Furnish a control system to provide safe, reliable, and efficient operation of the Flue Gas Cleaning System through integrated control of system processes and equipment. The control system shall perform safe boiler start-up and shutdown and shall respond to dynamic variations in boiler operating conditions including steam sootblowing while maintaining required emission levels. The control system shall include a vertical control and graphic system panelboard located in the Steam Plant control room and system cabinets located in the control equipment room. The Control system shall integrate local controls provided with the lime slurry preparation equipment, and other equipment, as specified, so that complete system operation can be remotely monitored and controlled from the Steam Plant control room. The Contractor shall provide instrumentation and control equipment, as specified and as required for a complete and operational system. Furnish instrumentation required to monitor the process variables. Furnish flow, pressure, and temperature instrumentation for each pump, to monitor operating conditions and indicated performance. Furnish flow, level, pressure, and temperature switches for alarm actuation in process lines, tanks, vessels, and heat exchangers. Furnish transmitters required to transmit the process variable to the control systems. Furnish instrumentation required to transmit the status of the process and equipment to control room panels. Furnish analyzers and sensors required to monitor and to control process reagents, flue gas influent and effluent, and waste products. Furnish supports, hardware, enclosures, and accessories required to mount, protect, and operate the instrumentation. Furnish instruments, meters, gages, switches, controllers, thermometers, thermocouples, transmitters, analyzers, panels, and gage boards as required. Furnish metal instrument identification tags on field devices. Furnish tubing, piping, and fittings required for a complete instrumentation and control system. Furnish electronic control systems to control and monitor continuous time-varying processes using either split architecture analog controllers or direct-digital control techniques to emulate analog controllers. Furnish electronic digital control systems to control and monitor sequential processes. Provide necessary control program software and hardware. Furnish control drives and control valve operators required for control of the FGD system including induced draft fan inlet damper control drives. Furnish control boards for at least the following areas or functions: FGD system control panelboard in Steam Plant control room, lime slurry preparation equipment, lime unloading, and at each spray dryer penthouse. Control panels in each area shall include the necessary control devices and instruments required to operate and monitor the equipment specified for control from that panel. Equipment which is specified to have both local control and control from the main system panelboard in the control room shall be provided with control mode selector switches at the main panelboard. Panelboards shall conform to UL 67. Analog loops shall be controlled from the main system panelboard only. Tag each field-mounted device and panel-mounted device using the following tag numbering scheme. Instruments shall be tagged according to contract number and type of device using standard device abbreviations. Tag numbers shall be prefixed with the number [_____] to signify this contract. Instruments furnished in multiples for multiple equipment shall have identical tag numbers suffixed by the letters A, B, C, etc., to correspond to the multiple equipment. Tag each device prior to shipment. Device tags shall be permanently attached (not with string or tape) to the stem or case of each device. Tags shall be fabricated of solid brass or aluminum with correct tag number stamped clearly on into the metal. Each tag shall be inscribed with a unique tag number assigned using the specified scheme. Submit drawings of mounting locations for devices to be mounted.
2.12.1 System Operation

**************************************************************************
NOTE: Failure Analysis. Provide a complete control system failure analysis demonstrating and explaining the effects of various system component failure on the system. The failure analysis shall specifically identify the control system features which will be provided to minimize the effect of component failures and protect the equipment, especially the fabric filter bags.
**************************************************************************

Operation and control of the Flue Gas Cleaning System shall be accomplished by a full-time operator from the steam plant control room. The control system shall be designed to allow operation of FGD system in either of two modes; remote manual or semi-automatic. In the remote manual mode the various dampers, control valves, pumps and associated equipment will be opened or closed, started or stopped from individual switches or push buttons located on the main control panel. In the semi-automatic mode the FGD system components for each boiler will automatically placed in or taken out of service in the proper sequence when the start or stop push button is activated. In both modes sufficient interlocks shall be provided to assure that proper sequencing is followed and to allow equipment to be automatically tripped when required. The control system shall be designed to ensure that in the event of a power failure of FGD system equipment failure, the necessary corrective action to prevent damage to the equipment will automatically be initiated. Contractor shall provide a complete system failure analysis. Process variable indicators and alarms required for proper monitoring of system performance shall be located on the main control panel. Furnish necessary instrumentation to provide positive indication of operational status of equipment; such as, flow or pressure switches to verify operation of pumps and limit switches to indicate position of dampers and valves. Local controls shall be provided for valves, dampers, and motors. A complete system graphic display shall be provided.

2.12.1.1 Lime Slurry Preparation

Provide a control panel adjacent to the truck unloading fill pipe connection. Provide a NEMA 4 enclosure for panel. Panel shall include bin vent filter fan indicating light, low bin level indicator light, high bin level indicator light and audible alarm with alarm silencer button. When truck unloading tube is connected to the fill pipes, a limit switch mounted on the fill pipe shall be actuated. Limit switch actuation shall activate bin vent filter exhaust fan. Disconnection of truck pipe shall return limit switch to normal and operate bag cleaning mechanism for a preset period of time. Reaching high bin level during truck unloading shall sound alarm. Level switches for high and low feed bin level shall be provided, as specified in paragraph entitled "Instrumentation and Controls." Provide local and remote monitoring of feed bin levels. Provide signal from low and high bin level indicators as required for input to control of pneumatic lime conveying system from bulk lime storage silo. Silo, conveying system, and controls for bulk lime storage will be provided by the Contractor. Provide space for additional level monitors on FGD system panelboard for use with bulk storage silo. Primary control of the lime slurry preparation operation shall be from the local control panels as specified herein. Main FGD system control panelboard shall interface with local controls as
specified paragraph entitled "Instrumentation and Controls." Once a feeder/slaker has been selected for operation from the local control panel, the lime slurry preparation equipment shall function automatically. A low level signal from the slurry tank level switch shall start water feed, lime feed, bin vibrator and other equipment as required including slaker agitator and grit removal equipment. A high-level signal from the slurry tank shall stop line feed and bin vibrator immediately and provide continued operation of water feed, slaker agitator and grit removal equipment for adjustable time periods. Provide control panels at the time slurry preparation area enclosure preparation area enclosure and shall include complete controls for equipment in the slurry preparation system. In addition to selector switches or push buttons for all equipment, the local controls shall provide full instrumentation to annunciate any component failures and automatically trip equipment. Local annunciator shall be provided for component faults including high slaker temperature, slaker overflow, slaker fail-to-start grit remover zero speed, slurry agitator zero speed, and low-low slurry tank level. Any local alarm shall register at the main FGD system panelboard in steam plant. Flushing of the slurry pumps and piping systems shall be controlled from a panel at the slurry tank level in the lime system enclosure.

2.12.1.2 Spray Dryer Absorbers

The following paragraphs provide a typical functional description of the control of sulfur dioxide concentration and flue gas temperature leaving the spray dryer absorbers. It is recognized that individual differences between control schemes may exist to the extent that not all of the control details specified are applicable to a given system. The [proposal] [bid] shall clearly indicate such differences and shall include a detailed description of the control system features provided to attain the control objectives specified in these paragraphs. The degree of sulfur dioxide control achieved in the spray dryer absorber and fabric filter baghouse is directly related to the rate of lime feed to the atomizer. The lime slurry feed rate to the atomizer shall be regulated by a control valve which is modulated by a signal from the analog control system utilizing an input from an sulfur dioxide analyzer located at the fabric filter baghouse outlet. The control valve shall fail closed on loss of air, power, or control signal and the control system shall be provided with sufficient interlocks so that FGD system upsets cannot result in excessive liquid feed and subsequent moisture carryover to the fabric filter baghouse. The control system shall be designed to automatically control the sulfur dioxide concentration leaving the fabric filter baghouse at a level set by the operator from an operating station in the control room. Provide continuous indication of the inlet and outlet sulfur dioxide concentration, control valve status and slurry feed rate on the main control panelboard. The temperature of the flue gas leaving the absorber shall be controlled to an operator-adjustable setpoint by automatic regulation of water feed to the atomizer. The water feed rate to the atomizer shall be regulated by a control valve which is modulated by a signal from the analog control system utilizing an input from a temperature transmitter located at the spray dryer outlet. The control system shall provide a means of assuring that the outlet temperature remains above the moisture dewpoint with an adequate margin of safety as required to prevent condensation at any point downstream in the FGD system. A control signal will be available to indicate the initiation and termination of the steam sootblowing cycle. The temperature control system shall make use of this signal to automatically compensate for the additional moisture input with the flue gas. The water control valve shall fail closed on loss of air, power, or control signal. Absorber inlet and outlet temperature, water control valve status, and
water feed rate shall be indicated at the main control panelboard. Each atomizer shall be provided with a local control panel mounted in the penthouse enclosure. Complete local controls, indicating lights and alarms shall be provided. Controls for the two-fluid nozzle atomizers shall be as follows: interlocks and automatic trips shall be provided to automatically stop the atomizer due to low oil pressure, high oil temperature, high motor temperature or high vibration level. Remote indication of atomizer operating conditions and alarms shall be provided on the main control panelboard. Atomizer start switches shall be provided both locally and remote.

2.12.1.3 Baghouses

Primary control of the fabric filter baghouses shall be from the FGD system panelboard located in the steam plant control room. Design the control system for automatic control of each fabric filter baghouse as required to ensure stable and reliable operation. Monitor status and position of motors, dampers, valves, etc. at the main control board by a graphic presentation. Design for automatic or manual start-up and automatic verification of the operation of each component of the fabric filter baghouse in sequence as required for proper operation of the system. The automatic start-up sequence will be manually initiated. Design for automatic or manual shutdown and automatic verification of the shutdown of each component of the fabric filter baghouse in sequence as required for proper shutdown of the system. Design for automatic and safe shutdown of any malfunctioning part of the system without disrupting boiler operation capabilities. Any effect on the steam plant due to system control changes will be avoided or minimized. The cleaning cycle will be initiated by measurement of pressure drop across total fabric filter baghouse, by timer, or by manual switch. Initiation mode shall be switch selectable. A manual selector switch will allow manual operation of the cleaning function for any module for the purpose of extra cleaning of any module or in the event of automatic sequence failure. Off-line cleaning of pulse-jet fabric filter baghouse modules (normal) or on-line cleaning shall be available at the selection of the operator. The automatic timer and manual selector switch will be interlocked with an isolation switch located at the tube sheet access doors to ensure isolation of the module for maintenance. The automatic timer will bypass any module not in service. This bypass will be accomplished without timing through the cleaning cycle for the module just bypassed (no dead time). The cleaning timer will allow for adjustment of the frequency and duration of cleaning cycles to obtain optimum bag cleaning. The bypass mode selector for each fabric filter baghouse will be functional for either automatic control and for manual control. The system shall automatically bypass the fabric filter baghouse as required to prevent moisture carryover from spray dryer. Monitor status of process and equipment for abnormal operation, failure, trip, etc. and provide visual and audible alarms. Alarm indication shall include, but not be limited to, high temperature drop across the fabric filter baghouse, high-pressure drop across fabric filter baghouse, cleaning system malfunction, high ash level (with indication of which hopper is alarming) and low hopper temperature (with indication of which hopper is alarming).

Graphic display shall include at a minimum the following indicating lights (color of lens in parentheses):

a. Inlet damper--OPEN (green).

b. Inlet damper--CLOSED (red).
c. Outlet poppet--OPEN (green).
d. Outlet poppet--CLOSED (red).
e. Module--ACTIVE (green).
f. Module--INACTIVE (red).
g. High ash level (red)*.
h. High inlet gas temperature (red)*.
i. Low compressed air pressure (red)*.
j. High system differential pressure (red)*.
k. Power--ON (red).
l. SYSTEM START (green).
m. SYSTEM STOP (red).

n. Cleaning mode OFF-LINE selected (white).
o. Cleaning mode ON-LINE selected (white).

*These items shall activate an audible alarm.

Two position selector switches shall be provided for the following.

a. Power--ON/OFF.
b. Module--ACTIVE/INACTIVE.
c. Cleaning mode--OFF-LINE/ON-LINE.

Momentary contact push buttons shall be provided for the following.

a. System--START (green head).
b. System--STOP (red head).
c. Alarm--ACKNOWLEDGE.

Provide auxiliary devices required for the control functions indicated including the following.

a. Position indication switches on isolation valves.
b. Hopper level alarms.
c. Temperature indicator and thermocouple.
d. Pressure switch.
e. Audible alarm.
f. Differential pressure gage (baghouse module and panel board).
g. Fan current.

h. Fan inlet static pressure.

i. Fan outlet static pressure.

j. Opacity.

Provide suitable laminated plastic nameplates for devices on panel face. Temperature controller and differential pressure gage shall be mounted on face of panel. In addition, provide a two pen, 250 mm 10 inch diameter circular chart recorder to record inlet gas temperature and pressure drop across baghouse system for each module. Differential pressure gage for each module shall be indicating type with diaphragm magnetically coupled to pointer mechanism.

Units shall include a programmable controller which shall be completely solid state and shall be preprogrammed to control the following.

a. Pulse duration (pulse-jet only).

b. Pulse sequencing (pulse-jet only).

c. Cleaning cycle time.

d. Settling time.

e. Module isolation valve control.

The system shall sense differential pressure between inlet and outlet of each baghouse. When the differential pressure reaches the setpoint, controller shall initiate cleaning of all modules. In addition, an overriding timer shall be provided so that the bags can be cleaned on a preset interval independent of pressure differential. (Pulse interval and duration), cleaning cycle time, setting time and time for valve operation shall all be adjustable. Differential pressure setpoint shall also be adjustable.

2.12.2 Analog Control Systems

Furnish an analog control system complete with transmitters, flow-measuring elements, control modules, control system cabinets and panelboard, control operating stations, prefabricated plug-in cables, signal converters, control drives and accessories as required to allow control of the FGD system from the central steam plant control room. The control systems and instruments shall be electronic and be designed for continuous operation. The control system shall be of the "split architecture" design where computing and logic modules are mounted in system cabinets. Operating stations shall be mounted in the panelboard and connected to the system control module racks, mounted in the system cabinets, using prefabricated cables.

2.12.2.1 Electronic Control Modules

Analog computing and logic modules shall use proven solid-state electronic design. Circuits shall be constructed with high-quality, pretested components making maximum use of integrated circuits. Components shall be readily available from known suppliers. Analog computing and logic modules shall be designed for plug-in rack mounting in the system cabinets. Module
pins and mating connectors shall be gold plated on nickel to withstand chemical attack by ambient atmospheric chemicals. Modules of the same type shall be interchangeable to facilitate maintenance and trouble-shooting by substitution. Pretest and age each module before installing in the module racks. Factory assemble, wire, and test the system using the operating stations and actual plug-in cables for the system. Provide input and output test jacks on each module for tests. Controllers and analog computing circuits shall perform as follows unless specifically noted otherwise for a particular system or control loop: Provide calibrated, front-mounted controls on appropriate modules, to adjust proportional, integral and derivative action. Adjustments shall be possible while operating in automatic without causing undesirable upsets such as a proportional step. Prevent reset windup action and design to develop response to demand without the system first performing internal controller balancing. Provide means to automatically balance each loop that has a manual-automatic operating station so that bumpless transfer may be made from manual to automatic and from automatic to manual without any intermediate manual balancing. Where both master stations and individual final control element stations are employed in a loop, the master, as well as individual stations shall transfer bumplessly and without balancing, and be tied together, as appropriate. Bumpless transfer is effected if the output signal to the final control element does not vary more than 2 percent of the full-scale output signal range when transferring from automatic to manual and from manual to automatic. Provide for all interlocks and contact inputs and outputs and all digital logic functions necessary to control or interface the analog circuits throughout the system. Provide signal monitor modules to track analog signals where required to produce contact outputs for alarm or interlock with other logic when the signal exceeds a predetermined level. Signal monitor units shall be equipped with independently adjustable high and low set points. Provide suitable isolating devices such as relays or optical couplers to protect the control system from external outputs or inputs. Provide indicating lights on the modules to show the status of all logic, transfer relays, and signal monitors. Lights shall be visible without removing or withdrawing the modules from the racks.

2.12.2.2 Input and Output Signals

Input signals from field transmitters shall be 4-20 mA dc "two-wire." Provide output signals to panel recorders and indicators. Provide square root extraction for flow signals outputs to devices furnished. Output signals shall be 4-20 mA dc. Transmitters required to provide multiple outputs to recorders, and indicators as well as providing an input to the control system shall be buffered so that disconnecting, shorting or grounding of the input at the recorder or indicator shall not cause an upset or failure in the control system. Output control signals to final control elements shall be 4-20 mA dc. The final control elements shall be provided with the proper signal converter.

2.12.2.3 System Electrical Power and Power Supplies

The following power sources will be provided by the Government: Source "A" 120-V ac from station inverter. Source "B" 120-V ac from station service. The Contractor shall furnish fuses or circuit breakers for each source to protect against faults or overloads at the system modules. System computing and logic power, transmitter power, or other power used for control or indication, used either remotely or internally, shall originate from within the system. Such power users shall be properly fused or furnished with circuit breakers to protect power sources and supplies from
overloads or faults. Power sources and power supplies shall be distributed into functional groups and protected from overloads or faults such that a power failure in one group does not cause power failure to the remainder of the control system. The system shall take appropriate control action and initiate an alarm contact upon partial power failure. Tripout of a circuit breaker or opening of a fuse due to control equipment failure or wiring fault in a control loop shall disable the loop in which the failure occurred and place the final drive in the manual mode and initiate an alarm contact. Fuses, breakers, and fuse or breaker panels shall be readily accessible and clearly identified. Provide input filters for noise suppression, as required. Where internal dc power supply buses are utilized, furnish two full-capacity power supplies for each bus voltage and auctioneer their outputs to ensure no control upsets if one supply or its source fails. Power one supply from source "A" or "B" is distributed internally to individual circuit cards or individual transmitters or converters which have separate dc power supplies, provide an automatic transfer switch to switch to the backup source upon primary source failure. Furnish manual reset feature and provide an alarm contact on transfer. Provide circuit isolation and monitoring to permit removal of faulty supplies during operation.

2.12.2.4 Operating Stations

Operating stations will be remote mounted on the control panelboard in the central steam plant control room. Furnish operating station with an individual mounting rack to permit simple and quick removal from the panel. Wiring to the system cabinets shall be by a prefabricated plug-in cable. Operating stations shall contain dials, switches, lights, and indicators necessary to operate the system by either manual or automatic mode. Stations shall not contain computing or logic elements which are a part of the control loop except for operator-system interface. Station shall have the following features, as applicable, depending upon their purpose in the control system:

a. Manual-automatic selector switch or push buttons.

b. Dedicated indicating meters displaying only one variable, and marked in appropriate engineering units where applicable. Indicating lights displaying manual or automatic status of the control loop. Lights displaying status of the switch are not acceptable.

c. Set point dials calibrated and marked in appropriate engineering units.

d. Deviation meter.

e. Position meter indicating the actual final drive element position over its full range, and not the loading signal.

f. Raise and lower control for manual operation.

Manual, set point, or indicator stations which have specified functions shall have no extraneous or ineffectual indicators, switches, or lights. The station shall be tailored to its purpose. Tag operating stations with a unique number, as specified. Provide an engraved nameplate on each operating station identifying the service such as spray dryer outlet temperature.
2.12.2.5 Control Drive

Control drives shall be pneumatic type. The term "control drive" refers to a power actuator which is primarily used for positioning another device such as a damper, in response to signals from a control system. Select each control drive size as required to provide adequate capacity for the existing loads and conditions. Each control drive used for modulating service shall positively position its controlled device accurately and without fluctuations with the existing load conditions and at any position. The time required for full-stroke travel in either direction shall be 15 seconds. Provide speed control to allow adjustment of full-stroke time from ten seconds to one minute. Provide couplings, adapters, linkages, clevises, ball joints, drive arms and damper arms required. Furnish control drives and handwheels, dual-pole-dual-throw limit switches for open and closed indication, on open-close drives, and 4-20 mA dc position outputs on modulating drives. Position shall be sensed electronically without the use of a slide wire. Provide control drives except the induced draft fan inlet damper drives with current-to-pneumatic positioners to accept a 4-20 mA dc control signal. The induced draft fan inlet damper drives shall be furnished with a pneumatic positioner to accept a 3-15 psi signal from a current-to-pneumatic signal converter furnished by the Contractor.

2.12.3 Digital Control Systems

Digital controls shall be relay logic, solid-state programmable logic. Baghouse sequence control shall be wired solid-state logic or solid-state programmable logic. Digital logic associated with analog process controls shall be as specified in paragraph entitled "Electronic Control Modules." Control circuits shall be 120 VAC maximum. Higher voltage power shall not be brought into a control system cabinet or control panelboard.

2.12.3.1 Wired Solid-State Logic

Components shall be highest quality industrial grade devices. Logic elements shall be integrated circuits. Components shall be subjected to a rigorous quality assurance inspection. Circuit cards shall be burned-in and tested in the completed system a minimum of 170 hours continuous operation. Logic elements shall be assembled on circuit cards to perform specific operational functions. Different types of circuit cards shall be minimized to reduce stocking of spares and to facilitate maintenance by card substitution. Logic cards shall be arranged in functional groupings for individual pumps or sequences. Failure of a single logic circuit or compartment shall not affect more than one pump or separate functional sequence. Power supplies shall be as specified for Analog Control Systems. System electronics shall be buffered and protected from external power sources by optical couplers or reed relays. Logic shall be documented by logic diagrams.

2.12.3.2 Solid-State Programmable Logic

Components shall be highest quality industrial grade devices. Components shall be subjected to a rigorous quality assurance inspection. Circuit cards shall be burned-in and tested in the completed system a minimum of 170 hours continuous operation. Small systems requiring a minimum of memory elements may use nonvolatile programmable memory. Larger systems shall use software programmable memory with nonvolatile memory for program and executive storage. Logic functions shall be performed by software engineer. Logic shall be documented by flow charts or word logic, and by
program listings. Memory shall be static. Programming aids shall be provided to permit easy field reprogramming. Battery power back-up may be approved by the Contracting Officer. System electronics shall be buffered and protected from external power sources by optical couplers or reed relays. Software shall be factory tested and debugged including simulating inputs and outputs and checking resulting logic sequences.

2.12.4 Flue Gas Cleaning System Panelboard and System Cabinets

Provide one common vertical panelboard and system cabinet sections, as specified, to control the flue gas cleaning equipment for boilers. Panelboard dimensions shall be 0.762 m deep by 2.44 m wide by 2.44 m high (30 inches deep by 96 inches wide by 96 inches high). No process fluids or pneumatic signal lines shall be brought into any panelboard or system cabinet.

2.12.4.1 Construction

Construct of 3 mm 1/8 inch hot-rolled steel panels reinforced with angles and channels in the interior to form a single, rigid, freestanding unit in compliance with NEMA 12. Panelboards shall be completely enclosed floor-mounted units, except with bottom open. Panelboards shall be constructed with no bolt heads or fastenings visible from the exterior. Construct with 6 mm 1/4 inch radius corners. Edges shall be filled and ground to conform to a 6 mm 1/4 inch radius. Provide interior innerpanels for mounting auxiliary equipment and terminal blocks, as required. Make provisions for anchoring to floor or foundation. Provide hinged doors on the rear of the panelboard with key locks to allow access to equipment. Provide lifting eyes and shipping pallet on the panelboard to facilitate moving into the steam plant. Provide ventilation grills, exhaust fans, ductwork, and filters, as required. Provide cutouts and removable cover plates for items designated as future. Paint cover plates to match panels. Prime and paint panelboard as specified. System cabinets shall conform to the following requirements: Steel frame and sides, freestanding, and fully enclosed. Front and rear access doors with key locks to allow access to racks. Cabinets shall be maintained at positive pressure using a fan powered by a 120-volt, single-phase motor with a minimum power output of 0.09 kW 1/8 hp. Maintain cabinet pressure at least at 125 Pa 0.5 inch water gage. Provide ventilation louvers as required. Size ventilation system to ensure adequate heat dissipation and to maintain continuous operation without loss of function or cause reduced life. Pressurizing air shall be filtered with a 98.5 percent minimum efficiency for dust particles one micron or larger. Control cabinet shall be equipped with a safety key interlock (and shall be located as indicated). Assemble cabinets in sections in sizes convenient for handling and moving into the steam plant, but with lifting eyes and shipping pallet for each separate section. Design cabinets to allow sections to be installed side-by-side. Provide side openings at the bottom of the sections as required to permit interconnection of the sections by prefabricated cables without routing the cables outside of the cabinets. Provide work light and one 120 VAC, duplex, 3-wire-polarized-grounding type, specification grade, convenience outlet in each cabinet.

2.12.4.2 Finish

Smooth, fill, and apply one coat of primer and two coats of finish paint to exterior surfaces. Apply one coat of primer and one coat of white paint to interior surfaces. Contractor shall furnish finish paint of type and color specified by the Contracting Officer.
2.12.4.3 Nameplates

Fabricate nameplates from laminated white phenolic plastic with black engraved letters. Size of nameplates shall be 40 mm high and 150 mm long for "Master" nameplates, with 10 mm 3/8 inch letters. Individual device nameplates shall be 20 mm high and 80 mm long with 3 mm 3/4 inch high and 3 inches long with 1/8 inch broad letters. Engrave designations as required later by the Contracting Officer. Nameplates shall be attached by permanent adhesive or screws. Self-adhesive, embossed plastic label tape is not acceptable. Fabricated bezels shall be laminated phenolic plastic with beveled edges, brushed aluminum or as approved by the Contracting Officer.

2.12.4.4 Graphics

**************************************************************************
NOTE: Refer to paragraph entitled "SPRAY DRYER ABSORBERS."
**************************************************************************

Provide the FGD system panelboard with a graphic subpanel to pictorially describe the flue gas cleaning system process to the operator. Graphic shall include pipelines, pumps, fans, equipment, tanks, vessels, valves, and dampers that are part of the process, with indicating lights and control switches located adjacent to the corresponding graphic equipment symbols. The graphic shall include the flue gas flow path for each of the spray dryer absorber and fabric filter baghouse systems. The graphic subpanel shall be provided with switches, indicating lights and other devices as required to control and display the status of the equipment. Indications provided shall include at least the operating status of the equipment. Indications provided shall include at least the operating status (running or stopped) of each pump, fan and other driven equipment and the position (open and closed) of each valve and damper. Graphic laminated acrylic symbols on a base of solid acrylic sheeting or panels shall be constructed of laminated phenolic. Acrylic sheeting shall be supported by the metal panel surface continuously. Laminated phenolic may be used as a subpanel. Base sheet shall be 6 mm 1/4 inch thick for phenolic, 5 mm 3/16 inch for acrylic. Color will be selected later from manufacturer's standard colors. Provide smoothly finished openings accurately sized for indicating lights, switches, meters, and oversized openings in panel metal behind acrylic sheeting. Attach base sheet with mechanical fasteners which allow for expansion and contraction of the base. Finish the edge between graphic base sheet and panel surfaces with a brushed stainless-steel trim. Graphic symbols, flow lines, nameplates shall be:

b. Thickness: Equipment symbols, flow arrows, and nameplates (10 mm (0.40 inch; flow lines: 0.51 mm 0.020 inch).

c. Color: Solid white core with colored satin finish overlay. Colors will be selected later from manufacturer's standard colors.

d. Engraving: Engrave through colored overlay to expose solid core. Cut laminate with beveled edges (except flow lines) to expose solid core on perimeter of all symbols, nameplates, etc.
e. Mounting: Attach to front face sheet by means of contact cement that may be loosened by a solvent that will not damage face sheet or symbols. Use of double-faced adhesive tape is not acceptable.

2.12.4.5 Wiring

Interconnecting wiring between the system cabinets and panelboard-mounted operating stations or subpanels and between separate sections of the system cabinets shall be prefabricated cables with plug-in connectors at both ends. Cable connectors shall incorporate a mechanical restraint between the mating halves to assure that each connecting pin-pair maintains electrical contact and that the connector does not separate due to mechanical vibration or cable sag. The male connector shall be of a design which protects the pins from damage during cable pulling and aligns the two halves accurately during mating. The connector shall be approved by the Contracting Officer. Prefabricated cables shall be rated 600 volt, 90 degree C conductor temperature, 18-gage minimum size copper conductors, overall neoprene or polychlorosulphonate jacket, and shielding if required. Prefabricated cable length between the panelboard and system cabinets shall be [_____] meters feet. Provide field terminal blocks in the Flue Gas Cleaning System panelboard or system cabinets as appropriate for analog and digital connections of remote devices. Transmitters furnished by this contract will be wired to terminals in the system cabinets and powered by the Contractor's power supplies. Field terminal blocks shall be grouped and wired into the system according to the function or site of the input or output signals to simplify termination of multiconductor field cables.

Wiring shall be insulated switchboard wire rated for 600 volt ac, 60 hertz, 90 degree C conditions. Size shall be No. 14 AWG or larger for 120-volt ac control and indicating circuits, No. 20 AWG for low voltage (28 volts or less) devices, and No. 10 AWG or larger for 120-volt ac main power supplies and tap circuits. Use heavy-duty terminal blocks rated at least 20 amperes, 600 volts with not less than 15 mm 1/2 inch spacing between terminals. Terminal blocks for main power supply circuits and control bus termination shall be rated at least 40 amperes. Terminals shall be sliding-link type to allow individual circuit isolation for testing without disconnecting field or cabinet wiring. Terminal shall be designed to receive ring-tongue cable connectors on the field side. Terminal blocks for current transformer circuits shall be 2 or 4 point, as required, short-circuiting type with one shorting screw for each terminal. Identify each terminal on all blocks by stamping or permanently marking the terminal designation on the marking strip. Self-adhesive embossed plastic label tape is not acceptable. Mount terminal blocks vertically in rows on interpanels within the panelboard and system cabinets with provisions for cleating external cables entering from the bottom. Location of the terminal blocks shall be subject to approval by the Contracting Officer. No terminal blocks shall be mounted at a height less than 300 mm 12 inches.

Provide a quantity of terminals sufficient for both signal and power circuits required to implement the system plus 10 percent spare for future modifications. Provide grouping of the following terminals: (1) Analog, (2) Annunciator, (3) Control. Provide a ground bus running the full length of the panelboard and system cabinet sections with No. 4-250 MCM lugs for ground cable connection at each end. The internal copper ground bus shall be at least 25 by 6 mm 1 by 1/4 inch. Connect internal grounds required to the ground bus. Furnish one two-tube, 40-watt, 120-volt fluorescent light fixture with a protective metal grill for the panelboard. Furnish 120-VAC, duplex, 3-wire polarized-grounding type, specification grade, convenience outlets in the panelboard. Furnish single-pole and three-pole fuse blocks with fuses for each set of relaying and metering potential circuits.

Provide 20A molded-case circuit breakers for connections from control buses.
to miscellaneous equipment installed in or served from the panelboard or system cabinet. Provide plug-in strips for connection of 120 VAC supplies to meters and recording equipment where required.

2.12.4.6 Power Supplies and Switches

Furnish a circuit breaker panelboard in the FGD system panelboard. Furnish mechanically interlocked, main circuit breakers mounted in the panelboard for switching or primary and backup power services. Furnish quantity as required. Furnish molded-case circuit breaker for each tap from the control bus to serve items requiring separate AC circuits. Provide one AC alarm relay connected to each AC bus with two sets of contacts to close after 2-second delay on loss of AC. Provide a 120-volt AC control bus and a 120-volt utility bus. Provide 24 VAC or VDC power supplies for low voltage indicating lights, meters, and transmitters, as required. Control switches shall be heavy-duty oiltight momentary contact, spring return unless otherwise specified, with normally open and normally closed contacts of adequate quantity. Switch handle types, colors, and retaining rings will be as required. Metal nameplates shall be used for position marking, but plastic nameplates shall be used for identification, as specified, unless otherwise noted.

2.12.4.7 Lights and Indicators

Indicating light size shall be nominal 15 mm 1/2 inch diameter and rating shall be 120 volts ac. Lens shall be transparent, color to be indicated later by the Contracting Officer, unless otherwise specified. Indicators shall be of the high-accuracy D'Arsevvol type. Provide indicators in groups, as required, with mounting hardware and frame. Meter movement shall be suitable for 4-20 mA dc input signal. Scale markings and colors shall be as required. Scales shall be illuminated.

2.12.4.8 Counters and Meters

Six-digit pulse counters to interface with 4-20 mA dc input shall be provided, as required. Meters shall be semi-flush mounting, 70 mm 2.7 inches square. Accuracy shall be rated at plus or minus 2 percent. Meter movement shall be 0-5 ampere AC, 0-1 milliamperc DC signal. Scales shall be as specified with overload red lines. Pushbuttons shall be heavy-duty oiltight construction. Contacts shall be momentary, one normally open and one normally closed, unless otherwise specified. Button type and color shall be specified later by the Contracting Officer.

2.12.4.9 Recorders

Multipoint printing strip chart size shall be 254 mm 10 inchesnominal width. Chart speed shall be 50 mm 2 inches per hour, nominal. Printing period shall be 5 seconds per point or multi-speed using numbered dots or plus signs with color selected later by the Contracting Officer. Provide engraved legend plate and rubber legend stamp. Provide a 12 month supply of charts and ink for each instrument. Recorders shall be designed for 120 volt AC power. Supply one complete set of manufacturer's tools and accessories. Provide internal fluorescent illumination. Furnish input circuitry for thermocouple, RTD, voltage and current input signals. Provide three separately adjustable alarm points with latching relay for wiring to the annunciator. Miniature pen strip chart size shall be 100 mm 4 inch nominal width. Chart speed shall be 25 mm one inch per hour. Provide indicating scale for each pen and scale legend markings. Provide a 12 month supply of charts and ink for each instrument miniature pen strip
2.12.4.10 Annunciators

Annunciator shall consist of remote logic rack and separate lamp box assemblies for control room applications, and integral logic, terminal blocks, and lamp box assemblies for local control panels. Mount the remote logic racks for the system panelboard annunciator in the system cabinets. Provide prefabricated display cables to connect the remote logic with lamp box assemblies mounted in the panelboard. Equipment shall be constructed of the highest quality solid-state electronics, factory-tested and burned in. Trouble contact circuitry shall meet IEEE C37.90.1 Surge Withstand Capability Test. Provide repeat contacts for each window wired to terminals. Equipment shall be powered from the Government's 120-volt AC station service source. Arrange power supplies, circuit breakers, and input terminal blocks in groups to permit servicing single sections of the annunciator system without disabling the entire system. Alarm windows shall be full 50 by 80 mm 2 by 3 inch nominal size. Cable connectors to lamp box assemblies shall be right-angle type to allow rear connection and cable routing from below. Terminal blocks in equipment cabinets shall be slide-link type. Provide terminal marking strips. Alarm audibles for the annunciator systems shall be electronic tone generators with variable pitch and volume controls.

2.12.5 Temperature Monitor

Temperature monitor shall scan thermocouple inputs, monitor critical process conditions, and record temperature in degrees C degrees F and point number upon alarm or operator demand. Scanning shall be continuous; recording shall be automatic for each alarm detected. Input point number, process value, and alarm condition shall be printed on a strip recorder. Front panel controls shall enable the operator to select scanning rate, continuous scanning, single point or group scanning, and print-on-alarm or print-on-demand. A digital display shall present point number and value for visual monitoring of any or all selected points. In addition to critical process temperatures such as spray dryer and fabric filter baghouse inlet and outlet temperatures, inputs shall include bearing
thermocouples and motor RTDs (one per motor). Instrument calibration accuracy shall be one half degree C one degree F, or better, throughout the temperature range of 18 to 149 degrees C zero to 300 degrees F and one percent full scale for process variables. Calibration stability shall be within one half degree C one degree F for six months with no adjustment, and equivalent value for process variables. Scanning rate of 6 points per second, continuous shall be used. Print speed shall be 6 lines per second. Provide five separate high-temperature alarm comparators with dual field adjustable set points wired for assignment to groups of inputs. Provide one isolated lock-in type alarm contact for each alarm set point for wiring to external annunciator, and wired for manual reset from a remote push button. Monitor output printer shall be numeric strip chart, nonimpact ribbonless, roll-type with take-up reel. Provide extra supply of paper for printing at least 10,000 lines. Provide for flush panel mounting with printer, indicators, and operator's controls accessible from the front. Alarm set-point modules, input modules, and auxiliary chassis shall be mounted behind panel or adjacent to operator's controls. Controller sensing element shall be stainless-steel armored bulb and capillary, 7.62 meter 25 feet in length. Controller shall include the following features:

a. Reset and rate as specified.

b. Set point, proportional ban, reset and rate adjustment.

c. Pressure gages for supply and control pressure.

d. Indicator for process temperature.

e. Supply air pressure regulator.

Provide thermowell sized for the bulb in accordance with the thermowell specification. Temperature switch elements shall be dry contact (mercury switch contacts not acceptable) single-pole-dual-throw, rated for at least 120 volt AC, 4 amp or 125 volt DC, 0.5-amp. Switch enclosure shall be NEMA 12. Sensing element shall be stainless-steel armored bulb and capillary, or direct-mounted bulb, as specified. Provide thermowell sized for the bulb in accordance with the paragraph entitled "Thermowells." Factory adjust each switch to the proper setting before shipment to the jobsite. Indicate the factory setting on the device tag.

2.12.5.1 Thermometers

Thermometers shall be dial type with an adjustable angle suitable for the service. Provide thermowell sized for each thermometer in accordance with the thermowell specification. Fluid-filled thermometers (mercury is not acceptable) shall have a nominal scale diameter of 125 mm 5 inches. Construction shall be stainless-steel case with molded glass cover, stainless-steel stem and bulb. Stem shall be straight, length as required to fit well. Bimetal thermometers shall have a scale diameter of 90 mm 3 1/2 inches. Case shall be hermetic. Case and stem shall be constructed of stainless steel. Bimetal stem shall be straight and of a length as required to fit the well.

2.12.5.2 Thermocouples

Pipe thermocouples shall be Type J, iron-constantan element, ungrounded, for pipeline mounting in a thermowell. Provide protective sheath, screw terminal head, and the thermowell sized for the service specified. Element shall be at least 20 gage wire, with 2 hole insulators, 304 stainless-steel
sleeve, silver plug tip, spring loaded. Head shall be universal type with screwed cover and chain and terminal connector. Provide stainless-steel nipple as required for head to clear insulation by at least 50 mm 2 inches. Well shall be sized for each thermocouple in accordance with the thermowell specification. Duct thermocouples shall have Type J ungrounded element with 20 AWG iron-constantan wires 2 hole insulators and universal head as specified for pipe thermocouples. Protecting tube shall be as specified under thermowells. Bearing thermocouples shall have Type J ungrounded element with 20 AWG iron-constantan wires and 25 mm one inch insulator cemented over measuring junction. Element shall be mounted in 5 mm 3/16 inch spun and welded copper tube, sealed at open end. Head shall be as specified for pipe thermocouples. Surface thermocouples shall have ungrounded Type K element (chromel-alumel) at least 20 AWG suitably protected from high temperatures using fiberglass insulating jacket.

2.12.5.3 Resistance Temperature Detectors (RTDs)

Detector shall be three lead resistance sensor with protective sheath and screw terminal head for pipeline mounting in a thermowell. Accuracy shall be plus or minus 1/2 degree C 1 degree F or plus or minus 0.5 percent of reading, whichever is greater. Element material and nominal resistance shall be 10 ohm copper. Head shall be universal type with screwed cover, chain, and terminal connector. Provide stainless-steel nipple as required for head to clear insulation by at least 50 mm 2 inches. Element length shall be as required for the insertion depth and insulation thickness specified. Provide thermowell sized for the element in accordance with the thermowell specification.

2.12.5.4 Thermowells

**************************************************************************
NOTE: General. Provide thermowell for each temperature sensing element (thermometer, thermocouple, remote bulb, etc.) unless otherwise noted.

Insertion:

Piping: 65 mm minimum, 150 mm 2 1/2 inch minimum, 6 inch maximum unless otherwise noted.

Ductwork: At least 1/2 duct depth but not over 910 mm 36 inch unless otherwise noted.

Lagging extension neck: As required to keep well wrench flats clear of insulation.

Protection: Provide cardboard inserts in each well to prevent internal damage prior to installing thermometer in installed well.

Pipeline Wells:

Bore: Straight or tapered bore sized to fit sensor.

Material: 316 stainless steel unless otherwise noted.

Ratings: Submit pressure vs. temperature and
velocity vs. insertion length ratings for each type of well furnished. Submit calculations (to verify that wells are safe for the specified conditions) for special wells for which ratings are not available.

**Duct Protecting Tubes:**

Provide a well for each temperature sensing element (thermometer, thermocouple, remote bulb) unless otherwise noted. Include specifications of insertion length, shipping protection, bore, material, and any necessary adapters.

2.12.6 **Pressure Gages**

Gage connections shall be bottom for flush, surface or line mounting. Furnish scale ranges to produce a reading 60 to 70 percent of full scale during normal operating conditions. Service legends shall be printed on the gage face by the manufacturer. Include adjustments for set point and proportional band of pressure controllers. Provide pressure gages indicating supply and control pressures. Provide cleanout push button for cleaning restricted feed orifice without dismantling. Case shall be dust-tight with air bleed hole. Pressure switch elements shall be dry contact (mercury switch contacts not acceptable) rated for at least 120-volt AC, 4 amperes or 125-volt DC, 0.5-amperes. Contacts shall be single-pole-dual-throw, or as specified. Switch enclosure shall be NEMA 12. Sensing element shall be type and material suitable for the service. Factory adjust each switch to the proper setting before shipment to jobsite. Indicate the factory setting on the device tag. Provide brass pulsation dampeners and liquid fill with high viscosity silicon oil for all gages used for steam, water, air, or liquid service. Diaphragm seal materials shall be 316 stainless-steel diaphragm and bottom housing with a

2.12.6.1 Panel Gages

Panel gages shall be provided with 150 mm 6 inch diameter face. Accuracy shall be 1/2 of one percent of scale range. Case shall be aluminum or high-impact polypropylene reinforced with glass fiber; solid front face; blowout back. Dial shall be white laminated plastic with black markings.

2.12.6.2 Header Gages

Header gage face shall be 113 mm 4 1/2 inch diameter. Accuracy shall be one percent of scale range. Bourdon tube shall be bronze, brazed. Movement shall be stainless-steel geared. Case shall be polished stainless-steel. Dial shall be fabricated of aluminum.

2.12.6.3 Differential Gages

Differential gage accuracy shall be 1/2 percent of scale range. Pressure unit shall be rupture-proof, stainless-steel bellows. Body shall be 316 stainless steel with 6894 kpa (gage) 1000 psig safe working pressure. Dial shall be 150 mm 6 inch diameter.

2.12.7 Level Elements

Level controllers shall be electrode probe type and shall feature remote electronic enclosure rated NEMA 4 with integral level indicator. Zero and span adjustments shall be noninteracting. Proportional band adjustment shall be provided. Electronic output as required. Power input: 115-volt AC. Prefabricate cable to connect probe to transmitter with quick disconnect connectors. Probe and electronic circuitry shall be designed to provide reliable level control unaffected by coating or material buildup on probe. Liquid level switch elements shall be dry contact (mercury switch contacts not acceptable), single-pole-dual-throw, rated for at least 120 volt AC, 4 amperes or 125-volt DC, 0.5-amperes, unless noted otherwise. Switch enclosure shall be NEMA 12 unless noted otherwise. The float actuated cage shall be external type with temperature and pressure rating equal to or greater than the design rating of the vessel to which it is attached. The float and trim materials shall be stainless steel. Float-type switches shall not be used for slurry tanks. Differential-pressure type shall be indicating type switch. Electrode probe types shall be provided with remote NEMA 4 electronic enclosure with integral level indicator, and noninteracting zero and span adjustments. Power input: 115-volt AC, single phase 60 hertz. Probe to transmitter prefabricated cable with quick disconnect connectors. Level indication shall be unaffected by material buildup on probe.

2.12.8 Flow Elements

Flanged orifice plates shall be 3 mm 1/8 inch thick, 304 stainless steel, sized for the service. Furnish a calculated calibration curve based upon design flow conditions plotting flow versus differential pressure. Insertion flow elements shall be Pitot-tube type using 304 stainless steel as material. Provide pipe connections. Application shall be for water only. Provide inline-magnetic type with liner material and thickness to match the piping. Accuracy shall be plus or minus one percent of rate.
Power supply shall be 110 volt AC, 60 hertz. Furnish prefabricated cable from primary element to transmitter. Provide integral indication of flow. Flow switch elements shall be dry contact (mercury switch contacts not acceptable) single-pole-dual-throw rated for at least 120-volt AC, 4 amperes or 125-volt DC, 0.5-amperes. Switch enclosure shall be NEMA 12, except as noted. Materials and pressure ratings shall be compatible with the service. Flow switch shall be paddle, plunger, differential-pressure, or ultrasonic type. Ultrasonic flow switches shall be provided with one flow setpoint, unless otherwise noted. Provide individual adjustment of setpoint and time response delay. Power input: 115-volt AC, single phase, 60 hertz. Provide NEMA 4 enclosure for electronics and encapsulated sensor probes. Use only when other types are not recommended for the service. Flow controllers shall include adjustments for set point, proportional band, rate, reset, and specific gravity. Provide pressure gages indicating supply and control pressures. Provide cleanout push button for cleaning restricted feed orifice without dismantling. Design shall utilize high-temperature diaphragms and gaskets, and shall provide dust-tight case, and cooling fins.

2.12.9 Density Elements and Transmitters

Shall be nuclear type and shall be accurate within 0.001-SGU maximum. Signal shall be linearized. Response of measurement system shall provide adequate response time when tied to mass flow. Power supply shall be 115-volt AC, single phase 60-hertz. Furnish prefabricated cable as required from primary element to transmitter.

2.12.10 Fly Ash Level Alarms

Each fabric filter baghouse hopper shall be provided with a fly ash level alarm utilizing nuclear type detectors. The detectors shall be single-point gamma source and detection units. The detectors shall be complete with separately mounted electronic units which shall include a local high level indicating light and relays for use with annunciation system specified in paragraph entitled "Annunciators." Relays shall be rated 10 amperes, 120 volts AC. Switch housings shall be dustproof and shall be mounted as one easily accessible location. Detector and source electronics shall be located at the hopper control panel. Detector shall
be explosion proof and have waterjacketing. Alarm shall be able to withstand vibration and temperatures up to \(260\) degrees C \(500\) degrees F. The source shall have a lockable shutter mechanism operated by an external handle to totally isolate the beam when in the closed position. Electrical wiring schematic shall be furnished. Electrical supply shall be \(115\) volts AC, single phase, 60 hertz. Alarm level shall be located at the 50 percent hopper capacity level. Each hopper shall have two sensors; one at the alarm level and one at the empty level. Level reproducibility shall be within one inch. Outdoor components shall operate between \([_____]\) degrees C and \(93\) degrees C degrees F and \(200\) degrees F. Source for each hopper level sensor shall be Cesium 137. Source head shall be designed with a spring return off system in the event of remote cable actuator failure. Source shall be interlocked with hopper access doors to prevent entry into hopper unless source has been secured. Hopper access door key shall only be able to open one pair of hopper doors.

2.12.10.1 Hopper Level Signals

Hopper level signals based on hopper status indicator system shall report to a microprocessor through a coaxial cable system. Each hopper shall have two indicators, one for full and one for empty. A flashing light shall indicate a wall buildup. Loss of power for any period of time shall not require a recalibration. Enclosure for microprocessor shall be [NEMA 4] [12] and shall be located in [____]. Each group of detector units for a single fabric filter baghouse shall be incorporated into the unit alarm system for its respective baghouse so that a high level in any hopper shall indicate as part of the unit alarm system.

2.12.11 Transmitters

Each transmitter shall be selected and adjusted for the service and operating conditions required and shall be designed to operate at the maximum condition expected. Transmitters shall be electronic, two-wire type with 4-20 mA current signal output powered by 24-volt DC source unless specified otherwise. Enclosures shall have NEMA 4 rating as a minimum. Devices shall be designed to operate continuously under the ambient conditions specified. Furnish condensing pots for flow and level transmitters when required by the conditions of the measured fluid. Furnish seal pots or diaphragm seals where required for the fluid being measured. Furnish transmitter mounting brackets suitable for either surface or piping mounting. Furnish any power supply, transformer, rectifier, or other device required to interface the equipment with the system. Magnetic flowmeter transmitters (signal converters) shall be compatible with the primary elements. Ultrasonic level transmitters shall be protected from process fluid corrosion by resistant coating or material. Temperature compensation shall be within accuracy requirements. Integral output indication shall be graduated in engineering units. Accuracy shall be at least plus or minus 2 percent of measured range. Provide with coaxial cable from each probe to each transmitter. Provide with recommended installation hardware for flange mounting. Transmitter shall use doppler effect to filter out moving fill material during measurement.

2.12.12 Limit Switches

Limit switches shall be provided with DPDT contacts. Limit switches shall be provided with housing conforming to NEMA 4 requirements.
2.12.13  Gage Glasses

Glass shall be 20 mm 3/4 inch borosilicate type class red line tubular. Length shall be a maximum of 915 mm 36 inches per section. Use multiple overlapping sections for more than 915 mm 36 inches length allowing one inch visible overlap between sections. Gage valves shall be offset with 20 mm 3/4 inch union tank connection. Provide four guard rods with holders. Drain valve shall be 15 mm 1/2 inch globe-type needle valve.

2.12.14  Solenoid Valves

Valve body shall be brass of 316 stainless-steel as required by the operating conditions. Coil shall be rated for continuous operation in ambient temperatures up to 50C. Voltage shall be 120 volts AC, single phase, 60 hertz. Provide design features as required that include 15 mm 1/2 inch threaded conduit hub, explosion-proof construction, metal-to-metal seats, and manual operation.

2.12.15  Sulfur Dioxide Analyzers

Analyzers shall have a history of successful application in coal-fired boiler flue gas analysis. Performance shall be unaffected by high moisture content and high grain loading. Analyzers shall meet or exceed the applicable requirements of U.S. EPA Regulation 40 CFR 60, Appendix B. Provide control units, calibration gas, signal cable, mounting flanges, accessories, and appurtenances required for integration of the analyzers into the process control system.

2.12.16  Factory Tests

Notify Contracting Officer, in writing, 45 days prior to factory tests. Conduct standard tests required by the applicable codes and standards. The Contracting Officer's representative may be present as an observer during functional factory testing to assure correct operation of circuits. Perform factory control systems tests with control system components and prefabricated cables connected together, except transmitters and control drive units. Provide an open loop test of each control system to check for circuit continuity. Provide a completely closed loop simulation for each analog control system to verify function and response, and to check direction of response. Provide a completely closed loop simulation for each digital control system to verify sequence operation, timing, and software integrity. Test control boards as follows: Supply control boards with 115-volt AC, 60 hertz, and operate each control switch and selector switch in all positions to verify that control circuits operate as shown on the schematic diagrams. Simulate remote contacts and switches with jumpers at the appropriate external terminal blocks to verify proper circuit operation. Test annunciator systems to verify that annunciator points operate correctly by jumpering or operating alarm initiating device or jumpering external terminals for remote alarm inputs.

2.12.17  Nameplates

Provide plastic, engraved nameplates for remote mounted devices. Fabricate nameplates from laminated white phenolic plastic with black engraved letters. Size shall be 19 mm high and 80 mm long 3/4 inch high and 3 inches long. Attach nameplates with permanent adhesive or screws.
2.13 STRUCTURAL AND MISCELLANEOUS STEEL

Provide structural and miscellaneous steel required to frame and support the spray dryer absorbers, fabric filter baghouses, ductwork, lime slurry preparation system, and component parts and equipment. Provide steel supports, access platforms, grating walkways and stairs for access to spray dryer absorbers, fabric filter baghouses, and other equipment, as specified in paragraph entitled "Access." Structural-steel supports shall be designed to support equipment from the top of concrete foundations set at elevation [_____] (150 mm 6 inches above grade). All concrete foundations, anchor bolts and grouting will be provided by the Contractor. The Contractor shall allow 50 mm 2 inches for grout, so that the bottom of the baseplates provided under this contract shall be at elevation [_____]. Provide steel girts, purlins, braces and framing required for enclosures. Compliance submittals shall include general arrangement and outline information, foundation design information, structural fabrication information, and erection information. Unless otherwise specified, all structural steel shall conform to ASTM A36/A36M, as designated in the AISC 360, Part I. High-strength structural steel as listed in AISC may be used if it conform to the appropriate ASTM specification and subject to approval of the Contracting Officer. Structural steel includes columns, beams, trusses, baseplates, girts, secondary bracings, purlins, girders and hangers of structural steel. Miscellaneous steel includes steel other than structural steel such as edge plates, handrails, stairs, grating, ladders, and plate. Structural and miscellaneous steel shall be designed to resist not less than the minimum loadings. Design, fabrication, and erection of structural steel shall conform to the AISC 360 Manual of Steel Construction. Structural components shall be designed for wind loads with a minimum wind velocity of [_____] km/s mph. Design for seismic loads in accordance with Section 22 05 48.00 20 MECHANICAL SOUND VIBRATION AND SEISMIC CONTROL. The entire structure along with components shall be designed in accordance with earthquake regulations for structures located in Zone [_____]. The site periods shall be between 0.8 and 1.2 seconds, whichever results in the highest lateral force. The term "W" as used in the calculations for seismic loading shall be interpreted as the normal operating weight of the unit including dead loads. Platform live loads may be excluded. The structural components shall be designed for a snow loading of [_____] kg per square meter pounds per square foot. The structural components shall be designed for dust loading of 98 kg per square meter 20 pounds per square foot. The structural components shall be designed for dust loading where appropriate based on 1600 kg per cubic meter 100 pounds per cubic foot minimum. Use a higher load where applicable. Walkways, platforms, and stairs shall be designed for live loads of 488 kg per square meter 100 pounds per square foot plus concentrated equipment loads. Stair live load shall be 610 kg per square meter 125 pounds per square foot and shall be designed to carry the live load or a moving concentrated load of 454 kg 1000 pounds, whichever is greater. Roof purlins shall be spaced so that the metal roof deck span will not exceed 2.13 meters 7 foot. Design for a roof dead load of 98 kg per square meter 20 pounds per square foot and a live load of 148 kg per square meter 30 pounds per square foot.

2.13.1 Girts and Opening Frames

Provide girts for support of metal-wall panels with maximum spacing of 2.13 meters 7 foot center-to-center and supported on the outside face of the columns. Girts shall have a girt line or outside edge distance of 560 mm 1 foot 10 inches from the supporting column centerline. Lowest girt on spray dryer absorbers, fabric filter baghouses, and lime slurry preparation
system enclosure to be located abovegrade (Elevation [______]) with support at base of wall by Contractor. Provide closed ends or miter-cut girts at corners. Provide structural subframing for doors and ventilators located more than [______] above grade. Contractor will provide doors, door frames, and ventilators and will also provide necessary structural subframing from these items up to [______] above grade.

2.13.2 Slide Bearings

Provide structural slide bearings for spray dryer absorbers, ductwork, and fabric filter baghouse to ensure correct alignment, prevent equipment damage, ensure that stresses in the ductwork, fabric filter baghouse duct, and supports are not excessive, and to allow efficient system operation at conditions. Provide ductwork and fabric filter baghouse supports, except at totally laterally restrained points, with structural slide bearings. Construct slide bearings with slide bars or other methods to prevent possible accumulation of ash, dirt, and other materials on the bearing area. Slide bearings shall have fluoroplastic self-lubricating bearing elements.

2.13.3 Miscellaneous Steel

Handrail shall be 40 mm 1 1/2 inch round black standard weight pipe conforming to ASTM A53/A53M Type E or S, Grade B, with two horizontal pipe runs at 584 mm and 1067 mm 1 foot 11 inches and 3 feet 6 inches above top of walking grating. Handrail, accessories, and kickplates shall be hot-dipped galvanized after fabrication in accordance with ASTM A123/A123M. Kickplates shall be 6 mm 1/4 inch thick steel plate. Steel floor grating shall be one-piece, resistance-welded steel construction without notching of bearing or crossbars before welding. Main bars shall be 5 mm 3/16 inch thick, spaced not more than 30 mm 1 3/16 inches on centers. Serrate main bars for outdoor use. Crossbars shall be spaced at four inches on centers and shall be one of the following shapes: hexagon with 8 mm 5/16 inch diameter of inscribed circle; rectangular 13 by 5 mm 1/2 by 3/16 inch; square 6 mm 1/4 inch with spiral twist; round 8.33 mm 21/64 inch diameter. Grating materials shall be of welding quality and conform to the following standards: (1) Crossbar - ASTM A108 - Grade 1010. (2) Main Bars - ASTM A108 - Grade 1015. Grating finish shall be hot-dip galvanized after fabrication in accordance with ASTM A123/A123M. Stairs shall be open-riser type with grating treads and grating landings conforming to "Steel Floor Grating" an with main bars 25 by 5 mm 1 by 3/16 inch (Serrate main bars for outdoor use). Stair treads and landings shall be hot-dip galvanized after fabrication in accordance with ASTM A123/A123M. Stairs shall be supported with carrier plates 65 by 5 mm 2 1/2 by 3/16 inch by tread width tack welded to all bearing bars and with 5 mm 3/16 inch fillet welds (one side only) to the front two and the rear bearing bars, or supported with 35 by 22 by 3 mm 1 3/8 by 7/8 by 1/8 inch minimum size angle welded to the front and rear bearing bar (one side only). Provide subframing so grating span on landings does not exceed 1067 mm 3 feet 6 inches. Provide nosing on all treads and at the head of all stairs. Raised pattern floor plate shall be 6 mm 1/4 inch minimum thickness with surface deformation of the four-way type. Hot-dip galvanize raised pattern floor plate and straighten warped plate after galvanizing so that warpage does not exceed one inch for every 3 meters 10 feet in any direction.

2.13.4 Fabrication

Shop fabrication and assembly of steel structures shall be done in conformance with AISC Specifications, Codes, and Standards. Field welding
shall be shielded metal arc or submerged arc. Shop welding shall be
shielded-metal arc, submerged arc, flux-core arc, or gas metal arc. Welding
shall be done in conformance with the requirements of the AWS D1.1/D1.1M
and AISC Specifications. Field welds shall be shown on erection drawings
in conformance to the applicable standards. Shop connections shall be
welded, riveted, or bolted with high-strength bolts at the Contractor's
option and as allowed by the seismic code. Unless restricted by
consideration of clearance or seismic design criteria, field connections
shall be shown as bolted friction type using ASTM A325M ASTM A325 or
ASTM A490M ASTM A490 bolts and shall be designed to conform to AISC
specification for "Structural Joints Using ASTM A325M ASTM A325 or
ASTM A490M ASTM A490Bolts." Form and weld handrails and do not exceed 1.83
meters 6 feet from center-to-center of posts. Grind welds smooth and even
with the surface of the pipe, remove weld splatter. Carefully form
transitions at corners where change of direction or elevation occurs as
required to provide continuous handrail. Clear columns or other vertical
or horizontal projections by at least 80 mm 3 inches. Furnish plates and
additional items as required for fastening to supporting members. Extend
kickplates 100 mm 4 inches above top of grating and install at the edge of
uncovered openings and at the edge of walkways and platforms. Kickplates
shall be constructed to allow water run-off. Shop fabrication shall be as
complete as possible and within standard industry practice. Large pieces
shall be left unassembled only to the extent necessary for shipment.

2.13.4.1 Grating

Fabricate grating main bars vertical within a tolerance of 2.5 mm per 25 mm
0.1 inch per inch of depth with the longitudinal bow before fastening to
supports shall be less than 1/200 of the length and the traverse bow before
fastening to supports shall be less than 10.41 mm in one meter 3/8 inch in
3 feet. Crossbars shall not deviate from a straight line perpendicular to
the main bars by more than 5.21 mm in one meter 3/16 inch in 3 feet.
Crossbars shall match crossbars of adjacent sections to form a continuous
pattern of straight lines. Grating panels shall be cut to size and piece
marked. Panel width and length tolerances shall be plus or minus 6 mm 1/4
inch. Provide openings in grating as required for installation of piping
and equipment furnished under this Contract. Band openings 100 mm 4 inches
and larger with a metal bar same size as main bearing bar. Weld to each
bearing bar with 4.76 mm 3/16 inch fillet weld 19 mm 3/4 inch long. Tack
weld to crossbars. Trim band open end of grating at head of ladder, manway
opening, hinged sections, and grating panels with four crossbars or less.
Grating shall be removable. Fasten raised pattern floor plate in place
with countersunk stainless-steel screw at each corner of each piece or plug
weld where permanent fastening is required. Screws shall be flathead, 6 mm
1/4 inch, national coarse thread stainless steel, and shall be countersunk.

2.13.4.2 Stairs

Construction of stringers of channel sections shall be adequate to carry
the specified design loads without excessive deflection. Construct cross
brace stringers to provide lateral stability where the horizontal run
exceeds 3.66 meters 12 feet. Provide struts and hangers where required to
suit specified live load with minimum size as specified. Bolt tread to
stringers with a minimum of two 9.53 mm 3/8 inch, national coarse thread,
stainless steel bolts.

2.13.5 Access

Provide access walkways across top of ductwork from boiler enclosures to
spray dryer absorbers as indicated. Extend walkways to fabric filter baghouses as indicated. Stair access and platforms shall be supplied to fabric filter baghouse hopper accessories. Provide stair access and walkways for access to the tube sheet level of the fabric filter baghouses with connecting walkways. Internal and external access walkways, lights, and platforms shall be provided to access doors, inspection or maintenance points, and other areas where access is required for operation, inspection, testing, and maintenance. Walkways and platforms at each level shall be interconnected by walkways at the same level. Walkways including roof, shall be connected by stairs. Caged ladders shall be provided at each level for secondary egress. Provide stair access and platforms to lime system equipment levels. Access shall be provided for dust valves, manholes, poke holes, hopper vibrators, conveyors, expansion joints, dampers, portion of the ductwork subject to dust accumulation, gas sampling points and all parts of equipment requiring routine maintenance, repair or replacement. Handholds shall be provided inside and outside directly above each access door. Access doors, and mechanical and electrical components shall be accessible from a walkway or platform. Complete layout of access system shall be subject to approval of the Contracting Officer. Provide supporting steel, grating, handrails, and kickplates electrical lights and outlets for walkways, stairs and platforms. Arrangement, design, and fabrication of access systems shall conform to OSHA regulations. Headroom shall be 2.13 meters 7 foot clear. Provide adequate allowance for installation of piping, conduit, electrical outlets, and lighting fixtures. Design exterior walkways and platforms which will be located above ductwork or other areas requiring insulation and lagging to allow a minimum of 150 mm 6 inches clearance between lagging and bottom of walkway structural steel assuming that insulation and lagging will be placed on top of ductwork stiffeners. Stairs, walkways, platforms, and ladders and their vertical support steel shall be located a minimum dimension of 0.91 m 3 foot from the outside column row centerline of structures for which the Contractor will be supplying and installing metal wall panel. Walkways width shall be 0.91 m 3 foot, minimum. Include handrail and kickplates around platforms. Design access stairs, as specified. Access stairs width shall be 0.91 m 3 foot, minimum. Include handrail along both sides, top rail to be 762 to 813 mm 2 foot 6 inches to 2 foot 8 inches above edge of tread. Stairs shall be open-riser type. Stair treads shall be as specified. Stairs shall have a minimum of 229 mm 9 inch tread and a maximum of 203 mm 8 inches rise. Minimum width of ladders shall be 457 mm 1 foot 6 inches. Rung diameter shall be 19 mm 3/4 inch. Rungs shall be spaced at 300 mm 12 inch on centers. Side rails shall be a minimum of 9.53 by 63.50 mm 3/8 by 2 1/2 inch. Exterior ladders and cages shall be hot-dip galvanized after fabrication in conformance with ASTM A123/A123M. Provide gas-tight and liquid-tight access doors to facilitate entry to parts of the flue gas cleaning system. Access doors shall be 610 mm 24 inch minimum diameter and the quick opening type. Access doors shall have ethylene propylene terpolymer (EPDM) gaskets. Provide access doors with hinges to support door when open. Provide access doors with external latches and tightening devices which allow for gasket shrinkage without loss of gas-tight seal. Provide safety chains on access doors to allow door to be cracked open slightly before opening completely. Provide a means of padlocking access doors in the open position. Provide inside and outside handholds directly above each access door.

2.13.6 Personnel Access Requirements

2.13.6.1 Class 1

Regularly attended areas shall have access operating platforms which are
fully accessible by stairs. No ladder or ships ladders for access will be permitted. Areas included: Lubricated equipment, bearings, instruments, valve operators, damper operators, damper linkages and drives, test ports, instrument connections, and equipment requiring access during operation and for normal day-by-day inspection and maintenance. Platforms at same elevation on each side of equipment or building shall have a walkway connecting the two sides.

2.13.6.2 Class 2

Maintenance access areas such as expansion joints, duct access doors, safety valves, valve packing, and other areas requiring access every two years or more, shall have access platforms of adequate size to permit two people to work, 1.12 meter 12 square feet minimum, with access ladders and maintenance access walkways for reaching the platforms in accordance with the following: Maintenance access walkways shall be not less than 610 mm 2 foot in width. Ladders shall be as specified in paragraph entitled "Access." Headroom shall be 2.13 meters 7 foot clear except 2 meters 6 foot 6 inches will be allowed in tight locations. Provide adequate allowance for installation of Government's piping, conduit, and lighting fixtures. Provide at least two avenues of escape from safety valves or other hazardous equipment.

2.13.6.3 Class 3

Maintenance access areas, where access is only required for painting, reinsulation, or replacement of components which have a service life of 10 years or more, shall be met by providing facilities to enable the erection of patent scaffolding, temporary ladders, platforms and safety nets to safely perform the work involved.

2.13.6.4 Maintenance Access Requirements

Provide rotating machinery and mechanical equipment components weighing in excess of 91 kg 200 pounds with monorails and eyebolts to permit the equipment to be removed and lowered to grade in a single lift.

2.13.7 Painting

The steel surfaces must be dry and clean in accordance with the following requirements. Remove grease, oils, and contaminants as outlined in SSPC SP 1. Remove weld spatter and grind burrs on cut edges and rough welds smooth. Blast-clean surfaces after fabrication, in accordance with SSPC SP 6/NACE No.3 and profile depth from 0.038 to 0.064 mm 1.5 to 2.5 mils. Apply first coat before any rust bloom forms. Apply one coat, dry film thickness of 0.076 mm three mils, of any of the organic zinc-rich primers meeting the requirements of SSPC PS 12.01, with a minimum of 82 percent zinc in the dry film. Apply primer in accordance with manufacturer's recommendations. Apply primer to steel surfaces except the areas within 50 mm 2 inches adjacent to field welds and surfaces specified to be hot-dip galvanized.

PART 3 EXECUTION

3.1 INSPECTION

As equipment is delivered to the jobsite, it shall receive a preliminary inspection by Contractor Quality Control Representative and the Contracting Officer. The inspection will be continued during the installation after
installation, and during testing. The right is reserved to inspect equipment at the plant of the manufacturer, during or after manufacture, and to require reasonable witness tests before shipments are made. Government and Contractor Quality Control Representatives shall be allowed unrestricted access to manufacturing and fabrication facilities. Any equipment rejected shall be either corrected or replaced before installation. The Contractor shall provide field representatives for technical direction of the erection, startup, and testing of the FGD system by the Contractor and for training of the Government's operating personnel.

3.1.1 Contractor Construction Representatives

The Contractor shall furnish experienced, competent, contractor construction representatives including travel and living expenses, to advise and consult the Contractor regarding erection procedures and quality standards for the equipment furnished. These inspection services shall be furnished from receipt of materials at the jobsite until the equipment and material furnished under this contract is ready for operation by the Government. The contractor construction Representative shall be responsible for the inventory and inspection of equipment and material furnished under this contract at delivery to determine if the equipment and material meets the requirements of the specifications for the Contractor's purpose of recovering, at the Contractor's option, the cost of new equipment and materials or the cost of corrections or modifications to the equipment, and materials from the Contractor's, subcontractors, or suppliers.

3.1.2 Contractor Construction Representative Areas of Work

The contractor construction representative shall advise and consult with the Contractor regarding the proper removal of equipment from rail cars, trucks, and other means of shipment, and the movement of material to and from storage facilities. Contractor shall advise Contracting Officer regarding the need for various classes of storage facilities. The Contractor shall advise the Contracting Officer regarding the protection of equipment while in storage. Contractor shall review the status of stored equipment and advise the Contracting Officer of any condition not in conformance with the Contractor's storage requirements. Contractor shall review the storage facilities to ensure the following:

a. Protection of motors, electrical equipment, and machinery of all kinds against corrosion, moisture deterioration including temporary wiring of motors space heaters while in storage, mechanical injury, and accumulation of dirt or other foreign matter.

b. Protection of exposed machined surfaces and unpainted iron and steel as necessary with suitable rust-preventive compounds.

c. Protection of bearings and similar items with grease packing or oil lubrication.

d. Handling and storing of steel plate, breeching sections, dampers, expansion joints, and similar items, in a manner to prevent deformation.

e. Blocking equipment and material stored outdoors, at least 6 inches above the ground and arranging for natural drainage with equipment drain connection open, but protected.

Contractor Construction Representative shall advise and consult with the
Contractor regarding the erection of structural and miscellaneous steel, installation, and retightening of valves, welding of piping, installation of instruments and controls, installation of insulation and lagging, erection of bracing and scaffolding, grouting, retouching paint surfaces, protection of equipment from freezing, and alignment of equipment.

3.1.3 Field Service Engineer Representatives

Contractor shall include in his bid the cost of the services of competent, qualified field service engineers from the manufacturers of purchased equipment. Field service engineers shall provide consulting and advising services required for placing equipment into successful operation. Field service engineers shall be provided for the spray dryer, fabric filter baghouse, hopper heaters, fly ash level detectors, induced draft fans, pumps, dampers, control valves, air pollution monitors, FGD system panelboard, and analog control systems. Field service engineers shall perform an inspection prior to startup to verify that the unit is installed in conformance with the manufacturer's recommendations. A written report of the inspection, performed by the field service engineer, shall be submitted to the Contracting Officer stating his findings including the acceptability of the FGD system for field performance tests within 15 calendar days after his inspection. Field service engineer shall be on call for 30 days after start-up.

3.2 INSULATION INSTALLATION

3.2.1 General

Insulation shall be applied with interruptions to permit access doors, inspection doors, flanges, and other special features to be opened or removed for inspection or maintenance without disturbing the insulation. Boxouts around code stamping symbols and nameplates shall be provided. Double thickness insulation shall be installed with the joints of the two layers staggered. Cracks, voids, and depressions in layers of insulation shall be filled with suitable insulating cements before application of another layer of insulation as required to allow for thermal expansion movements which might cause cracks or tears in the insulation. Insulation shall be installed between stiffeners or over stiffeners in such a manner that stiffeners are completely insulated. Additional insulation or casing spacers shall be installed between stiffeners so that a uniform level surface is achieved. The intent of this insulating procedure is to prevent a direct metal path between inside the dry FGD system and ambient air. Insulation shall be securely wired and laced in place using No. 14 dead soft type 302 stainless steel wire, conforming to ASTM A580/A580M.

3.2.2 Block and Mineral Fiberboard Insulation Installation

Block and mineral fiberboard insulation shall be held in place with insulation lugs spaced on not greater than 300 by 450 mm 12 by 18 inch center. The lugs shall be stud type welded in place. Blocks shall be reinforced on the exterior face with expanded metal, if necessary, to prevent sagging or cutting of the insulation by the lacing wire. Block and mineral fiberboard insulation of the specified thickness shall be securely wired in place over the entire surface by means of wire threaded through the lugs both ways, pulled tight with the ends of the wire loops twisted together with pliers, bent over, and carefully pressed into the surface of the insulation.
3.2.3 Mineral Fiber Blanket Insulation Installation

Mineral fiber blanket insulation shall be held in place with speed washers and impaling pins spaced on centers not exceeding 300 mm 12 inches. Mineral fiber blanket insulation shall be provided with expanded metal reinforcement on the outer surface and wire mesh or expanded metal on the inner surface. Sections of the blankets shall be tightly butted and jammed together, and securely tied for maximum sealing at joints. The blanket shall be secured at joints to prevent peeling or bulging away from blanket edges. Care shall be taken in applying speed washers so that the designed thickness of insulation is not reduced when washers are installed.

3.2.4 Protection From Insulation Materials

Equipment and structures shall be adequately protected from damage from insulation materials. After completion of the work, equipment and structures shall be cleaned, repaired, and restored to their original state. Casings which become corroded, discolored, or otherwise damaged shall be repaired by replacement of casing or other means acceptable to the Contracting Officer.

3.3 CASING INSTALLATION

3.3.1 Structural Steel Grid System

Casing shall be installed on aluminized structural steel grid system of subgirts designed, furnished, and installed by the Contractor. The subgirts shall be of sufficient size, gage, and depth to provide adequate support and a smooth exterior surface and shall be welded to the equipment and structural support surfaces. Subgirts shall be of sufficient depth to provide for application of the full thickness of insulation over the stiffeners, access doors, flanges, ribs, and other surfaces having uneven contours to provide a smooth finished surface. Subgirts on vertical and bottom surfaces shall be at a maximum spacing of 1220 mm four feet on centers. Subgirts on roof surfaces shall be at a maximum spacing of 600 mm two feet on centers. The walking surfaces shall be such as to transmit an external 114 kg 250 pound walking load from the casing to the structural steel grid system without compression of the insulation material.

3.3.2 Access Openings

Access doors and other penetrations through the insulation shall have insulation fitted closely to the fittings and shall be neatly framed and flashed to make weathertight and to create a pleasing appearance. Hinged or lift-off doors designed for convenient opening or removal shall be provided with nameplates, code stampings, and nonprojecting connections at all access openings. Access openings shall be pitched for water runoff and have flashing at door head as shown in SMACNA 1793.

3.3.3 Weatherproofing

Install casing with proper overlap to make the installation weathertight. The casing shall be carefully fabricated and fitted to ensure a neat appearance. Provide closures, flashings, and seals. The open ends of fluted sections shall be provided with tightfitting closure pieces. Flashing shall be suitably formed and installed so that water cannot enter and wet the insulation. The flashing shall be designed and installed to readily drain any water that might enter. Joints or openings in casing which cannot be effectively sealed from entry of moisture by flashings or
laps shall be weatherproofed by application of an aluminum-pigmented sealer manufactured for this type of service.

3.3.4 Convection Stops

Furnish and install convection stops on vertical surfaces over 3.70 meters 12 feet tall. The maximum interval between convection stops shall be 3.70 meters 12 feet. The convection stops shall consist of steel channels or Z girts.

3.3.5 Casing Attachment

Attach aluminum casing to the steel structural members by means of No. 14 stainless steel series 300 self-tapping screws on 300 mm 12 inch centers. Fasten vertical laps and flashing by means of 10 mm 3/4 inch No. 14 stainless steel series 300 sheet metal screws on 300 mm 12 inch centers. Exposed screws shall have aluminum or stainless steel backed neoprene washers preassembled to screws. Installation shall be such that the insulation is not compressed below nominal thickness.

3.4 FIELD INSPECTIONS AND TESTS

3.4.1 General

Field testing of the equipment provided under this contract shall include the tests specified herein. Field testing will be performed by the Contractor and observed by the Contractor's field representatives as indicated in Section 01 45 00 QUALITY CONTROL. If the equipment fails to perform as required by this specification during any of these tests due to any deficiency in the Contractor's work, the cost of any repairs and any retesting required as a result of such deficiency shall be borne by the Contractor.

3.4.2 Hydrostatic Tests

After erection, piping systems shall be given a hydrostatic test 50 percent in excess of the design working pressure in accordance with the ASME BPVC Boiler and Pressure Vessel Codes (Sections I, II, V, VIII, and IX) and the applicable portions of ASME B31.1. Hydrostatic tests shall be conducted before any piping systems are encased by jacketing or insulation. Contractor shall provide cold water for the tests and suitable disposal facilities for wastewater after tests are complete. Contracting Officer has option to provide or not provide cold water or disposal facilities. Contractor shall furnish necessary equipment and materials required for testing including pumps, gages, temporary blank-off plates, gaskets, anchors, and bracing required to conduct tests. Contractor shall furnish and install an accurate pressure recorder and continuously record the pressure during the complete hydrostatic test. Contractor will furnish and install adequate relief valves to limit the maximum pressure that can be developed during the hydrostatic test to the specified test pressure. Tanks will by hydrostatically tested with clear water by filling to not less than 150 mm six inches from the tank top. Welds at tank bottom will be tested using a bubble technique, as specified in ASTM E515.

3.4.3 Smoke Tests

Spray dryer absorber vessels, fabric filter baghouse modules and breaching will be given a smoke test with smoke bombs producing a larger volume than available in the FGD system. The purpose of this test is to detect leaks.
due to shop and field welding and at expansion joints around seals. Test will be made by sealing gas inlets, outlets, and other openings. Pressure will be produced with a special pressure fan or with compressed air. Testing equipment and materials will be provided by the Contractor. Perform testing prior to the placement of insulation and lagging. Leaks found during the test will be repaired and the equipment will be retested until complete system is acceptable. Conduct tests at a pressure of 1245 Pa / 5 inches W.C. Measure pressure with a suitable water manometer. High-intensity white smoke bombs shall be used to provide the means for leak detection. Contractor shall provide equipment and materials required for the tests including fans, compressor, blank-off plates, gaskets, and smoke bombs. Notify the Contracting Officer 48 hours in advance prior to conducting any smoke tests. Tests will be witnessed by the Government's Field Representative.

3.4.4 Acceptance Tests

**************************************************************************
NOTE: Method 17 of 40 CFR 60 may be used as an alternative to Method 5. Specify that testing shall include sootblowing where applicable in certain states. If necessary provide for steam venting. Test with fuel close to design parameters. Operate boiler close to design parameters.
**************************************************************************

**************************************************************************
NOTE: Since most Navy facilities are not base loaded determine turn down capabilities of system.
**************************************************************************

After a period of initial operation, a performance test will be conducted on the [entire steam plant] [dry FGD system]. Conduct tests to determine if, according to the Contracting Officer, equipment and systems provided under this contract appear to be operating in a reliable and satisfactory manner. Tests will be conducted to determine if the equipment is performing as specified. Conduct final acceptance tests for gas cleaning performance in accordance with the test procedures outlined in U.S. EPA regulation 40 CFR 60. Performance testing for the fabric filter baghouses shall conform to methods 1, 3, 5, 6, 7, and 9. [For the purpose of determining fabric filter baghouse performance, the term "particulate" shall not include material collected in the impingers of the Method 5 sampling train.] Performance simultaneously testing for sulfur dioxide removal efficiency will be based on testing upstream of the spray dryer sulfur dioxide absorber and downstream of the fabric filter baghouse utilizing Method 6. Three contiguous one-hour runs shall constitute one test. Tests shall be conducted on the flue gas cleaning equipment for each of the units. Conduct tests at both 50 and 100 percent of rated boiler capacity. The operating temperature limits specified will be maintained during the acceptance tests. [Sootblowers will [not] be operated during the performance test for sulfur dioxide removal or fabric filter baghouse performance]. Perform field performance tests by an independent testing organization approved by the Contracting Officer. The Contractor shall give written notice to the Contracting Officer, at least 45 calendar days before scheduled test date, stating that equipment is being scheduled for test. Perform a trial run of 30 days minimum before actual test to ensure that associated systems required for the test are ready. Contractor and the manufacturer's field service engineer shall witness the test. Tests shall be performed at design conditions herein specified. Conduct the
efficiency tests after the gas cleaning system has been in continuous service for at least 45 days.

3.4.5 System Stoichiometry Tests

Contractor shall conduct system stoichiometry tests for the flue gas cleaning systems. Measure system stoichiometry as the ratio of moles of sorbent entering the spray absorber per mole of sulfur dioxide entering the spray absorber. Sulfur dioxide entering the spray absorber shall be determined by Method 6 of 40 CFR 60, Appendix A. Sorbent entering the spray absorber shall be calculated from the lime slurry feed rate and the calcium hydroxide content of the lime slurry as determined by ASTM C25. Conduct separate tests for each spray absorber. Tests shall be performed at both 50 and 100 percent of rated boiler capacity. Contractor shall consult with the Contracting Officer and with the Government's operators to coordinate schedules and operating conditions for the tests.

3.4.6 System Power Consumption Tests

Contractor shall measure the total power consumption of the flue gas cleaning system with boiler unit in operation at 100 percent of rated capacity. Power consumption shall be determined through the use of watt-hour meters provided by the Contractor for the purpose. Watt-hour meters shall be used at the power supply inputs to the motor control center for the lime slurry preparation equipment, the motor control center for the spray absorber-baghouse combination in operation, and the operating induced draft fan motor. The watt-hour meters used shall be accurate to within 1.0 percent. Coordinate test schedule and operating requirements with the Contracting Officer and the Government's operators.

3.4.7 Test Failures

In case any of the equipment furnished under this contract fails to operate as required, or in case of failure to meet any of the provided for in this contract, the Government shall have the right to operate the equipment until such defects have been remedied, and guarantees compiled with as specified in paragraph entitled "Quality Assurance," without cost to the Government. Failure to meet guarantees for which a schedule of compensatory damages has been specified may be resolved, at the Government's Option, by deduction of compensatory damages from the final payment. Removal of rejected equipment shall be scheduled at the convenience and discretion of the Government. In the event that serious defects necessitate the rejection of equipment, the Government will have the right to operate the equipment until such time as new equipment is provided to replace the rejected equipment.

3.5 PAINTING

Provide field painting of those surfaces of the following equipment not in contact with the flue gas stream; cyclones, fabric filter baghouse, fans, dry scrubber, and ductwork. Field painting shall meet the requirements specified in Section 09 90 00 PAINTS AND COATINGS. Other equipment provided in this section shall be painted; either field-painted with systems conforming to the requirements specified in Section 09 90 00 PAINTS AND COATINGS or painted with factory or shop painting systems conforming to the requirements specified in Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS.
3.5.1 Galvanic Corrosion Prevention

To prevent galvanic corrosion, care shall be used to prevent permanent contact of aluminum casing with copper, copper alloy, tin, lead, nickel alloy including Monel Metal. Where it is necessary to attach the casing to carbon steel or low alloy steel, the steel shall first be prime painted with zinc chromate, and then painted with aluminum paint suitable for surface temperatures encountered. The use of lead base paint is not acceptable.

3.6 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing, installing, adjusting, and testing of mechanical cyclone-type dust collector(s).

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The dust collectors are intended to be used for flue gas particulate removal and collection associated with coal-fired or oil-fired boilers and refuse-fired waste disposal incinerators. Coal-fired boilers applicable to this specification are those designed for pulverized coal firing, spreader stoker firing, or underfeed stoker firing with capacities ranging between 3.78 and 44 kilogram of steam per second 30,000 and 350,000 pounds of steam per hour. The incinerators applicable to this specification are those designed for burning municipal-type waste having firing capacities between 454 kilogram per hour 1,000 pounds per hour and 182 Mg 200 tons per day.
NOTE: The following information shall be shown on the project drawings:

1. The physical geometry of the cyclone relative to the plant.
2. The manner in which the cyclone is connected to the ductwork.
3. The means of physical support of the cyclone.
4. The amount of clearance between the hopper and floor.

ICAC M-6 (1981) Simplified Method of Efficiency Calculations from Fractional Efficiency Curves
1.2 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Select the applicable paragraph(s) from the following:
**************************************************************************

**************************************************************************
NOTE: Use these paragraphs for multitube collectors 150 mm 6 inch diameter collecting tubes may cause a plugging problem. Designer must investigate flue gas particulate size, distribution and tendency of particulates to adhere to each other for the specific project before selecting diameter of collector tubes.
**************************************************************************

**************************************************************************
NOTE: The third sentence of this paragraph shall be used only when dust collector is used with spreader stoker-fired boiler.
**************************************************************************

[Dust collector(s) shall be multitube, mechanical cyclone type, having collector tubes in accordance with ICAC M-2, ICAC M-4, ICAC M-5, and ICAC M-6. Collector(s) shall remove fly-ash from flue gas produced by a [pulverized coal-fired boiler] [spreader stoker-fired boiler] [underfeed stoker-fired boiler] [No. 6 fuel oil fired boiler] [refuse fired waste disposal incinerator of water wall furnace design]. [There shall not be
any reinjection from dust collector hopper(s) into spreader stoker-fired boiler. Collector(s) shall be designed for [indoor] [outdoor] installation and located in the flue-gas system between [_____] outlet and [_____] inlet [existing] locations. Provide necessary gas distribution devices in the ductwork ahead of and at the entrance of the dust collector(s) to ensure even gas flow into the dust collector(s.)

**************************************************************************
NOTE: Use this paragraph for 600 mm 24 inch or larger diameter cyclone collectors. A choice of diameter is dependent upon design parameters that must be analyzed.
**************************************************************************

[Dust collector(s) shall be high-efficiency, mechanical cyclone-type, [600 mm] [24 inch] [_____] diameter centrifugal cyclone body with tangential entry having arrangements of one, two, four, or more parallel unit combinations in accordance with ICAC M-2, ICAC M-4, ICAC M-5, and ICAC M-6. Collector(s) shall remove fly ash from flue gas produced by a refuse fired waste disposal incinerator of the no-boiler furnace design. Collector(s) shall be designed for [indoor] [outdoor] installation and located in the flue gas system between [_____] outlet and [_____] inlet [existing] locations. Provide necessary gas distribution devices in the ductwork ahead of and at the entrance of the dust collector(s) to ensure even gas flow into the dust collector(s.)]

1.3 PERFORMANCE

**************************************************************************
NOTE:

1. The stack emission or efficiency requirement must comply with either (a) weight emission standards: (b) opacity regulations; or (c) community standards for visible emissions. Compliance with existing emission codes may not satisfy the opacity regulation. Similarly opacity regulations may not be as demanding as community standards. A specific quantitative emission rate must be selected on the basis of the goals established.

2. Stack opacity is influenced by particle size makeup. For example, with pulverized coal-fired boilers, about 45 percent of ash particles are below 10 microns in size; for a cyclone-fired boiler, about 70 percent are below 10 microns; for a stoker-fired boiler, about 25 percent are below 10 microns. A visually acceptable stack for these three options might require residuals of 0.046 g/m3 0.02 gr per cf, 0.023 g/m3 0.01 gr per cf, and 0.0929 g/m3 0.04 gr per cf, respectively.

3. A 90 percent overall collection efficiency may be attainable with most coals burned in underfeed or gravity feed stoker-fired boilers. Mechanical cyclones must be viewed as a part of an air pollution system on boilers or incinerators. When used as precleaners in conjunction with electrostatic precipitators (ESP) or baghouses, a
high efficiency cyclone is not necessary and may even adversely affect the high efficiencies of the ESP or baghouse. In addition, 90 percent efficiency is dependent upon particle size, distribution and concentration as well as the collector being or not being used in conjunction with higher efficiency ESP or baghouse collectors. The large diameter cyclones do have a low pressure drop, but the high efficient multitube collectors operate in a range from 747 to 1992 Pa 3 to 8 inches water gage.

[Multitube] [Centrifugal cyclone] collector shall operate with a minimum overall collection efficiency of [_____] percent at a maximum draft loss of [1992] [249] Pa [8] [1] [_____] inch water gage when operating at maximum [continuous] [peak] rating of flue gas flow conditions, dust loading, and dust particle size distribution specified in paragraph entitled "Inlet Gas Conditions."

1.4 DESIGN REQUIREMENTS

1.4.1 Mechanical Cyclone Dust Collector System

Indicate the kind, size, collector arrangement with duct gas distribution devices, duct transitions, hopper access, walkways, housing access, damper and damper controls, draft gage and sample portal connections, weight of each component, and breakdown for shipment. When detail drawings are submitted without statements describing sectional shipments, it will be understood that no field assembly of the equipment will be required. Indicate the arrangement of platforms, walkways, stairways, and fixed ladders that are required for operation, examination, testing and maintenance of each dust collector. Indicate the external connections, location of local controls and remote control panels, anchorages, and supports required; the dimensions needed for installation and correlation with other materials and equipment; and foundation and loading information. Submit the layout drawings for each component showing design and assembly. Layout drawings shall show each hopper face with all arrangement including control zones. Submit wiring diagrams and control schematics of all electrical and pneumatic circuits used.

1.5 OPERATING EXPERIENCE REQUIREMENTS

1.5.1 Equipment

Provide only [a] dust collector[s] which meet[s] all of the operating experience requirements listed below.

1.5.2 Operating Experience

Manufacturer shall certify that the manufacturer has constructed not less than three mechanical cyclone type dust collectors of the [multitube mechanical type] [high-efficiency; large-diameter centrifugal cyclone type] treating flue gas from [an incinerator] [a boiler] with [automatic] [manual] combustion control. Each collector shall have performed satisfactorily, normal maintenance or downtime of the associated [boiler] [incinerator] included, for a period of not less than 2 years treating at least [_____] L/s acfm of inlet gas at a temperature of at least [_____] degrees C F, with inlet dust loading of at least [_____] grams per liter grains per acf and outlet dust loading of at most [_____] grams per liter.
grains per acf. In determining this experience:

a. Only collection of fly ash as produced by [coal-fired boilers] [oil-fired boilers] [refuse-fired waste disposal incinerator] is considered as equivalent experience.

b. Only experience at the approximate flow gas volume, flue gas temperature and inlet dust loading is acceptable.

1.6 MANUFACTURER'S FIELD REPRESENTATIVE

Furnish the services of [a] field representative(s) specifically trained by the manufacturer to assist installers of their equipment. Field representative(s) shall be at the erection site during all phases of the installation including unloading, hauling, storing, cleaning, erecting, and testing. It is the responsibility of the field representative(s) to assist the installer during the erection of [the] dust collector(s) and to assure both parties that dust collector(s) [is] [are] being installed in accordance with the dust collector manufacturer's recommendations. The field representative(s) shall certify in writing to the Contracting Officer that dust collector(s) [has] [have] been installed as recommended by the manufacturer. The field representative(s) shall supervise the adjustment of all controls, control devices, and components supplied with dust collector(s) as necessary to place dust collector(s) in successful operation. Field representative(s) shall instruct plant operators in operation, care, and maintenance of the dust collector(s). Written notice from the Contracting Officer shall be received prior to scheduling these instructions. The field representative[s] services will be required for approximately [3] [_____] days and will include [2] [_____] round trips to the job site.

1.7 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, shall apply.

1.8 SUBMITTALS

******************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

[Centrifugal cyclone collector]

[Multitube collector]

Submit performance curves consisting of particle size distribution and fractional efficiency curves.

SD-02 Shop Drawings

Mechanical cyclone dust collector system

SD-07 Certificates

Lists of prior installations

Certification of testing capability

SD-06 Test Reports

Voltage testing certificate

Post-installation inspection of dust collectors

Performance test of dust collectors

Particulate tests of dust collectors

Submit post installation inspection report within 15 calendar days after inspection stating the findings including a statement that [the] mechanical dust collector(s) [are] [are not] acceptable for field performance tests. Perform dust collector tests in conjunction with boiler or incinerator. For each performance test, including cycling test and 100 percent load testing, submit data specified in paragraph entitled "Inlet Gas Conditions" and paragraph entitled "Dust Collector Data." Depict deficiencies and
failures of components in test reports. Test reports for particulators tests shall certify that instruments were calibrated and readings indicated are true, that computations required for testing are accurate, that acceptable methods were used, and that the equipment performed in accordance with the requirements or performed with depicted failures or deficiencies. Results of additional tests shall be recorded and submitted in a written report to the Contracting Officer.

SD-10 Operation and Maintenance Data

Centrifugal cyclone collector, Data Package 3

Multitube collector, Data Package 3

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Include complete installation, operation and maintenance instructions and data including models and serial numbers and part lists for the equipment.

1.9 QUALITY ASSURANCE

1.9.1 Lists of Prior Installations

Submit within 30 days after award and prior to commencement of installation, a certificate containing the following information:

a. A list of at least three installations meeting requirements set forth in paragraph entitled "Operating Experience."

b. Owner and location of each installation.

c. Date of owner acceptance of each installation.

d. Collector model number.

e. Design inlet gas volume, L/s acfm.

f. Design inlet gas temperature, degrees C F.

g. Design inlet dust loading, grams per liter grains per acf.

h. Design outlet dust loading grams per liter grains per acf.

i. Type of [coal-fired] [oil-fired] [boiler] [refuse-fired waste disposal incinerator].

1.9.2 Certification of Testing Capability

Certify that the factory is capable of performing electrical integrity tests of 1000 volts for hopper heater modules, blanket or tape.

1.9.3 Voltage Testing Certificate

Submit test.

1.10 BID FORMS

ICAC M-4 evaluation bid forms.
1.11 DELIVERY AND ASSEMBLY

Ship equipment completely factory-assembled, except when physical size, arrangement, or configuration of the equipment, or shipping limitations, makes the shipment of completely assembled equipment impracticable, in which case assemble equipment and ship as shown on the approved shop drawings. The Contractor is responsible for all costs encountered in the field for assembly of sections, accessories, or appurtenances not listed in the proposal as requiring field assembly.

1.11.1 Coordination

Contractor shall ensure that design parameters of collector are coordinated by dust collector manufacturer with manufacturers of system equipment and installing contractor of ductwork with gas distribution devices which will interface with, and optimize system operation.

1.12 DATA AND CONDITIONS

1.12.1 Boiler Data

**************************************************************************
NOTE: Select the applicable paragraph(s) from the following:
**************************************************************************
**************************************************************************
NOTE: Depending on air pollution emission regulations, mechanical cyclone-type dust collectors should not be used alone on pulverized coal-fired boilers. They should be used with, and ahead of, electrostatic precipitators. Specify range of properties for coal. If other air pollution equipment exists or is proposed, list: description, type, rating, performance, condition, expected life and how to be used with new equipment.
**************************************************************************
**************************************************************************
NOTE: Insert appropriate Section number and title in the blanks below using format per UFC 1-300-02.
**************************************************************************

Design mechanical cyclone-type dust collectors for operation with [the boiler(s) specified in [_____] [boiler(s) manufactured by [_____] Type [_____] Model No. [_____]]. The boiler is a [new] [existing] [pulverized coal-fired] [spreader stoker-fired] [underfeed stoker-fired] [No. 6 fuel oil fired] boiler rated [_____] kilogram per second of steam at [_____] kPa pounds per hour of steam at [_____] psi, having a gross heat input of [_____] kilowatt million Btu per hour, and utilizing coal with the following approximate properties:

a. Proximate analysis, as received, percent by weight:
<table>
<thead>
<tr>
<th>Range</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Moisture</td>
<td>[____]</td>
</tr>
<tr>
<td>Ash</td>
<td>[____]</td>

2. Include ash analysis if available. Classified
material contents description may change as plastic 
use increases. Check Incinerator Institute of 
America for latest information.

**************************************************************************

NOTE: Insert appropriate Section number and title 
in the blanks below using format per UFC 1-300-02.

**************************************************************************

Design mechanical cyclone-type dust collector(s) for operation with [the 
incinerator(s) specified in [_____] [incinerator(s) manufactured by 
[____], Type [____], Model No. [____]]. The incinerator is a [new] 
[existing] installation capable of burning [____] [ kilogram pounds] per 
hour [ Mg tons per day] of type [0], [1], [2], [3], [4], [loose paper] 
[loose wood] [classified material] wastes. The expected range of 
incinerator operation will be between [____] and [____] [ kilogram pounds 
] per hour [ Mg tons per day] of wastes. Incinerator combustion is 
controlled [manually] [automatically]. Auxiliary fuel is [____]. 
Proposed or other existing gas cleaning equipment includes [_____].

1.12.2  Inlet Gas Conditions

**************************************************************************

NOTE: 

1. To properly apply their equipment, the dust 
collector manufacturer must know the expected inlet 
gas conditions. This information can best be 
supplied by the boiler or incinerator manufacturer.

2. In determining the inlet gas conditions for 
existing installations, source testing should be 
performed to determine the gas flow and contents. 
Gas volume determinations should be made using a 
Pitot tube in accordance with ICAC "Test Procedure," 
Bulletin 101. This publication incorporates ASME 
techniques as called for in ASME PTC 38 "Determining 
the Concentration of Particulate Matter in a Gas 
Stream." For particulate loading an actual sample 
should be taken and analyzed in accordance with ASME 
PTC 28, "Determining the Properties of Fine 
Particulate Matter" or in accordance with EPA 40 CFR 
60, Appendix A, Method 5 or Method 17 or applicable 
local standard.

3. If off-design conditions exist, the following 
relationships are available for estimation purposes:

For Variable Gas Flow Rate:

\[ 100 - \text{Eff (1)} = [Q(2)]^{0.5} \]
\[ 100 - \text{Eff (2)} = [Q(1)]^{0.5} \]

For Constant Gas Flow Rate:

\[ 100 - \text{Eff (1)} = [U(2)]^{0.5} \]
\[ 100 - \text{Eff (2)} = [U(1)]^{0.5} \]
For Variations in Gas Density:

\[ 100 - \text{Eff (1)} = [Pp-Pg(2)]^{0.5} \]
\[ 100 - \text{Eff (2)} = [Pp-Pg(1)]^{0.5} \]

For Moderate Changes In Gas Particulate Loadings:

\[ 100 - \text{Eff (1)} = [C(2)]^{0.183} \]
\[ 100 - \text{Eff (2)} = [C(1)]^{0.183} \]

\text{Eff: Collector Efficiency}
\text{Pp: Particulate Density}
\text{Q: Volume Flow Rate}
\text{Pg: Gas Density}
\text{U: Gas Viscosity}
\text{C: Particulate Concentration}
\text{1,2: Operating Conditions (Mass Per Unit Volume)}

4. Mechanical cyclone type dust collectors should be able to handle up to 120 percent of inlet flue gas volume.

5. For new installations, the inlet gas conditions should be obtained from the boiler or incinerator manufacturer. If this is not possible, the gas contents must be estimated. When estimates are made, the emission factors and handbook data should be taken from U.S. Environmental Protection Agency publication No. AP-42, "Compilation of Air Pollutant Emission Factors" with the latest supplements.

******************************************************************************

NOTE: Supply excess air percentage for incinerator applications.
******************************************************************************

Design mechanical cyclone-type dust collector(s) for inlet gas conditions from the [boiler(s)] [incinerator(s)] specified above. Dust collector manufacturer shall coordinate the application of his equipment with the [boiler] [incinerator] manufacturer to assure that the collection efficiency specified herein is attained. The inlet gas conditions are:

\_\_\_]\).

j. Minimum casing design temperature, degrees \(\text{C F}\) \([\_
\_\_\_]\).
PART 2  PRODUCTS

2.1  MATERIALS

**************************************************************************
NOTE: Select the applicable paragraph(s) from the following:
**************************************************************************

**************************************************************************
NOTE: Use these paragraphs for multitube collectors
150 mm 6 inch diameter collecting tubes may cause a plugging problem. Designer must investigate flue
gas particulate size, distribution and tendency of particulates to adhere to each other for the
specific project before selecting diameter of collector tubes.
**************************************************************************

Multitube collector parts exposed to flue gas shall have a multilayer internal lining having physical characteristics suitable for the service
and able to withstand abrasive and chemical action of flue gas and fly ash. Insulating properties of lining shall be such that metal skin
temperature shall not exceed 343 degrees C 650 degrees F. All parts subject to deterioration shall be accessible for inspection, maintenance or replacement. Materials used shall conform to the following requirements:

**************************************************************************
NOTE: Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.
**************************************************************************

a. Exterior shell: [ASTM A242/A242M Type 1] [or] [ASTM A36/A36M] 6 mm 1/4 inch minimum thickness.
b. Hoppers: [ASTM A240/A240M] 6 mm 1/4 inch minimum thickness.

**************************************************************************
NOTE: Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.
**************************************************************************

c. Collecting and outlet tube sheets: [ASTM A242/A242M Type 1] [or] [ASTM A36/A36M].
d. Outlet tube: [ASTM A139/A139M Steel] [or] [ASTM A667/A667M Centrifugally Cast Iron] [or] [ASTM A532/A532M, Abrasion Resistant Cast Iron].
e. Collecting tube: [ASTM A667/A667M Centrifugally Cast Iron] [or] [ASTM A532/A532M, Abrasion Resistant Cast Iron].
f. Inlet vanes: [ASTM A667/A667M Centrifugally Cast Iron] [or] [ASTM A532/A532M, Abrasion Resistant Cast Iron].
g. Gaskets: Type E, fiberglass suitable for service temperatures up to
371 degrees C  700 degrees F.

**NOTE:** Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.

h. Inlet manifold: [ASTM A242/A242M Type 1] [or] [ASTM A36/A36M] 6 mm 1/4 inch minimum thickness.

**NOTE:** Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.

i. Structural and miscellaneous steel: [ASTM A242/A242M Type 1] [or] [ASTM A36/A36M].

**NOTE:** Use these paragraphs for 600 mm 24 inch or larger diameter cyclone collectors. A choice of diameter is dependent upon design parameters that must be analyzed (See paragraph entitled "SD-81, Operation and Maintenance Instructions, parts and Testing") and satisfied for each specific project.

[Centrifugal cyclone collector] parts exposed to flue gas shall be of materials having physical characteristics suitable for the service and able to withstand abrasive and chemical action of flue gas and fly ash. Materials used shall conform to the following requirements:

a. Cone: ASTM A36/A36M, 6 mm 1/4 inch minimum thickness.

**NOTE:** Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.

b. Body: [ASTM A242/A242M Type 1] [or] [ASTM A36/A36M] 6 mm 1/4 inch minimum thickness.

c. Hoppers: [ASTM A240/A240M] 6 mm 1/4 inch minimum thickness.

**NOTE:** Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.

d. Inlet manifold: [ASTM A242/A242M Type 1] [or] [ASTM A36/A36M].

e. Dense castable abrasion resistant lining: ASTM C401, Class B.

**NOTE:** Use ASTM A242/A242M steel when material is
subjected to continuous temperatures of 204 degrees C 
400 degrees F or higher.

f. Structural and miscellaneous steel: [ASTM A242/A242M Type 1] [or] [ASTM A36/A36M].

2.2 FABRICATION

NOTE: Select the applicable paragraph(s) from the following:

NOTE: Use these paragraphs for multitube collectors. 
150 mm 6 inch diameter collecting tubes may cause a plugging problem. Designer must investigate flue gas particulate size, distribution and tendency of particulates to adhere to each other for the specific project before selecting diameter of collector tubes.

NOTE: Use this and associated paragraphs for 600 mm 24 inch or larger diameter cyclone collectors. A choice of diameter is dependent upon design parameters that must be analyzed (See paragraph entitled "SD-81, Operation and Maintenance Instructions, Parts and Testing") and satisfied for each specific project.

Fabricate multitube type mechanical dust collector(s) of welded and flanged steel with structural steel supporting framework. Arrange internal inlet tubes so that no tube is more than one row away from alleyway with a minimum width of 460 mm 18 inches that will allow total accessibility for inspection and cleaning of tubes. Recovery vanes are not required and shall not be provided on dust collectors that receive the gases from oil burning [boilers] [incinerators]. Stresses due to draft differential and thermal expansion shall not cause excessive deflection of plates or members. Joints between tubes and tube sheets shall be gas tight; dust collector housings shall be gas tight and dust tight. Flange flue gas inlet and outlet connections and arrange to accommodate connecting breeching as shown on drawings. Arrange tubes in outlet and hopper sections so that no tube is more than two rows from physical access from an alleyway with a minimum width of 600 mm 24 inches.

NOTE: Use this and associated paragraphs for 600 mm 24 inch or larger diameter cyclone collectors. A choice of diameter is dependent upon design parameters that must be analyzed (See paragraph entitled "SD-81, Operation and Maintenance Instructions, Parts and Testing") and satisfied for each specific project.

Fabricate [600 mm] [24 inch] [_____] diameter centrifugal dust cyclone collector(s) of welded steel. Provide all portions of collector(s) subjected to high temperature flue gas flow with a multilayer internal lining having specified insulating and abrasion resistant properties suitable for service intended. In addition, provide inside surfaces of outlet manifold with ASTM C401, Class B abrasion resistant lining. Lining shall be suitable for maximum 343 degrees C 650 degrees F of metal skin temperatures. Apply and reinforce lining in accordance with lining manufacturer's recommendations to resist cracking, spalling, and blistering. Provide each hopper with a flanged fly ash outlet connection
to accept fly ash transportation system valves. Flange flue gas inlet and outlet connections and arrange to accommodate connecting breeching as shown on drawings.]

2.2.1 Structural Supports

**************************************************************************
** NOTE: Delete 1st sentence if project is not located in seismic Zone 3 and 4 of the Uniform Building Code. Use 6 mm 1/4 inch thick steel for temperatures over 260 degrees C 500 degrees F. Detail structural supports on the drawings. Obtain from manufacturer and provide collector operating pressure and design pressure (Pa\(\text{WC}\) negative-positive) and design temperature (degrees C F) on drawings.**
**************************************************************************

[Specify support for dust collector(s) for seismic probability zone [3] [4] in accordance with Section 22 05 48.00 20 MECHANICAL SOUND VIBRATION AND SEISMIC CONTROL.] Design dust collector(s) to support its own dead weight plus insulation, maximum weight of accumulated fly ash, and the following external loads based upon flue gas flow at maximum continuous [boiler] [incinerator] load rating and maximum pressure drop across the dust collector.

a. Snow load, kilogram per square meter pounds per square foot[_____]  
b. Wind load, kilogram per square meter pounds per square foot[_____]  
c. Live load, kilogram per square meter pounds per square foot[_____]  

2.2.2 Hoppers

**************************************************************************
** NOTE: Specify access door for clean gas side of collector(s) if such access door is not provided in the clean gas ductwork.**
**************************************************************************

Provide dust hopper(s) with dust collector(s). Provide a minimum of one pyramid hopper for each collector. Fabricate all hopper plates of 6 mm 1/4 inch thick ASTM A240/A240M, Type 316 stainless steel. Provide hopper(s) with untapered fillet sheets, fabricated of cold rolled 10 gage ASTM A167 Type 316 stainless steel in each corner. Extend fillet sheets the full length of the corner. Seal weld the fillet sheets to the hopper walls. Provide closure sheets at the top of the hopper at each corner to prevent flow into the area between the fillet sheet and the hopper corner. Steel reinforcements not in contact with the gas or ash may be either [ASTM A167] [ASTM A240/A240M] Type 316 stainless steel or ASTM A242/A242M Type 1 structural steel. Welding rods shall be specifically selected to be compatible with the base metal and shall be submitted to the Contracting Officer for approval. Provide protection of rods against moisture whether for factory or field assembly.

2.2.2.1 Hopper Accessories

Provide at least one key interlocked hinged inspection cleanout and access door on each hopper with gas tight seals. Each lock shall have a key
unique for this installation. Keys shall not be able to be removed from the locks when access doors are opened. Access doors shall be a minimum opening size of 460 by 600 mm 18 by 24 inches for rectangular openings and 600 mm 24 inches inside diameter for round openings. Hoppers with gas baffles shall have access doors on both sides of the hopper. Provide each hopper with provisions for attachment of vibrators. Hoppers shall have adequate flexibility for vibrating. Provide each hopper with two 100 mm 4 inch poke holes with a tee wash connection and screwed caps. Position poke holes to permit only downward thrusts into the hopper. A special reinforced "pounding area" plate shall be provided on each hopper face for external manual vibrating. Each pounding plate shall be 300 by 300 by 25 mm 12 by 12 by 1 inch thick ASTM A36/A36M plate steel. Provide a work platform with fixed stairs and railing and toe board to each pounding area for units with pounding areas more than 1.50 meters five feet above ground. Pounding plate shall not be insulated. Insulation shall be neatly finished at this discontinuity. Provide a flanged fly ash outlet connection on each hopper to accept the fly ash transportation system equipment. Provide access hatch not less than 200 by 200 mm 8 by 8 inches for cleanout within 200 mm 8 inches above flange on opposite sides. Bolt down type hatches are acceptable for the cleanout hatch.

2.2.2.2 Hopper Vibrators

Provide each hopper with 2 vibrators set at the mid-height and on opposite sides. Vibrator controls shall be interfaced with ash collection system to provide vibrator operation only at the inception and during an evacuation cycle. Operation shall be automatic. Provide manual override control for hopper vibrators and evacuation system in the hopper area. Enclose override control(s) in [a] case(s) to prevent accidental energization of systems. Place a warning over the vibrator manual control with the following inscription: "WARNING: VIBRATOR CONTROL. DO NOT ACTIVATE UNLESS HOPPER EVACUATION SYSTEM IS OPERATING."

2.2.3 Multitube Collector Collecting and Outlet Tubes

**************************************************************************
NOTE: Use these paragraphs for multitube collectors.
150 mm 6 inch diameter collecting tubes may cause a plugging problem. Designer must investigate flue gas particulate size, distribution and tendency of particulates to adhere to each other for the specific project before selecting diameter of collector tubes.
**************************************************************************

Fabricate multitube collector collecting tubes of material specified in paragraph entitled "Materials." Material shall have a Brinell hardness of not less than 400. Attach collecting tubes to tube sheet so that tubes may be readily removable and replaceable. Collecting tube diameter shall be not less than [150 mm] [6 inches] [______]. Fabricate multitube collector outlet tubes, to convey clean gases out of collector, of material specified in paragraph entitled "Materials," and vary length with longest row at flue gas inlet to collector. Provide steel wear angles not less than 100 by 100 by 10 mm 4 by 4 by 3/8 inch vertically tack welded in 5 or 6 places onto the exterior surface of the inlet row of the outlet tubes. Locate each angle so that each leg faces the inlet flue gas and deflects the flue gas by protecting the exterior surfaces of each outlet tube along the inlet row from abrasive particles contained in the incoming flue gas. These vertical wear angles shall extend between the top of the bottom header sheet and the
bottom of the top header sheet on the inlet row of the outlet tubes.

2.2.4 Hopper Heating Systems

**************************************************************************
NOTE: Use this paragraph when units are operated where incoming gases may be cooled below dew point.
**************************************************************************

Provide a hopper heating system for each cyclone hopper as specified herein.

2.2.4.1 Hopper Heater System Design

The system shall be furnished by the collector manufacturer with all material required for mounting and shall be designed to provide a 66 degrees C 150 degree F rise in temperature in the hopper, in the vicinity of the heaters, during offline and startup conditions. The system shall be sized to provide a hopper skin temperature of not less than 121 degrees C 250 degrees F when insulation specified herein is in place during minimum equipment operating temperatures. Design system with a minimum heating safety factor of 1.1 and a minimum wind heat loss factor of 1.12. Provide system with maximum heater coverage between hopper stiffeners utilizing modular heaters and flexible blanket or tape heaters for the hopper throat heating. Heater modules shall cover at least 33 percent of the hopper area, shall cover the bottom portion of the hopper to the maximum extent possible, and shall extend at least 70 percent up the hopper height. Use flexible electric heating blankets or tapes, capable of withstanding 427 degrees C 800 degrees F, where modular equipment will not fit. Design all equipment to withstand natural and induced vibrations, plus shock loadings normally experienced during operation of the dust collector and ancillary equipment including manual rapping of the strike plates. The hopper heater system shall be individually, thermostatically controlled with adjustable setpoint and shall be furnished and installed complete including all power, control, and alarm components. Locate the low temperature and control thermocouples in the lower portion of each heater zone. Heater power voltage shall be 480 volts AC. Heater control voltage shall be 120 volts AC.

Hopper Heater Module Design: Heater modules shall be self-contained and each modular heater shall be furnished complete. The modules shall have a flexible heating face to conform to the irregularities of the hopper surface, providing intimate contact between the heaters and the hopper, and providing maximum heat transfer. Hopper heater modules shall be of low watt density design (maximum of 0.0047 watts per square mm 3 watts per square inch of resistance element) with a minimum of 6 parallel resistance paths per heater (continuous blanket type elements shall be deemed to meet the multipath requirement). Heating element in the module shall be capable of being operated at and shall be rated at 2690 watts per square meter 250 watts per square foot, but shall be designed to operate at 2152 watts per square meter 200 watts per square foot. Size all wiring, circuits, and controls for 2690 watts per square meter 250 watts per square foot. Total power density shall not be less than 4304 watts per square meter 400 watts per square foot of heater module surface. Provide hopper throat blanket heater with a single heating element. Blanket element shall remain on during startup, offline, and online operating conditions. Heating elements shall be made of 600 series stainless steel alloy or nickel-chrome alloy encased in a minimum 20 gage aluminum or aluminized-steel mounting pan or casing. Two sets of heater pigtails shall exit each module, one set of pigtail for each element and circuit. Heater pigtail wires and
interconnecting wires shall be multi-strand copper wire with high
temperature (454 degrees C 850 degrees F) insulation. Provide heater
pigtails with strain relief fabricated in such a manner as to prevent
damage to the heater modules due to rough handling. Pigtails shall be of
sufficient length to reach the terminal box. Splices shall not be
permitted in pigtails from modules, tapes, or blankets to the terminal
box. Test each module, blanket, or tape for electrical integrity at 1,000
volts prior to installation. Heating units supplied shall have metal labels
firmly attached to the unit listing the wattage and voltage of the unit.
Heating units and mounting hardware shall be fabricated of high temperature
materials capable of withstanding 454 degrees C 850 degrees F. Insulate
heating units with high temperature woven glass cloth or mineral fiber.
Mica or magnesium oxide insulated heaters shall not be provided.

2.2.4.2 Hopper Heater Controls

Each hopper heater shall be thermostatically controlled with adjustable set
point and shall be furnished and installed complete including all power,
control, and alarm components. The thermostats for monitoring temperature
shall be 120 volt AC adjustable type mounted in NEMA ICS 6, Type 4
enclosures. For thermostatic control of the hopper heater system, the
Contractor shall provide a Master Hopper Heater Control Panel for the
Plant, a Local Hopper Heater Control Panel for the [boiler] [incinerator],
and a Local Hopper Heater Terminal Box at the hopper(s). The Contractor
shall furnish all materials, tools, and labor required for connections of
circuits and wiring between local hopper heater terminal boxes, local
hopper heater control panel(s), and the master hopper heater control
panel(s).

a. Local Hopper Heater Terminal Box: On each hopper, provide hot-dipped
galvanized NEMA ICS 6 Type 4 hopper heater terminal boxes with terminal
blocks for connection of heater pigtails and thermostat leads.
Terminal blocks in each terminal box shall contain a sufficient number
of terminals to connect heater pigtails and thermocouples.

b. Local Hopper Heater Control Panel: Provide each [boiler] [incinerator]
with a local hopper heater control panel located in the control room.
Each local hopper heater control panel shall contain: terminal blocks
for power, control, and alarm circuits, one control temperature
thermostat, one low temperature alarm thermostat, magnetic contactor
and alarm relay with two normally open contacts, and auxiliary relays
for automatic operation of the heater system. Provide a 3-pole fused
switched main disconnect device and a fused control transformer having
a 120-volt AC secondary for connection to the [boiler] [incinerator]
local hopper heater control panel. Provide thermostats with a set
point range of 38 to 260 degrees C 100 to 500 degrees F. Thermostats
shall measure hopper skin temperature using ungrounded, Type J
thermocouples. The local hopper heater control panel cover shall
contain the following devices.

(1) "START UP," "ON LINE," "OFF," "AUTO" selector switch.
(2) 120 V "ON" red light with integral transformer.
(3) 120 V "LO TEMP" alarm white light with integral transformer.
(4) Device and enclosure nameplates.

Wire the selector switch for the following system operation:
(1) "START UP": All elements on (includes throat heater).

(2) "ON LINE": All elements on (includes throat heater).

(3) "OFF": All elements off.

(4) "AUTO": Control functions transfer to Master Hopper Heater Control Panel.

c. Master Hopper Heater Control Panel: Provide panel(s) containing relays, contactors, circuit breakers, control transformers, and other devices required for complete control of [each] hopper heater system. Locate Master Hopper Heater Control Panel(s) in the control room. Panel components shall be factory installed and wired in a NEMA ICS 6, type 4 enclosure and shall include the following:

(1) A main circuit breaker.

(2) A circuit breaker and contactor alarm relay with two normally open contacts. The contactor shall have a 120-volt operating coil.

(3) "START UP," "ON LINE," "OFF," selector switch for each hopper.

(4) 120 V red "ON" light and 120 V white "LO TEMP" alarm light with integral transformers.

(5) Auxiliary relays and equipment required for operation of the heating alarm systems.

(6) Device and enclosure nameplates.

(7) Fused control transformer having a 120 volt AC secondary.

2.2.5 Fly Ash Level Alarms

**************************************************************************
NOTE: The nuclear detector radiation should not exceed 6x10^-7 sievert per hour 0.06 mR/Hr. The designer must contact the safety department of the using activity to coordinate the limit of the surface radiation and edit into this paragraph that limit for the specific project.
**************************************************************************

Provide each hopper with a fly ash level alarm utilizing factory installed lead shielded nuclear type detectors. The detectors shall be single-point gamma source and detection units. Provide lead shielding to cover the detector and surrounding mounting surfaces and additional lead shielding required around the source housing to limit the maximum measured surface radiation at any surface accessible to personnel during normal operation to [6x10^-7 sievert/hr] [0.06 mR/hr] [_____] above ground radiation. Provide manufacturer's standard nuclear warning sign. Provide detectors complete with separately mounted electronic units which shall include a local high level indicating light and relays for use with annunciation system herein specified. Relays shall be rated 10 amperes, 120 volts AC, or 125 volts DC continuous duty. Switch housing for all hoppers shall be dustproof and shall be mounted at one easily accessible location. Locate all detector and source electronics at the hopper control panel. Detector shall be
explosion proof and have waterjacketing. Alarm shall be able to withstand vibration and temperatures up to 427 degrees C 800 degrees F. Provide the source with a lockable shutter mechanism operated by an external handle to totally isolate the beam when in the closed position. Electrical supply shall be 120 volts, single phase, 60 hertz. Locate alarm at the 50 percent hopper capacity level. Provide each hopper with two sensors--one at the alarm level, and one at the empty level. Level reproducitivty shall be within one inch. All outdoor components shall operate between minus 40 and 93 degrees C 40 and 200 degrees F.

2.2.5.1 Hopper Source and Access Door

Source for each hopper shall be Cesium 137. Design source head with a spring return off system in the event of remote cable actuator failure. Interlock source with hopper access door(s) to prevent entry into hopper unless source has been secured. Hopper access door key shall only be able to open one pair of hopper doors.

2.2.5.2 Hopper Level Signals

Hopper level signals, based on hopper level status indicator system, shall report to a microprocessor through a coaxial cable system. Provide each hopper with two indicators, one for full and one for empty. A flashing light shall indicate a wall buildup. Loss of power for any period of time shall not require a recalibration. Provide microprocessor with a NEMA ICS 6, Type 4 enclosure.

2.2.6 Ductwork

Section 23 35 19.00 20 INDUSTRIAL VENTILATION AND EXHAUST, and SMACNA 1403, for [Class III] [Class IV] duct construction suitable for system operating pressures and temperatures indicated. Provide duct materials, fittings, hangers, supports, flanges, gaskets, expansion joints, connections, relief vents, reinforcements, [and corrosion protection] for the [existing] flue gases [to be] encountered in accordance with SMACNA 1403.

2.2.6.1 Ductwork to Cyclones

Design all ductwork between [boilers] [incinerator(s)] and cyclone(s) to be self-cleaning. Ductwork meeting the following requirements will be considered to be self-cleaning.

a. A duct at an angle greater than 45 degrees to the horizontal plane with gas flowing downward.

b. A duct at an angle greater than 60 degrees to the horizontal plane with gas flowing upward.

c. A duct with hopper-shaped bottom and a conveyor[ specified in Section 23 51 43.03 20 FABRIC FILTER DUST COLLECTOR OF FLY ASH PARTICLES IN FLUE GAS to remove the settled dust].

2.2.6.2 Flue Gas Velocity

Flue gas design velocities in ductwork shall be calculated at the design flow range specified in paragraph, "Dust Collector Data." The design velocities in self-cleaning ducts shall be between 1372 and 1524 m/s 4,500 and 5,000 fpm. Where a possibility of dust settling exists, the design velocity shall be 1676 to 1829 m/s 5,500 to 6,000 fpm. The design velocity
of clean gas shall be greater than 1219 m/s 4,000 fpm.

2.2.7 Draft Connections

Provide a 25 mm one inch capped connection in flue gas inlet and outlet breech of dust collector(s) for determining differential pressure across collector(s). Orient these connections so as to be accessible from access platform or walkway specified herein.

2.2.8 Inlet Manifold and Dampers

**************************************************************************
NOTE: Specify or indicate air pressure available for pneumatic operators or electrical characteristics available for electric operators.
**************************************************************************

Provide, specially made for the dust collector, a steel plate flue gas inlet manifold to provide single, flanged inlet connection. Furnish this manifold with sectionalizing dampers with [pneumatic] [electric motor] operators suitable for remote-manual operation. Dampers shall be guillotine type not louver type.

2.2.9 Access

2.2.9.1 Access Structures and Fixtures

Platforms, Walkways, Stairways, Handrails, Kickplates and Fixed Ladders: that are required for operation, examination, testing and maintenance of each dust collector and shall be provided with each dust collector. Platforms, walkways, stairways, handrails, kickplates and fixed ladders shall be factory or shop fabricated, shall provide suitable access to all openings in the hopper, and shall meet OSHA 29 CFR 1910-SUBPART D for safety of maintenance and operating personnel. Walkways shall be provided for maintenance and inspection of maintenance points. Walkways shall be located not more than 1.22 meters 4 feet directly below the centerline of collector striker plates and the centerline of [the] [each] access door to [the] [each] hopper. Walkways and platforms shall be connected by stairways or fixed ladders. Supporting steel for platforms, fixed ladders and walkways shall be designed for the live load specified herein. Platforms shall be designed to support a 488 kilogram per square meter 100 pound per square foot live load. Walking surfaces of walkways and platforms shall be fabricated of ASTM A242/A242M raised pattern floor plate minimum 5 mm 3/16 inch thickness. Platforms, walkways, stairways, fixed ladders, handrails and kickplates shall be hot dipped galvanized after fabrication in accordance with ASTM A123/A123M. Minimum galvanized coating weight per surface shall be not less than 0.70 kilogram per square meter 2.3 ounces per square foot.

2.2.9.2 Access Doors

Access doors to hoppers and mechanical or electrical components shall be accessible from walkways or be provided with a permanent steel ladder or stairway to facilitate maintenance. Provide internal and external handholes at all access doors to facilitate entry. Provide access doors to hoppers and to inlet plenums and to outlet plenums. Provide fixed industrial stairs or fixed ladders that meet OSHA 29 CFR 1910-SUBPART D to connect access doors. Access doors shall be permanently hinged or be completely removable by guide-action fastening devices. Key interlocks are
required only on hinged doors.

2.2.10 Insulation and Casing

Insulate and case the collector shell [including flue gas inlet manifold] and hoppers. Insulation shall be asbestos free. Provide a walking surface on all top surfaces hereinafter specified, where periodic equipment maintenance or inspection of equipment located in that area is required.

2.2.10.1 Insulation Material

**************************************************************************
NOTE:
1. For multitube collector(s) use minimum thickness of 65 mm 2 1/2 inches for operating temperature range of 94 to 260 degrees C 201 to 500 degrees F, and minimum thickness of 140 mm 5 1/2 inches for operating temperatures above 261 degrees C 501 degrees F.

2. For 300 mm 12 inch or larger diameter centrifugal cyclone collector(s) use minimum thickness of 140 mm 5 1/2 inches.

3. For ductwork with an operating temperatures 94 to 260 degrees C 201 to 250 degrees F, use minimum insulation thickness of 65 mm 2 1/2 inches; for operating temperatures 261 to 190 degrees C 251 to 375 degrees F, use minimum insulation thickness of 100 mm 4 inches; for operating temperature range 191 to 260 degrees C 376 to 500 degrees F, use minimum insulation thickness of 125 mm 5 inches for operating temperatures above 260 degrees C 500 degrees F, use minimum insulation thickness of 140 mm 5 1/2 inches.
**************************************************************************

Externally insulate shell, hoppers, and ductwork. Mineral fiber block and board insulation shall conform to ASTM C612 and mineral fiber blanket insulation shall conform to ASTM C592. Minimum insulation thicknesses shall be as follows:

a. Shell: [_____] mm inches

b. Hoppers: [_____] mm inches

c. Ductwork: [_____] mm inches.

2.2.10.2 Casing Materials

ASTM B209M ASTM B209 aluminum. Casing, except the top surface which might serve as personnel walking surface, shall be 1.27 mm 0.050 inch thick stucco embossed, 100 mm 4 inch rib unpainted aluminum panel. Top surface ductwork casing shall be flat aluminum sheet having a minimum thickness of 2.03 mm 0.080 inch and be suitably reinforced to support a 122 kilogram per square meter 25 pound per square foot live load.
2.3 SAMPLING PORTALS

Provide minimum 100 mm 4 inch inside diameter x minimum 6 mm 1/4 inch thick wall sampling portals for fly ash particulate sample testing on inlet breech and outlet breech of dust collector. Sampling portal material shall conform to ASTM A36/A36M and shall be insulated as specified elsewhere in this section. Locate sampling portals in accordance with EPA 40 CFR 60, Appendix A, Method 1 - "Sample and Velocity Traverses for Stationary Sources." Provide two portals 90 degrees apart on round inlet breech and two portals 90 degrees apart on round outlet breech. For rectangular breeching apply EPA 40 CFR 60, Appendix A, Method 1. Portals shall extend above the exterior surface of breech insulation at least 150 mm 6 inches. Exposed end of each portal outside of breech insulation shall be NPT threaded and closed with a NPT threaded, removable screw cap or plug. ASTM A36/A36M exterior surface areas of portal and cap or plug shall be painted as specified in paragraph entitled "Painting." Cap or plug when detached from portal shall be secured to portal by a galvanized or stainless steel chain welded at one end to the top of the cap or plug and welded to the side of the portal. Portal shall be continuously welded where it contacts breech and not extend inside the breech more than 15 mm 1/2 inch. In EPA 40 CFR 60, Appendix A, Method 1 the term "administrator" and "stack" or the word "duct" shall mean "Contracting Officer" and "breech" in that order, respectively.

PART 3 EXECUTION

3.1 INSTALLATION

**************************************************************************
NOTE: Revise this paragraph as necessary when it is desired to have the collector manufacturer install the equipment furnished.
**************************************************************************

Install equipment specified herein on foundations or structural-steel framework shown on the drawings, or as specified herein. Install in accordance with manufacturer's recommendations as shown on manufacturer's detailed drawings. Furnish the services of [a] field representative(s) of the dust collector manufacturer as hereinafter specified.

3.2 INSULATION INSTALLATION

Apply insulation in order to permit access doors, inspection doors, flanges, sampling portals and other special features to be opened, or removed for inspection or maintenance, without disturbing insulation. Provide boxouts around code stamping symbols and nameplates. Install double thickness insulation with joints of the two layers staggered. Fill cracks, voids, and depressions in layers of insulation with suitable insulating cements before application of another layer of insulation or jacket application. Provide expansion joints in insulation as required to allow for thermal expansion movements which might cause cracks or tears in the insulation. Install insulation between and over stiffeners in such a manner that stiffeners are completely insulated. Install additional insulation or casing spacers between stiffeners so that a level surface is achieved. The intent of this insulating procedure is to prevent a direct metal path between the collector inside and ambient air. Securely wire insulation and lace in place using No. 14 dead soft Type 302 stainless steel wire conforming to ASTM A580/A580M.
3.2.1 Block and Mineral Fiberboard Insulation Installation

Hold block and mineral fiberboard insulation in place with insulation lugs spaced on not greater than 300 to 460 mm 12 to 18 inch centers. Lugs shall be stud-type welded in place. Reinforce blocks on exterior face with expanded metal, if necessary, to prevent sagging or cutting of insulation by lacing wire. Securely wire block and mineral fiberboard insulation of specified thickness in place over entire surface by means of wire threaded through lugs both ways, pulled tight with ends of wire loops twisted together with pliers, bent over, and carefully pressed into surface of insulation.

3.2.2 Mineral Fiber Blanket Insulation

Hold mineral fiber blanket insulation in place with speed washers and impaling pins spaced on centers not exceeding 300 mm 12 inches. Provide mineral fiber blanket insulation with expanded metal reinforcement on the outer surface and wire mesh or expanded metal on the inner surface. Tightly butt sections of blankets, jam together, and securely tie for maximum sealing at joints and edges. Take care in applying speed washers so that designed thickness of insulation is not reduced when washers are installed.

3.3 CASING INSTALLATION

3.3.1 Structural Steel Grid System

Install casings on an aluminized structural steel grid system of subgirts. Provide subgirts of sufficient size, gage, and depth to provide adequate support and a smooth exterior surface. Subgirts shall be welded to equipment and structural support surfaces. Subgirts shall be of sufficient depth to provide for application of full thickness of insulation over the stiffeners, access doors, flanges, ribs, and other surfaces having uneven contours to provide a smooth finished surface. Subgirts on vertical and bottom surfaces shall be at a maximum spacing of 1.22 meters 4 feet on centers. Subgirts on top surfaces shall be at a maximum spacing of 610 mm 2 feet on centers. Design so as to transmit an external 114 kg 250 pound walking load from aluminum casing to structural steel grid system without compression of insulation material.

3.3.2 Access Openings

Access doors and other penetrations through the insulation shall have insulation fitted closely to the hinges and fasteners and shall be neatly framed and flashed to be weather tight and create a pleasing appearance. Provide hinged or lift off doors designed for convenient opening at nameplates, code stampings, non-projecting connections, and access openings. Flash and weatherproof openings. Pitch all horizontal access openings for water runoff. Provide all vertical access doors with flashing above door head and flash to prevent wind driven rain from seeping under the aluminum casing.

3.3.3 Weatherproofing

Install casings with proper overlap to make the installation weather tight. Carefully fabricate and fit casing to ensure a neat appearance; furnish required closures, flashings, and seals. Provide open ends of fluted sections with tight-fitting closure pieces. Form and install flashing so that water cannot enter and wet the insulation, and design and
install flashing to readily drain any water that might enter. Weatherproof joints or openings in casing, which cannot be effectively sealed from entry of moisture by flashings or laps by application of an aluminum pigmented sealer manufactured for this type of service.

3.3.4 Convection Stops

Furnish and install convection stops on vertical surfaces over 3.66 meters 12 feet tall; maximum interval between convection stops shall be 3.66 meters 12 feet. Convection stops shall consist of steel channel of Z-girt, covered with 80 mm 3 inch thickness of insulation.

3.3.5 Casing Attachment

**************************************************************************
NOTE: If a separate insulation section is part of this specification, add note to that section to indicate that insulation of the collector is covered by this section.
**************************************************************************

Attach aluminum casing to structural steel grid system by means of No. 14 stainless steel, Series 300, self-tapping screws on 300 mm 12 inch centers. Fasten vertical laps and flashings by means of 20 mm 3/4 inch No. 14 stainless steel, Series 300, sheet-metal screws on 300 mm 12 inch centers. Exposed screws shall have aluminum or stainless-steel backed neoprene washers preassembled to screws. Install insulation so that it is not compressed below nominal thickness.

3.4 HOPPER HEATER SYSTEM

Deliver system components to the job site in containers designed to protect the components from adverse handling, weather, and storage conditions. Store components in their original shipping containers, unless the containers are damaged, or under protective weatherproof covering until installation. Clean hopper surfaces of dust, grease, oil and rust thoroughly prior to installation of any heater. Heater modules shall be installed to provide maximum contact between the heaters and the hopper wall. Furnish heaters with mounting hardware, channels, and brackets. Throat heaters shall not overlap and shall be held in place with high temperature (454 degrees C 850 degrees F) glass tape or other means approved by the Contracting Officer. Cover the throat heater with insulation material prior to application of jacketing.

3.5 GALVANIC CORROSION

To prevent galvanic corrosion, avoid permanent contact of aluminum casing with copper, copper alloy, tin, lead, nickel, or nickel alloy including monel metal. Where it is necessary to attach casing to carbon steel or low alloy steel, first prime steel with zinc chromate, and then paint with aluminum paint conforming to FS TT-P-28 suitable for surface temperatures encountered. Use of lead base paint is prohibited.

3.6 PROTECTION FROM INSULATION MATERIALS

Protect equipment and structures from damage from insulation materials. After completion of work, clean, repair, and restore equipment and structure to their original state. Repair any casing that becomes corroded, discolored, or damaged or replace casing if beyond repair as
3.7 INSPECTIONS AND TESTS

3.7.1 Factory Inspection

The right is reserved by the Government to inspect the equipment at the manufacturer's plant, during or after manufacture. Acceptance at the factory shall not constitute final acceptance.

3.7.2 Field Inspection and Tests

3.7.2.1 Delivery Inspection

Upon delivery to the jobsite, materials and equipment will be inspected to assure that equipment and installation comply with local and Government requirements for equipment and safety.

3.7.2.2 Post-Installation Inspection of Dust Collectors

Dust collector manufacturer's field representative shall inspect mechanical dust collector after installation is completed and prior to start of testing to verify that the unit is installed in conformance with the manufacturer's recommendations.

3.7.2.3 Performance Test of Dust Collectors

**************************************************************************
NOTE:
1. If provision for operation at partial loads is included, specify that test shall also be conducted at the desired part-load conditions.

2. If Government operating personnel are available for operation of the associated equipment required to perform the tests, revise this paragraph accordingly. For installation in which a new boiler or incinerator is being installed, the Government operating personnel should be under the supervision of the Contractor.

3. Specifying inlet and outlet tests to determine efficiency or performance guarantees for cyclones can cause problems in retrofits and some new units. Cyclones with very short or angled inlet and outlet ducts can cause inaccurate test data to be collected. Therefore, specifying cyclone outlet grain loading requirements may be more appropriate than an efficiency requirement.
**************************************************************************

Field performance tests shall be performed by a testing laboratory with experience in EPA's test methods and approved by the Contracting Officer. Furnish a schedule of tests in writing to the Contracting Officer at least 10 calendar days before scheduled test(s) start date. Dust collector(s) field performance test shall be conducted with [its] [their] respective [boiler] [incinerator]. Operate each dust collector and its [boiler] [incinerator] for at least 45 calendar days at approximately 25, 50, 75 and
100 percent loads and cycle [boiler] [incinerator] not less than two complete cycles between 100 percent load and each partial load and back to 100 percent load. A trial run of 7 days minimum witnessed by the Government, shall be performed before the 45 day test to ensure that all associated systems required for the test are ready. The Contractor and the dust collector manufacturer's field representative shall witness the trial run and all tests. The testing laboratory shall furnish equipment, tools and personnel necessary for testing, data gathering, and recording test results.

a. **Particulate Tests of Dust Collectors**: Simultaneous inlet and outlet particulate tests on all mechanical dust collector(s) shall be performed in accordance with EPA 40 CFR 60, Appendix A, methods 1 through 5 and 17. Method 17, in stack filtration, may be performed as an alternate test to Method 5. Tests shall be performed at maximum and partial load conditions herein specified and report submitted to the Contracting Officer.

b. Additional Tests: In the event that the mechanical dust collector(s) do not meet performance requirements, failures and deficiencies shall be resolved and additional tests shall be performed by the testing laboratory as required to demonstrate that the resolutions used permitted acceptable performance of the mechanical dust collectors.

### 3.8 IDENTIFICATION

Provide an aluminum, brass, or type 304 or 316 stainless steel nameplate and fasten to equipment in a visible location by means of rivets or sheet metal screws of the same material as the nameplate material. Nameplate shall contain data that consists of the manufacturer's name, model or series number, and serial number. Indent or emboss the information in the metal. Offset the nameplate a sufficient amount to avoid being covered by insulation.

### 3.9 PAINTING

Clean the non-insulated exterior surfaces of equipment being furnished to base metal in accordance with SSPC SP 6/NACE No.3 and paint at the factory with two coats of paint conforming to FS TT-P-28. Performed painting in accordance with SSPC SSPM. Power clean to bare material and touch up exterior surfaces damaged during field installation or during shipment with two coats of FS TT-P-28 high temperature (up to 650 degrees C 1200 degrees F) heat resistant paint.

### 3.10 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing, installing, adjusting, and testing of electrostatic precipitator(s).

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The precipitator(s) is intended to be used for flue gas particulate removal and collection associated with coal-fired boilers and refuse-fired waste disposal incinerators. Coal-fired boilers applicable to this specification are those designed with capacities ranging between 3.78 and 31.5 kilogram of steam per second 30,000 and 250,000 pounds of steam per hour. The incinerators applicable to this specification are those designed for burning municipal-type waste having firing capacities between 454 kilogram per hour 1,000 pounds per hour and 182 Mg 200 tons per day. For engineering and design assistance on precipitators applied close to or outside these capacities, contact:
There are probably no precipitator manufacturers that can meet all the specifications. Discretion must be exercised to determine which deviations are acceptable.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

Electrostatic precipitator terminology shall be in accordance with ICAC EP-1 except for the following:

a. Aspect Ratio: Effective treatment length divided by effective collection plate height.
b. Collection Surface Area: Area of vertical grounded plates parallel to the gas flow. The area of components in walkways, hoppers, discharge electrical surfaces, inlet plenums, and outlet plenums shall be excluded. Exclude area of plates above or below the uniform gas flow.

c. Effective Collection Plate Height: Vertical height of the grounded collection plate in contact with the flue gas.

d. Effective Treatment Length: Horizontal length of the grounded collection plates parallel to the gas flow in a single passage in the direction of gas flow. Exclude walkways, inlet plenums, and outlet plenums.

e. Specific Collection Area: Total grounded collection surface area, in square meter feet, divided by maximum gas flow rate.

f. Rigid Frame Type: Typical design in which the discharge electrodes are fastened in a support frame of welded horizontal and vertical masts suspended from four support insulators.

g. Hot Roof: Top section of the precipitator casing between the penthouse and the gas stream.

h. Penthouse Roof: The walking surface on top of the penthouse; that is, the raised pattern plate that covers the top of the penthouse casing insulation.

i. Plate Spacing: Center to center spacing of the grounded collecting electrode surfaces.

1.3 DESCRIPTION

**************************************************************************

NOTE:

1. If fly ash conditioning or removal prior to the precipitator is included in the design, the system should be described.

2. If it is anticipated that the efficiency of the precipitator will be increased by the addition of field(s) in the future, this should be described.

3. If it is desired that the inlet and outlet breeching be furnished and/or designed by the collector manufacturer, it should be described.

4. Specify the ESP location and breeching tie points.

**************************************************************************

Provide electrostatic precipitator(s) of the rigid frame type designed in accordance with ICAC EP-1, ICAC EP-10W, ICAC EP-6, ICAC EP-7, and ICAC EP-8 to remove fly ash from flue gas produced by a [pulverized coal-fired boiler] [spreader stoker-fired boiler] [underfeed stoker-fired boiler] [refuse-fired waste disposal incinerator]. Provide precipitator(s) suitable for [indoor] [outdoor] installation. Locate the precipitator(s) in the flue gas system between the [_____] and the [_____].
1.3.1  **Electrostatic Dust Collector** Layout and Component Drawings

Drawings shall indicate the kind, size, arrangement, weight of each component, and breakdown for shipment; the external connections, location of local controls, remote control panels, anchorages, and supports required; the dimensions needed for installation and correlation with other materials and equipment; seismic structural calculations; and foundation and loading information. Supply drawings for each component showing design and assembly. Provide schematics of all electrical and pneumatic circuits used. Submission shall include, but shall not be limited to the following details:

a. Transformer-rectifier equipment.
b. High voltage switches and disconnects.
c. High voltage fuses and circuit breakers.
d. Control systems.
e. Ground lugs.
f. Protection against electrolysis.
g. Graphic display panel indicating power components.
h. Lubrication locations.
i. Electrodes and collecting surfaces.
j. Platforms, walkways, stairways, and ladders which will be required for operation, inspection, testing, and maintenance, and furnished with the precipitator.
k. Location of field welds, in conformance to AWS D1.1/D1.1M.

1.3.2  **Hopper Heater** Drawings

Provide layout drawings, wiring diagrams, and control schematics diagrams. Layout drawings shall show each hopper face including control zones.

1.3.3  **Dust Collection System**

Submit a full description of the system proposed, including arrangement, operation, and maintenance of the discharge electrodes and collecting surfaces. Indicate planned rapping cycle and performance test details and sampling location. Describe electrodes and collecting surfaces.

1.4  PERFORMANCE

**************************************************************************

NOTE:

1. Select either a collection efficiency or outlet dust loading condition, whichever is more stringent.

2. The stack emission or efficiency requirements must comply with (a) weight emission standards; (b)
opacity regulations; and (c) community standards for visible emissions. Compliance with existing emission codes may not satisfy the opacity regulation. Similarly, opacity regulations may not be as demanding as community standards. A specific quantitative emission rate must be selected on the basis of the goals established.

3. Stack opacity is influenced by particle size makeup. For example, with pulverized coal-fired boilers, about 45 percent of the ash particles are below 10 microns in size; for a cyclone-fired boiler, about 70 percent are below 10 microns; for a stoker-fired boiler, about 25 percent are below 10 microns. A visually acceptable stack for these three options might require residuals of 0.046 g/m³, 0.023 g/m³, and 0.092 g/m³, respectively.

4. If it is determined that a spare or additional precipitator section is desirable to increase reliability, the specification should be modified so that the performance can be met with any one section out of service.

1.5 OPERATING EXPERIENCE REQUIREMENTS

1.5.1 Equipment

Provide dust collectors which meet all of the operating experience requirements listed below.

1.5.2 Experience Required

The manufacturer has constructed not less than three electrostatic precipitators each at a separate facility, treating flue gas from [a refuse-fired waste disposal incinerator] [a coal-fired boiler] with [automatic] [manual] combustion control. Each precipitator shall have performed satisfactorily, normal maintenance or downtime of the associated
1.5.3 **List of Prior Installations** Contents

Submit a certificate from the manufacturer containing the information outlined below within 30 days after award and prior to commencement of installation. Information to be contained in the certificate shall include:

a. A list of at least three installations at separate facilities meeting the requirements set forth above.

b. Owner, location, point of contact, and phone number of each such installation.

c. Date of owner acceptance of each such installation.

d. Design inlet gas volume, L/s acfm; inlet gas temperature, degrees C F; inlet dust loading, grams per liter grains per acf; and outlet dust loading, grams per liter grains per acf.

e. Type of [coal-fired boiler] [refuse-fired waste disposal incinerator].

1.6 **MODEL TEST**

**************************************************************************

**NOTE:** Generally, the complete gas system is included in the model test.

**************************************************************************

The precipitator manufacturer or a Contracting Officer approved independent modeling and testing lab shall perform a three dimensional model test of not less than 1:100 1/8 scale. Hold all model dimensions to within plus or minus 1.50 mm 1/16 inch. The precipitator manufacturer or testing lab shall have at least five years experience in conducting electrostatic precipitator model tests. (The five years of experience is required prior to proposal submittal.) The test shall determine the gas flow patterns in accordance with ICAC EP-7 procedures, the potential areas of dust accumulation using sifted bleached wheat flour and neutral buoyancy bubbles, velocity distribution, and potential pressure drop reductions through the precipitator, nozzles, and breeching. Model breeching and particulate control equipment from [____] to [____]. Include precipitator hoppers, collection plates, distribution devices, turning vanes, anti-sneak baffles and internal bracing and supports. Simulate the cyclones to represent the adversely affected gas flow distribution from the cyclones. Perform flow and dust distribution tests at 30, 50, 75, 100, and 125 percent of maximum continuous flow rating. Notify the Contracting Officer of test dates in writing not less than 14 calendar days before tests are to begin.

1.6.1 **Precipitator Model Tests** Reports

**************************************************************************

**NOTE:** Include other test locations of concern based on the preliminary breeching design. These may include inlets to induced draft fans and stacks as
Complete model testing and have approved by the Contracting Officer prior to submittal of drawings. Provide reports within 30 days of test completion. Include a scale drawing of the model showing actual dimensions and a scale drawing of the full-size installation showing modifications made and devices added to the breeching and transitions as a result of the model study. Include uniform gas velocity diagrams and histograms, indicating the root mean square velocity deviation, standard deviation, and mean velocity, at strategic locations which shall include, but not be limited to, the following:

a. Inlet to electrostatic precipitator.

b. Outlet of electrostatic precipitator.

Provide a complete explanation of the test procedures including flow rates, pressures, sample calculations and assumptions prior to testing. List and justify deviations in dynamic or geometric similitude by the model from the full-size installation. The test report shall recommend breeching configuration changes, gas flow vaning, straightening or other gas distribution devices in the system required to meet ICAC EP-7 requirements and gas distribution specified in paragraph entitled "Gas Distribution Devices." Incorporate devices required for specified gas distribution and modifications necessary to the proposed breeching, that result from model testing, into the final breeching design. Recommend the location of test ports, the location and type of flow distribution devices in stack, and the location of gas flow instrumentation points and monitors. Provide a complete listing of pressure drop data taken at each pressure tap during each test run and also include data from runs before and after the addition of supplemental flow distribution devices that correct distribution problems identified by initial runs. Locate pressure tap as required to accurately determine the pressure drop across critical breeching components and the effect of the additional distribution devices on the pressure drop. Submit with the report a complete set of photographs and videotape recordings of model during air flow test.

1.6.2 Reports

For precipitator inspection, submit report of the factory service engineer's inspection within 15 calendar days after the inspection stating his findings including the acceptability of the precipitator for field performance tests. Submit air load test report with the precipitator inspection report. With performance test reports, certify that instruments were calibrated and readings indicated are true. Include certification that computations required for testing are accurate, that acceptable methods were used, and that the equipment performed in accordance with the requirements. For precipitator calibration, include certification that computations required for testing are accurate, and that acceptable methods were used.

1.7 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals
required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Electrostatic dust collector
   Hopper heater
SD-03 Product Data
   Warning signs
SD-05 Design Data
   Dust collection system
SD-06 Test Reports
   Precipitator model tests
   Hopper heater module voltage tests
Precipitator inspection
Air load test
Performance tests
Precipitator calibration
SD-07 Certificates
List of prior installations
SD-10 Operation and Maintenance Data

Electrostatic dust collector system, Data Package 3

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.8 DELIVERY AND STORAGE

Ship equipment completely factory assembled, except when the physical size, arrangement, or configuration of the equipment, or shipping limitations, makes the shipment of completely assembled equipment impracticable, in which case assemble the equipment and ship as stated in the Contractor's proposal. Provide storage and protection of delivered equipment in accordance with manufacturer's recommendations.

1.9 DESIGN CRITERIA

1.9.1 [Boiler Data]

**************************************************************************
NOTE: Select the applicable paragraph(s) from the following:
**************************************************************************
**************************************************************************
NOTE: Include ash analysis if available. Specify range of properties for coal.
**************************************************************************
**************************************************************************
NOTE: Insert appropriate Section number and title in the blanks below using format per UFC 1-300-02.
**************************************************************************

Provide electrostatic precipitator(s) for operation with [the boiler(s) specified in [____]] [boiler(s) manufactured by [____], Type [____], Model No. [____]]. The boiler is a [new] [existing] [pulverized coal-fired] [spreader stoker-fired] [underfeed stoker-fired] boiler rated [____] kilogram per second pounds per hour of steam at [____] kPa psi, having a gross heat input of [____] kilowatt millions Btu per hour, and utilizing coal with the following properties:

a. Proximate analysis, as received, percent by weight:
b. Ultimate analysis, as received, percent by weight:

<table>

Include ash analysis if available. Classified material contents description may change as plastic use increases. Check incinerator Institute of America for latest information.
Provide electrostatic precipitator(s) for operation with [the incinerator(s) specified in [_____] [incinerator(s) manufactured by [_____]]. The incinerator is a [new] [existing] installation capable of burning [_____] [kilogram per second pounds per hour] [Mg tons per day] of Type [0], [1], [2], [3], [4], [loose paper] [loose wood] [classified material] wastes. The expected range of incinerator operation will be between [_____] and [_____] [kilogram per second pounds per hour] [Mg tons per day] of wastes. Incinerator combustion is controlled [manually] [automatically]. The auxiliary fuel is [_____]..

1.9.2 Mechanical Collector Data

Provide the electrostatic precipitator(s) with [the mechanical cyclone-type dust collector(s) specified in Section 23 51 43.01 20 MECHANICAL CYCLONE DUST COLLECTOR OF FLUE GAS PARTICULATES [mechanical cyclone-type dust collector(s) manufactured by [_____] Type [_____], Model No. [_____]]. The mechanical cyclone-type dust collector [is specified to have] [was designed for] an overall collection efficiency of [_____] percent. The contractor shall assume that the cyclone may be operating at any point in the efficiency range of [_____] to [_____] percent.

1.9.3 Inlet Gas Conditions

1. To properly apply their equipment, the precipitator manufacturer must know the expected inlet gas conditions. For new equipment this information can be best supplied by the boiler manufacturer, incinerator manufacturer, and mechanical cyclone-type dust collector manufacturer.

2. In determining the inlet gas conditions for existing installations, source testing should be performed to determine the gas flow and contents. Gas volume determinations should be made EPA Methods 1-4 in 40 CFR, Part 60, Appendix A. For particulate size distribution an actual sample should be taken and analyzed in accordance with ASME PTC 28, "Determining the Properties of Fine Particulate Matter." For particulate loading only, use EPA Method 5 or 17.
3. For new installations, the inlet gas conditions should be obtained from the manufacturer. If this is not possible, the gas contents must be estimated. When estimates are made, the emission factors and handbook data should be taken from U.S. Environmental Protection Agency Publication no. AP-42, entitled "Compilation of Air Pollutant Emission Factors," with the latest supplements. Correction for expected combustible content should be made. Source testing should be conducted in accordance with the applicable portion of EPA 40 CFR 60, Appendix A or applicable local standard.

*************************************************************************************************

NOTE: Supply excess air percentage for incinerator applications.

*************************************************************************************************

Provide electrostatic precipitator(s) for entire operating range of gas conditions from the [boiler(s)] [incinerator(s)] [mechanical cyclone-type dust collector] specified above. The electrostatic precipitator inlet gas conditions shall be:

Verify data in the field and design the precipitator(s) to operate efficiently over the entire range of inlet gas conditions.

1.9.4 Precipitator Data

NOTE:

1. If a spare or additional precipitator section is included, the following should be added to the collection efficiency: "with one section out of service."

2. As a general rule, use four fields.

3. Usually a minimum of two electrically isolatable bus section per field is used.

4. Maximum velocity through precipitator is in the range of 1.22–2.13 m/s 4–7 fps.
5. Minimum specific collecting area is in the range of 69 to 98 square meter per 1000 L/s 350 to 500 square feet per 1000 acfm.

6. Minimum aspect ratio should be at least 1.5.

7. Minimum hopper storage should be at least 12 hours.

8. Usually a 55 degree hopper valley angle is used. If the ash is "sticky" as for western coal, or if moisture content is high, a 65 degree angle should be used.

9. Minimum casing design pressure and vacuum is usually 3735 Pa 15 inches WC.

10. Minimum design for dust on plates should be based on 6 mm 1/4 inch of dust on all internal surfaces assuming a dust weight of 640-1600 kg/m3 40-100 lb/ft 3.

**************************************************************************

Apply the following construction criteria to each of the electrostatic precipitator(s). Base applicable criteria on flow conditions at maximum continuous rating specified in paragraph entitled "Inlet Gas Conditions."

a. Minimum required collection efficiency, percent [_____

b. Minimum number of fields in direction of gas flow [_____

c. Minimum effective treatment time, seconds [_____

d. Minimum effective treatment length, meter feet [_____

e. Minimum number of electrically isolatable bus sections per mechanical field [_____

f. Maximum collection area per electrically separate bus sections, square meter feet [_____

g. Maximum number of electrically separate bus sections per transformer-rectifier [_____

h. Maximum number of gas passages per bus section [_____

i. Minimum number of transformer-rectifier sets per mechanical field [_____

j. Gas velocity minimum through precipitator, m/s fps[_____

k. Minimum specific collecting area, square meter per 305 cubic meter feet per 1000 acfm [_____

l. Maximum vertical height of discharge electrodes, meter feet[_____

m. Maximum vertical height of collecting electrodes, meter feet [_____

SECTION 23 51 43.02 20  Page 22
n. Range of plate spacing, mm inches [_____] to [_____] 

o. Minimum discharge electrode cross-sectional area, square mm inches [_____] 

p. Maximum horizontal length of each electrical field, meter feet [_____] 

q. Minimum aspect ratio [_____] 

r. Maximum pressure from [_____] to [_____] Pa inches watergage [_____] 

s. Minimum hopper storage capacity, each hopper, hours [_____] 

t. Minimum hopper storage capacity, each hopper, cubic meter feet [_____] 

u. Minimum hopper valley angle, degrees from horizontal [_____] 

v. Minimum number of hoppers for each electrical field [_____] 

w. Minimum casing design pressure at [_____] degrees C F, Pa inches watergage [_____] 

x. Minimum casing design vacuum at [_____] degrees C F, Pa inches Hg [_____] 

y. Minimum casing design temperature, degrees C F [_____] 

z. Minimum insulator design temperature, degrees C F [_____] 

aa. Minimum design wind load, kg per square meter pounds per square foot [_____] 

ab. Minimum design snow load, kg per square meter pounds per square foot [_____] 

ac. Minimum design live load, kg per square meter pounds per square foot [_____] 

ad. Minimum design load for dust on internal surfaces, kg pounds [_____] 

1.9.5 Breeching

Provide breeching, stiffeners, bracing, supports, hangers, supporting steel, expansion joints and heat insulation between the [_____] and [______]. Design the breeching to withstand internal pressures between plus 3735 to minus 6225 Pa 15 to minus 25 inch water gage. Include turning vanes in breeching as recommended by the report on model test. Provide self-cleaning type breeching to prevent dust accumulation. Provide expansion joints to give the breeching sufficient flexibility under thermal changes. Provide suitable supports and guides to eliminate transverse loading of flexible expansion joints.

1.9.6 Coordination

Coordinate design parameters and controls of precipitator between precipitator manufacturer and manufacturers of equipment which will interface with, or affect, system operation. Design the precipitator for operation with the [boiler] [incinerator] [and the mechanical cyclone type]
1.9.7 Electrostatic Dust Collector System

Submit operation and maintenance data for electrostatic dust collector system in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.10 AMBIENT ENVIRONMENT IN VICINITY OF ELECTRICAL EQUIPMENT

Guarantee that electrical equipment mounted external to the precipitator housing shall perform satisfactorily during normal operation of the boiler or incinerator at loads within its rated limits and during start-up and shutdown, with an ambient environment of [_____] to [_____] degrees C and [_____] to [_____] percent relative humidity, and exposure, including solar effects. Electrical equipment shall include the following:

a. Motors, motor starters, controllers, and controls
b. Transformer-rectifiers
c. Rapper coils
d. Insulators
e. High voltage bus
f. Raceway and conductors interconnecting precipitator electrical equipment
g. Pressure switches
h. Heater contactors.

1.11 MISCELLANEOUS

Provide installation complete in accordance with this specification and as shown and include the following:

a. Wiring, conduits, fittings, supports, and grounding of electrical equipment in accordance with Division 26, "Electrical."

b. Special tools and devices required for operating, adjusting, repairing, and maintaining the air pollution control with their accessories.

c. Warning signs, of an approved permanent type, where required for the safety of operating personnel.

d. Bronze grounding lugs outside each access door into the precipitator.

1.12 DELIVERY OF MODEL

The model used for testing shall remain the property of the Government. Deliver the model including a support table to the Contracting Officer within six months after Government acceptance of the full size units.
PART 2   PRODUCTS

2.1 MATERIALS

Parts exposed to the flue gas of materials having physical suitable for the service and able to withstand the abrasive and chemical action of the flue gas and fly ash. Make parts subject to deterioration easily accessible for inspection, maintenance, or replacement. The materials used shall conform to the following:

******************************************************************************
NOTE: Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.
******************************************************************************
a. Housing plate and stiffeners: [ASTM A242/A242M, Type 1]

******************************************************************************
NOTE: Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.
******************************************************************************
b. Hoppers: [ASTM A242/A242M, Type 1] [ASTM A276/A276M]

******************************************************************************
NOTE: Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.
******************************************************************************
c. Discharge electrodes: [ASTM A242/A242M, Type 1]

******************************************************************************
NOTE: Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.
******************************************************************************
d. Collecting surfaces: [ASTM A242/A242M, Type 1]

******************************************************************************
NOTE: Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.
******************************************************************************
e. Gas distribution devices: [ASTM A242/A242M, Type 1]

******************************************************************************
NOTE: Use ASTM A242/A242M steel when material is subjected to continuous temperatures of 204 degrees C 400 degrees F or higher.
******************************************************************************
f. Structural and miscellaneous steel: [ASTM A242/A242M, Type 1]
2.2 STRUCTURAL SUPPORTS

**************************************************************************
NOTE: Use 6 mm 1/4 inch thick steel for temperatures over 260 degrees C 500 degrees F.
Detail structural supports on drawings.
**************************************************************************

Provide steel support structures for the precipitator as [indicated] [specified herein]. Provide the precipitator with column extensions or stubs to project from the precipitator internal support system to the support structure. Provide column extensions or stubs of adequate length to provide clearance between the precipitator casing and hoppers and the support frame beams. Provide sufficient clearance to permit the insulation and casing to be installed and to accommodate the extremes of displacement caused by thermal expansion. Support precipitator components from the precipitator internal support system. Provide additional grid steel required at the unit for support of precipitator components. Anchor the precipitator on its centerlines and allow to expand in both directions. Provide slide plates for installation between the precipitator free support points and the support structure. [Design the precipitator supports for seismic probability zone [3][4] in accordance with Section 22 05 48.00 20 MECHANICAL SOUND VIBRATION AND SEISMIC CONTROL.] Fabrication and erection of structural steel shall conform to AISC 360.

2.3 ELECTRICAL REQUIREMENTS

2.3.1 Electrical Scope of Work

The work covered by this section consists of providing, adjusting, testing, and placing in operation electrical equipment and materials which are an integral part of the electrostatic precipitator provided under this section.

2.3.1.1 Material and Workmanship

Material and workmanship in factory assembled equipment, unless indicated or specified otherwise, shall conform to Division 16, "Electrical." Include interconnecting conduit and wire, grounding, and the electrical connection of the mechanical equipment to the electrical power circuit under Division 16, "Electrical."

2.3.1.2 Electrical Supply Voltage

Provide supply voltage of [_____] volt, three phase and [_____] volt, single phase, 60 hertz. Balance single phase loads on three phase systems. Except as specified herein, design all equipment for energization from a [_____] volt, single phase, 60 hertz electrical supply.

2.3.1.3 Transformers

Supply transformers and accessory equipment as required to convert the [_____] volt, three phase] [_____] volt, single phase], 60 hertz electrical supply to those voltages required.

2.3.2 Equipment Enclosure Heaters

Provide outdoor equipment enclosures with space heaters to prevent condensation of moisture within the equipment enclosures. Space the heaters away and thermally insulate from close painted surfaces. Control
the heaters by an adjustable thermostat set to deenergize the heaters when the temperature rises to 35 degrees C 95 degrees F, and to energize the heaters when the temperature decreases to 29 degrees C 85 degrees F. The space heaters shall not interfere with normal entrance of cables into the enclosures or equipment within the enclosure.

2.3.2.1 Equipment Enclosure Nameplates

Provide equipment enclosures and associated switches, indicating lights, meters, and devices with nameplates.

2.3.2.2 Equipment Enclosure Grounding

Provide equipment enclosures with a ground bus and connectors in accordance with National Electrical Code. Connect electrical equipment to the grounding system specified in Division 16, "Electrical."

2.3.2.3 Insulation and Weatherproofing

***************************************************************************
NOTE: Use this paragraph only when equipment is exposed to the atmosphere.
***************************************************************************

Insulate and weatherproof electrical enclosures exposed to the atmosphere. The enclosures shall conform to specification for insulation and enclosure for roof housing in paragraph entitled "Housing."

2.3.2.4 Wiring

Wiring design and installation shall be in accordance with NFPA 70 and as specified.

2.3.3 Transformer-Rectifier (T-R) Set

***************************************************************************
NOTE: T-R voltage should be 50 KV DC average as a minimum. Sump must be covered and piped to an oil-water separator if penthouse is not covered by a weather enclosure.
***************************************************************************

Enclose the high voltage rectifying equipment in the sealed transformer case to form a single enclosure. The enclosure shall meet the requirements of NEMA Type 3R construction as described in NEMA ICS 6. Provide oil-filled, air-cooled type transformer designed and shielded for precipitator service. Equip the transformer case with, at a minimum, the following items: connection box, grounding connection, filling connection, drain and sampling valves, thermometer, oil and vacuum gages, and high temperature alarm. Provide sump to contain the oil which may leak from the transformer. Provide rectifier with concentric pipe and guard conductors between power supply and precipitator. Voltage supply shall be rated for [_____] volts. T-R capacity shall be [_____] KVA maximum. T-R output voltage rating shall be [_____] kV minimum. T-R shall operate at 60 percent to 100 percent of its current rating at normal operating conditions.

2.3.3.1 Rectifier

Provide oil immersed, solid state silicone type rectifier. Mount within
the transformer case and equip with necessary surge equalizers and suppressors. Arrange interior parts to facilitate circulation of oil for adequate cooling.

2.3.3.2 Grounding Switches

Provide each transformer-rectifier set with a five-position grounding switch to permit grounding of both bushings; full-wave power to one bushing, grounding of the other bushing and vice versa; half-wave power to both bushings. Provide a bus duct between the power supply and the precipitator. Do not connect more than two bus sections to a single transformer-rectifier set; connect each bus section to a single bushing and connect each bushing to only one bus section.

2.3.3.3 Transformer Oil

Provide insulating mineral oil, PCB free, kV rated with required dielectric rating. Sample the oil after installation and test in accordance with ASTM D923 and ASTM D877/D877M. If the oil does not meet the ASTM specification, dry and filter until it meets or exceeds the requirements.

2.3.4 Control Cabinet

Provide controls for the high voltage precipitator supply in control cabinets and include all regulating devices. Provide control cabinets that are completely wired, self-ventilated, free standing, and enclosed in a grounded casing. Maintain cabinet at positive pressure using a fan powered by a 120 volt, single-phase motor with a power output of not less than [0.093 kW] [1/8 hp] [______]. Filter pressurizing air with a filter that is not less than 98.5 percent efficient for dust particles one micron or larger. Equip control cabinet and T-R with a safety key interlock. Construct the control cabinet in accordance with NEMA Type 12 as defined in NEMA ICS 6. Each controller shall conform to NEMA ICS 1 and NEMA ICS 2 and contain, but not be limited to, the following:

a. Completely automatic solid state controller which will maintain a preset spark rate, maximum current, and maximum voltage; silicon controlled rectifiers driven by transistorized automatic controls with auxiliary manual capability. Provide the reactor in conjunction with the T-R set with a nominal impedance of 40 percent and additional taps at 50 percent and 60 percent impedance. Provide easily accessible taps to facilitate changing of tap position. The reactor shall hold inductance within 5 percent at 2.5 times rated current at 40 percent impedance.

b. Full range control on both manual and automatic. Field adjustments to the automatic control shall be maximum current, maximum voltage, and spark rate set point.

c. Indicators, meters, and protection.

d. High voltage start and stop pushbuttons.

e. Thermal line breaker with undervoltage coil and adjustable magnetic trip.

f. Transformer primary AC voltmeter.

g. Transformer primary AC ammeter.
h. Precipitator DC milliammeter.

i. Precipitator DC voltmeter.

j. Precipitator spark rate meter.

k. High temperature alarm indicator for T-R oil temperatures.

l. Auxiliary contacts for the attachment of a portable oscilloscope in order to observe both voltage and current wave forms on the high tension electrodes.

m. Inverse time over current relay for units rated higher than 300 milliamperes.

n. Static regulator to limit precipitator current during automatic control.

o. Alarm circuit interlock which opens when transformer primary circuit is energized.

p. Fused control disconnect for circuit breaker undervoltage coil and automatic control.

q. Manual automatic control select switch.

r. Thyristors with heat sink sized for operation without thyristor fan.

s. Automatic voltage control unit.

t. Three position selector switch with indicating lights; "LOCAL-MANUAL," "LOCAL-AUTO," and "REMOTE-AUTO" positions.

u. Adjustable memory.

v. Visual annunciator for each of the following conditions:

   (1) T-R overload, one each transformer-rectifier.

   (2) T-R undervoltage, one each transformer-rectifier.

   (3) T-R high voltage short circuit and open circuit, one each transformer-rectifier.

   (4) T-R open circuit, one each transformer-rectifier.

   (5) High temperature indicator for T-R oil temperatures.

2.3.4.1 Arc Suppression Within the Precipitator

Controls shall prevent or minimize sparking. The device shall suppress an arc within 1/2 cycle and recover within two cycles to initial voltage before arc. Recovery rate shall be adjustable.

2.3.4.2 Auxiliary Alarm

Wire the control enclosure so that an isolated contact will close and alarm the local annunciator when any of the white indicating lights are illuminated for any of the T-R controls specified in paragraph entitled
"Control Cabinet." Similarly provide an isolated contact to close and to alarm the local annunciator when any T-R control is not in the "REMOVE-AUTO" position.

2.3.4.3 Pushbutton Stations

**************************************************************************
NOTE: Require these indicator lights if remote indication is required.
**************************************************************************

Wire the start pushbuttons to function only when the three position selector switch is in the "LOCAL-MANUAL" or "LOCAL-AUTO" positions. In addition to shutting down the T-R, the stop pushbutton shall clear all alarm outputs, except the output indicating that T-R control is not remote. Startup, whether by local pushbutton or remote control, shall arm the alarm system. Provide remote control so that all T-R sets which have their three-position selector switches in the "REMOTE-AUTO" position may be stopped by pushbutton station on the main control panel. Provide output contacts for remote indication of the status of T-R which are in the "REMOTE-AUTO" mode. Provide indicating lights for each precipitator on the auxiliary boiler control panel as follows:

a. Green -- all units off.
b. Red -- all units on.

**************************************************************************
NOTE: Require amber light if sequential startup is required.
**************************************************************************

c. Amber - startup in progress.

2.3.4.4 Redundant Protective Devices

Provide redundant protective devices on controller connections to the transformer unit secondary circuit.

2.3.5 High Voltage System Wiring and Support Insulators

**************************************************************************
NOTE: Use this paragraph for "bus-duct" wiring.
**************************************************************************

Provide wiring materials and insulators, including insulators for discharge electrode supports, required to electrically connect the T-R to the discharge electrodes. The high voltage lead from the rectifier to the discharge electrodes shall consist of a conductor in metal enclosed weatherproof bus duct. Furnish the bus duct complete with necessary insulators, duct supports and fittings, and supply formed to exact length ready for bolting to the equipment.

2.3.6 High-Voltage Leads

**************************************************************************
NOTE: Use this paragraph for "pipe" wiring.
**************************************************************************
Completely enclose high voltage leads to the precipitator in a grounded 16 gage minimum thickness sheet metal guard. The conductor shall be 20 mm 3/4 inch diameter, Schedule 40 iron pipe. Include equipment for the introduction of clean purging air in and around the support bushings to prevent dust buildup on the insulators. The high voltage conductor pipe shall have a union immediately connected to the T-R set so the T-R can be easily isolated from the precipitator. Connect the conductor pipe to the high voltage electrode frame by a removable wire lead.

2.3.7 High Voltage Insulators

Provide a minimum of four insulating support bushings for each electrical bus section. Compression-load the high tension insulators and install outside of the contaminated gas stream. Provide insulators of materials suitable for the temperature. Provide best process electrical glazed ceramic high density 85 percent alumina for temperatures below 454 degrees C 850 degrees F. Provide adequate access for removal and reinstallation of high voltage insulators. Provide four pad-eyes above each high voltage bus frame to facilitate lifting of the frame for precipitator maintenance. Attach pad-eyes to support beams. Each pad-eye and support beam shall be capable of supporting the entire weight of its respective high voltage bus frame. Provide other means for lifting high voltage bus frames if acceptable to Contracting Officer.

2.3.8 High Voltage Insulator and Pressurizing System Heaters

Provide a heating and pressurizing/purging system for the high voltage bus duct insulators and the discharge electrode support insulators. Furnish control devices to automatically energize the heaters, as required, when the temperature of the insulating support bushings falls below 107 degrees C [225 degrees F] and deenergize the heaters when the temperature reaches 121 degrees C [250 degrees F]. The system shall maintain an insulator temperature of 107 degrees C 225 degrees F when the precipitator is off line. Provide sufficient pressure to prevent the infiltration of dust and moisture laden air into the penthouse and to keep the inside of the high voltage insulators free from the flue gas. Supply a minimum of 47.20 L/s 100 acfm of heated, filtered air for each insulator. Direct the purge air downward in swirl pattern across the inside surface of each insulator. Provide a purge air filter of the disposable or cleanable type with a filter efficiency of not less than 98.5 percent for dust particles of one micron or larger. Provide remote annunciation for malfunctions of the heating and pressurizing system as specified in paragraph entitled "Annunciation and Indication." Provide pressurizing fans, complete with electric motor, automatic backflow prevention dampers, inlet filters, and a relief device for filter bypass in case of blocked filters. Furnish a minimum of two fans for each pressurizing system. Provide pressurizing fans of equal capacity and requiring the same size motors. Upon less of any one fan, the remaining fans shall automatically pressurize the system as required to ensure continued normal operation of the precipitator. Provide a control system consisting of necessary relays, pressure switches, flow switches, and control devices. Factory mount control devices, except those requiring local mounting, and wire in an indoor NEMA ICS 6, Type 12 floor-mounted control enclosure. Provide each fan discharge duct with an airflow switch for use in fan control. Furnish locally mounted NEMA ICS 6, Type 4 combination starters for the fans. Mount an "AUTO-ON" selector switch for each fan on the door of its associated local combination starter. Mount indicating lights for system status on the starter door. Provide each fan control circuit with a two-position, "AUTO-ON," selector switch. Provide a single normally open
contact, which will close upon start up of the induced draft fans, when the selector switch is in the "AUTO" position. Provide relays as required to multiply this signal. Electrically isolate output contacts for controls motor starters.

2.3.9 Discharge Electrodes and Collecting Surfaces

Provide rigid frame type discharge electrodes. Rigid electrode, or weighted wire design precipitators are not acceptable. The discharge electrodes in each passageway shall run in a vertical direction and shall be supported by a welded pipe, tube, or channel frame. Provide the frame with vertical pipe, tube, or channel supports spaced at a maximum interval of 1.22 meters four feet. Also provide the frame with horizontal pipe, tube, or channel supports spaced at a maximum interval of 1.22 meters four feet. The electrodes shall have a cross-sectional area of not less than 16 square mm 0.025 square inches and not more than 64.52 square mm 0.10 square inches. Fabricate collecting surface from rolled seamless sheet of not less than 16 gage thickness. Collecting surface plate spacing shall be not less than 280 mm 11 inches or greater than 330 mm 13 inches. Support discharge electrodes and collecting surfaces as required to maintain proper alignment during operation. Support each main discharge electrode bus section support frame by four alumina support insulators. Design collecting surfaces so that deflection from a plane surface will not exceed plus or minus 6 mm 1/4 inch about any axis. Design and construct discharge electrodes and collecting surfaces to be readily located and aligned within plus or minus 6 mm 1/4 inch of the normal design position. Assemble the collecting surfaces at the factory. Factory assembled modules which can be shipped to the field for erection may be provided. Provide high voltage frames with sway braces or other devices as required to prevent swaying. Incorporate gas baffles into the collecting plates to provide a gas flow quiescent zone and to provide stiffening.

2.3.10 Rappers

Provide falling hammer collecting surface and discharge electrode rappers with individual hammers for each plate and frame. Design plate rappers for sequential rapping to prevent simultaneous rapping of plates and provide a minimum of 27 N.m 20 foot pounds of rapping force per plate. Design discharge electrode rappers for sequential rapping to prevent simultaneous rapping of frames and provide a minimum of 12.24 N.m 9 foot pounds of rapping force per frame. Provide solid steel rapper drive shafts with a minimum diameter of 50 mm 2 inches. Provide magnetic impulse gravity return gas distribution plate rappers with individual rappers for each plate or screen.

2.3.10.1 Rapper Controls

Rapper controls shall have adjustments for independent field repeat intervals and for independent field rest time.

2.3.10.2 Rapper Control System

Provide a rapper control system conforming to NEMA ICS 1 and NEMA ICS 2 consisting of necessary devices for the complete control of each rapper system. Factory install and wire the system for [indoor] [outdoor] installation in a NEMA [12] [3R] cabinet as described in NEMA ICS 6 and locate in [control house] [control room] [roof]. Provide outdoor mounted units finish painted for outdoor service, wind braced for [_____] km miles per hour wind and completely weatherproofed.
2.3.10.3 Rapper Disconnects

Provide disconnecting switches for individual rapper groups to deenergize for servicing.

2.3.10.4 Rapper High Voltage Spikes

Provide the rapper system with surge suppressors and other devices as required to eliminate high voltage spikes.

2.3.10.5 Rapper Annunciation

Provide remote annunciation for malfunctions of the rapping system as follows:

"White" light for rappers not operating (power failure).

2.3.11 Annunciation and Indication

2.3.11.1 Off-Limit Conditions

Provide annunciator and indication equipment for individual annunciation and indication of the following off-limit conditions:

a. T-R control trouble.

b. T-R overload, one each transformer-rectifier.

c. T-R undervoltage, one each transformer-rectifier.

d. T-R open circuit, one each transformer-rectifier.

e. T-R not in remote, one each transformer-rectifier.

f. Penthouse or insulator compartment air pressure low.

g. Loss of penthouse pressurizing airflow.

h. Rapper control failure, one each rapper control enclosure.

i. Low hopper temperature.

j. Insulator temperature below [107 degrees C] [225 degrees F][____].

k. Purge air filter clogged.

2.3.11.2 Annunciator

Provide annunciator with a station for each alarm input plus a minimum of 25 percent spare stations. Provide sufficient stations for annunciation such that the items of equipment that failed can be easily identified. Provide a backlighted window for each station with an engraved legend that will be readable by a [standing] [sitting] operator at the operating station. The unit shall be complete with test, audible silence, flasher reset, and lamp reset pushbuttons and audible device. Incorporate an adjustable time delay relay in the annunciator audible device circuit to cause automatic silencing of the device after a manually selected time period. The annunciator stations shall, however, remain lighted until the
trouble is cleared. Provide solid-state type annunciator, suitable for 120 volts AC power supply with not less than 125 volts DC applied to the trouble contacts. Include one electrically isolated contact per window for remote annunciation. Provide positive oriented logic, 120 volts AC or 125 volts DC power supply for trouble contacts, and two lamps wired in parallel circuit per indicating window. Design annunciator alarm contacts to accept field contacts which close on alarm condition. Do not use contacts which open on alarm condition. Provide an auxiliary isolated contact for each station. The auxiliary contact action shall follow that of the field contact. Provide cover-mounted annunciator, test, audible silence, flasher reset, lamp reset, and acknowledge pushbuttons on a NEMA ICS 6, Type 12 enclosure. Mount and wire the following devices inside the enclosure:

a. Annunciator audible device.

b. Fuse and fuse holder for annunciator power supply.

c. Fuse and fuse holder for the audible device.

d. Terminal blocks for connections to all external circuits.

2.3.12 Electrical Service Outlets

Provide a 20 amp, 110 VAC duplex ground fault NEMA 5 20R terminal duplex interrupter receptacle within 2.44 meters 8 feet of access doors except doors in the hot-roof and gas distribution plates. The receptacles on each precipitor level shall be on a separate circuit. Ground fault interrupters shall test and reset at the receptacle. Wire receptacles to provide individual receptacle protection such that no other receptacles are interrupted by an individual receptacle trip. The receptacle shall interrupt at 5 plus or minus 1 milliamp ground fault current. Provide specification grade or better receptacles and protect by weather tight covers. Provide a CS 6369 (Alpha Configuration) 50 amp, 3 pole, 4 wire, 120/250 VAC twist type receptacle in a FS box with a weatherproof cover (Hubbell SR-50 or approved equal - item may be provided as an integral assembly or as individual components) inside each weather enclosure on separate circuits. Provide a weatherproof 100 amp, 3 pole, 4 wire, 120/250 VAC, pin ad sleeve receptacle conforming to IEC 60309-3 within 15 meters 50 feet of each stack base and each precipitator base. Provide each of the 50 amp receptacles with an individual 50 amp, 208 VAC service. Provide each of the 100 amp receptacles with an individual 100 amp 208 VAC service.

2.4 HOUSING

Construct the precipitator housing, including inlet and outlet nozzles, of minimum 6 mm 1/4 inch thick steel plate and attach to appropriate structural steel supporting members. Plumb the housing within 10 mm 3/8 inch measured at top, bottom, and tie points, side to side, and front to rear. The top of the precipitator support shall be flat within 1.50 mm 1/16 inch for area of support foot and at elevation within 3.18 mm 1/8 inch. Make provisions, including expansion joints if required, to allow for any expansion, differential expansion, and contraction that may occur. Design the expansion provisions to prevent escape of gas or inflow of ambient air. Provide a minimum of 1.50 meters 5 feet of vertical clearance inside the housing above the discharge electrodes and collecting surface frames to afford access for inspection and maintenance. Locate walkways internal to the housing between electrical fields, at the inlet to the first field, at the outlet to the last field, and as otherwise required to provide access to equipment located within the housing which may require inspection or...
maintenance. Provide access to internal walkways by two access openings located on opposite sides of the precipitator for each internal walkway. Access openings shall align directly with internal walkways and shall be unobstructed. The walkways shall provide a minimum passageway clearance of 762 mm 30 inches. Provide the housing with insulated, hinged, quick opening, access, inspection, and cleanout doors with gastight seals as required for proper operation and maintenance. Provide a minimum of one door above each bus section. The minimum access opening size shall be 460 by 600 mm 18 by 24 inches for rectangular openings and 600 mm 24 inches diameter for round openings. Provide key interlocks for openings through which personnel may come in contact with high voltage equipment to prevent opening before the electrical supply is deenergized. The housing shall be of all welded construction. Minimize the use of flanged or bolted joints. Use only where bolted assembly is required for adjustment or removal. Prevent structural members from acting as radiators, thereby reducing internal corrosion. The difference between the inside wall temperature at any point and the inlet gas temperature shall be less than 22 degrees C 40 degrees F.

