2.1.1  System Performance

**************************************************************************
NOTE: For work in the continental United States, Alaska and Hawaii select pCi/L as the unit of measure. For work elsewhere in the world Bq/cu m may be the required unit of measurement. Consult with the Contracting Officer and use the unit of measure familiar to the prospective Contractors.
**************************************************************************

Radon mitigation systems must reduce and maintain radon concentration levels below [148 Bq/cu m][4.0 pCi/L] after activation of the mitigation systems.

2.1.1.1  System Piping

Route radon mitigation systems piping so as not to interfere with the daily operations and functions of the building occupants. Keep visibility of the systems to a minimum. Enclose each radon mitigation system in occupied spaces, however, all operating components must be accessible for maintenance and repair. All spaces must be considered to be occupied spaces except for mechanical and electrical rooms, warehouses, storerooms, janitor closets, crawl spaces, [_____] and attic spaces. Enclosures are not required for portions of systems installed above suspended acoustical ceilings.

2.1.1.2  System Outlet Location

**************************************************************************
NOTE: In climates where condensation is subject to freezing and ice build-up at the discharge point above the roof line, include the bracketed text, otherwise delete.
**************************************************************************

Mitigation system discharge points must be as specified in ANSI/AARST RMS-LB and EPA 402-R-93-078. Prevent foreign objects from entering the outlet.[Rain caps are not permitted.] Maintain water tight seal through all penetrations to the building exterior.

SECTION 31 21 13  Page 17
2.1.1.3 System Failure Warning Monitor

Provide a means to detect and announce each radon mitigation system failure. System failure is defined as:

b. Mechanical failure: fan or other mechanical failure.

c. System leakage: pipe breakage or crack.

Provide an audio or visual annunciator device to indicate system failure and locate the annunciator device in an occupied space. Conform to the requirements of ANSI/AARST RMS-LB and EPA 402-R-93-078.

2.1.1.4 Air Cleaners

Do not use air cleaners as a radon reduction method.

2.1.1.5 Ventilation Devices

Do not use devices that solely increase ventilation as a radon reduction method.

2.1.1.6 Back Drafting

Do not allow radon mitigation systems to cause back drafting of building chimneys.

2.1.2 Radon Mitigation Systems Components

Mechanical and electrical materials, fabrication, construction and installation must conform to the following industry standards:

b. In-line Tubular Centrifugal Fans: AMCA 210 and UL listed.

c. Electrical Work: NFPA 70, NEMA MG 1, ANSI/AARST RMS-LB and EPA 402-R-93-078, No. 12 AWG minimum wire size, solid copper installed in EMT or surface metal raceway.

e. Sealants: ASTM C920, polyurethane, Type S, Grade P for horizontal application, Grade NS for vertical application, Class 25, Use T.

f. Crawl space soil-gas retarder membrane must be minimum [40][60] mils thick.

**************************************************************************
NOTE: Include mock downspouts and fittings only when round PVC piping is not acceptable for aesthetic reasons.
**************************************************************************

[ g. Mock Downspouts and Fittings: Aluminum, ASTM B209M ASTM B209, minimum
0.81 mm 0.032 inch thick, color to match existing. Seal seams and joints. Use downspout only on the building exterior above the fan with appropriate round to downspout shape PVC adapter.

2.2 RADON MITIGATION SYSTEMS ENCLOSURES

**************************************************************************
NOTE: Select the first bracketed paragraph for enclosure materials and construction when the project involves only radon mitigation work. Select the second bracketed paragraph when the project also involves building renovations which require project specification sections addressing the work listed in the second bracketed paragraph.
**************************************************************************

**************************************************************************
NOTE: When selecting the MPI painting/coating designations, determine whether an eggshell, semi-gloss or gloss finish is desired.
**************************************************************************

Radon mitigation systems enclosure components, materials, fabrication, construction and installation must conform to the following industry standards:

a. Concrete: ACI 301.

b. Wood Studs and Furring: WWPA G-5, WCLIB 17, SPIB 1003 or NELMA Grading Rules Standard Light Framing, air dried or kiln dried lumber.

e. Sealants: ASTM C834.

f. Painting/Coating: MPI 50 and [[MPI 139] [MPI 141][MPI 114]], provide primer, intermediate and top coat. Match existing coating material. Match the adjacent surfaces color.

g. Hardware: Be of the type and size necessary for the project requirements. Sizes, types and spacing of fasteners for manufactured building materials must be as recommended by the product manufacturer. Hardware exposed to the weather or embedded in or in contact with preservative treated wood, exterior masonry, or concrete walls or slabs must be zinc coated.

Radon mitigation systems enclosure components, materials, fabrication, construction and installation for concrete, wood studs and furring, metal studs and furring, gypsum wallboard, sealants and painting must conform to the requirements specified in the respective specification sections addressing this work contained in the project specification.
PART 3  EXECUTION

3.1  RADON MITIGATION SYSTEMS INSTALLATION

3.1.1  Furnishings

**************************************************************************
NOTE: Choose one of the following options. In most projects, the Government will remove furniture and equipment before the Contractor begins work. In this case the first paragraph should be used.
**************************************************************************

[ Furniture [,(_____)] and equipment will be removed from the area of work by the Government before radon mitigation work begins.

][Furniture [, (______)] and equipment will remain in the building. Cover and seal furnishings with 0.15 mm 6-mil plastic sheet or remove from the work area and store in a location on site approved by the Contracting Officer.

3.1.2  Installation

a. Provide radon mitigation systems as indicated in the approved design drawings, as specified in ANSI/AARST RMS-LB, EPA 402-R-93-078 and as required by the specifications and standards referenced herein for the respective materials using workmen skilled in the trades involved. Install piping plumb and parallel to existing walls, partitions and ceilings as appropriate, slope horizontal runs to drain, and secure in place in a rigid and substantial manner.

b. Seal new and existing floor slab penetrations in accordance with EPA 402-R-93-078 and as specified herein. Prevent entry of soil gas into the building and exhausting of conditioned air via the radon mitigation system. Seal cracks and openings around floor slab penetrations with polyurethane sealant. Provide backer rod or comparable filler material as required. Insure that all penetrations to the building exterior are weathertight.

c. Lay work out in advance. Exercise care where cutting, channeling, chasing or drilling floors, walls, partitions, ceilings or other surfaces as necessary for proper installation, support or anchorage. Patch and repair damage to buildings, piping and equipment using workmen skilled in the trades involved.

d. Coordinate all work with the Contracting Officer.

3.1.3  Supervision

Installation of the radon mitigation systems must be supervised by a qualified mitigation professional.

3.1.4  Electrical Work

3.1.5 Mechanical Work

3.1.6 System Identification

**************************************************************************
NOTE: For NAVFAC projects include the bracketed text, otherwise delete.
**************************************************************************

Label all components of the radon mitigation systems including, but not limited to, piping (every 3 meters 10 feet), enclosures, fans, electrical conduit (every 3 meters 10 feet) and circuit breakers. Labels must read:

Radon Reduction System. Do Not Turn Off.
Public Works Office Phone [_____
[ or as specified by the Contracting Officer.

3.2 RADON MITIGATION SYSTEM ENCLOSURES INSTALLATION

Provide enclosures as indicated in the approved design drawings and as required by the specifications and standards referenced herein for the respective materials using workmen skilled in the trades involved. Install enclosures plumb, level and parallel to existing walls, partitions and ceilings as appropriate, and secure in place in a rigid and substantial manner.

3.3 POST MITIGATION FUNCTIONAL EVALUATION/INSPECTION

3.3.1 ASD Systems

In conjunction with activating an ASD system, the suction in system piping must be measured and recorded along with at least one PFE measurement that is conducted under closed-building or normal operating conditions. It is recommended that both measurements be made under conditions that reflect normal building operation when significantly occupied and include consideration for worst-case conditions.

3.3.1.1 PFE Measurement

Obtain PFE measurements at more than one point distant from each suction point(s) to verify intended design using a differential pressure gauge capable of reading to 0.25 Pa 1/1000 in water column. Record PFE test location and close in a nonpermanent fashion to facilitate any future needs (e.g. diagnosing a system when radon tests do not indicate success in achieving mitigation goals).

3.3.2 Non-ASD Systems

Measurements of airflow volume, pressure and other system parameters that are applicable to the method chosen must be recorded after installation.

3.4 FIELD QUALITY CONTROL

3.4.1 Radon Mitigation System Inspection

Inspect and approve in writing by a qualified mitigation professional each
radon mitigation system. Verify compliance with the design, ANSI/AARST MALB, ANSI/AARST RMS-LB and the presence of fire stops. Provide the Radon Mitigation System inspection to the Contracting Officer. Deficiencies identified in the inspection report must be corrected by the Contractor at no additional cost to the Government.

3.4.2 Post Mitigation Testing and Monitoring

Perform post mitigation radon testing in the buildings as specified in ANSI/AARST RMS-LB, EPA 402-R-93-078 and herein.

3.4.2.1 Short Term

**************************************************************************
NOTE: For work in the continental United States, Alaska and Hawaii select pCi/L as the unit of measure. For work elsewhere in the world Bq/cu m may be the required unit of measurement. Consult with the Contracting Officer and use the unit of measure familiar to the prospective Contractors.
**************************************************************************

Test each radon mitigation system as described below.

a. Test each radon mitigation system for effectiveness no sooner than 24-hours nor later than 15 days after activation of the radon mitigation system. Perform all testing in accordance with ANSI/AARST MALB, ANSI/AARST RMS-LB and all local, state and Federal requirements. Provide short term radon detectors (charcoal, electret ion chamber or approved equivalent) at the rate of one detector per 196 square meters 2,000 square feet but not less than one detector per enclosed space, except for closets. On copies of the building floor plans, locate and identify each short term detector and provide short term detector data on copies of the "Device Placement Log" contained in EPA 402-R-92-014.

b. At the end of the testing period, collect the detectors and send the detectors to the testing laboratory for analysis. Provide radon test results of the effectiveness of the mitigation systems not later than 30 days after collecting the detectors. Radon test results must be sent from the testing laboratory directly to the Contracting Officer with one copy to the Contractor. Complete the line item information on the "Device Placement Log."

c. Radon test results above [148 Bq/cu m][4.0 pCi/L] require system redesign and installation modifications as necessary to achieve radon test results below [148 Bq/cu m][4.0 pCi/L]. Submit design modifications to the Government for review and approval. After approval of the design modifications, provide installation modifications to the radon mitigation system and retest for effectiveness. Repeat this short term test procedure until test results below [148 Bq/cu m][4.0 pCi/L] are achieved.

d. System modifications (as-built systems installations) must be reflected in the Contractor's design documents (drawings and design narrative).

3.4.2.2 Long Term

**************************************************************************
NOTE: For work in the continental United States, Alaska and Hawaii select pCi/L as the unit of measure. For work elsewhere in the world Bq/cu m may be the required unit of measurement. Use the unit of measure familiar to the prospective Contractors.

After acceptance of the radon mitigation systems, provide for long term testing (8 to 12 months), see below.

a. Perform all testing in accordance with ANSI/AARST MALB, ANSI/AARST RMS-LB and all local, state and Federal requirements. Provide long term radon detectors (alpha track, electret ion chamber or approved equivalent) at the rate of one detector per 186 square meters 2,000 square feet but not less than one detector per enclosed space, except for closets. Locate and identify each detector on copies of the building floor plans and in the Radon Detector Location Log. After installing the detectors, furnish the completed detector documentation and mailers to the Contracting Officer.

b. At the end of the testing period, collect the detectors, request return of the detector documentation and mailers from the Contracting Officer and send the detectors to the testing laboratory for analysis. Radon test results must be sent from the testing laboratory directly to the Contracting Officer with one copy to the Contractor. Complete the line item information in the Radon Detector Location Log.

c. At the end of the testing period, the Contracting Officer will collect and send the detectors to the testing laboratory for analysis. Radon test results must be sent from the testing laboratory directly to the Contracting Officer with one copy to the Contractor.

d. Radon test results above [148 Bq/cu m][4.0 pCi/L] require system redesign and installation modifications as necessary to achieve radon test results below [148 Bq/cu m][4.0 pCi/L]. Submit design modifications to the Government for review and approval. After approval of the design modifications, provide installation modifications to the radon mitigation system and retest for effectiveness. Repeat the short term and long term test procedures specified herein until test results below [148 Bq/cu m][4.0 pCi/L] are achieved.

e. Payment for work required because long term testing results in readings above [148 Bq/cu m][4.0 pCi/L] will be made from the funds identified in the "Schedule of Prices" for the work required under this paragraph and defined under the paragraph POST MITIGATION TESTING - SCHEDULE OF...
f. Final system modifications (as-built systems installations) must be reflected in the Contractor's design documents (drawings and design narrative).

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for tunnel excavation for underground construction by blasting. Tunnel Excavation guide specifications for excavation using mechanical methods such as Tunnel Boring Machine (TBM) or roadheader presently do not exist but may be developed in the future. This specification is currently for use in tunnel excavation in bedrock conditions equivalent to at least two tunnel diameters below top of rock (i.e., ledge) only. For mixed-face or soft ground tunneling conditions (i.e., soil-like conditions), consider alternate mechanical excavation methods to account for anticipated ground conditions for appropriate equipment selection and methods of ground support and groundwater control. For localized ground conditions including fault zones or other specialized ground conditions, revise specification to account for potentially adverse rock characterization conditions identified in the Geotechnical Baseline Report or other geotechnical design documents. This section was originally developed for USACE Civil Works projects.

For projects on a naval facility, consult with local NAVFAC office, Naval Ordnance Safety and Security Activity (NOSSA), and NAVSEA on requirements. NAVSEA OP5 Ammunition and Explosive Safety Ashore manual dictates many of the requirements and NOSSA has the final determination on blasting on a Navy installation above or underwater. Reference NAVSEA OP5 manual and contact local Explosives Safety Officer and Planner for the base prior to revising the specification. Overall NOSSA approval process can take 12-18 months depending on the level of approval required.

Adhere to UFC 1-300-02 Unified Facilities Guide
Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: For USACE: Consult with Subject Matter Experts (SME) from the Geotechnical Engineering, Structural Engineering, Engineering Geology, and Materials Community of Practice or District Office that has most recently completed a similar type of underground construction project, while editing this section, to be appraised of recent, specific requirements, guidance, excavation methods or understandings for the subject project.

Consult with or have Specification reviewed by a Subject Matter Experts in Underground Construction for projects involving Tunnel Excavation as a primary component of a project, or where Underground Construction issues are particularly challenging.

There are likely decisions and/or requirements of other agencies, the Safety Manual, and/or internal offices/divisions/branches, which could have an influence upon a project's underground construction specifications. Some of these issues may be: concerns from federal, state, and local jurisdictions and agencies; public use of nearby federal, state and/or local properties near or adjacent to the project; evaluations of acceptable construction vibrations, noise and/or pressures affecting individuals or reaching nearby structures; natural resource impact reviews, negotiations and/or requirements; constraints on the excavation means and methods; pre-construction inspections; special studies to facilitate lower cost of the bids or to encourage more bid submissions; the acquisition strategy for the payment; and, other concerns specific to the project.

This Tunnel Excavation guide specification covers the construction of underground facilities by means of blasting in rock and includes mucking. The details on excavation are typically covered by a
separate Rock Excavation specification.

The following minimum requirements for project information will be indicated on the project drawings:

1. Surface elevations, existing and new.

2. All utilities, whether trenched, buried, at the surface or overhead to distances well beyond the project's limits;

3. Spatial location and record of all soil and rock borings and test pits, instrumentation, and/or geophysical surveys including soil and rock classifications and the pertinent engineering properties. For example this data may include, but is not limited to, weathered rock, material strength, bit drops, circulation loss, voids, ground water observations, SPT, Recovery, RQD, RMR, lab testing results, permeability, stratigraphy, geologic features and structure, and topsoil thickness encountered in boring (NOTE: This is a list of examples of data pertinent to the tunnel design that may be provided in the project drawings or GBR/GDR but does not include all possible engineering properties or conditions of soil and rock that characterize a specific site.);

4. Reference to project Geotechnical Data Report (GDR), Geotechnical Interpretation Report (GIR) and/or Geotechnical Baseline Report (GBR) for additional site characterization information not contained on the project drawings.

5. Location and limits of hard material, whether rock or concrete, or other building materials;

6. Excavation or demolition limits, and clearing, stripping and grubbing limits, and tolerances of excavation;

7. Details of special limits that may require line drilling, presplitting, reduced subdrilling, and/or specialty blasting practices;

8. Location of borrow and disposal area, if located on Government property; or on site (as some sites may or may not remain government property, and disposal sites may be under control of project partners);

9. Hydrological, hydraulic and impoundment data, where applicable; and,

10. Details of all rights-of-way within the project boundaries.

**************************************************************************
**NOTE:** Typical Measurement and Payment language is to be inserted into the Measurement and Payment specification section. This is typical language used that will need to be tailored for the project needs.

---

1.1 **METHOD OF MEASUREMENT**

Tunnel support for the various support categories must be measured and paid by the individual components comprising each support category (e.g., Rock Bolts, Steel Arch Ribs, Shotcrete), under their respective specification or special provision section.

Tunnel Excavation must be measured by the measured in accordance with the 'B' line payment limit shown on the Drawings. Tunnel drainage must be measured and paid under Section 01 20 00 PRICE AND PAYMENT PROCEDURES.

1.2 **BASIS OF PAYMENT**

The accepted quantities measured as specified above must be paid for at the contract unit price for the pay items listed below.

<table>
<thead>
<tr>
<th>Pay Item</th>
<th>Pay Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tunnel Excavation</td>
<td>[Meter][Cubic Meter][Linear Foot][Cubic Yard]</td>
</tr>
</tbody>
</table>

Payment for Tunnel Excavation must constitute full compensation for all excavation, scaling, scaling reports, support, blasting, blasting reports, removal, hauling and disposal of excavated materials, construction ventilation and illumination, control of water and groundwater inflow including groundwater testing, supply of potable water, and all other work necessary for completion of the tunnel in accordance with the Contract Documents.

---

**NOTE:** The coordination with other federal, state, and local jurisdictions and agencies, the public, and private entities must be completely resolved before finalizing the specifications. A project's excavation and/or foundation requirements, for which, dense materials are being removed, may require navigation, highway, structural and/or other regulations and codes to be followed. Depending upon the proximity of public-use areas, private residences or businesses, and the project's location within a county or township, various accommodations will need to be required for the protection of the public, and the safety of private entities regarding local laws, regulations, and ordinances. Avoiding natural resource impacts may overlay other measures and require: seasonal or daily time limitations of the initiation of the individual blast patterns; special observers for some or all the underground construction work; special studies or monitoring while blasting operations is being conducted; and, other potential considerations.
Agency coordination will vary by project. Be certain that all government stakeholders have been involved with planning of the project and approved of all requirements for the specifications. List those important navigation or safety stakeholders. When there are navigable waters near the excavation zone, list in the controlled navigation perimeter's distance during the warning period of a shot. While the distance is project specific, the minimum distance is typically 300 m 1,000 ft.

It is essential that the agency/service person, using these Guide Specifications to prepare Plans and Specifications coordinate with the planners and environmental compliance specialists within their agency/Service to ensure that all appropriate restrictions and mitigation measures for hazards associated with tunnel excavation and underground construction are incorporated into the Plans and Specifications. Failure to comply with the requirements of applicable Federal or state laws and regulations could result in project delays or stoppages, as well as the potential for increased project costs.

**************************************************************************

1.3 SCOPE

This work must consist of excavation and disposal of all material within the rock tunnel limits indicated on the plans, in accordance with these specifications and in conformity to the lines, grades, stations and tolerances shown on the plans or as established in the field by the Contracting Officer. Some general guidelines to maintain the inherent strength of the ground surrounding the tunnel opening have been included. In addition, the work also includes geotechnical instrumentation for monitoring rock displacement and water management in the tunnel; including but not limited to, furnishing, installing, and monitoring of optical survey targets in the tunnel, collection and interpretation of data and furnishing all other necessary material, equipment and labor incidental to such work, [furnishing of optical survey targets], including installation and monitoring of instruments in accordance with the specifications. The Contractor must monitor all geotechnical instrumentation and interpret the data obtained from them. The data must be made available to the Contracting Officer [upon request] [within 24 hours of reading].

The breakage of rock and hard/unyielding materials may be conducted by any means unless otherwise stated herein. If the contractor elects to use drilling and blasting for breakage or displacement of units, this entire section is applicable and covers activities associated with drilling and blasting for rock excavation at the surface for portal and shaft construction, or underground tunneling operations. Contained herein are procedures for all activities relating to drilling; blasting and the transportation, storage and use of explosives; breakage and displacement of rock. The Contractor's blasting program and methods are those necessary to accomplish the excavation shown on the Contract drawings in accordance with the provisions specified herein. Contractor's blasting plan must address site-specific conditions affecting the control, quantity, and magnitude of explosives fired in all blasting operations to prevent injuries to persons

SECTION 31 23 00.00 Page 8
and avoid damage to all structures, properties, governmental and nonprofit entities, commerce and businesses, and natural resources and their habitat.

1.4 RELATED WORK SPECIFIED ELSEWHERE

**************************************************************************
NOTE: These specifications for related work specified elsewhere are not all inclusive. Add and remove specifications as needed for the project.

List specifications that are related, such as Earthwork, Excavation, Soil and Rock Anchors, Temporary Environmental Controls, Shotcrete, Natural Resources, are typical specs related depending on the project.

The specifications without numbers listed below presently do not have a corresponding UFGS Guide Specification. The designer will need to write a project-specific specification to address those features of work

"Geotechnical Interpretive Report" (GIR) dated [______], prepared by [______].

1.7 DEFINITIONS

**************************************************************************

NOTE: Delete definitions that will not be used in the specification text for a specific project. A complete list of frequently used tunneling terms can be found in Appendix B of the EM 1110-2-2901, blasting definitions can be found in the GLOSSARY of the EM 1110-2-3800, and other references. Recommend only including definitions not already referenced in the EM and definitions to further define the work on the specific project in the specification. It may be necessary to add definitions depending on what the Earthwork and/or Excavation specifications for the project have terms for Rock, Weathered Rock, Sound Rock, Voids, Sediment, etc.

**************************************************************************

1.7.1 Controlled Blasting

**************************************************************************

NOTE: This section may be applicable for the shaft/portal blasting construction.

**************************************************************************

Controlled blasting refers to blasting techniques used to better distribute the explosive charge to minimize impacts such as fracturing and loosening of the rock beyond the design excavation line (overbreak) and limit vibration effects. This is accomplished by using small diameter, decoupled charges in closely spaced blastholes placed on the perimeter of an excavation. Methods including but not limited to line drilling, and pre-splitting (pre-shearing) cushion blasting, and buffer zone blasting.

1.7.2 Airblast

Airblast are the overpressure waveforms that move though air as audible and sub-audible sound waves. These are also called compression waves. Airblast is one of the three, primary adverse impacts from blasting.
1.7.3 Vibrations

**************************************************************************
NOTE: There are other impacts that may be related to blasting that should be considered, such as ground settlement, disruption to structures or activities, hazardous environments.
**************************************************************************

Vibrations are the second of the three, primary adverse impacts from blasting. The third primary adverse impact from blasting is flyrock. Vibrations are the result of various wave forms emanating from the detonation or deflagration of ignited materials from a shot pattern. Peak particle velocity (PPV) is defined as the maximum absolute value among the three ground vibration velocities measured in the vertical, longitudinal, and transverse directions over the period of a record. Peak, total vector-sum particle velocity is the peak value over the full-time history of each time-unit's value of the square-root sum of the squared, component velocities. Velocity units are expressed in centimeters per second (cps) or inches per second (ips).

1.7.4 Initial Support

Installed at and adjacent to the excavation face following a heading advance to minimize ground movement and loosening and to maintain stability of the opening prior to construction of the permanent lining. Initial support for the rock tunnel generally refers to all elements of rock support required to provide a safe, stable rock excavation at all times during construction. Elements of rock support include, but are not limited to, such items as steel ribs, timber blocking, spiling, rock dowels and anchors, steel straps, welded wire fabric or shotcrete.

1.7.5 Additional Initial Support

May include rock bolts and dowels, crib and lagging, steel straps, spot-holds, steel sets, steel liner plates, shotcrete and pre-reinforcement spiling in addition to the initial support types and quantities for the support categories as shown on the Contract Drawings. Additional ground support measures should be installed in a systematic or non-systematic manner, for local stabilization and safety during tunneling operations.

1.7.6 Final Lining

**************************************************************************
NOTE: Tailor this paragraph to the type of final lining for the project, this may be a cast-in-place or precast reinforced concrete liner, steel liner that is backfilled with contact grout, or left unlined, maybe with shotcrete or reinforced (steel fiber) shotcrete or other.
**************************************************************************

[Cast-in-place reinforced concrete, steel] lining that is installed after the tunnel has been excavated and supported with initial support. Backfill concrete and contact grout are also included in the final lining.
1.7.7  Design (Excavation) Line

**************************************************************************
NOTE: This nomenclature should be defined during the development of the plans and specifications as it will be specific for each project.
**************************************************************************

A line within which no unexcavated material must remain. Only shotcrete, structural steel rib supports with limited blocking, rock dowels, including bearing plates and metal hardware, and tie rods may extend beyond the design line as shown on the Drawings. The minimum concrete cover over these elements is shown on the Drawings. Embedments shown on the Drawings within the design line must be placed as shown. The Contractor may select the size of the excavated opening provided that finished minimum excavation tolerances are maintained and the design line requirements and diameter constraints given in this section are satisfied.

1.7.7.1  A-line (Theoretical Excavation Line)

The A-line, shown in the contract drawings is the line within which unexcavated material must not be permitted to remain.

1.7.7.2  B-line (Pay Line)

The B-line shown in the contract drawings is the outside limit to which measurement for payment for excavation must be made. Measurement for payment must be made to this line regardless of whether the limits of the actual excavation are inside or outside of the B-line. Excavations beyond the B-line performed by the Contractor for purpose or reason except as shown on the Drawings or as may be ordered in writing by the Contracting Officer, must be at the expense of the Contractor.

1.7.8  Heading

A general term used to refer to the advancing (excavation) tunnel face.

1.7.9  Face

The position of the underground works that has been advanced the furthest for the respective section of the overall construction sequence adopted for the large span tunnels. Also referred to as "Working Face" or "Heading."

1.7.10  Forward Area

Is that area within which the initial ground support is to be installed behind the heading (depends on rock mass conditions, stand up time, and heading advance rate).

1.7.11  Initial Ground Support

**************************************************************************
NOTE: Other common terminology may include wood lagging and liner plate (gasketed and un-gasketed), splines, strapping, mesh, steel sets, steel-fiber reinforced shotcrete, expandable bolts.
**************************************************************************
NOTE: In addition, the initial support systems indicated on the Drawings for additional openings in the tunnel, must form part of the Permanent Support.

The support system installed after an excavation advance within the tunnel forward area to minimize ground deformation and loosening and to maintain stability and safety of the opening. Initial support measures include, but may not be limited to, rock bolts and dowels for rock reinforcement, shotcrete lining, steel ribs, and pre-reinforcement for the duration of construction and prior to installation of the permanent support.

1.7.12 Length of Advance Interval

Length of the unsupported span of ground exposed during one excavation advance increment (depends on rock mass conditions, stand up time, and heading advance rate).

1.7.13 Line Drilling

Line drilling may be applicable in and around tie-in structures where precise ground control is needed. Within tunnel blasting operations, perimeter holes, back holes or heading rounds may be line drilled for overbreak control along the rib, springline and through the crown. Typically line drilling is applied during shaft or portal construction.

1.7.14 Excessive Overbreak

The amount of ground unintentionally removed beyond the pay line, or B-Line. The Contractor should attempt to minimize overbreak.

1.7.15 Over-Excavation

Excavation of ground beyond the theoretical excavation line, or A-Line.

1.7.16 Probe Hole

An exploratory hole drilled in advance of an excavation to explore ground conditions or water infiltration conditions. Supplemental probe holes are those installed in addition to the probe holes shown on the Drawings or required herein and at the direction or approval of the Contracting Officer.

1.7.17 Scaling

Consists of barring, wedging, and picking to remove loose, shattered, or unstable pieces of rock around the heading advance. Individual pieces not in accordance with the specified tolerance must also be removed during scaling.

1.7.18 Shotcrete

Mortar or concrete conveyed through a hose and pneumatically projected at high velocity onto a surface.

1.7.19 Staged Excavation

NOTE: Advancing multiple headings is often performed in poor ground or for larger final tunnel
dimensions, where a top (left and/or right) heading is advanced, supported then the other heading or bench removed, potentially also removing the center support system separating the headings.

Sequence of excavation by which the final excavation is divided into a group of smaller drifts, also referred to as slashes and cuts, or top heading and bench.

1.7.20 Support Type

Method of excavation and initial support defined in the Drawings for use at a particular location.

1.7.21 Tights or Underbreak

Projections of rock in a tunnel inside the minimum excavation profile (A-line) that need to be removed prior to placement of lining.

1.7.22 Water Sheet or Panning and Drain Hose

PVC-sheet, PVC-pan and PVC-hose used to collect and drain off ground water from areas at either the excavated surface behind the shotcrete lining or to collect and drain seepage through the shotcrete lining.

1.7.23 Smooth Wall Blasting

NOTE: Smooth wall blasting can be used around openings and sensitive structures.

Refers to a technique involving perimeter holes drilled along the excavation limits which are lightly loaded to remove the final burden and are fired on the last delay of the detonation sequence. The objective is to obtain smooth walls with minimum overbreak and minimal damage to the rock outside the excavation limits.

1.7.24 Hangfire

Occurs where the explosive in the borehole begins burning and may eventually detonate when the fire reaches the area of the base charge of the failed detonator. This detonation may take place a few seconds after the blasting machine was fired or a few minutes later.

1.8 RESTRICTIONS

Tunnels must be excavated and supported using a continuous or incremental excavation-observation-support approach to provide the necessary and justifiable levels of ground control and permanent stabilization. The use of a staged excavation approach with integral, concurrent initial support and permanent stabilization of the tunnel periphery is fundamental to the successful execution of the project and recognizes that tunnel spans of different dimensions must be developed in variable and fractured rock mass conditions.

Do not begin underground tunnel blasting excavation operations until the following conditions have been met:
1. Do not begin tunnel excavation until all required submittals in paragraph SUBMITTALS have been submitted and the Contracting Officer has reviewed and approved the submittals.

2. Pre-construction inspections near the tunnel excavation have been completed by the Contracting Officer and pre-construction documents have been provided to Contractor.

3. Installation of geotechnical and structural instrumentation for monitoring surface structures near the tunnel excavation have been completed and initialized by the Contractor.

4. All issues related to health and safety have been met and all submittals have been made in accordance with OSHA requirements, EM 385-1-1, and other applicable codes and regulations of Federal, State, and local agencies having jurisdiction.

5. Required personnel with qualifications specified in paragraphs BLASTING PERSONNEL and TUNNELING PERSONNEL are available on site to perform work.

6. Temporary construction power substation has been installed and tested in accordance with the Division 16 specifications.

7. Blasting will not be carried out without the prior approval of the Contracting Officer.

8. The Contractor must take all necessary precautions to prevent premature detonation of explosive charges.

9. The Contractor must be responsible for safe transportation, storage, security/guarding and use of explosives, blasting agents, primers, initiators, and ancillary equipment and materials in accordance with 29 CFR 1910.109, 29 CFR 1926-SUBPART U, and all applicable federal, state, and local Regulations. All cost associated with the transportation, storage, security/guarding and use of explosives must be considered incidental to the cost of tunnel excavation and included in their respective unit costs.

10. Vibration monitoring equipment must be installed, calibrated and operating before blasting begins.

11. Public notification and meeting held.

1.9 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

SECTION 31 23 00.00  Page 16
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

**************************************************************************

NOTE: The following Submittal requirements are for tunnel excavation using excavation methods and should be included in all project specifications. Several other considerations include Tunnel and Confined space rescue team training and setting up an independent emergency communication lines within the tunnel. If the local fire department is not trained in confined space tunnel or mine rescue, they may have to be trained in confined space tunnel/mine rescue procedures prior to excavation of tunnel or a private specialty company can be hired for rescue services as required by federal, state, and local work ordinances.

Haul routes for muck disposal can also be an issue in densely populated areas. Haul routes may need to be coordinated with local and state officials as required by local ordinances.

COORDINATION

NOTE: The following paragraph can be used if working with multiple stakeholders/owners.

Underground construction employing blasting methods will be in the vicinity of the [existing lock, railroad, and highway, and river barge, train, hospital highway traffic, utilities and businesses] and their operation will not be impeded or delayed beyond that which has been coordinated with [TVA, U.S. Coast Guard, U.S. Army Corps of Engineers - [_____] District, [_____] environmental or natural resources offices, [_____] Department of Transportation, local government entities,] [_____] Railroad, regional or local utilities, and/private businesses]. Include a coordination and traffic control sub-plan as part of the Blasting Safety Plan, with the appropriate authorities that mitigates navigation and traffic delays in the Master Blasting Plan.

Coordinate, through the Contracting Officer, with other Contractors working on site to minimize work stoppages during blasting.

LIABILITY

NOTE: This section can be included in the front end documents (General Conditions) instead of here, consult with Contracting Officer.

Compliance with provisions in the contract will not relieve the Contractor of their responsibility for damages or injuries caused by, related to or arising out of blasting or associated blasting activities. The Contractor assumes all liability and hold and save the Government, its agents, officers, and employees harmless for all claims for personal injuries, property damage, or other claims arising out of or in connection with the handling of explosives or blasting under this contract.
PART 2   PRODUCTS

2.1 STORAGE AND USE OF EXPLOSIVES

2.1.1 General

**************************************************************************
NOTE: The specification writer may choose to list reasons the Contracting Officer may restrict the use of various tunnel excavation methods such as blasting, but not always necessary. Confirm and follow applicable federal, state, and local regulations and guidance on the transport, storage and use of all Explosive materials and components. State and local agencies and/or authorities may not easily allow the receipt of Explosives in a timely manner. State and local agencies and/or authorities may have specific reporting, certifications, adverse impact concerns, or distance regulations from the blast zone to private properties governing the use of Explosives. The Agency/Service may wish to allow storage of Explosives on federal premises. The winning contractor should independently assess and cite in the Master Blasting Plan all applicable federal, state, and local laws, regulations, ordinances, or authorities that impact the transportation and storage of Explosives if authorized on the project.
**************************************************************************

Store, transport, handle, use, and otherwise secure explosives in accordance with best practices as approved by the Contracting Officer and in accordance with all Federal, State and Local laws and regulations. Comply with all special rules, regulations and ordinances that may be made by the authorities having jurisdiction, or by the Contracting Officer, regarding construction of, and storage in, magazines and precautions in handling and transporting explosives for blasting. Times and imposed restrictions concerning the use of explosives must be conducted in accordance with Federal State, and local regulations. The Contracting Officer reserves the right to establish further restrictions or time windows when blasting will not be allowed beyond the Federal State, and local requirements. The Contractor is responsible for all claims for damages and injuries caused by or arising out of blasting activities. Perform all blasting operations in accordance with the current edition of EM 385-1-1.

2.1.2 Blasting Products

**************************************************************************
NOTE: This paragraph may need to be adjusted, for some projects it is not appropriate to allow bulk explosives, such as in karst conditions because the bulk explosives could fill voids if care is not taken while loading to monitor the amount being added to each hole.
**************************************************************************

All blasting caps used on the project must be one year or less of age. Millisecond delay, [shock tube] initiators, must be used as the initiation
system. To ensure the accuracy of firing times of blasting caps, it is required that each cap period come from one lot number. Mixing of lot numbers for one cap period is strictly prohibited. All explosives used on the project must be six months or less of age or no older than one half the shelf life shown on the explosives manufacturer's technical data sheet for that product. Cartridge [and bulk] explosives may be used in different sections of the project. Ammonium nitrate and fuel oil (ANFO) is not allowed in wet environments.

********************************************************************
NOTE: In projects where controlled blasting techniques are required to produce final walls which require presplit blasting, only explosives designed for this application must be allowed. Ammonium nitrate and fuel oil (ANFO) is not to be allowed in wet environments. Consider requiring cartridge explosives within a specified distance from new structure which requires neat excavation lines, i.e., "Bulk explosives such as ANFO or bulk emulsion or emulsion blends will not be allowed for production blasts at the area within 60 meters 200 feet of it or within 15 meters 50 feet of presplit walls."
********************************************************************

Explosives that do not meet the manufacturer's specifications must not be used. When, in the opinion of the Contracting Officer, blasting product is either of excessive age or appears to be in a deteriorated condition, all work must cease until the product's age and quality can be determined. Blasting products without date and batch codes are / will not be permitted on site. The Contracting Officer may require products to be tested by an independent organization to determine its performance as compared to the manufacturer's data sheet. If product performance or composition deviates by more than 10 percent from the manufacturer's data sheet, that lot number will be rejected. The Contractor is responsible for required testing and no additional compensation will be made for product testing directed by the Contracting Officer.

2.1.3 Magazines

********************************************************************
NOTE: Two paragraph options here first paragraph is for where explosives must be stored off site (off site magazine). The other covers the storage of explosives onsite. The designer will need to ensure these requirements are fully detailed and the appropriate regulations are followed.
********************************************************************

Explosives must be stored offsite. Obtain all necessary Federal and State magazine permits. Magazines must be located at safe distances as defined by the Bureau of Alcohol, Tobacco and Firearms (ATF) in addition to the State of [_____] requirements. There must be no permanent explosive storage or overnight explosive storage on site. Procure off-site explosive storage and expect to have daily explosives deliveries to the site. Secure a permit to transport explosives from the [_____] Highway Patrol when the amount of explosives to be transported exceeds 454 kilograms 1000 pounds, and transport explosives in accordance with 49 CFR 177 when carried on public highways.
Explosives may be stored onsite. Obtain all necessary Federal and State magazine permits. Magazines must be located at safe distances as defined by the Bureau of Alcohol, Tobacco and Firearms (ATF) in addition to the State of [_____] requirements. Secure a permit to transport explosives from the [_____] Highway Patrol when the total weight of explosives to be transported is less than 454 kilograms 1001 pounds, and transport explosives in accordance with 49 CFR 177 when carried on public highways.

2.1.4 Magazine Keeper

Each magazine keeper must be experienced and familiar with the laws and general practices concerning the handling, care, use, and storage of explosives and detonators. The magazine keeper is responsible for maintaining a cleared area around each magazine. The magazine keeper will not be required to perform duties that interfere with their duties as magazine keeper and being physically present at the magazines for every entry to the magazines for delivery, disbursement, and review of explosives at the magazines. If explosives are delivered and returned daily from the manufacturer or supplier to the project, the driver of the truck will serve as the magazine keeper.

2.2 SAFETY EQUIPMENT

a. Provide safety equipment and monitoring instruments according to requirements of Safety and Health Plan in accordance with Section 01 35 26 GOVERNMENT SAFETY REQUIREMENTS, to be included in the Materials Handling Plan as required in Section 01 33 00 SUBMITTAL PROCEDURES.

b. Provide personal protective equipment for protection against respirable dust, and all other protective measures that may be deemed necessary for dust control as per Federal Requirements. Submit the details of the Dust Suppression System.

c. All rock reinforcement, including spiling and other ground support in accordance with the requirements set forth in Section 31 68 13 SOIL AND ROCK ANCHORS and 03 37 13 SHOTCRETE.

d. Lattice girders and shotcrete lining must be in accordance with the requirements of Section XX XX XX GROUND SUPPORT SYSTEMS, and Section 03 37 13 SHOTCRETE.

e. Steel sets must be in accordance with the requirements of Section XX XX XX GROUND SUPPORT SYSTEMS, and Section XX XX XX REINFORCING STEEL.
f. Shotcrete materials must be in accordance with the requirements of Section 03 37 13 SHOTCRETE.

g. Water sheet and drain hoses as part of temporary construction measures to drain off local water inflows:

1. PVC sheet, or approved equal by the Contracting Officer, for application at exposed ground surface or shotcrete surface.

2. Flexible PVC hose with end couplings as required

2.3 PROBEHOLE DRILLING EQUIPMENT

A continuous probe must be maintained at [_____] meters [_____] feet, or least [_____] tunnel diameters ahead of the tunnel face. If the probing results indicate the presence of poor ground requiring the installation of pre-reinforcement, the Contractor must make adjustments as necessary to achieve the required excavation profile prior to excavating through the anticipated poor ground. During the probing operation the Contractor must monitor and measure the amount of in-flowing water.

Probe hole drilling equipment must be capable of drilling a minimum [_____]-inch diameter holes through sound and decomposed rock and concrete. Provide all necessary core hole drilling personnel, equipment, and accessories.

**************************************************************************

NOTE: Designer of record to provide input on the flow pressures for packer tests. Consideration must be taken by reviewing other data such as other data (piezometers, pressure cells, rock mass features).

**************************************************************************

The drill must be suitable for drilling in wet ground conditions, highly sheared or fractured zones, and through fault gouge. The drilling equipment must be capable offsetting packers in the hole against a pressure of [_____] kg/cm² [_____] psi.

PART 3 EXECUTION

**************************************************************************

NOTE: Consult with a District Office that has most recently completed a similar type of blasting, while editing this section, to be appraised of recent, specific requirements, guidance, blasting and underground excavation developments or understandings for the subject project.

**************************************************************************

NOTE: This specification is for use for tunnel excavation. For mixed face tunneling conditions, revise specification to account for anticipated ground conditions. This specification requires a Geotechnical Baseline Report (GBR) that defines the ground properties, conditions, and behavior related to tunnel excavation, support, and constructability along the tunnel alignment, portals, or along separate tunnel segments that is expected. The
Geotechnical Data Report (GDR) contains all the testing, and rock mass characterization data used to characterize the conditions and behavior of the ground along the tunnel alignment to establish the base line conditions for the project. The GBR defines what constitutes a differing site conditions for claim resolution per the frameworks of the contract.

3.1 GENERAL

**NOTE**: This paragraph should agree with the designations under paragraph SUBMITTALS, the Master Blasting Plan will always be for approval. The Individual Shot Plan may be approved ("G") or accepted ("FIO").

Obtain approval, or revise for approval, of the submitted Master Blasting Plan and Individual Shot Plans, acquire all required permits, and comply with all laws, regulations, ordinances, applicable safety code requirements, and regulations relative to the transportation, handling, storage, and use of explosives and the protection of life and property. Perform vibration and airblast monitoring at the Contracting Officer's specified locations to record blast effects. The peak particle velocity must be limited to the values in Paragraph BLAST EFFECTS MONITORING in these specifications. Minimize rock over-break and blast damages beyond the design excavation line. The Contracting Officer will, always, have the authority to prohibit or halt the blasting operations, if it is apparent that the required lines and grades and stable rock slopes are not being obtained with the methods being employed. Adhere to the general requirements as outlined below:

a. Care must be exercised to minimize overbreak, to prevent immediate or subsequent rock falls from within the tunnel or from portal areas and other rock slopes outside the tunnel, and to preserve the integrity of the rock outside the limits of tunnel excavation.

b. Clean working conditions must be always maintained inside the tunnel. All muck, slush, grout spills, and any other material not required for tunneling must be removed from the tunnel in a timely manner.

c. Detailed construction sequencing must be the responsibility of Contractor, consistent with the requirements of these Specifications, and those shown on the Contract Drawings.

d. Perform work in a manner that minimizes safety hazards and exposure of personnel and equipment to hazardous and potentially hazardous conditions in accordance with specified safety requirements and Contractor's Safety and Health Plan.

e. Minimize ground movement at the tunnel face and in the surrounding excavation, and prevent ground loss, subsidence, and movement in surface features, overlying structures, and utilities above and around the vicinity of the tunnel excavation.

f. Provide additional face and excavation stabilization by means of
discretionary ground support wherever ground conditions dictate.

g. In case of stoppages, maintain qualified personnel on-duty to monitor conditions that may threaten stability of the heading.

h. If monitoring of ground vibrations and air blast indicate that vibration levels, or noise levels are exceeding response levels as defined under paragraph BLAST EFFECTS MONITORING, and Section XX XX XX TUNNEL INSTRUMENTATION; adjust procedures for excavation and initial support installation in accordance with the accepted Contingency Plan to reduce the levels to within acceptable limits.

i. Maintain sufficient quantities of shotcrete materials at the tunnel face, ready for immediate application, during the entire excavation period. Excavation will not be permitted without this requirement being met or as approved by the Contracting Officer.

******************************************************************************

NOTE: The need to maintain sufficient quantities of tunnel support materials/equipment will vary per project. Define this quantity during design phase and incorporate in GBR. The Government will map the tunnel according to ASTM D4879.

******************************************************************************

j. As the excavation progresses, the Contracting Officer will perform inspection, photogrammetry, LiDAR scanning, and geologic mapping or other documentation of the exposed tunnel sections. This mapping will be accomplished after excavation and either before or in conjunction with support installation. The Contractor must provide cleaning of the heading and completed crown and sidewalls and a safe means of access to these areas to allow this mapping. Mapping of the crown and sidewalls will be conducted for documentation of the actual geologic conditions encountered and assessment of rock mass characteristics of the heading. The Contractor should assume that this inspection and mapping will be performed once each shift for a period of minimum [20 minutes] in each heading. Lighting and access will be provided for close inspection of the face. Where necessary the excavated surfaces may need to be cleaned by air or water jets to provide surfaces suitable for mapping, as directed by the Contracting Officer; provided, however, such cleaning will be minimal in areas where softer materials can be gouged out to depths greater than three inches. The Contractor must cease operations to the extent necessary to permit such mapping as directed by the Contracting Officer. Such work will be coordinated by the Contracting Officer in a manner to avoid undue disruption to Contractor's operations.

k. Establish and maintain surveyed tunnel station markers throughout both lined and unlined excavated tunnel. Placed station markers indicating the tunnel stationing at 50 feet intervals by spray painting the rock or shotcrete surface in a color to contrast with background. Intermediate station markers should be made at 10-foot intervals with visible paint marks located at or near tunnel spring-line

l. Sequence and Direction of Construction:

1. Sequence and direction of tunneling to be as shown on the drawings and as reviewed by the Contracting Officer.
m. Temporary niches or adits, temporary or future pump sump pits and other temporary openings:

1. Excavate these temporary openings conforming to excavation and support criteria of this Specification and as reviewed by the Contracting Officer.

2. Seal all temporary openings with [4,000 psi] 28-day strength concrete in accordance with the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE when no longer needed, before installation of the final lining and Contract completion and as reviewed by the Contracting Officer.

n. Survey:

1. Contractor is responsible for the development and implementation of a surveying program capable of satisfying all survey and accuracy requirements. This program is subject to the review of the Contracting Officer prior to the commencement of the work. The review does not release the Contractor of liabilities associated with or dependent on this part of the work.

2. Design and implement a functional underground network and determine all required measurements and the required accuracy of each measurement including horizontal angles, zenith angles, azimuth angles, distances, and height differences. Include analysis of required redundancy and measure of internal reliability associated with each planned observation.

3. Design and implement a functional surface control network, stations, positions, measurements, and accuracies. Measurements may include Global Positioning System (GPS) vectors, horizontal angles, zenith angles, azimuth angles, distances, and height differences. Include analysis of required redundancy and measure of internal reliability associated with each planned observation.

4. Obtain survey information prior to completing the last [100] feet of the tunnel excavation. Adjustments to line and grade to the tunnel over the last [100] feet may be necessary to meet project requirements. The purpose of conducting the survey is to obtain the true centerline alignment in 3-dimensions to locate the connections as shown on the Drawings. Vertical and horizontal alignment should be taken along both invert/sidewall construction joints. The center point on the invert is assumed as the dividing line between both invert/sidewall joints.

5. Obtain start point alignment for the survey from the surface at [_____] data for alignment consisting of at least 2 benchmarks with known elevation and geographic coordinates enabling tie-in to [NGVD29, NAVD88] elevation and the [_____] State Plane Coordinate System, respectively.

6. Perform in-tunnel survey to an accuracy of ½-inch in the horizontal and vertical dimensions. Record sufficient survey points to enable the complete horizontal and vertical profile of tunnel alignment to be detailed. Some tunnel alignment curves may not necessarily be circular arcs; they may be based on complex parabola or other geometric shape forms.
7. Assume that station of [_____] are as indicated in historical documents. All new survey stationing must reference these stations.

8. A survey was completed on [______]. This information is available and must be reviewed by the Contractor, prior to conducting the tunnel survey.

9. Shaft centerline is the basis of all tunnel stationing up and down station of the shaft centerline.

10. Calibration and data processing:

   a. Calibrate all survey instrumentation as required and as recommended by instrument manufacturer.

   b. Data reduction must incorporate calibrations and meteorological correction, and reduction of measurements to the ellipsoid and thence to the [_____] State Plane Coordinate System. Correct distance measurements by electro-optical distance measurement instrument (EODMI) for scale, cyclic error, zero error, and meteorological effects. Correct azimuth angles using the Laplace correction and include the deflection of the vertical components on angles and azimuth measurements.

   c. Data regression processing must include least squares adjustments, as required. Employ data outlier detection. Determine horizontal and vertical confidence intervals.

3.2 TEMPORARY SYSTEMS

**************************************************************************
NOTE: Review applicable consideration in EM 385-1-1, Ch. 26 and/or consult with a Safety professional with tunneling background. Ensure groundwater conditions and overall regime through rock mass is well understood by tunnel reach and rock type.
**************************************************************************

a. Provide, operate, and maintain a complete groundwater control/treatment system to collect water from within the tunnel and shaft and suitably treat it before discharge in accordance with the requirements of Section XX XX XX CONTROL OF WATER.

b. Water entering the tunnel from all sources must be controlled, managed, and disposed of in a manner to prevent damage to the tunnel and surrounding property and in accordance with all Federal, State, and local regulations.

c. Design, furnish, install, operate, and maintain a temporary lighting system in all underground and other working areas in strict compliance with all applicable Federal, State, and local regulations.

d. The system must provide a minimum light level in accordance with OSHA requirements and EM 385-1-1. In case of failure of the lighting system, provide an emergency lighting system in all work areas in strict compliance with all applicable Federal, State, and local regulations, and industry standards.
e. Design, furnish, install, operate, and maintain temporary ventilation during all phases of construction complying with all applicable Federal, State, local regulations, and industry standards. Operate and maintain the entire temporary ventilation system. Details of the Contractor's ventilation system must be presented to the Contracting Officer for agreement at least 60 days prior to its installation.

f. Two battery-operated handlamps of 20-Watts minimum power must be provided and maintained at each working face and portal for emergencies and inspection of the work.

g. Electric heaters or radiators having exposed coils or elements must not be allowed in the tunnels.

h. All main electrical cables installed within the tunnels must comply with all applicable Federal, State, and Local Requirements.

**************************************************************************
NOTE: Designer will need to ensure safety requirements in specification at a minimum follow OSHA/EM385/MSHA.
**************************************************************************

i. Provide additional floodlighting and ventilation locally as required at active ground support installation, shotcrete, and other locations, and provide portable floodlighting and ventilation equipment, as needed, for localized construction operations. Equipment for short-term use may be battery-operated.

j. For Contract requirements regarding temporary construction power, refer to Section XX XX XX TEMPORARY LIGHT AND POWER and Section XX XX XX TEMPORARY ELECTRICAL SYSTEM.

k. In all parts of the Underground Works, the atmosphere inhaled by those present must contain not less than 19.5 percent and maximum of 22.0 percent of oxygen and must not contain a concentration of contaminates such as gases, vapors and dusts greater than is safe for the health of the construction personnel having regard to the effects of exposure time, temperature, humidity and the combined effects of several contaminants. The concentration of inflammable contaminates must not exceed 10 percent of the lower explosive limit (minimum explosive concentration).

l. Wet drilling should be used. Where possible, drilling should be carried out using hollow bits with continuous water feed to reduce dust. Always wear suitable protective equipment.

**************************************************************************
NOTE: The potential for contaminants or hazardous conditions must be defined by the project owner (in the GBR) and assumed by the Contractor. If the conditions differ, owner is responsible for conditions more adverse than the baseline for this condition.
**************************************************************************

m. The Contractor must be responsible for obtaining all information necessary to determine what concentrations of contaminants are
harmless, without prejudice to the adoption of such lower figures as may be stated by competent authorities or directed by the Contracting Officer. The atmosphere inhaled by the workmen and other authorized persons in all parts of the tunnel must not contain more than 5 ppm of nitrous fumes (measured as NO₂) for longer than 10 minutes after each blast, 30 ppm of nitrous fumes as an absolute maximum, 50 ppm of carbon monoxide as an absolute maximum, 5,000 ppm of carbon dioxide as an absolute maximum, or for other contaminants. The Safety Professional must field calibrate air quality monitoring instrumentation in accordance with manufacturer's recommendations.

n. In all parts of the Underground Works, throughout the period in which explosives or other materials producing contaminants are used, and at such time as may be necessary to maintain the standard of purity of air required in this subsection, clean fresh air must be supplied by forced ventilation, using an exhaust system at the face or other method as agreed by the Contracting Officer, at a rate not less than the greater of the following:

1. [_____] cubic meters[_____] cubic feet per hour per person present in a tunnel;

2. [_____] meters[_____] feet per hour per kilowatt of combustion-engine generated power operating simultaneously in the heading.

o. The Contractor must take special measures to minimize the effect of particular sources of fumes. These measures must include the use of efficient and properly maintained exhaust smoke washers (scrubbers) for all internal combustion engines in the tunnel. Gasoline engines must not be permitted in the tunnel.

p. The means of dealing with blasting fumes must include, but not be limited to water sprays on muck piles after blasting and ventilation of the Underground Works immediately after blasting for as long as necessary to restore the purity of the atmosphere.

q. Notwithstanding requirements of this subsection the method of ventilation and treatment of fumes, including blasting fumes, must be subject to whatever tests may be necessary in the opinion of the Contracting Officer. The Contractor must provide, maintain, and use as directed by the Contracting Officer, an instrument approved by the Contracting Officer to measure the velocity of air, and an approved gas detector. Maintenance of the gas detectors must include the supply of all detector tubes.

3.3 SAFETY PROCEDURES FOR DRILL AND BLAST UNDERGROUND EXCAVATION

**************************************************************************
NOTE: Use below for general blasting safety procedures for drill and blast tunnel construction. Consider other Tunnel H&S issues which are related to tunnel operations, equipment, slip-trip-fall, cave-ins.
**************************************************************************

3.3.1 General Blasting

Ensure all work completed under this Contract is executed safely. Follow
the safety procedures outlined in EM 385-1-1. EM 385-1-1 will govern all activity unless more stringent safety requirements are specified here and in other applicable Federal, State, and local laws, regulations, and ordinances.

a. All blasting work must be carried out using controlled perimeter drilling and smooth wall blasting techniques to control the geometry of, and to minimize damage to, the final excavation profile and to minimize overbreak.

b. Only non-electric detonation systems must be used for tunnel blasting, unless another detonation system is approved by the Contracting Officer. Cap and fuse or safety fuse is prohibited. The Contractor will be allowed to use one electric blasting cap per round to initiate the shot. The electric blasting cap must not be tied into the blasting circuit until [traffic has been stopped and] the area has been secured.

c. The Contractor must carry out controlled blasting to achieve a blast surface that exhibits a regular fracture plane between perimeter holes with minimal overbreak. The excavation surface must be scaled to remove all loose and hollow sounding rock to leave a solid, intact surface. Special care must be required with such procedures in highly fractured rock.

d. If the methods of drilling and blasting do not produce a consistent, uniform profile with minimal overbreak within the tolerances specified, the Contractor must undertake further test blasts until a method is established that results in an excavation profile to the specified tolerances.

e. The blasting technique must be such as to ensure reproducibility of the blasting pattern, accurate positioning of drillholes and precision in drilling. It may include the use of a template, or other techniques as may be proposed by the Contractor, all of which must have the prior approval of the Contracting Officer, for setting out the blasting pattern.

f. During the progress of the excavation, this technique must be varied as necessary to suit rock conditions exposed and to obtain the best practicable excavation surface after blasting, to the satisfaction of the Contracting Officer.

g. All blasting rounds must incorporate smooth wall blasting techniques.

h. Blasting must not be carried out within [_____] hours of the application of shotcrete within [_____] meters [_____] feet of the face.

i. The shot firing and detonator delays pattern must be such that the peak particle velocity (PPV) must not exceed the requirements of paragraph BLAST EFFECTS MONITORING.

**************************************************************************
NOTE: The section below should be used when rock blasting excavation techniques are required.
**************************************************************************
3.3.2 Public Notice of Blasting Operations

At least thirty calendar days, and prior to blasting operations, prepare and submit to the Contracting Officer a public government notification letter of the proposed blasting activities. The Government will distribute copies of this notification letter by certified mail to law enforcement, local governments, public utilities, [public users of project recreational facilities,] and residents and commercial interests located within 0.8 kilometers one half mile of the blast site. This notification letter must contain at minimum:

a. Name, address, telephone number and e-mail address of the Contractor;

b. Plan maps identifying the specific areas in which blasting will take place, and major and secondary roads, geographic features and auxiliary features;

c. Proposed duration of blasting activities, and on which days of the week and hours of the day that blasts can be expected to occur;

d. Vehicular and pedestrian traffic control measures to be taken;

e. Methods to limit access to the blasting area; and,

f. Types, patterns and duration of audible warning and all clear signals to be used before and after blasting.

3.3.3 Public Meetings

******************************************************************************
NOTE: Communicate with the project manager and stakeholders about whether specific requirements for a meeting or multiple meetings are needed. It may be necessary to advertise the meeting in a local newspaper and specify the meeting room capacity.
******************************************************************************

Fifteen calendar days prior to commencing tunneling operations, provide for the approved Project Manager, Tunneling Superintendent, Seismic Specialist, Blasting Specialist and Blasting Consultant (as applicable) to attend a public information meeting to be conducted on an evening to be determined by the Contracting Officer. This meeting will inform the public about the anticipated tunneling and underground construction operations, including the need to use blasting (as applicable). The Project Manager and Tunneling Superintendent must make a short presentation on tunneling and underground construction and answer questions pertaining to concerns that may impact the public. The Blasting Specialist, Blasting Consultant and Seismic Specialist must make a short presentation of blasting operations and answer questions pertaining to public concerns dealing with the tunneling and blasting operations, the magnitude of ground vibrations, airblast and potential for flyrock that may impact the public. Distribute points of contact for the public and local entities in the event of concerns related to the blasting program.

3.3.4 Warnings and Signals

Establish a method of warning all employees on the job site of an impending blast following the guidance of the EM 385-1-1. The signal must consist of a five-minute warning signal to notify all in the area that a blast will be
fired in five minutes. A second warning signal must be sounded one minute before the blast. After the blast is over, sound an all-clear signal, after the blast site has been inspected for misfires by the Blaster-In-Charge to provide notification to all personnel in the area that the blasting operation is finished. No personnel other than the Blaster-In-Charge must enter the blast area until it has been determined to be all clear.