2.4.1 Penthouse

Provide a penthouse to enclose the high voltage system support insulators. Enclose the entire top of the housing. Design the penthouse to withstand the effects of differential thermal expansion between the precipitator housing and the penthouse. Design the expansion provisions to assure an airtight penthouse. Weld gas tight. Check for leaks using smoke candles or other method approved by the Contracting Officer. Repair leaks by welding or repair of mechanical seals. Do not use caulking. Provide a minimum of 2 insulated, hinged, quick-opening access doors on the penthouse roof; one at each end of the roof. Provide penetrations, openings and hatches in or on the penthouse roof with mechanical seals or weld to provide a gas tight and watertight seal. Install calcium silicate insulation conforming to ASTM C533 over 12 gage steel pines stud welded on 610 mm 2 foot centers on the penthouse roof. Hold in place by 65 mm 2 1/2 inch square speed washers and closely fit around penetrations. Construct top surface of 6 mm 1/4 inch thick raised pattern plate conforming to ASTM A242/A242M, Type I to form a continuous walking surface. Provide support to bear not less than 488 kg per square meter 100 pounds per square foot live load. Provide additional support for equipment placed on the roof. Seal joints by continuous fillet or complete penetration groove welds as applicable. Weld appurtenances similarly to the plate. Provide top penetrations with a 50 mm two inch minimum extension above the plate and similarly weld to the plate. Slope the top surface to allow water runoff and to prevent pooling. Extend top surface at least 25 mm one inch beyond side insulation. Provide a 80 mm 3 inch fascia of 6 mm 1/4 inch steel conforming to ASTM A242/A242M plate as a rain barrier. Provide a 80 mm 3 inch kickplate of 6 mm 1/4 inch steel conforming to ASTM A242/A242M plate around the perimeter of the top surface and provide adequate drain holes to permit water runoff. Provide a safety rail on the top perimeter. Manufacture top surfaces of appurtenant structures with 6 mm 1/4 inch steel conforming to ASTM A242/A242M raised pattern floor plate in a manner similar to that specified herein including soffit and fascia dimensions. Aluminum casing materials shall conform to ASTM B209M ASTM B209.

2.4.2 Insulation Materials

**************************************************************************
NOTE: For operating temperature range of 94 to 260 degrees C 201 to 500 degrees F use minimum thickness
of 115 mm 4 1/2 inches. For operating temperatures 261 degrees C 501 degrees F and above use minimum thickness of 140 mm 5 1/2 inches.

Insulate the precipitator housing, penthouse, and hoppers with ASTM C612 mineral fiber block or ASTM C592 mineral fiber blanket insulation. Insulate the roof with ASTM C533 calcium silicate block. Minimum insulation thicknesses shall be as follows:

a. Housing [_____] mm inches
b. Hoppers [_____] mm inches
c. Hot Roof [_____] mm inches
d. Penthouse [_____] mm inches.

2.4.3 Casing Materials

Casing except top surface casing, which might serve as personnel walking surface, shall be 1.27 mm 0.050 inch thick stucco embossed, 100 mm 4 inch rib, unpainted aluminum panel. Aluminum casing shall be ASTM B209M.

2.5 HOPPERS

Construct hopper plate of [Type 316 stainless steel conforming to ASTM A276/A276M] [structural steel conforming to ASTM A242/A242M Type 1] and a minimum 6 mm 1/4 inch thick. Provide hoppers with ASTM A242/A242M baffles to prevent flue gas from bypassing the electrostatic field. Hoppers shall span no more than one electrical field. Provide hoppers with untapered fillet plates, constructed of cold rolled minimum 10-gage ASTM A276/A276M Type 316 stainless steel, in each corner. Extend the fillet plates the full length of the corner. Seal weld the fillet plates to the hopper walls. Provide closure plates at the top of the hopper at each corner to prevent flow into the area between the fillet plate and the hopper corner. Steel reinforcements not in contact with the gas or ash may be either ASTM A276/A276M Type 316 stainless steel or ASTM A242/A242M structural steel. If the latter is used, select welding rods specifically for the service and submit to the Contracting Officer for approval. Provide protection of rods against moisture.

2.5.1 Hopper Accessories

Provide key interlocked access doors on each hopper on both sides of any hopper baffle. Doors shall be in accordance with the requirements specified herein. Hoppers shall have adequate flexibility for vibrators. Provide each hopper with two 100 mm 4 inch poke holes with a tee wash connection and screwed caps. Position poke holes to permit downward thrusts into the hopper. Provide a special plate reinforced "pounding area" on each hopper face for external manual vibrating. Each pounding plate shall be 300 by 300 by 25 mm 12 by 12 by 1 inch thick ASTM A36/A36M plate steel. Provide a work platform with stairs to each pounding area for units with pounding areas more than 1.50 meters five feet above ground. Do not insulate pounding plate. Finish insulation at this discontinuity. Provide a minimum 200 mm 8 inch diameter flanged fly ash outlet connection on each hopper to accept the fly ash transportation system equipment. Provide access hatch not less than 200 by 200 mm 8 by 8 inches for
cleanout within 200 mm 8 inches above flange.

2.5.2 Hopper Vibrators

Provide each hopper with two vibrators set at the mid-height and on opposite sides. Interface vibrator controls with ash collection system to provide automatic vibrator operation only at the inception and during an evacuation cycle. Provide manual override control for hopper vibrators and evacuation system in hopper area and enclose in (a) case(s) to prevent accidental energization of systems. Place a warning over the vibrator manual control with the following inscription:

"WARNING: VIBRATOR CONTROL. DO NOT ACTIVATE UNLESS HOPPER EVACUATION SYSTEM IS OPERATING."

2.5.3 Hopper Heater System

Provide a hopper heater system for each precipitator.

2.5.3.1 Hopper Heater System Design

Provide the system complete with all material required for mounting. The system shall provide a 139 degrees C 250 degree F rise in temperature in the hopper, in the vicinity of the heaters, during offline and startup conditions. Size the system to provide a hopper skin temperature of not less than 177 degrees C 350 degree F when the insulation is in place during minimum ambient temperatures specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Design the system with a minimum heating safety factor of 1.1 and a minimum wind heat loss factor of 1.12. Design the system to provide maximum heater coverage between hopper stiffeners utilizing modular heaters and flexible blanket or tape heaters for the hopper throat heating. Heater modules shall cover not less than 33 percent of the hopper area. Cover the bottom portion of the hopper to the maximum extent possible, and extend at least 70 percent up the hopper height. Provide a two zone system. Comprise the lower zone of heaters located on the bottom one-third of hopper height including the throat heater; the upper zone shall include the remaining hopper heaters. Use flexible electric heating blankets or tapes, capable of withstanding 427 degrees C 800 degree F, where modular equipment will not fit. Provide only equipment designed to withstand natural and induced vibrations, plus shock loadings normally experienced during operation of the precipitator and ancillary equipment including manual rapping of the strike plates. Provide an individually, thermostatically controlled hopper heater system with adjustable setpoint and include power, control, and alarm components. Locate the low temperature and control thermocouples in the lower portion of each heater zone. Heater voltage shall be 480 volts AC. Control voltage shall be 120 volts AC.

a. Hopper Heater Module Design: Provide self-contained, modular heaters. Provide hopper heater modules which have a flexible heating face to conform to the irregularities of the hopper surface, providing contact between the heaters and the hopper, and providing maximum heat transfer. Provide low watt density design modules with a maximum of 0.0047 watts per square mm 3 watts per square inch of resistance element and with a minimum of six parallel resistance paths per heater. Continuous blanket type elements shall be deemed to meet the multipath requirement. Each module shall have dual heating elements. Both elements shall function during startup and offline conditions. To reduce power consumption and cycling while maintaining the hopper
temperature during online operating conditions, controls shall automatically switch off one element in the lower zone and both elements in the upper zone without affecting the remaining element's operation. The hopper throat blanket heater shall have a single heating element and shall remain on during startup, offline, and online operating conditions. Each heating element in the module shall be capable of being operated at and shall be rated at 2690 watts per square meter 250 watts per square foot, but shall be designed to operate at 2152 watts per square meter 200 watts per square foot. Size wiring, circuits, and controls for 2690 watts per square meter 250 watts per square foot. Total power density shall be not less than 4303 watts per square meter 400 watts per square foot of heater module surface. Construct heating elements of 600 series stainless steel alloy or ni-chrome encased in a 20 gage minimum thickness aluminum or aluminized-steel mounting pan or casing. Provide two sets of heater pigtails for each module, one set of pigtails for each element and circuit. Provide multistrand copper pigtails and interconnecting wires with high temperature (454 degrees C 850 degree F) insulation. Furnish heater pigtails with strain relief constructed to prevent damage to the heater modules due to rough handling. Provide pigtails of sufficient length to reach the terminal box. Splices are not permitted in pigtails from modules, tapes, or blankets to the terminal box. Perform hopper heater module voltage tests for each module, blanket, or tape for electrical integrity at 1,000 volts. Provide heating modules with metal labels firmly attached to the module listing the wattage and voltage of the module. Construct heating modules and mounting hardware of high temperature materials capable of withstanding 454 degrees C 850 degrees F. Insulate heating modules with high temperature woven glass cloth or mineral fiber. Mica or magnesium oxide insulated heaters are not acceptable.

b. Hopper Heater Installation: Heater modules shall provide maximum contact between the heaters and the hopper wall.

2.5.3.2 Hopper Heater Controls

------------------------------------------------------------------------------------------------------------------
NOTE: Use these paragraphs for local control only.
------------------------------------------------------------------------------------------------------------------

------------------------------------------------------------------------------------------------------------------
NOTE: Use these paragraphs for master control only.
------------------------------------------------------------------------------------------------------------------

Control each hopper heater zone thermostatically with adjustable setpoint and provide complete including power, control and alarm components. Provide 120 volt AC adjustable type thermostats for monitoring hopper temperature and locate in NEMA ICS 6, Type 4 enclosures. For thermostatic control of the hopper heater system, provide a Master Hopper Heater Control Panel for each precipitator, a Local Hopper Heater Control Panel for each hopper, and a Local Hopper Heater Zone Terminal Box for each zone. Provide materials, tools, and labor required for connections of circuits and wiring between local hopper heater zone terminal boxes, local hopper heater control panels, and the master hopper heater control panels.

------------------------------------------------------------------------------------------------------------------
NOTE: Use these paragraphs for local control only.
------------------------------------------------------------------------------------------------------------------

SECTION 23 51 43.02 20  Page 38
a. Local Hopper Heater Zone Terminal Box: Provide hot-dipped galvanized NEMA ICS 6, Type 4 hopper heater terminal boxes with terminal blocks for connection of heater pigtails and thermostat leads on each hopper for each hopper zone. Provide a sufficient number of terminals to connect the heater pigtails and thermocouples for each hopper zone.

**************************************************************************
NOTE: Use these paragraphs for local control only.
**************************************************************************

b. Local Hopper Heater Control Panel: Provide each precipitator with a local hopper heater control panel at each hopper. Locate at a regularly accessed area near each hopper. For each zone, provide each local hopper heater control panel with: terminal blocks for power, control, and alarm circuits, one control temperature thermostat, one low temperature alarm thermostat, magnetic contactor and alarm relay with two normally open contacts, and auxiliary relays for automatic operation of the heater system. Provide a 3-pole fused switched main disconnect device and a fused control transformer having a 120-volt AC secondary for each local hopper heater control panel. Provide thermostats with a set point range of 38 to 260 degrees C (100 to 500 degrees F). Measure hopper skin temperature using ungrounded, type J thermocouples. Provide each local hopper heater control panel cover with the following devices:

(1) "START UP," "ON LINE," "OFF," "AUTO" selector switch.

(2) 120 V "ON" red light with integral transformers, one each zone.

(3) 120 V "LO TEMP" alarm white light with integral transformer, one each zone.

(4) Device and enclosure nameplates.

Wire the selector switch for the following system operation:

(1) "START UP": Upper and lower zones all elements on (includes throat heater).

(2) "ON LINE": Single element lower zone on (includes throat heater).

(3) "OFF": All elements off.

(4) "AUTO": Control functions transfer to Master Hopper Heater Control Panel.

**************************************************************************
NOTE: Use these paragraphs for master control only
**************************************************************************

c. Master Hopper Heater Control Panel: Provide panels containing relays, contactors, circuit breakers, control transformers, and other devices required for complete control of each precipitator hopper heater system. Locate Master Hopper Heater Control Panels with precipitator controls in the control room. Factory install and wire the panel components in a NEMA ICS 6, Type 12 enclosure and include the following:

(1) A main circuit breaker.
(2) A circuit breaker and contactor alarm relay with two normally open contacts for each hopper zone. The contactor shall have a 120-volt operating coil.

(3) "START UP," "ON LINE," "OFF," selector switch for each hopper.

(4) 120 V red "ON" light and 120 V white "LO TEMP alarm light with integral transformers for each hopper zone.

(5) Auxiliary relays and equipment required for operation of the heating and alarm systems.

(6) Device and enclosure nameplates.

(7) Fused control transformer having a 120 volt AC secondary.

2.5.4 Fly Ash Level Alarms

Provide each hopper with a fly ash level alarm utilizing nuclear type detectors. The detectors shall be single point gamma source and detection units. Provide the detectors complete with separately mounted electronic units including local high level indicating light and relays for use with annunciation system herein specified. Provide relays rated at 10 amperes, 120 volts AC, or 125 volts DC continuous duty. Provide dustproof switch housing for hoppers and mount at one easily accessible location. Locate alarm indicators and detector and source electronics at the hopper control panel. Provide detector that is explosion proof, waterjacketed, and able to withstand vibration and temperatures up to 427 degrees C 800 degrees F. Provide the source with a lockable shutter mechanism operated by an external handle to totally isolate the beam when in the closed position. Furnish electrical wiring schematics. Electrical supply shall be 120 volts, single phase, 60 hertz. Provide two sensors for each hopper--one at the alarm level and one at the empty level. Locate alarm level at the 50 percent hopper capacity level.

2.5.4.1 Temperature Range Requirement

Level reproducibility shall be within one inch. Outdoor components shall operate between minus 40 and 93 degrees C 40 and 200 degrees F.

2.5.4.2 Cesium Source Safety Systems

Provide Cesium 137 source for each hopper. Design source head with a spring return off system in the event of remote cable actuator failure. Interlock source with hopper access doors to prevent entry into hopper unless source has been secured. Hopper access door key shall only open one pair of hopper doors.

2.5.4.3 Hopper Level Indicator

Hopper level signals, based on hopper level status indicator system, shall report to a microprocessor through a coaxial cable system. Provide each hopper with two indicators, one for full and one for empty. A flashing light shall indicate a wall buildup. Loss of power for any period of time shall not require a recalibration. Provide NEMA ICS 6, Type 4 enclosure for microprocessor.
2.5.4.4 Alarm System

Incorporate each group of detector units for a single electrostatic precipitator into the unit alarm system for its respective precipitator so that a high level in any hopper shall indicate as part of the unit alarm system.

2.6 ACCESS

2.6.1 Walkways

Provide walkways for inspection and maintenance of discharge electrode hanger points. Access doors and external walkways shall make routine inspection tours readily performable. Connect walkways, including roof, by stairways. Interconnect walkways at each level by walkways at the same level. Provide caged ladders as a means of secondary egress connecting all levels.

2.6.2 Doors

Provide every access door with a corresponding exterior walkway connected to the general system of platforms and walkways. Provide insulated, hinged, quick opening access, inspection, and clean out doors with gastight seals. Access doors, including hopper doors, and mechanical and electrical components shall be easily accessible from the walkway or provide with a permanent steel ladder or stairway to facilitate maintenance. Provide internal and external handholds at all access doors to facilitate entry.

2.6.3 Platforms, Walkways, and Ladders

Shop fabricate walkways, stairways, and ladders. Provide access to openings in both the precipitator and hoppers. Provide walkways in the casing interior as specified in paragraph entitled "Housing." Provide walkways, platforms, stairways, ladders, handrails, and kickplates on the penthouse roof and housing roof, as applicable, and as specified in paragraph entitled "Penthouse." Design platforms, ladders, and walkways support steel for live load specified herein. Design platforms to support a 488 kg per square meter 100 pound per square foot live load. Construct external walkways and platforms of steel conforming to ASTM A242/A242M raised pattern floor plate.

2.6.4 Maintenance

**************************************************************************
NOTE: Provide 227 kg 500 pound crane unless T/R sets are to be replaced with the crane. If used for T/R replacement, size for T/R weight.
**************************************************************************

Provide jib crane as required to remove roof-mounted equipment. Load limits shall be [_____] kg pounds and the jib crane shall be properly signed for safety showing maximum load permitted.

2.6.5 Hot Dip Galvanizing

Hot dip galvanize platforms, walkways, stairways, ladders, handrails, and kickplates after fabrication in accordance with ASTM A123/A123M. Minimum galvanized coating per surface shall not be less than [_____] kg per square meter ounces/square foot.
2.6.6 Gas Distribution Devices

Provide the precipitator with inlet and outlet screens or baffles required to obtain proper gas distribution across the face of the precipitator as determined by model test study. Gas distribution devices shall contain removable 915 by 610 mm 3 by 2 feet panels on each screen or baffle for access between screens. Provide the precipitator with internal gas baffles as required to prevent gases from bypassing the treatment zone. Gas distribution velocities across the inlet to the precipitator shall have a root-mean-square deviation of no more than 15 percent and no flow shall exceed 125 percent of average flow velocity.

2.6.7 Interlocks

Provide a key type safety interlock system with sequential key arrangement on the precipitator housing and penthouse access doors, inlet and outlet nozzle access doors, rectifier enclosure access doors, transformer-rectifier grounding switch, hopper level indicator sources, hopper access doors, and control unit circuit breakers. No high voltage equipment shall be accessible without properly locking out the power supply and grounding the high voltage equipment. Keys shall not be able to be removed from the locks when access doors are open.

2.7 FABRICATION

Perform shop fabrication and assembly of steel structures in conformance with AISC Specifications, Codes and Standards. Field welding shall be shielded metal arc or submerged arc. Shop welding shall be shielded-metal arc, submerged arc, flux-core arc, or gas metal arc. Perform welding in conformance with the requirements of the AWS D1.1/D1.1M and AISC Specifications. Shop connections shall be welded, riveted, or bolted with high-strength bolts at the Contractor's option and as allowed by the seismic code. Unless restricted by consideration of clearance or seismic design criteria, show field connections as bolted friction type using ASTM A325M ASTM A325 or ASTM A490M ASTM A490 bolts and design to conform to AISC specification for "Structural Joints Using ASTM A325M ASTM A325 or ASTM A490M ASTM A490 Bolts." Form and weld handrails and do not exceed 6 feet from center-to-center of posts. Grind welds smooth and even with the surface of the pipe, remove weld splatter. Carefully form transitions at corners where change of direction of elevation occurs as required to provide continuous handrail. Clear columns or other vertical or horizontal projections by at least 80 mm 3 inches. Furnish plates and additional items as required for fastening to supporting members. Extend kickplates 100 mm 4 inches above top of grating and install at the edge of uncovered openings and at the edge of walkways and platforms. Construct kickplates to allow water run-off. Shop fabricate as complete as possible and within standard industry practice. Leave large pieces unassembled only to the extent necessary for shipment.

2.8 PAINTING

Steel surfaces shall be dry and clean before painting. Remove grease, oils, and contaminants as outlined in SSPC SP 1. Remove weld spatter and grind burrs smooth on cut edges and rough welds. Blast-clean surfaces after fabrication, in accordance with SSPC SP 6/NACE No.3 and profile depth of 0.038 to 0.051 mm 1.5 to 2.5 mils. Before any rust bloom forms, apply one coat, dry film thickness of 0.076 mm 3 mils, of any of the organic zinc-rich primers meeting the requirements of SSPC PS 12.01, with a minimum...
of 82 percent zinc in the dry film. Apply primer in accordance with manufacturer's recommendations. Apply primer to steel surfaces except the areas within 50 mm two inches adjacent to field welds and surfaces specified to be hot-dip galvanized.

PART 3 EXECUTION

3.1 FACTORY INSPECTION

Any material or equipment used in the manufacture of the precipitator and found to be defective during inspection at the manufacturer's plant shall be either corrected or replaced as approved by the Contracting Officer before shipment. Acceptance at the factory shall not constitute final acceptance.

3.2 INSTALLATION

**************************************************************************
NOTE: Revise this paragraph as necessary when it is desired to have the precipitator manufacturer install the equipment furnished.
**************************************************************************

The contractor shall install the equipment specified herein on foundations or structural-steel framework shown on the drawings or as specified elsewhere herein. Installation shall be in accordance with the manufacturer's recommendations.

3.3 MANUFACTURER'S FIELD REPRESENTATIVE

**************************************************************************
NOTE: The period of instruction should be reduced only if the operating personnel have significant experience on identical equipment.
**************************************************************************

The contractor shall provide the services of a field representative(s) specifically trained by the manufacturer to assist installers of their equipment. The field representative(s) shall be at the erection site during installation including unloading, hauling, storing, cleaning, erecting, and testing. The field representative(s) shall supervise the adjustment of all controls, control devices, and components supplied with the precipitator as necessary to place the precipitator in successful operation. The field representative(s) shall instruct the plant operators in the operation, care, and maintenance of the equipment. Provide a minimum of 10 working days advance notice to the Contracting Officer prior to scheduling these instructions. Provide a total of [20] [_____] days instruction including [6] [_____] round trips to the jobsite. Provide training by field representative in precipitator theory and design, start-up, shut-down, operation, performance monitoring, performance evaluation, problem diagnosis, maintenance, inspection methods, safety, operations and maintenance plans.

3.4 FIELD TESTS AND INSPECTIONS

3.4.1 Delivery Inspection

Materials and equipment shall be inspected in accordance with the Contract Clauses. Inspections may be made to assure that equipment and installation
comply with local and government requirements for equipment and safety as well as applicable specifications.

3.4.2 Post Installation Inspection

A factory service engineer employed by the precipitator manufacturer shall inspect the precipitator after installation is completed and prior to startup to verify that the unit is installed in conformance with the manufacturer's recommendations. Perform an air load test with precipitator readings recorded.

3.4.3 Performance Tests

Perform field performance tests by an independent testing organization acceptable to the Contracting Officer. Provide written notice to the Contracting Officer, at least 20 calendar days before scheduled test date, stating that equipment is being scheduled for test. Perform a trial run of 30 days minimum before actual test (operate boiler at least 60 to 90 percent load) to ensure that associated systems required for the test are ready. Perform boiler tune-up to optimum efficiency prior to performance test. The Contractor and the manufacturer's factory service engineer shall witness the test. Perform tests in accordance with applicable state or local methods. If no such methods or adaptations are required, then perform the tests in accordance with EPA 40 CFR 60, Appendix A, Methods 1-5, 9 and 17. Perform tests at the maximum continuous rating for the inlet gas conditions specified in paragraph entitled "Inlet Gas Conditions" and, if applicable, at other operating conditions that are required for approval by the appropriate regulatory agency. Test the precipitator for efficiency by simultaneous testing of precipitator inlet and outlet emissions. Conduct the efficiency tests after the precipitator has been in operation for at least 45 days.

3.5 IDENTIFICATION

Fasten an aluminum, brass, or corrosion-resistant steel nameplate to the equipment in a readily visible location by means of stainless steel Series 300 rivets or sheet metal screws. The nameplate shall contain data such as the manufacturer's name, and model or series number. Indent or emboss the information in the metal. Offset the nameplate a sufficient amount to avoid being covered by insulation.

3.6 INSULATION INSTALLATION

3.6.1 General Insulation Requirements

Apply insulation with interruptions to permit access doors, inspection doors, flanges, and other special features to be opened or removed for inspection or maintenance without disturbing the insulation. Provide boxouts around code stamping symbols and nameplates. Install double thickness insulation with the joints of the two layers staggered. Fill cracks, voids, and depressions in layers of insulation with suitable insulating cements before application of another layer of insulation or jacket application. Provide expansion joints in the insulation as required to allow for thermal expansion movements which might cause cracks or tears in the insulation. Install insulation between stiffeners and over stiffeners so that stiffeners are completely insulated. Install additional insulation or casing spacers between stiffeners so that a level surface is achieved. The intent of this insulating procedure is to prevent a direct metal path between the precipitator inside and ambient air. Securely wire
and lace in place insulation using number 14 dead soft Type 302 stainless steel wire, conforming to ASTM A580/A580M.

3.6.2 Block and Mineral Fiberboard Insulation Installation

Secure block and mineral fiberboard insulation in place with insulation lugs spaces on not greater than 300 by 460 mm 12 by 18 inch centers. Provide stud type lugs welded in place. Reinforce blocks on the exterior face with expanded metal if necessary to prevent sagging or cutting of the insulation by the lacing wire. Securely wire block and mineral fiberboard insulation of the specified thickness in place over the entire surface by means of wire threaded through the lugs both ways, pulled tight with the ends of the wire loops twisted together with pliers, bent over, and carefully pressed into the surface of the insulation.

3.6.3 Mineral Fiber Blanket Insulation Installation

Secure mineral fiber blanket insulation in place with speed washers and impaling pins spaced on centers not exceeding 300 mm 12 inches. Provide mineral fiber blanket insulation with expanded metal reinforcement on the outer surface and wire mesh or expanded metal on the inner surface. Tightly butt sections of the blankets together and securely tie for maximum sealing at joints. Secure the blanket at joints to prevent peeling or bulging away from blanket edges. Do not reduce the design thickness of insulation when applying speed washers.

3.6.4 Housing Hot Roof

Install calcium silicate insulation conforming to ASTM C533 over 12 gage steel pins stud welded on 610 mm two foot centers to the surface to be insulated. Hold the insulation in place by 65 mm 2 1/2 inch square speed washers and closely fit around penetrations. Construct top surfaces of steel conforming to ASTM A242/A242M raised pattern plate not less than 6 mm 1/4 inch thick and suitably support to bear 488 kg per square meter 100 pounds per square foot live load. Seal joints by continuous fillet or complete penetration groove welds as applicable. Weld appurtenances similarly to the plate. Provide top penetrations with a 50 mm 2 inch minimum extension above the plate and similarly weld to the plate.

3.7 PROTECTION FROM INSULATION MATERIALS

Protect equipment and structures from damage from insulation materials. After completion of the work, clean, repair, and restore equipment and structures to their original state. Repair any casing which becomes corroded, discolored, or otherwise damaged by replacing of casing or other means acceptable to the Contracting Officer.

3.8 CASING INSTALLATION

3.8.1 Structural Steel Grid System

Install casing over exterior insulated surfaces on an aluminized structural steel grid system of subgirts designed, furnished, and installed by the contractor. Provide subgirts of sufficient size, gage, and depth to provide adequate support and a smooth exterior surface and weld to the equipment and structural support surfaces. Provide subgirts of sufficient depth to provide for application of the full thickness of insulation over the stiffeners, access doors, flanges, ribs, and other surfaces having uneven contours to provide a smooth finished surface. Provide subgirts on
vertical and bottom surfaces at a maximum spacing of 1.22 meters 4 feet on centers. Provide subgirts on roof surfaces at a maximum spacing of 610 mm two feet on centers. Provide a roof surface system that will transmit an external 114 kg 250 pound walking load from the casing to the structural steel grid system without compression of the insulation material.

3.8.2 Access Openings

Closely fit insulation to fittings around access doors and other penetrations through the insulation. Neatly frame and flash to make weathertight and to create a pleasing appearance. Provide insulated hinged or lift-off doors designed for convenient opening or removal at nameplates, code stampings, nonprojecting connections, and access openings. Pitch access openings for water runoff and have flashing at door head as shown in SMACNA 1793.

3.8.3 Weatherproofing

Install casing with proper overlap to make the installation weathertight. Fabricate and fit the casing to ensure a neat appearance. Provide closures, flashings, and seals required. Provide the open ends of fluted sections with tightfitting closure pieces. Suitably form and install flashing so that water cannot enter and wet the insulation. Design and install flashing to readily drain any water that might enter. Weatherproof joints or openings in casing which cannot be effectively sealed from entry of moisture by application of an aluminum-pigmented sealer manufactured for this type of service.

3.8.4 Convection Stops

Provide steel channel or Z-girt convection stops on all vertical surfaces over 3.66 meters 12 feet tall. The maximum interval between convection stops shall be 3.66 meters 12 feet.

3.8.5 Casing Attachment

**************************************************************************

NOTE: If a separate insulation section is part of this specification, add a note to that section to indicate that insulation of the precipitator is covered by this section.
**************************************************************************

Attach aluminum casing to the steel structural members by means of Number 14 stainless steel Series 300 self-tapping screws on 305 mm 12 inch centers. Fasten vertical laps and flashing by means of 20 mm 3/4 inch Number 14 stainless steel Series 300 sheet metal screws on 305 mm 12 inch centers. Provide exposed screws with aluminum of stainless steel backed neoprene washers preassembled to screws. Do not compress insulation below nominal thickness when installing screws.

3.9 HEATER INSTALLATION

Thoroughly clean hopper surfaces prior to heater module, tape, or blanket installation. Install the heater module so the module surface contacts the hopper wall to the maximum extent possible. Provide heaters with necessary mounting hardware, channels, and brackets. Install throat heaters so the heater conforms to the surface of the throat and contacts the throat to the maximum extent possible. Do not overlap throat heaters. Hold throat
heaters in place with high temperature (454 degrees C 850 degrees F) glass tape or other means acceptable to the Contracting Officer. Completely cover the throat heater with the glass tape prior to lagging.

3.10 WIRE NUMBERS

Provide wire numbers on both ends of each wire appearing on the elementary diagram. Use space terminals for terminations. Markers shall be white plastic sleeves with black letters.

3.11 GALVANIC CORROSION PREVENTION

To prevent galvanic corrosion, prevent permanent contact of aluminum casing with copper, copper alloy, tin, lead, nickel, or nickel alloy including Monel metal. Where it is necessary to attach the casing to carbon steel or low alloy steel, paint the steel with zinc chromate primer. Then paint with aluminum paint suitable for surface temperatures encountered. Do not use lead base paint.

3.12 PAINTING

Provide field painting of those surfaces of the following equipment not in contact with the flue gas stream: precipitators, cyclones, fans, and breeching. Field paint as specified in Section 09 90 00 PAINTS AND COATINGS. Paint other equipment provided in this section; either field paint with paint systems conforming to Section 09 90 00 PAINTS AND COATINGS or paint with factory or shop painting systems conforming to the requirements specified in Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS.

3.13 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for providing, installing, adjusting, and testing of fabric filter type dust collectors (baghouses).

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com/CCR).

NOTE: The baghouse is intended to be used for flue gas particulate removal and collection associated with coal fire boilers or incinerators. Coal fired boilers applicable to this specification are those designed for pulverized coal firing, spreader traveling grate stoker firing, chain traveling grate stoker firing or underfeed stoker firing with capacities ranging between 3.78 and 31.50 kilogram 30,000 and 250,000 pounds of steam per second hour. Incinerators applicable to this specification are those designed for burning wastes having firing capacities between 454 kilograms 1,000 pounds per hour and 182 Mg 200 tons per day. For engineering and design assistance on baghouses applied close to or outside these capacities, contact:
Indicate on drawings who supplies compressed air cleaning and control system components, piping, valves, and fittings.

SECTION 23 51 43.03 20  Page 7
1.2 QUALITY ASSURANCE

Section 01 45 00 QUALITY CONTROL, applies to this section.

1.2.1 Experience

Manufacturers and contractors shall have constructed not less than three fabric filter type dust collectors (baghouses) of the type to be provided in this contract collecting flyash produced by [pulverized coal fired boilers] [(_____) stoker fired boilers] [incinerators] and operating under the following conditions:

**************************************************************************
NOTE: Use plus or minus 30 percent for inlet gas volumes up to and including 23,595 L/s 50,000 acfm and plus or minus 10 percent for gas volumes over 23,595 L/s 50,000 acfm.
**************************************************************************

a. Treating an inlet gas volume within plus or minus [_____] percent of the inlet gas volume specified in paragraph entitled "Design Criteria."

b. Operating in continuous duty, normal maintenance downtime included, for not less than two years at a minimum efficiency of 98 percent.

1.2.2 Model Study

**************************************************************************
NOTE: Choose model dust which will follow trajectories and depositions geometrically similar
**************************************************************************
to those of the flyash characteristics as specified in paragraph entitled "Design Criteria." Proper scaling must include centrifugal and gravity force effects. Refer to Electric Power Research Institute Report C5-2427, Development of Guidelines for Optimum Baghouse Fluid Dynamic System Design, June 1982. In this report, EPRI determined that finely ground cork dust (200/0 mesh) with a mass mean diameter of 38.3 um effectively simulates flyash with a 24.4 um mass mean diameter.

Conduct a three-dimensional model study to analyze and optimize pressure losses, velocity profiles, and dust flow distribution through the baghouse system. Model shall represent the system from the [air heater] [economizer] [_____] outlet to the stack inlet, reduced to not less than 1:100 1/8 scale. Construct model from transparent thermoplastic; dimensional tolerances shall be plus or minus 1.50 mm 1/16 inch. Perform tests at 30, 50, 75, 100, and 125 percent of maximum continuous flow rating using [_____]. Modify the model to minimize system pressure losses and to provide uniform, within plus or minus 10 percent of the mean, gas flow and dust flow distribution at baghouse inlet flange, inlet manifold, outlet manifold, hoppers, and the inlet and outlet of each compartment including the bag region. Retest to prove minimum system pressure losses, and uniform gas flow and dust flow distribution. Notify Contracting Officer or designated Government representative of test dates in writing no less than 15 working days prior to tests so that Contracting Officer or designated Government representative may witness both tests. Incorporate modifications into final design.

1.2.3 Bag Fabric Guarantee

Prior to manufacturing bags, test finished material lots to ensure fabric meets paragraph entitled "Design Criteria." Material lot tests shall include:

a. Yarn weight: ASTM D578/D578M
b. Permeability: ASTM D737
c. Tensile strength: ASTM D1682
d. Thickness: ASTM D1777
e. M.I.T. flex: ASTM D2176
f. Count: ASTM D3775
g. Fabric weight: ASTM D3776/D3776M
h. Bursting strength: ASTM D3887

1.2.4 Bag Guarantee

Bags and hardware shall as specified in paragraph entitled "Design Criteria" and paragraph entitled "Bags and Hardware," and shall be guaranteed for two calendar years from startup during which time bags which have abrasions, holes or tears, and hardware which have corrosion, sharp edges, bends, bad welds, or burrs shall be replaced free of charge to the
Government. Damage to bags and hardware due to obvious operator negligence is not covered by this guarantee. Do not use spare bags and hardware as replacements. Should replacements exceed 10 percent in any compartment during the two year period, replace bags and hardware in that compartment free of charge to the Government. Guarantee replacement bags and hardware for an additional two years.

1.2.5 Certificate

1.2.5.1 Certificate of Experience

Include:

a. List of not less than three baghouses at separate facilities meeting the conditions as specified in paragraph entitled "Quality Assurance."

b. Each installation owner's name, location, point of contact for operation and maintenance, address, and telephone number.

c. Date of owner's acceptance and startup of each installation.

d. Baghouse design conditions at each installation: Inlet gas volume, L/s acfm; inlet gas temperature, degrees C degrees F; inlet dust loading, grams per liter grains per acf; efficiency, percent; and net gas to cloth ratio, m/s fpm.

e. Baghouse actual operating conditions at each installation: Inlet gas volume, L/s acfm; inlet gas temperature, degrees C degrees F; inlet dust loading, grams per liter grains per acf; efficiency, percent; and net gas to cloth ratio, m/s fpm.

f. Type of [incinerator] [coal fire boiler] at each installation.

1.2.5.2 Factory Test Completion Certification

Submit certificate of completion for factory tests on control circuits, mechanical draft equipment, materials, and dampers except poppet dampers, as required in paragraph entitled "Source Quality Control."

1.2.5.3 Baghouse Installation

Submit certification from the field representative that the baghouse has been installed as recommended by the manufacturer.

1.2.6 Smoke Test

Prior to installing insulation, perform smoke tests on installed baghouse [including pulse jet weather enclosure] to identify leaks. Use forced draft fan to pressurize baghouse. Notify Contracting Officer or designated Government representative of test date in writing not less than 15 working days prior test so that Contracting Officer or designated Government representative may witness test. Repair leaks before installing insulation.

1.2.7 Particulate Emissions Test

**************************************************************************

NOTE:

1. Emissions must comply with local, state, and
federal standards for particulate and visible emissions. Note that compliance with particulate emission standards does not guarantee compliance with opacity standards; nor does compliance with federal or state standards guarantee compliance with local standards.

2. Opacity is influenced by particulate size distribution. For example, approximately 25 percent of the emissions from stoker fired boilers are below 10 microns, thus a visually acceptable stack may result in a particulate emissions loading of 0.09 g/m³ 0.04 grains per cu ft. However, approximately 45 percent of the emissions from pulverized coal fired boilers are below 10 microns, thus a visually acceptable stack may result in an emissions loading of 0.046 g/m² 0.02 grains per cu ft.

Prior to baghouse acceptance, provide simultaneous particulate emissions tests at the baghouse inlet and at the baghouse outlet. Test to ensure particulate emissions loadings does not exceed [_____] gram per dry std cubic meter grains per dry std cu ft when operating at maximum continuous flow rating and to ensure accuracy of inlet grain loading estimate. Perform three tests using procedures and equipment as in 40 CFR 60, EPA AP-42, Appendix A and local regulations. Operate the system in automatic without system failure or tripout, for 30 days prior to performing tests. Notify Contracting Officer or designated Government representative of test date in writing not less than 15 working days prior test so that Contracting Officer or designated Government representative may witness test. Should particulate emissions loading exceed [_____] gram per dry std cu meter grains per dry std cu ft, Contractor shall modify baghouse to meet emission limits. Retest baghouse, free of charge to the government, to provide compliance with emission limits.

1.3 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for...
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Dust collector system components
Dust collector system layout
Electrical and pneumatic circuit diagrams

SD-06 Test Reports

Dust collector model tests
Bag tests
Baghouse controls tests
Particulate emissions tests
Mechanical draft equipment tests
Damper tests
Baghouse inspection

SD-07 Certificates

Certificate of experience
Dust collector model study procedures
Particulate emissions test procedures
Factory test completion certification
Baghouse installation

SD-10 Operation and Maintenance Data
Baghouse, Data Package 3

Instrumentation and control systems, Data Package 3

Bypass system, Data Package 3

Dampers, Data Package 2

Fans, Data Package 3

Valves, Data Package 2

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Include procedures for:

a. Bag precoating.

b. Baghouse startup; initial and routine.

c. Baghouse shutdown; short duration, long duration, and emergencies.

1.4 DELIVERY AND STORAGE

Ship equipment as shop welded, factory assembled modules, except when physical size, arrangement, equipment configuration, or shipping limitations, make the shipment of assembled equipment impracticable. Do not ship modules with bags installed. Package bags separately to prevent damage during shipping, handling, and during outdoor storage at the job site. Handle, store, and protect equipment and materials to prevent damage before and during installation as recommended by the manufacturer. Replace damaged or defective items free of charge to the Government. Describe sectional shipments in proposal, otherwise it shall be understood that equipment shall not require field assembly. The manufacturer shall pay field assembly costs of sections, accessories, or appurtenances not listed in the proposal as requiring field assembly.

1.5 DESIGN CRITERIA

1.5.1 Detail Drawings

Obtain approval of dust collector model tests prior drawing submittal. Submit drawings for dust collector system components, dust collector system layout, and electrical and pneumatic circuit diagrams. For each component, indicate kind, size, design, arrangement, assembly, breakdown for shipment, and weight. Include locations for external connections, controls, remote control panels, anchorages, and supports. Indicate dimensions for installation and correlation with other materials and equipment. Include foundation and loading information.

1.5.2 [Boiler Data]
Design baghouse(s) for operation with [manually] [automatically] controlled [boiler(s) specified in [_____] [boiler(s) manufactured by [_____, Type [_____, Model Number [_____. The boiler is a [new] [existing] [pulverized coal fired boiler] [_____] grate spreader stoker fired boiler] [_____] retort underfeed stoker fired boiler] rated [_____] kg/s lbs/hr steam at [_____] kPa psi. Boiler gross heat input is expected to be [_____] kW MBtu/hr and boiler steam output is expected to be between [_____] and [_____] kg/s lb/hr. Boiler shall burn coal meeting the following criteria. The standby fuel is [____].

a. Proximate analysis, as received, percent by weight:

* Types 2, 3 and 4 are not suitable for baghouse applications. Include ash analysis if available.

**************************************************************************
**************************************************************************

NOTE: Insert appropriate Section number and title
Design baghouse(s) for operation with [manually] [automatically] controlled [incinerator(s) specified in [_____] [incinerator(s) manufactured by [_____] Type [_____] capable of burning [_____] [kg/s] [lb/hr] [Mg tons per day] of Type [0], [1], [2], [3], [4], [loose paper] [loose wood] [classified material] wastes. Operation is expected to be between [_____] and [_____] [kg/s] [lb/hr] [Mg tons per day] of wastes. The auxiliary fuel is [_____] in the blanks below using format per UFC 1-300-02.

1.5.4 Mechanical Collector Data

NOTE: Avoid using a mechanical collector upstream of a baghouse. Since mechanical collectors are most effective on particulate greater than 5 microns, baghouse inlet gas conditions would be skewed towards a finer particulate size distribution. However, an excess of fine particulates tends to cause baghouse pressure drop and bag life problems. Not only is there an increased pressure drop in the baghouse due to the finer particulates but the mechanical collector will add 498 to 747 Pa 2 to 3 inches WC to the overall system pressure drop. Use a mechanical collector upstream of a baghouse only if necessary to prevent glowing embers (from incinerators) from burning bags.

1.5.5 Inlet Gas Conditions

NOTE:

1. Baghouse manufacturer must know the expected range of inlet gas conditions. For operation sensitive at reduced load applications, eg. stokers and incinerators, include upset partial load conditions. This information can best be supplied by the boiler or incinerator manufacturer; compensate for system component effects between the baghouse inlet and boiler, or incinerator, outlet.

2. For existing installations, conduct source testing to determine baghouse inlet gas conditions. Use EPA, 40 CFR 60, Appendix A, Method 1 through Method 4, to determine gas volume flowrates. Use ASME PTC 28 to determine particulate size distribution. For particulate loading only, use EPA, 40 CFR 60, Appendix A, Method 5, or Method 17.
3. For new installations, obtain inlet gas conditions from the manufacturer. If this is not possible, estimate using EPA AP-42 emission factors. Make corrections for expected combustible content.

Baghouse inlet gas conditions, at [_____] meter feet above sea level, are:

<table>

1.5.6 Fabric Filter Type Dust Collector (Baghouse)

*******************************
NOTE:

1. Review projects to determine feasibility of purchasing an additional compartment for out-of-service maintenance.

2. Provide a manual flue gas bypass system for oil firing startup and provide also an automatic flue gas bypass system for use during operational upsets, should flue gas temperature exceed the bag material temperature limit or should baghouse pressure drop exceed paragraph entitled "Design Criteria" by 10 percent. This is particularly important if the standby fuel is oil. Local environmental
regulations may require a waiver to permit this necessary feature.

3. The air-to-cloth ratio effects the baghouse pressure drop, bag failure rate, and bag life. It is dependent upon the bag cleaning system, frequency of cleaning, and dust loading. Most reverse air baghouses have a net air-to-cloth ratio of 2-2.5 to 1. The Navy recommends use 2 to 1. Most pulse jet baghouses will have a net air-to-cloth ratio of 4-4.5 to 1, based on a continuous cleaning cycle. The Navy recommends use 4 to 1.

4. Pressure drop across the baghouse, measured after the bags have had time to season in service, is a function of the air-to-cloth ratio, inlet dust loading, and dust particulate characteristics. For a 2 to 1 air-to-cloth ratio and 4.60 g/m³ 2 grains per acf inlet dust loading, the flange to flange pressure drop should be approximately 1245 Pa 5 inches WC.

5. Use a 55 degree hopper valley angle unless the ash is "sticky" as for Western coal, or if moisture content is high; then use a 60 degree angle. Ash hopper collection capacity should be approximately 8 to 10 hours using 1/3 of the hopper volume.

**************************************************************************

Design baghouse(s) complete with structural supports, weather enclosure, manifolds, ductwork, dampers, bags, bag cleaning system, hoppers, and accessories to meet OSHA regulations, ICAC F-2, ICAC F-3, ICAC F-5, and the following criteria. Base applicable criteria on maximum flow conditions specified in the above paragraph with two compartments out of service; one out of service for cleaning and one out of service for maintenance.

a. Maximum outlet particulate emissions loading, grams per dry std cu meter grains per dry std cu ft [____]

b. Maximum gas velocity, m/s fps [____]

c. Minimum number of online compartments 4

d. Maximum net air-to-cloth ratio, L/s per meter acfm per sq ft (at maximum continuous rating, including volume used for reverse air) [____]

e. Minimum system pressure drop, Pa inches WC (from inlet flange to outlet flange) [____]

f. Maximum system pressure drop, Pa inches WC (from inlet flange to outlet flange) [____]

g. Minimum individual hopper storage capacity, hours [____]

h. Minimum individual hopper storage capacity, cu m cu ft[____]

i. Minimum hopper valley angle, degrees from horizontal 55
j. Maximum negative pressure, Pa inches WC [____]
k. Maximum snow load, kg/m² psf [____]
l. Maximum wind load, kg/m² psf [____]
m. Maximum live load, kg/m² psf [____]

1.5.7 [Bags--Reverse Air Cleaning System]

**************************************************************************
NOTE: Select this paragraph or the following paragraph entitled "Bags--Pulse Jet Cleaning System."
**************************************************************************

a. Maximum bag diameter, 305 mm 12 inches
b. Maximum bag length, 10.70 m 35 feet
c. Minimum tensile strength (warp direction), kPa psi [____]
d. Minimum tensile strength (fill direction), kPa psi [____]
e. Minimum yarn weight, g per sq m oz per sq yd [____]
f. Minimum permeability, L/s per sq m cfm per sq ft (clean at 125 Pa 1/2 inch WC) [____]
g. Minimum thickness, mm mil [____]
h. Minimum M.I.T. flex (warp direction), cycles [____]
i. Minimum M.I.T. flex (fill direction), cycles [____]
j. Minimum count, ends per 25 mm inch by picks per 25 mm inch [____]
k. Minimum fabric weight, 2894 g per sq m 9.5 oz per sq ft
l. Minimum bursting strength, kPa psi [____]

1.5.8 [Bags--Pulse Jet Cleaning System]

a. Maximum bag diameter, 152 mm 6 inches
b. Maximum bag length, 4.25 m 14 feet
c. Minimum tensile strength (warp direction), kPa psi [____]
d. Minimum tensile strength (fill direction), kPa psi [____]
e. Minimum yarn weight, g per sq m oz per sq yd [____]
f. Minimum permeability, L/s per sq m cfm per sq ft (clean at 125 Pa 1/2 inch WC) [____]
g. Minimum thickness, mm mil [____]
h. Minimum M.I.T. flex (warp direction), cycles [____]
1. Minimum M.I.T. flex (fill direction), cycles [_____] 

j. Minimum count, ends per 25 mm inch by picks per 25 mm inch [_____] 

k. Minimum fabric weight, 4874 g per sq m 16 oz per sq ft 

l. Minimum bursting strength, kPa psi [_____] 

1.5.9 Test

1.5.9.1 Particulate Emissions Test Procedures

Include:

a. Name, address, and telephone number of testing organization. 

b. Procedures and equipment description. 

c. Analytical techniques. 

1.5.9.2 Dust Collector Model Tests Report

Submit the model study report within 45 days of test completion. Model study report shall include:

a. Scale drawing of the model showing actual dimensions and modifications, and devices required as a result of the model study. 

b. Photographs and videotape recordings of model during air flow tests. 

c. Uniform gas velocity diagrams and histograms indicating the root mean square deviation, standard deviation, and mean velocity, at locations including the inlet and outlet to the baghouse, and the inlet and outlet to each baghouse compartment. 

d. Test procedures including flow rates, pressures, calculations, and assumptions. 

e. List of and justifications for dynamic or geometric similitude deviations in the model from the full size unit. 

f. Pressure drop data at each pressure tap during each test run, including data from initial runs used for identifying gas flow distribution problems and test data from runs made after the addition of supplemental gas flow distribution devices. 

g. Recommendations for test port locations, instrumentation monitor locations, and for providing uniform gas flow; breeching configuration changes, gas flow vaning, straightening, or gas distribution devices. 

h. Name and resumes of test personnel. 

1.5.9.3 Bag Tests Data

Submit test certification and sample for each finished material lot. Test certification data shall include, for each material lot analysis:

a. Yarn weight.
b. Permeability.
c. Tensile strength.
d. Thickness.
e. M.I.T. flex.
f. Count.
g. Fabric weight.
h. Bursting strength.

1.5.9.4 Particulate Emissions Tests Report

Submit the particulate emission test report within 45 days of test completion. Test report shall include:

b. Schematic drawings.
c. Test procedures including chain of custody and analytical techniques.
d. Test results including inlet loading, emission rates, and isokinetic sampling rates.
e. Raw data for each test run, including calculations, load sheets, and calibration data.
f. Name and resumes of test personnel.

1.5.9.5 Damper Tests Reports

Submit test reports in accordance with the paragraph entitled "Dampers." In lieu of poppet damper factory tests include field testing results for poppet dampers at similar installations.

1.5.9.6 Baghouse Inspection

Submit a written inspection report from the baghouse manufacturer's service engineers within 15 days after inspection.

1.6 EXTRA STOCK

Provide ten percent of total bags and two percent of total cages as spares. Provide fluorescent powder for one year of normal inspections and provide a portable ultraviolet light to leak test the bags.

1.7 MODEL

1.7.1 Dust Collector Model Study Procedures

Include:

a. Name, address, and telephone number of testing organization.
b. Procedures and equipment to be used.
c. Model design and construction.
d. Model dust use justification.

1.7.2 Delivery

Deliver model used during model study, including a support table, [to the Contracting Officer] within one year of startup of the full size unit.

PART 2 PRODUCTS

2.1 MATERIALS

**************************************************************************
NOTE: This guide specification presents nonpropriety materials and equipment. When the guide specification is edited or supplemented to suit project requirements, exercise care to present a project specification section which contains no proprietary materials or equipment.
**************************************************************************

Provide materials suited for the intended service. The material of parts exposed to the flue gas shall withstand chemical action of flue gas and flyash.

2.1.1 General

Provide the following materials and minimum thicknesses:

a. Ductwork (6 mm 1/4 inch): ASTM A36/A36M
b. Hoppers (6 mm 1/4 inch): ASTM A36/A36M
c. Housing (6 mm 1/4 inch): ASTM A36/A36M
d. Structural steel (6 mm 1/4 inch): ASTM A36/A36M
e. Tube sheet (6 mm 1/4 inch): ASTM A36/A36M
f. Weather enclosure (6 mm 1/4 inch): ASTM A36/A36M
g. Floor grating: NAAMM MBG 531
h. Stair tread grating: NAAMM MBG 531
i. Weather enclosure roof and top surface of appurtenant structures (6.40 mm 1/4 inch): ASTM A242/A242M, Type I, raised pattern plate.

2.1.2 Insulation

Insulate baghouse ductwork including [reverse air ductwork,] inlet manifold ductwork, and outlet manifold ductwork, hoppers, housing, and weather enclosure. Do not use materials containing asbestos, magnesium oxide, or Mica. Provide the following materials and minimum thicknesses:

a. Ductwork (80 mm 3 inches): ASTM C592, mineral fiber blanket; or ASTM C612, mineral fiber block.
b. Hoppers (100 mm 4 inches) (with 50 mm 2 inch air gap): ASTM C533, calcium silicate block; ASTM C592, mineral fiber blanket; or ASTM C612, mineral fiber block.

c. Housing (100 mm 4 inches): ASTM C533, calcium silicate block; ASTM C592, mineral fiber blanket; or ASTM C612, mineral fiber block.

d. Weather enclosure (80 mm 3 inches): ASTM C533, calcium silicate.

2.1.3 Casing

Case baghouse ductwork including [reverse air ductwork,] inlet manifold ductwork, and outlet manifold ductwork, hoppers, housing, and weather enclosure. Provide the following materials and minimum casing thicknesses:

a. Top ductwork surface and weather enclosure roof (2 mm 0.080 inch): ASTM B209M ASTM B209, flat aluminum sheet supported to permit use as a walking surface without causing distortion or damage.

b. All other surfaces (100 mm 4 inch rib) (1.25 mm 0.050 inch): ASTM B209M ASTM B209, unpainted aluminum panel and stucco embossed.

2.2 BAGS AND HARDWARE

2.2.1 [Bags and Hardware, Reverse Air Cleaning System]

**************************************************************************
NOTE: Select this paragraph or the paragraph below entitled "Bags and Hardware, Pulse Jet Cleaning System."
**************************************************************************

Provide glass fiber bags, 3 kg per sq m 9.5 oz per sq ft, 3 by 1 twill weave, as specified in paragraph entitled "Design Criteria." Coat bags with 100 percent Teflon B lubricant for 10 percent add on weight. Bags 305 mm 12 inches in diameter and maximum 10.70 meters 35 feet in length shall have not less than eight 3 mm 1/8 inch sewn-in cadmium plated welded steel anti-collapse rings. Bags 200 mm 8 inches in diameter and maximum 7.30 meters 24 feet in length shall have not less than five 3 mm 1/8 inch sewn-in cadmium plated welded steel anti-collapse rings. Provide leakproof quick release Type 301 stainless steel clamps to attach the lower portion of the bags to the caps and thimbles. Provide an adjustable suspension system without using nuts and bolts to attach the upper portion of the bags. Cadmium plate bag caps and suspension hardware which come into contact with the bag fabric. Provide ten percent of total bags as spare bags. Stitch bags using [_____] thread. Provide fluorescent powder for one year of normal inspections and provide a portable ultraviolet light to leak test the bags.

]2.2.2 [Bags and Hardware, Pulse Jet Cleaning System]

Provide glass fiber bags, 4874 gram per sq m 16 oz per sq ft, 3 by 1 twill weave, as specified in paragraph entitled "Design Criteria." Coat bags with 100 percent Teflon B lubricant for 10 percent add on weight. Provide the manufacturer's standard cage design including venturis, provided it has a reliable service record with the bags proposed. Attach bags and cages to the tub sheet to provide proper air seal, bag tension, and cage alignment. Clamp bags at top between the cage and tube sheet so that the bags may be
readily removed without special tools yet not sway.

2.3 STRUCTURAL SUPPORTS

Provide structural and miscellaneous steel to frame and support the baghouse, ductwork, weather enclosure, component parts, and equipment. Structural steel includes columns, beams, trusses, baseplates, girts, bracing, purlins, girders, and hangers. Miscellaneous steel includes edge plates, handrails, stairs, grating, and ladders. Provide steel supports for paragraph entitled "Access Provisions." Provide concrete foundations, anchor bolts, and grouting. Allow 50 mm 2 inches for grout so that bottom of baseplates are at an elevation of [_____] meters feet. Design structural steel support of baghouse to withstand differential thermal expansion and to support its own dead weight plus insulation, the maximum weight of accumulated flyash, and the maximum loads as specified in paragraph entitled "Design Criteria," or 4.8 kPa 100 psf, whichever is greater. Design to support equipment from the top of concrete foundations set an elevation of [_____] meters feet [150 mm 6 inches above grade]. Platform live loads may be excluded. Design for a roof dead load of one kPa 20 psf and a live load of 1.50 kPa 30 psf. Design for seismic loads using Section 22 05 48.00 20 MECHANICAL SOUND VIBRATION AND SEISMIC CONTROL, and earthquake regulations. Use site periods between [_____] and [_____] [0.8 and 1.2] seconds for Zone [_____] structures, whichever results in the highest lateral force. Use the normal operating weight of the unit including dead loads as "W."

2.3.1 Girts and Opening Frames

Provide doors, door frames, and ventilators. Provide structural subframing for doors and ventilators located above grade [_____] meters feet. Provide girts to support outside face of metal wall panel, spaced at maximum 2.10 meters 7 feet center-to-center. Locate lowest girt above grade [_____] meters feet] with support at the wall base. Design girt line or outside edge distance from the supporting column centerline for 0.56 meter one foot 10 inches. Provide closed ends or miter cut girts at corners.

2.3.2 Slide Bearings

Provide structural slide bearings using fluoroplastic self-lubricating bearing elements to ensure correct alignment and to prevent equipment damage and stress. Use slide bars to prevent ash and dirt from accumulating on the bearings.

2.4 DUCTWORK SYSTEM

Provide insulated weather-tight ductwork system from the [economizer] [air heater] [_____] outlet to the stack inlet including [reverse air ductwork,] bypass ductwork, and manifolds complete with transitions, structural steel, structural slide bearings, turning vanes, expansion joints, dampers, test ports, and mechanical draft equipment. Weld by continuous fillet or complete penetration groove welds. Design ductwork system for temperatures of minus 12 to plus 204 degrees C 10 to 400 degrees F, internal pressures of positive 5 kPa to negative 7.60 kPa 20 to negative 30 inches Water Column (WC), velocities of [_____] m/s fps, and for flyash fallout of 1171 kg/m2 240 lb/sq ft. Provide penetrations for control instruments.

2.4.1 General Ductwork

Provide insulated weather-tight ductwork. For ductwork sections greater
than [_____] meters feet in length, provide hoppers, clean-out doors, and additional structural support. Do not apply loads at interface points. Provide 9.50 mm 3/8 inch thick turning vanes for turns greater than 45 degrees and where indicated by the model study. Brace turning vanes with pipes and angles but do not brace with rods. Brace ductwork maintaining bolt hold tolerances of 0.8 mm 1/32 inch between adjacent holes and 1.50 mm 1/16 inch between two holes on the same side. Provide bolts, nuts, and ethylene propylene terpolymer (EPDM) gaskets for flanged connections.

2.4.2 Manifolds

Provide insulated weather-tight inlet and outlet manifolds supported from the baghouse structure. Include expansion joints. Locate manifolds, minimum 6 mm 1/4 inch stiffened ASTM A36/A36M of welded construction, between two rows of compartments and design to minimize pressure drop yet avoid low velocities which may allow flyash fallout. Base structural design on the assumption that manifolds are 30 percent full of flyash. Taper inlet manifold and provide take-offs to each compartments at or near the manifold bottom to assist flyash into the compartments. Provide a replaceable, abrasion resistant baffle plate at each compartment inlet.

2.4.3 Expansion Joints

Provide nonmetallic belt expansion joints with minimum 80 by 80 by 6 mm 3 by 3 by 1/4 inch carbon steel angle flanges. Belt material shall be minimum 6 mm 1/4 inch thick, two-ply, aramid or fiberglass reinforced, solid fluoroelastomer polymer, spliced to form an endless belt without sewn joints. Provide nuts and bolts to attach fabric to the flanges and to attach expansion joints to the ductwork. Flange bolt holes shall be factory punched and located at maximum 100 mm 4 inch centers.

2.4.4 Dampers

**************************************************************************

NOTE: Provide items in brackets for reverse air cleaning system baghouses only.
**************************************************************************

Provide automatically controlled damper units, including framing, operators, and accessories, for the induced draft fan inlet, [the reverse air fan inlet,] the inlet manifold, the outlet manifold, the inlet of each compartment, [the outlet of each compartment,] [the inlet reverse air ductwork,] and the bypass ductwork. Dampers shall conform to AMCA 500-D, AMCA 801, and AMCA 802 and shall withstand, without affecting damper operation, differential thermal expansion, 1464 kg/m² 300 lb/sq ft flyash load at the bottom of the damper frame, 908 kg 2,000 pound concentrated load at the maximum frame deflection point, and maximum loads specified in paragraph entitled "Design Criteria." Damper frame shall support the damper unit including controls, motors, drive mechanisms, and seal air system, with only one flange bolted to the ductwork without swaying or without causing the blade to blind. Bearings, bearing mount, and linkage system including connections shall withstand three times the damper blade load plus the operator output torque, at worst case design conditions. Damper units shall include:

a. Pneumatic operators; except guillotine dampers which shall have the manufacturer's standard motor operators. Locate outside of the gas stream and within access for maintenance during baghouse operation.
b. Control drive units with permanently mounted handwheels which may be disengaged during pneumatic or motor operation; exclude poppet damper actuators.

c. Limit switches to show damper position (opened or closed).

d. Mechanical position indicator, at the damper, to show percent of damper opening.

e. Flanged frames for bolting to connecting ductwork.

f. Lifting lugs for transportation and installation handling.

g. External, locally mounted audible alarms to signal loss of seal air. Upon loss of power or air, dampers shall fail in [failshut] [failopen] position.

h. Bearings. Permanently lubricated, self-aligning bearings located outside of the damper unit, insulation, and lagging, so that leaking packing shall not contaminate the bearing with flyash.

i. Sealing strips, bolting materials and backing strips: ASTM B443. Not required for induced draft fan dampers.

j. Nuts, bolts, and washers. Use self-locking Type 316 stainless steel, Unified Numbering System Number S31600 (0.03 to 0.08 percent carbon) bolts, so that damper unit vibrations do not cause bolts to back out.

2.4.4.1 Louver Dampers

Provide the induced draft fan inlet [and the reverse air fan inlet] with parallel or opposed airfoil louver damper units. Frame length shall be 25 mm one inch greater than the blade width; blade width shall be maximum 610 mm 24 inches. Provide a minimum of two blades. Dampers having an open area of 3.72 to 7.43 sq meter 40 to 80 sf shall have a minimum of three blades. Dampers having an open area over 7.43 sq meter 80 sf shall have a minimum of four blades. Allowable bending stresses shall not exceed 60 percent of yield at design conditions. Provide louver damper units with the following:

a. Damper blade shaft assembly. Limit deflections at maximum damper seal conditions to L/360 (L = blade length in mm inches) or 6 mm 1/4 inch, whichever is less, and to deliver the full operator torque to a blade without exceeding one-third of the shaft yield stress when operating at the worst case design conditions.

b. Stuffing boxes. Provide dust-tight stuffing boxes, to seal shaft openings, so that fluoroplastic packing may be adjusted or removed from the outside of the duct without removing bearings or linkage.

c. Linkage system. Provide fully adjustable self-locking linkage system outside of the damper unit. Key arms to the shaft for easy removal. Pin or bolt stub shafts to the through shaft or blade so that individual damper blades may be adjusted or removed. Use Type 304 stainless steel, Unified Numbering System Number S30400 (0.03 to 0.08 percent carbon), linkage pins or bolts to connect carbon steel clevis arm to the stub shaft. Provide two operators on the linkage system, one to operate the top blade, and one to operate the bottom blade. The upper blades shall closed first, then the bottom blade shall close.
Design linkage so that the number of blades operated by each operator may be changed.

d. Lock system. Provide a lock system using heavy-duty padlocks so the damper system can not be operated until the padlocks are removed.

2.4.4.2 Poppet and Butterfly Dampers

Provide each compartment with an inlet, an outlet, and an inlet reverse air damper having a maximum air leakage rate of 0.5 percent to provide for essentially zero leakage at maximum baghouse design differential pressure. Dampers shall be either poppet dampers or butterfly dampers with adjustable speed and stroke operators, shaft packing glands, replaceable seal plates, and machined steel seating cylinder and guide shaft. Provide a lock system to lock dampers closed to protect service personnel. Locate shafts out of the dirty gas stream, otherwise provide shaft seals.

2.4.4.3 Double Guillotine Dampers

**************************************************************************

NOTE: An outlet manifold damper is not required for single baghouse installations. Where two or more baghouses share a single stack, provide dampers at each baghouse outlet manifold to prevent flue gas from exiting one baghouse and entering another.
**************************************************************************

Provide the inlet manifold, [the outlet manifold,] and the inlet bypass, with double plate steel guillotine dampers having a maximum air leakage rate of 0.5 percent to provide for essentially zero leakage at maximum baghouse design differential pressure. One damper shall be open while the other damper is closed. Include a mechanical crank for manual operation. Provide dampers with carbon steel bonnets over the top frame, removable side plates for inspection of the damper drive assembly, and a removable bottom plate for access to the frame seal. Design bonnet for continuous seal air purge and provide an air reservoir to activate the damper upon loss of plant air. Design damper drive to lift the damper blade evenly on both sides. Provide damper units with the following:

a. Sealing strips, bolting materials and backing strips: ASTM B443. Provide both the upstream and downstream side of blade with sealing strips around the periphery of the blade and on the seating surfaces of the frame.

b. Control interlocks: Provide control interlocks to prevent dampers from simultaneously closing when the induced draft fan is operating.

2.4.4.4 Seal Air Systems

Provide each guillotine damper with a seal air system, consisting of an isolation damper or valve and a fan system, mounted onto the frame and located within access for maintenance. Mount so that condensation between the dampers flows into the ductwork. If installation on the damper frame is not possible, provide a platform to support the equipment. Fan, at design conditions, shall supply two times the guaranteed L/s cfm leakage rate through the dampers and shall maintain not less than 747 Pa 3 inches WC between the seal chamber and the flue gas. Control the seal chamber pressure using a mild steel manual control damper or a minimum 55 percent nickel, 20 percent chromium and 8 percent molybdenum gate or butterfly
Valve. Valve shall operate on 552 to 862 kPa (gage) 80 to 125 psig instrument air using a pneumatic piston operator. Should the air supply fail, the piston actuator shall remain in the last position. Provide instrumentation to monitor seal air system operation; tube and mount a 4-way dual-coil solenoid valve, with Class H coils rated for 120 VAC service. Provide two dual-pole dual-throw limit switches, one to actuate in the open position, one to actuate in the closed position, and house within a NEMA ICS 6, Type 4 enclosure.

2.4.5 Test Ports

ASTM A167, Type 316 stainless steel pipe, Schedule 40. Provide three 50 mm 2 inch pipe nipples with caps and rod-out on the topside of each guillotine damper seal chamber and provide one 50 mm 2 inch port with rod-out on the ductwork adjacent to each guillotine seal chamber, to attach seal chamber pressure measurement tubing. Provide 150 mm 6 inch diameter test ports on the horizontal side of the ductwork for air pollution sampling; locate the test ports upstream baghouse and downstream baghouse. Ports on ductwork shall extend 150 mm 6 inches beyond stiffeners to clear insulation and lagging. Provide a screw plug for each test port. Coat each plug with an antiseize lubricant appropriate for the design inlet temperatures. Determine number, arrangement, and location of air pollution sampling test ports using 40 CFR 60, EPA AP-42, Appendix A, Method 1. Final number, location, and arrangement of test ports is subject to Contracting Officer approval.

2.4.6 Mechanical Draft Equipment

Provide mechanical draft equipment complete with operators, accessories, and field service.

2.5 HOPPERS

Provide insulated gas tight pyramidal hoppers as specified in paragraph entitled "Design Criteria." Design to withstand vibration due to vibrators and differential thermal expansion. Hoppers shall span no more than one compartment. Weld hoppers to the baghouse compartments using continuous fillet or complete penetration groove welds. Provide a minimum 300 mm 12 inch diameter flanged flyash outlet connection on each hopper.

2.5.1 Poke Hole

Provide each hopper with a 100 mm 4 inch diameter poke hole extending a minimum of 150 mm 6 inches beyond the stiffeners and the hopper side, to clear insulation and lagging. Include a screwed cap. Locate the poke hole near the hopper outlet flange, orient to be accessible from the platform, and position to permit downward thrusts into hopper throat.

2.5.2 Vibrators

Provide each hopper with both mechanical and manual vibrators. Mechanical vibrators shall consist of two automatically controlled vibrators, with manual override control, set at mid height and on opposite sides of the hopper. Interface vibrator controls with the ash evacuation system so that vibrators operate at the inception of and during an ash evacuation cycle. Enclose controls in cases to prevent accidental energizing of system. Place a warning over the vibrator manual override control, "WARNING; VIBRATOR CONTROL. DO NOT ACTIVATE UNLESS HOPPER EVACUATION SYSTEM IS OPERATING." Manual vibrators shall consist of two uninsulated reinforced strike plates.
set at mid height and on opposite sides of the hopper. Provide strike plates, 300 by 300 by 25 mm 12 by 12 by one inch ASTM A36/A36M steel, within hinged insulated panels. Provide space around strike plate to swing a small sledge hammer. Provide a work platform with stairs for strike plates greater than 1.50 meters 5 feet above ground.

2.5.3 Flyash Level Alarm System

Provide each hopper with a flyash level alarm system consisting of a nuclear flyash level detector and alarm relays to indicate the 50 percent hopper capacity level and the empty level. The nuclear detector shall be an explosion proof, Cesium 137 single point gamma source detector having a lockable shutter mechanism operated by an external handle. Reproducibility shall be within one inch. Design to withstand vibration and temperatures up to 427 degrees C 800 degrees F. Interlock with hopper access doors to prevent entry into the hopper when the source is activated. Provide one access key per hopper door. The alarm relays shall be rated at 10 A, 120 VAC, or 125 VDC continuous duty. House flyash level detector controls in a [explosion proof] [dustproof] enclosure and mount in an easily accessible location. System shall be operational at outdoor temperatures between minus 40 and 93 degrees C 40 F and 200 degrees F.

2.5.4 Hopper Heater System

Provide each hopper with an automatically controlled hopper and hopper throat heater system able to withstand 454 degrees C 850 degrees F, the maximum expected mechanical (normal operation) vibrations, and manual (strike plate use) vibrations. Design using a minimum 1.1 heating safety factor and a minimum 1.12 wind loss. Hopper and hopper throat heaters with insulation in place, at minimum ambient temperature of [_____] degrees F, shall maintain an internal skin temperature of 121 degrees C 250 degrees F while offline and during startup, and shall maintain an internal skin temperature of 177 degrees C 350 degrees F or acid dew point temperature while online.

2.5.4.1 Hopper Heaters

Hopper heaters shall cover not less than 33 percent of the total hopper area and shall extend not less than 70 percent up the hopper height. Provide modular hopper heaters having a flexible heating face to conform to the irregularities of the hopper surface to provide maximum heat transfer. Where modular heaters do not fit, provide tape heaters or flexible blanket heaters. Heaters shall be maximum 0.0046 W/mm2 3 W/in2 of resistance element, with a minimum 6 parallel resistance path, rated at 2.7 kw/m2 250 W/ft2 but designed to operate at 2.2 kw/m2 200 W/ft2. Use Series 600 stainless steel alloy or nickel-chrome heating elements and encase in a minimum 20 Gage aluminum or aluminized-steel mounting pan or casing. Provide heaters with attached metal labels listing the heater's wattage and voltage.

2.5.4.2 Throat Heaters

**************************************************************************
NOTE: The hopper throats are normally part of the ash evacuation valve connected to the hopper outlet flange. This cast iron valve housing creates a restrictive outlet, a common area for pluggage unless the flyash is heated; thus the hopper throat heaters are intended for the inlet of the ash

SECTION 23 51 43.03 20  Page 32
evacuation valve housing. Insulate the hopper throats with a 50 mm 2 inch air gap with 80 mm 3 inches of insulation.

Provide tape heaters or flexible blanket heaters having a single Series 600 stainless steel alloy or nickel-chrome heating element, rated at 2.7 kW/m2 250 W/ft2. Design heaters to operate at 2.2 kW/m2 200 W/ft2 and to remain on during startup, offline, and online operating conditions. Encase in a minimum 20 Gage aluminum or aluminized-steel mounting pan or casing. Provide attached metal labels listing the heater's wattage and voltage.

2.6 WEATHER ENCLOSURES--REVERSE AIR CLEANING SYSTEM

Provide a weather-tight enclosure, including lighting, to enclose the top and the bottom of the baghouse. Enclose hoppers within the bottom weather enclosure. Conform to SMACNA 1793. Seal joints by continuous fillet or complete penetration groove welds. Do not use caulking. Design enclosures to withstand differential thermal expansion between housing and weather enclosures. Design weather enclosure roof to support minimum 4.8 kPa 100 psf. Space roof purlins so that roof deck span will not exceed 2.12 m 7 feet. Provide additional support for equipment placed on the roof. Slope and extend top surface and top surfaces of appurtenant structures, but not less than 25 mm one inch beyond side insulation, to allow water runoff and to prevent pooling. Provide a safety rail around the top perimeter surface, a 80 mm 3 inch fascia rain barrier of 6 mm 1/4 inch ASTM A242/A242M steel plate, a 80 mm 3 inch kickplate of 6 mm 1/4 inch ASTM A242/A242M steel plate, and drain holes to permit water runoff.

Provide an insulated clean gas outlet plenum directly above the bags. Since the outlet plenum shall enclose the entire top of the baghouse, do not provide a weather enclosure above the outlet plenum. However, enclose hoppers within a bottom weather enclosure. Plenum height shall be \7\ minimum\^ 305 mm\^ one foot\^ greater in height than bags \[minimum 4.50 meters 15 feet when using 4.30 meters 14 feet bags\] to provide an indoor bag replacement area. Conform to SMACNA 1793. Include lighting. Seal joints by continuous fillet or complete penetration groove welds. Do not use caulking. Design enclosure to withstand differential thermal expansion between housing and weather enclosure. Design plenum to support minimum 4.8 kPa 100 psf. Space roof purlins so that roof deck span will not exceed 2.13 meters 7 feet. Provide additional support for equipment placed on the roof. Slope and extend top surface and top surfaces of appurtenant structures, by not less than 25 mm one inch beyond side insulation, to allow water runoff and to prevent pooling. Provide a safety rail around the top perimeter surface, a 80 mm 3 inch fascia rain barrier of 6 mm 1/4 inch ASTM A242/A242M steel plate, a 80 mm 3 inch kickplate of 6 mm 1/4 inch ASTM A242/A242M steel plate, and drain holes to permit water runoff.
2.7 BAG CLEANING SYSTEM

2.7.1 General

Clean bags by [reverse air] [pulse jet]. Clean one compartment at a time on a predetermined adjustable programmed cycle or when the differential pressure across the bags reaches a set point. Provide 50 mm 2 inch capped pressure taps with rod-outs on each side of the tube sheet, accessible from the access platforms, to measure differential pressure. Connect pressure taps to remote indicators in the control room using minimum 10 mm 3/8 inch stainless steel tubing. Provide tubing with three-way valves, adjacent to the pressure indicators within the control room panel, to allow cleaning of the pressure lines with compressed air.

2.7.2 Reverse Air Cleaning System

Provide each baghouse with a reverse air cleaning system including two reverse air fans, connecting ductwork, dampers, valves, and automatic controls. Bags shall gradually reinflate after cleaning. Use air from the outlet manifold for reverse air cleaning and to maintain the reverse air ductwork temperature above the dewpoint temperature. Thimbles for 200 mm 8 inch diameter bags shall be of 12 Gage carbon-steel plate, one nominal bag diameter in length, and spaced not less than 241 mm 9 1/2 inch on centers. Thimbles for 300 mm 12 inch diameter bags shall be of 12 Gage carbon-steel plate, one nominal bag diameter in length, and spaced not less than 356 mm 14 inch on centers. Thimbles shall be inline, not staggered. Tubesheet and bag alignment shall be within 3 mm 1/8 inch for plumb.

2.7.2.1 Reverse Air Fans

**************************************************************************
NOTE: One fan is sufficient for most applications. However, two fans, each rated at 100 percent of required capacity, may be required where increased reliability, logistics, or service dictate.
**************************************************************************

Provide two heavy duty 100 percent capacity industrial reverse air fans; one fan shall be placed on standby while the other fan is operational. Each fan shall have a single flanged inlet, a single flanged outlet, and an automatically operated louver damper. Louver dampers shall be as specified in paragraph entitled "Ductwork System" and shall be designed for staged closing. Minimum reversing air flow shall be 10 L/s per sq m 2 acfm per sf of net cloth area in a single compartment. Fan shall be V-belt driven by a constant speed motor through an adjustable speed sheave, rated for flow, pressure, power, speed of rotation, and efficiency as in AMCA 210, AMCA 201, and AMCA 99. Mount the motor, Section 16, Electrical, on a slide motor base designed to allow belt tension adjustment from a screw mechanism. Provide motor with a belt guard. Provide a heat slinger for temperatures above 177 degrees C 350 degrees F.

2.7.2.2 Reverse Air Dampers

**************************************************************************
NOTE: Specify air pressure available for pneumatic installation and location. Include control wiring installation as part of this section or as part of Division 16, Electrical. If included in this section, it must comply with Division 16,
**************************************************************************
Electrical. A duplicate control timer may be specified if increased reliability is desired.

Provide each compartment with dampers for the dirty gas inlet, the clean gas outlet, and the reverse air inlet, as specified in paragraph entitled "Ductwork System." The dirty gas inlet damper shall be a manually operated poppet or butterfly damper with the operator located within access for maintenance. The clean gas outlet damper and the reverse air inlet damper shall be [air cylinder] [electrical motor] operated, adjustable speed poppet or butterfly dampers arranged for manual lockout capability with position indicating switches at both ends of travel. The clean gas outlet damper shall fail-safe in the open position and the reverse air damper shall fail-safe in the closed position.

Pulse Jet Cleaning System

Provide each compartment with a pulse jet cleaning system including compressed air dryer and filter system, isolation valves, pulse valves, and piping. Provide tube sheet arrangement and bag clearance to limit gas velocity between bags to a maximum 1.27 m/s 250 fpm at design conditions. Bag to bag clearance and bag to wall clearance shall be minimum 50 mm 2 inches. Provide additional space between rows of bags, if necessary, to clear access door supports crossing the tube sheet. Arrange tube sheet for individual top bag and cage removal, and reinforce for minimum 488 kg/m2 100 psf pedestrian traffic.

Dryer and Filter System

Provide a dryer and filter system to remove moisture and particulate from compressed air for pulse jet cleaning. Size dryer and filter system for maximum 2 degrees C 35 degrees F dewpoint temperature at 690 kPa (gage) 100 psig, 120 percent of design air flow, and for 90 days of operation without service under normal operating conditions. Locate filters to be easily accessible for inspection and service.

Valves and Piping

Provide each compartment with an isolation valve to isolate the compartments for offline cleaning. When offline, individually pulse each row of bags with 483 to 690 kPa (gage) 70 to 100 psig dry, filtered compressed air. Provide each row with a compressed air header including heavy duty, stainless steel, internal, diaphragm pulse valves and solenoid actuators to distribute the compressed air to the bags. Diaphragm valves shall be factory wired to a junction box and shall be no louder than 84 dBA, 1.50 meters 5 feet from the valve. After the bags are cleaned, the compartment shall remain offline for [_____] seconds to allow the dust to settle into the hoppers. Provide the distribution piping with couplings to allow removal of piping for bag replacement.

2.8 BAGHOUSE CONTROLS

2.8.1 Control Functions

Provide main baghouse control from the boiler plant control room panel board. The main control system shall include the following operational and monitoring functions:

a. Automatic and manual startup and shutdown. Provide manually initiated
automatic startup sequence.

b. Automatic baghouse control.

******************************************************************************

NOTE: For pulse jet cleaning systems both off line cleaning (normal) and on-line cleaning are available.
******************************************************************************

c. Automatic bag cleaning. Provide an automatic timer to initiate compartment cleaning when differential pressure across the bags reaches a set point.

d. Programmed bag cleaning. Provide an overriding timer to initiate compartment cleaning on a predetermined adjustable programmed cycle independent of pressure differential. Provide for [adjustable pulse jet duration time,] [adjustable pulse jet sequencing,] adjustable cleaning cycle time, adjustable settling time, and adjustable isolation valve operation.

f. Operations monitoring. Provide graphics and audible alarms to monitor equipment status for abnormal operation, malfunction, failure, or trip.

g. Automatic shutdown of malfunctioning components. Provide automatic and safe shutdown of malfunctioning components with minimal disruption to boiler operational capabilities.

h. Automatic and manual bypass. Provide automatic and manual bypass for out of service compartments or for system upset conditions. Design controls to bypass the baghouse when the inlet temperature is below [_____] degrees C F or above [_____] degrees C F. When a compartment is bypassed, exclude from the automatic cleaning cycle.

i. Compartment lockout. Interlock the automatic timer, overriding timer, and manual selector switch of each compartment with an isolation switch located at the tube sheet access door to isolate the compartment for maintenance.

Provide two position selector switches for the following:

a. Power--ON/OFF

b. Module--ACTIVE/INACTIVE

c. Cleaning Mode--OFFLINE/ONLINE

Provide momentary contact push buttons for the following:

a. System--START (green head)

b. Hopper level alarms

c. Alarm--ACKNOWLEDGE

Provide auxiliary devices for the following:
a. Position indication switches on isolation valves.
b. Hopper level alarms.
c. Temperature indicators, thermocouple alarm, and switch, to initiate bypass, at the baghouse inlet.
d. Temperature indicators and thermocouples at the baghouse outlet.
e. Temperature indicators and thermocouples for each hopper throat.
f. Differential pressure gages with pressure switch and audible alarm for each compartment.
g. Differential pressure gages with pressure switch and audible alarm for the baghouse inlet and outlet.
h. Opacity at baghouse outlet.

2.8.2 Instrumentation and Control Systems

Use solid-state analog circuitry. Assemble circuits using readily available pretested components making maximum use of integrated circuits. Gold plate pins and mating connectors on nickel to withstand chemical attack by ambient atmospheric chemicals. Arrange logic elements on circuit cards in functional groups so that failure of a single logic circuit or compartment shall not affect more than one separate functional sequence. Memory shall be static. Factory assemble, wire, test, and debug circuit cards using the operating stations and actual plug-in cables for the system. Test circuit card logic in the completed system for a minimum of 170 hours continuous operation. Provide programming aids to permit easy field reprogramming of adjustable parameters. Battery power backup may be approved by the Contracting Officer.

2.8.3 System Electrical Power and Power Supplies

The Government shall furnish one 120 VAC power source from the station service. Provide fuses or circuit breakers to protect each source against faults, overloads, and power failures. Fuses, fuse panels, breakers, and breaker panels shall be readily accessible and clearly identified. Provide input filters for noise suppression. Provide a full-capacity internal DC power supply for each bus.

2.8.4 Control Drive

Provide adjustable speed pneumatic control drives including handwheels, couplings, adapters, linkage system, drive arms, and damper arms, to respond to signals from the control system. Provide dual-pole dual-throw limit switches to electronically sense open and closed damper positions without using a slide mechanism. The full-stroke travel time of the damper drive piston in either direction shall be adjustable from one second to one minute.

2.8.5 Main Baghouse Control Panel

Provide an enclosed control panel cabinet for each baghouse. Baghouse controls and indicators shall include meters, recorders, thermocouples, pressure gages, graphics, annunciators, power supplies, power switches, and wiring. The cabinets, 3 mm 1/8 inch hot-rolled steel paneled NEMA ICS 6,
Type 12 enclosures, reinforced inside with angles and channels, shall have lifting lugs for shipping and handling. Provide a shipping pallet for each control panel cabinet. Cabinets shall also include one two-tube 40 W, 120 V fluorescent light fixture, one 120 VAC duplex 3 wire polarized grounded outlet, terminal blocks, interior panels for mounting auxiliary equipment, front and rear hinged access doors with key locks, cutouts with removable cover plates for items designated as future, and floor anchoring or a floor foundation. Install cabinet sections side by side and provide bottom side openings to interconnect the cables without routing the cables outside of the cabinets. Do not bring power greater than 120 V into the cabinet. Fill and grind cabinet edges to a 6 mm 1/4 inch radius. Maintain cabinets at minimum 125 Pa 0.5 inch WC using a fan powered by a 120 V, single-phase minimum 0.09 kW 1/8 hp motor. Provide a ventilation system including ventilation louvers, grills, exhaust fans, ductwork, and filters to ensure heat is dissipated. Filter pressurizing air for particulates greater than one micron at a minimum 98.5 percent efficiency.

2.8.5.1 Recorders

Provide each miniature pen strip chart recorder with an engraved scaled legend plate, a rubber legend stamp, internal fluorescent lighting, a set of tools and accessories, and a 12 month supply of charts and ink. Design recorders for 120 VAC power. Miniature pen strip chart recorders shall be 100 mm 4 inches in width having a 25 mm one inch per hour chart speed.

2.8.5.2 Thermocouples

Provide Type K ungrounded thermocouples with AWG Size 20 iron-constantan wires for measuring ductwork, and surface temperatures. Provide universal thermocouple heads with screwed covers, chains, terminal connectors, and stainless steel nipples so that head clears insulation by 50 mm 2 inches. Ductwork thermocouples shall be spring loaded with two hole insulators, Type 304 stainless steel sleeve sheath, and silver plug tip. Insulate surface thermocouples using a glass fiber insulating jacket to protect thermocouples from high temperatures.

2.8.5.3 Pressure Gages

Provide pressure gages indicating pressures from zero to 2490 Pa 10 inches WC, with high and low pressure rip set points. Pressure gages shall withstand up to 172 kPa (gage) 25 psig. Enclose pressure switch elements, 120 VAC, dual-pole dual-throw relays, in a NEMA ICS 6 enclosure.

2.8.5.4 Graphics

Provide a graphic subpanel to pictorially describe the flue gas flow path through each baghouse, including through the ductwork, bypass, dampers, fans, and valves, to display the operating status of each fan, and to display the position of each valve and damper. Provide control switches, indicating lights, and meters adjacent to the corresponding graphic equipment symbol. Provide smooth finished display openings for the switches, lights, and meters, in the panel metal behind acrylic sheeting. The graphic symbols, flow lines, nameplates shall be:

a. Base material: 6 mm 1/4 inch phenolic or 4.76 mm 3/16 inch solid acrylic sheeting.

b. Letters and symbol material: Laminated phenolic or acrylic sheeting.
c. Equipment symbols, flow arrows, and nameplates thickness: one mm 0.040 inch.

d. Flow line thickness: 0.50 mm 0.020 inch.

e. Color: Solid white core with colored satin finish overlay.

f. Engraving: Engrave through colored overlay to expose solid core. Cut laminate with beveled edges, except flow lines, to expose solid core on perimeter.

g. Mounting: Mount to front face sheet with contact cement. Cement shall be removeable using a solvent that will not damage face sheet or symbols. Do not use double-faced adhesive tapes.

Indicating lights shall be nominal 15 mm 1/2 inch diameter and rated for 120 VAC. Provide the following indicating lights; lens colors are in parentheses, * indicates items activating an audible alarm:

a. Inlet damper--OPEN (green)
b. Inlet damper--CLOSED (red)

2.8.5.5 Annunciators

Construct annunciators using factory-tested, burned in solid state electronics. Contact circuitry shall meet IEEE C37.90.1. Power equipment from the Government's 120 VAC station service source. Arrange power supplies, circuit breakers, and input terminal blocks in groups to permit servicing single section of the annunciator system without disabling the entire system. Alarm window shall be 50 to 80 mm 2 by 3 inch. Use electronic tone generators with variable pitch and volume controls.

2.8.5.6 Power Supplies and Switches

Provide mechanically interlocked, main circuit breakers mounted in the baghouse panelboard for switching, and for primary and backup power services. Provide a 20 A molded case circuit breaker for each tap from the control bus. Provide one AC alarm relay connected to each AC bus with two sets of contacts to close after a 2 second delay on loss of AC. Provide a 120 VAC control bus and a 120 V utility bus. Provide a 24 VAC power supply for low voltage indicating lights and meters. Use metal position marking nameplates and plastic identification nameplates.

2.8.5.7 Wiring

**************************************************************************
NOTE: Include control wiring installation and amperage ratings as part of this section or as part of Division 16, Electrical. If included in this section, it must comply with Division 16, Electrical. Amperage ratings shall comply with load requirements. Provide an automatic transfer switch to switch to the backup source upon primary source failure. Provide a manual reset and provide an alarm contact on transfer.
**************************************************************************

Provide cables, terminal blocks, grounding buses, and fuse boxes as follows:

a. Cables: Prefabricated cables, [_____] meters feet in length, with plug-in connectors at both ends of the interconnecting wire. Provide a mechanical restraint between the cable connector mating halves so that the connecting pin-pair does not separate due to mechanical vibration or cable sag. Design the male connector to protect the pins from cable pulling and to align the two halves during mating. The connector shall be rated for 600 V and 90 degree C 194 degrees F conductor temperature, with minimum 18 Gage copper conductors, neoprene or polychlorosulphonate jackets, and shielding.

b. Terminal Blocks: Heavy-duty, sliding-link rated not less than 20 A, 600 V with not less than 13 mm 1/2 inch spacing between terminals. Provide 10 percent spares. Main power supply circuit terminal blocks and control bus termination terminal blocks shall be rated not less than 40 A. Design to allow individual circuit testing without disconnecting cabinet wiring. Design terminal to receive ring-tongue cable connectors on the field side. Mount terminal blocks in rows within the panel cabinets at heights greater than 305 mm 12 inches, for connections of remote devices. Group and wire terminal blocks by function. Wire using insulated switchboard wire rated for 600 VAC, 60 Hz, 90 degree C conditions. Use American Wire Gage (AWG) Size 14 or larger for 120 VAC control and indicating circuits, AWG Size 10 or
larger for 120 VAC main power supplies and tap circuits, and AWG Size 20 for devices not greater than 28 V. Permanently stamp or mark the marking strip with the terminal designation. Do not use self-adhesive embossed plastic label tape.

c. Grounding Buses: Minimum 25 by 6 mm one inch by 1/4 inch grounding bus running the full length of the panel cabinet sections. Provide with Number 4, 250 thousand circular mil (MCM) lugs for ground cable connection at each end. Connect internal grounds to the ground bus.

d. Fuse boxes: Provide single-pole and three-pole fuse boxes with fuses for each set of relaying and metering potential circuits. Provide plug-in strips to connect 120 VAC supplies to meters and recording equipment.

2.8.6 Local Hopper Heater Control Panels

**************************************************************************
NOTE: Specify parallel alarm contacts within the control panel and connect to a terminal block within the panel to a remote alarm system.
**************************************************************************

Provide each hopper with a factory wired local hopper heater control panel containing relays, contactors, circuit breakers, and control transformers. Use non-spliced interconnecting multistrand copper wire with high temperature (454 degrees C 850 degrees F) insulation, from the hopper heater and from the hopper throat heater, to the local hopper heater control panel. Locate local hopper heater control panels near the corresponding hopper. Provide each hopper heater with individual automatic heater controls having adjustable setpoints and proportional bands. Heaters shall not operate when access doors are open. Heater voltage shall be [_____] VAC. Control voltage shall be 120 VAC. Size wiring, circuits, and controls for 2690 W/m2 250 W/ft2. Arrange heater wiring and connections to provide a balanced load on a [_____] V, 3-phase power supply system. Enclose in a NEMA ICS 6 [Type 12] [Type 4] [floor] [wall] mounted enclosure and include the following:

a. One control temperature thermostat (with bulbs and 1524 mm 60 inch flexible cable capillaries).

b. One low temperature alarm thermostat (with bulbs and 1524 mm 60 inch flexible cable capillaries).

c. One high temperature alarm thermostat (with bulbs and 1524 mm 60 inch flexible cable capillaries).

d. One main 3 pole [_____] V circuit breaker.

e. One individual fuse circuit protector for the [_____] V power circuit to each local hopper heater terminal box.

f. One [_____] V/120 V dry control transformer with one secondary lead fused and the other secondary lead grounded.

g. One 600 V contactor with a 120 V operating coil for each thermostatically controlled heater circuit.

h. Magnetic contactor and alarm relay with two normally open contacts.
i. Terminal blocks for termination of control and alarm circuits including 10 percent spares on each block.

j. Auxiliary relays for automatic operation of the heater system terminal blocks for power, control, and alarm circuits.

k. Throat heater surface thermocouples, one thermocouple per hopper heater.

Provide each local hopper heater control panel cover with the following:

b. 120 V "HIGH LEVEL" red light with integral transformer, one each zone.

c. 120 V "ON" green light with integral transformers, one each zone.

d. 120 V "LO TEMP" white light with integral transformer, one each zone.

e. Device and enclosure nameplates screwed or riveted to panel.

Wire the selector switch for the following system operation:

a. "ONLINE": Heaters operating (includes throat heater).

b. "OFF": All elements off.

c. "AUTO": Control functions transfer to Master Hopper Heater Control Panel.

2.8.7 Master Hopper Heater Control Panel

Provide a factory wired master hopper heater control panel containing relays, contactors, circuit breakers, control transformers, and devices for complete control of each hopper heater system, in the control room.

Enclosed in a NEMA ICS 6 [Type 12] [Type 4] [floor] [wall] mounted enclosure and include the following:

a. One main circuit breaker.

b. One circuit breaker and contactor alarm relay with two normally open contacts for each hopper zone. The contactor shall have a 120 V operating coil.

c. "ONLINE," "OFF," "AUTO" selector switch for each hopper.

d. 120 V "HIGH LEVEL" red light with integral transformer for each hopper.

e. 120 V "ON" green light with integral transformers for each hopper.

f. 120 V "LO TEMP" white light with integral transformer for each hopper.

g. Device and enclosure nameplates screwed or riveted to panel.

h. Auxiliary relays and equipment required for operation of the heating and alarm systems.

i. Fused control transformer having a 120 VAC secondary.
2.9 ACCESS PROVISIONS

2.9.1 Access Requirements

Provide access stairs, walkways, and platforms from boiler to baghouse. Baghouse access shall include interior and exterior access, including access to manifolds, bags, tube sheet, weather enclosure, hoppers, valves, conveyors, expansion joints, dampers, gas sampling ports, poke holes, and equipment requiring routine maintenance, repair, or replacement. Access provisions shall comply with OSHA regulations. Interconnect walkways and platforms on each side of the baghouse or each side of equipment, at the same elevation, by walkways. Connect walkways, including roof, by stairs. Provide caged ladders at each level for secondary egress. Provide allowance for installing piping, conduit, electrical outlets, and lighting fixtures. Provide 7 feet headroom clearance above walkways, platforms, and stairs. Provide manholes, inspection doors, and access doors with internal and external access walkways, lights, and platforms, at areas requiring access for operation and maintenance. Operation and maintenance access requirements are listed, by Class, below:

2.9.1.1 Class 1

Regularly attended areas including: lubricated equipment, bearings, instruments, valve operators, damper operators, damper linkages, damper drives, test ports, instrument connections, and equipment requiring daily inspection, maintenance, and operation. Provide platforms accessible by stairs. Do not use a ladder or ship ladders.

2.9.1.2 Class 2

Periodic maintenance access areas including expansion joints, ductwork inspection doors, safety valves, valve packing, and equipment requiring access every two years or more. Provide platforms accessible by ladders. Provide not less than two avenues of escape from safety valves or other hazardous equipment.

2.9.1.3 Class 3

Infrequent maintenance access areas, where access is required for painting, reinsulation, or replacement of components which have a service life of 10 years or more. Provide area to erect temporary scaffolding, ladders, platforms, and safety nets. Provide rotating machinery and mechanical equipment components weighing greater than 91 kg 200 pounds with lifting lugs and provide monorails to remove and lower the equipment to grade in a single lift.

2.9.2 Interior Access Provisions

Provide minimum 5 mm 3/16 inch ASTM A36/A36M manholes, inspection doors, and access doors to allow interior access to the hoppers, manifolds, ductwork, bags, and tube sheet. Access openings shall have gas-tight, insulated, externally hinged, ethylene propylene terpolymer (EPDM) gasketed doors with 13 mm 1/2 inch diameter smooth hand holds above the inside and outside of each door. Hinges shall support the doors when open. Provide safety chains to allow doors to be cracked slightly open before opening completely and padlocks to allow padlocking doors in the open position. Additional requirements are as follows:
2.9.2.1 Access to Hoppers

Provide each hopper with one quick-opening, minimum 610 mm 24 inch diameter manhole having an access door as specified in the above paragraph. Interlock hopper access doors to level detectors to prevent access when the nuclear level detectors are operational. Provide 13 mm 1/2 inch diameter smooth hand holds inside each hopper, every 460 mm 18 inches down the side of the hopper to the bottom, to serve as a ladder.

2.9.2.2 Access to Manifolds and Ductwork

Provide at least one quick-opening, minimum 610 mm 24 inch diameter manhole or one quick-opening minimum 460 by 610 mm 18 by 24 inch inspection door at the inlet manifold, the outlet manifold, and at ductwork areas greater than [_____] meters feet in length. Provide either a quick-opening, minimum 610 mm 24 inch diameter manhole or a quick-opening minimum 460 by 610 mm 18 by 24 inch inspection door at both sides of dampers, expansion joints, and both sides of gas distribution devices. The doors shall be as specified in the above paragraph.

2.9.2.3 [Access to Reverse Air System Bags

**************************************************************************
NOTE: Select the applicable paragraph(s) from the following:
**************************************************************************

Provide each compartment with interior walkways and access doors to allow access to the bags and both upper and lower bag supports. Interior walkways shall be minimum 610 mm 24 inches wide with kickplates. Access doors shall be minimum 508 by 1118 mm 20 by 44 inch with external bolt-down lugs and safety interlocks, and as specified in the above paragraph. Space lugs evenly around the door perimeter including the hinged side, minimum one lug per 305 mm foot of door perimeter, to assure uniform gasket pressure around the entire door periphery. Provide permanently attached caution signs and opening instructions at each door for operating personnel. Locate walkways between rows of bags maintaining minimum 13 mm 1/2 inch clearance with the bags inflated, to prevent bags from coming into contact with the walkways and wearing out, and maintaining a maximum three-bag reach. Provide upper access walkways one meter 3 feet below the upper end of the bags to prevent bags from coming into contact with the walkways and wearing out. Provide upper access walkways along the floor of the outlet plenum.

[Access to Pulse Jet System Bags

Provide each compartment with interior walkways and access doors to allow access to the bags and bag support. Interior walkways shall be minimum 610 mm 24 inches wide with kickplates. Access doors shall be minimum 508 by 1118 mm 20 by 44 inch with external bolt-down lugs and safety interlocks, and as specified in the above paragraph. Space lugs evenly around the door perimeter including the hinged side, minimum one lug per foot of door perimeter, to assure uniform gasket pressure around the entire door periphery. Provide permanently attached caution signs and opening instructions at each door for operating personnel. Locate lower walkways between rows of bags to maintain a maximum three-bag reach. Locate the lower walkways 152 mm 6 inches below the lower end of the bags to prevent bags from coming into contact with the walkways and wearing out. Provide upper access walkways along the floor of the outlet plenum.
2.9.3 Exterior Access Provisions

Provide ladders, stairs, walkways, and platforms, including supporting steel, handrails, kickplates, electrical lights, and electrical outlets, to manholes, inspection doors, and access doors. Design ladders, stairs, walkways, and platforms for live loads, as specified in paragraph entitled "Design Criteria." Provide walking surfaces on the roof for periodic equipment maintenance or inspection areas. Provide a 1829 by 2109 mm 72 by 83 inches uninsulated double utility door to each weather enclosure.

2.9.3.1 Ladders

Ladders shall be minimum 457 mm 1 foot 6 inches wide with 20 mm 3/4 inch diameter rungs spaced at 305 mm 12 inch on centers and minimum 10 by 65 mm 3/8 by 2 1/2 inch side rails.

2.9.3.2 Stairs

Stairs shall be open risers with a minimum 229 mm 9 inch grate tread, minimum 0.91 m 3 foot width, and a maximum 203 mm 8 inch rise. Design for 610 km/m2 125 psf live load or 454 kg 1,000 pound moving concentrated load, whichever is greater. Provide 40 mm 1 1/2 inch diameter black standard weight pipe, ASTM A53/A53M, Type E or Type S, handrails along both sides of stairs. Top handrail shall be 762 to 813 mm 2 feet 6 inches to 2 feet 8 inches above edge of tread. Main bars shall be 25 by 5 mm 1 by 3/16 inch. Use serrate main bars for outdoor use. Support stairs at bearing bars with tack welded 65 by 5 mm 2 1/2 by 3/16 inch side rails.

2.9.3.3 Walkways

Provide minimum 610 mm 2 feet walkways in Class 2 areas. Other walkways shall be minimum 0.91 m 3 feet. Design for 488 kg/m2 100 psf live loads plus concentrated equipment loads. Design walkways which are above ductwork or other surfaces, so that the underside of the walkway is a minimum of 150 mm 6 inches above the upper surface of the ductwork including insulation and lagging. Provide 40 mm 1 1/2 inch diameter black standard weight pipe, ASTM A53/A53M, Type E or Type S handrails. Pipe runs shall be horizontal at 584 mm and 1.07 m 1 foot 11 inches and 3 feet 6 inches above walk grating.

2.9.3.4 Platforms

Provide minimum 1.11 sq meters 12 sq feet platforms. Design platforms for live loads of 488 kg/m2 100 psf plus concentrated equipment loads. Design platforms which are above ductwork or other surfaces, so that the underside of the platform is a minimum of 150 mm 6 inches above the upper surface of the ductwork including insulation and lagging. Provide minimum 6 mm 1/4 inch thick raised steel floor plate grating of one piece, resistance-welded with 5 mm 3/16 inch diameter main bars, ASTM A108, Grade 1015, spaced at no more than 30 mm 1 3/16 inches on corners. Use serrate main bars for outdoor use. Provide subframing so grating span is no greater than 1.07 m 3 feet 6 inches. Space crossbars, ASTM A108, Grade 1010, at 102 mm 4 inches on centers. Crossbars shall be hexagonal of 8 mm 5/16 inch diameter of inscribed circle, 13 by 5 mm 1/2 by 3/16 inch rectangular, 6 mm 1/4 inch square with spiral twist, or 8.33 mm 21/64 inch diameter round. Provide 40 mm 1 1/2 inch diameter black standard weight pipe, ASTM A53/A53M, Type E or Type S handrails and 6 mm 1/4 inch thick steel kickplates. Pipe runs shall be horizontal at 584 mm 1 foot 11 inches and 1.07 m 3 feet 6 inches above grating.

SECTION 23 51 43.03 20  Page 45
2.10 SOURCE QUALITY CONTROL

Conduct standard factory tests and performance tests required by the applicable codes on control circuits, mechanical draft equipment and materials, and dampers, except poppet dampers. Notify Contracting Officer of test dates in writing not less than 45 days before factory tests so that Contracting Officer may witness test.

2.10.1 Baghouse Controls Tests

Perform control system factory tests with control system components connected together. To test, provide control boards with 115 VAC, 60 Hz, and operate each control switch and selector switch to verify that each control circuit operates as shown on the schematic diagrams. Simulate remote contacts and switches with jumpers at the appropriate external terminal blocks to verify proper circuit operation. Test annunciator systems to verify that annunciator points operate correctly by jumpering or operating alarm initiating device or jumpering external terminals for remote alarm inputs.

2.10.2 Mechanical Draft Equipment Tests and Materials

Factory tests shall include mechanical balancing of rotary parts.

2.10.3 Dampers

Test each damper following AMCA 500-D, including frame, except poppet dampers, five times in an airtight chamber at design flowrate temperature and pressure to determine gas leakage across the damper and the frame. Provide instruments to determine the amount of leakage and the static pressure against the damper. If a damper is equipped with a seal air system, test the damper both independently and with the seal air system. Operate system at design flowrate, temperature, and pressure.

PART 3 EXECUTION

3.1 COORDINATION

Coordinate design parameters and baghouse collection system controls with manufacturers whose equipment will interface with, or affect, the system operation.

3.2 INSPECTION

The Contractor Quality Control Representative and the Contracting Officer shall inspect equipment and materials before, during and after installation at the job site. Correct or replace defective material and equipment as approved by the Contracting Officer.

3.3 INSTALLATION

**************************************************************************
NOTE: Revise this paragraph as necessary when baghouse manufacturer is to install the equipment provided.
**************************************************************************

Install equipment on foundations or structural steel framework as shown on
3.3.1 Insulation

NOTE: If a separate insulation section is part of this specification, add a note to that section to indicate that baghouse insulation is covered by this section.

Insulate housing, hopper, and ductwork. Provide insulation with interruptions to permit access to the following openings without damaging the insulation system: manholes, inspection doors, access doors, and flanged openings. Provide boxouts around nameplates and code stamping symbols. Install a double layer of insulation with the joints of the two layers staggered. Fill cracks, voids, and depressions of insulation with insulating cements before applying another layer of insulation or jacket application. Provide insulation with expansion joints to withstand differential thermal expansion movements which may cause cracks or tears in the insulation. Install insulation between stiffeners and over stiffeners so that the stiffeners are completely insulated. Install additional insulation or casing spacers between stiffeners so that the surface is level. Securely wire and lace insulation in place using a soft ASTM A580/A580M, Number 14, Type 302 stainless steel wire.

3.3.1.1 Mineral Fiber Block and Board Insulation

Secure mineral fiber and block and board insulation with stud insulation lugs spaced not greater than 432 mm 17 inches on center. Weld lugs in place. Reinforce blocks on the exterior face with expanded metal to prevent sagging or cutting of the insulation by the lacing wire. Secure entire surface of mineral fiber block and board insulation in place using wire threaded lugs. Thread lugs with wire both ways, pull tight, twist ends together with pliers, bend over, and carefully press into the surface of the insulation.

3.3.1.2 Mineral Fiber Blanket Insulation

Secure mineral fiber blanket insulation with speed washers and impaling pins spaced not greater than 305 mm 12 inches on centers. When applying speed washers, do not compress the insulation below the design insulation thickness. Reinforce mineral fiber blanket insulation with expanded metal on the outer surface and wire mesh or expanded metal on the inner surface. Tightly butt blanket sections together and tie at joints to prevent the blanket edges from peeling or bulging, and to provide maximum sealing.

3.3.1.3 Calcium Silicate Insulation

Provide calcium silicate insulation over 12 Gage steel pins studwelded on 610 mm 2 feet centers. Do not place calcium silicate insulation directly in contact with the aluminum casing. Closely fit insulation around penetrations. Hold insulation in place by 65 mm 2 1/2 inches square speed washers. Protect calcium silicate on horizontal surfaces by 16 Gage sheet steel coated with a non-slip paint. On other areas, apply 13 mm 1/2 inch thick insulating concrete or cover using 16 Gage sheet steel. Provide access panels with removable insulation panels.
3.3.2 Casing

3.3.2.1 Structural Steel Grid System

Design the structural steel grid system to provide a smooth finished surface of insulation over the stiffeners, access doors, flanges, ribs, and uneven surfaces. Weld the grid system onto the equipment and structural support surfaces. Install aluminum casing onto grid system. Design the roof to transmit an external 114 kg 250 pound walking load from the casing to the structural grid system without compression of the insulation material.

3.3.2.2 Access Openings

Closely fit insulation to manholes, inspection doors, access doors, and flanged openings. Frame and flash to make weather-tight. Provide hinged or lift-off doors with nameplates, code stamping symbols, and non-projecting connections.

3.3.2.3 Weatherproofing

Fabricate and overlap casing to make weather-tight. Provide closures, flashings, and seals. Provide the open ends of fluted sections with tight-fitting closure pieces. Form and install flashing so that water cannot enter and wet the installation. Design and install flashing to readily drain any water that might enter. Weatherproof joints or casing openings which cannot be sealed by flashings or laps with an aluminum pigmented sealer.

3.3.2.4 Convection Stops

Provide convection stop on vertical surfaces over 3.67 meters 12 feet tall. The maximum interval between convection stops shall be 3.67 meters 12 feet.

3.3.2.5 Casing Attachment

Attach aluminum casing to the structural steel grid system using Number 14 stainless steel, Series 300, self-tapping screws on 305 mm 12 inch centers. Fasten vertical laps and flashings using 20 mm 3/4 inch Number 14 stainless steel, Series 300, sheet metal screws on 305 mm 12 inch centers. Provide exposed screws with aluminum or stainless steel backed neoprene washers preassembled to screws. Do not compress insulation below nominal thickness.

3.4 FIELD QUALITY CONTROL

3.4.1 Manufacturer's Field Representative

Furnish the services of a baghouse manufacturer field representatives trained by the manufacturer to assist baghouse installers to ensure that the baghouse is installed in accordance with the manufacturer's recommendations. The field representatives shall be at the erection site during installation phases including unloading, hauling, storing, cleaning, erecting, startup, and testing, until the system has been brought online and stabilized. The field representatives shall supervise the adjustment of controls, control devices, and components supplied with the baghouse and shall instruct the plant operators in the operation, care, and maintenance of the equipment. The field representatives shall certify in writing to the Contracting Officer that the baghouse has been installed as recommended.
by the manufacturer.

3.4.2 Post-Installation Inspection

The baghouse manufacturer's service engineer shall inspect the complete baghouse prior to startup to verify that the unit is installed as the manufacturer recommends.

3.5 IDENTIFICATION

Securely fasten an aluminum, brass, or corrosion resistant steel nameplate to the equipment in a readily visible location using rivet or sheet metal screws. The nameplate shall contain the manufacturer's name, model or series number, serial number, design gas inlet volume and temperature, and air-to-cloth ratio. Indent or emboss the information into the metal to avoid nameplate being covered by insulation. Provide plastic engraved nameplates for remote mounted devices. Fabricate nameplates from laminated white phenolic plastic with black engraved letters, 20 mm high and 76 mm long 3/4 inch high and 3 inches long. Attach nameplates with permanent adhesive or screws.

3.6 TRAINING PROGRAM OF OPERATING AND MAINTENANCE PERSONNEL

**************************************************************************
NOTE: CAUTION: There are restrictions on the type and extent of training which can be paid for with various categories of construction funds. The training routinely acceptable under construction contracts is the one- to two-day type where factory representatives or others instruct facility maintenance and operating personnel in the basics of operating and maintaining the equipment, generally on-site. If more extensive types of training are required, particularly where the student is required to travel and where special consultants are required to teach government personnel for extended amounts of time, consult the PA Director, Contact Division and the Head, Comptroller Department, for assistance in determining how to accomplish the training within the regulations. Anything over two- to three-days offsite should be highly suspect.
**************************************************************************

Provide classroom instruction, field instruction, and testing to the Government's operating personnel to ensure that operators will be qualified to properly and safely operate and maintain the baghouse system, including individual equipment components. Provide training at job site within 30 days of startup. Provide the operators with a working knowledge of operation theory and principles, operation and control requirements, and technical requirements for maintenance. Provide training manuals and testing materials so that, with the operating and maintenance manuals, the Government may train new operators without Contractor assistance.

3.6.1 Classroom Instruction

Develop and present 40 hours of organized classroom instruction on operation theory and principles, operation and control requirements, and technical requirements for maintenance. Administer tests at the conclusion of the course.
3.6.2 Field Instruction

After startup, a service engineer shall provide supervision of the system for not less than 8 hours per day for 30 days to assist and instruct Government operators. Instruction shall include, but not be limited to the following:

a. Precoating of bags.
b. Actual startup and shutdown.
c. Instrument, gage, and control functions.
d. Deliberate upset of the system and correction instructions.
e. Simulation of induced fan failure.
f. Baghouse maintenance including removal and replacement of bags.
g. Bypass system. When and how to use bypass system.

3.6.3 Testing Program

Provide a written test program to determine individual comprehension levels. Use the testing program in conjunction with the classroom instruction.

3.6.4 Video Recording

Provide color video tapes of field instruction or provide prepared color video tapes covering the field instruction material.

3.7 PAINTING

At the factory, blast clean exterior surfaces of the baghouse system to base metal, SSPC SP 6/NACE No.3, including ductwork, manifolds, hoppers, support structures, and access provisions, and prime and apply two coats of paint, FS TT-P-28. Surfaces exposed to the flue gas flow need not be painted but shall be protected during shipment and storage with a rust-protective coating.

3.8 PROTECTION FROM GALVANIC CORROSION

To prevent against galvanic corrosion, prevent permanent contact of aluminum casing with copper, copper alloy, tin, lead, nickel, nickel alloy, and Monel metal. Where it is necessary to attach the casing to carbon steel or to a low alloy steel, first prime the steel with zinc chromate, and then paint with aluminum paint, FS TT-P-28. Do not use lead based paints. Hot-dip galvanize, ASTM A123/A123M, external floor plates, ladders, grating, stairs, platforms, walkways cages, handrails, kickplates, and accessories. Floor plate warpage shall not exceed 25 mm one inch for every 3.05 meters 10 feet in any direction.

3.9 PROTECTION FROM INSULATION MATERIALS

Protect equipment and structures from insulation materials. Clean, repair, and restore equipment and structures to their original state after work is completed. Replace corroded, discolored, or damaged casing.
3.10 FUNGUS TREATMENT (TROPICAL AREAS ONLY)

**********************************************************************
NOTE: Use this paragraph only for projects in tropical areas with considerable moisture.
**********************************************************************

Do not treat components and elements inert to fungi, hermetically sealed, or of operations adversely affected by the application of varnish, for moisture and fungus resistance. Treat the electrical connections including terminals, as follows:

a. Starter and solenoid coils, except potted coils: MIL-T-152.

b. Motor coils which rise in temperature 40 degrees C 104 degrees F or less: MIL-V-173.

c. Motor coils which rise in temperatures over 40 degrees C 104 degrees F:
   Two coats Type AN, Class 105, MIL-I-24092.

Apply coats by the vacuum-pressure, immersion, centrifugal, pulsating pressure, or buildup method to fill coil interstices and to prevent entrapped air or moisture. The sealer coat may be applied by brushing or spraying.

3.11 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurements commonly agreed on by the manufacturers or other parties. The inch-pound and metric measurements shown are as follows:

PART 3 EXECUTION

3.1 EXAMINATION

3.2 ERECTION OF BOILER AND AUXILIARY EQUIPMENT

3.3 PIPING INSTALLATION
3.3.1 Hot Water Piping and Fittings
3.3.2 Vent Piping and Fittings
3.3.3 Gauge Piping
3.3.4 Steam Piping and Fittings
3.3.5 Condensate Return Pipe and Fittings
3.3.6 Joints
   3.3.6.1 Threaded Joints
   3.3.6.2 Welded Joints
   3.3.6.3 Grooved Mechanical Joints
   3.3.6.4 Flared and Brazed Copper Pipe and Tubing
   3.3.6.5 Soldered Joints
   3.3.6.6 Copper Tube Extracted Joint
3.3.7 Flanges and Unions
3.3.8 Branch Connections
   3.3.8.1 Branch Connections for Hot Water Systems
   3.3.8.2 Branch Connections for Steam Systems
3.3.9 Steam Connections to Equipment
3.3.10 Steam Risers
3.3.11 Air Vents for Steam Systems
3.3.12 Flared, Brazed, and Soldered Copper Pipe and Tubing
3.3.13 Copper Tube Extracted Joint
3.3.14 Supports
3.3.14   Seismic Requirements for Supports and Structural Bracing
  3.3.14.1   Seismic Requirements for Supports and Structural Bracing
  3.3.14.2   Pipe Hangers, Inserts, and Supports
    3.3.14.2.1   Types 5, 12, and 26
    3.3.14.2.2   Type 3
    3.3.14.2.3   Type 18
    3.3.14.2.4   Type 19 and 23 C-Clamps
    3.3.14.2.5   Type 20 Attachments
    3.3.14.2.6   Type 24
    3.3.14.2.7   Horizontal Pipe Supports
    3.3.14.2.8   Vertical Pipe Support
    3.3.14.2.9   Type 35 Guides
    3.3.14.2.10  Horizontal Insulated Pipe
    3.3.14.2.11  Piping in Trenches
    3.3.14.2.12  Structural Steel Attachments
  3.3.14.3   Multiple Pipe Runs
  3.3.15   Anchors
  3.3.16   Valves
  3.3.17   Pipe Sleeves
    3.3.17.1   Pipes Passing Through Waterproofing Membranes
    3.3.17.2   Optional Modular Mechanical Sealing Assembly
    3.3.17.3   Optional Counterflashing
    3.3.17.4   Fire Seal
  3.3.18   Balancing Valves
  3.3.19   Thermometer Wells
  3.3.20   Air Vents
  3.3.21   Escutcheons
  3.3.22   Drains
  3.3.23   Strainer Blow-Down Piping
  3.3.24   Direct Venting for Combustion Intake Air and Exhaust Air

3.4   GAS FUEL SYSTEM

3.5   FUEL OIL SYSTEM
    3.5.1   Piping and Storage Tank
    3.5.2   Fuel-Oil Storage Tank Heating-Coil Piping
    3.5.3   Automatic Safety Shutoff Valve
    3.5.4   Earthwork

3.6   RADIANT FLOOR HEATING SYSTEM
    3.6.1   Concrete Slab construction
    3.6.2   Wooden Floor Construction
    3.6.3   Penetrations to Fire Rated Assemblies

3.7   COLOR CODE MARKING AND FIELD PAINTING

3.8   MANUFACTURER'S SERVICES

3.9   TEST OF BACKFLOW PREVENTION ASSEMBLIES

3.10   HEATING SYSTEM TESTS
    3.10.1   Water Treatment Testing
    3.10.2   Boiler/Piping Test

3.11   CLEANING
    3.11.1   Boilers and Piping
    3.11.2   Heating Units

3.12   FIELD TRAINING

3.13   FUEL SYSTEM TESTS
    3.13.1   Fuel Oil System Test
    3.13.2   Gas System Test

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for packaged hot water and steam boiler systems (oil, gas or combination oil/gas fired) of up to 6000 kW 20,000,000 Btuh output capacity. The hot water boiler systems operate at water temperatures below 120 degrees C 250 degrees F and water working pressures less than 1100 kPa 160 psi. The steam heating systems operate up to 100 kPa 15 psig.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**SECTION 23 52 00 Page 11**
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE

**************************************************************************
NOTE: Where pipeline, structural, or other welding is required on the same project, tests will be required accordingly. Testing may be by the coupon method as prescribed in the welding code or by special radiographic methods. If the need exists for more stringent pipe welding requirements, delete the sentences in the first set of brackets.
**************************************************************************

Submit a copy of qualified welding procedures and a list of names and identification symbols of qualified welders and welding operators, at least 2 weeks prior to the start of welding operations. [Weld and braze boilers and piping in accordance with qualified procedures using performance-qualified welders and welding operators. Use procedures and welders that are qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests, and perform the tests at the work site if practical. The welder or welding operator must apply the personally assigned symbol near each weld made as a permanent record. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] [Welding and nondestructive testing procedures for piping are specified in Section 40 05 13.96 WELDING PROCESS PIPING.]

1.4 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from the weather, humidity and temperature variations, dirt and dust, and other contaminants.

1.5 EXTRA MATERIALS

Submit spare parts data for each different item of material and equipment specified, after approval of the detail drawings and no later than 2 months prior to the date of beneficial occupancy. Submit Detail Drawings consisting of equipment layout including installation details and electrical connection diagrams; combustion and safety control diagrams; ductwork layout showing the location of supports and hangers, typical hanger details, gauge reinforcement, reinforcement spacing rigidity classification, and static pressure and seal classifications; and piping layout showing the location of guides and anchors, the load imposed on each support or anchor (not required for radiant floor tubing), and typical support details. Include on the drawings any information required to demonstrate that the system has been coordinated and will properly function as a unit and to show equipment relationship to other parts of the work, including clearances required for operation and maintenance. Include in the data a complete list of parts and supplies, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after 1 and 3 years of service.
NOTE: In order to comply with UFC 1-200-02, designs must achieve energy consumption levels that are at least 30 percent below the ASHRAE 90.1 baseline. In accordance with P.L. 109-58 (Energy Policy Act of 2005), Executive Order 13423, and Federal Acquisition Regulation (FAR) Section 23.203 energy consuming products and systems must meet or exceed the performance criteria for ENERGY STAR®-qualified products as long as these requirements are nonproprietary. The ENERGY STAR product requirements are available on the web at www.energystar.gov/products. Where ENERGY STAR products are not applicable, energy consuming products and systems must meet or exceed the requirements of ASHRAE 90.1.

ENERGY STAR Eligibility Criteria Version 3.0 requires that residential boilers of less than 90 kW 300,000 Btuh energy input supplying low pressure steam or hot water for space heating applications have a minimum AFUE of 90 percent for gas-fired type or 87 percent for oil-fired type. Boilers intended only for commercial applications and/or with an input rating of 90 kW 300,000 Btuh or higher are not eligible for Energy Star.

If a FEMP efficiency is not stated for a particular boiler capacity, this document includes boiler efficiency requirements in conformance with ASHRAE 90.1. ASHRAE 90.1 requires that low and medium pressure boilers used primarily in commercial space heating applications meet the following thermal (Et) or combustion (Ec) efficiencies:

Natural Gas-fired Hot Water rated at 88 - 732 kW 300,000 - 2,500,000 Btuh capacity, Et = 80 percent.

Natural Gas-fired Hot Water rated greater than 732 kW 2,500,000 Btuh capacity, Ec = 82 percent.

Natural Gas-fired Steam (excluding natural draft) rated at 90 kW 300,000 Btuh capacity and larger, Et = 79 percent.

Natural Gas-fired - Natural Draft Steam rated at 90 kW 300,000 Btuh capacity and larger, Et = 77 percent.

#2 Oil-fired Water rated at 88 - 732 kW 300,000 - 2,500,000 Btuh capacity, Et = 82 percent.

#2 Oil-fired Water rated greater than 732 kW 2,500,000 Btuh capacity, Ec = 84 percent.

#2 Oil-fired Steam rated greater than 90 kW 300,000 Btuh capacity and larger, Et = 81 percent.

Include all equipment efficiencies on the equipment...
schedules on the drawings.

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Provide equipment supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Submit manufacturer's catalog data included with the detail drawings for the following:

a. Radiant floor heating system including tubing, joints, and manifold for radiant floor heating systems.

b. Data showing model, size, options, etc., that are intended for consideration. Ensure data submitted is adequate to demonstrate compliance with contract requirements. Include manufacturer's written installation instructions and manufacturer's recommendations for operation and maintenance clearances for the following:

(1) Boilers
(2) Unit Heaters
(3) Fuel Burning Equipment
(4) Combustion Control Equipment
(5) Pumps
(6) Fittings and Accessories
(7) Fuel Oil Storage System
(8) Water Treatment System

2.1.2 Asbestos Prohibition

Asbestos and asbestos-containing products will not be allowed.

2.1.3 Nameplates

Secure a plate to each major component of equipment containing the manufacturer's name, address, type or style, model or serial number, and catalog number. Also, display an Energy Star label as applicable. Provide an approved ASME stamp for each pressure vessel.

2.1.4 Equipment Guards

Fully enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts exposed to personnel contact in accordance with OSHA requirements. Properly guard high temperature equipment and piping exposed to contact by personnel or where it creates a potential fire hazard or cover with insulation of a type specified. Provide catwalks, operating platforms, ladders, and guardrails where shown and construct in accordance with Section [08 31 00 ACCESS DOORS AND PANELS][05 51 33 METAL LADDERS].

2.2 BOILERS

NOTE: A selection will be made between hot water
and steam service. Also select between firetube, water tube, cast iron, and condensing type boilers. Condensing type boilers should only be considered for hot water service. Natural draft/atmospheric burners will not be used for any boiler exceeding 300 kW, 1,000,000 Btuh output. Delete inapplicable references. A Life Cycle Cost Analysis should be performed to determine the appropriate type of boiler.

**************************************************************************

Provide each boiler with the output capacity in kilowatts (kW) British thermal units per hour (Btuh) as indicated when fired with the specified fuels. Furnish boiler complete with the [oil] [gas] [combination oil/gas] burning equipment, boiler fittings and trim, automatic controls, [[forced] [induced] draft fan,] [natural draft/atmospheric burner,] electrical wiring, insulation, piping connections, and protective jacket. Assemble boiler completely and test at the manufacturer's plant. Provide boiler auxiliaries including fans, motors, drives, and similar equipment with at least 10 percent excess capacity to allow for field variations in settings and to compensate for any unforeseen increases in pressure losses in appurtenant piping and ductwork. However, do not size the boiler safety devices for a 10 percent excess capacity. Design and install the boiler and its accessories to permit ready accessibility for operation, maintenance, and service. Design, construct, and equip boilers in accordance with ASME BPVC SEC IV. Each boiler must be of the [firetube] [watertube] [cast iron] [condensing] type and designed for [water] [steam] service as specified herein. Base boiler capacity on the ratings shown in HYI-005 or as certified by the American Boiler Manufacturers Association, or American Gas Association.

2.2.1 Firetube Boiler

Provide self-contained, multipass, packaged type boiler, complete with all accessories, mounted on a structural steel base. When the boilers are operating at maximum output, the heat input rates must not be greater than 21 Kw/square meter, 6,700 Btuh per square ft of fireside heating surface.

2.2.2 Watertube Boiler

**************************************************************************

NOTE: Select between standard, finned, or bent/flexible tube boiler. If bent or flexible tube boilers are not selected, remove all references to bent or flexible tube boilers. Standard water tube boilers are steel tube boilers that have historically been used for most heating applications. Finned tube boilers are typically small boilers (residential type) that utilize a finned tube arrangement. Bent or flexible tube boilers are steel tube boilers with bent tubes that experience multiple water tube passes. Bent/Flexible tube boilers typically require less space than standard water tube boilers. The bent or flexible tubes are also easier to replace than the standard water tubes; however, the interior surface of the tubes cannot be cleaned mechanically; they can only be chemically cleaned. Bent or flexible tube boilers also have a higher ratio of heat output
to heating surface area.

**************************************************************************

Provide a [standard] [finned] [bent or flexible] type of water tube boiler. Provide a self-contained, packaged type boiler, complete with all accessories, mounted on a structural steel base. [The boiler heating surface area for bent or flexible tube boilers must be at least 0.03 square meters/kW 4 square feet/boiler horse power. [The heat input rate for finned tube steam boiler or hot water generator must not be greater than 3.5 kW 12,000 Btuh based on internal heating area. ]Provide bent or flexible tube boilers with single or multiple downcomers for circulation without the need for exterior pumping. Design the tubes for bent or flexible tube boilers for replacement without requiring welding or rolling of tubes. Provide any special tools required for bent or flexible tube removal or installation with the boiler.]

2.2.3 Cast Iron Boiler

Provide rectangular, sectional type, self-contained, packaged type boiler, complete with accessories, mounted on a structural steel base. Use cast iron sections that are free of leaks under all operating conditions. Provide access to permit cleaning of internal tube surfaces.

2.2.4 Condensing Boiler

**************************************************************************

NOTE: Due to the sulfur content of fuel oil, condensing boilers should only be considered if natural gas is used.

The lower the return temperature of water entering the boiler the higher the resulting boiler efficiency. (See ASHRAE HVAC Equipment and Applications Handbook). The return water temperature should be at or below the dew point of the flue gas to result in the formation of condensate. This condition may not occur within a steam heating system. Therefore, condensing boilers should only be used for hot water service. In addition, the water distribution system and heating coils should be designed for higher temperature differentials.

Condensing boilers may be in the form of fire tube boilers with pulse combustion, copper fire tube boilers, or multiple heat exchanger boilers. The military specifications listed in the preceding paragraphs concerning fire tube and water tube boilers do not apply to condensing boilers.

**************************************************************************

Provide a self-contained packaged type boiler, complete with accessories, mounted on a structural steel base or a steel base which is integral to the boiler shell. Each boiler must conform to the commercial design used by the manufacturer and permit free thermal expansion without placing undue stress on any part of the boiler. Design each boiler which experiences the formation of condensate within the flue gas specifically for condensing application. Each boiler must withstand the corrosive effects of condensate for each part which may be in contact with the condensate at all
possible operating conditions. Provide each boiler with a separate air intake, exhaust, and condensate drain. Design each boiler to withstand the water temperature differentials anticipated at the required operating conditions without experiencing any damage due to thermal shock.

2.2.5 Modular Configuration

**************************************************************************
NOTE: A modular configuration is a series of small cast iron type and/or condensing type boilers. The smaller boilers are manifolded together to provide heating for larger loads. This arrangement may be economical when heating load variances are expected. Delete this paragraph if a modular configuration is not desired.
**************************************************************************

Provide [cast iron] [and] [condensing] type modular boilers with the capability of independent operation. Upon failure of any module, ensure the remaining modules are capable of operating at their designed capacity. Use size of the individual modules as indicated.

2.2.6 Hot Water Heating Boilers

**************************************************************************
NOTE: Hot water heating boilers will operate at pressures not over 1100 kPa 160 psi and at temperatures not above 120 degrees C 250 degrees F at or near the boiler outlet. If a pressure above 200 kPa 30 psi is selected, the boiler may be required to be manned 24 hours a day. Consult AR 420-49 for boiler attendance requirements. Fill in blank spaces to define operating conditions, under the listed subparagraphs which are not applicable to the design. Indicate the elevation of the project site and outdoor ambient air temperature range expected at the project site. Site conditions affect fan selection, boiler design, and stack design. Select appropriate boiler types. Allow adequate space around each boiler to permit accessibility for operation, maintenance, and service (including space for tube removal). A minimum clearance of 1200 mm 4 feet around the boiler will be required unless modular boilers are specified. Some modular boilers installations require little or no room between the individual boilers.
**************************************************************************

Provide hot water heating boiler capable of operating at the specified maximum continuous capacity without damage or deterioration to the boiler, its setting, firing equipment, or auxiliaries. The rated capacity is the capacity at which the boiler will operate continuously while maintaining at least the specified minimum efficiency. The boiler design conditions are as follows:

b. Operating pressure at boiler outlet [_____] kPa psig.

c. Hot water temperature [70] [80] [_____] degrees C [160] [180] [_____] degrees F.

d. Temperature differential between boiler discharge and system return [_____] degrees C degrees F.

f. Outdoor ambient air temperature [_____] degrees C degrees F (max), [_____] degrees C degrees F (min).

g. Site elevation [_____] m feet.

h. Maximum continuous capacity [_____] kW Btuh.

i. Rated capacity [_____] kW Btuh.

j. Maximum exhaust stack temperature [_____] degrees C degrees F.

**************************************************************************
NOTE: Energy efficiency data for residential boilers provided in item "k" below is from Energy Star Program Requirements Product Specification for Boilers, Eligibility Criteria Version 3.0. Energy efficiency data for commercial boilers provided in item "k" below is from ASHRAE 90.1 Table 6.8.1F.
**************************************************************************

k. Residential gas fired hot water boilers with a capacity less than 90 kW 300,000 Btu must have an Annual Fuel Utilization Efficiency of at least 90 percent, and must be Energy Star Labeled. Provide proof of Energy Star label for residential gas fired hot water boiler product.][
Residential oil fired hot water boilers with a capacity less than 90 kW 300,000 Btu must have an Annual Fuel Utilization Efficiency of at least 87 percent, and must be Energy Star Labeled. Provide proof of Energy Star label for residential oil fired hot water boiler product.][
Hot water boilers with a capacity less than 90 kW 300,000 Btu must have an Annual Fuel Utilization Efficiency of at least 80 percent.][
Gas fired boilers with a capacity of greater than or equal to 90 kW 300,000 Btu and less than or equal to 733 kW 2,500,000 Btu must have a thermal efficiency of at least 80 percent when fired at the maximum and minimum ratings allowed by the controls.][
Gas fired boilers with a capacity of greater than 733 kW 2,500,000 Btu must have a combustion efficiency of at least 82 percent when fired at the maximum and minimum ratings allowed by the controls][
Oil fired boilers with a capacity of greater than or equal to 90 kW 300,000 Btu and less than or equal to 733 kW 2,500,000 Btu must have a thermal efficiency of at least 82 percent when fired at the maximum and minimum ratings allowed by the controls.][
Oil fired boilers with a capacity of greater than 733 kW 2,500,000 Btu must have a combustion efficiency of at least 84 percent when fired at the maximum and minimum ratings allowed by the controls.]

**************************************************************************
NOTE: Minimum boiler efficiencies will either be presented in this specification or on the design drawings. Delete boiler efficiencies in the

SECTION 23 52 00 Page 20
2.2.7 Steam Heating Boilers

NOTE: Steam boilers will operate at pressures below 100 kPa 15 psi. In case of installation of a small boiler where the omission of the water column is standard in some manufacturers, the water column requirement and other inapplicable words will be deleted. However, if the water column requirement is deleted from the specification, include a visible water column in the external piping arrangement to the boiler. The boiler feed water piping must contain a loop or trap. The bottom portion of the trap must be below the anticipated water level within the boiler. All piping arrangements will be shown on the drawings. Delete those subparagraphs which are not applicable to the design. Indicate the elevation of the project site and the outdoor ambient air temperature range expected at the project site. Site conditions affect fan selection, boiler design, and stack design. Select the feed water temperature to avoid thermal shock. Typical ranges are between 10 degrees C 20 degrees F and 20 degrees C 40 degrees F below the boiler outlet temperature. The boiler manufacturer should be consulted for proper selection. Select appropriate boiler types. Allow adequate space around each boiler to permit accessibility for operation, maintenance, and service (including space for tube removal). A minimum of 1200 mm 4 feet around the boiler will be required.

Provide boiler with a water column with gauge glass and fittings including water column and gauge glass drain valves of the straight through type. Provide steam heating boiler that is capable of operating at the specified maximum continuous capacity without damage or deterioration to the boiler, its setting, firing equipment, or auxiliaries. The rated capacity is the capacity at which the boiler will operate continuously while maintaining at least the specified minimum efficiency. Design conditions are as follows:

a. Boiler design pressure 200 kPa 30 psig.
b. Operating pressure at boiler outlet [_____] kPa psig.
c. Steam temperature 120 degrees C 250 degrees F.
d. Feedwater temperature [_____] degrees C degrees F.
e. Outdoor ambient air temperature [_____] degrees C degrees F (max), [_____] degrees C degrees F (min).
f. Site elevation [_____] m feet.

g. Maximum continuous capacity [_____] kg pounds of steam per hour.

h. Rated capacity [_____] kg pounds of steam per hour.

i. Maximum exhaust stack temperature [_____] degrees C degrees F.

**************************************************************************
NOTE: Energy efficiency data for commercial boilers provided in item "j" below is from ASHRAE 90.1 Table 6.8.1F.
**************************************************************************

j. [Gas fired boilers with a capacity less than 90 kW 300,000 Btuh must have an Annual Fuel Utilization Efficiency of at least 75 percent.][Oil fired boilers with a capacity less than 90 kW 300,000 Btuh must have an Annual Fuel Utilization Efficiency of at least 80 percent.][Gas fired boilers (all, except natural draft) with a capacity of greater than or equal to 90 kW 300,000 Btuh must have a thermal efficiency of at least 79 percent.][Gas fired natural draft boilers with a capacity greater than or equal to 733 90 kW 300,000 Btuh must have a thermal efficiency of at least 77 percent.][Oil fired boilers with a capacity greater than or equal to 90 kW 300,000 Btuh must have a thermal efficiency of at least 81 percent when fired at the maximum and minimum ratings allowed by the controls.]

**************************************************************************
NOTE: Minimum boiler efficiencies will either be presented in this specification or on the design drawings. Delete boiler efficiencies in the specification if efficiencies are shown on the drawing. If the efficiencies are shown on the drawings, reference the applicable standard.
**************************************************************************

2.3 FUEL BURNING EQUIPMENT

**************************************************************************
NOTE: Include all the required data for proper design of the boiler. Delete all references to fuels which will not be used. When firing fuel oil, include nitrogen and sulfur content of fuel for emission requirements.

Review the Clean Air Act Amendment of 1990 (CAA) and other applicable Federal, state, and local regulations early in the design phase to determine the appropriate emission limitations and monitoring requirements.

The CAAA does not require the application of low NOx burner (LNB) technology for boilers within the size range of this specification. The CAAA limits SO2 emissions for fuel oil fired boilers over 10.55 gJ 10,000,000 Btu to 215 kg/nJ 0.5 lb per million Btu input or to firing oil with less than 0.5 weight percent sulfur. However, state implementation plans may place limits on NOx and particulates and more
Many options are available to reduce NOx emissions. The nitrogen and sulfur content of fuel oil should be specified in the fuel purchase contract. Restrictions on the nitrogen content will limit fuel flexibility. A careful analysis of proposed NOx reduction technologies must be performed to account for any required changes to auxiliary equipment and to identify future increase in O&M costs. Important questions that should be answered and be a part of the evaluation include the performance of NOx reduction over the entire load range, performance during backup fuel firing, and performance over the lifetime of the unit.

The majority of NOx control techniques can be defined as combustion modifications. The goals of combustion modification include redistribution of air and fuel to slow mixing, reduction of O2 in NOx formation zones, and reduction of the amount of fuel burned at peak flame temperatures.

Combustion modifications primarily deal with the control of fuel and air. Vertical staging includes overfire air (OFA) ports above the main combustion zone. Horizontal staging use registers or other devices to introduce air at different points along the flame. Fuel staging establishes a fuel rich zone above an air lean main combustion zone. Burner Out of Service (BOOS) techniques direct fuel to lower burner levels, while operating upper burners with air only. Flue Gas Recirculation (FGR) reduces O2 available to react with nitrogen and cools the flame. In addition to low NOx burners (LNB), OFA and BOOS other combustion modification techniques include fuel biasing, low excess air (LEA) and fuel reburning. Oil fired burners have successfully used advanced oil atomizers to reduce NOx without increasing opacity. Oil/water emulsion is a technique to reduce NOx on smaller industrial boilers.

Consideration will be given to the unique installation and space requirements of various NOx reduction systems. LNB may or may not require pressure port modifications. FGR involves routing large ductwork. OFA is very effective and involves modification to pressure parts. Fuel staging requires pressure port modifications for reburn fuel injection and/or OFA ports.

**************************************************************************

Design boiler to burn [gas] [oil] [combination gas and oil]. Each boiler must comply with Federal, state, and local emission regulations. As a minimum, meet the following emission requirements:

\[
\text{NOx} - \left[\frac{\text{______}}{\text{kg/joule lb/million Btu}}\right] \text{ input} \ [\text{parts per million (ppm)}] \text{ corrected to 3 percent Oxygen by volume}.
\]
SO2 - [[_____] kg/joule lb/million Btu input] [parts per million (ppm) corrected to 3 percent Oxygen by volume].

Particulate - [[_____] kg/joule lb/million Btu input] [parts per million (ppm) corrected to 3 percent Oxygen by volume].

2.3.1 Burners

**************************************************************************
NOTE: If No. 4, 5, or 6 oil will be one of the fuels, requirements for burners and accessories for these heavy oils will be inserted in the project specification.
**************************************************************************

2.3.1.1 Gas and Combination Gas-Oil Fired Burners and Controls

Burners must be UL approved [mechanical draft burners with all air necessary for combustion supplied by a blower where the operation is coordinated with the burner] [natural draft/atmospheric burners]. Provide burner complete with fuel supply system in conformance with the following safety codes or standards:

a. Provide gas-fired units with inputs greater than 0.117 MW 400,000 Btuh per combustion chamber conforming to UL 795. [Provide gas fired units less than 3.66 MW 12,500,000 Btuh input conforming to ANSI Z21.13/CSA 4.9.] [Provide single and multiple burner gas-fired units greater than or equal to 3.66 MW 12,500,000 Btuh input conforming to NFPA 85.]

b. Provide combination gas and oil-fired units conforming to UL 296. [Provide combination gas and oil-fired units less than 3.66 MW 12,500,000 Btuh input conforming to ASME CSD-1.] [Provide single and multiple burner combination gas and oil-fired units equal to or greater than 3.66 MW 12,500,000 Btuh input conforming to NFPA 85.]

2.3.1.2 Oil-Fired Burners and Controls

Oil-fired burners and controls for oil-fired units firing No. [_____] oil must be atomizing, forced-draft type in conformance with UL 726. [Provide oil-fired units less than 3.66 MW 12,500,000 Btuh input conforming to ASME CSD-1.] [Provide oil-fired units greater than or equal to 3.66 MW 12,500,000 Btuh input conforming to NFPA 85.]

2.3.1.3 Steam or Air Atomizer

**************************************************************************
NOTE: Delete this paragraph if steam or air atomization is not used.
**************************************************************************

Provide [steam] [or] [air] atomizer of the inside mix type utilizing [steam] [or] [air] mixing with the oil inside the nozzle. No moving parts are required within the atomizer assembly. Provide unit that is capable of completely atomizing the oil through a minimum capacity range of 4 to 1 without changing nozzles or sprayer plates and when supplied with [steam] [or] [air] at a maximum pressure of [100] [_____] kPa [15] [_____] psig. Provide unit with adjustable capacity. Furnish unit with a blowout valve
so that [steam] [or] [air] may be blown through the oil passages to clear them of any accumulation. Mount a diffuser designed to stabilize the flame near the furnace end of the atomizer in such a position that oil will not strike it.

2.3.1.4 Mechanical pressure atomizer

**************************************************************************
NOTE: If mechanical pressure atomization is not used delete this paragraph.
**************************************************************************

Operate mechanical pressure atomizer solely by the use of oil pressure and have no moving parts within the atomizer. Unit must be capable of completely atomizing the oil through a minimum capacity range of 4 to 1 without changing nozzles or sprayer plates and when furnished with oil at a constant pressure of [____]. Supply a constant volume of oil to the atomizer. Obtain variable capacity by adjusting control valve. Mount a diffuser provided to stabilize the flame near the furnace end of the atomizer, but in such a position that oil will not strike it.

2.3.2 Draft Fans

**************************************************************************
NOTE: If natural draft/atmospheric burners are utilized, all draft fan paragraphs will be deleted. Select between forced draft and induced draft fan or a combination of both. In most applications, a forced draft fan will be adequate. Fan bearings on induced draft fans must have adequate means to prevent overheating and provision for lubrication. Choice of type of cooling will depend on availability of water for the particular site. Water-cooled bearings are generally used for induced draft fans but air-cooled, sealed-type bearings are available; however, their use must be approved by the fan manufacturer for the application if specified. Forced draft fans are typically air cooled.
**************************************************************************

Furnish fans conforming to AMCA 801 [forced-draft] [and] [induced-draft] as an integral part of boiler design. Provide centrifugal fans with [backward-curved blades] [radial-tip blades] or axial flow type. Size each fan for output volume and static pressure rating sufficient for pressure losses, excess air requirements at the burner, leakages, temperature, and elevation corrections for worst ambient conditions, all at full combustion to meet net-rated output at normal firing conditions, plus an overall excess air volume of 10 percent against a 20 percent static overpressure. Do not exceed noise levels of 85 decibels for fans in any octave band at a 0.914 m 3 foot station. [Air cool draft fan bearings.] [Design induced-draft fans for handling hot flue gas at the maximum outlet temperature in the boiler. Provide induced draft fan housings with drain holes to accommodate the drainage of condensation. [Air-cool] [Water-cool] induced draft fan bearings. Provide induced draft fan scroll sheets and rotor blades with protective liners.]
2.3.2.1 Draft Fan Control

[Provide forced-draft centrifugal fans with inlet vane controls or variable speed control where indicated. Provide inlet vanes suitable for use with combustion control equipment.] [Provide induced-draft centrifugal fans with outlet dampers and variable speed control.] [Provide induced-draft fans with inlet vane controls.] Provide axial propeller fans with variable propeller pitch control.

2.3.2.2 Draft Fan Drives

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the description of motor starters.
**************************************************************************

Drive fans by electric motors. Electric motor must be [drip proof] [totally enclosed nonventilated] [totally enclosed fan cooled] [totally enclosed fan-cooled, suitable for installation in a Class II, Division 1, Group F, hazardous location conforming to NFPA 70]. [Motor starter must be [magnetic across-the-line] [reduced voltage start] type with [general purpose] [weather-resistant] [watertight] [dust-tight] [explosion-proof] enclosure and furnished with four auxiliary interlock contacts.]

2.3.3 Draft Damper

**************************************************************************
NOTE: Select between manual and automatic dampers. Normally, manual dampers are adequate for single boilers less than 600 kW 2,000,000 Btuh capacity. Select automatic dampers for modular boilers.
**************************************************************************

Provide boilers with [manual] [automatic] dampers, draft hoods, or barometric dampers as recommended by the boiler manufacturer to maintain proper draft in the boiler. Provide draft damper in a convenient and accessible location in the flue gas outlet from the boiler. Arrange automatic damper for automatic operation by means of a [damper regulator] [furnace draft regulator] [damper motor].

2.3.4 Ductwork

**************************************************************************
NOTE: In colder climates, tempering of combustion air may be required. Add an appropriate paragraph for tempering combustion air, if required. Delete this paragraph, if a plenum chamber is not needed.
**************************************************************************

Design air ducts connecting the forced-draft fan units with the plenum chamber to convey air with a minimum of pressure loss due to friction. Provide ductwork consisting of galvanized sheet metal conforming to ASTM A653/A653M. Ducts must be straight and smooth on the inside with laps made in direction of air flow. Ducts must have cross-break with enough center height to assure rigidity in the duct section, angle iron braced, and completely free of vibration. Provide access and inspection doors as indicated and required, with a minimum of one in each section between dampers or items of equipment. Construct ducts with long radius elbows.
having a centerline radius 1-1/2 times the duct width, or where the space
does not permit the use of long radius elbows, short radius or square
elbows with factory-fabricated turning vanes may be used. Duct joints must
be substantially airtight and have adequate strength for the service, with
38 x 38 x 3 mm 1-1/2 x 1-1/2 x 1/8 inch angles used where required for
strength or rigidity. Provide duct wall thickness of 16 gauge (1.5 mm
0.0598 inch) for ducts 1500 mm 60 inches or less and 12 gauge (2.66 mm
0.1046 inch) for ducts larger than 1500 mm 60 inches in maximum dimension.
Additional ductwork must be in accordance with Section 23 30 00 HVAC AIR
DISTRIBUTION.

2.4 COMBUSTION CONTROL EQUIPMENT

**************************************************************************
NOTE: If steam boilers are not utilized, delete all
references to steam pressure controllers. If hot
water boilers are not utilized, delete all
references to water temperature controllers.

Controls for facilities with operating Energy
Monitoring and Control Systems (EMCS) will be
specified to be compatible with existing EMCS
controls. Delete reference to multiple boilers if a
single boiler is used.

Delete "pneumatic controls" for new systems. Use
only pneumatic controls for existing pneumatic
controls systems that require new parts be purchased.
**************************************************************************

Provide combustion control equipment as a system by a single manufacturer.
Field install automatic combustion control system in accordance with the
manufacturer's recommendations and under the direct supervision of a
representative of the control manufacturer. [Control the boiler water
temperature by a water temperature controller.] [Control the boiler
pressure by a steam pressure controller.] Operate the equipment
[electronically] [either electrically or pneumatically as applicable]. On
multiple boiler installations, provide each boiler unit with a completely
independent system of controls responding to the load and to a plant master
controller. If recording instruments are provided, furnish a 1 year supply
of ink and 400 blank charts for each recorder.

2.4.1 Pneumatic Controls

If pneumatic operation is provided, provide a regenerant desiccant air
dryer unit. Shut down boiler on loss of control air pressure. Provide
pneumatic control systems conforming to CAGI B19.1. Install air filter
regulator sets at each control valve and transmitter in the system.
Provide dual type master air filter regulator set where one side can be
cleaned and repaired while the other is operating. Protect exterior
control air piping and devices from freezing.

2.4.1.1 Air Compressor Unit

Provide electric-motor driven, polytetrafluoroethylene or carbon ring type
automatic air compressor unit. Size the compressor unit to run no more
than 60 percent of the time when all controls are in service. Provide
air compressor unit complete with necessary accessories including automatic
pressure control equipment, relief valves, check valves, air filters,
moisture traps, and a receiver with ample capacity for emergency operation of the controls for 15 minutes after compressor shutdown. Do not exceed compressor speed of 900 rpm. Do not exceed motor speed of 1750 rpm. Provide compressor air intake with a low drop type air suction filter/silencer suitable for outdoor installation.

2.4.1.2 Air Receiver

******************************************************************************
NOTE: The condensate drain line will be located in such a manner as to prevent freezing.
******************************************************************************

Construct the air receiver in accordance with ASME BPVC SEC VIII D1 for unfired pressure vessels for 1379 kPa 200 psi working pressure, and equipped with inlet and outlet connections, valved drain connection, minimum 150 mm 6 inch dial pressure gauge, pop safety valves, and regulator connections.

2.4.2 Electrical controls

Provide electrical control devices rated at [120] [24] volts and connect as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.4.3 Water Temperature Controller

******************************************************************************
NOTE: If hot water boilers are not utilized, the following paragraph will be deleted. Consideration will be given to the utilization of outside air reset controls. Outside air reset control is typically used for boilers whose primary loads are due to space heating applications. Information on outdoor air reset controls for space heating application is located in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and UFC 3-410-02 or inactive UFC 3-540-02N (http://www.wbdg.org/ccb/DOD/UFC/INACTIVE/ufc_3_540_02n.pdf). Consideration will be given to the use of control based on return water temperature rather than supply water temperature.
******************************************************************************

Provide controller made of sturdy construction and protect against dust and dampness. Insert the thermostatic element in a separable socket installed [in the upper part of the boiler near the water outlet] [in the boiler return piping]. [Operate fixed position (on-off) and three position (high-low-off) controller on a 5.56 degree C 10 degree F differential over an adjustable temperature range of approximately 60 to 104.4 degrees C 140 to 220 degrees F.] [Provide modulating controllers to control the fuel burning equipment to maintain set boiler water temperature within 2 percent.] [Furnish controller with necessary equipment to automatically adjust the setting to suit the outside weather conditions. Operate the outside air reset controller in such a manner that the operating temperatures required by the boiler manufacturer are not compromised.]

2.4.4 Steam Pressure Controller

******************************************************************************
NOTE: If steam boilers are not utilized the
******************************************************************************
Provide controller made of sturdy construction and protect against dust and dampness. Ensure sensing elements of the steam controller are in direct contact with the steam. [Operate fixed position (on-off) and three position (high-low-off) type controllers on a 6.9 kPa 1 pound differential over a pressure range of 0 to 103.4 kPa 0 to 15 psig.] [Modulating controllers must automatically maintain, within 2 percent, the desired steam pressure by regulating the burner.]

2.4.5 Boiler Plant Master Controller

Provide controller made of sturdy construction and protect against dust and dampness. Ensure sensing elements of the steam controller are in direct contact with the steam. [Operate fixed position (on-off) and three position (high-low-off) type controllers on a 6.9 kPa 1 pound differential over a pressure range of 0 to 103.4 kPa 0 to 15 psig.] [Modulating controllers must automatically maintain, within 2 percent, the desired steam pressure by regulating the burner.]

2.4.6 Boiler Combustion Controls and Positioners

A pilot is required for all oil fired boilers over 875 kW 3,000,000 Btuh. However, a pilot is recommended for all fired boilers.

Select between fixed rate (on-off), three position (high-low-off), and modulating controls. Combustion controls will be fixed-rate, on-off for gross outputs up to 200 kW 700,000 Btuh; high-low-off or fixed-rate on-off, depending on anticipated load profile, for gross output from 200 to 600 kW 700,000 to 2,000,000 Btuh; high-low-off or modulating, depending on anticipated load profile, for gross output from 600 to 1200 kW 2,000,000 to 4,000,000 Btuh; modulating for gross outputs above 1200 kW 4,000,000 Btuh. Modular boilers will be fixed-rate on-off for each module. Delete inappropriate paragraphs.
b. Provide oil fired boiler units with [on-off] [high-low-off]
[modulating] combustion controls with [direct electric spark ignition system] [spark ignited [No. 2 oil] [natural gas] [liquified petroleum gas] pilot]. Provide modulating controls with a means for manually controlling the firing rate.

c. Accomplish modulating control function positioning type controls.
Control air flow ratio and fuel control valve relative positions of operative levers on a jackshaft responding to a [water temperature controller] [steam pressure controller]. Provide positioning type combustion control equipment including draft controls with synchronized fuel feed and combustion air supply controls that maintain the proper air/fuel ratio. Maintain the desired furnace draft within 0.25 mm 0.01 inch of water column.

d. [Fixed rate on-off] [High-low-off] controls for boilers with capacities up to 600 kW 2,000,000 Btuh must use a [water temperature controller in a temperature well in direct contact with the water] [steam pressure controller in direct contact with the steam].

2.4.7 Combustion Safety Controls and Equipment

******************************************************************************
NOTE: Provide feed water regulator with low-water cutoff on close coupled boilers (i.e. short supply and return lines with low pick-up losses) under 1200 kW 4,000,000 Btuh gross output with no process loads. Provide pump controller with low-water cutoff for all other boilers. Low-water cutoff will require a manual reset unless a supplementary low-water cutoff is provided. A supplementary low-water cutoff is required for boilers utilizing a pumped condensate return system. State and local codes may also require supplementary low-water cutoffs. When a supplementary low-water cutoff is provided, it will require manual reset and the initial low-water cutoff will not require manual reset.

Include the manually operated shutoff switch in the controls drawings, set point schedules and plans.
******************************************************************************

Provide combustion safety controls and equipment that are UL listed, microprocessor-based distributed process controller. Include mounting hardware, wiring and cables, and associated equipment. Mount completely wired, programmed, debugged controller, and test to perform all of its functions. Process the signals for complete control and monitoring of the boiler. This includes maintaining boiler status, starting and stopping all control functions, sequencing control functions and signaling alarm conditions. Document the program and include cross references in description of coils and contacts. Provide microprocessor to perform self diagnostics and contain a message center to provide operator with status and failure mode information. Mount controllers for each boiler on a separate, free standing panel adjacent to the boiler or for packaged boilers on the boiler supporting structure. Provide control systems and safety devices for automatically fired boilers conforming to ASME CSD-1. Provide electrical combustion and safety controls rated at 120 volts, single phase, 60 Hz and connect as specified in Section 26 20 00 INTERIOR.
DISTRIBUTION SYSTEM. Provide a 100 mm 4 inch diameter alarm bell and locate where indicated or directed. The alarm bell must ring when the boiler is shut down by any safety control or interlock. Provide indicating lights on the control panel. Use a red light to indicate flame failure, and a green light to indicate that the main fuel valve is open. The following shutdown conditions require a manual reset before the boiler can automatically recycle:

a. Flame failure.

b. Failure to establish pilot flame.

c. Failure to establish main flame.

d. [Low-water] [supplementary low-water] cutoff.

e. [High temperature cutoff] [High pressure cutoff].

2.4.7.1 Low-water Cutoff

**************************************************************************
NOTE: If state or local codes or regulations require a second cutoff, a separate supplementary low-water cutoff of the float type or electrode type may be provided. Delete supplementary low-water cutoff, if second cutoff is not required. Delete feedwater regulator and pump controller for water heating systems.
**************************************************************************

Provide float actuated switch or electrically actuated probe type low-water cutoff. Provide float chamber with a blow-down connection. Cutoff must cause a safety shutdown and sound an alarm when the boiler water level drops below a safe minimum level. A safety shutdown due to low water must require manual reset before operation can be resumed and prevent recycling of the burner. The cutoff must be in strict accordance to ASME CSD-1.

2.4.7.1.1 Feedwater Regulator with Low-Water Cutoff

Provide regulator of an approved design sized for the application. Provide a regulator for each boiler. Arrange the feeder so that water will be fed to the boiler automatically when the water level in the boiler drops below a preset point and will actuate the alarm bell when the water level reaches the low danger point. Arrange the boiler feeder so that the burner and forced-draft fan will stop whenever the water level drops below a preset danger point. Construct the boiler feeder so that the feedwater valve and seat are isolated from the float chamber to prevent overheating of the feedwater and precipitation of scale on either the valve or seat. Construct each float mechanism, valve, and seat of an approved, durable, corrosion-resistant steel alloy. Provide removable and renewable valve seats. Equip regulator with a large, self-cleaning strainer. Use gate or other straight-through type drain valve on the regulator.

2.4.7.1.2 Pump Controller with Low-Water Cutoff

Provide controller of a design approved by the boiler manufacturer. Provide a pump controller for each boiler which is used for space heating and process steam loads or long distribution lines. Control the operation of the burner, forced-draft fan, and pump. Provide pump controller and
low-water cutoff with a float-operated mercury switch arranged to start and stop the pump at preset boiler water levels. If the water level in the boiler reaches the low danger point, provide a second mercury switch to shut down the burner and actuate the alarm bell.

2.4.7.1.3 Supplementary Low-Water Cutoff

Provide supplementary low-water cutoff of the [electrically operated probe type] [float activated type] in addition to the low-water cutoff required above on each boiler. Mount supplementary low-water cutoff directly in the boiler shell and set below the low-water cutoff required above.

2.4.7.2 Water Flow Interlock

**************************************************************************
NOTE: Delete this paragraph if a hot water boiler is not utilized.
**************************************************************************

Provide hot water boiler limit controls to include protection for low boiler water flow and high boiler water temperature. Interlock the limit controls with the combustion control system to effect boiler alarm and shutdown. Do not allow boiler startup unless hot water flow is proven.

2.5 PUMPS

2.5.1 Fuel Oil Pumping and Heating Sets

**************************************************************************
NOTE: This paragraph may not be needed if the fuel does not require heating. This paragraph should be coordinated with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS and any burner mounted pump.
Select type I: simplex unit or type II duplex unit. Indicate the design requirements of filter/basket strainer located ahead of electric oil heater in order to match characteristics of fuel oil to be utilized. Select single filter/basket strainer for boilers below 60 kW 200,000 Btuh.
**************************************************************************

Provide [simplex] [duplex] and UL approved integrated, shop-fabricated oil pumping and heating set. Provide two positive displacement oil meters. Locate one meter on the fuel supply line. Locate the other meter on the fuel return line. Include an electric oil heater of adequate capacity to heat the specified fuel oil to ignition temperature at low boiler load until enough [hot water] [steam] is generated to operate the heat exchanger in each set. Control the electric heater by magnetic starter with a manually-operated On-Off switch in series with a thermostatic control. When oil temperature is raised to proper level and maintained by the [hot water] [steam] heater, disconnect the electric heater automatically by the thermostatic control. Provide electric-motor-driven fuel pumps. Each pump must have a capacity of no less than [_____] L/s gpm at a discharge pressure of [_____] kPa psig with a suction lift of 3.74 kPa 15 feet. Install a [duplex] [single] filter/basket strainer system ahead of the electric oil heater and final discharge filter/strainer system.
2.5.2 Hot Water and Boiler Circulating Pumps

NOTE: Boiler and hot water circulating pumps must be selected at the most efficient point of the pump curve which will generally lie on the sloped portion of the curve.

If separate pumps are not needed to provide water flow to the boilers, delete the requirement for boiler circulating pumps. The flow switch or pressure switch will only be needed for the pump which provides flow through the boiler. Pipe supported pumps are typically available up to 1.5 kW 2HP. Closed-coupled pumps are typically available up to 3.7 kW 5HP.

Provide circulating pumps for hot water that are electrically driven single-stage centrifugal type and have a capacity no less than indicated. Support boiler circulating pumps [on a concrete foundation with a cast iron or structural steel base] [or] [by the piping on which installed] and must be [closed-coupled shaft] [or] [flexible-coupled shaft]. The boiler circulating pumps must be [horizontal split case] [vertical split case] type. Support hot water circulating pumps [on a concrete foundation with a cast iron or structural steel base] [or] [by the piping on which installed] and with a [closed-coupled shaft] [or] [flexible-coupled shaft]. The hot water circulating pumps must be [horizontal split case] [vertical split case] type. Construct pump shaft of corrosion-resistant alloy steel, sleeve bearings and glands of bronze designed to accommodate a mechanical seal, and the housing of close-grained cast iron. Use pump seals capable of withstanding 115 degrees C 240 degrees F temperature without external cooling. Provide motor with sufficient power for the service required, of a type approved by the manufacturer of the pump, suitable for the available electric service, and conforming to the requirements of paragraph ELECTRICAL EQUIPMENT. Provide each pump suction and discharge connection with a pressure gauge as specified. Provide the [boiler] [hot water] circulating pump discharge heater with a [flow switch] [pressure switch]. Use a self-contained swinging vane type flow switch unit to indicate fluid flow. Use a self-contained snap action type pressure switch unit to indicate fluid pressure. Provide switch that is a SPDT with 120-volt, 15-ampere rating.

2.5.3 Condensate Pumping Unit

NOTE: If steam is utilized, only one type of condensate return unit will be required; delete either the condensate pumping unit or the vacuum pumping unit. Delete this paragraph if hot water is utilized.

Each pump must have a capacity no less than that indicated when discharging against the specified pressure. The minimum capacity of the tank is as indicated. The condensate pumping unit must be the [single] [duplex] [horizontal shaft] [vertical shaft] type as indicated. Provide unit consisting of [one pump] [two pumps] with electric motor drive, and a single receiver, all mounted on a suitable cast-iron or steel base. The
motor may be mounted on the top of the receiving tank. Provide centrifugal or turbine type pump, bronze-fitted throughout, with impellers of bronze or other approved corrosion-resisting metal. Ensure pump is free from air binding when handling condensate of temperatures up to 93 degrees C 200 degrees F. Connect pump directly to suitable drip-proof enclosed motors. Receiver must be cast iron or not less than 4.75 mm 3/16 inch thick black iron or steel and provide with all the necessary reinforced threaded openings, including condensate return, vent, overflow, and pump suction connections. Provide inlet strainer either integral in the tank or separate in the inlet line to the tank. Provide galvanized steel vent pipe, and galvanized malleable iron fittings. Extend vent pipe through the roof and properly flash. The pump, motor, and receiving tank may be mounted on a single base with the receiver piped to the pump suction connections. Provide a gate valve and check valve in the discharge connection from each pump and provide a strainer and gate valve in the suction line to each pump except where pumps are directly mounted on top of the receiver.

2.5.3.1 Controls for Space Heating Steam Loads Only

******************************************************************************
** NOTE: For loads where space heating is only part of the steam load, delete this paragraph. **
******************************************************************************

Install an enclosed float switch complete with float mechanisms in the head of the receiver. Control each condensate pump by a float switch which automatically starts the motor when the water in the receiving tank reaches the high level and stops the motor when the water reaches the low level. Provide motors with magnetic across-the-line starters equipped with general-purpose enclosures and three-position, "Manual-Off-Automatic" selector switches in the cover. Provide automatic alternator for duplex units.

2.5.3.2 Space Heating and Steam Loads or Distribution Lines

******************************************************************************
** NOTE: For space heating loads only, delete this paragraph. **
******************************************************************************

Provide condensate pump with an approved float-actuated valve or water feeder in the cold-water makeup connection either external to or integral with the receiver. Where a de-aerating feedwater heater is not included, control the condensate pumping unit automatically by a pump controller with low-water cutout on each boiler. Provide pump controller and low-water cutout with two float-operated mercury switches arranged to start and stop the condensate pump at preset boiler water levels. Use one switch to control the operation of the condensate pump by starting the pump when the water in the boiler reaches a preset low level and by stopping the pump when the water in the boiler rises to a preset high level. Use the second switch to ring an alarm bell and simultaneously shut down the burner. Provide relays if necessary. Install a minimum 100 mm 4 inch alarm bell with bell-ringing transformer where directed. Install a gate valve and a check valve or a stop-check (nonreturn) valve in the feed line between the boiler and the pump adjacent to the boiler connection. Provide condensate pump motor with a magnetic, across-the-line starter equipped with thermal-overload protection conforming to the requirements of paragraph ELECTRICAL EQUIPMENT. Where two or more boilers are provided, install a pump controller and low-water cutout at the normal waterline of each
boiler. Install an automatic feed valve in the feed line to each boiler. When any boiler requires water, the pump controller must open the feed valve by actuating an end switch which, in turn, operates the condensate pump. When the normal water level is restored, the pump controller must close the feed valve, and the end switch of the valve must stop the condensate pump.

2.5.3.3 Rating and Testing

Submit a certified test report covering the actual test of the unit and certifying that the equipment complies with the indicated requirements.

2.5.4 Vacuum Pumping Unit

Provide vacuum pumping unit which is a combination air removal and condensate return unit consisting of [a single pump, electric motor, and receiving tank] [pumps, electric motors, and other functioning parts in duplicate and a single receiving tank] as indicated. Two interconnected single units will be acceptable in place of a duplex unit. Arrange the unit for automatic operation. Where duplicate pumps are used, one pump will serve as a standby. Where it is standard with the manufacturer, separate pumps may be used for air removal and condensate return if both pumps are mounted on a common receiver. Construct the receiver of cast iron, or of no less than 4.75 mm 3/16 inch thick black iron or steel. Provide bronze pumping unit fitted throughout with bronze shafts or with shafts protected by bronze sleeves. Mount pumps, motors, and receiver on a single base and make provision for catching the drip from the stuffing boxes. Provide accessories consisting of a compound gauge, a pressure gauge inlet strainer, thermometer, water level gauge with stopcocks, adjustable vacuum relief valve, air discharge and condensate discharge check valves, and companion flanges for all flanged connections. Provide discharge line from each pump with a non-slam check valve and a globe valve. Provide each motor with a dripproof-type enclosure. Provide fully automatic controls for each pump motor. Provide controls consisting of a float in the receiving tank, a float switch, an adjustable vacuum switch, an automatic, magnetic, across-the-line type starter with general-purpose enclosure, and a three-position selector switch in the cover. The selector switch must provide for ["Automatic," "Float," "Vacuum,"] ["Automatic," "Float,"] and "Continuous" operation of the pump.

2.6 COLD WATER CONNECTIONS

Provide connections which include consecutively in line a strainer, reduced pressure principle backflow preventers, and water pressure regulator in that order in the direction of the flow. Provide reduced pressure principle backflow preventers as indicated and in compliance with Section 22 00 00 PLUMBING, GENERAL PURPOSE. Make cold water fill connections to the water supply system as indicated. Provide necessary pipe, fittings, and valves required for water connections between the boiler and cold water main as shown. Provide pressure regulating valve of a type that will not stick or allow pressure to build up on the low side. Set the valve to maintain a terminal pressure of approximately 35 kPa 5 psi in excess of the static head on the system and operate within a 15 kPa 2 psi tolerance regardless of cold water supply piping pressure and without objectionable
noise under any condition of operation.

2.7 RADIATORS AND CONVECTORS

Provide radiators, convectors and associated equipment in accordance with Section [23 57 10.00 10 FORCED HOT WATER HEATING SYSTEMS USING WATER AND STEAM HEAT EXCHANGERS] [23 58 00.00 10 CENTRAL STEAM HEATING AND UTILITIES SYSTEMS].

2.8 RADIANT FLOOR HEATING SYSTEMS

**************************************************************************

NOTE: Delete this paragraph if radiant floor heating systems are not required.

Although this specification deals with heating water produced by boilers, other sources of heat such as solar, domestic water heaters, waste heat, or heat pumps may also be used for radiant floor heating.

All pipe layouts, zones, pipe sizes, and pump sizes should be clearly shown on the drawings. The designer should provide a cross sectional detail of the integrated floor and piping system that clearly shows the floor design. Floor insulation, floor coverings, floor load bearing characteristics, and manifold access panel should be coordinated with the architect and structural engineer. The method of insulating the floor is different from typical construction. If the insulation is not properly designed, the system will not work.

The drawings should also address the desired control sequence for the radiant heating system. The drawings should indicate which loops will require temperature control, in order for the manufacturer to provide a proper manifold. Various control strategies can be found in HYI 400 and the RPA standard guideline for the Design and Installation of Residential Radiant Panel Heating Systems. The control sequence should consider the required circulation of water through the boiler. High mass radiant floor heating systems do not typically respond quickly to a change in load due to the thermal mass of the floor. Therefore, night setback control is not feasible for high mass floor radiant heating systems, unless long durations of unoccupied spaces occur such as in a chapel.

Radiant floor heating systems use lower water temperatures than standard convection heating. Therefore, the boiler may experience a water
temperature that is lower than recommended by the boiler manufacturer. If this occurs due to the design and selection of boiler, a mixing valve or other control devices should be provided to maintain the recommended water temperature for the boiler.

Several floor designs can be used for radiant heating. The following examples indicate a few possibilities:

Slab-on-grade: typical concrete floor system with tubing imbedded in concrete.

Thin-slab system: tubing imbedded in a thin lightweight concrete on top of a wooden sub-floor.

Above floor plate system: tubing installed in channels with reflective metal barriers above a wooden sub-floor. The tubing is then covered with thin sheets of plywood.

Below floor plate system: the tubing is installed below the wooden sub-floor using reflective metal barriers.

Below floor suspended tube system: the tubing is suspended within the interstitial space between a wooden sub-floor and insulation. (Seldom used due to higher water temperature requirements).

Below floor staple-up system: the tubing is stapled to the underside of a wooden sub-floor. This system is available; however, the below floor plate system is more energy efficient.

If outdoor air is required for ventilation, a separate make-up air system should be installed.

In accordance with the Standard Mechanical Code, the temperature of these heating systems should not exceed an operating temperature of 60 degrees C (125 degrees F), when the piping is used in gypsum assemblies.

**************************************************************************

Provide radiant floor heating system including all piping, manifolds, valves, pumps, expansion tank, pressure relief valves, and controls to provide a complete and operational heating system.

2.8.1 Tubing

Use tubing material in compliance with ASTM F876. Provide piping with a factory applied oxygen barrier with a diffusion rate that does not exceed 0.1 grams per cubic meter per day. The piping must be rated at 689 kPa 100 psi and 82.5 degrees C 180 degrees F.

2.8.2 Joints

Consult the manifold manufacturer to determine the proper joint for
connection of tubing to the manifold. For joints required to connect the tubing to the manifold, provide compression type fittings using crimp rings, a combination of inserts and O-rings, gripper type fittings using a retainer ring and O-rings, or as otherwise recommended by the manifold and tubing manufacturer.

2.8.3 Manifold

Provide design and construction of the manifold that is compatible with the tubing manufacturer's requirements. Provide piping manifold material that is compatible with the piping material. The manifold must be capable of providing the number of circuits as indicated on the drawings. The manifold must be suitable for an operating pressure of 689 kPa 100 psi and 82.5 degrees C 180 degrees F. Provide balancing valves for each circuit. Provide isolation valves for each supply and return connection. Provide each manifold with an air vent. Allow for the measurement of temperature for each circuit. Provide manifold with all required mounting hardware.

2.9 UNIT HEATERS

**************************************************************************

NOTE: Indicate capacity of unit heaters and heating and ventilating units on drawings. Show typical piping details on drawings for these units.

In critical areas where maximum noise level limits are required, the sentence in brackets will be retained and the brackets deleted. The maximum acceptable noise limits for these critical areas will be determined in NC level or dBA and should be indicated on the drawings. The sentence in brackets will be deleted for noncritical areas. Sound values will be selected by the designer based on a study of the design goal. The ASHRAE Handbook, Fundamentals, shows the range of sound pressure values for speech communications as being 50 dB for fair, 44 dB for very good, and 38 dB for perfect speech intelligibility.

**************************************************************************

Provide heaters as specified below, and with a heating capacity not in excess of 125 percent of the capacity indicated. [Noise level of each unit heater for areas noted must not exceed the criteria indicated.]

2.9.1 Propeller Fan Heaters

Design heaters for suspension and arrange for [horizontal] [vertical] discharge of air as indicated. Provide casings consisting of no less than 0.912 mm 20 gauge black steel and finished with lacquer or enamel. Provide suitable [stationary] [rotating air] deflectors to assure proper air and heat penetration capacity at floor level based on established design temperature. Suspension from heating pipes will not be permitted. [Operate fans for vertical discharge type heaters at speeds not in excess of 1,200 rpm, except that units with 84.4 MJ 80,000 Btu output capacity or less may operate at speeds up to 1,800 rpm.] [Provide horizontal discharge type unit heaters with discharge or face velocities not in excess of the following]:

SECTION 23 52 00 Page 38
<table>

</tbody>
</table>

2.9.2 Centrifugal Fan Heaters

Arrange heaters for floor or ceiling mounting as indicated. House heating elements and fans in steel cabinets of sectionalized steel plates or reinforced with angle-iron frames. Construct cabinets of black steel no lighter than 1.27 mm 18 gauge. Provide each unit heater with a means of diffusing and distributing the air. Mount fans on a common shaft, with one fan to each air outlet. Equip fan shaft with self-aligning ball, roller, or sleeve bearings and accessible means of lubrication. Fan shaft may be either directly connected to the driving motor or indirectly connected by adjustable V-belt drive rated at 150 percent of motor capacity. All fans in any one unit heater must be the same size.

2.9.3 Heating Elements

**************************************************************************
NOTE: For project designs requiring air-supply and distribution systems, consider using the optional choice of referencing Section 23 30 00 HVAC AIR DISTRIBUTION for the equipment in this paragraph.**************************************************************************

[Provide heating coils and radiating fins consisting of suitable nonferrous alloy with [threaded] [brazed] fittings at each end for connecting to external piping. Provide heating elements that are free to expand or contract without developing leaks and properly pitch for drainage. Test elements under a hydrostatic pressure of 1.38 MPa 200 psig and submit a certified report of the test to the Contracting Officer.] [Provide heating coils as specified in Section 23 30 00 HVAC AIR DISTRIBUTION for types indicated.] Ensure coils are suitable for use with water up to 121 degrees C 250 degrees F.

2.9.4 Motors

Provide motors with NEMA MG 1 open drip proof (ODP) [TEFC][_____] enclosure. Motors and motor controls must otherwise be as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.9.5 Motor Switches

2.9.6 Controls

Provide controls as specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.
2.10 HEATING AND VENTILATING UNITS

Provide heating and ventilating units and associated equipment in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION.

2.11 AIR HANDLING UNITS

Provide air handling units and associated equipment in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION.

2.12 FITTINGS AND ACCESSORIES

Install boiler fittings and accessories with each boiler in accordance with ASME BPVC SEC IV, unless otherwise specified.

2.12.1 Soot Blowers

**************************************************************************
NOTE: Soot blowers will normally be required on large water tube units burning No. 5 or 6 fuel oil. Manufacturers of boilers should be consulted to determine if soot blowers are applicable for the design contemplated. Small units are usually manually cleaned.
**************************************************************************

Where indicated, provide each boiler with soot blowers using [compressed air] [steam] as the blowing medium. Provide automatic sequencing and intermittent puff type soot blower system. Sequence the soot blower units automatically using successive steps by their controller, each step involving no more than a 70 kPa 10 psi drop in air pressure at the receiver. After one unit is operated in successive steps through its cycle, the controller must shift the operation to the second soot blower unit, and so on, until all units on that boiler have been operated, after which the controller must be shut down automatically by the sequence controls. Provide soot blower heads with elements of suitable material for the highest temperatures encountered in the boiler. The sequence timer must have provision for manual selection of the soot blower units to be used. Provide soot blower system for oil fired boilers conforming to NFPA 85.

2.12.1.1 Air Compressor Unit

Provide air compressor unit conforming to ASME PTC 10 except as specified otherwise. Do not exceed compressor speed of 900 rpm. Do not exceed motor speed of 1750 rpm. Provide service air requirements as indicated with receivers sized as indicated. Provide units that are suitable for heavy-duty service (soot blowing). Use simplex type, single-stage, double-acting compressors, with water-jacketed cylinder, fitted with intake and discharge valves of the lightweight feather, disc or plate type, and provide with necessary controls, water-cooled aftercooler, moisture separator, drive, receiver, relief valves, and cooling water controls as required. Provide compressor air intake with an air suction filter/silencer suitable for outdoor installation. The filter must have a collection efficiency of 99 percent of particles larger than 10 microns. The filter body and media must withstand a pressure of 850 kPa 125 psi. Provide shell-and-tube type aftercooler designed for air flow through the tubes with steel shell internal baffle plates. Size the cooling capacity of the after cooler for the total capacity of the compressor. Provide moisture separator with an automatic water discharge trap and level gauge.
Provide thermostatic valve type cooling water controls for regulating compressor cylinder water temperature and after-cooler water temperature and install with a three-valve bypass in the water outlet lines ahead of open sight drain funnels. Equip compressor with adjustable, pressure type unloader controls suitable for continuous compressor operation.

2.12.1.2 Air Receiver

Provide a vertical type air receiver constructed in accordance with ASME BPVC SEC VIII D1 for unfired pressure vessels for 1379 kPa 200 psi working pressure, and equip with flanged inlet and outlet connections, valved drain connection, minimum 150 mm 6 inch dial pressure gauge, pop safety valves, and regulator connections.

2.12.2 Continuous Emissions Monitoring

Emerging flue gas flow monitor technologies are available. The traditional differential pressure technique specified used familiar equipment that can be maintained by plant personnel. This type of measurement device has reliably satisfied regulatory requirements. The possible use of other technologies should include a thorough investigation of flue gas flow monitor regulatory requirements and inhouse maintenance capabilities.

a. Provide Continuous Emissions Monitoring System (CEMS) equipment as a system by a single manufacturer. Provide a CEMS, meeting the requirements of applicable federal, State of [_____] and local regulations, for each boiler in accordance with manufacturer's recommendations and under the direct supervision of the CEMS equipment manufacturer. Before acceptance of the installation, furnish the Contracting Officer a written test report which provides documentation that the CEMS equipment passed factory and field certification test required by federal, state, and local regulations. Submit written certification by the boiler manufacturer that each boiler furnished complies with Federal, state, and local regulations for emissions. Also include a description of applicable emission regulations. If any boiler is exempt from the emission regulations, indicate the reason for the exemption in the certification.

b. Include [sulfur dioxide (SO2)] [oxides of nitrogen (NOX)] [carbon dioxide (CO2)] [and] [particulate matter (PM)] and other information required by Federal, state, and local regulations in the reported data. Base SO2 reporting on [analyzer measurement] [fuel flow and percent sulfur calculation]. Base nitrous oxides, carbon dioxide and particulate matter reporting on analyzers.

c. The CEMS equipment includes the central processing unit, printer, hard disk drive, and floppy disk drive. The floppy disk drive must function as a recorder. The manufacturer must provide the software to generate the required reports in a format acceptable to the Federal, state and local regulatory agencies. Provide operator interface to the CEMS equipment via CRT screen.
2.12.2.1 Gaseous Emission Monitors

Provide extractive or in situ gaseous monitors. A combination of extractive and in situ monitors is not acceptable. Include automatic calibration checks for gas monitors. Provide an alarm horn and annunciator to alarm when any monitor parameter is out of range or a gaseous monitor malfunctions. Construct surfaces that are exposed to the corrosive gas of the boiler of noncorrosive materials such as 316 SS, teflon or hastelloy.

a. Mount in situ monitor on the ductwork at the location [shown on the plans] [recommended by the manufacturer]. The situ system must not be affected by the presence of particulate matter in the flue gas.

b. Provide [wet] [dry] [diluted] extractive systems. Locate analyzing equipment for the extractive system in a walk-in cabinet. Arrange the equipment to provide access for maintenance. Heat trace extractive system sampling between the probes and the analyzers to maintain the temperature recommended by the manufacturer when the ambient temperature is [_____] degrees C F. Mount probes on the ductwork at the location [shown on the plans] [recommended by the manufacturer].