### 3.3.5 Time Restrictions

**NOTE:** Research the specific State and local requirements. This paragraph will need to be tailored for the specific site conditions, for example, avoiding blasting during rush hours in the morning and afternoon. Most locations prohibit blasting on Sunday but may allow on Saturdays and some Holidays.

Blasting only during daylight hours, one-half hour before sunrise and one-half hour after sunset, and between [_____] AM and [_____] PM, local time, on weekdays and only during the approved time periods each day and at the same time each day, in concert with the approved closure time for area roads. No blasting is allowed on Saturdays, Sundays, or official holidays recognized by the Federal Government or the State of [or Commonwealth of [_____] unless consent is granted by the [State Fire Marshal]. Drilling activities and blasthole loading are not time restricted, except as noted in Section 01 14 00 WORK RESTRICTIONS.

### 3.3.6 Lightning Detection Equipment and Safety

**NOTE:** This section is needed when conducting blasting at the surface for shaft or portal blasting.

Furnish, maintain, and operate Lightning Detection Device during the entire period of blasting operations and during the periods that explosives are used at the site. Equipment must provide real time audio and visual alarm/signal and detection based on combined detection of electromagnetic, electrostatic, light wave spectral and audio disturbances, or a commercial service based on these as a minimum as approved. Equipment must be capable of detecting lightning within 40 kilometers 25 miles, as minimum, of the blast area.

**NOTE:** Obtain technical feedback from the rest of the design team for minimum lightning detection distance.

When and where the lightning detection device indicates a blasting hazard potential, immediately evacuate personnel from all areas where drilling is being conducted or explosives are present. When a lightning detector indicates a blasting hazard, perform the following:

a. Clear the blasting area of all personnel. Place guards at all access points to the blast area.
b. Immediately notify the Contracting Officer of the potential hazards and precautions being taken.

c. Terminate the loading of holes and secure the unused explosives to an approved location.

d. When the hazard dissipates, inform the Contracting Officer that the drilling and loading of holes will continue.

3.3.7 Check for Misfires

**************************************************************************
NOTE: Federal, or local entities may have different regulations applicable to the minimum time required before entering blast site after firing the shot. The more stringent regulation must apply.

If a misfire is declared, then the appropriate regulations must be followed for wait time and handling the misfire.
**************************************************************************

The Blaster-In-Charge must closely inspect the entire blast area following a blast to check for misfires and guard against rock fall or cave-in before commencing work in the tunnel. It is the responsibility of the Blaster-In-Charge to go into the shot area and check all holes to make sure that all explosives have been detonated.

3.3.8 Misfire Handling Procedures

Should a visual inspection indicate that complete detonation of all charges did not occur, only critical personnel involved in the blasting operation or excavation of the unexploded material are allowed within the established blasting area. Restrict access to the blast site until the Blaster-In-Charge and the Blasting Specialist indicate the site is safe. If the misfire poses problems that cannot be safely corrected by the Blaster-In-Charge or the Blasting Specialist, a consultant, or an explosives company representative skilled in correcting misfires must be brought to site to resolve the problem. Compliance with this or any other provision in the Contract must not relieve the Contractor of responsibility for damages or injuries caused by, related to, or arising out of blasting or associated blasting activities. Detail the misfire procedures in the Blasting Safety Plan including the distance of the restricted area when a misfire is discovered.

3.4 BLASTING PERSONNEL

3.4.1 Blasting Consultant

**************************************************************************
NOTE: Depending on the scope of the project, it may not be necessary to require a Blasting Consultant. This will be determined during design, an Agency/Service Blasting SME or Government Blasting Consultant should be consulted to discuss this. Projects where slope blasting, away from sensitive structures minor and lightly used public areas may be a consideration to not including this
requirement. One option is to still require a blasting consultant to be engaged but only for reviewing the Master Blasting Plan and engaged on very serious issues with the blasting (exceedance of vibration and/or airblast limits, misfires, flyrock, or excessive backbreak and/or overbreak). Excessive backbreak will need to be defined prior to issue of the specifications. This specification is geared towards IFB (Invitation for Bid) where there is no mechanism to select contractors prior to award. If another contract mechanism is used it may be necessary to include the bracketed text requiring a letter of commitment from the consultant.

**************************************************************************

The Blasting Consultant, Blasting Specialist, Blaster-In-Charge, and Vibration Specialist cannot be the same person, unless a justifiable request is presented and approved by the Contracting Officer. Retain a recognized Blasting Consultant to assist in the blast design. The Blasting Consultant must be approved by the Contracting Officer prior to the submission of the Master Blasting Plan. Submit the Blasting Consultant's Qualifications including resume, experience, current blasting licenses, credentials and training and a formal letter of commitment from the consultant verifying their availability on an "as needed" basis for the duration of the Contract prior to the award of the Contract. The consultant must be an expert in the field of drilling and underground blasting who has derived their primary source of income by providing specialized underground blasting and underground blasting consulting services. The consultant must not be an employee of the Contractor, explosives manufacturer, or explosives distributor or other sub-contractor. There must be no additional cost to the Government for the Blasting Consultant's duties, even when required by the Government.

**************************************************************************

NOTE: The paragraph below should be used when controlled blasting techniques are required.

**************************************************************************

The Contractor's Blasting Consultant with the Blasting Specialist must develop controlled blasting techniques to be utilized in the areas specified in the drawings during the Test Blasting program. The Blaster-In-Charge is responsible for the technical application of the controlled blasting methods specified during and following the Test Blasting. The Blasting Consultant must modify controlled blasting methods, as necessary, to meet safety requirements, airblast and vibration limits, and protect rock to be left intact. Proposed controlled blasting methods must be submitted to the Contracting Officer for approval.

The Blasting Consultant must review the Master Blasting Plan and Individual Shot Reports, attend the public meetings and be available for consultation on an "as needed" basis, as determined by the Contractor, Contracting Officer, or both. The Blasting Consultant is not required to be on the job site for review of the Master Blasting Plan or Individual Shot Reports. The Blasting Consultant must submit a short, signed Blasting Consultant's Report each month stating that the Blasting Consultant has briefly reviewed the Individual Shot Reports including blast videos, and problems, concerns or errors in the reports were addressed. This report is due within [_____] days after the end of the month.
3.4.1.1 Blasting Consultant's Qualifications

The consultant must be able to demonstrate involvement in at least [15] projects with underground blasting. The consultant must have as a minimum the credentials and experience outlined below:

a. The consultant must have at least 20 [_____] years of experience in general construction blasting within [_____] meters [_____] feet of protected structures, [natural resource concerns and environmentally sensitive areas], final tunnel periphery, and presplit shaft or walls.

b. The consultant must be able to demonstrate that he has attended at least [15] short courses, seminars, or conferences on blasting technology, or university engineering class studies on blast design during the past [20] years including a complete understanding of blasting seismology with emphasis on vibration frequency, acceleration, and displacement (ground strain).

c. For the past 10 years the consultant must have derived their primary source of income from providing specialized blasting consulting services.

d. Project list will contain a description of the projects, details of the blast plans, and modifications made during the project.

e. The names and telephone numbers of at least three project owners with enough knowledge of the projects to verify the submitted information.

f. The Blasting Consultant must be approved by the Contracting Officer prior to the beginning of drilling and blasting work including submission of the Master Blasting Plan.

g. Hands-on experience as a blaster for at least three years.

3.4.1.2 Issues Requiring the Blasting Consultant

If problems with vibration, airblast, smooth wall blasting, or production blasting, or adverse impacts on natural resources occur the Contracting Officer will require the Contractor to immediately summon the approved Blasting Consultant and have their presence on site within 10 days after the problem develops for the following:

a. To approve the blasting plans for each individual blast.

b. To be present to review the blasthole layout on the ground before drilling begins.

c. Observe blasthole loading.

d. To sign each blasting plan and each Individual Shot Report, at no
additional cost to the Government. The Blasting Consultant must have full authority to stop or delay blast they consider unsafe.

e. To submit and sign a written checklist that all necessary precautions were reviewed and followed by the drilling and blasting crews. The checklist must be as defined under the section on Individual Shot Reports. The signed checklist must be attached to each blasting report.

f. Submit Blasting Consultant's Reports after each site visit.

3.4.2 Blasting Specialist

Submit the Blasting Specialist's Qualifications including resume, experience, education, training, and valid blasting licenses of the Blasting Specialist for approval, at least 60 days before drilling and blasting operations commence. The Blasting Specialist must be approved before submission of the Master Blasting Plan. Detail the experience and training, which qualifies the specialist for work under this Contract. The duties of the Blasting Specialist are to prepare all necessary paperwork, to conduct quality control and to coordinate with the Contracting Officer on all issues dealing with underground blasting. The Blasting Specialist must be an employee of the Contractor on the job site each day.

a. The Blasting Specialist must have at least 10 years of verifiable experience utilizing underground controlled blasting techniques.

b. Within the last five years, the specialist must have completed at least five days of classroom training that has familiarized the specialist with the most current drilling and controlled blasting methods.

c. In the last five years he must have been responsible for the blast design or execution of large underground rock excavation projects similar in scope and complexity as this project.

********************************************************************************
NOTE: Include this sentence under paragraph a. if the project requires precision presplitting: [or projects where at least 30,500 meters 100,000 linear feet of Precision Presplitting was used].
********************************************************************************

d. Their credentials must include a list of the projects, including the location, duration, scope, description, geologic conditions, and the challenges that developed though the course of the projects and how the challenges were resolved.

e. Each project description must be accompanied with photos which exhibit the Blasting Specialist's competency and ability to create the designed tunnel periphery and shaft configuration if blasting at portals or shafts, to the specified tolerances. The list of projects must also contain the names and phone numbers of the project owner or their representative, Contracting Officer, or project engineers who has enough knowledge to verify the submitted information. The Contracting Officer will invalidate project submitted as reference that cannot be verified.

3.4.3 Blaster-In-Charge

*******************************************************************************
NOTE: Some USACE projects may require an Alternate Blaster-In-Charge based on the frequency, size, and complexity of the blasting operations. The Alternate Blaster-In-Charge must meet the same qualification requirements as the Blaster-In-Charge.

Submit the Blaster-In-Charge's Qualifications including resume, experience, education, blasting licenses and training of the Blaster-In-Charge for approval, at least 60 days prior to the commencement of drilling and blasting. Also submit the Contractor's Federal ATF License. Detail the experience and training, which qualifies the Blaster-In-Charge for work under this Contract. The Blaster-In-Charge is responsible for preparing the Individual Shot Plans that will be approved by the Blasting Specialist. The Blaster-In-Charge is responsible for marking the blasthole locations for drilling, accounting for the relevant geology, loading the blastholes according to the Individual Shot Plans and firing the blast.

a. The Blaster-In-Charge must be a licensed blaster in the State of [_____] per that State's regulations or issuing agency.

b. The Blaster-In-Charge must have a minimum of 10 years of experience.

c. The Blaster-In-Charge credentials must include a list of the projects, including the location, duration, scope, description, geologic conditions, and the challenges that developed through the course of the projects and how the challenges were resolved. Each project description must be accompanied with photos, which exhibit the Blaster-In-Charge's competency and ability to design the blast. [Create the designed shaft configuration or tunnel periphery to the specified tolerances.] The list of projects must also contain the names and phone numbers of the project owner or their representative, Contracting Officer, or project engineers who has enough knowledge to verify the submitted information. The Contracting Officer will invalidate project submitted as reference that cannot be verified.

3.4.4 Magazine Keeper

Each magazine keeper must be experienced and familiar with the laws and general practices concerning the handling, care, use, and storage of explosives and detonators. The magazine keeper is responsible for maintaining a cleared area around each magazine. The magazine keeper will not be required to perform duties that will interfere with their duties as magazine keeper. If explosives are delivered daily from the manufacturer, the driver of the truck will serve as the magazine keeper.

3.4.5 Vibration Monitoring Specialty Firm

NOTE: This requirement is a new format from previous specifications. The firm is submitted for approval, having the appropriate experience and the firm must have on staff the Seismic Specialists and Seismograph Technicians, typically a firm is subcontracted by the Contractor and having multiple experienced people approved allows them to have flexibility on supporting the site work. The people coming to the project or responding to the work must be within the group approved but does not need to be
Retain the services of a vibration monitoring specialty firm that specializes in the prediction, monitoring and control of ground vibration and airblasts applicable for tunneling. The firm must have experience conducting installation of seismographs for vibration monitoring, communicating vibration and airblast results, and developing and maintaining a site attenuation curve. The firm must have on staff at least two Seismic Specialists that specialize in vibration monitoring and analysis. The firm must have on staff at least four Seismograph Technicians that have five years or more experience with seismograph installation and vibration monitoring. Submit resumes for all personnel and for the firm for approval citing, in additional to other pertinent data, experience, training, and education, at least 60 days prior to the commencement of blasting. The Seismograph Technicians must be persons capable of setting up the seismographs at designated locations, effectively recording the blast, and appropriately interpreting results. The Seismic Specialists must interpret the seismograph records to ensure that the seismic data must be effectively utilized in the control of the blasting operations with respect to the existing structures. The Seismograph Technicians must supervise the placement, operation and maintenance of the seismographs. The Seismic Specialists must conduct the airblast and particle velocity regression analysis as described in this Section. The Contracting Officer may require the Seismic Specialists and Seismograph Technicians to be present during the test blast program, production blasting, or both.

3.4.6 Structural Inspection/Evaluation Technician

NOTE: This may be required for shaft/portal blasting/excavation. Depending on proximity of the tunnel it may be needed to document condition of structures in proximity to the work. Designers will need to determine project requirements/needs.

NOTE: Five years should be considered the minimum experience requirement. Depending on the project it might be necessary to increase the minimum if there is a special concern (i.e., complex ground conditions) or sensitive structures, consult with USACE SME to help determine appropriate experience requirements.

Pre and Post Blast structural inspections must be performed by technicians with at least [five] years’ experience in pre-blast and post blast surveys in the State of [______]. Submit a copy of the qualifications and certificates to the Contracting Officer.

3.5 TUNNELING PERSONNEL

3.5.1 Project Manager

Perform the work under the direct supervision of an experienced project manager with a minimum of 15 years (or as approved by the Contracting
3.5.2 **Tunneling Superintendent and Supervisors**

NOTE: The nomenclature of tunneling "supervisors" could vary based on geographic location. Foreman or Shifters are common terms for supervisor.

Submit for approval the qualifications. Perform the work under the direct supervision of an experienced tunneling superintendent and tunneling supervisors with experience requirements in accordance with Section [___], or as directed by the Contracting Officer. In addition, the Tunneling Superintendent’s experience should include at least one project of a comparable size to this Project within the previous ten years (or as approved by the Contracting Officer). Duties of the tunneling superintendent and tunneling supervisors should include the requirements set forth in Section [___]. Substitutions for the tunnel superintendent during the Contract period should not be made without prior written acceptance by the Contracting Officer. Substitute personnel must have the same qualifications specified herein for the position to be held.

NOTE: Use qualification criteria requirements for drill and blast tunnel superintendents and supervisors as described below.

Tunneling superintendents and supervisors must have a minimum of 15 years of comparable experience in supervising the excavation and support of tunnels in similar ground using the same construction methods and must have all necessary licenses and permits required by local agencies or others having jurisdiction. Supervisors and superintendents must have experience on at least two projects with full face hard rock drill and blast tunnel excavation. Tunneling must not be performed unless the tunneling superintendent, supervisors, drillers and miners meeting the above experience requirements are on site and in actual supervision of this portion of the work.

The following duties are also part of the responsibilities of tunneling supervisors and superintendents:

a. Supervising excavation to ensure safety and quality of construction.

b. Meeting daily [at the start of each shift] with the Contracting Officer at the tunnel face to discuss ground conditions encountered and corresponding excavation and support requirements including additional initial support and keeping records thereof.

c. Devising and implementing additional initial support measures as required by ground conditions or as directed by the Contracting Officer, coordinating remedial measures when ground loss at mined
tunnel heading or instability of mined tunnel occurs, or appears likely to occur.

**************************************************************************
NOTE: It is standard practice to have drill and blast supervisors (in addition to Tunneling superintendents, Consultants, Blaster) in drill and blast tunnel construction. Nomenclature of these positions may vary depending on geographic area.
**************************************************************************

3.5.3 Drill and Blast Supervisors

Drill and blast supervisors must have a minimum of 10 years of experience in designing, supervising, loading, and firing of blasts for shaft or tunnel excavations, as applicable, and must have all licenses and permits required by state and local agencies and others having jurisdiction. Submit for approval the qualifications

3.5.4 Geotechnical Engineer or Engineering Geologist

**************************************************************************
NOTE: A licensed professional must be used, that may vary on the state, since some do not license Engineering Geologists or Geotechnical Engineers. Tailor this section appropriately for your project needs.
**************************************************************************

Contractor's Geotechnical Engineer or Engineering Geologist must be a licensed Civil Engineer, Professional Geologist or Engineering Geologist in the State of [_____] with a minimum of 10 years' experience designing underground excavations and constructing such excavations, installing slope stabilization support, designing tunnel and underground support, evaluating rock mass properties, and groundwater conditions for large underground excavations.

The Geotechnical Engineer or Engineering Geologist must have worked on a minimum of two projects with full face hard rock drill and blast tunnel excavation. Tunneling must not be performed unless the Geotechnical Engineer or Engineering Geologist meeting the above experience requirements is on site and in actual supervision of this portion of the work. Submit for approval the qualifications.

The Contractor's Geotechnical Engineer or Engineering Geologist to provide inspection of excavations and evaluate rock and groundwater conditions during construction. The Geotechnical Engineer or Engineering Geologist must perform pre-construction and periodic site visits throughout construction to assess site conditions. The Geotechnical Engineer or Engineering Geologist must update the excavation, dewatering plans, geologic mapping, rock support mapping, and rock mass characterization as construction progresses to reflect changing conditions and changes in contract rock support based on in-situ conditions observed. The Geotechnical Engineer or Engineering Geologist must submit a written Monthly Excavation Status Report that informs the Contractor and Contracting Officer of the status of the excavation and provide an accounting of the Contractor's adherence to the plans and address present or potential problems or issues with ongoing construction. The Geotechnical Engineer or Engineering Geologist must be available to meet
with the Contracting Officer and Government representatives throughout the Contract duration.

3.6 PRE-CONSTRUCTION DOCUMENTS

**************************************************************************
NOTE: The section below should be used when rock blasting excavation techniques are required.
**************************************************************************

3.6.1 Tunnel Excavation Plan

The following documents must be submitted to the Contracting Officer at least 60 days prior to commencing excavation:

a. A drawing of proposed tunneling operations. The drawing must include detailed working drawings of mobilization, proposed methods, and sequence of excavating and disposing of materials for each portion of the work, drilling and blasting, ventilation, illumination, installation of ground support including placing of shotcrete, steel sets and rock reinforcement, dimensions for excavation and types of equipment to be used.

b. A method statement of the proposed tunneling operations. This method statement must include details of the Contractors proposed tunnel-logging system such as the NGI "Q" system or Rock Mass Rating (RMR) system for determining ground support, as defined in the GBR, in concert with guidelines provided in Chapter 7 Design of Initial Support, EM 1110-2-2901. The report must present details of proposed methods and sequences of excavating and disposing of materials for each portion of the work, probing ahead of the tunnel face, pre-grouting, drilling, and blasting, ventilation, illumination, placing Shotcrete, steel sets and rock reinforcement, surveying, monitoring, and construction equipment to be used.

c. Catalog cuts of drilling, mucking and transportation equipment to be used.

d. Contingency Plan for the excavation and support of the tunnels in the event that monitoring of blasting operations in accordance with Section [_____] and monitoring of ground deformations in accordance with Section [_____] TUNNEL INSTRUMENTATION. Refer to EM 1110-2-1009 for further guidance on instrumentation. Indicate vibrations or movements exceeding threshold values defined in the drawings.

e. The following Optical Survey Target Details must be submitted to the Contracting Officer for approval:

1. Manufacturer's address, phone number and name of the contact person.

2. List and description of special modifications if there are changes.

3. Description of instrument's operational principle.

4. Plans or diagrams of instrument.

5. Maintenance requirements.
6. Reading procedures, including sample data, and data processing calculations.

7. Complete data on all tests done to calibrate instruments or verify accuracy.

f. Working Drawings - The following must be submitted in accordance with the specifications:

1. Drawings and details of the initial support of all excavations.

2. Procedures for the control [, treatment ] and disposal of groundwater and water supplied for use during tunneling.

3. Methods and equipment for measuring and recording groundwater inflow. Methods, equipment, guidelines, and criteria for the use of fissure grouting must be proposed by the Contractor in method statement as required in Section 31 73 19 TUNNEL AND SHAFT GROUTING.

g. Instruments for monitoring air quality.

h. The following records of work accomplished must be submitted to the Contracting Officer within 24-hours of the installation of geotechnical instrumentation measuring tunnel convergence:

1. A list of instruments installed, including instrument identification numbers, calibration, elevation, orientation, stationing, offset, and initial coordinates as applicable to each instrument or installation.

2. Drawings showing details of installed instruments. All dimensions and materials used must be fully identified.

3. A statement describing the procedure used for the installation of each instrument.

i. Complete working drawings and system description of proposed equipment, materials, and method for handling water within the tunnel, measurement of pumped water, and disposal methods.

3.6.2 Blasting

3.6.2.1 Master Blasting Plan

Submit a Master Blasting Plan at least [_____] days prior to commencing drilling and blasting operations that includes a section called Blasting Safety Plan for review and approval. The Master Blasting Plan must contain the full details of the typical drilling and blasting patterns [and control for line drilling and for the presplit, buffer and production blasting, in the situation where controlled blasting is required for the project]. The Master Blasting Plan must contain the following information, at a minimum:

a. Typical plan and section views drawn to scale of proposed drill patterns including free face, burden, blasthole spacing, relief hole data, [burn, v, fan] cut design, blasthole diameters, blasthole angles, lift height and subdrilling depth, where allowed except for the blast that will carry the excavation to foundation grade where subdrilling is restricted as specified in the article SUBDRILLING. Base the typical
plan and section views on the geology and excavation plan for this project site, it cannot be a blast plan from a previous project.

b. Typical loading diagrams for each blast design being proposed showing type and amount of explosives, primers, boosters, decks, initiators and location and depth of stemming in each blasthole.

c. Typical initiator sequence of blastholes including delay times and delay system.

d. Predicted vibration and airblast amplitudes, and the mathematical equations used to calculate them. The Contractor must monitor the results of the test blasts and with the seismic data collected can determine the site-specific ground vibration equations and the site specific airblast equations for the project. After the first 10 blasts the Individual Shot Plans must use the site-specific estimates at the 95 percent confidence level.

**************************************************************************
NOTE: Some states or counties may have specific vibration amplitude and airblast equations for specific locations.
**************************************************************************

e. Manufacturer's data sheets, including Safety Data Sheet (SDS), for all explosives, primers, and initiators to be employed. Provide copies of SDS for all explosives and detonators and define specific details about hazard communication programs for employees and specify where copies of SDS will be kept.

f. The Master Blasting Plan submittal is for quality control and record keeping purposes. Approval of the Master Blasting Plan does not relieve the Contractor of responsibility for the accuracy and adequacy of the plan when implemented in the field. Retain the professional services of a Blasting Consultant to assist with the blast designs included in the Master Blasting Plan.

g. Provide the Test Blast Plan and procedures for test blasting and modifying shot plans during production blasting in the Master Blasting Plan. Also provide the expected results from each shot including, but not limited to, the likely maximum peak particle velocity and airblast levels at the nearest inhabited structures.

h. Indicate that the Individual Shot Report design and blast record documents must provide all the data of each blast in sufficient detail.

i. Include samples of all completed submittal forms and diagrams (Pre-Blast Surveys, Individual Shot Plan, Drilling Logs, Individual Shot Reports, Individual Shot Vibration Monitoring Report, Results of Vibration and Airblast Monitoring, and Individual Shot Video).

j. Manufacturer's specifications on equipment to be used including but not limited to drills, air compressors, drill bits, drilling equipment specifications, manufacturer's literature of the drill rods, bits, casing.

k. Plans for construction sequencing line drilling, presplitting, blasting, and mucking operations to complete the rock excavation within the limitations of the peak particle velocities. Describe the change
in placement of the seismographs with regards to the progression of blasting and excavation. Provide the names of individuals responsible for the instruments, data retrieval, and analyses.

1. Single Sheet plan view showing location of all seismographs. This sheet must be amended and resubmitted whenever seismographs are moved.

m. Sample checklist that the Contractor will use to ensure that all required information is included in each blasting plan.

n. Survey Control Plan: Establish survey control as approved by the Contracting Officer for horizontal and vertical control of all line drill, presplit and production blasts. Assure that all blast holes are drilled on the specified pattern and at the location and the depths as detailed in the blast plan.

3.6.2.2 Blasting Safety Plan

In addition to the Master Blasting Plan, a Blasting Safety Plan must also be prepared, as specified, and outlined in EM 385-1-1, Section 29. All blasting work must be conducted in accordance with the requirements specified in EM 385-1-1.

********************************************************************
NOTE: Minimum safe distance from blast point will vary with each project. Federal, state, and local regulations must be taken into consideration. Ensure NEPA, 408 permits, and environmental studies incorporated the blast safety radius.
********************************************************************

The required minimum safe distance for shaft blasting or when blasting at portal is [_____] meters [_____] feet from the blast point. All the public[, including swimming and boating recreationists] must be excluded from the safety zone during blasts, including pre- and post-blast operations. The safety zone must be marked with an intrusion prevention barrier and high hazard warnings.[ Patrol by boat before and during blasting to prevent the recreational public from entering the safety zone.]

The Blasting Safety Plan must provide a complete description of the clearing and guarding procedures that must be employed to ensure personnel, staff, visitors, and all other persons are at safe locations during blasting. A Blasting Safety Plan simply stating: "all regulations will be followed" is not acceptable and will be rejected. This plan must be developed and signed by the Contractor's Blasting Specialist with input from the Contractor's Site Safety and Health Officer (SSHO) with the intent to show how the Contractor's procedures and methods meet or exceed applicable rules, regulations and standards established by the Regulatory Agencies, codes and professional societies, and specifications listed herein. This information must include detailed descriptions and maps, when appropriate of traffic control, visible warning signs or flags, audible warning signals, method of determining blast areas (all areas affected by potentially harmful blast effects), access blocking methods, guard placement and guard release procedures, primary initiation method, and the system by which the Blaster-In-Charge must communicate with site security guards or other appropriate site supervisory personnel. The Blasting Safety Plan must be in accordance with and include items required in the EM 385-1-1, Section 29, 29 CFR 1910.109, 29 CFR 1926-SUBPART U.
The Blasting Safety Plan must state that explosive distributor will be delivering explosives on the day of the planned operation and recovering unused explosives at the end of the day. In the event of lightning detected at 16 kilometers or less from the project site requirements for ceasing operations must be described. Provide a plan for controlling the temporary onsite storage of explosives or of securing an area of loaded holes until the threat has passed.

The Blasting Safety Plan must contain detailed descriptions of how and from where explosives will be transported and used at the various project work areas, and a map of the transportation route. The Blasting Safety Plan must explain how explosive transport vehicles will satisfy all applicable ATF, OSHA, Federal, State, and local regulations. The Blasting Safety Plan must also include the following:

a. Specific details about hazard communication programs for employees.

b. Equipment that will be used to monitor the approach of lightning in such event, the site evacuation and site security plans, and the criteria for determining if the site is safe to re-occupy.

c. Methods for preventing spills or losses of explosives, drilling fluids, oil, or other pollutants onto the ground during handling and blast hole loading operations. Include details of spill containment and contingency plans for quickly and effectively cleaning up spilled materials.

d. Method of safe and approved disposal of all explosive packaging materials.

e. Detailed contingency plans for detection and disposal of misfires resulting from cutoffs or other causes, hangfires, inadvertent initiator extraction, or accidental loss of downlines. A narrative describing in detail job steps, controls, and hazards associated with but not limited to hung or bridged powder, overloaded holes, cutoffs during placement of blast mats, failure of communication system during pre and post blasting protocols, recovery protocols for unexploded objects (UXO).

f. Misfire mitigation procedures, including but not limited to restrictions of entry, securing the area prior to investigating and inspection, additional safety measures, time-sequence of operations, and mitigation protocols.

h. Fire Prevention Plan details, including tobacco smoking policies, procedures and limitations for work involving open flames or sparks, description and location of firefighting equipment, and firefighting and evacuation plans.

h. Digital copies of a valid [state] blasting license for the Blaster-In-Charge, Blasting Specialist and all personnel required to have one.

i. State required certifications for the Contractor's explosives supplier's Federal, ATF Explosives license or permit.

j. Other required county or state permits required for explosive transportation, use and offsite storage.
k. Explosive transporters' commercial driver's licenses with HazMat endorsements.

l. When a misfire is declared the Blaster-In-Charge must wait 1 hour before inspecting site and provide proper safeguards for excluding employees from the danger zone except those necessary to do the work.

m. Submit updates, modifications, and additions to the Master Blasting Plan in an appropriate and timely manner.

n. Complete project team organization with duties, responsibilities and authorities clearly defined. This organizational outline must also include names, addresses, resumes, responsibilities, and qualifications of all personnel authorized to sign for, receive and use explosives on this Contract.

o. Traffic Control Plan.

3.6.2.3 Pre-Blast Surveys

**************************************************************************
NOTE: During design consult with the stakeholders to determine what Pre-Blast Survey needs to be conducted and whether access is allowed, or special considerations are needed. This needs to be outlined in the specifications for a proper bid to be made for the scope. It is important to include the entire Project Development Team in design to ensure all project features of importance are documented before blasting. Lessons learned on one lock where blasters caused damage and it was not realized until well after the work was completed. The Government had no means to prove the damage occurred from blasting because there was no Pre-Blast Survey of the structures damaged.
**************************************************************************

Prior to the commencement of blasting, conduct a Pre-Blast Survey of any nearby buildings, structures and utilities within [_____] meters [_____] feet from the blast area that may potentially be at risk of blasting damage to document pre-existing conditions. The survey extent and method used must be acceptable to both the Contractor's insurance company and the Contracting Officer. Provide a letter from the insurance company to the Contracting Officer certifying that the proposed survey extent and methods are acceptable. The Contractor is responsible for damages or injuries resulting from blasting. Submit all Pre-Blast Surveys 30 calendar days before the start of blasting. There will be no blasting allowed until the Pre-Blast Survey is submitted and approved by the Contracting Officer. Provide owners of surveyed features a copy of their feature's Pre-Blast Survey results before or with the notice of blasting commencement. Notify owners and occupants of local buildings prior to the commencement of blasting. Perform the following when conducting Pre-Blast Surveys:

a. Provide methodology to be used in conducting the Pre-Blast Survey and listing of structures, determined from the survey to be sensitive, with reasons for these structures being sensitive.

b. Each structure must be documented (including high resolution photography and digital video) as to its construction, foundation type,
condition, and closest distance to excavation blasting. The general condition and all observable defects of each structure must be documented. This includes measurements of the defects.

c. The Commodity storage facilities that may be impacted by blasting must be addressed by the Contractor for safety and continued operation during the blasting program.

d. Freestanding structures (such as retaining walls) must be inspected on the exterior and on the interior as a room. All concrete walks, driveways, and structures must be inspected for cracks, level condition, holes, and defects.

e. Industrial structures, silo/elevators and special facilities, and office space must be described relative to their present conditions and tolerance to vibration. Besides the inspection of walls, columns and stairwells, the Contractor must survey the work areas and structures for distress.

f. An inspection of accessible structures must be made and a list of all structures, which could not be surveyed or refused to allow survey, must be completed. The dates of possible subsequent surveys and physical constraints prohibiting the survey must be documented. The requirement to perform Pre-Blast Surveys is not an indication of Right-of-Entry by the Contractor. Right-of-Entry associated with Pre-Blast Surveys, monitoring during blasting and Post-Blast surveys are the responsibility of the Contractor. In the event a property or properties identified as significant or intended to be included in the Surveys and monitoring are not included because access was denied, indicate this occurrence including the points of contact, dates contacted, and reasons provided for denial of access (if given.)

g. Certify that the survey was prepared prior to the start of blasting under this Contract. Submit a copy of the Pre-blast survey in conjunction with the Master Blasting Plan.

3.7 RECORD KEEPING

**************************************************************************
NOTE: The paragraph below applies to all excavation techniques.
**************************************************************************

Daily records should be maintained as excavation progresses and one copy of such records must be submitted to the Contracting Officer [before 12:00 PM] of the following workday. Keep such other records as deemed necessary. The following data must be included in the daily record for each tunnel heading:

a. Station of tunnel heading faces at start and end of each work shift.

  1. **Daily As-built Survey:** While tunnel excavation is in progress, submit to the Contracting Officer a daily as-built survey record showing line, level, and grade of centerline of tunnel at the invert relative to the theoretical alignment and profile and actual excavated tunnel cross-sections compared to the theoretical cross-sections shown on the Contract Drawings.

b. Type, quantity, and location of initial support and additional initial
support installed. Geologic mapping and excavation records that comply with EM 1110-1-1804 Appendix B and C.

c. Evaluation of in-tunnel monitoring results.

d. Probe hole records in accordance with paragraph DRILLING LOGS of this Section.

e. Number of workers employed per shift for each workday categorized by union trade, idle equipment, active equipment, and site visitors.

1. Air quality and gas monitoring data. Line and grade survey reports.

2. Water inflows, if encountered, with locations and estimates of rates.

3. Overbreak.

4. Other geological and unusual features such as faults, shears, crushed or soft zones, and raveling areas.

3.7.1 Individual Shot Plan

The Blasting Plan must be consistent with the general concepts, designs and layouts shown in the approved Master Blasting Plan. The number of rows of blastholes and the number of blastholes per row can be changed from one individual shot plan to the next. Provide reasons and technical justification for all significant changes from the Master Blasting Plan.

Submit a Blasting Plan for each blast at least [24] hours prior to the planned initiation of drilling. The results of the previous blast are to be jointly evaluated by the Contractor and Contracting Officer prior to the submission of the Individual Shot Plan. The Individual Shot Plan must contain but be not limited to the following:

a. Plan view, and at least two sectional views drawn to scale, of the shot pattern showing blasthole locations, inclinations and designations;

b. Individual blasthole depths, diameters, blasthole spacings, burden, depth intervals of stemming and depth of subdrill;

c. Type of shot, i.e. test, production, pre-split, line drilling or buffer and shot number;

d. Orientation and elevation of the collar and bottom of all blast holes;

e. Total volume of blasted material in cubic meters cubic yards;

f. Description of type of blast and indication if blast is on final slopes or inverts;

g. Amount, type, diameter and depth of explosives, stemming and delay in each hole, and amount, type, and location of boosters and centering devices and the lift elevation;

h. Plan view of blasthole shot pattern showing in-hole and surface delays and firing times of each blasthole or decked charge;

i. Anticipated time and date of blast;
j. Survey coordinates using State Plane coordinate system and, if appropriate, a local coordinate system;

k. Significant geologic features, and techniques planned for mitigating their influence upon results must be included in plan and section with appropriate elevations;

l. Estimated/anticipated peak particle velocities and maximum peak airblast predictions at seismographs located at protected structures using site specific data and regression analysis and the accurate distances from the blast to seismographs;

m. Name of Contractor;

n. Name, signature, and license number of the Blaster-In-Charge;

o. The maximum charge weight per delay, pattern and sequence of delays, and firing times for the blast;

p. Type of detonators, initiation and down hole lines;

q. Powder factors both in charge weight per cubic yard of material shot and in charge weight per meter per foot of total drillhole depth;

r. An elevation sketch of a typically loaded hole depicting each hole pattern, top of overburden elevation, top of rock elevation, bottom of hole elevation and diameter of hole, sub-drilling, decking charges, locations of explosives and stemming, and the locations of primers, boosters.

s. The location of the blast area on a scale plan map of the project indicating the location of the shot, and the distance and directional relationship between all seismic equipment and the nearest structure subject to damage using a scaled distance measured in a horizontal line from the blast site to the nearest building, structure, or facility.

t. A minimum of [_____] high resolution photos, taken with a camera with a resolution of at least twelve megapixels, of the entire blast area, preferably from above, of surface and open face, tunnel working face, tunnel crown, tunnel periphery, tunnel floor; of the shot and surrounding rock to document conditions prior to the shot.

u. Blastholes must not be drilled until the Individual Shot Plan for them is approved. Evaluate problems or impediments of the prior shot and implement solutions for those issues with the next Individual Shot Plan. Provide the Individual Shot Plan to the Contracting Officer electronically. The Contracting Officer will review the plan and send comments to the Contractor within 24 hours of receiving the plan if the plan is submitted between Monday and not later than close of business Thursday.

v. Include a tabular listing by hole in the ascending time order of delays by the describing: row and number within the row of the shot hole, total delay time, the total charge weight of explosive materials for the entire hole, top of sound rock elevation, bottom hole elevation, stemming elevations, and detonator, primer and booster elevations in the hole, by hole in the ascending total delay time order of delays by describing: row and number within the row of the shot; and for each
seismic monitoring location the closest approach, the square-root scaled distance, the cube-root scaled distance, and the estimated PPV and airblast overpressure.

3.7.2 Drilling Logs

******************************************************************************

NOTE: It may be necessary on sites with complex geology and blasting is occurring near very critical structures or rock outside of neat lines needs special protection, or neat line tolerances are especially important to consider the blaster or Contractor to have geologist(s) on staff to log blast holes or assist in logging blast holes, and aide the blaster in understanding the geology and for more accurate drilling logs. For rock excavation's objective(s); the project truly requires the designed tolerances and quality/stability of the remaining rock, which cannot be overcome at the Contractor's cost of dental clean-up, rock bolting, shotcrete or mass concrete placement; and, an experienced, agency (or third-party) geologist will be onsite for Quality Assurance of the logging & blasting & retained rock stability or damage. Logging may need to be in accordance with ASTM D2488, ASTM D5434, ASTM D6032/D6032M in some instances.

******************************************************************************

The drillers are required to keep precise drilling logs on each blasthole to show the depth of the geological features. At minimum, each drilling log must include:

a. Blast number;

b. Blasthole designation and location station number, bench number and type of blast (production, presplit, buffer[, and other types]);

c. Blasthole depth, inclination and diameter;

d. Elevation of top of blasthole;

e. Subdrill depth as permitted in the article SUBDRILLING;

f. Depth(s) of geologic structural features, e.g., voids, gouge or mud seams, soft weathered or altered zones, rusty intervals, changes in rock chip color, and other features encountered in the blasthole pertinent to loading the hole;

g. Relative penetration rates;

h. Start and end times of drilling;

i. List blasthole misalignment; and

j. Soft seams within the rock and sudden feed pressure changes on the drill;

k. If qualitative descriptors are used (e.g., soft, moderately hard, hard,
very hard, decomposed, highly weathered, moderately weathered, slightly weathered, unweathered), ensure consistency between drill operators in logging using these terms. Blasting Specialist and Blaster-In-Charge must ensure drillers are using consistent terminology between drillers. [Log soil and rock in accordance with ASTM D2487, ASTM D5434, ASTM D6032/D6032M.] Submit an example of the Drilling Logs with the Master Blasting Plan. Copies, both hard and electronic PDFs, of these drilling logs must be provided to the Contracting Officer at least 24 hours prior to loading blastholes. The drilling logs must be used to determine the proper design and loading of blastholes and for locating the depths for use of stemming decks across intersected geological features to protect against blowout, flyrock and unusual or hazardous blasting effects.

**************************************************************************
NOTE: The paragraph below may be necessary where preventing subdrilling and foundation damage is critical.
**************************************************************************
[ Survey the elevation at the collar of each production hole in the final blast to foundation grade to ensure that the production blastholes are not subdrilled below final foundation grade, except as permitted in article SUBDRILLING. The survey must be included in the Individual Shot Plan.]

3.7.3 Individual Shot Reports

**************************************************************************
NOTE: The Contractor must plan on multiple tunnel headings so that production can be maintained on schedule. The GBR may include recommendations as to how many headings can be expected in the project.
**************************************************************************

As a minimum, the Individual Shot Report must be the same form used in the Individual Shot Plan but provide all "as-built" information required for the blast plan. Furthermore, the Individual Shot Report must better describe part of the blasting operation that wasn't adequately described by the Individual Shot Plan including information on misfires, observed field conditions, and information how the Blaster-In-Charge compensated for compromising field conditions, such as increased stemming amounts, or stemming decks where voids, cracks, spalls or mud seams were identified and resolved. The Blasting Specialist is responsible for recording all explosives loaded in the blasthole and for accurate documentation of daily blasting activities. The Individual Shot Reports are for quality control and record keeping. Review of, and comments on, the blast reports by the Contracting Officer will not relieve the Contractor of responsibility for the accuracy and adequacy of the blast design. Submit the Individual Shot Report no later than 24 hours after the blast. No additional blast will be drilled or loaded in the immediate area of the completed blast until the previous day's Individual Shot Report is submitted to the Contracting Officer. The report must include at minimum the following information:

a. Blast number (i.e., R-L3-PS1);

b. Date and specific time the blast was initiated;

c. Blasthole designations, locations;
d. Amount, type and depth of explosives, decking, stemming, and delay in each hole;

e. Plan and section views, drawn to scale, of drill pattern including free face, burden, blasthole spacing, blasthole diameters, blasthole angles and azimuths, blasthole number, lift height, and subdrill depth. Show in-hole and surface delays, as well as actual firing times of each blasthole or decked charge. Use different symbols to distinguish the production, buffer, presplit and line-drilled blastholes. Include a north arrow, stationing, and scale on each plan view. Label the direction of the sections on the sections. Include section parallel to, and perpendicular to the blasthole rows. Show final grade and slope lines as appropriate in the sections. Show the location of the two video recorders on the plan in relation to the blast.

f. Drilling logs for presplit, line, buffer, and production blastholes. Each drill hole must be logged by the driller to provide additional information to the Blaster-In-Charge during loading operations. Drilling Logs must contain information pertinent to the rock characteristics and blast operations. At the minimum, drill logs must contain geological information on pertinent geologic structure, soft or weathered zones, voids, penetration rate changes, and driller's notes.

g. Loading diagram showing type, diameter, amount and depth interval of explosive, primers, initiators and location, depth, and type of stemming for each blasthole. Show the charge weight of each type of explosive and the total explosive load per delay or per hole.

h. Diagrams showing the delay system in the initiation sequence in each blasthole and the location and delay time of all surface delays of each blast. Indicate which blastholes are firing with a delay of less than 8 milliseconds.

i. Trade names and sizes of all explosives, primers, and initiators to be employed.

k. A description of all personal injuries and property damage caused by the blast; when the measured maximum peak particle velocity or airblast exceeded by 10 percent the anticipated values from the Blasting Plan; and, all problems with the Warning System and problematic results of the blast, such as overbreak or large fragmentation, or with the shot pattern, such as misfires.

l. The vibration and airblast report described in paragraph Vibration and Airblast Monitoring. Include a comparison of predicted and actual measured values.

m. Signature of the Blasting Specialist specifying that the Blasting Specialist has reviewed the Individual Shot Report for accuracy and completeness.

n. Signature of the Blaster-In-Charge.

o. Note if mats are used [or required by the Contracting Officer ]then list the type of blasting mats or other protective covering used.

p. A brief weather description at or near the time of the detonation such
as cloudy, clear, partly cloudy, and foggy, with approximate wind
direction and velocity, and temperature.

q. Updated or "as-built" Plan drawings depicting the blast hole pattern
and the delay pattern employed as well as pounds of explosives
utilized, hazard incidents, and blast holes not loaded.

r. Copies of drilling records and originals of the blast monitoring data.

s. A plan view map [of each bench ]showing the location of each completed
blast.

NOTE: A pre-blast photograph may be required for
some project, if so then including them with the
post-blast photographs in the shot report may be
required.

Include photos, after the shot, taken from the same locations and at
the same resolution as the blasting plan photos. Include the blasting
plan photos in the shot report.

Include an updated as-built tabular listing by hole in the ascending
time order of delays by the describing: row and number within the row
of the shot hole, total delay time, the total charge weight of
explosive materials for the entire hole, top of sound rock elevation,
bottom hole elevation, stemming elevations, and detonator, primer and
booster elevations in the hole, by hole in the ascending total delay
time order of delays by describing: row and number within the row of
the shot; and for each seismic monitoring location the closest
approach, the square-root scaled distance, the cube-root scaled
distance, and the estimated PPV and airblast overpressure.

Include two log-peak particle velocity versus square root scaled
distance as per RI8507 diagrams for each seismograph. [ One diagram
including all shots.][ The second including only data from the last 10
shots.]

Include seismic records with peak displacement, velocity, and
accelerations at their respective frequencies. Site curve modification
may be required to ensure that vibration levels[ structure of
interest][ are] acceptable.

If a recorded seismic value appears anomalous, the Contracting Officer
may request that the vibrations monitoring specialist interpret all the
collected seismic records from the seismographs for that blast and
provide an explanation of the anomalous readings. Anomalous readings
include, but are not limited to, unusually high or low particle
velocities, failure of a seismograph to trigger, or atypical wave forms
on the paper record. No additional blasting will be allowed until the
issue is resolved to the Contracting Officer's satisfaction.

w. Signatures of the Blasting Specialist and Blaster-In-Charge will be
considered as proof that the shot was laid out, drilled, loaded, and
wired as designed.[ Proof of the Blasting Specialist and Blaster-in
Charge's qualification must include remaining below the allowable peak
particle velocities at all structures.][ Inability to remain below the
allowable vibration levels may be cause for dismissal of either or both
The Blasting Specialist must oversee all loading operations and collect and keep accurate records of the information required for each Individual Shot Report. Submit an example of an Individual Shot Report to the Contracting Officer for approval at least 30 days before commencement of blasting. Failure to submit satisfactory Individual Shot Reports must result in suspension of additional drilling and blasting until the Contractor complies with this requirement. The Blasting Specialist will make sure that the drilling logs are used by the blaster when blastholes are loaded to prevent overloading in soft or weak rock in the borehole. The Blasting Consultant must develop a checklist of tasks that must be completed and checked off by the Blasting Specialist for each blast. Complete the tasks in an orderly fashion before a blast is fired. Submit the draft checklist for approval. Submit the completed and signed daily checklist with the Individual Shot Report.

Supplement the Individual Shot Reports with the original digital copy of the printed results of vibration and airblast monitoring showing peak readings and frequencies for each blast to the Contracting Officer. This submittal must also include the distance from the blast to the seismograph in meters feet as well as the maximum kilograms pounds of explosive per delay. The seismograph locations must be clearly marked and located on a map in the blast report. Supplement the Individual Shot Report with the original, handwritten, field notes showing field changes on the approved blasting plan.

3.7.4 Daily Explosive Material Consumption

Accurate daily records must be kept and account for each piece of explosive, detonator, and equipment from the time of delivery at the site until its discharge and used. No explosives must be accepted until it is plainly labeled and delivered as new stock in sound condition. Dates of manufacture and lot numbers must be recorded for all explosives delivered to the site. Temporary containers for explosives must be approved in advance by the Contracting Officer. Remaining or unused explosives must be inventoried each day and discrepancies that would indicate a theft or loss of explosive material must be reported immediately as specified in Paragraph Report of Loss.

3.7.5 Report of Loss

Should a loss or theft of explosives occur, all circumstances and details of the loss or theft must be immediately reported to the nearest office of the Bureau of Alcohol, Tobacco, Firearms and Explosives and to the local law enforcement authorities and the Contracting Officer. The Blasting Specialist must prepare a memorandum describing and explaining problems in the accounting of explosives used.

3.7.6 Individual Shot Videos

**************************************************************************
NOTE: Video size can be a point of discussion, larger files come out of the new high quality 1080 HD and 4K videos. It may be necessary to require a frames/second or use of HD/4K videos. It is likely technology will change faster than this guide specification. This paragraph can be updated by project. The use of sFTP allows for the larger
files.
**************************************************************************
When blasting at portal(s) and shafts, record each blast with high resolution digital video cameras from two designated locations, approximately perpendicular to one another, that provide side, front and rear views of the blast and area above it. The Contractor should anticipate at least one designated video camera location when blasting underground for each shot. The video images must not contain other text than the shot number, date, and time. Include metadata consisting of the blast ID, date, and time of the blast. Index the two video recordings to properly identify each blast. Submit the proposed locations of the two video recorders on a map with the Individual Shot Plan for approval. Furnish electronic file copies of video recordings on the sFTP within 24 hours of a blast. If the Contracting Officer requests that a copy of the video be submitted earlier, then deliver a copy within one hour of the request. Maintain a digital video library of all blasts. All drilling and blasting activities must cease after the 24 hours from the previous blast if the video recordings of the previous blast are not furnished to the Contracting Officer.

3.7.7 Post-Blast Surveys
**************************************************************************
NOTE: Pre- and Post-Blast Inspections and the Structural Inspection/Evaluation Specialist would only be required if there are structures or facilities requiring such inspections. Eliminate the paragraphs referencing Pre- and Post-Blast Inspections and the Structural Inspection/Evaluation Specialist if the project does not have a requirement for these inspections.
**************************************************************************
Post-blast surveys must be conducted at locations, where a reasonable notice of damage from blasting has been provided. Post-blast surveys will be conducted by, or under the supervision of, the Structural Inspection/ Evaluation Specialist, who will also sign and date each survey. The survey extent and method used must be acceptable to both the Contractor's insurance company and the Contracting Officer. The post-blast surveys must be conducted within a week of the notice of damage from blasting. The Contractor is responsible for damages or injuries resulting from blasting. Submit a copy of all post-blast surveys within two business days of the on-premises surveys to both the structure's owner and the Contracting Officer.

3.7.8 Probe Hole Drilling
**************************************************************************
NOTE: The design team must evaluate expected ground conditions including but not limited to: zones of intensely jointed rock mass due to faults, shears, etc., rock types, weathering profiles, groundwater regime, other pertinent geological information available from the site investigations to determine the adequate length of probing ahead of tunnel. This information must be included in the Geotechnical Baseline Report as a recommendation.
Insert gallons per minute (gpm) based upon results of packer tests performed, or other estimates of water inflow. In lieu of available project data, assume nominal amount of water on the order of 15-20 gpm. The inflow information must be included in the GBR and/or GDR.

The number of supplemental probe holes expected for the project must be determined during design phase and clearly listed as a recommendation in the GBR.

Typically these probe holes are incidental to the tunnel excavation pay item (cu.f. or cu.m), designer should ensure this is stated in the specification or include a CLIN for payment.

**************************************************************************

a. The Contracting Officer must be informed 24 hours prior to probing activities in the tunnel so that the Government may be present during the probe hole drilling. The results of probing ahead along with proposed amendments to excavation profile, sequence or support must be submitted to the Contracting Officer immediately within _____ hours of the completion of the probing.

b. Probe holes must be drilled to provide advance warning of abnormal inflow of water or degradation in rock quality, which might occur. Probe hole locations and extent of hole drilling is shown on the Drawings and will be modified as needed in the field as approved by the Contracting Officer. The Contracting Officer may direct supplemental probe holes to be drilled based on ground conditions. Exploratory probe holes may also be required to explore the nature of subsurface formations or following grout operations to investigate the effectiveness of the grouting program.

c. If the inflow of water from the probe hole exceeds _____ gpm, supplemental probe holes will be required, at the direction of the Contracting Officer, to probe the extent and character of the ground, and to drain the water, or for use as grout holes. If directed by the Contracting Officer, grout the face of the tunnel heading in accordance with Section 31 73 19 TUNNEL AND SHAFT GROUTING.

d. Probe holes must be drilled to a minimum of _____ meters _____ feet measured along the drilled hole and will overlap to maintain at least one hole a minimum of _____ meters _____ feet ahead of the plane of the tunnel face at all times. The Contracting Officer may reduce the drilling length based on ground conditions.

e. During probe hole drilling, the Contractor should stop at a minimum of each 3 meters 10 feet of hole advance to measure water flow and water pressure. The Contracting Officer waive this requirement on a hole-by-hole basis if little or no water is encountered.

f. Probe hole must be terminated _____ meters _____ feet beyond the first groutable feature, as determined by the Contracting Officer.

g. Probe holes must be sealed by grouting through a packer close to the first water producing feature to prevent water flows into the tunnel while the tunnel face is advanced.
h. If, in sections of the tunnel excavation, drilling is directed by the Contracting Officer for supplemental probe holes, other operations should be suspended or modified as may be necessary to permit such drilling; and the Contractor will not be entitled to compensation for delay nor will the Contractor be entitled to extension of time, such stopping of work being deemed an ordinary delay to be expected during construction operations.

**************************************************************************
NOTE: A conservative estimate for the number of supplemental probe holes should be defined in the GBR. Define how these supplemental probe holes are to be paid.
**************************************************************************

i. Follow format requirement in paragraph DRILLING LOGS.

3.8 BLAST EFFECTS MONITORING

**************************************************************************
NOTE: The vibration and air blast monitoring are covered under Section 31 23 06.00 BLASTING - SURFACE; it must be included when conducting blasting work.
**************************************************************************

3.8.1 Convergence Monitoring Construction Requirements

3.8.1.1 General Tolerance

The instruments must be installed as close as practicable to the locations [shown on the Drawings] [or as established in the field by the Contracting Officer]. The Contractor must submit to the Contracting Officer for consent, all final instrument locations prior to their installation. Where instruments are shown on the contract drawings to be installed in clusters, the Contractor must install all instruments shown within a [_____] mm [_____] in. radius

3.8.1.2 Availability of Data

The Contractor must monitor all instruments and provide data obtained to the Contracting Officer within a maximum of [24 hours] after taking the readings unless otherwise directed by the Contracting Officer.

Instrument monitoring data must not be disclosed to third parties and must not be published without the prior written approval of the Contracting Officer.

3.8.1.3 Instrument Installation Sequence

Optical survey targets must be installed following scaling and within [_____] meters [_____] feet of the advancing tunnel face.

3.8.1.4 Installation Requirements

The Contractor must assign an instrument identification number to each instrument. Each instrument identification number must be permanently affixed to a suitable material, such as the stamping of a brass tag. The
tag must be attached to the instrument or must be secured at the instrument location.

Optical survey targets must be installed as shown on the drawings.

3.8.1.5 Protection of Instruments

Full responsibility must be borne by the Contractor for protecting the instruments from damage caused by construction operations. Damaged instruments must be promptly replaced or repaired, as directed by the Contracting Officer, at the expense of the Contractor.

The instruments must be clearly marked and protected to avoid being covered by shotcrete. Access must be maintained to permit reading of instruments. Shotcrete applied around instruments must be removed immediately.

3.8.2 Rock Damage Control

The rock formations are known to contain geological features including variable weathering, alteration, fracturing and shearing, voids, weathered joints, and gouge seams. Rock cores recovered during drilling investigations disclose the site's geological conditions and are available for review by the Contractor. The Contractor is encouraged to review the [Geotechnical Data Report, Geotechnical Baseline Report, other reports provided with bid documents or made accessible], the drill core, drill core photographs, cut slopes, and all geotechnical and structural information available before planning and conducting blasting operations.

Use stemming decks across weak or open geological features to confine the energy into the hard rock and minimize explosive gas penetration into these features. No rock mass damage, uplift or shifting or significant overbreak will be tolerated. Control drilling accuracy and delay timing to provide proper relief toward the free face away from final rock slopes. Blasting damage or breakage into the excavation walls will be mitigated at the Contractor's expense. Damage is defined as the loosening of rock beyond the B-line, opening of joints in the final wall and rock block displacement in the final wall. If damage occurs to the final wall that requires remediation, it must be the responsibility of the Contractor to prove that the blasting method employed did not cause the damage.

3.9 TEST BLASTING

**************************************************************************

NOTE: The test blasting may be highly specific for the project site. The designer may have a way to carry out the test blasting to have the Contractor demonstrate satisfactory results. Typically, the main reason for test blasting is to gain understanding of how the blasting on the site causes vibrations/air blast on monitored structures, develop a site attenuation curve to design future blasts with vibration in mind. The other is to demonstrate results, line drilling and presplitting that meets the specifications and no damage to final faces and foundation grade when blasting at portals or final tunnel or shaft periphery when blasting underground. Typically, the test blasting occurs in an area where there is room for failure, if a test presplit causes significant back break it won't be
to a finished face and can be removed

The following is typical test blasting language.

**************************************************************************
Submit the Test-Blast Plan for review and approval. Approval of the revised plan will not relieve the Contractor of their responsibility to produce safe and satisfactory results as set forth by these specifications.

Prior to commencing full-scale blasting operations in a different rock type, weathering grade or new bench elevation, demonstrate the adequacy and effectiveness of the proposed blasting plan by drilling, blasting, and excavating short test sections, not exceeding \(15.3\) meters \([50\) feet\] in length, to determine which combination of method, hole spacing, and explosive loads produces the proper split. If more than one presplit design is tested in one test blast, each presplit design section must be at least \(6\) meters \([20\) feet\] in length along the surface.

The first opening blast starting from a level plane that has only vertical relief (i.e., a sinking cut), must not be used as the production test blast. However, its results must be considered when designing the test blasts. The opening blast must be excavated to full depth if possible before drilling the blastholes for the test blast. The test blast must incorporate the planned methods of presplitting and must be near the center of the excavation and at least \(4.5\) meters \([15\) feet\] away from the final excavation walls \([or invert]\). The Contracting Officer has the option to adjust the location of the test blast areas to optimize for geology. Anticipate blasting up to 10 test sections with at least one test at each different geologic condition and underground blast design. The location of the test blast section must be approved in advance. The Contracting Officer may direct the Contractor to use test section lengths less than \(15.2\) meters \([50\) feet\] if field conditions warrant.

Unless otherwise directed, begin the presplit test blast with presplit holes spaced at \(61\) centimeters \([24\) inches\] center to center. Requirements for presplit and production blasting operations are covered elsewhere in this specification but apply to test blasts.

Do not drill ahead of the test shot area until the test section has been as fully excavated as possible and the results have been evaluated by the Contracting Officer. If the results of the test blast(s) are unsatisfactory, in the opinion of the Contracting Officer, the Contractor's Blasting Consultant must revise the blast design as necessary to achieve the specified results. Unsatisfactory test blast results include poor fragmentation beyond the indicated lines and grade, extensive overbreak, flyrock, ground vibration, airblast or violation of other requirements or these specifications. All costs incurred by the Contractor in adopting revised blasting methods necessary to produce acceptable test blast results will be borne by the Contractor.

If during the progress of the work, the methods of drilling and blasting do not produce the desired result of an undamaged rock slope or tunnel design excavation lines within the specified tolerances, perform additional test sections by drilling, blasting, and excavating short sections, not exceeding \(15.2\) meters \([50\) feet\] in length, until a technique is developed that produces the desired results. No additional compensation will be made for the additional test sections.

At the conclusion of the test blast program, produce a Post-Test Blast
Evaluation Report which examines all reports, surveys, test data, and other pertinent information and conclusions reached. Submit a Test Blast Evaluation Report prepared by the Blasting Consultant and Blasting Specialist after testing blasting is completed.

3.10 BLASTHOLE DRILLING - PORTALS AND SHAFTS

Survey the elevation at the collar of each production hole in the final blast to foundation grade when at the portal excavation or to depth of advance when blasting in the tunnel to ensure that the production blastholes are not subdrilled below final foundation grade. The survey must be included in the Individual Shot Plan and must not be changed without prior approval from the Contracting Officer. Drill production blastholes according to the patterns in the approved Individual Shot Plan. Prior to commencement of drilling of production blastholes, all holes must be located by survey and clearly marked and numbered. Drill the production blastholes within two blasthole diameters of the marked collar location. The blastholes must have no more than a plus or minus \( \pm \) meter horizontal tolerance at the bottom. If holes are drilled outside of these tolerances, except for geologic reasons, fill the holes with crushed stone or neat grout and re-drill them at the approved location as directed by the Contracting Officer at no additional expense to the Government.

After drilling of blastholes at the portals, place approved, reusable plastic blasthole markers in each hole to identify all blasthole locations and keep material from falling into the holes. Check, measure and record the depth of all blastholes as soon as the drill is retracted from the blasthole. If a blasthole has become plugged or is unable to be fully loaded, re-drill or clean out those holes with air prior to commencement of loading operations. Check and measure the depth of all blastholes in a shot to ensure each blasthole is open to the original drilled depth prior to loading of holes. If a blasthole is found not to be open to the drilled depth, re-drill the blast hole to the proper depth at the Contractor's expense. If holes are too deep, fill the holes to the proper depth with crushed stone. When drilling and blasting at the portal areas, blasthole loading and drilling may be ongoing concurrently in a shot area; nonetheless, drilling must be separated from loaded holes by a distance equivalent to at least the depth of the loaded hole but in no case less than 15.2 meters 50 feet.

When blasting for portal excavation, the Contracting Officer may require inclined boreholes to reduce toe burdens and backbreak.

3.11 PRODUCTION BLASTING

The Contractor must provide a detailed narrative for the proposed sequence of production blasting for the project in the Master Blasting Plan, to be evaluated and approved by the Contracting Officer. The proposed sequence must be tailored primarily towards conducting a safe blasting operation and overall responsible, prudent, and professional blast design in efforts to keep overbreak, flyrock, vibration and airblast levels to a minimum. If in the opinion of the Contracting Officer satisfactory results in the production blasts are not being produced, the Contracting Officer reserves the right to require changes in the blast design which could include variables such as burden, spacing, bench height, timing sequence and delays, subdrill depths, explosive loads, detonators, blast matting and the use of air decks or stemming in borehole bottoms. Such required revisions will be at no additional cost to the Government.
NOTE: The proposed language below can be used as guidance when both presplit, and production blasting are used in the project. THE PRODUCTION BLASTING SECTION WILL BE HEAVILY TAILORED FOR THE PROJECT. THIS IS GENERAL TEXT THAT CAN BE ADJUSTED.

The drilling of presplit and production blastholes must be done one pattern at a time. Advanced drilling of adjacent presplit or production blastholes will not be permitted. The presplit wall conditions must be evaluated after each blast by both the Contractor and the Contracting Officer before the adjacent presplit blasting plan can be approved or drilled whenever possible.

The sequence of Production and Presplit blasting for a single blast must be as follows:

1. Submit an individual shot plan.
2. Individual shot plan approved, or revisions requested before approval.
3. Conduct drilling and submit Drilling Logs to Contracting Officer and Blaster-In-Charge.
5. Conduct rock removal, scaling, and rock reinforcement Joint Evaluation of results by Contractor and Contracting Officer.
6. Submit an Individual Shot Plan for the subsequent blast in that work area.
7. Prepare enough planned blasting areas in advance to maintain the project schedule.

The presplit wall conditions must be evaluated by the Contractor and the Contracting Officer after the Contractor exposes a minimum of [2.4] meters [8] feet (vertical) of the wall. If [2.4] meters [8] feet of exposure is not sufficient to determine the condition of the presplit wall, reinforce the exposed wall as necessary, then expose a minimum additional [2.4] meters [8] feet (vertical) of wall. Repeat this downward to the toe of the presplit wall or until the Contracting Officer can determine if the presplit wall condition is adequate before approving the Individual Shot Plan for the adjacent presplit blast. Evaluate the effects of each production blast on the presplit and line drilled walls before submitting a blasting plan for the next blast.

The drilling tolerance must be evaluated and if drill tolerance exceeded the allowable tolerance then benches will be reduced in height to where the drilling tolerance was obtained on the subsequent blasts.
3.12 SUBDRILLING

NOTE: Subdrilling is typically not utilized in underground blasting, however it may be a component required for shaft excavations for connecting surface blasting operations with the underground environment. If Section 31 23 06.00 BLASTING - SURFACE is being used, tailor that specification for the project or include language here.

[_____]  

3.13 PRESPLITTING

NOTE: Presplitting is typically not utilized in underground blasting, however it may be a component required for shaft or portal excavation for surface blasting operations. If Section 31 23 06.00 BLASTING - SURFACE is being used, tailor that specification for the project or include language here. Precision presplitting may also be utilized in these situations. It is a form of presplitting with closer spaced holes with an even lighter explosive load.

[_____]  

3.14 STEMMING

NOTE: Stemming may be used in shaft sinking operations using controlled blasting methods. Stemming is not typically used in tunnel heading advance. Depending on the geology of the project site this paragraph should be tailored to the project, for example in places with karst geologic conditions a more detailed procedure should be specified, or contractor required to submit a procedure for dealing with larger voids.

Variations in rock hardness, structure, and other geological conditions encountered at depth will require the Contractor to stem the blast holes through soft weak areas, shears, open joints, and voids; therefore, close attention will be taken to classify the rock while drilling the blast holes. Where necessary, holes will be stemmed with dry, angular, well-graded crushed stone from .3-cm to 1-cm 1/8-inch to 3/8-inches in diameter without fines. The Blasting Consultant may submit a written, signed request to use drill cuttings for applications such as in presplit blastholes, must be submitted to the Contracting Officer for approval. Wet holes must not be stemmed with drill cuttings. No separate payment is made for stemming.

NOTE: Include tolerance for each proposed structure
from the excavation lines. For example, "The tolerance for the perimeter walls is minus 100 cm/m 12 inches/foot from the design excavation line."

3.15 REQUIRED MUCKING

Required mucking operations should adhere to the details of the Muck Handling Plan. Prior to mucking operations, the Blaster-In-Charge and Tunneling Superintendent should perform an explosive safety check to ensure that all explosive materials have been detonated with the last tunnel heading advance. Undetonated explosive materials should be disposed of in advance of mucking operations in accordance with 29 CFR 1926-SUBPART U.

Muck and scaling follow each shot after firing for inspection of the heading, bottom of the shot lift, or foundation. Drilling and loading for the next shot must not be allowed before the required mucking of the previous shot. This requirement may be waived temporarily when in the opinion of the Contracting Officer, the Contractor's blasting is satisfactory (i.e., no backbreak, overbreak, vibration cracking, exceedance of vibration or airblast thresholds).

NOTE: The following paragraph should be tailored for the specific project, the GBR will provide recommendation on this distance. The Contracting Officer reserves the right to require additional ground support beyond that systematically required in the drawings.

Notwithstanding this requirement, the face must fully be dug out after every shot to a distance not less than [_____] meters [_____] feet prior to drilling and loading the next shot to allow inspection and evaluation of the shot face and allow for adjustments to the blast design for adjacent shots. Required mucking after each shot must be reinstated, when in the opinion of the Contracting Officer blasting is unsatisfactory. Excavation support deemed necessary by the Contractor [or Contracting Officer] for the safety of personnel in the excavation will be installed as the excavation proceeds. Blasting of the next heading advance or lift will not be permitted until the excavation has been accepted by the Contracting Officer.

The mucking system(s) must not restrict other operations including handling and erecting of initial support system materials.

For rail mucking systems, a track with ties and ballast or direct fixation system must be maintained for safe operation of trains. The head of the rails must not be submerged in water or covered with tunnel muck or other debris. Upon completion of excavation of the tunnel, remove all such trackwork prior to placement of final lining.

Submit for review at least [sixty (60)] [_____] days before the start of tunnel excavation the Muck Handling Plan, the methods, procedures, and details of the proposed mucking system. Submit for review the manufacturer's information for the proposed equipment including, but not limited to, specifications, drawings, details, maintenance procedures and requirements, operating procedures, and such other information as may be requested by the Contracting Officer.
3.16 SCALING

**************************************************************************
NOTE: Typically, a level of scaling is required for each project to remove loose, unstable rock prior to mucking operations or prior to required bolting application or other methods of stabilization before carrying out additional excavation operations
**************************************************************************

A program of frequent inspection and scaling must be maintained in all portions of the tunnel. Immediately after each blast, the roof and walls of rock excavations must be inspected by experienced and suitably equipped scalers who must dislodge and scale down all loose and unstable rock. Scale loose and unstable or unsafe appearing material remaining on the tunnel periphery or rock slopes at the portal areas as the excavation proceeds. Perform scaling immediately after each blasting round. The removal must be accomplished by compressed air or water jetting, pry bars, rock picks, hoe-ramming, excavator bucket or other means as approved by the Contracting Officer. Drilling of the next blasting round will not be allowed until the current excavation has been properly scaled and all initial ground support has been installed as determined by the Contracting Officer. No separate payment will be made for scaling.

3.17 GROUTING

Conduct pre-excavation and post-construction grouting in accordance with Section 31 73 19 TUNNEL AND SHAFT GROUTING and as shown on the Contract Drawings.

If groundwater exceeds [____] liters per minute (lpm) gallons per minute (gpm) during probe hole advancement during tunnel construction the Contractor's Engineering Geologist or Geotechnical Engineer will submit a grouting and excavation plan or establish protocols for excavation if certain inflows exceed threshold lpm gpm values prior to tunnel excavation. The Contracting Officer must be informed of the implementation of the aforementioned grouting plan if groundwater inflows exceed excavation plan established inflow thresholds.

3.18 INITIAL SUPPORT

**************************************************************************
NOTE: A UFGS for TUNNEL EXAVATION SUPPORT is being developed. The designer will need to include Initial Support as listed here and Permanent support. Often the contractor will be responsible for designing their own initial ground support types, and may not be defined in the GBR or specs. Alternatively, the GBR may give conceptual initial support types (spacing, types, lengths, etc...) to bid on but give multiple support Types that may be applied along different alignment stationing depending on the geologic conditions. Tailor this section as appropriate.
**************************************************************************

3.18.1 Support Classes and Support Class Ranges

All stations indicating limits of typical support classes referenced herein
or as shown on the Contract Drawings are only approximate and may vary due
to the geological and hydrological conditions encountered in the field.
Tunnel excavation support classes, as shown on the Contract Drawings, are
the minimum to be installed and should be adjusted above and beyond the
said minimum based on the actual ground conditions encountered and be
determined in the field in consultation between Contractor and the
Contracting Officer.

Each support class defines installation of a specific initial support
system. The support elements are as specified in Section XX XX XX TUNNEL
EXCAVATION SUPPORT and as shown on the Contract Drawings.

Initial support measures have been derived based on anticipated ground
conditions and the need to provide stabilization of the tunnel openings for
enlargements to cavern size openings under this Contract or future
contracts.

Excavation and support measures delineated hereafter are typical and should
be supplemented by additional initial support measures as required by
ground conditions encountered or as directed by the Contracting Officer.
To minimize ground movement; the initial support must be installed
following each heading round blast and as close to the working face as
practical in accordance with Section XX XX XX TUNNEL EXCAVATION SUPPORT.

**************************************************************************
NOTE: Verify that a Geotechnical Baseline Report
has been prepared for the project and has been
referenced in Section Related Attachments and
Specifications.
**************************************************************************

a. Ground support guidelines for the tunnel excavation are shown on the
Drawings and provided in the GBR. In addition to the ground support
shown on the contract plans, the Contractor must install such ground
support as necessary to always ensure the stability of the excavation
and the safety of the construction personnel. Ground support installed
by the Contractor without agreement or instruction from the Contracting
Officer must be for the Contractors convenience and at the Contractor's
expense.

b. The ground support must be installed as soon as practicable after
tunnel excavation to minimize loosening or movement of the surrounding
ground. The Contractor must be responsible for providing confirmation
that the ground support system has produced a stable excavation. The
support layouts shown on the contract drawings are a guide only and
must be modified as required on the field during tunnel excavation.

c. The approval of the proposed excavation and support sequence by the
Contracting Officer or failure to call attention upon improper or
inadequate application of the related excavation sequence or tunnel
support, pre-support, or face support or to require respective change
must not relieve the Contractor of responsibility for the integrity of
the tunnel support or the proper execution of the work.

[ d. Lengths of excavation rounds shown on the contract drawings are maximum
values and may have to be reduced due to the ground conditions
encountered.
e. Pneumatically projected concrete, either fiber reinforced Shotcrete or plain Shotcrete must comply with provisions set forth in Section 03 37 13 SHOTCRETE.

f. Rock reinforcement for tunnel excavation must comply with Section 31 68 13 SOIL AND ROCK ANCHORS.

g. Steel arch ribs, liner plates and additional ground support elements must comply with Section XX XX XX TUNNEL EXCAVATION SUPPORT.

3.19 EXCAVATION SEQUENCE FOR TUNNELS

Tunnel excavation must be accomplished in either a full face or top heading and bench format as indicated on the contract drawings. All initial support must be applied or installed prior to drilling subsequent rounds.

3.20 STABILIZATION TYPES

[_____] ground support categories have been developed for the stabilization of the main tunnels as defined in Section XX XX XX TUNNEL EXCAVATION SUPPORT.

An estimate has been made as to the lengths of each of the ground support categories required to stabilize the tunnel. The estimated lengths are shown on the contract drawings and presented in the Geotechnical Baseline Report (GBR). Actual stabilization requirements may vary from those estimated based on the geologic conditions encountered. In accordance with Section 01 35 26 GOVERNMENT SAFETY REQUIREMENTS, the Contractor must be responsible for the safety of the work and for accomplishing the permanent stabilization of the tunnel opening.

3.21 EXCAVATION FOR TRENCHES AND SUMPS

Excavation for trenches and sumps must conform with Section 31 00 00 Earthwork and as shown on the contract drawings.

3.22 EXCESS EXCAVATION

**************************************************************************
NOTE: The type/class of shotcrete used to fill overbreak areas in the tunnel should be defined by the designer in early stages of the development of the bid documents. Similarly, the type of material used to fill overbreak in the tunnel invert must also be defined during early stages of the project design.
**************************************************************************

Excavation outside of the B-Line shown on the Drawings must be filled with Class I, II, III Shotcrete in accordance with Section 03 37 13 SHOTCRETE at the expense of the Contractor. Overbreak excavation in the tunnel invert must be filled with [compacted crushed rock, lean concrete].

3.23 TOLERANCES

The tunnels must be excavated in accordance with the A-line dimensions shown on the Drawings. No unexcavated rock or other material must protrude within the A-line.
a. The Contractor is responsible for control of water in the tunnel during construction and must take all means necessary for such control. Control of water must include but not be limited to, furnishing, installing, operating, and maintaining pumps and other equipment including temporary measuring devices must as per (b) below, constructing temporary ditches and drains and keeping ditches and drains free to carry all water to sumps or other disposal areas; and disposal of all water, tested daily, draining or pumped from the tunnel. Disposal of water must conform to all applicable Federal, State, and local laws.

b. Automatic measuring devices must be furnished by the Contractor and must be employed to measure the flow rate of water coming out of the tunnel portals. Water piped in for construction operations and water exiting at the portals must be separately measured. The difference between the total flow rate out of and the total flow rate into the tunnel must be considered the rate of groundwater inflow to the tunnel. This rate of flow must be measured and recorded on a [daily basis][hourly basis] for information only.

c. Fissure grouting must mean grouting carried out in the rock mass surrounding the Underground Works to stem water flows emanating from fissures in the rock where if left un-stemmed the inflows could initiate instability. Pressure grouting must be carried out when instructed by the Contracting Officer and, where necessary the Contractor must carry out lugeon permeability tests to establish the extent of the fissure to delineate zones that will take grout. Further requirements are in SECTION 31 73 19 TUNNEL AND SHAFT GROUTING.

3.25 PERMANENT TUNNEL DRAINAGE

A drainage geotextile must be installed on the walls and crown of the excavation against the shotcreted surface at locations where actual flows of water are encountered and at other locations as shown on the Drawings or as may be required to the satisfaction of the Contracting Officer. The installation must comprise full coverage for ground support in accordance with Section XX XX XX TUNNEL EXCAVATION SUPPORT.

The drainage membrane must be fixed and sealed to the approval of the Contracting Officer so that the placing of shotcrete does not block or obstruct the drainage geotextile.

Geotextile must be installed in accordance with Section XX XX XX and Waterproof Membrane must be installed in accordance with Section XX XX XX.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for earthwork requirements for buildings, roads, and utilities.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Consult with a soils engineer while editing this section to determine specific requirements for each job.

NOTE: The following information shall be indicated on the project drawings:

1. Surface elevations, existing and new;

2. Location of underground obstructions and existing utilities;

3. Location and record of soil borings and test pits. Include ground water observations and topsoil
thickness encountered in boring, soil
classifications, and properties such as moisture
content and Atterberg limit determinations;

4. Soil classification(s) and properties;

5. Location of borrow and disposal area if located
   on Government property;

6. Clearing stripping and grubbing limits, if
different from clearing limits;

7. Areas to be seeded;

8. Hydrological data where available;

9. Shoring and sheeting required (trench protection
   is specified in Corps of Engineers Manual EM
   385-1-1);

10. Pipe trench excavation details;

11. Location and limits of hard material (rocks);

12. Details of special construction such as under
    railroad and highways right-of-way requirements for
    jacking and boring;

13. Details of sewage absorption trenches,
    absorption pits, and subsurface drains.

PART 1 GENERAL

NOTE: This guide specification does not include
provisions for separate measurement and payment for
any work specified herein. Measurement and payment
paragraphs may be provided in the contract
specifications when unit-price payment is more
equitable for rock excavation, borrow excavation,
and the removal and replacement of unsatisfactory
material below grades indicated. This section
includes requirements for clearing, grubbing,
stripping, grading, and topsoiling. If the contract
specifications contain separate sections on
clearing, grubbing, grading and turf establishment,
revise this section accordingly.

1.1 REFERENCES

NOTE: This paragraph is used to list the
publications cited in the text of the guide
specification. The publications are referred to in
the text by basic designation only and listed in
this paragraph by organization, designation, date,
and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

ASTM D4632/D4632M (2015a) Grab Breaking Load and Elongation of Geotextiles

DEFINITIONS

1.2.1 Capillary Water Barrier

A layer of clean, poorly graded crushed rock, stone, or natural sand or gravel having a high porosity which is placed beneath a building slab with or without a vapor barrier to cut off the capillary flow of pore water to the area immediately below a slab.

1.2.2 Degree of Compaction

Degree of compaction is expressed as a percentage of the maximum density obtained by the test procedure presented in [ASTM D698][ASTM D1557], for general soil types, abbreviated as percent laboratory maximum density.

1.2.3 Hard Materials

Weathered rock, dense consolidated deposits, or conglomerate materials

SECTION 31 23 00.00 20 Page 8
which are not included in the definition of "rock" but which usually require the use of heavy excavation equipment, ripper teeth, or jack hammers for removal.

1.2.4 Rock

Solid homogeneous interlocking crystalline material with firmly cemented, laminated, or foliated masses or conglomerate deposits, neither of which can be removed without systematic drilling and blasting, drilling and the use of expansion jacks or feather wedges, or the use of backhoe-mounted pneumatic hole punchers or rock breakers; also large boulders, buried masonry, or concrete other than pavement exceeding \[0.375 \times 0.75 \times [_____] \text{ cubic meter} \] \[\frac{1}{2} \times 1 \times [_____] \text{ cubic yard} \] in volume. Removal of hard material will not be considered rock excavation because of intermittent drilling and blasting that is performed merely to increase production.

1.2.5 Pile Supported Structure

As used herein, a structure where both the foundation and floor slab are pile supported.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are submitted for Contractor Quality Control approval. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

[Shoring and Sheeting Plan]
[Dewatering work plan]
[Blasting work plan]

Submit 15 days prior to starting work.

SD-06 Test Reports

Borrow Site Testing; G[,
[_____]]

Fill and backfill test
Select material test
Porous fill test for capillary water barrier
Density tests

Copies of all laboratory and field test reports within 24 hours of the completion of the test.

1.4 DELIVERY, STORAGE, AND HANDLING

Perform in a manner to prevent contamination or segregation of materials.

1.5 CRITERIA FOR BIDDING

******************************************************************************
NOTE: For most projects, the scope of earthwork can accurately be determined. However, if earthwork is approximately known, a unit price for earth work should be provided in the Bid Schedule. Unit-price items are multiplied by the approximated and stated quantity giving a sum that is then added to the price for the rest of the work. The result is a lump sum bid with automatic provision for payment or credit due to variations in earthwork within 15 percent of that shown and bid upon. Variations exceeding 15 percent of that shown and bid upon will become the subject of negotiations in accordance with FAR 52.211-18 Variation In Estimated Quantity.
******************************************************************************

Base bids on the following criteria:
a. Surface elevations are as indicated.

b. Pipes or other artificial obstructions, except those indicated, will not be encountered.

c. Ground water elevations indicated by the boring log were those existing at the time subsurface investigations were made and do not necessarily represent ground water elevation at the time of construction.

d. Ground water elevation is [_____] meter feet below existing surface elevation.

e. Material character is indicated by the boring logs.

**************************************************************************
NOTE: Choose the following option if no boring information is available, or if the boring information is insufficient to permit a bidder to develop an accurate estimate of hard material or rock to be encountered. If hard material or rock is to be encountered, the following option should be modified to include a percent figure or an approximate depth at which hard material or rock will be encountered.
**************************************************************************

f. Hard materials [and rock] [will not] [will] be encountered [in [_____] percent of the excavations] [at [_____] meter feet below existing surface elevations].

**************************************************************************
NOTE: Use statements in brackets to describe proposed source of borrow and other bedding or backfill materials if required by the project. Coordinate with submittals. The drawings should indicate the location(s) within the project site or within the boundaries of the Government property where suitable borrow may be obtained.
**************************************************************************

**************************************************************************
NOTE: Choose the types of materials to be provided as borrow. Delete the bracketed sentence that is not applicable regarding location of source. Coordinate requirements with paragraph entitled "Borrow".
**************************************************************************

[ g. [Borrow material] [Suitable backfill] [and] [bedding material] in the quantities required [is] [is not] available [at the project site] [on Government property] [at the location[s]]

**************************************************************************
NOTE: Choose one between the two following bracketed options.
**************************************************************************

h. Blasting will not be permitted. Remove material in an approved manner.
[1. **Blasting** will be permitted. Blasting shall be conducted in accordance with EM 385-1-1, and Federal, State, and local safety regulations. Submit for approval a blasting plan, including calculations for overpressure and debris hazard, prepared and sealed by a registered professional engineer. Blasting mats shall be provided, and non-electric blasting caps shall be used. Notify the Contracting Officer 24 hours prior to blasting.

### 1.6 REQUIREMENTS FOR OFF SITE SOIL

**************************************************************************

NOTE: Check with regional and local authorities as well as the activity to determine actual requirements of bracketed items. (Values shown come from the Commonwealth of Virginia).

**************************************************************************

Soils brought in from off site for use as backfill shall be tested for petroleum hydrocarbons, BTEX, PCBs and HW characteristics (including toxicity, ignitability, corrosivity, and reactivity). Backfill shall not contain concentrations of these analytes above the appropriate State and/or EPA criteria, and shall pass the tests for HW characteristics. Determine petroleum hydrocarbon concentrations by using appropriate State protocols. Determine BTEX concentrations by using EPA SW-846.3-3 Method 5035/8260B. Perform complete TCLP in accordance with EPA SW-846.3-3 Method 1311. Perform HW characteristic tests for ignitability, corrosivity, and reactivity in accordance with accepted standard methods. Perform PCB testing in accordance with accepted standard methods for sampling and analysis of bulk solid samples. Provide **borrow site testing** for petroleum hydrocarbons and BTEX from a grab sample of material from the area most likely to be contaminated at the borrow site (as indicated by visual or olfactory evidence), with at least one test from each borrow site. For each borrow site, provide borrow site testing for HW characteristics from a composite sample of material, collected in accordance with standard soil sampling techniques. Do not bring material onsite until tests results have been received and approved by the Contracting Officer.

### 1.7 QUALITY ASSURANCE

[1.7.1 **Shoring and Sheeting Plan**

**************************************************************************

NOTE: Include the following paragraph when scope of work requires excavations which are greater than 1.5 m 5 feet or when excavation complexity warrants extensive shoring and sheeting.

**************************************************************************

Submit drawings and calculations, certified by a registered professional engineer, describing the methods for shoring and sheeting of excavations. Drawings shall include material sizes and types, arrangement of members, and the sequence and method of installation and removal. Calculations shall include data and references used.

**************************************************************************

NOTE: Where site conditions require extensive monitoring of excavations and water levels include the following requirement.

**************************************************************************
The Contractor is required to hire a Professional Geotechnical Engineer to provide inspection of excavations and soil/groundwater conditions throughout construction. The Geotechnical Engineer shall be responsible for performing pre-construction and periodic site visits throughout construction to assess site conditions. The Geotechnical Engineer shall update the excavation, sheeting and dewatering plans as construction progresses to reflect changing conditions and shall submit an updated plan if necessary. A written report shall be submitted, at least monthly, informing the Contractor and Contracting Officer of the status of the plan and an accounting of the Contractor’s adherence to the plan addressing any present or potential problems. The Geotechnical Engineer shall be available to meet with the Contracting Officer at any time throughout the contract duration.

][1.7.2 Dewatering Work Plan

**************************************************************************
NOTE: Where water levels will impact excavation operations include the following paragraph.
**************************************************************************
Submit procedures for accomplishing dewatering work.

]1.7.3 Utilities

**************************************************************************
NOTE: Delete this paragraph in its entirety if no known utilities or subsurface construction is located below or adjacent to work covered in this specification.
**************************************************************************

Movement of construction machinery and equipment over pipes and utilities during construction shall be at the Contractor’s risk. [Perform work adjacent to non-Government utilities as indicated in accordance with procedures outlined by utility company.] [Excavation made with power-driven equipment is not permitted within [600] [_____] mm [two] [_____] feet of known Government-owned utility or subsurface construction. For work immediately adjacent to or for excavations exposing a utility or other buried obstruction, excavate by hand. Start hand excavation on each side of the indicated obstruction and continue until the obstruction is uncovered or until clearance for the new grade is assured. Support uncovered lines or other existing work affected by the contract excavation until approval for backfill is granted by the Contracting Officer.] Report damage to utility lines or subsurface construction immediately to the Contracting Officer.

PART 2 PRODUCTS

2.1 SOIL MATERIALS

**************************************************************************
NOTE: Use paragraphs titled "Expansive Soils" and "Nonfrost Susceptible Material" for Army projects. Use paragraphs titled "Backfill and Fill Material" and "Select Material" for Navy projects. Use all other paragraphs for both branches.
**************************************************************************
[2.1.1 Satisfactory Materials

**************************************************************************
NOTE: Satisfactory material will be defined in accordance with locally available materials, climatic and water conditions prevailing onsite, economic limitations of the project, design slopes, etc., and suitable classes, based on the geotechnical report, will be listed in the project specification in accordance with the Unified Soil Classification System, ASTM D2487.
**************************************************************************

Any materials classified by ASTM D2487 as GW, GP, GM, GP-GM, GW-GM, GC, GP-GC, GM-GC, SW, SP, [SM,] [SW-SM,] [SC,] [SW-SC,] [SP-SM,] [SP-SC,] [CL,] [ML,] [CL-ML,] [CH,] [MH] free of debris, roots, wood, scrap material, vegetation, refuse, soft unsound particles, and [frozen,] deleterious, or objectionable materials. Unless specified otherwise, the maximum particle diameter shall be one-half the lift thickness at the intended location.

[2.1.2 Unsatisfactory Materials

**************************************************************************
NOTE: Unsatisfactory material will be defined in accordance with locally available materials, design slopes, etc., and unsuitable classes will be listed in the project specifications in accordance with ASTM D2487. Normally, stones larger than 75 mm (3 inches) are considered unsatisfactory. This paragraph should be edited to delete inapplicable materials.
**************************************************************************

Materials which do not comply with the requirements for satisfactory materials. Unsatisfactory materials also include man-made fills, trash, refuse, or backfills from previous construction. Unsatisfactory material also includes material classified as satisfactory which contains root and other organic matter, frozen material, and stones larger than [_____] mm inches. The Contracting Officer shall be notified of any contaminated materials.

[2.1.3 Cohesionless and Cohesive Materials

**************************************************************************
NOTE: When classification will be necessary during construction, determination of grain size for classification will be specified to be made in conformance with ASTM C117, ASTM C136/C136M, and ASTM D422.
**************************************************************************

Cohesionless materials include materials classified in ASTM D2487 as GW, GP, SW, and SP. Cohesive materials include materials classified as GC, SC, ML, CL, MH, and CH. Materials classified as GM, GP-GM, GW-GM, SW-SM, SP-SM, and SM shall be identified as cohesionless only when the fines are nonplastic (plasticity index equals zero). Materials classified as GM and SM will be identified as cohesive only when the fines have a plasticity index greater than zero.
2.1.4 Expansive Soils

NOTE: Additional laboratory testing and analysis might be needed to better define site specific expansive soils. If expansive soils are anticipated at the construction site, this specification should be edited to ensure proper construction techniques are undertaken per Army TM 5-818-7.

Soils that have a plasticity index equal to or greater than [_____] when tested in accordance with ASTM D4318.

2.1.5 Nonfrost Susceptible (NFS) Material

NOTE: Contract specifications for nonfrost-susceptible fill and backfill will follow the gradation requirements recommended in UFC 3-250-01, "Pavement Design for Roads, Streets, Walks, and Open Storage Areas". For fill under critical structures, materials with ML, MH, and CH classification will be specified as unsatisfactory (if at all feasible from an economic or material-availability standpoint). If such materials must be used, the specification will point out the critical nature of the materials and the control difficulties to be anticipated. Organic materials and topsoil having OL, OH, and Pt classification will not be used in fill or backfill.

A uniformly graded washed sand with a maximum particle size of [_____] mm and less than 5 percent passing the 0.075 mm No. 200 size sieve, and with not more than 3 percent by weight finer than 0.02 mm grain size.

2.1.6 Common Fill

Approved, unclassified soil material with the characteristics required to compact to the soil density specified for the intended location.

2.1.7 Backfill and Fill Material

NOTE: Consult with a geotechnical engineer to determine the type of material, the classification of the material, and the particle size of the material. Never use site-excavated material without a thorough investigation. Excavated material should be of a quality that will compact, will not settle or shrink, and will not become unstable when wet. The borings or soils report will indicate properties of the native soils. Stones in backfill should generally not exceed 75 mm 3 inches in diameter.

ASTM D2487, classification GW, GP, GM, [GC], SW, SP, SM, [SC] with a

2.1.8 Select Material

**************************************************************************

NOTE: Delete this paragraph if there is not a requirement for select material in the project. It is important to specify select material under footings and slabs to minimize settlement and to ensure stability of a structure. Consideration should be made of the sensitivity of the structure to total and/or differential settlements related to the structural design. This is particularly true of add-on structures and structures to be founded partly on fill and partly on natural ground. For crib retaining wall, not more than 10 percent by weight of the fill material shall be finer than 75 micrometers No. 200 sieve. Also, specify coefficient of permeability within the range of 0.01 to 1.0 mm per second 0.002 to 0.20 feet per minute and soil classification GW, GP, SW and SP. Indicate with cross sections or section details on the contract drawings the limits or extents of any controlled fills or backfills. Specify class of material that is acceptable in the fill or backfill giving preference to any types available at or near the site. Select appropriate values for Atterberg limits and percentage of fines and specify maximum thickness of lifts for compaction.

If suitable materials for this project are limited to materials classified as GW, GP, SW, or SP, delete the bracketed sentences of this paragraph. Coordinate requirements with a geotechnical engineer. Select fill used for structures should extend a minimum of 1.5 m 5 feet outside the building foundation lines or other building elements gaining support from the fill.

**************************************************************************

Provide materials classified as [GW,] [GP,] [SW,] [SP,] or [____] by ASTM D2487 where indicated. [The liquid limit of such material shall not exceed [35] [____] percent when tested in accordance with ASTM D4318. The plasticity index shall not be greater than [12] [____] percent when tested in accordance with ASTM D4318, and not more than [35] [____] percent by weight shall be finer than 75 micrometers No. 200 sieve when tested in accordance with ASTM D1140.] [Coefficient of permeability shall be a minimum of [0.01] [____] mm per second [0.002] [____] feet per minute when tested in accordance with ASTM D5084.]

**************************************************************************

NOTE: Where California Bearing Ratio values are needed include the following paragraph:

**************************************************************************

[Bearing Ratio: At 2.5 mm 0.1 inch penetration, the bearing ratio shall be [_____] percent at 95 percent ASTM D1557 maximum density as determined in]
accordance with ASTM D1883 for a laboratory soaking period of not less than 4 days. [Maximum expansion shall be [_____] percent.] [The combined material shall conform to the following sieve analysis:]

<table>
<thead>
<tr>
<th>Sieve Size</th>

2.1.9 Topsoil

NOTE: If seeding is minor, use requirements specified herein. Otherwise, edit Section 32 92 19 SEEDING, and cover requirements (for most projects) therein.

[ Provide as specified in Section 32 92 19SEEDING. ]

[ Natural, friable soil representative of productive, well-drained soils in the area, free of subsoil, stumps, rocks larger than 25 mm one inch diameter, brush, weeds, toxic substances, and other material detrimental to plant growth. Amend topsoil pH range to obtain a pH of 5.5 to 7. ]

2.2 POROUS FILL FOR CAPILLARY WATER BARRIER

ASTM C33/C33M fine aggregate grading with a maximum of 3 percent by weight passing ASTM D1140, 75 micrometers No. 200 sieve, [or] [ 37.5 mm 1-1/2 inches and no more than 2 percent by weight passing the 4.75 mm No. 4 size sieve] [or coarse aggregate Size 57, 67, or 77] and conforming to the general soil material requirements specified in paragraph entitled "Satisfactory Materials."

2.3 UTILITY BEDDING MATERIAL

Except as specified otherwise in the individual piping section, provide bedding for buried piping in accordance with AWWA C600, Type 4, except as specified herein. Backfill to top of pipe shall be compacted to 95 percent of ASTM D698 maximum density. Plastic piping shall have bedding to spring line of pipe. Provide ASTM D2321 materials as follows:

a. Class I: Angular, 6 to 40 mm 0.25 to 1.5 inches, graded stone,
including a number of fill materials that have regional significance such as coral, slag, cinders, crushed stone, and crushed shells.

b. Class II: Coarse sands and gravels with maximum particle size of 40 mm 1.5 inches, including various graded sands and gravels containing small percentages of fines, generally granular and noncohesive, either wet or dry. Soil Types GW, GP, SW, and SP are included in this class as specified in ASTM D2487.

[2.3.1 Sand

**************************************************************************

NOTE: Use this section to define the requirements for sand used in normal backfill or pipe bedding. In general, any locally available fine aggregate for concrete or asphalt mixtures will suffice and may be specified by local gradation and specification number in lieu of "SW" or "SP." Drawings (details) should clearly show where sand backfill or bedding is required. Delete this paragraph if sand is not required.

**************************************************************************

Clean, coarse-grained sand classified as [____ in accordance with Section [____] [gradation [____]] of the [DOT] [____] State Standard] or [SW] [or] [SP] by ASTM D2487 for [bedding] [and] [backfill] [as indicated].

][2.3.2 Gravel

**************************************************************************

NOTE: Use this section to define the requirements for any gravel or crushed rock used in normal backfill or pipe bedding. In general, locally available coarse aggregate for concrete will suffice and may be specified by local gradation and specification number in lieu of "GW" or "GP." Maximum size of aggregate should not be more than 25 mm per 300 mm one inch per foot of pipe diameter or 75 mm 3 inches maximum. Refer to pipe manufacturer's criteria for more stringent requirements, if any, on aggregate size and gradation. On drawings (details), clearly show where gravel backfill or bedding is required.

**************************************************************************

Clean, coarsely graded natural gravel, crushed stone or a combination thereof [identified as [____] in accordance with Section [____] [gradation [____]] of the [DOT] [____] State Standard] or having a classification of [GW] [GP] in accordance with ASTM D2487 for [bedding] [and] [backfill] [as indicated]. [Maximum particle size shall not exceed [75] [____] mm [3] [____] inches.]

][2.4 SEWAGE ABSORPTION TRENCHES OR PITS

**************************************************************************

NOTE: Delete these paragraphs when sewage absorption trenches or pits are not included in the project. Consult a geotechnical engineer and local standards in selecting bracketed information.
2.4.1 Porous Fill

Backfill material consisting of clean crushed rock or gravel having a gradation such that 100 percent passes the 50 mm 2 inch sieve and zero percent passes the 12.5 mm 1/2 inch sieve. [conforming to the requirements of gradation [4.75 mm] [No. 4] [_____] for coarse aggregate in ASTM C33/C33M.]

2.4.2 Cover

NOTE: Select appropriate bracketed information to correspond to the design indicated on the drawings.

[Filter fabric] [Concrete] [Kraft paper conforming to CID A-A-203, Grade B, No. 2, 22.7 kg 50 pound weight] [or a layer of straw at least 50 mm 2 inches thick] as indicated.

2.5 BORROW

NOTE: Choose one of the following options. Choose the first option when borrow material has to come from off site. Choose the second option when use of a Government borrow pit is available. Edit paragraph to suit requirements for use of a Government borrow pit.

[ Obtain borrow materials required in excess of those furnished from excavations from sources outside of Government property.

] [Obtain borrow materials required in excess of those furnished from excavations from sources outside of Government property, except that borrow materials conforming to [common fill] [and] [fill and backfill material] [satisfactory material] [_____] may be obtained from the Government borrow pit. The Government borrow pit is located [as indicated] [within a haul distance of [_____] kilometers miles from the work site]. If the Government borrow pit is used, the Contractor shall perform clearing, grubbing, and stripping required for providing access to suitable borrow material. Dispose of materials from clearing and grubbing operations [off Government property] [at the Government landfill indicated]. Strip top 300 mm 12 inches of soil material from borrow area and stockpile. After removal of borrow material, regrade borrow pit using stockpiled soil material to contours which will blend in with adjacent topography. Maximum side slopes shall be two horizontal to one vertical. Excavation and backfilling of borrow pit shall ensure proper drainage.]

2.6 BACKFILL FOR UNDERDRAINAGE SYSTEMS

NOTE: Delete these paragraphs entirely when there is no subsurface drainage or where underdrainage requirements are completely described in another section. The type or types of pipe to be used will be indicated on the drawings. Where a Contractor's option is to be permitted, the types that are
acceptable will be included in the specification. Add the requirements for a specialized subsurface drain, if necessary, to what is specified in this section. Consult a geotechnical engineer to determine specific grading requirements of granular filters and backfill materials and suitability of filter fabric. Include typical cross section detail of subsurface drain type or options on contract drawings.

The thickness and gradation of granular fill material for subsurface drains will be determined by soil conditions and subsoil drainage requirements.

In Table 1, choose one of the three options for each of the three types. The gradations shown on Table 1 may be altered to fit project requirements or additional gradations may be added to fit requirements of various subsurface drains within the project. The material placed adjacent to perforated pipe and open joints (without filter fabric wrapping) will be of a size that will prevent the entrance of any of the porous material into the drain. This material shall be a minimum of 150 mm 6 inches thick on the side of the pipe where the perforations are and around all joints. Thicknesses of granular fill, especially for subsurface drains with two types of material, will be clearly shown on the drawings. Where site conditions require more than two types of granular fill for drains, the drawings will indicate the areas of different gradation and the table will expanded using additional types to show different gradations for different locations.

Clean sand, crushed rock, or gravel meeting the following requirements:

NOTE: Check gradations against size of pipe openings. Consult a geotechnical engineer if alternate gradations (Type III) of special backfill materials are desired.

[a. Perforated or Slotted-Wall Pipe: Backfill meeting requirements of [Type I] material as specified in Table 1.]

NOTE: Open-joint pipe (drain tile) will not be used for general airfield or heliport construction, drainage systems for structures, or for drains crossing or adjacent to paved areas. Open-joint pipe will be used only for subsoil drainage for drill areas, parade grounds, athletic fields, and other areas subject to lightweight vehicle traffic only, and where conditions justify its use. Consult the Government before use.
b. Open Joint Pipe: [Type III] backfill consisting of both Type I and Type II materials as specified in Table 1.

**************************************************************************
NOTE: Consult with a geotechnical engineer to determine coarse aggregate size, which is dependent on the flow anticipated. Specify Type II gradation, if appropriate, or specify a special, Type III gradation. Make sure that detail of this type drain is included on the drawings.
**************************************************************************

c. Blind or French Drains: Backfill consisting of [Type II] [Type III] material as specified in Table 1.

**************************************************************************
NOTE: Where filter fabric is used in construction of backfills, any type of pipe or drain is acceptable unless conditions dictate that only one be used. In critical applications filter fabric should not be used in subsurface drains adjacent to soils with 85 percent or more passing the 75 micrometers No. 200 sieve.
**************************************************************************

d. Any Type Drain Used With Filter Fabric: [Clean gravel or crushed stone or gravel conforming to ASTM C33/C33M coarse aggregate grading size 57, 67, or 7] [fill consisting of [Type I] [or] [Type II] [Type III] material as specified in Table 1].

**************************************************************************
NOTE: Select the applicable paragraph(s) from the following.

The thickness and gradation of granular fill material for subsurface drains will be determined by soil conditions and subsoil drainage requirements.

In Table 1, choose one of the three options for each of the three types. The gradations shown on Table 1 may be altered to fit project requirements or additional gradations may be added to fit requirements of various subsurface drains within the project. The material placed adjacent to perforated pipe and open joints (without filter fabric wrapping) will be of a size that will prevent the entrance of any of the porous material into the drain. This material shall be a minimum of 150 mm 6 inches thick on the side of the pipe where the perforations are and around all joints. Thicknesses of granular fill, especially for subsurface drains with two types of material, will be clearly shown on the drawings. Where site conditions require more than two types of granular fill for drains, the drawings will indicate the areas of different gradation and the table will expanded using additional types to show different gradations for different locations.

2.7 FILTER FABRIC

NOTE: Where filter fabric is used in construction of backfills, any type of pipe or drain is acceptable unless conditions dictate that only one be used. In critical applications Filter fabric should be used with caution in subsurface drains adjacent to soils with 85 percent or more fines passing the 75 micrometers No. 200 sieve. Values stated below are absolute minimums for the class indicated.

Delete this paragraph when filter fabric will not be used on the project. Adjust information in brackets to fit the needs of the project. Class A material is usually specified when material being compacted has very coarse sharp angular edges and requires a compaction percentage greater than 95 percent ASTM...
D698, or when trenches are more than 3 m 10 feet
deep. Class B is specified with smooth graded
surfaces having no sharp angular projections, no
sharp angular aggregate, and when compaction
requirements are less than 95 percent ASTM D698.
Where fabric will not be covered or where it will
exposed to direct sunlight, such as when it is, used
for silt dams, include the requirement for
ultraviolet resistance. Where fabric is used for
different applications, the AOS requirement or
strength may vary. Drawings should indicate
specific requirements for different applications.
Specify cloth that retains the soil being protected,
yet that has openings large enough to permit
drainage and prevent clogging. The standard wording
in the guide specification concerning Apparent
Opening Size will be suitable for all projects
except in critical areas. However, in critical
areas select the "apparent opening sizes" (AOS) and
"percent open area" based on the following criteria:

1. Filter cloth adjacent to granular materials
containing 50 percent or less by weight fines
(materials passing 75 micrometers No. 200 sieve):

   a. The nearest opening size of AOS sieve (nearest
      U.S. Standard Sieve) divided by the 85-percent size
      of the soil, is equal to or greater than two or
      three.
   
   b. Open area not to exceed 36 percent.

In critical areas to reduce the chance of clogging,
no cloth should be specified with an open area less
than 4 percent or an AOS with openings smaller than
the openings of a U.S. Standard Sieve Size 150
micrometers No. 100.

**************************************************************************

Provide a pervious sheet of polyester, nylon, glass or polypropylene [, 
ultraviolet resistant] filaments woven, spun bonded, fused, or otherwise
manufactured into a nonraveling fabric with uniform thickness and strength.
Fabric shall have the following manufacturer certified minimum average roll
properties as determined by ASTM D4759:

[2.8 MATERIAL FOR PIPE CASING]

******************************************************************************

NOTE: Indicate on the contract drawings all construction requirements conforming to the standards of the railroad or highway owner. Indicate limits of right-of-way and any other site requirements or dimensions. Where traffic can be interrupted, trenching in a pipeline casing is more economical with the same advantages of allowing future work without interruption of traffic.

******************************************************************************

2.8.1 Casing Pipe

ASTM A139/A139M, Grade B, or ASTM A252, Grade 2, smooth wall pipe. Casing size shall be of the outside diameter and wall thickness as indicated. Protective coating is not required on casing pipe.

2.8.2 Wood Supports

Treated Yellow Pine or Douglas Fir, rough, structural grade. Provide wood with nonleaching water-borne pressure preservative (ACA or CCA) and treatment conforming to AWPA P5 and AWPA C2, respectively. Secure wood supports to carrier pipe with stainless steel or zinc-coated steel bands.

[2.9 MATERIAL FOR RIP-RAP]

******************************************************************************

NOTE: Make sure there is no duplication of rip-rap requirements between this and other specification sections. In paragraph entitled "Material for Rip-Rap," refer to standard specifications for rip-rap if local specifications are satisfactory and available.

******************************************************************************

[Bedding material] [Grout] [Filter fabric] and rock conforming to [these requirements] [DOT] [_____] State Standard for construction indicated.
[2.9.1 Bedding Material

Consisting of sand, gravel, or crushed rock, well graded, [or poorly graded] with a maximum particle size of 50 mm 2 inches. Material shall be composed of tough, durable particles. Fines passing the 75 micrometers No. 200 standard sieve shall have a plasticity index less than six.

[2.9.2 Grout

Composed of cement, water, an air-entraining admixture, and sand mixed in proportions of one part portland cement to [two] [_____] parts of sand, sufficient water to produce a workable mixture, and an amount of admixture which will entrain sufficient air to produce durable grout, as determined by the Contracting Officer. Mix grout in a concrete mixer. Mixing time shall be sufficient to produce a mixture having a consistency permitting gravity flow into the interstices of the rip-rap with limited spading and brooming.

[2.9.3 Rock

**************************************************************************
[NOTE: Adjust weights in brackets to fit application. Take local practice into consideration.]
**************************************************************************

Rock fragments sufficiently durable to ensure permanence in the structure and the environment in which it is to be used. Rock fragments shall be free from cracks, seams, and other defects that would increase the risk of deterioration from natural causes. The size of the fragments shall be such that no individual fragment exceeds a weight of [68] [_____] kg [150] [_____] pounds and that no more than 10 percent of the mixture, by weight, consists of fragments weighing 0.91 kg 2 pounds or less each. Specific gravity of the rock shall be a minimum of [2.50] [_____] . The inclusion of more than trace [1 percent] [_____] quantities of dirt, sand, clay, and rock fines will not be permitted.

]2.10 BURIED WARNING AND IDENTIFICATION TAPE

**************************************************************************
[NOTE: Delete paragraph if tape is not required in the project. The use of a plastic warning tape for identification is mandatory for buried hazardous utilities such as electrical conduit, gas lines, fuel lines, high pressure nitrogen, high pressure water and steam lines, domestic sewage force mains, industrial waste force mains and industrial sewers carrying hazardous, explosive, or toxic waste. Coordinate color codes with other specification sections and conform, if possible, to local practice for identifying buried utilities.]
**************************************************************************

[Polyethylene plastic] [and] [metallic core or metallic-faced, acid- and alkali-resistant, polyethylene plastic] warning tape manufactured specifically for warning and identification of buried utility lines. Provide tape on rolls, 75 mm 3 inch minimum width, color coded as specified below for the intended utility with warning and identification imprinted in bold black letters continuously over the entire tape length. Warning and identification to read, "CAUTION, BURIED (intended service) LINE BELOW" or

SECTION 31 23 00.00 20  Page 26
similar wording. Color and printing shall be permanent, unaffected by moisture or soil.

<table>

2.10.1  [Warning Tape for Metallic Piping]

Acid and alkali-resistant polyethylene plastic tape conforming to the width, color, and printing requirements specified above. Minimum thickness of tape shall be 0.08 mm 0.003 inch. Tape shall have a minimum strength of 10.3 MPa 1500 psi lengthwise, and 8.6 MPa 1250 psi crosswise, with a maximum 350 percent elongation.

2.10.2  Detectable Warning Tape for Non-Metallic Piping

Polyethylene plastic tape conforming to the width, color, and printing requirements specified above. Minimum thickness of the tape shall be 0.10 mm 0.004 inch. Tape shall have a minimum strength of 10.3 MPa 1500 psi lengthwise and 8.6 MPa 1250 psi crosswise. Tape shall be manufactured with integral wires, foil backing, or other means of enabling detection by a metal detector when tape is buried up to 920 mm 3 feet deep. Encase metallic element of the tape in a protective jacket or provide with other means of corrosion protection.

2.11  DETECTION WIRE FOR NON-METALLIC PIPING

Detection wire shall be insulated single strand, solid copper with a minimum of 12 AWG.

PART 3  EXECUTION

3.1  PROTECTION

3.1.1  Shoring and Sheeting

**************************************************************************

NOTE: The Contractor will have the responsibility of designing the trench shoring and sheeting system or obtaining a suitable trench box on all trench excavations over 1.5 m 5 feet deep or where it is...
known that in-situ soils lack the stability to hold near vertical faces. Where sufficient room is available, the Contractor may slope back trench walls rather than having to use a shoring system. The Government is responsible for supplying the designer with any historic subsurface soil data that might be available. All such historical or new subsurface soil data demonstrating soil characteristics, stability, etc., will be included on the contract drawings.

Provide shoring [bracing] [cribbing] [trench boxes] [underpinning] [and] [sheeting] where indicated. In addition to Section 25 A and B of EM 385-1-1 [and other requirements set forth in this contract], include provisions in the shoring and sheeting plan that will accomplish the following:

   a. Prevent undermining of pavements, foundations and slabs.

   **************************************************************************

   NOTE: The Contractor should not be given the opportunity to slope the faces of excavations in lieu of providing shoring unless all the following conditions are met:

   1. The excavation is less than 6 m 20 feet in depth.

   2. There are no adjacent structures, roads, or pavements that will affect the excavation.

   3. No equipment, stored material, or overlying material will affect the excavation.

   4. Vibration from equipment, traffic, or blasting will not affect the excavation.

   5. There will be no ground water problems.

   6. Surcharges will not affect the excavation.

   7. Station operational considerations permit laying back the slopes of the excavation.

   **************************************************************************

   b. Prevent slippage or movement in banks or slopes adjacent to the excavation.

   [ c. Allow for the abandonment of shoring and sheeting materials in place in critical areas as the work is completed. In these areas, backfill the excavation to [the elevation indicated] [within 900 mm 3 feet of the finished grade] [_____] and remove the remaining exposed portion of the shoring before completing the backfill.

]3.1.2 Drainage and Dewatering

Provide for the collection and disposal of surface and subsurface water encountered during construction.
3.1.2.1 Drainage

So that construction operations progress successfully, completely drain construction site during periods of construction to keep soil materials sufficiently dry. The Contractor shall establish/construct storm drainage features (ponds/basins) at the earliest stages of site development, and throughout construction grade the construction area to provide positive surface water runoff away from the construction activity and/or provide temporary ditches, [dikes,] swales, and other drainage features and equipment as required to maintain dry soils[, prevent erosion and undermining of foundations]. When unsuitable working platforms for equipment operation and unsuitable soil support for subsequent construction features develop, remove unsuitable material and provide new soil material as specified herein. It is the responsibility of the Contractor to assess the soil and ground water conditions presented by the plans and specifications and to employ necessary measures to permit construction to proceed. Excavated slopes and backfill surfaces shall be protected to prevent erosion and sloughing. Excavation shall be performed so that the site, the area immediately surrounding the site, and the area affecting operations at the site shall be continually and effectively drained.

3.1.2.2 Dewatering

**************************************************************************
NOTE: Check depth of proposed utilities and foundations relative to the existing ground water elevation prior to editing. Revise as needed when specific methods of dewatering are required.
**************************************************************************

Groundwater flowing toward or into excavations shall be controlled to prevent sloughing of excavation slopes and walls, boils, uplift and heave in the excavation and to eliminate interference with orderly progress of construction. French drains, sumps, ditches or trenches will not be permitted within 0.9 m 3 feet of the foundation of any structure, except with specific written approval, and after specific contractual provisions for restoration of the foundation area have been made. Control measures shall be taken by the time the excavation reaches the water level in order to maintain the integrity of the in situ material. While the excavation is open, the water level shall be maintained continuously, at least [_____] m feet below the working level.

[Operate dewatering system continuously until construction work below existing water levels is complete. Submit performance records weekly.] [Measure and record performance of dewatering system at same time each day by use of observation wells or piezometers installed in conjunction with the dewatering system.] [Relieve hydrostatic head in previous zones below subgrade elevation in layered soils to prevent uplift.]

3.1.3 Underground Utilities

Location of the existing utilities indicated is approximate. The Contractor shall physically verify the location and elevation of the existing utilities indicated prior to starting construction. [The Contractor shall contact the [Public Works Department] [_____] for assistance in locating existing utilities.] [The Contractor shall scan the construction site with electromagnetic and sonic equipment and mark the surface of the ground where existing underground utilities are discovered.]
3.1.4 Machinery and Equipment

Movement of construction machinery and equipment over pipes during construction shall be at the Contractor's risk. Repair, or remove and provide new pipe for existing or newly installed pipe that has been displaced or damaged.

3.2 SURFACE PREPARATION

******************************************************************************************
NOTE: If special site preparation notes are indicated, they should be referenced here.
******************************************************************************************

3.2.1 Clearing and Grubbing

******************************************************************************************
NOTE: If selective clearing is required, the maximum or minimum tree diameter should be specified, measured at 1.5 m 4 1/2 feet from the existing ground. If merchantable timber is requested by the station, insert and edit the following paragraph:

"Cut merchantable timber into (logs) (cord wood) and store on site where directed. Merchantable timber will remain the property of the Government."
******************************************************************************************

Unless indicated otherwise, remove trees, stumps, logs, shrubs, brush and vegetation and other items that would interfere with construction operations within the [clearing limits] [within lines 1.5 m 5 feet outside of each building and structure line] [____]. Remove stumps entirely. Grub out matted roots and roots over 50 mm 2 inches in diameter to at least 460 mm 18 inches below existing surface.

3.2.2 Stripping

Strip suitable soil from the site where excavation or grading is indicated and stockpile separately from other excavated material. Material unsuitable for use as topsoil [shall be wasted] [shall be stockpiled and used for backfilling]. Locate topsoil so that the material can be used readily for the finished grading. Where sufficient existing topsoil conforming to the material requirements is not available on site, provide borrow materials suitable for use as topsoil. Protect topsoil and keep in segregated piles until needed.

3.2.3 Unsuitable Material

Remove vegetation, debris, decayed vegetable matter, sod, mulch, and rubbish underneath paved areas or concrete slabs.

3.3 EXCAVATION

Excavate to contours, elevation, and dimensions indicated. Reuse excavated materials that meet the specified requirements for the material type required at the intended location. Keep excavations free from water. Excavate soil disturbed or weakened by Contractor's operations, soils softened or made unsuitable for subsequent construction due to exposure to
weather. Excavations below indicated depths will not be permitted except to remove unsatisfactory material. Unsatisfactory material encountered below the grades shown shall be [removed as directed]. Refill with [backfill and fill material] [satisfactory material] [select material] [porous fill] and compact to [95] [_____] percent of [ASTM D698] [ASTM D1557] maximum density. Unless specified otherwise, refill excavations cut below indicated depth with [backfill and fill material] [satisfactory material] [select material] [porous fill] and compact to [95] [_____] percent of [ASTM D698] [ASTM D1557] maximum density. Satisfactory material removed below the depths indicated, without specific direction of the Contracting Officer, shall be replaced with satisfactory materials to the indicated excavation grade; except as specified for spread footings. Determination of elevations and measurements of approved overdepth excavation of unsatisfactory material below grades indicated shall be done under the direction of the Contracting Officer.

3.3.1 Structures With Spread Footings

Ensure that footing subgrades have been inspected and approved by the Contracting Officer prior to concrete placement. Fill over excavations with concrete during foundation placement.

3.3.2 Pile Cap Excavation and Backfilling

Excavate to bottom of pile cap prior to placing or driving piles, unless authorized otherwise by the Contracting Officer. Backfill and compact overexcavations and changes in grade due to pile driving operations to 95 percent of ASTM D698 maximum density.

3.3.3 Pipe Trenches

Excavate to the dimension indicated. Grade bottom of trenches to provide uniform support for each section of pipe after pipe bedding placement. Tamp if necessary to provide a firm pipe bed. Recesses shall be excavated to accommodate bells and joints so that pipe will be uniformly supported for the entire length. Rock, where encountered, shall be excavated to a depth of at least 150 mm 6 inches below the bottom of the pipe.