2.12.2.2 Flue Gas Flow Monitor

Flue gas flow monitor must utilize the pitot tube principle to measure the flow. Provide an across-the-duct-average pitot tube probe and design and locate to obtain representative measurement. Use differential pressure transmitters to sense the difference between the static and total pressure of the flowing gas steam. Ensure calibrations are stable. Arrange lines to prevent collection of condensate. Provide a purge system as required to keep the pitot pressure taps clear.

2.12.2.3 Particulate Matter Monitor

Provide particulate matter (opacity) monitor based on the principle of transmissometry. Provide transmissometer with automatic simulation of zero opacity and upscale check of calibration while the boiler is in service without dismounting the unit. Include analyzer internal circuitry and electronic circuitry in calibration check. Provide an alarm horn and annunciator to announce excess opacity and any system malfunction. Provide units with fans to keep the sending and receiving lenses pressurized and blown clean at all times.

2.12.2.4 Wiring

Provide CEMS equipment with plug-in prefabricated cable for interconnection between components. Provide 2-wire, 120 volt nominal or less, 60 Hz, power supply to the equipment with one side grounded. Connect electrical devices as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.12.3 Tankless Water Heater

**************************************************************************
NOTE: If the system will not be used to heat domestic hot water delete this paragraph.
**************************************************************************

Install a seamless copper immersion type tankless water heater of the specified capacity in the boiler. Equip the heater with an approved water-tempering valve which is set to supply hot water at approximately 60
degrees C 140 degrees F. Instead of the immersion type coil, an approved external shell and tube type or plate type heat exchanger may be installed as specified in Section 23 57 10.00 10 FORCED HOT WATER HEATING SYSTEMS USING WATER AND STEAM HEAT EXCHANGERS.

2.12.4 Conventional Breeching and Stacks

**************************************************************************
NOTE: Delete this paragraph for condensing boilers.
**************************************************************************

2.12.4.1 Breeching

Connect each boiler to the stack or flue by breeching constructed of black steel sheets no less than 1.2 mm 0.0478 inch thick nor less than thickness of stack, whichever is larger. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping of combustion gases. The clear distance between any portion of the breeching surface and any combustible material must not be less than that specified in NFPA 211. Fasten joints and seams securely and make airtight. Provide suitable hinged and gasketed cleanouts, which will permit cleaning the entire smoke connection without dismantling. Provide flexible-type expansion joints as required and do not require packing.

2.12.4.2 Stacks

**************************************************************************
NOTE: Frequently boiler outlets are designed to support no more than the weight of a 6 m 20 foot stack section, when installed directly above the boiler outlet. Ensure that the stack is properly supported.
**************************************************************************

[Extend individual stub stacks above the roof to the heights indicated. Use individual stub stacks that are [6] [_____] m [20] [_____] feet in height when assembled on the boiler and measured from the ground line. Provide sheet steel stack section having a thickness of no less than 2.47 mm 0.0972 inch.] [Extend prefabricated double wall stacks system above the roof to the height indicated. Provide stacks that are [6] [_____] m [20] [_____] feet in height when assembled on the boiler and measured from the ground line. Provide inner stack consisting of [304 stainless steel] [316 stainless steel] having a thickness of no less than 0.89 mm 0.035 inch. Provide outer stack consisting of sheet steel having a thickness of no less than 0.635 mm 0.025 inch. Incorporate a method of maintaining concentricity between the inner and outer stacks. Seal the joints between the stack sections to prevent flue gas leakage.] Provide a 7.92 mm 0.3125 inch diameter hole in the stack no greater than 150 mm 6 inches from the furnace flue outlet for sampling of the exit gases. Provide a method to seal the hole to prevent exhaust gases from entering the boiler room when samples are not being taken. Provide each stack complete with rain hood. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping of combustion gases.

2.12.5 Direct Vents

**************************************************************************
NOTE: Delete this paragraph if condensing boilers are not used. A conventional stack is not needed
**************************************************************************
for condensing boilers due to the low exhaust air temperature. Precautions should be taken due to the acidic condition of the condensate. The location and size of the vents should be shown on the drawings. Consult NFPA 54, UL 1738, and available vendor data to design the vents. The vents can be mounted on the roof or exterior wall with proper separation. The vents should be extended above the typical snow level. Vents should be located in such a manner as to prevent vandalism and to prevent discharge of condensate across walkways.

Use direct venting for condensing type boilers. Size and locate the air intake and exhaust vents as indicated on the drawings and as recommended by the boiler manufacturer. Provide a separate combustion air intake vent and exhaust vent for each boiler.

2.12.5.1 Combustion Air Intake Vent

Construct the combustion air intake piping of Schedule 40 PVC in accordance with ASTM D1784. Provide vent that is suitable for the temperature at the boiler combustion air intake connection point. Provide each intake complete with bird screen.

2.12.5.2 Exhaust Vent

Construct the exhaust vent piping of Schedule 40 CPVC or stainless steel conforming to UL 1738 and the boiler manufacturer's recommendations. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping of combustion gases. Provide exhaust vent that is suitable for the maximum anticipated boiler exhaust temperature and withstands the corrosive effects of the condensate. Provide a 8 mm 0.3125 inch diameter hole in the stack no greater than 152 mm 6 inches from the boiler flue outlet for sampling of the exit gases. Provide a method to seal the hole to prevent exhaust gases from entering the boiler room when samples are not being taken. Provide each exhaust stack complete with bird screen.

2.12.6 Expansion Tank

**NOTE: If a hot water heating system is not utilized delete this paragraph.**

Provide hot water pressurization system including a diaphragm-type expansion tank which will accommodate the expanded water of the system generated within the normal operating temperature range, limiting the pressure increase at all components in the system to the maximum allowable pressure at those components. The only air in the system will be the permanent sealed-in air cushion contained in the diaphragm-type tank. Provide sizes as indicated. Provide welded steel expansion tank, constructed, tested, and stamped in accordance with ASME BPVC SEC VIII D1 for a working pressure of [850] [_____] kPa [125] [_____] psi and precharged to the minimum operating pressure. Fit the tank's air chamber with an air charging valve and pressure gauge. Support the tank by steel legs or bases for vertical installation or steel saddles for horizontal installations. Provide lifting rings and a drain connection for the tank.
All components must be suitable for a maximum operating temperature of 120 degrees C 250 degrees F.

2.12.7 Air Separator

Provide steel external air separation tank, constructed, tested and stamped in accordance with ASME BPVC SEC VIII D1 for a working pressure of [850] [_____] kPa [125] [_____] psi. The capacity of the air separation tank indicated is minimum.

2.12.8 Filters

Provide filters conforming to ASHRAE 52.2.

2.12.9 Foundation (Setting) Materials

2.12.9.1 Firebrick

Provide ASTM C27 class firebrick as recommended by boiler manufacturer.

2.12.9.2 Tile

Provide ASTM C34, Grade LBX tile.

2.12.9.3 Insulating Brick

Provide insulating brick complying with ASTM C155.

2.12.9.4 Refractory Mortar

Provide refractory mortar complying with ASTM F1097.

2.12.9.5 Castable Refractories

Castable refractories must be ASTM C401. The minimum modulus of rupture for transverse strength must be no less than 4136 kPa 600 psi after being heat soaked for 5 hours or more at a temperature in excess of 1371 degrees C 2500 degrees F.

2.12.10 Steel Sheets

2.12.10.1 Galvanized Steel

Galvanized steel must be ASTM A653/A653M.

2.12.10.2 Uncoated Steel

Use uncoated steel which is composition, condition, and finish best suited to the intended use.

2.12.11 Gaskets

Provide gaskets consisting of nonasbestos material in accordance with ASME B16.20, full face or self-centering type. Provide gaskets spiral wound type gaskets with graphite filler material.
2.12.12 Steel Pipe and Fittings

2.12.12.1 Steel Pipe

Steel pipe must be ASTM A53/A53M, Type E or S, Grade A or B, black steel, standard weight.

2.12.12.2 Steel Pipe Fittings

Affix the manufacturer's trademark to fittings in accordance with MSS SP-25 to permanently identify the manufacturer.

2.12.12.3 Steel Flanges

Provide flanged fittings including items such as flanges, bolts, nuts, bolt patterns, in accordance with ASME B16.5 class 150 and have the manufacturer's trademark affixed in accordance with MSS SP-25. Provide flange material conforming to ASTM A105/A105M. Use serrated or raised-face type flanges for high temperature water systems. Provide blind flange material conforming to ASTM A516/A516M cold service and ASTM A515/A515M for hot service. Provide high strength or intermediate strength bolts with material conforming to ASTM A193/A193M. Submit written certification by the bolt manufacturer that the bolts furnished comply with the requirements of this specification. Include illustrations of product markings, the date of manufacture, and the number of each type of bolt to be furnished based on this certification.

2.12.12.4 Welded Fittings

Provide welded fittings conforming to ASTM A234/A234M with WPA marking. Provide buttwelded fittings conforming to ASME B16.9, and socket-welded fittings conforming to ASME B16.11.

2.12.12.5 Cast-Iron Fittings

Provide ASME B16.4, Class 125, type fittings required to match connecting piping.

2.12.12.6 Malleable-Iron Fittings

Provide ASME B16.3, type fittings as required to match connecting piping.

2.12.12.7 Unions

Provide ASME B16.39, Class 150 unions.

2.12.12.8 Threads

Provide pipe threads conforming to ASME B1.20.2MASME B1.20.1.

2.12.12.9 Grooved Mechanical fittings

******************************************************************************
NOTE: Grooved mechanical fittings will not be allowed for steam piping or condensate piping or hot water piping above 110 degrees C 230 degrees F.
******************************************************************************

Design joints and fittings for no less than [862 kPa 125 psig] [_____]

SECTION 23 52 00 Page 46
service, and ensure joints and fittings are the products of the same
manufacturer. Provide ductile iron fitting and coupling houses conforming
to ASTM A536. Provide molded synthetic rubber gaskets with central cavity,
pressure responsive configuration and conforming to ASTM D2000 for
circulating medium up to 110 degrees C or 230 degrees F. Provide grooved
joints conforming to AWWA C606. Provide steel coupling nuts and bolts
conforming to ASTM A183.

2.12.13 Copper Tubing and Fittings

2.12.13.1 Copper Tubing

Provide ASTM B88M ASTM B88, Type K or L tubing. Use brass or bronze
adapters for copper tubing for brazed fittings.

2.12.13.2 Solder-Joint Pressure Fittings

Provide wrought copper and bronze solder-joint pressure fittings conforming
to ASME B16.22 and ASTM B75/B75M. Provide cast copper alloy solder-joint
pressure fittings conforming to ASME B16.18 and ASTM B828.

2.12.13.3 Flared Fittings

Provide cast copper alloy fittings for flared copper tube conforming to
ASME B16.26 and ASTM B62.

2.12.13.4 Adapters

Adapters may be used for connecting tubing to flanges and to threaded ends
of valves and equipment. Extracted brazed tee joints produced with an
acceptable tool and installed as recommended by the manufacturer may be
used.

2.12.13.5 Threaded Fittings

Provide cast bronze threaded fittings conforming to ASME B16.15.

2.12.13.6 Brazing Material

Use brazing material conforming to AWS A5.8/A5.8M.

2.12.13.7 Brazing Flux

Provide paste or liquid form flux appropriate for use with brazing
material. Flux must be as follows: lead-free; have a 100 percent
flushable residue; contain slightly acidic reagents; contain potassium
borides, and contain fluorides. Use silver brazing materials in accordance
with AWS A5.8/A5.8M.

2.12.13.8 Solder Material

Provide solder metal conforming to ASTM B32 95-5 tin-antimony.

2.12.13.9 Solder Flux

Flux must be either liquid or paste form, non-corrosive and conform to
ASTM B813.
2.12.13.10 Grooved Mechanical Fittings

**************************************************************************
NOTE: Grooved mechanical fittings will not be allowed for steam piping or condensate piping or hot water piping above 110 degrees C 230 degrees F.
**************************************************************************

Design joints and fittings for no less than [862 kPa 125 psig] [_____] service, and ensure joints and fittings are the products of the same manufacturer. Provide ductile iron fitting and coupling houses conforming to ASTM A536. Provide molded synthetic rubber gaskets with central cavity, pressure responsible configuration and conforming to ASTM D2000, for circulating medium up to 110 degrees C 230 degrees F. Provide grooved joints conforming to AWWA C606. Provide steel coupling nuts and bolts conforming to ASTM A183.

2.12.14 Dielectric Waterways and Flanges

Provide dielectric waterways that have temperature and pressure rating equal to or greater than that specified for the connecting piping. Provide waterways with metal connections on both ends suited to match connecting piping. Include dielectric unions to prevent current flow between dissimilar metals. Use dielectric flanges meeting the performance requirements described herein for dielectric waterways.

2.12.15 Flexible Pipe Connectors

Design flexible pipe connectors for 861.8 kPa 125 psi or 1034.2 kPa 150 psi service. Install connectors where indicated. Construct the flexible section of rubber, tetrafluoroethylene resin, or corrosion-resisting steel, bronze, monel, or galvanized steel. Use materials and configuration suitable for the pressure, vacuum, and temperature medium. The flexible section must be suitable for service intended and may have threaded, welded, soldered, flanged, or socket ends. Equip flanged assemblies with limit bolts to restrict maximum travel to the manufacturer's standard limits. Unless otherwise indicated, the length of the flexible connectors must be as recommended by the manufacturer for the service intended. Provide internal sleeves or liners, compatible with circulating medium, when recommended by the manufacturer. Provide covers to protect the bellows where indicated.

2.12.16 Pipe Supports

Provide pipe supports conforming to MSS SP-58.

2.12.17 Pipe Expansion

2.12.17.1 Expansion Loops

**************************************************************************
NOTE: Whenever possible, utilize expansion loops, offsets, and bends instead of expansion joints to absorb and to compensate for expansion and contraction. Coordination will be made with seismic bracing. Seismic bracing should not interfere with thermal expansion.
**************************************************************************
Expansion loops and offsets must provide adequate expansion of the main straight runs of the system within the stress limits specified in ASME B31.1. Provide cold-sprung loops and offsets and install where indicated. Provide pipe guides and anchors as indicated.

2.12.17.2 Expansion Joints

Expansion joints must provide for either single or double slip of the connected pipes, as required or indicated, and for no less than the transverse indicated. Design joints for a [hot water] [steam] working pressure no less than [_____] kPa psig and in accordance with applicable requirements of EJMA Stds and ASME B31.1. Provide flanged end connection. Provide anchor bases or support bases as indicated or required. Sliding surfaces and water wetted surfaces must be chromium plated or fabricated of corrosion resistant steel. Make initial setting in accordance with the manufacturer's recommendations to compensate for an ambient temperature at time of installation. Install pipe alignment guides as recommended by the joint manufacturer, but in any case do not install pipe alignment guides more than 1.5 m 5 feet from expansion joint, except in lines 100 mm 4 inches or do not install smaller guides more than 600 mm 2 feet from the joint. Provide service outlets where indicated.

2.12.17.2.1 Bellows-Type joint

Provide bellows-type joints that are flexible, guided expansion joints. Provide expansion element consisting of stabilized corrosion resistant steel. Provide bellows-type expansion joints conforming to the applicable requirements of EJMA Stds and ASME B31.1 with internal lines. Guiding of piping on both sides of expansion joint must be in accordance with the published recommendations of the manufacturer of the expansion joint. Design joints for the working temperature and pressure suitable for the application but no less than 1135 kPa 150 psig.

2.12.17.2.2 Flexible Ball Joint

Construct flexible ball joints of alloys as appropriate for the service intended. Provide threaded, grooved, flanged, or welded end joints as required that are capable of absorbing the normal operating axial, lateral, or angular movements or combination thereof. Provide polished, chromium-plated balls and sockets when materials are not of corrosion-resistant steel. Design and construct ball type joint in accordance with ASME B31.1 and EJMA Stds. Provide flanges conforming to the diameter and drilling of ASME B16.5. Provide molded gaskets suitable for the service intended.

2.12.17.2.3 Slip Type Expansion Joint

Provide EJMA Stds and ASME B31.1, Class 1 or 2 slip type expansion joints. Provide Type II joints which are suitable for repacking under full line pressure.

2.12.18 Valves

Provide Class 125 valves that are suitable for the application. Grooved ends in accordance with AWWA C606 may be used for water service only. Provide valves in nonboiler external piping meeting the material, fabrication and operating requirements of ASME B31.1. The connection type of all valves must match the same type of connection required for the piping on which installed.
2.12.18.1 Gate Valves

Provide gate valves 65 mm 2-1/2 inches and smaller conforming to MSS SP-80 bronze rising stem, threaded, soldered, or flanged ends. Provide gate valves 80 mm 3 inches and larger conforming to MSS SP-70 cast iron bronze trim, outside screw and yoke, flanged, or threaded ends.

2.12.18.2 Globe Valves

Provide globe valves 65 mm 2-1/2 inches and smaller conforming to MSS SP-80, bronze, threaded, soldered, or flanged ends. Provide globe valves 80 mm 3 inches and larger conforming to MSS SP-85, cast iron, bronze trim, flanged, or threaded ends.

2.12.18.3 Check Valves

Provide check valves 65 mm 2-1/2 inches and smaller conforming to MSS SP-80, bronze, threaded, soldered, or flanged ends. Provide check valves 80 mm 3 inches and larger conforming to MSS SP-71, cast iron, bronze trim, flanged, or threaded ends.

2.12.18.4 Angle Valves

Provide angle valves 65 mm 2-1/2 inches and smaller conforming to MSS SP-80 bronze, threaded, soldered, or flanged ends. Provide angle valves 80 mm 3 inches and larger conforming to MSS SP-85, cast iron, bronze trim, flanged, or threaded ends.

2.12.18.5 Ball Valves

Provide ball valves 15 mm 1/2 inch and larger conforming to [MSS SP-72] [or] [MSS SP-110], ductile iron or bronze, threaded, soldered, or flanged ends.

2.12.18.6 Plug Valves

Provide plug valves 51 mm 2 inch and larger conforming to MSS SP-78. Provide plug valves smaller than 51 mm 2 inch conforming to ASME B16.34.

2.12.18.7 Grooved End Valves

**************************************************************************
NOTE: Grooved end valves will not be allowed for steam piping.
**************************************************************************

Valves with grooved ends in accordance with AWWA C606 may be used if the valve manufacturer certifies that their performance meets the requirements of the standards indicated for each type of valve.

2.12.18.8 Balancing Valves

Provide balancing valves that have meter connections with positive shutoff valves. Provide an integral pointer to register the degree of valve opening. Calibrate valves so that flow rate can be determined when valve opening in degrees and pressure differential across valve is known. Construct each balancing valve with internal seals to prevent leakage and supply with preformed insulation. Provide valves that are suitable for 120
2.12.18.9 Automatic Flow Control Valves

NOTE: In any facility where technological and occupancy requirements indicate that load imbalances cannot be tolerated and there is a need for automatic control ensuring constant hydronic flow, the design will incorporate automatic flow-control valves indicating their location and capacity on the drawings. The required pump head will be shown on the drawings.

Utilize electric motor controls for new systems; thus, delete bracketed selection "or pneumatic type as applicable" for projects involving new systems.

In lieu of the specified balancing valves, automatic flow control valves may be provided to maintain constant flow and designed to be sensitive to pressure differential across the valve to provide the required opening. Select valves for the flow required and provide with a permanent nameplate or tag carrying a permanent record of the factory-determined flow rate and flow control pressure levels. Control the flow within 5 percent of the tag rating. Ensure valves are suitable for the maximum operating pressure of 850 kPa 125 psi or 150 percent of the system operating pressure, whichever is greater. Where the available system pressure is not adequate to provide the minimum pressure differential that still allows flow control, increase the system pump head capability. Ensure valves are suitable for 120 degrees C 250 degrees F temperature service. Use valve materials that are the same as specified for the heating system check, globe, angle, and gate valves. Provide electric motor type or pneumatic type as applicable valve operator. Provide valve operator that is capable of positive shutoff against the system pump head. Provide valve bodies with tapped openings and pipe extensions with shutoff valves outside of pipe insulation. Provide pipe extensions with quick connecting hose fittings for a portable meter to measure the pressure differential across the automatic flow control valve. Provide a portable meter with accessory kit as recommended for the project by the automatic valve manufacturer.

2.12.18.10 Butterfly Valves

Provide 2-flange type or lug wafer type butterfly valves, and make bubble tight at 1135 kPa 150 psig. Provide valve bodies consisting of cast iron, malleable iron, or steel. Provide ASTM A167, Type 404 or Type 316, corrosion resisting steel stems, bronze, or corrosion resisting steel discs, and synthetic rubber seats. Valves smaller than 200 mm 8 inches must have throttling handles with a minimum of seven locking positions. Valves 200 mm 8 inches and larger must have totally enclosed manual gear...
operators with adjustable balance return stops and position indicators. Provide valves in insulated lines with extended neck to accommodate insulation thickness.

2.12.18.11 Drain valves

Provide drain valves at each drain point of blowdown as recommended by the boiler manufacturer. Provide piping conforming to ASME BPVC SEC IV and ASTM A53/A53M.

2.12.18.12 Safety Valves

Provide safety valves with steel bodies and equip with corrosion-resistant trim and valve seats. The valves must be properly guided and positive closing so that no leakage can occur. Adjustment of the desired back-pressure must cover the range between 15 and 70 kPa 2 and 10 psig. Make the adjustment externally, and provide any shafts extending through the valve body with adjustable stuffing boxes having renewable packing. Install boiler safety valves of proper size and of the required number, in accordance with ASME BPVC SEC IV, so that the discharge will be through piping extended [to the blowoff tank] [to a location as indicated]. [Provide each discharge pipe for steam service with a drip pan elbow to prevent accumulation of water on the valve. Provide a slip joint between drip pan elbow and riser.] [Pitch each discharge pipe for hot water service away from the valve seat.]

2.12.19 Strainers

Provide basket and "Y" type strainers which are the same size as the pipelines in which they are installed. Provide strainer bodies that are heavy and durable, fabricated of cast iron, and drill and tap bottoms with a gate valve attached for blowdown purposes. Design strainers for [_____] kPa psig service and [_____] degrees C degrees F. Clearly cast arrows on the sides of bodies indicating the direction of flow. Equip each strainer with an easily removable cover and sediment screen. Make the screen of 0.795 mm 22 gauge thick [brass sheet] [monel] [corrosion-resistant steel] with small perforations numbering not less than 6,150/square m 400/square inch to provide a net free area through the basket of at least 3.30 times that of the entering pipe. The flow must be into the screen and out through the perforations.

2.12.20 Pressure Gauges

Provide gauges conforming to ASME B40.100 with throttling type needle valve or a pulsation dampener and shutoff valve. Provide minimum dial size of 90 mm 3-1/2 inches. Provide a pressure gauge for each boiler in a visible location on the boiler. Provide pressure gauges with readings in kPa psi. Provide pressure gauges with an indicating pressure range that is related to the operating pressure of the fluid in accordance with the following table:

<table>
<thead>
<tr>
<th>Operating Pressure (kPa) (psi)</th>
<th>Pressure Range (kPa) (psi)</th>
</tr>
</thead>
<tbody>
<tr>
<td>519-1030 76-150</td>
<td>0-1400 0-200</td>
</tr>
<tr>
<td>105-518 16-75</td>
<td>0-690 0-100</td>
</tr>
</tbody>
</table>
2.12.21 Thermometers

Provide thermometers with wells and separable corrosion-resistant steel sockets. Do not use mercury in thermometers. Provide thermometers for [inlet water and outlet water for each hot water boiler] [the feedwater for each steam boiler] in a visible location on the boiler. Provide thermometers with brass, malleable iron, or aluminum alloy case and frame, clear protective face, permanently stabilized glass tube with indicating-fluid column, white face, black numbers, and a minimum 225 mm 9 inch scale. The operating range of the thermometers must be 0-100 degrees C 32-212 degrees F. Provide thermometers with readings in degrees C F.

2.12.22 Air Vents

**************************************************************************
NOTE: Air vent locations will be indicated on drawings; distinguish between manual and automatic air vents.
**************************************************************************

2.12.22.1 Manual Air Vents

Manual air vents must be brass or bronze valves or cocks suitable for the pressure rating of the piping system and furnished with threaded plugs or caps.

2.12.22.2 Automatic Air Vents

Automatic air vents must be 19 mm 3/4 inch quick-venting float and vacuum air valves. Provide each air vent valve with a large port permitting the expulsion of the air without developing excessive back pressure, a noncollapsible metal float which will close the valve and prevent the loss of water from the system, an air seal that will effectively close and prevent the re-entry of air into the system when subatmospheric pressures prevail therein, and a thermostatic member that will close the port against the passage of steam from the system. Clearly stamp the name of the manufacturer on the outside of each valve. Ensure the air vent valve is suitable for the pressure rating of the piping system.

2.12.23 Steam Traps

**************************************************************************
NOTE: The design engineer, when designating steam using equipment or special steam applications, will indicate the type of steam trap required in accordance with the following data:
**************************************************************************

a. Inverted Bucket Traps: This type of trap continuously vents air and carbon dioxide at steam temperature and is recommended for modulating loads. The bucket floats on steam to close the outlet and sinks into condensate to open the condensate outlet. Any trapped air is discharged.

<table>
<thead>
<tr>
<th>Operating Pressure (kPa) (psi)</th>
<th>Pressure Range (kPa) (psi)</th>
</tr>
</thead>
<tbody>
<tr>
<td>14-104 2-15</td>
<td>0-210 0-30 (retard)</td>
</tr>
</tbody>
</table>
first into the condensate return line and is followed by condensate discharge. This type of trap has the longest life on systems under modulated control. When large amounts of air are anticipated, an external thermostatic air vent should be installed on a line bypassing the trap to bleed air from the steam line and discharge it to the condensate return line. This system will give optimum performance at low steam pressures with maximum dependability. These traps will handle condensate from fan coil units where condensate must be lifted to return lines located above the equipment. They operate best at near full load conditions where loads do not vary over a wide range. Before operation, traps must be primed by filling them with water.

b. Vertical Open-Top Bucket Trap: Trap construction is more complex than inverted bucket type but is suitable for applications having wide variation of load and pressure and is recommended for constant pressure systems. Bucket sinks into condensate when condensate reaches top of trap and the discharge port opens. After discharge, the bucket floats on incoming condensate keeping the discharge port closed.

c. Impact-Operated Traps: These traps depend on steam velocity to keep the disc closed. As steam velocity decreases, the disc lifts off the seat and allows flow of condensate. These traps allow some steam leakage and do not vent air at low pressure. They are not recommended for service lower than 69 kPa (10 psig) or where back pressure may exceed 50 percent of inlet pressure. These traps are less expensive and have poor performance in the presence of dirt.

d. Thermostatic Traps: These traps are bellows-actuated and contraction of bellows at a few degrees below saturated steam pressure allows condensate air and noncondensable gases to be discharged. As steam reaches the bellows the expansion of the bellows closes the discharge port. These traps can also be utilized to vent air from a steam system and can be used in conjunction with an inverted bucket steam trap previously described.

e. Float and Thermostatic Trap: These traps provide optimum performance on modulating systems at lowest first cost. Where steam pressures modulate down to zero, large amounts of air may be liberated. They are ideal for dripping ends of steam risers, heels of up-feed steam risers, bottoms of down-feed stem risers. These traps are also ideal for fan coil units and unit heaters.

f. Any trap selected must be sized for the expected condensate load with an applicable safety factor.
applied for the particular type of equipment serviced. Manufacturer’s application manuals should be consulted to assist in sizing traps. Safety factors vary from 2:1 to 10:1. An average 3:1 safety factor value will cover most applications.

g. Service life between repairs or replacement of traps may be a determining factor in the choice of traps. One manufacturer of all types of traps offers the following experience record:

<table>
<thead>
<tr>
<th>Type of Trap</th>
<th>Average Service Life Between Replacement or Repairs (months)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inverted bucket traps</td>
<td>42</td>
</tr>
<tr>
<td>Float and thermostatic traps</td>
<td>24</td>
</tr>
<tr>
<td>Thermostatic traps</td>
<td>24</td>
</tr>
<tr>
<td>Impact-operated traps</td>
<td>19</td>
</tr>
</tbody>
</table>

2.12.23.1 Thermostatic Traps

Provide thermostatic traps conforming to the requirements of ASTM F1139 and install in the return connection from each radiator and elsewhere as indicated. Install drip traps for mains, risers, and similar lines with a cooling leg of 1.50 m 5 feet of uncovered 19 mm 3/4 inch pipe. Base capacity of traps a pressure differential of 15 kPa 2 psi. Design traps for a steam working pressure of 100 kPa 15 psig but operate with a supply pressure of approximately 15 kPa 2 psig. The traps must be angle or straight-through pattern with union inlet connections as indicated. Provide brass trap bodies and covers. Valve mechanisms and seats must be monel, stainless steel or hard bronze and removable for servicing or replacement.

2.12.23.2 Float-and-Thermostatic Traps

Provide float-and-thermostatic traps conforming to the requirements of ASTM F1139 and design for a steam working pressure of 100 kPa 15 psig but operate with a supply pressure of approximately 34 kPa 5 psig. Base trap capacity on a pressure differential of 15 kPa 2 psig. Provide each float-and-thermostatic trap with a cast iron body and provide with a hard bronze, monel, or corrosion-resisting steel valve seat and mechanism, an open- or closed-type float of brass or equally corrosion-resistant metal, and a corrosion-resisting steel thermostatic air vent, all of which can be easily removed for inspection or replacement without disturbing the piping connections. The inlet to each trap must have a brass or stainless steel strainer, either as an integral part of the trap or as a separate item of equipment.

2.12.23.3 Inverted Bucket Traps

Provide inverted bucket traps conforming to the requirements of ASTM F1139 and design for a steam working pressure of 100 kPa 15 psig but operate with a supply pressure of approximately 35 kPa 5 psig. Provide each trap with a
cast iron body and a corrosion-resistant steel valve and seat and a brass or corrosion-resistant steel bucket, all of which can be easily removed for inspection or replacement without disturbing the piping connections. The inlet to each trap must have a brass or stainless steel strainer, either as an integral part of the trap or as a separate item of equipment.

2.13 ELECTRICAL EQUIPMENT

**************************************************************************

NOTE: Select standard efficiency for motors used less than 750 hours per year and high efficiency for motors used over 750 hours per year. The efficiency of each motor will be indicated in the equipment schedules.

**************************************************************************

Provide electric motor-driven equipment complete with motors, motor starters, and necessary control devices. Provide electrical equipment, motor control devices, motor efficiencies and wiring as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Ensure motors which are not an integral part of a packaged boiler and which are integral in size are the premium efficiency type in accordance with NEMA MG 1. Ensure motors which are an integral part of the packaged boiler are the highest efficiency available by the manufacturer of the packaged boiler. Provide motor starters complete with properly sized thermal overload protections and other appurtenances necessary for the motor control specified. Furnish starters in [general purpose][watertight][explosion-proof, Class I, division I] enclosures. Provide manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices that are not shown.

2.13.1 Motor Ratings

Motors must be suitable for the voltage and frequency provided. Motors 375 W 1/2 hp and larger must be three-phase, unless otherwise indicated. Provide motors of sufficient capacity to drive the equipment at the specified capacity without exceeding the nameplate rating on the motor.

2.13.2 Motor Controls

**************************************************************************

NOTE: Coordinate motor controls properly with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.
Coordinate with the electrical designer for power factors, service factors, and desired type of control.

**************************************************************************

Provide motor controllers complete with properly sized thermal overload protection. Provide manual or automatic control and protective or signal devices required for the operation specified and any wiring required to such devices. Where two-speed or variable-speed motors are indicated, solid-state variable-speed controllers may be provided to accomplish the same function. Utilize solid state variable speed controllers for fractional through 7.46 kW 10 hp ratings. Use adjustable frequency drives for larger motors.
2.14 INSULATION

Use shop and field-applied insulation as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.15 TOOLS

Furnish special tools. Include uncommon tools necessary for the operation and maintenance of boilers, burners, pumps, fans, controls, meters, special piping systems, and other equipment. Furnish small hand tools within a suitable cabinet, mounted where directed.

2.15.1 Breeching Cleaner

Provide a cleaner to clean the breeching. The cleaner must have a jointed handle of sufficient length to clean the breeching without dismantling.

2.15.2 Tube Cleaner

If a watertube boiler is being furnished, provide a water-driven tube cleaner with three rotary cutters and rotary wire brush complete with the necessary length of armored water hose, valves, and other appurtenances necessary for operation. Provide tube cleaner and rotary brush for each size of water tube in the boiler, with one extra set of cutters for each size cleaner. Provide necessary valves and fittings to permit ready connection of the cleaner hose to a high-pressure pump for cold water supply to operate the cleaner.

2.15.3 Tube Brush

If a firetube boiler is being furnished, provide a tube brush, with steel bristles and jointed handle of sufficient length to clean full length of firetubes.

2.15.4 Wrenches

Provide wrenches as required for specialty fittings such as manholes, handholes, and cleanouts. Provide one set of extra gaskets for all manholes and handholes, for pump barrels, and other similar items of equipment. Package and properly identify gaskets.

2.16 FUEL OIL STORAGE SYSTEM

Provide fuel oil storage system as specified in Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS unless noted otherwise. Provide a [helical wound coil constructed of 25 mm 1 inch seamless steel tubing] [plate coil suction bell heater constructed of carbon steel no lighter than 1.9 mm (14 gauge) 14 gauge] in each tank for No. 6 fuel oil and install around the suction end of the oil line. Provide coil in each tank with capacity to heat the fuel oil from [_____] to [_____] degrees C degrees F, during the maximum demand of all oil burners connected to the tank. The coil must utilize [steam at [_____] kPa psig] [hot water at [_____] degrees C degrees F] as the heating medium. Attach the heating coil inlet and outlet connections and the fuel-oil suction and return piping connections to the same tank manway cover. Provide an additional manhole located above the heater for removal of the heater as a unit.
2.17 BOILER WATER TREATMENT

NOTE: The chemical piping will be indicated on the drawing. Piping for external chemicals will be connected to the boiler feedwater. Piping for internal chemicals will be connected to the boiler drum. If steam is used for cooking or humidification, a separate heat exchanger will be required due to environmental constraints with the use of amines. The following items will not be required for hot water boilers: water softening system, chemical feed pumps, tanks, injection assemblies, water meters, water treatment control panel, and sequence of operation. The chemical shot feeder will not be required for steam boilers.

Submit [six] [_____] complete copies of the proposed water treatment plan. Include a layout, control scheme, a list of the existing water conditions including the items listed in this paragraph, a list of all chemicals, the proportion of chemicals to be added, the final treated water conditions, and a description of environmental concerns for handling the chemicals. The water treatment system must be capable of feeding chemicals and bleeding the system to prevent corrosion and scale within the boiler and piping distribution system. Submit [6] [_____] complete copies of operating and maintenance manuals for the step-by-step water treatment procedures, including procedures for testing the water quality. Treat the water to maintain the conditions recommended by the boiler manufacturer. Provide chemicals meeting required federal, state, and local environmental regulations for the treatment of boilers and discharge to the sanitary sewer. Use the services of a company regularly engaged in the treatment of boilers to determine the correct chemicals and concentrations required for water treatment. The company must maintain the chemical treatment and provide all chemicals required for a period of 1 year from the date of occupancy. Do not use filming amines and proprietary chemicals. The water treatment chemicals must remain stable throughout the operating temperature range of the system and must be compatible with pump seals and other elements of the system.

2.17.1 MakeUp Water Analysis

NOTE: A water analysis may be available from the user. If an analysis is not available, an analysis will be performed during the design, and appropriate data will be entered.

The makeup water conditions reported as prescribed in ASTM D596 are as follows:

<table>
<thead>
<tr>
<th>Date of Sample</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>[_____] degrees C degrees F</td>
</tr>
<tr>
<td>Silica (SiO2)</td>

### Iron and Aluminum Oxides
- [_____] ppm (mg/l)

### Calcium (Ca)
- [_____] ppm (mg/l)

### Magnesium (Mg)
- [_____] ppm (mg/l)

### Sodium and Potassium (Na and K)
- [_____] ppm (mg/l)

### Carbonate (HCO3)
- [_____] ppm (mg/l)

### Sulfate (SO4)
- [_____] ppm (mg/l)

### Chloride (Cl)
- [_____] ppm (mg/l)

### Nitrate (NO3)
- [_____] ppm (mg/l)

### Turbidity
- [_____] ntu

### pH
- [_____] micro-mho/cm

### Conductivity
- [_____] ppm (mg/l)

#### 2.17.2 Boiler Water Limits

**NOTE:** The material contained within the first set of brackets will be used for steam boilers. The material contained within the second set of brackets will be used for hot water boilers.

Consult the boiler manufacturer for the determination of the boiler water chemical composition limits. The boiler water limits are as follows unless dictated differently by the boiler manufacturer's recommendations:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Causticity</td>
<td>20-200 ppm</td>

<td>20-40 ppm</td>
</tr>
<tr>
<td>Hardness</td>
<td>Less than 2 ppm</td>
</tr>
<tr>
<td>pH</td>
<td>9.3 - 9.9</td>
</tr>
</tbody>
</table>

2.17.3 Water Softening System

**************************************************************************
NOTE: The makeup water analysis and the boiler manufacturer's recommended feed water conditions will be used to determine the need for a water softener. UFC 3-230-03 contains general guidance for the selection.
**************************************************************************

Provide water softening system as specified in Section 22 31 00 WATER SOFTENERS, CATION-EXCHANGE (SODIUM CYCLE).

2.17.4 Chemical Feed Pumps

**************************************************************************
NOTE: The required maximum pump flow rate will be shown on the drawings. The flow rate will depend upon the makeup water flow rate and the chemical composition of the makeup water. A water treatment company should be consulted for determining the proper maximum pump flow rate.
**************************************************************************

Provide one pump for each chemical feed tank. Provide positive displacement diaphragm type chemical feed pumps. The capacity of the pumps must be adjustable from 0 to 100 percent while in operation. The discharge pressure of the pumps must not be less than 1.5 times the pressure at the point of connection. Provide pumps with a pressure relief valve and a check valve mounted in the pump discharge.
2.17.5 Tanks

**************************************************************************
NOTE: A water treatment company will be consulted to determine the number of tanks required. The number will depend on the size of the boiler, makeup water flow rate, and makeup water composition. A water line will be provided near the tanks for the mixing of chemicals.
**************************************************************************

Construct tanks of [high density polyethylene] [stainless steel] with a hinged cover. Provide tanks with sufficient capacity to require recharging only once per 7 days during normal operation. Include a level indicating device with each tank. Provide an electric agitator for each tank.

2.17.6 Injection Assemblies

Provide an injection assembly at each chemical injection point located along the boiler piping as indicated. Construct the injection assemblies of stainless steel. Extend the discharge of the assemblies to the centerline of the piping. Include a shutoff valve and check valve at the point of entrance into the water line with each assembly.

2.17.7 Water Meter

Provide water meter with an electric contacting register and remote accumulative counter. Install the meter within the makeup water line, as indicated.

2.17.8 Water Treatment Control Panel

**************************************************************************
NOTE: The MAN-OFF-AUTO switch should be deleted for continuously fed systems.
**************************************************************************

Provide a NEMA 12, single door, wall-mounted box conforming with NEMA 250 control panel. Construct the panel of [steel] [stainless steel] with a hinged door and lock. The panel must contain, as a minimum, the following functions identified with a laminated plastic nameplate:

a. Main power switch and indicating light
b. MAN-OFF-AUTO selector switch
c. Indicating lamp for blow down
d. Indicating lamp for each chemical feed pump
e. Indicating lamp for the water softener

2.17.9 Sequence of Operation

**************************************************************************
NOTE: Manually set flow rates should only be used when fluctuations in steam demand and makeup water are not expected. Typically, automatic blowdown will be economical for boilers with capacities
**************************************************************************
greater than 2.9 MW 10,000,000 Btuh.

Base the flow rate of chemical addition upon [metering the makeup water.] [a manual setting.] Provide the boiler with [continuous blowdown.] [automatic blowdown based upon conductivity or boiler load.] Determine the required rate of chemical feed and boiler blowdown by the water treatment company.

2.17.10 Chemical Shot Feeder

Provide a shot feeder as indicated. Base size and capacity of feeder upon local requirements and water analysis. Furnish the feeder with an air vent, gauge glass, funnel, valves, fittings, and piping.

2.17.11 Chemical Piping

NOTE: If steel piping is selected, an interior coating may be required depending upon the chemicals used.

Construct piping and fittings of [schedule 80 PVC] [steel] [stainless steel].

2.17.12 Test Kits

Provide one test kit of each type required to determine the water quality as outlined within the operation and maintenance manuals.

2.17.13 Glycol Feed System

Design the Glycol feed system to automatically maintain the desired glycol content of the closed water recirculation system(s). Each system must consist of the following components:

2.17.13.1 Supply Tank and Stand

Include a 200 liter/50 gallon cross lined polyethylene tank and steel support stand. Provide tank with a cover and bottom outlet fitting for pump suction. Equip the tank stand with a pump mounting platform and support for the control panel and level switch.

2.17.13.2 Glycol Pump

Rotary gear type of bronze construction with a capacity of 0.114 liter/sec 1.8 gpm at 275.8 kPa40 psi. Provide pump with a 0.35 kw1/3 horsepower, 1/115V/60hz motor and internal pressure relief. Provide the pump with a discharge check valve and shutoff valve.

2.17.13.3 Pressure Switch

Provide pressure switch that is adjustable over the range of 20.7 - 103.4 kPa3 - 15 psi with a 42.4 kPa6 psi differential and have contacts rated for 115V.
2.17.13.4 Level Switch

Equipped with N/O and N/C contacts to activate upon sensing a low level condition.

2.17.13.5 Control Panel

Install the control panel in a NEMA 1 enclosure with terminal strip and include a red low level alarm light, low level alarm bell and silence button, full voltage motor starter for the glycol pump, and a Hand-Off-Auto selector switch.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with details of the work, verify dimensions in the field, and advise the Contracting Officer of any discrepancy before performing any work or ordering any materials.

3.2 ERECTION OF BOILER AND AUXILIARY EQUIPMENT

**************************************************************************
NOTE: Consult boiler manufacturers for foundation requirements. Delete the requirement for packing the joint between the boiler and floor with nonasbestos rope, if not required. This packing is typically not required for smaller units.
**************************************************************************

Install boiler and auxiliary equipment in accordance with manufacturer's written instructions. Make proper provision for expansion and contraction between boiler foundation and floor. Pack this joint with suitable nonasbestos rope and fill with suitable compound that will not become soft at a temperature of 40 degrees C 100 degrees F. Support boilers and firing equipment from the foundations by structural steel completely independent of all brickwork. Boiler supports must permit free expansion and contraction of each portion of the boiler without placing undue stress on any part of the boiler or setting. Boiler breeching must be as indicated with full provision for expansion and contraction between all interconnected components.

3.3 PIPING INSTALLATION

Unless otherwise specified, provide nonboiler external pipe and fittings conforming to the requirements of ASME B31.1. Cut pipe accurately to suit field conditions, install without springing or forcing, and properly clearing windows, doors, and other openings. Cutting or other weakening of the building structure to facilitate piping installation will not be permitted. Provide pipes that are free of burrs, oil, grease and other foreign material and install to permit free expansion and contraction without damaging the building structure, pipe, pipe joints, or pipe supports. Make changes in direction with fittings, except that bending of pipe 100 mm 4 inches and smaller will be permitted provided a pipe bender is used and wide sweep bends are formed. The centerline radius of bends must not be less than 6 diameters of the pipe. Bent pipe showing kinks, wrinkles, flattening, or other malformations will not be accepted. Carry vent pipes through the roof as directed and flash properly. Unless otherwise indicated, pitch horizontal supply mains down in the direction of
flow with a grade of no less than 0.2 percent 1 inch in 40 feet. Properly cap or plug open ends of pipelines and equipment during installation to keep dirt or other foreign materials out of the systems. Pipe not otherwise specified must be uncoated. Unless otherwise specified or shown, make final connections to equipment with malleable-iron unions for steel pipe 65 mm 2-1/2 inches or less in diameter and with flanges for pipe 80 mm 3 inches or more in diameter. Provide brass or bronze unions for copper pipe or tubing. Use reducing fittings for changes in pipe sizes. In horizontal hot water lines, use eccentric type reducing fittings to maintain the top of the lines at the same level to prevent air binding.

3.3.1 Hot Water Piping and Fittings

Pipe must be black steel or copper tubing. Fittings for steel piping must be black malleable iron or cast iron to suit piping. Fittings adjacent to valves must suit valve material. Grooved mechanical fittings will not be allowed for water temperatures above 110 degrees C 230 degrees F.

3.3.2 Vent Piping and Fittings

Provide black steel vent piping. Fittings must be black malleable iron or cast iron to suit piping.

3.3.3 Gauge Piping

Piping must be copper tubing.

3.3.4 Steam Piping and Fittings

Provide black steel piping. Provide black, malleable iron, cast iron or steel fittings. Fittings adjacent to valves must suit valves specified. Grooved mechanical fittings will not be allowed for steam piping.

3.3.5 Condensate Return Pipe and Fittings

Provide black steel piping. Provide malleable iron, cast iron, or steel fittings. Grooved mechanical fittings will not be allowed for condensate piping.

3.3.6 Joints

Provide threaded, grooved, flanged or welded joints between sections of steel pipe and between steel pipe and fittings as indicated or specified. Except as otherwise specified, fittings 25 mm 1 inch and smaller must be threaded; fittings 32 mm 1-1/4 inches and up to but not including 80 mm 3 inches must be either threaded, grooved, or welded; and fittings 80 mm 3 inches and larger must be either flanged, grooved, or welded. Weld pipe and fittings 32 mm 1-1/4 inches and larger installed in inaccessible conduit or trenches beneath concrete floor slabs. Make connections to equipment with black malleable-iron unions for pipe 65 mm 2-1/2 inches or smaller in diameter and with flanges for pipe 80 mm 3 inches or larger in diameter. Provide flared, soldered, or brazed joints between sections of copper tubing or pipe.

3.3.6.1 Threaded Joints

Make threaded joints with tapered threads properly cut and make perfectly tight with a stiff mixture of graphite and oil or with polytetrafluoroethylene tape applied to the male threads only and in no
3.3.6.2 Welded Joints

Weld joints in accordance with paragraph GENERAL REQUIREMENTS unless otherwise specified. Make changes in direction of piping with welding fittings only; mitering or notching pipe to form elbows and tees or other similar type construction will not be permitted. Branch connections may be made with either welding tees or forged branch outlet fittings, either being acceptable without size limitation. Branch outlet fittings, where used, must be forged, flared for improved flow characteristics where attached to the run, reinforced against external strains, and designed to withstand full pipe bursting strength. Assemble socket weld joints so that the space between the end of the pipe and the bottom of the socket is no less than 1.5 mm 1/16 inch and no more than 3 mm 1/8 inch.

3.3.6.3 Grooved Mechanical Joints

Grooved mechanical joints may be provided for hot water systems in lieu of unions, welded, flanged, or screwed piping connections in low temperature hot water systems where the temperature of the circulating medium does not exceed 110 degrees C 230 degrees F. Prepare grooves according to the coupling manufacturer's instructions. Use pipe and groove dimensions in compliance with the tolerances specified by the coupling manufacturer. Measure the diameter of grooves made in the field using a "go/no-go" gauge, vernier or dial caliper, narrow-land micrometer or other method specifically approved by the coupling manufacturer for the intended application. Measure and record groove width and dimension of groove from end of pipe for each change in grooving tool setup to verify compliance with coupling manufacturer's tolerances. Do not use grooved joints in concealed locations. Mechanical joints must use rigid mechanical pipe couplings, except at equipment connections. At equipment connections, flexible couplings may be used. Provide bolted type coupling for use with grooved end pipes, fittings, valves, and strainers. Provide self-centering couplings that engage in a watertight couple.

3.3.6.4 Flared and Brazed Copper Pipe and Tubing

Cut tubing square, and remove burrs. Clean both inside of fittings and outside of tubing thoroughly with sand cloth or steel wire brush before brazing. Annealing of fittings and hard-drawn tubing must not occur when making connections. Install in accordance with the manufacturer's recommendations. Mitering of joints for elbows and notching of straight runs of pipe for tees will not be permitted. Make brazed joints in conformance with AWS B2.2/B2.2M and CDA A4015 with flux. Copper-to-copper joints must include the use of copper-phosphorous or copper-phosphorous-silver brazing metal without flux. Brazing of dissimilar metals (copper to bronze or brass) must include the use of flux with either a copper-phosphorous, copper-phosphorous-silver or a silver brazing filler metal. Joints for flared fittings must be of the compression pattern. Provide swing joints or offsets in all branch connections, mains, and risers to provide for expansion and contraction forces without undue stress to the fittings or to short lengths of pipe or tubing. Provide flared or brazed copper tubing to pipe adapters where necessary for joining threaded pipe to copper tubing.

3.3.6.5 Soldered Joints

Make soldered joints with flux and are only acceptable for lines 50 mm 2
inches and smaller. Provide soldered joints conforming to ASME B31.5 and CDA A4015.

3.3.6.6 Copper Tube Extracted Joint

An extruded mechanical tee joint may be made in copper tube. Produce joint with an appropriate tool by drilling a pilot hole and drawing out the tube surface to form a collar having a minimum height of three times the thickness of the tube wall. To prevent the branch tube from being inserted beyond the depth of the extracted joint, provide dimpled depth stops. Notch the branch tube for proper penetration into fitting to assure a free flow joint. Braze extracted joints using a copper phosphorous classification brazing filler metal. Soldered joints will not be permitted.

3.3.7 Flanges and Unions

Provide faced true flanges with 1.6 mm 1/16 inch thick gaskets, and make square and tight. Where steel flanges mate with cast-iron flanged fittings, valves, or equipment, provide flanges with flat faces and full face gaskets. Provide union or flange joints in each line immediately preceding the connection to each piece of equipment or material requiring maintenance such as coils, pumps, control valves, and other similar items. Provide dielectric pipe unions between ferrous and nonferrous piping to prevent galvanic corrosion. Use dielectric unions with metal connections on both ends. The ends must be threaded, flanged, or brazed to match adjacent piping. Separate the metal parts of the union so that the electrical current is below 1 percent of the galvanic current which would exist upon metal-to-metal contact. Install gaskets, flanges, and unions in accordance with manufacturer's recommendations.

3.3.8 Branch Connections

**************************************************************************
NOTE: Select the appropriate type of branch connections and delete those which are not required.
**************************************************************************

3.3.8.1 Branch Connections for Hot Water Systems

Pitch branches from the main up or down as shown to prevent air entrapment. Connections must ensure unrestricted circulation, eliminate air pockets, and permit complete drainage of the system. Pitch branches with a grade of no less than 8 mm in 1 m 1 inch in 10 feet. When indicated, install special flow fittings on the mains to bypass portions of the water through each radiator. Use special flow fittings that are standard catalog products and install as recommended by the manufacturer.

3.3.8.2 Branch Connections for Steam Systems

Take branches from the supply mains at an angle of 45 degrees above the horizontal, unless otherwise indicated. Take branches from return mains from the top or sides, unless indicated otherwise. Pitch branches up from the mains toward the undripped risers or radiator connections with a grade of no less than 8 mm in 1 m 1 inch in 10 feet. Connections must ensure unrestricted circulation, eliminate air pockets, and permit the complete drainage of the system.
3.3.9 Steam Connections to Equipment

**************************************************************************
NOTE: Delete this paragraph if steam connections are not required.
**************************************************************************
Provide steam supply and return connections as shown. Make connections with malleable-iron unions or with steel flanges, to match equipment. Install valves and traps in accordance with the manufacturer's recommendations. The size of the supply and return pipes to each piece of equipment must not be smaller than the outlets on the equipment.

3.3.10 Steam Risers

**************************************************************************
NOTE: Delete this paragraph if steam risers are not required.
**************************************************************************
The location of risers is approximate. The exact locations of the risers must be approved. Terminate downfeed risers in a dirt pocket and drip through a trap to the return line.

3.3.11 Air Vents for Steam Systems

**************************************************************************
NOTE: Delete this paragraph if a steam system is not utilized.
**************************************************************************
Install automatic balanced pressure thermostatic air vents at the ends of the steam lines and where shown on the drawings. Use vents that are rated for 862 kPa 125 psi steam service. Route the outlet of the vent to a point designated by the Contracting Officer's Representative. Provide inlet line with a gate valve or ball valve.

3.3.12 Flared, Brazed, and Soldered Copper Pipe and Tubing

Provide flared, brazed, or soldered copper tubing. Cut tubing square, and remove burrs. Clean both inside of fittings and outside of tubing thoroughly with sand cloth or steel wire brush before brazing. Annealing of fittings and hard-drawn tubing must not occur when making connections. Install in accordance with the manufacturer's recommendations. Mitering of joints for elbows and notching of straight runs of pipe for tees will not be permitted. Joints for flared fittings must be of the compression pattern. Provide swing joints or offsets on branch connections, mains, and risers to provide for expansion and contraction forces without undue stress to the fittings or to short lengths of pipe or tubing. Provide pipe adapters where necessary for joining threaded pipe to copper tubing. Make brazed joints in conformance with CDA A4015. Copper-to-copper joints must include the use of copper-phosphorous or copper-phosphorous-silver brazing metal without flux. Brazing of dissimilar metals (copper to bronze or brass) must include the use of flux with either a copper-phosphorous, copper-phosphorous-silver, or a silver brazing filler metal. Make soldered joints with flux and are only acceptable for lines 50 mm 2 inches or smaller. Provide soldered joints conforming to ASME B31.5 and in accordance with CDA A4015.
3.3.13 Copper Tube Extracted Joint

An extracted mechanical tee joint may be made in copper tube. Produce joint with an appropriate tool by drilling a pilot hole and drawing out the tube surface to form a collar having a minimum height of three times the thickness of the tube wall. To prevent the branch tube from being inserted beyond the depth of the extracted joint, provide dimpled depth stops. Notch the branch tube for proper penetration into fitting to assure a free flow joint. Braze extracted joints using a copper phosphorous classification brazing filler metal. Soldered joints will not be permitted.

3.3.14 Supports

Fabricate hangers used to support piping 50 mm 2 inches and larger to permit adequate adjustment after erection while still supporting the load. Install pipe guides and anchors to keep pipes in accurate alignment, to direct the expansion movement, and to prevent buckling, swaying, and undue strain. Support piping subjected to vertical movement when operating temperatures exceed ambient temperatures by variable spring hangers and supports or by constant support hangers. Do not use formed or bent threaded rods for support. Do not attach supports to the underside of concrete filled floors or concrete roof decks unless approved by the Contracting Officer.

3.3.14.1 Seismic Requirements for Supports and Structural Bracing

**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (either Corps Office of A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if no seismic requirements are provided. Section 13 48 73, properly edited, must be included in the contract documents.
**************************************************************************

Support and brace piping and attached valves to resist seismic loads as specified in Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT [and ] [as shown on the drawings]. Provide structural steel required for reinforcement to properly support piping, headers, and equipment, but not shown, in this section. Use material for supports as specified in Section 05 12 00 STRUCTURAL STEEL.

3.3.14.2 Pipe Hangers, Inserts, and Supports

**************************************************************************
NOTE: Details of pipe supports in trenches will be shown on the drawings. Mechanical and electrical layout drawings and specifications for ceiling suspensions should contain notes indicating that hanger loads between panel points in excess of 225 N 50 pounds must have the excess hanger loads suspended from panel points.
**************************************************************************

Provide pipe hangers, inserts, and supports conforming to MSS SP-58, except as modified herein.
3.3.14.2.1 Types 5, 12, and 26

Use of Types 5, 12, and 26 is prohibited.

3.3.14.2.2 Type 3

Do not use Type 3 on insulated pipe which has a vapor barrier. Type 3 may be used on insulated pipe that does not have a vapor barrier if clamped directly to the pipe, if the clamp bottom does not extend through the insulation, and if the top clamp attachment does not contact the insulation during pipe movement.

3.3.14.2.3 Type 18

Secure Type 18 inserts to concrete forms before concrete is placed. Continuous inserts which allow more adjustment may be used if they otherwise meet the requirements for Type 18 inserts.

3.3.14.2.4 Type 19 and 23 C-Clamps

Torque Type 19 and 23 C-clamps in accordance with MSS SP-58 and have both locknuts and retaining devices furnished by the manufacturer. Field fabricated C-clamp bodies or retaining devices are not acceptable.

3.3.14.2.5 Type 20 Attachments

Furnish Type 20 attachments used on angles and channels with an added malleable-iron heel plate or adapter.

3.3.14.2.6 Type 24

Type 24 may be used only on trapeze hanger systems or on fabricated frames.

3.3.14.2.7 Horizontal Pipe Supports

Space horizontal pipe supports as specified in MSS SP-58 and do not install a support over 300 mm 1 foot from the pipe fitting joint at each change in direction of the piping. Do not space pipe supports over 1500 mm 5 feet apart at valves.

3.3.14.2.8 Vertical Pipe Support

Support vertical pipe at each floor, except at slab-on-grade, and at intervals of no more than 4500 mm 15 feet, no more than 2400 mm 8 feet from end of risers, and at vent terminations.

3.3.14.2.9 Type 35 Guides

Provide Type 35 guides using steel, reinforced polytetrafluoroethylene (PTFE) or graphite slides where required to allow longitudinal pipe movement. Provide lateral restraints as required. Provide slide materials suitable for the system operating temperatures, atmospheric conditions, and bearing loads encountered.

a. Where steel slides do not require provisions for restraint of lateral movement, an alternate guide method may be used. On piping 100 mm 4 inches and larger, a Type 39 saddle may be welded to the pipe and freely rested on a steel plate. On piping under 100 mm 4 inches, a Type 40 protection shield may be attached to the pipe or insulation and
freely rested on a steel slide plate.

b. Where there are high system temperatures and welding to piping is not desirable, include a pipe cradle welded to the guide structure and strapped securely to the pipe. Separate the pipe from the slide material by at least \textit{100 mm 4 inches} or by an amount adequate for the insulation, whichever is greater.

3.3.14.2.10 Horizontal Insulated Pipe

Except for Type 3, pipe hangers on horizontal insulated pipe must be the size of the outside diameter of the insulation.

3.3.14.2.11 Piping in Trenches

Support piping in trenches as indicated.

3.3.14.2.12 Structural Steel Attachments

Provide structural steel attachments and brackets required to support piping, headers, and equipment, but not shown, under this section. Provide material and installation as specified under Section 05 12 00 STRUCTURAL STEEL. Do not exceed \textit{22 kg 50 pounds} for pipe hanger loads suspended from steel joist between panel points. Suspend loads exceeding \textit{22 kg 50 pounds} from panel points.

3.3.14.3 Multiple Pipe Runs

In the support of multiple pipe runs on a common base member, use a clip or clamp where each pipe crosses the base support member. Spacing of the base support member must not exceed the hanger and support spacing required for any individual pipe in the multiple pipe run. Attach the clips or clamps rigidly to the common base member. Provide a clearance of \textit{3 mm 1/8 inch} between the pipe insulation and the clip or clamp for piping which may be subjected to thermal expansion.

3.3.15 Anchors

**************************************************************************
NOTE: Anchors will be coordinated with seismic bracing. Seismic bracing should not interfere with the thermal expansion design.
**************************************************************************

Provide anchors where necessary to localize expansion or to prevent undue strain on piping. Provide anchors consisting of heavy steel collars with lugs and bolts for clamping and attaching anchor braces, unless otherwise indicated. Install anchor braces in the most effective manner to secure the desired results, using turnbuckles where required. Do not attach supports, anchors, or stays where they will injure the structure or adjacent construction during installation or by the weight of expansion of the pipeline.

3.3.16 Valves

Install valves where indicated, specified, and required for functioning and servicing of the systems. Ensure valves are safely accessible. Install swing check valves upright in horizontal lines and in vertical lines only when flow is in the upward direction. Install gate and globe valves with
stems horizontal or above. Disassemble valves to be brazed prior to brazing and remove all packing. After brazing, allow the valves to cool before reassembling.

3.3.17 Pipe Sleeves

Provide pipe passing through concrete or masonry walls or concrete floors or roofs with pipe sleeves fitted into place at the time of construction. Install a waterproofing clamping flange as indicated where membranes are involved. Do not install sleeves in structural members except where indicated or approved. Provide rectangular and square openings as detailed. Extend each sleeve through its respective wall, floor, or roof. Cut sleeves through walls flush with wall surface. Sleeves through floors must [be cut flush with floor surface] [extend above top surface of floor a sufficient distance to allow proper flashing or finishing]. Extend sleeves through roofs above the top surface of roof at least 150 mm 6 inches for proper flashing or finishing. Unless otherwise indicated, size sleeves to provide a minimum clearance of 6 mm 1/4 inch between bare pipe and sleeves or between jacket over insulation and sleeves. Use galvanized steel pipe or cast-iron pipe sleeves in waterproofing membrane floors, bearing walls, and wet areas. Sleeves in nonbearing walls, floors, or ceilings may be galvanized steel pipe, cast-iron pipe, or galvanized sheet metal with lock-type longitudinal seam. Except in pipe chases or interior walls, seal the annular space between pipe and sleeve or between jacket over insulation and sleeve in nonfire rated walls as indicated and specified in Section 07 92 00 JOINT SEALANTS. Provide metal jackets over insulation passing through exterior walls, firewalls, fire partitions, floors, or roofs.

a. Metal jackets must not be thinner than 0.1524 mm 0.006 inch thick aluminum, if corrugated, and 0.4 mm 0.016 inch thick aluminum, if smooth.

b. Secure metal jackets with aluminum or stainless steel bands not less than 9 mm 3/8 inch wide and not more than 200 mm 8 inches apart. When penetrating roofs and before fitting the metal jacket into place, run a 13 mm 1/2 inch wide strip of sealant vertically along the inside of the longitudinal joint of the metal jacket from a point below the backup material to a minimum height of 1000 mm 36 inches above the roof. If the pipe turns from vertical to horizontal, run the sealant strip to a point just beyond the first elbow. When penetrating waterproofing membrane for floors, extend the metal jacket from a point below the back-up material to a minimum distance of 50 mm 2 inches above the flashing. For other areas, extend the metal jacket from a point below the backup material to a point 300 mm 12 inches above material to a minimum distance of 50 mm 2 inches above the flashing. For other areas, extend the metal jacket from a point below the backup material to a point 300 mm 12 inches above the floor; when passing through walls above grade, extend the jacket at least 100 mm 4 inches beyond each side of the wall.

3.3.17.1 Pipes Passing Through Waterproofing Membranes

In addition to the pipe sleeves referred to above, provide pipes passing through waterproofing membranes with a 1.6 mm 4 pound lead flashing or a 0.55 mm 16 ounce copper flashing, each within an integral skirt or flange. Suitably form flashing, and extend the skirt or flange no less than 200 mm 8 inches from the pipe and set over the membrane in a troweled coating of bituminous cement. Extend the flashing above the roof or floor a minimum of 250 mm 10 inches. Seal the annular space between the flashing and the
bare pipe or between the flashing and the metal-jacket-covered insulation as indicated. Pipes up to and including 250 mm 10 inches in diameter which pass through waterproofing membrane may be installed through a cast-iron sleeve with caulking recess, anchor lugs, flashing clamp device, and pressure ring with brass bolts. Clamp waterproofing membrane into place and place sealant in the caulking recess.

3.3.17.2 Optional Modular Mechanical Sealing Assembly

At the option of the Contractor, a modular mechanical type sealing assembly may be installed in the annular space between the sleeve and conduit or pipe in lieu of a waterproofing clamping flange and caulking and sealing specified above. Provide seals with interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe/conduit and sleeve with corrosion-protected carbon steel bolts, nuts, and pressure plates. Assemble the links loosely with bolts to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and each nut. After the seal assembly is properly positioned in the sleeve, tighten the bolt to cause the rubber sealing elements to expand and provide a watertight seal between the pipe/conduit and the sleeve. Size each seal assembly as recommended by the manufacturer to fit the pipe/conduit and sleeve involved.

3.3.17.3 Optional Counterflashing

As alternates to caulking and sealing the annular space between the pipe and flashing or metal-jacket-covered insulation and flashing, counterflashing may consist of standard roof coupling for threaded pipe up to 150 mm 6 inches in diameter, lead flashing sleeve for dry vents with the sleeve turned down into the pipe to form a waterproof joint, or a tack-welded or banded-metal rain shield around the pipe, sealed as indicated.

3.3.17.4 Fire Seal

Where pipes pass through firewalls, fire partitions, or floors, provide a fire seal as specified in Section 07 84 00 FIRESTOPPING.

3.3.18 Balancing Valves

Install balancing valves as indicated.

3.3.19 Thermometer Wells

Provide a thermometer well in each return line for each circuit in multicircuit systems.

3.3.20 Air Vents

Install air vents in piping at all system high points. Keep the vent open until water rises in the tank or pipe to a predetermined level at which time it must close tight. Run an overflow pipe from the vent to a point designated by the Contracting Officer's representative. Provide inlet to the air vent with a gate valve or ball valve.

3.3.21 Escutcheons

Provide escutcheons at all finished surfaces where exposed piping, bare or insulated, passes through floors, walls, or ceilings except in boiler,
utility, or equipment rooms. Fasten chromium-plated iron or chromium-plated brass, either one-piece or split pattern, escutcheons securely to pipe or pipe covering and hold in place by internal spring tension or setscrews.

3.3.22 Drains

Install a drain connection with a 25 mm 1 inch gate valve or 19 mm 3/4 inch hose bib at the lowest point in the return main near the boiler. In addition, install threaded drain connections with threaded cap or plug on the heat exchanger coil on each unit heater or unit ventilator and wherever required for thorough draining of the system.

3.3.23 Strainer Blow-Down Piping

Fit strainer blow-down connections with a black steel blow-down pipeline routed to an accessible location and provided with a blow-down valve.

3.3.24 Direct Venting for Combustion Intake Air and Exhaust Air

**************************************************************************
NOTE: Delete this paragraph if condensing boilers are not used.
**************************************************************************

Install intake air and exhaust vents in accordance with NFPA 54 and boiler manufacturer's recommendations. Slope exhaust vent 20.8 mm/m 1/4 inch/ft toward the boiler's flue gas condensate collection point.

3.4 GAS FUEL SYSTEM

Provide gas piping, fittings, valves, regulators, tests, cleaning, and adjustments in accordance with the Section 23 11 20 FACILITY GAS PIPING. Submit proposed test schedules for the heating system and fuel system tests, at least 2 weeks prior to the start of related testing. Comply with NFPA 54 unless otherwise specified. Provide burners, pilots, and all accessories that are listed in UL FLAMMABLE & COMBUSTIBLE. Provide fuel system with a gas tight, manually operated, UL listed stop valve at the gas-supply connections, a gas strainer, a pressure regulator, pressure gauges, a burner-control valve, a safety shutoff valve suitable for size of burner and sequence of operation, and other components required for safe, efficient, and reliable operation as specified. Provide approved permanent and ready facilities to permit periodic valve leakage tests on the safety shutoff valve or valves.

3.5 FUEL OIL SYSTEM

Install fuel oil system in accordance with NFPA 31, unless otherwise indicated.

3.5.1 Piping and Storage Tank

Install fuel oil piping and storage tanks in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS, unless indicated otherwise.

3.5.2 Fuel-Oil Storage Tank Heating-Coil Piping

Install supply and return piping and fittings for the heating coil in accordance with paragraph PIPING INSTALLATION. Provide [hot water] [steam]
supply line to the heating coil with an automatic temperature-control valve, a strainer and a three-valve bypass. Provide return line from the coil with a [check valve] [steam trap] and a block valve.

3.5.3 Automatic Safety Shutoff Valve

Equip oil supply line to each oil burner with an automatically operated valve designed to shut off the oil supply in case of fire in the immediate vicinity of the burner. Provide thermoelectrically actuated or thermomechanically actuated type valve and locate immediately downstream of the manual shutoff valve at the day tank inside of the building. If a day tank is not used, locate the automatic safety valve immediately downstream of the building shutoff devices where oil supply line enters the building. Locate a thermoelectrical or thermomechanical detection device over the oil burner to activate the valve. A fire shutoff valve may be combined with other automatic shutoff devices if listed in UL FLAMMABLE & COMBUSTIBLE.

3.5.4 Earthwork

Perform excavation and backfilling for tanks and piping as specified in Section 31 00 00 EARTHWORK.

3.6 RADIANT FLOOR HEATING SYSTEM

Install radiant floor heating system in accordance with HI-004, unless otherwise indicated by the tubing manufacturer's installation instructions. During the installation, plug all tubing on each end to prevent foreign materials from entering the tubing. Check all tubing for abrasions prior to installation. Tubing with excessive abrasions that damage the oxygen barrier coating will not be acceptable. Tubing with any abrasion that is greater than 10 percent of the minimum wall thickness will not be acceptable. Install all tubing embedded or concealed by the floor without joints. The bending radius of the tubing must not exceed the values recommended by the tubing manufacturer. Install tubing in such a manner as to evenly distribute the heat across the floor. Do not place tubing near heat sensitive materials such as water closet seals. Install isolation valves on each side of each tubing manifold. The manifold and fittings must be accessible for maintenance. After the system is filled with water or glycol, vent all air from the system. After the system is allowed to stabilize at the operating temperatures of the heating fluid, vent the system again.

3.6.1 Concrete Slab construction

**************************************************************************
NOTE: Delete this paragraph if slab construction is not required. The type of installation under the slab should be coordinated with the architect and structural engineer.
**************************************************************************

In areas where tubing must cross expansion joints, control joints, or other crack control measures, install the tubing below the joints. Fasten the tubing to the reinforcing steel in accordance with the tubing manufacturer's recommendations. Pressurize tubing prior to and during the concrete pour to ensure system integrity.
3.6.2 Wooden Floor Construction

*NOTE:* Delete this paragraph if a wooden floor construction is not required.

Fasten tubing to the wood subflooring in accordance with the drawings and the tubing manufacturer's recommendations. Attach the tubing to the flooring without causing abrasions on the tubing.

3.6.3 Penetrations to Fire Rated Assemblies

Where pipe pass through firewalls, fire partitions, or floors, provide a fire seal as specified in Section 07 84 00 FIRESTOPPING.

3.7 COLOR CODE MARKING AND FIELD PAINTING

*NOTE:* Designer will coordinate color code marking with Section 09 90 00. Color code marking for piping not listed in Table 1 of Section 09 90 00 will be added to the table.

Color code marking of piping must be as specified in Section 09 90 00 PAINTS AND COATINGS. Clean, prepare, and paint ferrous metal not specified to be coated at the factory as specified in Section 09 90 00 PAINTS AND COATINGS. Paint exposed pipe covering as specified in Section 09 90 00 PAINTS AND COATINGS. Do not paint aluminum sheath over insulation.

3.8 MANUFACTURER'S SERVICES

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified to supervise the installing, adjusting, and testing of the equipment.

3.9 TEST OF BACKFLOW PREVENTION ASSEMBLIES

Test backflow prevention assemblies in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

3.10 HEATING SYSTEM TESTS

*NOTE:* Whenever possible, the testing of heating systems will be done under adverse winter conditions and low outside temperatures. The test data included will be modified as required to suit the particular heating system.

Select a 4 hour hydrostatic test for radiant floor heating systems in accordance with HYI 400. All other systems should be tested for 2 hours.

Submit the Qualifications of the firms in charge of installation and testing as specified. Submit a statement from the firms proposed to prepare submittals and perform installation and testing, demonstrating
successful completion of similar services of at least five projects of similar size or scope, at least 2 weeks prior to the submittal of any other item required by this section. Before any covering is installed on pipe or heating equipment, hydrostatically test and prove tight the entire heating system’s piping, fittings, and terminal heating units at a pressure of 1.5 times the design working pressure, but no less than 689 kPa 100 psi. Submit proposed test procedures for the heating system tests and fuel system tests, at least 2 weeks prior to the start of related testing.

a. Before pressurizing system for test, blank off items or equipment (e.g., vessels, pumps, instruments, controls, relief valves) rated for pressures below the test pressure or replace with spool pieces.

b. Before balancing and final operating test, remove test blanks and spool pieces; and reconnect protected instruments and equipment. With equipment items protected, pressurize the system to test pressure. Hold pressure for a period of time sufficient to inspect all welds, joints, and connections for leaks, but no less than 2 hours. No loss of pressure will be allowed. Repair leaks and retest repaired joint.

c. Repair joints are not allowed under the floor for floor radiant heating systems. If a leak occurs in tubing located under the floor in radiant heating systems, replace the entire zone that is leaking. If any repair is made above the floor for floor radiant heating systems, provide access for the installed joint. Caulking of joints is not permitted.

d. Drain system and after instruments and equipment are reconnected, refill the system with service medium and maximum operating pressure applied. Hold the pressure while inspecting these joints and connections for leaks. Repair the leaks and retest the repaired joints.

Upon completion of hydrostatic tests and before acceptance of the installation, submit test reports for the heating system tests. Upon completion of testing complete with results, balance the heating system in accordance with Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS and operating tests required to demonstrate satisfactory functional and operational efficiency. Cover a period of at least 24 hours for each system, and include, as a minimum, the following specific information in a report, together with conclusions as to the adequacy of the system:

a. Certification of balancing.

b. Time, date, and duration of test.

c. Outside and inside dry bulb temperatures.

d. [Temperature of hot water supply leaving boiler] [Steam pressure].

e. Temperature of [heating return water from system at] [condensate feed to] boiler inlet.

f. Quantity of water feed to boiler.

g. Boiler make, type, serial number, design pressure, and rated capacity.

h. Fuel burner make, model, and rated capacity; ammeter and voltmeter readings for burner motor.
i. [Circulating] [Condensate] [Vacuum] pump make, model, and rated capacity, and ammeter and voltmeter readings for pump motor during operation.

j. Flue-gas temperature at boiler outlet.

k. Percent carbon dioxide in flue-gas.

l. Grade or type and calorific value of fuel.

m. Draft at boiler flue-gas exit.

n. Draft or pressure in furnace.

o. Quantity of water circulated.

p. Quantity of fuel consumed.

q. Stack emission pollutants concentration.

Read indicating instruments at half-hour intervals unless otherwise directed. Furnish all instruments, equipment, and personnel required for the tests and balancing. Obtain necessary natural gas, water and electricity as specified in the [SPECIAL CONTRACT REQUIREMENTS][Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS] Provide necessary quantities of propane gas or No. [_____] fuel oil when propane gas or fuel oil is required for testing. Demonstrate that fuel burners and combustion and safety controls meet the requirements of [ASME CSD-1] [ANSI Z21.13/CSA 4.9] [NFPA 85]

3.10.1 Water Treatment Testing

Analyze the boiler water [prior to the acceptance of the facility] [a minimum of once a month for a period of 1 year] by the water treatment company. Submit a water quality test report identifying the chemical composition of the boiler water. Include a comparison of the condition of the boiler water with the manufacturer's recommended conditions. Document any required corrective action within the report. Identify the condition of the boiler at the completion of 1 year of service. Include a comparison of the condition of the boiler with the manufacturer's recommended operating conditions. Include the following information recorded in accordance with ASTM D596 in the analysis.

<table>
<thead>
<tr>
<th>Date of Sample</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>[_____] degrees C degrees F</td>
</tr>
<tr>
<td>Silica (SiO2)</td>
<td>[_____] ppm (mg/l)</td>
</tr>
<tr>
<td>Insoluble</td>
<td>[_____] ppm (mg/l)</td>
</tr>
<tr>
<td>Iron and Aluminum Oxides</td>
<td>[_____] ppm (mg/l)</td>
</tr>
<tr>
<td>Calcium (Ca)</td>
<td>[_____] ppm (mg/l)</td>
</tr>
<tr>
<td>Magnesium (Mg)</td>
<td>[_____] ppm (mg/l)</td>
</tr>
</tbody>
</table>
If the boiler water is not in conformance with the boiler manufacturer's recommendations, the water treatment company must take corrective action.

3.10.2 Boiler/Piping Test

**************************************************************************
NOTE: If a steam boiler is not used, delete the reference to condensate piping.
**************************************************************************

At the conclusion of the 1 year period, inspect the boiler and condensate piping for problems due to corrosion and scale. If the boiler is found not to conform to the manufacturer's recommendations, and the water treatment company recommendations have been followed, the water treatment company must provide all chemicals and labor for cleaning or repairing the equipment as required by the manufacturer's recommendations. If corrosion is found within the condensate piping, make proper repairs.

3.11 CLEANING

3.11.1 Boilers and Piping

After the hydrostatic tests have been made and before the system is balanced and operating tests are performed, thoroughly clean the boilers and piping by filling the system with a solution consisting of either 0.5 kg 1 pound of caustic soda or 0.5 kg 1 pound of trisodium phosphate per 190 L 50 gallons of water. Observe proper safety precautions in the handling and use of these chemicals. Heat the water to approximately 65 degrees C 150
degrees F and circulate the solution in the system for a period of 48 hours. Then drain the system and thoroughly flush out with fresh water. Thoroughly clean strainers and valves. Prior to operating tests, remove air from all water systems by operating the air vents.

3.11.2 Heating Units

Thoroughly clean inside space heating equipment, ducts, plenums, and casing of debris and blow free of small particles of rubbish and dust and then vacuum clean before installing outlet faces. Wipe equipment clean, with all traces of oil, dust, dirt, or paint spots removed. Provide temporary filters for fans that are operated during construction, and provide new filters after construction dirt has been removed from the building, and the ducts, plenum, casings, and other items specified have been vacuum cleaned. Perform and document that proper "Indoor Air Quality During Construction" procedures have been followed; provide documentation showing that after construction ends, and prior to occupancy, new filters were provided and installed. Maintain system in this clean condition until final acceptance. Lubricate bearings properly with oil or grease as recommended by the manufacturer. Tighten belts to proper tension. Adjust control valves and other miscellaneous equipment requiring adjustment to setting indicated or directed. Adjust fans to the speed indicated by the manufacturer to meet specified conditions.

3.12 FIELD TRAINING

**************************************************************************

NOTE: The number of hours required for giving instructions for operation and maintenance will depend on the complexity of the system specified. The blank will be filled with the appropriate number. When the system is to be installed at a location where experienced Government engineers are on duty, delete the entire paragraph.

**************************************************************************

Conduct a training course for the operating staff as designated by the Contracting Officer. The training period consists of a total of [_____] hours of normal working time and start after the system is functionally completed but prior to final acceptance tests.

a. Cover all of the items contained in the approved operation and maintenance manuals, as well as demonstrations of routine maintenance operations and boiler safety devices, in the field instructions.

b. Submit system layout diagrams that show the layout of equipment, piping, and ductwork and typed condensed operation manuals explaining preventative maintenance procedures, methods of checking the system for normal, safe operation, and procedures for safely starting and stopping the system, framed under glass or laminated plastic, at least 2 weeks prior to the start of related testing. After approval, post these items where directed.

c. Submit [six] [_____] complete operation and maintenance instructions listing step-by-step procedures required for system startup, operation, shutdown, and routine maintenance, at least 2 weeks prior to field training. Include the manufacturer's name, model number, parts list, simplified wiring and control diagrams, troubleshooting guide, and recommended service organization (including address and telephone
number) for each item of equipment. Each service organization must be capable of providing [4] [_____] hour onsite response to a service call on an emergency basis.

d. Notify the Contracting Officer at least 14 days prior to date of proposed conduction of the training course.

3.13 FUEL SYSTEM TESTS

Submit test reports for the fuel system tests, upon completion of testing complete with results.

3.13.1 Fuel Oil System Test

Test fuel oil system in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.13.2 Gas System Test

Test gas fuel system accordance with the test procedures outlined in NFPA 54.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for both fire-tube and water-tube heat recovery, steam generating boilers with individual capacities from 907 to 136,000 kg (2,000 to 300,000) pounds of steam per hour.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUMMARY

**************************************************************************

NOTE: Steam operating pressures will cover a range up to 3.45 MPa 500 psig. However, fire-tube boilers are not generally available above 2.07 MPa 300 psig. This specification is intended to be used primarily with heat recovery incinerators (Section 11 82 19 PACKAGED INCINERATORS), but may be used in other waste heat applications.

**************************************************************************

Provide a facility consisting of [_____] complete steam generation systems (unit systems) with connections to the steam distribution and condensate return systems and auxiliary equipment. Combustion equipment (heat source) is described in Section [23 52 49.00 20 STEAM BOILERS AND EQUIPMENT (500,000 - 18,000,000 BTU/HR)][23 52 53.00 20 STEAM BOILERS AND EQUIPMENT (18,000,000 - 60,000,000 BTU/HR)]. Each steam boiler must be capable of fully independent or simultaneous operation. The normal mode of operation must be the same as for the heat source. Vary combination of unit systems to optimize running times; therefore each unit system must provide identical features to provide redundancy and capability for maintaining continuous operation of the facility at full rated capacity.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy
and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

  Detailed Drawings
  Boiler Setting

SD-03 Product Data

  Operating and Maintenance Instructions; G[, [_____]]

1.4 QUALITY ASSURANCE

1.4.1 Welding

**************************************************************************

NOTE: Where pipeline, structural, or other welding is required on the same project, tests will be required accordingly. Testing may be by the coupon method as prescribed in the welding code or by special radiographic methods.

**************************************************************************

Perform all welding in accordance with qualified procedures using...
performance-qualified welders and welding operators. Use qualified procedures and welders in accordance with AWS B2.1/B2.1M or ASME BPVC SEC IX as applicable. Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests to be performed at the work site if practicable. The welder or welding operator must apply his assigned symbol near each weld he makes as a permanent record. The welders mark must not deform or remove metal. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.

1.4.2 Conformance with Agency Requirements

******************************************************************************

NOTE: In lieu of the label or listing, the Contractor may submit a written certificate from any nationally recognized testing organization adequately equipped and competent to perform such services, stating that the items have been tested and that the units conform to the requirements, including methods of testing, of the specified agency.

******************************************************************************

Where materials or equipment are specified to conform to the requirements of, or listed in rating publications of national agencies, submit proof of such conformance. The label or listing of the specified agency will be acceptable evidence. Where equipment is specified to conform to the requirements of the ASME Boiler and Pressure Vessel Code, provide design, fabrication, testing, and installation conforming to the code in every subject.

1.4.3 Detailed Drawings

Submit detailed drawings, for the specific equipment being proposed, consisting of schedules, performance charts, brochures, diagrams, drawings (including illustrations and equipment placement elevations), instructions, a complete list of equipment and materials, and other information necessary for installation of the steam-generating units and associated equipment, and for piping, wiring devices, trenches, and related foundations. Indicate on the drawings clearances required for maintenance and operation and show complete wiring and schematic diagrams, equipment layout and anchorage, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Support list of materials and equipment by descriptive material, such as catalog cuts, detailing conformance with the specification requirements. Catalog numbers alone will not be acceptable. Include the name and address of the nearest service and maintenance organization. Include on the detail drawings equipment connections, complete control wiring, connection diagrams, the proposed plan, elevations, cross section arrangements, and dimensions of the boiler systems. Show on the drawings proposed layout of equipment and appurtenances, and their relationship to other parts of the work to establish that the equipment will fit the allotted spaces with clearance for installation and maintenance. If departures from the contract drawings are deemed necessary by the Contractor, include details of such departures, including changes in related portions of the project and the reasons therefore, with the drawings.
1.5 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

1.6 EXTRA MATERIALS

Submit spare parts data for each different item of equipment specified, after approval of the detail drawings and not later than [_____] months before the date of beneficial occupancy. Include in the data a complete list of spare parts and supplies, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be maintained in inventory for [_____] months of facility operation.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

Provide material, equipment, and controls which are the standard products of a manufacturer regularly engaged in the manufacture of the product and that essentially duplicate items that have been in satisfactory use on at least [three] [_____] jobs for at least 2 years prior to bid opening. To meet the 2 year experience criteria, couple the heat recovery boiler with the same type of combustion equipment as stated in the bid package. Provide equipment supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the plant site. Provide controls of a type that has given satisfactory field performance under normal operating conditions for no less than 2 years or 6000 hours before the award of the contract. Types that have been shown to have operated satisfactorily for these periods may have modifications, provided it can be shown that the modifications will not increase maintenance and operating costs and will not decrease the life of the equipment.

2.1.1 Nameplates

Secure a plate to each major item of equipment containing the manufacturer's name, address, type or style, model number, serial number, and applicable equipment rating. Also affix the ENERGY STAR label to the equipment as applicable. Conform nameplates for electrical apparatus to the applicable NEMA Standards.

2.1.2 Equipment Guards and Access

**************************************************************************
NOTE: Catwalk, ladder, and guardrail requirements will be indicated on the drawings.
**************************************************************************

Fully enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts exposed to personnel contact. Guard or cover high-temperature equipment and piping over 66 degrees C 150 degrees F exposed to contact by personnel or where it creates a fire hazard properly with insulation of a type specified. Provide items such as catwalks, operating platforms, ladders, and guardrails where shown, constructed in accordance with Section [08 31 00 ACCESS DOORS AND PANELS][ 05 51 33 METAL LADDERS].

SECTION 23 52 30.00 10 Page 15
2.1.3 Prevention of Rust

Unless otherwise specified, factory prime paint surfaces of ferrous metal subject to corrosion with a rust inhibiting coating and subsequently factory finish painted in accordance with the manufacturer's standard practice. Prime and finish paint equipment exposed to high temperature when in service with the manufacturer's standard heat resistant paint to a minimum thickness of 0.025 mm 1 mil. Use a light color finish paint.

2.1.4 Use of Asbestos Products

**************************************************************************
NOTE: The first clause in brackets should be used when it is known that substitutes are available for any asbestos products which might be included with the equipment. The second clause in brackets should be used when it is possible or definitely known that asbestos products for which no technically acceptable substitute exists may be included with the equipment.
**************************************************************************

[Products which contain asbestos are prohibited. This prohibition includes items such as packings and gaskets, even though the item is encapsulated or the asbestos fibers are impregnated with binder material.] [Except as provided below, asbestos products are acceptable only in exceptional cases where the Contractor states in writing that no suitable substitute material exists, and in addition, the Contractor furnishes to the Contracting Officer a copy of U.S. Department of Labor, Occupational Safety and Health Administration, "Safety Data Sheet" (Form OSHA-20), completed by the asbestos manufacturer stating that the product is not an asbestos health hazard.]

2.2 BOILERS

**************************************************************************
NOTE: Select the appropriate ASME Standard for the desired pressure class and service specified.
**************************************************************************

Provide each boiler system with the capacity described herein and as shown on the contract drawings. The equipment design and accessory installations must permit accessibility for maintenance and service. Design boilers for a maximum allowable working pressure of [_____] kPa psig with an operating pressure of [_____] kPa psig. Design conditions are as follows:

<table>
<thead>
<tr>
<th>Rated capacity</th>
<th>[_____] kg/hour pounds/hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steam outlet temperature</td>
<td>[_____] degrees C degrees F</td>
</tr>
<tr>
<td>Site elevation</td>
<td>[_____] meters feet</td>
</tr>
<tr>
<td>Ambient air temperatures</td>
<td>[<em><strong><strong>] to [</strong></strong></em>] degrees C [<em><strong><strong>] to [</strong></strong></em>] degrees F</td>
</tr>
<tr>
<td>Reference air temperature</td>
<td>27 degrees C 80 degrees F</td>
</tr>
</tbody>
</table>

Provide boiler that is capable of operating continuously at maximum specified capacity without damage or deterioration to the boiler, setting,
heat source equipment, or auxiliaries. The boiler must be capable of automatically controlled operation while coupled to the heat source. Design the equipment in accordance with the latest ASME Standards; ASME BPVC SEC I, ASME BPVC SEC IV, and ASME BPVC SEC VIII D1. Certification of such compliance must be evidenced by applicable "P" forms before acceptance of the facility by the Government. Provide boiler piping under ASME B31.1. Equip each boiler with an [economizer] [air preheater]. Boiler unit or heat recovery section must be a standard part of a steam generation system package closely coupled to the combustion equipment.

2.2.1 Capacity

Rated capacity is the capacity at which the boilers will operate continuously without exceeding the specified boiler heat transfer rates, and boiler exit temperature. Provide boiler auxiliaries including fans, motors, drives, and similar equipment with at least 10 percent excess capacity to allow for field variations in settings and to compensate for any unforeseen increases in pressure losses in appurtenant piping and ductwork.

2.2.2 Electrical Equipment

**************************************************************************
NOTE: Indicate the type and class of motor enclosure depending on the environment in which the motor is to be used.
**************************************************************************

Provide electric motor-driven equipment specified complete with motors and necessary motor control devices. Provide motors, motor control devices, and power supply wiring conforming to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM including requirements for hazardous area locations. Use premium efficiency type integral size motors in accordance with NEMA MG 1. Submit a complete electrical connection diagram for each piece of mechanical equipment having more than one automatic or manual electrical control device for approval before installation. Provide motors with enclosures as indicated.

2.2.2.1 Motor Ratings

Use motors that are suitable for the voltage and frequency provided. Motors 373 W 1/2 horsepower and larger must be three phase, unless otherwise indicated. Ensure ratings are adequate for the duty imposed, but are not less than indicated. Provide motors conforming to NEMA MG 1 with enclosure as specified. Motors smaller than 746 W Fractional horsepower motors must be Type I, Class 1B or Class 2A or 2B, Continuous Duty. Motors larger than 746 W Integral horsepower motors must be Type I or II, Class 2 Continuous Duty, Design L or M.

2.2.2.2 Motor Starters

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.
**************************************************************************

Where a motor starter is not shown in a motor control center on the electrical drawings, provide a motor starter. Where required, provide
motor starters complete with properly sized thermal overload protection and other equipment at the specified capacity, including an allowable service factor and other appurtenances necessary for the motor control specified. Provide manual or automatic control and protective or signal devices required for operation specified and any wiring required to such devices not shown on the electrical drawings. Where two-speed or variable-speed motors are indicated, solid state variable-speed controllers may be provided to accomplish the same function.

2.2.3 Boiler Design Requirements

**************************************************************************
NOTE: Indicate whether the boiler should be fire-tube, water-tube, or can be either one.
**************************************************************************

Ensure each boiler is suitable for indoor installation and include a heat recovery [fire] [water]-tube section and a steam separator. Design tube section so the tubes are installed in an arrangement that will permit ease of access and replacement. Fire boilers with the hot gases generated by the associated combustion equipment. Draw hot gases [through] [over] the tube banks by an induced draft fan. Control gas flow by a system of automatically actuated dampers that will route the hot gases through the tube section and out the stack as required to satisfy the operational procedures. Provide boilers that are [either] [fire-tube] [or] [single or multiple drum, bare-tube, water-tube, natural circulation]. Provide sootblowing systems with coordinated controls.

2.2.3.1 Radiant Heating

**************************************************************************
NOTE: The following is a guide to determine maximum radiant heat release:
**************************************************************************

<table>
<thead>
<tr>
<th>Boiler Type</th>
<th>Maximum kW/square meter Btu/sq ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controlled circulation</td>
<td>water-tube boilers 394.3</td>
</tr>
<tr>
<td></td>
<td>125,000</td>
</tr>
<tr>
<td>Natural circulation</td>
<td>water-tube boilers 315.5</td>
</tr>
<tr>
<td></td>
<td>100,000</td>
</tr>
<tr>
<td></td>
<td>Fire-tube boilers 315.5</td>
</tr>
<tr>
<td></td>
<td>100,000</td>
</tr>
</tbody>
</table>

Limit the maximum effective radiant heating surface to [_____] kW/square meter Btu input per square foot/hour.

2.2.3.2 Combustion Gas

The combustion gas temperature at the furnace exit (boiler entrance) must be a minimum of 56 degrees C 100 degrees F less than the ash fusion softening temperature (reducing atmosphere) of any ash contained in the fuel. For boilers attached to waste incinerators, do not exceed 1093 degrees C 2000 degrees F.

2.2.3.3 Radiant Heating Surface

Effective radiant heating surface for water-tube boilers must include the
flat projected area of bare, metal covered or metallic ore covered tubes and headers, 90 percent of the flat projected area of extended metal or metallic surfaces from the tubes, and the flat projected area of those portions of the first two rows of exit tubes receiving radiant heat from the fire. The flat projected area is defined as the external diameter times the length of the tube. The flat projected area of the extended surfaces must not include the metal blocks not integral with tubes, extended surfaces less than [_____] mm inch thick or more than [_____] mm inch in length, and the portion of the extended surface which is more than one tube radius from the tube from which it extends. For fire-tube steel firebox boilers it must be the total water-backed area within the furnace boundaries exposed to the flame. Use the mean circumference for corrugated crown sheets.

2.2.3.4 Boiler Operating Capacity

The boiler must maintain continuous capacity within the specified range while operating on [1][2][3] shifts per day, [_____] days per week schedule at the specified pressure with boiler feedwater at a temperature of approximately [_____] degrees C degrees F. Ensure the hot gas entrance temperature is [_____] degrees C degrees F and the flue gas outlet temperature is [_____] degrees C degrees F, based on a flow of [_____] actual cubic meters/second ACFM. Ensure moisture in the steam and boiler water concentrations is in accordance with ABMA Boiler 402.

2.2.3.5 Boiler Output Capacity

**************************************************************************
NOTE: In order to comply with Executive Order 13423 and Public Law 109-58 (Energy Policy Act of 2005), designs must achieve energy consumption levels that are at least 30 percent below the level required by the 2004 publication of ASHRAE 90.1. In accordance with P.L. 109-58 (Energy Policy Act of 2005), Executive Order 13423, and Federal Acquisition Regulation (FAR) 23.203 Energy-efficient Products, meet or exceed the performance criteria for ENERGY STAR®-qualified or FEMP-designated products as long as these requirements are nonproprietary. The FEMP and ENERGY STAR product requirements are available on the web at www.eere.energy.gov/femp/procurement and www.energystar.gov/products. Where ENERGY STAR or FEMP products are not applicable, provide energy consuming products and systems that meet or exceed the requirements of ASHRAE 90.1.
**************************************************************************
Base output capacity of the boilers on tests of the boilers and combustion equipment as a unit. Provide a minimum efficiency of [80][_____] percent at maximum continuous capacity.

2.2.3.6 Boiler Markings

**************************************************************************
NOTE: Delete brackets if the boiler does not include a superheater.
**************************************************************************
Furnish each boiler with a metal nameplate including the following
information:

a. Maximum continuous capacity in *Watts and Btu/hour Btu/hour*.

b. Radiant heating surface in *square meters square feet*.

c. Total heating surface in *square meters square feet*.

d. Boiler maximum allowable working pressure.

e. Boiler system ASME Code Stamp and Certification.

f. Maximum steam flow of boiler in *kg/hour pounds/hour*.

g. Manufacturer's Model Number.

h. Serial Number.

i. Year manufactured.

[ j. Superheater final steam temperature in *degrees C degrees F*.

[ k. Superheater heating surface in *square meters square feet*.]

2.2.3.7 Noise

************************************************************************************************************

NOTE: Indicate the noise level required by the location of the equipment. Equipment in remote areas can be allowed to produce noise at a level slightly higher than the normal 85 decibel-A scale (dBA). Occupational Safety and Health Administration (OSHA) regulations and Corps of Engineers safety regulations should be consulted for the most current 8-hour exposure limits.  
************************************************************************************************************

The noise level 304.8 mm 1 foot from a boiler must not exceed 85 dBA. This includes the boiler, blowers, compressor, and any other noise-producing items related to the boiler.

2.3 BOILER DETAILS

2.3.1 Materials

Provide materials exposed to the internal environment of the boiler that are compatible with the temperature and atmospheric conditions which they will encounter. Do not use dissimilar metals that, when in contact or otherwise electrically connected to each other in a conductive solution, generate an electric current, in intimate contact.

2.3.2 Lubrication

Provide all sliding, moving, or rotating parts normally requiring lubrication, except those provided with "sealed-for-life" lubrication, with suitable means for lubricating. Ensure lubrication points are readily accessible and identified by a permanent instruction plate mounted in a convenient location on the boiler. Design equipment to operate efficiently and satisfactorily when lubricated using standard military lubricants.
2.3.2.1 Lubrication Fittings

Locate lubrication fittings in accessible protected positions. Paint a bright red circle around each point. Provide carbon steel balls, bodies and tips of fittings. Threads of fittings must be 1/4 - 28 taper, straight or 1/8 pipe threads. Incorporate a surface ball-check valve located at the surface of the inlet tip into fittings. Use cadmium plated carbon steel fittings in accordance with ASTM B766, Type I, Class 5 or zinc coated in accordance with ASTM B633, Type I, Class 1 except that the salt spray test period for red rust corrosion is a minimum of 50 hours.

2.3.2.2 Caution Plates

When the use of high-pressure lubrication equipment, 6.89 MPa 1,000 psi and higher, will damage grease seals or other parts, affix a suitable warning or caution plate to the equipment in a conspicuous location.

2.3.3 Lifting Attachments

Equip each unit with lifting attachments designed and installed to enable the equipment to be lifted in its normal position without undue stress on the unit.

2.3.4 Accessibility

Make all parts subject to wear, breakage, or distortion, and all parts that require periodic maintenance readily accessible for adjustment or replacement.

2.3.5 Interchangeability

Manufacture all parts to standards that will permit replacement without modification to parts or equipment.

2.3.6 Surfaces

Finish or paint all surfaces as specified in paragraph PAINTING AND FINISHING.

2.3.7 Fastening Devices

Provide bolts and nuts that are suitable and conforming to ASME B18.2.1 and ASME B18.2.2 respectively. Ensure all screw threads conform to the requirements of ASME B1.1. Install all screws, pins, bolts, hydraulic fittings, and similar parts with a means to prevent loss of tightness. Ensure such parts subject to removal or adjustment are not swagged, peened, staked, or otherwise permanently deformed.

2.3.8 Electrical

Bring all wiring to a single location. Provide factory wired equipment complete with all necessary accessory devices, so as to require only a source of power at [_____] volts, [_____] phase, 60 hertz, to make the equipment operable. Make wiring neat and secure.

2.3.9 Castings and Forgings

Ensure all castings and forgings are free from defects such as scale,
mismatching, blowholes, or any other defect that will affect life or function of the part. Use cast gray iron conforming to [ASTM A278/A278M] [ASTM A48/A48M], cast iron conforming to ASTM A319, and heat resistant alloy conforming to ASTM A297/A297M Grade HF.

2.3.10 Welding, Brazing, Soldering, Riveting, or Wiring

Employ welding, brazing, soldering, riveting, or wiring only where these operations are required in the original design.

2.3.11 Refractory and Insulation

Use manufacturer's proven standard design for refractory and insulation systems. Submit temperature estimates, material quality information, and description of installation methods in sufficient detail to permit evaluation of the materials and methods used. Construction materials and methods must be approved before manufacture. Install plastic refractory in accordance with the manufacturer's recommendations and by workmen skilled in its application. Provide insulation systems consisting of the manufacturer's proven standard materials and methods and submit with data as to adequacy of material. Field repair hot spots exceeding requirements as directed. Field install exposed areas as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.3.11.1 Insulation

Where specified or indicated, insulation must be insulating block containing no asbestos material, designed to prevent damage to foundation and boiler exterior due to excessive heat. Comply with EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING. Provide Class 5 mineral fiber block insulation conforming to ASTM C612. Lay insulating block in approved mortar specifically manufactured for this purpose or recommended by the insulating material manufacturer. Provide firebrick conforming to ASTM C27 and ASTM C155. Interpret firebrick to include straight brick, radial brick, wedge brick, skew-type brick, cupola blocks, and other similar shapes. Lay firebrick up in air-setting mortar. Dip each brick in mortar, rub, push into place, and then tap with a wooden mallet until it touches the adjacent bricks. Mortar thick enough to lay with a trowel will not be permitted. Use mortar conforming to ASTM F1097. Do not exceed maximum mortar joint thickness of 3.2 mm 1/8 inch and average joint thickness of 2.0 mm 1/16 inch. Insulate main arches of the boiler and flue connection above the firebrick and, where exposed to the weather, protect with a suitable concrete or brick slab. Insulate firebrick floors from the supporting floors with insulating brick except that if the supporting floor has full bearing on earth, a 75 mm 3 inch layer of contained dry sand may be used in lieu of insulating brick. Minimum thickness for walls is [_____] mm inches to limit the temperature of the outer casing to 49 degrees C 120 degrees F in an ambient temperature of 21 degrees C 70 degrees F when the unit is operating at full rated capacity, and as determined by a surface pyrometer.

2.3.11.2 Expansion Joints

Provide joints in the firebrick masonry at [approximately the locations shown] [spacings of approximately 2.44 meters 8 feet]. Provide joints that are 12.7 mm 1/2 inch wide and completely separate the sections without any interlocking of the bricks. [The locations may be changed from those indicated by as much as 300 mm 12 inches in either direction for convenience of construction and changed as necessary, by offset or
otherwise, to avoid weakening the arch over an opening.] Expansion joints closer than 300 mm 12 inches to the vertical side of an arched opening or to the top of the brick forming the arch over the opening are not permitted. When joints are offset, do not bond the horizontal faces between the two courses of brick along the offset. In addition, to allow for expansion of the inner face, provide a series of 3.2 mm 1/8 inch wide vertical openings spaced 1.8 m 6 feet apart on the furnace side of the wall. Make proper provision for expansion and contraction between boiler foundation and floor.

2.3.12  **Boiler Setting**

Construct boiler to comply with ASME BPVC SEC VIII D1 and provide with insulation, steel base, water column with gauge, automatic feed water pump control and low water cutoff, steam pressure gauge, relief valve, automatic steam pressure control and blowoff, and soot-blower. Submit complete setting plans, certified by the boiler manufacturer.

2.3.12.1  **Boiler Foundation**

Provide foundation structure and install in accordance with manufacturer's recommendations and as indicated. Use structural systems supporting pressure parts, tubes, and refractory with a safety factor to permit delivery of boiler, jacking, and rigging.

2.3.12.2  **Supports**

Provide boilers and separator drums with support lugs and saddles to provide an adequate and firm installation to the foundation structure. Supports are to provide for free expansion and contraction of each part of the boiler without placing undue stress on any part of the boiler or setting.

2.3.12.3  **Shell**

Construct casing or shell sides of carbon steel materials no lighter than 3.416 mm 0.1345 inch thick, either bolted or welded. Provide gas-tight casing and reinforce with steel ribs or stiffeners to provide rigidity and prevent buckling. Insulate boiler casing fully with sufficient thickness to limit the casing temperature as specified. Equip boiler shell with all necessary connections including outlet nozzles, return connections, and connections for pressure relief valves, water level controls, and other required trim. Provide manholes, handholes, and observation ports in accordance with ASME BPVC SEC I. Equip boilers with gas-tight observation ports.

2.3.12.4  **Expansion and Contraction**

Make adequate provisions for expansion and contraction of the boiler unit and associated breaching to prevent damage to the support structure or the equipment and associated ductwork. Make provisions for expansion and contraction between boiler foundation and floor. Pack joints with oakum and fill with a suitable compound that will not become soft at temperatures of 49 degrees C 120 degrees F.

2.3.13  **Water-Tube Boiler**

Provide a shop fabricated and field erected boiler or a packaged unit. Include water walls, soot-blowers, [economizer,] [super heater,] and steam
drums to withstand temperatures existing under maximum load conditions to ensure production of the steam as specified. Include setting refractory, insulation to maintain a casing temperature of no greater than 55 degrees C 130 degrees F with a surface air velocity at 5.4 km/hour 5 feet/second and an ambient temperature of 26 degrees C 80 degrees F while boiler is operating at maximum capacity (do not use asbestos material), and welded or doubled wall casing. Provide hinged access opening covers.

2.3.13.1 Drums or Dome Space

For water-tube boilers, each drum or dome space must be steel plate, fusion welded in conformance with ASME BPVC SEC I, including stress relieving and x-raying of welded seams. Provide main steam drums of sufficient size to accommodate steam separators and drum internals with provisions and space for accomplishment of maintenance. Provide baffling to separate the steam from the water in the drum and to maintain a stable water level under a fluctuating load. Do not exceed 50 mm 2 inches of variations in normal water level with an increasing load change of 20 percent of rated capacity per minute. Provide steam separators to deliver saturated steam with a maximum specified moisture content. Provide each drum with two 300 by 400 mm 12 by 16 inch elliptical manholes, with the exception of the mud drum which has at least one 300 by 400 mm 12 by 16 inch elliptical manhole. Provide a cover, yoke, and gaskets for each manhole.

2.3.13.2 Drum Outlets

Apply drum outlets in approved manner and of approved strength in accordance with ASME BPVC SEC I. Outlets include but are not limited to:

a. Steam nozzle of 2.07 MPa 300 pounds, flanged to receive specified nonreturn stop and check valve, and able to withstand forces and moments imposed by connected piping. Studdery will not be permitted.

b. Boiler vent on shell or steam drum as approved by ASME BPVC SEC I, to be equipped with 2.07 MPa 300 pound steel steam gate valve, nipples, and ells to vent away from operator.

c. Safety valve outlets in required number and size, located approximately as indicated, or as necessary to permit straight run of vent through roof.

d. Water column and low water cutoff connections with outside screw and yoke (OS & Y) valves, [lockable,] [and with locks and keys furnished].

e. Connections for boiler water feed, chemical admission, continuous blowdown and water sampling combined, located as indicated on plans.

f. Intermittent blowdown connections.

g. Water level sensor connections (for level control).

h. Pressure gauge and pressure switch connections.

2.3.13.3 Tubes

Provide tubes of the diameter and arrangement that best suits the manufacturer's recommendation to meet the specified design criteria. Provide electric-welded or seamless steel tubes, and connect to the drums and header by expanding into bored tube seats (standard fit) or by welding
in accordance with ASME BPVC SEC IX. Tube wall thickness must be at least the minimum recommended by the manufacturer. Allow finned tubes only when the fuel is gas or oil and provide a continuously welded bond between the tube surface and the helically wound fin. Use tube materials complying with ASTM A192/A192M and provide optimum life expectancy and corrosion resistance. Ensure tube headers, channels, and manifold pipes provide sufficient volume to ensure no part of the boiler will become water-starved. Make radii of all bends in tubes such that standard turbine type cleaners can easily pass through for cleaning of full length of tubes.

2.3.13.4 Baffles

Arrange baffles to bring the products of combustion into contact with the heating surfaces without excessive loss of draft. Ensure baffles are gas-tight and are either a refractory material or metal suitable for temperatures encountered.

2.3.14 Fire-Tube Boiler

Provide packaged type boiler and include programming control system with capacity as indicated. Provide hinged access opening covers.

2.3.15 Boiler Internals

2.3.15.1 Internal Fittings

Use securely mounted and demountable internal fittings for boiler access and cleaning. Internal fittings include, but are not limited to:

a. Boiler feedwater admission system to properly distribute feedwater.

b. Chemical feed piping to permit infusion of caustic, phosphate, and water mixture by continuous feed system.

c. Continuous blowdown and water sampling system as combined unit.

d. Intermittent blowoff system to properly collect mud from bottom and permit drainage of boiler without water accumulation.

2.3.15.2 Outlet Fittings

Provide flanged outlet fittings above 50 mm 2 inches, but may be threaded for 50 mm 2 inches and smaller. [Note that all boiler systems (steam, feedwater, and intermittent blowdown) operate into common headers serving more than one generator.] Provide all devices, designs, and piping methods in full accordance with applicable provisions of ASME BPVC SEC I for pressure piping and evidence by proper certificates of work performance and inspection.

2.3.15.3 Openings

Flash or seal steam outlets, safety valves, and other valve openings in outer casing at top of boiler in a manner to prevent water leaking into the casing insulation.

2.3.15.4 Settling Chamber

**************************************************************************

NOTE: Requirement for Settling Chamber is an option
depending on the fuel at the heat source.

Provide settling chamber for removal of fly ash, equipped with suitable means for frequent cleaning without shutting down the boilers, below the last pass of each boiler.

2.3.16 Access Doors

Provide access doors in sufficient number, of adequate size, and properly located for cleaning, inspection, and repair of all areas in the complete assembly. Provide gas-tight doors and line interior surfaces exposed to direct radiant heat and high temperatures with approved refractory material to prevent excessive heat losses and warping of doors. Hinge doors too large or bulky for hand removal. Provide at least one observation port with cast-iron cover on each door of the boiler. Provide an electrical interlock to prevent the tube cleaning system from operating unless the doors are closed and latched. Provide door casing of the same material and thickness as the adjoining boiler casing. Provide door lining consisting of 50 mm 2 inches of block insulation and 102 mm 4 inches of heavy castable refractory conforming to ASTM C401, Class R. Equip doors with high temperature gaskets and door latches.

2.3.17 Miscellaneous Pipe Connections

Provide miscellaneous pipe connections for steam outlet, safety valves, feedwater, feedwater regulator, water column, blowoff, steam supply to soot blowers, steam gauge and vent, continuous blowdown, continuous chemical feed, and instrument connections. Provide soot blowers if the combustion source utilizes solid fuel. Provide a suitable smoke outlet with steel frame, damper, and damper shaft. Provide damper with external high temperature roller or ball bearings at both ends of the shaft, and with a suitable operating arm and rod.

2.3.18 Observation Ports

NOTE: Requirements for observation ports and test holes depend upon the specific project, including competence and availability of operating and maintenance personnel, type of fuel to be burned, etc. The number and location of the test holes will conform to the requirements of the regulatory authority. In addition, test holes for monitoring operating efficiency will be provided as shown.

Provide one observation port 80 mm 3 inches in diameter on each access door and consisting of no less than 2.657 mm 12 gauge black steel or cast iron tube or duct with a heat resistant glass cover or an angular steel frame and closure plate with handle for operation without gloves or other protective devices. Extend tube or duct from the exterior of the casing to no less than one-half the thickness of the refractory opening and make gas-tight. Make provision for air purging of the port when solid fuels are used at the heat source.

2.3.19 Test Holes
NOTE: Coordinate with paragraph Observation Ports.

**************************************************************************

Provide test holes as indicated and fit with standard weight, 50 mm 2 inch diameter, black steel pipe. Extend sleeve from the exterior of the casing to no less than one-half the thickness of the refractory lining. Form refractory opening from the end of the pipe sleeve to the interior wall surface to shield the end of the sleeve from reflected heat. Fit sleeve with a brass screw cap and security chain. Weld two or more sturdy lugs in approximately the middle of the length of each test pipe to prevent the pipe from turning when the cap is being removed.

2.3.20 Safety Devices

Use boilers with safety devices providing automatic overheat shutdown and manual shutoff of the combustion equipment or flue gas dampers to bypass the boiler.

2.3.21 Freeze Protection

Equip low points of all piping and tubing with drains for freeze protection.

2.3.22 Fire Protection

Provide boilers meeting the requirements of NFPA 85.

2.4 BOILER AUXILIARY EQUIPMENT

2.4.1 Boiler Fittings and Appurtenances

Provide boiler fittings, and all other boiler appurtenances complying with ASME BPVC SEC I. Provide boilers with a continuous blowdown connection from an internal pipe running the length of the steam drum at the point of the highest concentration of dissolved solids. Make blowoff provisions from the mud drum or lower part of a fire-tube boiler. Provide pressure gauges for high-pressure steam units which include a siphon, gauge cock, and test connection. Ensure trim and appurtenances include a 150 mm 6 inch minimum pressure gauge and a safety valve. Provide a chemical feed connection with internal distribution pipe.

2.4.1.1 Water Column

Provide water column with straight-through type drain valve. Provide water column complete with gauge glass, high- and low-water alarm, and three quick-closing gauge valves and try cocks fitted with the necessary chains and handles for operation from the boiler room floor. Also include a test valve, blowdown valve, and a straight-through type drain valve. Do not combine water column with the low water cutoff. [Provide water column lighting for ease of reading at all times.]

2.4.1.2 Low Water Cutoff

**************************************************************************

NOTE: When the boiler is used as a "heat recovery unit," an alternate path is usually provided to vent or bypass the hot gases in the event the boiler is unable to perform its function. In all other cases, activation of the low-water cutoff will cause the loss of all support to the combustion process.
including loss of combustion air and fuel.

Provide a low-water cutoff, with alarm located on instrument panel, and include either a float-actuated switch as a means of making electrical contact or an electrically-actuated probe type low water cutoff. Provide float chamber with a blowdown connection. The cutoff must cause a safety shutdown and sound an alarm when the boiler water level drops below a safe minimum level [and route hot gases from the combustion equipment to the bypass stack]. [Install two low-water cutoffs on each boiler. Pipe low-water cutoffs for the boilers separately with separate drum connections. Provide a separate housing for each low-water cutoff. Two elements in one housing will not be permitted.] A safety shutdown due to low-water cutoff must require a manual reset before operation can be resumed and must prevent recycling of the combustion equipment. The cutoff must be in strict accordance to the latest version of code, ASME CSD-1, Controls and Safety Devices for Automatically Fired Boilers.

2.4.1.3 Feed and Check Valves

Provide feed and check valves adjacent to each boiler feed nozzle.

2.4.1.4 Continuous Blowdown Valve

NOTE: Continuous blowdown equipment will be provided as required by UFC 3-410-01 or UFC 3-410-02. If a fire-tube boiler is specified, these paragraphs will be deleted.

Provide manual proportioning continuous blowdown valves, fabricated of corrosion-resistant steel. Provide valves with a micrometer dial setting and a chart listing the capacities through the complete range of micrometer settings at the boiler pressure. Provide valves conforming to ASME BPVC SEC I. Provide blowoff valves in tandem at each point of blowdown as recommended by the boiler manufacturer. Provide piping consisting of extra-heavy weight, minimum, steel pipe conforming to ASTM A106/A106M Grade B. Use balanced, seatless type slow opening valves unless otherwise approved. Provide both surface and bottom blowdown connection points with required accessories. Provide valves with a capacity equal to the capacity of the boiler and forged steel bodies with socket weld connections. Provide valve with a solid Stellite disk with stainless steel seat sleeves. Design the bodies for a minimum working pressure of 2.07 MPa 300 psig. Quick opening valves must be lever operated, flat seat sliding disks with sealing bushing on the inlet side, and double tightening on both sides of the disk. Provide gear operated quick opening valves. All blowoff valves must be suitable for safe blowdown through the piping system installed. Supply all pipe, valves, and fittings as necessary to allow tie-in to a central point for surface and bottom blowdown.

2.4.1.5 Safety Valves

Provide safety valves of proper size and of the required number and construction and set pressures in accordance with ASME BPVC SEC I and install so that the exhaust steam will discharge through pipes extending through the roof. Provide a drip-pan elbow for each exhaust riser to prevent the accumulation of water on the valve. Provide a suitable slip
joint between the drip-pan elbow and the riser. Each exhaust head must be one-piece construction of plate steel, semisteel, or cast iron, equipped with suitable baffle arrangement and drain connection for removing entrained condensate and oil. Flow area through the valve must be larger than through the connecting pipe. Set valves to discharge at 10 percent above the operating pressure of the system.

2.4.1.6 Steam Nonreturn Valves

Install steam nonreturn valves of size and pressure rating shown in the steam supply line from each boiler. Arrange valves to close automatically when there is a pressure differential of 35 kPa 5 psi between the boilers and steam headers, and arrange to operate as stop valves. Set rising stem type valves with stem up, either inclined or vertical. Provide angle or straight-way type valves and operate without chattering, hammering, or sticking. Valves must be cast steel.

2.4.1.7 Feedwater Regulator

Connect feedwater regulator, sized for the application, complete with all necessary piping and accessories for automatic operation. Provide valved bypass around the control valve. Provide units with a device to lock the regulator in existing position in case of power failure. Provide unit with a manual/automatic selector panel located on the instrument panel in the control room. Provide feedwater control element with a drain valve. Fit feed-water line with a thermometer well. Mechanical linkages and chains to position the valve are not allowed. Provide feed-water piping conforming to the requirements of ASME BPVC SEC I. Provide a hand wheel or a manual jacking device to permit manual operation of the regulator valve.

2.4.1.8 Soot Blowers

**************************************************************************
NOTE: Soot blowers should be required for all boilers when solid fuel is burned, and are advisable when burning No. 6 fuel oil. If only gas or No. 2 fuel oil is being burned, this paragraph may be deleted. Soot blowers are available for fire-tube boilers.
**************************************************************************

Provide soot blowers in conjunction with the heat recovery or boiler section of each solid fuel fired steam generation system. Furnish soot blower or cleaning nozzles in sufficient numbers, permanently mounted, and so arranged or spaced to effectively clean all tube surfaces. Each soot blowing system must be an automatic sequencing, flexible operation using air or steam as the blowing medium. Construct elements within the boiler of heat-resisting alloys suitable for the flue gas temperature encountered and are removable without disturbing the boiler tubes. If the soot blowers are air operated, provide air compressors with sufficient capacity to accommodate the additional load of the soot blowers. [Provide each boiler unit with a cyclone separator installed in conjunction with the boiler stack to capture particulate matter emitted during tube cleaning operations.] Control frequency of the cleaning operation automatically by timers that are interlocked with the inspection doors to prevent cleaning when the doors are open. Furnish each blower unit complete with all necessary auxiliaries, controls, and equipment and connect according to the manufacturer's recommendations.
2.4.1.9 Drains

Install drains consisting of a 20 mm 3/4 inch hose bib or a 25 mm 1 inch hose gate valve at the lowest point in the return main near the boiler and at locations shown or as required for the convenient and thorough draining of the system.

2.4.2 Economizers

**************************************************************************
NOTE: The economizer or air preheater will be selected to be compatible with any pollution control equipment being utilized. Finned tubes will not be used for solid fuels.
**************************************************************************

Use economizers of a type normally provided by the boiler manufacturer and include [finned tubes,] [bare tubes,] baffles and headers and have provision for cleaning and tube bundle removal. At maximum load, economizer exit water must not be within 17 degrees C 30 degrees F lower than saturation temperature. Provide materials capable of withstanding the maximum boiler exit gas temperature plus 28 degrees C 50 degrees F. Provide tubes conforming to ASME BPVC SEC I. Overall design and installation must preclude cold-end corrosion under any load condition. Economizer exit flue gas temperature must be no less than 177 degrees C 350 degrees F and the tube metal temperature must be above the maximum flue gas dew point for the fuel being fired under all load conditions.

2.4.3 Air Preheaters

**************************************************************************
NOTE: The economizer or air preheater will be selected to be compatible with any pollution control equipment being used.
**************************************************************************

Use air preheaters of a type normally provided by the boiler manufacturer which are recuperative, tube plate, or regenerative type constructed of materials adequate to withstand the corrosion effects of the flue gases. Overall design must preclude cold-end corrosion of the air preheater under any load condition. Temperatures of all metals in contact with flue gas must be above the flue gas maximum dew point temperature for the fuel being fired under all load conditions. Control by steam preheat or by automatic bypass and integrate with the combustion control system.

2.4.4 Draft Fans

**************************************************************************
NOTE: Where induced draft fans are installed directly after the heat recovery boiler, it may be necessary to provide liners for scroll sheets and rotor blades if the gases contain particulates in excess of 229 mg per dry standard cubic meter (0.10 gr/DSCF). The fan design and construction will be strongly influenced by the type of particulate control device used and its location relative to that device.
**************************************************************************
Furnish induced draft centrifugal fans, as specified, as an integral part of the boiler design. Provide unit consisting of an electrical motor driven centrifugal fan, a housing (scroll and side plates), controls, guards and accessories. Attach all components to a common base which includes provisions for fastening to a foundation. Provide completely assembled unit, ready for installation and operation.

a. Provide fan assemblies suitable for continuous boiler draft operation to handle flue gases having temperatures up to 800 degrees F. Provide fans complying with AMCA 99 standard applicable to centrifugal furnace fans and that are rated for flow rate, pressure, power, speed of rotation and efficiency in accordance with AMCA 210 and ASME PTC 10. Submit to the Contracting Officer satisfactory evidence that the fan furnished meets the requirements of AMCA 210. Acceptable evidence of meeting the requirements of this standard will be the AMCA Certified Rating Seal or a certified inspection report from an independent testing laboratory indicating that the fan conforms to the requirements of AMCA 210.

b. Provide centrifugal fans with backward curved blades or radial tip blades. Size each fan for operation at an elevation of [_____] meters feet, with an output volume and equipment, leaks, and temperature and elevation corrections for a dirty boiler with worst ambient conditions, all at full combustion. In addition, include margins of 10 percent excess volume against a 21 percent static pressure and air temperature 22 degrees C 40 degrees F above operating temperature.

c. Design induced draft fans for handling hot flue gas at the maximum boiler outlet temperature adjusted for boiler surface fouling. Provide [single] [or] [double] width centrifugal type fans. [When the fan is a double-width centrifugal type, it must have a double inlet.] Ensure the direction of fan rotation is [clockwise] [or] [counterclockwise] as determined from the drive side of the fan. Ensure the direction of discharge is [top horizontal] [top angular down] [down blast] [bottom angular down] [top angular up] [up blast] [bottom angular up] [or] [bottom horizontal]. The position of inlet box must be [45] [90] [135] [180] [225] [270] [315] [or] [360]. Provide fans with a static efficiency of no less than 0 percent in standard air at best efficiency point. Construct fan wheel of [steel] [or] [aluminum]. Turn, grind, and polish the shaft. Balance the fan wheel and shaft assembly statically and dynamically. Balance the complete rotating assembly of the fan dynamically within the limits of the following formula:

\[
\frac{\text{Vibration displacement}}{\text{mills-peak-to-peak}} = 1.620 \times \frac{\text{revolutions per minute}}{\text{mills-peak-to-peak}}
\]

Noise levels for fans must not exceed 85 dBA at a 914.4 mm 3 foot station. Provide fan housing consisting of carbon steel of a nominal thickness no less than that selected in Table I.

<table>
<thead>
<tr>
<th>TABLE I HOUSING GAUGES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nominal fan diameter (mm) (inches)</td>
</tr>
<tr>
<td>up to 584 23</td>
</tr>
</tbody>
</table>
Provide continuously welded scroll and sideplate joints. Reinforce housing with steel member to provide a rigid structure and to minimize vibration. [Locate a threaded drain connection to accommodate a 25 mm 1 inch standard pipe at the lowest point in the scroll. Include a flush-type access door in the scroll and hold by quick-release clamps and locate as specified. Provide flanged inlet and outlet duct connections]. Equip the inlet of the fan with an inlet box of the same steel thickness as the housing.] Provide seals to minimize leakage where the shaft passes through the housing or inlet box. [Provide scroll sheets and rotor blades with liners.]

a. Insulate induced draft fans as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Factory paint fans with the manufacturer's standard finish. If drawings so indicate, design the induced-draft fan housing to support the portion of the boiler stack that is resting on the housing. Provide fans with [inlet vane control] [inlet damper control] [variable speed control]. Provide inlet vanes or dampers that are suitable for use with combustion control equipment. Equip fan with [precision anti-friction bearings that meet the requirements for a minimum rating life of 100,00 hours] [the self-aligning sleeve type] [or] [roller bearings mounted in suitable pillow blocks]. Fans with backward curved blades may have self-aligning anti-friction bearings.

b. Provide air cooled fan bearings. Provide air balanced pillow blocks or auxiliary seals to prevent the aspiration of oil from oil slinger type bearings. Provide oil reservoir with heat slingers for control of air movement over the bearing housing in order to prevent a buildup of ambient temperature. Provide means for lubrication in accordance with the manufacturer's standard practice. Locate parts requiring lubrications to make the lubricating points easily visible and accessible. Provide hydraulic lubrication fittings in accordance with SAE J534. Where use of high-pressure lubricating equipment, 1000 pound-force per square inch or higher, will damage grease seals or other parts, affix a suitable warning to the equipment in a conspicuous location. Properly lubricate all parts requiring lubrication before delivery.

c. Drive fans by electric motors. Provide electric motor which is [drip proof] [totally enclosed, nonventilated] [totally enclosed, fan-cooled] [totally enclosed, fan-cooled, suitable for installation in a Class 1, Division 1, Group F, hazardous location conforming to NFPA 70]. Motor starter must be magnetic [across-the-line] [reduced voltage start] with [general-purpose] [weather resistant] [watertight] [dust-tight] [explosion-proof] enclosure and furnished with four auxiliary interlock contacts. Connect fans directly or indirectly to the driving motor. If the fan is indirectly connected, provide a V-belt designed for 50 percent overload capacity, and mount the motor on the base in a manner that will permit tightening of the belt.
2.4.5 Flue Ducting

Connect each boiler to the stack or flue by means of a smoke connection constructed of black iron or steel sheet no less than 1.214 mm 0.0478 inch, nominal thickness. Ensure clear distance between any portion of the smoke connection surface and any combustible material is not less than that specified in NFPA 211. Fasten joints and seams securely and make airtight. Provide suitable clean-outs to permit cleaning the entire smoke connections without dismantling. Construct duct conforming to SMACNA 1966. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping of combustion gases.

2.4.6 Breaching

Construct breaching of no less than 3.416 mm 10 gauge steel sheets conforming to ASTM A36/A36M. Reinforce and brace breaching adequately with structural steel angles no smaller than 50.8 by 50.8 by 6.4 mm 2 by 2 by 1/4 inch and weld all joints and seams in the sheets and angles. Install flexible type expansion joints that require no packing as indicated and required to suit the installation. Provide breaching with angle flanges and gaskets for connection to boilers, fans, equipment, or stacks with breaching to be the full size of the opening. Line breaching with a minimum of 76.2 mm 3 inch thick refractory. Make gas-tight breaching connections, caulk tight all around and seal with cement to form an air-tight joint. Provide clean-out openings consisting of tight-fitting hinged doors with frames, of suitable size, and at approved locations for access to all sections of the breaching. Locate one 400 by 400 mm 16 by 16 inch inspection door in the side of the breaching just preceding the boiler unit. Locate a similar inspection door just following the boiler unit. Breaching may be supplied in bolted or welded sections for ease of handling and erection and constructed in accordance with SMACNA 1966. Provide connectors in accordance with NFPA 211. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping of combustion gases.

2.4.7 Flue Gas Inlet Damper

**************************************************************************
NOTE: Optional wording is applicable to guillotine-type dampers.
**************************************************************************

Install a [guillotine] [butterfly] [shutter] damper [of the thickness indicated] [at least 63 mm 2-1/2 inches thick] and consisting of refractory material enclosed in a steel frame at the entrance of the waste heat recovery boiler to isolate it from the combustion equipment during emergency boiler repairs. Furnish a [chain hoist] [manual lever] [electrical control] for raising and lowering the damper and must be of a size and design to ensure free movement by the damper. [Secure the hoist cable to the damper frame by shackles and bolts. Provide damper slot with a steel plate cover 6.4 mm 1/4 inch thick and of the proper length and width. Provide cover with a slot to permit passage of the damper cable, and for easy removal of the damper. Provide hoist that is a product of a manufacturer regularly engaged in the manufacture of hoists. Provide spur geared hoist. Design unit for high-speed lifting, have high mechanical efficiency, an automatic load brake, and a built-in load limit.] The operator must be able to move the required load freely and maintain the damper in any desired position within the limits of the flue opening. Do not exceed a maximum pull of 310 Newtons 70 pounds to operate the unit.
2.4.8 Flue Gas Discharge Dampers

Install a controller-actuated, refractory-lined damper at the boiler exit. Install another damper in the dump stack and open if any of the following conditions occur:

a. Excess boiler steam pressure.

b. Induced draft fan failure.

c. Boiler is shut off.

Operate boiler dampers by a controller-actuated motor based on the [boiler steam pressure] [boiler water temperature]. Provide reverse acting boiler and dump stack dampers, i.e., when the boiler damper is open, the dump stack damper will be closed.

2.4.9 Blowoff Tank

[Construct blowoff tank of 4000 psi reinforced concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE, and fit with a bolted steel manhole cover and frame. Install blowoff pipe, vent pipe, and drain pipe to sewer in pipe sleeves built into the concrete. Fill and caulk space between the pipe and sleeves with lead wool or similar material to make a water-tight connection. Divide tank into two sections by a baffle to form a sediment chamber] [Construct blowoff tank of steel].

2.4.10 Boiler Feed Pumps

Size and design boiler feed pumps for the specific application. Furnish pumps having a combined rating of flow and head that results in a horsepower rating less than 186 kW 250 bhp to meet the design requirements of API STD 610. Provide either end-suction or top suction, top-discharge pump and support at the center line. Pump size with higher ratings than the above must be horizontal-split case, multistage centrifugal pumps. All pump ratings must have, nominally, an excess capacity of 10 percent above the maximum continuous rating of the service. The required net positive suction head (NPSH) at the pump design flow, head, and speed must not exceed 80 percent of the available system NPSH at the same flow, assuming a low level in the storage tank. Ensure guaranteed NPSH requirements reflect 3 percent breakdown criteria. Ensure the pump's head-capacity (H-Q) curve is constantly rising to shutoff with no point of inflection. There must be no restriction to operation at any point from continuous flow to design flow. Provide turbine type pumps, bronze fitted throughout, with impellers of bronze or other corrosion-resistant metal as approved. Fit pump barrel assemblies with lifting rings. Use capacities and characteristics as indicated.

2.4.10.1 Casings

Construct casing using either volute or diffuser design and support at its centerline. Provide pumps with integrally cast suction and discharge flanges that are drilled to meet the design pressure of the application. Use a maximum operating temperature, for design purposes, of any feedpump that is no less than 204 degrees C 400 degrees F. Drill and tap casings. Provide casings with vent, gauge, and drain connections. Pumps designed for this service must not require cooling at ratings below 370 kW 500 bhp. This applies to both frame cooling or seal cooling. Below 370 kW 500 bhp,
employ antifriction radial and thrust bearings lubricated by flinger rings in a sealed housing. Provide seals consisting of mechanical and air-cooled flush piping conforming to API STD 610, Plan 23. Above 370 kW 500 bhp, employ a single cooling circuit for both cooling and delivering the oil by a forced-oil system to sleeve radial bearings, and a floating shoe thrust bearing, coupled with the seal coolers for both stuffing boxes. Provide mechanical seals and an extra seal replacement kit for each pump. In both cases, stuffing boxes must be site-convertible to a packed box. Ensure leakage is no more than 25 cc/hr for a seal life of not less than 25,000 hours. Ensure bearing rating is not less than 100,000 hours (L-10 life) at the point of maximum load, as defined by ABMA 9. Cool sump by indirect coil. Design pump casing to allow the pump barrel assembly to be removed as a unit, from the drive shaft end to the impeller, without disturbing the main piping or the drive [motor] [or] [turbine].

2.4.10.2 Pump Base

Support pumps on structural steel bases that do not require grouting in order to impart strength to the pump for static and dynamic loading from the piping system. Provide bases for pump and drive assembly and support complete with drain lip and pitch to a low-point drain. Shop align the complete pump and motor assembly using shims on both the pump and motor. Install pumps on their concrete foundations where shown on the drawings.

2.4.10.3 Pump Couplings

Furnish all pumps with nonlubricated flexible-disk couplings and a coupling guard. Provide spacer type couplings to permit removal of the mechanical seals and limited-end-float-type for pumps with sleeve bearings.

2.4.10.4 Pump Relief Valve

*************************************************************************
NOTE: If automatic recirculation valve is utilized, delete this paragraph.
*************************************************************************

Where an automatic boiler feedwater recirculation valve is not used, arrange each boiler feed pump for continuous operation and furnish with a suitable relief valve for bypassing the boiler feed to the deaerating feedwater tank to maintain a minimum flow of 5 percent under shutoff conditions. Use feedwater regulating valve to maintain a constant feed-pump discharge pressure. Provide an internal-pilot-operated piston valve, single-seated, V port or tapered plug, and adjust to maintain within 7 kPa 1 pound of the desired terminal pressure, regardless of fluctuations in the initial pressure or fluctuations in the rate of flow. Construct valve body of bronze with renewable disks and seats of hardened stainless steel and design for a working pressure of not less than [1.72] [_____] MPa [250] [_____] psig. Provide a position indicator with the valve.

2.4.10.5 Pump Shutoff Valve

Fit each pump with a shutoff valve on the suction inlet line and with a nonslam check valve and a shutoff valve on the discharge line. On pump sizes over 3 L/second 50 gpm, provide an automatic recirculating bypass valve unit on each pump discharge to prevent the pump from overheating and consequent damage at low flows. Where the automatic recirculating valve is so designed, it may be used as a combination check valve and recirculating valve and the separate nonslam check valve may be omitted.
2.4.10.6  Steam Turbines

**************************************************************************
NOTE: Steam driven boiler auxiliaries will not be used unless the exhaust steam can be used completely. It is recommended that a life cycle cost study be performed to determine if this section is applicable. Reference to steam drives will be deleted if inapplicable for the equipment specified.
**************************************************************************

Provide steam turbines for boilerfeed pump to operate the pump properly in a steam pressure range of [_____] kPa psig with steam back-pressure of [_____] kPa psig. Turbines must have horizontally-split, two-piece, centerline supported casings, water-cooled bearing cases with ring-oiled, babbitt lined, bronze packed sleeve bearings. Equip turbines with a mechanical shaft speed governor and valve, independent over-speed emergency governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, stainless steel steam strainer that is removable without disconnecting piping, any special wrenches and tools required for servicing the turbine, and a sentinel warning on the exhaust casings. Provide turbines conforming to NEMA SM 23.

2.4.10.7  Electric Motor Drives

Select electric motors for continuous duty and nonoverloading characteristics suitable for the power characteristics available. Provide [splashproof] [totally enclosed, nonventilated] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type, suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70] motors. Provide magnetic, reduced voltage start type motor starter with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.

2.4.10.8  Shop Hydrostatic Testing

Subject all pumps to shop hydrostatic testing. Subject one pump in each service to a complete shop performance test to demonstrate that, at rated capacity, head is within a margin of plus 3 percent and minus 0 percent of design; efficiency is within a tolerance of minus 0 percent; NPSH at the pump's BEP and at the rated condition is within a margin of plus 0 percent and minus 10 percent. Make performance tests in accordance with API STD 610. Procedures and results are subject to the approval of the Contracting Officer.

2.4.10.9  Control Location

Start boiler feedwater pumps through the combustion equipment/boiler panel, manual/automatic switch.

2.4.11  Condensate Pumps

**************************************************************************
NOTE: If inadequate NPSH is available, give consideration to substituting either a double suction or positive displacement pump.
**************************************************************************
Condensate pumps must be horizontal, end-suction, single-stage, centrifugal, motor-driven pumps. Provide casing of proper material for the pressure involved, and provide bronze or Monel trimmed pumps, with stainless steel shafts or shaft sleeves, and bronze impellers. Provide pumps with stuffing boxes. Lubricate by splash oil with oil level sightglass provided. Pumps are subject to the same tests specified for the boiler feedpumps. Install condensate pumps on suitable concrete foundations. Provide each pump with the capacity to pump 100 percent of the design load continuously. Pumps will pump a mixture of condensate and sodium zeolite softened water from the condensate tank to the deaerator. The NPSH required for all pumps must not exceed [_____] meters feet, and the pumps must be capable of handling water up to 99 degrees C 210 degrees F under these conditions without cavitating. Ball bearings amply sized for any and all thrust loads expected must be water-or oil-cooled and self-aligning. All necessary vents, drains, petcocks, oil sight glasses, etc., and the proper packing materials for mixed condensate and makeup water service must be of the manufacturer's highest standards. Provide factory assembled horizontal pumps to the motor drives on a rigid structural steel or cast iron baseplate. Connect each pump directly to a motor through a flexible coupling with approved coupling guards.

2.4.11.1 Design Conditions

The design conditions are:

a. [_____] L/second gpm.

b. [_____] head.

c. Water pumped at 16 to 99 degrees C 60 to 210 degrees F.

2.4.11.2 Condensate Pump Drives

Provide amply sized condensate pump motor drives to handle the pump power with low discharge heads and do not exceed 1750 revolutions per minute (rpm). Supply ball bearing motors of totally enclosed fan-cooled construction for the power characteristics available. Provide condensate pump motors with a magnetic across-the-line starter equipped with thermal overload protection. Locate starters in the motor control center.

2.4.11.3 Condensate Pump Auxiliaries

Provide condensate tank and pumps complete with all piping, suction strainers, suction and discharge valves, check valves, and fittings required for an integrated unit. Make provisions in the pump suction and discharge lines for thermal expansion and vibration isolation. Use factory assembled piping. Furnish all pumps with isolating valves on suction and discharge, suction strainers, startup strainers, silent check valves, and recirculating piping. Arrange pumps with bypass line and orifice in accordance with manufacturer's specifications to recirculate pumped fluid. Provide all controllers, alarms, gauges, sight glasses, control valves, etc., with shutoff and/or bypass valves as required for maintenance of the system while in operation.

2.4.12 Emergency Interlock

Provide emergency interlocks to bypass the flue gas or shut down the combustion source, in case of low water, high or low pressure, power

SECTION 23 52 30.00 10  Page 37
failure, or control failure. The system must act automatically.

2.4.13 Calorimeter

Provide a calorimeter connection in the steam main and provide a flange nozzle between the stop gate and the nonreturn valve to permit release to atmosphere when testing the boiler at maximum capacity. Equip the flanged nozzle with blind flange and gaskets.

2.5 CONDENSATE TANK AND ACCESSORIES

2.5.1 Condensate Tank

Design condensate tank for a working pressure of 103 kPa 15 psig and conform to ASME BPVC SEC VIII D1. Provide tank with a storage capacity equal to or greater than indicated and install complete with all piping and accessories. Factory prime condensate tank with the manufacturer's standard paint.

2.5.2 Feedwater Makeup Valve

Provide a float-controlled valve for emergency feedwater makeup to the tank. Operate valve by a float-control mechanism connected to the surge tank and maintain a suitable minimum water level in the tank. Locate float box outside the tank and ensure connections are properly valved to permit blowdown and servicing.

2.5.3 Overflow Trap

Install an overflow trap designed for the service with the condensate tank. Operate the trap to prevent the water level in the surge tank from rising above a predetermined point by automatically discharging the excess water and design to prevent the escape of steam and air.

2.5.4 Tank Connection and Controls

Provide tank with all necessary threaded and flanged openings for condensate return, 300 by 400 mm 12 by 16 inch (minimum) access manhole, overflow, drain, pump suction, gauge glass with cocks and drains, and other openings as required. Provide tank with a low-level alarm and pump shutoff and high-level alarm. Provide alarms consisting of an alarm horn and warning lights mounted on the control panel as specified.

2.5.5 Design Conditions

The design conditions are:

</tbody>
</table>
2.5.6 Detail Specifications

Provide tank consisting of butt fusion welded steel plate with a maximum diameter of [_____] and a maximum straight side length of [______]. Test tank under pressure to assure no leaks. Make provisions in the tank for all connections. After fabrication, clean the interior of the tank of all mill scale, oil, and weld splatter and then coat with a baked-on phenolic lining or approved equivalent material that is suitable and guaranteed for continuous immersion in condensate and softened water from a sodium zeolite softener at 99 degrees C 210 degrees F. Provide shop assembled condensate tank and check for proper fit of accessories. Determine what items should be removed and ship loose for field assembly. Erect condensate tank in a horizontal position.

2.5.7 Condensate Tank Trim

Provide condensate tank with the following trim:

a. Water gauge glasses with shutoff valves to cover the full water level travel.

b. Thermometer.

c. Makeup water control valve with inlet, outlet, and bypass valves. Mechanical linkage control will not be acceptable.

d. Pneumatic level controller.

e. Level switches with provisions to attach an alarm or 120 volt control signal.

f. Drain valve.

g. Insulation clips for 25 mm 1 inch block insulation.

h. Provide all controllers, alarms, gauges, sight glasses, control valves, etc., with shut off and/or bypass valves as required for maintenance of the system while in operation.

2.5.8 Additional Requirements

Provide all required foundations, anchor bolts, concrete work, and grouting shown in the manufacturer's load diagram and anchor bolt plan. Provide insulation and covering conforming to Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Provide all wiring incidental to the operation of controls and instrumentation. Provide all piping to connect to the tank for accessories.

2.6 HEAT EXCHANGERS

**************************************************************************

NOTE: If the bulk of the condensate return is at a high temperature, as from a laundry, a heat exchanger will be used. If the bulk of the condensate is returned to a heating pump unit, a
heat exchanger will not be required for that 
application. Heat exchangers can be used for either 
heating or cooling the condensate.

**************************************************************************

a. Design, fabricate, test, and stamp heat exchangers in accordance with 
ASME BPVC SEC VIII D1. Additionally, meet the requirements of HEI 2623. 
Ensure closed feedwater heater designs meet the requirements of HEI 2622. 
Provide all heat exchangers with relief valves as required by 
ASME BPVC SEC VIII D1 and HEI 2623 and design for a working steam 
pressure of [586] [_____] kPa [85] [_____] psig. [Design heat 
exchangers using service water to have the service water inside the 
tubes.] [The exchangers must be of straight tube design with bolted 
full diameter access channel covers to facilitate tube maintenance as 
required.] Return bonnets are acceptable when there are no tubeside 
connections at the far end.

b. Use carbon steel materials of construction, except use service water 
side materials that reflect the service water available. When the 
water quality permits, provide stainless steel tubes in accordance with 
ASTM A249/A249M, Grade TP 304; provide all carbon steel for the 
remainder of the tube side. When the service water is known to contain 
chloride levels harmful to stainless steels, provide 90-10 Copper-Nickel tubes in accordance with ASTM B111/B111MAlloy 706; 
provide the following for the remainder of the service water side: 
tubesheets, Monel-clad steel; channel covers, carbon steel lined with 
Monel; channels and bonnets, Monel.

c. Fixed tubesheet designs are preferred when operating conditions do not 
 impose a large differential movement that cannot be readily 
accommodated with a simple thin-wall metal bellows expansion joint. 
For larger differentials, a packed floating tubesheet with lantern ring 
is acceptable up to 1.03 MPa 150 psig design pressure. For pressures 
above 1.03 MPa 150 psig, use a split-ring floating-head design.

d. Provide heat exchangers, steam-to-heat domestic water or other fluids 
such as glycol-water mixtures or fuel oil with the steam in the shell 
side. Provide exchangers of U-tube designs with bolted full-diameter 
channel covers to facilitate tube maintenance as required. Ensure the 
tubesheet is the full diameter to match the shell flange and has 
sufficient threaded holes so that a shell hydro test may be applied 
without the channel in place. Materials of construction must be all 
carbon steel with the exception of the tubes which should typically be 
specified as stainless steel in accordance with ASTM A688/A688M, Grade 
TP 304, stress relief annealed temper with the U-bends stress relieved 
after bending. Provide fuel oil heaters with carbon steel tubes in 
accordance with ASTM A179/A179M and furnish in the stress relief 
annealed temper with the U-bends stress relieved after bending.

e. Use feedwater heaters consisting of all-welded construction with bolted 
full diameter channel covers to facilitate tube maintenance as 
required. Ensure the channel barrel is integral with the tubesheet and 
has an internal pass partition bolted cover design that is readily 
removable when the channel cover is removed. Pass partitions that are 
sealed with a gasketed groove in the channel cover are prohibited. Use 
carbon steel for all materials of construction except the tubes. 
Provide pressure boundary material in accordance with ASTM A516/A516M, 
Grade C, when plate material is required, or ASTM A350/A350M when 
forging material is required. Provide shroud plate material for
desuperheating and subcooling zones in accordance with ASTM A285/A285M, Grade C. Provide stainless steel tubes in accordance with ASTM A688/A688M, Grade TP 304, stress relief annealed temper with U-bends stress relieved after bending. Coat shell on the outer surfaces with an approved rust-inhibiting paint. Design coils for a working pressure of [_____] kPa psig. [Employ a heat exchanger to reduce the temperature of high-pressure condensate by heating domestic or boiler feedwater, to prevent excessive flashing in the condensate tank.]

2.7 DEAERATING FEEDWATER HEATER

Install deaerating feedwater heater, of the size and capacity indicated, where indicated. Provide steel plate shell. [Provide a corrosion-resistant steel tray system for a Type I unit.] Provide [copper] [corrosion-resistant steel] floats. Provide a [loop seal] [float-controlled overflow trap] overflow control. Provide a heater with a pressure relief valve, thermometers, pressure gauge, and oil separator. Install a combination temperature-pressure recorder for each feedwater heater. Take steam pressure readings from the shell, and the temperature bulb must [indicate] [record] the temperature of the feedwater after it passes over the trays and sprays. Provide an alarm to turn on a red pilot signal lamp and to sound a bell in the event that the water level in the feedwater heater storage tank falls to 300 mm 12 inches above the bottom of the tank. Operate system by an approved type of external electric float switch connected to the tank. Mount signal lamp and bell where directed. Provide float operator for the deaerator level control valve of the externally connected cage type of semisteel construction and noncorrodible float, both designed for 858 kPa 125 psig working pressure, piped with shut-off and drain valves.

### 2.7.2 Detail Specifications

**NOTE:** In general, use tray system for fluctuating loads and the spray system for steady loads.

Provide spray type heater with spray valve vent condenser in accordance with ASME BPVC SEC I and design for [_____] kPa psig working pressure. Deaerator must be ASME stamped. All steel plate used in construction of the heater and storage tank shells must be ASTM A285/A285M Grade C. Where thickness makes it desirable, ASTM A515/A515M or ASTM A516/A516M steel may be used as appropriate. Include at least 2.0 mm 1/16 inch corrosion allowance over the calculated ASME Code thickness. Test heater and storage tank at a pressure 50 percent in excess of the design pressure. Design heater so that corrosive gases do not come in contact with the outer shell or heads of the unit. However, units not complying with this provision will be accepted providing the upper head and the heater shell sections in contact with gases are clad with 304 stainless steel, 2.0 mm 1/16 inch minimum thickness. Provide heater with adequate supports, manholes, gauge glasses denoting full water travel in the storage section, and all other connections as necessary for a complete working unit, along with those called out as accessories. Provide heater with an internal vent condenser fabricated entirely of stainless steel which includes a vent hood and vent orifice or separate vent valve. Heater section must contain spring-loaded spray valves mounted in a stainless steel water box and a stainless steel vent condenser. Construct spray valves of 18/8 stainless steel and provide a constant angle of spray at ranges from 10 to 150 percent of capacity. Provide hydraulically balanced valves, thus requiring no guides that might bind, scale, or otherwise clog. Locate spray valves to allow their servicing, inspection, and removal. Maximum tank dimensions are [_____] outside diameter. Construct internal parts of the deaerating heater, including baffles, distributing nozzles, vent pipe, and vent collecting hood of heavy gauge stainless steel. Provide a drawing showing the "internal" construction of the heater with each bid. Include an internal sparger tube for chemical treatment injection with the deaerator. Provide boiler feedwater pump suction nozzle including a vortex breaker. Provide deaerator with all of the connections shown on the drawings, as a minimum.

### 2.7.3 Deaerator Trim

Provide deaerator with the following trim:

a. Safety relief valve set to open at 83 kPa 12 psig, and of sufficient capacity to protect the deaerator from excessive steam pressure with the steam regulating valve in fully open position.

b. Vacuum breaker valve.

c. Water gauge glasses with shutoff valves to cover the full water level range.

d. Provide pressure gauges conforming to ASME B40.100 complete with siphon and isolation valve.

e. Makeup steam control valve with strainer, bypass, inlet and outlet valves. Valves to reduce steam pressure from [_____] kPa psig to [_____] kPa psig, with capability to operate at up to [2.07] [3.45] MPa [300] [500] psig inlet pressure. Adjust reducing valve to maintain the...
desired terminal pressure, regardless of fluctuations in the initial pressure. Provide single-seated, spring loaded valves that are quiet in operation, and guaranteed not to stick. Valve body 65 mm 2-1/2 inches and larger must be cast steel; 50 mm 2 inches and smaller must be of bronze. Provide valve trim consisting of stainless steel, Monel metal, or approved corrosion-resisting material. Ensure all parts subject to wear are readily replaceable. Provide valves with seats and plugs faced with cobalt tungsten carbide mixture, or made of heat treated stainless steel or high chromium steel guaranteed to resist erosion. Provide seal and plug facing with a Brinell hardness of no less than 450. Install valve with a strainer, a bypass, [safety valve on deaerator] as indicated. Connect sensing line to the steam space in the deaerator. Size control valve for a minimum capacity of [_____] kg/hour lb/hour at design conditions, but do not exceed a capacity greater than [_____] kg/hour lb/hour for the same conditions. Select valve trim to result in a noise level not to exceed 85 dBA, measured 914 mm 3 feet from valve.

f. Makeup water control valve with bypass and inlet and outlet valves. Valve to operate at an inlet pressure of up to 552 kPa 80 psig.

g. Pneumatic level controller. Mechanical linkage control of makeup will not be acceptable.

h. Overflow trap or valve with float control.

i. Insulation clips for 38 mm 1-1/2 inch block insulation.

j. Lifting lugs as required.

k. Multiport relief valve with exhaust head for mounting in piping supplied by others.

l. Manual air vent valve.

m. Drain valve.

n. Chemical injection valve.

o. Sample valve.

p. High and low level switches.

q. All support steel.

2.7.4 Additional Requirements

All required foundations, anchor bolts, concrete work, and grouting, will be in accordance with Manufacturer's Load Diagram and Anchor Bolt Plan. Installation and covering must conform to Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. All wiring incidental to the operation of controls and instrumentation will be provided. All steam and water piping to connect to the deaerator will be provided. Provide testing outfit conforming to ASTM D888, complete with chemicals for 100 tests. Provide all controllers, alarms, gauges, sight glass, control valves, etc., with shutoff and/or bypass valves as required for maintenance of the system while in operation.
2.7.5 Performance Guarantee

Provide that the deaerator:

a. Is of sufficient design to reduce the oxygen content of the feedwater to \([_____]\) cc/liter when tested by the accepted modified Winkler or ASTM method.

b. Is of sufficient design to reduce free carbon dioxide to zero.

c. Is of sufficient design to ensure essentially noiseless operation at all rates up to and including maximum capacity.

d. Meets all performance requirements at all loads from 3 to 100 percent of capacity.

e. Admits makeup water only after giving preference to available condensate.

2.8 PIPING

Unless otherwise specified, provide pipe and fittings conforming to Section 33 63 23 EXTERIOR ABOVEGROUND STEAM DISTRIBUTION.

2.9 CHEMICAL TREATMENT AND WATER SOFTENING EQUIPMENT

2.9.1 Chemical Feeder

**************************************************************************
NOTE: Conform to requirements of UFC 3-410-01 or UFC 3-410-02.
**************************************************************************

Provide a feeder unit for each boiler. Provide automatic proportioning, shot, or pump type chemical feeders. Provide all appurtenances necessary for satisfactory operation. Base size and capacity of feeder upon local requirements and water analysis. Install feed piping to feed chemicals directly to each boiler, as shown on the drawings or as required for the equipment supplied.

2.9.2 Pumps and Tanks

Furnish chemical feed pumps and tanks as a package with the pumps mounted on and piping connected to the tank. Provide pump cylinders, plungers, ball check valves, and check valve bodies consisting of corrosion-resistant materials suitable for the chemicals being pumped. Ensure volumetric accuracy of the pumps is within one percent over the range indicated. Adjust pump capacities by positioning the crankpin with micrometer setscrews. Stroke length scale must be divided in percentage graduations engraved on the scale. Cylinders must be replaceable for increased or reduced pressure or capacity ranges. Provide drive motors that are suitable for the electric power available and that have drip-proof enclosures. Drive each pump by a separate motor. Make tanks of polypropylene and mount on legs. Provide tanks with filling and drain connections, and gauge glass. Furnish each tank with one pump, mounted and piped with black iron pipe and fittings, with suction strainer and stainless steel screen, and with 13 mm 1/2 inch relief valve with steel body and stainless steel trim. Each tank must have a hinged cover. Tank bottom must be dished concave to a radius equal to the diameter of the
tank. Units must be for phosphate or caustic feed and sulfate feeding. Provide motor-driven agitator. Design the pump to feed the chemical solutions into the boiler feedwater system.

2.9.3 Water Softening Equipment

**************************************************************************
NOTE: Need for softening equipment for makeup water will be as determined in accordance with UFC 3-410-01 or UFC 3-410-02. If water softening is not required, delete the paragraph.
**************************************************************************

Provide a complete sodium zeolite cycle water softening system as specified in Section 22 31 00 WATER SOFTENERS, CATION-EXCHANGE (SODIUM CYCLE). Size equipment to run 24 hours before regeneration when operating at a sustained softening rate of [_____] L/second gpm. Provide tanks complete with cover and design to eliminate the need for a gravel supporting bed.

2.10 BOILER CONTROL EQUIPMENT

**************************************************************************
NOTE: Positioning type control equipment will be specified for boilers with capacities of 13 MW 45 MBtuh or less. Metering type equipment will be used for larger boilers. Positioning type controls may be furnished for boilers with capacity of 13 MW 45 MBtuh or more in lieu of metering type.

A continuous emissions monitoring system (CEMS) is required by the Clean Air Act Amendment (CAAA) of 1990 if the fuel utilized is oil or coal and the heat input is 3 MW 10 million BTU/HR or greater. A CEMS may also be required by state or local laws. If a CEMS is necessary the designer should review the CAAA and the relevant state or local law early in the project to allow time to incorporate the requires CEMS specifications and to determine which flue gas emissions will be included in the required reports.
**************************************************************************

a. Install an automatic control system for each boiler in accordance with the manufacturer's recommendations. Provide all locally indicating instrumentation and controls and install complete, as required to suit equipment furnished and as shown. All remote instrumentation, controls, and their connection points will also be provided and installed as indicated. If the controls are manufactured by a manufacturer other than the boiler manufacturer, install controls in accordance with the control manufacturer's instructions. Locate automatic controllers on the control room panel as specified.

b. Operate equipment either pneumatically, electrically, or electronically. Provide pneumatic control systems conforming to CAGI B19.1. Install air filter regulator sets at each control valve and transmitter in the system. Provide dual type master air filter regulator set on the control panel where one side can be cleaned and repaired while the other is in operation. Protect exterior control air piping and devices from freezing by use of a regenerative desiccant
dryer. Provide each system with a selector switch or other means to permit manual control of the firing rate when required. Electrical control devices must be rated at 120 volts and connected as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Wire operating and limit controls to interrupt the ungrounded circuit conductor.

c.[ Steam and energy generating equipment must include instrumentation and sufficient metering for accountability interface with a future Energy Monitoring and Control System (EMCS).] If pneumatic controls are provided, use duplex air compressors with a drier between the compressors and tank. Size air compressor units to run no more than 60 percent of the time when all controls are in service.

2.10.1 Positioning Type

Provide positioning type control equipment capable of maintaining boiler steam pressure within plus or minus 2 percent of the set pressure over the complete range of boiler operation. Set point controllers may be used for on/off functions only. Maintain combustion efficiency without appreciable manual adjustment. Provide system capable of maintaining the specified pressure provided that the load does not exceed a 15 percent per minute change in capacity at any one time. Connect master transmitter to the main steam header where the steam pressure is to be controlled. The signal transmitted from this point to the master controller must be a function of steam pressure. On multiple boiler installations, provide a means to base load on individual boilers while on automatic, and control each boiler unit individually. Make provision on the control system for adding on other boilers to the system with only minor wiring or piping changes on the panel. Provide a manual-to-automatic station and indicator on the control panel for each automatic controller that will provide for selecting either automatic control or manual control and also will provide for manual operation. Arrange manual controls to allow any one or more of the functions of the control system to be controlled manually while the other functions remain on automatic control. Provide manual control station complete with all necessary indicators to facilitate changing from automatic control to manual control and vice versa. Mount controllers on the instrument panel which indicate and control measurement in the areas shown, and have a manual adjustment on the front of the instrument. Install controllers complete with wiring or piping between the controller, transmitter, and the final control device.

2.10.2 Equipment

Provide control equipment and instruments including fan controls, time clocks, relays, operating switches, indicating lights, gauges, motor starters, fuses, alarms, and circuit elements of the control system, and other controls and instruments necessary for unit operation. Provide control system in accordance with \textit{FM APP GUIDE}. Mount operating controls and instruments on one or more free-standing control panels conveniently located and place so that operating personnel may effectively monitor boiler operations but not in a position that would interfere with those operations. Indicating and recording instruments will be provided for pressure, flow of air and liquids, and alarm circuitry. Interlock automatic-control circuit systems and manual switches to prevent hazardous conditions or the discharge of excessive amounts of air pollutants.

2.10.3 Boiler System Operation
NOTE: If the fuel being burned contains any significant pollutants, some states may not allow the flue gases to be vented to the atmosphere without going through an air pollution control device.

When steam is demanded, direct gases through the boiler. As long as maximum energy is required, make this the mode of operation. If less than full energy production is required, modulate gas flow to reduce steam production by the boiler. Maintain specified steam pressure within plus or minus 1 pound by means of a pressurestat and a boiler-draft regulator. Provide pressurestat with necessary relays to stop and start the flow of gases by means of the induced draft fan so as to maintain the desired steam pressure.

2.10.4 Damper Control

Size power units for the movement of dampers to operate the device to be positioned, and mount so that a rigid mechanical connection to the device being operated can be used. Ensure units automatically close in the event of failure of the operating medium. Manual operation of the controller must not necessitate disconnecting the linkages during power failure or other emergency. Include position switches on fuel and air-drive units for interlock with safety systems. Place retransmitting devices on all power units for remote indication on the control panel of the position of the mechanism at any time. If electric operators are utilized, use oil immersed gear trains on the units.

2.10.5 Draft Fan Control

Provide induced draft centrifugal fans with outlet dampers [and variable speed control]. [Provide axial propeller fans with variable propeller pitch control.] Provide means for operating the induced draft fan for 15 minutes after the combustion equipment has ceased operation.

2.10.6 Soot Blower

Mount all controls, lights, switches, and indicators provided for operation of soot blower on the control cabinet.

2.10.7 Boiler Limit Controls

Provide limit controls and interlock switches conforming to UL 353.

2.10.7.1 Low-Water Cutoffs

Provide two low-water cutoffs to prevent startup and to shut down the combustion equipment if the boiler water level is below the preset safe level. Primary interlock may be automatic or manual reset type. Provide manual reset type secondary interlock.

2.10.7.2 High-Pressure Limit Switch

Provide a high-pressure limit switch to shut down the combustion equipment when steam pressure exceeds the preset safe limit. Provide this equipment in addition to the operating controls.
2.10.7.3 Draft Loss Interlock

Provide a draft loss interlock and an airflow switch or a suction switch to prevent startup and to shut down or bypass the combustion equipment when air is inadequate to safely support combustion. Provide limit and operating controls for operation on a two-wire grounded branch circuit.

2.10.8 Instrument Control Panel

Provide a NEMA ICS 6 Type 4 unit prewired panel, of steel, weathertight, and conforming to UL 50. Unless enclosed in a booth or separate room, also construct the panel to protect the instruments and controls from dust. Locate boiler control panel next to the control panel for the combustion equipment, or one panel may be used for both. Wire all instrument connectors and cable termination connectors in the factory by the instrumentation fabricator. Flush mount all controls, instruments, and other equipment at the factory and assembly-test before shipment. Furnish a lock and two keys. Identify all controls and instruments with nameplates. [Provide a thermostatically controlled heater to prevent condensation.]

2.10.8.1 Panel Details

a. Size instrument and control panel to contain all controls, instruments, gauges, and meters. Provide freestanding panels with a faceplate of no less than 7 mm 3/16 inch steel, properly reinforced, and finish with the manufacturer's standard finish coating. Mount units flush on the panel as far as practicable. Flush mount all controls, instruments, and other equipment, fit each neatly into a cutout, and completely cover the cutout and any mounting screws or bolts.

b. Enclose back of the panel with sheet metal and with adequate removable access panels or doors for maintenance and removal of any unit without interfering with other units. Provide proper latching equipment and hardware. Identify each recorder, indicator, and control unit with nameplates securely fastened to the panel. Provide nameplates consisting of black over white laminated plastic with the lettering penetrating the black surface to expose the white. Provide panel with continuous rapid-start fluorescent light fixtures mounted with reflectors providing suitable shielding to illuminate all controls, instruments, gauges, and meters.

c. Terminate all field piping connections in one bulkhead-mounted manifold, located to conform with the installation requirements of the system. Terminate all field electrical wiring in a color-coded terminal strip to conform with the installation requirements of the system. Ensure all electrical tubing or piping connections to controls, instruments, or other devices on the panel are inside the panel and not visible from the panel front. Provide a suitable plug-in strip in the rear of the panel for any required plug-in electrical connections of the instruments. Install all necessary transformers, separate relays, switches, and fuses in a fully enclosed junction box. Use a fused safety switch to serve the 120-volt power supply required for control circuits.

d. If a pneumatic control system is provided, include duplex air supply filter and regulator set mounted on the rear of the panel with properly identified pneumatic terminal blocks and low point drain. High pressure lines will not be allowed to enter the panel. [If packaged
burner units with integral controls are furnished, the control equipment may be mounted on a separate panel for each unit. Provide panel mounted controllers and indicators specified or required and test at the factory complete with relays, transformers, switches, wiring, valves, piping, and other appurtenances. Color-code all wiring and piping within the panel or identify otherwise. Isolate thermocouple and low energy signal conductors completely from power and alarm conductors, subject to approval by the Contracting Officer. Provide visual and audible alarms to protect personnel and equipment.

2.10.8.2 Recorders

Provide servo-mechanism type or multiple-pen type recorders. Provide [circular] [strip] chart. Minimum chart width is 100 mm 4 inches. Accuracy must be plus or minus 1/2 percent. Provide each pen with a separate scale calibrated in engineering units. Chart drive must be 120 volts ac. Provide one year's supply of chart paper. Make record in ink on a [24-hour] [31-day] chart driven by an electric clock mechanism. Make each recorder point with a different color ink. Install recorders complete with all necessary wiring or pipe between the recorder and the transmitter in the boiler room. Ensure recorders mounted on the instrument panel record and indicate measurement in the areas shown.

2.10.8.3 Panel Display

Include visual indication of the various modes of the main system components (i.e., damper positions, I.D. fans). As a minimum, display the following parameters on the panel:

a. Temperature recorder (boiler inlet exit).

b. Steam flow and pressure recorder (pressure immediately after second block valve, steam flow totalizer).

c. Clock with minimum 200 mm 8 inch diameter face (one panel only).

d. Steam gauge conforming to ASME B40.100 to indicate boiler shell or drum pressure.

2.10.8.4 Identification

Furnish all field items with a permanent metal tag suitable for tag number or service identification; include back of panel items in this category. Install wires and cables without joints or splices except at terminal points. Identify wires at both ends by labels.

2.10.8.5 System Diagram

Furnish laminated, color-coded system diagram mounted on the control panel indicating all system components and location of all sensors and alarm points.

2.10.9 Pilot Lights

Assemble pilot lights in a factory-built cabinet, suitable for flush mounting in cutouts in the control cabinet, complete with extruded trim, clamps, and sheet metal rear housing, and finished in baked black enamel. Integrate components through appropriate electro-mechanical devices with push-to-test indicating lights. Provide industrial oil-tight construction
in the following colors for the indication functions:

a.  Amber for power on the system.

b.  Green for boiler purge completion (one per boiler).

c.  White or manufacturer's standard color for energizing main fuel valves.

d.  Red for alarms.

   (1)  High temperature in combustion chamber.

   (2)  High temperature at induced draft fan inlet.

   (3)  System operation.

   (4)  Emergency damper closed.

2.10.10  Clock

Provide electric synchronous motor type clock.  Provide clock for surface mounting and suitable for operation on 115-volt, 60-Hz single-phase electric service.  Provide clock with a shatterproof, crystal-covered white dial, easy-to-read black Arabic numerals, black hour and minute hands, red sweep second hand, and external manual reset knob at bottom of case.  Seal the motor gear train in a permanent oil bath.

2.10.11  Alarm Annunciator Panel

**************************************************************************
NOTE:  Edit to indicate the number of points desired and specific items in the list.
**************************************************************************

Mount an annunciator system on each control panel.  Visual signals must be backlit nameplates for each point.  Provide a common audible alarm signal and a common acknowledge push button for each control panel.  Include a common alarm-silencing relay in the alarm circuit which will permit the boiler operator to silence the audible horn while retaining visual indication until the malfunction or abnormal condition has been cleared.  Nameplate size of alarm modules must be nominal 70 mm 2-3/4 inches high by 75 mm 3 inches wide in translucent white acrylic plexiglass and engrave all nomenclature on front surface in black lettering.  Mount flasher module and prewire with silence and test pushbuttons.  Ensure alarm points and window engraving are as shown below.

2.10.12 Steam Flowmeters

Provide steam flowmeters to measure the steam flow from each boiler and each main steam header outlet. Also provide flow meters to measure feedwater flow to each boiler. Provide flange-mounting type nozzles and orifice plates made of stainless steel. Provide orifice plates of the square edge, concentric, paddle type designed for flange taps. Provide condensate pots for steam service. Design meters to accurately measure saturated steam at a gauge pressure of [_____] kPa psi. Provide direct connected meters of the indicating, recording, and integrating type with electric chart drives. Provide dust-tight metallic or plastic instrument cases, finished in manufacturer's standard black, and arranged for flush-panel mounting. Ensure flow records are in thousands of kg pounds per hour on an ink chart recorder. Totalize steam flow in kg pounds by an integrator having no less than a six-digit counter. The installation of stainless steel orifice plates must include shutoff valves, equalizing valves, and blowdown valves. Provide each meter with a guaranteed accuracy of plus or minus 1/2 of 1 percent while operating at 20 to 100 percent of capacity. Install steam-flow orifices and associated steam piping in accordance with the manufacturer's recommendations and label with the following tags:

2.10.12.1 Orifice Plate

Size orifice plate to produce a 25.42 kPa 100 inch W.G. pressure differential at the rated flow of the meter as shown on the drawings. Provide orifice plates that are 3.2 mm 1/8 inch thick 316 or 304 SS, chambered with the sharp edge orifice facing upstream, fitted with a tab extending beyond flanges showing bore size, differential, and maximum flow. Calculation of flow must be made by the manufacturer under ASME MFC-3M, or equivalent by Spink or American Gas Association. Drill a weep hole in plates for steam or condensibles service when installed in horizontal meter runs.

2.10.12.2 Flow Transmitters

Provide pressure differential and transmitting components with an accuracy of plus or minus 1 percent, 0.15 percent repeatability, 4-20 milliamp dc signal into 0-500 ohms, (if electronic) internal square root extractor, adjustable zero and span, and equalizing valves. Ensure span range, and working pressure are as shown on the drawings. Install transmitters with condensate reservoirs where required to protect transmitter from excessive temperature.

2.10.13 Boiler Feedwater Flow Meters

**************************************************************************

NOTE: For boilers having less than 4500 kg/hour 10,000 lb/hour steaming capacity, a mechanical feedwater meter may be provided. Plants having metered zeolite softeners used exclusively for boiler makeup will not require an additional cold water makeup water meter. Boilers over 4500 kg/hour 10,000 lb/hour capacity will have indicating-recording meters and they will be integrating type where indicated.

**************************************************************************

Provide differential pressure type, Venturi style flow meters for boiler feedwater measurement. Provide pound-rated Venturi flow tubes with a series of nozzles around the inner surface to sense and average the velocity head. Ensure tubes 150 mm 6 inches and larger are flanged and install smaller tubes between welded neck flanges. Provide smaller flow tubes consisting of corrosion-resistant steel and flanged tubes with corrosion-resistant steel throat inserts. Metering must be for water flow [and feedwater temperature]. Mount receiver for each boiler on the boiler instrument panel. Equipment must be complete with differential pressure transmitter, shutoff valves, equalizing valves, and blowdown valves as required for a complete installation.

2.10.13.1 Indicating Feedwater Meter Receivers

Meter receivers must match other panel components in appearance and must indicate water flow in [______]. Where indicating feedwater meter only is utilized, provide a companion indicating feedwater temperature receiver.

2.10.13.2 Indicating, Recording, and Integrating Receivers

Provide indicating, recording, [and integrating] meter receivers. Furnish in a dust-tight metallic or plastic case finished in manufacturer's standard black finish and arrange for flush panel mounting. The indicator
must show with a pointer the rate of water flow. Record the flow, in thousands of kg pounds per hour, in ink on a 24 hour, 300 mm 12 inch diameter, equally graduated circular chart driven by an electric clock mechanism. Provide sufficient blank charts and ink for 400 days of operation. Also record boiler feedwater temperature in degrees C and degrees F on the same chart. [Totalize water in kg pounds by an integrator having no less than a six-digit counter.]

2.10.14 Blowoff Sample Cooler

Provide a water-cooled, shell-and-tube or shell-and-coil type heat exchanger with stainless steel tubes and cast-iron or steel shell suitable for cooling the blowoff before sampling. Connect cooler to a header and valve so the operator can obtain a sample of properly cooled blowoff from any boiler as desired. Properly support cooler and provide a brass or bronze sampling cock with lever or compression handle. Provide a sampling glass container suitable for handling the water temperature to be encountered and a hydrometer or equivalent device suitable for measuring the concentration of solids in the water and reading in parts per million.

2.10.15 Temperature Indicators

The Contractor may install any of the following temperature measuring devices as indicated. Ensure gauges match pressure gauges in appearance and match requirements of the transmitters supplied. Remote temperature indicators include condensate and steam temperature.

2.10.15.1 Thermometers

Provide thermometers conforming to ASME PTC 19.3 TW, Type 1, Class 3, dial with wells and separable corrosion-resistant steel sockets, and temperature range suitable for the use encountered. Do not use Mercury in thermometers. Provide thermometer consisting of a dial, 90 mm 3-1/2 inch diameter chromium-plated case, remote bulb or direct bulb as required, with plus or minus 1 degree C 2 degree F accuracy, and white face with black digits graduated in 2 degree increments. Install thermometers so as to be easily read from the operating floor.

2.10.15.2 Thermocouples

Use thermocouples suitable for continuous operation and control at temperatures up to 1260 degrees C 2300 degrees F, accurate to 0.75 percent, and long enough to be inserted 150 mm 6 inches into the boiler. Provide thermocouples conforming to ASTM E230/E230M, Type K with an adjustable flange and with a high-temperature metal alloy closed-end protection tube suitable for inserting into the furnace without support of the projecting end. Supply one hundred feet of 16-gauge compensating lead wire with a weatherproof braid for connecting the thermocouple to the instrument. Installed unit must indicate gas passage temperatures and control combustion equipment operation. Transmit temperature to the instrument in the control panel as shown.

2.10.15.3 Indicating, Recording Pyrometers

The instrument must have a temperature range from minus 18 to plus 1316 degrees C 0 to 2400 degrees F, and must be accurate to within plus or minus 1/4 of 1 percent of the range. Indicate temperature on a large scale with prominent black letters on a white background and record by chart recorder. The instrument must have automatic cold-junction compensation.
Provide a simple means of pyrometer standardization. Instrument must not be affected by vibration, dust, or air currents when the door of the instrument is open. Lighting circuit for 110 volts ac must be available.

2.10.16 Draft Indicator and Control

Provide an indicator continuously showing pressure in the boiler. Also provide a separate draft-controlling instrument maintaining a constant balanced (atmospheric) pressure in the boiler. Provide gauges conforming to ASME B40.100, Style 1 with a diaphragm or bellows actuating system and a circular scale. Provide gauges with a zero adjustment screw and a connection to atmosphere. Provide suitable shutoff cocks. Gauges must be remote reading to the control panel and install complete with all necessary piping between the gauges and the points at which the drafts are measured. Gauge piping must be copper tubing conforming to ASTM B68/B68M, Type K or L.

2.10.17 Pressure Gauges

Provide heavy-duty industrial type gauges conforming to ASME B40.100, Type I, Class 1 or 2, as applicable, style as required, suitable for specified pressure or vacuum with minimum 115 mm 4-1/2 inch diameter dial, except as otherwise specified. Install pressure gauges on the low-pressure side of each pressure-reducing valve, on the suction and discharge side of each pump, on inlets and outlets of heat exchangers, on the feedwater heater, and where shown or required for proper operation. Install pressure gauge with a 250 mm 10 inch or 300 mm 12 inch dial face on each boiler. Install gauges to be accessible and easily read from the operating floor. Equip gauges with integral or separate siphons, and pulsation dampeners and connect by brass pipe and fittings with shutoff cocks. Where pressure reducing valves are used, place upstream and downstream gauges close to the pressure reducing assembly, but connect approximately 3 m 10 feet therefrom. Operating ranges of the gauges must be approximately twice the normal operating pressure.

2.10.17.1 Pressure Gauges (Panel)

Furnish and install [three] [_____] 150 mm 6 inch dial size, phenol or brass, black enamel finished case, gauges to indicate main steam, boiler feedwater, and deaerator makeup. Provide Bourdon tube style gauges with back connections and white dials with black lettering. Equip steam gauges with siphons and ensure all gauges have shutoff valves at the panel. Make panel entry through bulk-head connectors located in the upper part of the panel. Gauge accuracy must be at least 1/2 of 1 percent and normal readings must be approximately 50 to 75 percent of full scale reading. Label gauges as follows:

<table>

</tbody>
</table>

2.10.17.2 Pressure Gauges (Local)

Furnish and install [_____] 115 mm 4-1/2 inch dial size, phenol or brass,
black enamel finished case, gauges for the services shown below. Provide Bourdon-tube style gauges with bottom connections and white dials with black lettering. Equip steam gauges with siphons and install all with shutoff valves. Gauge accuracy must be at least 1/2 of 1 percent and normal readings must be approximately 50 to 75 percent of full scale reading.

</tbody>
</table>

Provide gauges conforming to ASME B40.100, of pressure detecting class, single, Bourdon tube style, and suitable for detecting air pressure. Ensure gauges are remote reading to the control panel.

2.10.18 Feedwater Temperature and Pressure Recorder

Install feedwater temperature and pressure recorder on the boiler plant central metering panel to record the deaerated feedwater temperature and the pressure of steam space in the deaerating heater. Provide recorder as specified. Provide unit with interconnecting tubing and separable sockets for elements located in the feedwater heater. Totally enclose electrical connections. Provide accuracy within plus or minus 1 percent of the chart range.

2.10.19 Condensate Flowmeter

Furnish and install a 40 mm 1-1/2 inch in-line disk meter in the makeup line to the deaerator. Provide meter consisting of a bronze housing, stainless steel trim, and disk suitable for an operating temperature of 105 degrees C  220 degrees F. Equip meter with a register of at least six digits and have a capacity of at least 3 L/second 50 gallons per minute.
Furnish special tools only and include all uncommon tools necessary for the operation, cleanout, and maintenance of the boilers, pumps, fans, controls, meters, special piping systems, and other auxiliary equipment. Furnish small hand tools with a suitable cabinet, mount where directed. Also furnish the following tools.

2.11.1 Tube Cleaner

For water-tube boiler installations, provide a water-driven cleaner with three rotary cutters, the necessary length of armored water hose, valves, and all other appurtenances necessary for operation. Provide tube cleaner for each size of watertube in the boiler, with one extra set of cutters for each size cleaner. Provide necessary valves and fittings to permit convenient connection of the cleaner hose to one of the boiler feed pumps to supply cold raw water for operation of the cleaner. Arrange piping such that one boiler feed pump may be used to operate the cleaner without interfering with normal operation.

2.11.2 Tube Brush

Provide tube brush (for fire-tube boiler installations) with steel bristles and jointed handle of sufficient length to clean full length of fire-tubes.

2.11.3 Smoke Pipe Cleaner

Provide cleaner to clean the breeching and smoke connections. Cleaner must have jointed handle of sufficient length to clean breeching and smoke connections without dismantling.

2.11.4 Wrenches and Gaskets

Provide wrenches as required for opening boiler manholes, handholes, and cleanouts. Provide one set of extra gaskets for all boiler manholes and handholes, for pump barrels, and other similar items of equipment. Package and properly identify all gaskets.

2.12 PAINTING AND FINISHING

2.12.1 Preventing Corrosion

Unless otherwise specified, factory paint surfaces of ferrous metal subject to corrosion in accordance with the manufacturer's standard practice. Paint all exposed pipe covering as specified in Section 09 90 00 PAINTS AND COATINGS. Do not paint aluminum sheath over insulation. Protect all metallic materials against corrosion. Where connected to dissimilar metal, protect aluminum by approved fittings and treatment. Zinc coat all parts such as boxes, bodies, fittings, guards, etc., made of ferrous metals, but not of corrosion-resistant steel, in accordance with ASTM A123/A123M or ASTM A153/A153M, except where other equivalent protective treatment is specifically approved in writing by the Contracting Officer. Where a rust-inhibiting coating or hot-dip galvanizing is specified, any protective
treatment system that will pass the salt-spray fog test is acceptable.