3.3.4 Hard Material [and Rock] Excavation

**************************************************************************
NOTE: Where rock excavation is planned, foundation section details or typical grading or trench cross sections on plans should show the required limits of rock excavation and any special refill or bedding requirements.
**************************************************************************

Remove hard material [and rock] to elevations indicated in a manner that will leave foundation material in an unshattered and solid condition. Roughen level surfaces and cut sloped surfaces into benches for bond with concrete. Protect shale from conditions causing decomposition along joints or cleavage planes and other types of erosion. Removal of hard material [and rock] beyond lines and grades indicated will not be grounds for a claim for additional payment unless previously authorized by the Contracting Officer. Excavation of the material claimed as rock shall not be performed until the material has been cross sectioned by the Contractor and approved by the Contracting Officer. Common excavation shall consist of all excavation not classified as rock excavation.
3.3.5  Excavated Materials

******************************************************************************
NOTE: When spoil areas or borrow areas are within the limits of Government-controlled land, additional requirements based on the following, and as appropriate for the project, will be included in the contract document. Locations of areas will be indicated, or the approximate distances from the project site will be specified. Generally, unburned vegetative material and surplus excavated material will be disposed of in inconspicuous spoil areas where no future construction is planned. If economically justifiable, surplus suitable excavated material may be stockpiled or may be disposed of in areas where future construction is planned and where fill will be required. Spoil materials will be so placed and the worked portions of spoil areas and borrow areas will be so graded and shaped as to minimize soil erosion, siltation of drainage channels, and damage to existing vegetation. The degree of compaction will be specified.
******************************************************************************

Satisfactory excavated material required for fill or backfill shall be placed in the proper section of the permanent work required or shall be separately stockpiled if it cannot be readily placed. Satisfactory material in excess of that required for the permanent work and all unsatisfactory material shall be disposed of as specified in Paragraph “DISPOSITION OF SURPLUS MATERIAL.”

3.3.6  Final Grade of Surfaces to Support Concrete

Excavation to final grade shall not be made until just before concrete is to be placed. [For pile foundations, the excavation shall be stopped at an elevation 150 to 300 mm 6 to 12 inches above the bottom of the footing before driving piles. After pile driving has been completed, the remainder of the excavation shall be completed to the elevations shown.] Only excavation methods that will leave the foundation rock in a solid and unshattered condition shall be used. Approximately level surfaces shall be roughened, and sloped surfaces shall be cut as indicated into rough steps or benches to provide a satisfactory bond. Shales shall be protected from slaking and all surfaces shall be protected from erosion resulting from ponding or flow of water.

3.4  SUBGRADE PREPARATION

Unsatisfactory material in surfaces to receive fill or in excavated areas shall be removed and replaced with satisfactory materials as directed by the Contracting Officer. The surface shall be scarified to a depth of 150 mm 6 inches before the fill is started. Sloped surfaces steeper than 1 vertical to 4 horizontal shall be plowed, stepped, benched, or broken up so that the fill material will bond with the existing material. When subgrades are less than the specified density, the ground surface shall be broken up to a minimum depth of 150 mm 6 inches, pulverized, and compacted to the specified density. When the subgrade is part fill and part excavation or natural ground, the excavated or natural ground portion shall be scarified to a depth of 300 mm 12 inches and compacted as specified for
the adjacent fill. Material shall not be placed on surfaces that are muddy, frozen, or contain frost. Compaction shall be accomplished by sheepsfoot rollers, pneumatic-tired rollers, steel-wheeled rollers, or other approved equipment well suited to the soil being compacted. Material shall be moistened or aerated as necessary [to plus or minus [_____] percent of optimum moisture] [to provide the moisture content that will readily facilitate obtaining the specified compaction with the equipment used]. Minimum subgrade density shall be as specified herein.

3.4.1 Proof Rolling

**************************************************************************
NOTE: Specify proof rolling when the quality of the existing subgrade is questionable. Proof rolling can be used to verify that no unsatisfactory material is present (no bid quantity required, location shown or specified) or to locate suspected unsatisfactory material (indicate a bid quantity to be removed).
**************************************************************************

Proof rolling shall be done on an exposed subgrade free of surface water (wet conditions resulting from rainfall) which would promote degradation of an otherwise acceptable subgrade. [After stripping,] proof roll the existing subgrade of the [building] [_____] with six passes of a [dump truck loaded with 6 cubic meters 212 cubic feet of soil] [13.6 meter ton 15 ton, pneumatic-tired roller.] Operate the [roller] [truck] in a systematic manner to ensure the number of passes over all areas, and at speeds between 4 to 5.5 kilometers per hour 2 1/2 to 3 1/2 miles per hour. [When proof rolling under buildings, the building subgrade shall be considered to extend 1.5 m 5 feet beyond the building lines, and one-half of the passes made with the roller shall be in a direction perpendicular to the other passes.] Notify the Contracting Officer a minimum of 3 days prior to proof rolling. Proof rolling shall be performed in the presence of the Contracting Officer. Rutting or pumping of material shall be undercut [as directed by the Contracting Officer] [to a depth of [_____] mm inches] and replaced with [fill and backfill] [select] material. [Bids shall be based on replacing approximately [_____] square meters square yards, with an average depth of [_____] mm inches at various locations.]

3.5 SUBGRADE FILTER FABRIC

**************************************************************************
NOTE: Delete this paragraph in its entirety if filter fabric is not used for subgrade stabilization. Vegetation such as grass may remain when no other subgrade preparation is indicated. Overlap length may be adjusted to fit design requirements. Drawings should indicate location and extent of filter fabric in typical cross sections.
**************************************************************************

Place synthetic fiber filter fabric as indicated directly on prepared subgrade free of [vegetation,] stumps, rocks larger than [50 mm] [2 inches] [_____] diameter and other debris which may puncture or otherwise damage the fabric. Repair damaged fabric by placing an additional layer of fabric to cover the damaged area a minimum of [0.9 m] [3 feet][_____] overlap in all directions. Overlap fabric at joints a minimum of 0.9 m 3 feet. Obtain approval of filter fabric installation before placing fill or
backfill. Place fill or backfill on fabric in the direction of overlaps and compact as specified herein. Follow manufacturer's recommended installation procedures.

3.6 FILLING AND BACKFILLING

Fill and backfill to contours, elevations, and dimensions indicated. Compact each lift before placing overlaying lift.

[3.6.1 Common Fill Placement

**************************************************************************
NOTE: Delete bracketed item when a pile-supported structure is not in the job.
**************************************************************************

Provide for general site [and under [porous fill of] pile-supported structures]. [Use satisfactory materials.] Place in [150] [_____] mm [6] [_____] inch lifts. Compact areas not accessible to rollers or compactors with mechanical hand tampers. Aerate material excessively moistened by rain to a satisfactory moisture content. Finish to a smooth surface by blading, rolling with a smooth roller, or both.

]3.6.2 [Backfill and Fill Material Placement

Provide for paved areas and under concrete slabs, except where select material is provided. Place in [150] [_____] mm [6] [_____] inch lifts. Do not place over wet or frozen areas. Place backfill material adjacent to structures as the structural elements are completed and accepted. Backfill against concrete only when approved. Place and compact material to avoid loading upon or against the structure.

]3.6.3 Select Material Placement

Provide under [porous fill of] structures not pile supported. Place in [150] [_____] mm [6] [_____] inch lifts. Do not place over wet or frozen areas. Backfill adjacent to structures shall be placed as structural elements are completed and accepted. Backfill against concrete only when approved. Place and compact material to avoid loading upon or against structure.

]3.6.4 [Backfill and Fill Material Placement Over Pipes and at Walls

Backfilling shall not begin until construction below finish grade has been approved, underground utilities systems have been inspected, tested and approved, forms removed, and the excavation cleaned of trash and debris. Backfill shall be brought to indicated finish grade [and shall include backfill for outside grease interceptors and underground fuel tanks]. Where pipe is coated or wrapped for protection against corrosion, the backfill material up to an elevation 600 mm 2 feet above sewer lines and 300 mm 1 foot above other utility lines shall be free from stones larger than 25 mm 1 inch in any dimension. Heavy equipment for spreading and compacting backfill shall not be operated closer to foundation or retaining walls than a distance equal to the height of backfill above the top of footing; the area remaining shall be compacted in layers not more than 100 mm 4 inches in compacted thickness with power-driven hand tampers suitable for the material being compacted. Backfill shall be placed carefully around pipes or tanks to avoid damage to coatings, wrappings, or tanks. Backfill shall not be placed against foundation walls prior to 7 days after
completion of the walls. As far as practicable, backfill shall be brought up evenly on each side of the wall and sloped to drain away from the wall.

3.6.5 Porous Fill Placement

**************************************************************************
NOTE: The compacted thickness of capillary water barrier will be indicated and will not be less than 100 mm (4 inches). The paragraph will be deleted where site conditions make the barrier unnecessary.
**************************************************************************

3.6.6 Trench Backfilling

Backfill as rapidly as construction, testing, and acceptance of work permits. Place and compact backfill under structures and paved areas in [150] mm [6] inch lifts to top of trench and in [150] mm [6] inch lifts to 300 mm one foot over pipe outside structures and paved areas.

3.7 BORROW

**************************************************************************
NOTE: Coordinate this paragraph with the requirements in Part 2 Products.
**************************************************************************

Where satisfactory materials are not available in sufficient quantity from required excavations, approved borrow materials shall be obtained as specified herein.

3.8 BURIED WARNING AND IDENTIFICATION TAPE

Provide buried utility lines with utility identification tape. Bury tape 300 mm 12 inches below finished grade; under pavements and slabs, bury tape 150 mm 6 inches below top of subgrade.

3.9 BURIED DETECTION WIRE

Bury detection wire directly above non-metallic piping at a distance not to exceed 300 mm 12 inches above the top of pipe. The wire shall extend continuously and unbroken, from manhole to manhole. The ends of the wire shall terminate inside the manholes at each end of the pipe, with a minimum of 0.9 m 3 feet of wire, coiled, remaining accessible in each manhole. The wire shall remain insulated over its entire length. The wire shall enter manholes between the top of the corbel and the frame, and extend up through the chimney seal between the frame and the chimney seal. For force mains, the wire shall terminate in the valve pit at the pump station end of the pipe.

3.10 COMPACTION

**************************************************************************
NOTE: Use 90 percent of ASTM D698 or ASTM D1557 for General Site Compaction of cohesionless materials on

SECTION 31 23 00.00 20 Page 35
Army projects and 85 percent of same for Navy projects.

**************************************************************************

ARMY NOTE: See UFC 3-201-02, "Landscape Architecture" and UFC 3-230-01, "Water Storage, Distribution, and Transmission" for criteria and design guidelines.

**************************************************************************

NOTE: Specify most jobs using ASTM D698 compaction, except for roads, airfields, and other heavily loaded areas, which should use ASTM D1557 compaction. Specify compaction in terms of one compaction effort (ASTM D698 or ASTM D1557), if possible.

**************************************************************************

Determine in-place density of existing subgrade; if required density exists, no compaction of existing subgrade will be required. [Density requirements specified herein are for cohesionless materials. When cohesive materials are encountered or used, density requirements may be reduced by 5 percent.]

3.10.1 General Site

Compact underneath areas designated for vegetation and areas outside the 1.5 meter 5 foot line of the paved area or structure to [85] [90] [_____] percent of [ASTM D698] [ASTM D1557]. [Compact expansive materials to not less than [_____] percent nor more than [_____] percent.]

3.10.2 Structures, Spread Footings, and Concrete Slabs

Compact top 300 mm 12 inches of subgrades to [95] [_____] percent of [ASTM D698] [ASTM D1557]. Compact [common fill] [fill and backfill material] [select material] to [95] [_____] percent of [ASTM D698] [ASTM D1557].

3.10.3 Adjacent Area

Compact areas within 1.5 m 5 feet of structures to [90] [_____] percent of [ASTM D698] [ASTM D1557].

3.10.4 Paved Areas

Compact top 300 mm 12 inches of subgrades to [95] [_____] percent of [ASTM D698] [ASTM D1557]. Compact fill and backfill materials to 95 percent of [ASTM D698] [ASTM D1557].

3.10.5 Airfield Pavements

Compact top 600 mm 24 inches below finished pavement or top 300 mm 12 inches of subgrades, whichever is greater, to [100] [_____] percent of ASTM D1557; compact fill and backfill material to [100] [_____] percent of ASTM D1557.
3.11 PIPELINE CASING UNDER [RAILROAD] [AND] [PAVEMENT]

**************************************************************************

NOTE: Indicate on the contract drawings all construction requirements conforming to the standards of the railroad or highway owner. Indicate limits of right-of-way and any other site requirements or dimensions. Where traffic can be interrupted, trenching in a pipeline casing is more economical with the same advantages of allowing future work without interruption of traffic.

**************************************************************************

Provide new smooth wall steel pipeline casing under [new] [existing] [railroad] [and] [pavement] [in a trench] [by the boring and jacking method of installation]. Provide each new pipeline casing, where indicated and to the lengths and dimensions shown, complete and suitable for use with the new piped utility as indicated.

3.11.1 Earthwork for Pipeline Casings

Provide excavation, sheet piling, shoring, dewatering, and backfilling for pipeline casings under this section.

3.11.2 Steel Cased Pipelines

**************************************************************************

NOTE: Indicate on the contract drawings all construction requirements conforming to the standards of the railroad or highway owner. Indicate limits of right-of-way and any other site requirements or dimensions. Where traffic can be interrupted, trenching in a pipeline casing is more economical with the same advantages of allowing future work without interruption of traffic.

**************************************************************************

[Excavate and place bedding and backfill as indicated.] [Install pipeline casing by dry boring and jacking method as follows:]  

3.11.2.1 Hole for Pipeline Casing

Mechanically bore holes and case through the soil with a cutting head on a continuous auger mounted inside the casing pipe. Weld lengths of pipe together in accordance with AWS D1.1/D1.1M. Do not use water or other fluids in connection with the boring operation.

3.11.2.2 Cleaning

Clean inside of the pipeline casing of dirt, weld splatters, and other foreign matter which would interfere with insertion of the piped utilities by attaching a pipe cleaning plug to the boring rig and passing it through the pipe.

3.11.2.3 Piped Utilities

Provide in casing using wood supports adjusted to obtained grades and elevations indicated.
3.11.2.4 End Seals

After installation of piped utilities in pipeline casing, provide watertight end seals at each end of pipeline casing between pipeline casing and piping utilities. Provide watertight [end seals as indicated.] [segmented elastomeric end seals.]

3.12 SPECIAL EARTHWORK REQUIREMENTS FOR SUBSURFACE DRAINS

**************************************************************************

NOTE: Open-joint pipe (drain tile) will not be used for general airfield or heliport construction, drainage systems for structures, or for drains crossing or adjacent to paved areas. Open-joint pipe will be used only for subsoil drainage for drill areas, parade grounds, athletic fields, and other areas subject to lightweight vehicle traffic only, and where conditions justify its use.

Delete these paragraphs entirely when there is no subsurface drainage or where underdrainage requirements are completely described in another section. The type or types of pipe to be used will be indicated on the drawings. Where a Contractor's option is to be permitted, the types that are acceptable will be included in the specification. Add the requirements for a specialized subsurface drain, if necessary, to what is specified in this section. Consult a geotechnical engineer to determine specific grading requirements of granular filters and backfill materials and suitability of filter fabric. Include typical cross section detail of subsurface drain type or options on contract drawings.

The thickness and gradation of granular fill material for subsurface drains will be determined by soil conditions and subsoil drainage requirements.

At Table 1, choose one of the three options for each of the three types. The gradations shown on Table 1 may be altered to fit project requirements or additional gradations may be added to fit requirements of various subsurface drains within the project. The material placed adjacent to perforated pipe and open joints (without filter fabric wrapping) will be of a size that will prevent the entrance of any of the porous material into the drain. This material shall be a minimum of 150 mm 6 inches thick on the side of the pipe where the perforations are and around all joints. Thicknesses of granular fill, especially for subsurface drains with two types of material, will be clearly shown on the drawings. Where site conditions require more than two types of granular fill for drains, the drawings will indicate the areas of different gradation and the table will expanded using additional types to show different gradations for different locations.
Excavate to dimensions indicated. Provide a bedding surface of no more than 25 mm [one inch] of [sand] [gravel] [Type I subdrain backfill material] and place on compacted [native soil] [impermeable material] as indicated. Backfill [blind or french drains] [around and over the pipes after pipe installation has been approved]. Place special granular filter material in 150 mm [6 inch] lifts and compact with mechanical, vibrating plate tampers or rammers until no further consolidation can be achieved. Compact backfill overlying the special granular filter material as specified for adjacent or overlying work.

3.12.1 Granular Backfill Without Filter Fabric

NOTE: Coordinate with material specifications in Part 2. Consult a geotechnical engineer to determine optimum thickness of granular filter material and modify information in brackets if necessary. Indicate on drawings where different types of drains are to be used. Delete requirements for types of drains that are not included in the project.

3.12.1.1 Perforated or Slotted Wall Pipe

Place granular material as pipe is laid and extend fit for a minimum of [one] pipe diameter on each side of and 450 mm [18 inches] above the top of the pipe. Place a layer of [kraft paper] [____], on top of granular filter before continuing with the backfill.

3.12.1.2 Open-Joint Pipe

Place both types of granular material specified as pipe is laid forming an aggregate filter around the pipe. Provide [Type II] material to envelope the pipe a minimum of one-half the pipe diameter or twice the maximum aggregate size, whichever is larger, on each side and on top of the pipe. Place [Type I] material next to and on top of the [Type II] material to provide a total fill extending at least [one] pipe diameter on each side of and 450 mm [18 inches] above the top of the pipe. Place a layer of [kraft paper] [____], on top of the granular filter before continuing with the backfill.

3.12.2 Granular Backfill Using Filter Fabric

NOTE: Coordinate with material specifications in Part 2. Consult soils engineer to determine optimum thickness of granular filter material and modify information in brackets if necessary. Indicate on drawings where different types of drains are to be used. Delete requirements for types of drains that are not included in the project.

3.12.2.1 Perforated or Slotted Wall Pipes

Wrap one layer of filter fabric around pipe in such a manner that
longitudinal overlaps are in unperforated or unslotted quadrants of the pipe. Overlap fabric a minimum of 50 mm 2 inches. Secure fabric to pipe so that backfill material does not infiltrate through overlaps. Place granular material and extend it for [one] pipe diameter, minimum of 150 mm 6 inches on each side of and 450 mm 18 inches above top of pipe. Place a layer of filter fabric on top of granular filter before continuing with backfill.

3.12.2.2 Open-Joint Pipe

Wrap one layer of filter fabric around pipe joints overlapping a minimum of 50 mm 2 inches in the longitudinal direction and extending at least 150 mm 6 inches on both sides of the joint. Secure fabric to pipe so that backfill material does not infiltrate through overlaps. Place granular material specified and extend it for a minimum of [one] pipe diameter on each side of and 450 mm 18 inches above top of pipe. Place a layer of filter fabric on top of granular filter before continuing with backfill.

3.12.2.3 Blind or French Drains

Install filter cloth in trenches with smoothly graded sides and bottom, free of cavities or projecting rocks. Lay the cloth flat but not stretched [and secure with anchor pins]. Place filter cloth so that drain water must pass through the cloth into the specified granular filter material. Overlap ends at least of 300 mm 12 inches. Place backfill on filter cloth in the direction of overlaps. Where fabric is damaged, place a new piece of filter cloth over damaged area and overlap at least of 300 mm 12 inches in every direction.

[3.13 EARTHWORK REQUIREMENTS FOR SEWAGE ABSORPTION [TRENCHES] [PITS]

**************************************************************************

NOTE: Delete these paragraphs when sewage absorption trenches or pits are not included in the project. Consult geotechnical engineer and local standards in selecting bracketed information in paragraph entitled "Earthwork Requirements for Sewage Absorption [Trenches] [Pits]" to conform with design indicated on the drawings. Coordinate with requirements for exterior sanitary sewer systems. Provide details on drawings indicating specific construction requirements as suggested by Sketch 02302-1.

**************************************************************************

Provide sewage absorption [trench] [pit] as indicated. [Grade trenches uniformly downward to ends of laterals.] [Place [pre-cast concrete base ring] [concrete footing] for pit sections at the elevation indicated. Assemble succeeding sections as indicated and as recommended by manufacturer.] Place porous fill [around and over pipe] [around absorption pit] as indicated. Take special care to prevent displacement of or damage to [pipe] [pit walls]. Cover porous fill with [kraft paper] [filter fabric] [_____] [a concrete cover] as indicated before continuing with backfill for adjacent or overlying work.

[3.14 RIP-RAP CONSTRUCTION

**************************************************************************

NOTE: Make sure there is no duplication of rip-rap

**************************************************************************
requirements between this and other specification sections. In paragraph entitled "Material for Rip-Rap," refer to standard specifications for rip-rap if local specifications are satisfactory and available.

**************************************************************************
NOTE: Select information in brackets to best describe rip-rap construction. Provide detail or typical section through rip-rap on drawings as well as all dimensions necessary for estimating and construction. If DOT standard specifications are referenced for rip-rap construction, paragraphs entitled "Preparation" through "Grouting" may be deleted.
**************************************************************************

Construct rip-rap [on bedding material] [on filter fabric] [with grout] [in accordance with [DOT] [_____] State Standard, paragraph [_____]] in the areas indicated.

3.14.1 Preparation

Trim and dress indicated areas to conform to cross sections, lines and grades shown within a tolerance of 30 mm 0.1 foot.

3.14.2 Bedding Placement

Spread [filter fabric] bedding material uniformly to a thickness of at least [75] [_____] mm [3] [_____] inches on prepared subgrade as indicated. [Compaction of bedding is not required. Finish bedding to present even surface free from mounds and windrows.]

3.14.3 Stone Placement

Place rock for rip-rap on prepared bedding material to produce a well graded mass with the minimum practicable percentage of voids in conformance with lines and grades indicated. Distribute larger rock fragments, with dimensions extending the full depth of the rip-rap throughout the entire mass and eliminate "pockets" of small rock fragments. Rearrange individual pieces by mechanical equipment or by hand as necessary to obtain the distribution of fragment sizes specified above. [For grouted rip-rap, hand-place surface rock with open joints to facilitate grouting and do not fill smaller spaces between surface rock with finer material. Provide at least one "weep hole" through grouted rip-rap for every 4.65 square meters 50 square feet of finished surface. Weep holes shall consist of columns of bedding material, 100 mm 4 inches in diameter, extending up to the rip-rap surface without grout.]

3.14.4 Grouting

[ Prior to grouting, wet rip-rap surfaces. Grout rip-rap in successive longitudinal strips, approximately 3 m 10 feet in width, commencing at the lowest strip and working up the slope. Distribute grout to place of final deposit and work into place between stones with brooms, spades, trowels, or vibrating equipment. Take precautions to prevent grout from penetrating bedding layer. Protect and cure surface for a minimum of 7 days.]

SECTION 31 23 00.00 20 Page 41
3.15 FINISH OPERATIONS

3.15.1 Grading

Finish grades as indicated within 30 mm one-tenth of one foot. Grade areas to drain water away from structures. Maintain areas free of trash and debris. For existing grades that will remain but which were disturbed by Contractor's operations, grade as directed.

3.15.2 Topsoil and Seed

**************************************************************************
NOTE: If seeding is minor, use requirements specified herein. Check with the locate Agriculture County Extension Service Office for Recommended Fertilizer Mixture for local conditions. Otherwise, edit Section 32 92 19 and cover requirements therein.
**************************************************************************

[ Provide as specified in Section 32 92 19 SEEDING. ]

[Scarify existing subgrade. Provide 100 mm 4 inches of topsoil for newly graded finish earth surfaces and areas disturbed by the Contractor. Topsoil shall not be placed when the subgrade is frozen, excessively wet, extremely dry, or in a condition otherwise detrimental to seeding, planting, or proper grading. [Additional topsoil will not be required if work is performed in compliance with stripping and stockpiling requirements.] [If there is insufficient on-site topsoil meeting specified requirements for topsoil, provide topsoil required in excess of that available.] Seed shall match existing vegetation. Provide seed at 2.5 kg per 100 square meters 5 pounds per 1000 square feet. Provide granular controlled release fertilizer containing the following minimum percentages, by weight, of plant food nutrients:

[_____] percent available nitrogen
[_____] percent available phosphorus
[_____] percent available potassium
[_____] percent sulfur
[_____] percent iron]

Provide mulch and water to establish an acceptable stand of grass.]

3.15.3 Protection of Surfaces

Protect newly backfilled, graded, and topsoiled areas from traffic, erosion, and settlements that may occur. Repair or reestablish damaged grades, elevations, or slopes.

3.16 DISPOSITION OF SURPLUS MATERIAL

[Waste in Government disposal area [indicated] [which is located within a haul distance of [_____] kilometers miles.] [Remove from Government property] surplus or other soil material not required or suitable for filling or backfilling, and brush, refuse, stumps, roots, and timber.]
3.17 FIELD QUALITY CONTROL

3.17.1 Sampling

Take the number and size of samples required to perform the following tests.

3.17.2 Testing

Perform one of each of the following tests for each material used. Provide additional tests for each source change.

3.17.2.1 Fill and Backfill Material Testing

Test fill and backfill material in accordance with ASTM C136/C136M for conformance to ASTM D2487 gradation limits; ASTM D1140 for material finer than the 75 micrometers No. 200 sieve; ASTM D4318 for liquid limit and for plastic limit; ASTM D698 or ASTM D1557 for moisture density relations, as applicable.

3.17.2.2 Select Material Testing

Test select material in accordance with ASTM C136/C136M for conformance to ASTM D2487 gradation limits; ASTM D1140 for material finer than the 75 micrometers No. 200 sieve; ASTM D698 or ASTM D1557 for moisture density relations, as applicable.

3.17.2.3 Porous Fill Testing

Test porous fill in accordance with ASTM C136/C136M for conformance to gradation specified in ASTM C33/C33M.

3.17.2.4 Density Tests

**************************************************************************
NOTE: Density test frequency can vary from one test per 10 square meter 100 square feet for small areas up to one test per 900 square meter 10,000 square feet. The following table will also help establish test frequency for various situations:

<table>
<thead>
<tr>
<th>Material Type</th>
<th>Location of Material</th>
<th>Test Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Undisturbed native soil</td>
<td>Structures</td>
<td>Two random tests in native soil building footings and two tests on subgrade within building line.</td>

3.17.2.5 Moisture Content Tests

**************************************************************************
NOTE: Include moisture content test requirements in Army projects.
**************************************************************************

In the stockpile, excavation or borrow areas, a minimum of two tests per day per type of material or source of materials being placed is required during stable weather conditions. During unstable weather, tests shall be made as dictated by local conditions and approved moisture content shall be tested in accordance with ASTM D2216. Include moisture content test results in daily report.

3.10 SUBMERGED MATERIAL DISPOSAL

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for underwater (from overwater vessels and platforms) blasting and blasting near a water body with adverse impacts for any use of blasting, most commonly submerged rock excavation and/or submerged structural demolition. If any of the materials being blasted and excavated are known to be, or during the contract period may possibly be, above water, also use Section 31 23 06.00 BLASTING - SURFACE. For projects on a naval facility, consult with local NAVFAC office, Naval Ordinance Safety and Security Activity (NOSSA), and NAVSEA on requirements. NAVSEA OP5 Ammunition and Explosive Safety Ashore manual dictates many of the requirements and NOSSA has the final determination on any blasting on a Navy installation above or underwater. Reference NAVSEA OP5 manual and contact local Explosives Safety Officer and Planner for the base prior to revising the specification. Overall NOSSA approval process can take 12-18 months depending on the level of approval required.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
PART 1   GENERAL

**************************************************************************

NOTE: Consult with an office that has most recently completed a similar type of underwater or near-water blasting, while editing this section, to be appraised of recent, specific requirements, guidance, blasting developments or understandings for the subject project. Consult with, or have the specifications reviewed by, a subject matter expert in blasting for projects where blasting issues are particularly challenging or where protections to the public, structures/facilities, and/or natural resources will require project-specific designs or activities.

There are likely decisions and/or requirements of other agencies, the Safety Manual, and/or internal departments, which could have an influence upon a project's blasting specs. Some of these issues may be: navigational concerns and dealing with federal, state, and local jurisdictions and agencies; public use of nearby federal, state and/or local properties near the project; evaluations of acceptable vibrations and/or pressures affecting individuals or reaching nearby structures; natural resource (environmental) impact reviews, negotiations and/or requirements; cultural resource impact reviews for their considerations and/or requirements; constraints on the drilling or blasting procedures; pre-blast inspections; special studies to facilitate lower cost of the bids or to encourage more bid submissions; the acquisition strategy for the payment; and, other concerns specific to the project. If there are required natural resource protections, there will need to be resolutions concerning specialty firms or professions, including all of the appropriate references, designing the activity(-ies) for the project, and the Contractor's conduct of the activity(-ies), in full or part, or the Contractor's coordination with a government agency(-ies) or external office(s) conducting the activity(-ies).

The following information will be indicated on the project drawings:

1. Surface elevations, existing and new; Applicable datum for elevations and spatial coordinates will be stated clearly for reference.

2. All utilities, whether trenched, buried, at the surface or overhead to distances well beyond the project's limits;

3. Location and record of all soil and rock borings and test pits, including soil and rock
classifications and their properties, weathered rock, bit drops and voids, ground water observations, and topsoil thickness encountered in boring;

4. Location and limits of hard material, whether rock or concrete, or other building materials; with caveats as to uncertainty as appropriate;

5. Excavation or demolition limits with tolerances;

6. Details of any special limits that may require line drilling, presplitting, reduced subdrilling, and/or specialty blasting practices;

7. Location of borrow and disposal area, if located on Government property;

8. Hydrological, hydraulic and impoundment data, where applicable; and,

9. Details of all rights-of-way within the project boundaries.

1.1 SCOPE

The breakage of rock and hard/unyielding materials may be conducted by any means, unless otherwise stated herein. If the contractor elects to use drilling and blasting for breakage or displacement of any units, this entire section is applicable and covers activities associated with drilling and blasting for rock excavation at the surface. Contained herein are procedures for all activities relating to drilling; blasting and the transportation, storage and use of explosives; breakage and displacement of rock. The Contractor's blasting program and methods are those necessary to accomplish the excavation shown on the Contract drawings in accordance with the provisions specified herein. Control the quantity of explosives fired in all blasting to prevent injuries to persons and to avoid damage to all structures, properties, governmental and nonprofit entities, commerce and businesses, and natural resources and their habitat.

1.2 RELATED WORK SPECIFIED ELSEWHERE

NOTE: List any specifications that are related, such as Excavation, Earthwork, Demolition, Temporary Environmental Controls, Natural Resources, Shotcrete are typical specs related, depending on the project.

Section [______]

1.3 REFERENCES

NOTE: Add and remove references as needed for the project. Reference the appropriate state and local laws, regulations and ordinances concerning blasting where the project is to occur.
This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

INTERNATIONAL SOCIETY OF AUTOMATION (ISA)

ISEE PSBS (2017) ISEE Performance Specification for Blasting Seismographs

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

U.S. ARMY CORPS OF ENGINEERS (USACE)

U.S. Code (USC)

16 USC 470 National Historic Preservation Act

16 USC 668 Bald and Golden Eagle Protection Act

16 USC 1361 Marine Mammal Protection Act

16 USC 1531 Endangered Species Act

16 USC 1801 Magnuson-Stevens Act

33 USC 1251 Clean Water Act

33 USC 1401 Marine Protection, Research and Sanctuaries Act

42 USC 4321 National Environmental Policy Act
1.4 DEFINITIONS

**************************************************************************
NOTE: Delete definitions that will not be used in the specification text for a specific project. A complete list of blasting definitions can be found in the GLOSSARY of the EM 1110-2-3800. Recommend only using definitions not already in GLOSSARY in the EM and those definitions to further stipulate the work on the specific project in the specification. It may be necessary to add definitions depending on what the Earthwork and/or Excavation specifications for the project have terms for Rock, Weathered Rock, Sound Rock, Voids, Sediment, etc.

**************************************************************************

1.4.1 Controlled Blasting

Controlled blasting refers to blasting techniques used to better distribute the explosive charge to minimize adverse impacts. For underwater blasting, adverse impacts may be cited for the public's and contracted personnel's safety, lessening the fracturing of the rock being blasted, surrounding facilities' protection, and the avoidance of impacting natural resources or their habitats. Controlled blasting techniques must be deployed, such as careful loading to the pattern's design using the drilling log for each shot hole, stemming effectively the top of firm rock and any soft zones or voids, carefully observing maximum charge weight per delay, using delays between holes and rows of 25 milliseconds or greater, and avoiding rifling plumes by proper blasting techniques.

1.4.2 Flyrock

**************************************************************************
NOTE: Choose the distances for the project, the typical values are listed. Edit definition as needed for project site.

**************************************************************************

Flyrock is one of the three primary adverse impacts from blasting. Flyrock is defined as any airborne projectile flying the lesser distance of either 60 m (200 ft) horizontally from the shot pattern or one-half the distance between the shot pattern and the Contractor work limits, whichever distance is the lesser.

1.4.3 Green Concrete

**************************************************************************
NOTE: If no concrete placement is expected on the project then delete this definition. If concrete placements will occur when blasting operation is
ongoing, further define green concrete here and include appropriate thresholds and monitoring for the green concrete in Part 3. There needs to be limits on vibrations when there is green concrete because of the strength loss due to vibrations while curing. Involve the Structural Engineer project development team members in these determinations.

Green concrete is recently placed concrete that has initiated setting but may have substantial strength reduction from strong vibrations before the concrete has fully cured. Green concrete also includes the materials of shotcrete or cementitious grouts. Each Individual Shot Plan is required to consider vibrations emanating from its blast pattern reaching the location of the reported newly placed concrete to remain below allowable vibration levels depending upon the age of the concrete. Note the paragraph GREEN CONCRETE.

1.4.4 Pressure Waves

Pressure Waves, both Airblast (or noise) and Underwater Pressure Waves, are one of the three, primary adverse impacts from blasting. Airblast and Underwater Pressure Waves are solely compression waves passing through the air or water, respectively. Their units of measure may be in terms of pressure, Pascals (Pa) or pounds per square inch (psi), or in terms of the logarithmic scale, Decibels (dB). Note that pressures in dB have different reference values for Airblast and Underwater Pressure Waves, so the pressure waves through air are of a lower magnitude than pressure waves through water with the same numeric dB value.

1.4.5 Rock, Hard/Unyielding Material, Weathered Rock, Voids (Bit Drops), Sediment

1.4.5.1 Rock

Rock is natural solid, interlocking material with firmly cemented, laminated, and crystalline fabric, foliated masses or conglomerate deposits, none of which can be removed without systematic drilling and blasting, drilling and the use of expansion jacks or feather wedges, or the use of high-energy mechanical devices; and, so classified for this project as submerged large boulders, [masonry, or concrete other than pavement exceeding the capacity of the awarded contractor's underwater excavation capacity], which may be the minimum volume of 0.38 cubic meter 0.50 cubic yard.

1.4.5.2 Hard/Unyielding Material

NOTE: Depending upon the acquisition strategy and measurement and payment, hard materials should typically be included in lump sum payment.

Hard/Unyielding materials comprise weathered rock, dense consolidated deposits, or conglomerate materials which are not included in the definition of "rock" with stones greater than 25.4 mm 1.0 inch in any dimension. These materials usually require the use of heavy excavation equipment or high-energy mechanical devices for breakage or displacement to remove the materials.
1.4.5.3 Weathered Rock

**************************************************************************
NOTE: Weather rock and voids are particularly important for the percussion drilling's logging to properly stem the zone where the weather rock and bit-drops are encountered.
**************************************************************************

Weathered rock, for underwater percussion-drilling logging, is any original rock unit that has been altered to a weaker state that will not retain stemming when explosives are loaded into that material.

1.4.5.4 Voids

Voids, for underwater percussion-drilling logging, is any rapid bit drop with little or no resistance to the downward drilling pressure. Voids may be water or sediment filled, which may possibly determine that the original rock unit has been altered to a weaker state that will not retain the gaseous detonation products when the explosives are shot.

1.4.5.5 Sediment

Sediment is both: the loose to firm material that may be dredged above the surface of weathered or firm rock, which cannot be easily dredged; and the infill of voids as solid particles.

1.4.6 Unstable Material

Unstable materials are loose, submerged sediment that are easily displaced by water flow or turbulence and by vibrations or incidental impact.

1.4.7 Vibrations

Vibrations are one of the three, primary adverse impacts from blasting. Vibrations are the result of various wave forms emanating from the detonation or deflagration of ignited materials from a shot pattern. Peak particle velocity (PPV) is defined as the maximum absolute value among the three ground vibration velocities measured in the vertical, longitudinal, and transverse directions over a time of a record. Peak, total vector-sum particle velocity is the peak value over the full, time history of each time-unit's value of the square-root sum of the squared, component velocities. Velocity units are expressed in centimeters per second (cps) or inches per second (ips).

1.5 SYSTEM DESCRIPTION

Boring logs are [shown on the drawings] [appended to the SPECIAL CONTRACT REQUIREMENTS or GDR]. Bottom-sounding surveys are provided as contoured maps, as precise to the vertical and lateral tolerance on the date of the survey.

The subsoil investigation report and samples of materials taken from subsurface investigations may be examined at [______]. These data represent the best subsurface information available; however, variations may exist in the subsurface between boring locations.
1.5.1 Classification of Excavation

**************************************************************************
NOTE: Inapplicable portions will be deleted. Other classifications of excavation may be utilized as required. For underwater blasting, resolve whether there is any potential for anthropogenic materials, such as concrete or pavement, or lost shipping debris that must be included in paragraph DEFINITIONS above and paragraph CLASSIFICATIONS herein.

If no consideration will be given to the nature of the materials, then all excavation will be designated as unclassified excavation. Otherwise, finish the specified excavation on a classified basis, in accordance with the following designations and classifications.
**************************************************************************

1.5.1.1 Common Submerged Excavation

Include common excavation with the satisfactory removal and disposal of all materials not classified as rock or hard/unyielding materials. Include the removal of any concrete or masonry structures or pavements that may be encountered in the submerged excavation zone under this classification.

1.5.1.2 Rock Excavation

Submit notification of encountering rock and/or hard/unyielding materials in the project. Include rock excavation with blasting, excavating, grading, disposing of material classified as rock, and the satisfactory removal and disposal of boulders 1/2 cubic meter yard or more in volume; solid rock; rock material that is in ledges, bedded deposits, and unstratified masses, which cannot be removed without systematic drilling and blasting; firmly cemented conglomerate deposits possessing the characteristics of solid rock impossible to remove without systematic drilling and blasting; and hard materials as defined herein [requires inclusion of appropriate definition of hard materials for the project].

If at any time during excavation, including excavation from borrow areas, the Contractor encounters material that may not be classified as rock excavation, uncover such material, and notify the Contracting Officer. Do not proceed with the excavation of this material until the Contracting Officer has classified the materials as common excavation or rock excavation and has taken cross sections as required. Failure on the part of the Contractor to uncover such material, notify the Contracting Officer, and allow ample time for classification and cross sectioning of the undisturbed surface of such material will cause the forfeiture of the Contractor's right of claim to any classification or volume of material to be paid for other than that allowed by the Contracting Officer for the areas of work in which such deposits occur.

1.5.2 Blasting

Drilling and blasting are not required activities for breakage of materials to allow excavation. Should the Contractor elect to conduct drilling and blasting, the Contractor must perform the blasting in accordance with this section. The Contractor is responsible for all claims for damages and
injuries caused by, or arising out of, blasting activities and its adverse impacts, as noted in the FAR.

Perform blasting in accordance with EM 385-1-1 and in conformance with all Federal, State, and local laws, regulations, and ordinances. Submit notice 30 days prior to starting work. Submit a Master Blasting Plan for approval, prepared and signed by the Blasting Specialist that includes: a listing of all federal, state and local regulations and ordinances to conduct blasting at the project; the support documentation and certifications for all proposed blasting personnel; information and data sheets for all the explosives to be used at the project; the design approach to blasting; outlines of all required reports and formats for all the forms of the respective reports; and, the procedures to control all the adverse effects of blasting. Use the non-electric blasting caps for all underwater blasting. Obtain written approval prior to performing any blasting and notify the Contracting Officer 24 hours prior to blasting. Include provisions for storing, handling, and transporting explosives as well as for the blasting operations in the plan.

1.6 SUBMITTALS

********************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

********************************************************************************

Government approval is required for submittals with a "G" or "S"
classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Master Blasting Plan; G, SO
Blasting Safety Plan; G, SO
Navigation Control Plan; G, AO
Test-Blast Plan; G, AO
Certified Marine Survey; G, AO
Pre-Blast Surveys; G[, [_____]]
Blasting Consultant's Qualifications; G[, [_____]]
Blasting Specialist's Qualifications; G[, [_____]]
Blaster-In-Charge Qualifications; G[, [_____]]

1.7 COORDINATION

**************************************************************************

NOTE: The following paragraph can be used if working with multiple stakeholders/owners.
**************************************************************************

Blasting will be in the vicinity of the [existing lock, railroad, and highway, and river barge, train, highway traffic, utilities and businesses] and their operation will not be impeded or delayed beyond that which has been coordinated with [TVA, U.S. Coast Guard, U.S. Army Corps of Engineers - [____] District, [_____] environmental or natural resources offices, [state] Department of Transportation, [____], [_____] Railroad, regional or local utilities, and/private businesses]. A coordination plan, with the appropriate authorities that mitigates [navigation and traffic delays], in the Master Blasting Plan.

Coordinate, through the Contracting Officer, with other Contractors working onsite to minimize work stoppages during blasting.

1.8 LIABILITY

Compliance with provisions in the contract will not relieve the Contractor of their responsibility for any damages or injuries caused by, related to, or arising out of blasting or associated blasting activities. Notwithstanding federal, state, and local laws, regulations and ordinances, the Contractor assumes all liability and hold and save the Government, its agents, officers, and employees harmless for any and all claims for personal injuries, property damage, or other claims arising out of or in connection with the handling of explosives or blasting under this contract.

PART 2 PRODUCTS

2.1 TRANSPORTATION, STORAGE AND USE OF EXPLOSIVES

**************************************************************************

NOTE: Confirm and follow federal, state, and local
regulations and guidance on the transport, storage and use of all Explosives. State and local agencies and/or authorities may not easily allow the receipt of Explosives in a timely manner. State and local agencies and/or authorities may have specific reporting, certifications, adverse impact concerns, or distance regulations from the blast zone to private properties governing the use of Explosives. The Agency/Service may wish to allow storage of Explosives on federal premises. The winning contractor should independently assess and cite in the Master Blasting Plan all federal, state, and local laws, regulations, ordinances, or authorities that impact the transportation and storage of Explosives. Consider requiring cartridge explosives for water sensitive explosive materials or allowing the use of those bulk explosive that are not water sensitive, i.e., "Bulk explosives such as ammonium nitrate and fuel oil (ANFO) or bulk emulsion or emulsion blends will not be permitted."

2.1.1 General

Store, transport, handle, use, and otherwise secure explosives in accordance with best practices as approved by the Contracting Officer and in accordance with all Federal, State and Local laws and regulations. Comply with all special rules and regulations that may be made by the authorities having jurisdiction, or by the Contracting Officer, regarding construction of, and storage in magazines and precautions in blasting. Times and imposed restrictions concerning the use of explosives must be conducted in accordance with local, State, and Federal regulations. The Contracting Officer reserves the right to establish restrictions or time windows when blasting will not be allowed.

2.1.2 Blasting Products

2.1.2.1 Requirements

All explosive materials to be used on site must be proposed for approval in the Master Blasting Plan. Cartridge and bulk explosives may be used in different sections of the project. All explosive materials used on the project must be six months or less of age or no older than one half the shelf life shown on the explosives manufacturer's technical data sheet for that product. Millisecond delay, shock-tube initiators, must be used as the initiation system. To ensure the accuracy of firing times of blasting caps, it is required that each cap period come from one lot number. Mixing of lot numbers for any single cap delay period within a shot pattern is strictly prohibited. For underwater blasting's ability to displace rock against the water load, the minimum delay both between shot holes and shot rows will be 25 milliseconds.

2.1.2.2 Prohibited Explosive Materials

Explosives that do not meet the manufacturer's specifications must not be used. When, in the opinion of the Contracting Officer, any explosive materials is either of excessive age or appears to be in a deteriorated condition, all work must cease until the products age and quality can be determined. Blasting products without date batch codes will not be
permitted on site. The Contracting Officer may require any explosive materials to be tested by an independent organization to determine its performance as compared to the manufacturer's data sheet. If explosive materials' performance or composition deviates by more than 10 percent in any manner from the manufacturer's data sheet, that lot number will be rejected. The Contractor is responsible for any required testing and no additional compensation will be made for any product testing directed by the Contracting Officer.

Bulk explosives, which are water sensitive, are strictly prohibited.

Detonation Cord is strictly prohibited for initiation transmission through the air and water to the shot holes. An approved non-electric shock tubing, proposed in the Master Blasting Plan, must be used to transmit the firing initiation to each shot hole. Detonation cord may be used within the shot hole by proper connection to the shock tubing beneath the highest elevation offirm-rock stemming.

2.1.3 Magazines

**************************************************************************
NOTE: Determine whether not allowing onsite explosive storage magazines will be an adverse impact that will limit bidders. If the project has sufficient area of restricted open property, explosive magazines may be allowed onsite. For example, a rural federal project may have sufficient property to accommodate the stand-off distances from the magazine to other residential or essential structures to easily allow an onsite magazine, especially if the adjacent non-federal property owners might not wish to have a magazine on their property. Recognize that there will be at least two daily trips with appropriate explosive-transport vehicles between the magazine and the coming shot pattern. Delete the first paragraph, "No explosives ... explosive magazines.", if onsite magazines will be allowed.
**************************************************************************

[ No explosives will be stored onsite. There must be no permanent explosive storage or overnight explosive storage onsite. The Contractor will either obtain daily deliveries of the explosives to the site from a manufacturer or supplier or secure offsite explosive magazines.

] When the Contractor will maintain the explosive magazines, obtain all necessary Federal and State magazine permits for the magazines. Magazines must be located at safe distances as defined by the Bureau of Alcohol, Tobacco and Firearms (ATF), in addition to the State of [_____]'s requirements. Procure off-site explosive storage and expect to transport the daily volume of explosives to the site. Secure a permit to transport explosives from the State of [_____]'s Highway Patrol when and if required, and transport explosives in accordance with 49 CFR 177 when carried on public highways.

The Contractor must have two temporary magazines on board the drilling and loading barge of sufficient volume to hold the largest day's use of explosives and initiators separately. These temporary magazines must meet all ATF requirements and all regulations and ordinances of state and local
government. No explosives may remain overnight in the temporary magazines. A daily-use log of explosives delivered, loaded by shot hole through the day, and removed at the last shift must account for the use of all explosives.

2.1.4 Magazine Keeper

Each magazine keeper must be experienced and familiar with the laws and general practices concerning the handling, care, use, and storage of explosives and detonators. The magazine keeper is responsible for maintaining a cleared area around each magazine. The magazine keeper will not be required to perform any duties that will in any way interfere with their duties as magazine keeper and being physically present at the magazines for every entry to the magazines for delivery, disbursement, and review of explosives at the magazines.

If explosives are delivered and returned daily from the manufacturer or supplier to the project, the driver of the truck will serve as the magazine keeper.

PART 3 EXECUTION

3.1 GENERAL EXCAVATION AND REMOVAL

**************************************************************************
NOTE: Delete inapplicable sections. The coordination with other federal, state, and local jurisdictions and agencies, the public, and private entities must be completely resolved before finalizing the specifications.

While it is not typical to have low tolerances for the horizontal variation of submerged walls or for the vertical variation of submerged pay grades, some projects may require limited control of the walls and grades in underwater blasting. Before resolving the project's underwater tolerances, determine an easy and effective means to survey the submerged walls and grades, and further assess to what precision such surveys may accurately estimate horizontal and vertical variations over short distances.

Presplitting would be an unusual requirement for underwater blasting, even in shallow water, because of the accuracy of knowing the exact horizontal location of the Top of Firm Rock. In projects where controlled blasting techniques are required to produce final walls which require presplit blasting, only explosives designed for this application must be allowed.

Specific underwater blasting impacts' requirements, negotiated or specified with environmental agencies and offices, must be fully determined, and in some cases designed, for the project before the specs may be finalized. Some requirements, like seasonal restrictions on underwater blasting or the prohibition of detonation cord in the open air and
water, may easily be included. Other requirements, such as the required use of a bubble curtain, should be avoided if possible, because of its difficulty in its proper use, maintenance, and storage, but when required will need to be designed by an appropriate experienced professional for inclusion of the designed element in the specifications.

**************************************************************************

Perform the excavation of every type of material encountered within the limits of the project to the lines, grades, and elevations indicated and as specified. Dredging, breakage, displacement, and excavation of all the materials will be accomplished by appropriate techniques and with special care, such that no individuals, cited natural resources, structures, navigation and other sensitive features, and activities suffer any adverse effects from blasting. Perform the submerged removal in accordance with the typical sections shown and the tolerances specified in paragraph SUBMERGED MATERIAL DISPOSAL.

The Contractor's blasting program and methods will be those controlled blasting techniques necessary to accomplish the excavation shown on the contract drawings in accordance with the procedures specified in this section. Make necessary plans, examinations, surveys, and test blasts to determine the quantity of explosives that can be fired to accomplish the breakage (or displacement) and removal of materials without injuries to persons, and aquatic wildlife (or other natural resources), or damage to personal or public property. Test blasts will be performed to slowly build to acceptable loading and timing of production shot patterns, to verify that the monitoring network performs as designed, to begin to assemble monitoring data collection, and to resolve that the submerged material is adequately broken or displaced for removal. Use the test blasting results to optimize remainder of work. The blasting program must abide by all applicable Federal, state, and local laws, regulations, and ordinances established for the project's location.

Process any and all claims of public entities, companies and private citizens arising from the transportation, storage, and use of explosives promptly in an acceptable time period set by the Contracting Officer Representative (COR); in particular, all injury and property damage claims must be acknowledged by the Contractor, or their representative, and be submitted immediately as directed by the COR to the Contracting Officer providing name of claimant, location, time and description of alleged injury, and damage, and estimated value. The claimed injury or damage will be evaluated and inspected by an appropriate specialist within 48 hours following initial notification, and processed to a conclusion (honored, denied, or compromised) within 90 days after cessation of all blasting on the contract; but, in no case will the claims remain unresolved for a period exceeding 6 months (180 calendar days). Submit evaluation and inspection results and actions taken to the Contracting Officer on a weekly basis.

3.1.1 Removal of Submerged Materials

**************************************************************************

NOTE: Determine whether varied submerged materials being excavated may be placed in other submerged low-elevation zones that allows undifferentiated placement of the excavated volumes to the pay grade. There may be requirements to place certain
materials in specific locations by the submerged material's type. Different projects may require disposal only above water or only below water.

**************************************************************************

3.1.1.1 Sediment Within the Project Limits for Removal Displacement

Sediment vertically above the project limits for removal may be excavated, removed, or displaced by any means, including dredging, prior to action upon deeper materials. Sediment may be left in place for removal by mechanical means after the breakage of deeper materials allows those materials to be removed. Unless the Disposal of Materials requires differentiation of materials below or above the water surface, the sediment may be removed and placed in the disposal zone before or after the excavation of deeper materials.

3.1.1.2 Breakage of Rock and Hard/Unyielding Materials for Excavation and Disposal

**************************************************************************

NOTE: Determine whether the sentence below, "The lateral dimensions … azimuthal direction." is required. If it is necessary for specific project, determine the lateral distances the azimuthal directions that meet the project's needs. If it is not necessary for specific project, delete the sentence.

**************************************************************************

Blasting may be conducted to break or displace the rock and hard/underlying materials into sizes that may be removed by dredging or excavation equipment. Test blasting will be conducted to determine the parameters for the following production blasting. Care must be taken to prevent damage to any of the remaining specified materials, features or structures noted in the drawings; and avoid adverse effects from blasting to personnel, the public, natural resources, structures, and features. The lateral dimensions of any blast plan must not exceed [_____] m [_____] ft horizontally in any azimuthal direction. The Contractor must curtail blasting activities in designated areas when, in the opinion of the Contracting Officer, damage to in-place units or adverse impacts may have occurred. Blasting will be curtailed in these designated areas until both remediation, as directed by the Contracting Officer, has been completed, and the Contractor has resolved a means to conduct the blasting without the damage or adverse impacts.

3.1.2 Disposal of Materials Within the Project Limits

**************************************************************************

NOTE: The Guide Spec presumes that all dredged and/or excavated materials below the water surface may be placed below a specified elevation(s) in submerged, low-elevation zones already surveyed and provided in drawings. If any materials must be removed from the project area and/or will be placed by material type and/or within certain tolerances, compaction requirements and/or by having been dewatered, additional disposal sections and references to those locations of placement or disposal will be required to be added.
Transport and place all dredged, displaced, or excavated materials within the limits of the disposal zones below the specified elevations, according to the requirements specified in paragraph SUBMERGED MATERIAL DISPOSAL.

3.2 SAFETY PROCEDURES

3.2.1 General

Ensure all work completed under this Contract is executed safely. Follow the safety procedures outlined in EM 385-1-1. EM 385-1-1 will govern all activity unless more stringent safety requirements are specified in other applicable Federal, State, and local laws, regulations, and ordinances.

NOTE: Additional narrative may need to be added on coordination with other federal, state, or local entities before acceptance of the Master Blasting Plan for critical items and required limitations, which have been included within paragraphs SAFETY PROCEDURES, OPERATIONAL REQUIREMENTS, and IMPACT MONITORING. There may be compliance obligations for the Contractor, the Contracting Officer and/or other entities regarding those critical items and required limitations. For example, if a Marine Mammal Watch Program is required to avoid blasting while marine mammals are near the loaded, underwater shot array, then the CO, the Contractor and the entity requiring the watch program should schedule and meet both to discuss and to have a mutual understanding relative to project of the Marine Mammal Protection Plan.

3.2.2 Weekly Coordination Meeting

Coordinate all blasting schedules with the Resident Engineer's Office and Contracting Officer at least one week in advance and hold a weekly blasting coordination meeting with the Resident Office. Provide an agenda for the blasting coordination meeting that lists project's prior week's shots, the forecasted shot schedule, and displays a scale site plan showing the locations of the schedule shots. The Blasting Specialist, Blaster in Charge, and Seismic Specialist are required to participate in discussion of agenda items and lessons learned.

3.2.3 Public Notice of Blasting Operations

Thirty days, prior to any blasting operations, prepare and submit to the Contracting Officer a public government notification letter of the proposed blasting activities. The Government will distribute copies of this notification letter by certified mail to local governments, law enforcement, public utilities, public users of project recreational facilities, and residents and commercial interests located within 0.8 kilometers one half mile of the blast site. This notification letter must contain at minimum:

a. Name, address, telephone number and e-mail address of the Contractor;

b. Plan maps identifying the specific areas in which blasting will take
place, and major and secondary roads, geographic features and auxiliary features;

c. Duration of blasting activities, and on which days of the week and hours of the day that blasts can be expected to occur;

d. Vehicular and pedestrian traffic control measures to be taken;

e. Methods to limit access to the blasting area; and,

f. Types, patterns and duration of audible warning and all-clear signals to be used before and after blasting.

3.2.4 Public Meetings

**************************************************************************
NOTE: Communicate with the project manager and all stakeholders about whether specific requirements for a meeting or multiple meetings are needed. It may be necessary to advertise the meeting in a local newspaper and specify the meeting room capacity.
**************************************************************************

Fifteen calendar days prior to any blasting operations, provide the approved Blasting Specialist, Blasting Consultant, and Seismic Specialist to attend a public-relations meeting to be conducted on an evening to be determined by the Contracting Officer. This meeting will inform the public about the anticipated blasting operations. The Blasting Specialist, Blasting Consultant, and Seismic Specialist must each make a short presentation of blasting operations and answer any questions pertaining to public concerns dealing with the blasting operations, the magnitude of vibrations, airblast and potential for flyrock that may impact the public, and the project's required natural resource activities. Distribute points of contact should the public and local entities have an event of concern related to the blasting program.

3.2.5 Warnings and Signals

Establish a method of warning all employees on the job site of an impending blast following the guidance of EM 385-1-1. The signals must consist of a five-minute warning signal to notify all in the area that a blast will be initiated in five minutes. A second warning signal must be sounded one-minute before the blast. After the blast is over, sound an all-clear signal, once the blast site has been inspected for misfires by the Blaster in Charge to notify all in the area that the blasting operation is finished. No personnel other than the Blaster in Charge must enter the blast area, until it has been determined to be all clear.

3.2.6 Notification to Navigation

**************************************************************************
NOTE: Use the following paragraphs when working in or near navigable waters or navigation lock. The notice may need to be coordinated with multiple federal, state, or local agencies, which could include the U.S. Coast Guard, a Corps of Engineers' District Office, an entity of a District Office (e.g., a Lock), a state agency, a local agency for a harbor or its police or fire department, and other

SECTION 31 23 01 Page 22
Notify the [_____] a minimum of [14] [_____] calendar days prior to the commencement of blasting operations to allow for sufficient time to send out navigation notices. The information to be supplied will include the dates and time window of blasting operations.

3.2.7 Navigation Control During Drilling, Loading, and Blasting Operations

NOTE: Determine the number of patrol vessels required for the specific project. At least one patrol vessel should be required unless the AO totally controls the water surface far beyond the size of the excavation zone. Correct the second and third paragraphs with such determination for the specific project.

Placement of buoys in the third paragraph is also project specific. Resolve whether buoys are required and the distance beyond the shot pattern or excavation zone that the buoys should be positioned.

Notify the Coast Guard 24 hours prior to a scheduled blast and 2 hours prior to the actual blast's initiation. Contact should be made with: US Coast Guard's contact, whose name and an alternate's name will be provided at time of contract award.

Operate [two] patrol vessel[s] during blasting operations equipped with a visible yellow flashing light, audible horn, and radio with a hailer, whose sole function will be to monitor and maintain security in the blast area. Use patrol vessels during all blasting operations. Inspect and insure there is no vessel traffic within the work area prior to the firing of the blasting caps and until such time as the Contractor has sounded the "All-Clear Signal".

Establish and maintain a warning system as required by EM 385-1-1 and as stated in paragraph WARNINGS AND SIGNALS. Equip and maintain the floating plant with radio equipment capable of communications with the Coast Guard. The Contractor, after each blast, upon inspecting the area, notify the Coast Guard and Contracting Officer if all clear or misfire is noted. Buoy the area with warning signs. The warning signs are to be legible from a distance of [_____] m [_____] ft and contain the message "DANGER - EXPLOSIVES IN USE" visible on either side of the sign. Station patrol vessels at the drill barge and remain in the blasting area during all blasting operations. Land oriented access control and visual observation locations will be determined and approved by the Contracting Officer.

3.2.8 Lightning Detection Device

Furnish, maintain, and operate lightning detection equipment during the entire period of blasting operations and during the periods that explosives are used at the site. Equipment must provide real time audio and visual alarm/signal and detection based on combined detection of electromagnetic, electrostatic, light wave spectral and audio disturbances, or a commercial service based on these, as a minimum for approved. Equipment must be capable of detecting lightning within 40 kilometers 25 miles as a minimum.
of the blast area. Provide the equipment after approval. When and where
the lightning detection device indicates a blasting hazard potential,
immediately evacuate personnel from all areas where drilling is being
conducted or explosives are present. When a lightning detector indicates a
blasting hazard, perform the following actions.

a. Clear the blasting area of all personnel. Place guards at all access
   points to the blast area.

b. Immediately notify the Contracting Officer of the potential hazards and
   precautions being taken.

c. Terminate the loading of holes and secure the unused explosives to an
   approved location.

d. When the hazard dissipates, inform the Contracting Officer that the
   drilling and loading of holes will continue.

3.2.9 Drill-Boat or Barge Safety

All onboard day magazines must be permanently secured to the deck as
required by the Coast Guard. No high explosives will be stored on the boat
or barge deck in the open except for the one case that is to be loaded
immediately into the shot holes. Any explosives remaining on deck must be
returned to the day magazine prior to the firing of any blast. The firing
line reel or spool will be mounted on the rig in a manner that it cannot be
lost overboard. An approved blasting machine will be used for detonation
regardless of the number of caps used. No electric blasting system can be
used. The amount of explosives permitted aboard the drill boat or barge at
any one time will be subject to the approval of the Contracting Officer,
but in no case will such amount exceed the amount permitted by appropriate
codes and regulations.

Make necessary arrangements to prevent damage to any vessel, moored or
underway, building or structure and to preserve the crew or occupants
thereon from exposure to injury because of the Contractor's operations.
Automatic fire extinguishers of an appropriate type must be installed on
air compressors and in all engine compartments aboard vessels (drill boats,
barges) where explosives are stored, handled, and used. The Contracting
Officer may require additional arrangements. Have a Certified Marine Survey
of all floating plant proposed for underwater blasting work on this
contract performed prior to starting any work and provide the results to
the Contracting Officer. Remote fuel shut-offs and fire-signaling devices
must be provided aboard the drill boat.

3.2.10 Inspection for the All-Clear Signal

The Blaster in Charge must thoroughly inspect the entire blast area for a
minimum of five minutes following a blast. The five-minute delay between
blasting and commencing work is needed to ensure that no misfires have
occurred. Details of the misfire procedures were provided in the Blasting
Safety Plan, including the distance of the restricted area when a misfire
is discovered.

3.2.10.1 Check for Misfires

During the five-minute delay, it is the responsibility of the Blaster in
Charge to enter and inspect the shot-pattern area and verify for all loaded
shot holes that all explosives have been detonated.
3.2.10.2 Misfire-Handling Procedures

Should an inspection indicate that complete detonation of all charges did not occur, only critical personnel involved in the blasting operation or excavation of the unexploded material are allowed within the established shot-pattern area. Restrict the site until the Blaster in Charge or the Blasting Specialist indicate the site is safe. If the misfire poses problems that cannot be safely corrected by the Blaster in Charge or the Blasting Specialist, a consultant, or an explosives company representative skilled in correcting misfires must be called to resolve the problem. Provide within 60 minutes of the recognition of a misfire, a notice to the Contracting Officer and all applicable agencies and offices for public safety. Compliance with this or any other provision in the Contract will not relieve the Contractor of responsibility for any damages or injuries caused by, related to, or arising out of blasting or associated blasting activities.

Provide the details of the misfire and the correction measures in the Individual Shot Report for shot with the misfire to the Contracting Officer and the emailed addressees the next business day.

3.2.11 Natural Resource Protection (Environmental Resource Protection)

**************************************************************************
NOTE: During the planning process for projects requiring underwater blasting, the agency/Service responsible for construction would have conducted an environmental impact analysis of the project, including blasting impacts, and coordinated with applicable Federal and state Natural Resource agencies, under the authorities of a number of environmental laws. For example, an Environmental Assessment (EA) or Environmental Impact Statement (EIS) would have been completed per the requirements of the National Environmental Policy Act. Often mitigation is suggested or required by the reviewing agencies. These mitigation techniques could be as simple as the design of well stemmed shot-holes to reduce pressure entering the water column or the use of small repelling charges to scare fish from the blasting zone. The responsible, reviewing agencies could also require extensive planning and design for such mitigation techniques as post-blast monitoring studies or the design and use of an effective bubble curtain system to reduce blast pressures. If marine mammals are in the project area, the Marine Mammal Act comes into play. Depending on the project, the National Marine Fisheries Service (NMFS) has required the use of Marine Mammal Watch Programs to ensure that marine mammals are not within a specified distance from the blast prior to detonation. These distances (in the form of pressure limits) are often provided by the NMFS and the monitoring is conducted by specialized companies with specialists in the identification of marine mammals. The NMFS has also required near-field pressure monitoring to confirm Watch Program distances and far-field acoustic monitoring to
ensure that sound levels are below levels causing auditory damage. The major environmental laws that may require mitigation or place restrictions on project blasting are listed under paragraph REFERENCES. (If there are no requirements under an environmental law, then the no mitigation would be required under that law and the reference should be deleted). However, additional Federal and state laws may also apply, depending on the project. Coordination with other federal, state, and local agencies and jurisdictions, the public, and private entities must be completely resolved before finalizing the Specifications. It is essential that the agency/service person, using these Guide Specifications to prepare Plans and Specifications, coordinate with the planners and environmental compliance specialists within their agency/Service to ensure that all the blasting restrictions and mitigation measures are incorporated into the Plans and Specifications. Failure to comply with the requirements of Federal or state laws and regulations could result in project delays or stoppages.

**************************************************************************

The Contractor is required to utilize the following to avoid and minimize techniques designed to mitigate the impacts of underwater blasting that have been developed, in coordination with other Federal agencies, in compliance with the federal, state, and local environmental laws and regulations and with applicable regulations and requirements of Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. All activities requiring the Contractors' action or coordination are included in paragraph NATURAL RESOURCE ASSESSMENTS, Mitigation and Monitoring. The Contractor has full responsibility for not violating all the mitigation requirements. Associated fines for violations will be borne by the Contractor.

[3.2.11.1 National Environmental Policy Act]

Write detailed description of work to be performed by the Contractor here. If there is no required work under 42 USC 4321 then the section should be deleted and renumbered.

[3.2.11.2 Endangered Species Act]

Write detailed description of work to be performed by the Contractor here. If there is no required work under 16 USC 1531 then the section should be deleted and renumbered.

[3.2.11.3 Marine Mammal Protection Act]

Write detailed description of work to be performed by the Contractor here. If there is no required work under 16 USC 1361 then the section should be deleted and renumbered.

[3.2.11.4 Bald and Golden Eagle Protection Act]

Write detailed description of work to be performed by the Contractor here. If there is no required work under 16 USC 668 then the section should be deleted and renumbered.
3.2.11.5  Marine Protection, Research and Sanctuaries Act

Write detailed description of work to be performed by the Contractor here. If there is no required work under 33 USC 1401 then the section should be deleted and renumbered.

3.2.11.6  Magnuson-Stevens Act

Write detailed description of work to be performed by the Contractor here. If there is no required work under 16 USC 1801 then the section should be deleted and renumbered.

3.2.11.7  Clean Air Act

Write detailed description of work to be performed by the Contractor here. If there is no required work under 42 USC 7401 then the section should be deleted and renumbered.

3.2.11.8  Clean Water Act

Write detailed description of work to be performed by the Contractor here. If there is no required work under 33 USC 1251 then the section should be deleted and renumbered.

3.2.11.9  National Historic Preservation Act

Write detailed description of work to be performed by the Contractor here. If there is no required work under 16 USC 470 then the section should be deleted and renumbered.

3.2.11.10  Additional Federal Environmental Laws

Write detailed description of work to be performed under Federal environmental laws by the Contractor that are not listed in paragraph REFERENCES. If there is no required work under this Federal law, then the section should be deleted and renumbered.

3.2.11.11  State and Local Environmental Laws and Regulations

Write detailed description of work to be performed by the Contractor here. If there is no required work under an applicable state and local laws and regulations, then the section should be deleted and renumbered.

3.3  OPERATIONAL REQUIREMENTS

**************************************************************************
NOTE: The coordination with other federal, state, and local jurisdictions and agencies, the public, and private entities must be completely resolved before finalizing the specifications. A project's excavation and/or foundation requirements, for which submerged, dense materials are being removed, may require navigation, highway, structural and/or other regulations and codes to be followed. Depending upon the proximity of public-use areas, private residences or businesses, and the project's location within a county or township, various accommodations will need to be required for the protection of the

SECTION 31 23 01  Page 27
public, and the safety of private entities regarding local laws, regulations, and ordinances. Avoiding natural-resource impacts may overlay other measures and require seasonal or daily time limitations of the initiation of the individual blast patterns; special observers for some or all the blasting; special studies or monitoring while the blasting is being conducted; and other potential considerations.

Agency coordination will vary by project. Be certain that all government stakeholders have been involved with planning of the project and approved of all requirements for the specifications. List those important navigation or safety stakeholders in 3.3.2. When there are navigable waters near the excavation zone, list in 3.3.2 the controlled navigation perimeter's distance during the warning period of a shot. While the distance is project specific, the minimum distance is typically 300 m 1,000 ft.

3.3.1  Coordination

3.3.1.1  Schedules

Coordinate schedules for blasting with the proper authorities, federal, state, local. No blasting will be conducted unless the Contractor is notified by the appropriate parties that blasting may proceed. In addition, if channel restrictions of navigable waters are required for drilling and blasting, the Contractor will coordinate with the U.S. Coast Guard.

3.3.1.2  Permits

Obtain all necessary permits from the state and local authorities to transport explosives and all blasting agents necessary, and to perform blasting operations on site. The Contracting Officer will be notified in writing that all permits have been obtained and will be furnished copies of all permits.

3.3.2  Navigational, Lock or Vessel Control During Excavation and Removal

Various agencies and offices, [____], must be notified of the scheduled blasting times for coordination. The Contractor must assure that no vessels are within, nor on a heading and speed to be within, [____] m [____] ft of the shot pattern during the 5-minute warning.

3.3.3  Work Restrictions

NOTE: While it is not typical to have low tolerances for the horizontal variation of submerged walls or for the vertical variation of submerged pay grades, some projects may require limited control of the walls and grades in underwater blasting. Before resolving the project's underwater tolerances, determine an easy and effective means to survey the submerged walls and grades, and further assess to
what precision such surveys may estimate horizontal and vertical variations over short distances. Presplitting would be an unusual requirement for underwater blasting, even in shallow water, because of the precision of knowing the horizontal location and vertical relief of the presplit walls. In projects where controlled blasting techniques are required to produce final walls which require presplit blasting, only explosives designed for this application must be allowed.

List all the restrictions for blasting agreed to by various agencies and offices in the sentence of the first paragraph, "The restrictions include: [____]." Such restrictions may need to be detailed elsewhere in the specs, and may include any or all or the following: public notices; vessel traffic control by patrolling and through the Coast Guard; blast initiation only during daylight hours; prohibiting the use of bulk explosives; assuring confined detonations within sound rock; limiting the maximum charge weight of explosives per delay; assuring that airblast and vibration remain below acceptable levels; recording all shots with videography and blast seismographs; seasonal restrictions to lessen the likelihood of a species in the blasting area; and, the use of fish-repelling noise immediately preceding every shot. Some specialty requirements will require careful consideration for their need and will require the design input of experienced specialists. These specialty requirements include, but are not limited to, underwater pressure wave monitoring or mitigation by use of an air curtain. The design or limitation of the action is stated in these paragraphs. The Contractor's actions or coordination of required Natural Resource activities are listed in paragraph NATURAL RESOURCE ASSESSMENTS, MITIGATION AND MONITORING.

There are a variety of restrictions upon blasting to assure that there are no adverse impacts to the public and upon commerce, and to avoid harm to surrounding structures and to the natural resources and their habitats. The restrictions include: [____]. Several restrictions that are not fully detailed elsewhere within this chapter are noted in this paragraph.

3.3.3.1 Confined Detonations

The rock excavation after blasting will be more effective if each loaded drill hole is well confined by stemming within sound rock. The intent is to confine the gaseous detonation products of each shot hole, such that no rifling plumes, the visual result, are produced in any shot patterns. The premature release of the gaseous products reduces or eliminates effective fracturing and displacement and causes large water-borne pressures potentially damaging to natural resources. Drill-hole logging is required to recognize the depth of firm rock and voids, and to adjust the designed Individual Shot Plan loading of each shot hole with explosives and stemming according to the position of sound rock relative to the paid elevation of
removal. Video recording of each blast will detail the effectiveness of avoiding rifling plumes.

3.3.3.2 Temporal, Weekly and Seasonal Restrictions for Blasting

**************************************************************************
NOTE: Determine the times, days, and dates that blasting is permitted. Typically, blasting is only allowed during business hours on business days and Saturdays, particularly when there may be vibratory blasting impacts at residential, business and/or commercial structures. Specialty or critical facilities may require other temporal and vibratory restrictions. Usually, blasting is restricted from being conducted on Sundays and federal holidays. There may need to be date restrictions for specific local or regional events. In coordination with state and local entities, revise the paragraphs for your specific project.
**************************************************************************

Blast initiation is permitted: during daylight, business hours on business days; on Saturdays to [______]; and, on Sundays and federal holidays to [______]. Regardless of the season, blast initiation is only permitted, during the period from one-hour after sunrise to one-hour before sunset. The Contractor will not be constrained by weather conditions, except for lightning, for underwater blasting in depths of water greater than 0.9 m 3.0 ft for which airblast is often negligible. Drilling and blasting will not be permitted during the following seasonal periods: [______].

3.3.3.3 Allowable Vibration

**************************************************************************
NOTE: Vibration monitoring is required for every blasting project. The paragraph's narrative is a generic description for most projects, where the nearest structure/facility is: Standard Construction Timber Frame, Brick, and Concrete Buildings; Lock Monoliths; Powerhouse Switchyard; Highway and Railroad Bridges; Buried Utilities; and Wells and Aquifers. Some projects may require assessment by a trained experienced blasting specialist or structural engineer of lower allowable vibration criteria at critical or historic or special structures or facilities or structures with continuous occupants. Vibrations can cause the occupants of structures to become physically uncomfortable at levels well below the allowable vibration levels to avoid damage to the structure itself. Projects a with a Powerhouse and Electrical Power Relay Equipment or Pipelines, besides those with continuous occupants, should be evaluated for lower allowable vibration criteria. Some projects could utilize the assessment by a trained experienced blasting specialist or structural engineer to include higher allowable vibration criteria for those projects where typical structures/facilities are more than twice the distance of the closest approach of blasting to:

SECTION 31 23 01  Page 30
Steel and Reinforced-Concrete Structures; Mass Concrete Monoliths; and Cured Shotcrete.

Alternate language and charts for this section:

TABLE 1 below gives standards for allowable peak particle velocities as they relate to a variety of common construction materials. Do not exceed these vibration limits.

These vibration limits must not be incorporated in the blast design. Many projects have been constructed utilizing a fraction of these allowable values. Properly design the blasts, set allowable vibration limits, and maintain proper control throughout the duration of construction. The Contractor is responsible for all damages caused directly by, or as a result of the blasting operations. Compliance with this or any other provisions in the Contract must not relieve the Contractor of responsibility for any damages or injuries caused by, related to, or arising out of blasting or associated blasting activities.

Here are two examples of vibration tables. The first is more generic and should be used the section shows for a specific project also requiring an initial peak particle velocity for test blasting ramp up.

<table>

</tr>
</tbody>
</table>

Note that older deteriorated structures or utilities and structures housing computers or other sensitive equipment may require lower peak particle velocity limits than those provided in Table 1. Also, buried pipelines owned by private utility companies or bridge structures owned by other agencies may be subject to lower limiting values imposed by the owner. The safe vibration limits and charge weights per delay to achieve these vibration limits must be established by the Seismic Specialist and the Blasting Consultant. Vibration limits for all non-government owned structures must conform to the laws of the State of [____]. The text below can be used referring to the graph in NFPA 495 in lieu of site specific developed for the project.

The Contractor must conduct all the required monitoring as noted in paragraph IMPACT MONITORING. The Contractor must conduct all blasting by controlled blasting methods to avoid exceeding the allowable vibration in applicable federal, state, and local laws, regulations and ordinances at all structures and facilities, as monitored by blast seismographs.

The allowable vibration at any structure or facility must not exceed the maximum PPV of 5.0 centimeters/second (cm/s) 2.0 inches/second (ips), nor exceed the PPV amplitude in the Frequency versus Particle Velocity Graph Figure in NFPA 495 (Figure 11.2.1) for the frequency of the half-cycle amplitude.

NOTE: The section pertaining to Green Concrete may be removed and its definition removed, if the concern for newly placed concrete, shotcrete and/or cementitious grouts is not applicable. The period of hours is broad, because neither the exact time of the blast nor of the material placement will be known exactly. Values of allowable PPV have not been included greater than 2.0 ips, because above 2.0 ips will adversely affect ordinary structures.
and individuals within those structures. Further, most concrete structures should be limited to allowable PPV at or below 4.0 ips.

3.3.3.4 Limiting Blast-Induced Vibrations at Green Concrete

NOTE: Some guidelines for peak particle velocities related to time intervals after placing mass concrete/shotcrete/grout curtains are given in Tables 2 and 3 should be considered when designing a blast. The specification writer must include a limitation of the allowable vibration when there is green concrete expected on the project. Table 2 has two option, one is more conservative, designer should make engineering decision which to use or adjust based on data. There are other potential charts that can be used:

<table>

</table>

During the performance period, other construction activities may be placing concrete at varied locations on or near the project. The Contractor will coordinate with other project contractors or will be informed on the prior business day by the Contracting Officer concerning the likely placement of concrete near the project.

a. The Contractor will assure that a seismograph is monitoring vibrations from blasting at a location, which is closer to the blast pattern than the Green Concrete. Seismic monitoring must be conducted near the
concrete placement from prior to placement until 72 hours after placement.

b. The table below indicates that maximum allowable peak particle velocity (PPV) permitted, relative to the age of the recently-place concrete, as measured at an acceptable location or within 15 m 50 ft of the most recently placed concrete on the side of closest approach to the blast.

<table>
<thead>

<td>1.0</td>
<td>2.0</td>
</tr>
</tbody>
</table>

c. Adjust all blasting to conform to the table's maximum allowable PPV at the seismograph near the Green Concrete. See paragraph BLAST-EFFECTS MONITORING.

3.3.3.5 Allowable Airblast

**************************************************************************
NOTE: Airblast is rarely a concern with underwater blasting. Some provision for allowable airblast should be provided within this paragraph. Air blast limits should follow most stringent regulation as some states have a threshold more stringent than some agencies.
**************************************************************************

The Contractor must conduct all the required monitoring as noted in paragraph IMPACT MONITORING. The Contractor must conduct all blasting by controlled blasting methods to avoid exceeding the allowable airblast in applicable federal, state, and local laws, regulations and ordinances at all structures and facilities, as monitored by blast seismographs. Peak airblast overpressure must be held below [133 dB (linear peak scale), 100 Pascals (Pa) 0.015 pounds/square inch (psi)] at the nearest residential or inhabited structure or other designated location.

3.4 BLASTING PERSONNEL

**************************************************************************
NOTE: Depending on the scope and duration of the project, it may be prudent to require the Contractor to provide a named and approved alternate for some positions. Several positions are required to continuously perform blasting responsibilities, even when one individual is not available onsite for that role's responsibilities.
**************************************************************************

3.4.1 Blasting Consultant

**************************************************************************
NOTE: Depending on the scope of the project, it may not be necessary to require a Blasting Consultant. This will be determined during design, a USACE Blasting SME should be consulted to discuss this. Projects with few critical blasting limitations, far from sensitive structures or from heavily used public areas, or with few Natural Resource issues
may not need a Blasting Consultant. One option is to still require a blasting consultant to be engaged, but only for reviewing the Master Blasting Plan and engaged on serious blasting issues with the blasting (misfires, shot hole rifling loss of confinement, exceedance of vibration and/or airblast limits, approaching Natural Resource limitations without being able to properly break and displace rock) as and if the issues develop.

The Blasting Consultant, Blasting Specialist, Blasting Administrator, Blaster in Charge, and Vibration Specialist cannot be the same person. Retain a recognized Blasting Consultant to assist both with the project's blast design and with the resolution of any blasting issues for the project. The Contractor must submit the Blasting Consultant's expertise submission within [15] days of the Notice to Proceed. The Blasting Consultant must be approved by the Contracting Officer's Representative two weeks prior to the submission of the Master Blasting Plan.

3.4.1.1 Blasting Consultant's Responsibilities

NOTE: The paragraph below should be used when controlled blasting techniques are required.

The Contractor's Blasting Consultant must be available to review the Master Blasting Plan, assist with controlled blasting techniques, and resolve difficult or complex issues with blasting for the project. The Blasting Consultant will recommend controlled blasting methods, as necessary, to meet safety and natural resource requirements, retain airblast and vibration within the allowable limits, and protect the rock foundation. Proposed controlled blasting methods must be submitted in the Master Blasting Plan.

The Blasting Consultant must provide advice for, and review, the Master Blasting Plan, attend the public meeting(s), and be available for consultation on an "as needed" basis, as determined separately by the Contractor or by the Contracting Officer. The Blasting Consultant is not required to be at the project site for review of the Master Blasting Plan or of any specific shot plans or records. The Blasting Consultant must be present at the project site for any required shot issue or, if requested, for the subsequent shot following a misfire or significant exceedance of any onsite blasting issues.

The Blasting Consultant must provide a written summary of all site visits and special assignments within [2] business days of performing such actions to both the Contractor and the Contracting Officer's representative.

The Blasting Consultant must submit a short, signed Blasting Consultant's Report each month stating that he/she has briefly reviewed the individual shot documents, including blast videos, and has collaborated with the Contractor on all issues, concerns, or errors in the individual shot documents. This report is due within [3] business days after the end of the month.

If problems with vibration, airblast, rifling of a shot hole producing a water column plume, or production blasting occur, the Contracting Officer...
will require the Contractor to immediately summon the approved Blasting Consultant and have their presence on site within 10 days after the problem develops to:

a. Approve each Individual Shot Plan;

b. Observe in person shot-hole drilling, logging, revision to that hole's plan, and loading with the full authority to stop or delay any blast he/she considers unsafe;

c. Review and sign each Individual Shot Record at no additional cost to the Government; and,

d. Submit and sign a written checklist that all necessary precautions were reviewed and followed by the drilling and blasting crews.

The checklist must be as defined under the section on Individual Shot Reports. The signed checklist must be attached to each Individual Shot Report.

3.4.1.2 Blasting Consultant's Expertise

The consultant must be able to demonstrate involvement in at least 15 projects with controlled blasting. The consultant must provide, as a minimum, the credentials and experience for each outlined following items:

a. The consultant must have at least 10 years of experience in construction blasting within 75 m 250 ft of protected structures, and had consultation on three underwater blasting programs;

b. The consultant must be able to demonstrate that he has attended at least 15 short courses, seminars, or conferences on blasting technology, or university engineering class studies on blast design during the past 20 years, including a complete understanding of blasting seismology with emphasis on vibration frequency, acceleration, and displacement (ground strain);

c. For the past 10 years the consultant must have derived their primary source of income from providing specialized blasting consulting services;

d. A list of recent projects containing a description of the projects' details, summarize the blasting plans, and any modifications made during the projects from your consulting;

e. Provide the names and telephone numbers of contacts, who have sufficient stature with, and knowledge of, their individual project to verify the submitted information in competency and ability, for at least three recent projects;

f. Hands-on experience as a blaster for at least 3 years; and,

g. The Blasting Consultant, Blasting Specialist, Blaster in Charge, and Seismic Specialist cannot be the same person.

3.4.1.3 Blasting Consultant's Qualifications Submissions

Submit the resume, education, experience, current blasting licenses and credentials, and training of the proposed Blasting Consultant, and a formal
letter of commitment from the consultant verifying their availability on an "as needed" basis for the duration of the Contract. The consultant must be a drilling and blasting expert, who has derived their primary source of income by providing specialized blasting and blasting consulting services. The provided consultation must have included at least three, large underwater blasting projects. The consultant must not be an employee of the Contractor, an explosives manufacturer, an explosives distributor, or any other sub-contractor. There must be no additional cost to the Government for the Blasting Consultant's duties, even when required by the Government.

3.4.2 Blasting Specialist

The Blasting Specialist is the Contractor's employee most responsible for the project's blasting and conducting all coordination and providing all documentation for the underwater blasting. The Blasting Specialist must coordinate with the Contracting Officer on all issues dealing with blasting. The Blasting Specialist must be on the job site each day. The Contractor must submit the Blasting Specialist's expertise submission within [15] days of the Notice to Proceed. The Blasting Specialist must be approved by the Contracting Officer's Representative two weeks prior to the submission of the Master Blasting Plan.

3.4.2.1 Blasting Specialist's Responsibilities

The Blasting Specialist is responsible for the project's blast design, preparing and submitting all necessary blasting documentation, and conducting quality control. The Contractor may employee a documentation assistant to aid the Blasting Specialist with all the blasting documentation creation and submissions. The Blasting Specialist is solely responsible for the accuracy and timely submission of all blast documentation.

3.4.2.2 Blasting Specialist's Expertise

The Blasting Specialist must be able to demonstrate involvement in at least three projects with underwater blasting. The Blasting Specialist must provide, as a minimum, the credentials and experience for each outlined following items:

a. The proposed individual must have at least 10 years of verifiable experience utilizing controlled blasting techniques and have had conducted controlled blasting on three underwater projects;

b. Within the last five years, the proposed individual must have completed at least five days of classroom training that has familiarized the person with the most current drilling and controlled blasting methods;

c. The proposed individual must be a licensed blaster in the State of [_____] and hold all credentials that may be required by local jurisdictions;

d. In the last five years the proposed individual must have been responsible for the blast design or execution of underwater rock excavation projects, similar in scope and complexity as this project;

e. The names and telephone numbers of contacts, who have sufficient stature with, and knowledge of, their individual project to verify the submitted information in competency and ability, for at least three
underwater blasting projects; and,

f. The Blasting Consultant, Blasting Specialist, Blaster in Charge, and Seismic Specialist cannot be the same person.

3.4.2.3 **Blasting Specialist's Qualifications** Submission

Submit the resume, education, experience, current blasting licenses and credentials, and training of the proposed Blasting Specialist. Their credentials must include a list of the projects, including the location, duration, scope, description, geologic conditions, and the challenges that developed though the course of the projects and how the challenges were resolved.

3.4.3 **Blaster in Charge**

The Blaster in Charge may create the **Individual Shot Plan** for approval by the Blasting Specialist. The Blaster in Charge, in the absence of the Blasting Specialist, is the Contractor's employee responsible for on-deck supervision of all underwater blasting activities and its documentation. The Contractor must submit the Blaster-in-Charge's expertise submission within [15] [_____] days of the Notice to Proceed. The Blaster in Charge must be approved by the Contracting Officer's Representative two weeks prior to the submission of the Master Blasting Plan.

3.4.3.1 **Blaster-in-Charge's Responsibilities**

The Blaster in Charge, in the absence of the Blasting Specialist, is responsible for on-deck supervision of the drilling, shot-hole logging, possible revisions of the Individual Shot Plan, loading or abandoning of individual shot holes, and firing the blast. The Blaster in Charge is responsible for: the accurate placement of the shot holes' locations for drilling; conducting the drilling and shot-hole logging accurately; accounting for the relevant geology within each shot-hole's log; assuring the careful recording of every shot-hole's log and their submission with the individual Shot Report; loading the blastholes according to the Individual Shot Plan or the revision thereto based on the shot-hole's log; coordinating the likely time of the blast pattern's initiation; coordinating all notices of imminent blasting and providing the signaling before and after the shot; initiating the blast; performing the post-blast inspection; providing the All-Clear signal or instituting the notices and actions for a misfire; and, providing the documentation for, and signing, the Individual Shot Report.

3.4.3.2 **Blaster-in-Charge's Expertise**

The Blaster in Charge must be able to demonstrate involvement in at least two projects with underwater blasting. The Blaster in Charge must provide, as a minimum, the credentials and experience for each outlined following items:

a. The proposed individual must have verifiable experience in equivalently responsible roles for controlled blasting projects for at least 3 years and with underwater projects;

b. Within the last 5 years, the proposed individual must have completed at least five days of classroom training that has familiarized the person with the most current drilling and controlled blasting methods;
c. The proposed individual must be a licensed blaster in the State of [_____] and hold all credentials that may be required by local jurisdictions; and,

d. The Blasting Consultant, Blasting Specialist, Blaster-in-Charge, and Seismic Specialist cannot be the same person.

3.4.3.3 Blaster-in-Charge Qualifications Submission

Submit the resume, experience, current blasting licenses and credentials, and training of the proposed Blaster-in-Charge. Their credentials must include a list of the projects, including the location, duration, scope, description, geologic conditions, and the challenges that developed though the course of the projects and how the challenges were resolved.

3.4.4 Blasters

The Contractor may elect to employ multiple Blasters. Each Blaster is a Contractor's employee responsible for on-deck, underwater drilling and blasting activities under the supervision of the on-deck, Blasting Specialist or Blaster in Charge, whoever is present. The Blaster in Charge or a Blaster will log each shot hole, as the hole is being drilled. Each Blaster must be approved by the Contracting Officer's Representative after the submission of the Master Blasting Plan.

Blaster qualifications require each Blaster must be able to demonstrate prior experience with drilling and blasting. The proposed individuals must be a licensed or certified blaster in the State of [_____] and hold all credentials that may be required by local jurisdictions. Submit the resume, experience, current blasting licenses and credentials, and training of each proposed Blaster with the Master Blasting Plan.

3.4.5 Blasting Administrator

**************************************************************************
NOTE: For smaller projects this position may not be necessary. The Blasting Administrator was added for large projects to aid the Blasting Specialist with paperwork.
**************************************************************************

The duties of the Blasting Administrator are to be the direct assistant of the Blasting Specialist in preparing all necessary paperwork, and in performing quality control on all issues dealing with blasting. The primary function is to assist the Blasting Specialist in the preparation and completion of submittals, prepare the detailed post blast report, and the individual shot videos for submittal to the Contracting Officer, and submit the drilling logs with the post blast report. The Blasting Administrator cannot sign any paperwork. The Blasting Administrator must be approved by the Contracting Officer.

Blasting Administrator's qualifications require the Blasting Administrator to possess the following minimum qualifications and experience:

a. Holds a current Blaster's license;

b. Have prior experience in underwater blasting;

c. Must have completed at least five days of classroom training within the
last five years that has equipped the person with the most current knowledge in blasting procedures; and the software to be used on the project; and,

d. Have proven proficiency with blasting software and spreadsheets.

3.4.6 **Vibration Monitoring Specialty Firm**

*NOTE: This is requirement is a new format from previous specifications. The firm is submitted for approval, having the appropriate experience and the firm must have on staff the Seismic Specialists and Seismograph Technicians, typically a firm is subcontracted by the Contractor and having multiple experienced people approved allows them to have flexibility on supporting the site work. The people coming to the project or responding to the work must be within the group approved but does not need to be a single person anymore.*

Retain the services of a vibration monitoring specialty firm that specializes in the prediction, monitoring, and control of ground vibration and airblasts. The firm must have experience conducting installation of seismographs for vibration monitoring, communicating vibration and airblast results, and developing and maintaining a site attenuation curve. The firm must have on staff at least two Seismic Specialists that specialize in vibration monitoring and analysis. The firm must have on staff at least four Seismograph Technicians that have five years or more experience with seismograph installation and vibration monitoring. Submit resumes for all personnel and for the firm for approval citing, in additional to other pertinent data, experience, training, and education, at least 60 days prior to the commencement of blasting. The Seismograph Technicians must be persons capable of setting up the seismographs at designated locations, effectively recording the blast, and appropriately interpreting results. The Seismic Specialists must interpret the seismograph records to ensure that the seismic data must be effectively utilized in the control of the blasting operations with respect to the existing structures. The Seismograph Technicians must supervise the placement, operation, and maintenance of the seismographs. The Seismic Specialists must conduct the airblast and particle velocity regression analysis as described in this Section. The Contracting Officer may require the Seismic Specialists and Seismograph Technicians to be present during the test blast program, production blasting, or both.

3.4.7 **Seismic Specialist**

The Contractor will retain the services of an independent, seismic-monitoring firm with employees capable of monitoring, assessing, and predicting vibrations and airblast due to blasting. The Seismic Specialist must be an employee of the independent, seismic-monitoring firm, and must not be an employee of the Contractor. The Seismic Specialist will conduct, or assure the actions are being taken to obtain, the required blast seismograph monitoring for the project. The Seismic Specialist will supervise all Seismograph Technicians deployed to the project to deploy and maintain all the seismographs for recording vibrations and airblast, and to properly retain, store and submit all seismic records of the blasting. The Contractor must submit the independent, seismic-monitoring
UFGS

firm's, Seismic Specialist's expertise submission within [15] days of the Notice to Proceed. The firm and Seismic Specialist must be approved by the Contracting Officer's Representative two weeks prior to the submission of the Master Blasting Plan.

3.4.7.1 Seismic Specialist's Responsibilities

The Seismic Specialist must be a person able to deploy blast seismographs, effectively record and transmit the seismic data, comprehensively assess, and interpret seismic data regarding the monitored blast's parameters, and remotely supervise the firm's Seismograph Technicians. The Seismic Specialist must also interpret the seismic records to ensure that the seismic data will be effectively utilized in the control of the blasting operations with respect to the existing structures and conduct of an optimized blasting program.

3.4.7.2 Seismic Specialist's Expertise

The Seismic Specialist must be able to demonstrate monitoring deployment, seismic data assessment and interpretation, prediction of vibration and airblast from blasting, and remote supervision of field personnel for five blasting projects. The Seismic Specialist must provide, as a minimum, the credentials and experience for each outlined following items:

a. The proposed individual must have verifiable experience in equivalently responsible roles for controlled blasting projects for at least 3 years;

b. Within the last five years, the proposed individual must have completed at least five days of classroom training concerning seismic monitoring equipment, data telemetry, and seismic data interpretation;

c. The Blasting Consultant, Blasting Specialist, Blaster in Charge, and Seismic Specialist cannot be the same person. The proposed Seismic Specialist and Structural Inspection/Evaluation Specialist may be the same person.

3.4.7.3 Seismic Specialist Qualifications' Submission

Submit the credentials of the proposed seismic-monitoring firm with documentation for the Seismic Specialist. Submit the firm's history for this office, if there are multiple offices, years under the present office's leadership, the regional extent of clients, the approximate number of projects in the past year, and the number of present employees at this office. Submit the resume, education, experience, credentials, and training of the proposed Seismic Specialist. Their credentials must include a list of the projects, including the location, duration, scope, description, and the monitoring challenges that developed though the course of the projects and how the challenges were resolved. The documentation must provide experience and capability for the proposed Seismic Specialist to provide remote blast monitoring and supervision of support personnel while the individual is not on site.

3.4.8 Seismograph Technicians

The approved, independent, seismic-monitoring firm may provide Seismograph Technicians to assist the Seismic Specialist with the project's vibration and airblast monitoring. Each Seismograph Technician must be approved by the Contracting Officer's Representative after the submission of the Master Blasting Plan.
Each Seismograph Technician must be able to demonstrate prior experience with blast seismic monitoring on a prior project of equivalent size and similar telemetry requirements. The proposed individuals must have the required training and hold all credentials that may be required by local jurisdictions. Submit the resume, experience, credentials, and training of each proposed Seismograph Technician with the Master Blasting Plan.

3.4.9 Structural Inspection/Evaluation Specialist

**************************************************************************
NOTE: Pre- and Post-Blast Inspections and the Structural Inspection/Evaluation Specialist would only be required if there are structures or facilities requiring such inspections. Eliminate the paragraphs referencing Pre- and Post-Blast Inspections and the Structural Inspection/Evaluation Specialist if the project does not have a requirement for these inspections. The Structural Inspection/Evaluation Specialist must be experienced in both pre- and post-blast inspections. While there may be an advantage to this person being a registered professional engineer, it is more important that the specialist have experience in evaluating potential blasting effects by post-blast inspections. Consider whether a registered professional engineer is a requirement, as the most experienced persons may not be registered professional engineers or may be difficult for a bidder to acquire for some projects
**************************************************************************

Pre- and Post-Blast structural inspections must be performed by specialists with at least five years' experience in pre-blast and post-blast surveys.[The Structural Inspection/Evaluation Specialist must be a Registered Professional Engineer in the State of [____], who is qualified to conduct structural evaluations.] Submit the resume, education, experience, credentials, and training of the proposed Structural Inspection/Evaluation Specialist to the Contracting Officer with the Master Blasting Plan. The proposed Seismic Specialist and Structural Inspection/Evaluation Specialist may be the same person.

3.4.10 Magazine Keeper

The Magazine Keeper and an Alternate are the Contractor's employees responsible for explosive magazines and its record keeping. The position of Magazine Keeper is required only if the Contractor elects to have explosives' magazines under his control. The Magazine Keeper must be approved by the Contracting Officer's Representative after the submission of the Master Blasting Plan.

The Magazine Keeper must be familiar with the laws and general practices concerning the handling, care, use, and storage of explosives and detonators. The Magazine Keeper must be responsible for maintaining a cleared area around each magazine, and accounting for by record the throughput of explosives and detonators. The Magazine Keeper must be present for any transfer of explosives and detonators into or out of the magazines. The Magazine Keeper must not be required to perform any duties that will in any way interfere with his or her duties as Magazine Keeper.
The Magazine Keeper must be able to demonstrate prior experience explosives' magazines. The proposed individual must hold all credentials that may be required by the State of [_____] and local jurisdictions. Submit the resume, experience, credentials, and training of the proposed Magazine Keeper with the Master Blasting Plan.

3.5 RECORD KEEPING

3.5.1 Pre-Blast Surveys

Prior to the commencement of blasting, conduct a pre-blast survey of nearest buildings, structures, and utilities within 300 m 1,000 ft from the blast area by azimuth about the blasting zone to document pre-existing conditions. The pre-blast surveys will be conducted by, or under the supervision of, the Structural Inspection/Evaluation Specialist, who will also sign and date each survey. The survey extent and method used must be acceptable to both the Contractor's insurance company and the Contracting Officer. Submit a copy of all pre-blast surveys at least two weeks prior to the first Test Blast. Provide owners of surveyed structures a copy of
Perform the following when conducting pre-blast survey.

a. Provide methodology to be used in conducting the pre-blast survey and listing of structures, determined from the survey to be sensitive, with reasons for these structures being sensitive.

b. Each structure must be documented (including photography and video recordings) as to its construction, foundation type, condition, and closest distance to excavation blasting. The general condition and all observable defects of each structure must be documented.

c. The Commodity storage facilities that may be impacted by blasting must be addressed by the Contractor for safety and continued operation during the blasting program.

d. Freestanding structures (such as retaining walls) must be inspected on the exterior and on the interior as a room. All concrete walks, driveways, etc. must be inspected for cracks, level condition, holes, and defects.

e. Industrial structures, silo/elevators and special facilities, and office space must be described relative to their present conditions and tolerance to vibration. Besides the inspection of walls, columns and stairwells, the Contractor must survey the work areas and structures for distress.

f. An inspection of accessible structures must be made and a list of all structures, which could not be surveyed or refused to allow survey, must be completed. The dates of possible subsequent surveys and physical constraints prohibiting the survey must be documented.

g. Certify that the survey was prepared prior to the start of any blasting under this Contract.

3.5.2 Post-Blast Surveys

**************************************************************************
NOTE: Pre- and Post-Blast Inspections and the Structural Inspection/Evaluation Specialist would only be required if there are structures or facilities requiring such inspections. Eliminate the paragraphs referencing Pre- and Post-Blast Inspections and the Structural Inspection/Evaluation Specialist if the project does not have a requirement for these inspections.
**************************************************************************

Post-blast surveys are not typically required. Post-blast surveys must be conducted at any location, where a reasonable notice of damage from blasting has been provided. Post-blast surveys will be conducted by, or under the supervision of, the Structural Inspection/ Evaluation Specialist, who will also sign and date each survey. The survey extent and method used must be acceptable to both the Contractor's insurance company and the Contracting Officer. The post-blast surveys must be conducted within a week of the notice of damage from blasting. Submit a copy of all
post-blast surveys within two business days of the on-premises surveys to both the structure's owner and the Contracting Officer.

3.5.3 Daily Explosives' Magazine Inventory and Daily Explosives' Accounting

Accurate daily records must be kept by the Magazine Keeper, who must account for each piece of explosive, detonator, and equipment from the time of delivery at the magazine until its discharge in use or return to the magazine. If explosive products will be delivered and returned daily, the records of the driver must agree with the amount used in the day and a copy of each driver's record must be provided with the Daily Blasting and Removal Log submission. No explosive can be accepted until it has been plainly labeled and delivered as new stock in sound condition. Dates of manufacture and lot numbers will be recorded for all explosives delivered to the site. No explosive material older than 1 year will be used.

Containers for explosives must be approved in advance by the Contracting Officer. Remaining inventory must be checked each day and any discrepancies must be immediately reported, regardless of the potential of accounting error, loss, or theft of explosive material.

Should a loss or theft of explosives occur, all circumstances and details of the loss or theft must be immediately reported to the nearest office of Alcohol, Tobacco and Firearms, as well as to the local law enforcement authorities and the Contracting Officer's representative.

3.6 BLASTING DOCUMENTS

3.6.1 Master Blasting Plan

The Master Blasting Plan must be submitted for approval by the Contracting Officer 45 days before the first anticipated Test Blast. No blasting may be conducted prior to the approval of the Master Blasting Plan. No deviation from the Master Blasting Plan will be conducted by the Contractor. Any request for change or revision to the Master Blasting Plan must be provided in writing and approved by the Contracting Officer before such change or revision can be performed. The Contractor will submit a Test Blasting Plan within the Master Blasting Plan that includes calculations for all noted adverse impacts. Non-electric blasting caps must be used for all underwater shots. The Master Blasting Plan must contain provisions for storing, handling, and transporting explosives, as well as for the blasting operations. The means of surveying and locating the shot-hole positions horizontally and vertically must be described in detail within the Master Blasting Plan. Provide a signed statement by the Blasting Consultant that the plan represents a safe and efficient set of means and methods with which to achieve the goals of the work. The Master Blasting Plan must be submitted with the signature and date of the Blasting Specialist. The Contracting Officer will have a minimum of 30 calendar days review of the revised plan. The Contractor may elect, or may be required, to revise and resubmit the Master Blasting Plan or a portion thereof; additional time will be allotted for review by the Contracting Officer.

**************************************************************************
NOTE: Add or delete sections of the Master Blasting Plan, as appropriate. Include within the Master Blasting Plan.
**************************************************************************
3.6.1.1 Proposed Blasting Personnel

Submit all the approved and proposed blasting personnel and their required information from paragraph BLASTING PERSONNEL. List and copies of licenses, permits, and clearances required, including permit numbers, when applied for, and date of approval or anticipated approval by Federal, State, and local concerns. Provide their police records for every approved and proposed blasting individual. Submit the complete Project Team Organization with duties, responsibilities and authorities clearly defined. Identify the on-site Safety Officer and include a listing of all personnel authorized to sign for, receive and use explosives on this contract.

3.6.1.2 Explosives and Blasting Equipment

Submit all the explosives, their use, and their data sheets for the project. Data sheets, which include the products' specific gravity and water resistance, for all explosives and blasting agents that may be used.

3.6.1.3 Blasting Safety Plan

Submit Blasting Safety Plan, that is in accordance with EM 385-1-1, Section 29, and all other Federal, state, and local regulations. Implement all other applicable safety requirements in addition to that required below. Include, as a minimum, the following items.

a. Permanently secure all onboard magazines to the deck as required by all applicable Code of Federal Regulations.

b. Do not store explosives on the boat or barge deck in the open except for the one case that is to be loaded immediately into the shot holes. Return explosives remaining on deck to the day magazine prior to the firing of any blast. Clearly identify the location of the day magazine in the 'Blasting Safety Plan'.

c. Mount the non-electric, shock tubing spool on the rig in a manner that it cannot be lost overboard. Use an approved blasting machine for detonation regardless of the number of caps used. Do not use an electric blasting system.

d. Limit the amount of explosives aboard the drill boat at any one time to be in accordance with the amount permitted by appropriate codes and regulations. Do not exceed the amount permitted.

e. Make arrangements to prevent damage to any vessel, moored or underway, building or structure and preserve the crew or occupants thereon from exposure to injury as a result of the Contractor's operations. The Contracting Officer may require additional arrangements.

f. Perform a certified marine survey of all floating plant proposed for underwater blasting work on this contract prior to starting any work.

g. Install automatic fire extinguishers of an appropriate type on air compressors and in all engine compartments aboard vessels including but not limited to (drill boats, barges) where explosives are stored, handled, and used.

h. Provide remote fuel shut-offs and fire signaling devices aboard the drill boats.
i. Coordination Plans with the local Coast Guard office to provide notice of blasting and for vessel traffic control.

j. Alert sequence signals and public notice of blasting and all clear. See paragraph PUBLIC NOTICE OF BLASTING OPERATIONS in this section.

3.6.1.4 Navigation Control Plan

Submit the Navigation Control Plan in accordance with EM 385-1-1, Section 29, and all other Federal, state, and local laws and regulations. Implement all other applicable safety requirements in addition to that are required below.

Develop a Navigation Control Plan, which is incorporated into the Master Blasting Plan, that will provide the procedures required to maintain safe passage of all vessels within [____], during the project. The Contractor will maintain a 1/2 channel to a depth of [____] m ft below the low water datum for [____] for all marine traffic through [____] during the project. The 1/2 channel will always be maintained, except during blasting events.

The Contractor will buoy the area with floating warning signs. The warning signs will be legible from a distance of 60 m 200 ft and must contain the message "DANGER - EXPLOSIVES IN USE" visible on either side of the sign.

Operate two or more patrol vessels during blasting operations equipped with a visible yellow flashing light, audible horn, and radio with a hailer, whose sole function will be to monitor and maintain security in the blast area. A patrol vessel will be stationed at the drill barge and remain in the blasting area during all blasting operations. Land oriented access control and visual observation locations should be determined and approved by the Contracting Officer. Inspect and insure there is no vessel traffic within the buoyed work area prior to providing the Shot's Warning Signals and until such time as the "All Clear Signal" has sounded. Establish and maintain a warning system as required by the Corps of Engineers Safety Manual. Equip and maintain floating plant with radio equipment capable of communications with the Coast Guard. After each blast, upon inspecting the area, immediately notify the U.S. Coast Guard and the Contracting Officer of the all clear or of a misfire.

Maintain the work areas that are not completed and accepted by the Corps to a depth of [____] m ft below the low water datum for [____]. In addition, for work located along the channel centerline, remove immediately obstructions that have impacted the main channel above a depth of [____] m ft below the low water datum for [____], prior to the "All Clear Signal," for marine traffic to resume.

The Corps of Engineers will provide clearance surveys, following rock blasting activities along the centerline of the main channel. The clearance surveys will be conducted immediately following a blast, to ensure that no rock material has fallen into the 1/2 channel used for marine traffic.

3.6.1.5 Production Blasting Design

**************************************************************************

NOTE: Have an experienced person, who is provided with the work restrictions, determine the maximum
charge weight per delay, when potential
natural-resource impacts are being considered or
have been accepted/negotiated. In absence of
potential natural-resource impacts, the maximum
charge weight per delay will not specifically be
resolved. The allowable PPV at specific monitoring
locations will govern the charge weight per delay
designed for each shot pattern. The monitoring data
for smaller charge weights per delay will be
assembled from the Test-Blasting program.

Include within the Master Blasting Plan the detailed
design of all required safety, protective, and
natural-resource actions required of the Contractor
or the engagement of a specialty subcontractor by
the Contractor. Some of these safety, protective,
and natural-resource actions for a project may
include: special monitoring of a critical or
essential facility or of a government or commercial
structure; a fish repelling charge sequence prior to
firing every shot pattern; an avian or mammalian
watch program for assurance that a shot is not
initiated at a time when the cited species is
present; underwater pressure wave monitoring;
and/or, an air-curtain mitigation program.

**************************************************************************

No blasting, including the Test Blasting, may differ from the approved
Master Blasting Plan. Shot-hole drilling must not begin until the Master
Blasting Plan is approved in writing. Reflect changes to the blasting or
monitoring procedures, equipment, plant, products or personnel in a revised
Master Blasting Plan or portion thereof. Obtain approval from the
Contracting Officer, in writing, prior to implementation of any Master
Blasting Plan changes or revisions.

Confine the loaded charge with angular, granular stemming materials, placed
within competent rock, to perform the most work and to avoid a rifling
plume from occurring within any shot hole. See paragraph STEMMING. The
shortest delay period both between two adjacent shot holes and between two
adjacent shot rows in the shot pattern is 25 milliseconds (ms). The
maximum charge weight per delay may not exceed [_____] kg [_____] pounds of
all combined explosives and blasting agents in each 25-ms delay period.

Include in the Production Blasting Design Section, as a minimum, the
following items.

a. Proposed method of transportation, storage, and handling of explosives.

b. Procedure for monitoring the blast operations and handling misfires.

c. Plan showing the intended layout of the shot-hole patterns, timing and
sequence, anticipated burden dimensions and depth of sub-drilling for a
specified maximum charge weight per delay. Identify each drill hole by
a unique, sequential identifier.

d. Typical size, depth, and spacing of blast holes; methodology to assure
loading of explosives is only within sound rock; the maximum load
density (in pounds per foot of drill hole length) and the maximum
powder factor (in pounds of explosive per cubic yard of rock shot);
type of explosive and method of loading and detonating; procedure to confine the charge with stemming; and maximum number of holes to be detonated for a production shot pattern. Initiation system to be deployed and the means to assure each shot hole fires on its own delay.

e. Sequencing of delays for each shot hole that will be employed during blasting and the maximum explosive loading in pounds of explosive per delay.

f. Indication as to whether decking or boosters will be used.

g. Type and number of drill frames, including drill hole diameter, and expected production rates/day.

h. Type of blast seismographs to be used, manufacturer, and when last calibrated or certified, and types of video cameras.

i. The formats of all logs and reports to be used throughout the life of the project designed to record pertinent data before, during, and after the blasting operation. Pertinent information includes, but not be limited to, those items specified in paragraphs detailing the submittals.

j. Names, office mailing addresses and phone numbers of Contractor's representatives (Blasting Consultant, Blasting Specialist, Blaster in Charge, and Seismic Specialist) to which any informational inquiries may be addressed.

k. Location plan, manufacturer's literature, and parameters to be used in site selection for the blast seismographs and video cameras. The location of any other monitoring equipment, when used.

l. The methods that will be used to prevent all cited adverse impacts during the blasting activities, including protection of natural resources.

m. Complete list of floating plant involved in production blasting operations.

n. Within the blasting plan consider the multiple types of commercial vessels that will be on the water over the period of the excavation and removal program. Notify the sail/yacht clubs, etc., of plans to blast in advance and what traffic control and proximity restrictions will be implemented.

o. Cite the methods to be used to recover and dispose of all shock cord/tubing and initiation transmission-line debris immediately following each shot.

3.6.1.6 Test-Blast Plan

**************************************************************************

NOTE: Have an experienced person, who is provided with the work restrictions, determine the first test shot's number of shot holes, the initial maximum charge weight per delay for the test blasting, and the second test blast's number of shot holes. For some underwater blasting projects, the restrictions may be so limiting that the initial charge weight
per delay will be quite low, perhaps kg, 5 lb per 25 ms delay. Other large projects with few natural-resource concerns and great lateral distances to non-federal structures may have a large initial charge weight per 25 ms delay. The former projects may have a production blasting allowable maximum charge weight per delay.

Test Blasting is the initial blasting for the project starting with lower explosive loading in shot holes and fewer shot-holes in each initial shot pattern. The purpose of the Test Blasting is to safely build to the level of Production Blasting and to accumulate data to avoid shot-hole rifling and the cited adverse effects from blasting. An Individual Shot Plan must be provided for each Test Blast.

A minimum of three shots are required for the Test Blasting. Increase the number of shot holes loaded and the maximum charge weight per delay of subsequent test and production shot patterns only if the prior test shot was apparently successful. An apparently successful shot pattern is defined as a properly fired pattern without riffling plumes that has seemed to have been effective prior to excavation and has remained below the maximum, peak particle velocity values, as prescribed in paragraph ALLOWABLE VIBRATION. For the next immediate test shot pattern, use a smaller number of loaded drill holes and a smaller maximum charge weight per delay, if (1) the prior shot pattern had a rifling plume [and][or] (2) underestimated the recorded, PPV by 25 percent at any monitoring location [and][or] (3) had any type of misfire, damage or injury or accident or claim thereof.

a. Limit the first test shot to [3] [_____] total drilled shot holes in a single row and have a maximum charge weight per delay of [_____] kg [_____] lb of explosive materials per 25-ms delay.

b. Limit the second test shot to [7] [_____] total shot holes in a single row of the shot pattern of the Contractor's choosing and to a maximum charge weight per delay of double the first shot's maximum charge weight per delay, if the first test shot was completely satisfactory.

c. The third and any further test shot patterns may use double the number of the shot holes of the preceding satisfactory shot, included within two or more shot rows, and double maximum charge weight per delay of the preceding satisfactory shot[ to the production-shot maximum allowable charge weight per delay of [_____] kg [_____] lb of explosive materials per 25-ms delay].

A Test-Blast Evaluation Report must be provided within two business days to the Contracting Officer's representative in writing and by e-mail to the cited e-mail address listing once the last Test Blast has reached the explosive load per shot hole and the number of shot holes and rows to conduct Production Blasting.

3.6.2 Individual Shot Plans

**************************************************************************

NOTE: The Master Blasting Plan must provide the format of the Individual Shot Plan for approval with the Master Blasting Plan. Include within list item 3.6.2 b.(6) all special duties and/or actions
required for the project that have been established for protection of individuals, natural resources, and/or structures.

The Contractor must submit an Individual Shot Plan 24 hours prior to any subsequent drilling and blasting for that shot pattern. The format may utilize a spreadsheet for ease data entry but requires an actual signature and handwritten date for its submission.

Prior to each blast, including Test Blasts, the Contractor must submit for the Contracting Officer's documentation a plan detailing all the data required in the Individual Shot Plan's format of the approved Master Blasting Plan. The plan will provide all the pertinent aspects of the blast design including, but not limited to, the loading, firing, delay sequence, and special considerations. The Individual Shot Plan will provide the location and depth of holes, inclination of all holes that will not be vertical, the proposed depth and the spacing of the blast holes, amount, and strength of explosives per hole and per pattern, the proposed sequence of firing and time delays, and estimated time and day for the pattern's initiation. Each proposed shot pattern will be designed by the Contractor's Blasting Specialist with changes being determined by observation of the way the rock breaks as the operations progress. The Contractor must take such precautions as are necessary to prevent displacement, cracking or damaging the rock outside the prescribed limits of dredging or excavation. The rock outside the limits of the dredging must be left in as sound and undamaged a condition as possible.

a. Submit an Individual Shot Plan to the Contracting Officer, with the anticipated plan for the next shot pattern prior to drilling the shot holes. Furnish each submitted Individual Shot Plan as a signed paper copy and in digital form to the e-mail listing required by the Contracting Officer. The Individual Shot Plan may be developed in a format that easily provides data that remains the same for the actual shot information in the Daily Blasting and Removal Log and the Individual Shot Report with its included reports.

b. The Individual Shot Plan includes, as a minimum, the following items:

(1) The shot pattern's name/number, coordinate locations of the outermost holes of the shot pattern, any specific purpose for the shot, the anticipated time, date, weather conditions, and the water conditions and its elevation at the anticipated time of the shot;

(2) The total number of holes to be shot, the shot-hole diameter, the total weight of explosives, number of delays, load density and powder factor for the shot, the maximum charge weight per delay, the closest approach, scaled distance and estimated PPV and airblast overpressures at each monitoring location;

(3) A large-scale plan map depicting the proposed layout of shot hole pattern, timing and delay sequence;

(4) An elevation sketch showing a typical hole's loading from the water surface to the bottom of the drill hole with an elevation scale, including the elevation of the removal grade, the top of sound rock, the top and bottom elevation of stemming, the top and bottom position of explosive materials, and the position of all
detonators, boosters and primers in the hole;

(5) A tabular listing, which may be a printed spreadsheet page, by hole in the ascending total delay time order by the describing: row and number within the row of the shot hole, total delay time, the total charge weight of explosive materials for the entire hole, the largest charge weight of any deck within a hole on a separate 25-ms delay if any, top of sound rock elevation, bottom hole elevation or the top of stemming elevation at the bottom of a shot hole that was over-drilled in depth and backfilled, stemming elevations, and detonator, primer and booster elevations in the hole;

(6) The estimated PPV and airblast overpressure at each seismograph location and the lateral close approach distance from the shot pattern to each seismograph;

(7) the means to remove and dispose of all shock cord/tubing and/or initiation transmission-line debris immediately following the shot;

**************************************************************************
NOTE: Complete the required Natural Resource activities that the Contractor must either conduct or initiate the shot with coordination of other offices for them to conduct the required Natural Resource activities of paragraph NATURAL RESOURCE ASSESSMENT.
**************************************************************************

[ ] (8) The Contractor must employ a Natural Resource Subcontractor, submitted to the Contracting Officer to [list activities] and the Contractor must conduct the shot in coordination with other offices as they perform [list activities]; and

] (9) The name, title, and signature of the Blasting Specialist providing the form with the date of the signature.

3.6.3 Test-Blast Evaluation Report

Provide a report summarizing the Test Blasting and submit the report with the Individual Shot Report of the first apparently successful production shot.

3.6.4 Individual Shot Reports

The Contractor must submit an Individual Shot Reports, both in writing to the Contracting Officer and by e-mail distribution to the required e-mail addresses, on the next business day and prior to any subsequent drilling and blasting for the next shot pattern. The supporting reports related to each shot pattern, which was not included with the Individual Shot Report, must be provided with their required data by the submission date of each supporting submission. The Individual Shot Report may utilize the spreadsheets, maps, and sketches of that shot's Individual Shot Plan, which have been corrected or revised for the actual shot-hole use, loading, timing firing, and observed or recorded impacts.