2.12.2 Treatment

Clean all surfaces of castings, forgings, molded parts, stampings, welded parts, exterior surfaces of the boiler, before application of the insulation, and all interior surfaces of the sheet jacket, before assembly, to bare metal to remove oil, rust, sand, dirt, fins, spurs, scale, slag, flux, etc., before primer is applied at the factory. External surfaces must be smooth and all edges rounded or beveled, unless sharpness is required to perform a necessary function.

2.12.3 Boiler Coating

Finish boiler with one coat of silicone aluminum heat-resisting (up to 648 degrees C 1200 degrees F) paint. Apply paint directly to clean bare metal surfaces and attain a minimum dry film thickness of 1 mil. After assembly, clean all exposed surfaces of the equipment normally painted in good commercial practice to bare metal and finish with two coats of silicone aluminum heat-resisting paint, with each coat being a minimum dry film thickness of 0.025 mm 1 mil. Component parts procured factory finished need not be repainted. Mechanical cleaning need not be performed on the sheet steel jacket if the surfaces are free of all mill scale and rust. However, clean the surfaces to remove all grease and other foreign matter. Do not apply paint when the temperature is below 10 degrees C 50 degrees F or above 32 degrees C 90 degrees F.

2.12.4 Equipment Coating

Factory finish equipment and component items, when fabricated from ferrous metal, with the manufacturer's standard finish if located within buildings. Items located outside must have weather-resistant finishes that will withstand 500 hours of exposure to the salt-spray test specified in ASTM B117, using a 20 percent sodium chloride solution. This test may be performed on test specimens coated and finished in the same manner as the actual equipment. Immediately after the test, the specimens must show no sign of blistering, wrinkling, cracking, or loss of adhesion and no sign of rust beyond 3 mm 1/8 inch on either side of the scratch mark.

2.13 FACTORY TESTS

Conduct initial capacity and performance tests of factory-assembled boiler components at the manufacturer's plant. Repair or replace any rejected material or equipment before installation.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancies before performing the work. Because of the small scale of the drawings, it is not possible to detail all runs and indicate all required offsets, fittings, and accessories. Investigate structural and finish conditions affecting the work, arrange the work accordingly as required, and furnish the fittings and accessories required to meet such conditions. The plans are generally diagrammatic and coordinate the work of the different trades so interference between conduit, piping, equipment, architectural, and structural work will be avoided. Building design modifications
necessitated by the proposed equipment are the responsibility of the Contractor and must be approved before proceeding with the work.

3.2 INSTALLATION

******************************************************************************
NOTE: All pertinent piping and related equipment supports will be designed for seismic forces as specified in subparagraph Support Steel below.
******************************************************************************

Install equipment and material as indicated and in accordance with manufacturer's instructions. A manufacturer's representative experienced in installation of this type of boiler, must supervise the erection of the boiler and associated equipment.

3.2.1 Piping

Unless otherwise specified, provide pipe and fittings conforming to Section 33 63 23 EXTERIOR ABOVEGROUND STEAM DISTRIBUTION.

3.2.2 Field Painting

******************************************************************************
NOTE: Where identification of piping is required by the using service, this paragraph will be amplified to include appropriate requirements either directly or by reference to a separate section. Air Force requirements are covered in AFM 88-15.
******************************************************************************

Clean, prepare, and paint all ferrous metals not specified to be coated at the factory as specified in Section 09 90 00 PAINTS AND COATINGS. Paint all exposed pipe covering as specified in Section 09 90 00 PAINTS AND COATINGS. Do not paint aluminum sheath over insulation.

3.2.3 Insulation

Provide shop- and field-applied insulation as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS unless otherwise specified. Insulate breaching, unjacketed boilers, [dust collectors,] and induced draft fan housings with magnesia, mineral wool, calcium silicate, or approved mineral insulation. Insulation may be either block or blanket. Fill joints in the insulation with magnesia, mineral wool, or a suitable cement.

3.2.4 Foundation

Construct boiler foundation of [21] [_____] MPa [3000] [_____] psi concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Set anchor bolts of adequate length to install the boiler accurately. When embedded in concrete, provide anchor bolts with plates welded on the head and protect against damage until the equipment is installed. Provide plates conforming to ASTM A36/A36M.
3.2.5 Equipment Structural Support

3.2.5.1 Structural Steel

Design structural steel equipment supports in accordance with Section 05 12 00 STRUCTURAL STEEL.

3.2.5.2 Support Steel

**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if seismic details are not included. UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.
**************************************************************************

Design support steel to resist all applicable dead and live loads. Design seismic loads as specified in UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC [as indicated]. Show a complete loading and support diagram on the detail drawings. Equipment supports shown on the contract drawings are for a general equipment layout and may not conform to the system furnished. Piers and footings may be relocated to suit equipment furnished if no interference with other footings is encountered. Provide support steel complying with ASTM A242/A242M and fabricate in accordance with the provisions of Section 05 05 23.16 STRUCTURAL WELDING or field bolted using ASTM A325M ASTM A325 high strength bolts. Submit manufacturer's design data and structural computations for walls, roof, foundations, and other features for specialty type of construction, with design data for lateral forces that may be encountered due to wind loads and seismic forces. Include in the design data manufacturer's equipment design data.

3.2.5.3 Column Base Plates

3.2.5.4 Anchor Bolts

Provide ASTM A307 anchor bolts. Provide anchor bolt sizes and locations as shown on the detail drawings.

3.2.6 Stack Support

**************************************************************************
NOTE: Indicate wind force the stack design will have to withstand. Structural design will also include seismic resistance as specified in subparagraph Support Steel above.
**************************************************************************

Provide stack support in accordance with NFPA 211, as applicable. Ensure vertical and lateral supports for exterior chimneys withstand wind forces of [130] [_____] km/hour [80] [_____] mph.
3.2.7 Catwalks and Access Platforms

Furnish and install all necessary platforms, ladders, handrails, and stairs needed for safe and efficient operation and maintenance of the equipment. They may be relocated from the wall openings and passageways shown in order to suit the boiler equipment provided. All railings must have 100 mm 4 inch wide toe-board located no more than 6 mm 1/4 inch above the floor level. Construction must conform as close as practical to items indicated. Provide fabrication, materials, and coatings that conform to Section 05 12 00 STRUCTURAL STEEL.

3.2.8 Control System Installation

Install equipment in accordance with the manufacturer's instructions and approval by the Contracting Officer. Furnish and install all control conduit, wiring and/or tubing not specified elsewhere, but required to provide a complete and operable system under this section of the specifications. This includes material and items required to arrange the system to compensate for the actual field conditions encountered. Copper, stainless steel, or nonmetallic tubing may be used as appropriate. Provide ASTM B88M ASTM B8, Type K copper with flared cast brass or wrought copper fittings. Provide pneumatic tubing with 6.4 mm 1/4 inch OD with a minimum wall thickness of 0.762 mm 0.030 inch unless otherwise indicated. Where 9.5 mm 3/8 inch or 12.7 mm 1/2 inch OD tubing is used, the wall thickness must be a minimum of 1.245 mm 0.049 inch. The extent, general location, and arrangement of the system must be as indicated. Locate control panels as indicated and place so that operating personnel may effectively monitor boiler operations, but are not in a position that would interfere with those operations. Fit equipment, instruments, piping, wiring, and tubing into the space allotted and allow adequate clearances for entry, servicing, and maintenance. Install locally mounted instruments in such a manner as to prevent interference with mechanical installations and to ensure readability from the front aisles or operating area of the equipment. Coordinate installation of the instrumentation system carefully with the work of other trades.

3.2.9 Field Tubing

Provide compression type tube fittings compatible with tubing material (e.g., brass for copper tubing, stainless steel for stainless steel tubing, and nonmetallic for nonmetallic tubing). Check each connection for proper tightness and installation. All piping between primary connections and instruments must be a minimum of 9.5 mm 3/8 inch OD tubing. Provide all copper instrument single connecting lines with brass, ASTM B61, 20.7 MPa 3000 psi rating, forged body screws or tube ends.

3.2.9.1 Tubing Supports

Use PVC-coated expansion metal troughs or epoxy-coated vertical unistrut racks as tubing supports. Do not use elbows, tees, or crosses. Where the trough branches or changes direction, a suitable gap for the transition will be acceptable. Do not support the tubing over the gap.

3.2.9.2 Air Supply

Provide instrument air supply headers as shown. Distribute instrument air through the area at nominally 620 kPa 90 psig. Reduce pressure to that required at the instrument by a local regulator. Furnish and install an air set unit for each instrument that has a pneumatic output signal (e.g.,
transmitter, transducer, controllers, positioner, and relay). Provide air
set units with a filter regulator with integral drip-well and drain cock
and output gauge.

3.2.10 Electrical

Perform instrumentation and power-interconnecting wiring as [shown]
[recommended by the manufacturer] and as specified in NFPA 70. Terminate
all external wiring to the control panels on terminal boards or on devices
in the panels. Carry all cable wire and cable runs in conduit or
wireways. Run all signal wiring used for alarm or measurement of control
circuits in conduit separate from power circuits. Direct current signals
used for electronic transmission may be run in multiconductor cables.
Wiring for control, shutdown, or interlock circuits may be run in the same
conduit with power wiring as shown. Do not feed instruments from lighting
branch circuits. Make termination of all wires on instrument binding
screws with solderless insulated shoulder ring-tongue lugs of the proper
size for the wire and binding screw. Properly and securely crimp lugs to
the wire using the tool recommended by the lug manufacturer. Cut off any
termination that is made improperly and install a new lug. Strip all wire
with an approved stripping tool or in such a manner as not to damage the
conductor.

3.2.10.1 Cable Conductor Identification

Permanently attach identification to each wire terminating on a terminal
board or binding screw to facilitate maintenance. Identify by means of
plastic sleeving with printed markings, permanently attached stamped foil
markers, or other approved means. Wire numbers must correspond to wire
numbers shown.

3.2.10.2 Relays

Provide industrial relays for interlocking circuits. Ensure contacts and
coils are accessible for cleaning and replacement.

3.2.11 Steam Flowmeter Installation

Mount transmitters at the orifice flanges. Slope impulse lines to
eliminate liquid or gas pockets. Provide three-valved meter manifolds,
except use a five-valve manifold when the meter is sealed or purged.

3.3 MANUFACTURER'S SERVICES

Provide the services of a manufacturer's representative who is experienced
in the installation, adjustment, and operation of the equipment specified.
Supervise the installing, adjusting, and testing of the equipment. Ensure
that sufficient lead time is given to prevent installation delay resulting
from late delivery of equipment and materials.

3.4 TESTING

3.4.1 General

Before requesting the performance and acceptance test, conduct final
checking of systems installations and preliminary operation testing and
adjustments of all systems in accordance with the manufacturer's
recommendations and the requirements of the specifications. Schedule all
tests in advance and conduct at times approved. Perform testing in the
presence of the Contracting Officer. Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate the final position of controls in each test report. Submit a written statement from the manufacturer's representative certifying that control equipment has been properly installed and is in proper operating condition, upon completion of the installation. Provide the action settings for all automatic controls in the form of a typed, tabulated list indicating the type of control, location, setting, and function. Include logs, thermal efficiency calculations, tabulated results, and conclusions.

3.4.1.1 Schedule for Testing

Notify the Contracting Officer in writing at least [20] [_____] days in advance of the intent to test the boilers, and submit a testing schedule. The Contracting Officer will notify the appropriate authorities.

3.4.1.2 Visual Inspection

Examine each boiler for defects outlined below:

a. Parts of components missing.

b. Improper assembly.

c. Parts or components not functioning properly.

d. Workmanship not as specified.

e. Exposed edges of metal not smooth.

f. Materials not as specified.

3.4.1.3 Repairs

Replace all defective parts furnished and installed by the Contractor and complete all repairs identified during capacity and operating tests.

3.4.2 Instrumentation Tests

Test all instrument systems after completing the following activities:

a. Inspect complete work and make any nonoperating checks required to assure operability in the manner required for the process application.

b. Check instrument air lines and wiring for proper hookup.

c. Test air lines for tightness according to the requirement of the Instrument Society of America Recommended Practice ISA 7.0.01.

d. Commission instruments, controls, interlocks, alarms, and related items. Include operating checks, provision and installation of seals as required, checking and adjusting settings, standardizing and calibration, and proof tests.

e. Install relief valves and filter regulator sets.

f. Insulate and winterize instruments.
If all of the above cannot be completed before startup, advise the Contracting Officer in writing 2 weeks before testing.

3.4.3 Dielectric Tests

Test electrical system for dielectric strength. Electrical system, excluding control and recording instruments, are subject to a voltage of twice its rated voltage, plus [500] [_____] volts, for a period of not less than [1] [_____] minute. Before testing, disconnect all instruments and operating mechanisms that could be damaged. After the test, the circuit must still register a resistance of not less than 1 megohm at [600] [_____] volts dc. This test applies between all insulated circuits and external metal parts.

3.4.4 Control Tests

Test boiler under actual firing conditions. Verify with the tests that all controls function within the maximum and minimum limits for temperature or timing. Simulate unsafe conditions, such as high temperatures, during the tests by reducing the settings for activation of limit and safety controls.

3.4.5 Necessary Temporary Piping

Furnish necessary temporary test piping no less than [100] [_____] mm [4] [_____] inches in diameter. Provide a steam silencer to exhaust excess steam to the atmosphere in the event the boiler load is insufficient to meet the capacity specified. Provide a control valve for exhausting excess steam to atmosphere in a convenient location inside the boiler room.

3.4.6 Test of Deaerating Feedwater Heater

Test the deaerating feedwater heater in compliance with ASME PTC 12.3 and demonstrate that the equipment installed meets the requirements specified as to performance, capacity, and quality of effluent. During the operating test of the boilers, conduct tests to determine oxygen content in accordance with ASTM D888, Method A. Operate boilers at varying loads up to maximum heater capacity while oxygen tests are being made.

3.4.7 Test of Water Treatment Equipment

Test water treatment equipment meeting the requirements specified as to capacity and quality of effluent. Tests for ion exchange units must cover at least two complete regenerations and capacity runs. Boiler water conditioning includes chemical treatment and blowdown periods to prevent scale and corrosion in boilers and in supply and return distribution systems from the initial start of the system, through the testing period, and to final acceptance of the completed work. Use approved chemicals and method of treatment.

3.4.8 Hydrostatic Tests

Following erection, test each boiler hydrostatically and prove tight under a gauge pressure of 1-1/2 times the working pressure specified. Following the installation of all piping and boiler house equipment, but before the application of any insulation, make hydrostatic tests and prove the system tight under gauge pressures of 1-1/2 times the specified working pressure. Test boilers and inspect the piping connections by an NBBI-commissioned
boiler inspector for determining compliance with all requirements in ASME BPVC SEC VIII D1, and supply the Contracting Officer with a certificate of approval for each boiler. Apply shop foam to all seams to detect leaks. Boiler must not lose more than $1.27$ [_____] kPa $[5]$ [_____] inches water gauge in [10] [_____] minutes.

3.4.9 Test for Steam Purity and Water Level Stability

Perform test for steam purity, in accordance with ASTM D1066, and water level stability simultaneously under the operating conditions specified.

3.4.9.1 Steam Tests

Make steam tests for boiler over $2.07$ [_____] MPa $[300]$ [_____] psig, without superheaters, not used for power generation or large turbine drive, on steam sampled in accordance with ASTM D1066, using the conductivity method in ASTM D2186. Do not exceed 30 microhms at 18 degrees C conductivity of the steam corrected for carbon dioxide and ammonia content. Sample steam for boilers less than $2.07$ [_____] MPa $[300]$ [_____] psig, with or without superheat, used for power generation or turbine drive for air-conditioning equipment in accordance with ASTM D1066 and test in accordance with the conductivity method in ASTM D2186. Do not exceed 4.0 microhms at 18 degrees C 60 degrees F conductivity of the steam corrected for carbon dioxide and ammonia content. Test steam for moisture in accordance with calorimetric method outlined in Part II of ASME PTC 19.11.

3.4.9.2 Water Level Stability Test

Conduct water level stability test first by use of the manual bypass around the feedwater regulator. Then repeat test using the automatic feedwater regulator. Ensure boiler maintains specified water level stability under both conditions.

3.4.10 Performance Tests

Submit a proposed performance test procedure for the operating [and environmental] tests, 30 days prior to the proposed test date. Include a complete description of the proposed test with calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in the tests. Do not commence test until the procedure has been approved. The Contractor's complete plan for water treatment, including proposed chemicals to be used and nationally recognized testing codes applicable to the system, must be included and approved prior to system startup.

a. Upon completion of installation, subject the boiler and associated equipment and instrumentation to such operating tests as may be required to demonstrate satisfactory functional operation. [Stack sampling for compliance with applicable emission limits is covered under Section 23 52 00 HEATING BOILERS.] Perform testing in accordance with the test procedures indicated below and in accordance with the requirements of ASME PTC 19.10. All pressure measurements are to be taken in accordance with ASME PTC 19.2, and all temperature measurements are to be taken in accordance with ASME PTC 19.3 TW. Furnish all instruments, equipment, and personnel required for the tests. The Government will supply water, electric power, and fuel. Ensure two instruction manuals are available at all times during the tests.
b. Run an efficiency and capacity test on one boiler of each size installed, conducted in strict accordance with ASME PTC 4, abbreviated efficiency test, utilizing the input-output method, except for use of alternate measuring or metering devices properly calibrated before the test, for the purpose of metering the water used and change in the temperature of flue gas. Analyze and record combustion gases entering the heat recovery boiler. Record CO, CO2, H2O, O2, N2, HCl, SO2 and temperature. Use water meter in the test suitable for hot water. Ensure efficiency is not less than specified. Ensure maximum moisture content of saturated steam leaving the boiler is as specified. Conduct efficiency and general performance tests on the boilers by a qualified test engineer. Provide calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in efficiency and capacity tests before the test. Read all indicating instruments at 1/2-hour intervals unless otherwise directed. Instruments required for conducting the boiler tests are contained in ASME PTC 4 and ASME PTC 19.11.

3.5 CLEANING OF BOILERS AND PIPING

**************************************************************************
NOTE: Local guidelines may dictate the maximum discharge rate for cleaning chemicals into the sanitary sewer system.
**************************************************************************

After the hydrostatic tests, but before the operating tests, clean the boilers of foreign materials. Wherever possible, wire brush surfaces in contact with water to remove loose material.

a. The following procedure may be used or submit other standard procedure for review and approval by the Contracting Officer. Fill boilers with a solution consisting of the following proportional ingredients for every 1000 liters gallons of water and operated at approximately 200 to 350 kPa 30 to 50 psig for a period of 24 to 48 hours, exhausting steam to the atmosphere:

1. 2875 g 24 pounds caustic soda.
2. 2875 g 24 pounds disodium phosphate (anhydrous).
3. 960 g 8 pounds sodium nitrate.
4. 60 g 1/2 pound approved wetting agent.

b. Dissolve chemicals in the above proportions or as otherwise approved thoroughly in the water before placing in the boilers. After the specified boiling period, allow the boilers to cool, then drain and thoroughly flush. Clean piping by operating the boiler for approximately 48 hours, wasting the condensate.

c. Provide boiler water conditioning, including chemical treatment and blowdown during periods of boiler operation to prevent scale and corrosion in boilers and in supply and return distribution systems from the initial startup of the system, through the testing period and to final acceptance of the completed work. Use approved chemicals and method of treatment.
3.6 **FRAMED INSTRUCTIONS**

Provide framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, equipment, piping, valves, and control sequence. Post the instructions where directed. Prepare condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system in typed form, frame and post beside the wiring and control diagrams. Submit posted diagrams, instructions, and other sheets, before posting. Post framed instructions before acceptance testing of the systems.

3.7 **FIELD TRAINING**

**************************************************************************

**NOTE:** Consult equipment manufacturers for recommended time required to train personnel for the proper operation of the unit and insert number of hours.

**************************************************************************

Provide a training course for designated operating, maintenance, and supervising staff members. Provide training for a total period of [_____] hours of normal working time, starting after the system is functionally complete, but prior to final acceptance tests. Cover all of the items contained in the approved operating and maintenance instructions as well as demonstrations of routine maintenance operations. Submit [6] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation, and emergency shutdown. Include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Submit [6] [_____] complete copies of maintenance instruction listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include piping layout, equipment layout, and simplified wiring and control diagrams for the system as installed, and other information necessary for equipment maintenance. Also include recommendations for total staffing and job descriptions in the field training. Notify the Contracting Officer at least 14 days prior to date of proposed conduction of the training course.

3.8 **OPERATING TEST**

Perform test at full-scale for 24 hours, or longer if required by the combustion equipment specifications. During this period, the boilers must supply the rated amount of steam at the temperature, pressure, and thermal efficiency specified when the unit is supplied with the rated amount of hot gases at the specified temperature. The entire unit must maintain this efficiency during the entire test period. After [4] [_____] hours, temperature readings of the outer shell, taken at not less than five random locations, must not exceed the temperature limitation specified. Boilers must also demonstrate the ability to operate well with the combustion equipment and to follow changing load demands while maintaining specified steam temperature and pressure based upon the limitations of the equipment. At the conclusion of testing, inspect the boilers for deterioration such as slagged or spalling refractory, warping of parts, and discolored exterior paint.

    3.13.6.3 Water Level Stability Test

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for coal-fired central steam-generating systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature.
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

SECTION 23 52 30.01 10 Page 14
1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes
following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Steam-Generating Units; G, [_____]
Equipment Erection; G, [_____]

SD-03 Product Data

Steam-Generating Units
Spare Parts
Framed Instructions
Welding

SD-06 Test Reports

Tests

SD-10 Operation and Maintenance Data

Steam-Generating Units; G, [_____]

1.3 QUALITY ASSURANCE

1.3.1 Welding

NOTE: Where pipeline, structural, or other welding is required on the same project, tests will be required accordingly. Testing may be by the coupon method as prescribed in the welding code or by special radiographic methods. If the need exists for more stringent requirements for weldments, delete the first bracketed statement and delete the welding submittal.
[Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators, and a proposed performance test procedure, 30 days prior to the proposed test date, containing a complete description of the proposed test along with calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in the tests. No test will commence until the procedure has been approved. Submit complete plan for water treatment, including proposed chemicals to be used and nationally recognized testing codes applicable to the system, prior to system startup. Weld piping in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and welders are to be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests and perform the tests at the work site if practicable. The welder or welding operator must apply his assigned symbol near each weld he makes as a permanent record.]

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING, PRESSURE PIPING.]

1.3.2 Use of Asbestos Products

**************************************************************************
NOTE: The first clause in brackets should be used when it is known that substitutes are available for any asbestos products which might be included with the equipment. The second clause in brackets should be used when it is possible or definitely known that asbestos products for which no technically acceptable substitute exists may be included with the equipment.
**************************************************************************

[Products which contain asbestos are prohibited. This prohibition includes items such as packings or gaskets, even though the item is encapsulated or the asbestos fibers are impregnated with binder material.] [Except as provided below, products which contain asbestos are prohibited. This prohibition includes items such as packings and gaskets, even though the item is encapsulated or the asbestos fibers are impregnated with binder material. Asbestos products are acceptable only in exceptional cases where the Contractor states in writing that no suitable substitute material exists, and, in addition, the Contractor furnishes to the Contracting Officer a copy of U.S. Department of Labor, Occupational Safety and Health Administration, "Safety Data Sheet" (Form OSHA-20), completed by the asbestos manufacturer stating that the product is not an asbestos health hazard.]

1.4 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

1.5 EXTRA MATERIALS

Submit spare parts data for each item of equipment specified, after approval of the detail drawings and not later than [_____] months before
the date of beneficial occupancy. Include in the data a complete list of
spare parts and supplies, with current unit prices and source of supply,
and a list of the parts recommended by the manufacturer to be replaced

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials and equipment which are the standard products of a
manufacturer regularly engaged in the manufacture of the products and that
essentially duplicate items that have been in satisfactory use for at least
2 years prior to bid opening. Equipment must be supported by a service
organization that is, in the opinion of the Contracting Officer, reasonably
convenient to the site.

2.1.2 Nameplates

Each major item of equipment must have the manufacturer's name, address,
type or style, model or serial number, and catalog number on a plate
secured to the item of equipment.

2.1.3 Prevention of Rust

Unless otherwise specified, surfaces of ferrous metal subject to corrosion
will be factory prime painted with a rust inhibiting coating and
subsequently factory finish painted in accordance with the manufacturer's
standard practice. Equipment exposed to high temperature when in service
will be prime and finish painted with the manufacturer's standard heat
resistant paint to a minimum thickness of 0.025 mm 1 mil.

2.1.4 Equipment Guards and Access

Belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and
other rotating parts exposed to personnel contact must be fully enclosed or
guarded. High temperature equipment and piping exposed to contact by
personnel or where it creates a fire hazard must be properly guarded or
covered with insulation of a type specified. Items such as catwalks,
operating platforms, ladders, and guardrails are to be provided where shown
and be constructed in accordance with Section [08 31 00 ACCESS DOORS AND
PANELS] [05 51 33 METAL LADDERS].

2.2 BOILERS

**************************************************************************
Note: Specify steam outlet temperature in cases
where the boiler includes a super heater.
**************************************************************************

Each boiler must have the capacity indicated. The equipment design and
accessory installations will permit accessibility for maintenance and
service. Design boilers for a maximum allowable working pressure of [____] Pa
psig with an operating pressure of [____] Pa psig. Design conditions are follows:
Rated capacity [_____] kg/hour pounds/hour
Steam outlet temperature [_____] degrees C degrees F
Site elevation [_____] m feet
Ambient air temperatures [_____] to [_____] degrees C degrees F
Reference air temperature 27 degrees C 80 degrees F

The boiler must be capable of operating continuously at maximum specified capacity without damage or deterioration to the boiler, setting, firing equipment, or auxiliaries. The boiler must be capable of automatically controlled operation while burning the fuel specified.

2.2.1 Capacity

Rated capacity must be the capacity at which the boilers will operate continuously without exceeding the specified furnace heat release and transfer rates, furnace exit temperature, and gas exit temperature. Boiler auxiliaries including fans, motors, drives, and similar equipment must be provided with at least 10 percent excess capacity to allow for field variations in settings and to compensate for any unforeseen increases in pressure losses in appurtenant piping and ductwork. [Stoker and grate capacities are to also be provided with 10 percent excess capacity to allow for variations in coal analysis.]

2.2.2 Electrical Equipment

Provide electric motor-driven equipment specified complete with motors and necessary motor control devices. Motors and motor control devices will be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM including requirements for hazardous area locations. Integral size motors must be premium efficiency type in accordance with NEMA MG 1.

2.2.2.1 Motor Ratings

Motors must be suitable for the voltage and frequency provided. Motors 373 W 1/2 horsepower and larger are to be three phase, unless otherwise indicated. Ratings must be adequate for the duty imposed, but not be less than indicated.

2.2.2.2 Motor Starters

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.
**************************************************************************

Where a motor starter is not shown in a motor control center on the electrical drawings, provide a motor starter. Where required, provide motor starters complete with properly sized thermal overload protection and other equipment at the specified capacity, including an allowable service factor and other appurtenances necessary for the motor starter specified. Manual or automatic control and protective or signal devices required for operation specified and any wiring required to such devices not shown on
the electrical drawings must be provided. Where two-speed or variable-speed motors are indicated, solid-state variable-speed controllers may be provided to accomplish the same function.

2.2.3 Boiler Design Requirements

2.2.3.1 Radiant Heating

**************************************************************************

NOTE: The following is a guide to determine maximum radiant heat release:

<table>
<thead>
<tr>
<th>Boiler Type</th>
<th>Maximum kJ/sq meter</th>
<th>Maximum Btuh/sq ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controlled circulation watertube boilers</td>
<td>1,419,500</td>
<td>125,000</td>
</tr>
<tr>
<td>Natural circulation watertube boilers</td>
<td>1,135,650</td>
<td>100,000</td>
</tr>
<tr>
<td>Firetube boilers</td>
<td>1,135,650</td>
<td>100,000</td>
</tr>
</tbody>
</table>

**************************************************************************

The maximum effective radiant heating surface is limited to [_____] watt per square meter input Btu input per square foot per hour.

2.2.3.2 Heat Input

The maximum heat input per cubic meter cubic foot of furnace volume must be [931.5 Megajoules/cubic meter 25,000 Btu/cubic foot with spreader stokers] [1.7 Gigajoules/cubic meter 45,000 Btu/cubic foot with underfeed stokers].

2.2.3.3 Combustion Gas

The combustion gas temperature at the furnace exit will be a minimum of 38 degrees C 100 degrees F less than the ash fusion softening temperature (reducing atmosphere) of the coal specified.

2.2.3.4 Ash Discharge

[Spreader stoker units with continuous or intermittent automatic mechanical ash discharge grates, or one of the traveling grate type, will have a maximum loading of 2.2 Mega watts/square meter 700,000 Btuh/square foot of grate area.] [Underfeed dumping grate units will have a maximum loading 1.4 Mega watts/square meter 450,000 Btuh/square foot of grate, assuming a 10 percent maximum ash content and 1205 degrees C 2,200 degrees F minimum ash softening temperature. Do not include side dumping areas in the area.]

2.2.3.5 Radiant Heating Surface

Effective radiant heating surface will be as specified in ASME BPVC SEC I. For firetube steel firebox boilers it must be the total water backed area within the furnace boundaries exposed to the flame. The mean circumference must be used for corrugated crown sheets.

2.2.3.6 Furnace Volume

Furnace volume for watertube or firetube boilers is defined as the cubical volume between the top of the grate and the first plane of entry into, or
between, the tubes. If screen tubes are utilized, they constitute the plane of entry.

2.2.3.7 Boiler Operating Capacity

The boiler must maintain continuous capacity within the specified range at the specified pressure with boiler feedwater at a temperature of approximately [_____] degrees C degrees F. The flue gas outlet temperature will be [_____] degrees C degrees F, based on excess air of [_____] percent and carbon loss of [_____] percent at maximum continuous capacity. Moisture in steam and boiler water concentrations will be in accordance with ABMA Boiler 402.

2.2.3.8 Boiler Output Capacity

Output capacity of the boiler will be based on tests of the boiler as a unit.

2.2.3.9 Boiler Markings

**************************************************************************
NOTE: Delete brackets if the boiler does not include a superheater.
**************************************************************************

Each boiler must be stamped with:

a. Maximum continuous capacity in Watts Btuh.

b. Radiant heating surface in square meters feet.

c. Total heating surface in square meters feet.

d. Furnace volume in cubic meters feet.

e. Boiler unit design maximum allowable working pressure.

[f. Superheater final steam temperature in degrees C degrees F.]

[g. Superheater heating surface in square meters feet.]

2.3 BOILER DETAILS

2.3.1 Packaged Steam-Generating Units

Submit manufacturer's design data and structural computations for walls, roof, foundations, and other features, for specialty type of construction. Include design data for lateral forces that may be encountered due to wind loads and seismic forces.

Submit [6] [_____] complete copies of operating instructions, prior to the training course, outlining the step-by-step procedures required for system startup, operation, and shutdown. Include in the instructions the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Submit [6] [_____] complete copies of maintenance instructions, prior to the training course listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. The instructions will include piping layout, equipment layout, and simplified wiring, and control...
diagrams of the system as installed.

2.3.1.1 Firebox Type (for Boiler Capacities Less Than 2.9 Mega watts 10,000,000 Btuh)

Units must be furnished complete with coal burning equipment, [fly ash collector,] brickwork, insulation with steel jacket, safety and operating controls, forced- and induced-draft fans, low water cutoff and alarm, and other required appurtenances. The unit will be complete, self-contained, fully automatic, and ready for service upon completion of utility connections except that firing equipment, safety and operating controls may be packaged separately from the boiler, fully assembled, factory wired, and completely ready for field mounting. The firebox boiler will be of the watertube or firetube type in conformance with ASME BPVC SEC I. Control panel must be prewired and totally enclosed. Provide over-fire air jets for furnace turbulence. Provide positioning controls. [Equip the boiler with soot blowers.]

2.3.1.2 Watertube, Waterwall Type (Boiler Capacities Over 2.9 Mega watts 10,000,000 Btuh)

Except as modified, the steam-generating unit will comply with the requirements of ASME BPVC SEC I. Steam generating unit must be furnished complete with stoker, [fly ash collector,] forced- and induced-draft fans, control and instrument panel with limit and automatic controls, soot blowers, over-fire air system feedwater regulator, low water cutoff and alarm, feed piping and all other fittings, auxiliaries, and appurtenances necessary for safe and efficient operation. The steam generator must be factory fabricated and [assembled on a steel foundation or foundations] [top supported].

2.3.2 Watertube Boilers

Watertube type boilers will be of the [site assembled] [shop assembled] type with either two or three drums and arranged to suit the fuel burning equipment specified. Provide boilers capable of continuous operation at the indicated capacity.

2.3.2.1 Drums

Drums are to be steel plate, fusion welded in conformance with ASME BPVC SEC I, including stress relieving and x-raying of welded seams. The main steam drums will be of sufficient size to accommodate steam separators and drum internals with provisions and space for accomplishment of maintenance. Provide baffling to separate the steam from the water in the drum and to maintain a stable water level under a fluctuating load. Variations in normal water level are not to exceed 50 mm 2 inches, with an increasing load change of 20 percent of rated capacity per minute. Provide steam separators to deliver saturated steam with maximum specified moisture content. Each drum will have two 304.8 x 406.4 mm 12 x 16 inch elliptical manholes, with the exception of the mud drum which will have at least one 304.8 x 406.4 mm 12 x 16 inch elliptical manhole. Each manhole will have cover, yoke, and gaskets.

2.3.2.2 Tubes

Tubes will be no less than 50 mm 2 inches in diameter, electric welded or seamless steel, and be connected to the drums and headers by expanding into bored tube seats. Boilers will have water-cooled furnace walls of a design
suitable for the application. Lower header of sidewalls will be round design with tubes welded to header stubs. Each waterwall header must have enough supply and riser tubes to ensure that no portion of the waterwalls will become water starved at maximum capacity.

2.3.2.3 Baffles

Arrange baffles to bring the products of combustion into contact with the heating surfaces without excessive loss of draft. Baffles will be gas-tight and be either a refractory material or metal suitable for temperatures encountered.

2.3.2.4 Access Doors

Access doors in sufficient number, of adequate size, and properly located must be provided for cleaning, inspection, and repair of all areas in the complete assembly. Doors must be gas-tight and interior surfaces exposed to direct radiation and high temperatures must be lined with approved refractory material to prevent excessive heat losses and warping of doors. Doors too large or bulky for hand removal are to be hinged. At least one observation port with cast-iron cover must be provided on the front and rear wall of the furnace.

2.3.2.5 Miscellaneous Pipe Connections

Miscellaneous pipe connections must be provided for steam outlet, safety valves, feedwater, feedwater regulator, water column, blowoff, steam supply to soot blowers, steam gauge and vent, continuous blowdown, continuous chemical feed, and instrument connections. Provide boilers with necessary jets for furnace turbulence, the number and arrangement of as recommended by the boiler manufacturer. Provide soot blowers, if required by the manufacturer. Provide a suitable smoke outlet with steel frame, damper, and damper shaft. Damper must have external high temperature roller or ball bearings at both ends of the shaft, and have a suitable operating arm and rod.

2.3.2.6 Superheater Design

**************************************************************************
NOTE: Delete if the boiler does not include a superheater.
**************************************************************************

The design of the superheater will be such that at any given load, and to the extent feasible, all elements have the same outlet temperature. The superheater tube and support materials must be chosen so that with any reasonably expectable excess air and the worst expected unbalance in air, steam, and fuel distribution, there is an ample and conservative margin of safety to prevent damage by overheating or corrosion to the components. Pad-type permanent thermocouples must be installed on superheater tubes in sufficient number and so located as to indicate the variation in, and maximum value of, the tube temperature across the furnace width. Locate the thermocouples outside of the gas stream. The superheater outlet header must be capable of absorbing the reactions from the main steam piping. Extend the superheater terminals to sufficiently clear the boiler walls to facilitate connecting thereto. Any superheater piping must be extended beyond the boiler front wall line, 900 mm 3 feet beyond casing. Minimize header penetrations through the casing. Provide adequate superheater piping to mount the safety valves. The design must minimize external
corrosion on the superheater and reheater due to molten slag or fouling. Minimize the location of headers in the gas stream. Spray desuperheaters must be complete with thermal sleeves of sufficient length to prevent droplets of water from coming in contact with the hot wall of the pipe. Arrange the sleeves so they attach securely to the pipe, but in a manner that will permit differential expansion.

2.3.2.7 Boilers and Firing Equipment

Support boilers and firing equipment from the foundations with structural steel independent of all brickwork. Boiler supports must permit free expansion and contraction of each portion of the boiler without placing undue stress of any part of the boiler or setting.

2.3.3 Boiler Settings

2.3.3.1 Boiler Material

Conform materials to the following:

2.3.3.1.1 Firebrick

ASTM C27, class as recommended by the boiler manufacturer.

2.3.3.1.2 Insulating Brick

ASTM C155

2.3.3.1.3 Castable Refractory

ASTM C401. The minimum modulus of rupture for transverse strength will be no less than 4.1 MPa 600 psi after being heat-soaked for 5 hours or more at a temperature in excess of 1371 degrees C 2,500 degrees F.

2.3.3.1.4 Mortar, Air-Setting, Refractory

As recommended by the boiler manufacturer.

2.3.3.1.5 Brick, Common

ASTM C62

2.3.3.1.6 Galvanized Steel Sheets

ASTM A659/A659M, ASTM A653/A653M. Gauges specified are manufacturer's standard gauge.

2.3.3.1.7 Uncoated Steel Sheets and Strips, Low Carbon

ASTM A36/A36M. Gauges specified are manufacturer's standard gauge.

2.3.3.2 Firebox, Packaged Type

Install boiler refractories and insulation to permit free expansion without placing undue stress on the boiler or refractory. Insulation and jacket must provide a casing temperature not exceeding 77 degrees C 170 degrees F in an ambient temperature of 38 degrees C 100 degrees F with a surface wind velocity not exceeding 254.0 mm/second 50 fpm while operating at full load.
2.3.3.3 Watertube, Waterwall Type

**************************************************************************

NOTE: On watertube type boilers that will be used intermittently, welded wall construction is recommended to minimize corrosion. In other applications or with fuels containing not more than 0.5 percent sulfur, a casing type enclosure is suitable.

**************************************************************************

Boiler walls must be [steel-encased wall construction with fabrication details as recommended by the boiler manufacturer. Boiler wall and boiler roof lining must consist of a continuous screen of closely spaced finned, tangent, or intermittent watertubes. Steel-encased walls will have casing constructed of not thinner than 3.416 mm 10 gauge black steel sheets, either bolted or welded. Casing are to be gas-tight and be reinforced with structural steel to provide rigidity and prevent buckling. Make provisions for expansion and contraction. [Refractory behind the waterwall tubes are to be high-duty refractory, not less than 63.5 mm 2-1/2 inches thick.] High temperature block and mineral wool blanket insulation must be provided between the refractory backup and steel casing, or between an inner and outer casing, and be of sufficient thickness to limit the maximum casing temperature in the furnace area to [54] [_____] degrees C [130] [_____] degrees F with a surface air velocity of 508.0 mm/second 100 fpm and an ambient air temperature of 27 degrees C 80 degrees F when operating at full capacity. When boilers are provided with double casings, the inner casing will be constructed of not thinner than 1.897 mm 14 gauge steel sheets. Alloy steel conforming to ASTM A568/A568M will be used where temperatures over 370 degrees C 700 degrees F occur.] [of welded wall construction. The width of the fins are limited to 19 mm 3/4 inch to prevent overheating of the fins under all operating conditions. Designs exceeding 19 mm 3/4 inch may only be used when provided with supporting calculations and subject to the approval of the Contracting Officer. Tubes must be seamless type. The fin-to-tube weld must be continuous and on both the front (fireside) and back side of the fin. The fin will not be less than 6.4 mm 1/4 inch thick. The construction must form a pressure-tight structure capable of transferring a maximum amount of heat to the tube. Check all welded joints and openings by a pressure test. Repair any casing leakage and make pressure-tight. The maximum deflection of the reinforced panels are to not exceed 1/360 of the length of the maximum span. The structure tested must be capable of holding a pressure of 1.5 times the predicted maximum furnace operating pressure.]

**************************************************************************

NOTE: For personnel safety, the design temperature of the casing surface should not exceed 66 degrees C 150 degrees F. Should the designer wish to use a design surface temperature between 54 and 66 degrees C 130 and 150 degrees F, an economic evaluation must be performed. The evaluation must determine if the additional capital costs for insulation outweigh the cost savings due to reduced boiler radiation losses.

**************************************************************************

2.3.3.3.1 Boiler Roof

Boiler roof will have a casing constructed no thinner than 3.416 mm 10 gauge black steel sheet. Refractory lining will consist of 63.5 mm 2-1/2 inches,
minimum, of high-duty refractory backup behind the roof tubes and
sufficient thickness of high temperature block insulation or mineral wool
blanket to limit the maximum casing temperature in the furnace area to [54] [_____] degrees C [130] [_____] degrees F with a surface air velocity of
508.0 mm/second 100 fpm and an ambient air-temperature of 27 degrees C 80
degrees F when operating at full capacity. Exposed portions of the boiler
drums must be insulated with 75 mm 3 inches of suitable mineral wool
blanket or block insulation. Manholes and other inspection and access
openings, identification plates, and stamps will have insulation finished
neatly against a metal ring provided for this purpose.

2.3.3.3.2 Bridge Walls

Bridge walls exposed on all sides to radiant heat and to the products of
combustion are to be constructed of super-duty refractory not less than 450
mm 18 inches thick, conforming to the boiler manufacturer's requirements;
walls having only the front side exposed to radiant heat and to the
products of combustion will have front facing and cap constructed of 225 mm
9 inches of super-duty refractory and a back facing of not less than 225 mm
9 inches of low-duty firebrick. Base of the wall will be common brick.

2.3.3.3.3 Settling Chamber

Provide settling chamber [equipped with suitable means for frequent
cleaning without shutting down the boilers,] below the last pass of each
boiler for the removal of fly ash.

2.3.3.3.4 Expansion Joints

Provide expansion joints where indicated and else-where as required to
permit all brickwork to expand freely without interference with the
boiler. Joints will be of adequate width, tightly sealed against leakage,
and free from mortar, with the outer 100 mm 4 inches sealed with resilient
mineral wool suitable for 930 to 1095 degrees C 1,700 to 2,000 degrees F.
In addition, to allow for expansion of the inner face, a series of 3.2 mm
1/8 inch wide vertical openings spaced 1.8 m 6 feet apart must be provided
on the furnace side of the wall. Make proper provision for expansion and
contraction between boiler foundation and floor.

2.3.3.3.5 Firebrick

Lay up firebrick in air-setting mortar. Each brick must be dipped in
mortar, rubbed, shoved into its final place, and then tapped with a wooden
mallet until it touches the adjacent bricks. Mortar thick enough to lay
with a trowel will not be permitted. Maximum mortar joint thickness is not
to exceed 3.2 mm 1/8 inch and average joint thickness is not to exceed 1.6
mm 1/16 inch.

2.3.3.3.6 Plastic Refractory

Install plastic refractory in accordance with the manufacturer's
recommendations and by workmen skilled in its application.

2.3.3.4 Watertube, Waterwall (Packaged Type) Unit

Boiler setting, refractory, insulation, and casing will be in accordance
with ASME BPVC SEC I.
2.3.4 Boiler Fittings and Appurtenances

Boiler fittings and appurtenances suitable for a steam working pressure of [_____] Pa psig and [_____] degrees C degrees F will be installed with each boiler in accordance with ASME BPVC SEC I.

2.3.4.1 Water column

Provide water column with straight-through type drain valve. Water column will be complete with gauge glass, high- and low-water alarm, and three quick-closing gauge valves and try cocks fitted with the necessary chains and handles for operation from the boiler room floor. [Provide water column lighting for ease of reading at all times.]

2.3.4.2 Water Gauge

Provide water gauge drain valve of the straight-through type.

2.3.4.3 Low Water Cutoff

Low water cutoff with alarm located on instrument panel must include either a float-actuated switch as a means of making electrical contact or an electrically-actuated probe type low water cutoff. Provide the float chamber with a blowdown connection. The cutoff must cause a safety shutdown and sound an alarm when the boiler water level drops below a safe minimum level. A safety shutdown due to low water cutoff must require a manual reset before operation can be resumed and prevent recycling of the burner [stoker].

2.3.4.4 Bypass Button

Provide a spring-loaded shunt bypass button to prevent nuisance shutdowns during sightglass blowdown.

2.3.4.5 Steam Gauge

Provide steam gauge for each boiler in a visible location on the boiler.

2.3.4.6 Feed and Check Valves

Provide feed and check valves adjacent to each boiler feed nozzle.

2.3.4.7 Continuous Blowdown Valve

********************************************************************************************************
NOTE: Continuous blowdown equipment will be provided if required by UFC 3-410-01 or UFC 3-410-02. If a firetube boiler is specified, these paragraphs will be deleted.
********************************************************************************************************

Continuous blowdown valve must be manual proportioning type fabricated of corrosion-resistant steel. Equip the valve with a micrometer dial and pointer to indicate the proportional setting.

2.3.4.8 Safety Valves

Safety valves of proper size and of the required number and construction and set pressures will be in accordance with of the ASME BPVC SEC I and be
installed so that the exhaust steam will discharge through pipes extending through the roof. Each exhaust riser must have a drip-pan elbow to prevent the accumulation of water on the valve. A suitable slip joint must be provided between the drip-pan elbow and the riser.

2.3.4.9 Blowoff Valves

Provide blowoff valves in tandem at each point of blowdown as recommended by the boiler manufacturer. Piping must be extra-heavy weight, minimum, steel pipe conforming to ASTM A106/A106M Grade B. Blowoff valves will be the balanced seatless type unless otherwise approved.

2.3.4.10 Steam Nonreturn Valve

Install steam nonreturn valve of size and pressure rating shown in the steam supply line from each boiler. Arrange valves to close automatically when there is a pressure differential of 34.5 kPa 5 psi between the boilers and steam headers and also arrange to operate as stop valves. Set rising stem type valves with the stem up, either inclined or vertical. Provide angle or straight-way type, cast steel valves and operate without chattering, hammering, or sticking.

2.3.4.11 Feedwater Regulator

Connect feedwater regulator, sized for the application, complete with all necessary piping and accessories for automatic operation. Provide valved bypass around control valve. [Provide units with device to lock regulator in existing position in case of power failure.] [Provide units with manual/automatic selector panel located on instrument panel.] Provide feedwater control element with a drain valve. Fit the feedwater line with a thermometer well.

2.3.4.12 Soot Blowers

**************************************************************************

NOTE: Manually operated rotary soot blowers are normally supplied on boilers up to 6 Megawatts 20 million Btuh. Delete the inappropriate type of soot blower.

**************************************************************************

Furnish soot blowers as required to effectively clean all tube surfaces within the boiler. Use adjustable steam blowing pressure. Construct elements within the boiler of heat-resisting alloys suitable for the flue gas temperature encountered and are removable without disturbing the boiler tubes. Furnish soot blowers complete with necessary auxiliaries and connect in accordance with the manufacturer's recommendations. Provide soot blowers that are [permanently-mounted, rotary type manually-operated by a single chain. Provide quick-opening, positive-closing type valve located in the blower head, external to the boiler, with the working parts protected from the furnace gases, and operate by the same chain that rotates the element. Provide continuous chains that extend within easy reach of the operating floors. Furnish blowers complete with necessary auxiliaries and connect in accordance with the manufacturer's recommendations.] [electrically-operated rotary or retractable type, except that soot blowers exposed to flue gas temperatures over 815 degrees C 1,500 degrees F must be retractable type only. Provide rotary type soot blowers with a quick-opening, positive closing type valve located in the blower head, external to the boiler, with the working parts protected from the
furnace gases, and operate valve by the same motor that rotates the element. Provide electrically-operated retractable type soot blowers with either single motor-driven, totally-enclosed drive carriage with dual rack-and-pinion drives or dual-motor electric drive enclosed in a protective steel housing. Include starters and pushbutton stations for electrically-operated soot blowers.

2.4 STOKER EQUIPMENT

Certify that the stoker selected will be satisfactory for the boiler design. Provide stokers that are capable of efficiently burning coal with fuel sizing conforming to ABMA Boiler 203, approximately [_____] mm inches in size with an approximate moisture content of [_____] percent and having the following analyses:

<table>
<thead>

2.4.1 Spreader Stokers

NOTE: Any paragraphs describing stoker equipment not necessary for the system specified will be deleted. Stokers and stoking equipment selected will be based on the following:

Boilers having output capacities of 3.5 Megawatts 12,000,000 Btuh or more will be equipped with mechanically-driven grates operating continuously or intermittently. Dump grates will not be permitted in boilers in this size range. Spreader stokers will be specified for watertube boilers using bituminous coal with ash content on a dry basis in excess of 8 percent or ash fusion temperature lower than 1204 degrees C 2200 degrees F.

Underfeed or pulsating grate stokers may be specified for firebox packaged boilers when bituminous coal of any composition is used. Underfeed stokers will be the screw-feed type for boilers with capacity of less than 1635 kg (3600 pounds) of steam per hour, and the ram type for larger boilers. Pulsating grate units will be water-cooled and complete with automatic coal feed and continuous ash removal. Conveyor stokers may be specified for watertube boilers if suitable for the type of coal available. Chain or traveling grate may be specified by deletion of the inapplicable type of grate, or the choice between the two types may be left to the Contractor by including both types in the description. If steam drives are specified, plant must have an auxiliary boiler or an
alternate source of steam for startup. The following is a general guide in determining which type of grates to investigate:

<table>
<thead>
<tr>
<th>Size Steam rate of boiler kg/hr lb/hr</th>
<th>Type of Grate and Stoker</th>
</tr>
</thead>
<tbody>
<tr>
<td>1,135 -  9,070</td>

<td>Vibrating conveyor grate, front continuous ash discharge stoker</td>
</tr>
<tr>
<td>5,000 - 100,000</td>
<td></td>
</tr>
</tbody>
</table>

Provide overfeed self-feeding typespreader stokers suitable for burning a portion of the coal in suspension, but sized assuming 100 percent combustion on the grate. [Distribute coal evenly across the full width of the grate by no less than [_____] feeder units. Design unit for operation of any feeder independently of the others, or make it possible to operate all feeders simultaneously.] Provide mechanical-rotating type feeders that are capable of handling and uniformly distributing coal over the grate area and have no moving parts within the combustion chamber. Where moving parts are exposed to excessive heat, protect all bearings by suitable water jackets. Provide grease or oil lubrication for all bearings. Design stoker for readily adjustable feed distribution of coal on the grates.

2.4.1.1 Spread Stoker Grates

NOTE: Steam driven boiler auxiliaries will not be used unless the exhaust steam can be utilized completely. Reference to steam drives will be deleted if inapplicable for the equipment specified.

Ensure grates for spreader stoker firing are the high air-resistant type especially designed and arranged for powered mechanical or compressed air actuated dumping in sections. Ensure openings provide proper distribution of air under the fuel bed. [Provide grates in sections to match the feeders with provisions for shutting off the forced draft to each section so that any section of the grate can be cleaned while the others remain in service.] Provide heavy-duty, heat-resisting cast-iron grates. Perform mechanical dumping with [steam-] [air-] [water-]actuated power cylinders connected to the grates, and furnish grates complete with cylinders, linkages, valves, and piping as required. Ensure each section dumps independently of other sections. Provide necessary over-fire air jets complete with fans, ducts, and air control valves as required for proper turbulence and combustion. Ensure grate drives are independent of feeder drives to provide independent speed variation of feeders and grates.

2.4.1.2 Traveling Grates

Provide high air-resistant type traveling grates especially designed for spreader stoker firing and for continuous ash discharge. Ensure openings
provide proper distribution of air under the fuel bed. Provide heavy-duty, heat-resisting cast-iron grates, and ensure individual sections are replaceable without taking the grate out of service. Place air seals around grate to hold air leakage to a minimum. Furnish moving grates complete with supporting steel, shafts, sprockets, chain, gears, skid bars, and bearings as required. Enclose the front end of the grates where the ash is discharged with a dust-tight enclosure made of heavy cast-iron plates no less than 15.9 mm 5/8 inch thick and properly protect with firebrick where exposed to the furnace, or use a refractory-lined steel plate. Fit the vertical fronts of the enclosure with refractory-lined inspection and access doors, one for each feeder. Seal the roof of the enclosure with refractory to protect the metal parts from the furnace temperature. Enclose the underside of the grates to form a chamber. Construct hopper for receiving the ashes as indicated or as recommended by the manufacturer. Provide over-fire air jets as required for proper turbulence and combustion.

2.4.1.3 Vibrating Grate

Design high air-resistant type vibrating grate especially for spreader stoker firing and for continuous ash discharge. Provide grates that are either air- or water-cooled with openings to provide proper distribution of air under the fuel bed. Ensure grates are heavy-duty, heat-resisting cast iron and individual sections are replaceable. Provide a manual adjustment to regulate the ash bed thickness and automatically discharge ashes to the ash pit. Enclose the front of the grates where the ash is discharged with a dust-tight enclosure of heavy cast-iron plates no less than 15.9 mm 5/8 inch thick and properly protect with firebrick where exposed to the furnace, or use a refractory-lined steel plate. Fit the vertical fronts of this enclosure with refractory-lined inspection and access doors, one to each feeder. Seal roof of this enclosure with refractory for protecting the metal parts from the furnace temperature. Enclose the underside of the grates to form a chamber with a hopper for receiving the ashes. Provide over-fire air jets for turbulence and combustion.

2.4.1.4 Stoker Controls

Provide stoker controls to accurately regulate the coal feed rate and that are the type required for connection to the combustion control system. Ensure manual setting of the coal feed rate with variation of stoker feed, as required to maintain any desired capacity between 50 and 110 percent of boiler capacity, is possible without disconnecting linkage. Provide separate feeder and grate drives. Drive grate through a variable speed transmission with devices for changing speed interlocked with fuel feed regulation. Adjust grate speed manually to allow synchronization with fuel feed. Run all gears and chains of the variable speed transmission and gear reduction units, as required, in a bath of oil and enclose in a dust-tight and oil-tight case. Fit front and rear shafts of the grates with a forced lubrication system with fittings located outside the setting. Provide antifriction type bearings with hardened inner and outer races fitted with dust seals and easily accessible forced lubrication fittings. Provide stoker [and grate] with safety release devices to protect the mechanism from foreign materials or obstructions. Drive stoker by [electric motor] [steam turbine]. [Provide totally enclosed fan-cooled electric motor for installation in Class II, Division 1, Group F hazardous location in accordance with NFPA 70. Provide magnetic [across-the-line] [reduced voltage start] type motor starter with [general-purpose] [dust-tight] [explosion-proof] enclosure.] [Provide steam turbines utilized for stoker drives conforming to NEMA SM 23.]
2.4.1.5 Hoppers

Construct hoppers of steel plates no less than 6.4 mm 1/4 inch thick and with a capacity of no less than [_____] kg pounds per feeder. Provide hoppers with clean-out doors in the front of each feeder. Fit coal feed to the hoppers with concave type transitions to ensure the proper distribution of coal and coal fines across the width of the hoppers. Use stoker front plate to form the front of the boiler for the full width of the boiler and from the firing floor to some point above the stoker where it connects to the boiler structural framing. Front must be cast-iron or steel plate refractory lined with [auxiliary firing doors and] clean-out doors of refractory lined cast-iron. Provide structural framing as required to support the stoker and its components from the boiler foundation or boiler room floor. Divide the area under the grates into no less than four airtight zones for supply of forced draft having zone control dampers with external indicating operating and locking devices. Ensure all pressure parts for water-cooled grates including watertubes, headers, and valves furnished by the stoker manufacturer are for boiler pressure specified and constructed in conformance with ASME BPVC SEC I.

2.4.1.6 Over-Fire Turbulence and Cinder and Dust Reinjection System

Provide spreader stokers with over-fire turbulence and cinder-and-dust reinjection systems. Either air or steam may be used as the transport medium. Provide air systems with operating air by a single, low volume, high-pressure fan, driven by a splashproof electric motor. Design, locate, and size reinjection system ejectors for maximum fly ash pickup from all points. Equip nozzles for each system with manometer connections and heavy-duty adjustable dampers fitted with locking devices and position indicators. Ensure nozzles provide maximum combustion efficiency and furnace turbulence. Provide a manometer connection and a permanent manometer immediately downstream from the main reinjection air supply damper. Provide a portable manometer.

2.4.2 Underfeed Stokers

**************************************************************************
NOTE: Any paragraphs describing stoker equipment not necessary for the system specified will be deleted.
**************************************************************************

2.4.2.1 Single Retort, Heavy-Duty Ram-Type Stokers

Equip single retort, heavy-duty ram-type stokers with stationary or moving grates and side dump plates, and provide with [steam] [electric motor] drive and all necessary auxiliary equipment. Provide compressed air actuated dumping power cylinders. Feed coal from the hopper into the retort by means of a ram and distribute evenly along the full length of the retort with auxiliary pusher blocks on a pusher rod located at the bottom of the retort and actuated by the coal ram. Provide dampers between ash pits and main air chamber under stoker to permit control of air distribution to the grate surface. Arrange dampers for operation from the front plate of the boiler. Air distribution must be such that the air pressure is greatest where the fuel bed is the thickest. Air quantity must vary in direct proportion with coal feed rate and controlled automatically.
2.4.2.1.1 Grate Surface

Include the underfeed retort area, air admitting tuyeres, side combustion grates, and the side dumping plates. Provide retorts consisting of sectional construction of large capacity and proper shape to distribute coal uniformly over the entire grate surface with a minimum of moving parts within the furnace. Ensure stokers having total grate width of more than 2.1 m (7 feet) have movable grates providing positive lateral feeding of the coal from the retort toward the dump plates. Construct retort and grate sections of heavy-duty, heat-resisting cast iron, core for proper air distribution, and design for easy replacement of individual sections. Provide ash dump plates with necessary levers and linkage for hand operation from the front of the boiler.

2.4.2.1.2 Ram Feed

Provide mechanical [steam] [pneumatic or hydraulic] [driven by an electric motor connected through an efficient gear reduction unit, crankshaft, and connecting rod] ram feed. [Provide totally enclosed fan-cooled type motors [for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]]. [Provide magnetic [across-the-line] [reduced voltage start] type motor starter with [general-purpose] [dust-tight] [explosion-proof] enclosure.] Provide stoker controls for connection to the combustion control system to accurately regulate the coal feed rate. Ensure manual setting of the coal feed rate is possible without disconnecting linkage, with variation of stoker feed as required to maintain any desired capacity between 25 and 110 percent of boiler capacity in 10 or more equal increments. Regulate the coal feed rate by varying the time increments between strokes of the ram. Protect the coal feeding mechanism from injury in case foreign materials obstruct normal operation using a throw-out release.

2.4.2.1.3 Hoppers

Construct hoppers of steel plates no less than 6.4 mm (1/4 inch) thick and with a capacity of no less than [_____] kg pounds. Provide hoppers with clean-out doors. Use stoker front plate to form the front of the boiler for the full width of the boiler and extend from the firing floor to some point above the stoker where it connects to the boiler structural framing. Provide cast-iron or steel plate, refractory lined front with [auxiliary firing doors and] clean-out doors of refractory lined cast-iron. Provide structural framing, as required, to support the stoker and its components from the boiler foundation or boiler room floor. Provide water spray pipes and nozzles for quenching the ashes in the ash pit.

2.4.2.2 Single Retort Screw Type Stokers

Equip single retort, heavy-duty, screw feed stokers with rectangular firepot, side dump grates, forced-draft fan, electric-motor drive, and all necessary auxiliary equipment. Feed coal from the hopper into the retort with a spiral worm conveyor designed to feed a constant amount of coal and to prevent coal from packing in the worm. [Provide dampers between ash pits and main air chamber under stoker to permit control of air distribution to the grate surface. Arrange dampers to operate manually from the front plate of the boiler.] Provide stoker with an integral, forced-draft fan driven by the stoker motor. Air quantity must vary in direct proportion with the coal feed rate and controlled automatically. Construct retorts and grates of heavy-duty, heat-resisting cast-iron, core for proper air distribution, and design for easy replacement of individual sections.
sections. Provide retorts of proper size and shape to distribute coal uniformly over the entire grate surface. Provide stationary grates on all sides of the retort as required to suit the firebox. [Provide ash dump grates on each side of the retort complete with necessary levers and linkages for hand operation from the front of the boiler.] Electric motor must be belt-connected to an efficient gear reduction unit which drives the feed screw and forced-draft fan. Immerse gear reduction unit in oil in a dustproof housing. Provide stoker controls that are suitable for connection to the combustion control system to accurately regulate the coal feed rate. Control feed rate to allow manual setting for no less than three speeds and neutral, in equal increments, with speed changes possible while stoker is running. Protect the coal feeding mechanism from injury in case foreign materials obstruct normal operation using a suitable release. Provide totally enclosed fan-cooled type motors [for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. Provide [manual] [[magnetic] [across-the-line] [reduced voltage start] type motor with [general-purpose] [dust-tight] [explosion-proof] enclosure.] Construct reinforced hoppers of 6.4 mm 1/4 inch steel sheet, minimum, and with a capacity of no less than [_____] kg pounds. Provide hoppers with suitable cleanout. Provide removable feed screw and conveyor compartment with cleanout. Do not rest stoker on boiler room floor.

2.4.3 Conveyor Stokers

**NOTE: Any paragraphs describing stoker equipment not necessary for the system specified will be deleted.**

Provide conveyor stokers that are the grate level feed, forced-draft [chain grate] [traveling grate] type with hoppers, feed gate, drive shaft, sprocket wheels, grate, [electric motor] [steam] drive, and all necessary auxiliary equipment. Feed coal automatically at a constant rate from the hopper onto the moving grate and distribute evenly across the full width of the grate. Provide stoker frame with no less than four air-tight zones for supply of forced draft and suitable zone control dampers with external indicating, operating, and locking devices.

2.4.3.1 Grates

Provide grates with individual sections constructed of heavy-duty, heat-resisting cast-iron, fit or core for proper air distribution, and design for easy replacement of individual sections. [Provide chain grates with staggered links connected by pins to form a continuous flat chain the full width of the furnace.] [Provide traveling grates with grate blocks mounted on carrier bars which, in turn, are fastened to two or more drive chains to form a continuous flat grate surface the full width of the furnace.] Support continuous grates at the ends by suitable sprockets and at intermediate points on suitable tracks or skids.

2.4.3.2 Grate Operation

**NOTE: Steam driven boiler auxiliaries will not be used unless the exhaust steam can be utilized completely. Reference to steam drives will be deleted if inapplicable for the equipment specified.**
Drive conveyor grate by [electric motor connected through a suitable speed reduction unit] [steam] [hydraulically operated variable speed drive]. Enclose gears and chains required for the drive in a dustproof and oil-tight housing. Ensure main shafts for the grates have a forced system of lubrication with fittings located outside the casing or have self lubricating bearings. If the forced lubrication system is supplied, fit bearings with dust seals and easily accessible forced lubrication fittings. Provide stoker controls that are suitable for connection to the combustion control system to accurately regulate the coal feed rate. Manually set the coal feed rate by varying stoker feed, as required to maintain any desired capacity between 25 to 125 percent of boiler capacity without disconnecting linkage. Change feed rate by varying the speed of the grate. Air volume must automatically vary in direct proportion with the feed rate. Vary possible feed rate in no less than 10 equal increments. [Provide totally enclosed fan-cooled type electric motor [for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70].] [Provide [manual] [magnetic] [across-the-line] [reduced voltage start] type motor starter with [general-purpose] [dust-tight] [explosion-proof] enclosure.

2.4.3.3 Hoppers

Construct hoppers of steel plates no less than 6.4 mm 1/4 inch thick, with a capacity of no less than [_____] kg pounds, and provide with suitable cleanout doors. Fit coal feed to the hoppers with concave type transitions to ensure the proper distribution of coal and coal fines across the width of the hoppers. Construct stoker frame of cast-iron, cast steel, or forgings, and properly cool or otherwise protect all parts of the stoker, except the grates, from the furnace heat to prevent damage by warping or undue expansion. Use furnace arrangement and shape as recommended by the stoker manufacturer to ensure proper combustion of the fuel. Stoker front plate must form the front of the boiler for the full width of the boiler and extend from the firing floor to some point above the stoker where it connects to the boiler structural framing. Front must be cast-iron or steel plate, refractory lined with cleanout doors of refractory lined cast iron. Use structural framing, as required, to support the stoker and its components from the boiler foundation or boiler room floor. At the end of the grate, discharge the ash into a bunker or pit as indicated. Provide bunker with a dust-tight enclosure made of steel plates no less than 15.9 mm 5/8 inch thick, properly protected with firebrick where exposed to the furnace; that is fitted with cast-iron, refractory lined inspection and access doors; and with provisions for ash removal.

2.4.4 Vibrating Grate Stokers

**************************************************************************
**NOTE: Any paragraphs describing stoker equipment not necessary for the system specified will be deleted.**************************************************************************

Provide grate level feed, forced-draft type vibrating grate stokers with the vibrating action of the grate used to feed the coal from the hopper through the furnace and discharge the ashes into the ash pit. Ensure stokers are complete with hopper, feed gate, grate, drive mechanism, and all necessary auxiliary equipment. Feed coal automatically from the hopper onto the grate and distribute evenly across the full width of the grate. Provide a manual adjustment to regulate the fuel bed thickness. Discharge
ashes automatically and continuously to the ash pit. Divide the area under the grates into no less than four airtight zones for forced draft supply containing suitable zone control dampers with external indicating, operating, and locking devices.

2.4.4.1 Grates

Provide grates that are either air cooled or water cooled with grate bars in intimate contact with the watertubes. Provide grates with individually replaceable sections of iron or steel suitable for the temperatures encountered. Ensure pressure parts, including watertubes, headers, and valves are suitable for boiler pressure specified and constructed in accordance with ASME BPVC SEC I. Properly design grate sections for even air distribution over the entire grate area.

2.4.4.2 Stoker Controls

Design stoker controls for connection to the combustion control system to accurately regulate the coal feed rate and arrange for manual operation independent of the combustion control system. Vary the coal feed rate by changing the length of time of vibrations. Vibration generator must be belt connected or gear connected to the electric motor. Ensure unit is free of any vibration that may damage other parts of the boiler or the building structure. Provide bearings requiring lubrication with easily accessible lubrication fittings. Combustion air volume must automatically vary in direct proportion with the coal feed rate. Drive stoker by [electric motor] [steam turbine]. [Provide high-starting torque [totally enclosed, nonventilated] [totally enclosed, fan-cooled] [totally enclosed, fan-cooled motor suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with the NFPA 70].] [Provide magnetic, reversing, [across-the-line] [reduced voltage start] type motor starter with [general-purpose] [dust-tight] [explosion-proof] enclosure.]

2.4.4.3 Hoppers

Construct hoppers of steel plates no less than 6.4 mm 1/4 inch thick, with a capacity no less than [_____] kg pounds, and provide with a suitable method of cleanout. Ensure furnace arches are designed for the intended use and that proper combustion of the fuel is provided. Incline lower furnace sidewall headers in a waterwall boiler to accommodate the inclined grate arrangement. Use stoker front to form the front of the boiler for the full width of the boiler and extend from the firing floor to some point above the stoker where it connects to the boiler structural framing. Front must be cast-iron or steel plate refractory lined with cleanout and access doors of refractory lined cast-iron. Provide structural framing, as required, to support the stoker and its components from the boiler foundation or boiler room floor. At the end of the grate, discharge the ash into a bunker or pit as indicated. Provide bunker with a dust-tight enclosure made of steel plates no less than 15.9 mm 5/8 inch thick properly protected with firebrick where exposed to the furnace and fitted with cast-iron, refractory lined inspection and access doors, and provisions for ash removal as indicated.

2.5 PULVERIZED COAL BOILERS

****************************************************************************************
NOTE: Pulverized coal boilers require special consideration since they are usually designed to operate on one specific type of coal and usually are
utilized for large units where a steady minimum load of 68,040 to 90,720 kg per hour 150,000 to 200,000 pounds per hour is assured.

Small horizontal type units down to 36,290 kg per hour 80,000 pounds per hour of steam are available, but horizontal units also will range up to 113,400 kg per hour 250,000 pounds per hour of steam. Larger units are usually the vertical type.

The type of pulverizer will be determined from the coal analysis and the boiler manufacturer’s requirements. The pulverizer selected also affects the control system requirements. The furnace ash disposal system components will depend on the ash characteristics and EPA requirements. Volumetric heat release should be 745.2 Megajoules/cubic meter 20,000 Btu/per cubic foot of furnace volume. Coal is crushed in a central plant and stored in bunkers. Each boiler has two pulverizers, fed by a drag type coal feeder, and in turn feed the burners. This system requires room within the plant to accommodate the coal pulverizers. Fineness of pulverized coal may vary with different designs, and fine pulverized coal will significantly affect the selection of ash handling and pollution control equipment and will require special consideration for erosion control on induced-draft fan. Where pulverized coal boilers are specified, reference to stoker fired boilers will be deleted.

Where indicated, provide pulverized coal boilers. Design boiler and boiler accessories specifically to operate on the fuel specified. Ensure boilers are complete with coal feeders, crushers, dryers, burners, ignition system, air preheater, economizer, soot blowers, controls, and complete furnace ash handling facilities. Fly ash collection and pollution control equipment is specified in Section 44 10 00 AIR POLLUTION CONTROL. Provide [horizontal] [vertical] type boilers that are [top] [bottom] supported. Provide ash hoppers which are dry, refractory-lined type divided into compartments, each containing a hydraulically-operated clean-out door. Support the hopper from the boiler and use a dry seal to provide gastight connection. Furnish forced draft and induced draft fans with the boiler.

2.5.1 Coal Pulverizers

Provide each boiler with a minimum of two pulverizers arranged to allow operation of boiler at reduced capacity when one pulverizer is taken out of service either for maintenance or for operation of low loads. Provide coal pulverizer complete with all required accessories such as rotary drum feeder unit, air preheater, fans for drying coal by either the primary air or suction system, coal classifier distributor unit, and shut off coal valves to allow isolation of individual burners. Provide drum feeder unit with a tramp metal rejection device incorporated in the unit.

2.5.2 Burners

Design pulverized coal burners specifically for the boiler provided. Include an ignition system designed for ignition of pulverized coal.
2.5.3 Furnace Ash System

Ensure boiler is the dry bottom type, discharging ash to the hopper compartments. Handle pulverized coal boiler ash hydraulically rather than pneumatically. Provide facilities for pulverized coal boiler ash handling as indicated. Do not mix fly ash with furnace ash but economizer ash can be combined with furnace ash as indicated. Provide dual ash dewatering bins to allow recirculation of ash conveying water as indicated. Provide each bin with automatic controls and hydraulically operated gate for ash unloading to trucks or railroad cars. Maintain hopper in flooded condition and hydraulically operate sluice gates to allow for periodic removal of ash. Fit each ash hopper compartment with double-roll, electric motor driven clinker grinders fitted with manganese steel crusher rolls and teeth. Provide discharge from the grinders to an adaptor or to a sump for feed to the centrifugal pump. Provide centrifugal pump for each hopper compartment and incorporate special abrasive resistant metals and special seals for abrasive slurry handling. Ensure drives are totally enclosed electric motors as indicated. Make ash slurry conveying pipelines of abrasive resistant alloy metal with a Brinell hardness number of approximately 280. Ensure wall thickness is no less than 13 mm 1/2 inch and pipe lengths do not exceed 5.5 m 18 feet. Provide tangent end type fittings with a Brinell hardness number of approximately 400 and with removable wearbacks, where applicable, or the integral wearback type. Provide loading facilities for ash removal of dewatering bins as indicated.

2.5.4 Pulverizer Rejects

Collect pulverizer rejects such as tramp iron or pyrites in hoppers adjacent to each mill discharge spout. Provide high-level hopper indicators to initiate reject removal, in sequence, from each hopper to the central holding bin by properly sized jet pumps. Provide mill discharge control gates and interlock the control system with the furnace ash removal system to provide a completely automatic disposal system. Discharge of mill rejects into the ash hopper is not acceptable. Provide central holding bin and loading facilities as indicated.

2.5.5 Control Systems

Provide pulverized coal plant control systems in accordance with NFPA 85 and interlock to provide for a completely automatic boiler operation. Coordinate automatic controls for coal feed, pulverizer operation, combustion, and ash disposal systems.

2.5.5.1 Coal Master Control System

Regulate the total coal feed from the coal [bunkers] [silos] to the pulverizers in response to changing demand. Provide a parallel metering combustion control system that limits the firing rate to the actual total air flow available. Arrange the cross limiting of air and fuel so the air leads the fuel on load increase and trails the fuel on a load decrease. Provide a gain changer to compensate the fuel system for the number of pulverizers in service. Depending on the requirements of the pulverizer, actuate the coal master control system by the coal feeder speed or by the
coal/air mixture. Ensure the total fuel controller is a standard, proportional plus integral controller with a derivative or rate term on the master demand only. Multiply change in master demand by the derivative circuit to assist in overfiring on load increase and underfiring on a load decrease. Make provision for taking any one of the pulverizers for each boiler out of service with firing continuing at reduced rates for extended periods during maintenance or during low demand intervals. Provide alarms and interlocks of the fuel master control as required by the boiler but include, as a minimum, a unit trip to run the fuel master to zero and alarm contacts for "fuel master at maximum," "fuel master at minimum," "fuel greater than air," and "air demand limiting fuel."

2.5.5.2 Primary Air

Provide primary air fan or suction air fan control for each system with all required damper operating and sensing control devices. Ensure primary air system fans exhaust into a duct common with individual pulverizer primary air flow dampers in order to control the flow required by each pulverizer. Maintain common duct pressure at a given set point by modulating fan inlet dampers. Provide gain compensation to maintain system response with a different number of fans in operation. Provide biasing between fans.

2.5.5.3 Air Temperature Control

For pulverizer coal air temperature control, assume the maximum safe mixture temperature required to increase the firing efficiency at the furnace and to remove additional residual moisture that may be present in the coal for each pulverizer coal air exit. Provide tempering air inlet with controls to prevent combustion in the pulverizer.

2.5.5.4 Flame Safety System

Provide a burner control/flame safety system with the boiler. Meet the requirements specified in NFPA 85 as a minimum. Provide an interface between the analog control system and the flame safety system or burner control system. As a minimum, position coal feeders and pulverizer air dampers to respond to "unit tripped" and "pulverizer tripped" signals. Incorporate a pulverized coal ignition system. Incorporate boiler shutdown as well as normal monitoring of startup sequencing and normal operation. Ensure each burner has a scanner for the lighting system as well as a scanner for the main flame.

2.6 FLUIDIZED BED COMBUSTION BOILERS

**************************************************************************
NOTE: The designer will perform an economic analysis to compare the installation and operating costs of a fluidized bed combustion boiler against the use of a conventional boiler and its associated air pollution control equipment.
**************************************************************************

Where indicated, provide fluidized bed combustion boilers. The Contractor may provide either bubbling bed (AFB) or circulating bed (CFB) boilers. Use fluidizing velocities ranging from 1.2 to 3.7 m/second 4 to 12 fps for AFB boilers and ranging from 4.3 to 9.1 m/second 14 to 30 fps for CFB boilers. Ensure each boiler is in compliance with sulfur dioxide, nitrogen oxides, particulate, carbon monoxide, and all other emission regulations, as specified. Control the bed temperature within the appropriate range,
normally 815 to 900 degrees C 1500 to 1650 degrees F to enhance sulfur capture, inhibit the formation of nitrogen oxides, enhance combustion efficiency, and limit carbon monoxide formation. In AFBCs, generally introduce all the air required for combustion through the nozzles in the distribution plate in order to reduce the potential of forming reducing conditions within the bed that could cause severe corrosion of in-bed surfaces. The use of over-fire air in applications where it is needed to complete the burnout of carbon monoxide and the combustion of fines in the freeboard requires the approval of the Contracting Officer who will be satisfied that reducing conditions will not exist. CFB boilers may introduce as much as 40 to 50 percent of the combustion air as secondary air in one or more stages at various locations above the distribution plate. Design the boiler and boiler accessories specifically to operate with the specified fuel and sorbent. Provide boilers complete with the required crushers, dryers, coal and sorbent handling systems, burners, ignitors, air preheater, economizer, soot blowers, boiler controls and instrumentation, furnace ash handling system, draft systems, and superheater, where required.

2.6.1 General

Furnish the design, materials, and construction of equipment conforming to the applicable requirements of ASME BPVC SEC I and NFPA 85. Furnish the Manufacturer's Data Report required by ASME BPVC SEC I certified by the Authorized Inspector located in the manufacturer's shop. Make full provision so that each component can expand and contract under the operating cycle of temperatures without damage to itself or to any adjoining component, and without the leakage of any contained fluid outwards, or of air either inwards or outwards. Design the unit to accommodate thermal movement without side effects such as tearing, buckling, distortion, or vibration. Design the unit to prevent destructive vibration during normal operation. Provide balanced draft type furnace. Design the ducts and equipment from the forced draft fan, including the fluidized bed plenums, for pressures in accordance with NFPA 85. Provide access and observation doors to permit access to compartments and the observation of critical portions of the furnace and fluid bed. Anchor door frames securely. Provide doors with a suitable durable gasket, a device which when closed will force the door to an air-or gas-tight seal, and an interior design which will minimize erosion or deterioration of the inner surface from exposure to the internal conditions at that point. Ensure refractory is an integral part of the door. Use manufacturer's standard access doors that approaches in size 450 mm 18 inch wide by 400 mm 16 inch high. Provide all observation ports and lance doors with sealing and aspirating air facilities. Convection pass velocity greater than 15.2 m/second 50 fps is not permitted. Base the convection pass velocity on maximum guaranteed excess air at Maximum Continuous Rating (MCR) plus five percentage points (i.e., if excess air is 20 percent, base the convection pass velocity on 25 percent excess air). In CFB designs where convection surface exists in the high solids circulation passes, a velocity not greater than 4.6 m/second 15 fps is permitted between the tubes, based on 25 percent excess air. Design equipment such that the interior surfaces of all water-filled pressure parts and superheater sections are capable of being chemically cleaned. Furnish, as required, fill and drain connections. Ensure each header is drainable. Provide the secondary air and flue gas system resistance curves.

2.6.2 Furnace and Boiler

Provide water-tube welded-wall type boiler, having in-bed tube surface for
AFB offerings with natural and/or forced circulation. Use seamless tubes and weld all connections. Identify tubes of the electric resistance welding process, where used, and ultrasonically test along their entire length. Provide permanent thermocouples, as required, run to a terminal box outside the boiler casing. As a minimum, these thermocouples indicate:

- Water wall temperature in critical locations (risers, etc.).
- Heat absorption rates (cordial type t/c).
- Air and gas temperatures.
- Water and steam temperatures.

Fusion weld drums throughout and fit with manholes and hinged covers at both ends. Monitor the hydrostatic test temperature carefully, as indicated in paragraph "TESTS," to avoid brittle failure. Furnish boiler drains sufficient in size and number to completely drain the water from the entire unit in not more than 1 hour at 0 kPa psig pressure. Equip the drum with internals for steam separation.

2.6.3 Forced Circulation System

Provide boiler designs utilizing horizontal in-bed evaporating surfaces with a forced circulation system. Install number and capacity of the pumps such that with one pump out of service, the maximum rating of the boiler can be carried with complete safety. In addition, loss of all pumps, with the unit at MCR, must allow for a safe and orderly shutdown (without fans) without damage to the boiler. Ensure pumps are single stage, centrifugal, driven by constant speed motors. Provide pumps complete with all necessary accessories, including welded suction and discharge connections, lubrication system, casing drain valves in duplicate, and any necessary auxiliary pumps, heat exchangers, or other equipment. The pumps must withstand the boiler test pressure and all operating pressures and temperatures without distortion, binding, or other effects. Ensure casings withstand the forces and moments imposed upon them by the connecting piping without disturbing the alignment or successful operation of the pumping units. Ensure construction is such as to permit inspection of the rotating parts without dismantling the suction and discharge piping. Operate pumps satisfactorily at all loads, either by themselves or in parallel with the other pumps furnished. Provide motor operated pump suction valves. Furnish bypasses with valves around the pump isolating valves to maintain operating temperature in the idle pumps and piping. Provide discharge valves with impactor handwheels and lugs for air motor drive. Provide orifices, with protecting strainers as required, to assure adequate circulation to all parts of the boiler circuits. All materials that may come in contact therewith must be suitable to withstand acid and caustic boiler cleaning solutions. Provide connecting lines with stop valves between the main distributing header and the economizer inlet header for use as a circulating line to the economizer when the boiler is acid cleaned.

2.6.4 In-Bed Tube Surface (AFB Designs)

Provide in-bed tube surface as required to achieve steam generation or superheat temperature as defined in the data sheets. Ensure in-bed tubes are completely clear of bed material when the fluid bed (at the bed weight specified by the manufacturer at boiler MCR) is slumped. Alternatively, the manufacturer must ensure that the tubes are protected from overheating due to contact with a slumped bed and/or maintenance problems due to...
moisture in a slumped bed.

2.6.5 Coal and Sorbent Feed Systems

Furnish all equipment required to provide a boiler feed system to convey coal and sorbent to the boiler injection inlets. Size all components of these systems to provide flow of fuel and sorbent based on MCR condition in the boiler and the design coal and sorbent specified. Design the system to minimize the segregation or generation of fines.

2.6.5.1 AFB Coal Feed System

Coal feed systems for AFB may be either pneumatic under bed or spreader stoker over-bed. For pneumatic under-bed feed systems, provide a feed point every 1.7 to 2.3 square meters 18 to 24 square feet. The system must consist of a complete integrated system including weigh belt feeder, lock hoppers, and/or other components necessary for the pneumatic fuel injection system. Do not use rotary type feeders as the primary pressure sealing device. Consider the conveying air as part of the combustion air. Crush coal feed to approximately 6.4 mm 1/4 inch and use with fluidizing velocities ranging from 1.2 to 3.7 m/second 4 to 12 fps. For these systems, sorbent may be mixed with the coal in the appropriate proportion and fed with the fuel. However, a separate sorbent feed system is acceptable. Design over-bed feed systems to provide even distribution over the entire bed. Provide heavy duty standard production spreader/injector/feeders for dispersing the specified fuels into the boiler. Provide chain type spreader/feeders or equal, as approved by the Contracting Officer. Provide chain type feeder portion with infinitely adjustable feed rate from 0 to 100 percent of rated capacity. Provide spreaders consisting of adjustable rotating paddles on a shaft designed to disperse the specified coals into the boiler at the required locations and to minimize side throw into adjacent bed compartments which may not be in operation. The spreaders must be capable of rotating at variable rates of speed. The spreader/feeders must have overfire capability to the extent required by the design for use in compensating for a spreader/feeder out of service. For spreader stoker coal feed systems, sorbent feed must be by separate systems. These systems must consist of a method to feed the correct proportion of sorbent over the load range to keep the sulfur oxides emission in compliance. These systems must feed over-bed or in-bed and may be gravity, pneumatic, or a combination. Provide under-bed coal feed systems with coal dryers unless approved.

2.6.5.2 CFB Coal Feed Systems

For CFB systems, provide feed systems capable of providing the appropriate coal feed over the load range. Include weigh belt feeders, rotary feeders, screw conveyors or air swept feeders, or gravity-feed metered by weigh belt. Do not use rotary type feeders as the primary pressure sealing device. The fluidizing velocity in systems ranges from 4.3 to 9.1 m/second 14 to 30 fps. Permit maintenance of full load with loss of a single feed point. Design screw conveyors to operate continuously. Provide sorbent feed for CFB systems capable of providing the required proportion of sorbent over the load range. These systems must consist of a sorbent metering device weigh belt feeder and be fed by gravity, pneumatic injection, or air swept feeder. The sorbent must be fed in-bed, under-bed, or over-bed, and separately from the fuel.
2.6.6 Fluidized Bed Combustion Area

Ensure parts subject to severe wear or deterioration are replaceable with a minimum of dismantling. Design the fluid bed combustor to insure that no combustion air entering the bed is allowed to bypass contact with bed solids. Air distribution to the fluid bed will be through a number of nozzles located in the bed support plate. Average superficial velocity above the bed at the point of fuel and limestone feed must be between 1.2 to 3.7 m/second 4 to 12 fps at bed temperature and mix zone pressure. The pressure drop through the air distributor plate must be 3.7 kPa 15 inches water gauge minimum. Construct the walls of the fluid bed combustor of water-cooled tubes which form a part of the steam water circuit of the boiler. These walls must be of membrane wall type of construction. Designate distributor to assist with removal of large tramp material, where expected.

2.6.7 Bed Material Letdown System

Provide bed material letdown system that is capable of removing and cooling solids from the bed including spent sorbent, unfired fuel, bottom ash, rocks, and debris. Design the system to operate continuously and to cool all the solids going to disposal to 135 degrees C 275 degrees F or less. Size the system to continuously remove at least 80 percent of the total solids generated from the boiler, unless otherwise approved. Design the bed letdown system to include personnel safety considerations such as prevention of spillage of hot bed material from the unit.

2.6.8 Burners and Fuel Piping

Provide burners and burner equipment suitable for continuous service. Ensure parts subject to severe wear or deterioration are replaceable with a minimum of dismantling. Mount all valves or controls outside the boiler front and air housing. Ensure burner design provides positive and uniform mixing of the air and fuel at all loads, and produces sufficient turbulence to preclude stratification. The burner design must permit the firing of No. 2 fuel oil. Provide air atomizing type in-duct/over-bed burners. Ensure burners and/or ignitors have an aggregate capacity capable of bringing a cold unit up to ignition temperature using either precalcined limestone or spent bed material in 4 hours for AFBs, and 8 to 12 hours for CFBs, depending upon refractory limitations. Furnish equipment for remote positioning, if required, of each burner gun at either the fully retracted or fully inserted position. Provide air operated positioning equipment including limit switches to indicate the position of the gun and all necessary drives, linkages, and mechanisms; and that automatically purges the fuel from the guns before retracting.

2.6.9 Air Distribution System

Provide uniform air distribution to the fluid bed under any mode of operation. The system must also meet the mechanical and structural requirements of the boiler such as bed material dead load support, effective seal with the enclosure wall, and nonsifting air nozzles.

2.6.10 Mechanical Collector and Solids Recycle System for AFB Boilers

Provide a mechanical cyclone dust collector at the outlet of the boiler. Ensure mechanical dust collector is the high efficiency multicyclone type designed for maximum operating temperatures encountered under all operating conditions. Design collectors to resist erosion and minimize plugging,
that are gas-tight, and with a collection efficiency of 85 to 95 percent on particles greater than 20 microns aerodynamic diameter, depending upon the recycle rate selected by the manufacturer. No refractory lining will be acceptable in the mechanical dust collector. The collection hopper must have a valley angle of at least 60 degrees below the horizontal. Fabricate the line carrying recycle solids back to the bed of carbon steel with an allowance for wear and install at an angle of no less than 60 degrees below the horizontal. Provide solids collection hopper and dipleg with pressure differential measurement to indicate pluggage. Include provisions for sampling of recycle solids hopper contents. Fabricate hopper of material capable of enduring the conditions imposed by a flue gas atmosphere. Provide for continuous disposal of ash from the recycle hoppers.

2.7 IGNITION OIL SYSTEM

**************************************************************************
NOTE: Wherever light oil is required as a support and/or ignition fuel, a complete ignition oil system must be provided. The system should include two full-size rail/truck unloading pumps, capable of unloading a rail shipment in one 8 hour shift or a truck shipment in 1 hour; one ignition oil storage tank capable of storing either 88 hours continuous plant ignition fuel demand or one rail shipment, whichever is larger; two full size ignition oil supply pumps per boiler unit, each capable of supplying the maximum ignition oil demand for each boiler unit; and one ignition oil day tank per boiler unit capable of storing 8 hours of continuous boiler ignition oil demand. Both the ignition oil transfer and boiler ignition supply pumps should be centrifugal type, where allowed by suction conditions and discharge flow/pressure requirements; otherwise, use positive displacement pumps.
**************************************************************************

2.7.1 Ignition Oil Pumps

Furnish ignition oil pumps as duplex types assuring 100 percent standby. Provide pumps complete with coupling, coupling guard, and electric motor shop-mounted and aligned on a common skid.

2.7.2 Burners

Where indicated and specified, provide each boiler with oil-fired burner or burners. The burner assembly and control systems must conform to UL 296, UL 726 and NFPA 85, except as otherwise specified. Ensure supervised manual semiautomatic and fully automatic combustion safety controls conform to NFPA 85 and ASME CSD-1.

2.7.3 Aboveground Oil Storage Tanks

Provide aboveground oil storage tanks and associated piping systems in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.7.4 Underground Oil Storage Tanks

Provide underground oil storage tanks and associated piping in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.
2.8 COMBUSTION CONTROL EQUIPMENT

**************************************************************************
NOTE: Subparagraphs describing inapplicable types of combustion control equipment will be deleted. Positioning type combustion control equipment will be specified for boilers with capacity of 13.2 MW 45,000,000 Btuh or less. Metering type equipment will be used for larger boilers. Positioning type controls with oxygen compensation may be furnished for boilers with capacity of 13.2 MW 45,000,000 Btuh or more in lieu of metering type. Oxygen compensated controls may be specified for boilers having output capacities of 7.3 MW 25,000,000 Btuh and greater if a life cycle cost analysis indicates it to be favorable.
**************************************************************************

Provide combustion control equipment as a system by a single manufacturer. Install an automatic combustion control system for each boiler in accordance with the manufacturer's recommendations. Locate the controllers on the boiler room panel specified in paragraph BOILER ROOM PANELS AND INSTRUMENTS. Operate equipment either pneumatically, electrically, or electronically. Provide pneumatic control systems conforming to CAGI B19.1. Install air filter regulator sets at each control valve and transmitter in the system. Provide dual type master air filter regulator set on the control panel where one side can be cleaned and repaired while the other is in operation. Protect exterior control air piping and devices from freezing by use of a regenerative desiccant dryer. Provide each system with a selector switch or other means of manual control of the firing rate when required. Use electrical control devices that are rated at 120 volts and connect as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Wire operating and limit controls to interrupt the ungrounded circuit conductor. [Steam and energy generating equipment must include instrumentation and sufficient metering for accountability interface with a future Energy Monitoring and Control System (EMCS).]

2.8.1 Positioning Type

Provide positioning type combustion control equipment that is capable of maintaining boiler steam pressure within plus or minus 2 percent of the set pressure over the complete range of boiler operation. Maintain excess air within plus or minus 10 percent of the original control setting. The efficiency will be maintained without appreciable manual adjustment. Provide system that is capable of maintaining the specified pressure provided that the load does not exceed a 15 percent per minute change in capacity at any one time. Connect the master transmitter to the main steam header where the steam pressure is to be controlled. Ensure the signal transmitted from this point to the master controller is a function of steam pressure. On multiple boiler installations, provide a means to base load on individual boilers while on automatic, and control each boiler unit individually. Make provision on the control system for adding on other boilers to the system with only minor wiring or piping changes on the panel. Ensure the fuel-to-air ratio on this system is adjustable from one knob that indicates increase and decrease of air in proportion to fuel. Limit the range of this adjustment to prevent operation below safe combustion limits.
2.8.2 Metering Type Combustion Control Equipment

******************************************************************************
NOTE: This paragraph will be deleted if controls with oxygen compensation specified in paragraph COMBUSTION CONTROLS WITH OXYGEN TRIM are used.
******************************************************************************

2.8.2.1 Fuel-Flow, Air-Flow Type Combustion Control

******************************************************************************
NOTE: This paragraph will be used for spreader stokers.
******************************************************************************

[Provide fuel-flow, air-flow type combustion control equipment that is the proportioning and reset type, and position the fuel feed or air flow and then adjust one to the other by a ratio controller operating from air flow and fuel feed. Include fuel-flow measuring elements and air-flow measuring elements. Panel-mount separate fuel feed and air-flow controllers along with a fuel-to-air ratio controller. Set the air-flow index by a measuring element in the air stream. Systems controlling fuel and air by line shafting and mechanical connections will not be acceptable.]

2.8.2.2 Two Element (Steam Pressure, Steam Flow)

******************************************************************************
NOTE: If underfeed, traveling grate, or vibrating grate stokers are specified, use this paragraph.
******************************************************************************

[Provide two element (steam pressure, steam flow) combustion control equipment that is the proportioning and reset type, and control the fuel feed or air flow either in parallel or series. Include measuring elements for steam flow, fuel feed, and air flow. Panel-mount separate steam pressure, fuel flow, and air flow controllers along with a fuel-to-air ratio controller. Measure the actual steam flow an orifice or other flow measuring device in the steam line. Set air-flow by a measuring element in the combustion air stream. Systems controlling fuel and air by line shafting and mechanical connections will not be acceptable.]

2.8.2.2.1 Master Pressure Transmitter

Provide a master pressure transmitter and connect to the main steam header at a point where the steam pressure is to be controlled. Using the master controller, which is located on the panel, load the various individual boiler controllers according to steam pressure changes. On multiple boiler installations, provide an operator station to base load or bias each individual boiler while keeping its fuel and air controllers on automatic. Mount this boiler master station on the control panel between the master controller and the remainder of the control system. Provide indicators to show the loading impulse from the master controller to the boiler master station and each boiler master station output.

2.8.2.2.2 [Fuel Feed] [Steam-Flow] Transmitter

Provide a [fuel feed] [steam-flow] transmitter for each boiler and feed a signal to a fuel feed controller. Load each fuel feed controller using the master controller for the rate of [fuel feed] [steam-flow] corresponding to
the rating of the respective boiler. Operate the fuel device controlling the rate of fuel feed. Incorporate proportional plus reset control features.

### 2.8.2.2.3 Air-Flow Transmitter

Provide air-flow transmitter for each boiler. The air-flow controller must control from this signal or in such other manner as to maintain a predetermined ratio of air to fuel. Provide an indicator showing the amount of any manual adjustment to the air-to-fuel ratio. Provide controller with proportional plus reset modes of control.

### 2.8.2.2.4 Automatic Controller

Each automatic controller must have a manual-to-automatic station and indicator on the control panel that will provide for selecting either automatic control or manual control and also will provide for manual operation. Arrange the manual controls to allow any one or more of the functions of the control system to be controlled manually while the other functions remain on automatic control. Provide manual control station complete with all necessary indicators and provide bumpless balanceless transfer from automatic control to manual control and vice versa.

### 2.8.2.2.5 Power Units

Size power units for the movement of dampers and fuel feed levers to operate the device to be positioned and mount so that a rigid mechanical connection to the device being operated can be used. Allow units to remain in the last position to which they moved in event of failure of the operating medium. Manual operation of the controller does not necessitate disconnecting the linkages during power failure or other emergency. Include position switches on fuel and air-drive units for interlock with safety systems. Place retransmitting devices on all power units for remote indication on the boiler panel of the position of the operator at any time. If electric operators are utilized, provide oil-immersed gear trains on the units.

### 2.8.2.2.6 Furnace Draft Controller

Provide furnace draft controller of the modulating type with each boiler. Design the draft controller to maintain automatically within $2.5 \text{ Pa}$ the desired furnace draft for which it has been set manually. Fix the position of the boiler outlet damper through a power operator. Provide an indicator to show the amount of any manual adjustment that might be made. Equip the draft regulator with a manual-automatic switch.

### 2.8.3 Combustion Controls with Oxygen Trim

Flue gas oxygen trim may be furnished with combustion controls specified. Provide an oxygen analyzer and oxygen controller. Provide oxygen controller of the proportional band and reset type which feeds its signal in a biasing fashion into the fuel-to-air ratio system. Ensure the oxygen setpoint is a function of boiler load with operator biasing capability. Limit the amount of oxygen controller trim prevent potentially hazardous conditions caused by equipment failure or misoperation.

### 2.8.4 Boiler Limit Controls

a. Provide two low-water cutoffs to prevent startup and to shutdown the
fuel if the boiler water level is below the preset safe level. The primary interlock may be automatic or manual reset type. The secondary interlock must be the manual reset type.

b. Provide a high-pressure limit switch to shutdown the fuel when steam pressure exceeds the preset safe limit. This equipment is additional to the operating controls.

c. Provide a draft loss interlock and air-flow switch or a suction switch to prevent startup and to shutdown fuel supply when air is inadequate to safely support combustion. Provide limit and operating controls for operation on a two-wire grounded branch circuit.

d. Provide safety interlocks required by the applicable NFPA standard.

2.8.5 Burner Control/Fuel Safety System

2.8.5.1 Design Requirements

Provide control system of the microprocessor-based (distributed digital or programmable controller) or relay type. Furnish a dedicated hardwired insert panel for monitoring and operator interface with the burner control/fuel safety system, which also provides the operator with direct fuel tripping capability in emergency situations. Ensure the burner control system is sufficiently subdivided to permit inservice checkout and maintenance without impairing the reliability of the overall control system. Provide logic cabinets including status indicating lights for logic inputs and outputs, and for monitoring availability of control power to subsystems as required to facilitate troubleshooting. Provide indication of equipment status and system permissives at the operator interfaces. Where common power supplies internal to the system are furnished, include a full-capacity on-line backup supply. Failure of either power supply must be alarmed.

2.8.5.1.1 Maintenance and Reliability Requirements

In general, accomplish maintenance on-line and without imposing any special restrictions on overall plant operation. Provide diagnostic routines, interchangeable electronic cards or boards, and clear written procedures. Incorporate reliability, both software and hardware, into the system design. Include redundancy, loop distribution, component specifications and testing, and quality control to assure the highest level of system reliability.

2.8.5.1.2 Adverse Electrical Conditions

Equipment must be capable of operating as specified and without damage within the electrical environment of the plant. This environment includes high-voltage, high-frequency surges caused by electromechanical equipment, energy coupled between conductors by capacitance and mutual inductance, and imperfect grounds. Provide input and output isolation, shielding, separation of circuits, surge suppression, or other measures which may be required to meet these provisions. Ensure inputs, outputs, and other connections meet the surge to withstand requirements of IEEE C37.90.

2.8.5.2 System Design

Provide burner control system that is compatible in all respects with the boiler and auxiliary equipment. Design the system to meet the requirements
specified in NFPA 85. Incorporate a continuous purge of the furnace to
insure that the boiler is free of any accumulation of combustibles. Also
supervise the operation of the fuel-air equipment associated with the
pulverizer and fuel oil burners. The system must accept operator commands
and, if the required permissives are met, perform the required operation.
Monitor equipment continuously, and any deviation must be alarmed while the
system either corrects the deviation or shuts down equipment as necessary
to avoid hazardous furnace conditions or equipment damage. The system must
monitor the operation of the fuel equipment and, if the equipment fails to
respond to commands from the burner control system, initiate the equipment
trip sequence. Provide indications to allow the operator to determine the
equipment which initiated a trip of fuel equipment. Shut down tripped
equipment successfully before reset of the trip is permitted. Provide
burner control system including a fuel safety subsystem which includes a
master fuel trip (MFT) system, ignitor fuel trip system, and pulverizer
mill trip systems. Include a hardwired relay which may be directly
operated from the operator insert panel for each system. Inputs to the MFT
include, in addition to those associated with the burner control, those
that are required to provide overall boiler protection. Also, interface
the system with the combustion control system to position and monitor
devices for startup and shutdown which are normally modulated during
on-line operation. Design the burner control system to operate reliably
and to minimize the number of false trips.

2.8.5.3 System Functional Requirements

2.8.5.3.1 Operating Modes

The operator is responsible for initiating the start and stop sequence
listed below. Once initiated, the burner control system must automatically
place the mill or oil burner in service or remove it from service. The
steps, each of which requires operator initiation, are:

(1) Purge
(2) Igniter control
(3) Pulverizer control
(4) Feeder control

2.8.5.3.2 Furnace Purge and Boiler Monitor

Incorporate prelight off and post purges of the furnace to ensure that the
boiler is free of any accumulation of combustibles. Indicate completion of
the furnace purge to the operator, after which the operator will reset the
master fuel trip relay. A furnace purge is required on any master fuel
trip. Ensure boiler monitor prevents starting any fuel equipment if the
furnace firing permissives are not met. Provide indications to the
operator of the status and the progress of the furnace purge. Ensure
permissive indications are extinguished when the MFT is reset.

2.8.5.3.3 Mill Start-Stop Sequences

Start and stop the mill in three steps (ignitor, pulverizer, feeder)
following fixed sequences. Provide system capable of transferring between
the startup and shutdown sequences at any time. Monitor each mill and
should any unsafe conditions occur, trip that mill. Provide a mill first
out indication to indicate the initiating cause of trip. Delete the first
out indication only upon reset of the mill trip relay. Provide startup and shutdown sequence indications to allow the operator to follow the progress of the mill startup or shutdown sequences. These indications must show the next step to be performed, as well as the progress through the sequences.

2.8.5.3.4 Ignitor Control

An ignitor group consists of the ignitors associated with a pulverizer burner group. Control ignitors associated with a burner group from a separate electropneumatic ignitor control package. Provide sequential starting of ignitors between burner groups. Start and stop the ignitors associated with a burner group from the insert panel and local push buttons. Provide an ignitor fuel trip (IFT) first out indication to indicate the initiating cause of the IFT. Ensure this indication is extinguished only when the IFT relay is reset.

2.8.5.3.5 Fuel Safety Subsystem

The fuel safety subsystem comprises the MFT system, IFT system, and pulverizer mill trip (MT) systems. Provide a mill trip system for each mill. Ensure each fuel safety system provides the protection for its respective fuel and includes a dedicated hardwired relay which may be directly operated from the operator insert panel. Ensure the master fuel trip system provides overall boiler protection, also includes a dedicated hardwired relay, and directly trips all other fuel safety system relays. Design the system to deenergize to trip.

2.8.5.3.6 Flame Monitoring

Individual self-checking flame scanners are required for each burner. Use ignitor flame safety devices that discriminate individually from any flame that may exist at other burner locations. Ensure burner flame is discriminated individually from the associated ignitor flame and any other flame that may exist in the furnace. Ensure ignitor and burner flame discrimination covers the range from startup to full load operation. Blocking interlocks from closed valves in flame discrimination circuits to avoid false flame indication are not acceptable. If required to obtain satisfactory flame discrimination, include extended tube scanners. Individual flame detector output level indicators are required. Make provisions for cooling and cleaning, if required.

2.8.5.3.7 Enclosures

The system logic cabinets must contain control devices, power supplies, circuit protective devices, cable plugs, and terminal blocks. Provide spare space to accommodate a minimum of 20 percent additional devices. Provide cabinets that are accessible from both front and back, and have gasketed hinged doors with latches. Do not exceed 600 mm 24 inches in width for each door. Natural draft cooling of the control system cabinets is preferred. If cabinet cooling fans are furnished, alarm the loss of any fan.

2.8.5.3.8 Local Termination Boxes

Include local junction boxes, one at each burner level and one at each pulverizer. Provide burner level junction boxes that contain separate push buttons and indicating lights for local control of each ignitor group. In addition, provide terminal boxes that contain terminals for field wiring, internal wiring, cable connectors for intersystem wiring, circuit breakers
and, if required by the system, relays and reversing starters. Ensure terminal boards for field wiring include 20 percent spare connections. Also, include local pulverizer junction boxes for terminating field wiring associated with each mill in the system. These junction boxes must meet the requirements described above, except local control is not required.

2.8.5.3.9 Interconnecting Cable Requirements

Interconnecting cables between the logic cabinet, insert panel, local burner junction boxes, and local mill junction boxes must be via prefabricated plug-in cables, including connectors. Also, furnish flame scanner cables.

2.8.5.3.10 Buffered Output Signals

Fully isolate output signals required for tripping, control, and monitoring from each other. Ensure isolation is such that an open or short circuit in the related equipment does not affect other control systems.

2.9 BOILER ROOM PANELS AND INSTRUMENTS

2.9.1 Instrument Control Panel

Size instrument and control panel to contain all controls, instruments, gauges, and meters. Provide free-standing panel with faceplate of no less than 4.8 mm 3/16 inch steel, properly reinforced, and finished with the manufacturer's standard finish coating. Mount units flush on the panel as far as practicable. Flush mount controls, instruments, and other equipment, each fitting neatly into a cutout, and completely covering the cutout and any mounting screws or bolts. Enclose the back of the panel with sheet metal and with adequate removable access panels or doors for maintenance and removal of any unit without interfering with other units. Provide proper latching equipment and hardware. Identify each recorder, indicator, and control unit with nameplates securely fastened to the panel. Provide nameplates that are black over white laminated plastic with the lettering penetrating the black surface to expose the white. Mount nameplates no more than 25 mm 1 inch below the instrument or gauge, on the centerline. Use panel consisting of continuous, rapid-start, fluorescent light fixtures mounted with reflectors providing suitable shielding to illuminate controls, instruments, gauges, and meters. Terminate field piping connections in one bulkhead-mounted manifold, located to conform with the installation requirements of the system. Terminate field electrical wiring in a color-coded terminal strip so located as to conform with the installation requirements of the system. Ensure electrical tubing or piping connections to controls, instruments, or other devices on the panel are inside the panel and not visible from the panel front. Provide a suitable plug-in strip in the rear of the panel for any required plug-in electrical connections of the instruments. Install necessary transformers, separate relays, switches, and fuses in a fully enclosed junction box. Use a fused safety switch to serve the 120-volt power supply required for control circuits. If a pneumatic control system is provided, include duplex air supply filter and regulator set mounted on the rear of the panel with properly identified pneumatic terminal blocks and low point drain. No high-pressure lines will be allowed to enter the panel. [If packaged boiler burner units with integral controls are furnished, the control equipment may be mounted on a separate free-standing panel for each boiler. Ensure controllers and indicators specified or required are panel-mounted and tested at the factory complete with relays, transformers, switches, wiring, valves, piping, and other appurtenances. Ensure wiring
and piping within the panel is color-coded or otherwise identified.

2.9.2 Indicators

Flush mount indicator with a vertical scale of 100 to 150 mm 4 to 6 inch length. Indicators may be either electronic or pneumatic with zero adjustment, receiving standard signals from locally mounted transmitters. Ensure scales are in engineering units with an accuracy of plus or minus 1 percent.

2.9.3 Recorders

Provide servo mechanism type or multiple pen type recorders. Provide [circular] [strip] chart type. Minimum chart width is 100 mm 4 inches. Accuracy must be plus or minus 0.5 percent. Provide a separate scale calibrated in engineering units for each scale. Chart drive must be 120 volts ac. Provide one year's supply of chart paper.

2.9.4 Panel Display

As a minimum, display the following parameters on the panel:

<table>
<thead>
<tr>

**************************************************************************

NOTE: Steam flow meters will be specified for boilers having a continuous steam capacity of 4,540 kg 10,000 pounds or more per hour and must be integrating type where indicated. Feedwater meter will be provided on individual boilers not having steam flow meter.

**************************************************************************
### Panel Piping and Wiring

Transmit high-pressure and high temperature values pneumatically or electrically, or both, to the panel. Pneumatic signals must be 21 to 103 kPa (3 to 15 psig). Piping connectors to indicators must be 6 mm (1/4 inch) OD copper tubing conforming to ASTM B68/B68M. Transmit flow signals either pneumatically or electrically to the panel-mounted receiver. Run copper tubing connections and electric wiring to a terminal block located on the inside of the panel front near the bottom. Terminate wiring at an identified terminal strip. Provide wiring suitable for boiler room requirements and install according to NFPA 70.

### Pilot Lights

Assemble pilot lights in a factory-built cabinet, suitable for flush mounting in cutouts in boiler control panel, complete with extruded trim, clamps, and sheet metal rear housing, and finish in baked black enamel. Provide white plastic lens engraved in black ink. Lettering must be 19 mm (3/4 inch) high and black. Provide two lamps per pilot and wire independently. Ensure lamps are 6 watts, 24 volts dc, S-6 incandescent type, supplied with color caps, one red and one green per pilot light. Use black lens bezels unless otherwise indicated.

### Clock

Provide electric synchronous motor type clock. The clock must be for...
surface mounting and suitable for operation on 115-volt, 60 Hz single-phase electric service. Provide clock with a white dial, easy-to-read black numerals, black hands, red sweep second hand, and external manual reset knob at bottom of case. Seal motor gear train in a permanent oil bath. The clock dial must be 381.0 mm 15 inch size.

2.9.8 Alarm Annunciator Panel

Provide layout of annunciator panel as shown. Provide panel consisting of a flush-mounted cabinet, mounting trim with clamps, removable rear cover, and alarm modules. Finish cabinet with black baked enamel, aluminum trim, and black alarm bezels. Ensure nameplate size of alarm modules is nominal 70 mm 2-3/4 inches high by 75 mm 3 inches wide in translucent white acrylic plexiglass and engrave all nomenclature on front surface in black lettering. Provide plug-in alarm module that includes epoxy circuit board, one reversible plug-in relay, one general-purpose plug-in relay, relays with dust covers, two selector switches for relay contact selection, and two lamps wired in parallel at 24 volts dc, 6 watts. Mount flasher module and prewire with silence and test pushbuttons. Provide alarm horn of general-purpose construction and mount remotely. Input voltage must be 120 volts ac, 60 cycle. Provide power supply of 120 volts to 24 volts dc output of volt-ampere capacity to suit load. Alarm sequences of panel must provide for "first alert" sequence, with manual reset and ringback sequences. Prewire annunciator panel internally to a rear terminal strip.

2.9.9 Combustion Control Components

Provide components conforming to the requirements of paragraph COMBUSTION CONTROL EQUIPMENT.

2.9.10 Steam and Feedwater Flow Measurement

Provide flow nozzles to measure the steam flow from each boiler and each main steam header outlet. Provide orifice plates to measure feedwater flow to each boiler. Use flange-mounting type nozzles and orifice plates made of stainless steel. Ensure orifice plates are the square edge, concentric, paddle type designed for flange taps. Make minimum straight pipe runs in accordance with AGA XR0603. Provide condensate pots for steam service.

2.9.11 Flue Gas Opacity Monitor

Provide a flue gas monitoring system to provide continuous measurement, indication, and recording of smoke opacity from each boiler. Include a light source and a light detecting or receiving unit mounted in the stack or main breeching as recommended by the manufacturer for stack units. Provide control or transmitter unit with electronic solid-state circuitry and meter or digital type indicator, and provide an output signal of 4 to 20 mA dc for 0 to 100 percent opacity. In addition, provide control unit with calibration and alarm adjustments for compliance with Federal, State, and local environmental regulations. Ensure control or transmitter unit and recorder has dust-tight metal enclosure. Provide a purging air system to clean light source lens and light detector lens. Ensure control unit has adjustable alarm output contacts for various smoke densities.

2.9.12 Sample Cooler

Provide a water cooled shell and tube or shell and coil type heat exchanger with stainless steel tubes and cast-iron or steel shell suitable for cooling the blowoff before sampling. Connect the cooler to a header and
valved so that the operator can obtain a sample of properly cooled blowoff from any boiler as desired. Ensure the cooler is properly supported and has a brass or bronze sampling cock with lever or compression handle. Provide a sampling glass container suitable for handling the water temperature to be encountered and a hydrometer or equivalent device suitable for measuring the concentration of solids in the water and reading in parts per million.

2.9.13 Oxygen Analyzer

If oxygen compensation controls are furnished, provide an oxygen analyzer to indicate, record, and control the percentage of net excess oxygen in, and the average temperature of the flue gas leaving, the boiler. Provide direct probe type oxygen analyzer utilizing an in situ zirconium sensing element. Insert the element directly into the process flue gas stream and directly contact the process gases. Contain sensing element within a protective shield mounted to the ductwork by an adapter plate, furnished by the manufacturer. Equip the analyzer to allow daily automatic calibration check without removing the analyzer from the process. That is, sample gases may be injected directly on the sensing element while the analyzer is in the process. Include any temperature compensation of control required. The output signal range must be 4 to 20 mA dc and must represent 0 to 10 percent as a linear function.

2.9.14 Continuous Blowdown

**************************************************************************
NOTE: Continuous blowdown equipment will be provided if required by UFC 3-410-01 or UFC 3-410-02. If a firetube boiler is specified, these paragraphs will be deleted.

Blowdown system will be deleted if not required for the project.
**************************************************************************

Provide package type blowdown system that is rated as indicated. The system must automatically proportion blowdown to amount of makeup. Include [the heat exchanger's flow control valve,] strainer, sample cooler (if required), solenoid valve, and surge tank in the unit. [Provide an extra-heavy blowdown heat exchanger. Tubes must be of stainless steel. Provide a removable tube bundle with U-tubes having bends twice the thickness of the tubing. Use a rear baffle to support all tubes at the return bend.] Install a sample cooler so that shell and tubing can be removed without disturbing piping or mounting. Continuous blowdown valve must be the manual proportioning type fabricated of corrosion-resistant steel. Equip the valve with a micrometer dial and pointer to indicate the proportional setting.

2.9.15 Continuous Emissions Monitoring

**************************************************************************
NOTE: A continuous emissions monitoring system (CEMS) is required by the Clean Air Act Amendment (CAA) of 1990 if the fuel utilized is oil or coal and the heat input is 3 megawatts 10 million BTU/HR or greater. A CEMS may also be required by state or local laws. If a CEMS is necessary the designer will review the CAAA and the relevant state or local
law early in the project to allow time to incorporate the required CEMS specification and to determine which flue gas emissions will be included in the required reports. Before acceptance of the installation, furnish a written test report which provides documentation that the CEMS equipment has passed factory and field certification tests required by federal, state and local regulations to the Contracting Officer. The investigation will determine if the reported values may be calculated or should be direct measurements. Fill in the data to state what method of measurement or calculation will be utilized for the determination of the report variable.

Emerging flue gas flow monitor technologies are available. The traditional differential pressure technique specified uses familiar equipment that can be maintained by plant personnel. This type of measurement device has reliably satisfied regulatory requirements. The possible use of other technologies should include a thorough investigation of flue gas flow monitor regulatory requirements and in-house maintenance capabilities.

**************************************************************************

a. Provide continuous emissions monitoring system (CEMS) equipment as a system by a single manufacturer. Provide a CEMS, meeting the requirements of applicable federal regulations, State of [_____] and local regulations, for each boiler in accordance with manufacturer's recommendations and under the direct supervision of the CEMS equipment manufacturer.

b. Include [sulfur dioxide (SO2)] [oxides of nitrogen (NOx)] [carbon dioxide (CO2)] [particulate matter (PM)] and other information required by federal, state, and local regulations in the reported data. Base SO2 reporting on [analyzer measurement] [fuel flow and percent sulfur calculation] [daily heat input calculation]. Base nitrous oxides, carbon dioxide and particulate matter reporting on analyzers.

c. Include the central processing unit, printer, hard disk drive, and floppy disk drive in CEMS equipment. The floppy disk drive must function as a recorder. Provide the software to generate the required reports in a format acceptable to the federal, state and local regulatory agencies. The operator interface to the CEMS equipment must be via CRT screen.

2.10 WASTE HEAT RECOVERY EQUIPMENT

**************************************************************************

NOTE: Economizer or preheater will be selected to be compatible with pollution control equipment being utilized.

**************************************************************************

Equip each boiler with [an economizer] [an air preheater]. Units may be separate from or integral with the boiler and complete with insulation and jackets, casings, supports and access doors, and have provision for tube or tube bundle removal and for cleaning. Provide soot blowers as specified in
paragraph BOILERS.

2.10.1 Economizers

Provide economizers which are a type normally provided by the boiler manufacturer and that include [finned tubes] [bare tubes] baffles and headers and have provision for cleaning and tube bundle removal. At maximum load, economizer exit water must not be within 17 degrees C 30 degrees F lower than saturation temperature. Provide materials that are capable of withstanding the maximum boiler exit gas temperature plus 28 degrees C 50 degrees F. Provide tubes conforming to ASME BPVC SEC I. The overall design and installation must preclude cold-end corrosion under any load condition. Economizer tube metal temperature must be above the maximum flue gas dewpoint for the fuel being fired under all load conditions.

2.10.2 Air Preheaters

Provide air preheaters which are a type normally provided by the boiler manufacturer and are the recuperative tube plate or regenerative type constructed of materials adequate to withstand the corrosion effects of the flue gases. The overall installation must preclude cold-end corrosion of the air preheater under any load condition. Ensure temperatures of metals in contact with flue gas are above the flue gas maximum dewpoint temperature for the fuel being fired under all load conditions. Control by steam-preheat or by automatic bypass and integrate with the combustion control system.

2.11 DRAFT FANS

**************************************************************************
NOTE: Where fans are not protected by electrostatic precipitators or baghouse filters on boilers of 4540 kg per hour 10,000 pounds per hour and larger, provide liners for scroll sheets and rotor blades.

Induced draft fan outlet dampers may not be required in single fan/single boiler installations, except to eliminate the stack effect during outages.
**************************************************************************

Furnish centrifugal fans conforming to AMCA 801 [Type I] [Type II] [forced-draft] [and] [induced-draft] as an integral part of boiler design. Provide centrifugal fans with [backward curved blades] [radial tip blades] [or] [axial flow type]. Size each fan for an output volume and static pressure rating sufficient for pressure losses, excess air requirements at the burner or grate, leakages, temperature and elevation corrections for a dirty boiler with worst ambient conditions, all at full combustion to meet net rated output at normal firing condition. In addition, fan sizing must include margins of 10 percent volume and 21 percent static pressure, plus margins of 5 degrees C 10 degrees F for forced draft fans and 22 degrees C 40 degrees F for induced draft fans. Design induced-draft fans for handling hot flue gas at the maximum boiler outlet temperature adjusted for boiler surface fouling. [Provide induced draft fans with outlet dampers.] Noise levels for fans exceeding 85 decibels at 914.4 mm 3 foot station are not acceptable. Provide [air-cooled] [or] [water-cooled] fan bearings, and backward curved fan blade type with bearings not requiring water cooling may be of the self-aligning antifriction type. [Provide scroll sheets and rotor blades that have liners.]
2.11.1 Draft Fan Control

**************************************************************************
NOTE: Variable speed control, inlet vane control, and inlet damper control are, in descending order of efficiency, capable of control draft fan conditions. The choice is based on economics. However, in erosive services, inlet vane control is not desirable.
**************************************************************************

Provide forced-draft centrifugal fans with [inlet vane controls] [variable speed control] where indicated. Provide induced-draft centrifugal fans with [inlet vane control] [inlet damper control] [variable speed control]. [Provide axial propeller fans that have variable propeller pitch control.] Provide inlet vanes or dampers suitable for use with combustion control equipment.

2.11.2 Draft Fan Drives

**************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.
**************************************************************************

Steam driven boiler auxiliaries will not be used unless the exhaust steam can be utilized completely. Reference to steam drives will be deleted if inapplicable for the equipment specified.

Provide fan that is driven by [an electric motor] [or] [a steam turbine]. [Provide [drip-proof] [totally enclosed nonventilated] [totally enclosed fan-cooled] suitable for installation in a Class II, Division 1, Group F, hazardous location conforming to NFPA 70 electric motor.] [Provide motor starter which is magnetic [across-the-line] [reduced voltage start] type with [general-purpose] [weather-resistant] [watertight] [dust-tight] [explosion-proof] enclosure and furnish with four auxiliary interlock contacts.] [Operate steam turbines properly in a steam pressure range of [_____] Pa psig with steam back pressure of [_____] Pa psig. Ensure turbines have horizontally-split, centerline supported casings, water-cooled bearing housings with ring-oiled, babbitt-lined, bronze packed sleeve bearings. Also equip turbines with a mechanical shaft speed governor and valve, and independent emergency overspeed governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, removable stainless steel steam strainer [without disconnecting piping], any special wrenches and tools required for servicing turbine, and a sentinel warning on the exhaust casings. Provide turbines conforming to NEMA SM 23.]

2.12 AIR DUCTS

Design air ducts connecting the forced-draft fan units with the plenum chamber to convey air with a minimum of pressure loss due to friction. Provide galvanized sheet metal ductwork conforming to ASTM A653/A653M. Make ducts straight and smooth on the inside with laps made in direction of air flow. Brace ducts externally and install and anchor to be free of
vibration. Provide access and inspection doors as indicated and required. Construct ducts with long radius elbows having a centerline radius 1-1/2 times the duct width, or where the space does not permit the use of long radius elbows, short radius or square elbows with factory-fabricated turning vanes may be used. Make duct joints substantially air-tight and have adequate strength for the service, with 38.1 x 38.1 x 3.2 mm 1-1/2 x 1-1/2 x 1/8 inch structural steel angles used where required for strength or rigidity. Ensure duct walls thickness is as follows:

<table>
<thead>
<tr>
<th>Ducts, Maximum Dimension</th>
<th>Steel Sheet, Minimum Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up thru 1.5 m (60 inches)</td>
<td>1.519 mm (16 gauge) 16 gauge</td>
</tr>
<tr>
<td>Up through 60 inches</td>
<td></td>
</tr>
<tr>
<td>1.6 m (60 inches) 61</td>
<td>2.657 mm (12 gauge) 12 gauge</td>
</tr>
</tbody>
</table>

2.13 BREECHING

Construct breeching of no less than 3.416 mm 10 gauge steel sheets conforming to ASTM A36/A36M. Reinforce and brace breeching adequately with structural steel angles no smaller than 50 x 50 x 6.4 mm 2 x 2 x 1/4 inches, and weld all joints and seams in the sheets and angles. Install expansion joints as indicated and as required to suit the installation. Ensure expansion joint are the flexible type requiring no packing. Provide breeching consisting of angle flanges and gaskets for connection to boilers, fans, equipment, or stacks. Ensure breeching connections are gas-tight and are caulked tight all around and sealed with cement to form an air-tight joint. Provide clean-out openings of suitable size at approved locations for access to all sections of the breeching and consisting of tight-fitting, hinged, cast-iron doors with cast-iron frames. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping for combustion gases.

2.14 STACKS

Provide self-supporting double-wall insulated type stacks for individual boilers. Unless otherwise indicated, provide each stack complete with structural steel base, base plates, anchor bolts and nuts, clean-out door, [induced-draft fan] [boiler] connection and a thermometer well. Stub stacks for packaged boiler units may be supported directly on the boiler providing the boiler structure is designed to accommodate such an arrangement. Provide insulation suitable for sustained flue gas temperature of 480 degrees C 900 degrees F with intermittent temperatures up to 650 degrees C 1200 degrees F and the wall section must provide a "U" factor of approximately 0.26. Fabricate stacks of steel conforming to ASTM A242/A242M for both inner and outer shell. Provide inner shells of each section with an air-sealed and concealed expansion and contraction device to allow for differential expansion of inner and outer shells. Extend stacks above the roof to the height indicated. Plastic materials polyetherimide (PEI) and polyethersulfone (PES) are forbidden to be used for vent piping for combustion gases.

2.15 BLOWOFF TANK

[Construct blowoff tank of 28 MPa 4000 psi reinforced concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE, and fit with a bolted steel manhole cover and frame. Install blowoff pipe, vent pipe, and drain pipe to sewer in pipe sleeves built into the concrete. Fill and caulk the space...]

SECTION 23 52 30.01 10  Page 60
between the pipe and sleeves with lead wool or similar material to make a water-tight connection. Divide the tank into two sections by a baffle to form a sediment chamber.] [Construct blowoff tank of steel in accordance with NBBI NB-23 PART 1.]

2.16  PUMPS

2.16.1  Boiler Feed Pumps

Size and design boiler feed pumps for the specific application. Furnish pumps having a combined rating of flow and head that results in a wattage horsepower rating less than 185 kW 250 bhp to meet the design requirements of API STD 610. Provide pump that is end-suction, top discharge and support at its centerline. Ensure pump sizes with higher ratings than the above are horizontal-split case, multistage centrifugal pumps. Provide casing construction that is either volute or diffuser design and also support at its casing centerline. All pump ratings must have, nominally, an excess in capacity of 10 percent above the maximum continuous rating of the service. The required net positive suction head (NPSH) at the pump design flow, head, and speed must not exceed 80 percent of the available system NPSH at the same flow, assuming a low level in the storage tank. The pump's suction specific speed must not exceed 9000 at the pump's best efficiency point (BEP). The guaranteed NPSH requirements must reflect 3 percent breakdown criteria. The pump's head-capacity (H-Q) curve must be constantly rising to shutoff with no point of inflection. There will be no restriction to operation at any point from minimum continuous flow to design flow.

2.16.1.1  Casings

Pumps must have integrally cast suction and discharge flanges that must be drilled to meet the design pressure of the application. The maximum operating temperature, for design purposes, of any feedpump less than 204 degrees C 400 degrees F is not acceptable. Drill and tap casings. Provide casings with vent and drain connections. Do not require cooling at ratings below 375 kW 500 bhp for pumps designed for this service. This applies to both frame cooling or seal cooling. Below 375 kW 500 bhp, employ antifriction radial and thrust bearings lubricated by flinger rings in a sealed housing. Use mechanical and air-cooled flush piping seals conforming to API STD 610, Plan 23. Above 375 kW 500 bhp, employ a single cooling circuit for both cooling the oil being delivered by a forced oil system to sleeve radial bearings and a floating shoe thrust bearing, coupled with the seal coolers for both stuffing boxes. Also provide mechanical seals. In both cases, ensure stuffing boxes are site-convertible to a packed box. Ensure leakage is no more than 25 mm/hour 25 cc/hr for a seal life of no less than 25,000 hours. Bearing rating must be no less than 100,000 hours (L-10 life) at the point of maximum load, as defined by ABMA 9.

2.16.1.2  Base

Support pumps on structural steel bases that do not require grouting in order to impart strength to the pump for static and dynamic loading from the piping system. Pitch bases to a low point drain. The complete pump and motor assembly must be shop-aligned using shims on both the pump and the motor.
2.16.1.3 Couplings

Furnish all pumps with nonlubricated flexible-disc couplings and a coupling guard furnished to OSHA requirements. Use spacer-type couplings to permit removal of the mechanical seals and limited-end-float-type for pumps with sleeve bearings.

2.16.1.4 Automatic Recirculation

**************************************************************************
NOTE: If automatic recirculation valve is utilized, delete this paragraph.
**************************************************************************

Furnish all pumps with a self-contained automatic recirculation control valve that is sized for nominally 25 percent of the pump's BEP flow.

2.16.1.5 Turbines

Use steam turbines for boiler feed pump to operate the pump properly in a steam pressure range of [_____] Pa psig with steam backpressure of [_____] Pa psig. Provide turbines consisting of horizontally-split, two-piece, centerline supported casings, water-cooled bearing cases with ring-oiled, babbit-lined, bronze packed sleeve bearings. Also equip turbines with a mechanical shaft speed governor and valve, independent overspeed emergency governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, stainless steel steam strainer that is removable without disconnecting piping, any special wrenches and tools required for servicing the turbine, and a sentinel warning on the exhaust casings. Provide turbines conforming to NEMA SM 23.

2.16.1.6 Electric Motors

Select electric motors for continuous duty and non-overloading characteristics suitable for the power characteristics available. Provide motors that are [splashproof][totally enclosed, nonventilated][totally enclosed, fan-cooled type][totally enclosed, fan-cooled type, suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with the NFPA 70]. [Provide motor starter that is [manual][magnetic][across-the-line][reduced voltage start]] type with [general-purpose][weather-resistant][water-tight][dust-tight][explosion-proof] enclosure.] Ensure integral size motors are the premium efficiency type in accordance with NEMA MG 1.

2.16.1.7 Shop Hydrostatic Testing

Subject all pumps to shop hydrostatic testing. Subject one pump in each service to a complete shop performance test to demonstrate that, at rated capacity, head is within a margin of plus 3 percent and minus 0 percent of design; efficiency is within a tolerance of minus 0 percent; NPSH at the pump's BEP and at the rated condition is within a margin of plus 0 percent and minus 10 percent. Performance tests must be in accordance with API STD 610. Procedures and results are subject to the approval of the Contracting Officer.

2.16.2 Condensate Pumps

**************************************************************************
NOTE: If inadequate NPSH is available, the designer will give consideration to substituting either a double suction or positive displacement pump.

Provide horizontal, end suction, single stage, centrifugal, motor-driven condensate pumps with stainless steel shafts and bronze impellers. Provide pumps with stuffing boxes. Lubricate by splash oil with oil level sightglass provided. Subject pumps to the same tests specified for the Boiler Feedpumps.

2.17 CONDENSATE TANK AND ACCESSORIES

2.17.1 Condensate Tank

Design condensate tank for a working pressure of 103 kPa 15 psig and conforming to ASME BPVC SEC VIII D1. Ensure tank has a storage capacity equal to or greater than indicated and install complete with piping and accessories.

2.17.2 Feedwater Makeup Valve

Provide float-controlled valve for emergency feedwater makeup to the tank. Operate valve by a float-control mechanism connected to the surge tank and maintain a suitable minimum water level in the tank. Locate the float box outside the tank and valve the connections properly to permit blowdown and servicing.

2.18 HEAT EXCHANGERS

Design, fabricate, test, and stamp heat exchangers in accordance with ASME BPVC SEC VIII D1. Additionally, ensure heat exchanger designs meet the requirements of HEI 2623. Closed feedwater heater designs must meet the requirements of HEI 2622. Provide heat exchangers with relief valves as required by ASME BPVC SEC VIII D1 and the HEI Standards. Design heat exchangers using service water to have the service water inside the tubes. Provide exchangers of straight tube designs with bolted full diameter access channel covers to facilitate tube maintenance as required. Return bonnets are acceptable when there are no tubeside nozzle connections at the far end. Provide materials of construction that are all carbon steel, except the service water side which reflects the service water available. When the water quality permits, use stainless steel tubes in accordance with ASTM A249/A249M, Grade TP 304, the remainder of the tube side must be all carbon steel. When the service water is known to contain chloride levels harmful to stainless steels, the tubes must be 90-10 Copper-Nickel in accordance with ASTM B111/B111M Alloy 706; the remainder of the service water side must be as follows: tubesheets, monel-clad steel; channel covers, carbon steel lined with monel; channels and bonnets, monel. Fixed tubesheet designs are preferred when operating conditions do not impose a large differential movement that cannot be readily accommodated with a simple thin-wall metal bellows expansion joint. For larger differentials, a packed floating tubesheet with lantern ring is acceptable up to 1.03 MPa 150 psig design pressure. For pressures above 1.03 MPa 150 psig, use a split ring floating head design. Heat exchangers using steam to heat domestic water or other fluids such as glycol-water mixtures or fuel oil must have the steam in the shell side. Provide exchangers of U-tube designs with bolted full diameter channel covers to facilitate tube maintenance as required. The tubesheet must be the full diameter to match the shell flange and have sufficient threaded bolt holes so that a shell
hydro test may be applied without the channel in place. Use materials of construction that are all carbon steel with the exception of the tubes which should typically be specified as stainless steel in accordance with ASTM A688/A688M, Grade TP 304, stress relief annealed temper with the U-bends stress relieved after bending. Fuel oil heaters must have carbon steel tubes in accordance with ASTM A179/A179M and be furnished in the stress relief annealed temper with the U-bends stress relieved after bending. Provide feedwater heaters consisting of all welded construction with bolted full diameter channel covers to facilitate tube maintenance as required. The channel barrel must be integral with the tubesheet and have an internal pass partition bolted cover design that is readily removable when the channel cover is removed. Pass partitions that are sealed with a gasketed groove in the channel cover are prohibited. Ensure materials of construction are all carbon steel except the tubes. Provide pressure boundary material in accordance with ASTM A516/A516M, Grade C, when plate material is required, or ASTM A350/A350M when forging material is required. Provide shroud plate material for desuperheating and subcooling zones in accordance with ASTM A285/A285M, Grade C. Provide stainless steel tubes in accordance with ASTM A688/A688M, Grade TP 304, stress relief annealed temper with the U-bends stress relieved after bending.

2.19 DEAERATING FEEDWATER HEATER

**************************************************************************
NOTE: Economizer or preheater will be selected to be compatible with pollution control equipment being utilized.
**************************************************************************

Install deaerating feedwater heater where indicated and that is the size and capacity indicated. Provide [cast iron] [steel plate] shell. [Tray system for unit must be [cast-iron] [corrosion-resistant steel.] Floats must be of [copper] controlled overflow-trap type. Provide heater with [a pressure relief valve,] [thermometers,] [pressure gauge,] [and] [oil separator]. [Install a combination temperature-pressure recorder for each feedwater heater.] [Take steam pressure readings from the shell, and place the temperature bulb to [indicate] [record] the temperature of the feedwater after it passes over the trays and sprays.] Provide an alarm to turn on a red pilot signal lamp and to sound a bell gong in the event that water level in the feedwater heater storage tank falls to 300 mm 12 inches above the bottom of the tank. Operate the system by an approved type of external electric float switch connected to the tank. Mount the signal lamp and bell where directed. The deaerating feedwater heater must have a capacity of [_____] pounds of water per hour at a discharge temperature of [_____] degrees F at the following inlet conditions:

<table>
<thead>
<tr>
<th></th>
<th>Pressure (kPa) (psig)</th>
<th>Temperature range (deg C) (deg F)</th>
<th>Flow rate (kg/hr) (lb/hr)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condensate return</td>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>High-pressure trap returns</td>
<td>[_____]</td>

<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Heating steam</td>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>
NOTE: The design engineer, when designating steam-using equipment or special steam applications, will indicate the type of steam trap required in accordance with the following data:

a. Inverted Bucket Traps: This type of trap continuously vents air and carbon dioxide at steam temperature and is recommended for modulating loads. The bucket floats on steam to close the outlet and sinks into condensate to open the condensate outlet. Any trapped air is discharged first into the condensate return line and is followed by condensate discharge. This type of trap has the longest life on systems under modulated control. When large amounts of air are anticipated, an external thermostatic air vent should be installed on a line bypassing the trap to bleed air from the steam line and discharge it to the condensate return line. This system will give optimum performance at low steam pressures with maximum dependability. These traps will handle condensate from fan coil units where condensate must be lifted to return lines located above the equipment. They operate best at near full load conditions where loads do not vary over a wide range. Before operation, traps must be primed by filling them with water.

b. Vertical Open-Top Bucket Trap: Trap construction is more complex than inverted bucket type but is suitable for applications having wide variation of load and pressure, and is recommended for constant pressure systems. Bucket sinks into condensate when condensate reaches top of trap and the discharge port opens. After discharge, the bucket floats on incoming condensate keeping the discharge port closed.

c. Impact-Operated Traps: These traps depend on steam velocity to keep the disc closed. As steam velocity decreases, the disc lifts off the seat and allows flow of condensate. These traps allow some steam leakage and do not vent air at low pressure. They are not recommended for service lower than 70 kPa 10 psig or where back pressure may exceed 50 percent of inlet pressure. These traps are less expensive and have poor performance in the presence of dirt.

d. Thermostatic Traps: These traps are bellows-actuated and contraction of bellows at a few degrees below saturated steam pressure allows condensate air and noncondensable gases to be discharged. As steam reaches the bellows, the expansion of the bellows closes the discharge port. These traps can also be utilized to vent air from a
steam system and can be used in conjunction with an inverted bucket type steam trap previously described.

e. Float and Thermostatic Trap: These traps provide optimum performance on modulating systems at lowest first cost. Where steam pressures modulate down to zero, large amounts of air may be liberated. They are ideal for dripping ends of steam risers, heels of up-feed steam risers, bottoms of down-feed steam risers. These traps are also ideal for fan coil units and unit heaters.

f. Any trap selected must be sized for the expected condensate load with an applicable safety factor applied for the particular type of equipment serviced. Manufacturer's application manuals should be consulted to assist in sizing traps. Safety factors vary from 2:1 to 10:1. An average 3:1 safety factor value will cover most applications.

g. Service life between repairs or replacement of traps may be a determining factor in the choice of traps. One manufacturer of all types of traps offers the following experience record:

<table>
<thead>
<tr>
<th>Type of Trap</th>
<th>Average Service Life Between Replacement or Repairs</th>

</tbody>
</table>

**************************************************************************

Provide steam traps in accordance with ASTM F1139, type, style, and class as applicable.

2.20.1 Bucket Traps

Provide either the inverted bucket type or the vertical bucket type bucket traps with automatic air discharge. Design traps for a working pressure of 1.03 MPa 150 psig, but in the correct pressure class to operate properly at the actual steam supply pressure indicated for the system. Construct valve and seat of stainless steel. Construct all other interior parts of corrosion-resistant metal and the traps may be sealed type with corrosion-resistant steel bodies. Ensure traps discharge the condensate to the return line and are connected as indicated. Install a suitable strainer with blow-off valve in the intake connection to each trap. Ensure capacity of traps is no less than that indicated.

2.20.2 Impact-Operated Traps

Impact-operated traps, impulse-operated traps, or thermodynamic traps with continuous discharge may be installed in lieu of bucket traps if
applicable, subject to approval of the Contracting Officer.

2.20.3 Thermostatic Traps

Thermostatic traps designed for a steam working pressure suitable for the application may be furnished in lieu of the traps specified above if applicable. Base thermostatic trap capacities on a pressure differential not in excess of the following:

<table>
<thead>
<tr>
<th>Steam working pressure</th>
<th>Differential pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>275-350 kPa 40-50 psig</td>
<td>240 kPa 35 psig</td>
</tr>
<tr>
<td>620-690 kPa 90-100 psig</td>
<td>550 kPa 80 psig</td>
</tr>
</tbody>
</table>

2.20.4 Float and Thermostatic Traps

Design float and thermostatic traps for a steam working pressure of 103 kPa 15 psig which operates with the supply pressure indicated for the system. Base trap capacity on a pressure differential of 15 kPa 2 psi. Provide inlet to each trap with a brass or stainless steel strainer either separately or as an integral part of the trap.

2.21 PRESSURE GAUGES

Provide heavy-duty industrial type pressure gauges with phenolic case, solid front, rear blowout, threaded ring, shatterproof glass, and 13 mm 1/2 inch NPT bottom connection suitable for specified pressure or vacuum with minimum 114.3 mm 4-1/2 inch diameter dial, except as otherwise specified. Install pressure gauges on the low-pressure side of each pressure reducing valve, on the suction and discharge side of each pump, on inlets and outlets of heat exchangers, on the feedwater heater, and where shown or required for proper operation. Install pressure gauge with a [254.0 mm 10 inch] [304.8 mm 12 inch] dial face on each boiler. Install gauges to be accessible and easily read from the operating floor. Equip gauges with integral or separate siphons, and pulsation dampeners and connect by brass pipe and fittings with shutoff cocks. Where pressure reducing valves are used, place upstream and downstream gauges close to the pressure reducing assembly, but connect approximately 3 m 10 feet therefrom. The operating ranges of the gauges must be approximately twice the normal operating pressure.

2.22 THERMOMETERS

Provide bimetallic type thermometers with stainless steel case and stem, separable stem, separable thermowells, and temperature range suitable for the use encountered. Install thermometers in the feedwater heater storage and steam areas, boiler feed pump; in the main condensate return line before entering the surge tank; in the combustion air inlets and outlets of air preheaters, water inlets, and outlets of economizers; in the suction and discharge of boiler feed pumps; in air inlets to forced and induced draft fans; in the flue gas inlets and outlets of economizers and air preheaters; and elsewhere as indicated or specified. Provide thermometers with a universal joint and that are easily read from the operating floor. Ensure thermometers have 127.0 mm 5 inch scales except where 304.8 mm 12 inch scales are required for remote reading and plus or minus 1 percent accuracy.
2.23 WATER METER

NOTE: For boilers having less than 4,540 kg 10,000 lbs per hour steaming capacity, a mechanical type feedwater meter may be provided in accordance with this paragraph. Plants having metered zeolite softeners used exclusively for boiler makeup purposes will not require an additional cold water makeup water meter. Boilers over 4,540 kg 10,000 lbs per hour capacity will have indicating-recording meters and they must be integrating type where indicated.

Provide water meter, including the three-valve bypass and connections, in the cold water makeup line [and in each boiler feedwater line]. Provide disk type water meters with reinforced disk for hot water above 65 degrees C 150 degrees F and rubber or synthetic polymer disk for cold water, that are constructed of bronze composition and cast-iron protected by noncorrosive coating. Ensure moving parts subject to wear are easily removable. Provide meters conforming to the requirements of AWWA C700.

2.24 CHEMICAL TREATMENT AND WATER SOFTENING EQUIPMENT

NOTE: Inapplicable type of chemical feeder will be deleted in accordance with the requirements of UFC 3-410-01 or UFC 3-410-02.

2.24.1 Chemical Feeder

Provide a feeder unit for each boiler. Chemical feeder must be automatic proportioning, shot, or pump type. Provide all appurtenances necessary for satisfactory operation. Base size and capacity of feeder upon local requirements and water analysis. Furnish chemical feed pumps and tanks as a package with the pumps mounted on and piping connected to the tank. Provide pump cylinders, plungers, ball check valves, and check valve bodies consisting of corrosion-resistant materials suitable for the chemicals being pumped. Volumetric accuracy of the pumps must be within one percent over the range indicated. Adjust pump capacities by positioning crank pin with micrometer setscrews. Ensure stroke length scale is divided in percentage graduations engraved on scale. Provide replaceable cylinders for increased or reduced pressure or capacity ranges. Provide drive motors suitable for the electrical power available with drip-proof enclosures. Provide polypropylene tanks and mount on legs. Provide tanks with filling and drain connections and gauge glass. Furnish each tank with one pump, mounted and piped with black iron pipe and fittings, with suction strainer and stainless steel screen, and with 13 mm 1/2 inch relief valve with steel body and stainless steel trim. Provide hinged cover for each tank. Tank bottom must be dished concave to a radius equal to the diameter of the tank. Units must be for phosphate or caustic feed and sulfite feeding. Provide motor-driven agitator. Design the pump to feed the chemical solutions into the boiler feedwater system.

2.24.2 Water Softening Equipment
NOTE: Need for softening equipment for makeup water will be as determined in accordance with UFC 3-410-01 or UFC 3-410-02. If water softening is not required, delete the paragraph.

**************************************************************************

Provide a [single] [double] unit automatic water softener system as indicated. Design the system for a working pressure of [_____] Pa psig. The system must be complete with raw and regenerate water distribution; under drain; inlet and outlet connection in upper and lower header respectively; resin removal connecting pipe legs; control valve for service, backwash, regenerate, and rinse; water meters, pressure gauges, brine storage, and measuring tank and controls for automatic operation. Brine tank must be either hot-dipped galvanized after fabrication or polypropylene. Brine piping must be either all copper pipe and fittings or Schedule 80 PVC. Provide equipment with a total capacity between regenerations of no less than [_____] liters gallons of water of [_____] grams grains hardness when operating at a sustained softening rate of [_____] L/second gpm. Base the system on the data below. Provide test sets for pH comparator for the range [_____] to [_____] sulfite comparator, and phosphate comparator.

2.24.2.1 Water Analysis

The source of the raw water is [______]. The analysis of the water is approximately as follows:

<table>
<thead>
<tr>
<th>Constituents*</th>
<th>[_____] ppm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sodium as (Na)</td>

</tbody>
</table>

*Numbers in parentheses are subscripts.

2.24.2.2 Zeolite

Provide the high capacity polystyrene base sulphonie synthetic type
zeolite. Provide no less than [_____] cubic meter feet of zeolite with
each reactor tank.

2.24.2.3 Reactor Tank

Base reactor tank sizes on allowing a freeboard above the zeolite bed of no
less than 50 percent of the zeolite bed depth, and a maximum flow rate of
11.3 mL/square meters per second one gallon/square foot per minute for each
111 mm 4-3/8 inches of zeolite bed depth.

2.24.2.4 Softening System

Provide softening system complete with all piping, control, and power
wiring. Install a complete initial charge of rock salt in the brine tank
as recommended by the softener manufacturer.

2.24.2.5 Water Test Kit

Provide a kit complete with test containers, reagents, and instructions for
testing the raw and effluent water in a strong carrying case.

2.24.2.6 Treated Water Storage Tank

Fabricate treated water storage tank from steel plates no less than 4.7625
mm 0.1875 inch thick for shell and heads, and construct in accordance with
ASME BPVC SEC VIII D1 for unfired pressure vessels for a design working
pressure of 517 kPa 75 psig. Heads must be dished concave to pressure to a
radius equal to the diameter of the tank. Provide tank with the
connections indicated, an 203.2 mm 8 inch copper ball float, level-operated
control valve, valve bypass and accessories, and a protected gauge glass.
The tank must be the diameter shown and have a capacity no less than [_____] liters gallons. Hydrostatically test the tank at the factory at no less
than 690 kPa 100 psig.
2.25 BUILDING HEATING EQUIPMENT

2.25.1 Unit Heaters

2.25.1.1 General

Do not select individual heaters with a capacity in excess of 125 percent of the value specified for the heater. Provide orifice plates to reduce the joule Btu output where required. The noise level of each unit heater must be appropriate for the space in which the heater is installed. The sound power level \([_____] \) decibels reference must not exceed the following values in each octave band at the midfrequency, cycles per second:

<table>
<thead>

Base sound power level data for these units on tests conducted in accordance with ASA S1.13.

2.25.1.2 Propeller Type Unit Heater

Design heater for suspension and arrange for horizontal or vertical discharge of air as indicated. The casings must be no lighter than 0.912 mm 20 gauge steel. Provide suitable stationary or rotating air deflectors to assure proper air and heat penetration at floor level. Suspension from heating pipes will not be permitted. Operate vertical discharge heaters at speeds not in excess of 1200 rpm, except that units with 53 Megajoules 50,000 Btu output capacity or less may operate at speeds up to 1,800 rpm. Provide horizontal discharge unit heaters with discharge or face velocities no greater than the following:

<table>

2.25.1.3 Cabinet Unit Heaters

Provide centrifugal fan type heaters arranged for floor or ceiling mounting as indicated. House heating elements and fans in steel cabinets with angle iron frames. The cabinets must be of no lighter than 0.912 mm 20 gauge steel. Provide each unit heater fan discharge with an approved adjustment
for air diffusion and distribution. Mount the fans on a common shaft with one fan to each air outlet. Equip the fan shaft with self-aligning ball or roller bearings accessible for lubrication. Connect the fan shaft directly to the driving motor or connect indirectly by adjustable V-belt drive rated at 150 percent of motor capacity. Provide guards for all exposed moving parts. Ensure all fans in any one unit heater are the same size.

2.25.1.4 Heating Elements

Heating coils must be copper, and radiating fins may be copper, aluminum, or suitable ferrous alloy. Ensure heating elements are free to expand or contract without developing leaks and are properly pitched for drainage. Test elements under a hydrostatic pressure of 1.4 MPa (200 psi) and submit a certified report of the test to the Contracting Officer.

2.25.1.5 Manual Selection Switches

Provide motors with manual selection switches for [on, off, and automatic] operation and equip with thermal-overload protection.

2.25.1.6 Automatic Operation

2.25.1.6.1 Thermostatic Control by Fan Regulation

Control unit heaters automatically by thermostats located where indicated. Provide adjustable thermostats and fit with thermometers. Operate each thermostat on no more than a 2 degrees C (3 degrees F) differential over a temperature range of approximately 13 to 24 degrees C (55 to 75 degrees F). The thermostat must start or stop the respective unit heater fan motor when the room temperature falls below or rises above the thermostat set point. Provide summer-winter switches for fan operation adjacent to the thermostat for each unit heater.

2.25.1.6.2 Thermostatic Control by Steam Valve Regulation

Control cabinet type unit heaters automatically by proportioning type thermostats and modulating steam valves located where indicated. Provide on-off switches for fan operation adjacent to the thermostat for each fan unit. The thermostats and valves must maintain the desired room temperature within 1 degree C (2 degrees F) of the thermostat set point by regulating the steam supplied to the coil.

2.25.2 Radiator and Convector

Provide each [radiator] [convector] unit with a top supply connection with a control valve and a bottom return connection with a thermostatic trap. Test each unit hydrostatically at the factory and prove tight at a pressure of no less than 690 kPa (100 pounds). Provide extended surface tube-type radiators consisting of suitable metal fins permanently bonded to copper or steel pipe cores threaded at each end for connecting to external piping. Determine radiator capacities in accordance with the HYI-005 Rating Code. Equip radiators with [expanded metal cover grilles fabricated from steel sheets no lighter than 1.519 mm (16 gauge), secured either directly to radiators or to independent brackets] [solid front, slotted, horizontal top grilles fabricated from steel sheets no lighter than 1.214 mm (0.0478 inch) thick, secured either directly to radiators or to independent brackets] [solid front, slotted, sloping, top cover grilles fabricated from steel sheets no lighter than 1.214 mm (0.0478 inch) thick independently secured to masonry with brackets]. [Test nonferrous convectors hydrostatically at the...
factory and prove tight under a pressure of no less than 585 kPa 85 psig.]

2.26 AIR COMPRESSOR UNITS

Provide air compressor conforming to ASME PTC 10, except as specified otherwise. Do not exceed 900 rpm compressor speed. Do not exceed 1750 rpm motor speed.

2.26.1 Service Air Compressors

Meet service air requirements as indicated with receivers sized as indicated. Provide units suitable for heavy-duty service (soot blowing). Provide compressors that are simplex type, single-stage, double-acting, with water-jacketed cylinder; fitted with intake and discharge valves of the lightweight feather, disc, or plate type; and provide with necessary controls, water-cooled aftercooler, moisture separator, drive, receiver, relief valves, and cooling water controls as indicated or required. Provide compressor air intake with a low drop-type air suction filter/silencer suitable for outdoor installation. The aftercooler must be the shell-and-tube type designed for air flow through the tubes with steel shell internal baffle plates and Admiralty metal tubes expanded into Muntz metal tube sheets. Provide moisture separator with an automatic water discharge trap and level gauge. Provide vertical type air receiver, constructed in accordance ASME BPVC SEC VIII D1 for unfired pressure vessels for 1.4 MPa 200 psi working pressure, and equip with flanged inlet and outlet connections, valved drain connection, 152 mm 6 inch dial pressure gauge, pop safety valves, and regulator connections. Cooling water controls for regulating compressor cylinder water temperature and aftercooler water temperature must be thermostatic valve type and install with a three-valve bypass in the water outlet lines ahead of open sight drain funnels. Equip compressor with adjustable, pressure-type unloader controls suitable for continuous compressor operation.

2.26.2 Instrument Air Compressors

**************************************************************************
NOTE: The designer should determine if two redundant full-size instrument air compressors will be required as loss of air will cause unit shutdown unless other provisions are made, such as crossties to the soot blower/service air system. Delete paragraph if not required.
**************************************************************************

Provide an electric motor-driven oil-free automatic air compressor unit and a refrigerating drying unit. The air compressor must be capable of delivering, at a pressure of [_____] Pa psig, not less than 0.00472 standard cubic meters/second 10 scfm dry air at an atmospheric dew point of -23 degrees C -10 degrees F with entering air at 35 degrees C 95 degrees F, saturated. Size air compressor unit to run no more than 60 percent of the time when all controls are in service. Provide complete air compressor unit with all necessary accessories including automatic pressure control equipment, relief valves, check valves, air filters, moisture traps, and a receiver with ample capacity for emergency operation of the controls for 15 minutes after compressor shutdown. The receiver must be of vertical construction, in accordance, ASME BPVC SEC VIII D1 with relief valve and drain fittings. Provide a self-contained, refrigerated type air dryer, complete with refrigeration compressor, heat exchanger, automatic controls, and moisture removal trap, or a regenerative desiccant type dryer, as
required. Ensure refrigeration unit is the hermetically-sealed type capable of continuous operation at maximum load conditions.

2.27 PIPING

Unless otherwise specified herein, provide pipe and fittings conforming to ASME B31.1.

2.27.1 Pipe

Provide pipe material as specified in TABLE I.

2.27.2 Fittings

Provide pipe fittings as specified in TABLE II.

2.27.3 Nipples

Provide nipples conforming to ASTM A733, Type I or II, as required to match adjacent piping.

2.27.4 Unions

Provide unions conforming to ASME B16.39, type as required to match adjacent piping.

2.27.5 Pipe Threads

Provide pipe threads conforming to ASME B1.20.2M ASME B1.20.1, right- or left-hand tapered thread as required.

2.27.6 Expansion Joints

2.27.6.1 Guided, Slip-Tube Type Expansion Joints

**************************************************************************
NOTE: Wherever possible, provision for expansion of steam supply and return pipes will be made by changes in the direction of the run of the pipe or by field-fabricated expansion bends. If expansion joints are not required, applicable paragraphs will be deleted. Where space limitations prevent such provisions for expansion, expansion joints will be installed.
**************************************************************************

Guided, slip-tube expansion joints must conform to EJMA Stds and ASME B31.1. End connections must be flanged. Provide anchor bases or support bases as indicated or required. Design joints for a steam working pressure no less than [_____] Pa psig. Joints must provide for either single or double slip of the connected pipes, as indicated, and for not less than the traverse indicated. [Provide service outlets where indicated or required.]

2.27.6.2 Bellows Type Expansion Joints

Bellows type joints must be flexible, guided expansion joints conforming to EJMA Stds and ASME B31.1. The expansion element must be stainless steel. Guiding of piping on both sides of expansion joint must be in accordance with the published recommendations of the manufacturer of the expansion.
joint. Design joints for the working temperature and pressure suitable for the application, but design pressure less than 1.03 MPa 150 psig is not permitted.

2.27.6.3 Flexible Ball Type Expansion Joints

Provide flexible ball joints that are [stainless steel] [malleable-iron] [ductile iron] [carbon steel] [bronze] or other alloys as appropriate for the service intended. The joints may be threaded, flanged, or welded end, as required, and must be capable of absorbing the normal operating axial, lateral, or angular movements or combination thereof. Design and construct ball-type joint in accordance with ASME B31.1 and EJMA Stds, where applicable. Provide flanges conforming to the diameter and drilling provisions of ASME B16.5. Furnish molded gaskets suitable for the service intended.

2.27.7 Valves

Install valves at indicated locations, where specified, and where required for proper functioning and servicing of the system. Valves must be of the pressure class shown. Provide motor-operated valves capable of closing speeds of 2.5 to 5.1 mm/sec 6 to 12 inches/minute. Equip motor operators with position indicators, valve stem protectors above the motor operating units, and auxiliary handwheels for manual operation of the valves in the event of power failure. Ensure motors are suitable for operation on the electrical current characteristics indicated.

2.27.7.1 Check Valves

**************************************************************************
NOTE: The designer will indicate the type of valves, vertical lift or horizontal, on the drawings.
**************************************************************************

a. Provide valves for 125 pound class steel piping conforming to the following:

   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 3 or 4, Class 125.

   (2) Sizes 80 mm 3 inches through 600 mm 24 inches, cast-iron: MSS SP-71, Type III or IV, Class 125.

b. Provide valves for 150 pound class steel piping conforming to the following:

   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Class 150 minimum.

   (2) Sizes 80 mm 3 inches through 600 mm 24 inches, steel: ASME B16.34, Class 150 minimum, flanged ends, swing disc.

c. Valves for system operating pressure greater than 1.4 MPa 200 psi must be swing check or lift check valves having a steel body and suitable for specified operating pressure, but not less than Class 300 300 pound class. Valves 40 mm 1-1/2 inches and smaller must be cast or forged steel with socket welded ends. Valves 50 mm 2 inch and larger must be steel with butt welded ends. Check valves must have renewable composition discs or metallic discs of the regrindable type which
permits regrinding without removing valve from the line.

2.27.7.2 Gate Valves

Gate valves used as shutoff valves in the boiler leads to the steam headers, and elsewhere as indicated, must be of the chain-operated type, with enough chain for easy operation from the operating floor or walkway. Provide gate valves 200 mm 8 inches and larger used on high-pressure steam lines, and elsewhere as indicated with a globe valve bypass.

a. Provide valves for 125 pound class steel piping conforming to the following:

   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1 or 2, Class 125.

   (2) Sizes 80 mm 3 inches through 1200 mm 48 inches, cast-iron: MSS SP-70, Type I, Class 125, Design OT or OF (OS&Y), bronze trim.

b. Provide valves for 150 pound class steel piping conforming to the following:

   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1 or 2, Class 150 minimum.

   (2) Sizes 80 mm 3 inches through 600 mm 24 inches, steel: ASME B16.34, Class 150 minimum, flanged ends.

c. Valves for system operating pressure greater than 1.4 MPa 200 psi must be split wedge disc type, outside screw and yoke, steel and suitable for specified operating steam pressure, but no less than Class 300 300 pound class. Valves 50 mm 2 inch and smaller must be forged steel with socket welded ends. Valves 65 mm 2-1/2 inches and larger must be steel with butt welded ends.

2.27.7.3 Globe Valves and Angle Valves

Provide globe type valves with outside screw and yoke with bolted bonnets, stainless steel trim, and flat seats, but not the reversed cup type. Provide large and deep stuffing boxes. Install valves with the stem horizontal or above.

a. Provide valves for 125 pound class steel piping conforming to the following:

   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1, 2, or 3, Class 125.

   (2) Sizes 80 mm 3 inches through 300 mm 12 inches, cast-iron: MSS SP-85, Type III and Type IV, Class 125.

b. Provide valves for 150 pound class steel piping conforming to the following:

   (1) Sizes 65 mm 2-1/2 inches and less, bronze: MSS SP-80, Type 1, 2, or 3, Class 150 minimum.

   (2) Sizes 80 mm 3 inches through 600 mm 24 inches, steel: ASME B16.34, Class 150 minimum, flanged ends.
c. Valves for system operating pressure greater than 1.4 MPa 200 psi must be suitable for specified operating conditions, but no less than 300 pound class. Valves 50 mm 2 inch and smaller must be forged steel with socket welded ends. Valves 65 mm 2-1/2 inches and larger steel with butt welded ends. Valves must have renewable flat metal seats.

2.27.7.4 Steam Pressure Reducing Valves

**************************************************************************

NOTE: Single-seated valves should be used when a dead-end shutoff of the steam is required. When a thermostatically-controlled valve is installed after and near the reducing valve in a manner to cut off the passage of steam, the single-seated valve should be used. Double-seated valves may be used where the low (reduced) pressure lines will condense enough steam to offset normal leakage through the valve. Under conditions of widely varying initial pressure, double-seated valves usually give closer control of reduced pressure.

**************************************************************************

Provide reducing valves designed for the working pressure shown, but not for less than 1.4 MPa 200 psig, wherever indicated or required. Adjust each reducing valve to maintain the desired terminal pressure, regardless of fluctuations in the initial pressure. The valves must be [single seated] [doubled seated], spring-loaded, quiet in operation, and must not stick internally. Provide pilot-operated valves or other controllers using steam or compressed air for operating medium. Valves 65 mm 2-1/2 inches and larger must be cast steel, cast-iron, or semisteel as required for the steam pressure. Valves 50 mm 2 inches and smaller must be bronze. Valve trim for iron body valves must be stainless steel, nickel copper, or other approved corrosion-resisting material. All parts subject to wear must be readily renewable. Provide valves with seats and plugs faced with a cobalt-tungsten carbide mixture, or made of heat-treated stainless steel or a high chromium steel designed to resist erosion. Provide seat and plug facing with a Brinell hardness of no less than 450. Install each valve with a strainer, a three-valve bypass, and a safety relief valve as indicated. Where pressure reducing valves are used for reducing the steam pressure to the deaerating heater, use single seated type valves. Connect sensing lines to the steam space in the deaerator or at least 3 m 10 feet downstream of the pressure reducing valve.

2.27.7.5 Thermostatic Regulating Valves

**************************************************************************

NOTE: If a hot water generator is not installed, this subparagraph will be deleted.

**************************************************************************

Install valves of the self-contained type to control water temperature within the domestic hot water generator by regulating the steam supplied to the heating coil in the steam supply line to each generator. Design thermostatic regulating valves for a steam working pressure of 1.4 MPa 200 psig and operate at the pressure shown. The valves must be adjustable within an operating range of approximately 38 to 71 degrees C 100 to 160 degrees F and maintain the desired water temperature within plus or minus 3 degrees C 5 degrees F.
2.27.7.6 Back Pressure Relief Valves

Provide valves with cast-iron or steel bodies and equip with corrosion-resistant trim and valve seats. The valves must be properly guided and must be positive closing to prevent leakage. Adjustment of the desired back pressure must cover a range between 34 to 103 kPa 5 to 15 psig. The adjustment must be effected externally, and provide any shafts extending through the valve body with adjustable stuffing boxes having renewable packing.

2.27.7.7 Boiler Automatic Feedwater Recirculating Control Valve

**************************************************************************
NOTE: If automatic recirculation valve is not utilized, delete this paragraph.
**************************************************************************

Provide self-contained self-powered type valve. Automatically program the recirculation flow when required and assume all functions for prevention of the backflow of the main feedwater flow, for detection of low flow, for cycling of the control valve, and for the pressure reduction for liquid delivery to the low-pressure feedwater heater. Provide flanged type valve assembly with flanged spools provided in both the main line and recirculation line for ease of disassembly.

2.27.8 Exhaust Heads

Exhaust heads for the discharge of steam to atmosphere must be one-piece plate steel, semisteel, or cast-iron construction with internal baffle arrangement for the removal of entrained condensate and oil, and with provision for drain connection. Flow area through unit must be larger than connecting pipe.

2.27.9 Strainers

Make strainer body connections the same size as the pipelines in which the connections are installed. Provide strainer bodies consisting of heavy and durable cast steel [or gray cast-iron]. Clearly cast arrows on the sides of bodies to indicate the direction of flow. Equip each strainer with an easily removable cover and sediment basket. The basket must be no less than 0.63 mm 0.025 inch thick corrosion-resistant steel [or sheet brass] with enough small perforations to provide a net free area through the basket of at least 3.0 times that of the diameter of the entering pipe.

2.27.10 Pipe Hangers, Inserts, and Supports

Provide pipe hangers, inserts and supports conforming to MSS SP-58, except as modified herein:

a. Do not use Types 5, 12, and 32.

b. Do not use Type 3 on insulated pipe which has a vapor barrier. Type 3 may be used on insulated pipe that does not have a vapor barrier if clamped directly to the pipe and if the clamp bottom does not extend through the insulation and the top clamp attachment does not contact the insulation during pipe movement.

c. Secure Type 18 inserts to concrete forms before concrete is placed.
Continuous inserts which allow more adjustment may be used if they otherwise meet the requirements for Type 18 inserts.

d. Torque Type 19 and 23 C-clamps in accordance with MSS SP-58 and have both locknuts and retaining devices furnished by the manufacturer. Field-fabricated C-clamp bodies or retaining devices are not acceptable.

e. Furnish Type 20 attachments used on angles and channels with an added malleable-iron heel plate or adaptor.

f. Type 24 may be used only on trapeze hanger systems or on fabricated frames.

g. Where Type 39 saddle or Type 40 shield is permitted for a particular pipe attachment application, use the Type 39 saddle on all pipe 100 mm 4 inches and larger.

h. Space horizontal pipe supports as specified in MSS SP-58 and do not install a support over 300 mm 1 foot from the pipe fitting joint at each change in direction of the piping. Do not space pipe supports over 1.5 m 5 feet apart at valves. In the support of multiple pipe runs on a common base member, use a clip or clamp where each pipe crosses the base support member. Spacing of the base support members must not exceed the hanger and support spacing required for any of the individual pipes in the multiple pipe run. Ridge the clips or clamps to the common base member. Provide a clearance of 3 mm 1/8 inch between the pipe and clip or clamp for all piping which may be subjected to thermal expansion.

i. Support vertical pipe at each floor, except at slab-on-grade, and at intervals of no more than 4.5 m 15 feet, no more than 2.4 m 8 feet from end of risers, and at vent terminations.

j. Provide Type 35 guides using steel, reinforced polytetrafluoroethylene (PTFE) or graphite slides, where required, to allow longitudinal pipe movement. Provide lateral restraints as required. Provide slide materials suitable for the system operating temperatures, atmospheric conditions, and bearing loads encountered.

(1) Where steel slides do not require provisions for restraint of lateral movement, an alternate guide method may be used. On piping 100 mm 4 inches and larger, a Type 39 saddle may be welded to the pipe and freely rest on a steel plate. On piping under 100 mm 4 inches, a Type 40 protection shield may be attached to the pipe or insulation and freely rest on a steel slide plate.

(2) Where there are high system temperatures and welding to piping is not desirable, then the Type 35 guide must include a pipe cradle, welded to the guide structure and strapped securely to the pipe. Separate the pipe from the slide material by at least 100 mm 4 inches, or by an amount adequate for the insulation, whichever is greater.

k. Pipe hangers on horizontal insulated pipes, except for Type 3, must be the size of the outside diameter of the insulation.

l. Support piping in trenches as indicated.
2.28 INSULATION

Provide shop and field applied insulation as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.29 TOOLS

Furnish special tools only and include all uncommon tools necessary for the operation and maintenance of boilers, stokers, pumps, fans, controls, meters, special piping systems, and other equipment. Furnish small hand tools with a suitable cabinet, mount where directed. Also furnish the following tools.

2.29.1 Tube Brush

**********************************************************************************************************************
NOTE: Applies to firetube boilers.
**********************************************************************************************************************

Provide tube brush, with steel bristles and jointed handle of sufficient length to clean full length of firetubes.

2.29.2 Smoke Pipe Cleaner

Provide cleaner to clean the breeching and smoke connections. Provide cleaner with jointed handle of sufficient length to clean breeching and smoke connections without dismantling.

2.29.3 Firing Tools

Provide firing tools including hoe, poker, and slice bar for each boiler.

2.29.4 Wrenches and Gaskets

Provide wrenches as required for opening boiler manholes, handholes, and cleanouts. Provide one set of extra gaskets for all boiler manholes and handholes, for pump barrels, and other similar items of equipment. Package and properly identify all gaskets.

2.30 COAL HANDLING EQUIPMENT

2.30.1 Screw Conveyor

**********************************************************************************************************************
NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.
**********************************************************************************************************************

Provide screw conveyor for the lateral distribution of coal consisting of steel screw conveyor with capacity of no less than [_____] cubic meters/second cubic feet/hour when handling coal of the specified maximum lump size. Base maximum capacity of the conveyor on the screws carrying no more than 30 percent of their cross section (except feeder conveyors), and the maximum speed of conveyor must be 60 rpm. Assemble conveyor and housing in sections. Mount sectional flights on steel pipe and connect by coupling shafts. A feeder conveyor may be installed to assume the proper distribution of the load. Mount flights of both the feeder screw and the extended screw on the same pipe. Provide conveyor with sectional
supporting hanger bearings of the babbitted type. Do not exceed a conveyor length between bearings of 3.7 m 12 feet. Provide fabricated cast-iron trough ends with feet and fit with babbitted bearings. Locate drive consisting of an electric gear motor and chain drive at the discharge end of the conveyor. Enclose the chain drive from the motor to the reducer in an oil-tight casing. Thrust in either direction must be absorbed by the thrust bearings. The motor may be mounted on top of the trough. The trough conveyor housing must be no less than 4.8 mm 3/16 inch steel with a 1.897 mm 14 gauge steel, dust-proof cover. Furnish discharge spout and coal gate as indicated. Provide an approved type of supporting saddle. Space supports at no more than 3 m 10 foot intervals. Motor enclosure must be [totally enclosed, nonventilated] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in conformance with NFPA 70]. [Motor starter must be [manual] [[magnetic] [across-the-line] [reduced voltage start]] type with [weather-resistant] [dust-tight] [explosion-proof] enclosure.] Provide dust controlling covers and inlet and discharge enclosures for each conveyor.

2.30.2 Belt Conveyor

Belt conveyor must be of the trough type, as shown. Maximum incline of the belt conveyor must not exceed 15 degrees. Provide conveyor support frame with sufficient rigidity to maintain belt alignment, at least 75 mm 3 inches clearance to prevent damage to the edge of the belt on its return run, and adjustments for aligning shafts. Place decking to protect the return belt from coal sifting and to provide lateral stiffness on top of the stringers. Make idlers accurately to provide a rigid framework that will maintain permanent alignment of well balanced, smooth-running, easy turning idler rolls. All idlers and return rolls must be CEMA Belt Book, Series C5. Provide pressure lubrication to ball or roller bearings. Space 20-degree or 35-degree three-roll type idlers on 1.2 m 4 foot centers, except under loading points and skirts. Space return idlers on 3 m 10 foot centers. Provide Grade 2 belting as defined in RMA IP-1. The belting must have field-vulcanized splices. Design pulleys in accordance with CEMA B105.1, of heavy welded steel, true to diameter and accurately bored, key seated and tightly fitted to the shafts. Pulley face width for belts 1067 mm 42-inches wide and smaller, that are 150 m 500 feet or more in length, must be belt width plus 100 mm 4 inches; less than 150 m 500 feet in length, must be belt width plus 75 mm 3 inches. Pulley face width for belts 1.2 m 48 inches and larger must be belt width plus 150 mm 6 inches. Provide drive pulleys with 19 mm 3/4 inch thick Vulcanized and grooved lagging. Provide snub pulleys with 9.5 mm 3/8 inch vulcanized smooth lagging. Support all conveyor pulley shaft assemblies by two heavy-duty antifriction bearings having a minimum life expectancy of 50,000 hours for 90 percent of bearings in accordance with ABMA 11 for roller bearings. The pulley diameter must be sufficiently large to meet the requirements of the duck weight and ply of the belt to permit flexing of the belt around the pulley circumference without damaging the belt or shortening the belt life. Drive conveyor by a [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in Class II, Division 1, Group F hazardous location in conformance with NFPA 70] electric motor connected to a drive-shaft-mounted speed reducer unit by a [roller chain drive] [V-belt drive] [flexible coupling]. [The motor starter must be [manual] [[magnetic] [across-the-line] [reduced voltage start]] type with [general-purpose] [weather-resistant] [watertight] [dust-tight] [explosion-proof] enclosure.] Provide all belt conveyors with belt misalignment switches, emergency stop pull cords and pull switches, galvanized expanded metal
shields over tail pulley, zero speed switches, loading skirts, plugged chute switches, walkways, supports, belt take-ups, belt cleaners, skirt boards, and pulley scrapers. Provide dust controlling covers and inlet and discharge enclosures for each conveyor.

2.30.3 Flight Conveyor

[Scraper] [Shoe-suspended] flight conveyor arranged generally as shown and of the single-strand type must have capacity no less than [_____] metric tons/hour tons/hour when handling coal with approximate weight of 800 kg/cubic meter 50 pcf and with maximum lump size of [_____] mm inches diameter. Base capacity on a maximum speed of 0.508 m/sec 100 fpm with conveyor operating up a [_____] degree incline. Chain must be drop-forged steel type with flights made of either steel or malleable-iron, spaced at least three times the largest lump size. Foot shaft must have protected screw take-up with adjustment of no less than 300 mm 12 inches. Make trough of 4.8 mm 3/16 inch steel plate, minimum. Line all sliding surfaces in contact with the chain or flights with 19 mm 3/4 inch thick, removable, ultra high molecular weight polyethylene liners. Provide both sides of trough with a warning sign "DANGER - DO NOT WELD - FLAMMABLE PLASTIC LINER." Make signs visible on each floor level and at frequent intervals. Provide conveyor with discharge openings as indicated. Provide each with rack-and-pinion-operated gates with handwheels. Motor must drive conveyor through a speed reduction unit which is either direct-connected or roller-chain-connected to the drive shaft. Motor must be [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter must be [manual] [magnetic] [across-the-line] [reduced voltage start]] type with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.) Construct conveyor frame essentially as indicated, with additional bracing as required for rigidity. Provide dust controlling covers and inlet and discharge enclosures for each conveyor.

2.30.4 Bucket Elevators

Furnish dust tight vertical bucket elevators complete with continuous chain and attached buckets, upper and lower sprockets, gears, shafts, bearings, casing with flanged connections including top hood and discharge spout, bottom boot, access doors, electric motor drive, and all accessories. Bucket elevators must be [vertical spaced centrifugal discharge] [positive discharge] [continuous bucket type]. The capacity of the elevator must be no less than [_____] metric tons/hour tons/hour when handling coal weighing approximately 800 kg/cubic meter 50 pcf. Linear velocity must be as indicated below:

Construct head shaft and foot shaft of cold-rolled steel with the shaft diameters in accordance with manufacturers' standards. Mount both shafts in roller bearings with forced-type lubricating fittings. Foot shaft must
have screw take-up with adjustment of no less than 225 mm 9 inches.
Install an automatic backstop on the head shaft to prevent any backward
motion of the chain. Boot plates [, loading legs of continuous bucket
elevator,] and bottom plate of stub discharge chute must be 4.8 mm 3/16 inch
thick, minimum. All other flat casing members must be 2.657 mm 12 gauge
steel thick, minimum. Provide corner angles and stiffeners to make the
elevator self-supporting. In addition, tie the elevator to the adjoining
structure at close enough spacing to increase the rigidity of the
elevator. Provide boot section with clean-out doors, as well as front and
back removable panels. Provide an inspection door large enough to remove a
bucket from either run of the chain in the intermediate section at
operating level. Drive elevator by an electric motor installed in a
suitable housing at the top of the flight. Motors must be [totally
enclosed, nonventilated] [totally enclosed, fan-cooled type] [totally
enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. 
(Motor starter must be [manual] [[magnetic] [across-the-line] [reduced voltage start]]
type with [general-purpose] [weather resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.) Install a platform adjacent to the motor for servicing the motor and equipment mounted in the hood. Provide access to the platform by an approved type of safety ladder. Locate controls for the operation of the elevator as indicated. Provide dust control covers and inlet and discharge enclosures for each conveyor.

2.30.5 Vibrating Conveyor

Vibrating conveyor must be the electric-motor driven mechanical vibrating
type with a capacity of [_____] metric tons/hour tons/hour when handling
coal weighing approximately 800 kg/cubic meter 50 pcf and with maximum lump
size of [_____] mm inches in diameter. Conveyor must have a conveying
length as shown. Fabricate conveyor trough of [_____] mm gauge steel,
[_____] mm inches in width and [_____] mm inches deep [and provide with
dust-tight cover]. Provide conveyor pans of 9.5 mm 3/8 inch thick, Type
304L solid stainless steel plate. Mount trough on vibrator bars, torsion
bars, or coil springs attached to yoker legs of rigid cross brace
construction and fabricate of corrosion-resistant material with hardened
steel encased rubber bushings at articulation points. Fabricate base of
steel channels or angles bolted directly to [building support] [concrete
foundations]. The drive must be through an eccentric shaft supported by a
double row of self-aligning ball-or roller-bearing pillow blocks. Impart
positive action motion to the trough by a cast steel connecting rod
attached to the trough by rubber-bushed wristpin and securely locked by
taper lock bushings. Drive conveyor by a [totally enclosed, nonventilated
type] [totally enclosed, fan-cooled type suitable for installation in Class
II, Division 1, Group F hazardous location in accordance with NFPA 70]
electric motor connected to the eccentric shaft by V-belt drive. [The
motor starter must be [manual] [[magnetic] [across-the-line] [reduced
voltage start]] type with [general-purpose] [weather-resistant]
[water-tight] [dust-tight] [explosion-proof] enclosure.]

2.30.6 Gravimetric Weigh Feeder

The weigh feeder must be a metering belt type device designed to operate at
a variable rate ranging from 10 percent of maximum capacity to [_____] metric tons/hour tons/hour. Flow rate must be automatic. Use a
silicon-controlled, rectifier dc drive to automatically adjust the belt
speed to maintain the rate of material flow, as set on the controller.
Provide weigh feeders meeting or exceeding the requirements of NIST HB 44
[Southern] [Eastern] [Western] Weighing and Inspection Bureau. They must
have an accuracy of 1/2 of 1 percent of flow rates over their total variable rated capacity. Provide feeder with a flexible boot for connecting the gate to the feeder inlet chute, which in turn must be flared to produce a feed opening tapering from [_____] wide to [_____] wide with the direction of flow of material. Use belts for feeders that meet RMA IP-1 requirements, conforming to the Conveyor and Elevator Belt Handbook, fire-resistant type conforming to the standards of Part 18.65, of the 30 CFR 1. Top belt cover thickness must be 6.4 mm 1/4 inch with bottom cover 3.2 mm 1/8 inch thick. Belt edges must have minimum 25 mm 1 inch flanges and seal by covering the cover around the carcass edges during manufacture. Provide cover and skim coat material comparable to those meeting the requirements of the RMA IP-1 for impact and abrasion resistance. The weight sensor must be a heavy-duty, industrial, electronic force transducer flexure-mounted to the force collection system. Provide each sensor with a remote indicating meter and a six-digit totalizing counter located, installed, and connected in the boiler control panel. Use unit frame to provide rigid support for the material load, belt, and idlers. Provide shop assembled unit complete with drive and all appurtenances, which is dust-tight in operation.

2.30.7 Track Hoppers

Provide track hoppers that are standard double hopper design with a belt or vibrating-type feeder as indicated. The hoppers must have a capacity of approximately [_____] metric tons tons and constructed of no less than 9.5 mm 3/8 inch thick, Type 304L stainless steel plates, with slopes no less than 55 degrees, and stiffened with angles. The hoppers may also be of ASTM A36/A36M mild steel, minimum 6.4 mm 1/4 inch thick with replaceable liners 6.4 mm 1/4 inch thick, ASTM A167, Type 304L stainless steel. Use flat head rivets and field bolts inside the hopper. Suspend hopper from the track girders by heavy bolts and cast washers, or carry the sides to the bottom of the track and support by flanges fastened to concrete ledge continuously around the hopper with the concrete forming the top portion of hopper sides. Provide track girders consisting of wide flange beams conforming to the AREMA Eng Man for loading plus impact, complete with bearing plates, WF cross struts, and rail clips. Fit top of hopper with properly sized sections of grating made with steel bars sized [_____] by [_____] mm inches, and cross rods [_____] mm inches in diameter, to form openings [_____] mm inches square.