The Contractor must submit for the Area Office's documentation a specific set of reports of all the actual information from an initiated shot pattern, including Test Blasts, required in the Individual Shot Report's
format of the approved Master Blasting Plan. The record will provide all the pertinent aspects of the blast design including, but not limited to: the time, date and weather conditions at the blast's initiation; proposed shot holes that were abandoned; the actual shot holes' positions and elevations of stemming, loading, decking, its delay and firing sequence, and special considerations; the total weight of explosives and the maximum charge weight per delay for the pattern; all pertinent factors about signaling and providing the all-clear signal; the peak particle velocity of all seismographs; and, any delays to shot initiation and all blast impediments, including by not limited to, shot-hole rifling plumes, observed impacts from blasting, misfiring, and reports of damage from blasting. The Individual Shot Report will include or be followed with all the supporting reports from the shot pattern. Each Individual Shot Report will be signed by the Contractor's Blasting Specialist or Blaster in Charge, whoever initiated the shot pattern's firing. The Contractor must take such precautions as are necessary to prevent displacement, cracking or damaging the rock outside the prescribed limits of dredging or excavation. The rock outside the limits of the dredging must be left in as sound and undamaged a condition as possible.

a. The Individual Shot Report may be developed in a format that easily provides data that remains the same from the proposed design of the Individual Shot Plan and the actual shot information for the shot's supporting reports and in the Daily Blasting.

b. The Individual Shot Record includes, as a minimum, the following items:

1. The shot pattern's name/number, coordinate locations of the outermost holes of the shot pattern, any specific purpose for the shot, the anticipated time, date, weather conditions, water conditions and its elevation at the time of the shot;

2. The total number of holes to be shot, the shot-hole diameter, the total weight of explosives, number of delays, load density and powder factor for the shot, the maximum charge weight per delay, the closest approach, scaled distance and recorded PPV and airblast overpressures at each monitoring location;

3. A large-scale plan map depicting the layout of shot hole pattern, timing, and delay sequence;

4. A tabular listing, which may be a printed spreadsheet page, by the loaded shot hole in the ascending total delay time order by the describing: row and number within the row of the shot hole, total delay time, the total charge weight of explosive materials for the entire hole, the largest charge weight of any deck within a hole on a separate 25-ms delay if any, top of sound rock elevation, bottom hole elevation or the top of stemming elevation at the bottom of a shot hole that was over-drilled in depth and backfilled, stemming elevations, and detonator, primer and booster elevations in the hole;

5. The recorded PPV and airblast overpressure at each seismograph location and the lateral close approach distance from the shot pattern to each seismograph;

6. The removal and disposal of all shock cord/tubing and initiation transmission-line debris immediately following the shot[]; each required safety, protective, and natural-resource action conducted
for the initiated shot with their supporting data];

(7) A short narrative of any peculiarities or impediments or adverse impacts or accident/misfire with the shot, if any;

(8) The name, title, and signature of the Blasting Specialist providing the form with the date of the signature.

3.6.4.1 Drilling Logs

The Blaster in Charge or a Blaster with the assistance of the driller will log each shot hole, as the hole is being advanced. No drilling will be initiated without the Blaster in Charge or a Blaster to log the hole by a measurement means of drill bit's depth, the downward rig pressure, advancement rate of drilling, and air-water return of cutting with the driller's full assistance. The log must record the material encountered at the drill bit's depth to a precision of 0.03 m 0.1 ft. The drilling for each shot hole must be assessed to determine, and the log must record, the vertical depth/elevation of encountering sediment, weathered rock, the Top of Firm Rock, and voids to the total drilled depth. The shot-hole logs for all the shot holes in a shot pattern must be provided at the same time as the Individual Shot Report. An acceptable sample drilling log is provided in EM 1110-2-3800.

3.6.4.2 Individual Shot Vibration Monitoring Report

After each shot, submit an Individual Shot Vibration Monitoring Report, which will require the use of blast seismographs, to measure the vibration created from the blasting activities. Submit the Individual Shot Vibration Report to the Contracting Officer by or before Noon of the second business day following the shot, which is being reported. Submit each Individual Shot Vibration Report as a signed paper copy and in digital form to the e-mail listing required by the Contracting Officer. This will be provided at the pre-construction meeting.

Direct the specialty firm providing the seismic specialist, with approval of the Contracting Officer, to place blast seismographs, consisting of three component seismographs, (1) at important structures, and (2) other locations designated by the Contracting Officer. At least [three] [_____] seismograph locations will be required for every blast during this project.[ Place additional seismographs at each specified monitoring locations.]

Samples of possible Individual Shot Vibration Report formats are in EM 1110-2-3800, pp B-9 and B-10. The minimum required information to be submitted in the Individual Shot Vibration Report includes:

a. Date and time of recording from each seismograph;

b. Type (brand and model) of three-component seismographs used, serial #, and position name;

c. Who performed, and the date of, the most recent calibration of each seismograph, and its sensitivity;

d. The firm and employee who placed the blast seismograph;

e. Seismograph installation procedures to prevent disturbance during monitoring, vandalism, and damage, and whether the seismic data is
being telemetered or downloaded individually;

f. Set trigger levels;

g. Maximum for each of the three, component PPV in units of \textit{kilopascals (kPa) pounds per square inch (psi)}, the maximum total vector-sum peak particle velocity in units of \textit{kilopascals (kPa) pounds per square inch (psi)}, and a log-log graph of all maximum total vector-sum peak particle velocity versus square-root scaled distance in units of \textit{sqr meter/kilogram (sqr m/kg) sqr feet/pound (sqr ft/lb)} for all seismic records of all prior shots for this project;

h. A graph of the PPV versus frequency for each seismograph location that triggered;

i. The maximum airblast overpressures in units of \textit{kilopascals (kPa) pounds per square inch (psi)} at any triggered monitoring location and the results from noise tests before blasting in the first report;

j. A narrative description of any peculiarities or impediments or adverse impacts or accident/misfire for the shot; and,

k. The name, title, and signature of the Seismic Specialist processing and interpreting the data and providing the report with the date of the signature.

3.6.4.3 \textbf{Individual Shot Videos}

The Contractor will make a video recording of each shot pattern in a clear and consistent manner. Video recording must include date, time, and location. The digital video file must be furnished with the Individual Shot Report in a format noted within the Master Blasting Plan and approved by the Contracting Officer. The submission must be made to the Project Office and to all on the e-mail address listing. A library of blast videos will be maintained for all blasts and will be readily cross referenced with individual blast plans and post blast evaluations.

3.6.4.4 \textbf{Reports of Required Safety, Protective, and Natural Resource Programs}

Specify the data submission for required safety, protective, and natural-resource actions. A summary report must be submitted by noon [2] [_____] business days after the shot of the [special monitoring of a critical or essential facility or of a government or commercial structure, [and][or] an avian or mammalian watch program for assurance that a shot is not initiated at a time when the cited species is present, [and][or] underwater pressure wave monitoring, [and][or] other agreed/negotiated program].

3.6.5 \textbf{Daily Blasting and Removal Log}

The Contractor must submit a Daily Blasting and Removal Log, both in writing to the Contracting Officer and by e-mail distribution to the required e-mail addresses, on the next business day. The Daily Blasting and Removal Log summaries all the drilling and blasting activities, surveying, dredging [and][or] removal of spoils, and disposal operations for any day that one or more of those operations were conducted. The Daily Blasting and Removal Log will be signed by the designated representative of the Contractor, approved in the Master Blasting Plan.
3.7 DRILLING AND BLASTING

3.7.1 Underwater Shot Holes

No drilling will be initiated without the Blaster in Charge or a Blaster to log the hole and confirm the proper positioning of the shot hole. For underwater blasting, the Contractor must be prepared to: drill; log the hole; resolve the units encountered in drilling; reassess the Shot Plan's intent for that particular shot hole; load explosives, boosters, initiators and delays, place stemming in sound rock; and raise the firing line. If a shot hole cannot be drilled or cleaned out, the Contractor will be required to re-drill that shot hole or properly correct the shot design to delete that hole.

3.7.2 Shot Hole Logging

The Blaster in Charge or a Blaster will log each drilled hole, as the hole is being drilled. The Blaster in Charge or a Blaster will log the shot hole by a measurement means of drill bit's elevation, the downward rig pressure, advancement rate of drilling, and air-water return of cutting with the driller's full assistance. The shot holes must be logged during drilling and measured upon completion with a weighted tape for its full depth before any explosives are loaded into any of the holes.

If any holes are too deep, then these holes will be filled to the proper depth with stemming. Repeated, significant voids, 0.2 m 0.5 ft or larger, must be reported to the Contracting Officer. The Blasting Consultant may need to assess the issue of voids. Should voids become confinement issue blasting will be delayed until the Contracting Office is satisfied that potential problems related to blasting around the void have been properly addressed.

3.7.3 Stemming

All shot holes must have appropriately sized stemming material of the proper vertical placement length to optimize the blast design. Loss of explosive confinement can be due to improper stemming material type and poorly placed stemming. Tamped stemming must be placed from the top of firm rock (or hard material), as determined from the drilling log, to the top of the explosive charge. Stemming must also be used to fill voids, if any, as noted on the drilling log of that shot hole.

3.7.3.1 Stemming Material

Stemming must consist of well-graded, crushed, angular stone without fines. The gradation of the crushed, angular stone is between 3.0 mm 1/8 inch and 10.0 mm 3/8 inch in diameter. No soil or drill cuttings or rounded particles of the noted grading may be used as stemming material.

3.7.3.2 Length of Stemming

The minimum vertical length of tamped stemming within rock, or hard materials, of a shot hole must be the greater of 0.60 m 2.0 ft or eight times the shot hole's diameter. This minimum length of stemming must be placed in firm rock, or hard materials, to contain the gaseous products of detonation both below the top of firm rock and on either side of (above or below) voids, if any, with an explosive charge.
3.7.4  Loading Shot Holes

Stemming, decking, shot hole explosives' loading, and shot plan revisions for each shot hole must be made upon completion of drilling to the total depth from the logging of that underwater shot hole. Resolve whether to abandon the shot hole or load the hole from the Shot Plan's intent and the information resolved by the shot hole's log.

3.8  IMPACT MONITORING

Monitoring of the blasting may be required for public safety or natural-resource protection. The Contractor will be responsible for the payment and services of one or more, independent, third-party firms to conduct the required monitoring. The Contractor will make available the schedule and blasting documents to coordinate with other specialists monitoring issues for: the public's safety; environmental concerns for air, water, and property; natural resource protection; and the safety of structures and features.

******************************************************************************
NOTE: Delete inapplicable sections. The coordination with other federal, state, and local jurisdictions and agencies, the public, and private entities must be completely resolved before finalizing the specifications.
******************************************************************************

3.8.1  Public-Use Area Effects

The Contractor will provide personnel, patrolling vessels or vehicles, and the signage necessary to assure safe distances from all shot patterns are maintained and physically monitored at public-use areas on land or on water, and at occupied structures or highways or other features requiring control.

3.8.2  Airblast and Seismic Monitoring

******************************************************************************
NOTE: Determine the number of seismographs required for the project by the nearer structures or features to protect and their general azimuthal direction. Every blasting program should have at least three blast seismographs deployed. More seismographs may be needed at the project temporarily for green concrete or other temporary considerations or by the request of the Contracting Officer. While airblast is rarely a concern for underwater blasting, airblast should be recorded at a minimum of three seismograph locations in different azimuthal directions.
******************************************************************************

Airblast and vibration monitoring must conform to current industry standards and use equipment developed for blast monitoring. The Contractor will hire a subcontracted specialty firm, independent of the Contractor's firm and other sub-contractors to locate, maintain, and record the airblast and vibrations from every shot. The subcontracted seismic firm through their employee, the Seismic Specialist, will monitor the [three] seismic
positions shown on the plans or accepted by the Contracting Officer. Additional seismographs may be required temporarily for (green) concrete placement or other temporary considerations or as required by the Contracting Officer for specific airblast or vibration issues due to blasting suspected at locations without seismographs. The seismic records and the Individual Shot Vibration Monitoring Reports will inform the Contractor of the actual airblast and vibration parameters from every shot and assure the government that the blasting has remained within the allowable airblast and vibration levels.

Provide 3 blast Seismographs capable of sampling rates of 15,000 samples per second or higher that meets ISEE PSBS. The 15,000 samples per second accuracy is required to acquire reproducible vibration readings. Each seismograph provided to the project must have been calibrated by the manufacturer within six months of its installation. No seismograph may be used at the project may have manufacturer's calibration longer than eleven months prior to its date of use. The units must be self-contained except for external geophones and microphones. The seismographs without erasing the stored data must be capable of telemetering the digital data or downloading the digital data to a portable device. The units must be programmed with specific data for each site of seismograph placement, which includes seismograph location, geophone burial or mounting method, calibration signal, date, and time of the record. The seismographs must be housed in protective enclosures, if vandalism or high-traffic concerns or weather or other conditions could limit the continuous, proper recording by the seismographs.

The blast seismographs must not be placed inside of a structure, unless required for the designated purpose and authorized by the Contracting Officer. The seismographs should not be placed near a structure unless the intent is to measure that particular structure's specific response to the blast. The microphone must be positioned to avoid wave reflections of the airblast from the vertical, front or side of a structure, wall or rock face. The microphone should be placed at a height of 0.91 m 3.0 ft. The geophone for each seismograph must appropriate for buried in soil or for being physically secured to rock or sidewalk or pavement or a concrete foundation.

The seismographs must be operated continuously beginning [seven] days before the first anticipated Test Blast. All The airblast and vibration amplitudes' maximal, frequencies of those amplitudes, repeated occurrences, and other parameters for the first period of operation before the first Test Blast will be reported as the project's background conditions in the first Individual Shot Vibration Monitoring Report.

The seismographs must be operated continuously until the excavation has been approved by the Contracting Officer. The seismograph may be removed from the project and replaced after their initial deployment, if there will be no blasting for a period of seven days or longer and if there will be no explosives stored onsite during that period.

3.8.3 Individual Shot Videos

Record every shot pattern's blast with Full High Definition, 1080p, digital video recordings with a minimum of 30 frames per second from two designated locations, approximately perpendicular to one another, that provide side and front or rear views of the blast and area above it. The video images must not contain any other text than the shot number. Include metadata consisting of the blast ID, date, and time of the blast. Index
the two video recordings to properly identify each blast. Submit the proposed locations of the two video recorders on a map with the Individual Shot Plan. Furnish electronic file copies of video recordings on the sFTP within 24 hours of a blast. If the Contracting Officer requests that a copy of the video be submitted earlier, then deliver a copy within one hour of the request. Maintain a digital video library of all blasts.

3.8.4 Air, Water or Land Protections

The Contractor will assure that all escaping or released gases, fluids, and solids are within applicable limits of all federal, state, and local laws, regulations, ordinances, and guidelines. Any releases of fluids or solids that are not such limits will be immediately reported, mitigated, retained, and removed from the project.

The Contractor will remove all shock cord/tubing and initiation transmission-line debris immediately following each shot.

**************************************************************************

NOTE: Delete inapplicable NATURAL RESOURCE ASSESSMENTS, MITIGATION AND MONITORING paragraphs that are not required by coordination with other federal, state, and local jurisdictions and agencies, the public, and private entities, which must be completely resolved before finalizing the specifications. Each of the paragraphs for Natural Resources will require a design by a qualified professional(s), who has experience with such activity(ies). The activity's paragraph text for the Contractor's action must be written for the specific project and unique Natural Resource requirements. None of these activities or other possible required actions or coordination by the Contractor have generic or standard approaches, much less narratives. The Contractor may be required to hire a specialty contractor to perform the designed assessment, mitigation, or monitoring, or to coordinate the blasting with an external organization responsible for the activity.

**************************************************************************

3.8.5 Natural Resource Assessments, Mitigation and Monitoring

[___]

3.8.5.1 Fish-Repelling Noise

[___]

3.8.5.2 Watch Program

[___]

3.8.5.3 Post-Blast Fish Surveys

3.9 EXCAVATION VERIFICATION

**************************************************************************
NOTE: This Blasting Section presumes that the excavation(s) will fully achieve the required vertical and lateral limits. This paragraph references the location of the verification procedures by its section in the specifications.
**************************************************************************

Conduct the verification of the completed excavation, as specified in Section [EXCAVATION], Paragraph [SURVEYS].

3.10 SUBMERGED MATERIAL DISPOSAL

**************************************************************************
NOTE: The Guide Spec presumes that material disposal will properly place any onsite material disposal. This paragraph references the location of the material disposal procedures by its section in the specifications.
**************************************************************************

Transport and place all dredged, displaced, or excavated materials within the limits of the disposal zones below the specified elevations, as specified in Section [DISPOSAL].

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for blasting at the ground surface and the avoidance of adverse impacts for any use of blasting, most commonly rock excavation. If during the contract period any of the materials being blasted and excavated are known to be, or may possibly be, near a water body or below water, also refer to Section 31 23 01 UNDERWATER BLASTING. For projects on a naval facility, consult with local NAVFAC office, Naval Ordinance Safety and Security Activity (NOSSA), and NAVSEA on requirements. NAVSEA OP5 Ammunition and Explosive Safety Ashore manual dictates many of the requirements and NOSSA has the final determination on any blasting on a Navy installation above or underwater. Reference NAVSEA OP5 manual and contact local Explosives Safety Officer and Planner for the base prior to revising the specification. Overall NOSSA approval process can take 12-18 months depending on the level of approval required.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
PART 1   GENERAL

**************************************************************************

NOTE: Consult with a District Office that has most recently completed a similar type of blasting, while editing this section, to be appraised of recent, specific requirements, guidance, blasting developments or understandings for the subject project.

Consult with or have Specification reviewed by a Subject Matter Expert in Blasting for projects involving Blasting as a primary means of removing materials or where Blasting issues are particularly challenging.

There are likely decisions and/or requirements of other agencies, the Safety Manual, and/or internal offices/divisions/branches, which could have an influence upon a project's blasting specs. Some of these issues may be: concerns from federal, state, and local jurisdictions and agencies; public use of nearby federal, state and/or local properties near the project; evaluations of acceptable vibrations and/or pressures affecting individuals or reaching nearby structures; natural resource impact reviews, negotiations and/or requirements; constraints on the drilling or blasting procedures; pre-blast inspections; special studies to facilitate lower cost of the bids or to encourage more bid submissions; the acquisition strategy for the payment; and, other concerns specific to the project.

This blasting guide specification covers the blasting of rock and including mucking. The details on excavation are typically covered by a separate Rock Excavation specification.

The following information will be indicated on the project drawings:

1. Surface elevations, existing and new;

2. All utilities, whether trenched, buried, at the surface or overhead to distances well beyond the project's limits;

3. Location and record of all soil and rock borings and test pits, including soil and rock classifications and their properties, weathered rock, bit drops and voids, ground water observations, and topsoil thickness encountered in boring;

4. Location and limits of hard material, whether rock or concrete, or other building materials;

5. Excavation or demolition limits, and clearing,
stripping and grubbing limits, and tolerances of excavation;

6. Details of any special limits that may require line drilling, presplitting, reduced subdrilling, and/or specialty blasting practices;

7. Location of borrow and disposal area, if located on Government property; or on site (as some sites may or may not remain government property, and disposal sites may be under control of project partners);

8. Hydrological, hydraulic and impoundment data, where applicable; and,

9. Details of all rights-of-way within the project boundaries.

**************************************************************************

NOTE: The coordination with other federal, state and local jurisdictions and agencies, the public, and private entities must be completely resolved before finalizing the specifications. A project's excavation and/or foundation requirements, for which, dense materials are being removed, may require navigation, highway, structural and/or other regulations and codes to be followed. Depending upon the proximity of public-use areas, private residences or businesses, and the project's location within a county or township, various accommodations will need to be required for the protection of the public, and the safety of private entities in regard to local laws, regulations and ordinances. Avoiding natural resource impacts may overlay other measures and require: seasonal or daily time limitations of the initiation of the individual blast patterns; special observers for some or all the blasting; special studies or monitoring while the blasting is being conducted; and, other potential considerations.

Agency coordination will vary by project. Be certain that all government stakeholders have been involved with planning of the project and approved of all requirements for the specifications. List those important navigation or safety stakeholders. When there are navigable waters near the excavation zone, list in the controlled navigation perimeter's distance during the warning period of a shot. While the distance is project specific, the minimum distance is typically 300 m 1,000 ft.

It is essential that the agency/service person, using these Guide Specifications to prepare Plans and Specifications coordinate with the planners and environmental compliance specialists within their agency/Service to ensure that all the blasting
restrictions and mitigation measures are incorporated into the Plans and Specifications. Failure to comply with the requirements of Federal or state laws and regulations could result in project delays or stoppages.

1.1 SCOPE

The breakage of rock and hard/unyielding materials may be conducted by any means unless otherwise stated herein. If the contractor elects to use drilling and blasting for breakage or displacement of any units, this entire section is applicable and covers activities associated with drilling and blasting for rock excavation at the surface. Contained herein are procedures for all activities relating to drilling; blasting and the transportation, storage and use of explosives; breakage and displacement of rock. The Contractor's blasting program and methods are those necessary to accomplish the excavation shown on the Contract drawings in accordance with the provisions specified herein. Control the quantity of explosives fired in all blasting to prevent injuries to persons and to avoid damage to all structures, properties, governmental and nonprofit entities, commerce and businesses, and natural resources and their habitat.

1.2 RELATED WORK SPECIFIED ELSEWHERE

NOTE: List any specifications that are related, such as Earthwork, Excavation, Rock Bolts, Temporary Environmental Controls, Shotcrete, Natural Resources, are typical specs related depending on the project.

Section 01 33 00 SUBMITTAL PROCEDURES

1.3 REFERENCES

NOTE: These publications are not all inclusive, and it must remain the responsibility of the Contractor to obtain, know, and comply with applicable Federal, State, and Local regulations not included in the references. In case of a conflict between the regulations and specifications, the Contracting Officer will determine which applies.

Add and remove references as needed for the project. Reference the appropriate state regulations on blasting for where the project is to occur.

This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D2487 (2017; E 2020) Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)

ASTM D5434 (2012) Field Logging of Subsurface Explorations of Soil and Rock

INTERNATIONAL SOCIETY OF AUTOMATION (ISA)

ISEE PSBS (2017) ISEE Performance Specification for Blasting Seismographs

U.S. ARMY CORPS OF ENGINEERS (USACE)

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

29 CFR 1910.109 Explosives and Blasting Agents

29 CFR 1926-SUBPART U Blasting and the Use of Explosives

49 CFR 177 Carriage by Public Highway

1.4 DEFINITIONS

NOTE: Delete definitions that will not be used in the specification text for a specific project. A complete list of blasting definitions can be found in the GLOSSARY of the EM 1110-2-3800 and other references. Recommend only using definitions not already in GLOSSARY in the EM and definitions to further the define the work on the specific project in the specification. It may be necessary to add definitions depending on what the Earthwork and/or Excavation specifications for the project have terms

SECTION 31 23 06.00 Page 7
1.4.1 Blast Site

The area where explosive material is handled during the loading of blastholes, including 15.2 m 50 feet in all directions from the perimeter formed by loaded holes. A minimum of 9.1 m 30 feet may replace the 15.2 m 50 feet requirement if the perimeter of loaded holes is marked and separated from non-blast site areas by a barrier. The 15.2 m 50 feet or 9.1 m 30 feet distance requirements, as applicable, apply in all directions along the full depth of the blasthole.

1.4.2 Blast Area

The area of a blast within the influence of flying rock and eject gases, and concussion that may cause injury to persons or property.

1.4.3 Buffer Zone

Buffer Zone is defined as a designated section of rock between a slope to be formed by line drilling or pre-splitting during excavation and the production blast. The explosives in each blast hole and the burden in the buffer zone must be reduced to prevent damage to the final rock slopes.

NOTE: Choose one of the following sentences depending on when to shoot the buffer holes, sometimes it is appropriate to shoot them as a separate shot in order to further control the excavation and prevent backbreak.

[ The buffer zone blastholes must be fired in sequence after the adjacent production blastholes.

][The buffer zone blastholes must be fired as a separate blast, after the adjacent production shot.

1.4.4 Controlled Blasting

Controlled blasting refers to blasting techniques used to better distribute the explosive charge to minimize impacts such as fracturing and loosening of the rock beyond the design excavation line (overbreak). This is accomplished by using small diameter, decoupled charges in closely spaced blastholes placed on the perimeter of an excavation. Methods including but not limited to line drilling, and pre-splitting (pre-shearing) cushion blasting, and buffer zone blasting.

1.4.5 Flyrock

NOTE: Choose the distances for the project, the typical values are listed. Edit definition as needed for project site.

Flyrock is defined as any airborne rock flying more than 61 meters 200 feet
horizontally or 12 meters 40 feet vertically from the blast or if flyrock travels more than one-half the distance between the blast and the Contractor work limits, whichever distance is the lesser.

1.4.6 Green Concrete

**************************************************************************
NOTE: If no concrete placement is expected on the project then delete this definition. If concrete placements will occur when blasting operation is ongoing, further define green concrete here and include appropriate thresholds and monitoring for the green concrete in Part 3. There needs to be limits on vibrations when there is green concrete because of the strength loss due to vibrations while curing. Involve the Structural Engineer project development team members in these determinations.
**************************************************************************

Concrete that has undergone initial setting but has not hardened to design strength. Green concrete also includes the materials of shotcrete or cementitious grouts. Each Individual Shot Plan is required to consider vibrations emanating from its blast reaching the location of the reported newly placed concrete to remain below allowable vibration levels depending upon the age of the concrete. Note the paragraph Green Concrete.

1.4.7 Line Drilling

Line drilling is defined as a controlled excavation technique consisting of a series of closely spaced holes (spacing minimum of twice the hole diameter) that are either not loaded with explosives or lightly loaded and are drilled along the excavation line. The line drill hole spacing must be no greater than twice the hole diameter.

1.4.8 Pre-Splitting

Pre-splitting is defined as a method of controlled blasting utilizing a row of closely spaced, (typically 30 centimeters 12 inches or larger), lightly loaded blastholes placed on the perimeter of the excavation and fired before the production blast. The purpose of the pre-split blast is to form a crack between blastholes without serious damage, overbreak, heaving or cracking of the final wall.

1.4.9 Precision Pre-Splitting

**************************************************************************
NOTE: The loading density for precision pre-splitting holes needs to be evaluated and selected based on project design. The value may be reduced accordingly.
**************************************************************************

Precision pre-splitting is defined as a special pre-splitting method which utilizes closely spaced blastholes (61 centimeters 24 inches or less center to center) with light explosives loads (no more than 0.5 kilograms 0.2 pounds of explosive per .3 meter foot of blasthole) to supply only sufficient energy to shear the web of rock between holes without any damage to the Presplit wall.
1.4.10 Airblast

Airblast are the overpressure waveforms that move though air as audible and sub-audible sound waves. These are also called compression waves.

1.4.11 Vibrations

Vibrations are one of the three, primary adverse impacts from blasting. Vibrations are the result of various wave forms emanating from the detonation or deflagration of ignited materials from a shot pattern. Peak particle velocity (PPV) is defined as the maximum absolute value among the three ground vibration velocities measured in the vertical, longitudinal and transverse directions over the period of a record. Peak, total vector-sum particle velocity is the peak value over the full-time history of each time-unit’s value of the square-root sum of the squared, component velocities. Velocity units are expressed in centimeters per second (cps) or inches per second (ips).

1.5 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor’s Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for
Contractor Quality Control approval.[for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
   Blasting Consultant's Qualifications; G[, [____]]
   Vibration Monitoring Specialty Firm; G[, [____]]
   Structural Inspection/Evaluation Technician; G[, [____]]
   Blasting Safety Plan; G, SO
   Master Blasting Plan; G[, [____]]
   Survey Control Plan; G[, [____]]
   Test-Blast Plan; G[, [____]]
   Pre-Blast Surveys; G[, [____]]
   Public Notice Of Blasting Operations

SD-03 Product Data
   Seismographs; G[, [____]]
   Lightning Detection Device; G[, [____]]

SD-05 Design Data
   Individual Shot Plan; G[, [____]]

SD-06 Test Reports
   Individual Shot Reports; G[, [____]]
   Post-Blast Surveys
   Individual Shot Videos
   Drilling Logs
   Individual Shot Monitoring Report

SD-07 Certificates
   Blasting Consultant; G[, [____]]
   Blasting Specialist; G[, [____]]
   Blaster In Charge; G[, [____]]
   Blasting Administrator; G[, [____]]
   Magazine Keeper; G[, [____]]
1.6 COORDINATION

**************************************************************************
NOTE: The following paragraph can be used if working with multiple stakeholders/owners.
**************************************************************************
Blasting will be in the vicinity of the [existing lock, railroad, and highway, and river barge, train, hospital highway traffic, utilities and businesses] and their operation will not be impeded or delayed beyond that which has been coordinated with [TVA, U.S. Coast Guard, U.S. Army Corps of Engineers - [_____] District, [_____] environmental or natural resources offices, [_____] Department of Transportation, local government entities, [_____] Railroad, regional or local utilities, and/private businesses]. Include a coordination and traffic control sub-plan as part of the Blasting Safety Plan, with the appropriate authorities that mitigates navigation and traffic delays in the Master Blasting Plan.

Coordinate, through the Contracting Officer, with other Contractors working onsite to minimize work stoppages during blasting.

1.7 LIABILITY

Compliance with provisions in the contract will not relieve the Contractor of their responsibility for any damages or injuries caused by, related to or arising out of blasting or associated blasting activities. The Contractor assumes all liability and hold and save the Government, its agents, officers, and employees harmless for any and all claims for personal injuries, property damage, or other claims arising out of or in connection with the handling of explosives or blasting under this contract.

PART 2 PRODUCTS

2.1 STORAGE AND USE OF EXPLOSIVES

2.1.1 General

**************************************************************************
NOTE: The specification writer may choose to list reasons the Contracting Officer may restrict blasting but not always necessary. Confirm and follow federal, state and local regulations and guidance on the transport, storage and use of all Explosives. State and local agencies and/or authorities may not easily allow the receipt of Explosives in a timely manner. State and local agencies and/or authorities may have specific reporting, certifications, adverse impact concerns, or distance regulations from the blast zone to private properties governing the use of Explosives. The Agency/Service may wish to allow storage of Explosives on federal premises. The winning contractor should independently assess and cite in the Master Blasting Plan all federal, state and local laws, regulations, ordinances or authorities.
that impact the transportation and storage of Explosives.

Store, transport, handle, use, and otherwise secure explosives in accordance with best practices as approved by the Contracting Officer and in accordance with all Federal, State and Local laws and regulations. Comply with all special rules, regulations and ordinances that may be made by the authorities having jurisdiction, or by the Contracting Officer, regarding construction of, and storage in, magazines and precautions in handling and transporting explosives for blasting. Times and imposed restrictions concerning the use of explosives must be conducted in accordance with local, State, and Federal regulations. The Contracting Officer reserves the right to establish further restrictions or time windows when blasting will not be allowed beyond the Local, State, and Federal requirements; these windows may include times of day of high traffic volumes, times when school traffic is present, or during funerals. The Contractor is responsible for all claims for damages and injuries caused by or arising out of blasting activities. Perform all blasting operations in accordance with the current edition of EM 385-1-1.

2.1.2 Blasting Products

NOTE: This paragraph may need to be adjusted, some projects it is not appropriate to allow bulk explosives, such in karst because the bulk explosives could fill voids if care is not taken while loading to monitor the amount being added to each hole.

All blasting caps used on the project must be one year or less of age. Millisecond delay, [shock tube] initiators, must be used as the initiation system. To ensure the accuracy of firing times of blasting caps, it is required that each cap period come from one lot number. Mixing of lot numbers for any one cap period is strictly prohibited. All explosives used on the project must be six months or less of age or no older than one half the shelf life shown on the explosives manufacturer's technical data sheet for that product. Cartridge [and bulk] explosives may be used in different sections of the project. Ammonium nitrate and fuel oil (ANFO) is not allowed in wet environments.

NOTE: In projects where controlled blasting techniques are required to produce final walls which require presplit blasting, only explosives designed for this application must be allowed. Ammonium nitrate and fuel oil (ANFO) is not to be allowed in wet environments. Consider requiring cartridge explosives within a specified distance from any new structure which requires neat excavation lines; i.e. "Bulk explosives such as ANFO or bulk emulsion or emulsion blends will not be allowed for production blasts at the area of the Labyrinth Weir foundation or within 61 meters 200 feet of it or within 15.2 meters 50 feet of presplit walls."

SECTION 31 23 06.00 Page 13
Explosives that do not meet the manufacturer's specifications must not be used. When, in the opinion of the Contracting Officer, any blasting product is either of excessive age or appears to be in a deteriorated condition, all work must cease until the products age and quality can be determined. Blasting products without date and batch codes will not be permitted on site. The Contracting Officer may require any product to be tested by an independent organization to determine its performance as compared to the manufacturer's data sheet. If product performance or composition deviates by more than 10 percent in any manner from the manufacturer's data sheet, that lot number will be rejected. The Contractor is responsible for any required testing and no additional compensation will be made for any product testing directed by the Contracting Officer.

2.1.3 Magazines

**************************************************************************
NOTE: Two paragraph options here first paragraph is for where explosives must be stored off site (off site magazine). The other covers the storage of explosives onsite. The designer will need to ensure these requirements are fully detailed and the appropriate regulations are followed.
**************************************************************************

Explosives must be stored offsite. Obtain all necessary Federal and State magazine permits. Magazines must be located at safe distances as defined by the Bureau of Alcohol, Tobacco and Firearms (ATF) in addition to the State of [_____] requirements. There must be no permanent explosive storage or overnight explosive storage on site. Procure off-site explosive storage and expect to have daily explosives deliveries to the site. Secure a permit to transport explosives from the [_____] Highway Patrol when the amount of explosives to be transported exceeds 454 kilograms 1000 pounds, and transport explosives in accordance with 49 CFR 177 when carried on public highways.

**************************************************************************
NOTE: If explosives will be stored in an onsite magazine, it will be required to follow the requirements in EM385-1-1, including a submittal for an Explosive Site Safety Plan and the following paragraph can be used.
**************************************************************************

Explosives may be stored onsite. Obtain all necessary Federal and State magazine permits. Magazines must be located at safe distances as defined by the Bureau of Alcohol, Tobacco and Firearms (ATF) in addition to the State of [_____] requirements. Secure a permit to transport explosives from the [_____] Highway Patrol when the total weight of explosives to be transported is less than 454 kilograms 1001 pounds, and transport explosives in accordance with 49 CFR 177 when carried on public highways.

2.1.4 Magazine Keeper

Each magazine keeper must be experienced and familiar with the laws and general practices concerning the handling, care, use, and storage of explosives and detonators. The magazine keeper is responsible for maintaining a cleared area around each magazine. The magazine keeper will not be required to perform any duties that will in any way interfere with their duties as magazine keeper, and being physically present at the
magazines for every entry to the magazines for delivery, disbursement and review of explosives at the magazines. If explosives are delivered and returned daily from the manufacturer or supplier to the project, the driver of the truck will serve as the magazine keeper.

PART 3 EXECUTION

3.1 GENERAL

**************************************************************************
NOTE: This paragraph should agree with the designations under paragraph SUBMITTALS, the Master Blasting Plan will always be for approval. The Individual Shot Plan may be approved ("G") or accepted ("FIO").
**************************************************************************

Obtain approval, or revise for approval, of the submitted Master Blasting Plan and Individual Shot Plans, acquire all required permits, and comply with all laws, regulations, ordinances, applicable safety code requirements, and regulations relative to the transportation, handling, storage, and use of explosives and the protection of life and property. Perform vibration and airblast monitoring at the Contracting Officer's specified locations to record blast effects. The peak particle velocity must be limited to the values in Paragraph BLAST EFFECTS MONITORING in these specifications. Minimize rock over-break and blast damages beyond the design excavation line. The Contracting Officer will, always, have the authority to prohibit or halt the blasting operations, if it is apparent that the required lines and grades and stable rock slopes are not being obtained with the methods being employed.

3.2 SAFETY PROCEDURES

3.2.1 General

Ensure all work completed under this Contract is executed safely. Follow the safety procedures outlined in EM 385-1-1. EM 385-1-1 will govern all activity unless more stringent safety requirements are specified here and in other applicable Federal, State, and local laws, regulations, and ordinances.

3.2.2 Weekly Coordination Meeting

Coordinate all blasting schedules with the Resident Engineer's Office at least one week in advance and hold a weekly blasting coordination meeting with the Resident Office. Provide an agenda for the blasting coordination meeting that lists the prior week's shots, the forecasted shot schedule and displays a scale site plan showing the locations of the scheduled shots. The Blasting Specialist, Blaster in Charge, and Seismic Specialist are required to participate in discussion of agenda items and lessons learned.

3.2.3 Public Notice of Blasting Operations

At least thirty calendar days, and prior to any blasting operations, prepare and submit to the Contracting Officer a public government notification letter of the proposed blasting activities. The Government will distribute copies of this notification letter by certified mail to law enforcement, local governments, public utilities, public users of project recreational facilities, and residents and commercial interests located...
within 0.8 kilometers one half mile of the blast site. This notification letter must contain at minimum:

a. Name, address, telephone number and e-mail address of the Contractor;

b. Plan maps identifying the specific areas in which blasting will take place, and major and secondary roads, geographic features and auxiliary features;

c. Proposed duration of blasting activities, and on which days of the week and hours of the day that blasts can be expected to occur;

d. Vehicular and pedestrian traffic control measures to be taken;

e. Methods to limit access to the blasting area; and,

f. Types, patterns and duration of audible warning and all clear signals to be used before and after blasting.

3.2.4 Public Meetings

**************************************************************************
NOTE: Communicate with the project manager and stakeholders about whether specific requirements for a meeting or multiple meetings are needed. It may be necessary to advertise the meeting in a local newspaper and specify the meeting room capacity.
**************************************************************************

Fifteen calendar days prior to any blasting operations, provide the approved Seismic Specialist, Blasting Specialist and Blasting Consultant to attend a public relations meeting to be conducted on an evening to be determined by the Contracting Officer. This meeting will inform the public about the anticipated blasting operations. The Blasting Specialist, Blasting Consultant and Seismic Specialist must make a short presentation of blasting operations and answer any questions pertaining to public concerns dealing with the blasting operations, the magnitude of seismic vibrations, airblast and potential for flyrock that may impact the public. Distribute points of contact for the public and local entities in the event of concerns related to the blasting program.

3.2.5 Warnings and Signals

Establish a method of warning all employees on the job site of an impending blast following the guidance of the EM 385-1-1. The signal must consist of a five-minute warning signal to notify all in the area that a blast will be fired in five minutes. A second warning signal must be sounded one minute before the blast. After the blast is over, sound an all-clear signal, after the blast site has been inspected for misfires by the Blaster in Charge to provide notification to all personnel in the area that the blasting operation is finished. No personnel other than the Blaster in Charge must enter the blast area until it has been determined to be all clear.

3.2.6 Time Restrictions for Blasting

**************************************************************************
NOTE: Research the specific State requirements.
This paragraph will need to be tailored for the
specific site conditions, for example, avoiding blasting during rush hours in the morning and afternoon. Most locations prohibit blasting on Sunday but may allow on Saturdays and some Holidays.

Blast only during daylight hours, one-half hour before sunrise and one-half hour after sunset, and between 7 AM and 7 PM, local time, on weekdays and only during the approved time periods each day and at the same time each day, in concert with the approved closure time for area roads. No blasting is allowed on Saturdays, Sundays, or official holidays recognized by the Federal Government or the State of [_____] unless consent is granted by the State Fire Marshal. Drilling activities and blasthole loading are not time restricted, except as noted in Section 01 14 00 WORK RESTRICTIONS.

3.2.7 Traffic Control During Blasting

NOTE: This section should be edited for the specific project sites traffic control issues. Communicated with stakeholders and local utilizes, DOTs, Railroads, businesses during design phase to capture any special needs the Government will need to specify for the Contractor to carry out during blasting. This Paragraph is an example.

During blasting operations traffic may need to be temporarily halted to allow safe execution of blasting and possible removal of rock fragments and debris. Traffic control, including such delays must be the sole responsibility of the Contractor. Traffic control must be in close coordination with the [_____] Department of Transportation[ and the town of [_____]]. Include the traffic control plans with the Blasting Safety Plan.

It is not anticipated that blasting activities will impact traffic due to the distance of the blasting from the road. The Contractor will need to coordinate with [_____] for blasting [______]. In addition, use protective blasting mats for all shots [______], unless otherwise directed by the Contracting Officer to minimize any fly rock near [______] may be required, if, in the opinion of the Contracting Officer, flyrock becomes an issue. If traffic stoppages are warranted, coordinate with the Contracting Officer. A sentinel boat must be stationed [______] of the work area to prevent any boaters from entering the blast area.

Recreational boats, swimmers, fisherman and the public, on land or in the water must be prohibited access within 762 meters 2500 feet of the blasting area. Station sentinel boats to prevent any boaters from entering the blast area.

3.2.8 Notification to Navigation

NOTE: Use the following paragraph when working in or near navigable waters or navigation lock.

Notify the lockmaster at [______] Lock, the US Army Corps of Engineers, [______] District, Navigation Branch a minimum of [14] calendar days prior to the commencement of blasting operations to allow for sufficient time to
send out navigation notices. The information to be supplied will include the dates and time window of blasting operations.

3.2.9 Lightning Detection Equipment and Safety

Furnish, maintain and operate Lightning Detection Device during the entire period of blasting operations and during the periods that explosives are used at the site. Equipment must provide real time audio and visual alarm/signal and detection based on combined detection of electromagnetic, electrostatic, light wave spectral and audio disturbances, or a commercial service based on these as a minimum as approved. Equipment must be capable of detecting lightning within 40 kilometers 25 miles as minimum of the blast area.

**************************************************************************
NOTE: Obtain technical feedback from the rest of the design team for minimum lightning detection distance.
**************************************************************************

Provide the equipment after approval of lightning detection device. When and where the lightning detection device indicates a blasting hazard potential, immediately evacuate personnel from all areas where drilling is being conducted or explosives are present. When a lightning detector indicates a blasting hazard, perform the following:

a. Clear the blasting area of all personnel. Place guards at all access points to the blast area.

b. Immediately notify the Contracting Officer of the potential hazards and precautions being taken.

c. Terminate the loading of holes and secure the unused explosives to an approved location.

d. When the hazard dissipates, inform the Contracting Officer that the drilling and loading of holes will continue.

3.2.10 Check for Misfires

The Blaster in Charge must closely inspect the entire blast area for a minimum of five minutes following a blast to guard against rock fall before commencing work in the cut. The five-minute delay between blasting and commencing work is needed to ensure that no misfires have occurred. During the five-minute delay, it is the responsibility of the Blaster in Charge to go into the shot area and check all holes to make sure that all explosives have been detonated.

3.2.11 Misfire Handling Procedures

Should a visual inspection indicate that complete detonation of all charges did not occur, only critical personnel involved in the blasting operation or excavation of the unexploded material are allowed within the established blasting area. Restrict the site until the Blaster in Charge and the Blasting Specialist indicate the site is safe. If the misfire poses problems that cannot be safely corrected by the Blaster in Charge or the Blasting Specialist, a consultant or an explosives company representative skilled in correcting misfires must be called to resolve the problem. Compliance with this or any other provision in the Contract must not
relieve the Contractor of responsibility for any damages or injuries caused by, related to, or arising out of blasting or associated blasting activities. Detail the misfire procedures in the Blasting Safety Plan including the distance of the restricted area when a misfire is discovered.

3.3 BLASTING PERSONNEL

3.3.1 Blasting Consultant

**************************************************************************

NOTE: Depending on the scope of the project, it may not be necessary to require a Blasting Consultant. This will be determined during design, an Agency/Service Blasting SME or Government Blasting Consultant should be consulted to discuss this. Projects where slope blasting, away from sensitive structures minor and lightly used public areas may be a consideration to not including this requirement. One option is to still require a blasting consultant to be engaged but only for reviewing the Master Blasting Plan and engaged on very serious issues with the blasting (exceedance of vibration and/or airblast limits, misfires, flyrock, or excessive backbreak and/or overbreak). Excessive backbreak will need to be defined prior to issue of the specifications. This specification is geared towards IFB (Invitation for Bid) where there is no mechanism to select contractors prior to award. If another contract mechanism is used it may be necessary to include the bracketed text requiring a letter of commitment from the consultant.

**************************************************************************

The Blasting Consultant, Blasting Specialist, Blasting Administrator, Blaster in Charge, and Vibration Specialist cannot be the same person. Retain a recognized Blasting Consultant to assist in the blast design. The Blasting Consultant must be approved by the Contracting Officer prior to the submission of the Master Blasting Plan. Submit the Blasting Consultant Qualifications including resume, experience, current blasting licenses, credentials and training of the proposed Blasting Consultant[, and a formal letter of commitment from the consultant verifying their availability on an "as needed" basis for the duration of the Contract prior to the award of the Contract]. The consultant must be an expert in the field of drilling and blasting who has derived their primary source of income by providing specialized blasting and blasting consulting services. The consultant must not be an employee of the Contractor, explosives manufacturer, or explosives distributor or any other sub-contractor. There must be no additional cost to the Government for the Blasting Consultant's duties, even when required by the Government.

**************************************************************************

NOTE: The paragraph below should be used when controlled blasting techniques are required.

**************************************************************************

The Contractor's Blasting Consultant with the Blasting Specialist must develop controlled blasting techniques to be utilized in the areas specified in the drawings during the Test Blasting program. The Blaster in Charge is responsible for the technical application of the controlled
blasting methods specified during and following the Test Blasting. The Blasting Consultant must modify controlled blasting methods, as necessary, to meet safety requirements, airblast and vibrations limits, and protect the rock foundation. Proposed controlled blasting methods must be submitted to the Contracting Officer for approval.

The Blasting Consultant must review the Master Blasting Plan and Individual Shot Reports and attend the public meeting and be available for consultation on an "as needed" basis, as determined by the Contractor, Contracting Officer, or both. The Blasting Consultant is not required to be on the job site for review of the Master Blasting Plan or Individual Shot Reports. The Blasting Consultant must submit a short, signed Blasting Consultant's Report each month stating that the Blasting Consultant has briefly reviewed the Individual Shot Reports including blast videos, and any problems, concerns or errors in the reports were addressed. This report is due within [_____] days after the end of the month.

3.3.1.1 Blasting Consultant's Qualifications

The consultant must be able to demonstrate involvement in at least 15 projects with blasting. The consultant must have as a minimum the credentials and experience outlined below:

a. The consultant must have at least 20 [_____] years of experience in construction blasting within [_____] meters [_____] feet of protected structures, [natural resource concerns and environmentally sensitive areas], final presplit slopes or walls.

********************************************************************************
NOTE: "Natural resource concerns and environmentally sensitive" areas need to be defined elsewhere in this guide specification.
********************************************************************************

b. The consultant must be able to demonstrate that he has attended at least 15 short courses, seminars, or conferences on blasting technology, or university engineering class studies on blast design during the past 20 years including a complete understanding of blasting seismology with emphasis on vibration frequency, acceleration, and displacement (ground strain).

c. For the past 10 years the consultant must have derived their primary source of income from providing specialized blasting consulting services.

d. Project list will contain a description of the projects, details of the blast plans, and any modifications made during the project.

e. The names and telephone numbers of at least three project owners with enough knowledge of the projects to verify the submitted information.

f. The Blasting Consultant must be approved by the Contracting Officer prior to the beginning of any drilling and blasting work including submission of the Master Blasting Plan.

g. Hands-on experience as a blaster for at least three years, and

h. The Blasting Consultant, Blasting Specialist, Blaster in Charge, and Vibration Specialist cannot be the same person.
3.3.1.2 Issues Requiring the Blasting Consultant

If problems with vibration, flyrock, airblast, presplitting, or production blasting, or adverse impacts on natural resources occur the Contracting Officer will require the Contractor to immediately summon the approved Blasting Consultant and have their presence on site within 10 days after the problem develops for the following:

a. To approve the blasting plans for each individual blast.

b. To be present to review the blasthole layout on the ground before drilling begins.

c. Observe blasthole loading.

d. To sign each blasting plan and each Individual Shot Report, at no additional cost to the Government. The consultant must have full authority to stop or delay any blast the Blasting Consultant considers unsafe.

e. To submit and sign a written checklist that all necessary precautions were reviewed and followed by the drilling and blasting crews. The checklist must be as defined under the section on Individual Shot Reports. The signed checklist must be attached to each blasting report.

f. Submit Blasting Consultant's Reports after each site visit.

3.3.2 Blasting Specialist

Submit the Blasting Specialist's Qualifications including resume, experience, education, training, and valid blasting licenses of the Blasting Specialist for approval, at least 60 days before drilling and blasting operations commence. Detail the experience and training, which qualifies the specialist for work under this Contract. The duties of the Blasting Specialist are to prepare all necessary paperwork, to conduct quality control and to coordinate with the Contracting Officer on all issues dealing with blasting. The Blasting Specialist must be an employee of the Contractor on the job site each day.

a. The Blasting Specialist must have at least 10 years of verifiable experience utilizing controlled blasting techniques.

**************************************************************************
NOTE: Include this sentence under paragraph a. if the project requires precision presplitting:
[and Precision Presplitting methods to create uniform presplit faces in mixed rock types like the bedrock strata present at the project site].
**************************************************************************

b. Within the last five years, the specialist must have completed at least five days of classroom training that has familiarized the specialist with the most current drilling and controlled blasting methods.

c. In the last five years he must have been responsible for the blast design or execution of large rock excavation projects similar in scope and complexity as this project.
d. Their credentials must include a list of the projects, including the location, duration, scope, description, geologic conditions, and the challenges that developed though the course of the projects and how the challenges were resolved.

e. Each project description must be accompanied with photos which exhibit the Blasting Specialist's competency and ability to create the designed cut slope configuration to the specified tolerances. The list of projects must also contain the names and phone numbers of the project owner or their representative, Contracting Officer, or project engineers who has enough knowledge to verify the submitted information. The Contracting Officer will invalidate any project submitted as reference that cannot be verified.

3.3.3 Blaster in Charge

NOTE: Some USACE projects may require an Alternate Blaster in Charge based on the frequency, size, and complexity of the blasting operations. The Alternate Blaster in Charge must meet the same qualification requirements as the Blaster in Charge.

Submit the Blaster in Charge's Qualifications including resume, experience, education, blasting licenses and training of the Blaster in Charge for approval, at least 60 days prior to the commencement of drilling and blasting. Also submit the Contractor's Federal ATF License. Detail the experience and training, which qualifies the Blaster in Charge for work under this Contract. The Blaster in Charge is responsible for preparing the Individual Shot Plans that will be approved by the Blasting Specialist. The Blaster in Charge is responsible for marking the blasthole locations for drilling, accounting for the relevant geology, loading the blastholes according to the Individual Shot Plans and firing the blast.

a. The Blaster in Charge must be a licensed blaster in the State of [_____] per that State's regulations or issuing agency.

NOTE: If presplitting, precision presplitting, or both, is included in the project, include paragraph below as an additional requirement for the Blaster in Charge.

b. Blaster in Charge will have at least [_____] years of verifiable experience utilizing controlled blasting techniques [and at least [_____] years of experience with "Precision Presplitting" to create uniform presplit faces with blasthole spacing at 61 centimeters 24 inches or less in variably weathered and fractured rock similar to the bedrock strata present at the project site].
c. Within the last five years, the Blaster in Charge must have completed at least five days of classroom training that has familiarized the Blaster in Charge with the most current controlled blasting methods.

d. Blaster in Charge must have been responsible for at least [_____] large rock excavation projects similar in scope and complexity as this project.

**************************************************************************

NOTE: Include this sentence under paragraph d. if the project requires precision presplitting: [The projects must have included experience totaling at least [_____] linear meters [_____] linear feet of drilled blastholes for "Precision Presplitting".]

**************************************************************************

e. The Blaster in Charge credentials must include a list of the projects, including the location, duration, scope, description, geologic conditions, and the challenges that developed though the course of the projects and how the challenges were resolved. Each project description must be accompanied with photos, which exhibit the Blaster in Charge's competency and ability to design the blast. [Create the designed cut slope configuration to the specified tolerances.] The list of projects must also contain the names and phone numbers of the project owner or their representative, Contracting Officer, or project engineers who has enough knowledge to verify the submitted information. The Contracting Officer will invalidate any project submitted as reference that cannot be verified.

3.3.4 Blasting Administrator

**************************************************************************

NOTE: For smaller projects this position may not be necessary. The Blasting Administrator was added for large projects to aid the Blasting Specialist with paperwork.

**************************************************************************

The duties of the Blasting Administrator are to be the direct assistant the Blasting Specialist to prepare all necessary paperwork, and quality control on all issues dealing with blasting. The primary function is to assist the Blasting Specialist in the preparation and completion of submittals, prepare the detailed post blast report, and the individual shot videos for submittal to the Contracting Officer, and submit the drilling logs with the post blast report. The Blasting Administrator cannot sign any paperwork. The Blasting Administrator must be approved by the Contracting Officer. Submit the Blasting Administrator's Qualifications.

The Blasting Administrator will possess the following minimum qualifications and experience:

a. Hold a current Blaster's license;

**************************************************************************

NOTE: If the Blasting Administrator will not be performing blasting duties (handling explosives in the field) this requirement may be waived but will have to be evaluated on a project specific basis.

**************************************************************************
b. Have at least [5] [___] years of credible and verifiable experience in the industry utilizing controlled drilling and blasting techniques;

**************************************************************************
NOTE: If presplitting is required in the project, include "c" below, if not, delete.
**************************************************************************

[ c. Have at least five years of specialized experience with presplitting techniques;
]

] d. Must have completed at least five days of classroom training within the last five years that has equipped the Blasting Administrator with the most current knowledge in controlled blasting or perimeter control techniques.

e. Have proven proficiency with blasting software and spreadsheets.

3.3.5  Magazine Keeper

Each magazine keeper must be experienced and familiar with the laws and general practices concerning the handling, care, use, and storage of explosives and detonators. The magazine keeper is responsible for maintaining a cleared area around each magazine. The magazine keeper will not be required to perform any duties that will in any way interfere with their duties as magazine keeper. If explosives are delivered daily from the manufacturer, the driver of the truck will serve as the magazine keeper.

3.3.6  Vibration Monitoring Specialty Firm

**************************************************************************
NOTE: This is requirement is a new format from previous specifications. The firm is submitted for approval, having the appropriate experience and the firm must have on staff the Seismic Specialists and Seismograph Technicians, typically a firm is subcontracted by the Contractor and having multiple experienced people approved allows them to have flexibility on supporting the site work. The people coming to the project or responding to the work must be within the group approved but does not need to be a single person anymore.
**************************************************************************

Retain the services of a vibration monitoring specialty firm that specializes in the prediction, monitoring and control of ground vibration and airblasts. The firm must have experience conducting installation of seismographs for vibration monitoring, communicating vibration and airblast results, and developing and maintaining a site attenuation curve. The firm must have on staff at least two Seismic Specialists that specialize in vibration monitoring and analysis. The firm must have on staff at least four Seismograph Technicians that have five years or more experience with seismograph installation and vibration monitoring. Submit resumes for all personnel and for the firm for approval citing, in additional to other pertinent data, experience, training, and education, at least 60 days prior to the commencement of blasting. The Seismograph Technicians must be persons capable of setting up the seismographs at designated locations, effectively recording the blast, and appropriately interpreting results. The Seismic Specialists must interpret the seismograph records to ensure
that the seismic data must be effectively utilized in the control of the blasting operations with respect to the existing structures. The Seismograph Technicians must supervise the placement, operation and maintenance of the seismographs. The Seismic Specialists must conduct the airblast and particle velocity regression analysis as described in this Section. The Contracting Officer may require the Seismic Specialists and Seismograph Technicians to be present during the test blast program, production blasting, or both.

3.3.7 Structural Inspection/Evaluation Technician

**************************************************************************
NOTE: Five years is the minimum requirement experience, depending on the project it might be necessary to increase the minimum if there is a special concern or sensitive structures, consult with USACE SME to help determine.
**************************************************************************

Pre and Post Blast structural inspections must be performed by technicians with at least [five] years' experience in pre-blast and post blast surveys in the State of [______]. Submit a copy of the qualifications and certificates to the Contracting Officer.

3.4 PRE-CONSTRUCTION DOCUMENTS

3.4.1 Master Blasting Plan

Submit a Master Blasting Plan at least [____] days prior to commencing drilling and blasting operations that includes a section called Blasting Safety Plan for review and approval. The Master Blasting Plan must contain the full details of the typical drilling and blasting patterns [and control for line drilling and for the presplit, buffer and production blasting, in the situation where controlled blasting is required for the project]. The Master Blasting Plan must contain the following information, at a minimum:

a. Typical plan and section views drawn to scale of proposed drill patterns including free face, burden, blasthole spacing, blasthole diameters, blasthole angles, lift height and subdrilling depth, where allowed except for the blast that will carry the excavation to foundation grade where subdrilling is restricted as specified in the article SUBDRILLING. Base the typical plan and section views on the geology and excavation plan for this project site, it cannot be a blast plan from a previous project.

b. Typical loading diagrams for each blast design being proposed showing type and amount of explosives, primers, boosters, decks, initiators and location and depth of stemming in each blasthole.

c. Typical initiator sequence of blastholes including delay times and delay system.

d. Predicted vibration and airblast amplitudes, and the mathematical equations used to calculate them. The Contractor must monitor the results of the test blasts and with the seismic data collected can determine the site-specific ground vibration equations and the site specific airblast equations for the project. After the first 10 blasts the Individual Shot Plans must use the site-specific estimates at the 95 percent confidence level.
NOTE: Some states or counties may have specific vibration amplitude and airblast equations for specific locations.

**e.** Manufacturer's data sheets, including Safety Data Sheet (SDS), for all explosives, primers, and initiators to be employed. Provide copies of SDS for all explosives and detonators and define specific details about hazard communication programs for employees and specify where copies of SDS will be kept.

**f.** The Master Blasting Plan submittal is for quality control and record keeping purposes. Approval of the Master Blasting Plan does not relieve the Contractor of responsibility for the accuracy and adequacy of the plan when implemented in the field. Retain the professional services of a Blasting Consultant to assist with the blast designs included in the Master Blasting Plan.

**g.** Provide the Test Blast Plan and procedures for test blasting and modifying shot plans during production blasting in the Master Blasting Plan. Also provide the expected results from each shot including, but not limited to, the likely maximum peak particle velocity and airblast levels at the nearest inhabited structures.

**h.** Indicate that the Individual Shot Report design and blast record documents must provide all the data of each blast in sufficient detail; for example, the exact same blast design data conduct by anyone else from the Individual Shot Plan provided with no other information would produce similar blast results and impacts.

**i.** Include samples of all completed submittal forms and diagrams (Pre-Blast Surveys, Individual Shot Plan, Drilling Logs, Individual Shot Reports, Individual Shot Vibration Monitoring Report, Results of Vibration and Airblast Monitoring, and Individual Shot Video).

**j.** Manufacturer's specifications on equipment to be used including but not limited to drills, air compressors, drill bits, drilling equipment specifications, manufacturer's literature of the drill rods, bits, casing, etc.

**k.** Plans for construction sequencing line drilling, presplitting, blasting, and mucking operations to complete the rock excavation with the limitations of the peak particle velocities. Describe the change in placement any of the seismographs with regards to the progressing blasting and excavation. Provide the names of individuals responsible for the instruments, data retrieval, and analyses.

**l.** Single Sheet plan view showing location of all seismographs. This sheet must be amended and resubmitted whenever seismographs are moved.

**m.** Sample checklist that the Contractor will use to ensure that all required information is included in each blasting plan.

**n.** Survey Control Plan: Establish survey control as approved by the Contracting Officer for horizontal and vertical control of all line drill, presplit and production blasts. Assure that all blast holes are drilled on the specified pattern and at the location and the depths as
3.4.2 Blasting Safety Plan

In addition to the Master Blasting Plan, a Blasting Safety Plan must also be prepared, as specified and outlined in EM 385-1-1, Section 29. All blasting work must be conducted in accordance with the requirements specified in EM 385-1-1.

**************************************************************************

NOTE: Minimum safe distance from blast point will vary with each project. Local, state, county and federal regulations must be taken into consideration. Ensure NEPA, 408 permits, and environmental studies incorporated the blast safety radius.

**************************************************************************

The required minimum safe distance is [_____] meters [_____] feet from the blast point. All the public, including swimming and boating recreationists must be excluded from the safety zone during blasts, including pre- and post-blast operations. The safety zone must be marked with an intrusion prevention barrier and high hazard warnings. Patrol by boat before and during blasting to prevent the recreational public from entering the safety zone.

The Blasting Safety Plan must provide a complete description of the clearing and guarding procedures that must be employed to ensure personnel, staff, visitors, and all other persons are at safe locations during blasting. A Blasting Safety Plan simply stating: "all regulations will be followed" is not acceptable and will be rejected. This plan must be developed and signed by the Contractor's Blasting Specialist with input from the Contractor's Site Safety and Health Officer (SSHO) with the intent to show how the Contractor's procedures and methods meet or exceed applicable rules, regulations and standards established by the Regulatory Agencies, codes and professional societies, and specifications listed herein. The guarding procedures must also consider aircraft and water vehicles that may enter the danger zone. This information must include detailed descriptions and maps, when appropriate of traffic control, visible warning signs or flags, audible warning signals, method of determining blast areas (all areas affected by any potentially harmful blast effects), access blocking methods, guard placement and guard release procedures, primary initiation method, and the system by which the Blaster in Charge must communicate with site security guards or other appropriate site supervisory personnel. The Blasting Safety Plan must be in accordance with and include items required in the EM 385-1-1, Section 29, 29 CFR 1910.109, 29 CFR 1926-SUBPART U.

The Blasting Safety Plan must state that explosive distributor will be delivering explosives on the day of the planned operation and recovering unused explosives at the end of the day. In the event of lightning detected at 16 kilometers 10 miles or less from the project site requirements for ceasing operations must be described. Provide a plan for controlling the temporary onsite storage of explosives or of securing an area of loaded holes until the threat has passed.

The Blasting Safety Plan must contain detailed descriptions of how and from where explosives will be transported and used at the various project work areas, and a map of the transportation route. The Blasting Safety Plan
must explain how explosive transport vehicles will satisfy all applicable ATF, OSHA, Federal, State, County, and local regulations. The Blasting Safety Plan must also include the following.

a. Specific details about hazard communication programs for employees.

b. Equipment that will be used to monitor the approach of lightning or dust storms and in such event, the site evacuation and site security plans, and the criteria for determining if the site is safe to re-occupy.

c. Methods for preventing spills or losses of explosives, drilling fluids, oil, or any other pollutants onto the ground during handling and blast hole loading operations. Include details of spill containment and contingency plans for quickly and effectively cleaning up spilled materials.

d. Method of safe and approved disposal of all explosive packaging materials.

e. Detailed contingency plans for detection and disposal of misfires resulting from cutoffs or other causes, hangfires, inadvertent initiator extraction, or accidental loss of downlines. A narrative describing in detail job steps, controls, and hazards associated with but not limited to hung or bridged powder, overloaded holes, cutoffs during placement of blast mats, failure of communication system during pre and post blasting protocols, recovery protocols for unexploded objects (UXO), etc.

f. Misfire mitigation procedures, including but not limited to restrictions of entry, securing the area prior to investigating and inspection, additional safety measures, time-sequence of operations, and mitigation protocols.

g. Fire Prevention Plan details, including tobacco smoking policies, procedures and limitations for work involving open flames or sparks, description and location of firefighting equipment, and firefighting and evacuation plans.

h. Digital copies of a valid [state] blasting license for the Blaster in Charge, Blasting Specialist and all personnel required to have one.

i. State required certifications for the Contractor's explosives supplier's Federal, ATF Explosives license or permit.

j. Other required county or state permits required for explosive transportation, use and offsite storage.

k. Explosive transporters' commercial driver's licenses with HazMat endorsements.

l. A reference in Attachment II (under misfire) when a misfire is declared the Blaster in Charge must wait 1 hour before inspecting site and provide proper safeguards for excluding employees from the danger zone except those necessary to do the work.

m. Submit updates, modifications and additions to the Master Blasting Plan in an appropriate and timely manner.
n. Complete project team organization with duties, responsibilities and authorities clearly defined. This organizational outline must also include names, addresses, resumes, responsibilities, and qualifications of all personnel authorized to sign for, receive and use explosives on this Contract.

o. Traffic Control Plan.

3.4.3 Pre-Blast Surveys

**************************************************************************
NOTE: During design consult with the adjust businesses/stakeholders to determine what Pre-Blast Survey needs to be conducted and whether access is allowed, or special considerations are needed. This needs to be outlined in the specifications for a proper bid to be made for the scope. It is important to include the entire Project Development Team in design to ensure all project features of importance are documented before blasting. Lessons learned on one lock where blasters caused damage and it was not realized until well after the work was completed, the Government had no means to prove the damage occurred from blasting because there was no Pre-Blast Survey of the structures damaged.
**************************************************************************

Prior to the commencement of blasting, conduct a Pre-Blast Survey of any nearby buildings, structures and utilities within [_____] meters [_____] feet from the blast area that may potentially be at risk of blasting damage to document pre-existing conditions. The survey extent and method used must be acceptable to both the Contractor's insurance company and the Contracting Officer. The Contractor is responsible for any damages or injuries resulting from blasting. Submit all Pre-Blast Surveys 30 calendar days before the start of blasting. There will be no blasting allowed until the Pre-Blast Survey is submitted and approved by the Contracting Officer. Provide owners of surveyed features a copy of their feature's Pre-Blast Survey results before or with the notice of blasting commencement. Notify owners and occupants of local buildings prior to the commencement of blasting. Perform the following when conducting Pre-Blast Surveys:

a. Provide methodology to be used in conducting the Pre-Blast Survey and listing of structures, determined from the survey to be sensitive, with reasons for these structures being sensitive.

b. Each structure must be documented (including high resolution photography and videotaping) as to its construction, foundation type, condition, and closest distance to excavation blasting. The general condition and all observable defects of each structure must be documented. This includes measurements of the defects.

c. The Commodity storage facilities that may be impacted by blasting must be addressed by the Contractor for safety and continued operation during the blasting program.

d. Freestanding structures (such as retaining walls) must be inspected on the exterior and on the interior as a room. All concrete walks, driveways, etc. must be inspected for cracks, level condition, holes, and defects.
e. Industrial structures, silo/elevators and special facilities, and office space must be described relative to their present conditions and tolerance to vibration. Besides the inspection of walls, columns and stairwells, the Contractor must survey the work areas and structures for distress.

f. An inspection of accessible structures must be made and a list of all structures, which could not be surveyed or refused to allow survey, must be completed. The dates of possible subsequent surveys and physical constraints prohibiting the survey must be documented. The requirement to perform Pre-Blast Surveys is not an indication of Right-of-Entry by the Contractor. Any Right-of-Entry associated with Pre-Blast Surveys, monitoring during blasting and Post-Blast surveys are the responsibility of the Contractor. In the event a property or properties identified as significant or intended to be included in the Surveys and monitoring are not included because access was denied, indicate this occurrence including the points of contact, dates contacted and any reasons provided for denial of access (if given.)

g. Certify that the survey was prepared prior to the start of any blasting under this Contract. Submit a copy of the Pre-blast survey in conjunction with the Master Blasting Plan.

3.5 RECORD KEEPING

3.5.1 Individual Shot Plan

The Blasting Plan must be consistent with the general concepts, designs and layouts shown in the approved Master Blasting Plan. The number of rows of blastholes and the number of blastholes per row can be changed from one individual shot plan to the next. Provide reasons and technical justification for all significant changes from the Master Blasting Plan.

Submit a Blasting Plan for each blast at least [24] hours prior to the planned initiation of drilling. The results of the previous blast are to be jointly evaluated by the Contractor and Contracting Officer prior to the submission of the Individual Shot Plan. The Individual Shot Plan must contain but be not limited to the following:

a. Plan view, and at least two sectional views drawn to scale, of the shot pattern showing blasthole locations, inclinations and designations;

b. Individual blasthole depths, diameters, blasthole spacings, burden, depth intervals of stemming and depth of subdrill;

c. Type of shot, i.e. test, production, pre-split, line drilling or buffer and shot number;

d. Orientation and elevation of the collar and bottom of all blast holes;

e. Total volume of blasted material in cubic meters cubic yards;

f. Description of type of blast and indication if blast is on final slopes or inverts;

g. Amount, type, diameter and depth of explosives, stemming and delay in each hole, and amount, type, and location of boosters and centering devices and the lift elevation;
h. Plan view of blasthole shot pattern showing in-hole and surface delays and firing times of each blasthole or decked charge;

i. Anticipated time and date of blast;

j. Survey coordinates using State Plane coordinate system and, if appropriate, a local coordinate system;

k. Any significant geologic features, and techniques planned for mitigating their influence upon results must be included in plan and section with appropriate elevations;

l. Estimated/anticipated peak particle velocities and maximum peak airblast predictions at seismographs located at protected structures using site specific data and regression analysis and the accurate distances from the blast to seismographs;

m. Name of Contractor;

n. Name, signature, and license number of the Blaster in Charge;

o. The maximum charge weight per delay, pattern and sequence of delays, and firing times for the blast;

p. Type of detonators, initiation and down hole lines;

q. Powder factors both in charge weight per cubic yard of material shot and in charge weight per meter per foot of total drillhole depth;

r. An elevation sketch of a typically loaded hole depicting each hole pattern, top of overburden elevation, top of rock elevation, bottom of hole elevation and diameter of hole, sub-drilling, decking charges, locations of explosives and stemming, and the locations of primers and boosters; and

s. The location of the blast area on a scale plan map of the project indicating the location of the shot, and the distance and directional relationship between all seismic equipment and the nearest structure subject to damage using a scaled distance measured in a horizontal line from the blast site to the nearest building, or structure, berthing facility.

t. A minimum of ten high resolution photos, taken with a camera with a resolution of at least eight megapixels, of the entire blast area, preferably from above, of surface and open face of the shot and surrounding rock to document conditions prior to the shot.

u. No blastholes must be drilled until the Individual Shot Plan for them is approved. Evaluate any problems or impediments of the prior shot and implement solutions for those issues with the next Individual Shot Plan. Provide the Individual Shot Plan to the Contracting Officer electronically. The Contracting Officer will review the plan and send comments to the Contractor within 24 hours of receiving the plan if the plan is submitted between Monday and not later than close of business Thursday.

v. Include a tabular listing by hole in the ascending time order of delays by the describing: row and number within the row of the shot hole,
total delay time, the total charge weight of explosive materials for the entire hole, top of sound rock elevation, bottom hole elevation, stemming elevations, and detonator, primer and booster elevations in the hole; and for each seismic monitoring location the closest approach, the square-root scaled distance, the cube-root scaled distance, and the estimated PPV and airblast overpressure.

3.5.2 Drilling Logs

**************************************************************************
NOTE: It may be necessary on sites with complex geology and blasting is occurring near very critical structures or rock outside of neat lines needs special protection, or neat line tolerances are especially important to consider the blaster or Contractor to have geologist(s) on staff to log blast holes or assist in logging blast holes, and aide the blaster in understanding the geology and for more accurate drilling logs. For rock excavation's objective(s); the project truly requires the designed tolerances and quality/stability of the remaining rock, which cannot be overcome at the Contractor's cost of dental clean-up, rock bolting, shotcrete or mass concrete placement; and, an experienced, agency (or third-party) geologist will be onsite for Quality Assurance of the logging & blasting & retained rock stability or damage. Logging may need to be in accordance with ASTM D2487, ASTM D5434, ASTM D6032/D6032M in some instances.
**************************************************************************

The drillers are required to keep precise drilling logs on each blasthole to show the depth of the geological features. At minimum, each drilling log must include:

a. Blast number;

b. Blasthole designation and location station number, bench number and type of blast (production, presplit, buffer, etc.);

c. Blasthole depth and diameter;

d. Elevation of top and diameter of blasthole;

e. Subdrill depth as permitted in the article SUBDRILLING;

f. Depth(s) of geologic structural features, e.g., voids, gouge or mud seams, soft weathered or altered zones, rusty intervals, changes in rock chip color, and other features encountered in the blasthole pertinent to loading the hole;

g. Relative penetration rates;

h. Start and end times of drilling;

i. List any blasthole misalignment; and

j. Soft seams within the rock and sudden feed pressure changes on the rig;
k. If qualitative descriptors are used (e.g., soft, moderately hard, hard, very hard, decomposed, highly weathered, moderately weathered, slightly weathered, unweathered). Ensure consistency between drill operators in logging using these terms. Blasting Specialist and Blaster in Charge must ensure drillers are using consistent terminology between drillers. [Log soil and rock in accordance with ASTM D2487, ASTM D5434, ASTM D6032/D6032M.] Submit an example of the Drilling Logs with the Master Blasting Plan. Copies, both hard and electronic PDFs, of these drilling logs must be provided to the Contracting Officer at least 24 hours prior to loading any blastholes. The drilling logs must be used to determine the proper design and loading of blastholes and for locating the depths for use of stemming decks across intersected geological features to protect against blowout, flyrock and any unusual or hazardous blasting effects.

**************************************************************************
NOTE: The paragraph below may be necessary where preventing subdrilling and foundation damage is critical.
**************************************************************************

[ Survey the elevation at the collar of each production hole in the final blast to foundation grade to ensure that the production blastholes are not subdrilled below final foundation grade, except as permitted in article SUBDRILLING. The survey must be included in the Individual Shot Plan.

]3.5.3 Individual Shot Reports

As a minimum, the Individual Shot Report must be the same form used in the Individual Shot Plan but provide all "as-built" information required for the blast plan. Furthermore, the Individual Shot Report must better describe any part of the blasting operation that wasn't adequately described by the Individual Shot Plan including information on misfires, observed field conditions, and information how the Blaster in Charge compensated for compromising field conditions, such as increased stemming amounts, or stemming decks where voids, cracks, spalls or mud seams were identified and resolved. The Blasting Specialist is responsible for recording all explosives loaded in the blasthole and for accurate documentation of daily blasting activities. Submit the Individual Shot Report no later than 24 hours after the blast. No additional blast will be drilled or loaded in the immediate area of the completed blast until the previous day's Individual Shot Report is submitted to the Contracting Officer. The Contractor must plan on multiple work areas so that production can be maintained on schedule. The report must include at minimum the following information:

a. Blast number (i.e., R-L3-PS1);

b. Date and specific time the blast was initiated;

c. Blasthole designations, locations;

d. Amount, type and depth of explosives, decking, stemming, and delay in each hole;

e. Plan and section views, drawn to scale, of drill pattern including free face, burden, blasthole spacing, blasthole diameters, blasthole angles and azimuths, blasthole number, lift height, and subdrill depth. Show
in-hole and surface delays, as well as actual firing times of each blasthole or decked charge. Use different symbols to distinguish the production, buffer, presplit and line-drilled blastholes. Include a north arrow and scale on each plan view. Label the direction of the sections on the sections. Include section parallel to, and perpendicular to the blasthole rows. Show final grade and slope lines as appropriate in the sections. Show the location of the two video recorders on the plan in relation to the blast.

f. Drilling logs for presplit, line, buffer and production blastholes. Each drill hole must be logged by the driller to provide additional information to the Blaster in Charge during loading operations. Drilling Logs must contain information pertinent to the rock characteristics and blast operations. At the minimum, drill logs must contain geological information on pertinent geologic structure, soft or weathered zones, voids, penetration rate changes, and driller's notes.

g. Loading diagram showing type, diameter, amount and depth interval of explosive, primers, initiators and location, depth and type of stemming for each blasthole. Show the charge weight of each type of explosive and the total explosive load per delay and per hole.

h. Diagrams showing the delay system in the initiation sequence in each blasthole and the location and delay time of all surface delays of each blast. Indicate which blastholes are firing with a delay of less than 8 milliseconds.

i. Trade names and sizes of all explosives, primers, and initiators to be employed.

j. Daily explosives material consumption record.

k. A description of all personal injuries and property damage caused by the blast; when the measured maximum peak particle velocity or airblast exceeded by 10 percent the anticipated values from the Blasting Plan; and, all problems with the Warning System and problematic results of the blast, such as overbreak or large fragmentation, or with the shot pattern, such as misfires.

l. The vibration and airblast report described in paragraph Vibration and Airblast Monitoring. Include a comparison of predicted and actual measured values.

m. Signature of the Blasting Specialist specifying that the Blasting Specialist has reviewed the Individual Shot Report for accuracy and completeness.

n. Signature of the Blaster in Charge.

o. Note if mats are used or required by the Contracting Officer then list the type of blasting mats or other protective covering used.

p. A brief weather description at or near the time of the detonation such as cloudy, clear, partly cloudy, and foggy, with approximate wind direction and velocity, and temperature.

q. Updated or "as-built" Plan drawings depicting the borehole pattern and the delay pattern employed as well as pounds of explosives utilized, hazard incidents, and blast holes not loaded.
r. Copies of drilling records and originals of the blast monitoring data.

s. A plan view map of each bench showing the location of each completed blast.

t. Include photos, after the shot, taken from the same locations and at the same resolution as the blasting plan photos.

u. Include an updated as-built tabular listing by hole in the ascending time order of delays by the describing: row and number within the row of the shot hole, total delay time, the total charge weight of explosive materials for the entire hole, top of sound rock elevation, bottom hole elevation, stemming elevations, and detonator, primer and booster elevations in the hole, by hole in the ascending total delay time order of delays by describing: row and number within the row of the shot; and for each seismic monitoring location the closest approach, the square-root scaled distance, the cube-root scaled distance, and the estimated PPV and airblast overpressure.

Include two log-peak particle velocity versus square root scaled distance as per RI8507 diagrams for each seismograph. One diagram including all shots. The second including only data from the last 10 shots.

Include seismic records with peak displacement, velocity and accelerations at their respective frequencies. Site curve modification may be required to ensure that vibration levels at the control room remain acceptable.

If a recorded seismic value appears anomalous, the Contracting Officer may request that the vibrations monitoring specialist interpret all of the collected seismic records from the seismographs for that blast and provide an explanation of the anomalous readings. Anomalous readings include, but are not limited to, unusually high or low particle velocities, failure of a seismograph to trigger, or atypical wave forms on the paper record. No additional blasting will be allowed until the issue is resolved to the Contracting Officer's satisfaction.

Signatures of the Blasting Specialist and Blaster in Charge will be considered as proof that the shot was laid out, drilled, loaded, and wired as designed. Proof of the Blasting Specialist and Blaster-in Charge's qualification must include remaining below the allowable peak particle velocities at all structures. Inability to remain below the allowable vibration levels may be cause for dismissal of either or both parties.

The Blasting Specialist must oversee all loading operations and collect and keep accurate records of the information required for each Individual Shot Report. Submit an example of an Individual Shot Report to the Contracting Officer for approval as least 30 days before commencement of any blasting. Failure to submit satisfactory Individual Shot Reports must result in suspension of any additional drilling and blasting until the Contractor complies with this requirement. The Blasting Specialist will make sure that the drilling logs are used by the blaster when blastholes are loaded to prevent overloading in soft or weak rock in the borehole.

The Individual Shot Reports are for quality control and record keeping. Review of, and comments on, the blast reports by the Contracting Officer will not relieve the Contractor of his responsibility for the accuracy and adequacy of the blast design.
Supplement the Individual Shot Reports with the original digital copy of the printed results of vibration and airblast monitoring showing peak readings and frequencies for each blast to the Contracting Officer. This submittal must also include the distance from the blast to the seismograph in meters feet as well as the maximum kilograms pounds of explosive per delay. The seismograph locations must be clearly marked and located on a map in the blast report.

Supplement the Individual Shot Report with the original, handwritten, field notes showing any field changes on the approved blasting plan.

The Blasting Consultant must develop a checklist of tasks that must be completed and checked off by the Blasting Specialist for each blast. Complete the tasks in an orderly fashion before a blast is fired. Submit the draft checklist for approval. Submit the completed and signed daily checklist with the Individual Shot Report.

3.5.4 Individual Shot Videos

**************************************************************************
NOTE: Video size can be a point of discussion, larger files come out of the new high quality 1080 HD and 4K videos. It may be necessary to require a frames/second or use of HD/4K videos. It is likely technology will change faster than this guide specification. This paragraph can be updated by project. The use of sFTP allows for the larger files.
**************************************************************************

Record each blast with high resolution digital video cameras from two designated locations, approximately perpendicular to one another, that provide side, front and rear views of the blast and area above it. The video images must not contain any other text than the shot number. Include metadata consisting of the blast ID, date, and time of the blast. Index the two video recordings to properly identify each blast. Submit the proposed locations of the two video recorders on a map with the Individual Shot Plan for approval. Furnish electronic file copies of video recordings on the sFTP within 24 hours of a blast. If the Contracting Officer requests that a copy of the video be submitted earlier, then deliver a copy within one hour of the request. Maintain a digital video library of all blasts. All drilling and blasting activities must cease after the 24 hours from the previous blast if the video recordings of the previous blast are not furnished to the Contracting Officer.

3.5.5 Post-Blast Surveys

**************************************************************************
NOTE: Pre- and Post-Blast Inspections and the Structural Inspection/Evaluation Specialist would only be required if there are structures or facilities requiring such inspections. Eliminate the paragraphs referencing Pre- and Post-Blast Inspections and the Structural Inspection/Evaluation Specialist if the project does not have a requirement for these inspections.
**************************************************************************

Post-blast surveys must be conducted at any location, where a reasonable
notice of damage from blasting has been provided. Post-blast surveys will be conducted by, or under the supervision of, the Structural Inspection/Evaluation Specialist, who will also sign and date each survey. The survey extent and method used must be acceptable to both the Contractor's insurance company and the Contracting Officer. The post-blast surveys must be conducted within a week of the notice of damage from blasting. The Contractor is responsible for any damages or injuries resulting from blasting. Submit a copy of all post-blast surveys within two business days of the on-premises surveys to both the structure's owner and the Contracting Officer.

3.6 BLAST EFFECTS MONITORING

**************************************************************************
NOTE: Depending on the project, this section will vary and need to be tailored for the monitoring locations and thresholds specifically. The designer should engage any subject matter expert for various disciplines - Structural for concrete, Mechanical/Electrical for related equipment (powerhouses, locks, etc.).
**************************************************************************

3.6.1 Vibration and Airblast Monitoring

**************************************************************************
NOTE: Vibration monitoring is required for every blasting project. Consult with the Structural, Mechanical, and Electrical Engineers on the project in developing the vibration and airblast thresholds. The paragraph's narrative is a generic description for most projects, where the nearest structure/facility is: Standard Construction Timber Frame, Brick, and Concrete Buildings; Lock Monoliths; Powerhouse Switchyard; Highway and Railroad Bridges; Buried Utilities; and, Wells and Aquifers. The Figure below in the notes is Figure 8-19 of EM 1110-2-3800. Some projects may require assessment by a trained experienced blasting specialist or structural engineer of lower allowable vibration criteria at critical or historic or special structures or facilities or structures with continuous occupants. Vibrations can cause the occupants of structures to become physically uncomfortable at levels well below the allowable vibration levels to avoid damage to the structure itself. Projects a with a Powerhouse and Electrical Power Relay Equipment or Pipelines, besides those with continuous occupants, should be evaluated for lower allowable vibration criteria. Some projects could utilize the assessment by a trained experienced blasting specialist or structural engineer to include higher allowable vibration criteria for those projects where typical structures/facilities are more than twice the distance of the closest approach of blasting to: Steel and Reinforced-Concrete Structures; Mass Concrete Monoliths; and, Cured Shotcrete. The specification writer must include a limitation of
Vibration monitoring must conform to current industry standards and use equipment developed for that purpose. Peak particle velocity must be used as the unit of measure. Begin seismic vibration monitoring at least four weeks prior to the commencement of any blasting to determine vibration background levels on adjacent roads, and the [____]. Permanently mount the seismograph to record seismic events for a 24-hour period daily. Submit the background vibration monitoring reports and the baseline vibrations levels determined from the data for approval at least two weeks prior to the commencement of blasting. When blasting commences, analyze all events shown on the seismograph including normal background or blast induced vibrations. Monitor all blasts for vibration. Control ground vibration levels always using properly designed delay sequences and allowable charge weights per delay. Base allowable charge weights per delay on vibration levels recorded during the test and production blasting that produced no adverse impacts. Monitor each blast with an approved seismograph located between the blast area and the closest structure(s) of interest. The seismograph used must be capable of recording particle velocities for three mutually perpendicular direction components of vibration in the range generally found with controlled, cautious blasting. The peak particle velocity of each component must not be allowed to exceed current local, State and Federal vibration limits, whichever is more stringent, and never exceed the safe limits of the nearest structure subject to vibration damage.

Report peak particle velocity, peak acceleration and peak displacement in the Individual Shot Monitoring Report. The Individual Shot Monitoring Report must include the summary report from each seismograph which will include the peak particle velocity and frequency of the peak, peak particle displacement, peak acceleration, distance from the blast, map location of each seismograph and the blast, and charge weight per delay. A single delay includes the weight of all charges fired within 8 milliseconds of each other. Compile all vibration data in an up to date database of distance, charge weight per delay and measured peak particle velocity. The Seismic Specialist must conduct a linear regression of the particle velocities to determine the equation of the 95 percent confidence level propagation. Use the equation to predict the expected vibration in the next blast. Show the time history of the particle velocity in the vibration report.

The seismograph must also record airblast. This data must also be added to the Individual Shot Monitoring Report. The report must include the airblasts measured at each seismograph. Compile all airblast data in and up to date database with the Individual Shot Monitoring Report data. The Seismic Specialist must conduct a linear regression of the airblasts to determine the equation of the 95 percent confidence level airblast propagation. The equation must be used to predict the expected airblast in the next blast. Provide the linear regression data to the Contracting Officer in digital form to become part of the Individual Shot Monitoring Report.

NOTE: The following are the limitation of the allowable vibrations:

TABLE 1 below gives standards for allowable peak particle velocities as they relate to a variety of...
common construction materials. Do not exceed these vibration limits.

These vibration limits must not be incorporated in the blast design. Many projects have been constructed utilizing a fraction of these allowable values. Properly design the blasts, set allowable vibration limits, and maintain proper control throughout the duration of construction. The Contractor is responsible for all damages caused directly by, or as a result of the blasting operations. Compliance with this or any other provisions in the Contract must not relieve the Contractor of responsibility for any damages or injuries caused by, related to or arising out of blasting or associated blasting activities.

Here are two examples of vibration tables. The first is more generic and should be used the section shows for a specific project also requiring an initial peak particle velocity for test blasting ramp up.

</tr>
</tbody>
</table>

Note that older deteriorated structures or utilities and structures housing computers or other sensitive equipment may require lower peak particle velocity limits than those provided in Table 1. Also, buried pipelines owned by private utility companies or bridge structures owned by other agencies may be subject to lower limiting values imposed by the owner. The safe vibration limits and charge weights per delay to achieve these vibration limits must be established by the Seismic Specialist and the Blasting Consultant. Vibration limits for all non-government owned structures must conform to the laws of the State of [____].

Blast vibrations measured 30.5 meters 100 feet or less from final walls must not exceed 12.7 cm/s 5 ips. If any damage occurs to benches or final slopes above the blast area, the blast vibration levels may be reduced at the option of the Contracting Officer. The vibration limits will be subject to approval by the Contracting Officer.

**************************************************************************

3.6.2 Blasting Near Green Concrete, Grouting, and Shotcrete

Blasting operations are typically ongoing in one section of a project while placing concrete or applying shotcrete in another.

**************************************************************************

NOTE: The following are the limitations on allowable vibration:

Some guidelines for peak particle velocities related to time intervals after placing mass concrete/shotcrete/grout curtains are given in Tables 2 and 3 should be considered when designing a blast. The specification writer must include a limitation of the allowable vibration when there is green concrete expected on the project. Table 2 has two option, one is more conservative, designer should make engineering decision which to use or adjust based on data.

3.6.3 Measuring and Recording Instruments

Submit seismographs for approval. Provide up to [_____] blasting seismographs capable of sampling rates of 15,000 samples per second or higher that meets ISEE PSBS. The 15,000 samples per second accuracy is required to acquire reproducible vibration readings. The units must be self-contained except for external geophones and microphones. The seismograph must be capable of providing a printout of each blast or downloading the data to a portable device for off-site printing. The units must be programmed with specific data for each site of seismograph placement, which includes seismograph location, geophone burial or mounting method, calibration signal, date, time and closest distance to the blast area. The seismic record must also indicate the maximum charge weight of explosives per delay in the blast. The seismographs must not be placed inside of a structure, unless required for the designated purpose and authorized by the Contracting Officer. The seismographs and geophones must be placed on and secured to sound bedrock or virgin soil, or mass concrete foundations. The seismographs should not be placed near a structure, unless the intent is to measure that structure's specific response to the blast. Include the raw data values from the seismograph of vibration and airblast.
3.6.4 Seismograph Locations

NOTE: This paragraph will vary depending on the project, the designer should determine what structures need to be monitored. It may be necessary to require one or two extra seismographs that are placed at the Contracting Officer's direction.

Install seismographs at the following locations:

a. Closest point on the existing main dam and auxiliary dam.

b. Main dam powerhouse or as otherwise directed by the Contracting Officer.

c. Three other locations selected by the Contractor with the agreement of the Contracting Officer.

These locations are subject to change as the project progresses.

3.6.5 Individual Vibration Monitoring Report

Provide the original digital results of vibration monitoring in the form of peak readings and frequencies for each blast prior to conducting any subsequent blasts, provide the Contracting Officer with access to the online data available immediately after the shot. Submit the vibration monitoring reports with the individual shot reports. Data recorded for each shot must include the following:

a. Identification of instrument used and location.

b. Name of qualified observer and interpreter.

c. Distance and direction of recording station from blast area.

d. Maximum pounds of explosive per delay period.

e. Type of ground at recording station and material on which the instrument is sitting.

f. How the geophone is anchored, if peak acceleration is greater than 0.2 g to prevent decoupling of the sensor.

g. Maximum particle velocity in each component direction.

h. A dated and signed copy of seismic records with their supporting information.

i. Regression analysis of seismic data measured at each seismograph for each blast. The Seismic Specialist must conduct an independent regression analysis for each seismic location after each blast. The regression analysis is necessary to understand vibration transmission throughout the site and must be used to accurately predict the vibration levels generated on the next blast design.

j. Airblast results.
Take all necessary precautions to assure that the peak particle velocity readings available from the blast record are accurate to the maximum extent possible, as defined by the manufacturer of the equipment. The equipment must be calibrated annually.

3.6.6 Airblast Monitoring

**************************************************************************

NOTE: The peak overpressure threshold should be 133 dB in accordance with the EM385-1-1, some state regulations set a lower dB threshold. The designer must research state, county or local requirements and decide if the most stringent must be selected.

**************************************************************************

Take every precaution to minimize airblasts from all blasts. Install an airblast monitoring system between the main blasting area and the nearest structure subject to blast damage or annoyance. The equipment used to make the airblast measurements must be specifically manufactured for that purpose. Peak overpressure must be held below [133] dB (linear peak scale), 100 Pa 0.015 psi at the nearest residential or inhabited structure or other designated location. Appropriate blasthole patterns, detonation systems, and stemming must be used to prevent venting of blasts and to minimize airblast and noise levels produced by the blasting operations. A dated record of the peak overpressure measurements signed by the Seismic Specialist must be furnished to the Blasting Specialist immediately after each blast unless a variance is given by the Contracting Officer. Provide the Contracting Officer with access to the online data available immediately after the shot. Include the airblast data in the Individual Vibration Monitoring Report.

3.6.7 Flyrock Control

**************************************************************************

NOTE: Use of blasting mats may be required in specific areas depending on the project needs and risks.

**************************************************************************

Before firing any blast in areas where flying rock may result in personal injury or any damage to property or the work area, the rock to be blasted must be covered with approved blasting mats, or other equally serviceable material, to prevent flyrock. The Contractor must ensure that enough blasting mats are available at the project site to cover the blast area. If flyrock occurs all blasting must cease until the Blasting Consultant files a report explaining the cause of the flyrock and methods that must be employed on all subsequent blasts to prevent flyrock. Submit this report to the Contracting Officer for review before any additional blasts are detonated. No additional compensation will be given to the Contractor for work stoppage after a flyrock incident.

3.6.8 Rock Damage Control

**************************************************************************

NOTE: Tailor this paragraph to the specific site issues that may affect blasting.

**************************************************************************

The rock formations are known to contain geological features including
Use stemming decks across weak or open geological features to confine the energy into the hard rock and minimize explosive gas penetration into these features. No rock mass damage, uplift or shifting or significant overbreak will be tolerated. Control drilling accuracy and delay timing to provide proper relief toward the free face away from final rock slopes. Any blasting damage or breakage into the excavation walls will be mitigated at the Contractor's expense. Damage is defined as the loosening of rock behind final lines and grades, opening of joints in the final wall and rock block displacement in the final wall. If any damage occurs to the final wall that requires remediation, it must be the responsibility of the Contractor to prove that the blasting method employed did not cause the damage.

3.7 TEST BLASTING

******************************************************************************
NOTE: The test blasting will be highly specific for the project site. The designer may have a way to carry out the test blasting in order to have the Contractor demonstrate satisfactory results. Typically, the main reason for test blasting is to gain understanding of how the blasting on the site causes vibrations/air blast on monitored structures, develop a site attenuation curve to design future blasts with vibration in mind. The other is to demonstrate results, line drilling and presplitting that meets the specifications and no damage to final faces and foundation grade. Typically the test blasting occurs in an area where there is room for failure, if a test presplit causes significant back break it won't be to a finished face and can be removed. The designer must also keep in mind that a poorly design shot can result in blast damage, such as induced cracks or even opening of rock joints, and can extend beyond the blast area more than 30 meters 100 feet. Typically an area that would be removed with full production blasting. Test blasting will be reviewed by the Contractor's consultant and the Government's consultant (if retained), blasting Subject Matter Expert (SME) within USACE.

The following is typical test blasting language.
******************************************************************************

Submit the Test-Blast Plan for review and approval. Allow 21 days for review after submittal. Allow 14 days for Government review after submitting the revised plan. Approval of the revised plan will not relieve the Contractor of their responsibility to produce safe and satisfactory results as set forth by these specifications.
Prior to commencing full-scale blasting operations in a different rock type, weathering grade or new bench elevation, demonstrate the adequacy and effectiveness of the proposed blasting plan by drilling, blasting, and excavating short test sections, not exceeding 15.3 meters 50 feet in length, to determine which combination of method, hole spacing, and explosive loads produces the proper split. If more than one presplit design is tested in one test blast, each presplit design section must be at least 6 meters 20 feet in length along the surface.

The first opening blast starting from a level plane that has only vertical relief (i.e. a sinking cut), must not be used as the production test blast. However, its results must be considered when designing the test blasts. The opening blast must be excavated to full depth if possible before drilling the blastholes for the test blast. The test blast must incorporate the planned methods of presplitting and must be near the center of the excavation and at least 4.5 meters 15 feet away from the final excavation walls [or invert]. The Contracting Officer has the option to adjust the location of the test blast areas to optimize for geology. Anticipate blasting up to 10 test sections with at least one test at each different geologic condition. The location of the test blast section must be approved in advance. The Contracting Officer may direct the Contractor to use test section lengths less than 15.2 meters 50 feet if field conditions warrant.

Unless otherwise directed, begin the presplit test blast with presplit holes spaced at 61 centimeters 24 inches center to center. Requirements for presplit and production blasting operations are covered elsewhere in this specification but apply to test blasts.

Do not drill ahead of the test shot area until the test section has been as fully excavated as possible and the results have been evaluated by the Contracting Officer. If the results of the test blast(s) are unsatisfactory, in the opinion of the Contracting Officer, the Contractor's Blasting Consultant must revise the blast design as necessary to achieve the specified results. Unsatisfactory test blast results include an excessive amount of fragmentation beyond the indicated lines and grade, extensive overbreak, flyrock, ground vibration, airblast or violation of other requirements or these specifications. All costs incurred by the Contractor in adopting revised blasting methods necessary to produce acceptable test blast results will be borne by the Contractor.

If at any time during the progress of the work, the methods of drilling and blasting do not produce the desired result of an undamaged rock slope within the specified tolerances, perform additional test sections by drilling, blasting and excavating short sections, not exceeding 15.2 meters 50 feet in length, until a technique is developed that produces the desired results. No additional compensation will be made for the additional test sections.

At the conclusion of the test blast program, produce a Post-Test Blast Evaluation Report which examines all reports, surveys, test data, and other pertinent information and conclusions reached. Submit a Test Blast Evaluation Report prepared by the Blasting Consultant and Blasting Specialist after testing blasting is completed.

3.8 BLASTHOLE DRILLING

Survey the elevation at the collar of each production hole in the final
blast to foundation grade to ensure that the production blastholes are not subdrilled below final foundation grade, except as permitted in paragraph SUBDRILLING. The survey must be included in the Individual Shot Plan and must not be changed without prior approval from the Contracting Officer. Drill production blastholes according to the patterns in the approved Individual Shot Plan. Prior to commencement of drilling of any production blasthole, all holes must be located by survey and clearly marked and numbered. Drill the production blastholes within two blasthole diameters of the marked collar location. The blastholes must have no more than a plus or minus [_____] meter foot horizontal tolerance at the bottom. If holes are drilled outside of these tolerances, except for geologic reasons, fill these holes with crushed stone or neat grout and re-drill them at the approved location as directed by the Contracting Officer at no additional expense to the Government.

After drilling of blast holes, place approved, reusable plastic blasthole markers in each hole to identify all blasthole locations and keep material from falling into the holes. Check, measure and record the depth of all blastholes as soon as the drill is retracted from the blasthole. If any blasthole has become plugged or is unable to be fully loaded, re-drill or clean out those holes with air prior to commencement of loading operations. Check and measure the depth of all blastholes in a shot to ensure each blasthole is open to the original drilled depth prior to loading of any holes. If any blasthole is found not be open to the drilled depth, re-drill the shot holes to the proper depth at the Contractor's expense. If any holes are too deep, fill the holes to the proper depth with crushed stone. Blasthole loading and drilling may be ongoing concurrently in a shot area; nonetheless, drilling must be separated from loaded holes by a distance equivalent to at least the depth of the loaded hole but in no case less than 15.2 meters 50 feet.

The Contracting Officer may require inclined boreholes to reduce toe burdens and backbreak.

3.9 PRODUCTION BLASTING

The Contractor must provide a detailed narrative for the proposed sequence of production blasting for the project in the Master Blasting Plan, to be evaluated and approved by the Contracting Officer. The proposed sequence must be tailored primarily towards conducting a safe blasting operation and overall responsible, prudent, and professional blast design in efforts to keep overbreak, flyrock, vibration and airblast levels to a minimum. If in the opinion of the Contracting Officer satisfactory results in the production blasts are not being produced, the Contracting Officer reserves the right to require changes in the blast design which could include variables such as burden, spacing, bench height, timing sequence and delays, subdrill depths, explosive loads, detonators, blast matting and the use of air decks or stemming in borehole bottoms. Such required revisions will be at no additional cost to the Government.

**************************************************************************

NOTE: The proposed language below can be used as guidance when both presplit and production blasting are used in the project. THE PRODUCTION BLASTING SECTION WILL BE HEAVILY TAILORED FOR THE PROJECT. THIS IS GENERAL TEXT THAT CAN BE ADJUSTED.

The drilling of presplit and production blastholes must be done one pattern at a time. Advanced
drilling of adjacent presplit or production blastholes will not be permitted. The presplit wall conditions must be evaluated after each blast by both the Contractor and the Contracting Officer before the adjacent presplit blasting plan can be approved or drilled whenever possible.

The sequence of Production and Presplit blasting for any single blast must be as follows:

1. Submit an individual shot plan.
2. Individual shot plan approved or revisions requested before approval.
3. Conduct drilling and submit Drilling Logs to Contracting Officer and Blaster in Charge.
5. Conduct rock removal, scaling and rock reinforcement Joint Evaluation of results by Contractor and Contracting Officer.
6. Submit an Individual Shot Plan for the subsequent blast in that work area.
7. Prepare a sufficient number of planned blasting areas in advance to maintain the project schedule.

The presplit wall conditions must be evaluated by the Contractor and the Contracting Officer after the Contractor exposes a minimum of 2.4 meters 8 feet (vertical) of the wall. If 2.4 meters 8 feet of exposure is not sufficient to determine the condition of the presplit wall, reinforce the exposed wall as necessary, then expose a minimum additional 2.4 meters 8 feet (vertical) of wall.

Repeat this downward to the toe of the presplit wall or until the Contracting Officer can determine if the presplit wall condition is adequate before approving the Individual Shot Plan for the adjacent presplit blast. Evaluate the effects of each production blast on the presplit and line drilled walls before submitting a blasting plan for the next blast.

The drilling tolerance must be evaluated and if drill tolerance exceeded the allowable tolerance then benches will be reduced in height to where the drilling tolerance was obtained on the subsequent blasts.

**************************************************************************

3.9.1 General Blasting Considerations and Limitations

In order to help control the effects of vibration, flyrock and airblast, maintain a burden distance that is not more than one-half the bench height and the burden must be between 25 to 35 times the diameter of the explosive charges in the blastholes. Deck loading must be placed across joints and seams that may direct energy and gases into the final walls. "Mud capping" for secondary blasting or blasting to reduce oversize rock fragments of blocks is prohibited.
NOTE: The language below is suggested example for projects requiring presplit as a controlled blasting method for a new spillway. Consult with USACE Blast Consultant or Blasting SME during design phase for suggested blasting considerations and limitations tailored to the project.

Production blasts must advance from the center of the spillway cut toward the left and right final cut slopes. The final shot for the left and right cut slopes must be a buffer shot. Blasting may be conducted on the upstream and downstream ends of the spillway at the same time.

Perform all production blasting, including that carried out in conjunction with the test blast section requirements, in accordance with the following general requirements.

Drill Production blastholes according to the patterns in the approved Individual Shot Plan. Bulk blasting agents will be permitted in specified locations. The use of cartridge explosive is required at locations described in paragraph 2.1.2 Blasting Products.

Set a buffer zone where the row of production blast holes in the row that is immediately adjacent to the presplit line are drilled on a plane approximately parallel to the plane of the presplit line. Drill the line of 3-inch diameter buffer holes no closer than one meter three feet to the design excavation line and with a hole spacing no closer than one meter three feet. The explosive loads in buffer holes must not exceed 50 percent of the full explosive load that is placed in a 3-inch production blastholes.

Detonation of the buffer holes must be on a delay sequence towards a free face and fired in sequence after the adjacent production blastholes.

Other than for sinking cuts, all blasts within 15.2 meters 50 feet of the final walls must be designed such that the open face is parallel to the excavation walls to reduce excessive pressure on the presplit final walls.

The true burden of blasts along the final walls, must be designed to be perpendicular to the final walls.

Take all necessary precautions in the production blasting so as to prevent blast damage to the
presplit or line drill face. If presplit results are not satisfactory and production or buffer blasts damage the presplit or line drill face (as evidenced by back-break or opening of joints beyond the presplit line, uplifted rock blocks at the presplit line or damage to the perimeter as determined by the Contracting Officer or Blasting Consultant), the Contractor may be directed to add another line of buffer holes on a parallel plane adjacent to the presplit holes for some or all of the successive buffer zone blasts.

Lift Height and Explosive Cartridge Diameter:
Follow this specification for explosive diameter as a function of bench height. This may require the use of mixed drilling for maximum production efficiency. Tamping of explosive cartridges or cartridge compression will not be allowed.

Lifts up to 10 Feet Deep: Production blastholes that are designed for lifts or hole depths of 10 feet or less must be loaded with explosive cartridges no larger than 1.25-inches in diameter. The final lift above the design excavation line must be 10 feet high and use these small diameter charges at the Labyrinth Weir and within 200 feet of the Labyrinth Weir. Short blastholes along final cut slopes of 0.25H:1.0V or shallower must also use 1.25-inch diameter explosives. Tamping of explosive cartridges or cartridge compression will not be allowed.

Lifts from 10 to 15 Feet Deep: Load production blastholes designed for lifts of 10 to 15 feet deep with explosive cartridges no larger than 2-inches in diameter. Tamping of explosive cartridges or cartridge compression will not be allowed.

Lifts Greater Than 15 Feet Deep or within 50 Feet of Final Walls: Load production blastholes that are designed for lifts of 15 or more feet deep or within 50 feet of final walls with explosive cartridges no larger than 2.5-inches in diameter. Tamping of explosive cartridges or cartridge compression will not be allowed.

Lifts Between 20 and 35 Feet Deep and Greater than 50 Feet from Final Walls or Farther than 200 Feet from the Labyrinth Weir: Bulk explosives may be used in the area 200 feet beyond the Labyrinth Weir, and 50 feet beyond the final excavation walls. The blastholes may be up to 3.5 inches in diameter and bulk loaded with bulk blasting agents.

In the area less than 200 feet from the Labyrinth Weir, and/or less than 50 feet from the excavation walls, tamping of explosive cartridges or cartridge compression will not be allowed.
When blasthole alignment restrictions can be met and geological conditions permit, the lift depth may be increased to a maximum of 35 feet at the option of the Contracting Officer.

3.10 PRESPLIT BLASTING

**********NOTE: Delete paragraph if presplit blasting is NOT to be used in the project.**********

Perform all presplit blasting, including presplit test blasts, in accordance with the following requirements:

Unless otherwise permitted by the Contracting Officer, completely remove all loose and decomposed rock along the top of the excavation floor for a distance of at least 9 meters (30 feet) beyond the end of the production hole drilling limits or to the edge of the excavation cut slope to reduce the possibility of flyrock before drilling any presplit blastholes.

The presplit blastholes must be 7.6 centimeters (3 inches) in diameter.

**********NOTE: Use the suggested paragraph when requiring precision presplitting methods.**********

Use the precision presplitting methods defined in paragraph Precision Presplitting, for all presplit blasting on this project. Presplit blasthole spacing must be 61 centimeters (24 inches) on centers.

The Contracting Officer reserves the right to determine whether blasting results are satisfactory after evaluating the final rock slopes. Successful demonstration of presplit blasting including blasthole spacing and the ability to meet allowable tolerances must be completed using test blasts during the beginning of blasting operations and when there is a change in rock materials character and bench elevations as outlined in the blasting test section of the specifications.

Use proper equipment and techniques to control drilling operations and ensure that no hole deviates from the plane of the planned final face by more than 6 inches normal to the slope or 15.2 centimeters (6 inches) from its planned position along the slope. Presplit blastholes deviating more than these limits will not be paid for unless, in the Contracting Officer's opinion, satisfactory rock slopes are being obtained.

Drill presplit blastholes along a line that is within 7.6 centimeters (3 inches) of the design excavation line. If the presplit holes are outside of the tolerance given in Subpart c, fill the holes with crushed stone or neat grout and re-drill at the correct location. Use electro-mechanical or electronic devices installed on all equipment for drilling the presplit holes to accurately measure the angle at which the drill steel enters the rock. Presplit blasthole drilling will not be permitted if these devices are not being used. The drill rig used must have the ability to change feed, impact, and rotation pressures on demand to adjust for the varying rock conditions and maintain presplit hole alignment. If problems
maintaining the blast hole tolerances persist, use an approved device, to determine blasthole orientation before the holes are loaded.

**************************************************************************
NOTE: Use this subpart if specific areas need more alignment control.
**************************************************************************

Measure the blasthole orientation of all presplit blastholes drilled at the [location(s) where this method is needed] using an approved device to check borehole alignment.

The row of presplit holes must extend 9 meters 30 feet beyond the limits of the production blast.

Measure and record the blasthole depth on the drilling log after drilling is completed. Place protection over each blasthole before moving the drill to the next blasthole location. The Blaster in Charge must also measure the blasthole depth to determine that it is free of obstructions for its entire depth before loading the blasthole. The Blasting Specialist must record the depths on the Individual Shot Report. Exercise all necessary precautions so that placing the charges does not cause caving of material from the walls of the holes. Blasthole conditions may vary from dry to partially to filled with groundwater. The depth of water in each blasthole must be recorded in the Individual Shot Report. The maximum diameter of explosives used in presplit holes must not be greater than one-half the diameter of the presplit hole. Perform presplitting before the production blast.

Line drilling along final walls may be required at corners where presplit lines meet.

Blastholes exceeding the allowable tolerances for location and alignment must be refilled with crushed stone or lean grout (at the option of the Contracting Officer) and re-drilled at the proper location and alignment.

Use only standard cartridge explosives manufactured specifically for presplitting or detonating cord in presplit holes. Do not use continuous columns of presplit explosives in the presplit holes. Use lighter loads composed of fractional cartridges affixed to detonating cord with inert spacers between charges or detonating cord in the blastholes. Firmly affix the cartridges to the detonating cord in such a manner that the cartridges will not slip down the detonating cord nor bridge across the hole.

**************************************************************************
NOTE: Add this sentence if using precision presplitting.
**************************************************************************

Use "Precision Presplitting" methods as defined in paragraph DEFINITIONS.

Spacing between the fractional cartridges along the detonating cord must not exceed 91.4 centimeters 36 inches center to center and must be adjusted to give the desired results. Fractional sticks of presplit explosive must be assembled and affixed to the detonating cord in accordance with the explosive manufacturer's instructions, a copy of which must be furnished to the Contracting Officer. The "air deck" method of presplitting is not allowed. The bottom charge of a presplit hole may be larger than the line charges but must not be greater than one pound or so large as to cause
overbreak or damage to the toe of the slope. Place the column charge of the presplit hole far enough below the collar, and reduce the upper charge(s) sufficiently to avoid overbreak and heaving of rock at the collar of the hole.

Place stemming in the upper portion of all presplit blastholes, extending from the uppermost charge to the hole collar. Stemming material must not extend more than 76.2 centimeters 30 inches below the collar of the hole. If test blasts produce unsatisfactory results adjustments must be made. Stemming material for presplit blastholes must consist of dry sand or drill cuttings supported by a stemming plug. Cover the presplit blasts as well as an adjoining production blast with blasting mats, if required to prevent flyrock.

If required to reduce ground vibrations or noise, presplit holes may be delayed, providing the hole-to-hole delay is no more than 25 milliseconds.

The presplit face must not deviate more than 15.2 centimeters 6 inches either side of a plane passing through adjacent drill holes, except where the character of the rock is such that, as determined by the Contracting Officer, irregularities are unavoidable. The geologic conditions affecting rock character include joints, shears, voids, gouge seams and variable weathering/alteration zones of various thicknesses and orientations. Design the blasts in such a manner to keep explosives gases from entering these planes and zones of weakness. Use of the Daily Drill Logs during explosive loading to identify the depth of weak zones and install stemming decks across them. The stemming decks must be filled with dry, angular, well graded crushed stone with the gradation specified in paragraph STEMMING.

**************************************************************************
NOTE: Typically cushion or trim blasting are not used on Civil Works projects. Exceptions must be decided early in the project design phase.
**************************************************************************

3.11 CUSHION OR TRIM BLASTING

Do not use cushion or trim blasting on this project.

**************************************************************************
NOTE: Note: Use the following paragraph templates if needing for precision Presplitting of specific areas of the excavation or project:

Precision Presplitting of Foundation Excavations at Service Spillway: For presplitting of excavations for concrete wall foundations at the Service Spillway, the Contractor must use a spacing between blastholes not to exceed 18 inches. The explosive load cannot exceed 0.04 pounds per square foot of face created for the column load. The bottom charge in these precision presplit blastholes cannot exceed 0.5 pounds.

Precision Presplitting at Main Dam Right Wall: Explosives must not be permitted for precision presplitting to form final cut slope surfaces at the Main Dam Right Wall. The Contractor must use
non-explosive demolition agent to fracture bedrock. Presplit hole spacing must range from eight to 18 inches, center to center. Hole diameter, final hole spacing and grout mixing, and proportions must be in accordance with manufacturer's recommendations for bedrock conditions encountered. The Contractor must take care to assure proper temperature and other environmental considerations meet the manufacturer's recommendations prior to use. Nonexplosive demolition agent must be use in such a manner to shear the web of rock between holes without any damage to the presplit final wall.

3.12 LINE DRILLING

Perform all line drilling in accordance with the following requirements:

**************************************************************************
NOTE: Line drilling spacing is typically twice to four times the diameter of the drill hole size, it could be varied depending on the project.
**************************************************************************

a. The line drill holes must be 7.2 centimeters 3 inches in diameter and drilled with a spacing of 15.2 centimeters 6 inches on center.

b. Use proper equipment and techniques to control drilling operations and ensure that no line drill hole must deviate from the plane of the planned slope by more than 7.2 centimeters 3 inches normal to the slope or 7.2 centimeters 3 inches from its planned position along the slope plane. Line drill holes deviating more than these limits will not be paid for unless, in the Contracting Officer's opinion, satisfactory rock slopes are being obtained.

c. Drill line drill holes within [_____] centimeters [_____] inches of the marked collar location. If the line drill holes are outside of the 7.2-centimeters 3-inch tolerance, fill them with crushed stone or lean grout and re-drill at the correct location.

d. Locate line drill hole collars along a line that is within 7.2 centimeters 3 inches of the design excavation line. Line drilling will not be permitted if electro-mechanical or electronic devices are not being used to accurately determine the angle at which the drill steel enters the rock. The drill rig should have the ability to change feed, impact and rotation pressures on demand to meet the varying rock conditions and to maintain hole alignment. If problems maintaining the drill hole tolerance persist, use an approved device to determine blasthole orientation before the holes are loaded.

**************************************************************************
NOTE: Include the following paragraph if need to extend line drilling beyond lengths of cut:
**************************************************************************

Lined drill holes in those areas where located must extend a minimum of 9 meters 30 feet beyond the limits of the production holes to be detonated, or to the end of the cut, as applicable.
3.12.1 Line Drilling Locations

Line drilling must be performed at the following locations:

**************************************************************************
NOTE: Depending on the project geology and structure, it may be appropriate to lengthen the distances line drilling is to be conducted at corners, the bracketed lengths here should be considered a minimum. The orientation of the jointing/fractures/foliation may dictate this length.
**************************************************************************

a. [3][_____] meters [10][_____] feet on either side of outside corners with an angle equal to or less than 120 degrees.

b. [1.5][_____] meters [5][_____] feet on either side of inside corners with an angle equal to or less than 90 degrees.

**************************************************************************
NOTE: Use the following if project is in karst or areas of large cavities.
**************************************************************************

If cavities are encountered during presplit drilling, that section of presplit line must be lined drilled in order to prevent presplit gases from entering the cavity.

3.13 STEMMING

**************************************************************************
NOTE: Depending on the geology of the project site this paragraph should be tailored to the project, for example in places with karst a more detailed procedure should be specified or contractor required to submit a procedure for dealing with larger voids.
**************************************************************************

Variations in rock hardness, structure, and other geological conditions encountered at depth will require the Contractor to stem the blast holes through soft weak areas, shears, open joints, and voids; therefore, close attention will be taken to classify the rock while drilling the blast holes. Where necessary, holes will be stemmed with dry, angular, well-graded crushed stone from .3-cm to 1-cm 1/8-inch to 3/8-inches in diameter without fines. The Blasting Consultant may submit a written, signed request to use drill cuttings for applications such as in presplit blastholes, must be submitted to the Contracting Officer for approval. Wet holes must not be stemmed with drill cuttings. No separate payment is made for stemming.

3.14 SUBDRILLING

**************************************************************************
NOTE: Depending on the project features it may be necessary to further specify where subdrilling is allow and to what depth. Depth range of subdrilling shall be described in the Master Blasting Plan. There may be places where subdrilling is prohibited or limited as in the case where structures are to be
constructed on the blasted surface and anchored - as subdrilling can complicate and significantly alter planned anchorage.

Subdrilling of blastholes below the design excavation line of the foundation is restricted to limited areas of the excavation. Use precise survey control to attain accurate drill blasthole depths and locations in accordance with the approved Master Blasting Plan. The methods of controlling blasthole depths and locations are subject to approval. Describe in the Master Blasting Plan the depth range of subdrilling planned in areas where it is allowed.

If test blasts on higher benches in the same geologic material as that above foundation grade demonstrate that subdrilling with no explosive placed in the hole below grade (air or water cushion in subdrill) causes no cracking below the grade, a request to use the subdrilling procedure may be submitted for approval.

Backfill any blastholes that are not in compliance with these requirements with crushed stone to the appropriate depth at the Contractor's expense.

3.15 FRAGMENT SIZE DISTRIBUTION AND TOLERANCES

NOTE: This section should be written with direct coordination from the project designer of record, who will provide input on maximum rock size/gradation based on project (embankment fill zones, etc.). Large stones (riprap, armor stone, derrick stone) may be required in the project and the blast must be adequately designed to produce this large stone. Some projects will not need this paragraph. CAUTION: requiring stone gradation may imply that the stone may be conducive to that gradation - which may not be the case.

Produce rock fragmentation from blasts such that [_____] percent of the fragments are [_____] centimeters [_____] inches or less in diameter for placement into the rock crusher and into the rock fill zones of the embankments. Reduce oversize material from blasting to meet the size range specified above. Predictive methods involving photo comparison and image analyses such as Wipfrag or Motion Metrics are encouraged to analyze size distribution of fragmented rock. Any secondary blasts of oversize fragments must be covered with blasting mats, and use a charge diameter no greater than 3 centimeters 1.25 inches.