2.30.7.1 Hopper Gates

Provide a self-cleaning rack-and-pinion gate at each hopper outlet. [Hand-] [Motor-] operated sliding plate must be 9.5 mm 3/8 inch thick carbon steel, formed into the shape of a winged U. Protect gate plate surface completely by an overlapping liner of 3.2 mm 1/8 inch thick ASTM A167, Type 304 stainless steel. The gate body material, except for the dust cover, must be of 4.5 mm 3/16 inch thick ASTM A167, Type 304L stainless steel where in contact with coal flow.

2.30.7.2 Hopper Feeders

Provide vibrating or belt feeders of manufacturer's standard design for the service required. Motor must be [totally enclosed, nonventilated] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter must be [manual] [magnetic] [across-the-line] [reduced voltage start]] type with [weather-resistant] [dust-tight] [explosion-proof] enclosure.]
2.30.8 Truck Hoppers

Provide truck hoppers that are standard double hopper design with a belt or vibrating type feeder as indicated. The hoppers must have a capacity of approximately [_____] metric tons tons and constructed of 9.5 mm 3/8 inch thick Type 304L stainless steel plates, minimum, with slopes of at least 55 degrees, and stiffened with 6.4 mm 1/4 inch angles, minimum. The hopper may also be of ASTM A36/A36M mild steel, minimum 6.4 mm 1/4 inch thick, with replaceable liners 6.4 mm 1/4 inch thick, ASTM A167, Type 304L stainless steel. Use flat head rivets and field bolts inside the hopper. Support hopper by a flange fastened to the concrete ledge continuously around the hopper, with the concrete forming the top portion of hopper sides. Fit top of hopper with properly sized section of bar grating made with [_____] by [_____] mm inch mild steel bars and [_____] mm inch diameter cross rods to form openings [_____] mm inches square. Provide a supporting beam no less than [_____] mm inches deep, [_____] kg/meter pounds/foot, in a wide flange member, under the grating.

2.30.8.1 Hopper Gates

Provide a self-cleaning rack-and-pinion gate at each hopper outlet. [Hand-] [Motor-] operated sliding plate must be 9.5 mm 3/8 inch thick carbon steel, formed into the shape of a winged U. Protect gate plate surface completely by an overlapping liner of 3.2 mm 1/8 inch thick ASTM A167, Type 304 stainless steel. Provide gate body material, except for the dust cover, consisting of 4.5 mm 3/16 inch thick ASTM A167, Type 304L stainless steel where in contact with coal flow.

2.30.8.2 Hopper Feeders

Provide vibrating or belt feeders, complete with control of manufacturer's standard design for the service required. Motor must be [totally enclosed, nonventilated] [totally enclosed, fan-cooled] [totally enclosed, fan-cooled type, suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter must be [manual] [[magnetic] [across-the-line] [reduced voltage start]] type with [weather-resistant] [dust-tight] [explosion-proof] enclosure.]

2.30.9 Vibrator

Provide electromagnetic type vibrator with variable power control that produces mechanical pulsating motion. The net weight of the vibrator must be [_____] kg pounds and power input must be [_____] watts, [_____] amperes at [_____] volts ac. Provide 3600 vibrations per minute or 7200 vibrations for heavy duty applications. Provide semi-noiseless vibrator with mounting plates for welding to hoppers, as indicated, each complete with an eye bolt for attaching a safety chain. Provide electric control suitable for separate wall mounting complete with an electronic valve for changing alternating current to mechanical pulsating waves and a dial switch or rheostat to vary the power of vibration. Provide vibrators with Division I, Class II, Group F rating in the areas where coal dust is present, in accordance with NFPA 70.

2.30.10 Car Heaters

**************************************************************************
NOTE: The designer will determine if electrical facilities are sufficient to provide the power

SECTION 23 52 30.01 10  Page 85
requirements of electric car heaters or if gas-fired heaters must be used. The designer will determine if the location and climatic conditions will require sidecar panels or undercar heaters, or a combination of both types of heaters.

2.30.10.1 Gas-Fired Heaters

Provide infrared radiant type gas-fired heaters located between rails and along the walls of the shed. Heater must have an input of approximately 90 kW 300,000 Btuh. Provide heater with perforated, heavy-gauge stainless steel cover that is not affected by water or coal falling from the car. Provide burner with windproof pilot, main gas solenoid valve, and safety switch to interrupt gas supply to burner if pilot is not burning, and furnish with manual cutoff valves and pressure regulator. Supply heater with electric blower for furnishing combustion air to the burner and with all other controls and accessories as recommended by the heater manufacturer for a complete installation, and in compliance with ANSI Z83.19/CSA 2.35 and UL 795.

2.30.10.2 Electric Infrared Radiant Heaters

Electric infrared radiant heaters must be weatherproof car thawing equipment with radiating surfaces of alloy tubing enclosing electrically insulated conductors. Provide equipment in modular lengths suitable for both 45 and 90 metric tons 50 and 100 tons capacity cars and designed for [manual] [automatic] disconnection of units not required during thawing operations. Include sidecar or undercar heating banks, or both, capable of operating as independent units designed for maintaining a balanced three-phase distribution system. Provide heating conductor units, including factory assembled connections for attachment to water-tight terminal boxes, supported on corrosion-resistant metal framing and have rust-resistant steel reflectors with an approved coating. Wire heaters and connections using NEMA 4 enclosures, in accordance with NEMA ICS 1, suitable for cleaning by hosing down with water.

2.30.11 Coal Spouts, Chutes, Inlet Boxes, and Outlet Hoppers

Construct coal spouts, chutes, inlet boxes, and outlet hoppers of ASTM A36/A36M steel members no lighter than 3.416 mm 10 gauge, adequately reinforced and braced with angle frames, and with all joints dust tight. Make slopes as steep as possible, but no less than 55 degrees off horizontal. Provide stainless steel or ultra-high molecular weight polyethylene (UHMWP) liners. If UHMWP liners are used, provide each side of chute at each floor level with a warning sign "DANGER DO NOT WELD - FLAMMABLE PLASTIC LINER." Also use impact liners. Provide access openings and inspection openings with cover plates as indicated and required. [Construct silo frames of heavy channel frames the full size of the silo opening and provide with concealed steam pipe and coil around opening.] [Provide outlet hoppers with rack-and-pinion type gates and line with austenitic stainless steel [_____ mm inches] thick, conforming to ASTM A167, Type 304L]. Rack-and-pinion gates must be of the type specified for track hoppers.

2.30.12 Car Spotter

Provide electric-motor driven car spotter having a capstan mounted vertically on a rigid housing that completely encloses the gears. Include
helical gears and worm gear; fabricate helical gears of high grade steel accurately finished and splash-lubricated, and fabricate worm gear of bronze. Mount all of the mechanism on a steel base rigidly welded to maintain alignment. Couple unit to, and drive by, a separate, [_____] W hp, totally enclosed, nonventilated, hoist-type motor with a full-load speed of 1720 rpm. Use a roller-chain flexible type coupling enclosed in a revolving casing and protect by a heavy steel guard. The unit must have a starting pull of 22 kN 5000 pounds, a running pull of 11 kN 2500 pounds, and an average rope speed not in excess of 230 mm/sec 45 fpm. Provide unit complete with [ _____] m feet of [32 mm 1-1/4 inch diameter manila rope with a breaking strength of 60 kN 13,500 pounds, minimum,] [19 mm 3/4 inch diameter marline-covered standard steel wire rope with a breaking strength of 170 kN 37,600 pounds, minimum,] and a steel car pulling hook with an allowable rope pull of 45 kN 10,000 pounds, so fabricated as to be readily attachable to, and removable from, the car frames.

2.30.13 Coal Bunkers

Construct suspension coal bunkers of size and capacity indicated of ASTM A36/A36M steel plate reinforced and braced as required and install dust-tight. Provide bunkers designed for optimized coal flow, not susceptible to rat-holing or hangups. Provide cylindrical or silo type bunkers to reduce stagnation for each boiler, each with conical discharge hoppers and slopes no less than 70 degrees. Manufacture outlet cone of, or line with, ASTM A167, Type 304 stainless steel. Provide bunkers with rack and pinion type coal shutoff valves, self-cleaning, and dust tight. Valve materials exposed to flowing-coal must be of corrosion resistant steel. Provide an emergency diverter for emptying the bunker.

2.30.14 Coal Storage Silos

2.30.14.1 Silo Design

Silo walls may be slip-formed, cast-in-place reinforced concrete, precast concrete, or other approved construction materials. Concrete must have a 28-day compressive strength in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Silo roof must be reinforced concrete complete with 600 mm 24 inch square, weatherproof, hinged access door. Provide handrail and steel toe-board all around the roof of the silo. Live storage shelf for the silo must be reinforced concrete, sloped no less than 60 degrees from horizontal and supported by steel beams corbelled from the inside walls of the silo. Build live storage outlet hopper to chute and feeders of steel no lighter than 9.5 mm 3/8 inch. Silo reserve storage floor must be reinforced concrete, sloped no less than 60 degrees and laid on well-tamped fill material. Build reclaim outlet hopper to the chute feeding the flight feeder of steel no lighter than 9.5 mm 3/8 inch.

2.30.14.2 Silo Interior Finish

In a concrete stave silo, provide interior finish consisting of a three-coat concrete parget. Apply a brush coat, scratch coat, and a finish trowel coat, one after the other, to produce a smooth monolithic finish. Work parget into the vertical and horizontal grooves to permanently interlock the concrete staves.

2.30.14.3 Silo Exterior Finish

Cover exteriors of stave and concrete silos with a brush coat of gray cement. Apply this coating over all hoops, lugs, and staves to produce a
homogeneous finish.

2.30.14.4 Silo Level Controls

Mount a normal high-level and emergency high-level control switch at the top of the silo to shut off the feeding system when the silo is full of coal. Furnish a low-level switch at the low level of the silo's live storage shelf, as indicated, to signal by light that coal is at a low level in the live storage compartment. Also furnish switches near the bottom of the silo, as indicated, to signal by light that coal is at a low level in the reserve storage compartment. Provide switches for Class II, Division 1, Group F hazardous location in accordance with NFPA 70.

2.30.15 Coal Crusher

******************************************************************************
NOTE: The designer will select the appropriate type of crusher based on the throughput requirements and an economic analysis.
******************************************************************************

Provide [roll crusher][hammermill][granulator][impactor] coal crusher designed to reduce run-of-mine or lump coal to a maximum lump size of [_____] mm inches. Crusher must have a minimum capacity of [_____] metric tons/hour tons/hour when handling average size bituminous coal. Make housings of heavy castings or welded heavy steel plate. Interior of the housing must have replaceable liners, constructed of abrasion resistant steel. Provide replaceable breaker plate, grates, rolling rings, swing hammers, and other parts of the unit subject to excessive wearing. Crusher must have provisions to trap and reject hard foreign objects without damaging the crusher. Provide shafts consisting of forged, heat-treated alloy steel with bearings mounted in dust-tight housings. Motor must be [totally enclosed, nonventilated type][totally enclosed, fan-cooled type][totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70 ]. [Motor starter must be [manual][magnetic][across-the-line][reduced voltage start]] type with [general-purpose][weather-resistant][water-tight][dust-tight][explosion-proof] enclosure.] Provide premium efficiency type integral size motors in accordance with NEMA MG 1.

2.30.16 Vibrating Feeders

Vibrating feeders must be the [electromagnetic][electromechanical] [single input (Brute Force)] type with a capacity of 0 to [_____] metric tons/hour tons/hour when handling coal weighing approximately 800 kg/cubic meter 50 pcf and with maximum lump size of [_____] mm inches in diameter. Feeder pans and skirts must be replaceable [6.4][9.5][12.7] mm [1/4][3/8][1/2] inch thick, Type 304 solid stainless steel plate without liners. The feeder pan must be fabricated [_____] mm inches in width, [_____] mm inches in length and [_____] mm inches deep. Provide dust control covers of 3.416 mm No. 10 gauge thick steel for each unit. Provide [two][four] rectangular poke holes ([one][two] each side) with 6.4 mm 1/4 inch thick No. 304 stainless steel sliding covers. Make all feeder parts coming in contact with coal of, or line with, Type 304 stainless steel. Automatically compensate for material loads and weight effect to maintain a constant feed and must not damper out when operating under full silos or bins. Slopes on pan must not exceed 10 degrees. The vibratory feeders must be [foot][suspension] mounted and completed with supports. Provide suspended feeders with safety cables. Locate feeder drives [above][below] trough.
The motors must be [totally enclosed, nonventilated type][totally enclosed, fan-cooled type suitable for installation in Class II, Division I, Group F hazardous location in accordance with NFPA 70]. Provide premium efficiency type integral size motors in accordance with NEMA MG 1.

2.30.17 Tripper

The tripper must be of steel construction, motor-propelled, automatically reversible, or manually controlled. Equip tripper with anti-friction bearings throughout, rolled or forged steel wheels, hand-operated rail clamps for optional operation in a fixed location, scraper, and crossover walk with handrail. Do not exceed traversing speed of 127 mm/sec 25 fpm, and include a motor brake. Make chute one way toward the center of the silo and lope at no less than 55 degrees. Provide its seal with all necessary components for installation to suit the bunker/silo slot.

Provide plow type seal. Provide tripper with [_____] W hp motor, all reversing and end travel limit switches, cable reel, and 14 No. 12 AWG conductor cable (13 slip rings) and supports for the starter. Mount two pushbutton stations, one on each side of the tripper. Include forward-reverse and tripper stop-run pushbuttons on both stations. Provide conveyor frame including a ladder type cable tray to contain the cable from the reel. Mount reversing switches on the tripper and actuate by track dogs to permit reversal of the tripper over each extreme silo. Mount limit switches on the tripper to operate immediately beyond both extreme limits of tripper reversal. Also furnish a plugged chute switch. Furnish all tripper controls, including limit switches and reversing switches in explosion-proof enclosures approved for Class II, Division 1, Group F service, in accordance with NFPA 70. Also include pulley assemblies, shafts, bearings, carrying and return idlers, tripper framing, and supports.

2.30.18 Trackmobile

Provide trackmobile with a [_____] liter cubic inch industrial gasoline engine for moving/switching [_____] rail cars on the track and hauling carts and other portable vehicles while traveling on its road wheels. Design trackmobile to ride on [_____] mm inch gauge track. Provide rail wheels that are heat treated, cast steel, keyed on tapered axles, solidly mounted suspension system. Provide road wheels that are, heavy duty, [_____] ply, [_____] by [_____] tires, roller-bearing mounted wheels, with retractable suspension. The coupler must be heavy-duty, cast steel, remotely controlled from cab. Maximum speed must be provided on rail km/hour mph low [_______], high [_______]; on road, low [_______], high [_______]. Operate trackmobile on a maximum grade of [_____] percent and minimum curve of [_____] m foot radius. Equip trackmobile with [air brakes] [self-energizing drum and shoe type, hydraulic service], cab heater and defroster, Sanders, [electric horn] [air horn] strobe light, front and rear lights, backup alarm, [enclosed cab] [open cab] with windshield wipers [, radio remote control,] and power steering.

2.30.19 En-Masse Chain Conveyors

These conveyors must move materials horizontally and/or vertically, with multiple discharge points and in a dust-tight and completely enclosed unit. Conveyors must have a length as shown but not to exceed 75 m 250 feet. Conveyor capacity must be [_____] metric tons/hour tons/hour when handling coal with approximate weight of 800 kg/cubic meter 50 pcf and with maximum lump size of [_____] mm inches diameter. Base maximum capacity on a chain speed not to exceed 813 mm/second 160 fpm. Chain must be drop-forged, case hardened, steel alloy of the single-strand type with flights welded to the
chain links or integral chain and flights type. The hardness of the links must be 500–600 BHN. The conveyor casing must be dust tight and of 6.4 mm 1/4 inch thick ASTM A242/A242M high strength, low alloy steel with 3.416 mm No. 10 gauge cover of the same material. Provide casing with T-1 steel (ASTM A514/A514M Type B) removable liners. The liners must be 19 mm 3/4 inch thick on the bottom and 13 mm 1/2 inch thick on the sides. Provide 19 mm 3/4 inch T-1 steel wear bars for the empty run of the conveyor. Attach liners and wear bars to the casing using countersunk stainless steel bolts with stainless steel nuts and washers. Drive sprocket must be heat treated, induction hardened to a minimum depth of 6.4 mm 1/4 inch. Drive shaft must be heat treated, designed, and sized based on ANSI/AGMA 6113 AGMA 6013 requirements. Use spherical double roller bearings. Provide a dust seal where the drive shaft ends go through the casing. Provide inlet and outlet spouts, inspection doors giving access to the drive sprocket, cleaner, and wear surfaces. Chain tension is achieved by a screw take-up. Provide each discharge opening with rack-and-pinion-operated gates with [hand wheels][motor operated][air operated]. Motor must drive conveyor through a speed reduction unit which is either direct connected or roller chain connected to the drive shaft. Motor must be [totally enclosed, nonventilated type][totally enclosed, fan cooled type][totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter must be [manual] [[magnetic] [across-the-line] [reduced voltage start]] type with [general-purpose][weather resistant] [water-tight][dust-tight][explosion-proof] enclosure.] Conveyor frame must be constructed essentially as indicated, with support and additional bracing as required for rigidity. Integral size motors must be the premium efficiency type in accordance with NEMA MG 1.

2.31 ASH HANDLING SYSTEM

2.31.1 Boiler Room Ash Handling System

******************************************************************************
NOTE: When specifying boilers with capacity of 4.1 MW 14,000,000 Btuh per boiler or less, this paragraph and subsequent paragraphs will be deleted, except applicable portions.
******************************************************************************

The ash handling system must be the dry pneumatic type in stoker fired boilers. Gather ash from the boiler forward ash discharge grate hopper and from [economizer] [air preheater] ash discharge hopper and other filtration systems and discharge to the ash storage silo located outside of the building. Coordinate entire system to fit the equipment supplied. Use ash dust control conditioners to reduce fugitive dust emissions during discharge of ash from the storage silo.

2.31.1.1 Ash Hopper

Construct ash removal hopper for each boiler of 6.4 mm 1/4 inch thick steel plate, minimum, with suitable external structural steel supports for connection to boiler ash hopper and necessary internal anchors for holding refractory lining in place. Refractory lining must be 225 mm 9 inches thick on vertical walls and 150 mm 6 inches thick on feed plates. Furnish each hopper with a sliding ash gate. Provide each boiler sliding gate unit with an access compartment to allow gathering and cooling of ash. Provide a cast-iron grate along with a manually-operated air-tight inlet valve for feeding ash into the pneumatic gathering line. Provide a hinged, steel
access gate at each compartment. Provide spring loaded air intakes at the end of each header. Base the structural integrity of the hopper on the ash weight of 1120 kg/cubic meter 70 pcf.

2.31.1.2 Clinker Grinder

**************************************************************************
NOTE: Delete this paragraph if coal analysis indicates no possibility of slag formation.
**************************************************************************

Provide clinker grinder unit with [_____] mm inch wide double roll for each hopper outlet gate housing. Provide grinders that have manganese steel rolls and cast-iron housings with grinder shafts mounted on outboard bearings protected by a stuffing box and gland assembly. Pass grinder shafts through stuffing boxes equipped with packing rings and lantern rings for seal water flow. Provide clinker grinder with a reversing mechanism to reverse direction of the grinder rolls should an obstruction stall the grinder. Furnish a 9.5 mm 3/8 inch steel plate ejector feed hopper below each clinker grinder to feed the inlet of the pneumatic ash gathering system. Provide fixed passages in the clinker grinders to prevent discharge of particles too large to be handled by the pneumatic conveying system. Drive each clinker grinder by a totally enclosed type motor and provide with a reversing starter, pressure switch for seal water control, diaphragm-operated seal water valve, and a solenoid valve. Design units for the characteristics of the coal specified that are capable of handling bottom ash at a rate exceeding the conveying system capacity.

2.31.1.3 Conveyor Piping

Make conveyor pipe and fittings of an abrasive-resisting alloy metal cast by the sand-spun process, having a minimum Brinell hardness of 280. Wall thickness less than 13 mm 1/2 inch is not acceptable, and do not exceed pipe lengths of 5.5 m 18 feet. Make joints with flanges or sleeve pipe couplings and make airtight. Provide fittings with a Brinell hardness number of approximately 400 and provide with removable wearbacks, where applicable, or provide the integral wearback type. Design ash inlet fittings so that the ash cannot overload or clog the conveyor pipeline. Provide suitable adjustable supports or hangers. Provide vacuum hose connections as indicated. Provide 4.6 meters 15 foot lengths of vacuum hose with quick connectors and four floor sweep-up nozzles.

2.31.1.4 Vacuum and Combination Vacuum/Pressure Systems

2.31.1.4.1 Vacuum System

Provide pneumatic suction type ash conveying equipment, complete with vacuum pumps and all component parts necessary for complete and successful operation. Size ash conveying equipment approximately twice the predicted accumulation rate. Provide system with the capacity to convey and empty no less than [_____] metric tons/hour tons/hour of ash weighing approximately [_____] kg/cubic meter pcf. Base tonnage on average handling rate and not on the instantaneous rate.

2.31.1.4.2 Combination Vacuum/Pressure Systems

Provide commercially produced vacuum/pressure equipment for this particular type of service and include a pressure vessel equipped with a filter section at the top and an aeration ring at the bottom. Draw material into
the unit by vacuum, with the air separated from the material in the top filter section and exhausted through a silencer. A high level indicator within the vessel must then reverse the action of the vacuum/pressure pump by aspirating air through a silencer and filter unit and discharging the pressurized air into the vessel. Utilize part of the air to clean the filter and pass part of the air through the aeration ring of the vessel to pick up material and convey it under pressure to the storage silo. Furnish unit complete with all automatic air control valves to control air flow to and from the vessel continuously through the two modes of the operating cycle. Control unit operation automatically until switched off at the control cabinet. Skid-mount all automatic valves, interconnecting piping, and the vacuum/pressure vessel. Mount vacuum/pressure pump separately. The control cabinet may be mounted separately or skid-mounted on the vacuum/pressure vessel skid. Capacity of the unit must be approximately [_____] metric tons/hour tons/hour of ash weighing approximately [_____] kg/cubic meter pcf. Design piping sizes for ash collection system to fit the unit supplied. Use vacuum/pressure system where storage silo is more than 150 m 500 feet from the boiler plant. A vacuum system should be used for capacities of less than 45 metric tons/hour 50 tons/hour per system.

2.31.1.4.3 Pump Unit

**************************************************************************
NOTE: Where characteristics of the fly ash require additional treatment, incorporate a water spray in the filtering unit. If not required, delete the portion included in the brackets. Air discharged to the atmosphere must meet the local air pollution standards.
**************************************************************************

Size vacuum or vacuum/pressure pump unit to match system design requirements. Provide liquid-ring type pump unit having round rotor with curved blades rotating in an elliptical casing. Use water alternately entering and leaving the chambers within the rotor vanes to provide the required pumping action. Water within the casing must act as an air cleansing agent and the operation and maintenance of the unit must not be affected by dust-laden air. Base-mount unit with electric motor drive and all required heat exchangers, separators, and control valves. Provide vacuum pump inlet piping with a vacuum filter unit to remove the fly ash obtained from the economizer ash hopper. Include a metal housing containing filter bags and an automatic air purge back-washing system. [Incorporate a water spray into the filtering unit.] The filtering unit must remove all fly ash before discharge to the atmosphere.

2.31.1.4.4 Control Cabinet

Supply control cabinet for the complete operation of the system and include all running indicating lights as required. Locate a push-button switch conveniently in the boiler house to start and stop the system. Provide a vacuum breaker, operating automatically from a timer, in the bottom ash conveyor line to break the system vacuum.

2.31.1.4.5 Controls

Provide controls for a combination vacuum/pressure system with a selector switch set to automatic position to start the unit in the vacuum cycle. Provide high-level indicator in vacuum/pressure vessel to actuate necessary controls to cut off the vacuum gathering system and pressurize the vessel.
for pressure discharge of collected material. Provide a low-pressure switch in the control panel to sense the pressure drop in conveying pressure and to return the unit to vacuum operation. Operate unit continuously in this manner until manually shut down. Set selector switch in manual position to shut the unit down after filling. Then accomplish discharge by pressing the manual discharge button. Provide a high vacuum switch with time delay to shut the system down automatically in the event none of the inlet valves are actuated. Provide heavy-duty switches and controls in accordance with NEMA ICS 1.

2.31.1.4.6 Automatic Air Valve

Provide automatic air valve at economizer or air preheater ash inlet hopper discharge slide gate to allow air into system without causing a vacuum within the boiler ash hopper. Provide slide gate as part of the ash system that is manually-operated and interlocked to actuate the automatic air inlet valve.

2.31.1.5 Ash Silo

Provide ash storage silo with a capacity of no less than [_____] metric tons of ash and fly ash considered to have an average weight of [_____] kg/cubic meter pcf. Base this capacity on a minimum of 24 hours[ 60 hours if ash cannot be removed on weekends]. Make silo of welded steel with a cone bottom for truck filling and support on a structural steel tower. Design all elements exposed to the exterior for wind loads of [_____] kg/square meter psf. Provide a 4.3 m 14 foot clearance under the hopper outlet fitting or appurtenance. Provide silo with steel ladder and safety cage from the ground level to roof, steel ladder inside storage bin, and an angle railing around the roof perimeter. Provide minimum plate thickness of 6.4 mm 1/4 inch. Provide silo complete with all accessories required for an operable installation including, but not limited to, high ash level detector, roof manhole, pressure and relief valve, and other roof openings, as necessary. Interior coating must be coal-tar epoxy conforming to SSPC Paint 16.

a. Provide ash storage silo for vacuum system with two stage separators[ and a tertiary bag filter]. The primary receiver must be cylindrical and constructed entirely of sectional steel or cast plates suitable for this special service. The receiver must be no less than 900 mm 3 feet in diameter. Locate flanges and bolts on the outside, and direct the impact of ash against heavy iron wear plates of abrasive-resistant alloy. Provide receiver with an air-tight discharge passage no less than 450 mm 18 inches in diameter for free flow of clinkers. Provide means for positive, periodic, and automatic operation in dumping its entire contents into the silo; in addition, design the system so that all suction is positively shut off from the receiver during its dumping period so that no dust can be sucked out through the exhaust while the discharge of the receiver is open or opening. The air from the primary receiver must enter an external secondary separator which must remove 90 percent of the dust not collected by the primary receiver. The combined efficiency of the primary and external secondary separators[ and tertiary bag filter] must be no less than 98 percent. Provide secondary separator that is similar to the primary receiver in construction, but may be smaller and of lighter material. Do not extend part of the discharger into the main storage bin. Provide a housing constructed of 6.2 mm 1/4 inch steel plate with a tight-closing access door as an enclosure for the discharger.
b. Mount silo vent filter unit on top of the silo to act as an air release unit to separate the air from the ash. Drop ash into the silo. Back cleaning of the bag filters must be automatic, utilizing plant air at approximately 690 to 860 kPa (100 to 125 psig). Actuate back cleaning unit whenever the ash handling system is in use. Dust released from the filter bags in the back cleaning operation must fall into the storage silo. Provide housing to allow the unit to operate exposed to the weather in ambient temperatures ranging from minus 40 to plus 55 degrees C (minus 40 to plus 130 degrees F).

   c. Provide a rotary, dustless unloader to eliminate all dust in unloading ash and dust from the ash storage silo. Do not add water to the ashes in the conveyor or in the storage bin. Use dustless unloader to add water to the ash in controlled quantities so that no surplus water runs or drips from the ash after discharge. The discharged ash must be muddy but loose and free flowing. Open water valve only when drive motor is running. Provide unloader with a capacity of no less than 27 metric tons (30 tons) of conditioned ash per hour. Design rotating unit so that all bearings are located on the outside and not in contact with the material handled. Provide platform for access to unit with a handrail and a safety ladder to grade. Motor must be totally enclosed type for outdoor operation. [Motor starter must be [manual] [[magnetic] [across-the-line] [reduced voltage start]] type with [weather-resistant] [water-tight] [dust-tight] enclosure.]

2.31.1.6 Conveyor Type Ash Handling System

******************************************************************************
NOTE: When specifying boilers with capacity greater than 4.1 Megawatts 14 million Btuh per boiler, the following paragraphs will be edited.
******************************************************************************

Provide funnel shaped ash pits, constructed of 6.2 mm (1/4 inch) steel plate, minimum, and covered with a heavy grating with openings approximately 50 mm (2 inches) square. Discharge ashes and clinkers from the boiler ash hoppers into ash pits located directly below the ash hopper doors. Arrange a combination drag chain conveyor for horizontal conveying and an elevator conveyor for vertical conveying of ashes, as indicated, to take ashes from the bottom of the ash pits for discharge into the ash silo. Provide conveyors with a capacity of no less than [_____] metric tons/hour (tons/hour) when handling ashes weighing approximately [_____] kg/cubic meter (pcf) at a maximum speed of 508 mm/sec (100 fpm). Provide doors for access to all parts, as required. Motor must be [totally enclosed, nonventilated type] [totally enclosed, fan-cooled type] [totally enclosed, fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70]. [Motor starter must be [manual] [[magnetic] [across-the-line] [reduced voltage start]] type with [general-purpose] [weather-resistant] [water-tight] [dust-tight] [explosion-proof] enclosure.]

2.31.1.6.1 Drag Chain Conveyor

Drag chain conveyor must be of a single strand of wide, heat treated, high alloy, drop forged, rivetless drag chain with a [_____] mm (inch) pitch, [_____] mm (inch) overall width, and [_____] kg (pounds) working strength, and a hardness of 460-510 Brinell. Using the upper strand of the chain, convey the ash in a trough constructed of 9.5 mm (3/8 inch) cast-iron extending from [_____] mm (inches) in front of the foot shaft to [_____] mm (inches) behind...
the head shaft and set flush with the floor. Carry the return strand of chain in angle runways set flush with the trench floor. Drive drag chain conveyor by a [_____] mm inch pitch roller chain and [_____] mm inch pitch diameter, [_____] tooth sprocket on the drive shaft, and a [_____] mm inch pitch diameter, [_____] tooth sprocket on the elevator foot shaft.

2.31.1.6.2 Casing

Construct casing of 2.656 mm 12-gauge thick steel, minimum, with 9.5 mm 3/8 inch thick boot plates. Include a gear motor and steel roller chain complete with drive brackets, guards, and backstop in the head end drive. Equip elevator with head-end platform and ladder.

2.31.2 Ash Handling Controls

The ash handling system control panel must contain all necessary instrumentation, including selector switches, annunciators, push buttons, and ammeters required for monitoring and operation of the ash handling system. The panel must graphically display the system. In addition, the panel must contain all necessary timers, relays, and terminal blocks that are required for the control system. Control and monitor the ash removal system from a single panel. Provide panel with push buttons to start automatic operation of each system and also push buttons for individual control of each component. Provide panel with sufficient instrumentation to observe the removal operations and controls to permit effective emergency control. Also provide local control stations at each ash removal point for local manual operation. Provide local selector switches so that equipment may be operated manually for test and maintenance purposes. Control operation of the bottom ash system by a microprocessor-based control system, a solid-state programmable controller or an electromechanical system. All controls and instrumentation for location indoors must have NEMA 12 rating in accordance with NEMA ICS 1. All outdoor components must have NEMA 4 rating, in accordance with NEMA ICS 1. All major equipment components, including control panels and devices, must be factory-mounted, prewired, tubed, and tested to the maximum practical extent. Include controls for fully automatic and sequential operation of the ash handling system. Design these controls so that manual steps, such as continuous monitoring and regulation, will not be required. Incorporate suitable safety interlocks to assure that proper permissive conditions have been met prior to changing the operating status of major system components. Initiate shutdown of the ash handling system, or portion thereof, automatically with alarms, should unsafe conditions arise during operation of the system. Provide facilities for monitoring and control of the ash handling system for the following functions:

a. Manual start of the automatic control operations.
b. Selection of operating components.
c. Override of the automatic control sequences, both at the ash handling control panel and locally.
d. Manual operation, either remotely from the control center or locally.
e. Emergency shutdown on a unit or system basis.
f. Status monitoring at the ash handling control panel of the operation of the ash handling system and its components.
Operate automatic controls for bottom ash collection transport as specified. When a start command has been manually initiated, the automatic ash collection and transport sequences for the unit must progress through their complete cycles, and after completion of the cycles, automatically shut down the system. Include an annunciator system, complete with audio and visual alarms, as part of the ash handling control panel. The annunciator system must receive inputs from devices and system logic which indicate any out of specification or trip condition. Furnish recorders to provide a permanent record of selected variables that relate to the ash handling system's performance and operation. Supply control stations with analog control loops to provide bumpless transfer between the manual and automatic modes of operation. Use manual mode of operation to provide direct control of the end device with no intervening analog control components unless those components are powered by the same source as the end device.

2.31.3 Submerged Drag Chain Conveyor (SDCC)

Design submerged drag chain conveyor to extract ash at normal capacity [_____] metric tons/hour TPH and maximum capacity [_____] metric tons/hour TPH, based on a dry ash density of approximately [_____] kg/cubic meter pcf. The maximum chain speed must be 76 mm/second 15 fpm. Design SDCC for continuous operation and a storage capacity of [_____] cubic meter cu ft accumulation. The SDCC must have an upper compartment filled with water and a dry lower compartment. Provide equipment to maintain water temperature at approximately 60 degrees C 140 degrees F. The dewatering slope must be at an angle of [_____] degrees with the horizontal. The top trough must be no less than 9.5 mm 3/8 inch thick carbon steel plate, welded construction, lined with renewable abrasion resistant steel wear plates, with a minimum thickness of 13 mm 1/2 inch and 300 BHN. Grind all welds smooth. Provide necessary track guide angles, hold-down angles, and carbon steel chain protectors. The minimum depth of water in the upper trough must be [_____] m feet. Provide dry return chain bottom trough constructed of 9.5 mm 3/8 inch thick steel plate, stiffen and brace with structural shapes and make water-tight. Provide chain track angles with a minimum 13 mm 1/2 inch thick steel replaceable wear flats with a minimum 300 BHN. Also provide wear strips under the return flights, minimum 13 mm 1/2 inch thick and 50 mm 2 inch wide. The conveyor chain must be a double strand round-link or ship-type chain, case hardened, corrosion and abrasion resistant, chrome-nickel-alloy, annealed and carburized with surface hardness between 500-600 BHN. Base design strength and pitch on operating conditions. The conveyor flights must be [_____] mm inches deep by [_____] mm inches thick T-1 steel plates attached on both ends to the chain. Provide flight with top wear pads and bottom wear strips of abrasion resistant steel plate of 300 BHN minimum. Provide a chain tensioner at the tail end of SDCC for maintaining proper tension in both strands of the chain. The assembly must include cast-iron idler wheel, bearings, shaft, guide block and bearing housing. Idler assemblies for both troughs must include heavy duty spherical roller type bearings with external lubrication fittings. The chain drive assembly must include cast-iron wheels with removable, surface hardened, toothed segments, drive shaft, bearings. Drive conveyor by a hydrostatic drive unit coupled with a low speed, high torque hydraulic motor, built-in torque limiting valves for preventing damage to load train or electric motor. Provide speed regulation, self-lubrication, internal cooling, and dynamic braking with this drive. Provide inching capability. Provide hinged inspection doors, windows, and removable panels along the conveyor to permit access and observation at critical points. Provide all inspection doors, windows, and removable panels in mild steel with stainless steel hardware and must be made.
completely water-tight. Provide water cooling and drainage connections through flanged connections to the conveyor trough. Make provision for continuous water flow into the top trough of the conveyor including two overflow connections, one for normal level and one high level; including high level alarm and an overflow weir box to prevent drain clogging. Also provide chain cleaning spray.

2.31.4 Dense Phase Ash Handling

Provide pneumatic dense phase type ash conveying system, complete with transfer vessels, solenoid valves, air receiver tank, air producer, and ash conveying piping. Design ash handling system to handle [_____] metric tons/hour tons/hour of ash weighing approximately [_____] kg/cubic meter pcf. Bolt each transport vessel to the hopper discharge flange where ash flows into the vessel by gravity until a level indicator indicates the vessel is full. The transport vessel inlet valve then closes, and transport air between 175 to 350 kPa 25 to 50 psi enters the vessel through a fluidizing unit located at the bottom of the vessel. When the vessel has been brought to transport air pressure, the transport line valve opens and a "slug" of fly ash is transported to the storage silo. The transporting pipe must be Schedule 40 standard black iron pipe [_____] mm inches diameter. The material velocities in the transportation pipe must be [_____] meters/second fpm. Provide system with 210 to 410 kPa 30 to 60 psi compressed air to fluidize and transmit ash. Do not exceed conveying velocity of 5.1 meters/second 1000 fpm.

2.31.5 Fly Ash Collectors

Specify fly ash collectors as specified in Section 44 10 00 AIR POLLUTION CONTROL. Size fly ash collectors to handle total flue gas at maximum boiler load and stack temperature, and provide along with induced draft equipment. Coordinate fly ash collector requirements with boiler draft and control requirements.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 EARTHWORK

Perform excavation and backfilling for tanks and piping as specified in Section 31 00 00 EARTHWORK, except conform to the manufacturer's installation instructions for backfilling of fiberglass reinforced fuel tanks.

3.3 EQUIPMENT ERECTION

Install boiler and auxiliary equipment as indicated and in accordance with manufacturers' instructions. Submit detail drawings, consisting of schedules, performance charts, brochures, diagrams, drawings, and instructions necessary for installation of the steam-generating units and associated equipment. Include drawings for piping, pipe anchors, wiring devices, trenches and related foundations, and setting plans certified by the boiler manufacturer and burner manufacturer including coal and ash handling equipment. Indicate clearances required for maintenance and
operation and also contain complete wiring and schematic diagrams, equipment layout and anchorage, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Include manufacturer's written instructions indicating optimum pressures at all manometer connectors.

3.4 STORAGE TANK INSTALLATION

Install storage tank in accordance with Section 33 56 10 FACTORY-Fabricated FUEL STORAGE TANKS.

3.5 PIPING INSTALLATION

Cut pipe accurately to measurements established at the jobsite, install without cold springing, and properly clear windows, doors, and other openings. Cutting or other weakening of the building structure to facilitate piping installation will not be permitted. Pipes must be free of burrs, oil, grease, and other foreign matter. Install pipes to permit free expansion and contraction without damaging building structure, pipe, joints, or hangers. Make changes in direction with fittings, except that bending of pipe 100 mm 4 inches and smaller will be permitted provided a pipe bender is used and wide sweep bends are formed. The centerline radius of bends must not be less than 6 diameters of the pipe. Bent pipe showing kinks, wrinkles, flattening, or other malformations will not be accepted. Carbon steel piping to be bent must conform to ASTM A53/A53M, Grade A, standard, or Grade B extra-heavy weight. Carry vent pipes through the roof as directed and properly flash. Unless otherwise indicated, pitch horizontal supply mains down in the direction of flow, with a grade of no less than 25 mm in 12 m 1 inch in 40 feet. Properly cap or plug open ends of pipelines and equipment during installation to keep dirt or other foreign materials out of the systems. Pipe not otherwise specified must be uncoated. Unless otherwise specified or shown, make connections to equipment with malleable-iron unions for steel pipe 65 mm 2-1/2 inches or less in diameter and with flanges for pipe 80 mm 3 inches or more in diameter. Use brass or bronze unions for copper pipe or tubing. Electrically isolate connections between ferrous piping and copper piping from each other with dielectric couplings or other approved methods. Use reducing fittings for changes in pipe sizes. In horizontal steam lines, use eccentric type reducing fittings to maintain the top of the lines at the same level.

3.5.1 Pipe Sleeves

Provide pipe passing through concrete or masonry walls or concrete floors or roofs with pipe sleeves fitted into place at the time of construction. Install a waterproofing clamping flange as indicated. Do not install sleeves in structural members except where indicated or approved. Provide all rectangular and square openings as detailed. Extend each sleeve through its specified wall, floor, or roof, and cut flush with each surface, except extend sleeves through floors and roofs above the top surface at least 150 mm 6 inches for proper flashing or finishing. Provide membrane clamping rings where membranes are penetrated. Unless otherwise indicated, size sleeves to provide a minimum clearance of 6 mm 1/4 inch between bare pipe and sleeves or between jacket over insulation and sleeves. Sleeves in bearing walls, waterproofing membrane floors, and wet areas must be galvanized steel pipe. Sleeves in nonbearing walls, floors, or ceilings may be galvanized steel pipe, or galvanized sheet metal with lock-type longitudinal seam. Except in pipe chases or interior walls, seal the annular space between pipe and sleeve or between jacket over insulation.
and sleeve in nonfire rated walls and floors as indicated and specified in Section 07 92 00 JOINT SEALANTS, and seal fire rated walls and floors as indicated and specified in Section 07 84 00 FIRESTOPPING. Provide metal jackets for insulated pipes passing through exterior walls, firewalls, fire partitions, floors, and roofs that are no thinner than 0.15 mm 0.006 inch thick aluminum if corrugated, and 0.41 mm 0.016 inch thick aluminum if smooth, and secure with aluminum or stainless steel bands no less than 9.5 mm 3/8 inch wide and no more than 200 mm 8 inches apart. Where penetrating roofs, before fitting the metal jacket into place, run a 13 mm 1/2 inch wide strip of sealant vertically along the inside of the longitudinal joint of the metal jacket from a point below the backup material to a minimum of 900 mm 36 inches above the roof. If the pipe turns from vertical to horizontal, run the sealant strip to a point just beyond the first elbow. When penetrating waterproofing membrane for floors, extend the metal jacket from a point below the backup material to a minimum distance of 50 mm 2 inches above the flashing. For other areas, extend the metal jacket from a point below the backup material to a point 300 mm 12 inches above floor; or when passing through walls above grade, extend jacket at least 100 mm 4 inches beyond each side of the wall.

3.5.1.1 Pipes Passing Through Waterproofing Membranes

In addition to the pipe sleeves referred to above, provide pipes passing through roof or floor waterproofing membrane with a 1.8 kg 4 pound lead flashing or a 448 g 16 ounce copper flashing, each within an integral skirt or flange. Suitably form flashing, and do not extend the skirt or flange no less than 200 mm 8 inches from the pipe and set over the roof or floor membrane in a troweled coating of bituminous cement. Extend flashing up the pipe a minimum of 250 mm 10 inches above the roof or floor. Seal annular space between the flashing and the bare pipe or between the flashing and the metal-jacket-covered insulation as indicated. Pipes up to and including 250 mm 10 inches in diameter passing through roof or floor waterproofing membrane may be installed through a galvanized steel sleeve with caulking recess, anchor lugs, flashing clamp device, and pressure ring with brass bolts. Clamp waterproofing membrane into place and place sealant in the caulking recess. In lieu of a waterproofing clamping flange and caulking and sealing of annular space between pipe and sleeve or conduit and sleeve, a modular mechanical-type sealing assembly may be installed. Provide seals consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe/conduit and sleeve with corrosion protected carbon steel bolts, nuts, and pressure plates. Assemble links loosely with bolts to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and each nut. After the seal assembly is properly positioned in the sleeve, tighten the bolts to cause the rubber sealing elements to expand and provide a water-tight seal between the pipe/conduit and the sleeve. Size each seal assembly as recommended by the manufacturer to fit the pipe/conduit and sleeve involved. The Contractor electing to use the modular mechanical type seals must provide sleeves of the proper diameters.

3.5.1.2 Optional Counterflashing

As alternates to caulking and sealing the annular space between the pipe and flashing or metal-jacket-covered insulation and flashing, counterflashing may be accomplished by one of the following methods:

a. Standard roof coupling for threaded pipe up to 150 mm 6 inches in diameter.
b. Lead flashing sleeve for dry vents and turning the sleeve down into the pipe to form a waterproof joint.

c. A tack-welded or banded-metal rain shield around the pipe and sealing as indicated.

3.5.2 Pipe Joints

Use welded or flanged joints between sections of pipe and fittings. Except as otherwise specified, fittings 25 mm 1 inch and smaller must be threaded; fittings 32 mm 1-1/4 inches up to, but not including, 65 mm 2-1/2 inches may be either threaded or welded; and fittings 65 mm 2-1/2 inches and larger must be either flanged or welded. Use welded pipe and fittings 32 mm 1-1/4 inches and larger installed in inaccessible conduits or trenches beneath concrete floor slabs. Make connections to equipment with black malleable-iron unions for pipe 50 mm 2 inches or smaller in diameter, and with flanges for pipe 65 mm 2-1/2 inches or larger in diameter.

3.5.2.1 Threaded Joints

Make threaded joints with tapered threads properly cut and make perfectly tight with a stiff mixture of graphite and oil, or polytetrafluoroethylene tape or equal, applied to the male threads only, and in no case to the fittings.

3.5.2.2 Welded Joints

Provide fusion welded joints in accordance with ASME B31.1, unless otherwise required. Make changes in direction of piping with welding fittings only; mitering or notching pipe to form elbows and tees or other similar type construction will not be acceptable. Branch connections may be made with either welding tees or forged branch outlet fittings, either being acceptable without size limitation. Forge, flare branch outlet fittings, where used, for improvement flow where attached to the run, reinforced against external strains, and designed to withstand full pipe bursting strength.

3.5.2.2.1 Beveling

Provide field and shop bevels in accordance with the recognized standards and must be done by mechanical means or flame cutting. Where beveling is done by flame cutting, clean surfaces of scale and oxidation before welding.

3.5.2.2.2 Alignment

Align parts to be welded so that no strain is placed on the weld when finally positioned. Align height so that no part of the pipe wall is offset by more than 20 percent of the wall thickness. Flanges and branches must be set true. Preserve this alignment during the welding operation. Provide tack welds of the same quality and make by the same procedure as the completed weld; otherwise, remove tack welds during the final welding operation.

3.5.2.2.3 Erection

Where the temperature of the component parts being welded reaches 0 degrees C 32 degrees F or lower, heat the material to approximately 38 degrees C 100 degrees F for a distance of 900 mm 3 feet on each side of the weld before welding, and finish the weld before the materials cool to 0 degrees C.
3.5.2.2.4 Defective Welding

Remove and replace defective welds. Repair defective welds in accordance with ASME B31.1.

3.5.2.2.5 Electrodes

After filler metal has been removed from its original package, protect or store it so that its characteristics or welding properties are not affected. Do not use electrodes that have been wetted or that have lost any of their coating.

3.5.2.3 Flanges and Unions

Flanges and unions must be faced true and made square and tight. Provide gaskets consisting of nonasbestos compressed material in accordance with ASME B16.21, 1.6 mm 1/16 inch thickness, full face or self-centering flat ring type. Ensure gaskets contain aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR). Use NBR binder for hydrocarbon service. Provide union or flange joints in each line immediately preceding the connection to each piece of equipment or material requiring maintenance, such as coils, pumps, control valves, and other similar items.

3.5.3 Supports

3.5.3.1 General

**************************************************************************
NOTE: Mechanical and electrical layout drawings and specifications for ceiling suspensions should contain notes indicating that hanger loads between panel points in excess of 23 kg 50 pounds must have the excess hanger loads suspended from panel points.
**************************************************************************

Fabricate hangers used to support piping 50 mm 2 inches and larger to permit adequate adjustment after erection while still supporting the load. Install pipe guides and anchors to keep pipes in accurate alignment, to direct the expansion movement, and to prevent buckling, swaying, and undue strain. Support all piping subjected to vertical movement when operating temperatures exceed ambient temperatures by variable spring hangers and supports or by constant support hangers. [Pipe hanger loads suspended from steel joist between panel points must not exceed 23 kg 50 pounds. Suspend loads exceeding 23 kg 50 pounds from panel points.]

3.5.3.2 Seismic Requirements

**************************************************************************
NOTE: Provide seismic requirements if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase if seismic details are not included. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.
**************************************************************************
Seismic Requirements for Pipe Supports and Structural Bracing: Support and brace all piping and attached valves to resist seismic loads as specified under UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC[ as shown.] Provide structural steel required for reinforcement to properly support piping, headers, and equipment, but not shown, as specified under this section. Provide material used for supports as specified under Section 05 12 00 STRUCTURAL STEEL.

3.5.3.3 Structural Attachments

Provide structural steel brackets required to support piping, headers, and equipment, but not shown, as specified under this section. Provide material used for supports as specified under Section 05 12 00 STRUCTURAL STEEL.

3.5.4 Anchors

Provide anchors wherever necessary or indicated to localize expansion or prevent undue strain on piping. Provide anchors consisting of heavy steel collars with lugs and bolts for clamping and attaching anchor braces, unless otherwise indicated. Install anchor braces in the most effective manner to secure the desired results, using turnbuckles where required. Do not attach supports, anchors, or stays where they will injure the structure or adjacent construction during installation or by the weight of expansion of the pipeline.

3.5.5 Pipe Expansion

3.5.5.1 Expansion Loops

**************************************************************************
NOTE: Wherever possible, provision for expansion of steam supply and return pipes will be made by changes in the direction of the run of the pipe or by field-fabricated expansion bends.
**************************************************************************

Use expansion loops to provide adequate expansion of the main straight runs of the system within the stress limits specified in ASME B31.1. The loop must be cold-sprung and installed where indicated. Provide pipe guides as indicated. Except where otherwise indicated, utilize expansion loops and bends to absorb and compensate for expansion and contraction instead of expansion joints.

3.5.5.2 Expansion Joints

**************************************************************************
NOTE: If expansion joints are not required, this paragraphs will be deleted. Where space limitations prevent such provisions for expansion, expansion joints will be installed, and blanks will be filled as appropriate.
**************************************************************************

Use expansion joints to provide for either single or double slip of the connected pipes, as required and indicated. Make initial setting in accordance with the manufacturer's recommendations to allow for ambient
temperature at time of installation. Install pipe alignment guides as recommended by the joint manufacturer, but in any case no more than 1.5 m 5 feet from expansion joint, except in lines 100 mm 4 inches or smaller install guides no more than 600 mm 2 feet from the joint.

3.5.6 Valves

Install gate or globe valves with stems horizontal or upright. Install swing check valves in horizontal piping with the cap or bonnet up, or in vertical piping with the flow upward. Install lift or piston check valves in horizontal piping with the cap or bonnet up.

3.6 BURIED PIPING INSTALLATION

3.6.1 Protective Coating for Underground Steel Pipe

Give all steel pipe installed underground a protective covering, mechanically applied in a factory or field plant especially equipped for the purpose. Specials and other fittings which cannot be coated and wrapped mechanically must have the protective covering applied by hand, preferably at the plant, applying the covering to the pipe. Do not field apply coatings until the piping has satisfactorily passed the leak or hydrostatic test. Coat and wrap all field joints by hand. Perform all hand coating and wrapping in a manner and with materials that will produce a covering equal in effectiveness to that of the mechanically-applied covering.

3.6.2 Cleaning of Surfaces to be Coated

Solvent-wash steel surfaces to assure an oil-and-grease-free surface and blast-cleaned to bare metal as specified in SSPC SP 6/NACE No.3. Clean areas that cannot be cleaned by blasting to bare metal by powered wire brushing or other mechanical means. Ensure air supply for blasting is free from oil and moisture. Following cleaning, wipe surfaces with coal-tar solvent naphtha and allow to dry. The surfaces to be coated must be free of all mill scale and foreign matter such as rust, dirt, grease, oil, and other deleterious substances. Coat surfaces as soon as practicable after the cleaning operation.

3.6.3 Coating Materials

Coat buried steel piping with one of the following methods:

3.6.3.1 Bituminous Pipe Coating

**************************************************************************
NOTE: If coating system similar to coal tar coating and wrapping is required using different materials, rewrite this paragraph. If double wrap system is required, the designer will remove the brackets.
**************************************************************************

Provide bituminous protective system that is a coal-tar enamel and primer coating system, consisting of a coal-tar priming coat, a coal-tar enamel coat, a wrapper of coal tar saturated felt, and a wrapper of kraft paper, or a coat of water-resistant whitewash, applied in the order named and conforming to the requirements of AWWA C203 in all respects as to materials, methods of application, tests, and handling, except do not apply an interior lining. [In addition, where excessively corrosive soils are
encountered, give the piping a second coating of coal-tar enamel and a second wrapper of felt.] Coat and wrap joints and fittings.

3.6.3.2 Polyethylene Pipe Coating

Continuous extruded polyethylene coating and adhesive undercoat application procedure, including surface preparation, must be a factory-applied system conforming to NACE SP0189, Type A. Tape-wrap joints, valves, flanges, and other irregular surfaces as outlined under the tape-wrapping system, except apply the tape half-lapped, and prime all extruded polyethylene coating and adhesive undercoat surfaces to be tape-wrapped with a compatible primer before application of tape. Use primer as recommended by the tape manufacturer and approved by the applicator of the extruded polyethylene coating. Repair damaged areas of extruded polyethylene coating by tape-wrapping as described under the tape-wrapping system, except press any residual material from the extruded polyethylene coating into the break or trim off. Prime all areas to be taped and apply the tape half-lapped.

3.6.3.3 Tape-Wrap Pipe Coating

Prime cleaned surfaces before applying tape as recommended by the manufacturer of the tape. Provide tape which is an approved, pressure-sensitive, organic plastic tape with a minimum nominal thickness of 0.51 mm 0.020 inch. The tape must conform to ASTM G21 for fungus resistance. Apply tape to clean, dry, grease-free, and dust-free surfaces only. Weld beads must be wire-brushed. Remove all burrs and weld spatter. Cover weld beads with one wrap of tape before spiral wrapping. At each end of straight runs, apply a double wrap of one full width of tape at right angles to the axis of the spiral wrapping. Remove kraft paper protective wrapping, if any, from the pipe before the tape is applied. For material which is wrapped before it is placed in its final position, protect the wrapping at sling points with roofing felt or other approved heavy shielding material, or handle with canvas slings. Repair damaged wrapping as specified. Wrap pipe in straight runs spirally, half-lapping the tape as it is applied. For pipe smaller than 100 mm 4 inches, use one layer half-lapped. For pipe 100 mm 4 inches and larger, use two layers half-lapped with the second layer wrapped opposite-hand to the first. Wrap joints, coupling fittings, and similar units, and damaged areas of wrapping, spirally beginning with one complete wrap 75 mm 3 inches back from each edge of the corresponding size of straight pipe. On irregular surfaces such as valves and other accessories, apply one layer half-lapped and stretched sufficiently to conform to the surface, followed by a second layer half-lapped and applied with tension as it comes off the roll.

3.6.3.4 Epoxy Coating System

Provide epoxy coating system conforming to AWWA C213, Type II. Fittings, valves, and joints must be factory coated with materials identical to those used on the pipe, or may be field coated with a two-part epoxy system recommended by the manufacturer of the pipe coating system. Field protection may also be provided for joints and fittings with a coal tar tape hot-applied over a compatible primer.

3.6.3.5 Coating Inspection and Testing

After field coating of the pipe joints, inspect the entire pipe with an electric holiday detector having an operating crest voltage of from 12,000 to 15,000 volts when using a full-ring, spring-type coil electrode. Equip holiday detector with a bell, buzzer, or other audible signal which
operates when a holiday is detected. Repair all detected holidays in the protective covering. Occasional checks of holiday detector potential will be made by the Contracting Officer to determine suitability of the detector. Perform inspection for holidays just before covering the pipe with backfill and take every precaution during backfill to prevent damage to the protective covering. Furnish equipment and labor necessary for inspection.

3.6.4 Installing Buried Piping

Handle pipe and accessories carefully to assure a sound, undamaged condition. Take care not to damage coating when lowering pipe into a trench and when backfilling. Install nonmetallic pipe in accordance with pipe manufacturer's instructions. Lay underground pipelines with a minimum pitch of 25 mm per 15 m 1 inch per 50 feet. Horizontal sections must have a minimum coverage of 450 mm 18 inches. Piping must be free of traps and drain toward tank. Rest full length of each section of underground pipe solidly on the pipe bed. Make piping connections to equipment as indicated, or as required, by the equipment manufacturer. Make tank connections with two elbow swing joints [or flexible connectors] to allow for differential settlement. Clean interior of the pipe thoroughly of all foreign matter before being lowered into the trench and keep clean during installation. Do not lay pipe in water or when the trench or weather conditions are unsuitable. When work is not in progress, securely close open ends of pipe and fittings so that water, earth, or other substances cannot enter the pipe or fittings. Replace any pipe, fittings, or appurtenances found defective after installation. Make threaded joints with tapered threads and make perfectly tight with joint compound applied to the male threads only. This requirement does not apply for the gauging hatch or similar connections directly over the tank where the line terminates in a fitting within a cast-iron manhole designed to allow for differential setting. Where steel piping is to be anchored, weld the pipe to the structural steel member of the anchor and patch the abraded area with protective coating or covering as specified. Fit piping passing through concrete or masonry construction with sleeves. Make each sleeve sufficient length to pass through the entire thickness of the associated structural member and large enough to provide a minimum clear distance of 13 mm 1/2 inch between the pipe and sleeve, except where otherwise indicated. Sleeves through concrete may be 0.912 mm 20 gauge metal, fiber, or other approved material. Locate sleeves accurately on center with the piping and fasten securely in place. Caulk and fill space between the sleeves and the pipe with bituminous plastic cement or mechanical caulking units designed for such use.

3.6.5 Fiberglass Reinforced Plastic (FRP) Pipe

Field assemble pipe in conformance with the manufacturer's written instructions and installation procedures. Several pipe joints having interference-fit type couplings may be field-bonded and cured simultaneously. However, do not move pipe nor make additional joints until the previously laid joints are completely cured. Fit joints not having interference-fit type couplings with a clamp which holds the joint rigidly in place until the joint cement has completely cured. The clamps must have a protective material on the inner surface to prevent damage to the plastic pipe when the clamp is tightened in place. Provide pipe with a device or method to determine when the joint is pulled against the pipe stop. Use a gauge provided by the pipe manufacturer to measure the diameter of the spigot ends to insure the diameter conforms to the tolerances specified by the manufacturer. Gauge all pipe ends. Utilize FRP pipe for buried piping.
only. No aboveground FRP pipe is allowed. Cut with a hacksaw or circular saw with an abrasive cutting wheel.

3.6.5.1 Installation

Bury pipe to the elevation shown on the profiles, except do not bury pipe under roadways less than 900 mm (36 inches). Backfill must not include large or sharp-edged rocks of any size in direct contact with the pipe surfaces. Compact to avoid damage to the pipeline. Provide conduits or sleeves of steel pipe at least 50 mm (2 inches) in diameter larger than the FRP pipe size under heavy traffic roadways. Limit bending of pipe to follow ditch contours to long trench curvatures and do not permit for abrupt changes in pipe direction. Bend radii must not be less than shown in the manufacturer's installation procedures.

3.6.5.2 Thrust Blocks

Provide concrete thrust blocks at all tees, valves, blind flanges, reducers, or whenever the pipe alignment changes direction. Size them in accordance with the pipe manufacturer's instructions to suit local soil conditions, operating pressures, test pressures, pipe size, and thermal conditions. In case of a conflict, the most stringent requirements govern.

3.6.5.3 Curing of Field-Bonded Joints

Cure all field-bonded epoxy-cemented joints, regardless of ambient temperatures, with a self-regulating, thermostatically controlled electrical heating blanket for the time and temperature recommended by the manufacturer for the applicable size and type of joint, or by an alternate approved heating method. Do not move joined sections during heating or before the joint has cooled to 27 degrees C (80 degrees F) or to ambient temperature, whichever is higher.

3.6.5.4 Metal to FRP Connections

Make metal to FRP connections with flanged connections. Use flat-faced steel flanges for bolting to FRP flanges. Where raised-face steel flanges are used, utilize spacer rings to provide a flat-face seat for FRP flanges. Use a full-face Buna-N gasket, 3.2 mm (1/8 inch) thick with a shore hardness of 50 to 60, between all flanged connections. The FRP flange must have raised sealing rings. Use flat washers under all nuts and bolts on FRP flanges. Provide bolts and nuts consisting of noncorrosive metal and torque to no more than 135 newton meters (100 ft-lbs). Do not bury flanges. Provide a concrete pit for all flanged connections.

3.6.6 Buried Fuel Piping

Buried fuel piping must be in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.7 CATHODIC PROTECTION

Cathodic protection must be in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.8 FIELD PAINTING

**************************************************************************

NOTE: Where identification of piping is required by

SECTION 23 52 30.01 10  Page 106
Clean, prepare, and paint all ferrous metals not specified to be coated at the factory as specified in Section 09 90 00 PAINTS AND COATINGS. Paint exposed pipe covering as specified in Section 09 90 00 PAINTS AND COATINGS. Do not paint aluminum sheath over insulation.

3.9 CLEANING OF BOILERS AND PIPING FOR TESTING

3.9.1 Boiler Cleaning

After the hydrostatic tests but before the operating tests, clean boilers of foreign materials. Wherever possible, wire-brush surfaces in contact with water to remove loose material. The Contractor may use the following procedure or may submit his own standard procedure for review and approval by the Contracting Officer. Fill boilers with a solution consisting of the following proportional ingredients for every 3785 liters 1000 gallons of water and operated at approximately 207 to 350 kPa 30 to 50 psig for a period of 24 to 48 hours, exhausting steam to the atmosphere:

| 11 kg 24 pounds caustic soda | 3.6 kg 8 pounds sodium nitrate |
| 11 kg 24 pounds disodium phosphate, 230 mg 1/2 pound approved wetting |

Thoroughly dissolve chemicals in the above proportions or as otherwise approved in the water before placing in the boilers. After the specified boiling period, allow the boilers to cool and then drain and thoroughly flush. Clean piping by operating the boilers for a period of approximately 48 hours, wasting the condensate.

3.9.2 Boiler Water Conditioning

Provide boiler water conditioning including chemical treatment and blowdown during periods of boiler operation to prevent scale and corrosion in boilers and in supply and return distribution systems from the initial startup of the system, through the testing period, and to final acceptance of the completed work but for at least 30 days of operation. Use approved chemicals and method of treatment.

Note 1: Conform to ASME B31.1 for wall thickness. Match requirements for steam piping.

Note 2: Conform to ASME B31.1 for wall thickness, except minimum must be extra strong pipe. Match piping requirements.

3.10 MANUFACTURERS' FIELD SERVICES

Provide the services of a manufacturer's representative who is experienced...
in the installation, adjustment, and operation of the equipment specified. 
Supervise the installing, adjusting, and testing of the equipment.

3.11 FIELD TRAINING

Provide a field training course for designated operating staff members. Provide training for a total period of [_____] hours of normal working time and start after the system is functionally complete, but prior to final acceptance tests. Cover all of the items contained in the approved operating and maintenance instructions as well as demonstrations of routine maintenance operations. Notify Contracting Officer at least 14 days prior to date of proposed conduction of the training course.

3.12 FRAMED INSTRUCTIONS

Submit proposed diagrams, instructions, and other sheets, before posting. Post framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, where directed. Prepare condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system in typed form, frame as specified above for the wiring and control diagrams, and post beside the diagrams. Post framed instructions before acceptance testing of the systems.

3.13 TESTS

**************************************************************************
NOTE: Before occupancy of a facility, inspect the boilers in accordance with the Code of Boiler and Pressure Vessel Inspectors (BPVI) and the American Society of Mechanical Engineers (ASME). Inspectors must be certified in accordance with BPVI standards.

References to inapplicable types of boilers will be deleted.
**************************************************************************

Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate the final position of controls in each test report. Submit a written statement from the manufacturer's representative certifying that combustion control equipment has been properly installed and is in proper operating condition, upon completion of the installation. The action settings for all automatic controls in the form of a typed, tabulated list indicating the type of control, location, setting, and function.

3.13.1 Hydrostatic Tests

Following erection, test each boiler hydrostatically and prove tight under a gauge pressure of 1-1/2 times the working pressure specified. Following the installation of piping and boiler house equipment, but before the application of any insulation, make hydrostatic tests and the prove system tight under gauge pressures of 1-1/2 times the specified working pressure. Test the boilers and inspect the piping connections by a NBBI-commissioned boiler inspector for determining compliance with all requirements in ASME BPVC SEC VIII D1 and supply the Contracting Officer with a certificate
of approval for each boiler. After flushing and operationally testing, leak test underground portions of oil containing piping systems. The test must be the [standpipe method][buoyancy device] type and conform to the requirements in NFPA 329. Do not involve pressurization of the system in any way which could increase the rate of product escape through an established leak in the test method.

3.13.2 Efficiency and Operating Tests

Upon completion of installation, subject the boiler plant to operating tests required to demonstrate satisfactory functional operation. Adjust equipment and controls before the scheduled operating test. Submit a testing schedule to the Contracting Officer at least 15 days before the scheduled test. Conduct each operating test as directed by Contracting Officer.

a. Run an efficiency and capacity test on one boiler of each size installed, conducted in accordance with ASME PTC 4 abbreviated efficiency test utilizing the heat loss method, except for use of measuring or metering devices properly calibrated before the test, for the purpose of metering the water used and weighing the amount of fuel burned. Use water meter in the test suitable for hot water. Provide instruments, test equipment, and test personnel required to properly conduct tests. The necessary fuel, water, and electricity will be furnished by the Government.

b. The performance tests must, in each case, cover the periods for the capacities tabulated below:

<table>
<thead>
<tr>
<th>Time (Minimum)</th>
<th>Waterwall and Watertube Boilers</th>
<th>Firetube and Boilers</th>
</tr>
</thead>
<tbody>
<tr>
<td>First 1 hour</td>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>Next 1 hour</td>
<td>75</td>
<td>75</td>
</tr>
<tr>
<td>Next 4 hours*</td>
<td>100</td>
<td>100</td>
</tr>
<tr>
<td>Next 2 hours</td>
<td>110</td>
<td></td>
</tr>
</tbody>
</table>

*The efficiency tests may be conducted either concurrently with the operating tests or separately, at the option of the Contractor. Efficiency must be not less than specified. Maximum moisture content of saturated steam leaving the boiler must be as specified.

c. Conduct efficiency and general performance tests on the boilers by a qualified test engineer, and observed by the Contracting Officer. Set up all testing apparatus, calibrate, test, and be ready for testing the boiler before the arrival of the Contracting Officer.

d. Furnish calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in efficiency and capacity tests before the test. Deliver a test report including logs, heat-balance calculations, and tabulated results together with conclusions in quadruplicate. Submit an analysis
of the fuel being burned on the test to the Contracting Officer.

e. Include all pertinent data tabulated in the ASME PTC 4 abbreviated efficiency test. Provide necessary temporary test piping no less than 100 mm 4 inches in diameter and steam silencer to exhaust excess steam to atmosphere in the event the boiler load is insufficient to meet the capacity specified. Provide control valve for exhausting excess steam to atmosphere in a convenient location inside the boiler room. Instruments required for conducting the boiler tests are contained in ASME PTC 19.11.

3.13.3 Test of Fuel Burning Equipment

Test of fuel burning equipment must demonstrate that equipment installed will meet the requirements of the specifications. Oil burners must meet the test requirements of UL 296. Demonstrate accuracy range and smoothness of operation of the combustion controls by varying the demand throughout the entire firing range required by the turndown ratio specified for the [burner][ and ][stoker] and, in the case of automatic sequenced burners, by further varying the firing rate to require on-off cycling. The control accuracy must be as specified. Verify specified turndown ratio by firing at the minimum firing rate. Verify operation of the flame safeguard control by simulated flame and ignition failures.

3.13.4 Test of Deaerating Feedwater Heater

Test of deaerating feedwater heater must demonstrate that the equipment installed meets the requirements specified as to performance, capacity, and quality of effluent. During the operating test of the boilers, conduct tests to determine oxygen content in accordance with ASTM D888, Method A. Operate boilers at varying loads up to maximum heater capacity while oxygen tests are being made.

3.13.5 Test of Water Treatment Equipment

Test of water treatment equipment must meet the requirements specified as to capacity and quality of effluent. Tests for ion-exchange units must cover at least two complete regenerations and capacity runs.

3.13.6 Test for Steam Purity and Water Level Stability

Perform test for steam purity, in accordance with ASTM D1066, and water level stability simultaneously under the operating conditions specified.

\[3.13.6.1\] Conductivity Tests for Boilers without Superheaters

**************************************************************************
NOTE: Delete the inapplicable paragraph.
**************************************************************************

Make steam tests for boilers without superheaters, not used for power generation or large turbine drive, on steam sampled in accordance with ASTM D1066. Do not exceed 30 microhms at 18 degrees C65 degrees F conductivity of the steam corrected for carbon dioxide and ammonia content.

\[3.13.6.2\] Conductivity Test, Boilers with or without Superheaters

Sample steam for boilers, with or without superheat, used for power generation or turbine drive for air-conditioning equipment in accordance
with ASTM D1066 with the conductivity of the steam corrected for carbon dioxide and ammonia content not to exceed 4.0 microhms at 18 degrees C 65 degrees F.

3.13.6.3 Water Level Stability Test

[Conduct water level stability test first by use of the manual bypass around the feedwater regulator. Then repeat test using the automatic feedwater regulator. Boiler must maintain specified water level stability under both conditions.]

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steam generation plants based on operating pressure above 200 kPa 30 psig to a maximum of 1030 kPa 150 psig.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Sustainable design factors which should be considered during design of steam generating systems include, but are not limited to, the following: use of cleaner burning fuels (natural gas, low sulfur No. 2 oil); design for minimal air emissions; specification of boilers and ancillary equipment in the upper 25 percent of available efficiency for the capacity range used; proper insulation of piping, fittings, and other heated surfaces; returning condensate to the steam plant for reuse; blowdown heat recovery; appropriate use of water treatment systems and chemicals; use of electric rather than steam turbine motor drives; recycling of dismantled
or demolished material and equipment; and for new plants, building on a previously developed or "brownfield" site if possible. These factors are generally subject to life-cycle cost analysis.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

The definitions of the terms relating to process control instrumentation technology are those given in ISA 51.1. Use logic symbols in accordance with ISA 5.2. Use graphic symbols for distributed control in accordance with ISA 5.3.

1.3 SYSTEM DESCRIPTION

1.3.1 Design Analysis and Calculations

Submit manufacturer's design data and structural computations, and design analyses and calculations for walls, roofs, foundations, and other features, for specialty type of construction, with design data for lateral forces that may be encountered due to wind loads and seismic forces. Mount instrumentation on equipment in accordance with paragraph Supports in PART 3.

1.3.2 Electrical Environment

Provide electrical and electronic equipment that operate satisfactorily, both independently and in conjunction with other equipment. The operation of electrical and electronic equipment must not be adversely affected by interference voltages and fields from external sources, and that equipment provided must not be a source of interference that might adversely affect the operation of other equipment. Ensure the basic design of equipment, components, and assemblies limits the effects of radio frequency interference and electromagnetic interference.
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

1.5 QUALITY ASSURANCE

1.5.1 Experience

Submit evidence of the Contractor's prior experience in installing similar equipment, including a list of 5 combustion control installations on boilers of equal or larger size that have been in satisfactory operation for 2 years prior to bid opening; also, the location of the combustion
control installations.

1.5.2 Welding

**************************************************************************

NOTE: If the need exists for more stringent requirements for weldments, delete the first bracketed statement regarding welds and the welding submittal, and use the second bracketed sentence. Non return valves are only required on multiple boiler installations.

**************************************************************************

Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators. Furnish this information regarding welds, internal to packaged boilers, if requested by the Government.

a. Weld and stamp steam piping between the boiler [steam nozzle] [nonreturn valve] and the second stop valve in accordance with ASME BPVC SEC I. [Weld other piping in accordance with qualified procedures using performance qualified welders and welding operators. Use qualified procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1.]

b. Notify the Contracting Officer 24 hours in advance of tests. The welder or welding operator must apply the personally assigned symbol near each weld made as a permanent record.

c. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING [Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING].

1.5.3 Use of Asbestos Products

Products that contain asbestos are prohibited. This prohibition includes items such as packings or gaskets, even though the item is encapsulated or the asbestos fibers are impregnated with binder material.

1.5.4 Detail Drawings

Submit detail drawings consisting of schedules, performance charts, brochures, diagrams, drawings, and instructions necessary for installation of the steam-generating units and associated equipment, and for piping, wiring devices, trenches and related foundations. Detail drawings for steam generators and appurtenances, including the fuel system. Indicate clearances required for maintenance and operation and also contain complete wiring and schematic diagrams, equipment layout and anchorage, and other details required to demonstrate that the system has been coordinated and will function properly as a unit. Manufacturers' confidential information concerning manufacturing techniques and proprietary data such as detailed fabrication shop drawings are not required.

1.6 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from the weather, excessive humidity and excessive temperature variation; and dirt, dust, or
other contaminants.

1.7 PROJECT/SITE CONDITIONS

Design instruments located in furnace rooms for 79 degrees C 175 degrees F ambient temperature operation. Design other instruments for 40 degrees C 104 degrees F ambient temperature operation.

1.8 EXTRA MATERIALS

Submit spare parts data for each item of equipment provided, after acceptance of the detail drawings and not later than [_____] months before the date of beneficial occupancy. Include in the data a complete list of spare parts and supplies, with current unit prices and sources of supply. Include special tools necessary for the operation and maintenance of boilers, burners, pumps, fans, and other equipment. Furnish small hand tools with a suitable hardwood cabinet mounted where directed. Provide special wrenches for opening boiler manholes, handholes, and cleanouts.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Provide equipment supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.1.2 Nameplates

For each major item of equipment, secure a plate with the manufacturer's name, address, type or style, model or serial number, and catalog number to the item of equipment.

2.1.3 Equipment Guards and Access

Fully enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts exposed to personal contact. Properly guard or cover high temperature equipment and piping exposed to contact by personnel or where they create a fire hazard with insulation of the type specified. Provide items such as catwalks, operating platforms, ladders, and guardrails where shown and construct in accordance with Section [08 31 00 ACCESS DOORS AND PANELS][05 51 33 METAL LADDERS].

2.2 MATERIALS

Submit outline drawings, data sheets, parts lists, schedules, performance charts, installation instructions, brochures, diagrams, and other information to illustrate equipment, wiring related components, and material. Ensure performance charts provide information necessary to determine compliance to the specified and indicated requirements and include minimum capacity for stable operation of the equipment. Submit manufacturer's installation recommendations for each item of instrumentation. Provide product data including catalogs, and characteristic curves; and manufacturer recommended cleaning procedure,
interior and exterior, for applicable items. Provide materials complying with the following:

2.2.1 Brick, Common

ASTM C62.

2.2.2 Bricks, Refractory

ASTM A653/A653M, class as recommended by the boiler manufacturer.

2.2.3 Bricks, Refractory, Insulating

ASTM C155.

2.2.4 Coal-Tar Primer and Enamel

AWWA C203.

2.2.5 Draft Gauge

ASME B40.100, Style 1. Mount draft gauges for the windbox, combustion chamber, and last boiler pass in the panel front. Field-verify operating range for the draft gauges with normal reading in the middle of the scale range. Ensure draft gauges include piping between the gauges and the boiler.

2.2.6 Exhaust Head

One piece construction of plate steel, semisteel, or cast iron equipped with suitable baffle arrangement and drain connection for the removal of entrained condensate and oil. Flow area through unit must be larger than connecting pipe.

2.2.7 Expansion Joint

EJMA Stds Book of Standards and ASME B31.1. Provide packless, leak proof, externally pressurized bellows type expansion joint. Include integral guide rings, full thickness cover designed to contain full system pressure, and self-draining convolutions. Provide expansion joint that is insensitive to flow direction. Provide expansion joint with a drain connection for condensate removal. Provide expansion joint consisting of welded construction with ASTM A240/A240M T-304 stainless steel bellows, ASTM A106/A106M GR B cover and ASTM A106/A106M GR B standard wall pipe with flanged ends. For pumped condensate, use Schedule 80 pipe. Use expansion joint that is rated for 1.03 MPa 150 psig and 425 degrees C 800 degrees F and has maximum axial movement rating of 100 or 200 mm 4 or 8 inches with a rated cycle life of 1,000 for the full rated movement.

2.2.8 Gauge, Pressure and Vacuum

ASME B40.100, Type I, Class 1 or 2, as applicable, style as required, suitable for pressure or vacuum specified, with 150 mm 6 inch minimum diameter dial except as otherwise specified.

2.2.9 Low Water Cutoff

Provide float actuated low water cutoff switch or electrically actuated probe type. Provide float chamber with a blowdown connection. Low water
cutoff must cause a safety shutdown and sound an alarm when the boiler water level drops below a safe minimum. A safety shutdown due to low water must require manual reset before operation can be resumed and must prevent recycling of the burner. Perform low water cutoff in strict accordance with the ASME CSD-1.

2.2.10 Mortar, Refractory

As recommended by the boiler manufacturer.

2.2.11 Pipe and Fittings

2.2.11.1 Clay Pipe

ASTM C700, Class 1, Type I, Style a.

2.2.11.2 Nipple

ASTM A733, standard or extra strong weight to match adjacent piping.

2.2.11.3 Pipe

As specified in TABLE I for service use and size. Provide underground fuel piping in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.2.11.4 Flanges

As specified in TABLE II for service use and size. Convoluted steel flanges conforming to ASME BPVC SEC VIII D1 may be provided in lieu of flanges conforming to ASME B16.5. Provide convoluted flanges consisting of cold-formed steel conforming to ASTM A516/A516M. Mate flanges with ASME B16.5, Class 150 flanges.

2.2.11.5 Flange Gasket

Provide gasket consisting of nonasbestos compressed material in accordance with ASME B16.21, 1.6 mm 1/16 inch thickness, of self centering flat ring type. Provide gasket containing aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR). Use NBR binder for hydrocarbon service. Use metallic spiral wound nonasbestos gaskets for steam lines.

2.2.11.6 Flexible Connector

**************************************************************************
NOTE: Listed flexible connectors may be used when allowed by NFPA 30 and when approved by local codes as an alternative for swing joints.**************************************************************************

Provide flexible metal hose, corrugated type with braided wire sheath covering, close pitch annular corrugations, rated for a working pressure of at least 1.03 MPa 150 psig, 300 mm 12 inch minimum live length, threaded end connections and conforming to requirements of UL 567. Ensure metal for hose and braided wire sheath is stainless steel, any type of AISI series.
2.2.11.7 Union

ASME B16.39, limited to 690 kPa 100 psig, type to match adjacent piping. For higher pressure, use ground joint cast steel or forged steel union. Use unions with appropriate pressure and temperature ratings.

2.2.12 Pipe Support

MSS SP-58.

2.2.13 Pipe Threads

ASME B1.20.2M, ASME B1.20.1.

2.2.14 Steel Sheet

Carbon, zinc-coated (galvanized) by the hot-dip process: ASTM A653/A653M. Gauges specified are Manufacturer's Standard Gauge.

2.2.15 Strainer

Unless otherwise specified, provide strainer with screwed ends to 50 mm 2 inches, flanged for 65 mm 2-1/2 inches and larger.

2.2.15.1 Body

For systems up to 1.03 MPa 150 psi, Class 150 150 pound WSP class, cast steel; and for higher pressure, 2.06 MPa 300 psi, Class 300 300 pound use WSP class forged steel or cast steel.

2.2.15.2 Screen

**************************************************************************
NOTE: Specify screen size for the needs of the equipment.
**************************************************************************

Provide Type 304 stainless steel screen with free area no less than 2.5 times inlet area. For water system, ensure perforation is 6.4 mm 1/8 inch for strainer size up to 200 mm 8 inches, and 4 mm 5/32 inch for strainer 250 mm 10 inches and larger. For steam and condensate system, ensure perforation is 0.4 mm 1/64 inch for strainer size up to 50 mm 2 inches, 0.8 mm 1/32 inch for strainer 65 mm 2-1/2 inches through 100 mm 4 inches, and 1.2 mm 3/64 inch for strainers 125 mm 5 inches and larger. Provide reinforced wire gauge screen, with continuous magnetic field around entire circumference of screen and magnets with stainless steel retaining lugs and threaded rods.

2.2.15.3 Y-Type Strainer

Provide Y-type strainer as shown. Provide Y-type strainer that is full line size of connecting piping, with ends matching piping system materials. Provide Y-type strainers with a globe valve blowdown.

2.2.15.4 Tee Strainer

Provide tee strainer as shown. Provide tee strainer that is the full line size of the connecting piping with ends matching the piping system materials. Provide tee strainer with a swing bolt closure.
2.2.15.5  Basket Strainer, including Duplex Basket Strainer

Provide basket strainer as shown. Provide basket strainer with bolted covers to allow removal of the basket for cleaning. Provide duplex basket strainer including a multiport plug valve to allow the operator to switch active strainer baskets without interrupting system operation.

2.2.16  Tape

2.2.16.1  Threaded Pipe Joint

ASTM D3308.

2.2.16.2  Pipe Joint Coating

AWWA C203.

2.2.17  Tile, Load Bearing, Hollow

ASTM C34, Grade LPX.

2.2.18  Traps, Steam and Air

ASTM F1139.

2.2.19  Thermometer

Unless otherwise specified, provide dial type thermometer, 90 mm 3-1/2 inch diameter, chromium plated case for indoor use and stainless steel for outdoor use, remote or direct type bulb as required, with plus or minus 0.5 Degrees C 1 degree F accuracy and white face with black digits in 2 degree increments. Use well and temperature range for use encountered. Install thermometer so as to be easily read from the operating floor. Do not use Mercury in thermometers.

2.2.20  Valve

**************************************************************************
NOTE: Valves operating above 170 kPa/130 degrees C
25 psig/267 degrees F will be minimum Class 150.
Pressure class will be suitable for intended service.
**************************************************************************

2.2.20.1  Reference Standards

ASTM A126 and ASTM A278/A278M as applicable.

2.2.20.2  Check, Globe, Angle, and Gate

a. Sizes 40 mm 1-1/2 inches and smaller that are operating at or below 170 kPa 25 psig and also operating at or below 130 degrees C 267 degrees F, saturation temperature at 170 kPa 25 psig must be bronze, MSS SP-80, Class 125 with threaded connections.

b. Sizes 40 mm 1-1/2 inches and smaller operating above either 170 kPa 25 psig or 130 degrees C 267 degrees F, saturation temperature at 170 kPa 25 psig, must be [forged] [cast] steel, stainless steel trim, rising stem, Class [_____] with handwheels. Ensure connections are [socket
weld] [threaded] end connections.

c. Sizes 50 mm 2 inches and larger must be cast steel, stainless steel trim, rising stem, outside screw and yoke, Class 150 with handwheels. Provide either butt weld or flanged connections.

2.2.20.3 Back Pressure Relief

Provide ASME PTC 25 back pressure relief valve with stainless steel or cast steel body with valve internals and seats constructed of stainless steel. Provide positive closing back pressure relief valve with guides. Adjust the desired back pressure to cover a range between 14 and 70 kPa 2 and 10 psig. Effect the adjustment externally and provide any shafts extending through the valve body with adjustable stuffing boxes having renewable packing. Provide self contained, internal pilot piston operated back pressure relief valve. Provide an external positioner on each valve.

2.2.20.4 Blowoff and Quick Opening

Provide blowoff and quick opening valves as required in ASME BPVC SEC I. Provide balanced seatless type or double seated rotating disk type valve. Ensure quick opening valve is the straightway type. Design blowoff and quick opening valves for a working pressure of 2.06 MPa 300 psig and suitable for safe blowdown through the installed piping system.

2.2.20.5 Pressure Reducing

**************************************************************************
NOTE: Valves requiring tight shutoff for steam service will be ANSI Class IV. Where a thermostatically controlled valve is installed after and near the reducing valve in a manner to cut off the passage of steam, valves with ANSI Class IV shutoff will be used. Where valves are used for reducing pressure to the deaerating heater, valves will have ANSI Class IV shutoff.

Consider silencers in pressure reducing valve trains where acoustics to adjacent spaces or maximum noise level in mechanical room is an issue.
**************************************************************************

Design pressure reducing valve for a working pressure of no less than 1.03 MPa 150 psig, and ensure valve is quiet and nonsticking in operation. Provide spring loaded, internal pilot piston operated type pressure reducing valve with an external position indicator. Pressure reducing valve body 65 mm 2-1/2 inches and larger must be cast steel. Provide pressure reducing valve with raised face flanges to match the raised face flanges on connecting piping. Pressure reducing valve 38 mm 1-1/2 inches and smaller must be bronze with screwed connections. Ensure pressure reducing valve trim is stainless steel or monel metal. Parts subject to wear must be renewable. Provide pressure reducing valve with seat and plug faced with cobalt tungsten carbide mixture, or made of heat treated stainless steel or high chromium steel. Provide seat and plug facing with a Brinell hardness of no less than 450. Design pressure reducing valve for dead-end service. Do not exceed a resulting noise level of [_____] dBA.
2.2.20.6 Plug

Provide tapered plug, lubricated type plug valve. Use lubricant that is suitable for the intended application. Provide cast steel body. Provide carbon steel plug. Pressure class must be minimum ANSI Class 150. Plug valve 38 mm (1½ inches) and smaller must be screwed. Plug valve 50 mm (2 inches) and larger must be flanged.

2.2.20.7 Safety Relief

Size and construct safety relief valve in compliance with requirements set forth in ASME BPVC SEC I. Provide safety relief valve with a manual lifting device for testing.

2.2.20.8 Steam Nonreturn

Provide either angle type or straight type steam nonreturn valve with rising stem as shown. Operate steam nonreturn without chattering, hammering, or sticking over the entire operating range of the boiler. Provide valve complying with ASME BPVC SEC I. Provide steam nonreturn valve with Class 300 ASTM A216/A216M cast steel body. Provide steam nonreturn consisting of bronze trim, rising stem, bolted bonnet, outside screw and yoke and flanged ends.

2.2.20.9 Thermostatic Regulating

Design thermostatic regulating valve for a steam working pressure of 1.03 MPa (150 psig). Provide adjustable thermostatic regulating valve with an operating range of approximately 54 to 88 degrees C (130 to 190 degrees F) and maintain the desired fluid temperature within plus or minus 2.5 degrees C (5 degrees F). Provide [bronze] or [cast] [forged] steel or stainless steel body.

2.2.20.10 Ball

Provide Teflon seated and packed ball valve. Ball valve must provide bubble tight shutoff. Provide [bronze] or [cast] [forged] steel or stainless steel body. Ball valve must be two-piece full-port design.

2.2.20.11 Feedwater Control

Provide feedwater control valve with the boiler. Supply feedwater control valve with filter, regulator, supply and control pressure gauges, [metric] converter and positioner with charactering cam. Control system must provide 4 to 20 mAdc control signal.

2.2.21 Water Column

Construct water column valve in accordance with ASME BPVC SEC I, fit with gauge glass and quick-closing gauge valves with chains and handles for operation from the boiler room floor. [Provide mirror and illuminating light to allow water levels to be read from the boiler room floor] [Provide gauge glass with illuminating light].

2.2.22 Meters

2.2.22.1 Natural Gas Flow

**************************************************************************

NOTE: Ensure the turndown ratio (TDR) of the
natural gas flow meter is wider than that of the boiler burner TDR firing on natural gas.

Provide positive displacement type natural gas flow meter with an aluminum body and a pressure correcting device that will correct flow readings to atmospheric pressure. Use a minimum meter design pressure of 690 kPa 100 psig. Ensure accuracy is plus or minus 1 percent of calibrated span minimum. Turndown must be [______]. Provide threaded connections for sizes 38 mm 1-1/2 inches and smaller. Provide flanged connections for sizes 50 mm 2 inches and larger.

2.2.22.2 Water Flow

Provide disk type water flow meter with reinforced disk for hot water above 65 degrees C 150 degrees F, and rubber or carbon disk for cold water, and constructed of bronze composition and cast iron protected by noncorrosive coating. Ensure moving parts subject to wear are easily replaceable. Provide waterflow meters conforming to the requirements of AWWA C700.

2.2.22.3 Fuel Oil Flow

NOTE: Ensure the turndown ratio (TDR) of the oil flow meter is wider than that of the boiler burner TDR firing on fuel oil.

Provide nutating disc, positive displacement fuel oil flow meter with direct mechanical shaft drive from meter to register. Use construction materials consisting of cast iron housing, bronze internals, aluminum ball and web disc, and Type 316 stainless steel diaphragm. Provide totalizing register as specified. Use floe oil meter suitable for maximum oil temperature.

2.2.23 Natural Gas Pressure Regulator

Provide pilot operated type natural gas pressure regulator. Use nitrile diaphragms. Natural gas pressure regulator valve body must be steel. Use minimum pressure rating of 1.03 MPa 150 psig. Make vent connection in accordance with NFPA. Provide natural gas pressure regulator with an external position indicator.

2.2.24 Fractional and Integral Horsepower Motors

Provide premium efficiency type integral size motors in accordance with NEMA MG 1.

2.3 ELECTRICAL WORK

Provide specified electric motor driven equipment complete with motor, motor starter, and controls. Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Ensure electrical characteristics are as specified or indicated. Provide motor starters complete with thermal overload protection and other appurtenances necessary for the motor control specified. Use motor of sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Provide manual or automatic control and protective or signal devices required for the operation specified and
control wiring required for controls and devices specified.

2.4 BOILER AND APPURTENANCES

******************************************************************************
NOTE: Delete types of boilers that are not used.
Select appropriate fuels and fill in pressure and temperature requirements. Select efficiency in the upper 25 percent of the competitive range. Specify efficiencies that correlate to the fuel(s) required. Select applicable burner type and combustion control system. To accommodate shipping limitations or installation access requirements in existing boiler plants, the boiler may be specified to be knocked down and field assembled.
******************************************************************************

2.4.1 Boiler

******************************************************************************
NOTE: Coordinate turndown ratio with subparagraph "Fuel Oil Burner" and subparagraph "Natural Gas Burner" in paragraph FUEL BURNING EQUIPMENT.
******************************************************************************

Provide boiler as complete boiler-burner package, including integral forced draft burner, boiler trim, refractory, controls, fuel train and accessory components. Provide boiler-burner package [fully assembled] [field assembled] ready for floor mounting and connection to steam, feedwater, electrical, [fuel oil], [natural gas], vent, chemical feed, blowdown and control lines in accordance with the Setting Plans. Submit complete setting plans certified by the boiler manufacturer and burner manufacturer. Provide boiler with the capacity indicated. Ensure equipment design and accessory installations permit accessibility for maintenance and service. Provide boiler complying with NFPA 85. Design boiler for working pressure of [_____] kPa psig and operating pressure of [_____] kPa psig. Each boiler must be capable of continuously producing [_____] kg pounds per hour saturated steam [_____] degrees C degrees F while being supplied with [_____] degrees C degrees F feedwater. Boiler operation must be stable at a turndown ratio of [______]. Provide [natural gas] [fuel oil] [combination natural gas fuel oil] burners of type, size and so located and arranged such that the flame in no case impinges on any surface in the boiler nor extends beyond the limits of the furnace.

2.4.2 Performance

Provide boiler with the specified capacity at the operating pressure, feedwater temperature and boiler site elevation specified. Base capacity on the evaporation rate in kg pounds per hour at boiler specified outlet steam temperature and pressure while firing [No.[_____] fuel oil] [natural gas] [No. [_____] fuel oil or natural gas]. [Use fuel oil supply temperature and pressure of [_____] degrees C degrees F and [_____] kPa psig]. [Use natural gas supply pressure of [_____] kPa psig]. Boiler must be capable of continuous operation at full rated capacity. Ensure minimum efficiency is no less than [_____] percent when fired continuously at full rated capacity with [natural gas] [fuel oil] [natural gas or fuel oil]. Maintain both stable firing and efficiency over the entire firing range required by the turndown ratio. Base output capacity of the boiler on tests of the boiler and burner as a unit. Moisture in the steam must not
exceed 0.5 percent at maximum continuous rated boiler capacity and during a load swing of 10 percent of boiler capacity per minute with boiler water dissolved solids concentration at approximately 3,500 ppm and total alkalinity not in excess of 700 ppm.

2.4.3 Construction

Build and stamp boiler in accordance with ASME BPVC SEC I and as specified.

2.4.4 Identification

Stamp boiler as follows:

a. Maximum capacity in MW Btu/Hr.

b. Maximum allowable working pressure.

c. Radiant heating area.

d. Total heating surface area.

e. Furnace volume.

2.4.5 Watertube, Packaged Type Steam Boiler

Provide shop assembled type boiler with either 2 or 3 drums and water cooled furnace roof, floor, front, rear and side walls. Ensure the furnace side and rear walls are completely suitable for pressurized firing. Arrange boiler faces to give maximum cooling effect to furnace refractories. Furnace waterwall tubes must enter steam drum below the normal operating drum level. Provide tube inspection ports in furnace to boiler division wall, along both the steam and lower drums. Size furnace for complete combustion of fuel in the furnace with no flame impingement on the water-cooled surfaces and no combustion in the convection area. Do not exceed furnace heat release rate, based on fuel analysis and required fuel input, of [_____] gigajoules/hr per cubic meter Btu/hr per cubic foot of furnace volume. Ensure furnace heating surface is no less than [_____] square meters square feet on a flat protected area.

2.4.5.1 Drum

a. Extend drums beyond the entire length of furnace setting. Fabricate drum of steel plate, weld in accordance with ASME BPVC SEC I, including stress relieving and X-raying of welded seams. Provide steam drum with steam separators and drum internals required to maintain the specified steam moisture content, and provisions for maintenance. Provide necessary baffling to separate steam from water in the drum and to maintain stable water level under a fluctuating load. Ensure variations in normal water level do not exceed boiler manufacturer's recommendations as approved during the shop drawing submittal stage with an increasing load change of 10 percent of boiler capacity per minute. The steam drum diameter must not be less than the following:

1. 915 mm 36 inch (steam flow of 5,455 to 31,800 kg/hr 12,000 to 70,000 pounds/hr).

2. 1,070 mm 42 inch (steam flow of 31,800 to 45,450 kg/hr 70,000 to 100,000 pounds/hr).
3. 1,220 mm 48 inch (steam flow of 45,450 to 68,180 kg/hr 100,000 to 150,000 pounds/hr).

4. 1,370 mm 54 inch (steam flow of 68,180 to 81,800 kg/hr 150,000 to 180,000 pounds/hr).

b. Lower drum must not be less than 610 mm 24 inches in diameter.

c. Provide drum with two 300 by 400 mm 12 by 16 inch elliptical manholes with double clamps, studs and gaskets.

d. Provide boiler with connections as shown.

2.4.5.2 Tubes

2.4.5.2.1 Furnace and Boiler

Provide furnace and boiler tubes no less than 50 mm 2 inches in diameter and thickness conforming to that given in ASME BPVC SEC I for the pressure specified. Bend tubes to a true radius. Tubes that are distorted in bending, flattened or ridged are not acceptable. Drill, ream and serrate tube holes in the drum. Design tubes to permit drums and tubes to drain by gravity.

2.4.5.2.2 Furnace Waterwall

Provide furnace waterwall that extend the entire length of furnace setting and consists of 50 mm 2 inch tangential electric resistance welded steel tubes or welded furnace membrane wall. Expand tubes connected to the drums and/or lower headers into bored tube seats. If headers are provided, use lower headers of sidewalls that are round or square design. Provide lower header with gasketed handhole covers for easy access to each wall tube. Size tube bend radii for standard turbine type cleaners for easy pass through for cleaning of the full length of the tubes.

2.4.5.2.3 Convection Tubes

Provide convection tubes consisting of electric resistance welded construction in accordance with ASME BPVC SEC I. Arrange convection tubes to ensure proper and effective soot blowing. Expand convection tubes in the boiler section into the upper and lower drums.

2.4.5.3 Baffles

Arrange baffles to direct products of combustion into contact with heating surfaces without short circuit of flue gas at the outlet or excessive loss of draft. Provide baffles that are either a refractory material, tangent tubes or a metal suitable for the temperature encountered.

2.4.5.4 Supports

Support boiler and firing equipment from the foundation with structural steel independent of brickwork. Boiler supports must permit free expansion and contraction of each portion of the boiler without placing undue stress on any part of the boiler or setting. For lifting and handling of the boiler, weld lifting lugs to the steam drum. Reinforce boiler skid and provide with space beneath the end of the beam for jacking the unit during installation. Provide holes in the main beam for use by a rigger to drag or lift the unit by its base frame for final positioning, if this method is
recommended by boiler manufacturer.

2.4.5.5 Boiler Casing and Insulation

Encase boiler completely in a double casing and fill with blanket insulation. Construct casing of welded black steel sheets no lighter than 3.4 mm 10 gauge. Provide gastight casing and reinforce with structural steel to provide rigidity and prevent buckling. Provide refractory or insulation behind the waterwall tubes that is no less than 65 mm 2 1/2 inches thick. Provide insulation of sufficient thickness to ensure an average casing temperature in the furnace area not in excess of 60 degrees C 140 degrees F with a surface air velocity of 0.25 meters per second 50 fpm and an ambient air temperature of 38 degrees C 100 degrees F when operating at full capacity. Provide insulation material and installation as recommended by the boiler manufacturer. Insulate exposed portion of the boiler drum with mineral wool block and enclose in a welded 3.4 mm 10 gauge steel casing, field installed. Use factory installed refractory and insulation.

2.4.5.6 Access Door and Observation Port

Provide boiler with access doors in sufficient number, size and location for cleaning, inspection and repair. Ensure access door is gastight and interior surfaces exposed to direct radiation and high temperature are lined with approved refractory material to prevent excessive heat loss. Access doors that are large or weigh more than 23 kg 50 pounds must be hinged. In addition, provide at least two observation ports with cast iron covers, one on the front and one on the rear wall of the furnace, so that the entire inner surface of the furnace is visible from one or more ports.

2.4.5.7 Settling Chamber

**************************************************************************
NOTE: Specify for No. 4 and No. 6 fuel oil.
**************************************************************************

Provide settling chamber for the removal of fly ash below the last pass of the boiler with suitable means for frequent cleaning without shutting down the boiler.

2.4.5.8 Soot Blower

**************************************************************************
NOTE: Specify for No. 4 and No. 6 fuel oil.
**************************************************************************

Provide boiler with soot blower for convection bank cleaning. Provide steam operated soot blower, valve-in-head type and furnish complete with wall sleeve, clamps, hangers, supports, manual operating chains and other appurtenances required for a complete installation. Arrange blower elements so that all parts of the heating surfaces are cleaned of soot deposits when rotated by electric motor actuated by [automatic sequence from boiler control panel] [manual switch from boiler control panel]. Use soot blower elements of such length, diameter and total nozzle area such that for the operating pressure involved there will be no significant difference in the cleaning effect between the nozzle nearest the inlet and those farthest from the inlet of the element. Make soot blower of a material that will satisfactorily withstand the temperature in the zone where it is installed.
2.4.5.9 Economizer

a. Furnish boiler with a rectangular, package extended surface economizer. Provide shop assembled economizer and ship complete with structural steel frame, inner casing, shop applied insulation and [_____] mm gauge box ribbed metal lagging. Design and fabricate economizer in accordance with ASME BPVC SEC I. Flue gas flow through economizer must be vertical with orientation of economizer as shown.

b. Provide economizer of continuous tube, loop tube design and completely drainable by gravity after installation. Design and arrange economizer such that there will be no steaming in the economizer under any load or operating condition. Ensure minimum design temperature of the economizer is 370 degrees C 700 degrees F. Hydrostatically factory test economizer at 1.5 times the tube side design pressure or at least 2.07 MPa 300 psi in the presence of a Code Inspector. Provide ASME code stamped unit including nameplate and code documentation.

c. Extended surface must be of solid continuous, resistance welded carbon steel fins. Use maximum fin spacing of [_____] fins per meter foot. Fins must be no less than 1.9 mm 0.075 inches thick.

d. Provide SA-106-B headers with minimum Schedule 40 wall thickness and equip with minimum ANSI Class [_____] raised face weld neck flanged connections. Use header wall thickness and flange rating which is dependent on tube side design pressure in accordance with ASME BPVC SEC I requirements. Tube arrangement must be of the open lattice design. Drilled tube sheets are not acceptable.

e. Hot structure design must be gastight and designed for a minimum of 250 mm 10 inches wc gas side pressure.

f. Ensure pressure parts are not in contact with tube sheets.

g. Provide inner casing that is a minimum of 3.4 mm 10 gauge carbon steel.

h. Design the economizer for the maximum operating conditions of the boiler and capable of reducing boiler stack exit flue gas temperature to 148 degrees C 300 degrees F when the boiler is being fired with natural gas or oil and being supplied with feedwater at [107] [_____] degrees C [225] [_____] degrees F at all boiler loads.

i. The boiler feedwater head loss through the economizer must not exceed 103 Pa 15 psi at maximum boiler load.

j. Insulate economizer with a minimum 50 mm 2 inch thick blanket type mineral wool or approved equal.

k. Provide weatherproof outer casing with a minimum 7.5 mm 22 gauge corrugated galvanized carbon steel lagging. Paint exposed surfaces not enclosed by outer casing with high temperature aluminum paint.

l. Provide minimum 19 mm 3/4 inch vent and drain connections on feedwater headers.

m. Provide economizer with electrically operated soot blowers. Use quantity of soot blowers as recommended by the manufacturer. Install soot blowers transversely to provide maximum cleaning capabilities.
n. Provide access door of carbon steel construction in the economizer design. Insulate access door.

o. Design the economizer to accept piping reactions without distortion or creating overstressed conditions in the piping.

2.4.6 Firetube, Package Type Steam Boiler

Construct and stamp boiler pressure vessel in accordance with the rules of Section 1 of the ASME BPVC SEC I. Execute ASME manufacturer's data reports by the manufacturer and an authorized inspector who holds a valid commission issued by the National Board of Boiler and Pressure Vessel Inspectors prior to shipment. Furnish ASME manufacturer's data to the Contracting Officer, the inspection agency and the state and local authorities at the place of installation. Stamp pressure vessel for 1030 kPa 150 psig design pressure.

2.4.6.1 Heating Surface

Provide boiler furnace tube with its centerline below the boiler centerline for maximum water coverage. Provide boiler with a minimum of 0.465 square meters 5 square feet of fireside heating surface per rated BHP. Provide furnace large enough for complete combustion of fuel at maximum capacity without flame impingement. Ensure heating surface is fully accessible for inspection and cleaning without disturbing the burner equipment. Locate observation and sight ports at each end of the boiler to allow inspection of flame conditions. Provide a rear access opening with observation port. Provide handholes and manholes in accordance with ASME BPVC SEC I.

2.4.6.2 Boiler Firetubes

Provide boiler firetubes which are no less than 50 mm 2 inches in diameter, seamless steel tubing expanded to the tube sheets. Welded firetubes are not acceptable.

2.4.6.3 Flue Gas Exhaust

Locate flue gas exhaust connection and stack thermometer on the top centerline. Furnish boiler flue outlet with a manual cast iron locking damper.

2.4.6.4 Boiler Supports

Support boiler and firing equipment from the foundation. Provide boiler supports consisting of heavy duty structural steel base with lifting lugs and rigging holes in the skid to facilitate installation. Locate two or more lifting lugs on top of pressure vessel.

2.4.6.5 Refractory

Provide either hinged or davited front boiler door, as required, to provide access to firetubes without disconnecting the burner or fuel train. Configure front boiler door such that front tube sheets are fully accessible for inspection and cleaning when open. Rear door must be davited. "Dry back" boilers having rear door refractory are not acceptable. Seal doors with ceramic fiber rope gaskets and fasten securely using lugs and nuts threaded onto studs welded into the vessel. Insulate rear door with blanket insulation with a steel covering. Contain front
door refractory and insulation in the formed door which must swing open for inspection of brick work. Submit Safety Data Sheets detailing refractory materials contained within the boiler.

2.4.6.6 Boiler Insulation

Provide boiler insulation consisting of minimum 50 mm 2 inch fiberglass blanket covering entire circumference of pressure vessel and protect by preformed sheet metal lagging. Cover insulation with minimum 0.8 mm 22 gauge preformed sheet metal and factory paint before shipment using a hard finish enamel coating.

2.4.7 Boiler Trim

Provide boiler complete with the following trim:

a. Water column consisting of gauge glass set, gauge glass and water column blowdown valve.

b. Low water cutoff, as an integral part of the boiler feedwater control. Cutoff must be factory wired into the burner control circuit to prevent burner operation if the boiler water level falls below the safe operating level.

c. Mount an auxiliary low water cutoff below the primary unit, wire in series with the primary unit, and provide with a manual reset device.

d. Provide steam pressure gauge, range to suit operating pressure, on the boiler front, including siphon, cock and test connection.

e. Steam safety valve of type and size to comply with ASME Code requirements.

f. Two bottom blowdown connections, one at the bottom front and one at the bottom rear of the vessel.

g. A minimum of [_____] surface blowdown connection[s].

2.4.8 Prevention of Rust

Unless otherwise specified, factory prime paint surfaces of ferrous metal subject to corrosion with a rust-inhibiting coating and subsequently factory finish paint in accordance with the manufacturer's standard practice. Prime and finish paint equipment exposed to high temperature when in service with the manufacturer's standard heat resistant paint to a minimum thickness of 0.025 mm 1 mil. Do not paint internal surfaces of tubes and piping that will not be in storage more than three months prior to being placed in service, but coat with a water soluble pipe oil for rust protection. Do not coat surfaces which will be exposed directly to the flue gases (fireside furnace surfaces, OD surface of convection pass surfaces, inside of flues and ducts) with a high temperature heat resistant paint, but protect with a suitable coat of the manufacturer's standard primer. Paint surfaces that will be covered by insulation and lagging with a high temperature heat resistant paint.

2.4.9 Factory Coating

Factory finish equipment and component items, when fabricated from ferrous metal, with the manufacturer's standard finish unless otherwise specified.
2.5 FUEL BURNING EQUIPMENT

**************************************************************************
NOTE: Determine the boiler emissions NOx requirements. Boiler emissions must comply with local environmental permits. State regulations may be more stringent than Federal Regulations. Delete flue gas recirculation (FGR) if not required.
**************************************************************************

Provide fuel burning equipment complete with flame safeguard system, forced draft low NOx burner, combustion air windbox, piping, fuel trains and instrumentation supplied as a factory assembled and mounted package on the boiler front. Provide packaged burner capable of firing the boiler at a continuous rating as scheduled, using [natural gas at 69 Pa 10 psi] [No. 2 [4] [6] fuel oil] as an [integral] [combination] unit[.] [suitable for firing either fuel separately, designed to permit a quick changeover without modification of equipment]. Incorporate provisions for withdrawing, shielding or otherwise preventing the oil burner from cooking while firing gas. Apply emissions guarantees through specified turndown range. Utilize flue gas recirculation to lower emissions, but limit to 15 percent and induce by the combustion air fan. Provide burner with a stable flame over the turndown range. Ensure primary air spinner zone, zone divider and main burner are removable without removing the entire register or windbox. Provide register front plate with a swivel scanner and observation port. Submit an Environmental Permit Compliance certificate regarding the boiler emissions.

2.5.1 Pilot

**************************************************************************
NOTE: Select one type of pilot (natural gas, liquified petroleum gas or fuel oil) and remove the others.
**************************************************************************

a. Provide natural gas-electric type pilot burner with the capacity required to reliably light off the boiler. Supply a 6,000 volt secondary side ignition transformer and mount backside of the windbox.

b. Provide liquefied petroleum gas (LPG) type pilot. Locate two 18 kg 40 lb cylinders on concrete pads outside of the building as shown. Include manifold and valves for cylinders to allow removal and filling of one tank without interrupting service to pilot. Provide regulators and gauges with adequate capacity to serve pilot.

c. Provide straight mechanical or atomizing type pilot as specified for the burner. Design pilot system to fire No. 2 oil and provide complete with fuel oil pump, safety shut-off valve, integral metallic screen strainers and a cartridge type filter. Provide ignition transformer rated at no less than 10,000 volts on the secondary side.

d. Make provision in the burner housing for inspection of the pilot flame.

e. Provide pilot with individual manual shut-off valve, pressure gauge, pressure regulation separate from the main burner, self closing solenoid valve and vent valve in accordance with FM APP GUIDE and UL 795. Provide pilot and valving in accordance with NFPA 85.
2.5.2 Burner Refractory Throat

Make burner refractory throat of high quality castable refractory suitable for 1650 degrees C 3000 degrees F. Ship the precast refractory in a steel retaining ring with stainless steel anchors separately for field mounting on the boiler. Burner refractory throat must be concentric with the burner, contoured to ensure complete mixing of [air and natural gas] [air and oil] [air and natural gas and air and oil], and designed to assist in complete combustion by radiating heat to the fuel. Position burner so that the flame parallels the contour of the burner refractory throat but avoids striking the refractory.

2.5.3 Windbox

**************************************************************************
NOTE: Intent is to provide capability for flue gas recirculation (FGR) on all boilers specified, either for present use or future installation.
**************************************************************************

Windbox must provide even airflow. Windbox must not interfere with boiler smoke box door operation and have a flange bottom for easy firm mounting on a support structure. Provide windbox with an induced flue gas recirculation (FGR) inlet adaptor assembly.

2.5.4 Combustion Air Fan

Use centrifugal type combustion air fan with backwardly inclined air foil bladed wheel. Provide combustion air-fan wheel which is directly driven by a TEFC NEMA frame motor and complete with inlet cone and screen and flange outlet. Mount bottom flanged combustion air fan on same structural member as windbox. Size combustion air-fan to provide sufficient static pressure to overcome system losses when providing 15 percent excess air at maximum firing rate, plus the amount of flue gas induced to comply with the NOx emission requirements.

2.5.5 Combustion Air Damper

Provide flanged combustion air damper and locate between combustion air fan and windbox. Provide combustion air damper suitable for specified turndown and provide same turndown performance when up to 15 percent flue gas is induced and mixed in the airstream.

2.5.6 Fuel Oil Burner

Provide [mechanical pressure atomizing] [steam atomizing][air atomizing] type fuel oil burner conforming to UL 296, UL 726 and NFPA 85, capable of burning [heated] [unheated] [No. 6] [No. 4] [No. 2] fuel oil. Ensure fuel oil burner is capable of firing boiler to maximum capacity with turndown range of [eight (8) to one (1) for boiler above 2452 kW 250 horsepower] [four (4) to one (1) for boiler 2452 kW 250 horsepower or less]. Provide fuel oil burner that is quiet in operation without blowtorch effect or tendency to localize heat at any one part of combustion chamber and without depositing unburned oil on any part of combustion chamber or boiler. Ensure fuel oil burner is easily moved out of firing position for cleaning, inspection, adjustment and maintenance.
2.5.7 Natural Gas Burner

Natural gas burner must be a multi-spud burner with gas feed pipe in center of air register for easy removal. Provide forced draft type natural gas burner suitable for efficiently burning natural gas having a calorific value of [_____] Joules per cubic meter Btu per cubic foot when supplied at a pressure of approximately [_____] kPa psig. Discharge natural gas in burner throat area. Natural gas-air premix or natural gas discharged outside of burner throat are not acceptable. Main natural gas burner must be capable of firing the boiler to maximum capacity with a turndown of [ten (10) to one (1) for boilers above 2452 kW 250 horsepower] [four (4) to one (1) for boilers 2452 kW 250 horsepower or less].

2.5.8 Flame Safeguard System

**************************************************************************
NOTE: Edit for fuel choice and select appropriate options.
**************************************************************************

a. Provide flame safeguard system that is manufactured by burner manufacturer and mount in boiler control panel as a panel insert. Provide UL listed flame safeguard system components. Provide complete and automatic flame safeguard system in accordance with NFPA requirements safe start-up, on-line operation and shut-down of package burner.

b. Provide micro-processor based flame safeguard system including, but not limited to, automatic burner sequencing, flame supervision, status indication, fire-out annunciation and self diagnostics.

c. House overcurrent protective devices, and motor starters for the combustion air fan motor, burner damper motor and electric oil heater. Also include control transformers and an RS-232C serial communication port.

d. Flame scanner must not require a separate purge air supply. Connect flame scanner output signal to flame amplifier module in microprocessor based unit. Within four seconds after loss of flame, flame safeguard controller must shut the automatic safety shut-off fuel valve[s] [and open the gas automatic vent valve]. Display flame failure signal on flame safeguard display or burner control panel.

e. Provide logic with flame safeguard system to:
   (1) Prevent introduction of igniter flame (pilot) or main fuel flame to furnace until furnace, boiler passes, breeching and stack have been purged of combustible gases.
   (2) Prevent opening of automatic fuel shut-off valves in main fuel line until igniter flame is proven.
   (3) Limit trial for main fuel ignition to ten (10) seconds from time igniter flame is proven.
   (4) In event of burner failure, require operator intervention to manually reset flame safeguard controller prior to restart.

f. Provide first-out annunciation by an expansion module. Announce
alarms and flame-outs individually at panel front and transmit along
with other process points monitored by the panel to [Central Monitoring
System (CMS)] [Supervisory Computer Workstation[s]] for graphic
display. At a minimum, annunciate the following points individually by
flame safeguard system:

(1) Low water level.
(2) Low water cutoff.
(3) High water level.
(4) High steam pressure.
(5) Low atomizing [steam pressure] [or] [air pressure].
(6) Low fuel oil pressure.
(7) Low fuel oil temperature.
(8) High natural gas pressure.
(9) Low oxygen concentration.

g. Provide flame safeguard system cabinet with [natural gas] [No. 6] [No.
4] [and] [No. 2] oil fuel selector. Integrate selector into controls
such that when No. 2 oil is selected, low oil temperature switch [and
electric heater] [is] [are] taken off line from oil train.

h. Also provide indicating lights for the following:

(1) Limits satisfied.
(2) Purging.
(3) Pilot ON.
(4) Main flame ON.
(5) Flame failure.
(6) Fuel oil ON.
(7) Natural gas ON.

i. Provide industrial, oil-tight construction indicating pilot lights with
push-to-test feature or "All-Pilot Lights" test button.

2.5.9 Boiler Piping Trains

**************************************************************************
NOTE: Delete oil heater, oil temperature switches
and oil temperature gauge for plants which will not
burn oil heavier than No. 2 fuel oil now or in the
near future. When heavy oil is burned, steam is
typically used to heat it nearly to burning
temperature and electric heat is used for trimming
(approx. 11 to 17 degrees C 20 to 30 degrees F).
However, full capacity electric oil heating (approx.
56 degrees C 100 degrees F rise) or other independent heat source is needed to cold-start the plant. Cold start capability should be provided for at least two boilers for multiple boiler plants. If the plant is operable on emergency power, consideration should be given to supplying the full capacity electric oil heaters from the emergency source.

Provide completely prepiped piping train, wire and mount on boiler. Provide [fuel oil and [steam] [air] atomizing systems] [and] [natural gas] train in accordance with NFPA and FM standards and requirements and including, but not limited, to the following items:

2.5.9.1 Fuel Oil Train

a. **NFPA 31.**

b. Adjustable fuel oil pressure regulating and relief device.

c. Fuel oil flow control valve with characterizing adjustments to match airflow.

d. Dual (NC) motorized oil shut-off valve with proof of closure.

e. Low fuel oil pressure switch.

f. Fuel oil flow transmitter.

g. Fuel oil pressure gauge for fuel oil supply and burner pressure.

h. Manual shut-off valves at connections to supply and return headers.

i. "Y" type strainer.

j. Fuel oil check valve.

k. High fuel oil temperature switch.

l. Low fuel oil temperature switch.

m. Fuel oil temperature gauge.

n. Electric fuel oil preheater capable of raising oil temperature 56 degrees C 100 degrees F at rated firing rate and comply with UL 574.

2.5.9.2 Steam Atomizing Train

b. Y-type strainer in atomizing steam line.

c. Automatic shut-off solenoid and check valve in atomizing steam branch line to allow automatic purging of burner.

d. Check valve to prevent backflow in steam line.

e. Pressure gauge with isolating valve for servicing in atomizing steam
supply and at burner.

f. Solenoid shut-off valve to close when burner shuts down.

g. One self-contained pressure regulating valve to maintain atomizing steam pressure.

h. Low atomization steam pressure switch.

i. Steam trap.

2.5.9.3 Air Atomizing Train

a. Manual shutoff valve at connection to atomizing supply.

b. Y-Type strainer in atomizing air line.

c. Automatic shutoff solenoid and check valve in atomizing air line to allow automatic purging of burner.

d. Check valve to prevent backflow in air line.

e. Pressure gauge with isolation valve for servicing in atomizing air supply and at burner.

f. Solenoid shutoff valve to close when the burner shuts off.

g. One self-contained pressure regulating valve to maintain atomizing air pressure.

h. Low atomization air pressure switch.

2.5.9.4 Natural Gas Trains

a. NFPA 54.

b. Natural gas flow control valve with characterizing adjustments to match airflow.

c. Manual shut-off valve (NO) at supply and discharge of vent and drain valves.

d. Manual shut-off valve (NO) at igniter natural gas supply and discharge of vent and drain valve.

e. Y-type strainer supplied in igniter natural gas and main natural gas lines.

f. Two (NC) solenoid safety shut-off valves, in series, in igniter line with one (NO) solenoid vent valve located between safety shut-off valves, piped to atmosphere through the roof.

g. Two shut-off valves with proof of closure, piped in series in main gas line with one (NO) solenoid vent valve located between safety shut-off valves, piped to atmosphere through the roof.

h. One pressure regulating valve in igniter natural gas line to regulate natural gas pressure to igniter.
i. One pressure regulating valve to regulate main natural gas pressure at natural gas train inlet.

j. Natural gas meter.

k. Natural gas flow transmitter for main natural gas to burner.

l. Pressure gauge, with shut-off valve for main natural gas supply.

m. Pressure gauge, with shut-off valve for main natural gas at burner.

n. Pressure gauge, with shut-off valve for natural gas supply to igniter.

o. Pressure gauge, with shut-off valve for natural gas igniter.

p. Low natural gas pressure switch.

q. High natural gas pressure switch.

2.6 CONTROLS

**************************************************************************
NOTE: This paragraph specifies several levels of available control systems. Bracketed text or section denotes designer's options. The base level of required controls is an integrated system of local control and monitoring panels. An upgrade to this system would include a remote supervisory workstation to monitor and alarm functions of the boiler plant via a network controller LAN.
**************************************************************************

a. Provide boiler controller and plant master controller systems, and other sub-control systems specified herein by a single control manufacturer.

b. For multiple boiler installation, boiler No. 1 control panel must act as the plant master control and contain controls common to all boilers. Provide interfaces between flame safeguard, combustion control and burners.

c. Provide electronic, solid state, microprocessor type system components. Operate control components on 120 VAC power.

d. Provide 4-20 mA DC analog signals to and from field-mounted devices. Provide [4-20 mA] [1-5V] DC analog signals between rack or panel-mounted devices.

2.6.1 Instrument System

Power instrument systems by 120 volts alternating current, 60 Hertz or 24 volts direct current 2-wire system. The 24 volts direct current powered systems must receive power from the central control system. Provide instrument enclosures conforming to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Transmitter output signals must be 4 to 20 mADC.

2.6.2 Indicating Instruments

Provide indicating instruments that have the normal operating point marked
in green on instrument. Provide transmitters which include output meters in integrally mounted housings. Ensure calibration is set by manufacturer, and adjustment access is internal only.

2.6.3 Factory Tests

Inspect, calibrate, and test instruments, units, and other accessories. Calibrate to manufacturer's standard for accuracy of input versus output. Submit *Certificates of inspection, test, and calibration* tags of instrumentation to be used during boiler acceptance test ensuring compliance with standards; certificate of compliance with applicable codes after boiler installation and one certificate for each boiler. Control system manufacturer must configure, program, stage, and burn-in the control system prior to shipment to construction site. Perform programming of configuration and constants data at this time, and store on disks. Perform burn-in for a minimum of 10 days of continuous operation. The Government reserves right to witness factory tests. Give a thirty-day advance notice to the Government prior to commencing any factory tests.

2.6.4 Sequence of Operation

a. Using plant master controller vary firing rate of [all] boiler[s] [in parallel]. Plant master controller must receive a pressure signal from main steam header and generate a signal to drive boiler master controller[s].

b. Boiler master controller must increase or decrease firing rate based on comparison to setpoint.

c. Provide steam pressure control including proportional plus reset control modes.

d. Integrate combustion controls fully with flame safeguard system to assure low-fire startup and complete purge regardless of boiler master output signal.

e. Ensure combustion control strategy is single point positioning with oxygen trim.

f. Control boiler firing rate by actuating burner jackshaft drive motor to move jackshaft that mechanically links fuel and combustion airflow.

g. Accomplish boiler oxygen trim by modulating combustion air damper to alter fuel-air ratio based on input from oxygen analyzer.

h. Ensure control loops include manual-automatic stations to provide for control of system. Provide each manual-automatic station with a built in indicator to graphically depict variable being controlled.

i. Arrange control system so that failure of control system for one boiler does not affect automatic and manual operation of other boilers. Electrically isolate common electrical signals in each boiler section.

2.6.5 Enclosures

a. Provide free-standing or boiler-mounted factory-assembled steel enclosure with indicators, control switches, flame safeguard cabinet and indicating lights on cabinet front and relays and other components mounted on interior subbases for each boiler. For multiple boiler
installations, the boiler No. 1 panel must contain controls common to all boilers. Provide enclosure with locking doors and complying with NEMA ICS 6.

b. Provide NEMA 12, 11 gage steel enclosure, consisting of all welded construction with minimum radius corners, stiffened as required and framed with angles. Construct door of 14 gage steel with key-locking vault handle and three (3)point latches. Ensure doors are fully gasketed.

c. Clean, phosphatize, prime and finish metal surfaces. Interior must be glass white enamel. Exterior must be gray texture polyurethane enamel to provide resistance to fuel oil, solvents and abrasion. Provide engraved plastic laminated nameplates for devices on the front of the cabinet except where devices themselves are provided with a service engraving. Provide nameplates with white letters on a black background and minimum height of 6.5 mm 0.25 inch, mount with screws or epoxy or secure by pilot light or switch. Ensure doors are fully gasketed.

d. Support enclosure mounted devices properly, front and rear and must occupy the upper portion of the enclosure front.

e. Provide enclosure wiring in compliance with acceptable standard panel practice.

f. The 120 volt, 60 Hz circuit wiring must be number 16 AWG minimum, THWN 600 volt insulation, color coded. Signal circuits, less than 50 volts, must be number 18 AWG minimum or number 20 AWG in multi-conductor cable.

g. Wire devices requiring power so that when wires are removed from one device, power will not be interrupted to other devices. Wire enclosure-mounted devices to numbered lug and screw terminals so that field wiring can easily be terminated in the panel.

h. Supply signal common and power common buses. Connect signal common to earth ground at one point.

2.6.6 Controllers

**************************************************************************
NOTE: Single loop controllers are specified. Consider programmable logic controllers (PLCs) as an option.
**************************************************************************

a. Provide microprocessor-based controller of single loop design. Flush-mount controller with splash-proof mylar faces in control cabinet. Provide membrane type operator pushbuttons with tactile feedback. Provide a 4-1/2 digit numeric display on front of controller.

b. Provide two bar graphs on the front of controller to give an analog interpretation of process variables, setpoints or deviation. Ensure these are of the 100 segment LED type. Provide a dedicated 20 segment LED bar graph for the controller main output.

c. Provide each controller that drives a final control device (damper, valve or other) with a hard manual backup station to ensure operator control in the event of a memory failure or service requirement.
d. Provide controller output logic including proportional, plus integral, plus derivative (PID) modes.

e. Multiple loops on single controller are not acceptable. During integral hard manual backup mode, ensure operator has control of output via up-down pushbutton and output indication.

f. Should the controller or memory fail, controller must deenergize a dead-man relay and alert operator to use backup station.

g. Backup station may be separate station or may be integral to main controller. If Integral, backup circuitry must function when controller is removed for servicing.

h. Provide controller capable of being configured in field without use of external computers, hand-held terminals, EPROM programmers or other devices.

i. Accomplish configuration changes and tuning adjustments by means of key pad on controller front. Protect controller digital circuitry from power surges and spikes by optical isolation or by uninterruptible power supply.

j. Maintain configuration in (2) removable battery backed RAM chips. Failure in primary memory must cause backup memory to be downloaded automatically.

k. Equipment Controller Self-Tuning PID Loop Routine

(2) The tuning utility must display following information on display upon operator request: Control loop being tuned, Input process variable, Output control variable, setpoint of loop, Integral reset interval, and Proportional band, Derivative rate interval.

(3) Display above information on supervisory workstation in graphic format with automatic scaling such that the input and output variable are superimposed on a graph of time versus variable. Ensure program allows operator to affect output variable by modifying setpoint, and tuning parameters, and view results on display.

(4) Automatic Tuning: Provide controller with on-line or manual utility to disturb process. Monitor the results and calculate new parameters for sample interval, Proportional band, Integral gain, and Derivative gain. Ensure utility is usable during commissioning process to establish reasonable values, then turned off.

(5) Adaptive Tuning: Provide controller with on-line utility which may run continuously.

(6) Initiate adaptive tuning automatically whenever operator-defined change in the process input variable is detected. Utility must
monitor process (control loop) after natural disturbance, and automatically recalculate Proportional gain, Integral gain, and Derivative gain. Use this utility to keep a system tuned, as the equipment ages and occupancy and loads change, after commissioning.

1. The tuning utility must display following information on the CRT upon operator request:

   (1) Adaptive control is enabled or disabled.

   (2) Maximum bump: output step change required to produce a change in input, greater than noise level, but not so great as to damage equipment.

   (3) Setting time: time it takes PID output process variable to settle down after a process disturbance. For automatic tuning, time interval between setting PID output to control point and beginning of tuning cycle. For adaptive tuning, minimum time that will be observed between parameter calculations.

   (4) Maximum overshoot: percent allowed.

   (5) Target damping: desired reduction in process variable overshoot from first overshoot (maximum overshoot) to second, in percent.

   (6) Noise band: minimum process variable perturbation that will initiate adaptive calculation of PID parameters, in percent of input range.

2.6.7 Plant Master Controller

a. Plant master controller [must match individual boiler master controller[s] and] must provide for proportional, integral, and derivative (PID) control of firing rate demand based on steam header pressure. [Locate plant master controller in the boiler No.1 cabinet.] The output of the plant master controller must go to the boiler master plant master controller. Provide digital display of the following:

   (1) Controller output.

   (2) Steam pressure.

   (3) Steam pressure setpoint.

   (4) Outdoor temperature.

   (5) Total plant steam flow.

b. Provide inputs as follows:

   (1) Steam pressure (Analog).

   (2) Steam flow signal from individual boiler (Analog.)
(3) Outdoor temperature (Analog).

(4) Fuel oil temperature (Analog).

(5) Fuel oil pressure (Analog).

(6) Natural Gas pressure (Analog).

c. Provide outputs as follows:

(1) Boiler master signal (Analog).

(2) Total plant steam flow.

(3) Totalized steam flow pulse.

d. Provide controller with protocol converter/gateway with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory computer workstation.]

2.6.8 Boiler Master Controller

a. Provide each boiler with a boiler master controller. Control jackshaft in response to plant master demand signal or in response to boiler pressure and local setpoint. Use primary analog output to modulate jackshaft actuator of boiler. Logic required to ensure that prepurge, postpurge, lightoff and burner modulate cycles are handled correctly and according to local regulation is the burner manufacturer's responsibility. Controller digital display must include the following in their respective engineering units:

(1) Controller output.

(2) Natural Gas flow.

(3) Fuel Oil flow.

(4) Local setpoint.

b. Controller inputs are:

(1) Plant master signal.

(2) Steam flow.

(3) Steam pressure (Analog).

(4) Natural gas flow (Analog).

(5) Fuel oil flow (Analog).

(6) Firing rate hold (Contact).

(7) Purge from flame safeguard system (Contact).

(8) Auto from flame safeguard system (Contact).
(9) Remote alarm silence (Contact).

c. Controller outputs are:

(1) Jackshaft drive (Analog).
(2) Remote audible alarm (Contact).
(3) Flow pulse for natural gas flow totalizer (Contact).
(4) Pulse for fuel oil flow totalizer (Contact).

d. Provide controllers with protocol converter/gateways with an TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory computer workstation.]

2.6.9 Feedwater Controller

********************************************
NOTE: Specify two-element boiler water level control for smaller capacity plants with relatively stable loads, such as space heating. Specify three-element control for larger capacity plants and unstable loads, such as industrial process and Navy pier facilities.
********************************************

a. Feedwater controller must match other controllers in system and provide [two] [three] element PID control of boiler water level in response to changing boiler level and feed forward signal of steam flow. Automatically switch to single element feedwater control strategy during cold startup when steam and feedwater flow signals are not active. Ensure controller digital displays are as follows in their respective engineering units:

(1) Controller output.
(2) Water level.
(4) Steam flow.
(5) Feed water flow.

b. Controller inputs are:

(1) Water level.
(2) Steam flow.
(3) Feed water flow.
(4) Remote alarm silence (Contact).

c. Controller outputs are:

(1) Feedwater control valve (Analog).
(2) Remote audible alarm (Contact).
(3) Steam flow (Analog).

d. Provide controllers with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory computer workstation.]

2.6.10 Draft Controller

a. Draft controller must match other controllers in system and have capability of PI control of furnace draft in response to changing furnace pressure and feed forward signal of boiler load.

b. Control system includes logic required to interface with flame safeguard system so as to insure that prepurge, postpurge, lightoff and burner modulate cycles are handled correctly and in accordance with local regulations.

c. Provide controller with characterizable setpoint curves for feed forward signal based on load.

d. Ensure controller digital displays are as follows in their respective engineering units:

(1). Controller output.

(2) Furnace draft.

(3) Furnace draft setpoint.

e. Controller inputs are:

(1) Jackshaft output (Analog)

(2) Furnace draft (Analog).

(3) Purge from flame safeguard system (Contact).

(4) Auto from flame safeguard system (Contact).

(5) Remote alarm silence (Contact).

f. Controller outputs are:

(1) Flue gas damper actuator (Analog).

(2) Remote audible alarm (Contact).

g. Provide controller with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory computer workstation.].

2.6.11 Oxygen Trim Controller

a. Oxygen trim controllers must match other controllers in the system and have the capability of PID control of fuel/air ratio in response to flue gas oxygen content.
b. Provide controller capable of calculating and displaying boiler efficiency using ASME "By Losses" method.

c. Control system includes logic required to interface with flame safeguard system so as to ensure the prepurge, postpurge, lightoff and burner modulation cycles are handled correctly and in accordance with local regulations.

d. Ensure controller digital displays are as follows in their respective engineering units:

   (1) Controller output.
   (2) Flue gas temperature.
   (3) Combustion air temperature.
   (4) Boiler efficiency.
   (5) Flue gas oxygen percentage.
   (6) Jackshaft position.

e. Controller inputs are:

   (1) Fuel flow (oil or natural gas) (Analog).
   (2) Flue gas temperature (Analog).
   (3) Flue gas oxygen (Analog).
   (4) Combustion air temperature (Analog).
   (5) Fuel selection (Contact).
   (6) Remote alarm silence (Contact).
   (7) Jackshaft position (Analog).

f. Controller outputs are:

   (1) Oxygen trim actuator (Analog).
   (2) Boiler efficiency.
   (3) Remote audible alarm (Contact).

g. Provide controllers with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory workstation.]

2.6.12 Alarm Annunciator

a. Provide each boiler master panel with single horn and single alarm silencing pushbutton. Provide first out alarm annunciation for following alarm points to activate alarm horn:
(1) Low steam pressure.
(2) High steam pressure.
(3) Low water level.
(4) Low oxygen.
(5) Low draft.
(6) Low efficiency.
(7) High flue gas temperature.
(8) High opacity.

b. Each alarm condition must activate separate visual indication to allow operator to locate cause of alarm. This may be accomplished with first out annunciator having labeled windows and individual clearly labeled lights or with microprocessor based English language alarm message display. Sound horn for every new alarm, even if previously silenced.

c. Provide controllers with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory workstation.]

2.6.13 Opacity Monitor

a. Provide double pass system to provide continuous stack opacity indication.

b. Provide system consisting of transceiver and retro-reflector module mounted on opposite sides of the stack, and electronic monitor.

c. Use bi-directional digital communications link to connect electronics processor and transceiver module.

d. Provide transceiver with backlit pushbutton for calibration offline.

e. Provide light source and receiver with air purge system for use with plant air.

f. Ensure electronics withstand air failures and maintain on-line service without shutdown. Provide field-mounted device in NEMA 4 enclosure.

g. Ensure system is suitable for operation on 120 volt single-phase power.

h. Provide system in compliance with latest requirements of [____] City air pollution control code, [____] City engineering criteria for fuel burning equipment and [____] State Department of Environmental Protection Opacity Monitoring Requirements.

i. When performing on-stack calibration, check each component of opacity system including: light, source, receiver, optics on stack and associated electronics.

j. Provide a minimum of two (2) months unattended operation. At selected intervals the system must perform fully automatic, on-stack calibration
including zero and span. Automatically and continuously correct the measurement for variations in temperature, line voltage, lamp aging and component drift. Provide dirty lens detection system with alarm and four independently selectable optical density filters with range switches. System must sample and mold control output during calibration.

k. The output from the system includes:

1. 4-20 mADC output.
2. Digital display of opacity.
3. Two digital violation occurrence meters, one for total elapsed time and one for number of occurrences.

l. Program is as follows: When opacity exceeds setpoint, instant flashing alert light signals; at 20 seconds, alarm light lights and contacts close. At 60 seconds, lights and contacts lock and require manual reset.

2.6.14 Vertical Scale Indicators

Provide vertical scale indicators that are 150 mm 6 inches high for steam header pressure, outdoor air temperature and combustion air temperature.

2.6.15 Digital Indicators

Provide oversized digital indicators for fuel oil flow and gas flow. [At manufacturer option, controller displays may be used if they show each value in engineering units, include 16 character alphanumeric display describing what is displayed and include dedicated bar graph that can be used for each value.]

2.6.16 Draft Gauge

Mount draft gauges for wind box, combustion chamber and last boiler pass on panel front. Field verify operating ranges for draft gauges with normal reading in middle of scale range. Include piping between gauge and boiler with three (3) way cocks for shutoff and zero check.

2.6.17 Recorder

a. Provide circular chart type recorder with direct reading having evenly divided graduation. Drive charts by 120 volt, 60 Hz motors. Provide pens with different color ink and arrange to pass each other without interference. Each chart must show 24 hours.

b. Record up to four points. Ensure recorder unit is fully programmable in order that each channel can be configured to accept 4-20 mA DC voltage, thermocouple and RTD inputs. Ensure nonlinear inputs are linearized and make provisions for special linearizations.

c. In addition to recording, make provisions for individual 16 character tags and messages per channel and provide up to four integrators which are selectable either as reset or non-reset type. Fit each channel with two alarms selectable as absolute, rate of change or deviation.

d. Measure the following points:
(1) Steam flow.
(2) Percent oxygen.
(3) Flue gas temperature.
(4) Opacity.

e. Provide recorder with protocol converter/gateways with TIA-485 multi-drop communications port for controller LAN network interconnection to field panel controllers [and to supervisory workstation.]

2.6.18 Totalizer

Provide eight-digit, non-resettable totalizers for: natural gas, fuel oil and steam flow flush-mounted in each boiler control panel. Display directly in engineering units. Only powers of ten (10) are allowable as scale factors. Back up power by a lithium battery with a life span of no less than 8 years. [Smart transmitters may be used to communicate to associated controllers on a device level network LAN. Smart transmitters are not allowed to reside on controller LAN]

2.7 FIELD DEVICES

Furnish and install the following field devices to provide a complete working system.

2.7.1 Oxygen Analyzer

**************************************************************************
NOTE: Consider specifying a reference and calibration gas system for plants having two or more boilers at 11,700 kW 40,000 lb/hr or greater capacity. Otherwise, delete.
**************************************************************************

a. Provide oxygen analyzer for each boiler. Stack-mount oxygen analyzer and utilize zirconium sensing element. Insert sensing element directly in flue gas stream and in direct contact with process gases. Contain sensing element within a protective housing mounted to flue gas outlet by means of adapter plate, both furnished by manufacturer.

b. Equip oxygen analyzer to allow daily calibration check without removing analyzer from process.

c. Sample gases may be injected directly on sensing element while analyzer is in process.

d. In order to eliminate temperature effect of flue gases, provide externally-mounted temperature controller. Provide isolated 4-20 mA DC temperature controller output representing 0-10 percent oxygen content as linear function.

e. Provide reference and calibration gas system for each boiler consisting of gas supply, regulator with relief valve, gauge and necessary valving and piping. Provide electrical power connections and piping for distribution to calibration gas connection on each analyzer.
2.7.2 Fuel Oil Flow Transmitter

a. Provide fuel oil flow transmitter for each fuel oil flow meter. Ensure transmitter output is isolated 4-20 mA dc.

b. Connect panel-mounted totalizer to transmitter. Provide necessary signal conditioning devices to integrate fuel oil flow transmitter with control and recording instrument panels.

c. Smart transmitters may be used to communicate to associated controllers on device level network LAN. Smart transmitters are not allowed to reside on controller LAN.

2.7.3 Natural Gas Flow Transmitter

Provide natural gas flow transmitter for each natural gas meter. Smart transmitters may be used to communicate to associated controllers on device level network LAN. Smart transmitters are not allowed to reside on controller LAN.

2.7.4 Steam Flow Meter-Transmitter

a. Provide steam flow meter-transmitter consisting of a Vortex-Bar meter probe designed for pipe insertion type installation by means of hot tap or other non-disruptive method. Measure media flow by means of a vortex shedding flow element located in flow stream.

b. Provide steam flow meter-transmitter with sliding-type stem passing through two pressure seals allowing proper positioning of sensor in flow stream and isolation valve so that transmitter can be completely removed from pipeline without disruption of process. Supply steam flow meter with a two-wire preamplifier with analog 4 to 20 mA dc output signal.

c. Meet the following performance criteria:

(1) Pressure Rating: To [950 kPa 125 psig] [205 degrees C 400 degrees F] [______].

(2) Seals: Teflon.

(3) Wetted Parts: Type 316 stainless steel with 304 stainless steel body.

(5) Linearity: Plus or minus 1.0 percent (to 24 mA output).

(6) Repeatability: Plus or minus 0.25 percent at maximum.

(7) Current Limit: To approximately 30 mA.

d. Meet the following materials of construction criteria:

(1) Sensor: Type 316 stainless steel.

(2) Sensor Support: Type 304 stainless steel.
(3) Bushings: Stellite or stainless steel hardened with stellite.

(4) Stem: 300 Series stainless steel.

e. Provide with steam flow meter-transmitter a full port gate valve with proper flanged connection that allows steam flow sensor to be inserted and removed from pipe under full pressure. Provide both valve and pipe tap with a minimum [48 mm 1.875 inches] internal diameter clearance.

g. Smart transmitters may be used to communicate to associated controllers on device level network LAN. Smart transmitters are not allowed to reside on controller LAN.

2.7.5 Temperature Transmitter

a. Provide platinum resistance temperature detector (RTD) temperature transmitter. Ensure resistance is 100 ohms at [0 degrees C 32 degrees F] with tolerances in accordance with BS 101-4 and DIN 43760.

b. Make connections to control cabinet via three identical copper conductors of No. 14 AWG minimum.

c. Insert RTD in protective sheath or well suitable for the environment.

d. Utilize platinum RTD input to provide 4-20 mA dc output to control cabinet. Ensure transmitter is plus/minus 0.2 percent accuracy of calibration span, to include combined effects of transmitter repeatability, hysteresis, linearity and adjustment resolution.

e. Smart transmitters may be used to communicate to associated controllers on device level network LAN. Smart transmitters are not allowed to reside on controller LAN.

f. Monitor the following temperatures.

(1) [Fuel oil (each boiler)].

(2) Flue gas (each boiler).

(3) Combustion air (each boiler).

(4) Outdoor air (one (1) per plant).

2.7.6 Electric Drive

a. Provide electric drive for jackshaft and flue gas dampers. Accept signal input from control system and provide feedback of actuator position by means of integral potentiometer. Include four adjustable end switches.

b. Provide electric drive with 90 degree rotation in 15 seconds and capable of [_____] Newton Meter ft-lbs of torque under continuous duty.

2.7.7 Pressure Transmitter

Provide pressure transmitter with 0.25 percent of full scale accuracy,
process fluid isolating diaphragms, 5:1 field calibration adjustability, NEMA 4 housing and 4-20 mA dc output. Provide pressure transmitter with a calibration valve manifold. Include an isolating siphon with pressure transmitter for steam service. Provide the following transmitters:

a. Steam pressure (one per plant).

[ b. Fuel oil pressure.]

[ c. Natural gas pressure.]

d. Furnace draft.

2.7.8 Differential Pressure Water Level Transmitter

a. Provide boiler with differential pressure type water level transmitter.

b. Provide differential pressure type water level transmitter with 0.25 of full scale accuracy, process fluid isolating diaphragms, 5:1 field calibration adjustability, NEMA 4 housing and 4-20 mA dc output.

[ c. Smart transmitters may be used to communicate to associated controllers on a device level network LAN. Smart transmitters are not allowed to reside on the controller LAN.]

2.7.9 Pressure Switch

Provide pressure switch with repetitive accuracy of plus or minus 1 percent of the operating range. Adjust pressure switch actuation over the operating range. Provide pressure switch with snap-action Form C contacts rated for the application.

2.7.10 Temperature Switch

Provide temperature switch with repetitive accuracy of plus or minus 1 percent of the operating range. Adjust temperature switch actuation over operating temperature range. Provide temperature switch with a snap-action Form C contacts rated for the application.

2.7.11 Oxygen Trim Drive

Provide oxygen trim drive that is the in-line piston type actuator in linkage from jackshaft to combustion air damper. Use oxygen trim drive to position combustion air damper based on signal from oxygen trim controller.

2.7.12 Supervisory Computer Workstation

**************************************************************************
NOTE: For new central steam plants or as an upgrade of existing central steam plants consider the following section to provide remote monitoring capability trend logging and graphical system interface.**************************************************************************

a. Provide dedicated monitoring and data collection system supervisory computer workstation, complete with custom software as specified. Collect and store data transmitted from system controllers and other sensing and monitoring devices, and log alarms. Use software described
to generate periodic reports. Data collection function takes priority over report generation function and do not interrupt by generation of reports.

b. Log data at five (5) second interval that is adjustable as required. In event of alarm condition or unusual plant operating condition, immediately initiate data logging.

c. Design supervisory computer workstation computer such that a failure of the CPU, the storage disk, or any other device does not result in the loss of any previously stored data.

d. Include the computer, keyboard, printer, monitor, and other peripherals and locate as shown. Provide cabling between the work station and the system controllers. Provide all prefabricated cabling required between the work station and peripheral devices.

e. Ensure authorized personnel is capable of editing and modifying programs with access code. Provide password protection for all levels of access. Ensure multiple level password protection system is acceptable to the Owner.

f. Ensure supervisory computer workstation computer is a microprocessor based personal computer. Provide computer with eight expansion slots. Ensure computer is Microsoft Windows (R) compatible, each with a floppy disk drive, 17 inch high resolution SVGA color monitor for graphic displays. Provide hard disk drive with sufficient capacity to perform required data substitution routines without accessing other data storage media. [Provide a 650 MB CD-RW reader-writer-rewriter drive with minimum of 8X write, 4X rewrite and 24X read speeds and 25 preformatted rewritable and 100 preformatted writable CD media disks or archival and routine backup.] Include the following minimum equipment as part of the supervisory computer workstation:

(1) Intel Pentium III Class 633 Mhz Micro Processor or approved equal.

(2) 128 MB RAM.

(3) 4 MB RAM video adapter.

(4) [20] [_____] GB hard disk.

(5) 2 Parallel Ports.

(6) 2 Universal Serial Bus (USB) Ports.

(7) 56,600 Baud Modem.

(8) Synchronous adapter with dual port compatible with supervisory computer workstation interface hardware.

(9) Equip the keyboard with thirty-two function keys with custom legends for each key, to allow report generation, graphic display selection, alarm silencing, and data retrieval with single key strokes. Provide keyboard with a high resolution track ball.

g. Provide the following additional peripheral equipment as shown:

(1) Inkjet printer, 1200 dpi by 1200 dpi, tri-color and black ink
cartridges or four ink cartridges (red, blue, yellow and black).

(2) Inkjet printer, 1200 dpi by 1200 dpi, dual ink cartridges (tri-color and black) or red, blue, yellow and black ink cartridges or color laser printer.

2.7.12.1 Software

**************************************************************************
NOTE: Text within brackets denotes the designer's options.
**************************************************************************

a. Provide software required for efficient operation of automatic system functions required by this specification. Software must be modular in design.

b. Provide available supervisory computer workstation application and system software with system, which resides in supervisory computer workstation computer. Unbundled software packages for which vendor can charge user extra fees, require dedicated work stations or require system rebooting for access, are unacceptable.

c. Provide licensing agreement from PC manufacturer for each software program or package specified to ensure customer support from PC manufacturer for each copy of software program or package provided at supervisory computer workstations.

d. Provide software in system consisting of both firmware, resident in the controller, and software resident in the supervisory computer workstation computer. Distribute architecture of system, application software and firmware with no single system component responsible for a control function for entire LAN. Provide each controller with the necessary firmware, control software and I/O capability to function independently in case of network failure. Ensure controller is able to stage, rotate and fully control the equipment during a communication failure with network LAN. Active control sequences are prohibited in supervisory computer workstation or central control unit. Provide workstation and controllers that are removable from system without loss of control function. Only alarm monitoring, long-term history collection and operator monitor, command, and edit functions may be lost.

e. Provide software upgrades while maintaining full operational control of loss of any operating features for five years after Government acceptance of system at no additional cost. Software upgrades include new versions, releases, upgrades and wholesale revisions in software. This does not include labor required to update graphic pages or revise control sequences, except as caused by revisions in software.

f. Provide necessary hardware, software and programming to allow remote access to system via the Internet. Access will allow user located off-site to view and monitor current conditions at site. Acceptable configurations are software program making the host PC accessible through the Internet or development of Internet web pages specifically for site.
2.7.12.2 Software Capabilities

[ a. Provide primary operator interface to system through graphical, object oriented, and interactive presentation using mouse and cursor for object selection and commands. Use Microsoft Windows based plant management software.]

[ b. Support pop-up windows for point commands. On selecting object with cursor, open up a window to present operator with choices corresponding to operator's password authorizations. These point commands include state changes, manual override of application software, test mode activation and test value entry. This window includes the point descriptor (name), the point hardware address and alarm status.]

[ c. Support pop-up windows for point editing. On selecting object with cursor, open up a window to present operator with a list of active point data base editors, if permitted by the operator's password level. Allow operator to modify basic parameters associated with a point, as well as access to programs assigned to the point such as time schedules, calculations, and events by selecting one of these editors.]

[ d. Base system on interactive prompts and choices, using dialogue boxes as opposed to memorization of commands, syntax or exact spellings. Use interactive prompt and choices approach in monitoring, issuing commands, and editing. Use command choices which entail clicking cursor to select correct work choice prompts, for example: ON-OFF, without typing in letters. Provide editing mode choices that prompt ranges or options, for example: 16 CHARACTERS for point name, or DIRECT-REVERSE for control action.]

[ e. Zoom: Make it possible for operator to locate system point to monitor status, issue commands, or edit associated database without knowledge of the point name, address, or associated controller, and without having to refer to a tree directory. Ensure operator is able to locate control points by, for example, zooming in on a floor in a building graphic or zooming in on a system in a floor plan graphic.]

f. Compile system software for faster execution speeds and offer the following features and capabilities.

(1) Input/Output Capabilities: From the connected supervisory computer workstation, the system operator must have ability to:

(2) Request displays of current values or status using a tabular [or graphic format.] [Use a global data base sorting utility which allows an expanded tabular display of only points on current graphic display.] This [expanded tabular] display must list point name, hardware address, dynamic state or value, alarm status, override and test mode status.

(3) Initiate logs and reports.

(4) Change analog limits.

(5) Change point input and output descriptors, status, alarm descriptors and engineering unit descriptors while system is on-line.

(6) Modify and set up maintenance scheduling parameters.
(7) Develop, modify, delete or display full range of color graphic displays. Ensure development, editing and display work is possible with system fully on-line and in full communications with the Controller LAN without disruption of system function.

(8) Select discrete or analog sample data from the field to be automatically archived in the assigned workstation. This archiving must occur even if workstation is running third party software such as word processing or electronic spreadsheets.

(9) Comprehensive report writer capability to sort and extract data from archived files and to generate finished custom reports. Initiate reports manually or print automatically. Provide system with capability to print reports on daily, weekly, monthly, yearly or scheduled basis. Provide capability for statistical data manipulation and extraction. As a minimum, the custom report writer must provide capability to generate following types of reports:

(a) Statistical detail reports

(b) Summary reports.

(c) Trend graphic plots.

(d) X-Y graphic plots.

(10) Ensure report function is on-line for both development and printout, and does not require export to a third party spreadsheet program for execution.

(11) [In addition to on-line function, ensure historical database is capable of being converted to Data Interchange Format (DIF) for use in spreadsheet for off-line manipulation. Ensure transmission to DIF files is manual or automatic based on operator selectable parameters including: time of day, frequency (daily, weekly, monthly, yearly), scheduled days (32 days minimum).]

(12) File transfer must support appending new data to existing file data.

(13) Print alarm annunciations and normal operator acknowledgments, action messages, system alarms, operator sign-on and sign-off. Operator control activities include the operator's initials in the printed and disk record. The data printer will be reserved for printing reports, page prints, and data base prints.

(14) Provide operator the option of selecting daily, weekly or monthly scheduled frequency to synchronize time and data in controllers from the supervisory computer workstation. Perform synchronization for dialup as well as direct connected locations. Accommodate automatic daylight savings time adjustments.

(15) Provide a feature to indicate audibly [and visually,] when Off-Normal conditions and messages exist.

(16) Ensure operator is able to request a summary of points on controller LAN currently in test mode or in off-normal condition.]
g. **Supervisory Computer Workstation:** The supervisory computer workstation must:

1. Accept data from Controller LAN on an as needed basis without having to scan entire network for updated point data.
2. Interrogate Controller LAN for updated point data as requested by operator.
3. Allow operator command of equipment connected to controllers.
4. Store duplicate data base on file for every controller and allow database to be downloaded to remote panel while system is on-line.
5. Develop, store and modify dynamic color graphics utilizing system supplied mouse and mouse supported software.
6. Provide data archiving of assigned points throughout system [and to support overlaid graphing of utilizing up to four (4) variables.]

h. **Alarm Processing:** Provide the following alarm processing features, all of which are definable through the input keyboard:

1. Each OFF-NORMAL condition must cause an alarm and appropriate message, including time and date of alarm, system and point descriptor and alarm condition. Ensure operator has the ability to select, at any time, which state or value are considered alarms and which alarms cause automatic dial-out to occur.
2. Display each critical alarm or change-of-state message. Store controller LAN network alarm messages on disk which may be reviewed on the display printed on operator selected printer at any time. Ensure it is possible to sort this alarm and change-of-state database by date, time or item fields.
3. Provide automatic user defined time delay of alarms during equipment start-up or shut-down.
4. Unacknowledged alarms will continue to blink even if alarm condition has returned to normal.
5. Only operator acknowledgment can remove the blinking alarm indication.
6. Operator workstation will notify an operator of an alarm condition in one or more points or controllers anywhere in the system.
7. Provide alarm notification consisting of an automatic print of the alarm condition.

i. **Prepared Historical Report:** Provide an on-line, historical, data base sort report utility with: Prompts to select data base sort by time, by date, by point or range of points with system supplied default values of 24 hours, today, all Controller LAN points, respectively. Prompts for activating "conditional" sorts, including: changes-of-state, alarms, returns to normal, operator sign on/off, operator
acknowledgements, command errors, program control of a point, test on/off, manual on/off, program control (Demand, Event) override, power restore, LAN reconfiguration, controller off line, time/data modifications and archive disk memory 90 percent full, 95 percent full and full. Single keystroke retrieval resulting in a report listing the most recent condition first, along with the time, date, address, name, condition type, and value. The supervisory computer workstation must provide functions listed below.

2.7.12.3 Graphics Screen Format

Submit graphics screen format showing process variable in engineering units, such as process variable setpoints, analog or digital input or output conditions, and to meet requirements of the Centralized Monitoring System of this specification. Include the proposed input conditions shown on flow diagrams created by the Contractor based on Drawings, including process and instrumentation drawings and shop drawings from boiler manufacturer.

2.7.12.4 Graphic Display

At a minimum, make the following screens available:

a. Plant overview.

b. Individual Boilers.

c. Individual controllers.

d. Display of all measured variables and setpoints.

2.7.12.5 Historical Trending

Provide system capable of storing values from transmitters as well as system computed values, such as efficiency and compensated flow rates, at selected intervals for archival storage and future analysis.

2.7.12.6 Totalization of Data

a. Provide system capable of totalizing the following data:

   (1) Steam Utilization.

   (2) Total Feedwater Flow.

   (3) Total Natural Gas Consumption.

   (4) Run Time for monitored motors.

   (5) Total Fuel Oil Consumption.

b. Run time logged for each motor driven equipment must enable the plant maintenance to schedule regular maintenance for each motor driven device. Once a motor driven device has been serviced or repaired as a part of regular maintenance or due to emergency, plant maintenance must be able to log servicing or repair data in the supervisory computer. Plant maintenance must also be capable of logging servicing or repair data for equipment monitored in the steam plant.
2.7.13 Centralized Monitoring System (CMS)

**************************************************************************
NOTE: The CMS paragraphs apply to existing plants without a supervisory computer workstation.
**************************************************************************

a. Use CMS for centralized monitoring and data acquisition of various plant variables.

b. Provide services required for installation, programming, testing and startup of system.

c. Employ industrial grade equipment in CMS that is Underwriter Laboratories (UL) listed.

d. Provide CMS to include, but not be limited to, the following functions:
   (1) System engineering.
   (2) System hardware.
   (3) System programming and configuring.
   (4) System documentation.
   (5) System installation.
   (6) System testing.
   (7) Packing and shipping.
   (8) Maintenance training program.
   (9) Operator training program.
   (10) System startup.
   (11) Scheduled system maintenance.
   (12) Attend construction review meetings and provide progress reports.

2.7.13.1 System Controller

a. Monitor various plant variables, log data and generate summary reports as required by plant operations. Provide system controller capable of data reduction and backup data logging. Perform data and alarm interfaces between CMS equipment and Government equipment at system controller.

b. Provide an industry standard programmable logic controller (PLC), or direct digital controller (DDC), rack mounted in NEMA 12 CMS equipment cabinets. Use compatible interconnecting cabling and fittings and clearly label as to the equipment and termination points they are to interconnect.

c. Provide backup digital storage of CMS data. Provide backup data storage device with sufficient memory to store at least seventy two (72) hours of CMS data in event of failure of monitoring and data
acquisition system computer or communications hardware. Upon restoration of communications with monitoring and data acquisition system computer, transfer data logged during communications failure period automatically to monitoring and data acquisition system computer. Provide battery backup for backup data storage device if required to preserve data in event of a power supply failure.

d. Provide system controller consisting of solid-state control system which has a user programmable memory for storage of instructions to implement specific instructions such as input-output control, Boolean logic, timing, counting, arithmetic, and data manipulation. Provide system controller consisting of central processors, input-output interfaces, memory, power supplies, a programming device, and tape or disk drive for storing and rapidly loading programs. Make provision for portable operator interface panel with CMS system to provide the capability of viewing access to data stored in the CPU and input of constants required by system controller.

e. Provide central processing unit consisting of solid-state design on modular printed circuit boards. Provide hardware, source code, and programming parameters required for internal programming of controller.

2.7.13.2 Interface Requirements

a. Ensure system controller is capable of interfacing with plant controllers, computers, or printers in accordance with TIA-232 or another communications interface common to all plant microprocessor-based control equipment.

b. Electrically isolate inputs and outputs from other input-output and from all cabinet wiring.

2.7.13.3 Alarm Interface

Provide CMS with 2 annunciator cabinets, each equipped with one (1) white indicating light, one (1) flashing red indicating light, 1 audible horn, 1 Acknowledge pushbutton and 1 Test pushbutton as shown. Locate one of these annunciator cabinets [_____] and locate the other in the plant control room. Provide momentary Acknowledge and Test pushbuttons. Connect equipment in these cabinets directly to the CMS input-output ports as shown. When alarm condition is detected, sound horn at both annunciator cabinets and flash the red indicating lights. When Acknowledge button is pressed in any one of the annunciator cabinets, or when the alarm is acknowledged at either of the work stations, silence horn, stop red flashing lights, and turn on the white indicating light. At this point the system is ready to annunciate new alarm condition detected. The white indicating light must stay on until the alarm condition is removed. If the Test pushbutton is pressed, the horn must sound and the red indicating light must flash. Pressing the Acknowledge button must silence horn and reset alarm system. Provide lamptest pushbutton to allow verification that all indicating lights are operational.

2.7.14 Monitoring Requirements

2.7.14.1 Monitoring of Boilers

Boiler may be supplied from manufacturer with stand-alone controller. System controller must receive output signals from stand-alone boiler controller by means of data communication link. Send other variables...
requiring monitoring to CMS as analog or discrete contact closure signals. If existing boiler control system is utilized, make provision to acquire data from these controllers, preferably by means of serial communication links. If it is not feasible to establish serial communication links, send variables to be monitored to CMS as appropriate analog or discrete signals. Apply calibration factors to analog inputs accessed from recorders, controllers and transmitter as required.

2.7.14.2 Variables to be Accessed from Boiler Control systems

At a minimum, access data for the following variables from boiler control system:

a. Steam pressure in kPa psig.
b. Steam pressure setpoint in kPa psig.
c. Steam flow in thousands of kg/ hr lb/ hr.
d. Flue gas temperature in degrees C degrees F.
e. Flue gas oxygen in percent.
f. Opacity in percent.
g. Fuel oil flow in R/sec GPH.
h. Fuel oil supply pressure in kPa psig.
i. Fuel oil supply temperature in degrees C degrees F.
j. Natural gas flow in thousand standard cubic meters.
k. Natural gas supply pressure in psig.
I. Boiler control system power ON or OFF.
m. Fuel selected: GAS, OFF or OIL.
n. Purging.
o. Ready.
p. Pilot ON.
q. Fuel oil ON.
r. Natural gas ON.
s. Emergency trip.
t. Boiler efficiency.

2.7.14.3 Alarms to be Accessed from Boiler Control Systems

At a minimum, access the following alarms from boiler control system:

a. High steam pressure.
b. High water level alarm.
c. Low water level alarm.
d. Low water cutoff.
e. High natural gas pressure.
f. Low natural gas pressure.
g. Low atomizing steam pressure.
h. Low fuel oil pressure.
i. Low fuel oil temperature.
j. Low oxygen level.
k. Flame failure.
l. High opacity.

2.7.15 Balance of Plant (BOP) Variables

a. Monitor status of equipment common to all boilers and any other plant variables not part of any boiler control system directly by the CMS controller via input-output interface modules. Input-output modules must be analog, discrete or communication ports as required. Provide isolated or nonisolated discrete inputs-outputs as required by prevailing conditions. Apply calibration factors to raw analog transmitter output as required.

b. Controller inputs-outputs include, but are not limited to, those indicated.

2.7.15.1 BOP Variables to be Monitored:

Access the following balance of plant variables from dedicated instruments or controllers:

a. Outside air temperature in degrees C.
b. Steam header pressure in [KPA] [MPA].
c. Boiler feedwater temperature in degrees C.
d. Boiler feedwater flow in liters/gallons per minute.
e. Boiler feedwater pressure in [KPA] [MPA] PSI.
f. Boiler water makeup flow in liters/gallons per minute.
g. Air Compressor status (one per compressor).
h. Boiler Feed Pump status (one per pump).
i. Condensate Transfer Pump status (one per pump).
j. City water supply valve status ("OPEN" or "CLOSE").
k. Fuel Oil Pump status (one per pump).

2.7.15.2 BOP Alarms

Access the following alarms from dedicated instruments or controllers:

a. Air Compressor Low Pressure (one per compressor).
b. Condensate Transfer Pump Trip (one per pump).
c. Fuel Oil Pump Trip (one per pump).
d. Deaerator Tank Level High.
e. Deaerator Tank Level Low.
f. Atmospheric Condensate Receiver Level High.
g. Atmospheric Condensate Receiver Level Low.
h. Heating Plant Pressure Receiver Trouble.
i. Water Softener Trouble.
j. Blow Off Separator High Level.

2.7.16 Uninterruptible Power Supply (UPS)

Provide a [_____] kVA UPS, with a minimum run time of thirty five (35) minutes at full load to power work stations and their peripherals, controllers and input-output systems.

2.7.17 Monitoring and Communication Cables and Associated Raceways

Provide monitoring and communication cables, wiring, and associated raceways, including conduit, junction boxes, and fittings in accordance with applicable sections of specifications. Contractor is responsible for providing cables required as indicated in these specifications and to provide a complete and working system. Provide cables as required for connection between CMS equipment, boiler controllers and field devices.

2.7.18 Remote Communication Interface Modem

Provide system with auto dial-auto answer modem suitable for use with voice grade telephone lines. Provide communications in English language and limit to ASCII character codes. Ensure system is capable of automatically dialing up in both pulse and tone dial mode.

2.7.19 Instrument Power Supply

Provide instrument power supplies, as necessary, to power panel and field mounted instruments, including instruments within instrument cabinets and back-of-panel components. Provide regulated plus-minus 24 V dc or as required for transmitter and transducer power requirements. Select power supply current rating based on loop burden. Meet the following requirements:

a. Provide 120 V ac, 60 Hz, single-phase input power to the instrument
power supply. Wire power supply as a tap circuit through a separate pull-out type fusible block rated 300 V ac minimum at rated amperes, and wire to the same branch circuit as CMS controller.

b. Provide power supply with output current protection.

c. Supply power supply with brackets for installation on mounting panels within the CMS cabinet.

2.7.20 System Architecture

Design system in modular fashion. Provide spare capacity of the following:

a. Input, digital - 25 percent.

b. Input, analog - 25 percent.

c. Controller memory - 25 percent spare.

d. Output digital - 10 percent.

e. Output analog - 10 percent.

2.7.20.1 Inputs

CMS controller must be capable of accepting inputs as described below:

a. Analog Inputs (AI): Monitor analog inputs originating from sensing elements and buffer as AI, except that automatic conversion to proper engineering units must occur without any additional signal conditioning as follows:

(1) Convert temperature inputs from thermistors or RTDs or temperature transmitters to degree C,

(2) Convert flow inputs from flow transmitters to liter per minute, cubic meter per minute or as specified in process and instrumentation diagram.

(3) Convert valve or damper position from potentiometer or similar device to percent open.

(4) Convert pressure input from pressure transmitter to mm of water kPa as specified in process and instrumentation diagram.

b. Discrete Inputs: CMS controller must accept discrete signal from device such as contactor, relay, limit switch, pressure switch, and temperature switch. Provide input device capable of withstanding continuous shorting to 120 V ac or to 1500 volts for fifty (50) microseconds.

2.7.20.2 Outputs

Provide controllers that are capable of directing outputs as follows:

2.7.20.2.1 Analog Outputs (AO)

Analog outputs as direct or reverse function of associated analog inputs must modulate final elements in response to controller algorithms. Final
element actuators must be industrial grade capable of accepting a modulated [electronic] [pneumatic] signal from the controller [via a signal converter, current to pneumatic]. Electronic signal must be 4-20 mA dc with a minimum of 16 [_____] bit resolution. [The pneumatic signal must be 21 to 34 kPa 3 to 15 psi. Each pneumatic output must have feedback for monitoring of the actual pneumatic signal.]

2.7.20.2.2 Digital Outputs (DO)

Command equipment to the selected position via schedules and programs. Provide contact closure with contacts rated at a minimum of 1 ampere at 24 volts. The output signals include, but are not limited to:

a. Enable-Disable.
b. Start-Stop.
c. On-Off.
d. Open-Close.
e. Demand Limit
f. Temperature Reset.
g. Boiler Selection
h. Floating Control.

2.7.20.3 Program Storage

CMS controller must be able to store programs on a solid state memory PC card, a hard disk drive, or a CD-RW reader-writer-rewriter disk drive requiring no front end computer for the data conversion.

2.7.21 System Software

Document CMS controller program code sufficiently that operator can modify controller logic and setpoints. Software provided includes, but is not limited to, operating systems, communication control, definition of process, operator interface, and system services. Provide Read Only Memory [ROM] and Programmable Read Only Memory [PROM] as required, as resident operating system. Application software must be RAM resident. Do not use bulk storage devices, such as magnetic disks, in an interactive on-line mode, but may be added for extended data storage.

2.7.21.1 Trend Logging.

Initiate a custom log for any variable value in the control program. Select type of log, number of values log contains, and time interval between values. Assign trend log activation period from keypad by day, month, year, and time span desired for each log.

2.7.21.2 Alarm Reporting.

Provide control capable of analyzing any variable in the program and evaluate for alarm condition. Alarm can be generated based on analog value out of limits or based on a programmed sequence of events. Store alarms in log upon each occurrence and report them immediately.
2.7.21.3 Alarm Lockout Routine.

Provide alarm lockout routine to inhibit nuisance alarms.

2.7.22 Documentation

Provide the following documentation:

2.7.22.1 List of Hardware

Complete list of hardware required to provide a complete and fully functional CMS.

2.7.22.2 Input and Output Point List.

Complete input and output point list.

2.7.22.3 Operating and Maintenance Manuals.

Provide functional description of proposed equipment, and descriptions of maintenance on system components. Ensure operating and maintenance manuals cover inspection, periodic preventive maintenance, fault diagnosis, replacement and repair of defective components.

2.7.22.4 Equipment Installation Details.

Submit detail drawings showing installation requirements for each component of the CMS.

2.7.22.5 System Interconnection Block Diagram.

Show the interconnection of components in the CMS network.

2.7.22.6 Software Manual

Provide software manuals describing programming and testing for CMS controller and containing system overview with detailed description of software features. Instruct operator on programming CMS controller, including control programs, algorithms, mathematical equations, variable, setpoints, time periods, messages, and other information necessary to load, alter, test, and execute system operation. Include the following in the software manual:

a. Complete description of programming language, including commands, algorithms, printouts and logs, mathematical calculations, and passwords.

b. Instructions on modifying any algorithm or parameter, verifying errors, status, changing passwords, and initiating or disabling control programs.

c. Software documentation providing easy reference from summary sheets which compare pertinent information about hardware, and wiring information in the field. Include the following documentation:

(1) Complete point identification, including terminal number, symbol, engineering units, control program reference number, and logic printout.
(2) setpoint s for various analog input loops.

(3) Field information including location, device, device type and functions

(4) Location identification of the CMS hardware.

2.7.23 Equipment Cabinet Factory Wiring

Factory install internal equipment cabinet wiring, color code and bundle neatly or route via wiring duct. Install cables and wiring as specified.

2.7.23.1 Termination

Make terminations with pressure type connectors or lugs. Do not wrap stranded conductors around screw type terminals. Connect incoming cables to CMS controller via terminal blocks. Terminate internal wiring at one side of the terminal blocks.

2.7.23.2 Nameplate for Device Inside Equipment Cabinets.

Stamp nameplate for device mounted inside equipment cabinet with the device number only. Provide nameplate consisting of 10 mm 3/8 inches wide stainless steel tape. Attach to the device with stainless steel wire.

2.7.24 Continuous Emissions Monitoring

**************************************************************************

NOTE: A continuous emissions monitoring system (CEMS) is required by the Clean Air Act Amendment (CAAA) of 1990 if the fuel utilized is oil or coal and the heat input is 3 megawatt 10 million BTU/HR or greater. A CEMS may also be required by state or local laws. If a CEMS is necessary the designer must review the CAAA and the relevant state or local law early in the project to allow time to incorporate the required CEMS specification and to determine which flue gas emissions will be included in the required reports. Before acceptance of the installation, furnish a written test report which provides documentation that the CEMS equipment has passed factory and field certification tests required by federal, state and local regulations to the Contracting Officer. The investigation will determine if the reported values may be calculated or should be direct measurements. The CAAA includes measurement options for gas/oil fired units depending upon the particular category of unit as defined by the regulations. Fill in the data to state what method of measurement or calculation will be utilized for the determination of the report variable.

Emerging flue gas flow monitor technologies are available. The traditional differential pressure technique specified uses familiar equipment that can be maintained by plant personnel. This type of measurement device has reliably satisfied regulatory
requirements. The possible use of other technologies should include a thorough investigation of flue gas flow monitor regulatory requirements and in-house maintenance capabilities.

**************************************************************************

a. Provide continuous emissions monitoring system (CEMS) equipment as a system by a single manufacturer. Provide CEMS, meeting requirements of applicable federal regulations, State of [_____] and local regulations for boiler in accordance with manufacturer's recommendations and under direct supervision of CEMS equipment manufacturer.

b. Reported data includes [sulfur dioxide \( \text{SO}_2 \)] [oxides of nitrogen \( \text{NO}_x \)] [carbon monoxide \( \text{CO} \)] [carbon dioxide \( \text{CO}_2 \)] [particulate matter \( \text{PM} \)] and other information required by federal, state, and local regulations. Base \( \text{SO}_2 \) reporting on [analyzer measurement] [fuel flow and percent sulfur calculation] [daily heat input calculation]. Base nitrous oxides, carbon oxides and particulate matter reporting on analyzers.

c. Include central processing unit, printer, hard disk drive, and floppy disk drive. Provide floppy disk drive to function as recorder. Provide software to generate required reports in format acceptable to federal, state and local regulatory agencies. Provide operator interface to CEMS equipment by means of CRT display.

2.7.24.1 Gaseous Emissions Monitor

Provide extractive or in-situ gaseous emissions monitors. Combination of extractive and in-situ monitors is not acceptable. Gaseous emissions monitors include automatic calibration checks. Provide alarm horn and annunciator to alarm when any monitored parameter is out of range or gaseous emissions monitor malfunctions. Construct surfaces exposed to corrosive gas of boiler of noncorrosive materials such as 316 SS, Teflon or Hastelloy.

Provide [wet][dry][diluted] extractive systems. [Provide rack-mounted analyzing equipment for extractive system.][Locate analyzing equipment for extractive system in a walk-in cabinet].

2.7.24.2 Flue Gas Flow Monitor

Utilize the pitot tube principle to measure flue gas flow. Provide flue gas flow monitor base which is across-the-duct average pitot tube and properly design and locate to obtain representative measurement. Use differential pressure transmitters to sense the difference between the static and total pressure of the flowing flue gas stream. Ensure calibrations are stable.

2.7.24.3 Particulate Matter Opacity Monitor

Base particulate matter opacity monitor on principle of transmissometry. Include automatic simulation of zero opacity and up scale check of calibration while boiler is in service without dismounting monitor. Include analyzer internal circuitry and electronic circuitry in calibration check. Provide alarm horn and annunciator to annunciate excess opacity and system malfunction. Provide monitor with fans to keep sending and receiving lenses pressurized and blown clean at all times.
2.7.24.4 Wiring

Provide CEMS equipment with plug in prefabricated cable for interconnection between components. Use 2 wire, 120 volt nominal or less, 60 Hz, power supply to the equipment with one side grounded. Connect electrical devices as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.8 BOILER FEEDWATER SYSTEM

2.8.1 Deaerators

******************************************************************************
NOTE: Deaerator manufacturers should be consulted regarding specific features of construction for a particular application. Specifications are included for atomizing spray-type, tray-type, and atomizing spray, two tank type deaerators. Careful consideration will be given to the type of deaerator selected. Tray type is preferred however it requires more space than the other types. To satisfy shipping requirements or where access is limited, the deaerator may be knocked down and field assembled. Select applicable pump type and control.
******************************************************************************

2.8.1.1 Components

Provide deaerator as a complete package by one manufacturer including receiver with deaerating section, pumps, electrical control and accessories. Deaerator components include but are not limited to the following:

a. Storage tank.
b. Deaerator [spraymaster][ or ][column.] ASME PTC 12.3.
c. Water inlet atomizing valve.
d. Steam inlet atomizing valve.
e. Deaerator manual and automatic vents.
f. Gauge glass.
g. Steam pressure gauge.
h. Feedwater thermometer.
i. Tappings.
j. Water level controller with makeup valve.
k. Three valve by-pass and strainers for control devices.
l. Steam relief valve.
m. High water level alarm.
n. Low water level alarm.
o. High temperature condensate diffuser.
p. Boiler feed pump and motor sets.
q. Recirculation orifice.
r. Pump suction shutoff valve.
s. Suction strainer.
t. Suction flexible fitting.
u. Pump discharge shutoff valve.
v. Pump discharge pressure gauge.
w. Pump discharge manifold.
x. Overflow drain connection.
y. Control panel.
z. Chemical feed quill.
aa. Vacuum breaker.
bb. Sentinel relief valve.
c. Tank drain valve.

2.8.1.2 Deaerator, General Requirements

Provide deaerator water storage tank with a [_____] mm inches diameter, and [_____] mm inches long.

a. Provide storage tank section with [_____] minutes of storage and a capacity of [_____] liters gallons measured to overflow. Provide an 280 by 380 mm 11 by 15 inch elliptical manhole for access. Provide deaerator rated at [_____] kg pounds of steam per hour.

b. Design deaerator to remove dissolved oxygen in boiler feedwater to 0.005 cc/liter or less and eliminate carbon dioxide at any load between 5 and 100 percent of rated capacity.

c. Provide tank consisting of welded steel construction built in accordance with Section VIII of the ASME pressure vessel code for 345 kPa 50 psig at [_____] degrees C degrees F and stamped accordingly. Construct internal surfaces which come in contact with underaerated water of Type 316 stainless steel.

d. Provide deaerator with manual and automatic vent valves. Control automatic vent valve thermostatically to provide fast venting of sudden buildup of gases. Provide manual vent valve with an orifice for continuous minimum venting. Do not exceed a manual minimum venting rate of 0.1 percent of rated deaerator capacity. Provide deaerator that is suitable to operate from 13.6 to 102 kPa 2 to 15 psig.

e. Provide steel fabricated deaerator stand of appropriate height for the
feed pump-motor set, and mount on a solid base. Reinforce base to prevent vibration.

f. Nozzles 100 mm 4 inches and under must be 1350 kg 3000 pounds forged steel couplings. Nozzles 63.5 mm 2-1/2 inches and over must be 1.03 MPa 150 psig rated flat face flanges.

g. Mount pump-motor set on individual base before mounting on the stand base. Provide individual suction piping, including strainer, shutoff valve and flexible connector, for pump. Provide pump suction nozzle with vortex breakers to eliminate loss in NPSH and cavitation. Make connections as shown.

h. Provide factory-lined tank interior with high quality baked epoxy lining. Apply lining to white metal surface in accordance SSPC SP 5/NACE No. 1. Apply four to six coats with each dry coat being approximately 0.38 mm 1.5 mils dry, for a total thickness of 0.152 mm 6 mils dry minimum. Holiday spark test lining using low voltage and a wet sponge to ensure uniform coating free of pin holes.

i. Prime exterior with a high heat silicone acrylic primer, 0.05 mm 2 mil minimum DFT.

2.8.1.3 Deaerator, Atomizing Spray-Type

Provide atomizing spray-type, pressurized horizontal type deaerator. Provide ASME torospherical type heads constructed of ASTM A516/A516M GR 70 carbon steel with a minimum thickness of 6.35 mm 0.25 inch. Fabricate shell plate of ASTM A36/A36M carbon steel with minimum thickness of 6.35 mm 0.25 inch. Provide main deaerating portion, located internally, consisting of water collector and steam atomizing valve. Build spring loaded water spray nozzle which includes automatic and manual vent valves into a flange on top of the tank.

2.8.1.4 Deaerator, Tray-Type

Provide tray-type deaerator with spray manifold in a 300 Series stainless steel deaeration dome with integral cascade trays, pressurized horizontal type. Flange mount deaeration dome with integral cascade trays containing a spray manifold with stainless steel spray nozzles to the boiler feed receiver. Flange mount manifold to the dome. Make flange opening large enough to permit the manifold to be easily withdrawn for servicing. Install direct injection steam heating assembly in the receiver. Provide heating assembly consisting of double flange mounted injection pipe, steam control valve, pressure-temperature regulator, wye strainer and pressure gauge.

2.8.1.5 Deaerator, Atomizing Spray Two-Tank Type

a. Provide atomizing spray-type two-tank deaerator, divided into two separate sections. Divide deaerator water storage and condensate surge sections by a double inner head. Pack air space between 2 inner spaces with fiberglass insulation and provide a breather and drain connections. Fabricate shell plate of ASTM A36/A36M carbon steel with minimum thickness of 6.35 mm 0.25 inch. Provide ASME torospherical type heads constructed of ASTM A516/A516M GR 70 carbon steel with a minimum thickness of 6.35 mm 0.25 inch.

b. Provide surge tank section with [_____] minutes of storage and a
capacity of [_____] liters gallons flooded. Provide a 280 by 380 mm 11 by 15 inch elliptical manhole for access. ASME stamp is not required for the surge tank.

c. Surge tank must receive returning condensate and be supplemented by makeup by water to maintain desired operating level. Vent surge tank to the atmosphere. Transfer collected water to deaerator. Locate main deaerating portion, consisting of water collector and steam atomizing valve, in deaerator storage tank. Build a spring loaded water spray nozzle which includes an automatic and manual vent valve into a flange on top of deaerator storage tank.

d. Provide deaerator and surge tank support of appropriate height to meet the NPSH requirements of the transfer pumps and feedwater pump/motor set.

e. Height of deaerator support must not exceed 1220 mm 48 inches.

2.8.1.6 Chemical Feed Quill

Locate chemical feed quill beneath the normal tank water level. Use stainless steel chemical feed quill material. Provide even distribution and bleeding of chemicals.

2.8.2 Boiler Feed Pump

**************************************************************************
NOTE: Pump manufacturers should be consulted regarding specific features of construction for a particular application. In general, for lower pressure and flow applications vertical in-line pumps with stainless steel shafts and impellers can be applied. Cast iron or cast steel casings could also be used for these applications. Horizontally split pump casing specifications should require nozzles on the suction and discharge and feet on the lower half of the casing so the top half of the casing can be removed without disturbing the main piping. Designer is required to determine the upper temperature limit for pumps based on the project requirements. Delete design conditions if pump schedule is shown on the drawings.
**************************************************************************

For installations including more than one boiler feed pump, each boiler feed pump must be identical [_____] L/hour gpm, [vertical in-line] [horizontally split case, multi-volute or diffuser], centrifugal, self-contained, multistage pump. The nomenclature used in these specifications pertaining to pumps and hydraulic conditions is as used by the Hydraulic Institute Standards for Centrifugal, Rotary and Reciprocating Pumps.

2.8.2.2 Construction Materials

Provide pump with [_____] Class [_____] suction flange and [_____]Class [_____] discharge flange. Provide stainless steel shaft, impeller, and internals including sleeves and wearing rings containing no less than 11 percent chromium. [Provide closed type horizontal pump impellers, cast in one piece.] Ensure casing is 11 to 13 percent chromium steel. [Provide cast iron suction and discharge chamber.] [Design horizontal pump to pump water at any temperature from 10 to [_____] degrees C 50 to [_____] degrees F without undue temperature strains within pump. Properly balance rotating parts. Dynamically balance assembled rotor. Stagger casing volutes to ensure radial balance of the assembled rotor under operating conditions. On volute pumps, mount impeller on the shaft half facing in one direction and the other half facing in the opposite direction to give axial balance to the motor.]

2.8.2.3 Cooling Water Piping

Furnish pump with complete cooling water system which connects jacket cooler to common header. Factory assemble piping as completely as possible on the pump. Provide Type 316 stainless steel seal flush piping. Provide Type 304 stainless steel seal flush cooler tubing. Provide flow regulating valve and 6.35 mm 1/4 inch bypass needle-valve on each supply branch.

2.8.2.4 Bearings

[Provide horizontal pump including a double row ball type thrust bearing on the outboard end and a single row deep groove radial bearing on the inboard end. Provide splash type bearing lubrication .]

[Provide vertical type pump bearings that are water lubricated sleeve type constructed of babbitted graph alloy with Type 304 stainless steel shaft sleeves.] Design bearings for L-10 bearing life of [______].

2.8.2.5 Shaft Sealing System

[Equip vertical pump with an effective mechanical shaft seal to seal.] [Fit horizontal pump with balanced mechanical seals, pressurized type, tungsten carbide and carbon sealing faces especially designed for high temperature, high pressure boiler feed pump service. Provide mechanical seals with pumping rings. Provide complete field flush piping from each mechanical seal to its respective seal cooler with a temperature alarm thermometer, adjustment for silencing, range of 10 to 204 degrees C 50 to
400 degrees F with contacts suitable for 100 milliamperes at 125 V dc, closing on rise of temperature.]

2.8.2.6 Shaft Coupling

[Provide direct coupled type shaft coupling between vertical pump and drive.] [Connect horizontal pump directly to its motor by means of a spacer disc type coupling. Provide spacer piece between motor and pump to facilitate removal of coupling flanges and mechanical seals without disturbing the pump or motor hold-down bolts. Disc coupling must be limited and float. Use stainless steel disc. Furnish suitable coupling guards.]

2.8.2.7 Special Tools

Furnish complete set of special tools as required for assembly, disassembly or maintenance of pumps.

2.8.2.8 Pump Characteristics

a. Provide pump discharge head such that the maximum discharge head occurs at shutoff and continually decreases as pump delivery increases. Ensure head capacity characteristics permit stable operation when pump is operating alone or in parallel with another pump.

b. Provide pump with shutoff head of no greater than 150 percent and no less than 115 percent of design head. Ensure design point capacity on the selected pump curve is within 25 percent of the capacity at the best efficiency point for the impeller selected. Ensure minimum flow required for continuous pump operation is no greater than 30 percent of the specified design flow for each pump.

c. Provide pump with an efficiency of 60 percent or greater at rated capacity.

2.8.2.9 Horizontal Pump Accessory Equipment

Provide the following as package from pump manufacturer:

a. Pump and drive, mounted on a suitable, full length baseplate.

b. Suitable vent valves for the pump.

c. Stainless steel orifice plate for minimum flow across the pump.

d. Standard accessories and integral piping required for complete unit.

e. One flanged end suction tee type strainer of corrosion resistant materials, of size compatible with suction piping. Use tee type strainer with fine mesh screen fitted over it for use during startup period. Remove fine mesh screen after condensate system is clean.

f. One set of spare pump gaskets and "O" rings.

g. Renewal parts for mechanical pump seal.

2.8.3 Deaerator Control

Furnish completely wired control cabinet, mounted on pump unit or
free-standing. Provide cabinet with hinged door and include the following:

a. Combination magnetic starters having 3 overload relays, with circuit breakers and cover interlocks.

b. Auto Lead-Lag-Off-Continuous selector switches.

c. Pilot lights indicating pump operation.

d. Control circuit disconnect switch.

e. Terminal block.

f. Control circuit transformer, fused.

g. Momentary contact Test pushbuttons.

h. Deaerator Control Panel meeting the following requirements:

(1) Construction: Properly size deaerator control panel to contain control devices, instrument gauges and meters. Provide unit mounted or free-standing deaerator control panel with face-plate of no less than 4.7 mm 3/16 inch reinforced steel plate. Ensure control cabinet is factory-assembled steel enclosure with locking door. Provide panel consisting of NEMA 4 construction, 12 gauge steel all welded construction with minimum radius corners, stiffened as required and framed with angles. Construct the door of 12 gauge steel with door clamps and continuous hinge. Ensure door is fully gasketed.

(2) Wiring: Wire deaerator control panel in accordance with NFPA 70 and provide individual motor starter with 120 volt holding coil and fuse protection. Provide individual green oil-tight pump run lights. Provide NEMA 4 rated switches and light with nameplate identification. Paralleling of individual control power transformers will not be permitted. Provide panel with main disconnect device, consisting of nonfused disconnect or nonautomatic circuit breaker. Equip disconnect with mechanical door interlock preventing door opening the disconnect in closed position. Provide cartridge type fusing. Provide multiple horsepower rated, heavy duty type dual element, current limiting, time delay safety switches. Provide NEMA type, full voltage, non-reversing magnetic motor starter for motor assembly, which is overload protected for each phase, and with auxiliary contacts. Ensure overload relay is trip-free, thermal bimetallic, manual reset with trip heaters based on actual full load current of motor. Provide spare NO and NC auxiliary contacts wired to the terminal block. Provide control power transformer with primary fuse disconnect and secondary fusing. Provide factory mounted and wired control, arrange to receive a signal from the boiler plant master controller and water regulating valve assembly. Match quantity of deaerator feedwater pumps to the quantity of boilers. Provide panel mounted Lead-Lag-Off-Continuous switch for each feedwater pump.

(3) Sequence of Operation: From cold start of plant, when plant master controller indicates one boiler to start, start lead pump. When second boiler is indicated to start, start lag pump and continue this process for additional boiler starts. Run feedwater
pumps continuously. When one boiler shuts down, shut down one feedwater pump. When all boilers are off, all pumps must be off. Should there be a failure of any pump, operate the next pump in sequence automatically. Provide audible and visual high and low water level alarms by bell or horn with silence switch and individual red oil tight lights. Use a low-low water level signal to cut off feedwater pumps. Deaerator water level control system must provide a 4-20 mA dc signal to the condensate receiver control panel to start transfer pumps.

2.9 CONDENSATE RETURN SYSTEM

**************************************************************************
NOTE: Coordinate the components of this system with the deaerator selection. Some components are specified with the two tank-type deaerator.
**************************************************************************

Provide condensate return system that is a factory assembled package system including condensate surge tank, transfer pumps, controls, auxiliary equipment and piping as shown.

2.9.1 Condensate Surge Tank

Provide condensate surge tank with a [_____] mm inch diameter by [_____] mm inch long with 280 by 380 mm 11 by 15 inch elliptical manhole. Provide condensate surge tank with [_____] minutes of storage and capacity of [_____] liters gallons flooded. Provide condensate surge tank, base, piping nozzle construction as specified. Include the following:

a. Required tappings and manway.
b. Thermometer.
c. Gauge glass.
d. Water level controller with make-up valve.
e. Three-valve bypass and strainer for control devices.
f. Suction shutoff valve.
g. Suction strainer.
h. Suction flexible fitting.
i. Pump discharge check valve.
j. Discharge shutoff valve.
k. Pump suction and discharge gauge.
l. Discharge manifold.
m. Chemical feed quill.
n. Sparge tube.
o. High water level alarm.
p. Low water level alarm.
q. Low water pump cut-off.
r. Recirculation orifice.
s. Insulation and lagging.
t. Transfer pump and motor.
u. Control panel.

2.9.1.1 Gauge Glass

Provide surge tank with gauge glass assembly that covers entire tank diameter. Provide quartz gauge glass with 16 mm 5/8 inch diameter by 610 mm 24 inch maximum length. Furnish gauge glass with bronze gauge cock set and protector rods.

2.9.1.2 Makeup Valve and Controller

a. Provide motorized makeup valve with steel body and threaded connections. Provide gear type makeup valve directly coupled to the valve stem and control electronically by solid state controller with internally mounted capacitance probes. Maintain water level setpoint. Provide controller with hand selector for automatic and manual operation. Ensure makeup valve does not exceed 69 kPa 10 psig pressure drop and is rated for 150 degrees C 300 degrees F.

b. Provide makeup valve rated for [_____] kPa psi 1/hr. inlet pressure and ensure valve C_v does not exceed [______]. Include two additional probes for high and low water level alarms.

2.9.1.3 Sparge Tube

Locate sparge tube beneath normal tank water level. Construct sparge tube of 50 mm 2 inch pipe. Provide even distribution of high pressure condensate return.

2.9.2 Condensate Pump

******************************************************************************
NOTE: Pump manufacturers should be consulted regarding specific features of construction for a particular application. Specifications are included for horizontal end suction and vertical type pumps. Careful consideration will be given to the type of pump selected. The Pump Column paragraph applies only to vertical type pumps and should be deleted if horizontal type pumps are selected. Delete design conditions if pump schedule is shown on drawings.
******************************************************************************

Condensate pumps must be [_____] identical [_____] L/hour gpm, [horizontal end suction ANSI size A70 type pumps][vertical type pumps with suction barrels] type. Nomenclature used in this specification pertaining to pumps and hydraulic conditions is that used by the Hydraulic Institute Standards for Centrifugal, Rotary and Reciprocating Pumps.

2.9.2.2 Construction and Materials

Provide [centrifugal, horizontal end suction, top discharge type] [vertical, multistage, self contained type with suction barrel] pump. Include [_____] Class [_____] suction flange and [_____] Class [_____] discharge.

2.9.2.3 Casing and Casing Bowls

Flange pump [casing] [casing bowls] and bolt with jacketing top bolt. [Construct casing of ductile iron ASTM A395/A395M, Grade 60-40-18.] Provide flanged casing bowls, constructed of ASTM A48/A48M Class 30 cast iron equipped with pinned, replaceable wearing rings constructed of ASTM A276/A276M Type 316 stainless steel with 11 to 13 percent chrome hardened to 450 BHN. Provide unlined bowls. Design bowl assemblies to withstand an operating pressure of 4.3 MPa 630 psi. [Use minimum casing thickness for horizontal pumps of 12.7 mm 1/2 inch with an additional 3.2 mm 1/8 inch corrosion allowance.]

2.9.2.4 Impeller

[Impeller for horizontal type pump must be totally open type, screw mounted directly to shaft with an O-ring seal and constructed of ductile iron ASTM A536, Grade 60-40-18. Balance impeller dynamically to the maximum rated speed.] [Provide enclosed, split ring, keyed mounted type impeller for vertical can type pumps constructed of 11 to 13 percent chrome steel in accordance with ASTM A743/A743M or 316 SS ASTM A290/A290M GR CF-8M. Provide impeller with replaceable wearing rings constructed of 11 to 13 percent chrome hardened to 300 BHN. Statically and dynamically balance impeller to maximum rated speed. Ensure impeller is 95 percent of maximum allowable impeller diameter.]

2.9.2.5 Pump Shaft

[Construct pump shaft and shaft sleeve for horizontal pumps of Type 316 stainless steel. Ensure shaft diameter and design is sufficient to transmit at least 2.5 times rated motor power of the pump.] [Provide one
piece pump shaft for vertical type pumps constructed of ASTM A582/A582M Type 416 stainless steel. Supply largest diameter shaft available for use with selected impeller that is able to transmit at least 2.5 times rated motor power.]

2.9.2.6 Pump Construction

[Construct pump and bearing frame and housing of cast iron, ASTM A48/A48M.] [Provide discharge head and suction barrel with mounting flange constructed of carbon steel, designed in accordance with ASME BPVC SEC VIII D1 with a 7.6 mm 300 mil corrosion allowance. Also provide sole plate constructed of a minimum of 25 mm 1 inch thick carbon steel plate with a minimum of four 19 mm 3/4 inch anchor bolts. Ensure welds on the pressure containing section of the pump are the full penetration type with welders and welding procedures in accordance with ASME BPVC SEC IX. Size suction barrel so that the velocity in the barrel does not exceed 915 mm 3 feet per second at 150 percent of design flow. Discharge head and can type must be the "T" type configuration so that discharge and suction are above baseplate. Provide suction barrel of sufficient length to accommodate installation of 2 additional turbine stages.]

2.9.2.7 Pump Column

Provide flanged pump column constructed of carbon steel. Design pump column assembly to withstand 4.1 MPa 600 psig and incorporate 7.6 mm 300 mil corrosion allowance. Construct bearing retainers located in the pump column in a manner that will assure concentric alignment of the shaft within 0.13 mm 0.005 inches.

2.9.2.8 Miscellaneous Hardware

Provide Type 316 stainless steel bolts, lock washers, nuts and miscellaneous hardware used with casing, pump frame and gland.

2.9.2.9 Shaft Sealing System

Equip pump with effective mechanical shaft seal to seal against discharge pressure when pump is operating. Provide cartridge type seals with Hastalloy "C" bellows mounted on Type 316 stainless steel shaft sleeve. Use tungsten carbide seal faces versus silicon carbide. Provide one spare mechanical seal. Provide flush vent and drain type gland constructed of ASTM A276/A276M Type 316 stainless steel. Also provide bypass line, constructed of ASTM A269/A269M Type 316 stainless steel, from the stuffing box to the suction side of the pump.

2.9.2.10 Pump Bearings

[Provide anti-friction type horizontal end suction pump bearings and operate in oil bath. Design pump bearings for radial and unbalanced axial loads imposed by the pump.] [Provide vertical type pump bearings that are water lubricated sleeve type constructed of babbitted graph alloy with Type 304 stainless steel shaft sleeves.] Design bearings for L-10 bearing life of [_____] hours.

2.9.2.11 Shaft Coupling

Provide shaft coupling between the pumps and motors of the flanged, adjustable, rigid, spacer type with OSHA approved coupling guard. [On horizontal end suction type pump, this coupling must facilitate removal of
the mechanical seal without removing the driver.] Also design shaft coupling to transmit at least 2 1/2 times the motor power rating.

2.9.2.12 Painting and Corrosion Protection

Protect pumps, motors and accessories prior to initial startup. Thoroughly clean and smooth unfinished work. Factory paint surfaces which will not be in contact with the pumping fluid with a finish coat. Coat internal surfaces with a water soluble rust preventative material.

2.9.2.13 Special Tools

Provide complete set of special tools, if required for assembly, disassembly or maintenance of pump.

2.9.2.14 Bedplate

Provide horizontal type pump which includes single bedplate long enough to accommodate pump, motor drive and cooler. Provide bedplate in accordance with API and of heavy rigid construction, made of suitably structural steel members and plate to provide a stable platform for pump, drive and accessories. Suitably reinforce and brace bedplate to minimize deflection or bending during shipment and erection. Provide sufficient grout holes, minimum 75 mm 3 inch diameter, and grouting area vent holes in each corner of each grout space. Provide bedplate including horizontal jacking screws and vertical leveling screws along the length and width. Make provisions on the bedplate to collect drainage from the unit at one point. Locate and drill hold down bolts and dowel holes in field. Mount pump on bedplate at factory and ship as unit with bedplate mounted on a suitable skid to prevent deformation of the bedplate during shipment and erection.

2.9.2.15 Alignment

Precision align pump unit. Mount and matchmark pump coupling, mechanical seal and motor prior to shipment. Maximum allowable shaft runout must be 0.05 mm 0.002 inch as measured at impeller end.

2.9.2.16 Pump Characteristics

a. Pump discharge head must be such that maximum discharge head occurs at shutoff and continually decreases as the capacity increases. Ensure head capacity characteristics permit stable operation when pump is operating alone or in parallel with another pump.

b. Pump must have a shutoff head of no greater than 150 percent and no less than 115 percent of design head. Design point capacity on the selected pump curve must be within 25 percent of capacity at best efficiency point for impeller diameter selected to meet design point conditions. Minimum flow required for continuous pump operation must not be greater than 30 percent of specified design flow for each pump.

c. Provide pump with efficiency of 50 percent or greater at rated capacity.

2.9.3 Sump Pump

Provide sump pump for sump pit shown. Provide heavy duty, upright type sump pump, certified by the Sump and Sewage Pump Manufacturers' Association.
2.9.3.1 Design Conditions

2.9.3.2 Construction

Bronze fitted cast iron volute with non-clogging cast bronze impeller and stainless steel sediment screen. Use brass upright column. Discharge connection must be ISO NPT. Furnish high efficiency non-clogging impeller with stainless steel shaft journal and bearing suitably designed for intended service.

2.9.3.3 Backwater Valve

Provide a backwater valve in the pump discharge.

2.9.3.4 Float Switch

Actuate float switch by an adjustable copper float mounted on stainless steel rod.

2.9.4 Pump Drive

**************************************************************************
NOTE: Delete the Steam Turbine Drives paragraph if all-electric motor drives are used and the Electric Drives paragraph if all-steam turbine drives are used.
**************************************************************************

2.9.4.1 Steam Turbine Drive

Provide steam turbine drive rated for the specified operating conditions and designed in accordance with NEMA SM 23. Provide turbine of the single or multiple valve design and utilize impulse type blading. Provide flexible support for thermal expansion at governor end of turbine. Ensure turbine is horizontally or vertically split case with metal to metal joints without the use of gaskets. Properly lubricate journal bearings as recommended by turbine manufacturer for operating conditions. Provide anti-friction bearings that have L-10 bearing life of [_____] hours. Use thrust bearings of [ball] [tilting pad] design. Do not weld turbine blading. Ensure turbine blading is securely anchored and renewable. Provide blading material consisting of minimum stainless steel and suitable for steam quality and purity. Seal steam glands [interstage diaphragms] with carbon rings or labyrinths. Finish turbine shaft with hard chrome in gland sealing zones. Provide turbine with single governor to control valve(s). Ensure governor is NEMA SM 23 Class [_____] . Furnish hand valves in cases where operating conditions will be substantially different than design or where future operating conditions will change. Provide overspeed trip set at 110 percent of the normal operating speed. Ensure
overspeed trip is NEMA SM 23 Class [____]. Include manual trip lever. Factory test turbine to check operation.

2.9.4.2 Electric Drive

Motor must be [splashproof] [totally enclosed, nonventilated] [totally enclosed, fan cooled] [totally enclosed, fan cooled suitable for installation in a class II, division 1, group G hazardous location as defined in NFPA 70]. Motor starter must be [manual] [magnetic] [across the line] [reduced voltage] type with [general purpose] [weather resistant] [watertight] [dust tight] [explosion proof] enclosure.

2.9.5 Condensate Return System Control

Furnish completely wired control cabinet, mounted on condensate return equipment or free-standing. Provide cabinet with hinged door and include the following:

a. Auto Lead-Lag-Off-Continuous selector switch.

b. Pump running Pilot light.

c. Control circuit disconnect switch.

d. Terminal block.

e. Control circuit transformer, fused.

f. Momentary contact Test pushbutton.

g. Control Panel meeting the following requirements:

(1) Construction: Size the condensate return surge tank control panel properly to contain all control devices, instrument gauges and meters. Ensure control cabinet is factory assembled steel enclosure with locking door. Provide panel consisting of NEMA 12 construction, 11 gauge steel with key-locking vault handle, three (3) point latches, and continuous hinge. Provide fully gasketed door.

(2) Wiring: Wire control panel in accordance with NFPA 70 and include individual motor starter with 120 volt holding coil and fuse protection. Provide individual green oil-tight pump run lights. Provide switches and lights with nameplate identification. Paralleling of individual control power transformers is not permitted. Provide panel with a non-fuse disconnect or non-automatic circuit breaker main disconnect device. Equip disconnect with mechanical door interlock preventing door opening with the disconnect in the closed position. Use cartridge type fusing. Use dual element, current limiting, time delay safety switches which are multiple horsepower rated, heavy duty type. Provide magnetic motor starter for each motor assembly that is NEMA type, full voltage, non reversing, overload protected for each phase, with auxiliary contacts. Ensure overload relay is trip-free, thermal bimetallic, manual reset with trip heaters based on actual full load current of motor. Provide spare NO and NC auxiliary contacts wired to the terminal block. Provide control power transformer with primary fuse disconnect and secondary fusing. Provide factory mounted and wired control,
arrange to receive a signal from the deaerator water level assembly. Provide a panel mounted Lead-Lag-Off-Continuous switch for feedwater pump.

(3) Sequence of Operation: From a cold start, when the plant master controller indicates one boiler to start, start the lead pump and operate continuously. When all boilers are off, all pumps must be off. Should there be a failure of any pump, operate the next pump in sequence automatically.

2.10 BOILER BOTTOM BLOWDOWN TANK

Provide blowdown tank with [_____] mm inches diameter by [_____] mm inches high. Provide supports, associated accessories and appurtenances as specified and shown. Provide blowdown tank consisting of welded steel construction built in accordance with ASME BPVC SEC VIII D1 and stamped for a 1.03 MPa 150 psig rating. Include a tangential inlet, size to match boiler blowdown pipe, stainless steel striking plate at point of inlet impingement, internal stainless steel flow restrictor plates, waterleg type drain vent, gauge glass opening, inspection opening and clean-out connections. Use materials in fabrication of boiler blowdown tank equipment in compliance with ASME BPVC SEC II-C. Provide inspection openings on tank as required in paragraphs UG-45 and 46 of ASME BPVC SEC VIII D1 and as shown. Provide connections as shown. Ensure interior surface preparation is in accordance with SSPC SP 5/NACE No. 1 and the coating manufacturer's recommendations. Coat interior with a suitable baked epoxy phenolic coating, minimum 0.13 mm 5 mil DFT. Ensure exterior surface preparation is in accordance with SSPC SP 6/NACE No.3 and the coating manufacturer's recommendations. Prime exterior with a high heat silicone acrylic primer, minimum 0.05 mm 2.0 mil DFT. Supply the blowdown tank with drain aftercooler and temperature regulating valve. Provide aftercooler with cold water inlet, flanged body for easy removal, 6.35 mm 1/4 inch NPTF connection for temperature regulating valve sensing bulb. Use valve adjustable range of 43 to 65 degrees C 110 to 150 degrees F. Provide a thermostatic regulating valve to inject potable water to maintain acceptable discharge temperature to the sewer.

2.11 BOILER SURFACE BLOWDOWN HEAT RECOVERY SYSTEM

2.11.1 General Requirements

Provide blowdown flush separator that is [_____] mm inches in diameter by [_____] mm inches high. Provide supports, associated accessories and appurtenances in accordance with these specifications and as shown. Provide steel tank consisting of welded construction in accordance with ASME BPVC SEC VIII D1 and stamped for a 1.0 MPa 150 psig rating. Provide tank with a tangential inlet connection sized to match the boiler blowdown pipe, stainless steel striking plate at the point of inlet impingement, internal stainless steel flow restrictor plates, float level control, gauge glass openings, inspection opening and clean-out connection. Provide thermostatic regulating valve to inject potable water to maintain acceptable discharge temperature to sewer.

2.11.2 Materials

Use materials in fabrication of boiler blowdown equipment in compliance with ASME BPVC SEC II-C. Provide inspection openings on tank as required in Paragraphs UG-45 and 46 of ASME BPVC SEC VIII D1 and as shown. Provide connections as shown. Ensure interior surface preparation is in accordance.
with SSPC SP 5/NACE No. 1 and the coating manufacturer's recommendation. Coat interior with a suitable baked epoxy phenolic coating, minimum 0.13 mm 5 mil DFT. Ensure exterior surface is in accordance with SSPC SP 6/NACE No. 3 and coating manufacturer's recommendations. Prime exterior with high heat silicone acrylic primer, minimum 0.05 mm 2.0 mil DFT. Pipe flash separator to heat exchanger. Provide heat exchanger consisting of horizontal U-tube with removable tube bundle and of self-draining type. Blowdown water must pass through shell and cooling water must pass through tubes. Provide stainless steel tubes with rear supporting baffle. Provide steel side welded shell with anti-vibration hold-down clamps, ASME Code stamping for 1.03 MPa 150 psig rated for 208 degrees C 400 degrees F and supporting structural steel stand. Supply heat exchanger with drain aftercooler and temperature regulating valve. Provide aftercooler with cold water inlet, flanged body for easy removal, 6.35 mm 1/4 inch NPT connection bimetallic thermometer, and 25.4 mm 1 inch NPTE connection for temperature regulating valve sensing bulb. Use valve adjustable range of 43 to 65 degrees C 110 to 150 degrees F.

2.11.3 Monitor-Controller

Provide one electronic monitor-controller for use in boiler surface blowdown line for each boiler, consisting of:

b. Ensure panel display includes the following:

(1) Long-life LED indicators on front panel and labeled power and control.

(2) Manually-operated two position switch to allow operator to turn monitor-controller on or off. Manually-operated two position switch to allow operator to test the output circuits.

(3) Manually operated two position switch to allow the operator to select either a low or high scale of conductivity.

(4) A manually operated two position switch to allow the operator to continuously read system conductivity level or to set or read the front panel operator adjustable trip point.

(5) Calibration adjustment.

(6) Timer for adjustment of intervals between sampling periods.

c. Provide one prepiped blowdown piping assembly installed in each boiler surface blowdown line. Provide assembly consisting of:

(1) Shut-off valve 19 mm 3/4 inch rated for system operating pressure and temperature.

(2) Conductivity probe.

(3) Normally closed motorized flow control valve [19 mm 3/4 inch] rated for system operating pressure of [1150 kPa 150 psig] and temperature up to [200 degrees C 400 degrees F].
(4) Throttling valve [19 mm 3/4 inch] [_____] rated for system operating pressure and temperature.

(5) Temperature compensation probe.

2.12 CHEMICAL FEED SYSTEM

Provide chemical feed system for steam and condensate chemical treatment consisting of introduction of chemical solutions into deaerator, boiler and boiler feedwater lines. Ensure chemical feed system is the automatic proportioning pump type for single or multiple boiler installation and consists of pumps, tank, piping, control and accessories. Provide chemical feed system consisting of a completely preassembled package, factory tested, hydraulically and electrically, and furnish with required special tools, lubricants, and installation instructions. Provide chemical feeding and control equipment for the following:

a. For each boiler:

(1) Boiler scale inhibitor and antifoaming chemical treatment.

(2) Alkalinity supplement.

(3) Neutralizing amines.

b. For deaerator feedwater condensate return systems: chemical treatment consisting of oxygen scavenger such as sodium sulfite.

Provide a 1 year supply of chemicals. Ensure chemical products are compatible with system materials of construction and operating conditions and comply with all applicable regulatory agencies. Interlock the chemical feeder with boiler and deaerator operation.

2.12.1 Chemical Feed Pump and Tank

Provide chemical feed pump and tank as indicated. Ensure chemical feed pump and tank is a package with pump mounted and piping connected to the tank. Provide chemical feed pump capacity as indicated. Provide positive displacement metering type chemical feed pump. Provide chemical feed pump with micrometer capacity adjustment from 0-100 percent while the chemical feed pump is running and metering accuracy within plus or minus one (1) percent. Provide chemical feed pump components constructed of materials suitable for the chemicals being pumped. Provide 120 volts ac, 60 Hz, single phase drive motors, with general purpose dripproof enclosure. Fabricate chemical feed tank of materials suitable for chemicals used and provide with fill and chemical feed drain connections and gauge glass. Furnish chemical feed tank with one chemical feed pump, mounted and piped with piping and fittings constructed of materials suitable for the chemicals being pumped, and include a suction strainer and 13 mm 1/2 inch relief valve. Provide chemical feed tank with hinged cover. Ensure chemical feed tank bottom is dished concave to radius equal to diameter of tank.

2.12.2 Agitator

Equip chemical feed tank with agitator. Provide motor driven agitator with Type 316 stainless steel impeller and drive shaft. Maximum speed is 1750 rpm. Mount agitator and support on chemical feed tank.
2.12.3  Boiler Chemical Treatment System

NOTE: For steam boiler plant with more than one boiler select a bulk storage system 800 liters 200 gallons for each chemical or dedicated feeder system for each chemical with individual drums 200 liters 50 gallons for the chemical treatment for boilers listed above.

Provide the following for each boiler:

a. Three chemical feed pumps. Provide each pump with a pressure relief valve piped on discharge side of the pump to divert overpressurized chemical solution back to the storage tank. Ensure chemical feed pumps have the capability of accepting 4 to 20 mA dc signal.

[ b. One 800 liter 200 gallon bulk storage tank.]
[ c. Three 200 liter 50 gallon drums.]

d. One connecting head water meter. Use maximum operating pressure of 1650 kPa 225 psig and maximum temperature of 120 degrees C 250 degrees F. Provide turbine type water meters with cast iron Maine cases.

e. Proportional chemical feed controller and electronic pulse timer.
Control proportional feed of treatment chemicals based on feedwater as measured by a contacting head water meter. Provide controller with the following features:

(1) Painted steel NEMA 12 enclosure.

(2) Panel display including: proportional pulse timer, automatic-off-manual switch, push-to-test momentary switch which simulates a water meter pulse and runs the timer for one cycle, 12-volt signal to water meter, and pulse accumulator.

2.12.4  Deaerator Condensate Return System Chemical Treatment System

NOTE: Select 200 liters 50 gallons drum for boiler plant up to 22,650 kg/hr

Provide one feedwater chemical treatment system for deaerator including the following:

a. One chemical feed pump. Provide chemical feed pump with pressure relief valve piped on discharge side of chemical feed pump to divert overpressurized chemical solution back to the storage tank. Ensure chemical feed pump is capable of accepting 4 to 20 mA dc signal.

b. [One 8000 liter 200 gallon tank.] [or ][One 200 liter 50 gallon tank.]

c. Provide one contacting head water meter. Use maximum operating pressure of 1650 kPa 225 psig and maximum temperature of 120 degrees C 250 degrees F. Provide turbine type meter with cast iron Maine case.
d. Proportional chemical feed controller and electronic pulse timer. Control proportional feed of treatment chemicals based on makeup water as measured by contacting head water meter. Provide controller with the following features:

(1) Painted steel NEMA 12 enclosure

(2) Panel display including one proportional pulse timer, Automatic-Off-Manual switch. Test momentary switch which simulates a water meter pulse and runs timer for one cycle, and pulse accumulator.

2.12.5 Testing Equipment

Provide testing equipment, including carrying case and spare reagent, for maintaining control of a program of water treatment standards in steam boiler system in accordance with the water treatment plan. Submit a plan for water treatment, including proposed chemicals to be used and nationally recognized testing codes applicable to the system, prior to system startup. Provide testing equipment consisting of the following:

a. Reagents and apparatus for determination of phosphate and sulfite levels in the boiler water.

b. Reagents and apparatus for determination of PH, P and M alkalinity and chloride.

c. Reagents and apparatus for determination of neutralizing amine level in the steam and condensate return lines.

d. One conductivity meter with temperature compensation and multiple measurements ranges of 0-10, 0-100, and 0-10,000 micromhos.

e. Wall mounting test equipment cabinet for storage of testing glassware and reagents. Provide cabinet with one shelf, keylock door and fluorescent light. Construct cabinet of 1 mm No. 18 gauge thick cold-rolled steel, primed and painted with white polyurethane enamel for corrosion protection.

f. Prefabricated steel corrosion nipple bypass assembly to monitor program effectiveness. Include inlet and outlet shut-off valve, wye strainer, and two corrosion nipples.

2.13 WATER SOFTENING EQUIPMENT

**************************************************************************
NOTE: Insert water analysis specific to the site. Insert desired water treatment conditions, e.g. pH level, hardness, chemical concentrations.
**************************************************************************

a. Provide a [single] [double] unit automatic water softener system as indicated. Design water softener system for working pressure of [_____] MPa psi. Provide water softener system complete with raw and regenerate water distribution; under drain, inlet and outlet connections in upper and lower header respectively; resin removed connecting pipe legs; control valve for service, backwash, regenerate, and rinse; water meters, pressure gauges, brine storage, measuring tank
and controls. Provide test sets for pH comparator for range [_____] to [____], sulfide comparator, and phosphate comparator.

b. Influent water analysis for which system must be designed is [____].
c. Treatment conditions to be maintained in circulation water are [____].

2.14 MAINTENANCE EQUIPMENT

2.14.1 Tube Cleaner

Provide water turbine driven tube cleaner that includes three rotary cutters, complete with necessary length of armored water hose, valves, and other appurtenances necessary for operation. Provide tube cleaner for each size of watertube in boiler, with one extra set of cutters for each size cleaner. Provide necessary valves and fittings to permit convenient connection of tube cleaner hose boiler feed pump to supply cold raw water for operation of tube cleaner. Arrange piping such that one boiler feed pump may be used to operate tube cleaner without interfering with normal operation.

2.14.2 Tube Brush

**************************************************************************
NOTE: The tube brush applies only to firetube boilers and will be deleted if not applicable.
**************************************************************************

Provide brush with steel bristles and jointed handle of sufficient length to clean full length of fire tubes.

2.15 FACTORY COATING

Factory finish equipment and component items, when fabricated from ferrous metal, with the manufacturer's standard finish unless otherwise specified.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION, EXCEPT FUEL SYSTEM

Install work as indicated and in accordance with manufacturer's diagrams and recommendations and applicable requirements of FM and NFPA.

3.2.1 Piping

a. Unless otherwise specified, use pipe and fittings conforming to requirements of ASME B31.1. Cut pipe to measurements established at the jobsite and work into place without springing or forcing, completely clearing windows, doors, and other openings.

b. Install pipes a minimum of 2.4 m 8 feet above walkway elevations.

c. Cutting or other weakening of the building structure to facilitate
piping installation will not be permitted without written approval.

d. Remove burrs from pipes by reaming and install to permit free expansion and contraction without causing damage to building structure, pipe, joints, or hangers. Wipe filings, dust, or dirt from interior of pipe or tubing before connections are made.

e. Make changes in direction with fittings, except that bending of pipe 100 mm 4 inches and smaller will be permitted, provided a pipe bender is used and wide sweep bends are formed. Ensure centerline radius of bends is no less than 6 diameters of pipe. Bent pipe showing kinks, wrinkles, flattening, or other malformations will not be accepted. Carry vent pipes through the roof as directed and flash.

f. Unless otherwise indicated, pitch horizontal supply mains down in direction of flow with a grade of no less than 25 mm in 12 meters 1 inch in 40 feet.

g. Cap or plug open ends of pipelines and equipment during installation to keep dirt or other foreign materials out of the system.

h. Pipe not otherwise specified must be uncoated. Provide brass or bronze unions for copper pipe or tubing.

i. Electrically isolate connections between ferrous piping and copper piping from each other with dielectric couplings or other approved methods.

j. Provide pipe and fittings of the types indicated in TABLES I and II for the applicable service and pressure.

3.2.2 Joints

Provide threaded, flanged, or welded joints between sections of pipe and between pipe and fittings as specified. Except as otherwise specified, ensure fittings 38 mm 1-1/2 inches and smaller are either threaded or socket welded, and fittings 50 mm 2 inches and larger are either flanged or butt welded. Weld pipe and fittings 32 mm 1-1/4 inches and larger installed in inaccessible conduits or trenches under concrete floor slabs. Unless otherwise specified or indicated, make connections to equipment with black malleable iron unions for pipe 38 mm 1-1/2 inches or smaller in diameter, and with flanges for pipe 50 mm 2 inches or larger in diameter.

3.2.2.1 Threaded Joints

Make threaded joints with tapered threads properly cut, and make tight with PTFE tape, or equivalent joint compound material applied to the male threads only. Do not apply joint compound to fittings.

3.2.2.2 Welded Joints

a. Make welded joints as specified. Make changes in direction of piping with welding fittings only.

b. Branch connection may be made with either welding tees or branch outlet fittings. Provide forged branch outlet fittings, flared for improvement of flow where attached to the run, and reinforced against external strains.
c. Bevel, align, heat treat, and inspect weld conforming to ASME B31.1.

d. Remove weld defects and make repairs to the weld, or remove weld joints entirely and reweld.

e. Store and dry electrodes in accordance with AWS D1.1/D1.1M or as recommended by manufacturer. Do not use electrodes that have been wetted or that have lost any of their coating.

3.2.2.3 Expansion Joints

Perform guiding of piping on both sides of expansion joint in accordance with published recommendations of manufacturer.

3.2.2.4 Flanges and Unions

Ensure flanges are faced true, provided with metallic spiral wound nonasbestos gaskets, and made square and tight. Provide union or flange joints in each line immediately preceding the connection to each piece of equipment or material requiring maintenance such as coils, pumps, control valves, and other similar items.

3.2.3 Supports

3.2.3.1 General

**************************************************************************

NOTE: Mechanical and electrical layout drawings and specifications for ceiling suspensions will contain notes indicating that hanger loads between panel points in excess of 22.7 kg 50 lbs steel joist must have the excess hanger loads suspended from panel points.

Provide seismic details, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase in item a. if no seismic details are provided. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, will be included in the contract documents.

Support for steam piping from boiler nozzle to steam header and steam lines 150 mm 6 inches and larger will be detailed on the drawings as excessive stress and movement can occur in these piping systems due to thermal expansion. Each spring hanger location will be clearly indicated. They will be assigned a number in a schedule on the drawings that lists hanger details, load, and movement.

**************************************************************************

Fabricate hangers used to support piping 50 mm 2 inches and larger to permit adequate adjustment after erection while supporting the load. Install pipe guides and anchors to prevent buckling, swaying, and undue strain. Support piping subjected to vertical movement when operating temperatures exceed ambient temperatures by variable spring hangers and supports or by constant support hangers. Submit detailed drawings of spring type pipe hangers, before installation. Ensure pipe hanger loads
suspended from steel joists between panel points do not exceed 23 kg 50 pounds. Suspend loads exceeding 23 kg 50 pounds from panel points.

a. Seismic Requirements for Pipe Supports and Structural Bracing: Support and brace piping and attached valves to resist seismic loads as specified in UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC. Provide structural steel required for reinforcement to properly support piping, headers, and equipment but not shown under this section. Use material for supports as specified under Section 05 12 00 STRUCTURAL STEEL.

b. Structural Attachments: Provide structural steel brackets required to support piping, headers, and equipment, but not shown, under this section. Provide material and installation as specified under Section 05 12 00 STRUCTURAL STEEL.

3.2.3.2 Pipe Hangers, Inserts, and Supports

Provide pipe hangers, inserts and supports conforming to MSS SP-58 except as otherwise specified.

a. Do not use Types 5, 12, and 26.

b. Do not use Type 3 on insulated pipe which has a vapor barrier. Type 3 may be used on insulated pipe that does not have a vapor barrier if clamped directly to the pipe and if the clamp bottom does not extend through the insulation and the top clamp attachment does not contact the insulation during pipe movement.

c. Secure Type 18 inserts to concrete forms before concrete is placed. Continuous inserts which allow more adjustment may be used if they otherwise meet the requirements for type 18 inserts.

d. Torque Type 19 and 23 in accordance with MSS SP-58 and have both locknuts and retaining devices furnished by the manufacturer. Do not construct C-clamp body from bent plate.

e. Furnish Type 20 attachments used on angles and channels with an added malleable iron heel plate or adapter.

f. Type 24 may be used only on trapeze hanger systems or on fabricated frames.

g. Where type 39 saddle or type 40 shield is permitted for a particular pipe attachment application, use the type 39 saddle on pipe 100 mm 4 inches and larger.

h. Space horizontal pipe supports as specified in the tables in MSS SP-58 and do not install a support over 300 m 1 foot from the pipe fitting joint at each change in direction of the piping. Space pipe support as required for specified hydrostatic tests. Do not space pipe supports over 1.5 m 5 feet apart at valves. In the support of multiple pipe runs on a common base member, use a clip or clamp where each pipe crosses the base support member. Ensure spacing of the base support members does not exceed the hanger and support spacing required for any of the individual pipes in the multiple pipe run. Connect clips or clamps rigidly to the common base member. Provide a clearance of 3.2 mm 1/8 inch between the pipe and clip or clamp for piping which may be
subjected to thermal expansion.

i. Support vertical pipe at each floor, except at slab on grade, and at intervals of no more than 4.5 meters 15 feet, nor more than 2.4 m 8 feet from ends of risers, and at vent terminations.

j. Type 35 guides using steel, provide reinforced PTFE or graphite slides where required to allow longitudinal pipe movement. Provide lateral restraints as required. Provide slide materials suitable for the system operating temperatures, atmospheric conditions, and bearing loads encountered.

(1) Where steel slides do not require provisions for restraint of lateral movement, an alternate guide method may be used. On piping 100 mm 4 inches and larger, a type 39 saddle may be welded to the pipe and freely rest on a steel plate. On piping under 100 mm 4 inches, a type 40 protection shield may be attached to the pipe or insulation and freely rest on a steel slide plate.

(2) Where there are high system temperatures and welding to piping is not desirable, use type 35 guide including a pipe cradle, welded to the guide structure and strapped securely to the pipe. Separate pipe from the slide material by at least 100 mm 4 inches, or by an amount adequate for the insulation, whichever is greater.

(3) Insulated pipes: Except for type 3, use pipe hangers on horizontal insulated pipe that are the size of the outside diameter of the insulation.

3.2.3.3 Piping in Trenches

******************************************************************************
NOTE: Detail pipe in trenches on the drawings. Show exact locations of pipe supports. Include individual hanger identification. Provide schedule of data to include, but not be limited to identification number, detail references, load, and movement.
******************************************************************************

Support piping as indicated.

3.2.4 Pipe Anchors

Provide anchors wherever necessary or indicated to localize expansion or prevent undue strain on piping. Provide anchors consisting of heavy steel collars with lugs and bolts for clamping and attaching anchor braces, unless otherwise indicated. Install anchor braces in the most effective manner to secure the desired results, using turnbuckles where required. Do not attach supports, anchors, or stays in places where they will injure the construction during installation, or by the weight of expansion of the pipeline. Submit detailed drawings of pipe anchors for approval before installation.

3.2.5 Pipe Sleeves

Provide pipe passing through concrete or masonry walls or concrete floors or roofs with pipe sleeves fitted into place at the time of construction. Do not install sleeves in structural members except where indicated or
approved. Provide rectangular and square openings as indicated. Extend each sleeve through its respective wall, floor, or roof, and cut flush with each surface. Unless otherwise indicated, use sleeves of a size that will provide a minimum of 6.35 mm 1/4 inch all around clearance between bare pipe or insulation jacket and sleeves. Ensure sleeves in bearing walls, waterproofing membrane floors, and wet areas are steel pipe or cast iron pipe. Sleeves in non-bearing walls, floors, or ceilings may be steel pipe, cast iron pipe, or galvanized sheet metal with lock type longitudinal seam and of the metal thickness indicated. Except in pipe chases or interior walls, seal the annular space between pipe and sleeve or between jacket over insulation and sleeve in non-fire rated walls and floors as indicated and specified in Section 07 92 00 JOINT SEALANTS, and in fire rated walls and floors seal as indicated and specified in Section 07 84 00 FIRESTOPPING. Sleeve pipes passing through wall waterproofing membrane as described above. In addition, install a waterproofing clamping flange as indicated.

3.2.5.1 Pipes Passing Through Roof or Floor Waterproofing Membrane

Install pipes through a 1.8 kg 4 pound lead flashing sleeve, a 0.450 kg 16 ounce copper sleeve, or a 0.8 mm 0.032 inch thick aluminum sleeve, each having an integral skirt or flange. Form flashing sleeve suitably, and extend the skirt or flange no less than 200 mm 8 inches from the pipe and set over the roof or floor membrane in a troweled coating of bituminous cement. Extend flashing sleeve up the pipe a minimum of 50 mm 2 inches above the highest flood level of the roof or a minimum of 250 mm 10 inches above the roof, whichever is greater, or 250 mm 10 inches above the floor. Seal the annular space between the flashing sleeve and the bare pipe or metal jacket covered insulation as indicated. Pipes up to and including 250 mm 10 inches in diameter passing through roof or floor waterproofing membrane may be installed through a cast iron sleeve with caulking recess, anchor lugs, flashing clamp device, and pressure ring with brass bolts. Clamp waterproofing membrane into place and place sealant in the caulking recess.

3.2.5.2 Counterflashing

As an alternate to caulking and sealing the annular space between the pipe and flashing sleeve or metal jacket covered insulation and flashing sleeve, counterflashing may be by standard roof coupling for threaded pipe up to 150 mm 6 inches in diameter; lead flashing sleeve for dry vents and turning the sleeve down into the pipe to form a waterproof joint; or tack welded or banded metal rain shield round the pipe and sealing as indicated.

3.2.5.3 Sealing Uninsulated Pipes or Conduits

A modular mechanical type sealing assembly may be installed in lieu of a waterproofing clamping flange and caulking and sealing, as specified, of annular space between pipe and sleeve or conduit and sleeve. Provide seals consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between pipe/conduit and sleeve with corrosion protected carbon steel bolts, nuts, and pressure plates. Assemble links loosely with bolts to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and each nut. After the seal assembly is properly positioned in the sleeve, tighten the bolt to cause the rubber sealing elements to expand and provide a watertight seal between the pipe/conduit and sleeve. Size each seal assembly as recommended by the manufacturer to fit the pipe/conduit and sleeve involved. The Contractor electing to use the modular mechanical type seals must provide sleeves of
the proper diameters.

3.2.6 Escutcheons

Provide escutcheons at finished surfaces where exposed piping, bare or insulated, passes through floors, walls, or ceilings except in boiler, utility, or equipment rooms. Where sleeves project slightly from floors, use special deep type escutcheons. Fasten chromium plated iron or chromium plated brass, either one piece or split pattern, escutcheons securely to pipe or pipe covering and hold in place by internal spring tension or setscrew.

3.2.7 Clay Sewer Pipe

Install pipe where indicated for housing steam supply and condensate return lines. Install sewer pipe on properly graded and well tamped earth or gravel base. Pack joints with twisted jute packing and seal with bituminous sealing compound or portland cement mortar.

3.2.8 Pipe Expansion

**************************************************************************
NOTE: Detail expansion loops on the drawings.
**************************************************************************

Install expansion loops and pipe guides where indicated.

3.2.9 Valves

Install valves at locations indicated and where specified. Use gate valves for isolation service unless otherwise indicated or specified. Use globe valves for throttling service unless otherwise specified. Install valves with stems horizontal or vertical, except install steam nonreturn valves as specified. Use chain operated type gate valves as shutoff valves in the boiler lines to and from steam headers, and elsewhere as indicated, if walkways are not provided for their operation. Ensure chain operated valves have sufficient chain for easy reach of the operating personnel from the operating floor or walkway. Provide gate valves 200 mm 8 inches and larger used on high pressure steam lines, and elsewhere as indicated, with a valve bypass integral with the valve body.

3.2.9.1 Back Pressure Relief

Set backpressure valve to exhaust at the pressure indicated.

3.2.9.2 Steam Pressure Reducing

Adjust steam pressure reducing valve to maintain desired terminal pressure, regardless of fluctuations in the inlet steam pressure. Steam pressure reducing valves must fail closed. Provide pilot, or auxiliary operated valves using steam for operating medium, or sliding gate and plate valves. Install steam pressure reducing valve with strainer, 3 valve bypass, and safety valve as indicated. Where steam pressure reducing valves is used for reducing steam pressure to deaerating heater, provide pneumatic pilot operated type valve. Connect sensing line to the steam space in the deaerator.
3.2.9.3 Thermostatic Regulating

Provide thermostatic regulating valve to control temperature of water within hot water generator, by regulating steam supplied to the heating coil, in the steam supply line to each generator.

3.2.10 Flow Meter

**************************************************************************

NOTE: Specify which meters should receive 3-way bypass to maintain service during a meter service or replacement (suggest that fuel oil flow meters have a 3-way valve bypass if service is critical.)

**************************************************************************

Install flow meter in straight line pipe of at least [_____] pipe diameters to maintain accuracy. [Provide a 3-way valve bypass for [_____] flow meters.]

3.3 FUEL OIL SYSTEM INSTALLATION

3.3.1 Fuel Storage Tank Installation

Install fuel storage tank in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.3.2 Underground Ferrous Metallic Piping

Provide underground ferrous metallic piping in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.4 FIELD PAINTING AND FINISHING

Painting required for surfaces not otherwise specified, and finish painting of items only primed at the factory, are specified in Section 09 90 00 PAINTS AND COATINGS.

3.5 ELECTRICAL

3.5.1 General

Perform field run conduit, wiring and terminations in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.5.2 Splice

Splice stranded conductors by solder or pressure type connectors. Do not use wirenut connectors on stranded conductors. Cover splices with electrical insulation equivalent to, or of higher rating than, insulation of conductors being spliced. Splices will not be allowed in control or signal wiring, except where sensors or controlled devices are provided with pigtails for connecting to incoming cable.

3.5.3 Identification

Label both ends of wires.
3.5.4 Grounding of Drain Wire of Shielded Cable.

Ground shield cable drain wire at the source end, terminate at a copper bus ground bar 3.175, 12.7, by 100 mm 1/8, 1/2, by 4 inches minimum.

3.5.5 Analog Signal Cable Connections

Connect analog signal cables to controller by means of terminal blocks with knife isolation switches with test plugs to enable isolation of each instrument without disconnecting common instrument power supply. Ensure these terminal blocks are double level terminal blocks with knife disconnect point with test plugs at the upper level and feed through terminal at lower level. Provide minimum of thirty percent (30 percent) spare terminal points.

3.5.6 Digital Input-Output

Connect digital input-output cables to controller by means of terminal blocks. Provide minimum of thirty percent (30 percent) spare terminal points.

3.6 INSULATION

Use thickness of insulation materials for piping and equipment and application in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.7 BOILERS AND AUXILIARY EQUIPMENT

***************************************************************************
NOTE: Before occupancy of a facility, inspect the boilers in accordance with the Code of Boiler and Pressure Vessel Inspectors (BPV I) and American Society of Mechanical Engineers (ASME). Inspectors must be certified in accordance with BPV I standards.
***************************************************************************

3.7.1 Inspection

Inspect areas and conditions under which boiler and auxiliary equipment are to be installed. Field verify location of connections to piping, equipment and supports and make connection to said items utilizing field-verified dimensions. Notify Contracting Officer of discrepancies and ensure that unsatisfactory conditions have been corrected in an acceptable manner.

3.7.2 Preparation

a. Coordinate the installation of equipment and appurtenances prior to installation with other work.

b. Provide work required to correct situations resulting from the Contractor's failure to coordinate with the work of other trades, at no additional cost.

c. Take into consideration priority needs for location and space of work of all trades. Failure to do so will require the Contractor to remove and relocate the work at no additional cost.
3.7.3 Installation

**************************************************************************
NOTE: Delete reference to local city and state codes if not applicable.
**************************************************************************

3.7.3.1 Boiler

Install boiler in accordance with the manufacturer's written instructions, [in accordance with boiler installation requirements of local, city, state codes] and in accordance with applicable provisions of NFPA and ASME code standards. Locate boiler and associated components where indicated. Install boiler level to a tolerance of 3 mm in 3 m 1/8 inch in 10 feet in all directions. Make electrical connections in accordance with Section [______].

3.7.3.2 Protection

It is the Contractor's responsibility to protect boiler and components from damage after installation, until Government takes custody. After installation, provide touchup paint to damaged areas on shop and finish-coated surfaces of the equipment. Ensure surfaces are free of rust, scale and foreign substances before application of touchup paint. Use touchup paint that is equivalent to the shop and/or finish paint.

3.7.3.3 Adjusting, Inspecting, and Cleaning

Submit test reports, in booklet form showing field tests performed to adjust each component and field tests performed to prove compliance with the specified performance criteria, upon completing and testing the installed system. Indicate the final position of controls in each test report. A written statement from the manufacturer's representative certifying that combustion control equipment has been properly installed and is in proper operating condition, upon completion of the installation. Include action settings for automatic controls in the form of a typed, tabulated list indicating the type of control, location, setting, and function.

a. Thoroughly clean inside of boiler by performing boil-out, flushing and cleaning in accordance with manufacturer's instruction prior to startup.

b. Make final adjustment to boiler in accordance with manufacturer's recommendations, but no less than following:

   (1) Verify lubrication of moving parts.

   (2) Verify fan rotation direction.

   (3) Adjust water level control for proper operating level.

   (4) Adjust firing rate control.

   (5) Confirm operation of safety devices.

   (6) Adjust controls and verify operation.
3.7.3.4 Field Quality Control.

a. Provide trained field representative to supervise installation of boiler and its components. Inspect alignment and balancing of rotating and moving parts. After completion of installation, provide services of factory-trained field representative to start and adjust boiler.

b. Provide trained field representative for final inspection of boiler for proper installation, alignment and leveling prior to boiler startup.

c. Coordinate with other representatives on startup of other items and building services as required.

d. Contractor's representative must be available to instruct and train Government personnel for not less than two (2) days after boilers are operational.

3.7.4 Gaseous Emissions Monitor

Provide extractive or in-situ gaseous emissions monitor. Combination of extractive and in-situ monitors is not acceptable. Include automatic calibration checks. Alarm horn and provide annunciator to alarm when any monitored parameter is out of range or gaseous emission monitor malfunctions. Construct surfaces exposed to corrosive gas of boiler of noncorrosive materials such as 316 SS, Teflon or Hastelloy.

a. Mount in-situ gaseous emissions monitor on ductwork at location [shown on plans] [recommended by the manufacturer]. Do not affect in-situ system by presence of particulate matter in flue gas.

b. Provide [wet] [dry] [diluted] extractive systems. [Provide rack-mounted analyzing equipment for extractive system.] [Locate analyzing equipment for extractive system in a walk-in cabinet.]

c. Arrange equipment to provide access for maintenance. Heat trace extractive system sampling between probes and analyzers to maintain temperature recommended by manufacturer when ambient temperature is [______]. Mount probes on ductwork at the location [shown on the plans] [recommended by manufacturer].

d. Submit a Boiler Emissions Report of air pollutants showing compliance with the limits established in the environmental permit.

3.7.5 Flue Gas Flow Monitor

Utilize pitot tube principle to measure flow. Ensure flue gas flow monitor probe is across-the-duct average pitot tube and properly designed and located to obtain representative measurement. Use differential pressure transmitters to sense the difference between the static and total pressure of the flowing flue gas stream. Arrange lines to prevent collection of condensate. Provide purge system to keep pitot pressure taps clear.

3.7.6 Testing

ASME PTC 19.3 TW.

3.7.6.1 Factory Testing

Provide boilers guaranteed to perform in accordance with stated operating
conditions. Complete packaged boiler must be hydrostatically and fire tested at boiler manufacturer's factory to check construction, operation and function of all controls. Submit certification of factory tests. Tests may be witnessed by Contracting Officer or Representative of Contracting Officer. Notify Contracting Officer two weeks prior to factory testing.

3.7.6.2 Field Testing

a. Furnish personnel, equipment, instrumentation, and supplies necessary to perform field testing. Upon completion, and prior to acceptance of the work, subject boiler plant to such operating tests as may be required to demonstrate satisfactory functional operation of the plant, including safety devices. Conduct operating tests at such times as the Contracting Officer may direct.

b. Submit proposed test procedure to Contracting Officer, 30 days prior to the proposed test date, for approval. Include a complete description of the proposed test with calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in the tests. Do not commence test until the procedure has been approved. The Government will witness the field tests. Obtain written permission from the Contracting Officer before proceeding with testing. Tests must be supervised by respective manufacturers.

c. Turn over original copies of data produced, including results of each test procedure during field testing, to the Government at the conclusion of testing prior to Government approval of the test.

d. Do not schedule testing during seasonal off-periods of heating systems. Perform testing in accordance with approved test procedures. Cover actual equipment and functions specified for the project.

3.7.6.3 Hydrostatic Test

**********************************************************************************************************
NOTE: Delete boiler isolation valve test for single-boiler plants. This test is critical for multiple-boiler plants as it verifies that individual boilers can be isolated for maintenance or replacement while the steam system is in operation.
**********************************************************************************************************

a. General: Submit a written field hydrostatic test schedule [7] [____] days in advance to Contracting Officer for approval. Schedule will be approved by the Contracting Officer.

b. After installation is completed and prior to startup, furnish the services of local boiler and pressure vessel inspector to observe field hydrostatic test, inspect installation and piping and certify that installation is in accordance with ASME code.

c. Following installation of piping and boiler plant equipment, but before application of piping and boiler insulation, complete a hydrostatic test, including boiler and associated piping within boiler plant. Prove system tight for at least two hours under gauge pressure of 1.5 times the working pressure specified and no less than the following:
(1) Low pressure lines up to 448 kPa 65 psig working - Test pressure 590 kPa 100 psig.

(2) Medium pressure from 448 to 690 kPa 65 to 100 psig, working - test pressure 1.03 MPa 150 psig.

(3) High pressure 1.03 MPa 150 psig working - Test pressure 1.55 MPa 225 psig.

d. Test boiler isolation valves individually to isolate against the specified hydrostatic test pressure. At the conclusion of the system hydrostatic test, close each boiler's isolation valves (steam discharge, boiler feedwater, etc.); drain down the boiler; and monitor pressure on both sides of each isolation valve for a minimum of two hours to verify that the valves isolate each boiler.

e. Test boilers and inspect piping connections by a certified boiler inspector for compliance with ASME BPVC SEC I.

f. Submit certificate of compliance with ASME BPVC SEC I for each boiler to Contracting Officer.

3.7.6.4 Inner Casing Air Tests for Packaged Force Draft Boilers

Following installation, air test each packaged forced draft boiler up to 2.5 kPa 10 inches water gauge. Apply soap foam to seams to detect leaks. Ensure boiler does not lose more than 1.3 kPa 5 inches water gauge in 10 minutes. Perform this test prior to installing insulation.

3.7.6.5 Efficiency and Capacity Test

a. Run efficiency and capacity test on one boiler of each size installed, conduct in strict accordance with ASME PTC 4, abbreviated efficiency test.

b. Properly calibrate measuring devices used for measuring feedwater evaporated and amount of fuel burned prior to test. Use water flow meter suitable for hot water. Furnish instruments, test equipment, test personnel, and fuel oil required to properly conduct tests. Submit a fuel oil analysis report of Independent Agency for fuel oil used during efficiency testing.

c. Calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and furnish thermometer to be used in the efficiency and capacity test prior to test.

d. Obtain necessary natural gas, water and electricity as specified in the [SPECIAL CONTRACT REQUIREMENTS][Section 01 50 00 TEMPORARY CONSTRUCTION FACILITIES AND CONTROLS] Provide necessary quantities of propane gas or No. [_____] fuel oil when propane gas or fuel oil is require for testing.

e. Conduct efficiency and general performance tests on boiler by a qualified test engineer furnished by Contractor.
### Testing and Performance

f. Efficiency tests may be conducted concurrently with operating tests, or separately. Ensure thermal efficiency is no less than specified. Ensure maximum moisture content of saturated steam leaving boiler is as specified.

g. Submit Performance Test report including logs, heat balance calculations, and tabulated results together with conclusions to Contracting Officer in quadruplicate.

h. Submit an analysis by an independent testing laboratory of fuel being burned during test to the Contracting Officer. Include pertinent data tabulated in ASME PTC 4, abbreviated efficiency test.

i. Contracting Officer will observe and approve tests.

### 3.7.6.6 Control System Operational Testing

**NOTE:** For operational functional testing, consider adding project specific equipment and sequences of operation, alarms and other critical interface points between contracts (such as mechanical and instrumentation) for field operational tests. Consider integrating these tests into a larger project commissioning plan and specification.

a. Conduct full operational test of boiler plant control system to demonstrate compliance with sequences of operation, safety interlocks and control functions of the specification.

b. Field Installation Test: Following the installation of the control system, align and adjust all hardware, and record all test readings in accordance with the manufacturer and installer recommended tests and maintenance procedures. Include in the associated test report a list of all hardware or components replaced or changed between the completion of factory tests and the start of field installation test. Demonstrate all hardware to be operational by running off-line diagnostics. Include electrical continuity, complete exercising of each Input and Output point, and simulation of each control loop. Consider field installation test complete only after all variances generated during installation are resolved and tested.

c. Startup Test and Punchout: Prior to on-line operation, conduct a complete demonstration and readout of the control system scope of
surveillance and control. Include simulation of analog inputs and observation of the action of system final control elements. Generate a hardcopy printout and perform punchout of all Input and Output points. Submit startup test hardcopy printout to Contracting Officer two (2) weeks prior to demonstrating the control system. Conduct full functional test in accordance with the control system sequences of operation. Conduct startup test and punchout in the presence of the Contracting Officer. Notify the Contracting Officer no later than ten days prior to scheduled startup testing.

d. Operational Acceptance Test: After all previous testing has been successfully completed, operate control system for thirty (30) days to the complete satisfaction of the Contracting Officer. Submit to Contracting Officer a bound log reporting all control system failures that occur red during operational acceptance test. Show the point name and number, time and date of failure, and time and date of return to service. During the 30-day acceptance test, any operational failures due to malfunction of the control panels, wiring, or Control Room Equipment must require that the 30 day test begin again when repairs are completed. Correct any failures between field-sensing equipment and the control panels, and continue the testing from the day of failure. During the last seven calendar days of testing, no failures of any kind will be accepted or repeat the last seven days. If the season of the year prevents complete testing of any individual component of the control system, acceptance will be conditional upon the successful demonstration of the specific component at the appropriate season.

e. Final Acceptance: The control system will not be considered accepted by the Government until all tests are successfully completed. Beneficial use of the system by the Government will not be considered as acceptance. The Government will deem the control system to be fully accepted when:

(1) Structured, unstructured and availability tests have been successfully completed, and all incidents and variances have been resolved to the Government's satisfaction.

(2) Documentation and training requirements have been completed and are satisfactory to the Government.

(3) Maintenance and related contracts and releases of subcontractors have been duly executed and submitted to the Government.

(4) Identified defects have been corrected to the Government's satisfaction.

3.7.6.7 Boiler Room Panels and Instruments

After inspections of installation and calibration of instruments, and after boiler test, provide a certificate of compliance to Contracting Officer stating that controls and instrumentation operate satisfactorily and within the operating parameters as specified for each fuel. If units fail to operate satisfactorily or fail to achieve specified performance, make adjustments, modifications, repairs, or replacements as necessary at no additional cost until specified performance has been achieved and certified by Contracting Officer.
3.7.6.8 Temporary Piping for Testing

Furnish necessary temporary piping, of no less than 100 mm 4 inches in diameter, and provide a muffler to exhaust excess steam to atmosphere in event boiler load is insufficient to meet capacity specified. Provide control valve for exhausting excess steam to atmosphere in a convenient location inside the boiler room. Provide instruments required for conducting boiler tests as described in ASME PTC 4 and ASME PTC 19.11. Provide temporary piping, valves, pipe hangers, mufflers and test equipment at no additional cost. Muffler must have level of noise of exhaust steam within requirements as set forth by Occupational Safety and Health Act.

3.7.6.9 Fuel Burning Equipment Testing

a. Test fuel burning equipment to demonstrate that equipment installed will meet requirements of specifications, and that overall efficiency is as specified, with not over 15 percent excess air, can be obtained with boiler operating at 100 percent capacity without flame impingement on any combustion chamber wall, floor, baffle or watertube.

b. Include all boiler and burner interlocks, safety interlocks, combustion controls, actuators, valves, controllers, gauges, thermometers, pilot lights, switches, etc. prior to combustion testing. Replace all malfunctioning components. Submit an itemized data record sheet of this component testing.

c. Calibrate each boiler control system and all boiler appurtenances and set to ensure the specified performance. Ensure the fuel burner, forced-draft fan, controls, and other such items are fully coordinated, manually capable, and automatically controllable to hold the required settings. Ensure boiler fuel burning system is continuously variable throughout the specified operating range without manual adjustment of burner, register or nozzle, and achieve turndown without manual adjustment. Ensure testing apparatus is set up, calibrated, tested and ready for use prior to final combustion testing. Furnish calibration certificates for all test instruments with test data.

3.7.6.10 Deaerating Feedwater Heater Testing

Test deaerating feedwater heater to demonstrate that equipment installed meets specified requirements as to performance, capacity, and quality of effluent. During operating test of boiler, conduct tests to determine oxygen content in accordance with ASTM D888, Method B or C, or ASTM D5543. Operate boilers at varying loads, up to maximum heater capacity, while oxygen tests are being made. Furnish means and equipment to perform this test.

3.7.6.11 Water Treatment Testing

Test water treatment equipment meeting requirements specified as to capacity and quality of effluent. Tests for ion exchange units must cover at least 2 complete regenerations and capacity runs. Test for hot process or other precipitation type softeners must cover a minimum continuous period of 48 hours with samples being taken at 2 hour intervals.

3.7.6.12 Steam Quality Testing

Test for steam quality and water level stability must be simultaneous under operating conditions specified.
3.7.6.13 Water Level Stability Testing

Boiler water level stability must be specified by boiler manufacturer in writing to Contracting Officer prior to test. Conduct test first by use of manual bypass around feedwater regulator. Repeat test using automatic feedwater regulator. To be acceptable, boiler must maintain specified water level stability as specified by boiler manufacturer under both conditions.

3.7.6.14 Testing of Piping Systems

a. General: Submit a written schedule 7 days in advance of test to Contracting Officer for approval, and a detailed manufacturer's acceptance testing plan, for approval, for each item of instrumentation; including procedures for pressure testing and repair of piping and tubing materials failing pressure tests.

b. Hydrostatically test piping before piping insulation is applied. Ensure hydrostatic test pressure at any point in piping system is no less than 1.5 times the design pressure, but does not exceed the maximum allowable test pressure of nonisolated components.

c. Test underground lines in pressure service prior to backfilling, as specified, with pressure to be maintained for 12 hours without drop. Furnish accessories required for test.

d. When particular circumstances prohibit hydrostatic tests, Contracting Officer may exercise option to have Contractor perform air pressure and soap solution test. If this type of test is approved by Contracting Officer, perform air pressure and soap solution test at weld and flange joints. Ensure pneumatic test pressure is no less than 1.2 nor more than 1.5 times the design pressure of piping system. Do not exceed maximum allowable test pressure of non-isolated components. Correct leaks discovered during test and perform successive tests. Repeat test until leaks are sealed. Conduct test before insulation is applied. Use a portable sprayer to spray soap solution on joints to detect leaks. Provide temporary pumps and air compressors required to pressurize system prior to and during tests. Perform tests in accordance with ASME B31.1.

3.7.7 Cleaning of Boiler and Piping

After hydrostatic tests have been made, and prior to performance of operating tests, thoroughly and effectively clean boiler of foreign materials by mechanical cleaning, initial chemical cleaning, a chemical boiling period and finally by operating steam system at 100 percent (100 percent) makeup water and wasting the condensate. Submit procedure for cleaning, prior to connecting tubing and piping to instruments and prior to pressure testing, test equipment use, and cleaning after completion of testing and installation. Wherever possible, wire brush water contacted surfaces to remove loose material, then fill boiler with solution consisting of following proportional ingredients and circulate at approximately 207 to 344 kPa 30 to 50 psig for period of 24 to 48 hours:

| Caustic soda  | 10.9 kg 24 lbs |
Dissolve chemicals in proportions above, or as approved by Contracting Officer, thoroughly in water before placing in boiler. After this initial chemical cleaning, drain boiler and refill with the above chemical solution and boil in accordance with the manufacturer's instructions. After specified boiling period, allow boiler to cool, after which drain boiler and thoroughly flush. Finally, clean piping by operating boiler for period of approximately 48 hours with 100 percent (100 percent) makeup water, wasting the steam and condensate.

3.7.8 Boiler Water Conditioning

Provide boiler water conditioning by chemical treatment and blowdown during periods of boiler operation from the initial starting of system, through testing period, and to final acceptance of completed work by the Government. Use chemicals and treatment method approved by Contracting Officer.

3.7.9 Fuel Oil Leak Test

Conduct fuel oil leak tests for the underground portion of the system in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

3.8 MANUFACTURER'S SERVICES

Provide services of a manufacturer's representative who is experienced in installation, adjustment, and operation of equipment specified. Supervise installing, adjusting, and testing of equipment. Contractor personnel will not be allowed to render specified services. Manufacturer's test representatives must be on manufacturer's payroll on a continuing eight hour pay basis, especially trained, and regularly rendering such services.

3.9 FIELD TRAINING

**************************************************************************
NOTE: Consult equipment manufacturer for hours required to train plant personnel for equipment operation and then insert the hours.
**************************************************************************

a. Provide field training course for designated operating staff members. Provide training for a total period of [_____] hours of normal working time and start after system is functionally complete, but prior to final acceptance tests. Cover items contained in approved operation and maintenance instructions as well as demonstrations of routine maintenance operations. Notify Contractor in writing at least 14 days prior to start of training.

b. Submit [6] [_____] complete copies of operation manual outlining the step-by-step procedures required for system startup, operation and
shutdown. Include the manufacturer's name, model number, service manual and a brief description of equipment and their basic operating features.

c. Submit [6] [_____] complete copies of maintenance manual listing routine maintenance procedures, possible breakdowns and repairs, preventative maintenance schedule, and troubleshooting guides. Include piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed. Also include equipment lubrication requirements and schedules, recommended spare parts list, index, instruction book binders with hard back covers and printing to identify the name of the facility, Government entity operating the facility, Contractor, shop order, equipment, and volume number if required. Obtain approval of operation and maintenance manuals prior to the training course.

d. Provide a minimum of [_____] days of training for [_____] of Government's representatives at [plant site] [factory]. Training includes, but is not limited by the following:

(1) Use of operating console display; their interface with process; their aid in system diagnostics; all with hands on experience with equipment for trainees.

(2) Training to emphasize process control techniques, with demonstrations to show variations that can be implemented with algorithms and system configuration instructions.

(3) Training to acquaint the operators with specifics of this process, and how system operates.

(4) Training to include theory of operation, maintenance, and troubleshooting techniques, using flow charts and diagnostics with equipment in operation, and framed instructions containing wiring and control diagrams under glass or in laminated plastic, to be posted where directed. Frame condensed operating instructions, prepared in typed form, as specified above and post beside the diagrams. Post framed instructions before acceptance testing of the systems.

e. Video tape field training. Provide reproducible copies of each training session video tape, printed training materials for each designated operating staff member, and two spare copies for file.

STEAM HEATING PLANT WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL

11/08, CHG 3: 02/22

PART 1   GENERAL

1.1 REFERENCES
1.2 RELATED REQUIREMENTS
1.3 DEFINITIONS
1.4 SYSTEM DESCRIPTION
  1.4.1 Design Requirements
    1.4.1.1 Boiler
    1.4.1.2 Economizer
    1.4.1.3 Forced Draft Fan (Coal Firing)
    1.4.1.4 Induced Draft Fan Design
    1.4.1.5 Expansion Joints
    1.4.1.6 Fuel Oil Pump
    1.4.1.7 Fuel Oil Pump and Heater Set
    1.4.1.8 Electric Startup Heater
    1.4.1.9 Ash Handling System (Pneumatic)
    1.4.1.10 Ash Handling System (Mechanical)
    1.4.1.11 Deaerating Heater
    1.4.1.12 Water Softening System
  1.4.2 Detail Drawings
    1.4.2.1 Steam Generating Unit
    1.4.2.2 Boiler Room Auxiliary Equipment
    1.4.2.3 Stokers
    1.4.2.4 Ash Handling System
    1.4.2.5 Burners
    1.4.2.6 Stacks, Dampers, and Breechings
    1.4.2.7 Coal Handling Equipment Drawings
    1.4.2.8 Fuel Oil Equipment
    1.4.2.9 Piping and Specialty Items
    1.4.2.10 Furnishing Approved Drawings
  1.4.3 Posted Operating Instructions
  1.4.4 Performance Requirements
    1.4.4.1 Boiler
    1.4.4.2 Economizer
1.4.4.3 Oil Burner/Windbox Package

1.5 SUBMITTALS

1.6 QUALITY ASSURANCE
1.6.1 Standard Commercial Product
1.6.2 Equipment Furnished
1.6.3 Responsibility
1.6.4 Certification of Backflow Preventer
1.6.5 Modification of References
1.6.6 Certificates
   1.6.6.1 List of Equipment Manufacturers
   1.6.6.2 Proof of Experience
   1.6.6.3 Manufacturer's Installation Approval
   1.6.6.4 Boiler Inspector's Report
   1.6.6.5 System and Equipment Installation
   1.6.6.6 Vertical Fuel Oil Tank Calibration
   1.6.6.7 Backflow Preventer

1.7 ENVIRONMENTAL REQUIREMENTS
1.7.1 Air Permits
1.7.2 Burner Emission Requirements
   1.7.2.1 NOx Emission Regulations

1.8 DELIVERY, STORAGE, AND HANDLING

1.9 EXTRA MATERIALS

PART 2 PRODUCTS

2.1 MATERIALS
2.1.1 Identical Items

2.2 BOILER
2.2.1 Packaged Watertube Boiler
2.2.2 Operational Requirements
2.2.3 Tubes
2.2.4 Boiler Trim
   2.2.4.1 Boiler Blowoff Valves
   2.2.4.2 Steel Gate, Globe and Angle Valves
   2.2.4.3 Safety, Relief, and Safety Relief Valves
   2.2.4.4 Steam Gage
   2.2.4.5 Water Column
   2.2.4.6 Safety Valves
   2.2.4.7 Non-Return Valve
   2.2.4.8 Blowoff Connections
   2.2.4.9 Miscellaneous Stop Valves
   2.2.4.10 Tube Cleaner
   2.2.4.11 Wrenches
2.2.5 Boiler Limit Interlocks
2.2.6 Sootblowers
   2.2.6.1 Fixed Position Soot Blowers (Steam)
   2.2.6.2 Fixed Position Sootblowers (Air Puff)
   2.2.6.3 Retractable Sootblowers
   2.2.6.4 Sootblower Elements
   2.2.6.5 Pushbutton
   2.2.6.6 Control for Sootblowing System
2.2.7 Combustion Controls

2.3 ECONOMIZER
2.3.1 Construction
2.3.2 Equipment
2.3.3 Insulation

2.4 COAL STOKERS
2.4.1 Stoker Grate Area and Heat Release Rate
2.4.2 Construction
2.4.2.1 Coal Fuel Feed Control
2.4.2.2 Coal Hopper
2.4.2.3 Stoker Front Enclosure
2.4.2.4 Stoker Grates
2.4.2.5 Stoker Drive
2.4.2.6 Stoker Drive Electric Motor
2.4.2.7 Air Distribution Control
2.4.2.8 Overfire Air System
2.4.2.9 Ash Discharge System
2.4.2.10 Doors
2.4.2.11 Lubrication

2.5 OIL BURNER/WINDBOX PACKAGE
2.5.1 Burner
  2.5.1.1 Burner Characteristics
  2.5.1.2 Atomization
  2.5.1.3 Electric Ignition System
  2.5.1.4 Natural Gas Pilot Ignition System
  2.5.1.5 Windbox
  2.5.1.6 Purge Connection
  2.5.1.7 Aspirating System
  2.5.1.8 Piping
  2.5.1.9 Metal Parts
  2.5.1.10 Fuel Oil Control Valve
  2.5.1.11 Fuel
  2.5.1.12 Burner Blower Fan For Oil Fired Burner
  2.5.1.13 Electric Motor

2.5.2 Flame Safeguard Controls
  2.5.2.1 Fuel Oil Train
  2.5.2.2 Control Sequencing
  2.5.2.3 Light Off
  2.5.2.4 Circuit Analyzer
  2.5.2.5 Control Panel

2.6 FANS
2.6.1 Forced Draft Fan (Coal Firing)
  2.6.1.1 Fan Size
  2.6.1.2 Fan Construction
  2.6.1.3 Electric Motor
  2.6.1.4 Noise Level for Forced Draft Fan

2.6.2 Induced Draft Fan
  2.6.2.1 Fan Size
  2.6.2.2 Fan Construction
  2.6.2.3 Dampers
  2.6.2.4 Painting
  2.6.2.5 Electric Motor
  2.6.2.6 Noise Level for Induced Draft Fan

2.7 COMPRESSED AIR SYSTEM
2.7.1 Plant Compressed Air System
  2.7.1.1 Air Filter
  2.7.1.2 Oil Filter
  2.7.1.3 Air Receiver
  2.7.1.4 Electric Motor
  2.7.1.5 Controls

2.7.2 Instrument Compressed Air System
  2.7.2.1 Air Compressor
  2.7.2.2 Air Receiver
  2.7.2.3 Aftercooler
  2.7.2.4 Electric Motor
  2.7.2.5 Controls
  2.7.2.6 Accessories
2.7.2.7 Desiccant Air Dryer
2.7.2.8 Refrigerated Air Dryer
2.7.3 Pressure Reducing Regulator

2.8 BREECHING, EXPANSION JOINTS, STACKS, DAMPERS, AND ACCESSORIES

2.8.1 Breeching
2.8.1.1 Breeching Connections and Joints
2.8.1.2 Uninsulated Breeching
2.8.1.3 Breeching Access Doors
2.8.1.4 Breeching Cleanout Doors
2.8.1.5 Breeching Structural Materials

2.8.2 Expansion Joints
2.8.2.1 Metallic Breeching Expansion Joints
2.8.2.2 Non-Metallic Expansion Joints

2.8.3 Stacks (For Installation Without Flue Gas Scrubbers)
2.8.3.1 Manufacturer's Calculations Required
2.8.3.2 Construction
2.8.3.3 Finish
2.8.3.4 Obstruction Lighting
2.8.3.5 Stack Sampling Platform

2.8.4 Dampers
2.8.4.1 Multilouver Dampers
2.8.4.2 Guillotine Dampers

2.9 COAL HANDLING EQUIPMENT

2.9.1 Railroad Hopper Car Thawing System
2.9.1.1 Pit-Type Railroad Hopper Car Thawing System
2.9.1.2 Surface Mounted Enclosed Railroad Hopper Car Thawing System
2.9.1.3 Shed

2.9.2 Top-Mounted Railroad Hopper Car Shaker (Unloader)
2.9.2.1 Shaker
2.9.2.2 Shaker Hoist
2.9.2.3 Controls
2.9.2.4 Frame [and Enclosure]

2.9.3 Capstan Car Puller
2.9.3.1 Accessories
2.9.3.2 Rope
2.9.3.3 Rope Storage Reel
2.9.3.4 Electric Motor

2.9.4 Reversible Drum Type Car Puller
2.9.4.1 Puller
2.9.4.2 Accessories

2.9.5 Track Hopper
2.9.5.1 Track Girders
2.9.5.2 Grating
2.9.5.3 Cover
2.9.5.4 Hopper Outlet

2.9.6 Truck Hopper
2.9.6.1 Grating
2.9.6.2 Hopper Outlet
2.9.6.3 Cover

2.9.7 Reclaim Hoppers
2.9.7.1 Grating
2.9.7.2 Hopper Outlet
2.9.7.3 Cover

2.9.8 Belt Feeder
2.9.8.1 Head and Foot Shafts
2.9.8.2 Pulleys
2.9.8.3 Belt
2.9.8.4 Electric Motor
2.9.8.5 Reduction Gear
2.9.8.6 Backstop
2.9.8.7 Idlers
2.9.8.8 Load Skirts
2.9.8.9 Frame, Supports, and Enclosure
2.9.8.10 Loading Hopper
2.9.8.11 Vibrating Feeder

2.9.9 Shallow-In-Built Bar Flight Feeder and Receiving Hopper
2.9.9.1 Head and Foot Shafts
2.9.9.2 Terminal Sprockets
2.9.9.3 Chains and Flights
2.9.9.4 Frame and Enclosure
2.9.9.5 Trough
2.9.9.6 Hopper
2.9.9.7 Grating
2.9.9.8 Flight Feeder Drive
2.9.9.9 Electric Motor

2.9.10 Bucket Elevator
2.9.10.1 Head and Foot Shafts
2.9.10.2 Terminal Sprockets
2.9.10.3 Buckets and Chain
2.9.10.4 Backstop
2.9.10.5 Elevator Casing
2.9.10.6 Head Section
2.9.10.7 Boot Section
2.9.10.8 Electric Motor
2.9.10.9 Reduction Gear
2.9.10.10 Anchoring Brackets

2.9.11 Flight Conveyor
2.9.11.1 Head and Foot Shafts
2.9.11.2 Terminal Sprockets
2.9.11.3 Flights and Chain
2.9.11.4 Frame and Enclosure
2.9.11.5 Trough
2.9.11.6 Loading Hopper
2.9.11.7 Outlets
2.9.11.8 Electric Motor
2.9.11.9 Gates
2.9.11.10 Reduction Gear

2.9.12 Belt Conveyor
2.9.12.1 Head and Foot Shafts
2.9.12.2 Takeups
2.9.12.3 Pulleys
2.9.12.4 Magnetic Pulley
2.9.12.5 Belt
2.9.12.6 Electric Motor
2.9.12.7 Reduction Gear
2.9.12.8 Backstop
2.9.12.9 Emergency Stop Cord and Switch
2.9.12.10 Belt Alignment Switch
2.9.12.11 Idlers
2.9.12.12 Load Skirts
2.9.12.13 Frame, Supports, and Walkway
2.9.12.14 Discharge Hopper

2.9.13 Coal Scales
2.9.13.1 Body
2.9.13.2 Feeder
2.9.13.3 Feed Belt
2.9.13.4 Electric Motor And Drive
2.9.13.5 Coal Bypass
2.9.13.6 Weighing Mechanism
2.9.13.7 Scale Weigh Hopper
2.9.13.8 Controls
2.9.13.9 Counters
2.9.13.10 Scale Inlet
2.9.13.11 Scale Outlet Hopper

2.9.14 Stoker Hopper Extension
2.9.15 Coal Valve
2.9.15.1 Valve Body
2.9.15.2 Valve Gate
2.9.15.3 Operating Shaft
2.9.15.4 Electric Motor Operators
2.9.16 Track and Reclaim Hopper Valves
2.9.16.1 Valve Body
2.9.16.2 Valve Gate
2.9.16.3 Operating Shaft

2.9.17 Chutes
2.9.18 Coal Presence Indicators and Equipment Response Switches
2.9.18.1 Type A - Diaphragm Type Presence Indicator
2.9.18.2 Type B - Paddle Type Presence Indicator
2.9.18.3 Type C - Tilt Type Presence Indicator
2.9.18.4 Type D - Rotating Type Presence Indicator
2.9.18.5 Type E - Vibrating Type Presence Indicator
2.9.18.6 Equipment Speed Response Switch
2.9.18.7 Presence Indicators and Response Switches

2.9.19 Control Panel and Controls
2.9.19.1 Control Panel
2.9.19.2 Remote Controls
2.9.19.3 Control Sequence
2.9.19.4 Additional Controls

2.9.20 Multiple Belt Scrapers
2.9.21 Steel Coal Bunker
2.9.21.1 Construction
2.9.21.2 Accessories:

2.9.22 Stackout Tube

2.10 FUEL OIL SYSTEM

2.11 ASH HANDLING SYSTEM (PNEUMATIC)
2.11.1 System Requirements
2.11.2 Type
2.11.3 Ash Silo
2.11.4 Ash
2.11.5 Maximum Noise Level
2.11.6 Dry Ash Storage Hopper
2.11.6.1 Construction
2.11.6.2 Refractory Materials
2.11.6.3 Discharge Doors or Gates
2.11.6.4 Hopper Lift Door Enclosure
2.11.6.5 Hinged Hopper Access Door

2.11.7 Clinker Crusher
2.11.7.1 Construction
2.11.7.2 Fluid Gear Drive

2.11.8 System Valving
2.11.8.1 Side Intake Valves for Fly Ash Collection
2.11.8.2 Manual Valve Intakes for Bottom Ash
2.11.8.3 Rotary Valve Intakes for Bottom Ash
2.11.8.4 Air Intake
2.11.8.5 Isolating Valves (Line Valves)
2.11.8.6 Silo Discharge Valve

2.11.9 Ash Conveyor Pipe and Fittings
2.11.9.1 Conveyor Piping
2.11.9.2 Elbows and Fittings
2.11.9.3 Hangers and Supports
2.11.9.4 Contractor's Option
2.11.9.5 Expansion Joints
2.11.10 Vacuum Air Piping
2.11.11 Compressed Air Piping and Accessories
2.11.12 Primary Ash Receiver-Separator and Secondary Ash Separator
  2.11.12.1 Primary Receiver-Separator
  2.11.12.2 Secondary Separator
  2.11.12.3 Dusttight Enclosure
2.11.13 Mechanical Exhausters
  2.11.13.1 Isolation Gates
  2.11.13.2 Accessories
  2.11.13.3 Electric Motor
  2.11.13.4 Noise Level
2.11.14 Pulse Jet Self-Cleaning Bag Filter Assembly
  2.11.14.1 Cloth Area
  2.11.14.2 Filter Construction
  2.11.14.3 Discharge Gate
  2.11.14.4 Bag Cleaning Mechanism
  2.11.14.5 Filter Bag Assemblies
  2.11.14.6 Control Panel
  2.11.14.7 Vacuum Breakers
2.11.15 Steam Exhauster
  2.11.15.1 Steam Condenser, Air Washer and Silencer
2.11.16 Ash Storage Silo
  2.11.16.1 Construction
  2.11.16.2 Concrete Stave Silo
2.11.17 Bag Filter Vent
2.11.18 Rotary Ash Conditioner (Unloader)
2.11.19 Fluidizing System
2.11.20 Control Panel and Controls
  2.11.20.1 General
  2.11.20.2 Control Panel
  2.11.20.3 Operation
2.12 ASH HANDLING SYSTEM (MECHANICAL)
  2.12.1 Ash Silo
  2.12.2 Ash
  2.12.3 Maximum Noise Level
  2.12.4 System Valving
    2.12.4.1 Rotary Valves
    2.12.4.2 Manual Valve Intakes for Bottom Ash
    2.12.4.3 Silo Discharge Valve
  2.12.5 Conveyors
    2.12.5.1 Chain Drag Conveyor
    2.12.5.2 Screw Conveyors
  2.12.6 Bucket Elevator
    2.12.6.1 Head and Foot Shafts
    2.12.6.2 Terminal Sprockets
    2.12.6.3 Buckets and Chain
    2.12.6.4 Backstop
    2.12.6.5 Elevator Casing
    2.12.6.6 Head Section
    2.12.6.7 Boot Section
    2.12.6.8 Electric Motor
    2.12.6.9 Anchoring Brackets
    2.12.6.10 Discharge Chute
  2.12.7 Ash Storage Silo
2.12.7.1 Construction
2.12.7.2 Concrete Stave Silo
2.12.8 Pulse Jet Bag Filter Vent
2.12.9 Rotary Ash Conditioner (Unloader)
2.12.10 Fluidizing System
2.12.11 Control Panel and Controls
  2.12.11.1 Control Panel

2.13 AIR POLLUTION CONTROL EQUIPMENT
  2.13.1 Mechanical Cyclone Collectors
  2.13.2 Fabric Filter Baghouse
  2.13.3 Electrostatic Precipitator Filters
  2.13.4 Scrubbers

2.14 MISCELLANEOUS EQUIPMENT
  2.14.1 Condensate Receiver
    2.14.1.1 Coating
    2.14.1.2 Accessories
  2.14.2 Deaerating Heater
    2.14.2.1 Heater Capacity
    2.14.2.2 Inlet Water Characteristics
    2.14.2.3 Storage Tank
    2.14.2.4 Vent Condensing Arrangement
    2.14.2.5 Materials
    2.14.2.6 Accessories
    2.14.2.7 Connections
    2.14.2.8 Level Control
    2.14.2.9 Low Pressure Steam Control
    2.14.2.10 Gage Glasses
    2.14.2.11 Alarms
    2.14.2.12 Multiport Back Pressure Relief Valve
    2.14.2.13 Exhaust Head
  2.14.3 Boiler Feed Pumps
    2.14.3.1 Pump Service Requirements
    2.14.3.2 Construction
    2.14.3.3 Drives
    2.14.3.4 Minimum Flow Protection for Boiler Feed Water Pumps
    2.14.3.5 Feedwater Stop and Check Valves
  2.14.4 Condensate Pumps
    2.14.4.1 Pump Service Requirements
    2.14.4.2 Construction
    2.14.4.3 Drives
  2.14.5 Variable Speed Motor Control
    2.14.5.1 Housing
    2.14.5.2 Controller Environmental Protection
    2.14.5.3 Method of Control
    2.14.5.4 Variable Speed Motor Controller
  2.14.6 Valve Actuators
  2.14.7 Sump Pumps
  2.14.8 Water Softening System
    2.14.8.1 Softener Equipment
    2.14.8.2 Brine Storage System
  2.14.9 Chemical Feed Systems
    2.14.9.1 Storage Tank
    2.14.9.2 Exterior Gage Glass
    2.14.9.3 Low Level Alarm
    2.14.9.4 Dissolving Baskets
    2.14.9.5 Tank Strainer
    2.14.9.6 Supporting Steelwork
    2.14.9.7 Agitator
    2.14.9.8 Proportioning Pumps
2.14.9.9   Safety Relief Valve
2.14.10   All Welded Blowdown Tank
  2.14.10.1   Construction
  2.14.10.2   Accessories
  2.14.10.3   Controls
2.14.11   Continuous Blowdown System
  2.14.11.1   Automatic Blowdown Controller
  2.14.11.2   Flash Tank
  2.14.11.3   Sample Cooler
  2.14.11.4   Heat Exchanger
2.15   PIPING
  2.15.1   Expansion
  2.15.2   Steam Heating and Distribution and Hot Water
  2.15.3   Materials
    2.15.3.1   Pipe Materials
    2.15.3.2   Fittings
    2.15.3.3   Flanges
    2.15.3.4   Valves
    2.15.3.5   Bolts and Nuts
    2.15.3.6   Gaskets
    2.15.3.7   Expansion Joints
    2.15.3.8   Pipe Hangers and Supports
    2.15.3.9   Instrumentation
    2.15.3.10  Miscellaneous Pipeline Components
    2.15.3.11  Backflow Preventers
    2.15.3.12  Insulation
    2.15.3.13  Pipe Sleeves
    2.15.3.14  Piping Identification
2.16   FIRE PROTECTION SYSTEM
2.17   MARKING
2.18   TOOLS AND TESTING EQUIPMENT
2.19   WELDING MATERIALS
2.20   MOTORS AND DRIVES
  2.20.1   Motors
  2.20.2   SOURCE QUALITY CONTROL
  2.20.3   Instrument Air Compressor Package

PART 3   EXECUTION

3.1   INSTALLATION
  3.1.1   Boiler and Equipment Installation
    3.1.1.1   Boiler and Equipment Foundations
    3.1.1.2   Installing Stoker Ash Pit Firebrick
    3.1.1.3   Forced and Induced Draft Fans
    3.1.1.4   Stack
    3.1.1.5   Horizontal Fuel Oil Tanks (Below Ground)
    3.1.1.6   Horizontal Fuel Oil Tanks (Above Ground)
    3.1.1.7   Vertical Fuel Oil Tank
  3.1.2   Piping
    3.1.2.1   Fittings
    3.1.2.2   Grading of Pipe Lines
    3.1.2.3   Anchoring, Guiding, and Supporting Piping
    3.1.2.4   Copper Tubing
    3.1.2.5   Sleeves
    3.1.2.6   Flashing for Buildings
    3.1.2.7   Outlets for Future Connections
    3.1.2.8   Screwed Joints in Piping
    3.1.2.9   Welded Joints
    3.1.2.10  Cleaning of Piping

SECTION 23 52 33.01 20  Page 9
3.1.2.11 Reduction in Pipe Size
3.1.2.12 Expansion Control
3.1.2.13 Connection to Equipment
3.1.2.14 Valve Installation
3.1.2.15 Traps and Connections
3.1.2.16 Pressure Gate Installation
3.1.2.17 Thermometers and Thermal Sensing Element of Control Valves
3.1.2.18 Strainer Locations
3.1.2.19 Dissimilar Piping Materials
3.1.2.20 Surface Treating, and Pipe Wrapping

3.1.3 PAINTING
3.1.3.1 Piping, Fittings, and Mechanical and Electrical Equipment
3.1.3.2 Painting
3.1.3.3 Boilers
3.1.3.4 Vertical Fuel Oil Tank
3.1.3.5 Surfaces Not to be Painted

3.1.4 INSULATION

3.2 FIELD QUALITY CONTROL
3.2.1 Tests and Inspections (Piping)
3.2.1.1 Hydrostatic and Leak Tightness Tests
3.2.2 Preliminary Operation
3.2.3 General Start-Up Requirements
3.2.4 Plant Equipment Tests
3.2.4.1 Plant Air Compressors
3.2.4.2 Instrument Air Compressors
3.2.4.3 Coal Handling System
3.2.4.4 Ash Handling System
3.2.4.5 Horizontal Fuel Oil Tanks (Below Ground)
3.2.4.6 Vertical Fuel Oil Tank
3.2.4.7 Blowdown Valves and Try Cocks
3.2.4.8 Draft Fans, Fuel Oil Heaters, Fuel Pumps, and Electric Motors
3.2.5 Boilers and Auxiliaries Tests and Inspections
3.2.5.1 Strength and Leak Tightness Tests
3.2.5.2 Boiler Inspection
3.2.5.3 Boiler Cleaning and Startup
3.2.5.4 Boiler Preliminary Operational Tests
3.2.5.5 General Operational Tests
3.2.5.6 Auxiliary Equipment and Accessory Tests
3.2.5.7 Feedwater Equipment Tests
3.2.5.8 Capacity and Efficiency Tests
3.2.5.9 Temporary Waste Steam Connection
3.2.5.10 Fire Safety for Oil-Fired Boilers
3.2.5.11 Plant Acceptance Operation
3.2.5.12 NAVFACENGCOM Acceptance
3.2.6 Manufacturers Field Services
3.2.6.1 Erection/Installation Supervisors and Service Engineers
3.2.6.2 Boiler and System Representatives
3.2.7 Instruction to Government Personnel
3.2.8 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for equipment for a steam heating plant which will generate from 2 1/2 to 9 1/2 kg per second 20,000 to 75,000 pounds per hour of steam.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This specification is intended to be used in the procurement and installation of heating plant equipment. Requirements for materials and procedures for special or unusual design shall be added to and modifications made to this specification as necessary to fit specific projects. This guide specification shall be used in conjunction with the following NAVFAC definitive drawings and UFC 3-410-06N, "Central Heating Plants Operation and Maintenance".

NAVFAC NO./DRAWING TITLE

1429327 - STEAM HEATING PLANT NO. 4 2 1/2 to 9 1/2 KG PER SECOND 20,000 to 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL SITE PLAN AND SECTIONS

1429328 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL FLOOR PLAN

1429329 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL LONGITUDINAL SECTION

1429330 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL TRANSVERSE SECTION

1429331 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL PIPING SCHEMATIC

1429332 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL PIPING SCHEMATIC

1429333 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL CONTROL SCHEMATICS

1429334 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL HANDLING CONTROLS

1429335 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL DETAILS

1429336 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL FUEL OIL UNLOADING

1429337 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL FUEL OIL STORAGE

1429338 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL SITE DETAILS COAL HANDLING

1429339 - STEAM HEATING PLANT NO. 4 2 1/2 TO 9 1/2 KG PER SECOND 20,000 TO 75,000 POUNDS PER HOUR
WATERTUBE (SHOP ASSEMBLED) COAL/OIL OR COAL SITE DETAILS
PART 1   GENERAL

1.1   REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 RELATED REQUIREMENTS

The following guide specification sections apply to this section with the additions and modifications as stated in the paragraph cited:

- 01 78 23 OPERATION AND MAINTENANCE DATA
- 03 30 00 CAST-IN-PLACE CONCRETE
- 05 12 00 STRUCTURAL STEEL
- 09 97 13.28 PROTECTION OF BURIED STEEL PIPING AND BULKHEAD TIE RODS
- 09 90 00 PAINTS AND COATINGS
- 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION
- 41 22 13.14 BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING
- 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS
- 22 05 48.00 20 MECHANICAL SOUND VIBRATION AND SEISMIC CONTROL
1.3 DEFINITIONS

a. Standard Commercial Product: A product which has been sold or is being currently offered for sale on the commercial market through advertisements or manufacturer's catalogs, or brochures, and represents the latest production model.

b. System Supplier: A manufacturer, fabricator, erector, corporation or firm that regularly is employed in the design, fabrication, erection, or erection supervision, testing and startup of systems comparable in size and type to those specified and indicated. The system supplier shall arrange the equipment selected, design the equipment interconnections, produce related shop drawings, supervise the erection, and start up and test the equipment.

1.4 SYSTEM DESCRIPTION

1.4.1 Design Requirements

1.4.1.1 Boiler

Boiler design and service conditions:

a. Design pressure: [_____] kPa (gage) psig

b. Operating pressure: [_____] kPa (gage) psig

c. Steam temperature: [_____] degrees C F

d. Feedwater temperature: [_____] degrees C F

e. Site elevation: [_____] meters feet

f. Ambient air temperatures:
   (1) Minimum: [_____] degrees C F
   (2) Maximum: [_____] degrees C F

g. Maximum continuous output (steam): [_____] kg/sec lb/hr

h. Minimum continuous output (steam): [_____] kg/sec lb/hr (without smoking)
i. Continuous blowdown: [_____] percent

**************************************************************************
NOTE: Regarding the text below, the specified efficiency for the boiler at maximum continuous load shall be not less than 80 percent for coal and 82 percent for oil. If an economizer is used, use 82 and 84 percent respectively for coal and oil firing. Depending on the particular application and fuel used, these efficiencies could be higher.
**************************************************************************

j. Efficiency at maximum continuous rating [includes economizer]
   (1) Coal: [_____] percent
   (2) [Oil]: [_____] percent

1.4.1.2 Economizer

**************************************************************************
NOTE: Economizers shall be specified for all boilers with operating pressure greater than 345 kPa (gage) 50 psig and a capacity of 2 1/4 kg/sec 18,000 pounds per hour and larger. For boilers from 1/2 to 2/14 kg/sec 4,000 to 18,000 pounds per hour the designer shall make the decision based upon a specific economic analysis. This paragraph shall be included as applicable.
**************************************************************************
**************************************************************************
NOTE: Unless a coal or a fuel oil to be burned has an uncommon tendency to foul tubes, finned tube economizers should be suitable for both fuels. Feedwater temperatures should be 110 degrees C 230 degrees F when sulphur (S) content of oil is 0.5 percent; 116 degrees C 240 degrees F, S=1.5 percent - 2 percent; 121 degrees C 250 degrees F, S=2.0 percent - 2.7 percent. Where fuels having more than 1.5 percent sulfur content are to be fired, finned tubes shall not be used unless they are steel tubes covered with cast iron finned casing.
**************************************************************************

a. Design pressure: [_____] kPa (gage) psig
b. Operating pressure: [_____] kPa (gage) psig
c. Fuel: Coal [and No.: [_____] fuel oil]
d. Specific heat of the flue gas: [_____] kJ/kg - degrees C Btu/lb - degrees F
e. Feedwater flow: [_____] L/s gpm
f. Flue gas temperature entering economizer: [_____] degrees C F
g. Flue gas temperature leaving economizer: [_____] degrees C F
h. Feedwater temperature entering economizer: [_____] degrees C F
i. Maximum pressure drop, economizer gas side: [_____] Pa inches water
j. Maximum pressure drop, economizer water side: [_____] kPa psi
k. Fouling factor on feedwater side: [____]
l. Fouling factor on gas side: [____]

1.4.1.3 Forced Draft Fan (Coal Firing)

Design fan to handle air at temperatures from [_____] to [_____] degrees C F. Fan shall be [single] [double] width inlet, [single] [double] width outlet, with [clockwise] [counter clockwise] rotation when viewed from the motor end.

1.4.1.4 Induced Draft Fan Design

Design fan of materials which will withstand flue gas temperatures up to 316 degrees C 600 degrees F without damage. Fan shall be [single] [double] width inlet, [single] [double] width outlet, with [clockwise] [counterclockwise] rotation when viewed from the motor end.

1.4.1.5 Expansion Joints

a. Stacks (for installation without flue gas scrubbers):

(1) Temperature:
   Maximum ambient: [_____] degrees C F
   Minimum ambient: [_____] degrees C F
   Inlet gas at maximum gas flow (coal): [_____] degrees C F
   Inlet gas at maximum gas flow (oil): [_____] degrees C F
   Inlet gas at minimum gas flow (coal): [_____] degrees C F
   Inlet gas at minimum gas flow (oil): [_____] degrees C F

(2) Gas flow at inlet
   Maximum: [_____] kg/sec lb/hr
   Minimum: [_____] kg/sec lb/hr

(3) Required net available draft at stack inlet
   At maximum gas flow: [_____] Pa inches water

(4) Gas exit velocity (cone exit)
   Maximum at maximum conditions: [_____] m/sec ft/sec

(5) Flue gas acid dew point
Coal: [_____] degrees C F
Fuel oil: [_____] degrees C F

(6) Test pressures
Shop test: [_____] Pa inches water

(7) Thermal efficiency of stack: 96 to 98 percent

(8) Stack friction, max. at design condition: [_____] Pa inches water

(9) Stack height
Ground elevation: [_____] m ft
Roof elevation: [_____] m ft
Stack height: [_____] m ft
Foundation or footing elevation: [_____] m ft

(10) Wind pressure: [_____] kg/m2 psf
(11) Wind velocity, gusting: [_____] km/hr mph

(12) Stack Diameter, min. (below exit cone): [_____] mm inches

(13) Max. stack deflection (from vertical center line): [_____] mm inches

(14) Soil bearing stress, maximum: [_____] kg/m2 psf

(15) Seismic zone: [_____]
(6) Operating temperature: [27 to 54] [_____] to [_____] degrees C [80 to 130] [_____] to [_____] degrees F

(7) Viscosity range: [450 to 5000] [_____] to [_____] ssu

(8) Specific gravity: [.92 to .99] [_____] to [_____] 

(9) Viscosity at brake power selection point: [9000] [_____] ssu

(10) Maximum pump speed: 1750 rpm

(11) Motor kW hp: [_____] 

(12) Fuel oil: No. [6, low sulfur] [_____] 

b. Transfer pumps (for fuel oil transfer from tanks to heating plant):

(1) Number of assemblies: [_____] 

(2) Tag numbers: As indicated 

(3) Capacity: [_____] L/s gpm at 450 ssu 

(4) Suction lift required: [_____] kPa ft of water 

(5) Discharge pressure: [_____] kPa (gage) psig 

(6) Operating temperature: [49] [_____] degrees C [120] [_____] degrees F 

(7) Viscosity range: [450 to 3000] [_____] to [_____] ssu 

(8) Specific gravity: [.92 to .99] [_____] to [_____] 

(9) Viscosity at brake power selection point: [5000] [_____] ssu 

(10) Maximum pump speed: 1750 rpm 

(11) Motor kW hp: [_____] 

(12) Fuel oil: No. [6, low sulfur] [_____] 

c. Fuel oil recirculation pump sets (at remote storage):

(1) Number of assemblies: [_____] 

(2) Tag numbers: As Indicated 

(3) Capacity: 1.60 L/s 25 gpm at 450 ssu 

(4) Suction lift required: [_____] kPa ft of water 

(5) Discharge pressure: [_____] kPa (gage) psig 

(6) Operating temperature: [49] [_____] degrees C [120] [_____] degrees F 

(7) Viscosity range: [450 to 3000] [_____] to [_____] ssu
(8) Specific gravity: [.92 to .99] [_____] to [_____] 

(9) Viscosity at brake power selection point: [5000] [_____] ssu

(10) Maximum pump speed: 1750 rpm

(11) Motor kW hp: [_____] 

(12) Fuel oil: No. [6, low sulfur] [_____] 

1.4.1.7 Fuel Oil Pump and Heater Set

a. Capacity each pump and each steam heater: [_____] L/s gpm 

b. Suction lift: [_____] kPa ft of water 

c. Discharge pressure at outlet of heater: [_____] kPa (gage) psig 

d. Maximum pump speed: 1750 rpm 

e. Specific gravity range: [.92 to .99] [_____] to [_____] 

f. Viscosity at brake power selection point: 5000 ssu 

g. Viscosity range: [500 to 5000] [_____] to [_____] ssu 

h. Oil temperature at inlet of heater: [_____] degrees C F 

i. Oil temperature at outlet of heater: [_____] degrees C F 

j. Maximum oil pressure drop through heater: [_____] kPa psi 

k. Heating medium: Steam 

l. Steam pressure available: [_____] kPa (gage) psig 

m. Steam temperature: [_____] degrees C F 

n. Heater type: [Bare Tube] [Extended Surface] 

1.4.1.8 Electric Startup Heater 

a. Oil temperature at inlet of heater: [_____] degrees C F 

b. Oil temperature at outlet of heater: [_____] degrees C F 

c. Maximum oil pressure drop through heater: [_____] kPa psi 

d. Capacity of heater: [_____] L/s gpm 

e. Heating power supply at three phase, 60 Hz: [_____] volts 

f. Control power supply 120 volts, single phase, 60 Hz 

1.4.1.9 Ash Handling System (Pneumatic) 

a. Capacity:
(1) Ash Handling System: Estimated capacities at maximum plant output are listed below; ash handling system capacity shall be sized for twice the amounts listed.

[_____] Mg tons per hour for fly ash

[_____] Mg tons per hour for bottom ash at the farthest ash intake from the exhauster

[_____] Mg tons per hour in main ash line leaving the boiler house (minimum).

(2) Ash silo: Storage capacity of ash silo is specified in the paragraph ASH STORAGE SILO.

(3) Rotary unloader: [_____] Mg tons per hour

b. General Data

(1) Available water pressure: [_____] kPa (gage) psig

(2) Available air pressure: [_____] kPa (gage) psig

(3) Seismic Zone: [____]

(4) Wind Velocity (Gusts): [_____] km/hr mph

(5) Altitude of plant: [_____] m ft

(6) Steam rating of plant: [_____] kg/sec lb/hr

   (a) Maximum continuous rating of boiler No. 1 [_____] kg/sec lb/hr

   (b) Maximum continuous rating of boiler No. 2 [_____] kg/sec lb/hr

   (c) Maximum continuous rating of boiler No. 3 [_____] kg/sec lb/hr

   (d) Maximum continuous rating of boiler No. 4 [_____] kg/sec lb/hr

(7) Coal Analysis

   (a) Ash: [_____] percent

   (b) Carbon: [_____] percent

   (c) Hydrogen: [_____] percent

   (d) Sulfur: [_____] percent

   (e) Moisture: [_____] percent

   (f) Nitrogen: [_____] percent

   (g) Oxygen: [_____] percent

(8) Ash Analysis

   (a) Carbon: [_____] percent
(b) Calcium: [_____] percent

(9) Minimum velocities required for materials

(a) Fly Ash: 19.30 meters per second (m/s) 3800 feet per minute (fpm)

(b) Bottom Ash [Single Retort Underfeed] 28.40 m/s 5600 fpm
[Traveling Grate] stoker

1.4.1.10 Ash Handling System (Mechanical)

a. Capacity:

(1) Ash Handling System: Estimated capacities at maximum plant output are listed below; ash handling system capacity shall be sized for twice the amounts listed.

[_____] Mg tons per hour for fly ash

[_____] Mg tons per hour for bottom ash

[_____] Mg tons per hour in bucket elevator leaving the boiler house (minimum).

(2) Ash Silo: Storage capacity of ash silo is specified in the paragraph ASH STORAGE SILO.

(3) Rotary unloader: [_____] Mg tons per hour

b. General Data:

(1) Available water pressure: [_____] kPa (gage) psig

(2) Available air pressure: [_____] kPa (gage) psig

(3) Seismic Zone: [_____] km/hr mph

(5) Altitude of plant: [_____] m ft

(6) Steam rating of plant: [_____] kg/sec lb/hr

(a) Maximum continuous rating of boiler No. 1 [_____] kg/sec lb/hr

(b) Maximum continuous rating of boiler No. 2 [_____] kg/sec lb/hr

(c) Maximum continuous rating of boiler No. 3 [_____] kg/sec lb/hr

(d) Maximum continuous rating of boiler No. 4 [_____] kg/sec lb/hr

(7) Coal Analysis

(a) Ash: [_____] percent

(b) Carbon: [_____] percent

(c) Hydrogen: [_____] percent
(d) Sulfur: [_____] percent
(e) Moisture: [_____] percent
(f) Nitrogen: [_____] percent
(g) Oxygen: [_____] percent

(8) Ash Analysis
(a) Carbon: [_____] percent
(b) Calcium: [_____] percent

1.4.1.11 Deaerating Heater

i. Storage capacity to overflow of storage tank: [_____] liters gallons

1.4.1.12 Water Softening System

Base the water softening system on the following:

******************************************************************************
NOTE: Analysis of the water available for makeup shall govern the softener system selected. A competent water treating consultant shall be obtained to formulate specific system recommendations if the makeup water analysis indicates any of the following:

1. Iron in excess of 0.1 ppm as Fe.

2. Mg Alkalinity in excess of 50 ppm as CaCO3.

******************************************************************************

a. Raw Water Analysis: Source of raw water is [____]. Raw water is available at pressures of [____] to [____] kPa (gage) psig. Analysis of water available for makeup is approximately as follows:

<table>

b. Softener Effluent Analysis:

**************************************************************************

**NOTE:** Total solids of 175 ppm in the feedwater concentrated 20 times give 3,500 ppm in the boiler water.
**************************************************************************
(1) Hardness: Maintain hardness of softened feedwater near zero and in no case allow it to exceed 1.0 part per million (ppm) as CaCO3.

(2) Total Solids: Maintain total solids in softened feedwater at a level to ensure a total solids concentration in the boiler water of less than 3,500 ppm without excessive blowdown.

1.4.2 Detail Drawings

1.4.2.1 Steam Generating Unit

Submit steam generating unit (boiler) manufacturer's drawing for the following:

a. Refractory details, expansion joints;

b. Certified outline, general arrangement (setting plan), and anchor bolt detail drawings including foundation loading diagrams;

c. Plans and elevations detailing piping connections;

d. Detailed dimensional drawings of auxiliaries furnished with unit;

e. Piping schematics for auxiliaries, such as sootblowers or hydraulic stoker drives (when used);

f. Shop fabrication details of boiler/furnace: Including details showing tubing, spacing, radii, dimensions, and gage; sections through walls and expansion joints showing refractory construction and replacement details; internal and external dimensions of boiler;

g. Wiring diagrams for subsystems;

h. Economizer and economizer inlet breeching;

i. Sootblowers;

j. Auxiliaries furnished with boilers;

k. Forced draft fan, drives and ductwork;

l. Induced draft fan, drives and ductwork;

m. Structural steel and loading diagrams; and

n. Overfire air fan system.

1.4.2.2 Boiler Room Auxiliary Equipment

Include equipment arrangements, wiring diagrams, piping diagrams and details of valves and piping. Submit descriptive information for each item on the drawings.

a. Water softening equipment;

b. Brine storage tank;

c. Condensate receiver;
d. Condensate transfer pumps including certified performance curves;

e. Deaerator;

f. Boiler feed pumps including certified performance curves;

g. Steam turbines;

h. Continuous blowdown system;

i. Chemical feed units;

j. Air compressors;

k. Air dryers;

l. Cranes and hoists; and

m. Plant heating and ventilating equipment showing related ductwork.

1.4.2.3 Stokers

Include the following:

a. General arrangement drawings;

b. Foundation drawings;

c. Front plates;

d. Ash hoppers;

e. Fuel gate mechanism;

f. Grate details;

g. Zone dampers;

h. Air seal details;

i. Overfire air nozzle arrangement;

j. Coal feeder details;

k. Fuel feeder drives;

l. Piping schematics;

m. Wiring schematics; and

n. Access doors.

1.4.2.4 Ash Handling System

Include the following:

a. General arrangement;

b. Construction details of ash storage silo complete with loading diagrams;
c. Control panel arrangement and schematics;

d. Wiring and control diagrams;

e. Ash piping arrangement drawings and schematic drawings;

f. Wear back fitting details;

g. Piping and fittings;

h. Details of [steam] [motor driven mechanical] exhauster [and air washer – steam condenser];

i. Details of separators, tertiary bag filter, and ash silo vent bag filter; and

j. Silo fluidizing system and rotary ash conditioner.

1.4.2.5 **Burners**

Include the following:

a. General arrangement;

b. Piping details;

c. Burner control schematics;

d. Flame safety schematics;

e. Component details; and

f. Throat tile details.

1.4.2.6 **Stacks, Dampers, and Breechings**

Include the following:

a. General arrangement;

b. Breeching, reinforcing details;

c. Breeching hangers and support details;

d. Dampers and operators;

e. Access doors and frames;

f. Expansion joints; and

g. Stack details including anchor bolt and foundation details, stack sampling ports, platforms, and accessories.

1.4.2.7 **Coal Handling Equipment** Drawings

Include the following:

a. Certified outline and general arrangement drawings for complete coal
handling system;

b. Dimensional equipment and fabrication drawings, including equipment weights, equipment locations, support details, and anchor bolt arrangements for items and equipment specified under the paragraph COAL HANDLING EQUIPMENT;

c. Control panel, coal presence indicators, and equipment response switch details; and

d. Control schematic diagrams and complete wiring diagrams.

1.4.2.8 Fuel Oil Equipment

Manufacturer's standard size for pumps, pump curves, valves, strainers and pump wiring and include the following:

a. Certified outline and general arrangement drawings;

b. Certified pump curves;

c. Equipment detail sheets including viscosity controller, heater and valves;

d. Electrical wiring diagrams; and

e. Oil tanks, foundations, tank heaters, appurtenances, water drawoff and level indication.

1.4.2.9 Piping and Specialty Items

Manufacturer's standard size and include the following:

a. Details of valves and fittings;

b. Feedwater regulator details and schematics;

c. Details and schematics of feedwater automatic recirculation; and

d. Installation details for ball expansion joints for saturated steam piping including allowable angular flex and minimum offset dimensions.

1.4.2.10 Furnishing Approved Drawings

Furnish one reproducible mylar shop drawing of each approved drawing sheet to the Contracting Officer for the following items:

a. Boiler layout, foundations, construction and details including economizers, and auxiliaries;

b. Breeching layout, construction and details;

c. Burner control and flame safety schematics;

d. Burner details;

e. Wiring diagrams;

f. Fuel tanks, foundations and appurtenances;
g. Feedwater automatic recirculation system;

h. Piping schematics;

i. Control diagram schematics including control panel construction and layouts;

j. Coal handling system;

k. Stoker details; and

l. Ash handling system.

1.4.3 Posted Operating Instructions

Provide posted operating instructions for each piece of equipment installed.

1.4.4 Performance Requirements

1.4.4.1 Boiler

Efficiency listed for coal burning shall be based on stoker firing with [_____] percent excess air. Efficiency for fuel oil firing shall be based on [_____] percent excess air. Efficiency shall allow for [_____] percent continuous blowdown and 1.5 percent unaccounted losses and manufacturer's margin. Base boiler performance on burning fuels in accordance with the Coal Analysis [and Fuel Oil Analysis] listed below.

a. Coal Analysis

(1) Ultimate Analysis (percent by weight)

<table>

- Heating Valve: [_____] kJ/kg Btu per pound
- Specific Gravity: [_____] degrees API
- Viscosity at burner
  - [_____] (SSF at 50 degrees C 122 degrees F)
  - [_____] Water and Sediment (percent by volume)
  - [_____] Flash Point degrees C F

Submit predicted economizer performance along with and as a part of the boiler predicted performance.

1.4.4.2 Economizer

Increase in efficiency due to the economizer shall be not less than [_____] percent at full load. Fully coordinate economizer with the boiler to which it is to be applied.

1.4.4.3 Oil Burner/Windbox Package

Burner turndown ratio on specified fuel oil shall be not less than eight to one, with excess air not over 15 percent at full steam load, and excess air not over 22 percent at 20 percent steam load.[ Air flow shall be modulated through a single set of register louvers.]

1.5 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**********************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Make submittals within [60] [75] [90] days after award of the contract.

SD-02 Shop Drawings

Steam Generating Unit
Boiler Room Auxiliary Equipment
Stokers
Ash Handling System
Burners
Stacks, Dampers, and Breechings
Coal Handling Equipment
Fuel Oil Equipment
Piping and Specialty Items

Each drawing size shall be A1 841 by 594 mm 34 by 22 inches, unless otherwise noted.

SD-03 Product Data

Steam Generating Unit (Boiler)
Coal Handling System

Insulation

Fans

Pumps

SD-04 Samples

Insulation

Submit samples of each type of insulation with indications of its intended application and manufacturer's stamp or label attached giving name of manufacturer, brand and description of material.

SD-05 Design Data

Stack Manufacturer's Calculations

Submit as specified under the paragraph MANUFACTURER'S CALCULATIONS REQUIRED.

SD-06 Test Reports

Boiler Predicted Performance

Economizer Performance

Instrument Air Compressor Package

Variable Speed Motor Controller

Submit certified copies of variable speed motor controller design, production and conformance tests for approval before delivery of the equipment.

Heating Plant

Submit for tests and inspections specified under the paragraph FIELD QUALITY CONTROL.

SD-07 Certificates

List of Equipment Manufacturers

Proof of Experience; G[, [_____]]

Manufacturer's Installation Approval

Boiler Inspector's Report

System and Equipment Installation

Vertical Fuel Oil Tank Calibration

Backflow Preventer
1.6 QUALITY ASSURANCE

Equipment shall be factory assembled except for steam generators, coal handling equipment and ash handling equipment which shall utilize shop assembled components to the maximum extent to facilitate erection and minimize field labor.

1.6.1 Standard Commercial Product

Boilers and equipment shall, as a minimum, be in accordance with requirements of this specification and shall be the manufacturer's standard commercial product. Include additional or higher quality features which are not specifically prohibited by this specification, but which are a part of the manufacturer's standard commercial product, in the boilers and equipment being provided.

1.6.2 Equipment Furnished

Equipment furnished by the Contractor shall be furnished by the manufacturers listed in the submittal letter listing equipment manufacturers.

1.6.3 Responsibility

The contract drawings show the required general arrangement configuration and location of equipment items. However, the contract allows for selection of any vendor's equipment at the option of the Contractor, provided the vendor's experience and equipment meet the requirements of these specifications and drawings. Because there may be significant variation between the drawings and the individual vendor's equipment as to foundations, physical dimensions and detailed arrangement of equipment items, the Contractor shall furnish detailed design and shop drawings and calculations for the systems selected. Show foundation arrangements, walkways and other information as required for a completely coordinated, useable and properly functional system. A single system supplier shall be responsible for a complete system including erection or erection supervision for each of the following systems:

a. Boiler system, including but not limited to the following: Boiler, stoker, oil burners, [economizer,] refractories, insulation, induced draft fan, sootblowers, steam separator, forced draft fan, overfire air fan, boiler trim, blowdown valves, safety valves and trim, and breeching. Ensure that the system manufacturer coordinates the required instrumentation and control logic with the controls and instrumentation supplier. Controls and instrumentation are specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.
b. Coal handling system, including but not limited to the following: Track and reclaim hoppers, belt feeders, belt conveyors and tube galleries, telescoping chute, flight conveyor, coal bunker, under bunker conveyor and triple valves, coal scale, controls, coal chutes and gates.

c. Ash handling system including ash piping, fittings, intakes, ash silo, separators, tertiary filter, [mechanical exhauster] [steam exhauster, air washer-condenser], and rotary unloader.

d. Stack system including steel stack, internal acid resistant lining and external coating.

1.6.4 Certification of Backflow Preventer

Certificate of Full Approval or current Certificate of Approval for each backflow preventer being provided for the project shall be from the Foundation for Cross-Connection Control Research, University of Southern California and shall attest that the design, size, and make of backflow preventer has satisfactorily passed the complete sequence of performance testing and evaluation for the respective level of approval. A Certificate of Provisional Approval will not be acceptable in lieu of the above.

1.6.5 Modification of References

In the API publications referred to in this specification, the advisory provisions shall be considered mandatory, as though the word "shall" had been substituted for "should" and "suggested" wherever they appear.

1.6.6 Certificates

1.6.6.1 List of Equipment Manufacturers

Submit to the Contracting Officer a letter listing the equipment manufacturers for the following equipment:

a. Boilers and stokers;
b. Boiler feedwater pumps;
c. Coal car handling equipment;
d. Induced draft fans;
e. Coal handling equipment; and
f. Ash handling equipment.

When the Contracting Officer determines that a manufacturer does not meet the qualification or experience requirements of the specifications, the Contractor shall submit, to the Contracting Officer, the name of another manufacturer within 15 days of notification.

1.6.6.2 Proof of Experience

Submit proof of experience of manufacturers, system suppliers and installers as follows.

a. Experience, Responsibility and Certification: Submit to the
Contracting Officer, the required information and experience certificates within 30 days after award and prior to commencing work on the site.

**************************************************************************

NOTE: Regarding the text below, verify number of manufacturers' installations operating and years of operation for boiler, coal handling systems, ash handling systems, forced draft fan, burner/windbox package and control systems to avoid an unnecessarily restrictive experience requirement.

**************************************************************************

b. Experience Requirements: Boilers and equipment installed within or as a part of the heating plant shall be of proven designs. Each manufacturer or system supplier shall be regularly engaged in designing, fabricating, erecting or erection supervision, testing and starting up of the equipment or system. Within 30 days after contract award, or at any time during performance of the contract, if the Contractor is required to use a different manufacturer or system supplier from one that was designated previously, through no fault of the Contractor, the Contractor shall submit certification and other evidence of acceptable experience from each replacement manufacturer or system supplier. Such certification shall show that equipment and systems made or furnished by the manufacturers or system suppliers have operating characteristics which are substantially similar to the equipment or systems specified. The certification shall also state that essentially equivalent equipment or systems supplied by the manufacturer or system supplier have been successfully installed and reliably operated in at least [one] [two] [three] installation[s] under comparable operating conditions for a period of not less than two years.

c. Information Required: Submit to the Contracting Officer, evidence or proof of experience required from the equipment manufacturer or system supplier containing the following information:

(1) List of installations meeting requirements of the paragraph EXPERIENCE REQUIREMENTS including detailed description of equipment furnished for each one;

(2) Owner and location of each installation;

(3) Name and phone number of supervisory person at each installation; and

(4) Date of Owner acceptance of such installation.

d. Vertical Fuel Oil Tank Calibration Experience: Submit to the Contracting Officer evidence or proof that the tank calibration organization has at least 2 years of prior successful and accurate experience in calibrating tanks of comparable type and size.

1.6.6.3 Manufacturer's Installation Approval

Submit manufacturer's installation approval for the following systems and equipment as specified under the paragraph SYSTEM AND EQUIPMENT INSTALLATION:

a. Steam generating units (boilers) and auxiliary equipment;
b. Coal handling system;
c. Ash handling system;
d. Plant air compressors;
e. Steam turbines;
f. Variable speed motor controller; and

g. [____].

1.6.6.4 Boiler Inspector's Report

Submit as specified under the paragraph BOILER INSPECTION.

1.6.6.5 System and Equipment Installation

Submit from each system supplier and each manufacturer of the equipment, written certification that the system and equipment installation is in accordance with the system supplier's and equipment manufacturer's instructions and recommendations, that the unit or system has been run, rotating parts have been dynamically balanced, fluid (including air) flows have been balanced, instrumentation and controls are properly functioning, adjusted and have been calibrated, and the equipment or system is ready for final testing. Certificates shall be submitted before the entire boiler plant may be given an acceptance test.

1.6.6.6 Vertical Fuel Oil Tank Calibration

Submit four copies of the certified record.

1.6.6.7 Backflow Preventer

Submit a Certificate of Full Approval or a current Certificate of Approval for each design, size, and make of backflow preventer being provided for the project.

1.7 ENVIRONMENTAL REQUIREMENTS

Boiler plant shall comply with all applicable Federal, State, and local environmental regulations.

1.7.1 Air Permits

Permits for construction and operation of the boiler plant must be obtained from and/or submitted to the local environmental regulatory agency prior to the start of construction.

1.7.2 Burner Emission Requirements

The emission requirements shall be met at the maximum required continuous output. The burner shall meet all applicable environmental rules and regulations. Emission requirements to be considered are oxides of nitrogen (NOx), opacity, particulate, sulfur dioxide, and carbon monoxide. Other emission requirements may be imposed.
1.7.2.1 NOx Emission Regulations

Compliance shall be met using [one] [a combination] of the following:

a. Low NOx burners
b. Flue gas recirculation equipment which conforms to UL 795
c. Other NOx reduction techniques. See Nitrogen oxide control for stationary combustion sources.

1.8 DELIVERY, STORAGE, AND HANDLING

Each assembly of components packaged as a unit shall be of a size that can be transported by common carrier without disassembly insofar as shipping clearances are concerned.

1.9 EXTRA MATERIALS

Furnish a spare set of refractory bricks for each railroad hopper car thawing system.

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials free of defects which would adversely affect the performance or maintainability of individual components or of the overall assembly. Materials not specified shall be of the same quality used for the intended purpose in commercial practice. Unless otherwise specified, equipment, material, and articles incorporated in the work covered by this specification shall be new.

2.1.1 Identical Items

Provide physically and mechanically identical boilers and equipment of the same classification, size or capacity to permit the interchangeability of replacement parts. This requirement includes parts, assemblies, components, and accessories. Parts provided on the same type unit regardless of size and identifiable by identical part numbers shall be functionally and dimensionally interchangeable. No deviation is acceptable without prior written approval of the Contracting Officer.

2.2 BOILER

[Coal/Oil] [Coal] Fired. Submit steam generating unit (boiler) data for the following:

a. Safety valve calculation sheets;
b. Boiler predicated performance data, and
c. Economizer predicted efficiency calculations.

2.2.1 Packaged Watertube Boiler

Provide Type I boiler conforming to FS F-B-2902 except as modified below. Provide lifting attachments.
2.2.2 Operational Requirements

Boiler shall be capable of operating continuously at the maximum specified conditions without damage or deterioration to the boiler, settings, firing equipment or auxiliaries. Boiler shall be capable of automatically controlled operation while burning the specified fuel[s].

2.2.3 Tubes

******************************************************************************
NOTE: Use this paragraph if tube diameters larger than specified in FS F-B-2902 are desired and insert minimum acceptable diameter.
******************************************************************************

Boiler and furnace tubes shall be not less than [_____] mm inches in outside diameter. Furnace tubes and first two rows of main boiler bank shall be one gage heavier than other tubes.

2.2.4 Boiler Trim

Fitting, drain valves, drain piping, feed piping, pressure gages, feed valves, stop valves, check valves, safety valves, and remaining appurtenances shall comply with applicable requirements of the ASME Boiler and Pressure Vessel Code. Components shall conform to the following:

2.2.4.1 Boiler Blowoff Valves

Provide flanged [Class 250 cast iron] [Class 300 cast steel] body, seatless, sliding plunger type valves mounted in tandem at each boiler blowoff connection.

2.2.4.2 Steel Gate, Globe and Angle Valves

ASME B16.34.

2.2.4.3 Safety, Relief, and Safety Relief Valves

ASME BPVC SEC I.

2.2.4.4 Steam Gage

******************************************************************************
NOTE: Select gage scale to operate within the middle third of range.
******************************************************************************

Provide a 300 mm 12 inch diameter indicating steam gage with chromium plated trim and zero to [_____] kPa (gage) psig scale. Gage shall be complete with syphon, valve, piping, and fittings to properly connect same. Gage shall be flush mounted on a 368 mm square by 5 mm 14 1/2 inch square by 3/16 inch thick steel plate. Provide plugged tee connection for connection to remote steam gage.

2.2.4.5 Water Column

Provide a safety water column with high and low water alarm suitable for the design pressure of the boiler. Column shall be complete with three-chain-operated gage cocks, heavy duty inclined gage glass, and
quick-closing water gage valves having cross leavers and chains operated from floor. Gage glass shall be readable from any point directly below unit. Make connections to water column from boiler with extra strong steel pipe and forged steel fittings. Provide crosses instead of tees or elbows, with screwed plugs in open ends. Terminate bottom of water column and water column gage glass with plug-type valves accessible from operating floor. Provide screwed plugged connections in water column piping for remote level indicator. Provide gate valves immediately below water column and gage glass. Provide a suitable lamp fixture to illuminate water column.

2.2.4.6 Safety Valves

Provide not less than [_____] cast steel or cast iron body high capacity safety valves to give a total steam relieving capacity in accordance with the ASME BPVC SEC I requirements as to total boiler and water wall heating surface. Valves shall be set with a set pressure of [_____] kPa (gage) psig, [_____] kPa (gage) psig] [_____] kPa (gage) psig] [_____] kPa (gage) psig] respectively. Valves shall have flanged inlet and outlet connections.

2.2.4.7 Non-Return Valve

Provide a non-return valve on each boiler steam outlet. Valve shall be a stop check angle body valve, flanged, [Class 250 cast iron] [Class 300 steel] body with handwheel shutoff, pressure operated disc and external equalizer. Assembly for manual operation shall be outside screw and yoke type.

2.2.4.8 Blowoff Connections

Bottom drum blowoff connection on boiler shall be [_____] mm inch diameter and extended to outside of setting terminating with tandem flanged blowoff valves as specified above. Boiler water wall blowoff connections and economizer inlet pipe blowoff shall be 40 mm 1 1/2 inch diameter and extended to outside of setting and equipped with same type valves. Provide stop valves for water column blowoff connections. Boiler blowoff connections shall conform to the applicable requirements of ASME BPVC SEC I, Part PG-59.

2.2.4.9 Miscellaneous Stop Valves

Provide stop valves near boiler for each connection to boiler; include valves for soot blowers, chemical feed, vent, continuous blowoff, and required drains.

2.2.4.10 Tube Cleaner

Provide one tube cleaner suitable for cleaning boiler tubes. Tube cleaner shall operate on water at 1034 kPa (gage) 150 psig pressure. Tube cleaner shall be complete with one motor, one wrench, one cutter head assembled, one universal coupling for cutter head, two sets of cutters, two sets of cutter pins, one set of arm pins, one set ofkeeper pins, one brush with a set of refills, one tool box, and two 15 meters 50 foot lengths of heavy duty hose with 20 mm 3/4 inch diameter pipe connections.

2.2.4.11 Wrenches

Provide special wrenches required for proper maintenance of equipment.
2.2.5 Boiler Limit Interlocks

Provide applicable boiler limit interlocks required by FS F-B-2910 and connect to effect safety shutdown of the stoker[ and oil burners]. Interlocks shall be compatible with and integrated into the control and instrumentation system.

2.2.6 Sootblowers

Provide boiler [and economizer] with a sootblowing system using [steam] [compressed air] for removing deposits of soot and fly ash from heat transfer surfaces. Sootblower elements shall be of a sufficient number and in a proper location to clean every heat transfer surface susceptible to soot or ash deposition. Fixed position, multi-nozzle rotating elements may be used in applications where flue gas temperatures do not exceed 982 degrees C 1800 degrees F. Retractable soot blowers shall be provided where flue gas temperatures exceed 982 degrees C 1800 degrees F.

[2.2.6.1 Fixed Position Soot Blowers (Steam)]

**************************************************************************
NOTE: Choose this paragraph or the paragraph below,
FIXED POSITION SOOTBLOWERS (AIR PUFF).
**************************************************************************

Steam, fixed position, multi-nozzled, rotating, valve-in-head type with electric motor operation to permit proper cleaning of heat transfer surfaces with cam operated valves arranged to automatically open steam valve through proper arc of rotation. cams shall be adjustable to give proper operating arc or shall be specially designed for each location. Furnish and install soot blowers complete, including valve-in-head blower heads, wall sleeve bushings, high temperature elements, low temperature elements, [_____] volt, [_____] Hz, [_____] kW hp motor operators, hand operated drain valve, with drilled orifice and disc to prevent tight shutoff, element supports, clamps, bolts, and other required hardware. Furnish necessary piping and valves including drain lines, shutoff valves, piping supports and insulation. Weld sootblower piping and fittings. No screwed piping or fittings will be permitted. Install sootblower elements with care so that they do not rub on tubes and cause eventual tube failure. Provide scavenging air connections from forced draft fan where required to protect blower in non-blowing position. Provide a single control station containing start and stop pushbuttons and necessary relays to control motor operators.

[2.2.6.2 Fixed Position Sootblowers (Air Puff)]

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph above FIXED POSITION SOOTBLOWERS (STEAM).
**************************************************************************

Air puff type, fixed position, multi-nozzled rotating element type complete with air master controller for each boiler, entirely air-operated and designed for controlled automatic sequential operation. Units shall be operated in such a manner that air issues from the element in a series of sustained high pressure puffs of approximately one second duration each. During each puff, element shall be rotated through a predetermined and measured short arc (17 degrees) by means of a ratchet mechanism in the sootblower head. Between each puff, no air shall flow through blowers and...
there shall be sufficient time for system to be restored to full pressure. When each blowing cycle is complete, the controller shall automatically stop its operating sequence. Provide sootblowers complete, with wall sleeve bushings, element supports, clamps, bolts, and other required hardware. Provide necessary piping and valves, including shutoff valves, piping, and supports. Sootblower piping and fittings shall have welded connections. No threaded piping or fittings will be permitted. Install sootblower elements with care so that they do not rub on tubes and cause eventual tube failure.

2.2.6.3 Retractable Sootblowers

Provide in lieu of fixed position type and use where flue gas temperatures exceed 982 degrees C 1800 degrees F. Sootblowers shall be [air] [electric] motor operated. Rotation of sootblower shall be continuous from the moment the lance or element begins to extend. Rotational and translational speeds shall be independently adjustable by changing sprockets. Sootblowers shall be complete with heavy steel housing, outside adjustment of nozzle pressure, alloy element or lance, wall sleeve, supports, and necessary hardware required for a completely workable system.

2.2.6.4 Sootblower Elements

Provide sootblowers with elements specially designed for use with [steam] [air]. Elements subjected to temperatures of 482 to 816 degrees C 900 to 1500 degrees F shall be chromium covered extra heavy carbon steel tubing or a chrome alloy as specified for high temperatures; between 817 to 927 degrees C 1501 to 1700 degrees F, elements shall contain not less than 20 to 23 percent chrome; from 928 to 982 degrees C 1701 to 1800 degrees F, not less than 24 to 27 percent chrome. Provide a flexible connection between each head and element.

2.2.6.5 Pushbutton

On the operating floor provide a pushbutton for each boiler for starting and stopping sootblower system.

2.2.6.6 Control for Sootblowing System

Provide sootblowing system with an automatic programmable control system which will automatically start and stop each soot blower in programmable sequence and monitor and display operation of soot blowers. Provide an override control which will permit manual start-stop operation of sootblowers.

2.2.7 Combustion Controls

As specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.3 ECONOMIZER

********************************************************************************
NOTE: Economizers shall be specified for all boilers with operating pressures greater than 345 kPa (gage) 50 psig and a capacity of 2 1/4 kg/sec 18,000 pounds per hour and larger. For boilers from 1/2 to 2 1/4 kg/sec 4,000 to 18,000 pounds per hour the designer shall make the decision based upon a specific economic analysis. This paragraph shall be
NOTE: Unless a coal or a fuel oil to be burned has an uncommon tendency to foul tubes, finned tube economizers should be suitable for both fuels. Feedwater temperatures should be 110 degrees C 230 degrees F when sulphur (S) content of oil is 0.5 percent; 116 degrees C 240 degrees F, S=1.5 percent - 2 percent; 121 degrees C 250 degrees F, S=2.0 percent - 2.7 percent. Where fuels having more than 1.5 percent sulfur content are to be fired, finned tubes shall not be used unless they are steel tubes covered with cast iron finned casing.

Provide a modular [bare tube] [cast iron finned, steel tube] unit constructed in accordance with the ASME BPVC SEC I. Water flow shall be parallel to flue gas flow (incoming water shall enter at the same end that the flue gasses enter the economizer).

2.3.1 Construction

Provide manufacturer's standard economizer design for the operating conditions and the fuel(s) specified. Coordinate the amount of heating surface with the flue gas conditions exiting the boiler or boilers on which the economizer is to be applied to preclude reaching the "acid dew point" for specified fuels. When necessary (sulfur is present in the specified fuel and the designed inlet temperature could fall below the "acid dew point"), provide a feedwater temperature control system. Provide casing of not less than 12 gage steel plate reinforced with steel support lugs and breeching flanges. Provide building framing steel to properly support the economizer. Provide built-in rotary chain operated soot blowers for each economizer to thoroughly clean surfaces exposed to flue gas. Economizer shall be designed so that internal construction can be easily cleaned and inspected.

2.3.2 Equipment

Provide the following equipment for each unit:

a. Relief valve

b. Shutoff gate valve on feedwater outlet and shutoff globe valve on inlet with globe valve bypass. Size valves as shown in economizer piping detail

c. Temperature indicator on feedwater outlet

d. Temperature indicator on feedwater inlet

e. Temperature indicator on flue gas outlet

f. Temperature indicator on flue gas inlet

g. Temperature alarm switches for high and low flue gas temperatures

h. Alarm with trouble light and silencing switch
i. Panel with annunciator and temperature indicators for feedwater inlet, feedwater outlet, flue gas inlet, flue gas outlet of each economizer

j. A drain valve downstream of the economizer before the shutoff valve

k. A stack flue gas temperature control system to control and limit flue gas temperature to not less than 149 degrees C 300 degrees F by modulating a motorized feedwater control valve in a bypass around the economizer. Provide a shutoff valve on each side of the control valve with a strainer upstream of each valve. Provide this system parallel to the manual shutoff and bypass described above

l. Differential pressure indicator on water side

m. Differential pressure indicator on gas side

n. Pressure gages on feedwater inlet and outlet

2.3.3 Insulation

Submit manufacturer's literature of each insulation type and installation, adhesives, coating mastic and accessories. Make reference to specification paragraph numbers where they apply. Insulate economizer with not less than the equivalent of 50 mm 2 inches of mineral wool insulation and lag with not less than 27 gage galvanized, weatherproof lagging.

2.4 COAL STOKERS

**************************************************************************
NOTE: The single retort underfeed stoker can be used for up to a maximum continuous rating of approximately 3 kilogram per second (kg/s) 25,000 pounds per hour steam flowrate and a two hour peak rating of 3.75 kg/s 30,000 pounds per hour depending upon the manufacturer.
**************************************************************************

**************************************************************************
NOTE: If the boiler is not part of this project insert Coal Analysis at end of this paragraph and delete the last sentence.
**************************************************************************

Provide for each boiler a single retort underfeed stoker with moving grates arranged for side dump ash discharge. Stoker shall be capable of continuous operation at such rate as required for continuous output of not less than that specified for the boiler and shall satisfactorily provide for automatic operation, by means of a combustion control system, within the range given when burning specified coal and operated in accordance with manufacturer supplied instructions. Satisfactory operating conditions shall be obtained throughout the full operating range of the stoker. Stoker shall be considered as an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service conditions together with requirements of tests, performance guarantees and other warranties specified for the boiler. Coal analysis shall be as specified in the Coal Analysis Schedule for the boiler.
2.4.1 Stoker Grate Area and Heat Release Rate

**************************************************************************
NOTE: The designer shall refer to the graph of Stoker Allowable Rating - Percent Of Full Load Rating Versus Ash Fusion Temperature shown in NAVFAC DM-3.6, NAVFAC Design Manual, Figure 11 and select the appropriate combustion rate.
**************************************************************************

Provide a grate with area sufficient to give specified steam output when burning specified coal. Grate shall fit between furnace side wall headers and between the inside face of the front wall and face of the bridge wall. Maximum stoker heat release rate shall be not greater than \[\text{____}_\] watt per square meter \[\text{Btu per square foot per hour}\] at the specified maximum continuous rating for the boiler.

2.4.2 Construction

2.4.2.1 Coal Fuel Feed Control

Provide a stoker ram with a constant stroke for feeding fuel to the central retort and necessary auxiliary rams or pushers to secure an even distribution of fuel throughout the entire length of the retort and over the grate surface. Determine rate of coal feed by the length of the rest period between full strokes. Provide for control by adjustment at a single point. Design stoker controls for connection to a combustion control system.

2.4.2.2 Coal Hopper

Provide a \[\text{____}_\] mm inch thick Type 316 stainless steel coal hopper having a capacity of not less than \[\text{____}_\] kg pounds at the front of each stoker.

2.4.2.3 Stoker Front Enclosure

Provide stoker front with dusttight enclosure of cast iron, or not less than 10 gage steel plate, of height and width to match boiler front to eliminate dust from the boiler room and prevent air infiltration to grate.

2.4.2.4 Stoker Grates

Grate surface shall consist of air cooled lateral firebars or grates inclined downward from the central retort toward side walls of furnace. Provide for agitation of fuel bed by either an alternating arrangement of moving and stationary grate bars or an undulating grate bar motion. Moving grates shall be adjustable to obtain the degree of movement necessary to suit characteristics of the fuel. Adjustments shall be capable of being made while unit is in operation. Design firebars or grates to prevent sifting of coal through spaces provided for air admission to the fuel bed. As a minimum, construct stoker grates of alloyed cast iron.

2.4.2.5 Stoker Drive

Stoker may be hydraulically or mechanically driven through cranks and machine cut, double reduction worms and gears, fully enclosed in an oiltight case and running in a bath of oil. Bearings shall be antifriction type, with hardened inner and outer races and fitted with forced lubrication fittings.
2.4.2.6 Stoker Drive Electric Motor

[_____] volt, [_____] phase, 60 Hz, [_____] rpm, totally enclosed, fan cooled not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES.

2.4.2.7 Air Distribution Control

Divide stoker plenum chamber into high and low pressure zones. High pressure zone shall be adjacent to retort where fuel bed is normally heaviest. Low pressure zone shall be under end of grate furthest from retort and shall compensate for thinner fuel bed normally carried in that area. Make provisions to admit air under pressure through the dump grates by manually operated blast gates.

2.4.2.8 Overfire Air System

Overfire air system shall consist of a blower, damper, manifold with properly sized nozzles and connecting air piping to ensure full penetration and proper turbulence. Blower volume shall not be less than 15 percent of total volume of combustion air. Blower pressure shall be sufficient for penetration of the full length of the furnace. Nozzles shall be located in rear of furnace wall and nozzle spacing shall be approximately 150 to 230 mm 6 to 9 inches o.c. Utilizing air from forced draft fan for overfire air system is not acceptable. Design shall conform to requirements of the stoker manufacturer to suit the boiler furnished.

2.4.2.9 Ash Discharge System

Provide each stoker with power operated dump grates extending from front wall to bridge wall on both sides adjacent to side walls and of sufficient area to handle ash resulting from burning of coal specified at the maximum capacity specified. Stoker dump cylinders shall be [steam] [air] [hydraulically] operated. Perforate dump grates for admission of air to burn out combustibles before refuse is discharged to ash pit. Provide ash spray pipes with manually operated valves on front of stoker beneath each dump grate.

2.4.2.10 Doors

Provide stoker front with not less than two lined furnace access doors not less than 460 mm wide by 400 mm high 18 inches wide by 16 inches high with observation ports, two ash pit doors not less than 350 mm wide by 300 mm high 14 inches wide by 12 inches high, and two air plenum cleanout doors.

2.4.2.11 Lubrication

Provide stoker drive mechanism with grease cups, oil cups, or splash pans to provide proper lubrication.

2.5 OIL BURNER/WINDBOX PACKAGE

**************************************************************************
NOTE: The designer shall fill in the appropriate information as defined in FS F-B-2910.
**************************************************************************

Provide a fully modulating, oil burner conforming to FS F-B-2910, Class
burner, burner blower fan, dampers, fuel train and associated controls to comprise a complete factory assembled package. Total heat input to the boiler furnace shall be provided by [_____] burners. Burner package shall be considered an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service together with the requirements of tests, performance guarantees and other warranties specified for the boiler.

2.5.1 Burner

2.5.1.1 Burner Characteristics

Burner shall be quiet in operation and shall operate with a balanced flame so as not to localize heat in any part of the combustion chamber. Burner shall be capable of completely atomizing and effectively mixing oil with air so as to ensure complete combustion. Air admitted shall be of sufficient quantity for complete combustion, but not of such quantity as to produce an undue percentage of excess air with attendant high stack loss. Oil burner shall operate without clogging or failure, and shall have sufficient capacity to develop not less than the specified capacity. Burner unit shall be easily removed from firing position and readily accessible for inspection, cleaning, and other purposes. Provide adequate observation ports on burner. Burner manufacturer shall guarantee that there will be no flame impingement on sidewalls, top, bottom, or rear walls of furnace. Install burner manufacturer furnished refractory throat tiles or other items required for proper installation of burner.

2.5.1.2 Atomization

**************************************************************************
NOTE: For boilers below 7100 kW 25,000 pounds per hour the designer shall select either compressed air or steam atomization after performing an economic analysis. For 7100 kW 25,000 pounds per hour and above, atomization shall be by compressed air unless steam pressure is required for greater turndown.
**************************************************************************

Burner shall be [steam atomizing; steam pressure at header is [_____] kPa (gage) psig; steam temperature at header is [_____] degree C F] [air atomizing; filtered compressed air shall be available for burner atomization and the maximum requirement for each burner shall not exceed [_____] L/s scfm of air at [_____] kPa (gage) psig]. Provide pressure reducing valve and controls as required.

2.5.1.3 Electric Ignition System

**************************************************************************
NOTE: Natural gas pilot ignition system may be considered only when natural gas is available at the site.
**************************************************************************

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph below, NATURAL GAS PILOT IGNITION SYSTEM.
**************************************************************************
Burner shall be equipped with an electric ignition system. System shall be either high energy ignition or glow rod type. Gas ignition system is not acceptable. High energy ignition system shall use stored energy to develop 2000 Vdc pulses. Glow rod system shall use a low voltage, carbon rod electrode which develops a tip temperature of $1427 \text{ degrees C}$ $2600 \text{ degrees F}$. Provide ignition system complete.

2.5.1.4 Natural Gas Pilot Ignition System

**************************

NOTE: Natural gas pilot ignition system may be considered only when natural gas is available at the site.
**************************

**************************

NOTE: Choose this subparagraph or the subparagraph above, ELECTRIC IGNITION SYSTEM.
**************************

Provide a complete interrupted type natural gas-fired, spark ignited pilot system for the burner assembly. Combustion air supply shall be from the burner windbox. Lighting system shall have capacity to stabilize firing during startup periods. Lighter shall be arranged for easy removal and servicing while boiler is in operation. Furnish igniter complete with spark rod and power pack. Power pack shall operate on 120 volt, 60 cycle, single phase power. Provide gas piping, to one point of supply, including necessary gas pressure regulators. Igniter system shall include controls, gages, flame safety systems, interlocks and accessories to comply with Industrial Risk Insurers' (I.R.I.) (formerly F.I.A.) requirements and applicable codes and regulations.

2.5.1.5 Windbox

Construct of carbon steel plate not less than 10 gage thickness with $6\text{ mm}$ 1/4 inch thick front plate. Design windbox to provide even and uniform air entrance into the burner register and seal weld to the boiler front wall. Provide windbox with support legs.

2.5.1.6 Purge Connection

Provide [steam] [air] purge connection, properly valved, for purging oil from gun prior to removal from burner.

2.5.1.7 Aspirating System

**************************

NOTE: Provide aspirating system only for boilers in which the expected furnace pressure exceeds $1245 \text{ Pa}$ 5 inches water.
**************************

Provide an air aspirating system for fuel oil atomizer guide pipes to prevent blowback of hot furnace gases. Aspirating system shall use approximately [_____] L/s scfm of [_____] kPa (gage) psig compressed air.

2.5.1.8 Piping

Provide piping and flexible hoses for guide pipe purge[ and aspirating]
system[s]. Air from forced draft fan shall be used for guide pipe purging during normal operation.

2.5.1.9 Metal Parts

Metal parts exposed to radiant heat, including atomizer shield, shall be of stainless steel or other approved alloy.

2.5.1.10 Fuel Oil Control Valve

Fuel oil will be supplied at [_____] kPa (gage) psig and [_____] degrees C F at the inlet of the fuel piping train. Size fuel oil automatic control valve for 103 kPa 15 psi differential pressure.

2.5.1.11 Fuel

ASTM D396, Grade No. [______].

2.5.1.12 Burner Blower Fan For Oil Fired Burner

Provide fan fully integrated with and mounted on windbox. Provide an inlet silencer, when required, to ensure operation at noise level below 85 dBA as specified in Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION AND SEISMIC CONTROL.

2.5.1.13 Electric Motor

Motor shall be [two speed,] [_____] volt, [_____] phase, 60 Hz, [totally enclosed, non-ventilated] [totally enclosed, fan cooled], not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES.

2.5.2 Flame Safeguard Controls

Provide a complete system of valves, interlocks and controls in accordance with NFPA 85 and as approved by Factory Mutual Engineering and Research.

2.5.2.1 Fuel Oil Train

Provide fuel oil train consisting of [steam] [air] atomizing oil gun, auxiliary [steam] [air] atomizing oil gun for changing guns without a shutdown, fuel oil control valve, two safety shutoff valves, recirculation valve, strainer, and flexible hose connections to oil burner. Provide low oil pressure and low atomizing air pressure switches, and all other safety interlocks and devices as required. Provide in panel mounted on burner package the following gages. Gages shall be 150 mm 6 inch with white coated dials and black figures:

a. Fuel oil supply pressure (0 to 1034 kPa (gage) 150 psig)

b. Fuel oil pressure at burner (0 to 1034 kPa (gage) 150 psig)

[ c. Atomizing air pressure at burner (0 to 1034 kPa (gage) 150 psig)

][d. Atomizing steam pressure at burner (0 to 1034 kPa (gage) 150 psig)]

2.5.2.2 Control Sequencing

Flame safeguard system shall be designed to ensure safe purge, light-off and shutdown procedures, and to monitor light-off, main flame and boiler
operating conditions.

[a. Flame safeguard system shall be automatically sequenced type with programming timed and sequenced by a heavy duty, industrial type timer. Timer shall be tamper-proof and shall be designed so that advancement of timer to shorten purge will shut down unit.

] b. Provide system with [ultraviolet] [infrared] scanner and electronic relay located in the front wall which will shut down the fuel within 2 to 4 seconds of loss of flame.

c. Provide scanner output meter in panel for indication of scanner signal strength.

d. Safety system shall include the following limit devices incorporated into a limit circuit:

(1) Flame failure
(2) High boiler outlet pressure
(3) Low fuel oil pressure
(4) Low water level cutout
(5) Low combustion air flow
(6) Low atomizing [air] [steam] pressure
(7) Any additional as required by FM or NFPA
[     (8) Low fuel oil temperature]

e. Safety System Limits: Safety system limits specified above shall be displayed on a first out annunciator mounted in the burner panel.[Provide a common alarm contact to be wired to the operator control console.]

2.5.2.3 Light Off

Failure shall require a manual restart of the programmer. Safety system shall provide a mandatory purge with forced draft fan vanes proven open, and a return to proven low fire position before light off. Main fuel valve shall open for a timed period of 10 seconds during trial for ignition.

2.5.2.4 Circuit Analyzer

Provide a circuit analyzer system, which, by means of 12 or more lights, will indicate which circuits are energized at any specific time, and will thereby indicate improperly operating circuits.

2.5.2.5 Control Panel

Programmer, limit control, relays, annunciator, shall be mounted in a [NEMA MG 1 control panel, modified with fully gasketed doors and panels mounted on burner package] [control panel as specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS].
2.6  FANS

Submit fans and blowers characteristic curves.

2.6.1  Forced Draft Fan (Coal Firing)

**************************************************************************
NOTE: The designer shall make a technical evaluation to determine if the coal forced draft fan should be integrated with the stoker front or mounted separately on the floor.
**************************************************************************

CID A-A-59222, Type [____], Class 1, except as specified otherwise.

2.6.1.1  Fan Size

Size fans for complete combustion of fuel at maximum firing rate taking into account design allowances, corrections for burner pressure drop, furnace pressure, combustion air temperature, plant elevation, and other design factors[ including allowance for economizer]. After fans have been sized in accordance with the above, add the following allowances for momentary overloads and normal deterioration of fans, firing equipment and boilers to obtain the required test block rating:

a. Excess volume: 20 percent
b. Excess pressure: 32 percent

2.6.1.2  Fan Construction

Construct fan wheel of steel. Direction of fan discharge shall be easily changed at angles of 45 degrees. Provide fan with roller bearings mounted in pillow blocks. Provide one coat manufacturer's shop prime paint over interior and exterior of fan and wheel.

2.6.1.3  Electric Motor

**************************************************************************
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the fan drive motor shall be provided with variable speed control. Generally variable speed drives for fans over 7 1/2 kW 10 hp will be cost effective.
**************************************************************************

Motor for driving forced draft fan shall be [variable speed] [two speed], [____] volt, three phase, 60 Hz, [open drip-proof] [totally enclosed, fan cooled] not less than [____] kW hp, as specified in the paragraph MOTORS AND DRIVES, and shall not overload at the specified capacity with unheated cold air. Provide [____] mm inch thick steel soleplate for motor. Soleplate shall be common for all four motor mounting bolts. Separate parallel soleplate bars are not acceptable.

2.6.1.4  Noise Level for Forced Draft Fan

Not to exceed 85 dBA sound pressure level at 1 1/2 meters 5 feet above floor and 1 1/2 meters 5 feet from fan in any direction. Provide heavy
duty sound attenuator with screen on fan inlet when required to meet sound pressure level requirements.

2.6.2 Induced Draft Fan

CID A-A-59222, Type [______], Class 2 except as specified otherwise.

2.6.2.1 Fan Size

Size fans to handle combustion gases at maximum firing rate. Maximum fan speed shall not exceed [_____] rpm at test block rating. Design allowances and corrections for furnace, economizer, [scrubber,] [baghouse,] [dust collector,] breeching pressure drop when operating at [10] [20] [40] percent excess air, flue gas temperature, plant elevation and other design factors shall be made. Add the following allowances for momentary overloads and normal deterioration of fans, firing equipment and boilers after sizing in accordance with the above, to obtain the required test block rating:

2.6.2.2 Fan Construction

Fan wheel shall be radial tip design constructed of steel. Balance fan wheel both statically and dynamically at factory. Direction of fan discharge shall be easily changed at angles of 45 degrees. Provide fan with [air] [water] cooled sleeve type or roller bearings mounted in pillow blocks.

2.6.2.3 Dampers

Provide inlet dampers with multi-parallel-stream flow blades with anti-friction bearings with 80 mm 3 inch minimum spacers and stuffing boxes to keep bearings cool. Dampers shall be mounted in 200 mm 8 inch channel frames and interconnected with one extended, ball bearing mounted control level for connection to control actuator.

2.6.2.4 Painting

Interior of fan, including wheel, shall be coated with protective coatings suitable for flue gas conditions expected to be encountered by this fan. Exterior surface of fan shall have coatings of quality weather and heat resistant paint. Fan shall be shop assembled and match-marked by manufacturer before dismantling for shipment. Surface cleaning and painting shall be in accordance with manufacturer's standards for service expected.

2.6.2.5 Electric Motor

**************************************************************************

SECTION 23 52 33.01 20  Page 58
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the fan drive motor shall be provided with variable speed control. Generally variable speed drives for fans over 7 1/2 kW 10 hp will be cost effective.

Motor for driving induced draft fan shall be [variable speed] [two speed], [_____] volt, three phase, 60 Hz, [open drip-proof,] [totally enclosed fan cooled,] not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES, and shall not overload over the range of the fan with unheated air. Provide [_____] mm inch thick steel soleplate for motor. Soleplate shall be common for all four motor mounting bolts. Separate parallel soleplate bars are not acceptable.

2.6.2.6 Noise Level for Induced Draft Fan

Noise level shall not exceed 85 dBA sound pressure level at 1 1/2 meters 5 feet above floor and 1 1/2 meters 5 feet from the fan in any direction. Provide sound attenuation to meet sound pressure level requirements.

2.7 COMPRESSED AIR SYSTEM

NOTE: Refer to utilities schedule on definitive drawings for suggested plant air requirements.

2.7.1 Plant Compressed Air System

Provide two packaged units conforming to FS XX-C-2816, Type [____], except as modified below. Each compressor capacity shall be not less than [_____] standard L/s scfm of air, at 20 degrees C 68 degrees F and [_____] kPa (gage) psig (equivalent to pressure at an elevation of [_____] meters feet), compressed to 1379 kPa (gage) 200 psig at the discharge. Compressor speed shall not exceed [_____] rpm. Number of stages shall be [_____.][ Compressor shall have water cooled cylinders and heads.][ Oil free delivery is required.] Provide a safety valve between each compressor discharge and its shutoff valve. Provide a shutoff valve on the discharge piping of each compressor. Provide an electric thermostatically controlled immersion heater. Provide compressor with [[[air] [water] cooled intercooler and] aftercooler.][ Compressor and motor shall be tank mounted.] Provide lifting lugs and tie down attachments.

2.7.1.1 Air Filter

Air Filter on inlet shall act as a muffler. Provide filter of the [oil wetted type] [dry type] readily removable for cleaning.

2.7.1.2 Oil Filter

Provide full flow type filter for positive forced feed lubrication conforming to FS F-F-351.

2.7.1.3 Air Receiver

Receiver shall be [_____] liter cubic feet minimum volume designed in conformance with FS XX-C-2816 except that working pressure shall be 1724
kPa (gage) 250 psig. Provide the receiver, with a safety valve set for 1792 kPa (gage) 260 psig, a drain valve and an air trap with shutoff valve. Provide a stand for mounting the receiver. Provide a dial gage, not less than 114 mm 4 1/2 inches diameter, range zero to 2068 kPa (gage) 300 psig, on the receiver.

2.7.1.4 Electric Motor

Motor shall be [_____] volt, [_____] phase, 60 Hz, totally enclosed, fan cooled not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES. Control circuits for motors shall be nominal 120 volts.

2.7.1.5 Controls

Provide [constant speed] [dual control] regulation and the "optional safety controls" as specified in Table I of FS XX-C-2816 for the compressor system. In addition, provide a lead-lag control system with alternating lead-lag cycles.

2.7.2 Instrument Compressed Air System

Provide air compressor package with two compressors, two electric motors, one horizontal receiver, and control panel, [mounted on one supporting steel base with skids] [mounted separately].

2.7.2.1 Air Compressor

Each shall be a single stage, cross head type, vertical, double acting, water cooled, nonlubricated head type. Compressor shall be specially designed for non-lubricated service, with a honed cylinder, piston rod packing, piston rings and piston wear rings. Valve guide inserts and wear rings shall be TFE. Valves shall be reversible and hardened, with stainless steel seat plates for nonlubricated service. Provide necessary sleeves, baffles, and collars to prevent oil carryover. Provide air operated, piston type, free air unloaders for capacity reduction and starting. Mount filter-silencer directly on air inlet to cylinder.

Design and Performance: Each compressor shall deliver not less than [_____] standard L/s scfm of free air at a discharge pressure of 690 kPa (gage) 100 psig.

2.7.2.2 Air Receiver

Horizontal tank with a volume not less than [_____] liters cubic feet. Design unit for 1034 kPa (gage) 150 psig working pressure in accordance with the ASME BPVC SEC VIII D1. A receiver bearing the ASME Code Symbol stamp will be accepted as meeting these requirements. Provide an automatic condensate trap, safety valve, and outlet connection.

2.7.2.3 Aftercooler

Aftercoolers shall be water cooled, with counter current flow, and shall be installed directly between each compressor cylinder and the air receiver. Design cooler to cool total output air flow of compressor to within 9 degrees C 15 degrees F of inlet cooling water temperature. Tube bundle shall be removable for cleaning and inspection.
2.7.2.4 Electric Motor

Each compressor shall be V-belt driven by a [_____] volt, [_____] phase, 60 Hz motor not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Provide a removable, totally enclosed belt guard.

2.7.2.5 Controls

Provide controls and shutdowns necessary for automatic operation of compressor package. House controls in NEMA 12 control cabinet. Controls shall include two, full voltage, automatic across-the-line starters; alternator to switch compressors from lead to lag and to run both compressors when needed; 120 volt control transformer; air discharge pressure gage; selector switches for constant speed or automatic dual control, along with necessary time delay and control relays. Provide automatic solenoid operated cooling water valve in the cooling water line to the compressors and aftercoolers. Factory wire control cabinet and mount as part of package.

2.7.2.6 Accessories

Factory assemble compressors, electric motors, controls, air receiver, aftercoolers, and miscellaneous hardware and mount on steel supporting base. Provide lifting lugs and tiedown attachments. Provide air, water, and condensate piping and terminate them at the edge of the supporting base.

2.7.2.7 Desiccant Air Dryer

**************************************************************************
NOTE: Choose this subparagraphs or the subparagraph below, REFRIGERATED AIR DRYER.
**************************************************************************

Provide for systems exposed to freezing temperatures a compressed air desiccant dryer with noncorrosive desiccant housed in twin pressure vessels, capable of drying [_____] standard L/s scfm of air to [_____] degrees C F pressure dewpoint. Unit shall be field adjustable to maintain pressure dewpoint of dried air at any preselected value below operating temperature, to minus 40 degrees C F. As an integral part of the unit, provide an indicator showing the water content of the dry air and a calibrated adjustment control to change water content to any preselected level.

a. Design: Design unit for maximum temperature of not less than 49 degrees C 120 degrees F and maximum operating pressure of not less than 1034 kPa (gage) 150 psig. Pressure drop through unit operating at full rated flow shall not exceed 27 kPa 4 psi.

b. Controls: Provide continuous supply of dry air by automatically cycling operation of desiccant beds. Dryer shall be complete with panel mounted gages showing pressure in each drying tower and spark suppressor to protect microswitch in timer circuit. Total electrical power requirements shall not exceed 75 watts at 110 Vac.

c. Filters: Provide prefilter upstream of dryer to remove oil vapor, liquid water, and solid particles. It shall have greater than 99 percent efficiency in removing both 0.5 micron diameter solid particles and 0.5 micron diameter oil aerosol. Filter shall have replaceable oil absorbing filter element which turns red to indicate saturation with
oil and which shall be mounted in a transparent cast methyl methacrylate tube for visibility and inspection while on stream. Protect transparent acrylic tube by a safety shield. Provide afterfilter for removal of solid particles down to 5 microns size.

][2.7.2.8 Refrigerated Air Dryer

**************************************************************************

NOTE: Choose this subparagraph or the subparagraph above, DESICCANT AIR DRYER.
**************************************************************************

Provide for systems not exposed to freezing temperatures a compressed air dryer of the self contained refrigerated type complete with heat exchanger, a commercial quality refrigeration system, a moisture separator and condensate trap, and internal wiring and piping. Install dryer between receiver and distribution line.

a. Heat Exchanger: Provide air and refrigerant coils surrounded by aluminum granules of sufficient mass to ensure adequate cooling capacity for varying air flow loads without causing excessive refrigeration cycling. Provide an automatic control system, for heat exchanger with a sensing element located in the aluminum granules, to shut down refrigeration system on low or no-load conditions. Provide means to determine exchanger temperature.

b. Moisture Separator: Provide a centrifuge type located within the heat exchanger to provide for moisture separation at point of minimum air temperature.

c. Refrigeration Unit: Provide hermetically sealed type which operates intermittently at all but maximum load conditions. Unit shall be capable of drying [_____] standard L/s scfm of air to an atmospheric dew point of not less than minus 23 degrees C 10 degrees F with entering air at 38 degrees C 100 degrees F, saturated. Maximum operating pressure of dryer shall be [_____] kPa (gage) psig. House entire unit in a steel cabinet. Provide cabinet with access door and panel for easy access to parts for maintenance and inspection.

]2.7.3 Pressure Reducing Regulator

Provide self-operating type designed for not less than a 1724 kPa (gage) 250 psig operating pressure, and a normal operating temperature range of minus 29 degrees C 20 degrees F to plus 65 degrees C 150 degrees F. Regulator shall have an adjustable outlet pressure range not less than 34 to 690 kPa (gage) 5 to 100 psig with not less than four ranges. Provide external adjusting screw for adjustment throughout each spring range. Provide internal pressure tap for outlet pressure regulation.

2.8 BREECHING, EXPANSION JOINTS, STACKS, DAMPERS, AND ACCESSORIES

2.8.1 Breeching

Provide with rectangular cross section stiffened on sides, top and bottom and fabricated of not less than 5 mm 3/16 inch thick black steel plate unless otherwise noted. Stiffeners shall be not less than 65 by 50 by 6 mm 2 1/2 by 2 by 1/4 inch steel angles welded to exterior with 50 mm 2 inch leg outstanding. Stiffeners shall not exceed one meter 3 feet on center. Breeching shall connect to [each boiler flue gas outlet,] [intermediate
heat recovery equipment,] [air pollution control equipment,] [and to stack as required].

2.8.1.1 Breeching Connections and Joints

Weld or bolt breeching joints unless indicated otherwise. Welding shall conform to AWS D1.1/D1.1M and AWS D1.3/D1.3M. Bolts for bolted connections shall be not less than 15 mm 1/2 inch diameter and spaced not more than 80 mm 3 inches apart, with bolts, lockwashers and nuts being hot-dipped galvanized. Provide bolted joints with a minimum of 3 mm 1/8 inch thick non-asbestos gaskets, suitable for the intended use. Bolt breeching connections to all boilers, equipment items, dampers, expansion joints, and breeching accessories. Flanged breeching connections to equipment shall be drilled to match flanges on equipment. Seal weld flanged joints to make connection gas-tight.

2.8.1.2 Uninsulated Breeching

Thoroughly wire brush breeching which is not to be insulated and clean by degreasing with nonflammable solvent such as trichloroethylene prior to painting.

2.8.1.3 Breeching Access Doors

Provide where indicated. Construct access doors with frame and hinged door of cast iron or reinforced steel plate. Frame shall be not less than 635 by 940 mm 25 by 37 inches with access opening of 457 by 762 mm 18 by 30 inches. Connection to breeching shall be gasketed and made with minimum 15 mm 1/2 inch diameter hot-dipped galvanized bolts, lockwashers, and nuts spaced not more than 125 mm 5 inches on center. Each side of access door shall have not less than two quick-clamp positive closing latches, with long side opposite hinges containing three clamps to give a gastight seal. Side of access door opposite hinges shall contain a minimum 80 by 125 mm 3 by 5 inch size handle. Provide a gasket consisting of 10 mm 3/8 inch diameter fire resistant resilient rope seal and mastic compound between access door and access door frame.

2.8.1.4 Breeching Cleanout Doors

Provide where indicated. Construct cleanout doors of not less than 5 mm 3/16 inch thick steel plate. Secure cleanout doors to a 32 by 32 by 5 mm 1 1/4 by 1 1/4 by 3/16 inch thick angle frame with 10 mm 3/8 inch hot-dipped galvanized mounting bolts welded to the angle frame and spaced not more than 150 mm 6 inches on center. Weld frame to breeching and provide a 1.60 mm 1/16 inch non-asbestos gasket suitable for the intended service between frame and cleanout door. Cleanout doors shall be not less than 610 mm 24 inches square except where breeching dimensions are smaller, in which case cleanout door shall be full height of the breeching and not less than 305 mm 12 inches in length.

2.8.1.5 Breeching Structural Materials

**************************************************************************
NOTE: The designer shall detail breeching supports and breeching stiffening. Breeching hangers shall be designed to carry not less than 5 times the breeching weight, or the breeching weight plus 136 kg 300 pounds whichever is greater. Hangers for rectangular breeching shall be of the trapeze type

**************************************************************************

SECTION 23 52 33.01 20  Page 63
with angle or channel support members and hanger rods. Breeching shall be stiffened with angle or channel members as required to withstand internal breeching static pressure.

Structural and support materials shall be steel and shall comply with applicable sections of the AISC 360.[ Support and stiffen breeching as indicated.]

2.8.2 Expansion Joints

2.8.2.1 Metallic Breeching Expansion Joints

Provide factory fabricated metallic breeching expansion joints[ where indicated]. Expansion joints shall be guided metal bellows type capable of a minimum of [_____] mm inches of axial travel. Form metal bellows from not less than 1.60 mm 1/16 inch thick type 321 stainless steel plate. Cover plates shall be not less than 3 mm 1/8 inch thick steel plate.

2.8.2.2 Non-Metallic Expansion Joints

Provide factory fabricated non-metallic breeching expansion joints 3 mm 1/8 inch minimum thickness[ where indicated]. Expansion joints shall be constructed of a fluoroelastomer vulcanized to two plies of knitted wire mesh capable of a minimum of [_____] mm inches of axial compression, [_____] mm inches of axial extension and [_____] mm inches of lateral offset [ unless indicated otherwise]. Joints shall have a continuous operating temperature rating of 204 degrees C 400 degrees F, with excursion design standards up to 400 degrees C 750 degrees F. Operating pressure range shall be minus 34 kPa (gage) 5 psig to plus 34 kPa (gage) 5 psig. Expansion joints shall be preformed with integrally molded corners, suitable for mounting against a 150 mm 6 inch flange. Provide carbon steel backup bars with slotted holes, bolts, and nuts.

2.8.3 Stacks (For Installation Without Flue Gas Scrubbers)

Free standing, dual wall with insulated annular space, self supporting, steel construction. Provide stack manufacturer's calculations for supporting steel and concrete foundations, that suit specified design conditions. Provide each stack complete with accessories and appurtenances, including test ports, sampling platforms, caged safety ladders, anchors, sleeves, insulation, base and chair rings, and cleanout door.

2.8.3.1 Manufacturer's Calculations Required

a. Foundation (including bearing and moment forces) and anchor bolts

b. Stack (Static and Dynamic Analysis)

   (1) Stresses due to various loading conditions including wind and seismic loads

   (2) Damping of vortex shedding and seismic response

   (3) Vibration and damping

   (4) Heat transfer at various design and ambient conditions
(5) Expansion profiles
(6) Shipping and erection stress analysis

2.8.3.2 Construction

a. Provide in annular air space between the two steel shells insulation with sealing means to accommodate thermal expansion differentials and lateral deflections or sway of inner and outer shells.

b. Provide openings with adequate reinforcement to minimize stress concentrations.

c. Design wall thickness of inner shell to be 1.60 mm 1/16 inch thicker than that required by dynamic and static structural design but not less than 5 mm 3/16 inch.

d. Construct outer shell of ASTM A242/A242M steel with a plate thickness not less than [_____] mm inch.

e. Construct expansion devices of corrosion resistant stainless steel suitable for the temperatures and flue gas combinations to be experienced by stacks.

f. Base construction of stack shall transmit forces and moments in the shell to the [foundation] [supporting steel] without local stresses of appreciable magnitude being induced in the shell or exceeding allowable stresses of the supporting [concrete] [steel].

g. Provide openings in breeching and stack for test equipment for sampling flue gas and for monitoring devices. Openings shall be properly reinforced and designed for differential expansion. Breeching opening shall be of double wall construction. Penetrations through inside shell of stack shall be completely welded to provide proper sealing between the stack and the opening.

h. Provide top 1.22 meters 4 feet cone section of stack of corrosion resistant steel.

i. Provide suitable anchor bolts furnished by the stack manufacturer.

j. Accessories to be provided.

(1) Provide double wall insulated steel plate door cleanout complete with 25 mm one inch round hinge pin, gasket and not less than 18 swing bolts.

(2) Provide a ring of Type 304 Corrosion Resistant Steel (CRES) to support an inspection or painter's trolley. Weld ring and support from stack plates with not less than three brackets 10 by 65 by 381 mm 3/8 by 2 1/2 by 15 inches. Space brackets at not more than 610 mm 2 feet on center around circumference of stack.

(3) Provide a three wheel CRES flat rail trolley of 227 kg 500 lbs capacity. Trolley shall have guides to prevent it from leaving the track [_____] meters of 8 mm feet of 1/4 inch CRES plow steel cable.
(4) Provide each stack with an external ladder with cage for full height of stack. Construct ladder and cage of corrosion resistant steel.

(5) Provide a flue gas sensing thermocouple well with thermocouple one meter 3 feet above breaching opening and 1 1/2 meters 5 feet below top of stack. Wells shall be CRES and shall extend about halfway into stack.

2.8.3.3 Finish
Stacks shall be shop coated prior to shipping from factory.

2.8.3.4 Obstruction Lighting

**************************************************************************
NOTE: Stack obstruction lighting requirements are dependent on a number of factors including the location and height of the stack. The designer shall refer to NAVFAC DM-23.1, NAVFAC DM-23.2, and FAA AC 150/5345 to determine if obstruction lighting is required.
**************************************************************************

Provide an obstruction lighting system for each heating plant stack, consisting of one red, flashing, 300 millimeter hazard beacon atop each stack, two steady burning, red obstruction marker lights halfway up each stack, photoelectric and flasher controls, weather-tight terminal boxes, cable, and conduit.

b. Obstruction Lights: FAA AC 150/5345-43 Type L-810.

2.8.3.5 Stack Sampling Platform

**************************************************************************
NOTE: Designer shall detail a stack sampling platform if required. If not required delete this paragraph. If required the platform will have to be located at a point as approved by air pollution control agency having jurisdiction. Many local and state codes incorporate Title 40 Code of Federal Regulations, Part 60. Depending upon final air pollution control equipment arrangement this location may be on the stack or possibly on a long length of horizontal breeching. Stack sampling platform should have the following features:

1. Sampling ports located according to 40 CFR 60 Appendix A, Method.

2. Platform should be 914 mm 36 inches wide but at ports location it should project away from breeching or stack a minimum of 610 mm 2 feet plus the diameter of the breeching or stack for up to 3 meters 10 feet in diameter stack.

3. If any type of continuous air pollution
monitoring devices are located at stack sampling point or anywhere else on breaching, a non-vertical access (stairs or catwalk) is required. For stack sampling purposes a non vertical ladder is preferred but is not required. Platform with grating shall be designed for a live loading of 1464 kg/m² 300 lbs/sq. ft; platform should have railing with two intermediate railings and 100 mm 4 inch toeplate. Four 30 amp weatherproof receptacles and adequate lighting including lights over the test ports should be provided.

**************************************************************************

2.8.4 Dampers

2.8.4.1 Multilouver Dampers

**************************************************************************

NOTE: Opposed blade dampers shall be used for throttling service and parallel blade dampers shall be used for two-position service.

**************************************************************************

Provide factory fabricated multilouver dampers with [parallel][ or ][opposed] blade type operation. Construct damper frame of distortion resistant welded steel channels with raised seat to ensure free nonbinding operation of blades and to keep blades square in the frame. Construct blades of 6 mm 1/4 inch thick steel plate in a stressed skin airfoil-shape with fully welded seams containing no external ribs. Blade shafts shall be stainless steel. Blades shall be pinned to blade shafts. Louver shaft bearings shall be outboard type and shall be self-lubricating and self-cleaning. Bearing seals shall be gas-tight.

a. Multilouver damper linkage shall be adjustable and of pinned construction for easy removal and shall be designed to handle full operation torque. Linkage on dampers in clean flue gas areas shall operate from a single connection point. Design linkage on dampers in dirty flue gas areas, between boiler outlet and inlet to air pollution equipment, so that bottom blade linkage arm is not connected to above linkage, to allow this blade to operate separately. Remaining linkage for this damper shall be constructed to operate from a single operating point.

b. Provide control damper operators as noted. Operators may be either electrically or pneumatically operated with positive positioning, manual override, and hydraulic or oil immersed gear trains. Each operator shall be full-proportioning type, with spring return to position indicated in case of loss of power. Damper operating speeds shall be selected or adjusted so that operators will remain in step with controller. Operators acting in sequence with other operators shall have adjustment of control sequence as required by operating characteristics of system.

c. Two-position damper operators shall be pneumatically operated with air cylinder, four way valve, and solenoid valve arrangement.
2.8.4.2 Guillotine Dampers

**************************************************************************
NOTE: Guillotine dampers shall be used for open-shut service where tight shutoff is required; for example, for air pollution control equipment bypass dampers.
**************************************************************************

Provide factory fabricated guillotine dampers with heavy structural frame rigid enough to support extended blade and external loads through the breeching flange. Damper shall be capable of operating without precleaning or manual assistance under normal operating conditions. Enclosed bonnets will only be required where indicated. Provide 80 mm 3 inch diameter cleanout ports on both sides for cleaning bottom sections.

a. Provide stress-relieved flat plate guillotine damper blades. Damper blade shall be nonwarping. Intermediate blade supports are acceptable to limit blade deflection. Leading edge of damper blade shall be beveled and capable of guiding damper blade into frame seat. Blade guides shall be continuous and self-cleaning and capable of preventing binding from deposits and damage from misalignment. Bonnet guides shall be removable. Design damper so that a damper blade can be replaced without opening the frame.

b. Provide guillotine damper bonnet seal to effectively seal against atmospheric leakage under normal operating conditions.

c. Guillotine damper drive shall be a positive dual endless chain drive capable of driving damper in both directions. Chain drive headshaft shall have sufficient torsional rigidity to prevent binding of blade when blade is stalled. Damper shall be motor operated with manual override. Design drive mechanism to prevent back driving of motor. Entire drive mechanism shall be of a simple design and require no routine maintenance other than inspection. Chain shall be capable of operating up to the stall torque of the damper drive motor.

d. Electric motor shall be [_____] volt, [_____] phase, 60 Hz, [totally enclosed, fan cooled] [open drip-proof], not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES. Provide removable, totally enclosed chain guard.