NOTE: Include tolerance for each proposed structure from the excavation lines. For example, "The tolerance for the perimeter walls is minus 30.5 cm/ft 12 inches/foot from the design excavation line. The tolerance for the invert in the area of the Labyrinth Weir foundation and within 61 meters 200 feet downstream from the Weir is minus 31 centimeters 12 inches from the design excavation line. Elsewhere, the tolerance for the invert is plus or minus 31 centimeters 12 inches from the design line."
3.16 REQUIRED MUCKING

Muck and scale following each shot after firing for inspection of the slopes, bottom of the shot lift, or foundation. Drilling and loading for the next shot must not be allowed before the required mucking of the previous shot. This requirement may be waived temporarily when in the opinion of the Contracting Officer, the Contractor's blasting is satisfactory (i.e. no backbreak, overbreak, vibration cracking, exceedance of vibration or airblast thresholds etc.). Notwithstanding this requirement, the face must fully be dug out after every shot to a distance not less than 6 meters 20 feet prior to drilling and loading the next shot to allow inspection and evaluation of the shot face and allow for adjustments to the blast design for adjacent shots. Required mucking after each shot must be reinstated, when in the opinion of the Contracting Officer blasting is unsatisfactory. Any excavation support deemed necessary by the Contractor or Contracting Officer for the safety of personnel in the excavation will be installed as the excavation proceeds. Blasting of the next lower lift will not be permitted until the slope has been accepted by the Contracting Officer.

3.17 SCALING

NOTE: Typically a level of scaling is required for each project, an excavation spec may have more detail on this, or require bolting or other methods of stabilization before carrying down an excavation with more blasting.

Scale any loose and unstable or unsafe appearing material remaining on the rock slopes after blasting and as the excavation is carried down. Perform scaling immediately after each lift of the rock mass is removed by production blasting. The scaling must be accomplished by methods approved by the Contracting Officer. Drilling of the next lift will not be allowed until a rock slope has been properly scaled and rock reinforcement installed as determined by the Contracting Officer. No separate payment is made for scaling.

NOTE: This guide specification covers the requirements for termiticide treatment measures for subterranean termite control.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Termite infestation exists throughout the United States and overseas areas with the exception of Alaska. Soil treatment will be specified for all types of construction where termites are likely to establish colonies and make concealed access to wood construction, including wood doors, windows, finish, and trim, or to wood-product, cloth, or cellulose storage in buildings. Soil treatment will also be required for structures constructed of or containing wood-preservative-treated items or containing electronic equipment (e.g., hydraulic digital interfaces, medical equipment) that will be damaged due to nuisance swarms of termites that may occur due to untreated soil. However, soil treatment is
not required for power plants, central-heating plants, water or sewer treatment plants, incinerators, pump houses, and structures of similar nature which have neither electronic equipment that could be damaged due to nuisance swarms, wood in their construction nor wood or cellulose items stored within, and which have little chance of conversion to alternative uses.

Modification of this section, including materials, concentrations, or rates of application, considered necessary because of climatic conditions, porosity of soil to be treated, type of termite, or heavy infestation of termites, will be as recommended by the cognizant Pest Management Consultant. The modification will be in accordance with the guidance contained in the installation integrated pest management plan. Army Regulation 210-50, Housing Management, paragraph SPECIAL CONDITIONS, prohibits termiticide treatment through or under concrete slabs where HVAC ducts or vents are within or beneath the slab. Information is also available from state and local agriculture agencies and from the EPA National Pesticide Telephone Network at 1-800-858-7378.

When termites are known to be present on the project site, any crawl space on the ground level designed in a building needs to be designed for a concrete cover to be placed over the soil after treatment by a termiticide. Since the crawl space remains accessible to people and animals, it requires the concrete cover and signage.

For maximum termite protection, new structures should be designed and constructed using EPA registered lumber, especially for foundation members. Untreated lumber in existing structures may be treated by rodding using EPA registered wood treatment chemicals, which can be applied to untreated wood.

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. DEPARTMENT OF DEFENSE (DOD)

DODI 4150.07 (2019) DOD Pest Management Program

1.2 ADMINISTRATIVE REQUIREMENTS

Coordinate work related to final grades, landscape plantings, foundations, or any other alterations to finished construction which might alter the condition of treated soils with this specification.

1.3 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY CONTROL

1.4.1 Regulatory Requirements

**************************************************************************

NOTE: Contact regional pest management consultant to obtain service specific reporting requirements.

**************************************************************************
Comply with DODI 4150.07 for requirements on Contractor's licensing, certification, and record keeping. Maintain daily records using the Pest Management Maintenance Record, DD Form 1532-1, or a computer generated equivalent, and submit copies of records when requested by the Contracting Officer. These forms may be obtained from the main web site: http://www.dtic.mil/whs/directives/forms/eforms/dd1532-1.pdf

1.4.2 Qualifications

For the application of pesticides, use the services of an applicator whose principal business is pest control. The applicator must be commercially certified in the state where the work is to be performed as required by DODI 4150.07. Termite applicators must also be certified in the U.S. Environmental Protection Agency (EPA) pesticide applicator category which includes structural pest control. Submit a copy of the pest control business license and pesticide applicator certificates.

1.4.3 Safety Requirements

Formulate, treat, and dispose of termiticides and their containers in accordance with label directions. Draw water for formulating only from sites designated by the Contracting Officer, and fit the filling hose with a backflow preventer meeting local plumbing codes or standards. Perform filling operations under the direct and continuous observation of a contractor's representative to prevent overflow. Secure pesticides and related materials under lock and key when unattended. Ensure that proper protective clothing and equipment are worn and used during all phases of termiticide application. Dispose of used pesticide containers off Government property.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery

Deliver termiticide material to the site in the original unopened containers bearing legible labels indicating the EPA registration number, manufacturer's registered uses and in new or otherwise good condition as supplied by the manufacturer or formulator.

1.5.2 Inspection

Inspect termiticides upon arrival at the job site for conformity to type and quality in accordance with paragraph TERMITICIDES. Each label must bear evidence of registration under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), as amended or under appropriate regulations of the host county. Inspect other materials for conformance with specified requirements. Remove unacceptable materials from the job site.

1.5.3 Storage

Storage of pesticides on the installation will not be permitted unless it is written into the contract.

1.5.4 Handling

Handle and mix termiticides in accordance with the manufacturer's label and SDS, preventing contamination by dirt, water, and organic material. Protect termiticides from weather elements as recommended by the manufacturer's label and SDS. Spill kits must be maintained on pest control vehicles and
must be available at the mixing site. Conduct termiticide mixing in an area with adequate spill containment.

1.6 SITE CONDITIONS

The following site conditions determine the acceptable time of application.

1.6.1 Soil Moisture

Test soils to be treated immediately before application. Test soil moisture content to a minimum depth of 75 mm 3 inches. The soil moisture must be as recommended by the termiticide manufacturer. Application of the termiticide is not permitted when soil moisture content exceeds manufacturer's recommendations.

1.6.2 Runoff and Wind Drift

Application of termiticide will not be permitted during or immediately following heavy rains, when conditions may allow runoff, or create an environmental hazard or when average wind speed exceeds 16 km 10 miles per hour. Termiticide is not permitted to enter water systems, aquifers, or endanger humans or animals.

1.7 WARRANTY

**************************************************************************
For Navy projects, modifications must be approved by the cognizant NAVFAC Applied Biologist. Contact information can be found at https://hub.navfac.navy.mil/webcenter/faces/oracle/webcenter/page/scopedMD/sa0

For Army projects, contact information can be found at http://www.aec.army.mil/services/conserve/pestmanagement.aspx
**************************************************************************

Provide a 5 year written warranty against infestations or reinfestations by subterranean termites of the buildings or building additions constructed under this contract. Include in the warranty annual inspections of the buildings or building additions during the warranty period. If live subterranean termite infestation or subterranean termite damage is discovered during the warranty period, and the soil and building conditions have not been altered in the interim:

a. Retreat the site and perform other treatment as may be necessary for elimination of subterranean termite infestation;

b. Repair damage caused by termite infestation; and

c. Reinspect the building approximately 180 days after the re-treatment.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Chemical termite control uses liquid termiticide treatments applied to the soil to form a continuous chemical barrier in the soil around both sides of the foundation. The application can be surface applied or rodded and trenched. This barrier prevents foraging termites from reaching the
foundation and piers. Only the soil adjacent to these foundation elements is treated. For slab construction (including foundations, patios and garages), the entire soil (or gravel) surface is treated before the vapor barrier is installed and the slab poured over it. Soil treatment is coordinated with all building activities from foundation construction through final grading of the soil around the building's exterior. In order for the treatment to be effective, the final phase of the application must be done after final grading and sometimes after landscaping is completed so that the treated soil is not disturbed.

2.2 MATERIALS

2.2.1 Termiticides

Provide termiticides currently registered by the EPA or approved for such use by the appropriate agency of the host county and as approved by the Contracting Officer. Select non-repellant termiticides for maximum effectiveness and duration after application. Select a termiticide that is suitable for the soil and climatic conditions at the project site and apply at the highest labeled rate. Submit manufacturer's label and Safety Data Sheet (SDS) for termiticides proposed for use.

PART 3 EXECUTION

3.1 PREPARATION

Eliminate food sources by removing debris from clearing and grubbing and post construction wood scraps such as ground stakes, form boards, and scrap lumber from the site, before termiticide application begins.

3.1.1 Verification

Before work starts, verify that final grades are as indicated and smooth grading has been completed in accordance with Section 31 00 00 EARTHWORK. Finely grade soil and remove particles larger than 25 mm 1 inch. Compact soil particles to eliminate soil movement.

3.1.2 Foundation Exterior

If the exterior perimeter treatment is applied when the horizontal barrier is applied it will be damaged or removed before construction is completed. The exterior foundation perimeter treatment will have to occur in phases when any pads, porches, aprons, sidewalks, final grading or landscape planting are simultaneously involved adjacent to the building foundation. This treatment area should be coordinated after all major construction but before any pads, porches, or other items requiring special consideration are poured adjacent to the foundation walls. Submit written verification that final grading, landscape planting and other items adjacent to the foundation will not disturb treatment of the soil on the exterior sides of foundation walls, grade beams, and similar structures.

3.1.3 Utilities and Vents

Turn off and block HVAC ducts and vents located in treatment area prior to application, to protect people and animals from termiticide. Submit written verification that the HVAC ducts and vents, water and sewer lines, and plumbing have been turned off or blocked prior to applying termiticide.
3.1.4 Crawl and Plenum Air Spaces

Submit written verification that crawl and plenum air spaces have been located and identified prior to applying termiticide.

3.1.5 Application Plan

Prior to commencing application of termiticide, submit a Termiticide Application Plan addressing the following items:

a. proposed sequence of treatment work including dates and times of application
b. termiticide trade name
c. EPA registration number
d. chemical composition
e. concentration of original and diluted material
f. formulation
g. manufacturer's recommended application rates
h. regional requirements
i. application rate of active ingredients
j. method of application
k. area or volume to be treated
l. amount to be applied
m. copy of the pest control business license
n. copy of the pesticide applicator certificates

3.2 APPLICATION

For areas to be treated, establish complete and unbroken vertical and horizontal soil poison barriers between the soil and all portions of the intended structure which may allow termite access to wood and wood related products. Make applications to crawl spaces in accordance with label directions. Applications to crawl space areas that are used as plenum air spaces will not be permitted.

3.2.1 Equipment Calibration and Tank Measurement

Submit a list of equipment to be used. Conduct calibration test on the application equipment to be used immediately prior to commencement of termiticide application. Measure the volume and contents of the application tank. Testing must confirm that the application equipment is operating within the manufacturer's specifications and meets the specified requirements. Submit written certification of the equipment calibration test results within 1 week of testing. Where results from the equipment calibration and tank measurements tests are unsatisfactory, re-treatment will be required.

3.2.2 Mixing and Application

Perform all work related to formulating, mixing, and application in the presence of the Contracting Officer and a DOD certified pesticide applicator, Pest Management QAE/PAR, or Integrated Pest Management Coordinator. Submit mixing formulation:

a. Quantity of pesticide used.
b. Rate of dispersion.
c. Percent of use.
d. Total amount used.

A closed system is recommended as it prevents the termiticide from coming into contact with the applicator or other persons. Only use water from designated locations. Fit filling hoses with a backflow preventer meeting local plumbing codes or standards. Prevent overflow during the filling operation. Spill kits must be maintained on pest control vehicles and must be available at the mixing site. Termiticide mixing must be conducted in an area that has been designated by the Government representative and that has adequate spill containment. Inspect the application equipment for applying termiticides prior to each day of use for leaks, clogging, wear, or damage. Immediately perform repairs on the application equipment to prevent or eliminate leaks and clogging.

3.2.2.1 Application Method

******************************************************************************
NOTE: Termiticide may be applied as a surface spray or by rodding and trenching.
******************************************************************************

[3.2.2.1.1 Surface Application

Use surface application for establishing horizontal barriers. Apply surface applicants as a coarse spray and provide uniform distribution over the soil surface. Termiticide must penetrate a minimum of 25 mm 1 inch into the soil, or as recommended by the manufacturer. If soils are treated to a depth less than specified or approved, repeat work performed to the depth specified at no additional cost to the Government.

] [3.2.2.1.2 Rodding and Trenching

Use rodding and trenching for establishing vertical soil barriers. Trenching must be to the depth of the foundation footing. Width of trench must be as recommended by the manufacturer, or as indicated. Rodding or other approved method may be implemented for saturating the base of the trench with termiticide. Backfill the trench immediately after termiticide has reached maximum penetration as recommended by the manufacturer. If maximum penetration is not achieved, as recommended by the manufacturer, repeat work performed to maximum penetration as recommended by the manufacturer at no additional cost to the Government. Backfill in 150 mm 6 inch rises or layers. Treat each rise or layer with termiticide.

] 3.2.3 Sampling

The Contracting Officer may draw samples for analysis, at any time and without prior notice, from stocks at the job site to determine if the amount of active ingredient specified on the label is being applied. When analysis, performed by the Government, indicates samples contain less than the amount of active ingredient specified on the label, repeat work performed with pesticides conforming to this specification at no additional cost to the Government.

3.2.4 Vapor Barriers and Waterproof Membranes

Apply termiticide prior to placement of a vapor barrier or waterproof membrane.
3.2.5 Placement of Concrete

Place concrete covering treated soils as soon as the termiticide has reached maximum penetration into the soil as recommended by the manufacturer.

3.2.6 Clean Up, Disposal, And Protection

Once application has been completed, proceed with clean up and protection of the site without delay.

3.2.6.1 Clean Up

Clean the site of all material associated with the treatment measures, according to label instructions, and as indicated. Remove and dispose of excess and waste material off Government property.

3.2.6.2 Disposal of Termiticide

Dispose of residual termiticides and containers off Government property, and in accordance with label instructions and EPA criteria.

3.3 FIELD QUALITY CONTROL

3.3.1 Verification of Measurement

Once termiticide application has been completed, measure tank contents to determine the remaining volume. The total volume measurement of used contents for the application must equal the application rate established in the application plan. Submit written verification that the volume of termiticide used meets the application rate established in the application plan.

3.3.2 Inspection

3.3.2.1 Technical Representative

Provide a technical representative who is a DOD certified pesticide applicator or Pest Management Quality Assurance Evaluator (QAE)/Performance Assessment Representative (PAR). The technical representative must be present at all meetings concerning treatment measures for subterranean termites and during treatment application. Contact the Integrated Pest Management Coordinator prior to starting work.

3.4 CLOSEOUT ACTIVITIES

Upon completion of this work, submit the Pest Management Report DD Form 1532, or an equivalent computer product, to the Integrated Pest Management Coordinator. This form identifies the target pest, type of operation, brand name and manufacturer of pesticide, formulation, concentration or rate of application used.

3.5 PROTECTION

3.5.1 Protection of Treated Area

Immediately after the application, protect the area from other use by erecting barricades as required or directed. Provide signage in accordance with Section 10 14 00.10 EXTERIOR SIGNAGE. Place signage inside the
entrances to crawl spaces and identify the space as treated with termiticide and not safe for children or animals. Cover treated areas with plastic if slab is not to be poured immediately following termiticide application.

3.5.2 Disturbance of Treated Soils

Re-treat soil and fill material disturbed after treatment before placement of slabs or other covering structures.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for termite control barriers, including both steel mesh and basaltic sand barriers. Project requirements and local conditions will dictate which barrier system is to be used.

This section is tailored for steel mesh and basaltic sand termite barrier systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This specification consists of furnishing and installing a complete stainless steel mesh barrier system or graded basaltic barrier sand at all penetrations, joints and perimeter foundations as a physical barrier below the concrete slabs and foundations of a structure to prevent the entry of Formosan and other ground termites into wood components of the structure, similar to laying down a chemical barrier of soil termiticide treatments.
The use of these materials does not preclude the use of other preventive measures such as chemical treatment and pressure treated lumber for construction to provide maximum protection to the structure. In fact, it is recommended that these materials be used in conjunction with chemical treatment at all vulnerable areas such as penetration areas around electrical conduits and plumbing pipes that penetrate the slab as well as the foundation perimeter and shoulder portions of the barrier. These termite barriers must comply with all codes. It is also recommended that pressure treated lumber be used to provide maximum protection to the structure.

**************************************************************************

NOTE: For Air Force, termite control barriers are not recommended, by the Air Force Civil Engineer Center, as a cost-effective method of termite prevention or control for Air Force real property. Instead use Section 31 31 16.13, CHEMICAL TERMITE CONTROL.

**************************************************************************

**************************************************************************

PART 1   GENERAL

**************************************************************************

NOTE: Termite infestation exists throughout the United States and overseas areas with the exception of Alaska. Steel mesh termite barriers or graded basaltic sand can be prescribed for installation at all sites where termites are likely to establish colonies and make concealed entries to wood construction, when it is deemed appropriate and cost effective.

**************************************************************************

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Pre-Installation Meetings

Convene a pre-installation meeting at least one week prior to beginning installation to review conditions of preparation, storage and handling, installation procedures, sequencing, protection, and coordination with other related work. The project superintendent, installer, installer's crew leader, and representatives of the trades affected by this work are required to attend. Notify the Contracting Officer at least 10 calendar days before the meeting.

1.3 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Steel Mesh Shop Drawings; G[, [_____]]
Basaltic Sand Shop Drawings; G[, [_____]]

SD-03 Product Data
Steel Mesh Materials
Accessories
Steel Mesh System
Written Warranty

SD-04 Samples
Steel Mesh Materials; G[, [_____]]

SD-06 Test Reports
Basaltic Sand; G[, [_____]]

SD-07 Certificates
1.4 QUALITY CONTROL

1.4.1 Qualifications

a. Only employee system installers trained in the behavior of termites and installation techniques of the mesh barrier, and accredited by the system's manufacturer. Submit certification that system installers meet the requirements specified and for the effective time period of accreditation.

b. Only employ workers trained and accredited at the appropriate level by the system's manufacturer.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the site in original, unbroken packaging and containers, with original labels in place, to include any U.S. Environmental Protection Agency (EPA) designation. Store materials in conformance with system manufacturer's recommendations. Store and handle the material so as to prevent contamination by dirt, water, and organic material.

1.6 SITE CONDITIONS

1.6.1 Environmental Requirements

In addition to the manufacturer's installation instructions and before placing material, ensure project site is free from standing water.

1.7 WARRANTY

**************************************************************************

NOTE: Choose the first sentence for minimum 1-year written warranty for existing building repair or renovation projects. Choose the second sentence for 5-year written warranties on new building or addition projects.

**************************************************************************
[Provide a minimum 1-year written warranty against infestations or re-infestation by subterranean termites of existing buildings with barrier installed during repair or renovation.][Furnish a 5-year written warranty against infestations or re-infestation by subterranean termites of the buildings or building additions constructed under this contract.] Written warranty must be jointly signed by an officer of the Contractor and the supplier. Perform annual inspections of the building[s] or building addition[s]. If live subterranean termite infestation or subterranean termite damage is discovered during the warranty period, and building conditions have not been altered in the interim, take the following actions:

a. Correct defective steel mesh basaltic sand installation and perform other treatment as may be necessary to eliminate subterranean termite infestation.

b. Repair damage caused by termite infestation.

c. Reinspect the building approximately 180 calendar days after the repair.

PART 2 PRODUCTS

NOTE: Check with local agencies to determine the local building code requirements and specifications to ensure conformance where required.

2.1 SYSTEM DESCRIPTION

2.1.1 Steel Mesh System Description

A complete termite control barrier system encompasses a fine steel mesh placed across all termite entry points to the building. Principal entry points include all cracks, joints, penetrations and other termite entry points within the concrete slabs and cavities in walls. The steel mesh and fastening system physically prevents the termites from entering the building. The mesh is too fine for the termites to squeeze through, too hard to chew through, and highly corrosion resistant for future break down.

2.1.2 Basaltic Sand System Description

A complete termite control barrier system encompasses a graded basaltic sand as a physical barrier below the concrete slab or foundation of a structure to prevent the entry of Formosan ground termites into wood components of the structure, similar to laying down a chemical barrier of soil termiticide treatments. The use of this preventive measure does not preclude the use of other preventive measures such as chemical treatment, steel mesh barrier system and pressure treated lumber for construction to provide maximum protection to the structure. In fact, it is recommended that this material be used in conjunction with chemical treatments of vulnerable areas such as around electrical conduits, plumbing pipes that penetrate the slab, and the shoulder portions of the barrier and with pressure treated lumber to provide maximum protection to the structure.
2.2 MATERIALS

2.2.1 Asbestos Prohibition

No asbestos containing materials or equipment are permitted at the job site. Ensure materials proposed for the project are asbestos free.

2.2.2 Steel Mesh Materials

Provide stainless steel mesh that conform to ASTM A478 and ASTM A580/A580M, Type A1AA marine grade 316 stainless steel mesh of 0.18 mm 0.007 inches diameter wire with mesh openings of 0.66 by 0.465 mm 0.026 by 0.018 inches.

2.2.2.1 Steel Mesh Material Submittals

Submit statements signed by responsible officials of the manufacturer of material attesting that material meets specification requirements. These statements must be dated after award of the project contract and clearly name the project.

Submit samples of steel mesh materials. Provide 102 by 102 mm 4 by 4 inches samples of steel mesh to be used in this work.

2.2.3 Accessories

Provide parging adhesives, bonding cement, high grade stainless steel clamps, ties, and other accessories as recommended by system's manufacturer.

2.2.4 Basaltic Sand

Provide clean, dry sand material manufactured from crushed basalt rock that meets the following requirements.

a. Material gradation, ASTM C136/C136M.

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.75 mm No. 4</td>

<td>1-10</td>
</tr>
</tbody>
</table>

b. Specific gravity, ASTM C128, 2.80.

c. Silica (S102) content, 45 percent.

d. Abrasion loss, after 500 revolutions, 20 percent, when tested in accordance with ASTM C131/C131M.

PART 3 EXECUTION

**************************************************************************

SECTION 31 116.19 Page 9
NOTE: Provide stainless steel mesh graded basaltic sand in a manner to provide maximum protection to the dwelling. The material provides a physical barrier against termites, thus, preventing entry. A range of techniques and material widths may be required to meet site conditions. The designer is required to determine the extent of openings to be covered to provide quantity estimates for the material installed.

3.1 EXAMINATION

Examine the substrates and conditions under which work of this section will be performed. Coordinate with this specification all work related to final grades, landscape plantings, foundations, or any other alternations to finished construction that might alter the condition of the site. Do not proceed until any unsatisfactory conditions detrimental to timely and proper completion of the work have been corrected. Submit written verification that site conditions are as required and other site work will not disturb the installation.

3.2 PREPARATION

In addition to the manufacturer’s requirements and before placing material, remove any visible plant roots, construction wood scraps such as ground stakes, form boards, and scrap lumber, and standing water from the excavated area. Inspect the utility trenches to ensure they are sufficiently wide to permit adequate cover under, around, and over pipes and conduit that will be encapsulated with the basaltic sand materials. In addition, inspect the foundation perimeter to ensure there is sufficient room between the sides of the excavations and the edges of the foundations to provide the required barrier depth and width.

Provide finished or temporary site grading to remove standing water from the project site (i.e., excavated areas or adjacent areas). Grading must provide positive drainage towards temporary, new or existing drainage features. Grading must not result in low spots that hold water or direct water towards new or existing facilities.

3.2.1 Surface Preparation

Perform work related to final grades, landscape plantings, foundations, or any other operations that might alter the condition of the site, in accordance with this specification. Before installing the steel mesh, ensure that the following have been completed:

a. Eliminate termite food sources by removing wood debris, such as ground
stakes, form boards, and scrap lumber from the work area.

b. The work area has been filled with finely graded soil consisting of particle sizes no larger than 25 mm 1 inch and compacted to eliminate soil movement. Ensure the site conditions meet the manufacturer's recommendations for installing the steel mesh.

c. Footings, foundations, and outer forms are in place.

d. Penetrating pipes for communications, electrical, and plumbing are in place.

e. Submit site conditions certificate documenting that the site conditions are acceptable for the steel mesh barrier system.

3.3 INSTALLATION

Install a basaltic sand system in accordance with the manufacturer's installation instructions.

Submit basaltic sand shop drawings of the basaltic sand installation at all interior and perimeter foundations, joints, and penetration conditions to the Contracting Officer for approval before installation.

3.3.1 Steel Mesh Instructions

Strictly follow the manufacturer's instructions published in Manufacturer's Installation Instruction Manual. In addition to the system manufacturer's instructions, place the stainless steel mesh across all openings, joints, penetrations, and other termite entry points to the building (including all shrinkage cracks in concrete slabs and built penetrations in slabs and walls that termites may use for access points) and in accordance with manufacturer's recommendations. Clamp, parge adhere, bond, or embed the steel mesh to the material surrounding the opening in accordance with the manufacturer's recommendations. Install with no gaps, penetrations, or damage to the mesh system. Submit steel mesh shop drawings of the termite steel mesh installation at all perimeter foundations, joints, and penetration conditions to the Contracting Officer for approval before installation.

To avoid an electrolytic reaction, do not place dissimilar metals in contact with the steel mesh.

3.3.1.1 Installation Sequence

a. Install the steel mesh barrier in accordance with the manufacturer's recommendations. Fit and clamp the mesh around all pipe penetrations, and terminate the mesh at the perimeters, as appropriate for the building construction and as described in the manufacturer's installation manual. Lap joint the mesh 10 to 15 mm 0.39 to 0.59 inches and the joint may be strengthened by using bonding cement for a minimum distance of 500 mm 20 inches along the joint.

b. Install special fittings that are appropriate to the construction, as described in manufacturer's installation manual.

c. Following installation of mesh and vapor barrier, install reinforcing steel and concrete, as specified under other sections. Seal penetrations and shrinkage cracks through concrete slabs in accordance
with manufacturer's recommendations.

d. To maintain resistance to termites, complete the system and do not disturb, penetrate, or damage during the remaining contract time period.

3.3.1.2 Steel Mesh Integration

Where required, integrate mesh into subsequent construction, as described in manufacturer's installation manual.

3.3.2 Placement

Place the basaltic sand barrier under slabs, in utility trenches, along edges of concrete pavement, in concrete masonry unit (CMU) cells, along retaining walls, and other areas that termites may use for access points and in accordance with manufacturer's recommendations.

Place material in one lift for thicknesses of 150 mm 6 inches or less and in successive lifts of 100 to 150 mm 4 to 6 inches where the indicated thickness is greater than 150 mm 6 inches. Compact each lift prior to placing successive lifts. Use power driven, vibrating-plate type tampers for large areas and rod-and-plate type hand tampers for small areas such as utility trenches and foundation and walk edges.

3.3.2.1 Slab on Grade

**************************************************************************
NOTE: Show the required depths on the drawings.
100 mm Four inches depth is the minimum required.
For areas where capillary action is a problem, consult a soils engineer if the depth should be increased or other capillary prevention measures are required.
**************************************************************************

Provide a barrier of the depth indicated. Rake smooth and machine tamp, making at least three passes over the entire area. Hand tamp around pipe and conduit risers.

3.3.2.1.1 Utility Trenches

Place the required depth of material for bedding in the trenches prior to placing pipes and conduits and hand tamp the material. For pipes 75 mm 3 inches and larger in diameter: After placing the pipe, bring material up to the top of the pipe and carefully hand tamp the material. Then, bring the material up to the top of the trench and tamp. For pipes smaller than 75 mm 3 inches in diameter and for conduit: Bring material up to the top of the trench and tamp.

3.3.2.1.2 Edges

After concrete is placed and the form is removed, remove any dirt, loose concrete, and other debris and hand place and tamp additional material to the existing grade

3.3.2.2 CMU Block Walls

Place the material in non-grouted cells at a height of at least one course above grade of the wall.
3.3.2.3 Fence Posts and Utility Poles

Line the designated hole with a geotextile or similar material before proceeding with the work.

Once the geotextile is in place, put a 100 to 150 mm 4 to 6 inches layer of the basaltic sand at the bottom of the hole. Hand tamp the material. After positioning the fence post or utility pole in the middle of the hole, fill around the sides, compacting the material after successive lifts of 150 to 300 mm 6 to 12 inches until the hole is completely filled. Ensure that a 100 to 150 mm 4 to 6 inches basaltic sand barrier exists around the perimeter of the post or pole.

3.3.2.4 Retaining Walls

Place the required amount of material below the footing and up to the grade level of the wall. Place lifts of 100 to 150 mm 4 to 6 inches with compaction of each lift prior to placing successive lifts.

3.4 FIELD QUALITY CONTROL

3.4.1 Inspection

Provide Manufacturer's Guidance for performing a visual inspection of the installed mesh to ensure the steel mesh provides the designed termite physical barrier.

3.4.2 Manufacturer Field Services

Before installing the steel mesh, verify that final grades are as indicated and smooth grading has been completed. Provide written verification that the site conditions under the proposed slabs are proper for the installation of the termite barrier system in accordance with the manufacturer's recommendations.

3.5 PROTECTION

Protect the installed steel mesh system, attachments, and accessories before, during, and after the work of all trades, as required by the system manufacturer or as directed by the Contracting Officer.

In the event that subsequent trades on the site move or damage the mesh, clamps, or parging mix, immediately contact the mesh installer for a recommendation of the necessary repairs.

NOTE: This guide specification covers the requirements for geosynthetic drainage layers including both geonets and geocomposites.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 MEASUREMENT AND PAYMENT

NOTE: Delete this paragraph when lump sum bidding is used.

Measure the total surface area in square meters feet covered by geosynthetic drainage layer. Base final quantities on as-built conditions. Allowance will be made for geosynthetic drainage layer in anchor and/or drainage trenches but no allowance will be made for waste, overlap, or materials used for the convenience of the Contractor. Geosynthetic drainage layer accepted by the Contracting Officer will be paid for at the respective contract unit price in the bidding schedule.

ASTM D5035 (2011) Breaking Force and Elongation ofTextile Fabrics (Strip Method)

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S"
classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
- Sampling and Testing
- Penetrations
- Construction Quality Control (QC) Laboratory

SD-04 Samples
- Geosynthetic Drainage Layer
- Seams and Overlaps

SD-06 Test Reports
- Sampling and Testing
- Geosynthetic Drainage Layer

1.4 QUALITY ASSURANCE

Provide a construction quality control (QC) laboratory that has also performed quality assurance (QA) testing, if required, of geosynthetic drainage layers for at least five completed projects, having a total minimum area of 186,000 square meters or 2 million square feet. Submit qualifications of laboratory which shall carry current accreditation via the Geosynthetic Accreditation Institute's Laboratory Accreditation Program (GAI-LAP) for the tests it will be required to perform.

1.5 DELIVERY, STORAGE, AND HANDLING

The QC inspector shall be present during delivery and unloading of the geosynthetic drainage layer. Ensure the drainage layer material has not been damaged during shipping, storage, or handling. Any drainage layer material found to be damaged shall be repaired or replaced. Accept delivery of material only after the required submittals have been approved. Each roll shall be labeled with the manufacturer's name, product identification, lot number, roll number, and roll dimensions. Rolls that have attached geotextiles shall be individually wrapped in plastic. Store the rolls in a level and dry area.

PART 2 PRODUCTS

2.1 GEOSYNTHETIC DRAINAGE LAYER

**************************************************************************
NOTE: The flow capacity required for the geosynthetic drainage layer should be determined using a procedure such as the one described in GRI Report Number 19 - The Design of Drainage Systems Over Geosynthetically Lined Slopes. Appropriate global safety factors and reduction factors should be applied to transmissivity values reported by manufacturers. A global factor of safety of 2 is typically used. Guidance on reduction factors for
intrusion, creep, chemical clogging, and biological clogging are provided in Designing with Geosynthetics by Dr. Robert Koerner and GRI Standard-GC8 Determination of the Allowable Flow Rate of a Drainage Geocomposite.

If high long term normal stresses are anticipated (e.g. 192 kPa 4000 psf or greater), requirements for maximum allowable creep strain should be included in Table 1. Creep strain requirements for geosynthetic drainage layers are determined using test method GRI GS 4 - Time Dependent (Creep) Deformation Under Normal Pressure. Typically, a normal stress of 2 to 3 times the design stress for a period of at least 10000 hours is used for creep strain testing.

Delete paragraphs and sentences which describe geotextile material and construction requirements if geotextiles will not be attached to the geonet.

The polymer used to manufacture the geonet component of the geosynthetic drainage layer shall be polyethylene which is clean and free of any foreign contaminants. Submit one properly identified 610 by 610 mm 24 by 24 inch minimum size geosynthetic drainage layer sample; fasteners proposed for use; and the method of seaming and overlapping. Submit manufacturer's quality control test results. Regrind material which consists of edge trimmings and other scraps may be used to manufacture the geonet; however, post-consumer recycled materials shall not be used. Conform the geosynthetic drainage layer to the property requirements listed in Table 1. Component criteria for the geonet alone and geotextile alone are also listed in Table 1. The geonet shall be covered on [one] [both] sides with nonwoven geotextile. Create geocomposite by heat bonding geotextile to the geonet. The geotextile shall not be bonded to the drainage net within 150 mm 6 inches of the edges of the rolls. Where applicable, Table 1 property values represent minimum average roll values (MARV). The value for AOS represents the maximum average roll value (MaxARV).

Note 1: The diameter of the presser foot shall be 56 mm 2.22 inches and the pressure shall be 20 kPa 2.9 psi. For other thickness options, see manufacturer's literature.

Note 2: This is the average peak value for five equally spaced machine direction tests across the roll width.

Note 3: Manufacturer's historical data.

Note 4: Manufacturing quality control transmissivity tests shall be measured using a gradient of [0.1] [_____] under a normal pressure of [10] [100] [_____] kPa [1.45] [14.5] [_____] psi. Use a minimum seating period of 15 minutes. Perform the test between rigid end platens.

Note 5: Average of five tests across the roll width. Discounting the outer 305 mm 1 foot of each side of the roll, collect samples at the 10, 30, 50, 70, and 90 percent positions across the roll width. Test both sides for double sided geocomposites.

2.2 SAMPLING AND TESTING

2.2.1 Manufacturing Quality Control Testing

Manufacturing quality control test methods and frequencies shall be in accordance with Table 1 unless otherwise approved. Submit manufacturer's quality control manual and construction quality control test results.
2.2.2 Construction Quality Control Testing

NOTE: One or more additional performance type transmissivity tests are often required to be performed by the Contractor's quality control laboratory. These tests should be performed at gradients and normal stresses that model site conditions. The type of material in contact with the geosynthetic drainage layer affects the flow properties of the drainage layer. Performance tests should use site specific soils and geosynthetics when such materials are known.

Typically, normal loads for CQC transmissivity tests are seated on the geosynthetic drainage layer for 100 hours prior to testing to account for long-term intrusion and creep. A reduction factor for intrusion should be used if a seating period of less than 100 hours is used.

The transmissivity requirement for the construction quality control transmissivity tests will generally be lower than the value shown in Table 1 for the manufacturing quality control tests.

Perform a minimum of [one] construction quality control transmissivity test in accordance with the requirements of this paragraph. Measure transmissivity using a gradient of [_____] under a normal pressure of [_____] kPa psf. Attach geotextile to the geonet in the same configuration as will be used in the field. The drainage layer shall be sandwiched between [_____] on the bottom and [_____] on the top. Use a minimum seating period of [100][_____] hours. The construction quality control test results shall achieve a minimum transmissivity of [_____].
spacing shall be a maximum of 1.5 m 5 feet. In anchor trenches, fastener
spacing shall be a maximum of 305 mm 1 foot.

3.1.3.2 Geonet End Seams

**************************************************************************
NOTE: Flow capacity of the geosynthetic drainage
layer must be adequate to ensure all flow remains in
the drainage layer and head does not build up in the
cover soils above the drainage layer. For this
reason, consideration must be given to flow capacity
of end seams on slopes. If end seam flow capacity
is a concern, end seams can be prohibited on side
slopes or they can be configured such that water can
flow from one geonet to another without passing
through any geotextile layers.
**************************************************************************

Overlap geonet end seams a minimum of 305 mm 1 foot. End seam fastener
spacing shall be a maximum of 305 mm 1 foot. The overlaps shall be in the
direction of flow.

3.1.3.3 Geonet Fasteners

Tie geonet rolls together with plastic fasteners. The fasteners shall be a
contrasting color from the geonet and attached geotextiles. Metallic
fasteners will not be allowed.

3.1.3.4 Geotextile Seams

The geotextile component of the geocomposite shall be [overlapped in the
direction of flow] [thermally bonded using approved methods] [sewn using
approved methods].

3.1.3.5 Geotextile Cap Strips

Place geotextile cap strips over any exposed edges of geocomposite. Cap
strips shall be a minimum of 610 mm 2 feet in width and shall be thermally
bonded to the geotextile component of the geocomposite.

3.1.4 Stacked Geosynthetic Drainage Layers

When geosynthetic drainage layers are to be stacked, stagger roll ends and
edges so that joints do not lie above one another.

3.1.5 Corners

In the corners of landfill liner side slopes, install an extra layer of
drainage layer material from the top to the bottom of the slope.

3.1.6 Penetrations

Submit penetration details. Mechanically attach a geotextile apron to
pipes and other appurtenances penetrating through the drainage layer so
that soil is prevented from getting into the drainage layer. The apron of
the attached geotextile shall extend out from the pipe or appurtenance a
minimum of 610 mm 2 feet. The apron geotextile shall be thermally bonded
to the geotextile [component of the geocomposite.][overlying the geonet.]
3.2 REPAIRS

3.2.1 Geonet Damage

Make repairs by placing a patch of the geosynthetic drainage layer over the damaged area. Extend the patch a minimum of 610 mm 2 feet beyond the edge of the damage. Use approved fasteners, spaced every 150 mm 6 inches around the patch, to hold the patch in place. If more than 25 percent of the roll width is damaged, approval must be obtained to repair or replace the damaged roll.

3.2.2 Geotextile Damage

Repair damaged geotextile by placing a patch of geotextile over the damaged area with a minimum of 305 mm 12 inches of overlap in all directions. The geotextile patch shall be thermally bonded in place.

3.3 PROTECTION AND BACKFILLING

Cover the geosynthetic drainage layer with the specified materials within [14] [_____] days of acceptance. Place cover soil from the bottom of the slope upward and shall not be dropped directly onto the drainage layer from a height greater than 915 mm 3 feet. The cover soil shall be pushed out over the geosynthetic drainage layer in an upward tumbling motion so that wrinkles in the drainage layer do not fold over. No equipment shall be operated on the top surface of the geosynthetic drainage layer without permission from the Contracting Officer. The initial loose soil lift thickness shall be 305 mm 12 inches. Use equipment with ground pressures no greater than 50 kPa 7 psi to place the first lift of soil. A minimum of [460] [610] [915] [_____] mm [18] [24] [36] [_____] inches of soil shall be maintained between construction equipment with a ground pressure greater than 50 kPa 7 psi and the drainage layer. Cover soil compaction and testing requirements are described in Section 31 00 00 EARTHWORK.

NOTE: This guide specification covers requirements for geotextiles.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: The "Geotextile Engineering Manual" by the Federal Highway Administration and "Designing with Geosynthetics" by Robert M. Koerner provide information on design criteria and example calculations used for the design of geotextiles.

1.1 MEASUREMENT

NOTE: Delete paragraphs MEASUREMENT and PAYMENT when lump sum bidding is used.

Measure the as-built surface area, covered by geotextile, in square meters.
yards. Allowance will be made for geotextile in anchor and/or drainage trenches but no allowance will be made for waste, overlaps, damaged materials, repairs, or materials used for the convenience of the Contractor.

1.2 PAYMENT

Geotextile installed and accepted will be paid for at the respective contract unit price in the bidding schedule. This unit price will include the cost of materials, equipment, installation, testing, and other costs associated with placement of the geotextile.

1.3 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D4354 (2012; R 2020) Sampling of Geosynthetics for Testing

ASTM D4355/D4355M (2014) Deterioration of Geotextiles from Exposure to Light, Moisture and Heat in a Xenon-Arc Type Apparatus

ASTM D4632/D4632M (2015a) Grab Breaking Load and Elongation of Geotextiles

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
SD-03 Product Data

Manufacturing Quality Control Sampling and Testing

SD-04 Samples

Quality Assurance Samples and Tests

SD-07 Certificates

Geotextile

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver, store, and handle geotextile in accordance with ASTM D4873/D4873M.

1.5.1 Delivery

Notify the Contracting Officer a minimum of 24 hours prior to delivery and unloading of geotextile rolls packaged in an opaque, waterproof, protective plastic wrapping. The plastic wrapping shall not be removed until deployment. If quality assurance samples are collected, immediately rewrap rolls with the plastic wrapping. Geotextile or plastic wrapping damaged during storage or handling shall be repaired or replaced, as directed. Label each roll with the manufacturer's name, geotextile type, roll number, roll dimensions (length, width, gross weight), and date manufactured.

1.5.2 Storage

Protect rolls of geotextile from construction equipment, chemicals, sparks and flames, temperatures in excess of 71 degrees C (160 degrees F), or any other environmental condition that may damage the physical properties of the geotextile. To protect geotextile from becoming saturated, either elevate rolls off the ground or place them on a sacrificial sheet of plastic in an area where water will not accumulate.

1.5.3 Handling

Handle and unload geotextile rolls with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Rolls shall not be dragged along the ground, lifted by one end, or dropped to the ground.

PART 2 PRODUCTS

2.1 RAW MATERIALS

A minimum of [7] [_____] days prior to scheduled use, submit manufacturer's certificate of compliance stating that the geotextile meets the requirements of this section. For needle punched geotextiles, the manufacturer shall also certify that the geotextile has been continuously inspected using permanent on-line full-width metal detectors and does not contain any needles which could damage other geosynthetic layers. The certificate of compliance shall be attested to by a person having legal authority to bind the geotextile manufacturer.
2.1.1 Geotextile

**************************************************************************
NOTE: This note contains information from Standard Specifications for Transportation Materials and Methods of Sampling and Testing, Part I - Specifications, Copyright 1999 by the American Association of State Highway and Transportation Officials (AASHTO), Washington, D.C. AASHTO has given permission to use this information.

Values for grab strength, seam strength, tear strength, and puncture strength for various applications can be obtained from the AASHTO M 288 - Standard Specification for Geotextiles. The most recent version of M 288 should be used as a reference. The table in M 288 is divided into three geotextile classes. The severity of installation conditions for the application generally dictates the required geotextile class.

The following values for permittivity and apparent opening size (AOS) are from AASHTO M 288. Values for permittivity and maximum AOS should be compared to actual values of commonly manufactured products to assure there are a sufficient number of manufacturers who can meet specifications.

<table>
<thead>
<tr>
<th>AASHTO M288 PERMITIVITY AND AOS REQUIREMENTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOIL TO BE FILTERED</td>

<tr>
<td>15 TO 50 PERCENT PASSING 75 µm NO. 200</td>
</tr>
<tr>
<td>GREATER THAN 15 PERCENT PASSING 75 µm NO. 200</td>
</tr>
</tbody>
</table>

The values listed above provide general guidance only. A site specific geotextile design should be performed especially if one or more of the following problematic soil environments are encountered: unstable or highly erodible soils such as non-cohesive silts; gap graded soils; alternating sand/silt laminated soils; dispersive clays; or rock flour. For cohesive soils with a plasticity index greater than 7, the geotextile maximum average roll value for AOS should be 0.30 mm No. 50 sieve.
Compatibility testing should be considered in situations where the geotextile will be exposed to chemicals which could degrade its physical properties. Refer to ASTM D5322 - Practice for Immersion Procedures for Evaluating the Chemical Resistance of Geosynthetics to Liquids for additional guidance on compatibility testing.

Geotextiles may also be used to provide puncture protection for geomembranes. Needle-punched nonwoven geotextiles are commonly used to provide puncture protection. GRI Report Number 13 - A Design Methodology for the Puncture Protection of Geomembranes provides guidance on the design of geotextile cushion layers. Typical index properties for a 350 g/square meter geotextile are shown below:

Provide geotextile that is a [woven] [nonwoven] pervious sheet of polymeric material consisting of long-chain synthetic polymers composed of at least 95 percent by weight polyolefins, polyesters, or polyamides. The use of woven slit film geotextiles (i.e. geotextiles made from yarns of a flat, tape-like character) will not be allowed. Add stabilizers and/or inhibitors to the base polymer, as needed, to make the filaments resistant to deterioration by ultraviolet light, oxidation, and heat exposure. Regrind material, which consists of edge trimmings and other scraps that have never reached the consumer, may be used to produce the geotextile. Post-consumer recycled material [may also] [shall not] be used. Geotextile shall be formed into a network such that the filaments or yarns retain dimensional stability relative to each other, including the edges. Geotextiles shall meet the requirements specified in Table 1. Where applicable, Table 1 property values represent minimum average roll values (MARV) in the weakest principal direction. Values for AOS represent maximum average roll values.

2.1.2 Thread

A minimum of [7] ______ days prior to scheduled use, submit proposed thread type for sewn seams along with data sheets showing the physical properties of the thread. Construct sewn seams with high-strength polyester, nylon, or other approved thread type. Thread shall have ultraviolet light stability equivalent to the geotextile and the color shall contrast with the geotextile.

2.2 MANUFACTURING QUALITY CONTROL SAMPLING AND TESTING

The Manufacturer is responsible for establishing and maintaining a quality control program to assure compliance with the requirements of the specification. A minimum of [7] ______ days prior to scheduled use, submit manufacturer's quality control manual. Documentation describing the quality control program shall be made available upon request. Perform manufacturing quality control sampling and testing in accordance with the manufacturer's approved quality control manual. As a minimum, geotextiles shall be randomly sampled for testing in accordance with ASTM D4354, Procedure A. Acceptance of geotextile shall be in accordance with ASTM D4759. Tests not meeting the specified requirements will result in the rejection of applicable rolls.

PART 3 EXECUTION

3.1 QUALITY ASSURANCE SAMPLES AND TESTS

**************************************************************************
NOTE: The need for and amount of quality assurance testing should be based on site conditions and the amount of geotextile being placed. EPA/600/R-93/182
indicates that a frequency of testing of once per 10,000 square meters 100,000 square feet has been used in the past for some large waste containment facilities.

3.1.1 Quality Assurance Samples

Provide assistance to the Contracting Officer in the collection of quality assurance samples for quality assurance testing; assign [7] [_____] days in the schedule to allow for testing. Collect samples upon delivery to the site [at the request of the Contracting Officer.] [in accordance with ASTM D4354, Procedure B. Lot size for quality assurance sampling shall be considered to be the shipment quantity of the product or a truckload of the product, whichever is smaller. The unit size shall be considered one roll of geotextile.] [at a frequency of one per 10,000 square meters 100,000 square feet]. Identify samples with a waterproof marker by manufacturer's name, product identification, lot number, roll number, and machine direction. The date and a unique sample number shall also be noted on the sample. Discard the outer layer of the geotextile roll prior to sampling a roll. Samples shall then be collected by cutting the full-width of the geotextile sheet a minimum of 1 meter 3 feet long in the machine direction. Rolls which are sampled shall be immediately resealed in their protective covering.

3.1.2 Quality Assurance Tests

[Provide] [The Contracting Officer will provide] quality assurance samples to an Independent Laboratory. Samples will be tested to verify that geotextile meets the requirements specified in Table 1. Test method ASTM D4355/D4355M shall not be performed on the collected samples. Geotextile product acceptance shall be based on ASTM D4759. Tests not meeting the specified requirements will result in the rejection of applicable rolls.

3.2 INSTALLATION

3.2.1 Subgrade Preparation

NOTE: Reference the appropriate sections for compaction requirements if the geotextile will be placed on a soil subgrade.

The surface underlying the geotextile shall be smooth and free of ruts or protrusions which could damage the geotextile. Subgrade materials and compaction requirements shall be in accordance with Section [______].

3.2.2 Placement

NOTE: For collection ditches, geotextile placed in the direction of flow should be wide enough to cover the entire width of the ditch. If this is not possible, the geotextile should be placed perpendicular to the direction of flow and shingled in the down-gradient direction.
Notify the Contracting Officer a minimum of 24 hours prior to installation of geotextile. Geotextile rolls which are damaged or contain imperfections shall be repaired or replaced as directed. The geotextile shall be laid flat and smooth so that it is in direct contact with the subgrade. The geotextile shall also be free of tensile stresses, folds, and wrinkles. On slopes steeper than 10 horizontal on 1 vertical, lay the geotextile with the machine direction of the fabric parallel to the slope direction.

3.3 SEAMS

**************************************************************************
NOTE: Overlapped seams are commonly used for geotextile not placed in tension. Geotextile seams can also be produced by sewing or the application of thermal energy. Contact the geotextile manufacturer for installation instructions using thermal methods. ASTM D4886 should be referenced for heat seamed geotextiles.

For geotextile placed in tension, seams should be sewn and the stitch type should be based on the manufacturer's recommendations.
**************************************************************************

3.3.1 Overlap Seams

**************************************************************************
NOTE: Seams are typically overlapped a minimum of 300 mm 12 inches. The specified seam overlap should be greater than 300 mm 12 inches for soft subgrades or where large amounts of differential settlement are anticipated. The maximum overlap is typically 1 meter 36 inches. For soils with a CBR value of less than 1, seams are typically sewn. Refer to AASHTO M 288 for additional guidance on overlaps for soft subgrade conditions.
**************************************************************************

Continuously overlap geotextile panels a minimum of [300] [_____] mm [12] [_____] inches at all longitudinal and transverse joints. Where seams must be oriented across the slope, lap the upper panel over the lower panel. If approved, sewn seams may be used instead of overlapped seams.

3.3.2 Sewn Seams

**************************************************************************
NOTE: The plans and/or specifications should indicate which seams must be sewn.

Seam strength can be specified based on ASTM D4632/D4632M for applications where the geotextile will not be placed in tension. In this case, seam strength is typically measured in accordance with ASTM D4632/D4632M and is typically specified to be equal to or greater than 85 to 90 percent of the grab strength of the geotextile. If seam strength testing will be required, add seam strength requirements to Table 1.
The need for quality assurance testing needs to be determined on a site specific basis and should be based on how critical the project is and the consequences of failure.

If the geotextile is designed to be in tension, strength testing should be required and ASTM D4884/D4884M should be used to determine seam strength. Quality assurance and quality control testing should be performed on all seams that are designed to be in tension.

Factory and field seams shall be continuously sewn [on all slopes steeper than 1 vertical on [4][_____] horizontal] [at the locations shown on the drawings.] The stitch type used shall be a 401 locking chain stitch or as recommended by the manufacturer. [For field and factory seams which are sewn, provide at least a 2-meter sample of sewn seam before the geotextile is installed. For seams that are field sewn, the seams shall be sewn using the same equipment and procedures as will be used for the production seams. If seams are sewn in both the machine and cross machine direction, provide samples of seams from both directions.] [Provide Quality Assurance seam samples to the Government at the request of the Contracting Officer]. Seam strength shall meet the minimum requirements specified in Table 1. The thread at the end of each seam run shall be tied off to prevent unraveling. Skipped stitches or discontinuities shall be sewn with an extra line of stitching with a minimum of 450 mm 18 inches of overlap.

3.4 PROTECTION

NOTE: The use of staples or pins to hold geotextiles in place should not be allowed in applications where the geotextile will be located adjacent to other geosynthetic layers which could be damaged.

The purpose of limiting exposure time prior to covering geotextiles is to minimize damage due to UV radiation and to prevent direct contact by vehicles, humans, and animals. To prevent UV degradation, exposure time of polypropylene geotextile should be limited to 14 to 28 days. Polyester geotextile is more resistant to UV degradation and may be exposed to UV radiation for at least 28 days without damage.

Protect the geotextile during installation from clogging, tears, and other damage. Damaged geotextile shall be repaired or replaced as directed. Use adequate ballast (e.g. sand bags) to prevent uplift by wind. The geotextile shall not be left uncovered for more than [14] [_____] days after installation.

3.5 REPAIRS

Repair torn or damaged geotextile. Clogged areas of geotextile shall be removed. Perform repairs by placing a patch of the same type of geotextile over the damaged area. The patch shall extend a minimum of 300 mm 12 inches
beyond the edge of the damaged area. Patches shall be continuously fastened using approved methods. The machine direction of the patch shall be aligned with the machine direction of the geotextile being repaired. Remove and replace geotextile rolls which cannot be repaired. Repairs shall be performed at no additional cost to the Government.

3.6 PENETRATIONS

Construct engineered penetrations of the geotextile [as shown on the drawings] [by methods recommended by the geotextile manufacturer].

3.7 COVERING

NOTE: This paragraph should be modified if the geotextile will be covered by another geosynthetic layer.

If large stones or riprap will be placed over the geotextile, the drop height of the stones should be addressed in the specifications. At some projects, the Contractor is required to construct a small test fill to verify his placement techniques will not damage the geotextile and to determine the maximum allowable drop height.

Do not cover geotextile prior to inspection and approval by the Contracting Officer. Place cover soil in a manner that prevents soil from entering the geotextile overlap zone, prevents tensile stress from being mobilized in the geotextile, and prevents wrinkles from folding over onto themselves. On side slopes, soil backfill shall be placed from the bottom of the slope upward. Cover soil shall not be dropped onto the geotextile from a height greater than 1 m 3 feet. No equipment shall be operated directly on top of the geotextile without approval of the Contracting Officer. Use equipment with ground pressures less than 50 kPa 7 psi to place the first lift over the geotextile. A minimum of [300][_____] mm [12][_____] inches of soil shall be maintained between full-scale construction equipment and the geotextile. Cover soil material type, compaction, and testing requirements are described in Section 31 00 00 EARTHWORK. Equipment placing cover soil shall not stop abruptly, make sharp turns, spin their wheels, or travel at speeds exceeding [2.2] [_____] m/s [5] [_____] mph.

3.18 DOCUMENTATION
3.18.1 Maintenance Records
3.18.2 Final Project Report

-- End of Section Table of Contents --
NOTE: This guide specification covers bioengineering practices as related to stabilizing stream banks and shorelines using natural vegetation by itself or in conjunction with stone, rock, dead vegetation structures, or organic erosion control matting. The methods may also be applied to small tributaries, gullies, canals, and drainage channels. The use of the term bioengineering refers to soil bioengineering in this specification. Soil bioengineering is a method of stabilizing soils using living and dead plant material and biodegradable manufactured products. Bioengineered structures should not at anytime be constructed on
embankments, levees, or flood control structures where there is a risk of failure of the project from a single event or a storm with a recurrence interval of 10 years.

This specification focuses only on stream banks and shorelines at or near the edge of water. This specification is not for coastal protection. This specification does not include requirements for hard or dead vegetation structures that are for erosion control or habitat restoration. This specification does not include the use of geosynthetic materials, metal, or requirements for traditional stone or rock hardened structures for bank protection. The designer should be cognizant that the structures described in this specification often must be augmented with the establishment or enhancement of vegetative zones on the landward portions of the banks or shores. Refer to TR-EL-97-8 Bioengineering for Stream Bank Erosion Control Report 1 Guidelines for guidance.

The designer should use caution in the selection of bioengineering methods for bank stabilization. Many bioengineering methods provide improved erosion resistance to stream banks or shorelines. However, bioengineering methods are not designed to repair inherently unstable stream banks or shorelines, which require engineering design, soil improvement, or extensive soil removal prior to vegetation efforts. Bioengineering methods will not prevent bank failures due to poor soil conditions, over steepened or undercut slopes, rapid draw down or drop of water levels, or where flow velocities exceed bioengineering established tolerances. Improved stability due to the development of root mats in the soil may take two or more years to be realized. Therefore, the desired bioengineering methods or bioengineered structures must be selected based on-site specific conditions, realistic expectations of performance, and consultation with soil, hydraulic, and structural engineers and environmental resource personnel.

The designer should compare bioengineered structures to more traditional stabilization methods, such as stone revetments or concrete channel lining, in terms of cost and performance before final selection of stabilization methods. Traditional stabilization methods may be better suited and more economical and provide greater protection at lower costs than bioengineered structures. The designer should review case histories on the performance and maintenance of existing bioengineered structures during selection and design. It is important to anticipate possible future failures of banks due to toppling of large mature vegetation, changes in vegetation species, and impact on the structure and vegetation by animal and human activities. Hard
structures may be preferred at locations where the risk of loss of life or property is apparent or where rapid changes in land use may pose such a risk in the future.

This specification is applicable to semiarid and temperate regions. The construction of bioengineered structures in arid regions requires special attention to the selection of appropriate plant species, water supply, irrigation, and maintenance for successful completion and performance. Other bank protection alternatives may be more cost effective than bioengineered structures in arid regions.

The construction of bioengineered structures in cold climates requires additional design efforts to reduce or prevent damage. Structures may be damaged by the impact of ice flows or ice blocks in the stream or river. The development of ice at the stream bank that incorporates the vegetation of the structure may result in vegetation loss or increased forces on the structure. Consult with a hydraulic engineer on methods to minimize damage to the structure. The percent of damage and mortality to vegetation may be higher due to frost or severe cold. Free draining soils should be used to reduce the amount of frost heave on structural components. Structures may not be suitable in climates with deep frost depths where surficial soil may be subject to flow when disturbed during the spring thaw. Bioengineering methods may not be suitable in cold regions where plant development and growth are stunned due to the climate and where root development, which is required for performance of the structure, may require more than 2 years. Consult with regional experts when planning bioengineered structures in these regions.

Planning of the bioengineered structure requires a multidisciplinary team approach. The designer should consult at a minimum with personnel in soil mechanics, structural design, hydraulic engineering, biological sciences, botany, regulatory, cost estimating, contracting, and construction during the initial development of conceptual designs, comparison of alternatives, and throughout project execution as required. Clear objectives for the selection, performance, and risk of the structure must be developed early in the planning phase. Sponsors and the public must be advised about the cost, performance, safety, benefits, and risks of the selected structure during the early stages of design. The designer should be aware of the need for construction oversight during installation to ensure quality.

The designer should include the long-term costs of maintenance in cost estimates and the amount of