2.9 COAL HANDLING EQUIPMENT

Submit coal handling system manufacturer's data for the following:

a. Railroad hopper car thawing system;

b. Railroad hopper car shaker;

c. Railroad hopper car puller;

d. Coal scale;

e. Belt scraper; and

f. Coal dust suppression system.
2.9.1 Railroad Hopper Car Thawing System

NOTE: Pit type railcar thawing system is capable of operating on natural gas, liquified petroleum gas or No. 2 fuel oil. The radiant heat (infrared) type railcar thawing system can only burn natural gas or liquified petroleum gas or use electric resistance heaters. The radiant heat (infrared) type provides a slower method of thawing but causes less damage to the railroad car finish and is preferred provided natural gas or liquified petroleum gas or electrical power is economically available and permitted by current DoD policy.

[Pit-type] [Prefabricated surface mounted enclosed type] [or electric radiant type] hopper car thawing unit including burners, controls, combustion air blowers, fuel storage and handling, and related work. Design system to thaw 56 Mg, 71 Mg and 102 Mg 55 ton, 70 ton and 100 ton capacity coal cars. System shall be capable of thawing [_____] bottom hopper unloading coal cars simultaneously. Railroad hopper car thawing system shall utilize [No. 2 fuel oil] [natural gas] [liquified petroleum gas] as a fuel. Provide a sufficient number of heaters to have a minimum heat input of 2198 kW 7,500,000 Btu/hr per car station, with heaters distributed under hopper car, or under and beside hopper car, such that entire car is heated. Locate [burner pits] [heater units] for even heating of hopper cars without subjecting air hoses, air brake equipment, and bearings to excessive heat.

2.9.1.1 Pit-Type Railroad Hopper Car Thawing System

NOTE: Choose this subparagraph or the subparagraph below SURFACE MOUNTED ENCLOSED RAILROAD HOPPER CAR THAWING SYSTEM.

a. Pit-Type Thawing Unit: Pit-type hopper car thawing unit shall be complete with a refractory lined steel box, burner assemblies, steel burner enclosure with cover, valves, piping, and hinged main pit protective covers. Each pit shall have the capacity to generate 366 kW 1,250,000 Btu/hr when burning [No. 2 fuel oil] [natural gas] [liquified petroleum gas]. Burners shall fire horizontally and tangentially into pit from opposite sides to heat refractory lined pit up to radiant temperature. Heat shall be transferred to hopper car by radiation from hot refractory surfaces and by convection from exhaust gases and evaporated moisture to rail car bottom and sides. Construct pit outer shell of not less than 6 mm 1/4 inch thick corrosion resistant steel plate, with end plates of 10 gage (3.42 mm 0.1345 inch) steel. Provide supporting flanges and handling loops on both ends and provide cap strips on top of both sides. Place cast iron heat deflecting plates with overlapping edges on pit sides and bottom supported off ledge on outer shell. Provide a minimum 25 mm one inch air space between plates and outer shell. Pit side walls and bottom shall have a minimum 65 mm 2 1/2 inch thickness of standard firebrick with one course of standard end skew brick along top of side walls. Firebrick shall be easily replaceable. End section shall have not less than 114 mm 4 1/2 inch thick precast high temperature refractory panels.
Provide burner refractory ignition tiles with steel jacket casings having mounting lugs for bolting to end plates of pit. Provide concrete railroad ties adjacent to each thawing pit. Deliver combustion air to burners by means of pressure blowers which take fresh air from outside thawing area. Factory wire and assemble heaters, control panels, blowers, and zone controls. Shop fabricate burner piping and control valve assemblies.

**************************************************************************
NOTE: Designer shall make selections in the text below based on fuel to be used in thawing system.
**************************************************************************

b. Fuel System: Provide complete fuel system for operation with, [natural] [liquified petroleum] gas including piping, regulators, low and high pressure limit switches interlocked with combustion controls, gages, solenoid valves, shutoff valves, and accessories which may be required for each manufacturer's particular system. Provide complete fuel system for operation with duplex fuel oil pump set with [_____] liters gallon horizontal [below] [above] ground fuel tank and accessories which may be required for each manufacturer's particular system. Provide fuel oil system in accordance with the requirements specified under the paragraph FUEL OIL SYSTEM.

c. Burner controls shall meet Industrial Risk Insurers' (I.R.I.) (formerly F.I.A.) requirements. Connect fuel system piping to fuel supply piping as indicated. Burners shall be controlled (modulate) to regulate heat output to suit the operating requirements. Provide a manual light-off, low pressure [gas] [oil] pilot for automatic light-off of each thawing unit.

d. Air System: Provide complete air systems for operation with blowers, inlet silencers, gages, shutoff valves, low pressure limit switches interlocked with combustion controls, and accessories which may be required for each manufacturer's particular system.

e. Control Panel: Provide centrally located control panel, with panel front consisting of a graphic display of the thawing system. Display shall be approximately to scale and coordinated with control and light indication for combustion air blowers and on-off control of convenient groups of heaters. Provide on-off control with indicating light for each thawing pit. Panel shall have a NEMA [12] [3R-8], dust-tight enclosure with internal equipment and wiring accessible from panel front. Provide nameplates on panel front to designate function of switches and indicating lights. Controls shall be suitable for [_____] volt, [_____] phase, 60 Hz operation. Provide and mark terminals for connections with the exception of the neutral. Terminal blocks shall be 600 volt rated. Control relays shall have convertible contacts and shall have rating suitable for intended services but not less than 10 amp, 600 volt rating. Components shall be oiltight type. Connections to panel shall be watertight. Motor starters for combustion air blowers shall be installed in each respective blower cabinet.

}[2.9.1.2 Surface Mounted Enclosed Railroad Hopper Car Thawing System

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph above PIT-TYPE RAILROAD HOPPER CAR THAWING SYSTEM.
**************************************************************************
[ a. Surface Mounted Enclosed Thawing Unit (Gas): Burner shall be of multiport cast iron construction and provide for even heating of radiant elements. Heater design shall be essentially the same for undercar and sidecar heaters, with heat transmitted to hopper car by both radiation and convection. Design burner and radiant element for radiation being the primary mode of heat transfer. Radiant element over burner shall be of a heavy corrosion-resistant metal material. Design burner to operate on [natural gas] [liquified petroleum gas], and such that open flame from combustion will not extend beyond emitter surface either during normal operation or in the event of emitter deterioration or burnout. Provide shields where necessary to direct radiation and hot exhaust gases to hopper car surface. Provide means for shielding car air hoses, air brake equipment, and bearings from excessive heat. Provide each heater with individual heater control boxes constructed as to provide positive air pressure inside control box. Control boxes shall contain mixing valve for maintaining proper gas-air ratio for satisfactory combustion. Locate gas and air piping connections for easy removal of individual burners. Deliver combustion air to heaters by means of pressure blowers which take fresh air from outside thawing area to ensure continued satisfactory combustion of gaseous fuels. Factory wire and assemble thawing units, control panels, blowers, and zone controls.

[ b. Surface Mounted Enclosed Thawing Unit (Electric): Thawing unit may be an electric radiant heat thawing unit which includes self-contained heater banks such as under-car heater sections, outside the rail heater sections, lower side car heater sections and vertical side car heater sections, with reflectors, hinged cover, waterproof and weatherproof wired terminal blocks and zone controls for flexibility of operation.

[ c. Burner Controls (for Gas Fired Units): Burners shall be electrically ignited with controls meeting Industrial Risk Insurers' requirements. Provide a gas pressure regulator for serving not more than eight individual burners. Regulator shall reduce gas pressure in supply line to pressure required for burners. Provide each burner with an air regulating valve for fuel-air ratio adjustment. Regulating valve shall contain positive vibration-proof locking device for maintaining critical adjustment.

[ d. Control Panel: Provide centrally located control panel with panel front having a graphic display of the thawing system. Display shall be approximately to scale and coordinated with control and light indication for combustion air blowers and on-off control of individual heaters. Provide a modulating control for each heater to regulate heat output to suit the operating requirements. Panel shall be NEMA [12] [3R-8], dust-tight enclosure with internal equipment and wiring accessible from the panel front. Provide nameplates on panel front to designate function of switches and indicating lights. Controls shall be suitable for [_____] volt, [_____] phase, 60 Hz operation. Provide and mark terminals for connections, with the exception of the neutral.
Terminal blocks shall be 600 volt rated. Control relays shall have convertible contacts and shall have rating suitable for intended service but not less than 10 amp, 600 volt rating. Components shall be an industrial design of the oiltight type. Connections to the panel shall be watertight. Motor starters for combustion air blowers shall be installed in each respective blower cabinet.

]2.9.1.3 Shed

**************************************************************************
NOTE: Shed should be used in the severe climate areas.
**************************************************************************

Provide shed of pre-engineered metal space frame construction with corrugated siding as indicated. Provide ventilation with roof vents and openings along bottom of sides.

2.9.2 Top-Mounted Railroad Hopper Car Shaker (Unloader)

**************************************************************************
NOTE: If noise is a major factor of concern, design a shaker enclosure with acoustical treatment which will be capable of reducing the noise to a tolerable level.
**************************************************************************

Provide top-mounted rail car shaker complete with shaker, frame, vibrator, motors, hoists, hoist frame, [enclosure,] and controls. Design unit for operation under all weather conditions.

2.9.2.1 Shaker

Shaker shall operate with a nominal 4 mm 5/32 inch stroke at 1200 rpm. Stroke shall be generated by large eccentric SAE 1045 steel shaft mounted in high capacity, self-aligning, spherical roller bearings. Seal bearings with a double piston ring labyrinth seal and dust and water slinger to retain lubricant and prevent entry of contaminants. Shaker frame shall be stress-relieved, all welded steel construction. Fabricate frame of heavy steel plate, with bearing housing seats machined after stress relieving. Provide four lifting eyebolts of heat-treated forged alloy steel for connecting to hoist chains.

Shaker Electric Motor and Drive:

Motor shall be totally enclosed, fan cooled, 1800 rpm, [_____] volt, three phase, 60 Hz, not less than 15 kW 20 hp, as specified in the paragraph MOTORS AND DRIVES. Motor shall be mounted on heavy spring isolated supporting frame with adjustable motor base. Shaker shall be belt driven with special deep groove sheaves, taper locking type hubs, and constant belt tensioning spring.

2.9.2.2 Shaker Hoist

Twin hook type having a rated capacity exceeding the weight of the shaker unit. Hoist shall have a lift of not less than 7.50 meters 25 feet with a hoist speed of not less than 0.08 m/sec 16 fpm. Hoist shall have not less than 460 mm 18 inch long sling chains for connecting hoist to shaker lifting eyes, and hooks shall have U-bolt safety latches. Hoist shall be
mounted on an electrified trolley as specified in Section 41 22 13.14 BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING.

Shaker Hoist Electric Motor:

Totally enclosed, [fan cooled,] [non ventilated,] 1800 rpm, [___] volt, three phase, 60 Hz, not less than 5 1/2 kW 7 1/2 hp as specified in the paragraph MOTORS AND DRIVES. Motors shall be high slip type with thermal overload protection embedded in the windings.

2.9.2.3 Controls

Provide [remote] [pendant] pushbutton station for both shaker and hoist operation. Provide automatic controls with upper and lower screw type limit switches to limit hook travel, slack cable limit switch to stop lowering of hooks when car shaker has been lowered on top of car, electrical interlock to prevent operation of car shaker motor until shaker is lowered on car, and electrical interlock to prevent operation of hoist motor while car shaker is running. Mount electrical equipment in NEMA 4 enclosures.

2.9.2.4 Frame [and Enclosure]

**************************************************************************
NOTE: If noise is a major factor of concern, design a shaker enclosure with acoustical treatment which will be capable of reducing the noise to a tolerable level.
**************************************************************************

Provide frame [and enclosure] as indicated for support of hoist and shaker unit[ and for attenuation of noise].

[2.9.3 Capstan Car Puller]

**************************************************************************
NOTE: Designer shall select either a capstan type or drum type car puller. A capstan type puller is satisfactory for handling rail cars on level grade provided the pulling capacity is not exceeded. For high pulling capacities and locations where rails are not on level grade, the drum type puller should be used. Designer shall detail required footings and foundations based on the selected puller and soil conditions at each plant site.
**************************************************************************

**************************************************************************
NOTE: Choose this paragraph and subparagraphs or the paragraph REVERSIBLE DRUM TYPE CAR PULLER, and its subparagraphs below.
**************************************************************************

Capstan-type designed with capacity of not less than 4540 kg 10,000 pounds of starting pull and an average rope speed of approximately 0.23 m/sec 45 fpm. Assembly shall be totally enclosed, weatherproof, and suitable for exterior installation with vertical capstan. Capstan shall be semisteel alloy construction designed for use with marlin-covered wire rope.
2.9.3.1 Accessories

Provide capstan complete with accessories, including controls, rope, rope storage reel, car hooks, sheaves, snatch blocks, anchors, and ratchet holdback.

2.9.3.2 Rope

Capstan rope shall be not less than 25 mm one inch o.d. marlin clad wire rope with a breaking strength of not less than 13,620 kg 30,000 pounds.

2.9.3.3 Rope Storage Reel

Construct of metal, hand operated with the drum not less than 300 mm 12 inches in diameter and the reel faces not less than one meter 3 feet in diameter. Drum shall have not less than [_____] mm inches face width and store not less than [_____] meters of 25 mm feet of one inch diameter marlin clad wire rope.

2.9.3.4 Electric Motor

Totally enclosed, [fan cooled,] high starting torque, reversing type, [_____] volt, three phase, 60 Hz, not less than 7 1/2 kW 10 hp as specified in the paragraph MOTORS AND DRIVES.

2.9.4 Reversible Drum Type Car Puller

**************************************************************************

NOTE: Designer shall select either a capstan type or drum type car puller. A capstan type puller is satisfactory for handling rail cars on level grade provided the pulling capacity is not exceeded. For high pulling capacities and locations where rails are not on level grade, the drum type puller should be used. Designer shall detail required footings and foundations based on the selected puller and soil conditions at each plant site.

**************************************************************************

**************************************************************************

NOTE: Choose this paragraph and subparagraphs or the paragraph CAPSTAN CAR PULLER, and its subparagraphs above.

**************************************************************************

Single drum reversing] [Double drum] type designed with a capacity of not less than [_____] kg pounds of running rope pull. Starting pull capacity shall be not less than twice the running pull capacity. Provide assembly on one-piece heavy steel base with weatherproof motor and gear reducers suitable for exterior location.

2.9.4.1 Puller

Unit shall consist of a [_____] mm inch pitch diameter by [_____] mm inch face, spirally grooved for [_____] mm inch diameter wire rope with sealed anti-friction bearings, alloy steel ring mounted spur gear and SAE 1045 steel shaft. Provide an SAE 1045 steel countershaft with anti-friction pillow blocks and heat-treated alloy steel spur pinion roller chain drive with steel sprockets and enclosed guard. Speed shall be a minimum of
[___] m/sec fpm.

a. Electric Motor: [Totally enclosed,] [fan cooled,] high starting torque, reversing type, [___] volt, [___] phase, 60 Hz, not less than [___] kW hp, as specified in the paragraph MOTORS AND DRIVES. Provide clutch for engaging and disengaging power to drum.

b. Reduction Gears: AGMA Class I sized for the motor power with motor base and coupling. Motor shall include motor mounted disc brake in dust and watertight enclosure. Provide rope overwind switch assembly and rotary type limit assembly.

2.9.4.2 Accessories

a. Rope Sheaves: Provide four stationary type, 762 mm 30 inch pitch diameter single sheaves and one 762 mm 30 inch takeup sheave assembly. Sheave shall be cast steel, grooved for [___] mm inch diameter rope and shall be oriented horizontally and mounted in a welded steel frame with self-lubricating bronze bushings. Provide removable steel rope guards over sheaves.

b. Wire Rope: Not less than [___] mm inch in diameter with a breaking strength of not less than [___] kg pounds. Rope shall consist of six 19 wire strands of improved plow steel rope with hemp center.

c. Safety Warning System: Provide a safety warning system, including an audible horn and three flashing lights to indicate cars in motion. System shall activate 30 seconds before puller motor is energized and shall not deactivate until puller motor is de-energized. Provide a permanent warning sign at each light indicating "Railcar in Motion."

d. Miscellaneous: Provide reversing controls, car hooks, snatch blocks, and anchors.

2.9.5 Track Hopper

NOTE: Determine if a track hopper will be required.

Welded construction of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel] plate not less than 4.50 meters long 14 feet wide and 28 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.5.1 Track Girders

Two wide flanged beams designed for Cooper's E-[___] loading with 50 percent impact allowance and sized at W [___] by [___]. Provide beams with cross struts for rigidity and bearing plates for mounting on pit wall as indicated.

2.9.5.2 Grating

Hopper grating between the rails of [___] by 10 mm 3/8 inch steel bars and [___] by 10 mm 3/8 inch steel cross bars with openings [100] [150] by [100] [150] mm [4] [6] by [4] [6] inches. Grating outside rails shall have
openings 100 by 100 mm 4 by 4 inches and be constructed of same size steel bars as specified above. Construct grating in removable panels and support from concrete pit walls and by steel angle supports resting on track girders.

2.9.5.3 Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Cover for portions of hopper outside rails shall be hinged with edges turned down. Construct cover between rails in easily removable sections with handles.

2.9.5.4 Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a water-collecting reclaim hopper type coal gate not less than [_____] by [_____] mm inches in size along with a dusttight all metal slip joint, constructed of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel] plate. Slip joint shall be of split construction to allow for disassembly and replacement. Design slip joint to allow for necessary flexibility to take care of deflection of the hopper outlet due to varying coal loads and temperature variations without imposing load on the feeder enclosure. Provide rope packing or other resilient gasket material to make the slip joint completely dusttight.

2.9.6 Truck Hopper

**************************************************************************
NOTE: Determine if a track hopper will be required.
**************************************************************************

Welded construction of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel] plate not less than 3 meters wide and 3 meters long 10 feet wide and 10 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.6.1 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 125 by 13 mm 5 by 1/2 inch steel bars and 25 by 10 mm one by 3/8 inch steel cross bars. Weld grating and make in sections for ease of removal. Provide two intermediate support beams sized not less than W8 by 31 arranged for a maximum grating span of 1016 mm 3 feet 4 inches.

2.9.6.2 Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a water-collecting reclaim hopper type coal gate not less than [_____] by [_____] mm inches size.

2.9.6.3 Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Construct cover in sections with handles for ease of removal.
2.9.7 Reclaim Hoppers

Welded construction of not less than 6 mm 1/4 inch thick structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel plate not less than 3 meters wide and 3 meters long 10 feet wide and 10 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.7.1 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 125 by 13 mm 5 by 1/2 inch steel bars and 25 by 10 mm one by 3/8 inch steel cross bars. Weld grating and make in sections for ease of removal. Provide two intermediate support beams sized not less than W8 by 31 arranged for a maximum grating span of 1016 mm 3 feet 4 inches.

2.9.7.2 Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a special reclaim hopper gate not less than [_____] by [_____] mm inches.

2.9.7.3 Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Construct cover in sections with handles for ease of removal.

2.9.8 Belt Feeder

Totally enclosed, dusttight, approximately [_____] meters feet between pulley centers, designed to operate at a speed not to exceed [_____] m/sec fpm, and having a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide belt feeder complete with continuous belt, shafts, pulleys, idlers, belt cleaner, frame, enclosure, reduction gear, and drive motor.

2.9.8.1 Head and Foot Shafts

Cold rolled steel, not less than [_____] and [_____] mm [_____] and [_____] inches in diameter respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than a [_____] mm inch adjustment. Shafts shall fit tight in pulley hubs.

2.9.8.2 Pulleys

Welded steel type with detachable compression grip-type hubs, steel plate ends, and crown faces 50 mm 2 inches wider than the belt width. [Provide an adjustable spring loaded or counter weighted type rubber bladed belt wiper beneath the head pulleys.]

2.9.8.3 Belt

Mine Safety and Health Administration (MSHA) approved fire resistant construction, belt not less than [_____] mm inches wide, [_____] ply, [_____] kg per square meter ounces per square foot, with 3 mm 1/8 inch thick oil and chemical resistant cover on carrying side, 0.79 mm 1/32 inch thick oil and chemical resistant rubber cover on under side. Cover shall be fire resistant. Belt shall have a cover tensile strength of not less
than [_____] kPa pounds per square inch (psi) and friction between plies of not less than [_____] kPa pounds per inch. Belt shall have vulcanized splice.

2.9.8.4 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Motor shall be direct connected by means of flexible coupling with guard to a reduction gear.

2.9.8.5 Reduction Gear

Alloy steel helical gear type enclosed in oiltight housing. Provide an adjustable base for motor and reducer unit. Drive from the output shaft of the speed reducer to the conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B16.39 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall also conform to ASME B29.100. Properly tension drive chain.

2.9.8.6 Backstop

Differential band brake type, cam type, or internal type to prevent reversal of belt.

2.9.8.7 Idlers

Flat type with 125 mm 5 inch diameter steel shells, malleable iron end brackets, grease sealed roller-type antifriction bearings, and self-cleaning angle bases. Idler spacing shall be not greater than 1372 mm 4 feet 6 inches. Return idler shall be of the flat single-pulley type having 125 mm 5 inch diameter steel shells, grease sealed roller-type antifriction bearings spaced on not more than [_____] meters feet on center. Provide self-aligning training type idlers, as required, to ensure proper training of the belt. Provide additional idlers, as required, beneath track or truck hopper for support of belt and coal and to properly protect belt from impact caused by coal. Extend grease pipes to one side for four point lubrication from tunnel walkway.

2.9.8.8 Load Skirts

Steel plate 6.35 mm 1/4 inch thick supported by structural brackets from conveyor frame. Skirts shall have rubber strips along bottom edge to seal the belt. Strips shall be easily adjustable by means of a clamp bar arrangement not requiring slotted bolt holes.

2.9.8.9 Frame, Supports, and Enclosure

Construct frame of either structural steel channel side stringers properly tied and braced for support of head and foot shafts with 12 gage (2.66 mm 0.1046 inch) steel deck plate full length of feeder, or integrally formed plate conveyor and deck frame. Support idlers from conveyor frame. Support frame from floor of tunnel [by steel channel legs] [as indicated]. Completely enclose feeder in a dust-tight enclosure constructed of not less than 10 gage (3.42 mm 0.1345 inch) steel plate with easily removable gasketed side panels containing handles at each panel end.
2.9.8.10 Loading Hopper

Constructed of not less than 10 mm 3/8 inch thick steel plate connected to bottom flange of the track or truck hopper. Provide an adjustable regulating gate adjacent to loading hopper for regulating height of coal on the belt.

2.9.8.11 Vibrating Feeder

Flat pan type vibrating feeder to convey coal from day hopper to belt conveyor. Pan shall be [_____] mm inches wide by [_____] mm inches long, with 150 mm 6 inch sides, constructed of 6 mm 1/4 inch thick stainless steel. Provide feeder with integral electromechanical drive and a remote controller. Controller shall contain operating switches and rate of flow adjustment and the power source for the feeder drive. Controller shall be designed for 460 volt, 60 Hz. supply voltage. Support feeder from hopper.

[2.9.9 Shallow-In-Built Bar Flight Feeder and Receiving Hopper

**************************************************************************
NOTE: Determine by an economic analysis and a technical evaluation if shallow-in-built bar flight feeders and receiving hoppers might be used instead of track or truck hoppers with belt feeders.
**************************************************************************

Bar flight feeder shall be totally enclosed, dusttight type with shallow-in-built [track] [truck] hopper. Bar flight feeder shall have a horizontal length of [_____] meters feet [_____] mm inches between sprocket centers, operate at not greater than [_____] m/s fpm, and have a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide feeder complete with continuous chains and attached bars, terminal sprockets, gears, shafts, bearings, troughs, enclosure, frames, [track] [track] hopper, grating, regulating gate, hinged inspection doors, discharge chute, electric motor, reduction gear, and supports.

2.9.9.1 Head and Foot Shafts

Head and foot shafts shall be not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively. Construct shafts of cold rolled steel and mount in antifriction roller bearings. Mount head shaft in fixed pillow blocks and foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.9.9.2 Terminal Sprockets

Cast iron with chilled rims not less than 380 mm 15 inches in diameter. Foot shaft sprockets shall be split type in two 180 degree sections to facilitate removal in shallow pit.

2.9.9.3 Chains and Flights

Chains shall be bar link type each having a pitch of not greater than 150 mm 6 inches and an ultimate strength of not less than 20,430 kg 45,000 pounds. Construct chain of heat treated carbon steel components with not less than a 22 by 38 mm 7/8 by 1 1/2 inch wide center link, 10 mm wide by 38 mm 3/8 inch wide by 1 1/2 inch thick side bars, fastened with 18 mm 5/8 inch diameter pins. Construct bar flights of 10 mm 3/8 inch thick steel bars not less than 50 mm 2 inches high with flight width of not less than [_____]
Flight spacing shall be such that feeder shall move the required coal with a head shaft speed not greater than [_____] rpm.

2.9.9.4 Frame and Enclosure

Construct feeder frame of structural steel properly tied and braced, complete with guides and track for both carrying and return runs, of not less than 80 by 80 by 10 mm 3 by 3 by 3/8 inch steel angles with not less than 6 mm 1/4 inch high-renewable carbon steel wear bars. Enclosure shall be dusttight of not less than 10 gage (3.42 mm 0.1345 inch) commercial hot rolled steel plate. Enclosure shall be removable in sections. Top and side panels at head and foot sections shall be hinged and removable for access to chain sprockets.

2.9.9.5 Trough

Construct with flat bottom of not less than 10 mm 3/8 inch thick steel plate. Trough shall be removable and constructed with flanged discharge opening.

2.9.9.6 Hopper

Construct not less than 2 1/2 meters long and 3 meters wide 8 feet long and 10 feet wide of structurally reinforced 10 mm 3/8 inch thick steel plate lined with 10 gage (3.42 mm 0.1345 inch) 410 stainless steel plate. Hopper sides shall not slope less than 55 degrees from the horizontal. Construct hopper with a shield over return run so that coal is fed directly to bottom conveying run.

2.9.9.7 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 65 by 10 mm 2 1/2 by 3/8 inch steel bars and 20 mm 3/4 inch diameter steel rods. Weld grating and make in sections for ease of removal. Provide intermediate beams to support grating.

2.9.9.8 Flight Feeder Drive

Flight feeder shall be driven by an electric motor direct connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and gear. Drive from output speed shaft of the reduction gear to the conveyor head shaft shall be by means of standard finished steel roller chain running over cut tooth sprockets, both conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall also conform to ASME B29.100. Properly tension drive chain.

2.9.9.9 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES.

2.9.10 Bucket Elevator

Dusttight [centrifugal discharge] [continuous bucket] type having approximately [_____] meters feet [_____] mm inch sprocket centers, vertical chain and bucket, operating at a speed not to exceed [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of
[_____] size coal. Provide bucket elevator complete with continuous double chains and attached buckets, upper and lower sprockets, gears, shafts, bearings, casing, top hood, discharge spout, bottom boot, access doors, electric motor drive, reduction gear, service platform, and accessories.

2.9.10.1 Head and Foot Shafts

Cold rolled steel not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than a [_____] mm inch adjustment. Shafts shall fit tight in sprocket hubs.

2.9.10.2 Terminal Sprockets

Cast iron with chilled rims. Head sprockets shall be not less than [_____] mm inches in diameter and foot sprockets not less than [_____] mm inches in diameter.

2.9.10.3 Buckets and Chain

Construct buckets of [malleable iron] [not less than [_____] mm inch steel plate] not less than [_____] mm inches long, [_____] mm inches wide, and [_____] mm inches deep. Buckets shall be mounted by not less than four bolt attachments to double strand of steel bushed chain each having an ultimate strength of not less than [_____] kg pounds and pitch of [_____] mm inches. Bucket spacing shall not be greater than [_____] mm inches.

2.9.10.4 Backstop

Differential band brake type, cam type or internal type to prevent reversal of chain and buckets in case of power failure.

2.9.10.5 Elevator Casing

Not less than [_____] by [_____] mm inches inside of not less than [_____] [gage] [mm inch thick] commercial hot rolled mild steel plate with 50 by 50 by 6 mm 2 by 2 by 1/4 inch corner angles for full height of elevator casing. Construct casing in standard sections from 3048 to 3658 mm 10 to 12 feet high with 50 by 50 by 6 mm 2 by 2 by 1/4 inch angle flanges at the end of each section. Provide a hinged inspection door not less than 610 by 760 mm 24 by 30 inches in the section immediately above the boot section [and where indicated]. Casing and inspection doors shall be of dust-tight construction with flange angles continuously welded and gasketed. No makeshift repairs or field patching to overcome leakage shall be permitted. Casing interior shall be given a 1.60 mm 1/16 inch thick coating of coal tar primer and enamel in accordance with SSPC PS 11.01.

2.9.10.6 Head Section

Not less than [_____] mm inch thick commercial hot rolled mild steel plate in heavy angle frame with split, hinged, and removable top cover hood. Construct hood of not less than [_____] mm inch thick commercial hot rolled mild steel plate with flanged discharge throat built of not less than [_____] mm inch thick commercial hot rolled mild steel plate. Design head section to support drive machinery and head bearings. Provide maintenance access ladder and platform conforming to applicable OSHA regulations [as indicated].
2.9.10.7 Boot Section

Not less than [_____] mm inch thick commercial hot rolled mild steel plate in heavy rolled mild steel plate in heavy angle frame with curved and renewable bottom plate built of not less than [_____] mm inch thick commercial hot rolled mild steel plate, and flanged inlet. Mount take up and foot terminal bearing on one side of boot in a bolted removable side panel so foot shaft and [sprocket] [sprockets] may be removed through side of door. Bolt end panels so they are removable for cleanout and inspection.

2.9.10.8 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES. Motor shall be direct connected by means of flexible coupling to a reduction gear.

2.9.10.9 Reduction Gear

Alloy steel herringbone or helical gear type enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear unit. Drive from the output shaft of the reduction gear to the elevator head shaft shall be by means of standard finished steel roller chain running over cut tooth sprockets, both conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall also conform to ASME B29.100. Properly tension drive chain.

2.9.10.10 Anchoring Brackets

Provide steel brackets at intervals [as indicated] at [not less than [_____] meters feet over centers] for anchoring elevator and to increase rigidity.

2.9.11 Flight Conveyor

Dusttight double strand chain-type with [_____] meters feet sprocket centers, operating speed not greater than [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide flight conveyor complete with continuous chain and attached flights, terminal sprockets, gears, shafts, bearings, trough, casing, frame, hinged inspection doors, electric motor drive, reduction gear, and supports. [Design flight conveyor for future length of [_____] meters feet for future plant expansion.]

2.9.11.1 Head and Foot Shafts

SAE 1045 steel not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively, mounted in antifriction tapered roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.9.11.2 Terminal Sprockets

Cast iron with chilled rims and not less than 8 teeth. One sprocket shall be keyed on shaft and the other shall be free to turn.

2.9.11.3 Flights and Chain

Construct flights not less than [457] [508] [610] [762] mm [18] [20] [24]
[30] inches long and [200] [250] mm [8] [10] inches high of not less than 6 mm 1/4 inch thick abrasion resistant steel. Mount flights at not greater than [457] [508] [610] [914] mm [18] [20] [24] [36] inch intervals between two matched strands of steel bushed roller chain having [_____] mm inch pitch and an ultimate strength of not less than [_____] kg pounds per each strand. Chain shall have [_____] by [_____] mm inch high carbon steel side bars, high carbon steel, heat-treated pins, carbon steel case-hardened bushings, and [_____] mm inch diameter single flange chilled gray iron or chrome iron rollers. Support chain so that chain does not lie or run in coal.

2.9.11.4 Frame and Enclosure

Construct conveyor frame of structural steel properly tied and braced, complete with track for both the carrying and return run of chain of not less than 80 by 80 by 10 mm 3 by 3 by 3/8 inch steel angles with not less than 6 mm 1/4 inch high renewable molybdenum steel wear bars. Enclosure shall be dust-tight of not less than 10 gage (3.42 mm 0.1345 inch) hot rolled steel plate with easily removable side panels containing handles at each panel end. Enclosure shall have hinged inspection doors 600 mm 24 inches wide and full height of the enclosure opposite loading hopper and at each discharge chute. End panels shall be hinged and removable for access to the chain sprockets.

2.9.11.5 Trough

Not less than 6 mm 1/4 inch thick corrosion resistant steel plate made in boxlike U-shape. Trough shall be removable in not more than 2.44 meters 8 foot long sections and constructed with flanged discharge openings where indicated.

2.9.11.6 Loading Hopper

Steel plate not less than 6 mm 1/4 inch thick sloped at not less than 60 degrees.

2.9.11.7 Outlets

Bottom of trough shall have [_____] outlets not less than [457] [508] [610] [762] mm [18] [20] [24] [30] inches long with gates to discharge coal into cylindrical bunkers. Provide outlets with deflection plate type baffle designed to make coal drop straight down into bunker.

2.9.11.8 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Motor shall be directly connected by means of flexible coupling to a reduction gear.

2.9.11.9 Gates

Provide coal gates on bottom trough of flight conveyor, immediately under outlets. Opening shall be [_____] mm inch square with motor operated slide gates for controlling discharge to each bunker. Provide double rack and pinion type gates driven by not less than 0.56 kW 3/4 hp motor. Provide limit switches for signal lights, control and interlocking. Provide outlets from gates with a 6 mm 1/4 inch abrasion resistant steel plate discharge chute.
2.9.11.10  Reduction Gear

Alloy steel helical or herringbone gear type with antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear. Drive from output shaft of motor reducer to conveyor head shaft shall be by means of standard finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.12  Belt Conveyor

Inclined and approximately [_____] meters feet between pulley centers, operated at a speed not to exceed [_____] m/s fpm, and have a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide belt conveyor complete with continuous belt, shafts, pulleys, idlers, takeups, belt cleaner, frame with conveyor cover and walkway, transfer chute, hopper, emergency stop cord and switch, alignment switch, reduction gear, electric motor, bin high level limit switch and alarm.

2.9.12.1  Head and Foot Shafts

Construct shafts of turned and polished cold rolled steel not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.9.12.2  Takeups

[Three pulley guided vertical counter weighted type] [Screw type] to maintain proper belt tension. Shafts shall be as specified above and not less than [_____] mm inches in diameter. Provide a safety device to prevent free fall of takeup pulley. Takeups shall provide a minimum adjustment of 1.5 percent of total belt length.

2.9.12.3  Pulleys

Welded steel type with detachable compression grip-type hubs, steel plate ends, and crown faces 50 mm 2 inches wider than the belt width. Provide a multiple belt scraper at each head pulley.

2.9.12.4  Magnetic Pulley

Drive pulley of [_____] conveyor shall be a nonelectric permanent magnet type designed to remove tramp iron. Provide a removable pan to collect tramp iron.

2.9.12.5  Belt

Synthetic fabric, not less than [_____] mm inches wide, a minimum of [_____] ply, with 3 mm 1/8 inch thick oil and chemical resistant cover on carrying side, [1.59] [0.79] mm [1/16] [1/32] inch thick oil and chemical resistant rubber cover on under side. Cover shall be fire resistant. Belt shall have a tension pull strength of not less than [_____] N per mm pounds per inch of belt width. Belt shall have vulcanized splice.
2.9.12.6  Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Motor shall be direct connected by means of flexible coupling with guard to a reduction gear.

2.9.12.7  Reduction Gear

Alloy steel helical gear type enclosed in an oiltight housing. Provide an adjustable base for mounting motor and reducing unit. Drive from output shaft of speed reducer to conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.12.8  Backstop

Differential band brake type, cam type, or internal type to prevent reversal of belt.

2.9.12.9  Emergency Stop Cord and Switch

Provide emergency stop cord the length of the conveyor to actuate a switch for stopping the conveyor. Switch shall have flag to indicate actuated switch and shall have positive safety lock that cannot be accidentally reset. Cord shall be not less than 2.38 mm 3/32 inch galvanized aircraft cable with a minimum 1.19 mm 3/64 inch vinyl or nylon protective coating. Provide sufficient number of switches to prevent cable weight from actuating switch.

2.9.12.10  Belt Alignment Switch

Provide belt alignment switches on each side of the belt mounted off conveyor frame or discharge chute to stop conveyor under belt misalignment or runoff conditions. Mount switches on breakaway mounts to prevent damage from runaway belt.

2.9.12.11  Idlers

Troughing idlers shall be [20] [35] degree three-pulley type with 125 mm 5 inch diameter steel shells, malleable iron end brackets, grease sealed roller type antifriction bearings, and self-cleaning angle bases. Troughing idler spacing shall be not greater than 1.37 meters 4 feet 6 inches, with additional idlers at the loading point. Return idler shall be flat single-pulley type having 125 mm 5 inch diameter steel shells, grease sealed roller type antifriction bearings and spaced not more than 3 meters 10 feet on center. Provide self-aligning training type trough and return idlers at not greater than 15.24 meters 50 foot intervals to ensure proper training of belt. Extend grease pipes to one side for four point lubrication from walkway.

2.9.12.12  Load Skirts

Not less than 6 mm 1/4 inch thick steel plate and supported by structural brackets from conveyor frame. Skirts shall have rubber strips along bottom edge to seal belt. Strips shall be easily adjustable by means of a clamp
bar arrangement not requiring slotted bolt holes.

2.9.12.13 Frame, Supports, and Walkway

Frame shall be structural steel truss type with head and foot terminals framed of structural steel. Support frame from grade on structural A-frames set on concrete footings as indicated. Support idlers on not less than 150 mm 6 inch channel stringers braced and tied to structural steel truss frame. Provide a 12 gage (2.66 mm 0.1046 inch) steel deck plate for full length of conveyor. Provide a curved belt cover constructed of not less than 16 gage (1.52 mm 0.0598 inch) corrugated galvanized metal having removable panels on walkway side for access to idlers. Provide walkway not less than 914 mm 36 inches wide, supported from structural steel framing for entire length of conveyor. Walkway shall be complete with handrails and metal nonslip grating meeting requirements of 29 CFR 1910-SUBPART D, Walking and Working Surfaces.

2.9.12.14 Discharge Hopper

Construct of not less than 6 mm 1/4 inch thick steel plate to discharge on a discharge chute. Provide a discharge hood built of 10 gage (3.42 mm 0.1345 inch) steel plate enclosing top, front, and sides above discharge hopper.

2.9.13 Coal Scales

Stationary, automatic, dust-proof, belt-fed, batch type with rated capacity of not less than [___] Mg tons per hour and a hopper capacity of 91 kg 200 pounds. Coal scales shall be complete units, including body, belt feeder, feeder drive, bypass, weighing mechanism, weigh hopper, controls, counters, and remaining items required to make a completely automatic coal scale.

2.9.13.1 Body

Dusttight, of welded heavy steel plate construction with base angles not less than 6 mm 1/4 inch thick. Top plate, bypass plate, and reducer mounting plate shall be not less than 6 mm 1/4 inch thick, with other plates of not less than 11 gage (3.04 mm 0.1196 inch) steel plate. Provide large, gasketed, dusttight doors with adjustable pre-set compression type latches and forged steel hinges for inspection and maintenance purposes. Door openings shall be sufficient to allow removal of feeder and hopper without removal of screws or bolts.

2.9.13.2 Feeder

A self-contained unit with an endless belt which is capable of being removed from one end or side. Construct feeder of heavy rigid steel frame with an 11 gage (3.04 mm 0.1196 inch) stainless steel plate to support the belt on the carrying run. Head and takeup shafts shall be cold rolled steel carried on self-aligning ball bearings equipped with dust seals and fitted for pressure lubrications. Bearings shall be capable of being lubricated during scale operation. Takeup shaft shall have screw-type takeup bearings and pulleys shall be crown faced steel for proper belt tracking.

2.9.13.3 Feed Belt

Channel type and of endless construction without splice. Belt shall be not
less than 7.94 mm 5/16 inch thick of three ply heavy fabric core construction with chemical and abrasion resistant rubber coating. Feeder skirts and leveling plate shall be stainless steel and shall be arranged to provide a continuous stream of constant width and depth coal on the feed belt.

2.9.13.4 Electric Motor And Drive

Totally enclosed [_____] volt, [_____] phase, 60 Hz, with heavy duty reduction gear not less than 0.56 kW 3/4 hp as specified in the paragraph MOTORS AND DRIVES. Scale shall be capable of bypassing coal without disconnection of drive. Drive disconnection shall not be required for feeder removal unless special provisions are made for a quick and simple drive disconnection.

2.9.13.5 Coal Bypass

Provide a quick-operating coal bypass with an easily operable lever located on the outside of scale body. Operating lever operation shall instantly bypass coal around the feeder section and weighing mechanism without release of belt tension to prevent entry of coal between belt and pulley or support plates. Bypass construction shall not restrict inlet opening size for normal scale operation.

2.9.13.6 Weighing Mechanism

Enclose in a dusttight compartment. Construct of cold rolled steel for minimum deflection, warp, and twist. Pivot points shall be self-aligning with hardened double bearing surfaces. Weighing mechanism shall be complete with weight lever, tare adjustment, and compensator [, with design subject to approval by the Contracting Officer] and scale shall be guaranteed to weigh coal accurately within 0.25 percent.

2.9.13.7 Scale Weigh Hopper

Construct scale weigh hopper and discharge gate of not less than 14 gage stainless steel plate, continuously welded and stiffened with angle irons. Weigh hopper shall be of such design and construction to ensure clean discharge.

2.9.13.8 Controls

Provide controls, except those required for weigh hopper discharge, prewired and located in a NEMA [12] [3] dusttight enclosure. Provide circuit breaker interlocked with electrical panel door. Control circuits shall be two wire nominal 120 volt systems obtained by using an isolation transformer with one side grounded and wired to a single terminal block which shall be included in the electrical panel. Segregate circuits of different voltage levels. Controls shall include large, oiltight, industrial type pushbuttons for use as "start-stop," "test," and "dump" switches mounted on the scale body adjacent to the electrical panel.

2.9.13.9 Counters

Mount a mechanical type coal counter on the scale body. Counter shall be rugged, reliable, with heavy duty register and designed so that double counting is impossible.[ A remote motor operated counter shall be furnished located on the coal handling control panel in the control room. Counter shall be designed so that double counting is impossible.][ Provide
a contact closure for sending a pulse signal of each weigh hopper discharge to the operator control console.

2.9.13.10 Scale Inlet

Scale inlet shall contain coal gate with opening not less than 457 by 457 mm or 406 by 508 mm 18 by 18 inches or 16 by 20 inches along with a dusttight all metal slip joint constructed of not less than 4.76 mm 3/16 inch thick steel plate. Slip joint shall be of split construction to allow for installation after coal scale is in place. Design slip joint to allow necessary flexibility to take care of deflection of [bunker] [silo] outlet due to varying load and temperature variations without imposing load on the scale. Provide rope packing or other resilient gasket material to make slip joint completely dusttight.

2.9.13.11 Scale Outlet Hopper

Not less than 6 mm 1/4 inch thick 410 stainless steel plate of capacity not less than 227 kg 500 pounds and 13 mm 1/2 inch thick steel plate flanges.

2.9.14 Stoker Hopper Extension

Dusttight and bolted to hopper furnished with stokers. Construct hopper extensions as indicated of 6 mm 1/4 inch thick 410 stainless steel plate with structural stiffeners. Hopper extension shall hold not less than [_____] Mg tons of coal at a density of 800 kg per cubic meter 50 pounds per cubic foot. Hopper extensions shall have bolted emergency firing doors of not less than 610 by 610 mm 24 by 24 inches which shall contain a 152 by 152 mm 6 by 6 inch glass observation window. Connections shall be dusttight.

2.9.15 Coal Valve

Dusttight and dripproof of the double ladder rack-and-pinion type sized as indicated for each valve. Valve shall be capable of closing through a standing coal column. Valve opening shall be full size with no bridges, internal braces, or other barriers.

2.9.15.1 Valve Body

Not less than 6 mm 1/4 inch thick formed 410 stainless steel with heavy 19 mm 3/4 inch thick flanges. Continuously weld joints in contact with coal both inside and out and grind smooth. Valve body shall have dusttight steel gate assembly cover with molded gasket for removal of gate without removing coal valve. Provide a minimum of two dusttight poke holes with rigid covers and molded gaskets.

2.9.15.2 Valve Gate

Dripproof and siftproof of 10 mm 3/8 inch thick steel plate with an 11 gage (3.04 mm 0.1196 inch) 410 stainless steel liner. Support gate by ball bearing rollers with 16 gage (1.52 mm 0.0598 inch) stainless steel shells equipped with felt grease seals and stainless steel grease retainers. Provide rollers with grease fittings extended through valve body for pressure lubrication. Design gate so that supporting rollers, racks, and pinions are located completely out of the coal stream. Provide cold formed, self cleaning racks, with stainless steel self cleaning pinions located over racks for positive tooth engagement.
2.9.15.3 Operating Shaft

Mount operating shaft in ball bearings with felt seals, stainless steel shells, stainless steel grease retainers, and grease fittings. Provide handwheels with proper finger clearance or pocket sheaves with heavy hot-dipped galvanized chain and chain guard as indicated. Handwheels and sheaves shall be not less than 457 mm 18 inches in diameter. Provide valves with mechanical type position indicator consisting of large pointer and legend to indicate position of valve gate.

2.9.15.4 Electric Motor Operators

Provide motor operators where indicated and capable of remote operation from the coal handling control panel. Operator shall consist of totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz motor as specified in the paragraph MOTORS AND DRIVES with reduction gear, clutch and limit switches. Motor horsepower shall be as recommended by the manufacturer. Provide motorized valves that have manual operators, with fail-safe interlocks that make manual operation impossible while motor is operating.

2.9.16 Track and Reclaim Hopper Valves

Dusttight, double rack and pinion type, with water collecting trough. Valve shall have inlet opening not less than [_____] by [_____] mm inches in direction of gate travel with a larger outlet opening. Inlet and outlet shall be flanged and constructed of mild steel.

2.9.16.1 Valve Body

Not less than 10 mm 3/8 inch thick mild steel continuously welded both internally and externally and lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate where body comes in direct contact with coal. Construct inlet skirt of not less than 6 mm 1/4 inch thick 410 stainless steel with outlet body plates constructed of 10 mm 3/8 inch thick mild steel lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate. Construct water collecting trough of not less than 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate and containing water sprays for flushing. Valve body shall have dust-tight steel gate assembly cover with molded gasket for removal of gate without removing the coal valve. Provide a hinged access panel not less than [_____] by [_____] mm inches in the direction of gate travel with compression-type latches over water collecting trough for removing obstructions.

2.9.16.2 Valve Gate

Slope gate plate toward water collecting trough and mount it on large ball bearing rollers with 16 gage (1.52 mm 0.0598 inch) stainless steel shells equipped with felt grease seals and stainless steel grease retainers. Provide rollers with grease fittings extended through valve body for pressure lubrication. Gate shall be U-shaped with ladder racks on both sides and shall be constructed of not less than 15.90 mm 5/8 inch thick mild steel lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate. Gate design shall be such that supporting rollers, racks, and pinions are located completely out of coal stream. Racks shall be cold formed and self-cleaning, with stainless steel, self cleaning pinions over racks.
2.9.16.3 Operating Shaft

Mount operating shaft in ball bearings with felt seals, stainless steel shells, stainless steel grease retainers, and grease fittings. Mount a reduction gear on the gate shaft and provide an ample gate clearance pocket in the body to ensure ease of operation through a standing column of coal. Handwheel for operating valve shall be not less than 457 mm 18 inches in diameter.

2.9.17 Chutes

Construct coal chutes dusttight as indicated of not less than 6 mm 1/4 inch thick 410 stainless steel plate. Weld chutes with flanges located as indicated to facilitate equipment and chute section removal. Flanges shall be not less than 10 mm 3/8 inch thick steel and gasketed to maintain dust-tight seal. Provide poke holes and access panels where indicated.

2.9.18 Coal Presence Indicators and Equipment Response Switches

May be of the following types and shall be interlocked with coal handling controls to indicate equipment failures, coal stoppages, and provide for a semi-automatic system. Enclosures for components shall meet requirements of NEMA Type 7, Class I, Division I, Groups C and D, and NEMA Type 9, Class II, Division I, Groups E, F, and G.

2.9.18.1 Type A - Diaphragm Type Presence Indicator

Pressure-sensitive to presence of coal consisting of housing, diaphragm, limit switches, wiring, and mounting bracket flanges. Housing shall be either cast iron, stainless steel, or protected cast aluminum, with synthetic diaphragm as recommended for coarse slightly abrasive materials. Diaphragm deflection shall actuate a limit switch to indicate coal presence. Design unit so that maintenance, diaphragm replacement and sensitivity adjustment can be made from outside the bin. Type and number of contacts and voltages shall be as indicated on control diagrams.

2.9.18.2 Type B - Paddle Type Presence Indicator

Paddle mounted on a counterweighted horizontal shaft so that deflection of paddle rotates a cam which actuates a limit switch in a control box mounted on the shaft. Unit shall consist of paddle, shaft, enclosure, limit switches, wiring, and mounting brackets. Shaft shall be cold rolled steel and paddle shall be stainless steel with control enclosure of cast iron, stainless steel, or suitably protected cast aluminum. Type and number of contacts and voltages shall be as indicated on control diagram. Mount shaft in ball bearings equipped with suitable dust seals and fittings for pressure grease lubrication.

2.9.18.3 Type C - Tilt Type Presence Indicator

Conical steel float that shall be tilted by presence of coal. Unit shall consist of housing, conical float, universal pivot-collar, pendant mechanism, dust seal, limit switches, wiring, and mounting brackets. Unit shall operate so that tilting of float actuates a limit switch in enclosed housing above. Provide a hood constructed according to manufacturer's recommendations for the indicator's location of not less than 5 mm 3/16 inch thick steel plate. Provide access panel for servicing the unit. Tilt type indicator may be a totally enclosed type in which tilting causes a ball to roll off the center actuating a limit switch. Design unit to be
cable hung and to tilt on presence of coal. Type and number of contacts and voltages shall be as indicated on control diagram.

2.9.18.4 Type D - Rotating Type Presence Indicator

Rotating paddle where presence of coal stalls motor and actuates a limit switch. Unit shall have either cast iron or cast aluminum housing, stainless steel paddle, couplings, and flexible shaft. Shaft seal shall be spring loaded and shall prevent buildup of fines between shaft and hub. Operation shall be such that when paddle stalls motor continues to operate until limit switch is actuated, which in turn shuts off current to motor. Vane and baffle arrangements shall be according to manufacturer's recommendations for each indicator location. Type and number of contacts and voltages shall be as indicated on control diagrams.

2.9.18.5 Type E - Vibrating Type Presence Indicator

Vibrating sensing rod so that presence of coal dampens vibrations actuating a control signal. Sensing rod shall be stainless steel not less than 10 mm 3/8 inch in diameter. Control unit shall be solid state, with type and number of contacts and voltages as indicated on control diagrams.

2.9.18.6 Equipment Speed Response Switch

Actuates a control signal when preset abnormal equipment operating conditions are encountered. Switch shall be adjustable so that it may be used as an underspeed switch, overspeed switch, or zero speed switch. Switch shall consist of input shaft from which the equipment speed is measured and compared to a preset point. Enclosure shall be cast iron or suitably protected cast aluminum. Mount speed response switches as indicated. Type of switch adjustment, type and number of contacts, and voltages shall be as indicated on control diagrams.

2.9.18.7 Presence Indicators and Response Switches

Provide at hoppers and conveyor discharges located and protected according to manufacturer's recommendations to ensure safe and reliable operation. Mount presence indicators in such a manner that they will not be damaged by occasional large lumps or falsely operated by stray lumps or collected amounts of coal.

2.9.19 Control Panel and Controls

Provide a semi-automatic control system for coal handling system as indicated.

2.9.19.1 Control Panel

NEMA 12 construction, centrally located in main plant control room. Panel front shall include a system graphic display as indicated. Display shall be approximately to scale and painted with an industrial acrylic enamel. Outline each item with 3 mm 1/8 inch wide black lines. Lettering shall be on engraved plastic screwed to front of panel, with white letters on a black background. Provide controls for operation on [_____] volt, [_____] phase, 60 Hz ac. Panel shall be complete with an annunciator and interlocks, relays, switches, running and safety lights, and auxiliary parts necessary to safely control and operate the system. Items located in door shall be dust-tight and oil tight with push-to-test transformer type indicating lights. Control relays shall be 10 amp, 600 volt class with
convertible contacts. Provide and mark terminals for connections with the exception of the neutral. Panel shall contain [_____] percent spare terminals. Wiring shall be No. 14 AWG type THHN stranded. Neutral wire shall be white. Color code and label wiring of 120 volts or less. Provide plastic wire duct of sufficient size to provide [_____] percent cross sectional spare. Wiring shall be in accordance with requirements of NFPA 70.

a. Panel Devices: Control panel shall include the following indicating lights and color:

b. Provide momentary contact pushbuttons or selector switches for the following:

(1) System START (3 required)
Rail unloading hopper to boiler plant
Rail unloading hopper to storage yard
Reclaim hopper to boiler plant

(2) System - STOP (red head)
(3) Rail unloading surfactant spray system - ON-OFF
(4) Rail unloading hopper surfactant spray - START/STOP
(5) Reclaim surfactant spray system - ON-OFF
(6) Reclaim hopper surfactant spray - START/STOP
(7) Coal to stackout tube (SELECT)
(8) Alarm - ACKNOWLEDGE

c. Annunciator panel shall include the following:
   (1) Bunker - HIGH LEVEL
   (2) Bunker - LOW LEVEL
   (3) Stoker hopper (one required for each hopper) - HIGH LEVEL
   (4) Stoker hopper (one required for each hopper) - LOW LEVEL
   (5) EMERGENCY SHUTDOWN (Auxiliary contacts for remote alarm)
   (6) Blank (3 required)

d. Size panel to accommodate future addition of one stoker hopper and associated equipment.

e. Provide auxiliary devices required for control functions indicated above.

f. Provide laminated plastic name plates for devices on panel face.

2.9.19.2 Remote Controls

Provide controls for the following items in the main plant control room as specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS:

a. Conveyor system - EMERGENCY STOP
b. Bunker - HIGH LEVEL ALARM
c. Bunker - LOW LEVEL ALARM
d. Stoker hopper (one required for each hopper) - HIGH LEVEL
e. Stoker hopper (one required for each hopper) - LOW LEVEL
f. Under Bunker conveyor system - START/STOP
g. Coal scale - START/STOP
2.9.19.3 Control Sequence

To ensure that coal does not back up during system startup or shutdown, design controls so that on startup, the last piece of equipment to handle coal starts first and on shutdown, stops last.

2.9.19.4 Additional Controls

Provide as shown. These controls include local START and STOP pushbuttons or three-position selector switches for the following:

a. Belt feeders
b. Belt conveyors (at head pulley)
c. Flight conveyor
d. Coal scale
e. EMERGENCY STOP pushbuttons which stop the entire system shall be provided where indicated.

2.9.20 Multiple Belt Scrapers

Equip conveyor belts at the head pulley, with multiple belt scrapers. Provide adequate room and service access in head chute design for multiple cleaners. Provide a doctor blade on face of head pulley to remove most of the carryback material and a torsion arm type multiple blade cleaner to scrape and remove material that bypasses primary cleaner. Provide tail pulley takeups with a plow to protect against material being carried back between belt and pulleys. Both cleaners and plows shall have features that enable the operator to safely inspect and adjust the blades. Dribble chutes shall be designed to resist material buildup and shall be plastic lined. Provide a convenient dust tight door for clean out and inspection purposes on each side of the dribble chute.

2.9.21 Steel Coal Bunker

Cylindrical shaped type having a storage capacity of not less than [_____] Mg tons of coal having a density of 800 kg per cubic meter 50 pounds per cubic foot.

2.9.21.1 Construction

All welded construction, not less than [_____] meters feet in diameter with a vertical cylindrical section [_____] meters feet [_____] mm inches high. Construct vertical cylindrical section of not less than 7.90 mm 5/16 inch thick steel plate. Slope bottom cone shaped hopper section at not less than 55 degrees and fabricate from not less than 10 mm 3/8 inch thick 410 stainless steel plate. Top of bunker shall be conical 35 degree sloped structurally reinforced 6 mm 1/4 inch thick steel plate. Provide ladder inside bunker. Provide dusttight, weather tight access hatch of not less than 610 by 610 mm 24 by 24 inches in bunker top immediately above ladder. Shell and bottom plates shall be beveled for full penetration butt weld on inside of bunker and a finish weld on outside of bunker. Provide bunker with flanged outlet drilled to match inlet of gate.

a. Responsibility: Ensure that full responsibility for final design and details of construction of steel coal bunker is assumed by the
b. **Supports:** Bunker shall be self supporting from four stub columns which shall be supported from on top horizontal structural steel framing. Structural steel framing for supporting the stub columns is specified in Section 05 12 00 STRUCTURAL STEEL.

c. **Liner:** Surface blast vertical inside surfaces of the bunker to a near white metal, and then coat with 6 mm 1/4 inch thick troweled-on heavy duty three compound corrosion resistant liner consisting of a resin, a hardener and graphite aggregate. Liner shall have an operating temperature limitation of not less than 66 degrees C 150 degrees F.

2.9.21.2 **Accessories:**

a. **Alarm Switches:** Provide bunker with two automatic bin level indicators with neoprene rubber diaphragm and a single pole, double throw switch mounted in explosion proof aluminum housing to signal high and low level alarms. Provide mounting plates on bunker shell and holes for installation of indicator housing on outside of bunker. Wiring shall be as specified in Division 26.

b. **Vibrators:** Provide on cone bottom of coal bunker a heavy duty pulsating magnet electric vibrator, semi-noiseless type, complete with mounting plate. Provide one vibrator controller panel arranged for mounting in wall mounted control panel. Panel shall contain an "ON-OFF" switch, power control dial, fuses and rectifier. Power supply to panel shall be 460 volt, single phase, 60 Hz current.

2.9.22 **Stackout Tube**

Provide a stackout type discharge tube not less than 10 mm 3/8 inch thick, reinforced, stainless steel plate for discharging coal from stackout conveyor to coal storage yard. Tube shall be 1220 mm 4 feet in diameter, and designed as the structural support for a portion of the stackout conveyor and support steel as indicated. Tube shall be a window chute designed to discharge coal at not more than 1829 meters 6 feet above coal pile.

2.10 **FUEL OIL SYSTEM**

**************************************************************************
NOTE: In reference to the following text, choose either Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS, for below ground tanks, or Section 33 52 10 FUEL SYSTEMS PIPING (_SERVICE STATION_), for above ground tanks. The rest of the fuel oil system is covered in Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION).
**************************************************************************

The fuel oil system shall be designed and built in accordance with Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION)[.][, except for below grade level fuel tanks, which shall be constructed to Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.]

2.11 **ASH HANDLING SYSTEM (PNEUMATIC)**
NOTE: Designer shall select type of ash handling system most suited for each project. For plants over 4 kg per second 31,500 pounds per hour steam ultimate capacity use a pneumatic ash handling system. For plants under 4 kg per second 31,500 pounds per hour steam ultimate capacity use a mechanical system. Refer to NAVFAC DM-3.6, Section 5, paragraph 4d for design criteria.

**************************************************************************

NOTE: Choose this article (and the paragraphs and subparagraphs following) or the article, (paragraphs and subparagraphs) below, ASH HANDLING SYSTEM (MECHANICAL).

**************************************************************************

2.11.1 System Requirements

Provide a complete integrated, pneumatic, semi-automatic sequencing, ash handling system with air intakes, material intakes, [ash doors and enclosures,] iron alloy conveyor line, fittings, rotary slide gates, primary and secondary material separators, tertiary bag filter, [steam exhauster,] [electric motor driven positive displacement blower (mechanical exhauster,)] [air washer,] silo vent filter, ash silo, rotary ash conditioner, and equipment that may be necessary for a complete pneumatic ash handling system. Provide related electrical work required to operate the ash handling system. Design system so that the ash silo is never placed under a partial vacuum.

2.11.2 Type

System shall be the intermittent vacuum type, whereby the vacuum is interrupted permitting periodic discharge of collected materials into the silo on a programmed time cycle. System shall have sufficient air velocity to pick up ash that may be deposited in the pipe.

2.11.3 Ash Silo

System shall receive, and on a sequenced basis convey to the ash silo, ash from the stoker fired boiler [ash storage hoppers,] [ash storage pits,] [siftings hoppers,] [soot hoppers,] [economizer hoppers,] [baghouse hoppers,] and other pollution control equipment hoppers. Convey ash from only one pickup point at a time.

2.11.4 Ash

Discharge ash into the ash storage silo in a dry condition. Arrange silo equipment for disposal of conditioned ash to trucks. The operation shall be as nearly dustless as possible.

2.11.5 Maximum Noise Level

The noise level of the operation shall not exceed 85 decibels sound pressure level 1.50 meters 5 feet from the equipment in any direction.

2.11.6 Dry Ash Storage Hopper

Provide for each boiler to receive and store bottom ash as it is discharged
from the traveling grate. Hopper shall be compatible with the grate ash discharge enclosure and shall have a net volume to receive and to store material for an 8 hour period at maximum boiler output. Size hopper for mean ash level for one meters 3 feet below the stoker floor with ash density of 640 kg per cubic meter 40 pounds per cubic foot for volumetric sizing.

2.11.6.1 Construction

Not less than 6 mm 1/4 inch thick, ASTM A36/A36M, steel plate, dusttight, floor supported steel structure with refractory lining. Provide required steel columns, beams stiffeners and cross bracing. Bolt top section of hopper to stoker support steel. Base design load of hopper on 1120 kg per cubic meter 70 pounds per cubic foot. Slope sides at not less than 45 degrees from horizontal to maintain positive feed to outlet.

2.11.6.2 Refractory Materials

As recommended by the manufacturer; minimum total thickness of refractory and insulating block lining shall not be less than 178 mm 7 inches. Refractory shall be minimum of 114 mm 4 1/2 inches thick.

2.11.6.3 Discharge Doors or Gates

Provide each hopper with refractory lined, dusttight, water cooled, vertical lift doors, of an opening size not less than 560 by 560 mm 22 by 22 inches. Each door shall be [air-cylinder operated] [chain wheel operated]. Provide intermediate positioning capability with air cylinder operators. Provide each door with guide rollers and support arms to ensure smooth operation without binding. When doors are vertical, minimum number of guide rollers shall be 4; for a sloping surface, minimum number of guide rollers shall be 6.

2.11.6.4 Hopper Lift Door Enclosure

Provide not less than 6 mm 1/4 inch thick steel, dusttight, enclosure, for each vertical lift door. Match enclosure to housing of clinker crusher and make enclosure large enough to enclose the outlet and the vertical lift door. Provide hinged inspection and cleanout door on enclosure front.

2.11.6.5 Hinged Hopper Access Door

Provide on one side wall of each hopper. Door shall be cast iron, air tight swingaway locking type with refractory lining. Install door so that it is conveniently accessible and easy to use.

2.11.7 Clinker Crusher

Provide mounted below each hopper discharge outlet, under vertical lift door enclosure, capable of reducing clinkers from bottom ash to a maximum size of 50 mm 2 inches at a rate not less than conveyor system capacity.

2.11.7.1 Construction

Single roller crusher unit with extra heavy housing, outboard bearings sealed against grit infiltration, motor and drive. Housing shall be 15 mm 1/2 inch thick. Crusher rollers shall have replaceable cam segments (teeth) with a minimum Brinell hardness of 450. Each cam tooth shall be designed to permit resurfacing with hard material. Stationary heavy cast
iron or manganese steel abrasion resistant wear plates, of a Brinell hardness not less than 350, shall be mounted about the crusher rollers. Cam shaft rotational speed shall not exceed 20 rpm.

2.11.7.2 Fluid Gear Drive

Crushers shall be driven by a fluid gear drive including a totally enclosed, fan cooled, [_____] volt, three phase, 60 Hz electric motor not less than 3.75 kW 5 hp, as specified in the paragraph MOTORS AND DRIVES, fluid coupling and reduction gear, integrally mounted in dust and oil tight enclosures. Fluid drive shall protect unit from excessive shock. Drive shall automatically reverse when stalled; crusher shall reverse and move forward three times and, after third time, shut down and alarm when still stalled.

2.11.8 System Valving

2.11.8.1 Side Intake Valves for Fly Ash Collection

Provide at each hopper, including dust collection hoppers and rear pass hoppers, and other collection points. Side intake valve shall be pneumatically opened, spring closed, totally enclosed disc valve of cast iron construction with wearing surfaces of Brinell hardness not less than 350. Provide valve complete with flanged inlet hopper, handhole with gasketed cover and clamp and couplings. Side intake valve shall feed ash to conveyor line on an angle, thus permitting air to mingle with ash in the proper proportion to eliminate clogging. Valves shall provide positive and automatic air tight shutoff and dust tight pickup. Valve shall close on failure of operating air and before discharge cycle of intermittent conveyor operation. A full load regulating switch shall control each valve to prevent overloading of conveyor system.

[2.11.8.2 Manual Valve Intakes for Bottom Ash

**************************************************************************
 NOTE: Choose this subparagraph or the subparagraph
 ROTARY VALVE INTAKE FOR BOTTOM ASH.
**************************************************************************

Provide in front of stoker ash pit doors, a 610 by 610 mm 24 by 24 inch cast iron grid and hopper complete with a self-feeding bottom ash intake, seal plug and pull-out rod that may be lifted to permit ash to enter system.

2.11.8.3 Rotary Valve Intakes for Bottom Ash

Provide a rotary valve, designed for regulating bottom ash to the a conveyor pipeline, under each crusher. Valve shall provide intake isolation and prevent overfilling or plugging of the conveyor line. Construction of valve shall be of cast iron with wearing surfaces of Brinell hardness not less than 350. Valve shall be pneumatically operated.

2.11.8.4 Air Intake

Provide spring loaded, swing disc, check valve type air intake, designed for air induction, at the end of each conveyor branch. When intake is located exposed to weather, provide a rain hood.
2.11.8.5 Isolating Valves (Line Valves)

Provide an air operated, totally enclosed rotary slide gate isolating valve at each branch pipe line connection to prevent air flow through an unused branch line. Construct valve of abrasion resistant metal, machined and fitted to ensure a vacuum tight fit and guard against leakage and excessive maintenance. Provide purge air connection and a solenoid valve in the valve housing or cavity for purging the gate cavity of ash.

2.11.8.6 Silo Discharge Valve

Provide a rotary feeder for discharging bottom ash and fly ash from the ash silo. Feeders shall be of ductile iron or cast steel and shall be complete with motor, motor support, chain drive, and necessary guards. Chain shall be driven through a torque limiting clutch on the driven sprocket equipped with electric cutout switch and alarm.[ Feeder shall have spring-loaded hinged bypass plate to permit passage of clinkers.] Inlet and outlet flanges shall be standard drilled pipe flange. Rotor blades and sealing arrangement shall be the manufacturer's standard for the intended service. When rotors are equipped with adjustable tips, provide a service door in the valve body for tip adjustment. Provide packing gland type shaft seals with suitable packing materials. Shaft bearings shall be outboard sealed ball bearings. Periphery seals shall be such that a complete seal is accomplished at a differential of [_____] Pa inches of water static pressure.

2.11.9 Ash Conveyor Pipe and Fittings

Abrasion resistant cast iron alloy free of blowholes and other defects and suitable for use in ash conveying systems.

2.11.9.1 Conveyor Piping

Centrifugally cast, abrasion resistant cast iron alloy pipe with a Brinell hardness of not less than 280.

2.11.9.2 Elbows and Fittings

Cast iron alloy with a Brinell hardness of not less than 350 and shall have renewable wearbacks not less than 25 mm one inch thick.

2.11.9.3 Hangers and Supports

Provide adjustable roller supports and pipe hangers to properly support the pipe. System supplier shall design support system and furnish supports.

2.11.9.4 Contractor's Option

At the Contractor's option, conveyor pipe handling only fly ash may be Schedule 80 black steel pipe in lieu of the iron alloy pipe; however outlet fitting, elbows, tees and laterals shall be iron alloy with wearbacks. Pipe for a distance of one meter 3 feet after the cast iron alloy fittings shall be cast iron alloy pipe. Provide pipe with couplings or split flanges, bolts and gaskets all rated not less than 538 degrees C 1000 degrees F.

2.11.9.5 Expansion Joints

Stainless steel bellows type with abrasion resistant liners of a Brinell
hardness not less than 350 or slip tube expansion joints fabricated of cast iron alloy, of Brinell hardness not less than 280, machined for smooth sliding fit with its mating part to absorb system thermal movement and shock loads.

2.11.10 Vacuum Air Piping

Provide from the secondary separator to the tertiary bag filter and from the tertiary bag filter to the [steam exhauster] [mechanical exhauster] not less than 10 gage, ASTM A211, spiral welded, vacuum air piping with ASTM A1011/A1011M, standard radius, mitered 10 gage elbows.

2.11.11 Compressed Air Piping and Accessories

Provide pressure reducing valves, safety valves, pressure gages, manual plug or ball valves, compressed air piping, as specified under the paragraph PIPING and other items required for a complete, operable, pneumatic system.

2.11.12 Primary Ash Receiver-Separator and Secondary Ash Separator

Provide on top of ash silo two stages of receiving and separating, with each stage a complete self-contained unit with efficient dust and air separation and gravity dump bottom gates to open with interruption of vacuum and discharge into a silo. Design system so that suction is positively shut off from receiver during its dumping period, so that no dust can be sucked out through exhaust while discharge of the receiver is open or opening. Air from the primary receiver shall enter the external secondary separator which shall remove approximately 85 percent of the dust not collected by the primary receiver. Combined efficiency of primary and external secondary separators shall be not less than 95 percent. Provide completely contained gate assemblies in a dust-tight enclosure fitted with access doors large enough to remove the entire gate assembly. Provide receivers of hard abrasion-resistant cast alloy iron with a Brinell hardness of not less than 500 constructed as specified below:

2.11.12.1 Primary Receiver-Separator

Not less than [914] [1219] mm [36] [48] inches inside diameter with cast sections 19 mm 3/4 inch thick and 50 mm 2 inch thick impingement section. Cylinder, along with discharge hopper shall be of segmental bolted construction. Construct receiver to ensure dropping of maximum quantity of solids from transporting air. Provide carbon steel outlet pipe and discharge gate. Receiver-separator shall have an internal baffle assembly to prevent reentrainment of ash.

2.11.12.2 Secondary Separator

Not less than [406] [508] [610] mm [16] [20] [24] inches inside diameter of not less than 8 mm 5/16 inch thick one piece construction with at least 13 mm 1/2 inch thick inlet wear section. Design receiver to minimize carryover of fly ash into the [air washer] [tertiary bag filter]. Separator shall have an internal baffle assembly to prevent reentrainment of ash once it has fallen into the collection hopper of the separator.

2.11.12.3 Dusttight Enclosure

Support primary and secondary receivers on not less than 6 mm 1/4 inch thick, dust tight, carbon steel support boxes with hinged access doors or
removable panels on each side for servicing the receiver swing gates. Provide support box with airtight roller bearings, hinged, counterweighted swing gates with removable neoprene seals. Gates may as an option, be air cylinder operated gates in lieu of the counterweighted gates.

2.11.13 Mechanical Exhausters

**************************************************************************
NOTE: When environmental restraints, availability of steam or water or economics preclude the use of steam exhausters, use a mechanical (electrical driven) exhauster with a pulse jet bag filter to produce the required system air flow.
**************************************************************************

Provide two, V-belt drive, positive displacement, blowers with electric motors and accessories with each capable of producing a vacuum of at least 41 kPa 12 inches of mercury and with air flow necessary for handling ashes through the system. One blower (exhauster) shall be used as a prime mover and the other as a standby unit.

2.11.13.1 Isolation Gates

Each exhauster shall include a manual bolt-up type gate for isolation and crossover. Gates shall include limit switches for status indication.

2.11.13.2 Accessories

Exhauster shall be complete with belt guard, air inlet silencer, air discharge snubber, support stand, expansion joint on inlet and outlet, belt and shaft guards, high temperature safety switch and vacuum relief valve.

2.11.13.3 Electric Motor

Totally enclosed, fan cooled, [_____] volts, three phase, 60 Hz as specified in the paragraph MOTORS AND DRIVES.

2.11.13.4 Noise Level

Not to exceed 85 dBA sound pressure level at 1.50 meters 5 feet above the floor and 1.50 meters 5 feet from blower in any direction.

2.11.14 Pulse Jet Self-Cleaning Bag Filter Assembly

Provide as a tertiary means of removing fine ash particles from the conveying air system. Installation of the assembly shall be on the silo roof, downstream of the two-stage cyclone type mechanical separator so as to permit a combined minimum separating efficiency of 99.5 percent (by weight), with a guaranteed outlet emission less than 0.005 grains particulate per dry standard cubic foot of exhaust air. Filter assembly shall include a main housing, bag assemblies, bag cleaning mechanism, discharge gate and control panel. Equipment shall be integrated with cyclone type separators, vacuum breakers, vacuum switches and conveying system controls as specified elsewhere. Bag filter shall be capable of operating at 25 percent above the system design vacuum. Filter housing shall be capable of withstanding a vacuum of 96 kPa 28.5 inches of mercury.
2.11.14.1 Cloth Area

Size filter on the basis of not greater than 25.40 L/s 5 acfm of air per square meter foot of cloth area. The acfm shall be calculated on the maximum system air flow.

2.11.14.2 Filter Construction

All welded construction housing or body of, ASTM A36/A36M plate with an upper clean gas plenum, bag compartment, hopper bottom, internal access platform and support structure. Plate thickness shall be a minimum of 6 mm 1/4 inch with exception of plenum tube sheet, which shall be a minimum of 13 mm 1/2 inch thick. Housing shall be cylindrical, having a minimum diameter of [_____] meters feet [_____] mm inches.

   a. Upper Gas Plenum: Dished head, with flanged inlet and discharge connections, tube sheet, venturis and blow tubes. These appurtenances shall be welded airtight. Venturis shall be fabricated from carbon steel having a minimum thickness of 16 gage. Minimum centerline spacing between venturis shall be 191 mm 7 1/2 inches. A series of blow tubes shall be employed over the venturis. Each tube shall extend through dished housing wall and be manifolded externally. Include support of external manifold.

   b. Bag Compartment: Of sufficient height to allow internal access by maintenance personnel. Base of compartment shall include metal platform supported by steel angle cross bracing. Platform shall extend over entire base area of compartment. Sidewall of compartment shall include a hinged access door with locking handle. Door shall be gasketed and opening shall be a minimum of 762 mm high by 406 mm wide 30 inches high by 16 inches wide.

   c. Hopper Bottom: Conical having a slope angle of not greater than 45 degrees with a flanged outlet.

   d. Access Platform: With [stairs] [ladder] and safety handrail for external mounting to filter housing. Mount platform at a height to allow convenient access through hinged door located on bag compartment sidewall. Platform floor area shall be not less than 1.40 square meter 15 square feet.

   e. Provide filter housing with required columns and cross bracing to support structure from silo roof to discharge directly into silo. This support shall be of sufficient height to allow convenient installation of filter discharge gate.

2.11.14.3 Discharge Gate

Air cylinder operated swing disc type. A rotary feeder type gate is not acceptable. When in the open position, gate disc shall swing out of the path of material being discharged. Both gate disc and seal shall be replaceable. Include handhole on gate housing for easy access to both disc and seat.

2.11.14.4 Bag Cleaning Mechanism

Provide venturis, blow tubes, manifold, solenoid air valves, diaphragm valves and differential pressure switch conveniently located at the filter unit. Operation of these devices shall be on a sequential basis.
(adjustable setting) to allow periodic surges of compressed air through the filter venturi sections. Compressed air requirement for bag cleaning shall not be greater than 7.08 standard L/s at 690 kPa (gage) 15 scfm at 100 psig.

2.11.14.5 Filter Bag Assemblies

Each shall include the filtering media, wire retainer and stainless steel clamping device. Filter bag shall slide over retainer and both shall be clamped to the venturi by a stainless steel common band clamp. Top portion of retainer shall have the inside dimension equal to the mating venturi to ensure a tight fit.

a. Retainers: Cage type construction, fabricated from No. 1018 rounds or equal, using minimum of 3 mm 1/8 inch diameter rounds on vertical strands and 5 mm 3/16 inch diameter rounds on horizontal strands. Coat retainer with nickel and zinc after completion of fabrication.

b. Filter Bags: Not less than 474 g per square meter 14 ounces per square yard felted material. Provide felted polyester or dacron bags when operating temperatures are below 135 degrees C 275 degrees F. Provide Nomex bags or bags of similar abrasion and temperature resistant qualities when temperatures are above 135 degrees C 275 degrees F but not greater than 218 degrees C 425 degrees F. Bags shall have an exterior finish to aid in dust release.

2.11.14.6 Control Panel

NEMA 4, wall mounted control panel to sequentially control bag cleaning and dump operations of the filter unit. Locate panel near filter unit to permit easy field adjustment of sequence timers. Panel overall dimensions shall be not less than 610 mm wide by 762 mm high by 200 mm deep 24 inches wide by 30 inches high by 8 inches deep. As a minimum, panel instrumentation shall include a dump cycle timer, pulse valve sequence timer, two high differential pressure delay relays, alarm relay, time delay relay, manual/auto selector switch, pulse valve "ON" indicating light, high differential indicating light, terminal blocks and internal wiring. Welds and scratches of panel enclosure shall be polished smooth and thoroughly cleaned before painting. Surface finish shall be free from blemishes. Paint panel exterior with manufacturer's standard enamel. Interior of panel shall be white enamel. Shop inspect panel and test prior to shipment.

2.11.14.7 Vacuum Breakers

Provide two air cylinder operated vacuum breakers. One shall be a pop-up or single ported type for installation in the air line between the secondary separator and tertiary bag filter. Second breaker shall be a three-ported type for locations in the air line between the tertiary bag filter and the exhauster. Each breaker shall use a disc type gate or equivalent to ensure full closure of the gate against its mating seat.

2.11.15 Steam Exhauster

**************************************************************************
NOTE: The steam exhauster system requires 0.32 kg os stream per second 2500 pounds of steam per hour for a 150 mm 6 inch system ( 8 to 23 Mg 9 to 25 tons per hour) and 0.44 kg of steam per second 3500 pounds of steam per hour for an 200 mm 8 inch system ( 13.60 to 31.75 Mg 15 to 35 tons per hour) and
approximately 1.89 L/s 30 gpm of water to the air washer. A steam condenser, air washer and silencer should be used when the steam exhauster is used and should not be used when a mechanical exhauster is specified.

Provide a steam jet exhauster of cast iron construction with venturi throat of the high efficiency type for producing the vacuum necessary for handling ashes through the system. Make inlet air connection on the steam jet exhauster through a special spiral fitting so that air enters the exhauster unit tangentially, avoiding direct impingement on the nozzle. Provide a unit capable of producing a vacuum of at least 40.56 kPa 12 inches of mercury column at shutoff and not requiring more than [0.32] [0.44] kg of steam per second at 690 kPa (gage) [2,500] [3,500] pounds of steam per hour at 100 psig.

2.11.15.1 Steam Condenser, Air Washer and Silencer

NOTE: The steam exhauster system requires 0.32 kg of steam per second 2500 pounds of steam per hour for a 150 mm 6 inch system ( 8 to 23 Mg 9 to 25 tons per hour) and 0.44 kg of steam per second 3500 pounds of steam per hour for an 200 mm 8 inch system (13.60 to 31.75 Mg 15 to 35 tons per hour) and approximately 1.89 L/s 30 gpm of water to the air washer. A steam condenser, air washer and silencer should be used when the steam exhauster is used and should not be used when a mechanical exhauster is specified.

Provide a double stage cyclone type steam condenser, which also extracts the remaining solids from the steam-air system. Construct steam condenser body of hard metal castings not less than 16 mm 5/8 inch thick suitable for this special service except that inlet connector shall be not less than 19 mm 3/4 inch thick. Castings shall have a Brinell hardness of not less than 250. Remaining metal used in the condenser shall be at least 6 mm 1/4 inch thick steel with the top not less than 13 mm 1/2 inch thick steel plate. Provide drain connection not less than 76 mm 3 inches and water connection not less than 38 mm 1 1/2 inches. Provide silencer as required for quiet operation.

2.11.16 Ash Storage Silo

NOTE: Use enclosure for silo roof and unloader level in climates where protection of equipment and personnel from the weather is desired.

[_____] meters feet in diameter with [_____] meters feet high walls with a live bottom and flyash storage capacity of not less than [_____] Mg tons, based on ash bulk density of 640 kg per cubic meter 40 pounds per cubic foot for volumetric sizing. Structural joints shall be dusttight and watertight. Provide columns, beams, bracing, and other structural members as required for complete erection of silo and accessories. Live storage capacity shall allow for 20 degree angle of repose from silo outlet.
Height of silo storage shall not be more than twice the diameter. Provide a minimum of one meter 3 feet of freeboard above the ash level. Design of support steel shall be approved by the ash system supplier. Design silo in accordance with the ICC UBC. Design shall take into account seismic load, wind load, snow load, equipment loads and an ash bulk density of 1120 kg per cubic meter 70 pounds per cubic foot. Ash silo support shall be free standing and shall be of sufficient height to allow gravity discharge of ash through the rotary ash conditioner to a [truck] [railroad car]. Provide access stair tower with intermediate platforms at 3.66 meters 12 feet intervals for access to ash conditioner level, silo floor level and silo roof level. Platforms from adjacent structures with stair access may be provided in lieu of the stair tower, but ladders with safety cages and access platforms must then be also provided. Provide ladder with stainless steel fall prevention device on inside of silo from manhole in top of silo to bottom of silo.[ Provide silo roof enclosure and unloader room enclosure each with single one by two meters 3 by 7 feet access door, [_____] by [_____] meters feet double door, two windows, ventilator, [heater,] insulated metal panel siding to match boiler plant walls and electrical lighting and convenience receptacles. Unloader room enclosure shall have reinforced concrete floor.]

2.11.16.1 Construction

Construct silo of steel with refractory lining or of concrete staves with steel hoops and concrete roof. Roof accessories shall include manhole, relief valve and vent filter. Bottom of silo shall be [conical, sloped a minimum of 45 degrees] [flat with a steel plate feeding hopper in bottom of silo to funnel the ash into the inlet of the rotary vane feeder]. Provide hopper with expansion joints and sufficient poke holes with cover or cap.

2.11.16.2 Concrete Stave Silo

Construct of either lightweight solid or hollow precast concrete staves with post-tensioned steel reinforcing hoops around the exterior. Mechanically measure and mix materials in concrete staves. Vibrate and shape staves under pressure and steam or air cure.

a. Wall Coating: Coat interior surface with a three-step process of a brush coat, scratch coat, and finish trowel coat of a mixture of fine sand and portland cement in accordance with silo manufacturer's recommendations. Apply each coat successively to produce a smooth interior surface. Work mixture into the formed horizontal and vertical grooves to permanently interlock the concrete staves. Brush coat the exterior surface with a double application of waterproof mixture. Mixture shall include a chemical agent for waterproofing and portland cement, sand, and water. Work coating into joints and over the steel reinforcing hoops to form a weatherproof protective coating.

b. Steel Reinforcing Hoops: Galvanized steel rods not less than 14 mm 9/16 inch in diameter with not less than 16 mm 5/8 inch rolled threads. Join hoop ends together with nuts and heavy malleable galvanized iron lugs or heavy duty galvanized steel lugs to a close tolerance for a tight fit. Electrogalvanize rods, nuts, and lugs to ensure adequate protection against corrosion. Rods shall be high quality, metallurgically sound steel with tensile strength not less than 448 MPa 65,000 pounds per square inch, yield point not less than 276 MPa 40,000 pounds per square inch, and a minimum elongation of 14 percent in 229 mm 9 inches. Reinforcing shall be sufficient to resist maximum lateral pressure and loads imposed by ash pressure within the
silo. Structurally connect together hoop rods that pass through silo outlets on inspection frames.

c. Hollow Concrete Stave Silos: Construct silo of precast concrete staves with lateral air spaces. Cast staves from a well proportioned mix of portland cement and an expanded clay light weight aggregate. Minimum compressive strength of concrete at 28 days shall be 34.50 MPa 5,000 psi. Hollow staves shall be 92 mm thick by 250 mm wide by 762 mm long 3 5/8 inches thick by 10 inches wide by 30 inches long with five lateral air cores per stave, except that shorter starter staves may be used to permit horizontal joints to be staggered.

d. Solid Concrete Stave Silos: Construct silo of solid lightweight precast concrete staves. Solid staves shall be not less than 92 mm thick and 250 mm wide by 762 mm long 3 5/8 inches thick and 10 inches wide by 30 inches long, except starter staves may be shorter. Solid staves shall be constructed from a well proportioned mix of portland cement, washed sand and gravel which is free from injurious organic impurities and contains less than 5 percent of deleterious substances. Grade aggregate from coarse to fine. Compressive strength of solid concrete staves at 28 days shall be 34.50 MPa 5,000 psi.

2.11.17 Bag Filter Vent

**************************************************************************
NOTE: Consult the manufacturer of ash handling equipment for venting requirements.
**************************************************************************

Provide pulse jet bag filter vent for silo constructed of 10 gage steel plate, fitted with rain hood. Bag material shall be sateen cotton capable of withstanding not less than 91 degrees C 195 degrees F, weighing 0.33 kg per square meter 9.75 ounces per square yard, having thread count of 4 by 2 per square mm 96 by 60 per square inch and permeability of 76 to 102 L/s per square meter at 249 Pa 15 to 20 cfm per square foot at one inch water column. Vent shall have not less than [_____] square meter feet effective cloth filtering area, with each bag having a maximum effective cloth filtering area of 0.56 square meter 6 square feet.

2.11.18 Rotary Ash Conditioner (Unloader)

Provide a complete dustless horizontal, floor mounted unloading device to discharge ashes from silo to a [truck] [railroad car]. Unloader (ash conditioner) shall include a 762 mm 30 inch diameter revolving drum which rotates about fixed spray nozzles, and shall be complete with conditioner and discharge compartments, scrapers, and other accessories as required. Unloader drum shall be constructed of steel plate not less than 10 mm 3/8 inch thick and shall be roller chain driven by a totally enclosed, fan cooled, [_____] volt, three phase, 60 Hz electric motor not less than 3.75 kW 5 hp as specified in the paragraph MOTORS AND DRIVES. Unloader shall discharge conditioned ashes to a truck through a 6 mm 1/4 inch thick steel plate chute. Unloader shall be designed to eliminate most dust in unloading ash from the ash silo. Unloaders that utilize screws as a means of mixing are not acceptable. Dustless unloader shall add water to ash, but not to the extent that there is free or surplus water running or dripping from the ash after discharge. Discharge ash shall be in a semi-fluid, loose, free flowing condition.
2.11.19 Fluidizing System

***********************************************************************
NOTE: Delete fluidizing system if not necessary.
***********************************************************************

Provide a fluidizing system on the silo floor to ensure a constant and uniform feed of ash through silo discharge outlet. System shall consist of a series of diffuser modules, a conical diffuser hood, designed to support the total weight of ash when the silo is full, and compressed air piping. Each diffuser module shall be mounted on the silo floor using sloped concrete pads. System shall operate from plant air system. Provide pressure reducing valves, safety valves, and controls for a complete system.

2.11.20 Control Panel and Controls

Provide a semi-automatic control system for the ash handling system[ as indicated].

2.11.20.1 General

Provide a centrally controlled operation, with auxiliary local operation, and a monitoring control system with graphic display for the ash conveying system. Provide local control stop-start pushbuttons and indication stations for [clinker crusher and ash hopper vertical lift door at each bottom ash hopper] [mechanical exhausters] and rotary ash conditioner. Ash handling system manufacturer shall provide measuring devices, status switches, solenoid vales, and auxiliary parts necessary to safely control and operate the system. Provide related electrical work required to operate the ash handling system.[ Provide detailed control logic diagrams from ash handling system manufacturer to the manufacturer of the digital process control and data acquisition system.]

2.11.20.2 Control Panel

Provide a [separate control panel] [subpanel mounted in the main plant control panel] of NEMA 12 construction, centrally located in the main plant control room. Panel front shall include a system graphic display as indicated. Display shall be approximately to scale and painted with an industrial acrylic enamel. Outline items with 3 mm 1/8 inch wide black lines. Lettering shall be on engraved plastic screwed to front of panel, with white letters on a black background. Provide controls for operation on [_____] volt, [_____] phase, 60 Hz ac. Panel shall be complete with an annunciator and interlocks, relays, switches, running and safety lights, and auxiliary parts necessary to safely control and operate the system. Items located in the door shall be dusttight and oil tight with push-to-test transformer type indicating lights. Control relays shall be 10 amp, 600 volt class with convertible contacts. Provide and mark terminals for connections with the exception of the neutral. Panel shall contain [_____] percent spare terminals. Wiring shall be No. 14 AWG type THHN stranded. Neutral wire shall be white and remaining wiring of 120 volts or less shall be color coded and labeled. Provide a plastic wire duct of sufficient size to provide [_____] percent cross sectional spare. Wiring shall be in accordance with requirements of NFPA 70.

a. Provide capability to perform the following functions from the ash handling system control panel[ operator interface console].

(1) System Start
(2) System Stop

(3) Auto/Manual/Index Mode of Operation Selection

(4) Selection of Bypass of any Boiler [Bottom Ash,] [Siftings,] [Economizer] Hoppers

(5) Manual Index to any Intake

(6) Selection of Ash Silo for Baghouse Ash

b. Provide sensors or contact closures for status indication on the ash handling system control panel annunciator[ operator interface console].

(1) Conveyor On

(2) Unit on (one required for each unit)

(3) Final Line Purge On/Complete

(4) Baghouse Ash to Ash Silo

c. Provide sensors such that the following items can be alarmed on the ash handling system control panel annunciator[ operator interface console].

(1) Blower Failure

(2) Blower High Temperature

(3) Bag Filter Failure

(4) Bag Filter High Differential

(5) Bag Filter Off

(6) Plugged Hopper

(7) Conveying Complete

(8) Clinker Crusher Abnormal Shutdown (1 required for each boiler)

(9) Low Conveying Air

(10) High Conveying Vacuum

d. Vacuum Transmitter: To measure conveying system vacuum. Range shall be zero to 101 kPa 30 inches mercury with 4 to 20 mA dc linear transmitter output. Display vacuum on the ash handling system control panel[ operator interface console].

2.11.20.3 Operation

a. Normally operated in the automatic mode. Automatically sequence through the automatic intakes except [clinker crusher] [bottom ash intake] for each boiler after system is started. When a unit is not in operation, selecting the "bypass mode" shall cause intakes on that unit to be skipped. For manual operation, "index" is used to select the
desired intake. As conveying system shuts down automatically, main conveyor line shall be purged for approximately one minute to remove ash remaining in it.

b. Sequence system under control of vacuum switches and timers. Maximum vacuum will be when system is conveying material. When a hopper is empty, vacuum will drop and a "no load" vacuum switch shall cause system to shift to the next intake. Prevent premature sequencing due to momentary low vacuum with a timer. When a plugged hopper occurs, vacuum will be between "no load" and normal value. Provide a timer to allow packed or arched material to break loose before alarming the condition.

c. Provide solenoid air valves for each air operated device, timers, contactors, relays and devices and equipment required for system control, measuring and operation. Identify each device with an engraved plastic identification plate [in accordance with a system graphic display] to be provided by the ash handling system supplier.

d. Bottom Ash Hopper Local Control Stations: Provide a wall mounted, NEMA [______], control station at each bottom ash hopper with front access door, lock, circuit breakers, selector switches, lights and pushbuttons.

(1) Selector Switches:

(a) Crusher: three position switch, "Reverse (momentary)-Off-Forward"

(b) Rotary Valve Intake: two position switch "Open-Close"

(c) Vertical Lift Door: position switch "Open-Intermediate-Close"

(2) Emergency "Stop" Pushbutton, for clinker crusher, with manual reset.

(3) Indicating Lights:

(a) "On-Manual"

(b) "Crusher Stalled"

[2.12 ASH HANDLING SYSTEM (MECHANICAL)]

**************************************************************************
NOTE: Designer shall select type of ash handling system most suited for each project. For plants over 4 kg per second 31,500 pounds per hour steam ultimate capacity use a pneumatic ash handling system. For plants under 4 kg per second 31,500 pounds per hour steam ultimate capacity use a mechanical system. Refer to NAVFAC Design Manual DM-3.6, Section 5, paragraph 4d for design criteria.
**************************************************************************
**************************************************************************
__________________________________________________________________________
NOTE: Choose this article, paragraphs and subparagraphs or the article, paragraphs and subparagraphs above ASH HANDLING SYSTEM (PNEUMATIC).
__________________________________________________________________________

SECTION 23 52 33.01 20  Page 109
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine the degree of sophistication of the mechanical ash handling system. Preference should be given to keeping the system as simple as possible. An example of this would be an arrangement where the plant would not require an ash silo and ash is simply removed by the operators raking the ash pits and shoveling the ash into wheeled dumpsters for removal. Mechanical collector hoppers would have ash removed by means of rotary airlock valves dumping through chutes into additional wheeled covered dumpsters. For greater ash removal rates screw conveyors could be used for removing ash from the stoker ash pits. These could convey ash to wheeled ash dumpsters or into a drag conveyor, bucket elevator, ash silo system.

Provide a complete integrated, mechanical, semi-automatic, ash handling system with chain drag conveyor, screw conveyors, bucket elevator, material intakes, rotary valves, ash doors and enclosures, silo vent filter, ash silo, rotary ash conditioner, and other equipment that may be necessary for a complete mechanical ash handling system. Provide related electrical work required to operate the ash handling system.

2.12.1 Ash Silo

The system shall receive, and convey to the ash silo, ash from the stoker fired boiler ash storage pits, [economizer hoppers,] [baghouse hoppers,] and other pollution control equipment hoppers.

2.12.2 Ash

Discharge ash into the ash storage silo in a dry condition. Arrange silo equipment for disposal of conditioned ash to trucks. Operation shall be as dustless as possible.

2.12.3 Maximum Noise Level

Noise level of operation shall not exceed 85 decibels sound pressure level 1.50 meters 5 feet from the equipment in any direction.

2.12.4 System Valving

2.12.4.1 Rotary Valves

Provide rotary valve feeders of carbon steel construction complete with drive, guard, motor mount and gaskets, carbon steel adjustable blade tips, adjustable shoe type air seal and right angle gearhead drive motor. Rotor blade tips and shoes shall have a minimum Brinell hardness of 500. Valves requiring part of the housing to form an airlock seal are not acceptable. The electric motor for the rotary valve feeders shall be totally enclosed, fan cooled, [_____] volt, [_____] phase, 60 Hz., and not less than [_____] kW hp, as specified in the paragraph MOTORS AND DRIVES.
2.12.4.2 Manual Valve Intakes for Bottom Ash

Provide in front of stoker ash pit doors, a 610 by 610 mm 24 by 24 inch cast iron grid and hopper with opening approximately sized for the conveyor. Provide intake with dusttight, removable 6 mm 1/4 inch thick checkered steel plate cover.

2.12.4.3 Silo Discharge Valve

Provide a rotary feeder for discharging bottom ash and fly ash from the ash silo. Feeders shall be of ductile iron or cast steel and shall be complete with motor, motor support, chain drive, and necessary guards. Chain shall be driven through a torque limiting clutch on the driven sprocket equipped with electric cutout switch and alarm.[ Feeder shall have spring-loaded hinged bypass plate to permit passage of clinkers.] Inlet and outlet flanges shall be standard drilled pipe flange. Rotor blades and sealing arrangement shall be manufacturer's standard for the intended service. When rotors are equipped with adjustable tips, provide a service door in body of valve for tip adjustment. Provide packing gland type shaft seals with suitable packing materials. Shaft bearings shall be outboard sealed ball bearings. Periphery seals shall be such that a complete seal is accomplished at a differential of [_____] Pa inches of water static/pressure.

2.12.5 Conveyors

2.12.5.1 Chain Drag Conveyor

Provide with endless chain for dragging coal ashes from front of boilers along a recessed trough to the inlet chute of a bucket elevator. Conveyor shall have [_____] meter feet sprocket centers, operate at speed not greater than 35 mm/sec 7 fpm, and have a capacity of not less than [_____] Mg tons per hour of 640 kg per cubic meter 40 pounds per cubic foot ash. Provide conveyor complete with continuous chain, drive, and take up terminals, gears, shafts, bearings, return rolls, hard white iron trough, ash intake gratings, floor plates, discharge chute, electric motor, reduction gear, and supports.[ Chain drag conveyor shall be designed for future length of [_____] meters feet.]

a. Head and Foot Shafts: Provide SAE-1045, steel head and foot shafts not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively, mounted in anti-friction roller bearings in pillow blocks. Foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

b. Terminal Sprockets: Gray iron chilled rim not less than [_____] mm inches in diameter with solid web and not less than eight teeth each.

c. Chain: Combination drag type of riveted construction. Design chain symmetrically so that it can be turned over after one side is worn. Chain shall be [_____] mm inches wide with a pitch not greater than 200 mm 8 inches and an ultimate strength of not less than [187] [249] kN [42,000] [56,000] pounds. Construct chain of promal, a pearlitic malleable iron, center links not less than [_____] mm inches high, and heavy [_____] mm inch thick heat treated carbon steel side bars. Steel pins shall be cold rolled steel not less than [_____] mm inch in diameter, press-fitted into sidebars, and machined flat on one side to prevent rotation. Center section shall be rugged block type forming a rigid rectangle for maximum resistance to distortion with broad wearing
shoes contoured to prevent snagging and damage to chain or trough. Barrels of center section shall be chambered to provide lubricant reservoir and still provide maximum bearing area for pins. Shape barrel with pushing surface on one side and for contact with sprocket on the other side.

d. Trough: Concrete lined with not less than [_____] mm inch thick hard white iron approximately as indicated. Trough shall be [_____] mm inches wide with hinged 6 mm 1/4 inch thick checkered steel plate covers. Covers shall be installed to be dusttight. Coordinate concrete work with conveyor manufacturer’s requirements.

e. Return Rollers: Chilled rim, single flange, enclosed-oiling type on [_____] mm inch diameter carbon steel shafts spaced at not more than 3 meters 10 feet apart.

f. Discharge Chute: Construct of not less than 10 mm 3/8 inch steel plate and slope at not less than 60 degrees.

g. Electric Motor and Drive: Totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES, in this section, direct connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear. Drive, from output shaft of reduction gear to conveyor head shaft, shall be by means of finished steel roller chain running over cut tooth sprockets complete with steel plate chain guard. Roller chain, sprockets and roller chain attachments shall conform to ASME B29.100.

2.12.5.2 Screw Conveyors

Provide each screw conveyor dusttight and furnished complete, with trough, screw, inlet and discharge spouts, discharge gates, bearings, bearing hangers, dust cover, electric motor, reduction gear,[ service platform,] and supports. Each screw conveyor shall meet the following minimum design and performance specifications when handling dry flyash of density not greater than [_____] kg per cubic meter pounds per cubic foot:

<table>
<thead>
<tr>
<th></th>
<th>CONVEYOR NO. 1</th>
<th>CONVEYOR NO. 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capacity</td>

<td>[_____] mm</td>
</tr>
<tr>
<td>Trough thickness</td>
<td>[_____] mm</td>
<td>[_____] mm</td>
</tr>
</tbody>
</table>
a. Inlet and Discharge Spouts: Arrange as indicated. Spouts shall be flanged and square with opening dimensions equal to inside diameter of trough.

b. Screw Trough: Provide dusttight screw trough with trough covers. Support trough by 6 mm 1/4 inch thick steel plate feet at not less than 3 meter 10 foot intervals. Individual trough sections shall not be greater than 3 meters 10 feet long with steel angle end flanged connections.

c. Bearings and Hangers: Provide thrust bearings and trough end dust seals for both drive and tail bearings. Thrust bearings shall be bronze in antifriction pillow blocks. Screw hanger bearings shall be babitted-type, with cast iron hangers having removable bearing caps held in place by a U-bolt. Design hangers to fit inside the conveyor trough and equip bearings for grease lubrication with grease fittings penetrating dust cover to allow bearings to be greased without removing dust cover. Hangers shall not be located at trough joints, feed, or discharge openings. Locate hangers at not less than [3.66 meter 12 foot intervals for screw diameters larger than 250 mm 10 inches] and [3 meter 10 foot intervals for screw diameters 250 mm 10 inches in diameter and smaller].

d. Conveyor Screws and Couplings: Construct conveyor screws of helicoid-type flights and connect with cold rolled steel couplings. Assemble conveyor screws so that at the hangers there is 180 degrees
rotation between flight ends of each adjacent screw section. Screw flight shall end over last discharge spout so bare pipe extends across this area to prevent material carry-over.

e. Electric Motor: Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES. Install motor at discharge end of conveyor. Motor shall be supported by a unit bracket attached to the screw conveyor trough end plate and connected to reduction gear through a V-belt drive. Reduction gear shall be shaft mounted, double reduction type mounted directly on the conveyor shaft. Provide tie rods, when required, to prevent reduction gear rotation and for adjusting belt tension.

f. Service Platforms: Conform to OSHA regulations as indicated to properly maintain and service conveyor drive unit.

2.12.6 Bucket Elevator

Provide a dusttight bucket elevator centrifugal discharge type, having approximately [_____] meters feet [_____] mm inch sprocket centers, vertical chain and bucket, operating at a speed not to exceed [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of 640 kg per cubic meter 40 pounds per cubic foot ash. Provide bucket elevator complete with continuous chain and attached buckets, sprockets, gears, shafts, bearings, casing, top hood, discharge spout, bottom boot, access doors, electric motor, reduction gear, service platform, and accessories.

2.12.6.1 Head and Foot Shafts

Not less than [_____] and [_____] mm [_____] and [_____] inches in diameter, respectively. Construct shafts of cold rolled steel and mount in antifriction roller bearings with forced lubricating type fittings. Mount foot shaft in fixed pillow blocks. Head shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.12.6.2 Terminal Sprockets

Cast iron with chilled rims. Head sprocket shall be not less than [_____] mm inches in diameter and foot sprocket not less than [_____] mm inches in diameter.

2.12.6.3 Buckets and Chain

Construct buckets of malleable iron not less than 200 mm long, 127 mm wide, and 140 mm deep 8 inches long, 5 inches wide, and 5 1/2 inches deep. Buckets shall be mounted by not less than four bolt attachments to a single strand of steel bushed chain having an ultimate strength of not less than 178 kN 40,000 pounds and pitch of 100 mm 4 inches. Bucket spacing shall not be greater than 406 mm 16 inches.

2.12.6.4 Backstop

Differential band brake type to prevent reversal of chain and buckets in case of power failure.

2.12.6.5 Elevator Casing

Not less than 298 by 991 mm 11 3/4 by 39 inch internal dimension and
constructed of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate with 50 by 50 by 6 mm 2 by 2 by 1/4 inch corner angles for full height of elevator casing. Fabricate casing in standard sections from 3 to 3.66 meters 10 to 12 feet high with 50 by 50 by 6 mm 2 by 2 by 1/4 inch angle flanges at the end of each section. Provide a hinged inspection door not less than 610 by 762 mm 24 by 30 inches in the section immediately above the boot section and where indicated. Casing and inspection doors shall be of dusttight construction with flange angles continuously welded and gasketed. No makeshift repairs or field patching to overcome leakage shall be permitted. Coat casing interior with not less than 1.60 mm 1/16 inch thick coal tar primer and enamel conforming to SSPC PS 11.01.

2.12.6.6 Head Section

Construct of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate in heavy angle frame with split, hinged, and removable top cover hood built of not less than 10 gage (3.42 mm 0.1345 inch) commercial hot rolled mild steel plate and flanged discharge throat built of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate. Design head section to support the drive machinery and head bearings. Provide access ladder and service platform conforming to applicable OSHA regulations as indicated for providing proper service and maintenance of elevator.

2.12.6.7 Boot Section

Construct of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate in heavy angle frame with curved and renewable bottom plate and renewable internal loading leg, both built of not less than 5 mm 3/16 inch commercial hot rolled mild steel plate, and flanged inlet. Mount take-up and foot terminal bearing on one side of boot in a bolted removable side panel so foot shaft and sprocket may be removed through side of the door. Bolt end panels so they are removable for cleanout and inspection.

2.12.6.8 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified in the paragraph MOTORS AND DRIVES, direct connected by means of flexible coupling to a reduction gear unit having alloy steel herringbone or helical gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear unit. Drive, from the output speed shaft of the reduction gear to the elevator head shaft, shall be by means of finished steel roller chain running over cut tooth sprockets, complete with steel plate chain guard. Roller chain, sprockets, and roller chain attachments shall conform to ASME B29.100.

2.12.6.9 Anchoring Brackets

Provide steel brackets as indicated at intervals for anchoring elevator to increase rigidity.

2.12.6.10 Discharge Chute

Construct of not less than 10 mm 3/8 inch thick steel plate and attach to ash silo.

2.12.7 Ash Storage Silo

**************************************************************************
NOTE: Use enclosures for silo roof and unloader level in climates where protection of equipment and personnel from the weather is desired.

[_____] meters feet in diameter with [_____] meters feet high walls with a live bottom and flyash storage capacity of not less than [_____] Mg tons, based on ash bulk density of 640 kg per cubic meter 40 pounds per cubic foot for volumetric sizing. Structural joints shall be dusttight and watertight. Provide columns, beams, bracing, and other structural members as required for complete erection of silo and accessories. Live storage capacity shall allow for 20 degree angle of repose from silo outlet. Height of silo storage shall not be more than twice the diameter. Provide a minimum of one meter 3 feet of freeboard above the ash level. Provide support steel design approved by the ash system supplier. Design silo in accordance with ICC UBC. Design shall take into account seismic load, wind load, snow load, equipment loads and an ash bulk density of 1120 kg per cubic meter 70 pounds per cubic foot. Ash silo support shall be free standing and of sufficient height to allow gravity discharge of ash through the rotary ash conditioner to a [truck] [railroad car]. Provide access stair tower with intermediate platforms at 3.66 meters 12 feet intervals for access to ash conditioner level, silo floor level and silo roof level. Platforms from adjacent structures with stair access may be provided in lieu of the stair tower, but ladders with safety cages and access platforms shall then be also provided. Provide ladder with stainless steel fall prevention device on inside of silo from manhole in top of silo to bottom of silo. Provide silo roof enclosure and unloader room enclosure each with single one by 2 meters 3 by 7 feet access door, [_____] by [_____] meter [_____] by [_____] feet double door, two windows, ventilator, [heater,] insulated metal panel siding to match boiler plant walls and electrical lighting and convenience receptacles. Unloader room enclosure shall have reinforced concrete floor.

2.12.7.1 Construction

Construct silo of steel with refractory lining or of concrete staves with steel hoops and concrete roof. Roof accessories shall include manhole, relief valve and vent filter. Bottom of silo shall be [conical, sloped a minimum of 45 degrees] [flat with a steel plate feeding hopper in bottom of silo to funnel the ash into the inlet of the rotary vane feeder]. Provide hopper with expansion joints and sufficient poke holes with cover or cap.

2.12.7.2 Concrete Stave Silo

Construct of either lightweight solid or hollow precast concrete staves with post-tensioned steel reinforcing hoops around the exterior. Mechanically measure and mix materials in concrete staves. Vibrate and shape staves under pressure and steam or air cure.

a. Wall Coating: Coat interior surface with a three-step process of a brush coat, scratch coat, and finish trowel coat of a mixture of fine sand and portland cement in accordance with silo manufacturer's recommendations. Apply each coat successively to produce a smooth interior surface. Work mixture into the formed horizontal and vertical grooves to permanently interlock the concrete staves. Brush coat exterior surface with a double application of waterproof mixture. Mixture shall include a chemical agent for waterproofing and portland cement, sand, and water. Work coating into joints and over steel reinforcing hoops to form a weatherproof protective coating.
b. Steel Reinforcing Hoops: Galvanized steel rods not less than **14 mm** (9/16 inch) in diameter with not less than **16 mm** (5/8 inch) rolled threads. Join hoop ends together with nuts and heavy malleable galvanized iron lugs or heavy duty galvanized steel lugs to a close tolerance for a tight fit. Electrogalvanize rods, nuts, and lugs to ensure adequate protection against corrosion. Rods shall be high quality, metallurgically sound steel with tensile strength not less than **488 MPa** (65,000 pounds per square inch), yield point not less than **276 MPa** (40,000 pounds per square inch), and a minimum elongation of 14 percent in **229 mm** (9 inches). Reinforcing shall be sufficient to resist the maximum lateral pressure and loads imposed by the ash pressure within the silo. Structurally connect together hoop rods that pass through silo outlets on inspection frames.

c. Hollow Concrete Stave Silos: Construct silo of precast concrete staves with lateral air spaces. Cast staves from a well proportioned mix of portland cement and an expanded clay light weight aggregate. Minimum compressive strength of the concrete at 28 days shall be **34.50 MPa** (5,000 psi). Hollow staves shall be **92 mm** thick by **250 mm** wide by **762 mm** long (3 5/8 inches thick by 10 inches wide by 30 inches long) with five lateral air cores per stave, except that shorter starter staves may be used to permit the horizontal joints to be staggered.

d. Solid Concrete Stave Silos: Construct silo of solid lightweight precast concrete staves. Solid staves shall be not less than **92 mm** thick by **250 mm** wide by **762 mm** long (3 5/8 inches thick and 10 inches wide by 30 inches long), except starter staves may be shorter. Solid staves shall be constructed from a well proportioned mix of portland cement, washed sand and gravel which is free from injurious organic impurities and contains less than 5 percent of deleterious substances. Grade the fine aggregate from coarse to fine. Compressive strength of the solid concrete staves at 28 days shall be **34.50 MPa** (5,000 psi).

2.12.8 Pulse Jet Bag Filter Vent

**************************************************************************
NOTE: Consult the manufacturer of ash handling equipment for venting requirements.
**************************************************************************

Provide for the silo constructed of 10 gage steel plate, fitted with rain hood. Bag material shall be sateen cotton capable of withstanding not less than 91 degrees C (195 degrees F), weighing 0.33 kg per square meter (9.75 ounces per square yard), having thread count of 4 by 2 per square mm (96 by 60 per square inch) and permeability of 76 to 102 L/s at 249 Pa one inch water column. Vent shall have not less than [_____] square meter feet effective cloth filtering area, with each bag having a maximum effective cloth filtering area of 0.56 square meter 6 square feet.

2.12.9 Rotary Ash Conditioner (Unloader)

Provide a complete dustless horizontal, floor mounted unloading device to discharge ashes from silo to a [truck] [railroad car]. Unloader (ash conditioner) shall include a **762 mm** (30 inch) diameter revolving drum which rotates about fixed spray nozzles, and be complete with conditioner and discharge compartments, scrapers, and other accessories as required. Unloader drum shall be constructed of steel plate not less than **10 mm** (3/8 inch).
inch thick and shall be roller chain driven by a totally enclosed, fan
cooled, [_____] volt, three phase, 60 Hz electric motor not less than 3.75
kW 5 hp as specified in the paragraph MOTORS AND DRIVES. Unloader shall
discharge conditioned ashes to a truck through a 6 mm 1/4 inch thick steel
plate chute. Unloader shall be designed to eliminate most dust when in
operation. Unloader may utilize screws as a means of mixing. Dustless
unloader shall add water to ash, but not to the extent that free or surplus
water is running or dripping from ash after discharge. Discharge ash shall
be in a semi-fluid, loose, free flowing condition.

2.12.10 Fluidizing System

**************************************************************************
NOTE: Delete fluidizing system if not necessary.
**************************************************************************

Provide a fluidizing system on silo floor to ensure a constant and uniform
feed of ash through the silo discharge outlet. System shall consist of a
series of diffuser modules, a conical diffuser hood, designed to support
the total weight of ash when silo is full, and compressed air piping. Each
diffuser module shall be mounted on the silo floor using sloped concrete
pads. System shall operate from the plant air system. Provide pressure
reducing valves, safety valves, and controls for a complete system.

2.12.11 Control Panel and Controls

Provide a semi-automatic control system for the ash handling system[ as
indicated]. Provide a centrally controlled operation, with auxiliary local
operation, and a monitoring control system with graphic display for the ash
conveying system. Provide local control stop-start pushbuttons and
indication stations for chain drag conveyor, screw conveyors, bucket
elevator, and rotary ash conditioner. Ash handling system manufacturer
shall provide measuring devices, status switches, solenoid valves, and
auxiliary parts necessary to safely control and operate the system.
Provide related electrical work required to operate the ash handling
system.[ Provide detailed control logic diagrams from ash handling system
manufacturer to manufacturer of the digital process control and data
acquisition system.]

2.12.11.1 Control Panel

Provide a [separate control panel] [subpanel mounted in the main plant
control panel] of NEMA 12 construction, centrally located in the main plant
control room. Panel front shall include a system graphic display as
indicated. Display shall be approximately to scale and painted with an
industrial acrylic enamel. Outline items with 3 mm 1/8 inch wide black
lines. Lettering shall be on engraved plastic screwed to front of panel,
with white letters on a black background. Provide controls for operation on
[_____] volt, [_____] phase, 60 Hz ac. Panel shall be complete with an
annunciator and interlocks, relays, switches, running and safety lights,
and auxiliary parts necessary to safely control and operate the system.
Items located in the door shall be dusttight and oil tight with
push-to-test transformer type indicating lights. Control relays shall be
10 amp, 600 volt class with convertible contacts. Provide and mark
terminals for connections with the exception of the neutral. Panel shall
contain [_____] percent spare terminals. Wiring shall be No. 14 AWG type
THHN stranded. Neutral wire shall be white and remaining wiring of 120
volts or less shall be color coded and labeled. Provide a plastic wire
duct of sufficient size to provide [_____] percent cross sectional spare.
Wiring shall be in accordance with requirements of NFPA 70.

a. Panel Devices: Control panel shall include the following indicating lights and color:

<table>
<thead>
<tr>
<th>(1) Power - ON</th>
<th>red</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2) System Run (3 required)</td>
<td></td>
</tr>
<tr>
<td>Chain drag conveyor to elevator</td>
<td>green</td>
</tr>
<tr>
<td>Screw conveyors to drag conveyor</td>

<td>red</td>
</tr>
<tr>
<td>(4) Ash Silo - LOW LEVEL</td>
<td>red</td>
</tr>
<tr>
<td>(5) Silo Vent Filter - ON</td>
<td>green</td>
</tr>
</tbody>
</table>

b. Provide momentary contact pushbuttons or selector switches for the following:

(1) System - START (3 required)
   - Bucket elevator
   - Chain drag conveyor
   - Screw conveyors

(2) System - STOP (red head)

c. Provide sensors such that the following items can be alarmed on an ash handling system control panel annunciator.

(1) Ash silo - HIGH LEVEL
(2) Bucket elevator - EMERGENCY SHUTDOWN
(3) Screw conveyor - EMERGENCY SHUTDOWN
(4) Chain drag conveyor - EMERGENCY SHUTDOWN
(5) Silo vent filter - OFF
(6) Plugged Hopper

d. Provide auxiliary devices required for the control functions above and laminated plastic name plates for devices on the panel front.

e. Provide local control panel for operating and indication of the rotary ash conditioner with the following functions:

(1) Power - ON (red)
(2) Water - ON/OFF
(3) Ash feeder - ON/OFF
(4) Rotary ash conditioner - START/STOP/JOG

(5) Normal Stop

(6) Wash out - START/STOP

(7) Emergency Stop: Provide control panel mounted at grade level for remote operation of the rotary ash conditioner with the following functions:

(a) Rotary ash conditioner - START/STOP

(b) Normal stop

(c) Emergency stop

2.13 AIR POLLUTION CONTROL EQUIPMENT

**************************************************************************

NOTE: Mechanical cyclone collectors should be used for soot blowing and as a prefilter on baghouse fabric filters or electrostatic precipitators. The fabric filter should be used where necessary to meet local, state or federal regulations or statutes for particulate emissions, when sulfur emissions are within regional limits through the burning of low sulfur "compliance coal." When coal containing more than 2 percent sulfur is burned, an electrostatic precipitator is generally more economical for control of particulates than the fabric filters, if sulfur emissions will meet regional limitations. When sulfur emissions are not within the regional limits, a scrubber with a prefilter mechanical cyclone and possibly a baghouse filter may be required to meet the emission limitations.

**************************************************************************

2.13.1 Mechanical Cyclone Collectors

As specified in Section 23 51 43.01 20 MECHANICAL CYCLONE DUST COLLECTOR OF FLUE GAS PARTICULATES.

2.13.2 Fabric Filter Baghouse

As specified in Section 23 51 43.03 20 FABRIC FILTER DUST COLLECTOR OF FLYASH PARTICULATES IN FLUE GAS.

2.13.3 Electrostatic Precipitator Filters

As specified in Section 23 51 43.01 20 MECHANICAL CYCLONE DUST COLLECTOR OF FLUE GAS PARTICULATES.

2.13.4 Scrubbers

**************************************************************************

NOTE: Insert appropriate Section number and title in blank below using format per UFC 1-300-02.

**************************************************************************
As specified in [____].

2.14 MISCELLANEOUS EQUIPMENT

2.14.1 Condensate Receiver

Provide a [horizontal] [vertical] type tank not less than [_____] meters feet [_____] mm inches in diameter by [_____] meters feet [_____] mm inches [long] [high] overall with a storage capacity of not less than [_____] liters gallons. Tank shall be constructed of welded steel plate not less than 10 mm 3/8 inch thick. Provide condensate tank with a 610 mm 24 inch diameter manway, dual gage glasses with protective guards, saddles, and other connections as indicated.

2.14.1.1 Coating

Surface blast interior of tank to bare metal and coat with a bake-on phenolic lining or corrosion resistant liner consisting of a resin and hardener suitable for immersion in water at not less than 121 degrees C 250 degrees F. Coat exterior of tank with one shop coat of manufacturer's standard primer rated for service of not less than 121 degrees C 250 degrees F.

2.14.1.2 Accessories

Provide condensate receiver with the following:

a. Connections for condensate pumped return, vent, water outlet, drain, sampling outlet, level transmitter and controls.

b. [_____] mm inch vent.

c. Reflex type water gage glasses with shutoff valves and guards.

d. One, 125 mm 5 inch dial, thermometer, 10 to 149 degrees C 50 to 300 degree F range, with lagging extension type wells, for steam and water space.

e. [_____] mm inch overflow trap.

f. One high water alarm switch with stainless steel float and trim. Circuit shall close as liquid level rises. Locate switch to close circuit when water level rises to 25 mm one inch below overflow level of receiver.

g. One low water alarm switch with stainless steel float and trim. Circuit shall close as liquid level falls. Locate switch to close circuit when water level drops to 25 percent of the storage capacity of the storage tank.

h. Install switches on a single column with valved connections to tank. Provide unions in pipe on each side of each float switch.

i. Furnish pipe, fittings, controls, specialties, bolts, gaskets, drains, valves, necessary for a complete unit and install at jobsite.

j. Provide automatic control system to control level in condensate tank by modulating discharge from condensate pumps.
2.14.2 Deaerating Heater

Provide a deaerating feedwater heater with storage tank conforming to FS W-H-2904, except as modified below and to ASME BPVC SEC VIII D1. Tank shall be ASME Code stamped. Provide stainless steel trays. No test model will be required.

a. Model A - Pressurized operation.
b. Type I - Tray-type heating and deaerating element.
c. Class 3 - 10 minute water storage capacity (minimum).
d. Grade A - Guaranteed removal from water of all dissolved oxygen in excess of 0.005 cubic centimeters (cc) per liter 0.0012 cubic inches per gallon, over a ten to one load swing.

2.14.2.1 Heater Capacity

Provide deaerating heater capable of heating and deaerating makeup water consisting of [_____] kg per second pounds per hour of softened makeup water from [_____] to [_____] degrees C F (outlet temperature).

2.14.2.2 Inlet Water Characteristics

Softened makeup water:

a. Ph: [_____]  

b. Total hardness (as CaCO3): [_____]  

2.14.2.3 Storage Tank

Horizontal design with steel supports [drilled for bolting] of approved design. Provide storage tank with not less than a 410 by 510 mm 16 by 20 inch minimum size manhole and cover and provide heater section with not less than a 300 by 460 mm 12 by 18 inch minimum size tray access handhole and door.

2.14.2.4 Vent Condensing Arrangement

Provide deaerating heater with a vent condenser which shall condense vented steam when heater is operating at full capacity with inlet water mixture at a temperature not exceeding 82 degrees C 180 degrees F. Construct vent condenser, when of the direct contact type, with stainless steel baffling.

2.14.2.5 Materials

Construct trays, tray supports, water distributors, and all other parts coming in contact with underaerated water or air laden steam of 430 stainless steel.

2.14.2.6 Accessories

Provide the deaerating heater with the following accessories:

a. Pressure Relief Valve: Sized in accordance with FS W-H-2904.
b. Thermometers: Two, 125 mm 5 inch dial thermometers, 10 to 149 degrees C 50 to 300 degrees F, with lagging extension type wells for the storage tank and heater section. Provide a thermometer similar to above but with range of minus [_____] degrees C F to plus [_____] degrees C F for the makeup water connection.

c. Lifting attachments for tray section and storage tank.

d. Water Gage Glasses: Reflex type with shutoff valve and guards.

e. Pressure Gages: One 150 mm 6 inch dial compound pressure gage for the heater section with range from [_____] kPa inches of mercury (vacuum) to [_____] kPa (gage) psig.

f. Float Controllers:
   (1) Inlet condensate controller
   (2) Makeup water controller
   (3) Overflow controller

g. Overflow Control Valve: With pneumatic controller arranged for local automatic operation.

h. Storage Tank Gage Glass: Full height, shielded, for storage tank including shutoff valve and drain cocks.

i. Makeup Water Inlet Control Valve: With pneumatic controller.

j. Switches: For low water level alarm in the storage tank, high water level alarm, condensate pump shutdown in the storage tank, and low steam pressure alarm. Install switches on a single column with connections valved and unions provided in pipe on each side of each float switch.

k. Special Tools: One set for maintenance.

l. Condensate Pump Reset: With stainless steel float and trim to reset pump shutdown switch on fall of liquid level in tank to [_____] mm inches below level of overflow level of storage tank.

m. Furnish pipe, fittings, controls, specialties, bolts, gaskets, drains, and valves, necessary for proper attachment of accessories and trimmings and install.

[ n. Oil separator

2.14.2.7 Connections

Provide necessary connections for condensate, steam, makeup water, removal of vented gases, vacuum breakers, discharge of deaerated water, and instruments and controls.

a. Provide heater connections as follows:
   (1) [_____] mm inch steam inlet
   (2) [_____] mm inch makeup water inlet
(3) [_____] mm inch condensate
(4) [_____] mm inch high pressure trap return
(5) [_____] relief valves sized as required
(6) [_____] mm inch vent
(7) [_____] mm inch for thermometer well
(8) [_____] mm inch for pressure gage
(9) Vacuum Breakers: As required
(10) [_____] mm inch heater drain
(11) [_____] mm inch spare [capped] [flanged]
(12) [_____] mm inch spare [capped] [flanged]
(13) Handholes And Manhole: With covers

b. Tank connections shall include:

(1) [_____] mm inch drain
(2) [_____] mm inch boiler feed recirculation ([_____] required)
(3) 25 mm One inch sampling
(4) 25 mm One inch chemical feed
(5) [_____] mm inch for sight glass ([_____] sets required)
(6) [_____] mm inch for high and low level alarm switches
(7) [_____] mm inch thermometer well
(8) Vacuum Breakers: As required
(9) [_____] mm inch spare (capped)
(10) [_____] mm inch spare (flanged)
(11) [_____] mm inch level transmitter and controller ([_____] sets required)
(12) Downcomer And Equalizer: As required
(13) [_____] mm inch feedwater outlet
(14) [_____] mm inch overflow outlet with internal water seal

2.14.2.8 Level Control

Provide an automatic control system to control the water level in the storage tank, by modulating valves in the makeup water lines. Output of condensate pump shall be controlled by level in condensate storage tank.
a. Controllers: Provide external cage type air operated level controllers for both the condensate and makeup water lines complete with 40 mm 1 1/2 inch screwed connections, external cage, and controller. Cage body shall be Class 125 cast iron construction. Internal components including displacer, torque tube, displacer rod, displacer rod driver and bearings shall be 316 stainless steel. Displacer shall be 356 mm 14 inches long. Controller shall be direct acting with 20 to 103 kPa (gage) 3 to 15 psig range with proportional band adjustment. Locate controller to maintain an operating level at 2/3 full point of storage tank. Provide level controller with air pressure reducing valve, filter, gages and isolating valves for float cage. Provide unions on each side of float cage.

b. Air Operated Regulating Valves: Provide air operated control valves for both the condensate and makeup water lines. Valves shall have Class 125 or Class 150 rating with iron or semi-steel bodies and 316 stainless steel internals. Provide condensate valve which fails open on loss of air and makeup water valve with an air lock mounted on valve diaphragm to hold valve in last position on loss of air. Design valves for the following conditions:

2.14.2.9 Low Pressure Steam Control

Provide an automatic control system to control steam to the deaerating heater. Maintain steam pressure in the heater by modulating a pressure reducing valve in the steam supply line. Control shall be local and remote from the control panel.

a. Controller: Adjustable proportional band, 0 to 103 kPa (gage) 15 psig brass bellows for input signal, and 20 to 103 kPa (gage) 3 to 15 psig output air pressure range, pilot controller complete with air set...
(valve, filter, drier and pressure regulator) mounted on control valve yoke.

b. Pressure Reducing Station Control Valve: Provide a [_____] mm inch air operated pressure reducing valve with proper internals to pass a flow of [_____] kg per second pounds per hour of steam. Steam at the valve inlet shall be [_____] kPa (gage) psig saturated, and outlet shall be controlled at [_____] kPa (gage) psig. Minimum steam flow shall be approximately [_____] kg per second pounds per hour. Minimum valve Cv shall be [_____] at 100 percent open. Valve shall be Class 250 or Class 300 flanged, iron or semi-steel body with stainless steel internals equal percentage flow characteristics and a full size port. Provide valve actuator including travel indicator, hand jack, valve positioner, and air supply filter-reducer set. Valve shall move to open position in case of failure.

2.14.2.10 Gage Glasses

Provide to cover the entire range of water level in the storage section. Gage glasses shall not be greater than 610 mm 24 inches center-to-center. Provide gage glasses complete with[ chain operated] ball check shutoff and drain cock valves and safety shield.

2.14.2.11 Alarms

Provide high and low water level alarms for storage tank as follows:

a. High Water Level Alarm: Switch with stainless steel float and trim. Locate switch to close circuit when water level rises to 25 mm one inch below overflow level of storage tank.

b. Low Water Level Alarm: Switch with stainless steel float and trim. Locate switch to close circuit when water level falls to [_____] meters feet [_____] mm inches above bottom of storage tank.

c. Coordinate alarms with annunciator panel as indicated.

2.14.2.12 Multiport Back Pressure Relief Valve

**************************************************************************
NOTE: Use multiport valve on systems where deaerating heater will be subject to occasional overpressuring.
**************************************************************************

Provide valve capable of relieving not less than [_____] kg per second pounds per hour of steam with not more than a [_____] kPa (gage) psig pressure rise when set at [_____] kPa (gage) psig initial operating pressure. Set pressure shall be fully adjustable by means of an external handwheel or chain operator for a range of zero to 172 kPa (gage) 25 psig. Locate on low pressure steam header manifold for the deaerating heater. Valve shall be multiport vapor cushion type rated for operating temperatures up to but not greater than 149 degrees C 300 degrees F with Class 125 cast iron body, bronze trim and carbon steel springs.

2.14.2.13 Exhaust Head

Type [I (cast iron)] [II (fabricated steel plate)] of [_____] mm inch size with [_____] mm inch diameter drain, and a capacity of [_____] kg per second
pounds per hour of steam at [_____] kPa (gage) psig.

2.14.3  Boiler Feed Pumps

**************************************************************************

NOTE: Use this paragraph for centrifugal boiler feed pumps. If regenerative type turbine pumps are required for the smaller capacities, they must be specified. Use Style 1, horizontal split case pumps in all sizes where available. Pump service requirements shall include pump capacity of a minimum of 135 percent of boiler requirements at maximum load for modulating service and 200 percent for on-off service. Discharge head must include all change in elevation, friction losses through pipe, valves and fittings and be sufficient to deliver water to the boiler at a pressure 6 percent higher than the setting of the lowest set boiler safety valve.

**************************************************************************

CID A-A-50562, Type II (boiler feed), Style 1 (horizontal split case), Class [1 single] [2 multi-] stage except as modified below. Submit pump characteristic curves superimposed on system curves at various pumping rates, 20, 40, 60, 80, 100 percent capacity.

2.14.3.1  Pump Service Requirements

a. Capacity: [_____] \( L/s \) gpm

b. Pumping temperature: [_____] degrees C \( F \)

c. Liquid pH: [_____] 

d. Discharge head: [_____] meters feet

e. Available NPSH: [_____] meters feet

f. In addition to the operating point established above, pump curve shall run through the following points:

<table>
<thead>
<tr>
<th>Capacity L/s</th>
<th>Discharge Head meters</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____] L/s</td>
<td>[_____] meters</td>

</tbody>
</table>

2.14.3.2  Construction

Bronze fitted including bronze impeller and impeller wear rings, and ASTM A48/A48M, Class 30, cast iron casing. Provide casing with suction and
discharge gages in tapped openings. Mount each pump and prime mover on a fabricated steel bed plate having a drip collection chamber with tapped drain openings. Provide lifting attachments to enable equipment to be set into its normal position and to enable pumps to be easily dismantled in place.

2.14.3.3 Drives

**************************************************************************
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the boiler feed or condensate pump motors shall be provided with variable speed control. Generally variable speed drives for pumps over 5 1/2 kW 7 1/2 hp will be cost effective.
**************************************************************************

[Variable speed] electric motors [or turbines] direct connected to respective pumps with a gear type, forged steel, flexible coupling. Provide a shaft and coupling guard.

a. Electric Motors: [Variable speed,] [open dripproof,] [totally enclosed,] [fan cooled,] [_____] volt, three phase, 60 Hz of not less than [_____] kW hp, as specified in paragraph[s] MOTORS AND DRIVES [and VARIABLE SPEED CONTROL FOR MOTORS].

b. Steam Turbines: Single stage, rated at not less than [_____] kW hp, with inlet steam pressure of [_____] kPa (gage) psig and [_____] degrees C F and normal exhaust back pressure of 34 kPa (gage) 5 psig or a maximum back pressure of 103 kPa (gage) 15 psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg per BkW per second pounds per BHP per hour. Provide a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and one hand valve.

(1) Turbine Construction: Turbine casing split on the horizontal centerline constructed of ASTM A48/A48M cast iron, with a design pressure rating of 1724 kPa (gage) at 232 degrees C 250 psig at 450 degrees F at inlet, and 379 kPa (gage) at 232 degrees C 55 psig at 450 degrees F at the outlet.

(2) Turbine Bearings and Shaft: Horizontal split, ring oiled, sleeve type, water cooled. Shaft shall be stainless steel or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

(3) Speed Governor: Variable speed oil relay, NEMA SM 23, Class D governor for speed control and pneumatic operator to maintain an adjustable, preset pump discharge header pressure by variation of turbine speed. Input to the operator shall be a 20 to 103 kPa (gage) 3 to 15 psig pneumatic signal. Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the control acquisition system.

(4) Emergency Overspeed Governor: Completely independent of the speed governor and shall operate a separate trip valve.

(5) Insulation: Turbine shall be insulated and lagged by the manufacturer as specified in Section 23 07 00 THERMAL INSULATION
FOR MECHANICAL SYSTEMS.

2.14.3.4 Minimum Flow Protection for Boiler Feed Water Pumps

a. Automatic Flow Control Valve: Provide with each pump an automatic bypass valve. Valve shall automatically program recirculation flow, detection of low flow, cycling of control valve and pressure letdown for high pressure boiler feedwater return to the feedwater heater. Bypass valve shall be cast steel with stainless steel internals, and shall have a rating of not less than 2068 kPa (gage) at 204 degrees C 300 psig at 400 degrees F. Valve shall have a line size body with a 25 mm one inch recirculation connection.

b. Boiler Feedwater Automatic Recirculation System: (Option to Automatic Valve). Provide to protect feedwater pumps at low flow conditions. System shall be capable of recirculating the minimum flow recommended by the pump manufacturer. System shall be an engineered system consisting of various functional components specified or shall be a self-contained and self-powered mechanical system. Components of the engineered system shall include a flow transmitter with orifice in feedwater line, bypass flow controller with bypass flow control valve, and a bypass pressure reducing orifice.

(1) System Bypass Flow Controller: Include detection of low flow and modulation of a control valve in a bypass line returning to a low pressure sink. Incorporate a pressure let-down feature or device to reduce pressure from boiler feedwater pump discharge pressure to that of the low pressure sink.

(2) System Bypass Control Valve: Modulate to provide minimum flow recommended by the pump manufacturer and to provide shutoff or recirculation flow when feedwater flow to boilers exceeds minimum flow required for pump protection.

2.14.3.5 Feedwater Stop and Check Valves

Provide a Class 300, flanged, cast steel feedwater stop gate valve and check valve on the feedwater outlet of each pump. Provide piping from valves to economizer inlet, and from economizer to flanged connection on boiler drum. Provide connection on pipe at economizer outlet for remote recording thermometer.

2.14.4 Condensate Pumps

**************************************************************************
NOTE: Use this paragraph for centrifugal condensate pumps. If regenerative type turbines are required for the smaller capacities, they must be specified. Use Style 1, horizontal split case pumps in all sizes where available. Pump service requirements shall include pump capacity of a minimum of 135 percent of boiler requirements at maximum load for modulating service to the deaerator and 200 percent for on-off service. Discharge head must include all change in elevation and friction loses through pipe, valves and fittings.
**************************************************************************

CID A-A-50562, Type I (general service), Style [1 (horizontally split
2.14.4.1 Pump Service Requirements

a. Capacity: [_____] L/s gpm
b. Pumping temperature range: [_____] to [_____] degrees C F
c. Liquid pH: [_____] 
d. Discharge head: [_____] meters feet
e. Available NPSH: [_____] meters feet

f. In addition to the operating point established above, pump curve shall also run through the following points:

<table>
<thead>
<tr>
<th>Capacity</th>
<th>Discharge Head</th>
</tr>
</thead>
<tbody>

2.14.4.2 Construction

Bronze impellers and impeller wear rings. [Cast iron] [ductile iron] pump casing designed for the specified conditions. Bearings shall be oil lubricated. Equip casing with tapped openings for suction and discharge gages. Provide gages in openings. Mount pump and driver on a fabricated steel bed plate having a drip collection chamber with tapped drain openings. Provide lifting attachments for installation and maintenance.

2.14.4.3 Drives

**************************************************************************
NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine if the boiler feed or condensate pump motors shall be provided with variable speed control. Generally variable speed drives for pumps over 5 1/2 kW 7 1/2 hp will be cost effective.
**************************************************************************

[Variable speed] electric motors or [turbines] direct connected to respective pumps with a gear type flexible coupling. Provide shaft and coupling guards.

a. Electric Motors: [Variable speed,] [open dripproof,] [totally enclosed,] [fan cooled,] [_____] volt, three phase, 60 Hz of not less than [_____] kW hp, as specified in paragraph[s] MOTORS AND DRIVES [and VARIABLE SPEED CONTROL FOR MOTORS].
Steam Turbines: Single stage, rated at not less than [_____] kW hp, with inlet steam pressure of [_____] kPa (gage) psig and [_____] degrees C F, normal exhaust back pressure of 34 kPa (gage) 5 psig and a maximum back pressure of 103 kPa (gage) 15 psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg per BkW per second pounds per BHP per hour. Provide a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and one hand valve.

(1) Turbine Construction: Turbine casing split on the horizontal or vertical centerline constructed of ASTM A48/A48M cast iron, with a design pressure rating of 1724 kPa (gage) at 232 degrees C 250 psig at 450 degrees F at inlet, and 379 kPa (gage) at 232 degrees C 55 psig at 450 degrees F at the outlet.

(2) Turbine Bearings Shaft: Ring oiled, anti-friction type. Shaft shall be stainless steel or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

(3) Speed Governor: Variable speed governor for speed limiting and pneumatic operator to maintain an adjustable preset level in [deaerator tank] [condensate receiver] by variation of turbine speed. Input to the operator shall be a 20 to 103 kPa (gage) 3 to 15 psig pneumatic signal and vary the turbine speed from minimum to full speed in a linear response. Maximum and minimum speed shall be adjustable. Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the controller.

(4) Emergency Overspeed Governor: Completely independent of the speed governor and shall operate a separate trip valve.

(5) Insulation: Turbine shall be insulated and lagged as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.14.5 Variable Speed Motor Control

Remotely installed cabinet housed units with solid state rectification and inverter equipment to vary frequency of electrical power to drive motors.

2.14.5.1 Housing

House controller in a [wall] [floor] mounted, NEMA [_____] enclosure finished with manufacturers standard painted finish. Provide control panel complete with fused disconnect switches, magnetic [across the line] [part winding] starters with thermal overload protection, transformer, hand-off-automatic selector switches, hand potentiometer for manual speed control, fuses and running lights.

a. Provide the manual switch within the control panel so that in the event failure of a component, motor can be put across the line at full voltage to maintain air or pump pressure. Provide a mechanical door interlock that allows panel to open only when fused disconnect is in the off position.

b. Variable Frequency Controllers: Variable frequency controllers shall use solid-state semiconductor power conversion equipment. Provide controllers as integrated and assembled products. Controllers shall be
furnished by the same manufacturer.

(1) Each controller shall be rated for a supply of [_____] volts, three phase, 60 Hz. Output shall be [_____] volts, three phase with frequency variable between zero and 60 Hz. Controllers shall be rated to operate motors continuously at their rated horsepower and frequency. Speed regulation shall be three percent or better without tachometer feedback. Electrical supply system has an available short circuit rating of [_____] amperes symmetrical.

(2) Each controller shall be capable of driving motor continuously at a lower speed no greater than 20 percent of full rated motor speed with stable operation and without overheating the motor under rated ambient conditions. Provide estimate of minimum speed at which motor can be operated continuously without overheating or problems of instability due to overhauling of load.

c. Provide controller fault protection so that a single or three phase short circuit at the controller terminals or inverter commutation failure will not result in damage to power circuit components. Provide overload protection so that motor and controller are protected against operating overloads.

d. Provide adjustable time delay undervoltage protection so that motors will continue to operate during momentary voltage fluctuation or loss of voltage. Time adjustment shall be zero to 5 seconds. Provide for orderly shutdown on undervoltage conditions exceeding the time delay interval.

e. Provide adjustable timed linear acceleration and deceleration.

f. Provide volts/Hz control to prevent motor overheating throughout the speed range.

g. Provide door interlocks to prevent opening of enclosure doors unless power is disconnected.

h. Controllers shall be self protecting and shall provide orderly shutdown for, but not limited to, the following conditions:

(1) Loss of input power
(2) Undervoltage
(3) Sustained gradual overload
(4) Fault or large instantaneous overload
(5) Overtemperature
(6) Failure of ventilating system
(7) Overvoltage
(8) Control circuit failure

Provide contacts for remote annunciation of shutdown or abnormal condition.

i. Electrical Bypass: Provide each controller with manual isolation and
bypass switching. Switch shall be manually operated with controller deenergized. Switch shall be two position with provisions for locking switch in either position.

(1) Normal Position: Bypass shall be open and controller shall be connected to supply circuit and load.

(2) Bypass Position: Bypass shall be closed and controller shall be electronically isolated from supply and load. Isolating contacts shall be located so that it is possible to verify by visual inspection that contacts are open and controller is electrically isolated. In the bypass position the motor shall be operated at constant speed and controlled from the air circuit breaker. Provide auxiliary contacts that close in the bypass position. Auxiliary contacts shall be used to activate the damper control to provide fan load control in the bypass position.

2.14.5.2 Controller Environmental Protection

a. Ventilation: Design controllers enclosed and ventilated for installation in a moderately dusty area. Provide forced filtered ventilation including fans, filters, controls and accessories required for operation. Enclosures shall be operated under positive pressure at all times. Provide filtered ventilating openings and gasketed doors to prevent infiltration of dust.

b. Heating: Provide electric heaters to prevent condensation in the enclosure and to prevent low ingoing air temperatures that exceed the equipment rating. Provide a low temperature alarm to sound when enclosure temperature falls below required minimum temperature. Provide contacts for remote annunciation of alarm condition.

2.14.5.3 Method of Control

Supply each controller from an electrically operated air circuit breaker or motor starter. Controller ventilation and heating shall be from another circuit.

a. Start Signal: Closes the electrically operated air circuit breaker or motor starter to energize the controller. Controller shall accelerate fan to operating speed. Fan speed shall be controlled from the load control signal.

b. Stop Signal: Opens electrically operated air circuit breaker or motor starter to deenergize the controller. Upon deenergization, controller control system shall revert to stop condition.

c. Boiler Feedwater Pump Speed Control System: Matches pump discharge to system demand and maintains a system header pressure controlled to the set point values. Provide Manual/Automatic control stations for master pressure and for each boiler feed pump. Provide indicators for feedwater header pressure and individual boiler feedwater pump flow.

2.14.5.4 Variable Speed Motor Controller

Conduct burn-in tests for at least 50 hours at rated conditions. If a component fails during burn-in test, replace it, and run test again on entire assembly for another 50 hours. Burn-in test shall not be complete until entire assembly has operated for 50 hours without failure.
2.14.6 Valve Actuators

[Electrically][ or ][pneumatically] operated and designed so that valve may be manually operated by removing drive pins. Actuators shall be operated by push button control. Locate one push button at a position adjacent to the valve. Locate a second push button within the boiler control room. Provide a valve position indicator utilizing indicating lights. A green light shall indicate valve is fully open and an amber light shall indicate valve is fully closed. Both lights on shall indicate when valve is partially open. [Provide torque limit controls to protect valve during opening and closing for electrically operated valves.] Actuator electric motor shall be totally enclosed, [_____] volts, [_____] phase, 60 Hz as specified in the paragraph MOTORS AND DRIVES. Provide NEMA 4 control enclosures.

2.14.7 Sump Pumps

CID A-A-50555 with automatic float switch and disconnect switch in NEMA 6 enclosure.

2.14.8 Water Softening System

**************************************************************************
NOTE: One hundred percent makeup shall be assumed in calculating the sustained softening rate.
**************************************************************************

Ion exchange resin type conforming to WQA S-100 except as modified below. [Manual] [Push button automatic] [Fully automatic] in operation with operating controls housed in a NEMA 12 enclosure having a minimum total capacity between regenerations of [_____] liters gallons of water of [_____] grams grains hardness when operated at a sustained softening rate of [_____] L/s gpm. Maximum effluent water temperature shall be [_____] degrees C F.

2.14.8.1 Softener Equipment

Including but not limited to the following:

a. Water Hardness Monitor: Provide with an alarm point at 1.0 ppm to ensure compliance for boilers rated above 3150 grams/sec 25,000 lb/hr.

b. Total Solids Monitor and Controller: Provide a continuous monitor and controller (when required) to control concentration of dissolved solids and treatment chemicals in water for boilers rated above 3150 grams/sec 25,000 lb/hr.

c. Water Meter: Provide a [_____] mm inch cold water meter on each softener unit.

d. Ion Exchange Resin: High capacity, polystyrene base, sulfonated synthetic type except that exchange capacity shall be not less than 68.70 kg per cubic meter 30 kilograins per cubic foot at a salt dosage of 240 kg per cubic meter 15 pounds per cubic foot.

e. Tank Sizing: Minimum acceptable bed depth of 762 mm 30 inches; maximum acceptable bed depth of 1829 mm 72 inches. Base reactor tank sizes on allowing a freeboard above the resin bed of not less than 75 percent of

SECTION 23 52 33.01 20 Page 134
resin bed depth, and flow rate between 1.11 and 7.13 L/s per cubic meter
0.5 and 3.2 gpm per cubic foot of resin.

2.14.8.2 Brine Storage System

Provide complete, including fiberglass storage tank, sight level gage, bulk salt delivery tube, internal distribution system, level control system, tank vent with dust collection system, top and side manholes, access ladder, and other required appurtenances.

a. Storage Tank: Filament wound fiberglass with flat bottom and domed top as recommended by the manufacturer for brine storage. Tank shall be [_____] meters feet [_____] mm inch in diameter by [_____] meters feet [_____] mm inch wall height with a nominal capacity of [_____] liters gallons and a dry salt storage capacity of [_____] Mg tons. Design water distribution system, internal piping distributors, and brine collection system so that system shall be capable of dissolving [_____] kg pounds of rock salt per second minute to produce [_____] L/s gpm of brine. System shall be able to dissolve [_____] Mg tons of salt before cleanout.

b. Accessories: Provide the following accessories:

(1) Steel holddown lugs securely bonded to tank in adequate number to properly anchor tank to concrete base;

(2) Side bottom flanged drain not less than 100 mm 4 inches in diameter;

(3) Side and top manholes not less than 559 mm 22 inches in diameter;

(4) Flanged top connections for delivery pipe and vent;

(5) Ladder for access to top manhole;

(6) Water inlet connection;

(7) Brine outlet connection;

(8) Level control system; and

(9) Sight level gage

c. Pneumatic Delivery Pipe: Not less than 100 mm 4 inches in diameter.

d. Dust Collection Vent System and Safety Relief Valve: Provide storage tank with dust collection vent system and safety relief valve.

e. Access Ladder: Of steel construction to be bolted to tank by means of FRP (fiberglass reinforced plastic) mounting lugs complete with safety cage. Platform shall connect ladder to tank for safe access to the manhole.

f. Tank Internals: Construct tank internals including water distribution piping and brine collectors of FRP or polyvinyl chloride (PVC).

g. Tank Nozzles: ASME B16.5, Class 150, FRP or PVC flanges.

h. Level Control System: Electrode holder and electrodes mounted in a
standpipe exterior to the tank. Position electrodes so that a solenoid operated water makeup valve will be opened or closed to maintain liquid level to within plus or minus 25 mm one inch of the set level. Provide tank with a high water alarm. Electrodes shall be easily removable for cleaning and constructed of materials, that will allow continual immersion in brine.

2.14.9 Chemical Feed Systems

Provide systems complete with storage tank, supporting framework, hinged cover, mixer, strainers, level indicators, proportioning pumps, relief valves and interconnecting piping for a complete chemical feed packaged unit.

2.14.9.1 Storage Tank

Capacity of 190 liters 50 gallons constructed of FRP. Provide removable, hinged cover.

2.14.9.2 Exterior Gage Glass

Protected, full height of tank complete with gage cocks.

2.14.9.3 Low Level Alarm

Provide tank with a low level switch to sound alarm and shut down pumps should level drop to preset minimum.

2.14.9.4 Dissolving Baskets

**************************************************************************
NOTE: The chemical feed solution to be used shall be inserted here.
**************************************************************************

Construct baskets of a corrosion resistant material suitable for continuous immersion in a [_____] solution.

2.14.9.5 Tank Strainer

In suction line to pump.

2.14.9.6 Supporting Steelwork

Provide to adequately support tank, mixer, and the number of proportioning pumps specified.

2.14.9.7 Agitator

Provide with mounting bracket to mount to storage tank. Agitator shaft and propeller shall be of stainless steel.

2.14.9.8 Proportioning Pumps

Provide [two] [three] [_____] [simplex] [duplex] proportioning pump[s]. Each pump shall have a minimum capacity of [_____] L/s gallons per hour at a [_____] kPa (gage) psig discharge pressure. Capacity shall be adjustable from zero to 100 percent by a convenient screw adjustment of stroke length. Provide pump with integral check valves. Electric motors shall be
[totally enclosed,] [fan cooled,] [_____] volts, [_____] phase, 60 Hz as specified in the paragraph MOTORS AND DRIVES.

2.14.9.9 Safety Relief Valve

Provide for each pump to discharge back into the tank in event of excessive line pressure.

2.14.10 All Welded Blowdown Tank

Provide in accordance with the NBBI NB-27 (supplemental to the National Board Inspection Code) latest edition published by the National Board of Boiler and Pressure Vessel Inspectors, Columbus, Ohio.

2.14.10.1 Construction

**************************************************************************
NOTE: The volume of the blowdown tank shall be calculated to be twice the volume of water removed from one boiler when the normal water level is reduced not less than 100 mm 4 inches.
**************************************************************************

Construct equipment and accessories in accordance with requirements of ASME BPVC SEC VIII D1 for a working pressure of at least the maximum allowable working pressure of the boiler but in no case shall plate thickness be less than 10 mm 3/8 inch. Provide corrosion allowance of [2.54] [_____] mm [0.1] [_____] inch. Tank dimensions shall be [_____] meters feet [_____] mm inches o.d. by [_____] meters feet [_____] mm inches long over the heads (overall). Provide tank with wear plate not less than 10 mm 3/8 inch thick and [279 by 381 mm] [457 by 508 mm] [11 by 15 inch] [18 by 20 inch] manhole.

a. Provide the following tank connections:

(1) Blowdown inlet for bottom blowdown: [20] [25] mm [3/4] [one] inch;

(2) Tangential blowdown inlet: [_____] mm inch;

(3) Steam vent, flanged: [_____] mm inch;

(4) Discharge water outlet, flanged: [_____] mm inch with internal water seal and 20 mm 3/4 inch siphon breaker;

(5) Drain: 50 mm 2 inch;

(6) Thermometer connection: 20 mm 3/4 inch;

(7) Pressure gage connection: 6 mm 1/4 inch;

(8) Cold water inlet: [_____] mm inch with temperature regulating valve and backflow preventer; and

(9) Two gage glass connections: 15 mm 1/2 inch.

b. Angle Supports and Coating: Provide tank with steel angle support legs extending [_____] meters feet below bottom of tank. Coat tank with one coat of manufacturer's standard high temperature primer.
2.14.10.2 Accessories

a. Gage Glass: 300 mm 12 inch reflex type with shutoff valves and guard.
b. Thermometer: Bi-metal dial type with separable socket, 125 mm 5 inch dial, 10 to 149 degrees C 50 to 300 degrees F range.
c. Pressure Gage: Zero to 172 kPa (gage) 25 psig range.
d. Internal Baffles and Pipes: As detailed.

2.14.10.3 Controls

Provide a self operating regulator to control the flow of cooling water to the tank. Regulator shall include a 20 mm 3/4 inch screwed bronze body with stainless steel trim, reverse acting actuator (for cooling), capillary tubing and a union connection bulb with a stainless steel well. Control setting shall be 60 degrees C 140 degrees F with a minimum Cv of [_____].

2.14.11 Continuous Blowdown System

Provide a complete automatic continuous boiler blowdown system which shall include a controller/programmer unit and flow assembly for each boiler, plus a continuous blowoff heat exchanger, flash tank and boiler water sample cooler.

2.14.11.1 Automatic Blowdown Controller

Intermittent type boiler blowdown system rated for not less than 1724 kPa (gage) 250 psig steam pressure.

a. Flow Assembly: Include a 25 mm one inch ball valve with 316 stainless steel ball and stem and stainless steel electrode assembly.
b. Controller/Programmer: Include a conductivity meter with zero to 6000 microhms range, valve open/closed indicators and manual/auto control switch. Cycle interval and sample duration shall both be adjustable over a wide range. Mount units at the operating floor near the boiler front.
c. Accessories and Connections:
   (1) Continuous Blowdown Connection: At each boiler, provide a gate valve and extend piping to header at flash tank.
   (2) Header Connections: Provide with a tee with valved sampling connection. Provide a 20 mm 3/4 inch, three globe valve bypass around each flow assembly.
   (3) Common Header: Provide from valved outlet connections on flow assembly units to connection on flash tank.

2.14.11.2 Flash Tank

Designed for [_____] kPa (gage) psig and constructed in accordance with ASME BPVC SEC VIII D1. Tank shall be [_____] mm inches in diameter by [_____] mm inches long including heads and shall be ASME Code stamped.

a. Provide tank with blowdown inlet, steam outlet, gage glass, float
operated outlet valve, relief valve, and inspection openings. Tank shall have steel angle legs with plate feet for bolting to floor. Legs shall be of sufficient length so that bottom of lower head of tank will be not less than 457 mm 18 inches above floor.

b. Automatic Control System: Control level in the flash tank, by modulating a valve in the water outlet line.

(1) Level Controller: External cage type air operated level controller, complete with 40 mm 1 1/2 inch screwed connection, 350 mm 14 inch stainless steel float and Class 125 cast iron body. Controller shall be direct acting with 20 to 103 kPa (gage) 3 to 15 psig range with proportional band. Locate controller to maintain an operating level at center line of storage tank. Provide level controller with air pressure reducing valve, filter, gages and isolating valves for float cage. Provide unions on each side of float cage.

(2) Outlet Water Valve: [_____] mm inch air operated control valve with a capacity to pass [_____] L/s gpm at a pressure drop of [_____] kPa (gage) psig. Cv shall not be less than [_____] at 100 percent open. Valve shall be Class [______], flanged, iron or semi-steel body with stainless steel internals. Valve shall have equal percentage flow characteristics with a full size port. Provide an air lock mounted on valve diaphragm and piped to hold valve in last position on air failure.

2.14.11.3 Sample Cooler

Water cooled shell and tube type with valves and accessories required to safely withdraw a water sample from the boiler drum. Provide drain under sampling valve terminating with a 20 mm 3/4 inch splash proof funnel, 229 mm 9 inches below outlet of valve.

2.14.11.4 Heat Exchanger

Provide an ASME code stamped continuous blowoff heat exchanger designed and constructed in accordance with ASME BPVC SEC VIII D1, to transfer heat from the continuous blowoff water leaving continuous blowoff flash tank to treated makeup water entering the feedwater heater. Heat exchanger shall be a bare tube, helical coiled bundle, installed in a one piece casing with removable front plate. Bundle shall be removable. Tube diameter shall be not less than 20 mm 3/4 inch. Tubes shall be ASTM B111/B111M copper alloy with cast iron shell. Design tube side for not less than [_____] kPa (gage) psig pressure at [_____] degrees C F. Design shell side for not less than [_____] kPa (gage) psig pressure at [_____] degrees C F.

2.15 PIPING

Piping work shall include the provision of piping systems, including valving and specialty items, for steam plant and related external auxiliary equipment. Piping shall be in accordance with ASME B31.1 except as modified below or indicated otherwise.

2.15.1 Expansion

Compute expansion of pipe with operating temperatures above minus 19 degrees C zero degrees F with minus 19 degrees C zero degrees F in lieu of 21 degrees C 70 degrees F specified in ASME B31.1.
2.15.2 Steam Heating and Distribution and Hot Water

Requirements of ASME B31.1 apply to building steam heating and steam distribution piping designed for 103 kPa (gage) 15 psig or lower and hot water heating systems 207 kPa (gage) 30 psig or lower.

2.15.3 Materials

Suitable for the maximum pressure at the maximum temperature at which equipment must operate.

2.15.3.1 Pipe Materials

a. Steel Pipe:

1. Steam Pipe, Boiler Feedwater Pipe, Relief Pipe and Steam Tracer Pipe: Black, ASTM A53/A53M or ASTM A106/A106M seamless steel pipe, Grade A or B. Wall thickness not less than Schedule 40. Steam tracer pipe, with steam up to 103 kPa (gage) 15 psig, may be ASTM B88M ASTM B88, Type K copper tubing.

2. Condensate Pipe and Boiler Blowdown Pipe: Black, welded or seamless ASTM A53/A53M or ASTM A106/A106M, steel pipe, Grade A or B. Wall thickness not less than extra strong (XS or Schedule 80).

3. Chemical Feed Pipe: ASTM A312/A312M austenitic stainless steel.

4. Fuel Oil Pipe: ASTM A53/A53M or ASTM A106/A106M, seamless black steel pipe, Grade A or B.

5. Treated Water, Hot Water Heating, High Temperature Water, Drains (Other Than Sanitary), and Overflow Pipe: ASTM A53/A53M or ASTM A106/A106M, Grade A or B.

6. Gas Pipe and Compressed Air Pipe: ASTM A53/A53M or ASTM A106/A106M, Grade A or B.

b. Copper Tubing:

1. Instrument Air Pipe: ASTM B88M ASTM B88hard copper tubing, Type K or L; except in a corrosive atmosphere or outside pipe shall be copper tubing, Type K or L, with ASTM D1047 PVC jacketing.

2. Steam Tracer Pipe: Contractor may provide ASTM B88M ASTM B88, Type K, copper tubing for steam up 103 kPa (gage) 15 psig.

3. Potable Water, Sanitary Drains and Storm Drains: As specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE unless otherwise specified. Chlorinated polyvinyl chloride (CPVC) and other plastic tubing and fittings shall not be used in the steam heating plant.

2.15.3.2 Fittings

a. Fittings for Steel Pipe:

1. Sizes 6 to 50 mm 1/8 to 2 inches: ASME B16.3 malleable iron, screwed end fittings, for working pressures not greater than 2068
kPa (gage) 300 psig at temperatures not greater than 232 degrees C 450 degrees F or ASME B16.11 forged steel.

(2) Sizes 6 to 50 mm 1/8 to 2 inches: ASME B16.11 steel, socket welded end fittings.

(3) Sizes 6 to 65 mm 1/8 to 2 1/2 inches: ASME B16.9 steel, butt welding fittings.

(4) Sizes 65 to 600 mm 2 1/2 to 24 inches: ASME B16.5 forged steel, flanged fittings.

b. Welded Outlets and Welding Saddles: Make branch connections of 45 and 90 degrees either with ASME B16.9 forged steel welded outlet fittings or welding saddles. Welding outlets and saddles shall not be smaller than two pipe sizes less than main pipe sizes.

c. Fittings For Copper Tubing: ASME B16.18 cast bronze solder joint or ASME B16.22 wrought copper solder joint. For instrument air, fittings may be ASME B16.26 compression joint type.

d. Unions:

(2) Unions For Copper Tubing: ASME B16.22. For instrument air, unions may be compression joint type.

2.15.3.3 Flanges

ASME B16.5, forged steel, welding type. Remove raised faces on flanges when used with flanges having a flat face. Unless specified otherwise, pressure and temperature limitations shall be as specified in ASME B16.5 for the proper class and service, and type face specified.

2.15.3.4 Valves

a. Valves for maximum working pressure of 1034 kPa (gage) 150 psig saturated steam or 1550 kPa (gage) 225 psig W.O.G. (Water, Oil, Gas) at 93 degrees C 200 degrees F (non-shock service). For working pressures not exceeding 862 kPa (gage) 125 psig saturated steam or 1379 kPa (gage) 200 psig water at 93 degrees C 200 degrees F non shock service, Class 125 may be used in lieu of Class 150 or Class 250.

(1) Valve Sizes 50 mm 2 Inches and Smaller:

(a) Non Throttling Valves: Gate valves, bronze, wedge disc, rising stem, Class 150, MSS SP-80 or ball valves, bronze, double stem seals, stainless steel ball and shaft, tight shutoff.

(b) Globe Valves and Angle Valves: Bronze, Class 150, MSS SP-80.

(c) Check Valves: Bronze, Type [IV, swing check] [III, lift check], Class 150, MSS SP-80.

(2) Valve sizes 65 mm 2 1/2 inches and larger.

(a) Gate Valves: Flanged, cast iron, Class 250, MSS SP-70 or
steel, Class 150, ASME B16.34. Valves shall have wedge disc, outside screw and yoke (OS&Y), rising stem; valves 200 mm 8 inches and larger shall have globe valved bypass.

(b) Globe Valves and Angle Valves: Flanged, cast iron, Class 250, MSS SP-85 or steel, Class 150, ASME B16.34.

(c) Check Valves: Flanged, cast iron, Class 250 or steel, Class 150, Type [____], [lift] [swing] check, style [____], ASME B16.34.

b. Valves for maximum working pressure of 1724 kPa (gage) 250 psig steam at a maximum temperature of 232 degrees C 450 degrees F or 3474 kPa (gage) 500 psig W.O.G. at 93 degrees C 200 degrees F (non-shock).

(1) Valve sizes 65 mm 2 1/2 inches and larger:

(a) Gate Valves: Flanged or butt welded, cast iron, Class 250, MSS SP-70 (Maximum size 300 mm 12 inches) or steel, Class 300, ASME B16.34. Valves shall have wedge disc, OS&Y, rising stem; each valve 200 mm 8 inches and larger shall have globe valved bypass.

(b) Gate Valves, Globe Valves and Angle Valves: Flanged or butt welded, cast iron, Class 250, MSS SP-85 or steel, Class 300, ASME B16.34.

(c) Check Valves: Flanged or butt welded, iron body, Class 250 or steel, Class 300, Type [____] [lift] [swing] check, style [____], ASME B16.34.

c. Valves for maximum working pressure of 2068 kPa (gage) 300 psig steam at a maximum temperature of 454 degrees C 850 degrees F or a maximum W.O.G. pressure of 4653 kPa (gage) at 149 degrees C 300 degrees F (non shock).

(1) Valve sizes 65 mm 2 1/2 inches and larger:

(a) Gate Valves, Globe Valves, and Angle Valves: Flanged or butt welded, ASME B16.34, steel, Class 300, rising stem, OS&Y. Gate valves 200 mm 8 inches and larger shall have globe valved bypass.

(b) Check Valves: Flanged or butt welded, steel, Class 300, Type [____], [lift] [swing] check, style [____], ASME B16.34.

d. Ball Valves: ASME B16.5 and API Std 607 double stem seal type for bubble tight shutoff. Seats and seals shall be TFE material. Ball and shaft shall be stainless steel. Provide mechanical stops to prevent cycling valve in wrong direction and self-aligning stem seal.

e. Valve Accessories: Valve operating mechanisms include chain wheels, gear operators, floor stands, electric motors, air motors and cylinder-type actuating devices. Provide accessories as follows and as indicated.

(1) Power Operators: [Electric] [Pneumatic]. Power operated valves shall open and close at rates no slower than 254 mm 10 inches per minute for gate valves and 100 mm 4 inches per minute for globe and angle valves. Valves shall open fully or close tightly without requiring further attention when actuating control is
moved to the open or closed position. A predetermined thrust exerted on the stem during operation resulting from an obstruction in the valve shall cause motor to automatically stop. Power operators shall be complete with gearing and controls necessary for size of valve being provided. Power operators shall be designed to operate on the [electric] [compressed air] power supply indicated. Provide power operators with remote position indicators on the following valves: soot blowers, [____], [____].

(2) Floor Stands and Extension Stems: Floor stands shall be cast iron or steel, constructed for bolting to floor and shall include an extension stem, an operating handwheel and a position indicator for non-rising stems. Floor stand shall be not less than 762 mm [30 inches] high. Handwheel shall identify rotation direction for closing valve and shall be of such diameter as to permit operation of valve with a force of not more than 18 kg [40 pounds]. Extension stems shall be corrosion resisting steel designed for rising and non-rising stems, as applicable, and for connection to valve stem by a sleeve coupling or universal joint. Provide in length required to connect valve stem and [handwheel] [operating mechanism] and of sufficient cross section to transfer torque required to operate valve. Provide floor stands and valve extensions on floors and platforms for the following valves: deaerator drain valves, [____] [____].

(3) Provide motorized actuators or chain wheels with chain and guides on valves with handwheel centerline higher than 2 meters [7 feet] above floor or platform except where specified otherwise. Chainwheel operator shall be fabricated of cast iron or steel and shall include a wheel, endless chain and a guide to keep the chain on the wheel. Provide galvanized steel endless chain extending from valve to within one meter [3 feet] of floor or platform. Provide impact chain wheels on steam headers and other locations where the valve has a tendency to stick. When a valve is motorized, provide hand operation for emergency.

(4) Provide gear operators on ball valves larger than 80 mm [3 inches] and on gate valves 200 mm [8 inches] and larger.

f. Steam Pressure Regulating Valves: CID A-A-50558, minimum of Class [125] [150] [250] [300], except as specified otherwise. [Cast iron], [cast steel] valve body with valve seats and disc of replaceable heat treated stainless steel. Valves shall be single seated, shall seat tight under dead end conditions, and shall go to the closed position in the event of pressure failure of the operating medium. Valves shall be spring loaded diaphragm operated type, except valves exposed to ambient temperature of less than 2 degrees C [35 degrees F] or exposed to the weather shall be piston operated type. Capacity of valves shall be not less than that indicated. Pilot valves shall have strainer at inlet from external feeder piping:

(1) Spring Loaded Diaphragm Operated Valves: Fabricate main spring of stainless steel, and it shall not be in the path of steam flow through the valve. Control valve by pilot valve through external feeder piping.

(2) Piston Operated Valves: Control valve by integral pilot valve through external feeder piping.
g. Safety Relief Valves: ASME BPVC SEC I, with Class [150] [300] inlet flange, with test lever, designed for the intended service.

2.15.3.5 Bolts and Nuts

a. Bolts: ASTM A193/A193M, Grade B8. Lengths of bolts shall be such that not less than two full threads will extend beyond nut with bolts tightened to the required tensions and washers seated.

2.15.3.6 Gaskets

ASME B31.1 and as specified below, except provide spiral wound metal covered non-asbestos gaskets in lieu of compressed sheet non-asbestos. Gaskets shall be as thin as the finish of surfaces will permit. Do not use paper, vegetable fiber, rubber, or rubber inserted gaskets for temperatures greater than 121 degrees C 250 degrees F. Provide metal or metal jacketed non-asbestos gaskets with small male and female and small tongue-and-groove flanges and flanged fittings; they may be used with steel flanges with lapped, large male and female, large tongue-and-groove, and raised facings. Provide fullface gaskets with flat-faced flanges. Raised face cast iron flanges, lapped steel flanges, and raised faced steel flanges shall have ring gaskets with an outside diameter extending to inside of bolt holes. Widths of gaskets for small male and female and for tongue-and-groove joints shall be equal to widths of male face and tongue. Gaskets shall have an inside diameter equal to or larger than port opening. Dimensions for nonmetallic gaskets shall be in accordance with ASME B16.21. Materials for flanged gaskets shall be as listed below for service specified:

a. Steam, Boiler Blowdown, Exhaust Steam: Spiral wound metal composition or copper

b. Boiler Feed Water: Metal jacketed non-asbestos, copper or monel

c. Hot Water, (above 38 degrees C 100 degrees F): Spiral wound metal non-asbestos

d. Cold Water: Red rubber or neoprene rubber

e. Heavy Fuel Oil (No. 6): Spiral wound metal non-asbestos, soft steel, or monel

f. Diesel Fuel (No. 2): ASME B16.21 metallic

g. Compressed Air: Spiral wound metal non-asbestos

2.15.3.7 Expansion Joints

a. Slip Tube Expansion Joints: ASTM F1007, single or double slip tube as indicated, designed for [1034] [2068] kPa (gage) [150] [300] psig saturated steam working pressure. Expansion joints shall be of the type which permits injection of semi plastic type packing while joint is in service under full line pressure. Slip tube shall be of chromium plated, wrought steel construction, guided by internal and external guides integral with joint body. Fit slip tube ends with forged steel pipe flanges or bevel for welding into pipe line where indicated. Deliver joints complete with packing and ready for installation.
b. Ball Expansion Joints: Capable of 360 degrees rotation plus 15 degrees angular flex movement. Ball joints shall have steel bodies and polished steel balls. Provide end connections to suit class of piping hereinbefore specified. Seals shall be of pressure molded composition designed for the working pressure. Design joints for [1034] [2068] kPa (gage) [150] [300] psig saturated steam working pressure. Cold set joints as necessary to compensate for temperature at time of installation. Do not use ball joints on superheated steam or on joints subject to frequent flexure. Ball joints shall be installed in strict accordance with recommendations of the manufacturer.

c. Bellows Expansion Joints: ASTM F1120 flexible guided type with stainless steel expansion element, internal sleeves and external covers. Joints shall be designed for a working pressure of [_____] kPa (gage) psig and a temperature of [_____] degrees C F.

2.15.3.8 Pipe Hangers and Supports

MSS SP-58 and MSS SP-69, Type [_____] or Type [_____] of the adjustable type, except as specified or indicated otherwise. Suspended steam and condensate piping shall have pipe hangers Type [_____] with insulation protection saddles Type [______]. Provide insulated piping, except steam and condensate piping, with insulation protection shields Type 40. Provide bronze or copper plated collars on uninsulated copper piping. Support rods shall be steel. Rods, hangers and supports shall be zinc plated, except for uninsulated copper piping which shall be copper plated; cast iron rollers, bases and saddles may be painted with two coats of heat resisting aluminum paint in lieu of zinc plating. Axles for cast iron rollers shall be stainless steel. Size hanger rods with a 150 percent safety factor for a seismic design.

2.15.3.9 Instrumentation

a. Pressure and Vacuum Gages: Conform to applicable requirements of ASME B40.100.

b. Indicating Thermometers: Liquid-in-glass or MIL-T-19646 dial type. Thermometer shall include a separable immersion well.

2.15.3.10 Miscellaneous Pipeline Components

a. Cold and Hot Water Meters: CID A-A-59224 for maximum flow of [_____] L/s at 38 degrees C gpm at 100 degrees F and reduced flow of up to [_____] L/s at 121 degrees C gpm at 250 degrees F.

b. Air Traps: Float controlled valves arranged to close properly when water enters traps. Air traps shall conform to requirements for float operated steam traps (non-thermostatic), CID A-A-60001, except that valve mechanism shall be inverted so as to be closed, not opened, by rising water.

c. Steam Traps: CID A-A-60001. Inverted bucket high pressure steam traps designed for use at [_____] kPa (gage) psig at [_____] degrees C F. Low pressure steam traps shall be float and thermostatic type for pressures up to 103 kPa (gage) 15 psig. Provide traps with separate strainers unless specified otherwise.

d. Strainers: FS WW-S-2739, Style Y for Class [125] [250] with blow off
outlet. Construct strainers for Class 300 of cast carbon steel in accordance with ASME B16.5 for minimum of 2068 kPa (gage) 300 psig saturated steam pressure. Provide blow off outlet with pipe nipple and gate valve.

2.15.3.11 Backflow Preventers

Reduced pressure principle type conforming to applicable requirements of [AWWA C510 and AWWA C511] [Section 22 00 00 PLUMBING, GENERAL PURPOSE].

2.15.3.12 Insulation

Materials and application shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.15.3.13 Pipe Sleeves

a. Floor Slabs, Roof Slabs, and Outside Walls Above and Below Grade: Galvanized steel pipe having an inside diameter at least 15 mm 1/2 inch larger than outside diameter of pipe passing through it. Provide sufficient sleeve length to extend completely through floors, roofs, and walls, so that sleeve ends are flush with finished surfaces except that ends of sleeves for floor slabs shall extend 13 mm 1/2 inch above finished floor surface. Sleeves located in waterproofed construction shall include flange and clamping ring.

b. Partitions: Galvanized sheet steel, 26 gage or heavier, of sufficient length to completely extend through partition thickness with sleeve ends flush with partition finished surface.

2.15.3.14 Piping Identification

Conform to MIL-STD-101 and place in clearly visible locations; except paint piping in the boiler room the primary color of the color code. Provide labels and tapes conforming to ASME A13.1 in lieu of band painting or stenciling. Labels shall be outdoor grade acrylic plastic. Markings on labels shall indicate direction of flow, flowing media, and media design pressure and temperature. Spacing of identification marking shall not exceed 3 meters 10 feet. Provide two copies of complete color and stencil codes used. Frame codes under glass and install where directed.

2.16 FIRE PROTECTION SYSTEM

Provide fuel oil room with a wet sprinkler system as specified in Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION.

2.17 MARKING

Identify equipment, valves, switches, motor controllers, and controls or indicating elements by printed, stamped or manufactured identification plates or tags of rigid plastic or non-ferrous material. Lettering for identification plates or tags shall be not less than 5 mm 3/16 inch high. Nomenclature and identification symbols used on the identification plates or tags shall correspond to those used in maintenance manuals, operating instructions, and schematic diagrams. Rigidly affix identification plates or tags to the equipment or devices without impairing functions or, when this is not possible, attach using a non-ferrous wire or chain. In addition to identification plate or tag, each major component of equipment shall have a nameplate listing manufacturer's name, model number, and when
applicable, electrical rating and other information required by pertinent standards or codes.

2.18 TOOLS AND TESTING EQUIPMENT

Provide special tools and wrenches required for installation, maintenance, and operation of equipment. Testing equipment to be provided shall include necessary equipment to perform routine tests:

a. On lubricating oil for acidity (pH-potentiometer), viscosity (saybolt test), and dirt (gravimetric).

b. On softened water for hardness (soap test or colorimetric test), and boiler blowdown water for pH (colorimetric) and conductivity (potentiometer).

c. For water (distillation) and sediment (gravimetric) in fuel oil.

2.19 WELDING MATERIALS

Comply with ASME BPVC SEC II-C. Welding equipment, electrodes, welding wire, and fluxes shall be capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

2.20 MOTORS AND DRIVES

Alternating current electric motors shall meet requirements of NEMA MG 1. Motors shall be designed for continuous operation at rated load under usual service conditions as defined by NEMA. Unless specifically noted otherwise, motors less than 3/8 kW 1/2 hp shall be 115 volt, 60 Hz, single phase, capacitor-start, or permanent split capacitor, with Class B insulation for 40 degrees C 104 degrees F ambient. Unless specifically noted otherwise, motors 3/8 kW 1/2 hp and larger shall be 460 volt, 60 Hz, three phase, Design B, squirrel cage induction with a minimum insulation of Class F for 40 degrees C 104 degrees F ambient. Size motors to meet power requirements of driven unit at design conditions, including drive and coupling losses which are incurred, without loading motor beyond its nameplate horsepower rating. Minimum service factor for open drip-proof motors shall be 1.15 and for totally enclosed, fan cooled motors 1.0. Motor shall be quiet operating. Bearings shall be heavy duty, grease lubricated, anti-friction, single shielded, regreasable type and shall have approved lubricating fittings extended to an easily accessible location for field servicing. Provide sole plates for motors installed on concrete pads. Motor shall have copper windings.

2.20.1 Motors

Motors used to drive equipment specified under "Coal Handling Equipment" shall be designed to operate in Class II, Division II, Group F atmosphere.

2.20.2 SOURCE QUALITY CONTROL

2.20.3 Instrument Air Compressor Package

Factory test air compressor package at full load for not less than 2 hours. Check capacity, smoothness of operation, alternation of units, and proper operation of air unloaders during test.
PART 3   EXECUTION

3.1   INSTALLATION

Install materials and equipment as indicated and in accordance with manufacturer's recommendations.

3.1.1   Boiler and Equipment Installation

Boiler and equipment installation shall be strictly in accordance with this specification, and installation instructions of the manufacturers. Grout equipment mounted on concrete foundations before installing piping. Install piping in such a manner as not to place a strain on equipment. Do not bolt flanged joints tight unless they match adequately. Expansion bends shall be adequately extended before installation. Grade, anchor, guide and support piping, without low pockets.

3.1.1.1   Boiler and Equipment Foundations

Of sufficient size and weight, and proper design to preclude shifting of equipment under operating conditions, and under abnormal conditions which could be imposed upon equipment. Design boiler foundation to accommodate and support stoker and incorporate stoker ash pits. Limit equipment vibration to within acceptable limits, and isolate. Foundations shall be adequate for soil conditions of the site and shall meet requirements of the equipment manufacturer. Trowel exposed foundation surfaces smooth except properly roughen surfaces to receive grout.

3.1.1.2   Installing Stoker Ash Pit Firebrick

Lay up in air-setting mortar. Dip each brick in mortar, rub, place into its final position, and then tap with a wooden mallet until it touches adjacent bricks. Mortar thick enough to lay with a trowel will not be permitted. Maximum mortar joint thickness shall not exceed 3 mm 1/8 inch and average joint thickness shall not exceed 1.60 mm 1/16 inch.

3.1.1.3   Forced and Induced Draft Fans

Set, shim level, anchor and grout each fan assembly into place prior to setting driver. Properly shim driver on base plate using steel shim stock. Shims shall be full size of feet and shall have slotted hole for installation. After drive has been properly aligned and shimmed, by an approved millwright, millwright shall drill and ream foot and base plate and install taper pins with nut on top for pullout removal. One front foot and diagonally opposite rear foot shall be pinned to base plate. Equipment shall be adequately bolted in place in an approved manner. Level and grout fan and bearing pedestal sole plates in place.

3.1.1.4   Stack

Install level and plumb. Erected stack shall be no more than 25 mm one inch out of plumb per 15 meters 50 feet. Remove roughness, marks, and lifting lugs, from stack and grind surfaces smooth and flush with surrounding surfaces.

3.1.1.5   Horizontal Fuel Oil Tanks (Below Ground)

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph
**************************************************************************

SECTION 23 52 33.01 20  Page 148
below, HORIZONTAL FUEL OIL TANKS (ABOVE GROUND), or the following subparagraph VERTICAL FUEL OIL TANK.

Provide concrete ballast slabs for tanks and concrete protective ground level slabs for FPR tanks. Ballast slabs shall be full length and width of tanks and protective slabs shall extend 610 mm 2 feet beyond tanks. Concrete work shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

a. Install and backfill fiberglass reinforced tanks as recommended by the manufacturer; backfill adjacent to tanks shall be pea gravel unless otherwise recommended by the manufacturer. Backfill for steel tanks shall be sand.

b. Set steel tanks on a bed of sand not less than 152 mm 6 inches deep over the concrete slab and strap in place with stainless steel hold-down straps with stainless steel turnbuckles. Set FRP tanks on a bed of pea gravel not less than 305 mm 12 inches thick and pre-shape for tank contours for FRP tanks. Fabricate straps for FRP tanks from FRP resins reinforced with stainless steel to prevent breaking of straps and floating of empty tanks.

c. Slope tank toward sump not less than 25 mm one inch in each 1 1/2 meters 5 feet.

][3.1.1.6 Horizontal Fuel Oil Tanks (Above Ground)

Continuously support steel tank saddles along the full length of the base and level and grout to ensure full bearing.

][3.1.1.7 Vertical Fuel Oil Tank

Provide [sand, crushed stone or fine gravel cushion] [concrete base].

a. Sand, Crushed Stone or Fine Gravel Cushion: Cover area beneath tank with a fuel resistant plastic membrane with a thickness of not less than 0.51 mm 20 mils. Carefully fuse or cement plastic membrane seams. Lay plastic over a thoroughly compacted select subgrade free from rocks that could puncture the plastic. Over plastic, provide a bed of sand, crushed stone or fine gravel not less than 152 mm 6 inches thick. Stabilize bed with an approved material and shape to tank bottom. Slope bed down to center sump approximately 152 mm 6 inches for each 3 meters 10 feet of tank radius. When in place, tank shell shall be plumb.

b. Concrete base shall be as indicated and in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

c. Mastic Seal: Place mastic seal between tank and concrete ring to the cross section indicated. Compact mastic thoroughly. Immediately before placing mastic, coat tank surfaces to be in contact with concrete ring with a coat of AASHTO M 118 bituminous material.

][3.1.2 Piping

Unless specified otherwise, erection, welding, brazing, testing and inspection of piping shall be in accordance with ASME B31.1 and Section 40 17 26.00 20 WELDING PRESSURE PIPING. Piping shall follow the general
arrangement shown. Cut piping accurately to measurements established for the work. Work piping into place without springing or forcing, except where cold-springing is specified. Piping and equipment within buildings shall be entirely out of the way of lighting fixtures and doors, windows, and other openings. Locate overhead piping in buildings in the most inconspicuous positions. Do not bury or conceal piping until piping has been inspected, tested, and approved. Where pipe passes through building structure, conceal pipe joints but locate where they may be readily inspected and building structure not be weakened. Avoid interference with other piping, conduit, or equipment. Except where specifically shown otherwise, run vertical piping plumb and straight and parallel to walls. Install piping connected to equipment to provide flexibility for vibration. Support and anchor piping so that strain from weight of piping is not imposed on equipment.

3.1.2.1 Fittings

Provide long radius ells on welded piping to reduce pressure drops. Mitering of pipe to form elbows, notching straight runs to form full sized tees, or similar construction shall not be used. Make branch connections with welding tees, except factory made forged welding branch outlets or nozzles having integral reinforcements conforming to ASME B31.1 may be provided.

3.1.2.2 Grading of Pipe Lines

Unless indicated otherwise, install horizontal lines of steam and return piping to grade down in the direction of flow with a pitch of not less than 25 mm in 9 meters one inch in 30 feet, except in loop mains and main headers where flow may be either direction. Pitch air lines to source of supply, and make provisions for draining off condensate. Install water lines to drain to a shutoff valve.

3.1.2.3 Anchoring, Guiding, and Supporting Piping

Anchor and support piping in a manner such that expansion and contraction will take place in the direction desired, prevent vibration by use of vibration dampeners, and prevent undue strains on boilers and equipment served. Fabricate hangers used for the support of piping of 50 mm 2 inch nominal pipe size and larger to permit adequate adjustment after erection while still supporting the load. Provide wall brackets where pipes are adjacent to walls or other vertical surfaces which may be used for supports. Provide supports to adequately carry weight of the lines and maintain proper alignment. Provide inserts and sleeves for supports in concrete where necessary and place in new construction before pouring concrete. Provide insulated piping with a pipe covering protection saddle at each support. Provide pipe guides and anchors of approved type at points where necessary to keep pipes in accurate alignment, to direct expansion movement, and to prevent buckling and swaying and undue strain. Provide pipe guides for alignment of pipe connected to free unanchored end of each expansion joint. Support pipe rollers in concrete conduits and trenches by extra strong steel pipe with ends inserted in slots provided in concrete walls. Set pipe supports for rollers at correct elevations either by metal shims or by cutting away of concrete and after pipe lines have been placed in alignment, grout ends of pipe supports and fix in place. Space pipe supports to provide adequate support for pipes. Pipe shall not have pockets formed in the span due to sagging of pipe between supports, caused by weight of pipe, medium in the pipe, insulation, valves, and fittings. Maximum spacing for pipe supports for steel pipe shall be in
in accordance with ASME B31.1; maximum spacing for supports for copper tubing shall be in accordance with MSS SP-69.

3.1.2.4 Copper Tubing

Copper tubing shall have solder joints with solder suitable for pressure-temperature ratings of piping system. Tubing 20 mm 3/4 inch and smaller for instrument air may be compression joint in lieu of soldered joint. Tin-antimony (95/5) solder is suitable for saturated steam up to 103 kPa (gage) 15 psig but tin lead (50/50) solder is not acceptable for steam service. Flux shall be non corrosive. Wipe excess solder from the joints.

3.1.2.5 Sleeves

Provide pipe sleeves where pipes and tubing pass through masonry and concrete walls, floors, and partitions. Space between pipe, tubing, or insulation and the sleeve shall be not less than 6 mm 1/4 inch. Hold sleeves securely in proper position and location before and during construction. Sleeves shall be of sufficient length to pass through entire thickness of walls, partitions, and slabs. Sleeves in floor slabs shall extend 13 mm 1/2 inch above the finished floor. Firmly pack space between pipe or tubing and the sleeve with oakum and caulk on both ends of sleeve with elastic cement.

3.1.2.6 Flashing for Buildings

Where pipes pass through building roofs and outside walls, provide proper flashing and counter flashing and make tight and waterproof.

3.1.2.7 Outlets for Future Connections

Locate as directed capped or plugged outlets for connections to future equipment, when not located exactly by project drawings.

3.1.2.8 Screwed Joints in Piping

Use teflon tape or suitable pipe joint compound applied to male threads only for making up screwed joints. Piping shall be free from fins and burrs. Ream or file out pipe ends to size of bore, and remove chips.

3.1.2.9 Welded Joints

Weld joints in piping by the metal-arc or gas welding processes in accordance with ASME B31.1 and as specified in Section 40 17 26.00 20 WELDING PRESSURE PIPING. Number or mark each weld to identify the work of each welder on welds on which stress relieving or radiographic inspection is required.

a. Contracting Officer reserves the right to require the Contractor to provide re-examination and recertification of welders.

b. Radiographic testing of circumferential butt welded joints of pipe with operating temperature of 177 degrees C 350 degrees F and above shall be required on ten percent of the joints, the location of which will be determined by the Contracting Officer; when more than ten percent of the radiographically tested joints show unacceptable defects radiographically test every joint of this type piping.
c. Equipment and Protection: Items of equipment for welding shall be so designed and manufactured, and shall be in such condition as to enable qualified operators to follow procedures and to attain results specified. Protect welders and gas cutters from the light of the arc and flame by approved goggles, shields, helmets, and gloves. Replace cover glasses in helmets and shields when they become sufficiently marred to impair the operator's vision. Take care to avoid risk of explosion and fire when welding and gas cutting near explosive or flammable materials. Ventilate welding and gas cutting operations in accordance with paragraph 1910.252 (f) of 29 CFR 1910-SUBPART Q.

d. Surface Conditions: Do not weld when atmospheric temperature is less than minus 18 degrees C zero degrees F, when surfaces are wet, when rain or snow is falling or moisture is condensing on surfaces to be welded, nor during periods of high wind, unless welder and work are protected properly. At temperatures between 0 degrees C and minus 18 degrees C 32 degrees F and zero degrees F, heat with a torch the surface for an area within 80 mm 3 inches of the joint to be welded to a temperature warm to the hand before welding. Free surfaces to be welded from loose scale, slag, rust, paint, oil, and other foreign material. Joint surfaces shall be smooth, uniform and free from fins, tears, and other defects which might affect proper welding. Remove slag from flame-cut edges to be welded by grinding, but temper color need not be removed. Thoroughly clean each layer of weld metal by wire brushing prior to inspection or deposition of additional weld metal.

3.1.2.10 Cleaning of Piping

Before installing pipe, thoroughly clean pipe of sand, mill scale and other foreign material. After erection but before making final connections to apparatus, thoroughly clean interior of piping. Flush piping with water except air and fuel lines. In addition, blow out steam lines with intermittent high pressure steam blows to promote shedding of internal scale. Blow compressed air and fuel oil lines clean with 552 to 690 kPa (gage) 80 to 100 psig air dried to a 2 degrees C 35 degree F dew point at 552 kPa (gage) 80 psig. Sterilize potable water piping by means of liquid chlorine or hypochlorite in accordance with AWWA C651 before placing water system in service. Take care during fabrication and installation, to keep piping, valves, fittings and specialties free of loose welding metal chips of metal or slag, welding rods and foreign matter. Blowing or flushing shall in no case be channeled through equipment, pump, control valve, regulating valve, instrument gage or specialty in the system. Provide temporary screens, strainers, connections, spool pieces and bypasses consisting of piping or hoses, pumps and other required equipment temporarily installed for the purpose of cleaning and flushing piping. Drain flushing water and test water to the sanitary sewer system.

3.1.2.11 Reduction in Pipe Size

Provide reducing fittings for changes in pipe size; bushings will not be permitted. In horizontal steam lines, reducing fittings shall be the eccentric type to maintain bottom of lines in the same plane. In horizontal water mains, reducers shall be set to maintain top of lines in the same plane.

3.1.2.12 Expansion Control

Provide bends, loops, and offsets wherever practical to relieve overstressed piping systems due to thermal expansion and to provide
adequate flexibility. Cold spring piping system as indicated but not more than 50 percent of the total linear expansion.

3.1.2.13 Connection to Equipment

Provide unions or flanges where necessary to permit easy disconnection of piping and apparatus. Provide unions and gate valves at each connection to threaded end control valves, strainers and equipment.

3.1.2.14 Valve Installation

Install valves in positions accessible for operation and repair. Install stems in a vertical position with handwheels or operators on top or in a horizontal position. Do not install handwheels on stop valves below the valve. When centerline of valve is more than 2 meters 7 feet above floor or platform, provide valve with a chain-operated handwheel. When valve is motorized, provide hand operation for emergency use.

a. Gate Valves: Arrange back outlet gate valves for turbine exhaust for hand operation and provide with a floor stand.

b. Globe Valves: Pressure shall be below the disc. Install globe valves with stems horizontal on steam and exhaust lines, when better drainage is required or desired.

c. Steam Pressure-Reducing Valves: Provide steam line entering each pressure-reducing valve with a strainer. Provide each pressure-reducing valve unit with two shutoff valves and with a globe or angle bypass valve and bypass pipe. A bypass around a reducing valve shall be of reduced size to restrict its capacity to approximately that of the reducing valve. Provide each pressure-reducing valve unit with indicating steam gages to show reduced pressure and upstream pressure and an adequately sized safety valve on low pressure side.

d. Valve Tags and Charts: Permanently tag each valve with a black and white engraved laminated plastic tag showing valve number, valve function and piping system and whether another valve must be opened or closed in conjunction with this valve. Furnish a typed chart which will show required valve tagging plus the location of each valve. Frame valve charts under glass and install as directed.

3.1.2.15 Traps and Connections

Traps shall be of the type and capacity for the service required, and shall be properly supported and connected. Except for thermostatic traps in pipe coils, radiators, and convectors, install traps with a dirt pocket and strainer between trap and piping or apparatus it drains. When it is necessary to maintain in continuous service, apparatus or piping which is to be drained, provide a three valve bypass so that trap may be removed and repaired and condensate drained through the throttled bypass valve. Provide a check valve on the discharge side of the trap when trap is installed for lift or operating against a back pressure, or trap discharges into a common return line. Provide test connections on the discharge side of the high and medium pressure traps when specifically required. Test connection shall include a 1/2-inch globe valve with open blow.
3.1.2.16 Pressure Gage Installation

Provide with a shutoff valve or petcock between the gage and the line, and provide gage on steam lines with a siphon installed ahead of the gage.

3.1.2.17 Thermometers and Thermal Sensing Element of Control Valves

Provide with a separable socket. Install separable sockets in pipe lines in such a manner to sense the temperature of the flowing fluid and minimize obstruction to flow.

3.1.2.18 Strainer Locations

Provide strainers with meshes suitable for the services upstream of each control valve and where dirt might interfere with the proper operation of valve parts, orifices, or moving parts of equipment.

3.1.2.19 Dissimilar Piping Materials

Provide dielectric unions or flanges between ferrous and nonferrous piping, equipment, and fittings, except that bronze valves and fittings may be used without dielectric couplings for ferrous-to-ferrous or nonferrous-to-nonferrous connections. Dielectric fittings shall utilize a nonmetallic filler which will prevent current flow from exceeding one percent of the short circuit current. Spacer shall be suitable for pressure and temperature of the service. Fittings shall otherwise be as specified in this section.

3.1.2.20 Surface Treating, and Pipe Wrapping

Uninsulated steel piping buried in the ground shall have exterior surfaces protected with a tape wrapping system or a continuously extruded polyethylene coating system as specified in Section 09 97 13.28 PROTECTION OF BURIED STEEL PIPING AND STEEL BULKHEAD TIE RODS.

3.1.3 PAINTING

3.1.3.1 Piping, Fittings, and Mechanical and Electrical Equipment

Equipment shall be factory finished to withstand the intended end use environment in accordance with the specifications for particular end item. Retouch damaged areas on factory finished equipment on which finish has been damaged and then give a complete finish coat to restore finish to original condition. Finish coat shall be suitable for exposure in the intended end use environment.

3.1.3.2 Painting

Unless specified otherwise, paint pipe hangers, structural supports, pipe and pipe fittings, conduit and conduit fittings, air grilles, pipe coverings, insulation, and metal surfaces associated with mechanical and electrical equipment including zinc-coated steel ducts as specified in Section 09 90 00 PAINTS AND COATINGS. Zinc-coated steel duct in unpainted areas shall not be painted. Apply a protective coating to piping to be insulated, except zinc-coated and copper pipe, prior to installing insulation.
3.1.3.3 Boilers

After erecting and testing boilers, clean as necessary exposed surfaces of the boiler normally painted in commercial practice to remove grease, coal dust, flyash and other foreign matter and finish with one coat of aluminum heat resisting paint applied to minimum dry film thickness of 0.025 mm one mil.

3.1.3.4 Vertical Fuel Oil Tank

Clean interior surfaces to bare metal in accordance with SSPC SP 10/NACE No. 2. Clean to bare metal by powered wire brushing or other mechanical means surfaces that cannot be cleaned satisfactorily by blasting. Wash members which become contaminated with rust, dirt, oil, grease, or other contaminants with solvents until thoroughly clean. Remove weld backing plates prior to blast cleaning; when left in place, round off corners prior to blast cleaning and coating.

3.1.3.5 Surfaces Not to be Painted

Unless specified otherwise, do not paint equipment having factory applied permanent finish, switchplates and nameplates, motor starters, and concrete foundations.

3.1.4 INSULATION

Insulate mechanical equipment, systems and piping as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.2 FIELD QUALITY CONTROL

Provide labor, equipment, test apparatus and materials required for preparation and performance of tests and inspections specified to demonstrate that boilers and auxiliary equipment as installed are in compliance with contract requirements. During start up and during tests, ensure that factory trained engineers or technicians employed by the boiler manufacturer and system suppliers or manufacturers of such components as the boiler, burner, forced draft fan, feedwater treatment equipment, and other auxiliary equipment be present, to ensure the proper functioning, adjustment, and testing of the individual components and systems. Furnish a detailed written record of test conditions, test procedures, field data, and start up and operational performance of the entire heating plant to the Contracting Officer before the Contractor's operational and test personnel leave the site. The Government will furnish, if available, water, electricity and fuel for the tests, except fuel required for retesting. The Contractor shall rectify defects disclosed by tests and retest equipment. The Contractor's boiler plant personnel shall be experienced in starting up and operating boiler plants.

3.2.1 Tests and Inspections (Piping)

Examine, inspect, and test piping in accordance with ASME B31.1 except as modified below. Rectify defects disclosed by tests. Necessary subsequent tests required to prove system tight after additional work by the Contractor shall be provided by the Contractor. Make tests under the direction of and subject to the prior approval of the Contracting Officer.
3.2.1.1 Hydrostatic and Leak Tightness Tests

a. Perform hydrostatic and leak tightness test on piping systems attached to the boilers and included under jurisdiction of ASME BPVC SEC I in accordance with requirements of that Code. Piping bearing ASME Code symbol stamp will be accepted only as indicating compliance with the design and material requirements of the code.

b. Test piping which is a part of the steam generation or auxiliary systems, including piping within the boiler room and external to the boiler room, by the following methods:

(1) Perform hydrostatic test at 150 percent of design pressure for welded and screwed steel piping systems except those for air, oil, and gas. Hold hydrostatic tests for a period of one hour with no pressure loss. Temperature of testing fluid shall not exceed 38 degrees C 100 degrees F.

(2) Test air and oil lines in accordance with requirements of ASME B31.1 for pneumatic tests with exception that the test pressure shall be held for one hour. Examination for leaks shall be by a soap or other foaming agent test.

(3) Inspection and test of gas piping shall conform to the requirements of NFPA 54.

c. For tests install a calibrated test pressure gage in the system to observe loss in pressure.

3.2.2 Preliminary Operation

The Contractor under the direction of the respective manufacturer's representative shall place in operation equipment provided by the Contractor except as specifically noted otherwise. Make adjustments to equipment that are necessary to ensure proper operation as instructed by the equipment manufacturer.

a. Lubricate equipment prior to operation in accordance with manufacturer's instructions. Provide lubricants. Furnish lubrication gun with spare cartridges of lubricant to operating personnel.

b. Dry out motors before operation as required to develop and maintain proper and constant insulation resistance.

c. Check drive equipment couplings for proper alignment at both ambient and operating temperature conditions.

3.2.3 General Start-Up Requirements

Prior to initial operation of complete system, check each component as follows:

a. Inspect bearings for cleanliness and alignment and remove foreign materials found. Lubricate as necessary and in accordance with manufacturer's recommendations. Replace bearings that run roughly or noisily.

b. Adjust direct drives for proper alignment of flexible couplings. Provide lubrication when a particular coupling so requires. Check
security of couplings to driver shafts. Set drive components to ensure free rotation with no undesirable stresses present on the coupling of attached equipment.

c. Check motors for amperage comparison to nameplate value. Correct conditions that produce excessive current flow and that exist due to equipment malfunction.

d. Check speeds of each motor and driven apparatus to ensure that motors are operating at the desired point.

e. Check actual suction and discharge pressure of each pump against desired performance curves.

f. Check pump packing glands or seals for cleanliness and adjustment before running each pump. Inspect shaft sleeves for scoring and proper placement of packing; replace when necessary. Ensure piping system is free of dirt and scale before circulating liquid through pumps.

g. Inspect both hand and automatic control valves. Clean bonnets and stems, tighten glands to ensure no leakage, but permit valve stems to operate without galling. Replace packing in valves that require same to retain maximum adjustment after system is judged complete. Replace entire packing in valves that continue to leak after adjustment. Remove and repair bonnets that leak. Coat packing gland threads and valve stems with a suitable surface preparation after cleaning.

h. Inspect and make certain that control valve seats are free from foreign matter and are properly positioned for intended service.

i. Check flanges and packing glands after system has been placed in operation. Replace gaskets in flanges that show signs of leakage after tightening.

j. Inspect screwed joints for leakage and remake each joint that appears to be faulty. Do not wait for rust to form. Clean threads on both parts, apply compound and remake joint.

k. Thoroughly blow out strainers through individual valved blow-off connection on each strainer prior to placing in operation.

l. Thoroughly blow out or dismantle and clean strainers after systems have been in operation one week. Thoroughly clean, repair, and place back in service traps or other specialties in which foreign matter has accumulated, causing malfunction or damage.

m. Adjust pipe hangers and supports for correct pitch and alignment.

n. Remove rust, scale and foreign materials from equipment and renew defaced surfaces. When equipment is badly marred, the Contracting Officer shall have authority to request new materials be provided.

o. Adjust and calibrate temperature, pressure and other automatic control systems.

p. Inspect each pressure gage and thermometer for calibration, and replace those that are defaced, broken or read incorrectly.

q. Vertical Fuel Oil Tank Calibration: After completing installation of
tank, prepare a calibration table for the tank showing fuel volume in liters, gallons in the tank to any height of liquid in meters and mm feet, inches, and eighths of an inch when measured by a steel tape lowered through the roof. Calibrate tank in accordance with [API MPMS 2.2A][API MPMS 2.2B] for "critical measurement" "operating control." Perform calibration of tank by a qualified organization that can certify to at least 2 years of prior successful and accurate experience in calibrating tanks of comparable type and size. Correct data obtained for use with product to be stored.

3.2.4 Plant Equipment Tests

3.2.4.1 Plant Air Compressors

Test plant air compressors in service to determine compliance with contract requirements and warranty. During tests, test equipment under every condition of operation. Test safety controls to demonstrate performance of their required function. Completely test system for compliance with specifications.

3.2.4.2 Instrument Air Compressors

Test air compressor package at full load for not less than 2 hours. Check capacity, smoothness of operation, alternation of units, and proper operation of the air unloaders during the test.

3.2.4.3 Coal Handling System

Test coal handling system under operating conditions and demonstrate that work is in conformance with the specified requirements. Conduct this test in the presence of the Contracting Officer.

3.2.4.4 Ash Handling System

Test ash handling system under operating conditions and demonstrate that work is in conformance with specified requirements. Conduct test in the presence of the Contracting Officer.

3.2.4.5 Horizontal Fuel Oil Tanks (Below Ground)

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph below, VERTICAL FUEL OIL TANK.
**************************************************************************

a. Test tanks before placing in service, in accordance with applicable paragraphs of the code under which tanks were built. An UL label, ASME Code Stamp, or API monogram on a tank shall be evidence of compliance with code requirements.

b. Holiday Detection Test: Inspect coal tar epoxy coating system for film imperfections using a low voltage (75 volt) holiday tester. Inspect FRP coated tanks with a 10,000 volt spark test for imperfections or holidays. Repair holidays or pinholes in the coatings.

3.2.4.6 Vertical Fuel Oil Tank

**************************************************************************
NOTE: Choose this subparagraph or the subparagraph below.
**************************************************************************
above, HORIZONTAL FUEL OIL TANKS (BELOW GROUND).
**************************************************************************
Inspect and test vertical fuel oil tank as specified in API Std 650. Use the radiographic method of inspection of butt welds as required by API Std 650; sectioning method will not be acceptable as an alternative to radiographic inspection.

3.2.4.7 Blowdown Valves and Try Cocks

Test blowdown valves and try cocks for proper operation.

3.2.4.8 Draft Fans, Fuel Oil Heaters, Fuel Pumps, and Electric Motors

Test draft fans, fuel oil heaters, fuel pumps, and electric motors to determine compliance with the referenced standards. Standard symbols and certifications from the referenced organization may be accepted at the discretion of the Contracting Officer. Closely observe the operation of fans, fuel oil heaters, fuel pumps, and electric motors[ including variable speed motor controllers] and correct defects.

3.2.5 Boilers and Auxiliaries Tests and Inspections

The Contractor, with qualified personnel provided by the Contractor, shall make tests and inspections at the site under the direction of and subject to the approval of the Contracting Officer. The Contractor's boiler plant personnel under the direction of the respective manufacturer's representatives and consultants, shall operate each boiler and appurtenances through the entire testing period and shall ensure that necessary adjustments have been made. Notify the Contracting Officer in writing at least 7 days in advance that equipment is ready for testing. The Contractor shall provide testing equipment, including gages, thermometers, calorimeter, Orsat apparatus, thermocouple pyrometers, fuel flow meters, water meters and other test apparatus and calibrate instruments prior to testing. Draft, fuel pressure and steam flow may be measured by permanent gages and meters installed under the contract. The Contractor is responsible for providing an analysis of the fuel being used for the tests. Control of noise levels developed by exhaust steam shall be as directed by the Contracting Officer to satisfy environmental conditions of the surrounding area. Perform the following tests and, when feasible, in the sequence listed:

a. Strength and tightness tests
b. Standards compliance tests
c. Preliminary operational tests (steady state combustion test and variable load combustion test)
d. Tests of auxiliary equipment
e. Feedwater equipment test
f. Capacity and efficiency tests

3.2.5.1 Strength and Leak Tightness Tests

Subject the boiler[s] to the following strength and tightness tests:
a. Watersides Including Fittings and Accessories: Hydrostatically test watersides in accordance with requirements of ASME BPVC SEC I. The ASME label will be accepted as evidence of this test.

b. Boiler Casing, Breeching and Ductwork: Prior to installing breeching and ductwork, boiler[s] [on the furnace side] shall be pneumatically tested, at the maximum possible draft pressure of the boiler furnace; the soap bubble method [and] [or] a smoke test shall be used to verify tightness of the casing. Boiler casing, breeching and ductwork shall be pressurized with the forced draft fan to the maximum draft pressure; the smoke test shall be used to verify tightness of the casing, breeching and ductwork. Leaks observed or detected shall be sealed.

3.2.5.2 Boiler Inspection

Ensure that the Boiler Inspector is present to witness the appropriate tests which need to be observed in order to certify the safety of the boiler. The inspection shall include requirements of NAVFAC MO 324. The Boiler Inspector shall complete NAVFAC form 9-11014/40, Data Record Sheet; NAVFAC form 9-11014/41, Inspection Report; NAVFAC form 9-11014/32 Inspection Certificate for each boiler after boiler has been inspected and found to be safe. No boiler may be fired until it has passed the inspection of the Boiler Inspector. The boiler inspection forms shall be submitted through the Contractor to the Contracting Officer. Place the Inspection Certificate under framed glass, and mounted on or near the boiler in a conspicuous location.

3.2.5.3 Boiler Cleaning and Startup

Dry out, boil out, and operate the firing rate of the new boiler[s] under direct responsibility and supervision of the manufacturer[, and in the presence of the boiler room operating personnel]. Provide chemicals that are required. Allow sufficient time for the boiling out process to ensure interior surfaces are clean. This time shall be at least 24 continuous hours and generally not more than 36 hours; boil out shall continue until water is clear. Boil out, cleaning and starting procedures shall be in accordance with requirements of ASME BPVC SEC VII and FM DS 12-17.

3.2.5.4 Boiler Preliminary Operational Tests

Conduct a boiler operational test on each unit continuously for two weeks. Operate one boiler at a time to demonstrate control and operational conformance to requirements of the specifications including ability to respond to load swings from the specified capacity to minimum turndown. Operational test shall be under the supervision of a registered professional engineer or a licensed power plant operator and shall serve to prove safeties, controls, maintenance of stable combustion at low loads, [proper coal distribution and combustion, and ability to operate without furnace slagging,] [proper flame lengths and patterns to avoid flame impingement on the tubes for oil firing,] and proper mechanical and electrical functioning of each system. Test shall include items specified in this section as well as items mentioned in the specification of the particular pieces of equipment. Conduct tests with factory trained combustion equipment engineers as previously specified. Test and record steam quality, steam flowrates, flue gas temperature, percentages of carbon dioxide, carbon monoxide, oxygen and nitrogen in flue gas and percent excess air for each boiler at tested load and graphically present the test data.
3.2.5.5 General Operational Tests

a. Steady State Combustion Tests: Test fuel burning and combustion control equipment with each of the specific fuels at the minimum limit of the turndown range and at increments of 50, 75 and 100 percent of full rated load. Each test run shall be at least two hours on each fuel and until stack temperatures are constant and capacity and efficiency requirements of this specification have been verified and recorded. Verify proper operation of instrumentation and gages during the tests.

b. Varying Load Combustion Tests: Test boiler continuously under varying load conditions to demonstrate proper operability of the combustion control, flame safeguard control, programming control and safety interlocks. Conduct these tests after adjustment of combustion controls has been completed under the steady state combustion tests. Continue variable load operational tests for a period of at least 8 hours.

(1) Sequencing: Boiler shall start, operate and stop in strict accordance with the specified operating sequence.

(2) Flame Safeguard: Verify operation of the flame safeguard controls by simulated flame and ignition failures. Verify trial-for-main flame ignition, combustion control reaction and valve closing times by stop watch.

(3) Immunity to Hot Refractory: Operate burner at high fire until combustion chamber refractory reaches maximum temperature. Main fuel valve shall then be closed manually. Combustion safeguard shall drop out immediately causing the safety shutoff valves to close within the specified control reaction and valve closing times.

(4) Pilot Intensity Required: Gradually reduce the fuel supply to the pilot flame to the point where the combustion safeguard begins to drop out (sense "no flame") but holds in until the main fuel valve opens. At this point of reduced pilot fuel supply, the pilot flame shall be capable of safely igniting the main burner. When the main fuel valve can be opened on a pilot flame of insufficient intensity to safely light the main flame, the boiler shall be rejected.

(5) Boiler Limit and Fuel Safety Interlocks: Safety shutdown shall be caused by simulating interlock actuating conditions for each boiler limit and fuel safety interlock. Safety shutdowns shall occur in the specified manner.

(6) Combustion Controls: Demonstrate accuracy, range and smoothness of operation of the combustion controls by varying steam demand through the entire firing range required by the turndown ratio specified for the burner. The control accuracy shall be as specified.

(7) Safety Valves: High pressure limit switch shall be locked out or otherwise made inoperative and boiler safety valves shall be lifted by steam. Determine relieving capacity, popping pressure, blowdown and reseating pressure by observation and measurement in accordance with ASME BPVC SEC I. The ASME standard symbol will be
3.2.5.6 Auxiliary Equipment and Accessory Tests

Observe and test blowdown valves, stop valves, try cocks, draft fans, fuel oil heaters, pumps, electric motors, and other accessories and appurtenant equipment during operational and capacity tests for leakage, malfunctions, defects, and for compliance with referenced standards.

3.2.5.7 Feedwater Equipment Tests

Perform test of the feedwater treatment equipment in two steps. Conduct one test concurrently with the combustion tests. The Government will perform a second test during the first period of heavy loading after the plant has been accepted and put in service. Correct deficiencies revealed during the Government tests under the guarantee provisions of the contract. Both the first and second series of tests shall determine compliance with the limits for chemical concentrations of this specification. Supply equipment for taking samples and test kit for analyzing the samples. Sampling equipment and test kit shall become the property of the Government when tests are completed.

3.2.5.8 Capacity and Efficiency Tests

Perform capacity and efficiency tests after operating tests have been satisfactorily completed and boiler has been operated continuously for at least 14 days with no nuisance shutdowns and without the necessity for frequent or difficult adjustments. Perform capacity and efficiency tests on each boiler. Conduct tests using specified fuel[s]. Test procedures shall be in accordance with the heat loss method[ and the input-output method] of ASME PTC 4. Before performing tests, the Contracting Officer and the Contractor shall reach agreement on those items identified in ASME PTC 4, Section 3, paragraph 3.01 "Items on Which Agreement Shall be Reached." A test run shall not start until boiler and accessories have reached an equilibrium and stabilization condition for at least one hour in duration. Duration of tests shall be sufficient to record necessary data but in no case shall each run be less than [4] [10] [24] hours.

a. Accomplish maximum output testing by means of a single 2 hour run at 110 percent load on the boiler under test. Calculate boiler efficiency, both input-output and heat loss, from the consistent readings taken during the runs. Runs shall be made at four different loads 30, 50, 70, and 100 percent of boiler rating during which both heat loss and input-output data shall be taken. Predict unmeasured losses used in conjunction with heat loss calculations and include with equipment data when submitted for approval. Subsequent tests required because of failure of the equipment to perform adequately during specified capacity and efficiency tests shall be the financial responsibility of the Contractor, including the cost of fuel.

b. Should analysis of the fuel being burned during performance tests vary from that specified as the performance fuel, adjust guarantees in accordance with accepted engineering practice to determine compliance. Carbon loss shall be determined in accordance with ABMA Boiler 103.

3.2.5.9 Temporary Waste Steam Connection

When necessary to obtain sufficient load for these tests, provide a
temporary steam line at a point outside the building. Provide necessary pipe, fittings, supports, anchors and appurtenances including a field fabricated silencer as directed by the Contracting Officer. Remove temporary piping and silencer after satisfactorily completing tests.

[3.2.5.10 Fire Safety for Oil-Fired Boilers]

Conduct tests as necessary to determine compliance with the applicable UL Safety Standards. The presence of the applicable Underwriters' label may be accepted as evidence of compliance in this respect.

a. Oil-fired Boilers: Meet test requirements of UL 726.

b. Oil Burners: Meet test requirements of UL 296.

[3.2.5.11 Plant Acceptance Operation]

**************************************************************************
NOTE: Include bracketed portion if project is for coal fired installation with flue gas desulfurization system.
**************************************************************************

After satisfactory completion of tests specified, operate the complete plant including each boiler[, its related flue gas cleaning equipment] and subsystems for a period of 30 continuous 24 hour operational days prior to final acceptance by the Government. Furnish labor, chemicals, test equipment and apparatus; the Government will furnish fuel, electricity and water. During this 30 day period, provide readily available, the services of qualified representatives from manufacturers of plant components and systems for the purpose of additional operational assistance, component and system adjustment and repairs. Government personnel will observe Contractor's operational procedures and will be asking pertinent questions, which the Contractor's representatives shall answer, about plant operation.

[3.2.5.12 NAVFACENGCOM Acceptance]

Operational, piping systems, auxiliary equipment and accessory tests shall be conducted prior to requesting an acceptance inspection by a Naval Facilities Engineering Systems Command (NAVFACENGCOM) Boiler Inspector. The Contracting Officer, upon receipt of 14 calendar days advance notice from the Contractor, shall request the boiler be inspected by a NAVFACENGCOM Boiler Inspector. The Contractor shall perform final operational performance testing of all plant systems in the presence of the NAVFACENGCOM Boiler Inspector, at the discretion of the NAVFACENGCOM Boiler Inspector. The NAVFACENGCOM Boiler Inspector shall receive copies, and review the results, of all pertinent operational test reports before approving acceptance of the boiler plant by the Government.

3.2.6 Manufacturers Field Services

3.2.6.1 Erection/Installation Supervisors and Service Engineers

a. Boiler: Furnish the services of a competent supervisor who is in the direct employ of the boiler manufacturer. Supervisor shall remain on the construction site the full 8 hours per day, 5 days per week, or the same hours, that the boiler installation takes place. Supervisor shall be responsible for the complete steam generating unit, including steam generator, stoker[, burner,] fans and related work, such as refractory,
or insulation regardless of whether stoker, burner, fans or other related items of work are furnished by manufacturers other than the boiler manufacturer.

b. Stoker: Furnish a competent erection supervisor for the equipment furnished by the stoker manufacturer.

c. Fans: Furnish a company service engineer to advise on the erection or installation of fans and related equipment.

d. Service Engineers: Services of the manufacturing companies' service engineers and the system suppliers' service engineers shall be provided by the Contractor to advise during erection and installation of other systems and equipment such as control system, coal handlings system, ash handling system, air compressors, air dryers, boiler feedwater pumps, fuel oil pumps, condensate pumps, water treatment equipment, chemical feed pumps, deaerating feedwater heater and stacks.

3.2.6.2 Boiler and System Representatives

a. Furnish factory trained engineers or technicians who are representatives of the boiler manufacturer and system suppliers to supervise testing of the boilers and auxiliary equipment.

b. Furnish the services of a Boiler Inspector who is qualified and certified as such by the National Board of Boiler and Pressure Vessel Inspectors and who is presently employed full time by an independent firm, such as Hartford Steam Boiler Inspection and Insurance Company, which has a business of inspecting boilers.

3.2.7 Instruction to Government Personnel

In accordance with the provisions of Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, supervisors and service engineers shall provide instruction for the Government's operators in the operation and maintenance of the equipment furnished under this section. The minimum number of hours provided shall be as follows:

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Operation Instruction</th>

2.21 SOURCE QUALITY CONTROL
   2.21.1 Instrument Air Compressors
   2.21.2 Variable Speed Motor Controller Factory Test

PART 3 EXECUTION

3.1 INSTALLATION
   3.1.1 Boiler
      3.1.1.1 Installing Tubes In Headers
      3.1.1.2 Installing Tubes In Drums
      3.1.1.3 Inspecting Tubes
      3.1.1.4 Installing Firebrick
      3.1.1.5 Installing Plastic Refractory
      3.1.1.6 Installing Casing Insulation
   3.1.2 Equipment Installation
      3.1.2.1 Equipment Foundations
      3.1.2.2 Induced Draft Fan
      3.1.2.3 Stack
      3.1.2.4 Fuel Oil Tanks
   3.1.3 Piping
      3.1.3.1 Fittings
      3.1.3.2 Grading of Pipe Lines
      3.1.3.3 Anchoring, Guiding, and Supporting Piping
      3.1.3.4 Copper Tubing
      3.1.3.5 Sleeves
      3.1.3.6 Flashing for Buildings
      3.1.3.7 Outlets for Future Connections
      3.1.3.8 Screwed Joints in Piping
      3.1.3.9 Welded Joints
      3.1.3.10 Cleaning of Piping
      3.1.3.11 Reduction in Pipe Size
      3.1.3.12 Expansion Control
      3.1.3.13 Connection to Equipment
      3.1.3.14 Valve Installation
      3.1.3.15 Traps and Connections
      3.1.3.16 Pressure Gage Installation
      3.1.3.17 Thermometer and Sensing Element Installation
      3.1.3.18 Strainer Locations
      3.1.3.19 Dissimilar Piping Materials
      3.1.3.20 Surface Treating, and Pipe Wrapping
   3.1.4 Painting
      3.1.4.1 Piping, Fittings, and Mechanical and Electrical Equipment
      3.1.4.2 Boilers
      3.1.4.3 Vertical Fuel Oil Tank
      3.1.4.4 Surfaces Not to be Painted
3.1.5 Insulation
3.2 FIELD QUALITY CONTROL
   3.2.1 Tests and Inspections (Piping)
      3.2.1.1 Hydrostatic and Leak Tightness Tests
   3.2.2 Preliminary Operation
   3.2.3 General Startup Requirements
   3.2.4 Plant Equipment Tests
      3.2.4.1 Plant Air Compressors
      3.2.4.2 Coal Handling System
      3.2.4.3 Fuel Oil Tanks
      3.2.4.4 Blowdown Valves and Try Cocks
      3.2.4.5 Fans, Heaters, Pumps, and Motors
   3.2.5 Boilers and Auxiliaries Tests and Inspections
      3.2.5.1 Strength and Leak Tightness Tests
      3.2.5.2 Boiler Inspection
      3.2.5.3 Boiler Cleaning and Startup
      3.2.5.4 Boiler Preliminary Operational Tests
   3.2.6 General Operational Tests
      3.2.6.1 General Controls
      3.2.6.2 Steady State Combustion Tests
      3.2.6.3 Varying Load Combustion Tests
      3.2.6.4 Auxiliary Equipment and Accessory Tests
      3.2.6.5 Feedwater Equipment Tests
      3.2.6.6 Capacity and Efficiency Tests
      3.2.6.7 Temporary Waste Steam Connection
      3.2.6.8 Fire Safety for Oil-Fired Boilers
      3.2.6.9 Plant Acceptance Operation
      3.2.6.10 NAVFACENGCOM Acceptance
   3.2.7 Manufacturer's Field Services
      3.2.7.1 Erection/Installation Supervisors and Service Engineers
      3.2.7.2 Boiler and System Representatives
      3.2.7.3 Instruction to Government Personnel

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steam heating plants from 7 1/2 to 60 1/2 kg/sec, 60,000 to 480,000 lbs/hr steam capacity using a field erected watertube boiler.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

NOTE: This guide specification covers requirements for equipment for a steam heating plant which will generate from 7 1/2 to 60 1/2 kg of steam per second, 60,000 to 480,000 pounds of steam per hour. This specification is intended to be used in the procurement and installation of heating plant equipment. Requirements for materials and procedures for special or unusual design shall be added to and modifications made to this specification as necessary to fit specific projects. This guide specification shall be used in conjunction with the following NAVFAC definitive drawings:

**NAVFAC NO./DRAWING TITLE**
ERECTED) COAL/OIL OR COAL RESERVE COAL STORAGE

1429361 - STEAM HEATING PLANT NO. 5 7 1/2 - 34 kg/sec 60,000 - 270,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL SITE PLAN - ELECTRICAL

1429362 - STEAM HEATING PLANT NO. 5 7 1/2 - 34 kg/sec 60,000 - 270,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL BASEMENT FLOOR PLAN - ELECTRICAL

1429363 - STEAM HEATING PLANT NO. 5 7 12/ - 34 kg/sec 60,000 - 270,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL MAIN FLOOR PLAN - ELECTRICAL

1429364 - STEAM HEATING PLANT NO. 5 7 1/2 - 34 kg/sec 60,000 - 270,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL ONE-LINE DIAGRAM - ELECTRICAL

1429366 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL SITE PLAN

1429367 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL MAIN FLOOR PLAN

1429368 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL BASEMENT FLOOR PLAN

1429369 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL LONGITUDINAL SECTION

1429370 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL TRANSVERSE SECTION

1429371 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL PIPING SCHEMATIC

1429372 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL PIPING SCHEMATIC

1429373 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL CONTROL SCHEMATIC

1429374 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE (FIELD ERECTED) COAL/OIL OR COAL CONTROL SCHEMATIC

1429375 - STEAM HEATING PLANT NO. 6 25 1/4 - 60 1/2 kg/sec 200,000 - 480,000 POUNDS PER HOUR WATERTUBE
PART 1 GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

**References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.**

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies to this section with the additions and modifications specified herein.

1.3 DEFINITIONS

**************************************************************************
NOTE: Information describing any specific project and site conditions which the Contractor would need to know in order to submit a firm price shall be specified in Division 1 of the project specifications. Such conditions include:

1. Allocated space for storage of materials.

2. Railway spurs and sidings available to the Contractor for delivery of materials.

3. Any restrictions on daily working hours.

4. Procedure for scheduling outages and tests.

5. Any noise or traffic restrictions.

6. Availability of utilities required for construction.
**************************************************************************

1.3.1 Effective Radiant Heating Surface

Heat exchange surface, exclusive of superheat elements, which is directly exposed to radiant heat of the flame on one side and to water or water-steam mixture being heated on the other. Effective radiant heating surface shall be calculated on the side receiving heat and shall consist of plain or finned tubes and headers which may be bare, metal covered, or metallic-ore covered. Refractory covered surfaces shall not be counted. Computations shall be made as follows:

a. Flat projected area of bare, metal covered, or metallic-ore covered tubes and headers shall be considered as effective radiant heating surface.

b. Metal and metallic surfaces extending from tubes or headers shall be considered to have an effective radiant heating surface equal to 60 percent of their flat projected area except that the following extended
surfaces shall not be considered as effective radiant heating surface.

(1) Metal blocks not integral with tubes or headers.

(2) Extended surfaces less than 6 mm 1/4 inch thick.

(3) That portion of the extended surface more than one tube or header radius from the tube or header from which it extends.

(4) Extended surfaces larger than 32 mm 1 1/4 inches.

c. Flat projected areas of portions of first two rows of furnace exit tubes that receive radiant heat from the fire shall be considered as effective radiant heating surface.

1.3.2 Flue Gas Velocity

*************************************************************************
NOTE: The maximum velocity to prevent erosion will vary according to whether boiler is multipass or single pass, the type of stoker and the type of fuel. See DM-3.6, Table 4, Maximum Velocities (MPS FPS) in Convection Sections for Coal, Wood or Solid Waste Boilers.
*************************************************************************

Velocity of the gas entering the convection section shall not exceed [10] [15] [18] [23] meters per second (m/s) [35] [50] [60] [75] feet per second (fpm).

1.3.3 FRP

Fiberglass reinforced plastic.

1.3.4 Furnace Volume

The cubic volume of the space provided for combustion of the fuel between the top grate line and the first plane of entry into, or between the tubes, of the furnace face of the bridge wall. When screen or superheater tubes are utilized, they shall be considered as the first plane of entry. The manufacturer shall state the furnace volume of the boiler.

1.3.5 PVC

Poly-vinyl chloride.

1.3.6 Standard Commercial Product

Standard commercial product is a product which has been sold or is being currently offered for sale on the commercial market through advertisements or manufacturer's catalogs, or brochures, and represents the latest production model.

1.3.7 System Supplier

A manufacturer, fabricator, erector, corporation or firm that regularly is employed in the design, fabrication, erection (or erection supervision), testing and startup of systems comparable in size and type to those specified and indicated. System supplier shall arrange the equipment
selected, design equipment interconnections, produce related shop drawings, supervise erection, and startup and test the equipment.

1.4 SYSTEM DESCRIPTION

1.4.1 Design Requirements

1.4.1.1 Boiler

Design boiler in accordance with the ASME BPVC SEC I. Provide design data with computations and performance guarantees covering the full range of operation at full load, 75 percent load, 50 percent load and 30 percent load. Assemble tubes, drums, and headers so that the entire boiler can be drained dry. The furnace shall be water cooled on the side, top, front and back walls.

a. Boiler design and service conditions

   (1) Steam capacity:  
      Continuous peak for 2 hours: [_____] kg/sec lb/hr
      Maximum continuous: [_____] kg/sec lb/hr
      Minimum (without smoking): [_____] kg/sec lb/hr

   (2) Design pressure: [_____] kPa (gage) psig

   (3) Operating pressure: [_____] kPa (gage) psig

   (4) Steam temperature: [_____] degrees C F

   (5) Feedwater temperature to economizer: [_____] degrees C F
      Continuous blowdown: [_____] percent

   (6) Maximum moisture content of steam leaving drum at peak rating:  
      [_____] percent

   (7) Total solids concentration in drum: [_____] PPM

   (8) Fuel:
      Coal (see coal analysis):
      [Oil (see oil analysis)]:

   (9) Heating surface, minimum:  
      Radiant: [_____] sq. m ft.
      Convective: [_____] sq. m ft.

   (10) Furnace volume, minimum: [_____] cu. m ft.

   (11) Maximum boiler flue gas exit
      Temperature: [_____] degrees C F
      Continuous rating: [_____] degrees C F

   (12) Maximum economizer flue gas exit
      Temperature: [_____] degrees C F
      Continuous rating: [_____] degrees C F

   (13) Efficiency at maximum continuous rating [includes economizer]
      Coal: [_____] percent
      [Oil]: [_____] percent
(14) Elevation above sea level: [_____] meters feet
(15) Boiler room & combustion air ambient: [_____] degrees C F
(16) Maximum allowable total draft loss furnace, boiler, exit damper, and economizer outlet at continuous rating: [_____] Pa inches of Water
(17) Steam drum, minimum diameter: [_____] mm inches
(18) Mud drum, minimum diameter: [_____] mm inches
(19) Seismic zone: [_____] 

1.4.1.2 Economizer

**************************************************************************
NOTE: Feedwater temperatures should be 110 degrees C 230 degrees F when sulfur (S) content of fuel is 0.5 percent to 1.5 percent; 116 degrees C 240 degrees F, S = 1.5 percent to 2 percent; 121 degrees C 250 degrees F, S = 2.0 percent to 2.7 percent. Where fuels having more than 1.5 percent sulfur content are to be fired, finned tubes shall not be used unless the steel tubes are covered with cast iron fin casing.
**************************************************************************

a. Flue gas quantity: [_____] kg/s lbs/hr
b. Flue velocity: [_____] m/s ft/min
c. Flue gas temperature entering economizer: [_____] degrees C F
d. Flue gas temperature leaving economizer: [_____] degrees C F
e. Feedwater Temperature entering economizer: [_____] degrees C F
f. Feedwater Temperature leaving economizer: [_____] degrees C F
g. Fouling factor on feedwater side: [_____] 
h. Fouling factor on gas side: [_____] 
i. Boiler operating pressure: [_____] kPa (gage) psig
j. Design pressure: [_____] kPa (gage) psig
k. Steam loads shall be as specified under boiler[s]
l. Performance: The efficiency due to the economizer shall be included with and stated as part of the overall boiler efficiency.

1.4.1.3 Forced Draft Fan

Design fan to handle air at temperatures from [_____] to [_____] degrees C F. Fan shall be [single] [double] width inlet, [single] [double] width outlet, with [clockwise] [counter-clockwise] rotation; viewed from the [motor] [turbine] end.

SECTION 23 52 33.02 20 Page 25
1.4.1.4 Induced Draft Fan

Design fan of materials which will withstand flue gas temperatures up to 316 degrees C 600 degrees F without damage. Fan shall be [single] [double] width inlet, [single] [double] width outlet, with [clockwise] [counter clockwise] rotation when viewed from [motor] [turbine] end. Provide outboard pedestal bearings with sole plates[ and dual extension shaft].

1.4.1.5 Screw Conveyors for Coal Handling Equipment

Each screw conveyor shall meet the following minimum design and performance specifications when handling [_____] size coal:

<table>
<thead>
<tr>
<th></th>
<th>CONVEYOR NO. 1</th>
<th>CONVEYOR NO. 2</th>

1.4.1.7 Stacks With Flue Gas Scrubbers

Stacks with flue gas scrubbers, boilers 5 kg/sec 40,000 lb/hour and over:

a. Temperature
   (1) Maximum ambient: [_____] degrees C F
   (2) Minimum ambient: [_____] degrees C F
   (3) Inlet gas at maximum gas flow (coal): [_____] degrees C F
   (4) Inlet gas at maximum gas flow (oil): [_____] degrees C F
   (5) Inlet gas at minimum gas flow (coal): [_____] degrees C F
   (6) Inlet gas at minimum gas flow (oil): [_____] degrees C F

b. Gas Flow at Inlet
   (1) Maximum: [_____] kg/s lbs/hr
   (2) Minimum: [_____] kg/s lbs/hr

c. Required net available draft at stack inlet
   Maximum gas flow: [_____] Pa inches water

d. Gas exit velocity (cone exit)
   Maximum at maximum conditions: [_____] m/s ft/sec

e. Flue gas dew point
   (1) Fuel oil: [_____] degrees C F
   (2) Fuel-coal: [_____] degrees C F

f. Test pressures
   Shop test: [_____] Pa inches water

g. Thermal efficiency of stack: 96 to 98 percent

h. Stack friction
   Maximum at design conditions: [_____] Pa inches water

i. Stack height
   (1) Ground elevation: [_____] m ft
(2) Roof elevation: \([_____] \text{ m ft}\)

(3) Stack height: \([_____] \text{ m ft}\)

(4) Foundation or footing elevation: \([_____] \text{ m ft}\)

n. Soil bearing stress, maximum: \([_____] \text{ kg/m}^2 \text{ psf}\)

o. Seismic zone: \([_____]\)
1.4.1.8 Fuel Oil Pumps

a. Transfer pumps (for fuel oil tank truck or railroad tank car unloading and transfer to tanks):

**************************************************************************
NOTE: At the text below, the values enclosed in brackets are for No. 6 Low Sulfur fuel oil. Adjust values to suit fuel oil used when other than No. 6.
**************************************************************************

(1) Number of assemblies: [_____]

(2) Tag numbers: [_____]

(3) Capacity each at 450 ssu: [_____] L/s gpm

(4) Suction lift required: [_____] kPa ft of water

(5) Discharge pressure: [_____] kPa (gage) psig

(6) Operating temp.: [27 to 54 80 to 130] [_____to_____] degrees C F

(7) Viscosity range: [450 to 5000] [_____to_____] ssu

(8) Specific gravity: [.92 to .99] [_____to_____]

(9) Viscosity at brake power selection point: [9000] [_____] ssu

(10) Maximum pump speed: 1750 rpm

(11) Motor kW hp: [_____]

(12) Fuel oil: No. [6, Low Sulfur] [_____]

b. Transfer pumps (for fuel oil transfer from tanks to heating plant):

**************************************************************************
NOTE: At the text below, the values enclosed in brackets are for No. 6 Low Sulfur fuel oil. Adjust values to suit fuel oil used when other than No. 6.
**************************************************************************

(1) Number of assemblies: [_____]

(2) Tag numbers: As indicated

(3) Capacity at 450 ssu: [_____] L/s gpm

(4) Suction lift required: [_____] kPa (gage) ft of water

(5) Discharge pressure: [_____] kPa (gage) psig

(6) Operating temperature: [49 120] [_____] degrees C F

(7) Viscosity range: [450 to 3000] [_____] to [_____] ssu

(8) Specific gravity: [.92 to .99] [_____] to [_____]
(9) Viscosity at brake power point: [5000] [_____] ssu
(10) Maximum pump speed: 1750 rpm
(11) Motor kW hp: [_____]
(12) Fuel oil: No. [6, low sulfur] [_____] c. Fuel oil recirculation pump sets (at remote storage):

**************************************************************************
NOTE: At the text below, the values enclosed in brackets are for No. 6 Low Sulfur fuel oil. Adjust values to suit fuel oil used when other than No. 6.
**************************************************************************

(1) Number of assemblies: [_____]
(2) Tag numbers: As indicated
(3) Capacity: 1.58 L/s 25 gpm at 450 ssu
(4) Suction lift required: [_____] kPa ft. water
(5) Discharge pressure: [_____] kPa (gage) psig
(6) Operating temperature: [49 120] [_____] degrees C F
(7) Viscosity range: [450 to 3000] [_____] to [_____] ssu
(8) Specific gravity: [.92 to .99] [_____] to [_____]
(9) Viscosity at brake power point: [5000] [_____] ssu
(10) Maximum pump speed: 1750 rpm
(11) Motor kW hp: [_____]
(12) Fuel oil: No. [6, low sulfur] [_____]

1.4.1.9 Fuel Oil Pump and Heater Set for Fuel Oil System

**************************************************************************
NOTE: At the text below, the values enclosed in brackets are for No. 6 Low Sulfur fuel oil. Adjust values to suit fuel oil used when other than No. 6.
**************************************************************************

a. Pump/heater set

(1) Capacity each pump and each steam heater: [_____] L/s gpm
(2) Suction lift: [_____] kPa ft water
(3) Discharge pressure at outlet of heater: [_____] kPa (gage) psig
(4) Maximum pump speed: 1750 rpm
(5) Specific gravity range: [.92 to .99] [_____] to [_____]
(6) Viscosity at brake power point: 5000 ssu
(7) Viscosity range: [500 to 5000] [_____] to [_____] ssu
(8) Oil temperature at inlet of heater: [_____] degrees C F
(9) Oil temperature at outlet of heater: [_____] degrees C F
(10) Maximum oil pressure drop through heater: [_____] kPa psi
(11) Heating medium: Steam
(12) Steam pressure available: [_____] kPa (gage) psig
(13) Steam temperature: [_____] degrees C F
(14) Heater type: [Extended surface][Bare tube]

b. Electric startup heater

(1) Oil temperature at heater inlet: [_____] degrees C F
(2) Oil temperature at heater outlet: [_____] degrees C F
(3) Maximum oil pressure drop through heater: [_____] kPa psi
(4) Capacity of heater: [_____] L/s gpm
(5) Heating power supply at three phase, 60 Hz [_____] volts
(6) Control power supply 120 volts, single phase, 60 Hz

1.4.1.10 Ash Handling System (Mechanical)

a. Capacity:

(1) Ash handling system: Estimated capacities at maximum plant output are listed below; ash handling system capacity shall be sized for twice the amounts listed.

[_____] Mg tons per hour for fly ash
[_____] Mg tons per hour for bottom ash
[_____] Mg tons per hour in bucket elevator leaving the boiler house (minimum).

(2) Ash silo: Storage capacity of ash silo is specified in the paragraph ASH STORAGE SILO.

(3) Rotary unloader: [_____] Mg tons per hour

b. General data

(1) Available water pressure: [_____] kPa (gage) psig
(2) Available air pressure: [_____] kPa (gage) psig
(3) Seismic zone: [_____]
(4) Wind velocity (gusts): [_____] km/hr mph
(5) Altitude of plant: [_____] m ft
(6) Steam rating of plant: [_____] kg/s lb/hr
   (a) Maximum continuous rating of boiler no. 1 [_____] kg/s lb/hr
   (b) Maximum continuous rating of boiler no. 2 [_____] kg/s lb/hr
   (c) Maximum continuous rating of boiler no. 3 [_____] kg/s lb/hr
   (d) Maximum continuous rating of boiler no. 4 [_____] kg/s lb/hr
(7) Coal analysis
   (a) Ash [_____] percent
   (b) Carbon [_____] percent
   (c) Hydrogen [_____] percent
   (d) Sulfur [_____] percent
   (e) Moisture [_____] percent
   (f) Nitrogen [_____] percent
   (g) Oxygen [_____] percent
(8) Ash Analysis
   (a) Carbon [_____] percent
   (b) Calcium [_____] percent

1.4.1.11 Ash Handling System (Pneumatic)

a. Capacity:
   (1) Ash handling system: Estimated capacities at maximum plant output
   are listed below; ash handling system capacity shall be sized for
twice the amounts listed.
      [_____] Mg tons per hour for fly ash
      [_____] Mg tons per hour for bottom ash
      [_____] Mg tons per hour in bucket elevator leaving the boiler
   house (minimum).
   (2) Ash silo: Storage capacity of ash silo is specified in the
   paragraph ASH STORAGE SILO.
   (3) Rotary unloader: [_____] Mg tons per hour.

b. General Data
   (1) Available water pressure: [_____] kPa (gage) psig
   (2) Available air pressure: [_____] kPa (gage) psig
(3) Seismic zone: [_____]

(4) Wind velocity (gusts): [_____] km/hr mph

(5) Altitude of plant: [_____] m ft

(6) Steam rating of plant: [_____] kg/s lb/hr
   
   (a) Maximum continuous rating of boiler no. 1 [_____] kg/s lb/hr
   (b) Maximum continuous rating of boiler no. 2 [_____] kg/s lb/hr
   (c) Maximum continuous rating of boiler no. 3 [_____] kg/s lb/hr
   (d) Maximum continuous rating of boiler no. 4 [_____] kg/s lb/hr

(7) Coal analysis
   
   (a) Ash: [_____] percent
   (b) Carbon: [_____] percent
   (c) Hydrogen: [_____] percent
   (d) Sulfur: [_____] percent
   (e) Moisture: [_____] percent
   (f) Nitrogen: [_____] percent
   (g) Oxygen: [_____] percent

(8) Ash analysis
   
   (a) Carbon: [_____] percent
   (b) Calcium: [_____] percent

(9) Minimum velocities required for materials
   
   (a) Fly ash: 19.30 m/s 3800 ft./min.
   (b) Bottom ash (traveling grate stoker): 28.44 m/s 5600 ft./min.
   (c) Bottom ash (spreader stoker): 26 m/s 5100 ft./min.

1.4.1.12 Miscellaneous Equipment

   a. Deaerating heater: Design the deaerating heater for the following conditions:

   (1) Design pressure: 207 kPa (gage) 30 psig
   (2) Normal steam operating pressure: [_____] kPa (gage) psig
   (3) Maximum steam operating pressure: [_____] kPa (gage) psig
   (4) Capacity (minimum): [_____] kg/s lb/hr of feedwater
(5) Inlet Conditions at Heater:

<table>

1. Condensate return

2. High pressure trap returns

3. Makeup water (softened)

(6) Outlet temperature of feedwater from heater at design capacity:

[_____] degrees C F

(7) Heating steam pressure: [_____] kPa (gage) psig

(8) Heating steam enthalpy: [_____] kJ/kg Btu/lb

(9) Storage capacity to overflow of storage tank: [_____] liters gallons.

**************************************************************************

NOTE: At the text below, analysis of the water available for makeup shall govern the water treatment system selected. A competent water treating consultant shall be obtained to formulate specific system recommendations when the makeup water analysis indicates any of the following:

1. Iron in excess of 0.1 ppm as Fe.

2. Mg alkalinity in excess of 50 ppm as CaCO3.

**************************************************************************

b. Water softening system: Base the water softening system on the
(1) Raw water analysis: Source of raw water is [______]. It is available at pressures of [_____] to [_____] kPa (gage) psig. The analysis of the water available for makeup is approximately as follows:

(2) Softener effluent analysis:

Hardness: Maintain hardness of the softened feedwater near zero and in no case allow it to exceed 1.0 part per million as CaCO3.

**************************************************************************

NOTE: At the text below, total solids of 175 ppm in the feedwater concentrated 20 times give 3,500 ppm in the boiler water.

**************************************************************************

Total solids: Maintain total solids in the softened feedwater at a level to ensure a total solids concentration in the boiler water of less than 3,500 ppm without excessive blowdown.

### 1.4.2 Detail Drawings

#### 1.4.2.1 Boiler Drawing

Submit safety valve calculation sheets or Manufacturer's standard sheets) and detail drawings for the following:

a. Refractory details, expansion joints

b. Certified outline, general arrangement (setting plan), and anchor bolt
detail drawings including foundation loading diagrams
c. Plans and elevations detailing piping connections
d. Detailed dimensional drawings of auxiliaries furnished with the unit
e. Piping schematics for auxiliaries, such as sootblowers or hydraulic stoker drives (when used)
f. Shop fabrication details of boiler/furnace: Include details showing tubing, spacing, radii dimensions, and gage; sections through walls and expansion joints showing refractory construction and replacement details; internal and external dimensions of the boiler
g. Wiring diagrams for subsystems
h. Economizers and economizer inlet breeching
i. Soot blowers
j. Auxiliaries furnished with the boilers
k. Forced draft fan, drives and duct work
l. Induced draft fan, drives and duct work
m. Structural steel and loading diagrams
n. Overfire air fan system

1.4.2.2 Boiler Room Auxiliary Equipment

Submit descriptive information for the following items on the drawings including arrangements, wiring diagrams, piping diagrams, and details of valves and piping.

a. Water softening equipment
b. Brine storage tank
c. Condensate receiver
d. Condensate transfer pumps including certified performance curves
e. Deaerator
f. Boiler feed pumps including certified performance curves
g. Steam turbines and their drives
h. Continuous blowdown system
i. Chemical feed units
j. Air compressors
k. Air dryers
l. Cranes and hoists
m. Plant heating and ventilation equipment showing related ductwork

1.4.2.3  **Stokers**

Include the following:

a. General arrangement

b. Foundation drawings

c. Front plates

d. Ash hoppers

e. Fuel gate mechanism

f. Grate details

g. Zone dampers

h. Air seal details

i. Overfire air nozzle arrangement, overfire air fan and drives

j. Coal feeder details

k. Fuel feeder drives

l. Piping schematics

m. Wiring schematics

n. Access doors

1.4.2.4  **Ash Handling System**

Include the following:

a. General arrangement

b. Construction details ash storage silo complete with loading diagrams

c. Control panel arrangement and schematics

d. Wiring and control diagrams

e. Ash piping arrangement drawings and schematic drawings

f. Wear back fitting details

g. Piping and fittings

h. Details of [steam] [motor driven mechanical] exhauster[ and air washer-steam condenser]

i. Details of separators, tertiary bag filter, and ash silo vent bag filter

j. Silo fluidizing system and rotary ash conditioner
k. Bottom ash hopper and vertical lift doors

l. Ash crusher

1.4.2.5 **Burners**

Include the following:

a. General arrangement

b. Piping details

c. Burner control schematics

d. Flame safety schematics

e. Component details

f. Throat tile details

1.4.2.6 **Dampers, Stacks and Breechings**

Include the following:

a. General arrangement

b. Breeching, reinforcing details

c. Breeching hangers and support details

d. Dampers and operators

e. Access doors and frames

f. Expansion joints

g. Stack details including anchor bolt and foundation details, stack sampling ports, platforms, and accessories

[ Submit drawings stamped by a registered professional engineer for stacks with flue gas scrubbers, boilers 5 kg/sec 40,000 lb/hour and over. ]

]1.4.2.7 **Coal Handling Equipment**

Include the following:

a. Certified outline and general arrangement drawings for complete coal handling system

b. Dimensional equipment and fabrication drawings, including all equipment weights, equipment locations, support details, and anchor bolt arrangements for items and equipment specified under the coal handling section

c. Control panel, coal presence indicators, and equipment response switch details
d. Control schematic diagrams and complete wiring diagrams

1.4.2.8 Fuel Oil Equipment

Drawings may be manufacturer's standard size for pumps, pump curves, valves, strainers and pump wiring.

a. Certified outline and general arrangement drawings

b. Certified pump and performance curves and tabulations

c. Equipment detail sheets including viscosity controller, heater and valves

d. Electrical wiring diagrams

e. Oil tanks, foundations, tank heaters, appurtenances, water draw-off and level indication.

1.4.2.9 Piping and Specialty Items

Drawings may be manufacturer's standard size.

a. Details of valves and special fittings

b. Feedwater regulator details and schematics

c. Details and schematics of feedwater automatic recirculation

1.4.2.10 Flexible Ball Expansion Joint Installation Details

Include allowable angular flex and minimum offset dimensions for approval.

1.4.2.11 Reinforced Concrete Foundation

Concrete and reinforcing for the foundation shall be detailed on the Contractor's submitted shop drawings as specified under Section 03 30 00 CAST-IN-PLACE CONCRETE.

1.4.2.12 Reproducible Drawings

Submit one reproducible plastic shop drawing of each approved drawing sheet to the Contracting Officer for the following items:

a. Boiler layout, foundations, construction and details including [preheaters,] [economizers,] auxiliaries and details

b. Breeching layout, construction and details

c. Burner construction, control and flame safety schematics, and details

d. Burner details

e. Wiring diagrams

f. Fuel tanks, foundations and appurtenances

g. Feedwater automatic recirculation system
h. Piping schematics
i. Control diagrams schematics including panel construction and layout
j. Coal handling equipment
k. Stoker drawings and details
l. Ash handling system, including panels, schematics and details

1.4.3 Test Reports

1.4.3.1 Boiler Predicted Performance Data
Submit certified copies of design, production and conformance tests for approval before delivery of the equipment.

1.4.3.2 Fan Performance Data
Submit to the Contracting Officer manufacturer's fan performance data based on performance tests made in accordance with the requirements of AMCA 210. AMCA certified test data from prototype fan designs is acceptable.

1.4.4 Performance Requirements

1.4.4.1 Boiler

**************************************************************************
NOTE: The specified efficiency for the boiler at maximum continuous load shall be not less than 80 percent for coal and 82 percent for oil. When an economizer is provided, use 82 and 84 percent respectively for coal and oil firing. Depending on the particular application and fuel used, these efficiencies could be higher.
**************************************************************************

The efficiency listed for coal burning shall be based on stoker firing with [_____] percent excess air. The efficiency for fuel oil firing shall be based on [_____] percent excess air. The efficiency shall allow for [_____] percent continuous blowdown and 1.5 percent unaccounted losses and manufacturer's margin. Base the performance on the boiler burning fuels in accordance with the Coal Analysis [Fuel Oil Analysis] listed below.

a. Coal analysis
   (1) Ultimate analysis (percent by weight)

<table>
<thead>
<tr>
<th>Carbon</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hydrogen</td>

1.5 SUBMITTALS

********************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal
items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
  Boiler Drawing
  Boiler Room Auxiliary Equipment

[ Refrigerant (compressed air refrigerated air dryers) - Provide SDS sheets for all refrigerants

] Insulation

Submit for approval within [60] [75] [90] days after award of contract.

SD-04 Samples

Each Type of Insulation

Include the intended application for each type of insulation and attach manufacturer's stamp or label giving name of manufacturer, brand and description of material.

[ SD-05 Design Data

**************************************************************************
NOTE: Choose this paragraph only if the paragraph STACKS WITH FLUE GAS SCRUBBERS, BOILERS 5 kg/sec 40,000 lb/hour AND OVER and its subparagraphs are chosen. Delete this paragraph if the paragraph STACKS WITH NO FLUE GAS SCRUBBERS, BOILERS 5 kg/sec 40,000 lb/hour & UNDER and its subparagraphs are chosen.
**************************************************************************

Stacks with Flue Gas Scrubbers, boilers 5 kg/sec 40,000 lb/hour and over

Submit design calculations for static and dynamic analysis and damping. Submit manufacturer's foundation and stack calculations. Submit as specified under the paragraph STACKS WITH FLUE GAS
SCRUBBERS, BOILERS 5 kg/sec 40,000 lb/hour AND OVER.

SD-06 Test Reports

Boiler Predicted Performance Data
Fan Performance Data
Instrument Air Compressors
Variable Speed Motor Controller

Submit certified copies of variable speed motor controller design, production and conformance tests for approval before delivery of the equipment.

Steam Heating Plant

Submit for tests and inspections specified under the paragraph FIELD QUALITY CONTROL.

SD-07 Certificates

List of Equipment Manufacturers
Proof of Experience

Submit the required information and experience certificates prior to commencing work on the site.

System and Equipment Installation
Vertical Fuel Oil Tank Calibration
Backflow Preventer
Ozone Depleting Substances Technician Certification

SD-10 Operation and Maintenance Data

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

Equipment, Data Package 3
Control Components, Data Package 4

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals

Posted Operating Instructions

1.6 QUALITY ASSURANCE

Equipment shall be factory assembled except for steam generators, coal handling equipment, and ash handling equipment which shall utilize shop assembled components to the maximum extent to facilitate erection and
minimize field labor.

1.6.1 Standard Commercial Product

Boilers and equipment shall as a minimum, be in accordance with the requirements of this specification and shall be the manufacturer's standard commercial product. Include additional or better features which are not specifically prohibited by this specification, but which are a part of the manufacturer's standard commercial product in the boilers and equipment being provided.

1.6.2 Equipment Furnished

Equipment furnished by the Contractor shall be furnished by the manufacturers listed.

1.6.3 Responsibility

The Contract drawings show the required general arrangement configuration and location of equipment items. However, this contract allows selection of vendor's equipment, at the option of Contractor, provided that vendor's experience and equipment meet requirements of these drawings and specifications. Because there may be significant variation between the drawings and individual vendor's equipment as to foundations, physical dimensions and detailed arrangement of these equipment items, the Contractor is required to furnish detailed design and shop drawings and calculations for the systems selected. Foundation arrangements, walkways and other information as required shall be shown for a completely coordinated, useable and properly functional system. A single system supplier shall be responsible for a complete system including erection or erection supervision for each of the following systems:

a. Boiler system, including but not limited to the boiler, stoker, oil burners, [economizer,] [air preheater,] refractories, insulation, induced draft fan, sootblowers, steam separator, forced draft fan, overfire air fan, reinjection system, boiler trim, blowdown valves, safety valves and trim, and breeching. System manufacturer shall coordinate required instrumentation and control logic with controls and instrumentation supplier. Controls and instrumentation are specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

b. Coal handling system, including but not limited to the track and reclaim hoppers, belt feeders, belt conveyors and tube galleries, telescoping chute, flight conveyor, coal bunker, under bunker conveyor with triple valves, coal scale and non-segregating distributor.

c. Ash handling system including clinker crusher, ash intakes, ash silo with baghouse filter, vacuum pump and rotary dustless filter.

d. Stack system including steel stack, internal acid resistant lining and external coating.

e. Emission equipment including precipitator, scrubber and baghouse.

1.6.4 Certification of Backflow Preventer

Certificate of Full Approval or current Certificate of Approval for each backflow preventer being provided for this project shall be from the Foundation for Cross-Connection Control Research, University of Southern
California, and shall attest that the design, size, and make of backflow preventer has satisfactorily passed the complete sequence of performance testing and evaluation for the respective level of approval. A Certificate of Provisional Approval will not be acceptable in lieu of the above.

1.6.5 Modification of References

In the API publications referred to in this paragraph, the advisory provisions shall be considered mandatory, as though the word "shall" had been substituted for "should" and "suggested" wherever they appear.

1.6.6 Certificates

1.6.6.1 List of Equipment Manufacturers

Submit a letter which names the equipment manufacturers for the following equipment. When the Contracting Officer determines that a manufacturer does not meet the qualification or experience requirements of the specifications, the Contractor shall submit, to the Contracting Officer, the name of another manufacturer within fifteen days of notification.

a. Boilers and stokers
b. Boiler feedwater pumps
c. Coal car handling equipment
d. Induced draft fans
e. Coal handling equipment
f. Ash handling equipment

1.6.6.2 Proof of Experience

Submit proof of experience of manufacturers, system suppliers and installers as follows:

a. Experience, Responsibility and Certification: Submit to the Contracting Officer, the required information and experience certificates within 30 days after award and prior to commencing work on the site.

**************************************************************************
NOTE: Verify number of manufacturers' installations operating and years of operation for coal handling systems, ash handling systems and control systems to avoid an unnecessarily restrictive experience requirement.
**************************************************************************

b. Experience Requirements: Boilers and equipment installed within or as a part of the heating plant shall be of proven designs. Each manufacturer or system supplier shall be regularly engaged in designing, fabricating, erecting or erection supervision, testing and starting up of the equipment or system. Within 30 days after award or at any time during performance of the contract, when the Contractor is required to use another manufacturer or system supplier is required through no fault of the Contractor, the Contractor shall submit a
c. Information Required: Submit to the Contracting Officer, evidence or proof of experience required from the equipment manufacturer or system supplier containing the following information:

(1) List of installations meeting the aforementioned requirements including detailed description of equipment furnished for each one.

(2) Owner and location of each installation.

(3) Name and phone number of supervisory person at each installation.

(4) Date of Owner acceptance of such installation.

d. Vertical Fuel Oil Tank Calibration Experience: Submit to the Contracting Officer evidence or proof that the tank calibration organization has at least 2 years of prior successful and accurate experience in calibrating tanks of comparable type and size.

1.6.6.3 System and Equipment Installation

Submit from each system supplier and each manufacturer of the equipment, written certification that the system and equipment installation is in accordance with the system supplier's and equipment manufacturer's instructions and recommendations, that the unit or system has been run, rotating parts have been dynamically balanced, fluid (including air) flows have been balanced, instrumentation and controls are properly functioning, adjusted and have been calibrated, and the sub-system (or equipment) is ready for final testing, before entire boiler plant may be given an acceptance test.

1.6.6.4 Vertical Fuel Oil Tank Calibration

Submit four copies of the certified record.

1.6.6.5 Backflow Preventer

Submit a Certificate of Full Approval or a current Certificate of Approval for each design, size, and make of backflow preventer being provided for the project.

1.6.6.6 Ozone Depleting Substances Technician Certification

**************************************************************************
NOTE: The following paragraph requires a certification for technicians who work on equipment that could release ozone depleting refrigerants into the atmosphere. This is required as of January 1, 2018 to meet the requirements of 40 CFR 82, Subpart F.
**************************************************************************
All technicians working on equipment that contain ozone depleting refrigerants must be certified as a Section 608 Technician to meet requirements in 40 CFR 82, Subpart F. Provide copies of technician certifications to the Contracting Officer at least 14 calendar days prior to work on any equipment containing these refrigerants.

1.6.7 Posted Operating Instructions

Provide posted operating instructions for each piece of equipment installed.

1.6.8 Operation and Maintenance Data

Submit operation and maintenance data for each equipment, including control components. Include the following supplemental information in addition to requirements of Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS.

a. Illustrations, catalog information, shop drawings, and certified drawings of each item of equipment and control components

b. Tests and test results

c. Adjustments

d. Fan and blower characteristics curves

e. Pump characteristic curves superimposed on system curves at various pumping rates (20, 40, 60, 80, 100 percent capacity)

f. Boiler predicted performance data

g. List of special tools required

1.7 DELIVERY, STORAGE AND HANDLING

1.7.1 Assembly of Components

Each assembly of components packaged as a unit shall be of the size that can be transported by common carrier without disassembly insofar as shipping clearances are concerned.

1.7.2 Storing Tubes

Grind tube ends before shipment and properly coat against elements that may cause rusting or decomposition prior to erection. Store tubes used in erection of boiler with full protection from elements and at no time shall tubes be stored upon the ground. Maintain sufficient space between bottom row of tubes and ground to give good circulation of air at all times. Before installing tubes, remove mill scale and other foreign matter.

1.8 ENVIRONMENTAL REQUIREMENTS

1.8.1 Air Permits

Permits for construction and operation of the boiler plant shall be obtained from the local environmental regulatory agency prior to the start of construction.
1.8.2 Boiler Emissions

Comply with local, state, and federal emission regulations for the fuel to be fired.

1.8.3 Oil Burner/Windbox Package

The emission requirements shall be met at the maximum required continuous output. The burner shall meet environmental rules and regulations. Emission requirements to be considered are oxides of nitrogen (NOx), opacity, particulates, sulfur dioxide, and carbon monoxide. Compliance with NOx emission regulations shall be met using one [a combination] of the following:

   a. Low NOx burners
   b. Flue gas recirculation
   c. Other NOx reduction methods

1.9 EXTRA MATERIALS

a. Furnish two extra sets of air filters for each compressor.

**************************************************************************

NOTE: At the text below, choose one of the two following items in coordination with the option chosen in Part 2 "Compressed Air Desiccant Air Dryer" or "Compressed Air Refrigerated Air Dryer."

**************************************************************************

[ b. Furnish 4 spare prefilters and 4 spare afterfilters for compressed air desiccant air dryer.

][c. Furnish 4 spare disposable cartridge type prefilters and afterfilters each, for compressed air refrigerated air dryer.

] d. Furnish a spare set of refractory bricks for each thawing unit.

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials free of defects which would adversely affect the performance or maintainability of individual components or of the overall assembly. Materials not specified herein shall be of the same quality used for the intended purpose in commercial practice. Unless otherwise specified herein, equipment, material, and articles incorporated in the work covered by this specification shall be new.

2.1.1 Identical Items

Provide physically and mechanically identical boilers and equipment of the same classification, size or capacity to permit the interchangeability of replacement parts. This requirement includes parts, assemblies, components, and accessories. Parts provided on the same type unit regardless of size and identifiable by identical part number shall be functionally and dimensionally interchangeable. No deviation is acceptable without prior written approval of the Contracting Officer.
2.2 [COAL/OIL] [COAL] FIRED BOILER

Multiple-drum, bent tube, field erected, cross drum, high static head, and vertical combustion chamber type designed for stoker [and oil] firing. Stoker [and oil burner] shall be as specified elsewhere in this section. Utilize shop assembled components to the maximum extent to facilitate erection and minimize field labor. Materials shall be as specified herein. Materials and piping shall meet requirements of ASME BPVC SEC I. Boiler shall be a fully erected water tube boiler, including engineering, labor, supervision, tools, materials, and testing required for a complete operational unit. Equipment shall include boiler, waterwalls, refractories, insulation, supporting structural steel, steel casing and lagging, windbox, ductwork, sootblowers, stoker, [oil burners], ASME required safety valves, valves and trim, forced draft fan, induced draft fan and overfire air fan. Boiler design shall be fully integrated with and coordinated with stoker, [fuel oil burner,] economizer, and forced draft fan, induced draft fan, and controls specified elsewhere in this section. Boilers with [welded wall,][ or ][tube and tile] are acceptable.

2.2.1 Operational Requirements

Boiler shall be capable of operating continuously at the maximum specified conditions without damage or deterioration to boiler, settings, firing equipment or auxiliaries. Boiler shall be capable of automatically controlled operation while burning specified fuel[s].

2.2.1.1 Furnace Heat Input

**************************************************************************
NOTE: See NAVFAC Design Manual DM-3.6, Table 12 Stoker Selection Criteria.
**************************************************************************

When boiler is operating at a maximum continuous rating, heat input to furnace shall not exceed either of the following limits:

a. [310] [362] kW [30,000] [35,000] Btu per hour per cubic meter foot of furnace volume.

b. 315 kW 100,000 Btu per hour per square meter foot of effective radiant heating surface.

Combustion gas temperature at furnace exit shall not exceed [1149 degrees C 2100 degrees F when firing oil and] 93 degrees C 200 degrees F below ash fusion temperature when firing coal.

2.2.2 Construction

2.2.2.1 Boiler Drums

**************************************************************************
NOTE: Boilers 11 1/4 kg of steam per second 90,000 pounds of steam per hour or more should have a steam drum of not less than 1372 mm 54 inches in diameter and a lower drum of not less than 1067 mm 42 inches in diameter.
**************************************************************************
Drums shall be steel plate, fusion welded in conformance with the ASME BPVC SEC I. The manufacturer shall determine the inside diameter and overall length of each drum except that the steam drum shall be sized sufficiently large to contain the steam-water separating equipment, to prevent excessive rise of water due to sudden change in steam demand, and to allow for ready access into the drum. The steam drum shall be at least [_____] mm inches internal diameter. The lower drum shall be at least [_____] mm inches internal diameter. Provide each drum with an elliptical manhole at each end not less than 300 by 400 mm 12 by 16 inches, with hinged manhole cover, yoke and gaskets and machined to fit manhole flange of head. Provide flat bar ring of not less than 10 gage steel plate welded to the exterior of the drum heads around the manholes for protection of the drum head insulation. Rings shall be continuous and shape shall conform to the general outline of the manhole opening. Groove the tube holes in the drums for maximum holding power. Fusion weld the longitudinal seams in drums and the circumferential joints between heads and shells. Remove excess welding material and clean drum surface. Relieve stresses caused by welding by heat treatment in annealing furnaces, and X-ray the seams to ensure complete and proper welding. Drum variation shall not exceed one percent between maximum and minimum diameters at any section and when necessary, reheat, reroll or reform drums to meet this requirement.

a. No part of the boiler drum or header surface shall be directly exposed to furnace radiation unless it is adequately protected by a water screen in such a manner that no part of the exposed drum or header surface shall be more than 50 mm 2 inches from the nearest water tube.

b. Fit the steam outlet drum of the boiler with easily removable efficient dry pipe, special baffle, or other separating device so that the steam delivered to the boiler header shall have not more than 1.0 ppm of total solids at maximum continuous load, and during change of load from 50 percent to 100 percent of continuous rated capacity within a three minute period, provided that the total solids concentration in the boiler water does not exceed 3500 parts per million, the total alkalinity concentration does not exceed 700 parts per million, and no organic matter is present.

c. Nozzles for safety valves, main steam outlet, feed and blowdown lines, shall be forged steel, straight neck type, flanged and fusion welded to drums. Weld threaded connections in the steam drum for the feed water regulator, continuous blowdown, vent gage, and chemical feed lines.

d. Provide steam drum with internals for continuous blowdown, running the length of the steam drum at the point of highest concentration of dissolved solids, and an internal distribution pipe for chemical feed. Continuous blowdown and chemical feed pipe inside of drum shall be stainless steel.

2.2.2.2 Headers

Horizontal lower and upper side wall headers shall preferably be square. However, round headers are acceptable, provided approved stoker seals are provided. Provide rear wall and front wall headers. Protect the front wall header by studs and pack with insulating cement. Provide headers with key caps or gasketed type handhole fittings.

2.2.2.3 Tubes

Boiler design pressure shall not be less than 1724 kPa (gage) 250 psig.
Water tube rows and first two rows of main boiler bank shall be one gage heavier than other tubes. Tubes shall be resistance welded or seamless, ASME BPVC SEC II-A SA-178/SA-178M, Grade A carbon steel not less than 63.50 mm 2 1/2 inches O.D.; tubes shall not be reduced in size at the boiler drums. Manufacturer shall indicate the size, weight, and kind of tubes on the submittal drawings. Furnace walls and roof shall be water cooled. Radii of bends in tubes shall be such that standard turbine type cleaners can easily pass through the full length of the tubes.

a. When a boiler is provided with welded wall construction, the tube side walls, front wall, and furnace roof shall be of gastight construction, tubes shall be skin cased for gastight construction.

b. The width of the water wall tubes, as determined by the outside diameter of the tubes, shall cover at least 50 percent of each of the front, rear furnace, side walls, and roof of the boiler.

c. Tube connections to upper drum shall be so arranged that the ends of downcomer tubes shall be covered with water when the water level in the steam drum is 50 mm 2 inches below the bottom of the gage glass with the gage glass being centered at the normal water level in the drum. Tube bends shall be free of wrinkles and at no point of the bend shall the diameter of the tube be more than 3 mm 1/8 inch less than the minimum allowable diameter of the tubes.

d. Space boiler and water wall tubes so that tubes may be removed and replaced without disturbing another tube.

2.2.3 Boiler Setting and Insulation

Provide a complete setting including firebrick, refractory tile, insulation, tile supports, supporting steel, steel casing, material for expansion joints, and necessary work and materials to provide a complete gas envelope for the convector and water walls.

2.2.3.1 Expansion Joints

Provide expansion joints where required to permit brickwork to expand freely without interference with the boiler. Joints shall be of adequate width, tightly sealed against leakage, and free from mortar, with the outer 100 mm 4 inches sealed with resilient material suitable for 927 to 1093 degrees C 1,700 to 2,000 degrees F. In addition, to allow for expansion of the inner face, a series of 3 mm 1/8 inch wide vertical openings spaced 1.83 meters 6 feet apart shall be provided on the furnace side of the wall. Proper provision shall be made for expansion and contraction between boiler foundation and floor.

2.2.3.2 Welded Wall

a. Inner Casing: Provide No. 10 gage inner casing for tangent tube construction.

b. Insulation and Firebrick: Back up the walls and roof of the furnace with not less than 63.50 mm 2 1/2 inches of block insulation (816 degrees C 1500 degrees F class) or ASTM C155 insulating firebrick. Provide standard welded casing or lagging to cover and protect insulation.

c. Furnace Roof Tube Openings: Where necessary, such as where the furnace
roof tubes are separated to enter the drum, the opening shall be completely inner cased and filled with ASTM C401 castable refractory.

2.2.3.3 Tube and Tile Furnace Construction

Sides, front and rear walls, and the roof of the boiler, as far as is practical, shall include water wall tubes backed up with not less than a thickness of 63.50 mm 2 1/2 inches of super duty Class, regular type, ASTM C27 fire brick followed by high temperature block insulation 816 degrees C 1500 degrees F Class or ASTM C155 insulating firebrick. Insulation shall not be less than 127 mm 5 inches thick on the furnace walls and roof, 100 mm 4 inches thick on the side walls beyond the furnace, and 76 mm 3 inches thick on the rear wall, consisting of two layers with staggered joints. Plaster the entire exterior of the setting with a thin coating of plastic high temperature cement before the casing is applied.

2.2.3.4 Drum, Header and Miscellaneous Insulation

a. Drum Heads: Insulate drum heads with a minimum thickness of 51 mm 2 inches of calcium silicate blocks applied in two 25 mm one inch layers with 25 mm one inch mesh wire fabric embedded between layers. Entire surface shall be neatly finished with 13 mm 1/2 inch coat of smooth, hard finish hydraulic setting insulating cement with one inch chicken wire mesh embedded therein. Neatly finish drum heads with a field applied 0.47 kg 14 ounce per square meter yard glass cloth.

b. Drum Top and Header: Insulate the top half of the steam drum as previously specified for drum heads, but finish with 16 gage welded steel casing. Provide insulation to the flange on smoke outlet of the boiler. Insulate headers and downcomer tubes with not less than 38 mm 1 1/2 inch thick calcium silicate blocks banded in place, covered with 13 mm 1/2 inch thick coat of hydraulic setting insulating cement and enclosed in an 18 gage metal lagging with openings for access to handhole fittings, as required.

c. Miscellaneous: Provide special firebrick and tile required in connection with fitting of doors and seals, and around stoker and headers. Build arches of wedge brick where arches are required for door openings. Line doors exposed to furnace radiation for full depth of door with plastic refractory properly fastened to door. Caulk expansion joints with temperature resisting caulk material at points where setting joins parts of boiler. Provide air passages in insulated walls or brick work required for the stoker.

2.2.3.5 Baffles

When provided, baffles shall be properly located and practically gastight. Maximum velocity at end of baffle where gas turns shall be 17 meter 55 feet per second, except at baffle above rear pass hopper where maximum velocity shall not exceed 12 meter 40 feet per second.

2.2.3.6 Casing

**************************************************************************
NOTE: Designer shall fill in this blank depending on type of air pollution equipment and maximum pressure possible to be exerted on boiler casing by induced draft fan. Do no use less than 4980 Pa 20 inches of water gage.

SECTION 23 52 33.02 20  Page 57
Provide the entire setting, other than the top half of the steam drum with a continuously welded tight skin steel casing of not less than 10 gage, or an integral wall construction with outer casing of not less than 12 gage construction. Weld other steel casing joints where practicable, and reduce the number of bolted joints to a minimum. In places where sections of the casing are subject to removal periodically for inspection and maintenance, the casing shall be bolted using 18 mm \(\frac{5}{8}\) inch bolts on not more than 76 mm 3 inch centers with joints gasketed. Design the steel cased settings to withstand an internal negative or positive pressure of not less than the maximum static pressure generated by the boiler fans at shutoff and test block, plus a 25 percent safety factor without objectionable deflection of sides, or damage to side walls, casing, or refractory materials, or other parts of the unit. The minimum design pressure shall be a [_____] Pa inch water column. Make proper provisions for expansion and contraction of the casing without creating breakage or air leaks. With a surface wind velocity of 0.07 meter 2 feet per second, the average surface temperature of the casing shall not exceed 66 degrees C 150 degrees F while the boiler is operated at full rated load in an ambient temperature of 38 degrees C 100 degrees F. Finish the top half of the steam drum with 16 gage welded steel casing, as previously specified for the setting.

2.2.3.7 Access and Observation Doors

a. General: Provide boiler with a sufficient number of access and observation doors, to give free and easy access and observation to parts of the interior of the boiler.

b. Access and Cleaning Doors: Provide a minimum of [_____] by 450 mm 18 inch access and cleaning doors to give free and easy access to parts of the interior of the setting and the convection section of boiler. Brick up the furnace access door openings with No. 1 firebrick or firebrick tile properly held in place, between door and furnace.

c. Observation Doors: Provide boiler with not less than [_____] by 250 mm 10 inch observation doors and [_____] 100 by 100 mm 4 by 4 inch peep doors.

NOTE: At the text below, do not specify less than 8 observation doors and consider using more when it is desired. On traveling grate stokers an observation door should be located above each air zone on both sides of the boiler which will probably result in using a greater number of observation doors.

d. Door and Opening Frames: Frames and front plates for openings for doors, soot blowers, overfire air openings, and other such items, in the pressure parts shall be completely gastight and airtight. Doors
shall close against planed seats or the equivalent and shall be provided with heavy latches. Anchor door frames securely. There shall be no air leaks between door frames and setting.

2.2.3.8 Draft Connections

Provide draft connections through setting and steel casing for draft and airflow connections for combustion control and metering. Provide draft connections for measuring furnace draft, boiler outlet gas pressure, [and] economizer outlet gas pressure[, and fly ash collector outlet gas pressure]. Provide other openings as required for temperature elements and other combustion control and metering items in accordance with ABMA Boiler 103, recommended standard instrument connections unless otherwise specified.

2.2.4 Support and Framing

a. Support the boiler entirely independent of the casing and tile work, in a manner that will allow for expansion and contraction without straining part of boiler or affecting the setting. Support boiler and stoker entirely on structural steel work extending down to foundations as indicated.

**************************************************************************
NOTE: At the text below, provisions must be made for adequate boiler foundations based on soil conditions at each plant location. Foundations should be typically detailed on the drawings.
**************************************************************************

b. Provide structural steel columns and beams to support the boiler [____], [____] [and] [stoker] [and the boiler operating floor adjacent to the boiler,] [walkways, and platforms] [as indicated]. Size steel to support the equipment dead loads imposed, plus a minimum live load of 976 kg 200 pounds per square meter foot.

**************************************************************************
NOTE: Designer should include here any provisions where boiler steel is to serve as support for portions of building, or equipment.
**************************************************************************
c. Boiler manufacturer shall furnish a drawing showing the magnitude and location of the loads imposed by the equipment and structural steel on the building structural steel.

d. Provide anchor bolt setting plans along with anchor bolts with nuts and sleeves that shall be set in concrete for attachment in support of boiler and allied equipment. Provide bolts and nuts as required for items furnished.

2.2.5 Boiler Hoppers

2.2.5.1 Rear Pass Hoppers

**************************************************************************
NOTE: Delete bracketed portions with cinder return (fly ash reinjection) when a cinder return system will not be incorporated into the project.
**************************************************************************

Provide rear pass hoppers at the rear of the stoker or boiler setting. Construct hoppers of 6 mm 1/4 inch thick welded steel plate as approved. Hoppers shall have minimum storage capacity based on 8 hours of operation at full load with no cinder return (fly ash reinjection) and shall have 200 mm 8 inch diameter outlets with standard flanges on the bottom of the hoppers.[ Coordinate hoppers and hopper outlet flanges with overfire air-cinder return reinjection system furnished by the stoker manufacturer.] Provide insulation and lagging for the hoppers as specified for the boiler.

2.2.5.2 Plenum Chamber

Enclose the underside of the grates so as to form a plenum chamber and not permit any leakage of siftings onto the floor. Provide this chamber with a single hopper complete with access door and supporting steel. Provide manually operated double leaf stoker blast gates at duct connection to plenum chamber. Provide an 200 mm 8 inch diameter outlet with standard flange on bottom of the hopper.

2.2.5.3 Ash Storage Hopper

Hopper is specified under the paragraph ASH HANDLING EQUIPMENT in this section.

2.2.6 Boiler Trim

Fittings, drain valves, drain piping, feed piping, pressure gages, feed valves, stop valves, check valves, safety valves, and other appurtenances shall comply with the applicable requirements of the ASME Boiler and Pressure Vessel Code. Components shall conform to the following:

2.2.6.1 Boiler Blowoff Valve

Provide flanged [Class 250 cast iron] [Class 300 cast steel] body, seatless, sliding plunger type valves mounted in tandem at each boiler blowoff connection.

a. Steel gate, globe and angle valves: ASME B16.34.

b. Safety, relief, and safety relief valves: MIL-DTL-18436.
2.2.6.2 Steam Gage

**************************************************************************
NOTE: Select gage scale to operate within the middle third of the range.
**************************************************************************

Provide a 300 mm 12 inch diameter indicating steam gage with chromium plated trim and zero to [_____] kPa (gage) psig scale. Gage shall be complete with siphon, valve, piping, and fittings to properly connect same. Gage shall be flush mounted on a 368 mm 14 1/2 inch square by 5 mm 3/16 inch thick steel plate. Provide plugged tee connection for connection to remote steam gage.

2.2.6.3 Water Column

Provide a safety water column with high and low water alarm suitable for the design pressure of the boiler. Column shall be complete with three-chain-operated gage cocks, heavy duty inclined gage glass, and quick-closing water gage valves having cross levers and chains operated from floor. Gage glass shall be readable from any point directly below unit. Make connections to water column from boiler with extra strong steel pipe and forged steel fittings. Provide crosses instead of tees or elbows, with screwed plugs in open ends. Terminate bottom of water column and water column gage glass with plug-in type valves accessible from operating floor. Provide plugged, screw-in type connections in water column piping to accommodate a remote level indicator. Provide gate valves immediately below water column and gage glass. Provide a suitable lamp fixture to illuminate water column.

2.2.6.4 Safety Valves

Provide not less than [_____] cast steel or cast iron body high capacity safety valves to give a total steam relieving capacity in accordance with the ASME BPVC SEC I requirements as to total boiler and water wall heating surface. Valves shall be set with a set pressure of [_____] kPa (gage) psig, [_____ kPa (gage) psig], [____ kPa (gage) psig] [and kPa (gage) psig] respectively. Valves shall have flanged inlet and outlet connections.

2.2.6.5 Non-Return Valve

Provide a non-return valve on each boiler steam outlet. The valve shall be a stop check angle body valve, flanged, Class 250 cast iron or Class 300 steel body with handwheel shutoff, pressure operated disc and external equalizer. The assembly for manual operation shall be outside screw and yoke type.

2.2.6.6 Blowoff Connections

Bottom drum blowoff connection on boiler shall be [_____] mm inch diameter and extended to outside of setting terminating with Class 250, tandem iron body, flanged blowoff valves, and shall be in accordance with ASME BPVC SEC I, Art. PG-59. Boiler water wall blowoff connections and economizer inlet pipe blowoff shall be 40 mm 1 1/2 inch diameter and extended to outside of setting and equipped with same type valves. Provide stop valves for water column blowoff connections.
2.2.6.7 Miscellaneous Stop Valves

Provide stop valves for each connection to boiler near boiler; include valves for soot blowers, chemical feed, vent, continuous blowoff, and required drains.

2.2.6.8 Tube Cleaner

Provide one tube cleaner suitable for cleaning tubes of the boiler. Tube cleaner shall operate on water at 1034 kPa (gage) 150 psig pressure. Tube cleaner shall be complete with one motor, one wrench, one cutter head assembled, one universal coupling for cutter head, two sets of cutters, two sets of cutter pins, one set of arm pins, one set of keeper pins, one brush with a set of refills, one tool box, and two 15 meter 50 foot lengths of heavy duty hose with 20 mm 3/4 inch diameter pipe connections.

2.2.6.9 Wrenches

Provide special wrenches required for proper maintenance of equipment.

2.2.7 Boiler Limit Interlocks

Provide applicable boiler limit interlocks required by FS F-B-2910 and connect to effect safety shutdown of the stoker[ and oil burners]. Interlocks shall be compatible with and integrated into the instrumentation system as specified.

2.2.8 Sootblowers

Provide the boiler [and] [economizer] [and air preheaters] with a sootblowing system using [steam] [compressed air] for removing the deposits of soot and fly ash from the heat transfer surfaces. Sufficient number of blower elements shall be provided to adequately clean the heat transfer surfaces. Fixed position, multi-nozzle rotating elements may be provided in applications where flue gas temperatures do not exceed 982 degrees C 1800 degrees F. Retractable soot blowers shall be provided where flue gas temperatures exceed 982 degrees C 1800 degrees F.

2.2.8.1 Fixed Position Soot Blowers (Steam)

Soot blowers shall be steam, fixed position, multi-nozzled, rotating, valve-in-head type with electric motor operation to permit the proper cleaning of the heat transfer surfaces with cam operated valves arranged to automatically open the steam valve through the proper arc of rotation. Cams shall be adjustable to give the proper operating arc or shall be specifically designed for each location. Furnish and install soot blowers complete, including valve-in-head blower heads, wall sleeve bushings, high temperature elements, low temperature elements, [_____] volt, [_____] Hz., [_____] kW hp motor operators, hand operated drain valve, with drilled orifice and disc to prevent tight shutoff, element supports, clamps, bolts, and other such items. Furnish necessary piping and valves including drainlines, shut-off valves, piping supports and insulation. Weld soot blower piping and fittings. No screwed piping or fittings will be permitted. Blower elements shall be carefully installed to avoid rubbing on tubes which would cause eventual tube failure. Scavenging air connections from forced draft fan shall be provided where required to protect blowers in non-blowing position. Provide a single control station containing start and stop pushbuttons and necessary relays to control the motor operators.
2.2.8.2 Fixed Position Sootblowers (Air Puff)

Sootblowers shall be air puff type, fixed position, multi-nozzled rotating element type complete with air master controller for each boiler, entirely air-operated and designed for controlled automatic sequential operation. Units shall be operated in such a manner that air issues from the element in a series of sustained high pressure puffs of approximately one second duration each. During each puff, the element shall be rotated through a predetermined and measured short arc (17 1/2 degrees) by means of a ratchet mechanism in the sootblower head. Between each puff, no air shall flow through the blowers and there shall be sufficient time for the system to be restored to full pressure. When the blowing cycle has been completed, the controller shall automatically stop the sequence. Provide sootblowers complete with wall sleeve bushings, element supports, clamps bolts and other required components. Provide necessary piping and valves, including shutoff valves, piping and supports. Weld sootblower piping and fittings. No screwed piping or fittings will be permitted. Carefully install blower elements to avoid rubbing on tubes which would cause eventual tube failure.

2.2.8.3 Retractable Sootblowers

Provide in lieu of fixed position type and where flue gas temperatures exceed 982 degrees C 1800 degrees F. Sootblowers shall be [air] [electric] motor operated. Rotation of the blower shall be continuous from the moment the lance begins to extend. Rotating and traversing speeds shall be independently adjustable by changing sprockets. Blowers shall be complete with heavy steel housing, outside adjustment of nozzle pressure, alloy lance, wall sleeve, supports, and other necessary appurtenances required for a completely workable system.

2.2.8.4 Elements

Equip units with elements specially designed for use with [steam] [air]. Elements subjected to temperatures of 482 to 816 degrees C 900 to 1500 degrees F shall be chromium covered extra heavy carbon steel tubing or a chrome alloy as specified for a higher temperature; between 817 to 927 degrees C 1501 to 1700 degrees F, they shall contain not less than 20 to 23 percent chrome; from 928 to 982 degrees C 1701 to 1800 degrees F, not less than 24 to 27 percent chrome. Provide a flexible connection between each head and element.

2.2.8.5 Control

On the operating floor provide a pushbutton for each boiler for starting and stopping system.

2.2.8.6 Control for Sootblowing System

Provide sootblowing system with an automatic programmable control system which will automatically start and stop each sootblower in programmable sequence and monitor and display operation of sootblowers. Provide an overriding control which will permit manual start-stop operation of sootblowers.

2.3 ECONOMIZER

Provide economizer [separate from the boiler] [integral to and within the
boiler setting]. Economizer shall be of the [bare tube] [cast iron fin covered steel tube] design complete with feedwater piping between economizer and boiler drum. Economizer shall be constructed in accordance with the requirements of ASME BPVC SEC I meeting the design and operating conditions as specified for the boiler and bearing the ASME Code symbol stamp. Economizer shall be suitable for the operating conditions and the fuels specified. Materials provided shall withstand temperatures and pressures prevailing under maximum load conditions. Economizer casing, insulation, and lagging shall be specified for the boiler.

2.3.1 Accessories

Provide the following accessories and equipment for each economizer.

a. Sootblowers of the same manufacturer and construction as sootblowers to be provided for boilers;

b. Stack temperature control with sensor and motorized feedwater temperature control valves to function to limit flue gas temperature to a minimum of [_____] degrees C F by modulating feedwater to the bypass;

c. Temperature and pressure indicators on feedwater outlet;

d. Temperature and pressure indicator on feedwater inlet;

e. Temperature and pressure indicator on flue gas outlet;

f. Temperature and pressure indicator on flue gas inlet;

g. Manual shutoff and bypass piping and valving;

h. Low point drain pipe complete with two blowoff valves as specified for the boiler; and

i. Audible alarm with silencing switch and indicating lights for high feedwater exit temperature, low feedwater exit temperatures, low or high flue gas exit temperature, low feedwater entrance temperature or pressure.

2.4 COAL GRATE STOKERS

**************************************************************************
NOTE: Choose from either the paragraphs and subparagraphs below TRAVELING GRATE COAL STOKER or the paragraphs and subparagraphs TRAVELING GRATE SPREADER COAL STOKER that follow it.
**************************************************************************

2.4.1 Traveling Grate Coal Stoker

**************************************************************************
NOTE: Designer shall select type of stoker most suited for each project. Stoker Selection Criteria is shown in NAVFAC Design Manual DM-3.6, Table 12.
**************************************************************************

**************************************************************************
NOTE: When the boiler is not part of this project insert Coal Analysis at end of this paragraph.
Stoker shall be of the bar and key traveling grate type arranged for rear ash discharge. Stoker shall be capable of continuous operation at such rate as required for the continuous output of not less than that specified for the boiler and shall satisfactorily provide for automatic operation, by means of combustion control system, within the range given when burning the specified coal and operated in accordance with instructions supplied by the manufacturer. Obtain satisfactory operating conditions throughout the full operating range of the stoker. The stoker shall be considered as an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service conditions together with requirements of tests, performance guarantees and other warranties specified for the boiler. Coal analysis shall be as specified in the Coal Analysis Schedule for the boiler. The gate moving mechanism shall be positive, up and down, and equipped with suitable operating mechanism for manual control. Provide an indicator to show the vertical position of the gate and the thickness of the fuel bed.

2.4.1.1 Stoker Grate Heat Release Rate

NOTE: Normally the stoker grate heat release will be 1417 kW per square meter 450,000 Btu per square foot per hour when coal meeting the criteria set out in the Stoker Selection Criteria shown in NAVFAC Design Manual DM-3.6, Table 12 is used. When coal is specified which does not meet this criteria then the grate heat release will have to be lowered accordingly.

Not greater than [_____] kW per square meter Btu per square foot per hour at the specified maximum continuous rating for the boiler. The square meter feet of projected grate area shall be the product of the length measured between the inside of the coal gate and the centerline of the rear shaft or return bend and the width of the grate.

2.4.1.2 Construction

a. Fuel Feed Control: Control fuel feed to the stoker by the stoker speed and the vertical position of the coal regulating gate. Coal gate to vary the thickness of the fuel bed shall be of heavy cast iron with refractory facing to protect it from the furnace heat. The gate moving mechanism shall be positive, up and down, and equipped with suitable operating position of the gate and the thickness of the fuel bed.

b. Coal Hopper: Provide a coal hopper of 6 mm 1/4 inch thick Type 304 or 316 stainless steel plate at the front of each stoker. The capacity of the hoppers shall not be less than [_____] cubic meters feet.

c. Stoker Front Enclosure: Provide stoker fronts with dust tight enclosures of not less than 10 gage plate to eliminate dust from the boiler room and prevent air infiltration to the grate. Fit these fronts with access doors.

d. Air Plenum (Siftings Hopper) and Ducts: Provide an undergrate air plenum and air ducts for the stoker which will receive air from the
forced draft fan. Plenum and air ducts shall be not less than 10 gage steel plate. Provide concrete ducts or airways along the sides of the setting when adaptable to use by the stoker submitted. Provide ducts in accordance with drawings and requirements furnished by the stoker manufacturer. Provide unit with necessary observation doors or ports of the self-closing glass-covered type for side walls, including a minimum of four for observing the underside of the grate.

e. Stoker Air Zones: The stokers shall have not less than [_____] air zones with individual control to each zone in order to provide optimum control of combustion conditions for loads within the specified range and shall be so arranged that a positive air seal will be formed between each zone. Design the zones to provide removal of siftings. To ensure proper air distribution to each zone, provide an air control valve or damper for each zone. Control valves or dampers shall be hand controlled and shall be accessible for instant adjustment by the operator from the side of the stoker. Provide each zone with a pipe opening for a draft gage connection and provide connection in the overfire air duct for the same purpose.

f. Stoker Grate: Mount the traveling grate stoker grate keys (clips) on carrier bars supported from an endless heat treated type steel chain. Provide wearing shoes on the carrier bars to carry the grate weight on skid rails extending the length of the furnace. The chain links shall mesh with the shaft sprockets transmitting the driving force to the endless chain. Grate keys (clips) shall be chrome alloyed cast iron to resist growth. Links shall be uniform. Grates shall be made of the best quality, heavy duty, heat resisting, cast iron or cast alloy carefully cast to minimize initial strain. The sifting hoppers and removal system shall be so arranged that siftings may be removed from zones.

g. Grate Thermocouples: Provide two grate temperature sensing thermocouple arrangements on each grate to indicate and record grate temperatures on the operator's [interface console] [control panel].

h. Tension Adjustment: Provide a conveniently located adjustment accessible from outside of the boiler or through access plates in the stoker front cover for regulating the tension of the grate. Provide adequate adjustment for the chain length.

i. Stoker Seals: Provide the stoker with seals between the bottom of the sidewall header and the frame. Provide restraints in the boiler setting to prevent seals at rear of stoker from opening up.

j. Stoker Support: Stoker and drive shall be complete with supporting structural steel framework. Locate and protect structural supports so that they will not be overheated or damaged by heat from either the furnace or ash pit.

k. Grate Return Run Support: Adequately support the lower return run of the grate on a system of cross members and longitudinal members or skids. Provide an air seal between this lower drag frame and ash pit and siftings hopper.

2.4.1.3 Grate Ash Discharge Enclosure

Enclose rear end of grate, where ash is discharged into the hopper below the floor line, with a dust tight enclosure made of heavy steel plates
properly protected with fire brick where exposed to the furnace. Fit vertical ends of this enclosure with cast iron, refractory lined inspection and access doors, one for each feeder. Seal off roof of this enclosure with refractory, protecting metal parts from the furnace temperature with refractory. Exposed metal parts in the enclosure are not acceptable. Enclosure shall be compatible with the ash storage hopper as specified under the paragraph ASH HANDLING SYSTEM in this section.

2.4.1.4 Stoker Grate Drive

Drive the grate of the stoker through hydraulic drive, or with electrical motor and transmission equipment as specified below. Drive shall have a variable speed ratio of not less than six to one with the speed changing device, controlled automatically by the combustion control system. Provide a manual and reversing adjustment so the grate speed can be operated independent of the combustion control system. Provide adequate safety release to prevent damage to the drive or grates due to foreign material or jamming of the grates. Provide the front and rear shafts of the grates with an adequate lubrication system with fittings located on the outside of the setting.

a. Electric Motor: Motor shall be [_____] volt, [_____] phase, [_____] rpm, 60 Hz, totally enclosed, fan cooled, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

b. Mechanical Drive: Mechanical drive shall include variable speed transmission with gears and chains, enclosed in an oil tight case, and running in a bath of oil. Bearings shall be of the anti-friction type, with hardened inner and outer races and fitted with forced lubrication fittings.

c. Hydraulic Drive: Hydraulic drive shall include a complete hydraulic system with adequately sized reservoir, dual pumps, oil piping to and from drive, control and isolating valves, oil cooler, when required, with self-operated cooling water control valve, oil temperature indicator, and other accessories for a complete, satisfactory operating system.

2.4.1.5 Miscellaneous Equipment

Provide shafting, couplings, bearings, drives with guards, linkages, rods, and other miscellaneous equipment from the stoker manufacturer required or necessary for interconnecting of the stoker units and drives necessary for a complete operating system. Provide equipment even though it is not specifically mentioned herein. Gears, chains, belts, couplings, and other moving parts shall be properly enclosed or guarded.

2.4.1.6 Lubrication

The entire stoker mechanism shall have adequate provisions for proper lubrication where required and shall be equipped with conveniently located fittings for this purpose.

2.4.1.7 Overfire Air System

Provide an overfire air system from the stoker manufacturer to ensure good ignition at the stoker front and adequate control of smoking. System shall include necessary nozzles, ducts, and overfire air fan with motor drive. When more than one row of nozzles is supplied, provide individual air
volume control for each row or set as required. Locate nozzles or protect them with shields so as to prevent plugging of the nozzles in service. Nozzles shall be constructed of materials suitable for service at maximum temperatures anticipated. Provide necessary arrangements to the water wall tubes, arch construction, refractory, insulation, and casing from the boiler manufacturer, to permit installation of an adequate overfire air system. Overfire system shall be capable of providing a minimum of 15 percent of total combustion air at the required static pressure.

2.4.2 Traveling Grate Spreader Coal Stoker

Stoker shall be of the overfeed, synchronized, self-feeding, spreader stoker type with continuous cleaning forward moving bar and key grates suitable for burning a portion of the coal in suspension and burning the balance on the grates. Stoker shall be capable of continuous operation at such rate as required for the continuous output of not less than that specified for the boiler, and shall satisfactorily provide for automatic operation by means of the combustion control system, within the range given when burning the specified coal and operated in accordance with instructions supplied by the manufacturer. Stoker shall be considered an integral part of the steam generator and shall be subject to all applicable provisions of the boiler design and service conditions together with requirements of tests, performance guarantees and other warranties specified for the boiler. Coal analysis shall be [as specified in the Coal Analysis Schedule for the boiler] [as listed below].

2.4.2.1 Stoker Grate Heat Release

The active grate area shall be such that the heat release at the maximum continuous rating shall not exceed [_____] kW per square meter Btu per hour per square foot. At minimum boiler rating the stoker grate heat release shall be a minimum of [2280] [2850] MJ per square meter [200,000] [250,000] Btu per square foot; this results in a guaranteed turndown ratio of [_____] to 1. Grate area shall be the product of the width between the inside faces of the sidewall heaters at the grate line and the length of the air-supplied grate area. The grate shape shall be designed so that the heat release per front meter foot of stoker width does not exceed 2930 kW.
2.4.2.2 Construction

a. Fuel Feed Control: Coal shall be fed to and distributed in the furnace by not less than three overfeed type spreader stoker feeders for each boiler. Feeders shall be operated simultaneously and at synchronized speeds so that any one feeder may be taken out of service without affecting the operation of the others. Each feeder shall be readily adjustable to ensure proper fuel distribution within the furnace. Design and size the total combined width of the feeder openings for proper distribution of the fuel over the width of the stoker grate. Design shall be such that the combined width of the feeders shall not be less than 40 percent of the width of the stoker grate. The feeders shall be capable of handling and uniformly distributing coal varying in size from 6 to 32 mm 1/4 to 1 1/4 inches with no more than 40 percent passing a 6 mm 1/4 inch round mesh over the entire grate area. The feeder shall be capable of properly performing with moisture in the fuel as high as 15 percent by weight. Materials of construction shall be such that coal with high sulfur content can be satisfactorily used without extensive corrosion over the lifetime of the parts. Provide moving parts of the feeders with anti-friction type bearings and with a forced system of lubrication. Bearings subject to high temperatures shall be water cooled. Gear teeth shall be machine cut.

b. Coal Hopper: Provide a metal hopper for each spreader stoker feeder. Hoppers shall be not less than 6 mm 1/4 inch thick 304 stainless steel plate, rigidly reinforced and connected to the coal grates. Support hoppers from the floor or boiler columns to eliminate weight on the feeders. Provide hoppers with suitable cleanout doors located in the front.

c. Air Plenum (Siftings Hopper) and Ducts: The traveling grate/stoker shall be complete with under grate air plenum, manually operated blast gates and operating handles, and siftings hopper. Plenum and air ducts shall be not less than 10 gauge steel plate. Locate and protect structural supports so that they will not be overheated or damaged by heat from either the furnace or ash pit. Provide unit with necessary observation doors or ports of the self-closing glass-covered type for side walls, including a minimum of four for observing the underside of the grate.

d. Stoker Grate: Grates shall be made of the best quality, heavy duty, heat resisting, cast iron or cast alloy carefully cast to minimize initial strain. Specially design the grates for spreader stoker firing. Grates shall be of high resistance, air metering type with closely and uniformly spaced self-cleaning air openings. The grates shall have close fitting, overlapping edges to prevent air leakage at the joints. Provide undergrate air seals at both the front and rear ends fabricated of cast iron and counterweighted so that they will always be in close contact with the under sides of the grates. Construct the rear seal to proportion the air flow through the rear end of the grate to expedite coking and ignition of the coal, thereby properly conditioning it for efficient combustion when the fuel bed reaches the active air admitting area. Side seals between edge of stoker grate and boiler shall be approved bellows type.

e. Grate Thermocouples: Provide two grate temperature sensing thermocouple arrangements on each grate to indicate and record grate...
temperatures on the operator's [interface console] [control panel].

f. Tension Adjustment: Provide a conveniently located adjustment accessible from outside of the boiler or through access plates in the stoker front cover for regulating the tension of the grate. Provide adequate adjustment for the chain length.

g. Stoker Support: Stoker and drive shall be complete with supporting structural steel framework. Locate and protect structural supports so that they will not be overheated or damaged by heat from either the furnace or ash pit.

2.4.2.3 Grate Ash Discharge Enclosure

Enclose front end of grate, where ash is discharged into the hopper below the floor line, with a dust tight enclosure made of heavy steel plates properly protected with fire brick where exposed to the furnace. Fit vertical fronts of this enclosure with cast iron, refractory lined inspection and access doors, one for each feeder. Seal off roof of this enclosure with refractory, protecting the metal parts from the furnace temperature with refractory. Exposed metal parts in the enclosure are not acceptable. Enclosure shall be compatible with the ash storage hopper as specified under "Ash Handling System" this section.

2.4.2.4 Feeder Drives

At the option of the Contractor, the drives shall be either individually driven and controlled feeders or feeders driven by a line shaft with individual clutch arrangements.

a. Controlled Feeders: The individually driven and controlled feeders shall have a variable speed drive on each distributor and a silicon controlled rectifier (SCR) D.C. motor drive for each drum or feed box. A master controller shall receive a fuel demand signal from the combustion control system and control the individual slave controllers of the individual SCR units to satisfy the particular fuel demand. Control arrangement shall provide for simple adjustments between feeders for equal fuel delivery and also for single feeder biasing.

b. Line Shaft Feeder: The feeders driven by a line shaft shall be driven through a variable speed drive having a ratio of not less than three to one. Feeder drive shall be so arranged that each feeder is independently driven from a lineshaft so that any feeder can be engaged or disengaged without disturbing the operation of the remaining feeders. Fuel delivery shall be governed by the combustion control system.

c. For either stoker drive system, provide a complete operating unit with necessary shafting, couplings, bearings, drives with guards, linkages, rods, and other equipment, as required or necessary for any interconnecting of the stoker units and drives. This equipment shall be provided even though it is not specifically mentioned. Provide safety release to prevent damage to the units due to foreign materials in the coal or other causes of overload.

d. Distributor: The distributor shall be driven by a variable speed electric drive which is manually adjusted to achieve optimum distribution.
2.4.2.5 Stoker Grate Drive

Drive the grate the stoker by [hydraulic package] [electrical motor] [steam turbine] through a variable speed device with a speed ratio of at least six to one, with the speed changing device, controlled automatically by the combustion control system. Provide a manual adjustment to regulate grate speed ratio to fuel feed in order to compensate for variations in the ash content. Provide a suitable safety release device to prevent damage to the drive or grates due to foreign material or other obstruction interfering with the grate operation.

**************************************************************************
NOTE: Make heat balance to determine whether it is more economical to use turbine drives rather than electric motors.
**************************************************************************

a. Electric Motor: Motor shall be [_____] volt, [_____] phase, [_____] rpm, 60 Hz, totally enclosed, fan cooled, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

b. Steam Turbines: Drive shall be by steam turbine conforming to NEMA SM 23 as modified below. Turbine shall be noncondensing capable of producing braking power [_____] kW horsepower at [_____] rpm at a steam rate of not more than [_____] kg pounds per brake power hour. Inlet steam condition, upstream of built-in governor, shall be [_____] kPa (gage) psig and [_____] degrees C F. Exhaust steam conditions at exhaust nozzle shall be [_____] kPa (gage) psig. Turbine rotation shall be [clockwise] [counterclockwise] and shall be [direct connected] [geared] to the driven piece of equipment which shall operate at [_____] rpm. Piping connections 50 mm 2 inches and smaller shall be screwed. Connections 65 mm 2 1/2 inches and larger shall be flanged. Inlet flanges shall be raised face suitable for the inlet pressure specified. Exhaust flanges shall be Class 125 or Class 150 flat-faced flanges. Turbine shall be complete with insulation and lagging. Insulation shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Turbine governor shall be of direct oil relay type with 10 percent adjustable speed range. Lubrication shall be of the manufacturer's standard non-pressure type.

c. Mechanical Drive: Mechanical drive shall include variable speed transmission with gears, worm drives and bearings, enclosed in an oil tight case, and running in a bath of oil. Bearings shall be of the anti-friction type, with hardened inner and outer races and fitted with forced lubrication fittings.

[d. Hydraulic Drive: Hydraulic drive when required shall include a complete hydraulic system with adequately sized reservoir, dual pumps, oil piping to and from drive, control and isolating valves, oil cooler, when required, with self-operated cooling water control valve, oil temperature indicator, and other accessories for a complete, operating system. Hydraulic drive system motor, shall be [_____] volt, [_____] phase, 1200 rpm, 60 Hz totally enclosed, fan cooled, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

e. Miscellaneous Equipment: For a stoker drive system, provide a complete operating unit with necessary shafting, couplings, bearings, drives with guards, linkages, rods, and other equipment, as required or
necessary for any interconnecting of the stoker units and drives. This equipment shall be provided even though it is not specifically mentioned herein. The front and rear shafts of the grate are to be fitted with a forced system of lubrication with fittings located on the outside of the setting. The devices for changing the speed ratio of the grate drives shall be connected to the fuel feed regulation system, so both fuel feed and grate speed can be synchronized and controlled automatically by the combustion control system. A manual adjustment shall be provided to regulate grate speed ratio to fuel feed in order to compensate for variations in ash content of the fuel. A suitable safety release device shall be provided to prevent damage to the drives or grates, due to foreign material or other obstruction interfering with the grate operation. Gears, chains, belts, couplings, and other moving parts shall be properly enclosed or guarded.

2.4.2.6 Overfire Air System

**************************************************************************
NOTE: Designer should include bracketed sentence when cinder return (fly ash reinjection) will not be incorporated in the project.
**************************************************************************

Provide a high pressure overfire air system for each stoker, including fan, [motor drive,] ductwork, dampers and nozzles. The fan shall have a capacity of not less than 15 percent of the total air required at maximum steaming capacity when operating at the predicted amount of excess air in the furnace. Static pressure of the fan shall be sufficient to ensure full penetration of the furnace by the air jets, but not less than 6225 Pa 25 inches of water. Overfire air distribution nozzles shall be fabricated from heat resistant alloy. Locate air jets properly and in sufficient numbers to create proper furnace turbulence for complete combustion at all ratings. Make modifications and additions to the system to ensure penetration and turbulence of areas of the furnace as required after startup. [There will be no cinder return system incorporated in the overfire air system.]

**************************************************************************
NOTE: At the text below, delete the following paragraph on pneumatic cinder return (fly ash reinjection) system when this system will not be incorporated in the project.
**************************************************************************

[a. Cinder Return System (Fly Ash Reinjection): Provide a pneumatic cinder return system to reinject collected fly ash and unburned combustibles into the furnace. The system shall operate in conjunction with the overfire air system and shall be complete with necessary air lines, nozzles, ducts, and dampers for returning the cinders from the rear convection pass hopper of the boiler and the economizer soot hopper or air heater hopper. Cinder return lines, shall be constructed of abrasion-resistant iron having a Brinnell hardness of not less than 350, with the exception that the straight conveyor lines, starting at a point not less than 600 mm 2 feet downstream from each cinder pickup nozzle or elbow extending to within not less than 600 mm 2 feet of the furnace, may be constructed of extra strong Schedule 80 steel pipe. Provide glass viewing ports at the end of each cinder return line so that interior of lines are visible all the way through to furnace.
2.5 OIL BURNER/WINDBOX PACKAGE

NOTE: Choose this paragraph and its subparagraphs when oil is used.

NOTE: The designer shall fill in the appropriate information as defined in FS F-B-2910.

Provide a fully modulating, oil burner conforming to FS F-B-2910 Rev F, Class [______], except as modified below. Provide burner with windbox, forced draft fan, dampers, fuel train and associated controls to comprise a complete factory assembled package. Total heat input to boiler furnace shall be provided by [______] burners. Burner package shall be considered an integral part of the steam generator and shall be subject to applicable provisions of the boiler design and service together with requirement of tests, performance guarantees and other warranties specified for the boiler.

2.5.1 Burner

2.5.1.1 Burner Characteristics

The burner shall be quiet in operation and operate with a balanced clean, stable flame so as not to localize heat in any part of the combustion chamber. Burner shall be capable of completely atomizing and effectively mixing oil with air so as to ensure complete combustion. Air admitted shall be of sufficient quantity for complete combustion, but not of such quantity as to produce an undue percentage of excess air with high stack loss. Oil burner shall operate without clogging and shall have sufficient capacity to develop not less than the specified capacity. Burner unit shall be easily removed from firing position and readily accessible for inspection, cleaning and other purposes. Provide adequate observation ports on burner. Burner manufacturer shall guarantee that there will be no flame impingement on sidewalls, top, bottom, or rear walls of furnace. Burner manufacturer shall furnish, and contractor shall install refractory throat tiles or other items required for proper installation of burner.

2.5.1.2 Atomization

NOTE: Burners may be air atomizing or steam atomizing. When a separate compressed air system is used the designer shall fill in blanks with the quantity and pressure of compressed air that will be available for fuel oil atomization. The designer should allow for an adequate amount of atomizing air. Atomizing air requirements will vary depending on many factors including burner design, fuel oil characteristics, fuel oil pressure, air pressure and even furnace conditions. See NAVFAC Design Manual DM-3.6 for empirical information.

Burner shall be [steam atomizing; steam pressure at header is [______] kPa (gage) psig; steam temperature at header is [______] degree C F] [air atomizing; filtered compressed air shall be available for burner].
atomization and the maximum requirement for each burner shall not exceed [_____] L/s scfm of air at [_____] kPa (gage) psig. Provide pressure reducing valve and controls as required.

2.5.1.3 Electric Ignition System

Burner shall be equipped with an electric ignition system. System shall be either the high energy ignition or glow rod type. Gas ignition system is not acceptable. The high energy ignition system shall use stored energy to develop 2000 Vdc pulses. The glow rod system shall use a low voltage, carbon rod electrode which develops a tip temperature of 1427 degrees C 2600 degrees F. Provide ignition system complete in all respects.

2.5.1.4 Windbox

Construct of carbon steel plate not less than 10 gage thickness with 6 mm 1/4 inch thick front plate. Design windbox to provide even and uniform air entrance into the burner register and seal weld to the boiler front wall. Provide windbox with support legs.

2.5.1.5 Purge Connection

Provide [steam] [air] purge connection, properly valved, for purging oil from gun prior to removal from burner.

2.5.1.6 Aspirating System

**************************************************************************
NOTE: Provide aspirating system only for boilers in which the expected furnace pressure exceeds 1245 Pa 5 inches water.
**************************************************************************

Provide an air aspirating system for the fuel oil atomizer guide pipes to prevent blowback of hot furnace gases. Aspirating system shall use approximately [_____] L/s scfm of [_____] kPa (gage) psig compressed air.

2.5.1.7 Guide Pipe Purge

Provide piping and flexible hoses for the guide pipe purge and aspirating systems. Air from the forced draft fan shall be provided for guide pipe purging during normal operation.

2.5.1.8 Metal Parts

Metal parts exposed to radiant heat, including the atomizer shield, shall be of stainless steel or other approved alloy.

2.5.1.9 Fuel Oil Control Valve

Fuel oil will be supplied at [_____] kPa (gage) psig and [_____] degrees C F at the inlet of the fuel piping train. Size fuel oil automatic control valve for 103 kPa 15 psi differential pressure as specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.5.1.10 Fuel

ASTM D396, Grade no. [_____].
2.5.1.11 Forced Draft Fan

NOTE: The designer shall make a technical evaluation to determine when the forced draft fan should be integrated with or mounted separately from the windbox on the floor next to the boiler. When the forced draft fan is to be mounted separately, delete this paragraph and specify the fan in the paragraph FANS.

Fan shall be fully integrated with and mounted on the windbox. Provide an inlet silencer, when required, to ensure operation at noise level below 85 dBA as specified in Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL.

2.5.1.12 Electric Motor

NOTE: The designer shall perform an economic analysis and make a technical evaluation to determine when forced draft fan motor shall be provided with variable speed control. Generally, variable speed drives for forced draft fans over 7 1/2 kW 10 hp will be cost effective.

Motor shall be [variable speed], [_____] volt, [_____] phase, 60 Hz, [totally enclosed, fan cooled], [totally enclosed, non-ventilated], not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

2.5.2 Flame Safeguard Controls

Provide a complete system of valves, interlocks and controls in accordance with NFPA 85 and as approved by Factory Mutual Engineering and Research.

2.5.2.1 Fuel Oil Train

Provide fuel oil train consisting of [steam] [air] atomizing oil gun, auxiliary [steam] [air] atomizing oil gun for changing guns without a shutdown, fuel oil control valve, two safety shutoff valves recirculation valve, strainer, and flexible hose connections to oil burner package the following gages. Gages shall be 150 mm 6 inch with white coated dials and black figures:

a. Fuel oil supply pressure (0 to 1034 kPa (gage) 150 psig)

b. Fuel oil pressure at burner (0 to 1034 kPa (gage) 150 psig)

[c. Atomizing air pressure at burner (0 to 1034 kPa (gage) 150 psig)]

[d. Atomizing steam pressure at burner (0 to 1034 kPa (gage) 150 psig)].

2.5.2.2 Control Sequencing

Flame safeguard system shall be designed to ensure safe purge, light-off and shutdown procedures, and to monitor light-off, main flame and boiler...
operating conditions.

a. The flame safeguard system shall be of the automatically sequenced type with programming timed and sequenced by a heavy duty, industrial type timer. This timer shall be tamper-proof and shall be designed so that advancement of the timer to shorten purge will shut down the unit.

b. Provide system with [ultraviolet] [infrared] scanner and electronic relay located in the front wall which will shut down the fuel within 2 to 4 seconds of loss of flame.

c. Provide scanner output meter in panel for indication of scanner signal strength.

d. The safety system shall include the following limit devices incorporated into a limit circuit:

   (1) Flame failure
   (2) High boiler outlet pressure
   (3) Low fuel oil pressure
   (4) Low water level cutout
   (5) Low combustion air flow
   (6) Low atomizing [air] [steam] pressure
   (7) Any additional devices as required by FM or NFPA

   (8) Low fuel oil temperature

e. Safety system limits specified above shall be displayed on a first out annunciator mounted in the burner panel. [Provide a common alarm contact to be wired to the operator control console, specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.]

2.5.2.3 Light Off

Failure shall require a manual restart of the programmer. The safety system shall provide a mandatory purge with the forced draft fan vanes proven open, and a return to proven low fire position before light off. Main fuel valve shall open for a timed period of 10 seconds during trial for ignition.

2.5.2.4 Circuit Analyzer

Provide a circuit analyzer system, which, by means of 12 or more lights, will indicate which circuits are energized at specific time, and will thereby indicate any improperly operating circuit.

2.5.2.5 Control Panel

Programmer, limit control, relays, annunciator, shall be mounted in a [NEMA MG 1 control panel, modified with fully gasketed doors and panels mounted on burner package] [control panel as specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS].
2.6 FANS

2.6.1 Forced Draft Fan

**************************************************************************
NOTE: The fan type shall be specified in accordance with CID A-A-59222.
**************************************************************************

CID A-A-59222, Type [_____], Class 1, except as specified otherwise.

2.6.1.1 Fan Size

Size fans for complete combustion of fuel at maximum firing rate. Maximum fan speed shall not exceed 1800 rpm at test block rating with [10] [20] [40] percent excess air, taking into account design allowances, corrections for burner or stoker pressure drop, furnace pressure, combustion air temperature, plant elevation, and other design factors. Minimum static efficiency at maximum continuous rating shall be [_____] percent. Add the following allowances for momentary overloads and normal deterioration of fans, firing equipment, and boilers after sizing fans in accordance with the above to obtain the test block rating:

2.6.1.2 Fan Construction

Fan shall be arrangement [_____] in accordance with AMCA 801. Fan shall have backward inclined or backward curved single thickness blades. Fan shall have stable characteristics with self-limiting power curve. Construct fan wheel of steel. Balance fan wheel both statically and dynamically at factory. Provide fan with air cooled roller bearings mounted in horizontally split pillow blocks. Fan housing shall be welded constructed of a minimum of 12 gage steel. Provide flanged inlet and outlet connections, 50 mm 2 inch plugged opening in low point of scroll and hinged, quick opening access door in scroll. Provide a multi-blade vortex ball bearing damper in fan inlet with an extended, ball bearing mounted control lever for field connections to control actuator. Interior of fan, including wheel, shall be painted with two coats of red primer and one coat of rust resistant enamel with a total dry film thickness of 0.152 mm 6 mils. Exterior surface of the fan shall have two coats of red primer with a total dry film thickness of 0.10 mm 4 mils. Cleaning and painting shall be in accordance with the manufacturer's standards.

2.6.1.3 Fan Drive

Equip fans with [both] [a motor] [and] [steam turbine] drive. The [motor] [and] [turbine] shall be direct connected to the fan [with a gear type flexible coupling] [with a roller type, hardened steel clutch coupling consisting of an over-running clutch and double flexing coupling to permit
instantaneous change-over from one drive to the other. One clutch coupling shall be provided between the fan and each driver. Clutch couplings shall be selected for the maximum torque requirement of the fan, with a 1.5 service factor. Provide a removable guard over each clutch coupling].

2.6.1.4 Electric Motor

Motor for driving the forced draft fan shall be [_____] volt, three phase, 60 Hz, [open drip-proof] [totally enclosed fan cooled] [two speed] [variable speed] not less than [_____] kW hp, as specified under MOTORS AND DRIVES in this section, and shall not overload at the specified capacity with unheated cold air. [Fan motor shall be suitable for installation in a hazardous location as defined by NFPA 70.] Provide [_____] mm inch thick steel soleplate for motor. Soleplate shall be common for four motor mounting bolts. Separate parallel soleplate bars are not acceptable.

2.6.1.5 Steam Turbine

Steam turbine shall drive the fan through a reduction gear shall be single stage, rated at not less than [_____] kW hp, with inlet steam pressure of [_____] kPa (gage) psig, [_____] degrees C F total temperature and a normal exhaust back pressure of [_____] kPa (gage) psig or a maximum back pressure of [_____] kPa (gage) psig. Water rate at full load and normal steam conditions shall not exceed [_____] kg pounds per brake power hour. Maximum turbine speed shall not exceed [_____] rpm.

a. Turbine Construction: Turbine casing split on the horizontal centerline constructed of ASTM A48/A48M cast iron, with design pressure rating of 1724 kPa (gage) 250 psig at 232 degrees C 450 degrees F at the inlet, and 379 kPa (gage) 55 psig at 232 degrees C 450 degrees F at the outlet. Turbine shall also include a stainless steel steam strainer, sentinel relief valve, sight oil level indicator and two hand valves.

b. Turbine Bearings and Shaft: Bearings horizontally split, ring-oiled, sleeve type water-cooled. Shaft shall be stainless steel sprayed or chrome plated under the packing glands. Shaft seals shall be segmented carbon rings with springs and stops.

c. Speed Governor: Variable speed oil relay NEMA Class [A] [D] governor for speed limiting [and pneumatic operator to maintain an adjustable turbine speed]. [Input to the operator shall be a 20 to 103 kPa (gage) 3 to 15 psig pneumatic signal.] [Provide an electro-pneumatic transducer to accept the 4 to 20 mA signal from the controller specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.] [Turbine shall go to maximum rated speed on air failure.]

d. Emergency Overspeed Governor: Completely independent of the speed governor and shall operate a separate trip valve.

e. Insulation: Turbine shall be insulated and lagged by the manufacturer as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

f. Reduction Gear: High speed, heavy duty, double helical, full pressure lubricated, horizontal offset type with a service factor not less than 2 provided in a horizontally split casing. The gear and pinion shall be spray lubricated from a pressure lubricating system. The pressure lubricating system shall include a shaft driven oil pump, strainer,
cooler, pressure gage, low oil pressure switch, relief valve, reservoir and piping. Provide a high speed, gear type, forge steel coupling between the turbine and the gear. Reduction gear and turbine shall be mounted on a common baseplate.

g. Turbine Trip: Provide solenoid valve to trip turbine on failure of induced draft fan.

2.6.1.6 Noise Level

Noise level shall not exceed 85 dBA sound pressure level at 1 1/2 meters above the floor and 1 1/2 meters from the fan in any direction. [Provide heavy duty sound attenuator with screen on fan inlet to meet the sound pressure level requirements.]

2.6.2 Induced Draft Fan

******************************************************************************
NOTE: The fan type shall be specified in accordance with CID A-A-59222.
******************************************************************************

CID A-A-59222, Type [____], Class 2.

2.6.2.1 Fan Size

Size fans to handle combustion gases at maximum firing rate. Maximum fan speed shall not exceed 1200 rpm at test block rating. Design allowances and corrections for furnace, economizer, [scrubber,] [baghouse,] dust collector, breeching pressure drop when operating at [10] [20] [40] percent excess air, flue gas temperature, plant elevation, and other design factors shall be made. Add the following allowances for momentary overloads and normal deterioration of fans, firing equipment and boilers after sizing fans in accordance with the above, to obtain the required test block rating:

<table>
<thead>
<tr>
<th></th>
<th>Excess Volume</th>
<th>Excess Pressure</th>
</tr>
</thead>

2.6.2.2 Fan Construction

Fan shall be arrangement [____] in accordance with AMCA 801. Fan wheel shall be radial tip design (forward curved-backward inclined) or straight radial blade with shrouds for high efficiency design. Blading shall be 8 gage minimum thickness steel [with the addition of 6 mm 1/4 inch thick steel partial blade wear strips, 125 mm 5 inch minimum width each side of centerplate]. A minimum number of blades is preferred; a maximum of twenty-four is acceptable. Balance fan wheels both statically and dynamically at factory. Minimum static efficiency at maximum rating including allowances shall be 67 percent.

******************************************************************************
NOTE: At the text below, heat slingers may not be necessary on low temperature flue gas applications.

a. Bearings and Pedestals: Provide fan with water-cooled self-aligning sleeve type bearings mounted in suitable pillow blocks. Bearings shall be independent high temperature, oil lubricated, pedestal type with dust seals. [Provide fan shaft heat slingers.] Cast iron or fabricated steel pedestals mounted on fabricated steel soleplates shall be provided. Provide a self-contained temperature control valve, with water piping to control temperature of bearings.

b. Housing: Fan shall have 5 mm 3/16 inch thick welded steel housing and inlet boxes which shall be split with flanged and gasketed joints. Construction shall permit one piece removal of rotor from rear of fan without disturbing duct connections. Provide hinged, quick opening access door in scroll and inlet boxes and 50 mm 2 inch plugged openings in low points of scroll and inlet boxes.

c. Dampers: Provide inlet dampers with multi-parallel-stream flow blades with anti-friction bearings with 80 mm 3 inch minimum spacers and stuffing boxes to keep bearings cool. Dampers shall be mounted in 200 mm 8 inch channel frames and interconnected with one extended, ball bearing mounted control level for connection to control actuator.

d. Welding: Welding of fan components shall be in accordance with current production standards. High stress fan wheels shall be continuously welded. Low stress exterior housing bracing, dampers, and other similar components shall be intermittently, plug or continuously welded.

e. Painting: Interior of fan, including wheel, shall be coated with protective coatings suitable for the flue gas conditions expected to be encountered by this fan. Exterior surface of fan shall have coatings of quality weather and heat resistant paint. Fan shall be shop assembled and match-marked by manufacturer before dismantling for shipment. Surface cleaning and painting shall be in accordance with the manufacturer's standards for the service expected.

2.6.2.3 Fan Drive

Fans shall be equipped with [both] [a motor] [and] [steam turbine] drive. The [motor] [and] [turbine] shall be directly connected to the fan [with a gear type flexible coupling] [with a roller type, hardened steel clutch coupling consisting of an over-running clutch and double flexing coupling to permit instantaneous change-over from one drive to the other. One clutch coupling shall be provided between the fan and each driver. Clutch couplings shall be selected for the maximum torque requirement of the fan, with a 1.5 service factor. Provide a removable guard over each clutch coupling].

2.6.2.4 Electric Motor

Motor for driving the induce draft fan shall be [_____] volt, three phase, 60 Hz, [open drip-proof,] [totally enclosed fan cooled,] variable speed not less than [_____] kW hp, as specified under the paragraph MOTORS AND DRIVES in this section, and shall not overload over the range of the fan with unheated air. [Fan motor shall be suitable for installation in a hazardous location as defined by NFPA 70.] Provide [_____] mm inch thick steel soleplate for motor. Soleplate shall be common for each of the four motor
mounting bolts. Separate parallel soleplate bars are not acceptable.

2.6.2.5  Steam Turbine

Steam turbine shall drive the fan through a reduction gear and shall be
single stage, rated at not less than [_____] kW hp, with inlet steam
pressure of [_____] kPa (gage) psig, [_____] degrees C F total temperature
and a normal exhaust back pressure of [_____] kPa (gage) psig or a maximum
back pressure of [_____] kPa (gage) psig. Water rate at full load and
normal steam conditions shall not exceed [_____] kg pounds per brake power
hour. Maximum turbine speed shall not exceed [_____] rpm.

a. Turbine Construction. Turbine casing shall be split on the horizontal
centerline constructed of ASTM A48/A48M, cast iron, with design
pressure rating of 1724 kPa (gage) 250 psig at 232 degrees C 450
degrees F at the inlet, and 379 kPa (gage) 55 psig at 232 degrees C 450
degrees F at the outlet. Turbine shall include a stainless steel steam
strainer, sentinel relief valve, sight oil level indicator and two hand
valves.

b. Turbine Bearings and Shaft. Turbine bearings shall be horizontally
split, ring-oiled, sleeve type water-cooled. Shaft shall be stainless
steel sprayed or chrome plated under the packing glands. Shaft seals
shall be segmented carbon rings with springs and stops.

c. Speed governor variable speed oil relay NEMA Class D governor for speed
limiting and pneumatic operator to maintain an adjustable, preset draft
pressure in boiler by variation of turbine speed. Input to the
operator shall be a 30 to 103 kPa (gage) 3 to 15 psig pneumatic
signal. Provide an electro-pneumatic transducer to accept the 4 to 20
mA signal from the controller specified in Section 23 09 53.00 20 SPACE
TEMPERATURE CONTROL SYSTEMS. [Turbine shall go to maximum rated speed
on air failure.]

d. Emergency Overspeed Governor. Completely independent of the speed
governor and shall operate a separate trip valve.

e. Insulation. Turbine shall be insulated and lagged by the manufacturer
as specified under Section 23 07 00 THERMAL INSULATION FOR MECHANICAL
SYSTEMS.

f. Reduction Gear. High speed, heavy duty, double helical, full pressure
lubricated, horizontal offset type with a service factor not less than 2
provided in a horizontally split casing. The gear and pinion shall
be spray lubricated from a pressure lubricating system. The pressure
lubricating system shall include a shaft driven oil pump, strainer,
cooler, pressure gage, low oil pressure switch, relief valve, reservoir
and piping. Provide a high speed, gear type, forged steel coupling
between the turbine and the gear. Reduction gear and turbine shall
[each] be provided with a [common] [_____] mm inch thick steel
baseplate[s].

2.6.2.6  Noise Level

Not to exceed 85 dBA sound pressure level at 1 1/2 meters 5 feet above the
floor and 1 1/2 meters 5 feet from the fan in any direction. Sound
attenuation shall be provided to meet the sound pressure level requirements.
2.7 COMpressed Air System

2.7.1 Plant Air Compressor

Provide two plant air compressor systems, each with a compressor, filters, intercooler, aftercooler, accessories, control panel and controls. Provide a receiver for each of the two compressor systems.

2.7.1.1 Air Compressor

**************************************************************************
NOTE: Select standard L/s SCFM of air to compensate for plant elevation.
**************************************************************************

Packaged unit, FS XX-C-2816, as modified below. Each compressor capacity shall be not less than [94] [118] [142] [165] standard L/s [200] [250] [300] [350] scfm of air, at 20 degrees C 68 degrees F and [862] [1379] kPa (gage) [125] [200] psig at the discharge. Compressor speed shall not exceed [_____] rpm. Compressor shall be [belt drive] [direct drive] double acting, two stage, with flange mounted water cooled cylinders and heads. Provide a safety valve between each compressor discharge and its shutoff valve which is required on the discharge piping of the compressor. Provide a full flow type oil filter for positive forced feed lubrication and an electric thermostatically controlled immersion heater. Provide lifting lugs and tie downs.

2.7.1.2 Air Filter

Provide a dry type air filter constructed of pleated filter paper with protective stainless steel cloth on each side. Filter shall also act as a muffler and shall be readily removed for cleaning.

2.7.1.3 Intercooler and Aftercooler

Compressed air intercooler and aftercooler heat exchangers shall each be water cooled, with counter current flow, and shall be integrally mounted with no external air piping between compressor cylinders and cooler. Design heat exchangers to cool the total output air flow of the compressor to within 9 degrees C 15 degrees F of the inlet cooling water temperature. The tube bundles shall be removable for cleaning and inspection.

2.7.1.4 Air Receiver

Vertical tank with a minimum volume of [1585] [1840] [2717] liters [56] [65] [96] cubic feet. Design unit for [1034] [1724] kPa (gage) [150] [250] psig working pressure in accordance with the ASME BPVC SEC VIII. A receiver bearing the ASME Code Symbol stamp will be accepted as meeting these requirements. Provide an automatic condensate trap, safety valve, outlet connection, and a 114 mm 4 1/2 inch pressure gage ( [1379] [2068] kPa (gage) [200] [300] psig range).

2.7.1.5 Electric Motor

Motor shall be [totally enclosed fan cooled], [open-drip proof], [_____] kW hp, [_____] volts, [_____] phase, 60 Hz as specified under the paragraph MOTORS AND DRIVES in this section. Control circuits for motor shall be nominal 120 volts. [Provide removable totally enclosed belt guard.]
2.7.1.6 Controls

Provide controls and shutdowns necessary for automatic operation of the compressor package. House controls in NEMA 12 control cabinet. Controls shall consist of alarm and running lights, push buttons and selection switches for automatic dual control, 120 volt control transformer connected to power circuit serving the compressor, along with necessary time delay and control relays, and indicators. Provide automatic solenoid-operating cooling

a. Start-and-Stop Control: When set for start and stop control, motor shall stop automatically when discharge pressure reaches maximum pressure setting and start automatically when discharge pressure falls to minimum setting. Cylinders shall unload during periods of motor shutdown.

b. Constant Speed Control: Compressor shall operate continuously at constant speed. Provide means to automatically load and unload compressor at preset minimum and maximum pressure settings respectively. Provide means for automatic release of pressure within cylinders when the unit is operating without load. Also provide means for manual or automatic unloading of cylinders during starting of unit. Equip each compressor with a timed control to stop compressor after a 10 minute unloaded period when air is not used. Compressor shall re-start automatically at a preset minimum pressure.

c. A lead-lag system shall be provided to alternate compressor start-ups and to operate both compressors when discharge pressure cannot be met with one operational compressor. The operator selector switch shall have the following positions:

(1) Both compressors alternating as specified above;

(2) Compressor "A" operation only;

(3) Compressor "B" operation only;

(4) Off.

Total elapsed time shall be recorded for operation time of each compressor.

d. Compressor Safety Controls and Management Panel:

(1) Provide light in panel, alarm and shutdown of compressor for the following functions:

(a) High Main Bearing Temperature
(b) High Discharge-air Temperature
(c) High Discharge-air Pressure
(d) High Water Temperature for [Water Supply,] [Intercooler,] [Aftercooler,] [Lubrication Oil Cooler]
(e) Excessively High Motor Temperature
(f) Excessive Vibration
(g) Low Crankcase Oil Level
(h) Low Oil Pressure

1. Provide light in panel and alarm for the following functions:
   a. High Lubrication Oil Temperature
   b. Low Suction Pressure (Dirty Filter)

2.7.2 Instrument Compressed Air System

Provide two instrument air compressor systems each with a compressor, filters, aftercooler, accessories control panel, controls and receiver, [mounted on one supporting steel base with skids] [mounted separately].

2.7.2.1 Air Compressor

Each compressor shall deliver a minimum of [_____] std. L/s scfm of air at 20 degrees C 68 degrees F at a discharge pressure of 862 kPa (gage) 125 psig. Compressor speed shall not exceed [_____] rpm. Air compressor shall be belt drive, single stage, crosshead type, vertical, double acting, water cooled, non-lubricated head type. Compressor shall be specially designed for non-lubricated service, with a honed cylinder, piston rod packing, piston rings, and piston wearing rings. Valve guide inserts and wear rings shall be TFE. Valves shall be reversible and hardened, with stainless steel seat plates for nonlubricated service. Provide necessary sleeves, baffles, and collars to prevent oil carryover. Provide air-operated, piston type, free air unloaders for capacity reduction and starting. Mount inlet filter-silencer directly on the air inlet to the cylinder.

2.7.2.2 Aftercooler

Water cooled, with counter current flow, and installed directly between each compressor cylinder and the air receiver. Design cooler to cool the total output air flow of the compressor to within minus 9 degrees C 15 degrees F of the inlet cooling water temperature. Tube bundle shall be removable for cleaning and inspection.

2.7.2.3 Air Receiver

Horizontal tank with a minimum volume of [_____] liters cubic feet. Design unit for 1034 kPa (gage) 150 psig working pressure in accordance with ASME BPVC SEC VIII receiver bearing the ASME Code Symbol stamp will be accepted as meeting these requirements. Provide an automatic condensate trap, safety valve, and outlet connection.

2.7.2.4 Electric Motor

Motor shall be [totally enclosed, fan controlled], [open drip proof], [_____] kW hp, [_____] volt, [_____] phase, 60 Hz as specified under the paragraph MOTORS AND DRIVES in this section. Provide a removable, totally enclosed belt guard.

2.7.2.5 Accessories

Factory assemble air compressors, drives, controls, air receiver, aftercoolers, and miscellaneous hardware and mount on a steel supporting base. Provide lifting lugs and tie down attachments. Air, water, and
condensate piping shall be provided and terminated at the edge of the supporting base.

2.7.2.6 Controls

Provide controls and shutdowns necessary for automatic operation of the compressor package. House controls in NEMA 12 control cabinet. Controls shall include alternator control to switch compressors from lead to lag and run both compressors when needed; 120 volt control transformer connected to power circuit of compressor; air discharge pressure gage; selection switches for constant speed for automatic dual control, along with necessary time delay and control relays. Provide automatic solenoid-operated cooling water valve in the cooling water line to the compressors and aftercoolers. Factory wire control cabinet and mount as a part of the package. Compressor safety controls and management panel shall be provided as specified in the paragraph PLANT AIR COMPRESSOR, located in this section.

2.7.3 Air Dryers

**************************************************************************
NOTE: Choose the following subparagraph or the subparagraph COMPRESSED AIR REFRIGERATED AIR DRYER.
**************************************************************************

2.7.3.1 Compressed Air Desiccant Air Dryer

**************************************************************************
NOTE: The refrigerated air dryer is limited with an atmospheric dew point of approximately minus 23 degrees C 10 degrees F equivalent to minus 12 degrees C plus 10 degrees F at 172 kPa (gage) 25 psig and 2 degrees C 35 degrees F at 690 kPa (gage) 100 psig, and where this may be a problem the desiccant air dryer should be used as a much lower dew point can be attained.
**************************************************************************

Provide for systems exposed to freezing temperatures [one] [two] compressed air dual chamber type desiccant dryer[s] each of sufficient capacity for each system listed below. Each dryer shall be equipped with an automatic regeneration system which uses [steam heated dry air] [unheated dry air] for the regenerative media. The capacity of each dryer shall be such that compressed air, in the quantities listed below will be dried from a saturated condition at [_____] degrees C F to a pressure dew point of minus 40 degrees C F.

<table>
<thead>
<tr>
<th>Service</th>
<th>Capacity (Each Tower)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baghouses</td>
<td>[_____] L/s at 862 kPa (gage)</td>
</tr>
<tr>
<td>Ash Handling</td>
<td>[_____] L/s at 862 kPa (gage)</td>
</tr>
<tr>
<td>Instrumentation</td>
<td>[_____] L/s at 862 kPa (gage)</td>
</tr>
</tbody>
</table>
The contact time of the air in the chambers shall not be less than 4.5 seconds. Velocity of the air shall be less than that which will fluidize the desiccant bed. Pressure drop through the unit when operating at rated flow shall not exceed 27 kPa 4 psi. Units shall be field adjustable to maintain the pressure dew point of the dried air at any preselected value below operating temperature, to minus 40 degrees F. Units shall have as an integral part of the construction an indicator showing the water content of the dry air and a calibrated adjustment control to change the water content to any preselected level. Desiccant dryers shall provide a continuous supply of dry air by automatically cycling operation of the desiccant beds.

a. Chambers: Designed for 1034 kPa (gage) 150 psig working pressure in accordance with the ASME BPVC SEC VIII, and so stamped. Each chamber shall be fitted with separate fill and drain ports so that inlet and outlet piping manifolds need not be removed to fill or drain the chambers. Each chamber shall be provided with stainless steel screens at the inlet and the outlet to contain the desiccant bed, pressure gage, and safety valve. Normal air flow during drying shall be upward through the desiccant chamber. Desiccant shall be spherical activated alumina.

b. Regeneration: Accomplish by depressurizing the chamber on reactivation and purging with a portion of the dry outlet air from the chamber on stream. Purge air flow shall be downward. Maximum allowable purge flow rate at design conditions shall be 10 percent of design capacity of dryer. Purge system shall be controlled by a cam timer such that each desiccant bed is regenerated as required. Provide a flow control valve, flow indicator, and exhaust muffler for the purge system.

c. Controls: Cam timer, switches and relays shall be housed in a NEMA 12 control panel, mounted as part of the dryer. Provide interconnecting wiring in accordance with Division 16. In the case of electrical power failure, automatic valves shall fail in the open position to allow the wet gas to pass through the chambers. Provide gages to indicate pressure in each chamber.

d. Accessories: Dryer shall be complete with necessary solenoid operated control valves, check valves, and interconnecting piping. Mount equipment on a steel base plate suitable for floor mounting. [Provide pressure reducing valve to reduce pressure to suit desiccant dryer.]

e. Prefilter: Provide prefILTER upstream of dryer to remove oil vapor, liquid water, and solid particles. Prefilter shall have greater than 99 percent efficiency in removing both 0.5 micron diameter solid particles and 0.5 micro diameter oil aerosol. Filter shall have replaceable oil absorbing filter element which turns red to indicate saturation with oil and which shall be mounted in a transparent cast methyl methacrylate tube for visibility and inspection while on stream. Protect transparent acrylic tube by a safety shield.
f. Afterfilter: Provide an additional afterfilter for instrument air. Filter shall combine three filter mechanisms—mechanical separation, coalescence and absorption in a single, cartridge type unit. Filtration efficiency shall be greater than 99.99 percent at 0.5 micron particle size for oil and other contaminants. A visible color change shall indicate when element should be replaced.

[2.7.3.2] Compressed Air Refrigerated Air Dryer

**************************************************************************
NOTE: Choose this subparagraph or the above subparagraph COMPRESSED AIR DESICCANT AIR DRYER.
**************************************************************************

**************************************************************************
NOTE: The refrigerated air dryer is limited with an atmospheric dew point of approximately minus 23 degrees C 10 degrees F equivalent to minus 12 degrees C plus 10 degrees F at 172 kPa (gage) 25 psig and 2 degrees C 35 degrees F at 690 kPa (gage) 100 psig, and where this may be a problem the desiccant air dryer should be used as a much lower dew point can be attained.
**************************************************************************

Provide for systems not exposed to freezing temperatures a self-contained refrigerated type compressed air dryer capable of drying [_____] std. L/s scfm of air to an atmospheric dew point of not less than minus 23 degrees C 10 degrees F with entering air at 38 degrees C 100 degrees F, saturated. Dryer shall be complete with heat exchanger, a commercial quality refrigeration system, a moisture separator and condensate trap. Maximum operating pressure of the dryer shall be [_____] kPa (gage) psig. Install dryer between the receiver and distribution line.

Provide internal tubing, wiring, and piping complete, such that only connections to air inlet and outlet, to refrigerant compressor contractor, and to condensate drain are necessary.

a. Heat Exchanger: Heat exchanger shall consist of air and refrigerant coils surrounded by aluminum granules of sufficient mass to ensure adequate cooling capacity for varying air flow loads without causing excessive refrigeration cycling. Moisture separator shall be of centrifuge type and shall be located within the heat exchanger to provide for moisture separation at point of minimum air temperature. Suitably control heat exchanger temperature and provide an automatic control system, whose sensing element is located in the aluminum granules, to shut down the refrigeration system on low or no load conditions. Provide means to ascertain exchanger temperature.

b. Refrigeration Unit: Hermetically sealed type and shall operate intermittently at all but maximum load conditions. House entire unit in a steel cabinet. Provide cabinet with access door and panel for easy access to each part for maintenance and inspection.

c. Refrigerant: CFC-based refrigerants are prohibited. Refrigerant must have an Ozone Depletion Potential (ODP) no greater than 0.0, with exception to R-123.
d. Instrumentation and Control: Include control panel in dryer cabinet containing:

(1) Indicators for the following services: Inlet air pressure gage, discharge air pressure gage, inlet air temperature gage, refrigeration compressor suction pressure gage, refrigeration compressor discharge pressure gage, power interruption light, and high temperature light.

(2) Electrical relays located in an enclosed portion of panel, accessible for ease of servicing.

(3) Green "POWER ON" indicating light.

(4) Controls and interlocks to maintain required compressed air dew point and to cycle air-cooled condenser with refrigeration compressor.

(5) Dryer capable of automatic zero to 100 percent capacity control. Dryer shall use an automatic control expansion valve with sensing bulb to control capacity; dryer to have automatic shutdown switch sensor located at point of lowest temperature to prevent freezing.

e. Filters: Provide a disposable cartridge type prefilter and afterfilter at the air dryer. Filter cartridges shall have a differential pressure rating, and the design flow clean pressure drop shall not exceed 1.40 kPa 0.2 psi. Filter shall be designed to remove liquid water and oil particles 5 microns and larger. Provide an additional afterfilter for instrument air. Filter shall combine three filter mechanisms - mechanical separation, coalescence and absorption - in a single, cartridge type unit. Filtration efficiency shall be greater than 99.99 percent at 0.5 micron particle size for oil and other contaminants. A visible color change shall indicate when element should be replaced.

f. Pressure Reducing Regulator: Self-operating type designed for not less than a 1724 kPa (gage) 250 psig operating pressure, a normal operating temperature range of minus 29 degrees C 20 degrees F to plus 66 degrees C 150 degrees F, and shall deliver constant reduced pressure compressed air. Regulator shall have an adjustable outlet pressure range of at least 34 to 690 kPa (gage) 5 to 100 psig with not less than 4 ranges. Provide external adjusting screw for adjustment throughout each spring range. Provide internal pressure tap for outlet pressure registration.

]2.8 BREECHING, EXPANSION JOINTS, STACKS AND DAMPERS

2.8.1 Breeching

Rectangular cross section, stiffened on sides, top and bottom, and fabricated of not less than 5 mm 3/16 inch thick black steel plate unless otherwise noted. Stiffeners shall be not less than 65 by 50 by 6 mm 2 1/2 by 2 by 1/4 inch steel angles welded to exterior with 50 mm 2 inch leg outstanding. Separation of stiffeners shall not exceed one meter 3 feet o.c. [Connect breeching to [each boiler flue gas outlet,] [intermediate heat recovery equipment,] [air pollution control equipment,] [and to stack as required].]
2.8.1.1 Breeching Access Doors

**************************************************************************
NOTE: Specify locations for breeching access and cleanout doors. Where practical show locations on project drawings. Show access and cleanout door details on project drawings.
**************************************************************************

Construct access doors with frame and hinged door of cast iron or reinforced steel plate. Frame shall be not less than 686 by 787 mm 27 by 31 inches with access opening of not less than 508 by 610 mm 20 by 24 inches. Connection to breeching shall be gasketed and made with minimum 15 mm 1/2 inch diameter hot-dipped galvanized bolts, lockwashers, and nuts spaced not more than 125 mm 5 inches on center. Sides of the access door shall have not less than two quick clamp positive closing latches, with the long side opposite the hinges containing three clamps to give a gastight seal. Side of access door opposite the hinges shall contain a minimum 80 by 125 mm 3 by 5 inch size handle. Provide a gasket consisting of 10 mm 3/8 inch diameter fire proof resilient rope seal and mastic compound between the hinged access door and the access door frame. Provide breeching access doors at the following locations [and where indicated]:

[ a. [____] ]

][b. [____].

2.8.1.2 Breeching Cleanout Doors

**************************************************************************
NOTE: Specify locations for breeching access and cleanout doors. Where practical show locations on project drawings. Show access and cleanout door details on project drawings.
**************************************************************************

Construct cleanout doors of not less than 5 mm 3/16 inch thick steel plate. Secure cleanout doors to a 32 by 32 by 5 mm 1 1/4 by 1 1/4 by 3/16 inch thick angle frame with 10 mm 3/8 inch hot-dipped galvanized mounting bolts welded to the angle frame and spaced not over 150 mm 6 inches on center. Weld frame to breeching and provide a 3 mm 1/8 inch gasket between frame and cleanout door. Cleanout doors shall be not less than 610 by 610 mm 24 by 24 inches except where breeching dimensions are smaller, in which case the cleanout door shall be full height of the breeching and not less than 610 mm 24 inches in width. Provide breeching cleanout doors at the following locations [and where indicated]:

[ a. [____] ]

][b. [____].

2.8.1.3 Breeching Connections and Joints

Weld breeching joints [unless indicated or specified otherwise]. Welding shall conform to AWS D1.1/D1.1M and AWS D1.3/D1.3M. Bolts for bolted connections shall be hot-dipped galvanized bolts not less than 15 mm 1/2 inch diameter and spaced not more than 80 mm 3 inches apart, with hot-dipped galvanized lockwashers, and nuts. Provide bolted joints with a minimum of 3 mm 1/8 inch thick gaskets. Bolt flanged breeching connections
to boilers, equipment items, dampers, expansion joints, and breeching accessories. Flanged breeching connections to equipment shall be drilled to match flanges on equipment. Flanged joints shall be sealed welded to make connection gas-tight.

2.8.1.4 Breeching Structural Materials

**************************************************************************

NOTE: Designer shall detail breeching supports and breeching stiffening. Breeching hangers shall be designed to carry not less than 5 times the breeching weight, or the breeching weight plus weight of fly ash when breeching is half full plus 136 kg 300 pounds whichever is greater. Hangers for rectangular breeching shall be of the trapeze type with angle or channel support members and hanger rods. Breeching shall be stiffened with angle or channel members as required to withstand internal breeching static pressure. Designer shall verify that expansion joint flexure for axial travel is suitable. Expansion joints shall be detailed on the drawings.

**************************************************************************

Structural and support materials shall be steel and comply with the applicable sections of the AISC 303 or AISC 360. [Support and stiffen breeching as indicated].

2.8.1.5 Insulation

Provide insulation on breeching as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.8.1.6 Breeching Paint

When breeching is shop fabricated, wire brush and clean interior and exterior with a nonflammable solvent and paint with FS TT-P-28 heat resistant paint, immediately after fabrication. When breeching is to be fabricated on the job, prime paint steel sheets, one coat each side, prior to delivery to job site.

2.8.2 Expansion Joints

2.8.2.1 Metallic Breeching Expansion Joints

Provide factory fabricated metallic breeching expansion joints [where indicated]. Expansion joints shall be guided metal bellows type capable of a minimum of [_____] mm inches of axial travel. Form metal bellows from not less than 1.60 mm 1/16 inch thick type 321 stainless steel plate. Cover plates shall be not less than 3 mm 1/8 inch thick steel plate.

2.8.2.2 Non-metallic Expansion Joints

Provide factory fabricated non-metallic breeching expansion joints 3 mm 1/8 inch minimum thickness [where indicated]. Expansion joints shall be constructed of fluoroelastomer vulcanized to two plies of knitted wire mesh capable of a minimum of [_____] mm inches of axial compression, [_____] mm inches of axial extension and [_____] mm inches of lateral offset [unless indicated otherwise]. Joints shall have a continuous operating temperature
rating of 204 degrees C 400 degrees F, with excursion design standards up to 400 degrees C 750 degrees F. Operating pressure range shall be minus 34 kPa (gage) 5 psig to plus 34 kPa (gage) 5 psig. Expansion joints shall be pre-formed with integrally molded corners, suitable for mounting against a 150 mm 6 inch flange. Provide carbon steel backup bars with slotted holes, bolts, and nuts.

2.8.3 Stacks

2.8.3.1 Stacks With Flue Gas Scrubbers

**************************************************************************
NOTE: Use stack with acid resistant lining if temperatures below dew point of flue gas are expected in stack. Designer has to consider down drafts in stack at low firing rate.
**************************************************************************

Stacks shall be free standing, self-supporting, steel construction with an acid resistant lining system. Provide each stack complete with all accessories and appurtenances, including test ports, sampling platforms, ladders, safety climb devices, anchors, sleeves, insulation, stainless steel base and chair rings, and clean-out door.

a. Construction: Acid resistant lined steel stacks shall be fabricated of [ASTM A242/A242M, Type 1] [ASTM A36/A36M] structural steel plate with a 1.60 mm 1/16 inch corrosion allowance. Design shall include a static analysis of stack of wind loadings and critical wind velocity and dynamic analysis of stack including damping of vortex shedding and seismic response. Minimum steel plate thickness of stack shall not be less than 6 mm 1/4 inch. Stack sections shall be of welded construction and fabricated in sections not to exceed normal shipping limitations. Longitudinal seams shall have full penetration, continuous butt-welded joints. The section or horizontal joints of the stack shall also be full penetration continuous butt welds. Welding shall be done by certified welders. Secure the stack to the foundation by a base plate with gussets, counterforts or steel beams provided as required. A reinforced concrete foundation, the design of which shall be approved by the stack manufacturer, shall be provided. Base construction of the stack shall transmit forces and moments in the shell to the [foundation] [supporting steel] without local stresses of appreciable magnitude being induced in the shell or exceeding the allowable stresses of the supporting [concrete] [steel].

b. Stack-Breeching Connection: A lined breeching connection of the same wall thickness as the stack shall be welded to the stack and the steel jacket of the stack reinforced as required to compensate for the structural strength of steel removed. A flange for bolting breeching to the connection shall be provided. A hinged cast iron or steel cleanout door with refractory lining and heavy duty steel frame shall be provided at the bottom of the stack. Frame and door shall be fitted gastight. Door shall be a minimum of 457 by 610 mm 18 by 24 inches in size.

c. Block Lining: Provide a lining consisting of inorganic borosilicate glass blocks bonded to the steel. Entire inside of each stack shall be sandblasted to a white metal blast finish. Block shall be 40 mm 1 1/2 inches thick, constructed of totally organic-free closed cell borosilicate glass. Blocks shall be shaped to reasonably match the
inside of the stack and beveled to match adjacent blocks such that no gaps between surfaces shall be greater than 3 mm 1/8 inch. Blocks shall be bonded to the steel and adjacent blocks with a two compound, urethane adhesive membrane. Adhesive membrane shall be trowelled to both the steel and block. Blocks shall be pressed into place in accordance with the manufacturer's instructions to provide a bond free of voids.

d. Optional Stack Lining: In lieu of the borosilicate glass block lining specified above an acid resistant cast insulating refractory lining with an acid resistant membrane liner over an anchoring system may be provided. Lining system shall be suitable for use in the pH range of 1.6 to 8. Liners composed of calcium aluminate or calcium silicate will not satisfy service requirements of the stack system.

(1) Membrane Liner: Urethane-Asphalt, or suitable similar material, which has been used successfully in similar installations to protect stacks from acid attack when flue gas temperatures are below their dew point. Service temperature range of the liner shall be minus 40 to plus 82 degrees C 180 degrees F, when applied to a thickness of 3 mm 1/8 inch.

(2) Refractory Lining: Potassium silicate single component chemically hardened cement or two component potassium silicate bonded cement with an inert filler material such as silica, or suitable similar material, gunite applied or cast monolithic insulating refractory, suitable for use on flue gas from 66 degrees C 150 degrees F and up to 232 degrees C 450 degrees F and resistant to continuous exposure of sulfuric acid, nitric and nitrous acid, carbonic acid and other liquids, in the pH range of 1.6 to 8 and formed when the surface of the stack is at a temperature at and below the flue gas dewpoint.

(3) Membrane/Refractory Lining Certification: Manufacturers of the membrane liner and the refractory lining shall certify that the lining system to be provided in the stack shall be suitable for the specific application, considering the flue gas temperature, velocities, moisture content and corrosive qualities of the fuel being burned.

(4) Refractory Lining Anchor System: Tinned metal anchors welded to the stack wall, or wire mesh fabric welded to anchors welded to stack wall, shall support the refractory lining of the stack. Tinned anchor system shall have anchors welded to stack shell on vertical spacing not greater than 200 mm 8 inches on center and horizontal spacing not greater than 100 mm 4 inches on center, in staggered rows to provide a minimum of 48 4.5 anchors per square meter foot. Wire mesh fabric shall be No. 10 or 12 wire gage made into a welded fabric approximately 50 by 50 mm 2 by 2 inches mesh size. Mesh shall be welded to anchors o.c. not to exceed [250] [300] mm [10] [12] inches. Mesh and anchors shall be of the same alloys.

(5) After anchor system is welded in place, blast clean entire inside surface of stack including stack base, and anchor system to a white metal blast finish and then coat with two coats of membrane liner to a total minimum thickness of 3 mm 1/8 inch. The stack base shall be included in the coating system. Prior to the installation of the refractory, spark test coated surfaces with a
holiday detector to ensure membrane is free of voids. Refractory lining shall be trowelled on or pneumatically applied to a minimum thickness of 76 mm 3 inches.

(6) Design of anchor system and application of refractory lining shall permit expansion and prevent cracking of the refractory.

e. Manufacturer's Calculations Required for Foundation and Stack:

(1) Foundation (including bearing and moment forces) reinforcement and anchor bolts

(2) Stack

- Stresses due to various loading conditions including wind and seismic loads
- Vibration and damping
- Heat transfer at various design and ambient conditions
- Expansion profiles
- Shipping and erection stress analysis

f. Finish: Stacks shall be shop coated prior to shipping from the factory. After erection, touch-up damaged shop coated surfaces and apply a prime coat and two coats of finish paint suitable for the temperatures and environmental exposure as specified in Section 09 90 00 PAINTS AND COATINGS.

g. Platforms and Ladders: Stacks shall be provided with platforms for sampling tests, monitoring equipment maintenance and obstruction-lighting maintenance. Access to lower platform shall be by ASTM A242/A242M, Type 1, steel [stairway] [catwalk or platform] [ladder] from the [heating plant] [pollution control building] [ground level]. Design for a minimum live load on platforms to be 488 kg 100 pounds per square meter foot. Platforms shall be not less than 1220 mm 48 inches wide and the sampling platform shall be a minimum width of 610 mm 2 feet plus the stack diameter, but not more than 3 meters 10 feet in width. Toe plates shall be not less than 150 mm 6 inches high around the platform perimeter. Platform railings shall have two intermediate railings. Ladders shall be [caged] corrosion resistant steel, 406 mm 16 inches wide with 305 mm 12 inch rung spacing. Ladders shall be provided from the lower platform to the top of each stack and shall be provided with a full length stainless steel safety climb device. The climb device shall consist of a notched rail attached to the rings' centerline with a sleeve which rides on the rail and locks into position on a sudden downward pull. Two belts for attaching the device to the climber shall be furnished.

h. Anchor Bolts: Provide anchor bolts, nuts, washers and sleeves to properly anchor the stacks. Stack manufacturer shall furnish certified dimensional drawings showing location for setting bolts in concrete.

i. Miscellaneous:

(1) Sample Ports: Provide two sample ports at 90 degree orientation to each other about 1220 mm 4 feet above platform. Each sample
port shall consist of a 100 mm 4 inch diameter pipe welded to the steel jacket and provided with a flange and mating blind flange. Provide openings required for installation of opacity monitor and SO2 analyzer specified in Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS. [Locations of sample ports and instrumentation openings shall be as detailed on drawings].

(2) Obstruction Lighting: Provide an obstruction lighting system for each heating plant stack, consisting of one red, flashing, 300 millimeter hazard beacon atop each stack, two steady burning, red obstruction marker lights halfway up each stack, photoelectric and flasher controls, weather-tight terminal boxes, cable, and conduit.

(a) Hazard Beacons: Federal Aviation Administration FAA AC 150/5345-43, Type L-866.

(b) Obstruction Lights: FAA AC 150/5345-43 Type L-810.

(3) Painter's Trolley: Provide a ring of Type 304 stainless steel to support an inspection or painter's trolley. Provide a three wheel standard steel flat rail trolley of 227 kg 500 pounds capacity. Guide trolley to prevent it from leaving the track.

**************************************************************************
NOTE: Velocity cones decrease cold air down drafts and increase velocity of discharged flue gas but increase flow resistance of stack; they may be used when justified.
**************************************************************************

(4) Velocity Cone: Provide stack with an acid resistant lined truncated velocity cone. Velocity cone shall be lined with the same insulating refractory as applied to the stack with a 80 mm 3 inch minimum thickness. Cone shall be 1220 mm 4 feet long, bolted to top of stack, and shall taper to a diameter of [_____] mm inches inside.

2.8.4 Dampers

2.8.4.1 Multilouver Dampers

Provide factory fabricated parallel multilouver dampers for two position service (open-closed) and opposed blade damper for modulating control. Construct damper frame of distortion resistant welded steel channels with raised seat to ensure free nonbinding operation of blades and to keep blades square in the frame. Construct blades of [_____] mm inch thick steel plate in a stressed skin airfoil-shape with fully welded seams containing no external ribs. Blade deflection in mm inches shall not exceed the length in mm inches divided by 360, consistent with AISC 360 beam deflection criteria. Blade shafts shall be stainless steel. Blades shall be pinned to blade shafts. Louver shaft bearings shall be outboard type and shall be self-lubricating and self-cleaning. Bearing seals shall be gastight.

a. Multilouver Damper Linkage: Damper linkage shall be adjustable and of pinned construction for easy removal and shall be designed to handle full operation torque. Linkage on dampers in clean flue gas areas shall operate from a single connection point.
b. Control Damper Operators: Provide control damper operators as shown. Operators shall be pneumatically operated with positive positioning, manual override, and hydraulic or oil immersed gear trains. Each operator shall be full-proportioning type, with spring return to position shown in case of loss of power. Damper operating speeds shall be selected and adjusted so that operators will remain in step with controllers. Operators acting in sequence with other operators shall have adjustment of control sequence as required by the operating characteristics of the system.

c. Two-Position Damper Operations: Two-position damper operators shall be pneumatically operated with air cylinder, four-way valve, and solenoid valve arrangement.

2.8.4.2 Guillotine Dampers

**************************************************************************

NOTE: Guillotine dampers shall be used for open-shut service where tight shutoff is required for example, for air pollution control equipment bypass dampers.
**************************************************************************

Provide factory fabricated guillotine dampers with heavy structural frame rigid enough to support the extended blade and external loads through the breeching flange. Damper shall be capable of operating without precleaning or manual assistance under normal operating conditions. Provide enclosed bonnets [where indicated]. Provide 80 mm 3 inch diameter cleanout ports on both sides for cleaning bottom sections.

a. Guillotine Damper Blade: A stress-relieved flat plate. Damper blade shall be nonwarping; intermediate blade supports are acceptable to limit blade deflection. Leading edge of damper blade shall be beveled and capable of guiding damper blade into frame seat. Blade guides shall be continuous and self-cleaning and capable of preventing binding from deposits and damage from misalignment. Bonnet guides shall be removable and damper shall be designed so that a damper blade can be replaced without opening the frame.

b. Guillotine Damper Bonnet Seal: Provide bonnet seal to effectively seal against atmospheric leakage under normal operating conditions.

c. Double-bladed Guillotine Dampers: Provide where indicated. Damper frame, blades, and bonnet seals shall be as specified for single-bladed guillotine dampers, except frame shall be thicker and two blades shall be provided instead of one. Double-bladed guillotine damper shall provide absolute zero leakage across damper blades. This shall be accomplished by utilizing a blower to introduce air into the space between the damper blades. Blower shall be mounted on damper frame complete with isolation valve. Blower shall have sufficient capacity to maintain a pressure of at least 498 Pa 2 inch water column over breeching pressure.

d. Guillotine Damper Drive: A positive dual endless chain drive capable of driving damper in both directions. Chain-drive head shaft shall have sufficient torsional rigidity to prevent binding of blade when the blade is stalled. Damper shall be motor-operated with manual override. Design drive mechanism to prevent back driving of motor. Entire drive mechanism shall be of a simple design and require no routine
maintenance other than inspection. Chain shall be capable of operating up to the stall torque of the damper drive motor.

e. Electric Motor: Motor shall be [totally enclosed fan cooled] [open drip-proof], [_____] kW hp, [_____] volt, [_____] phase, 60 Hz, as specified under the paragraph MOTORS AND DRIVES in this section. Provide removable, totally enclosed chain guard.

2.9 COAL HANDLING EQUIPMENT

2.9.1 Railroad Hopper Car Thawing System

**************************************************************************
NOTE: Pit type railcar thawing system is capable of operating on natural gas, liquified petroleum gas or No. 2 fuel oil. The radiant heat (infrared) type railcar thawing system can only burn natural gas or liquified petroleum gas or use electric resistance heaters. The radiant heat (infrared) type provides a slower method of thawing but causes less damage to the railroad car finish and is preferred provided natural gas or liquified petroleum gas or electrical power is economically available and permitted by current D.O.D. policy.
**************************************************************************

Hopper car thawing system shall be pit-type or prefabricated surface mounted enclosed type or electric radiant type hopper car thawing unit and shall include burners, controls, combustion air blowers, fuel storage and handling, and related work. Design system to thaw 56 Mg 55 ton, 71 Mg 70 ton and 102 Mg 100 ton capacity coal cars. System shall be capable of thawing [_____] bottom hopper unloading coal cars simultaneously. Railroad hopper car thawing system shall utilize [No. 2 fuel oil] [natural gas] [liquified petroleum gas] as a fuel. Provide a sufficient number of heaters to have a minimum heat input of 2198 kW 7,500,000 Btu/hr per car station, with heaters distributed under hopper car, or under and beside hopper car, such that the entire car is heated. Locate burner pits or heater units for even heating of the hopper cars without subjecting air hoses, air brake equipment, and bearings to excessive heat.

2.9.1.1 Pit-type Railroad Hopper Car Thawing System

a. Pit-type Thawing Unit: Pit-type hopper car thawing unit shall be complete with a refractory lined steel box, burner assemblies, steel burner enclosure with cover, valves, piping, and hinged main pit protective covers. Each pit shall have the capacity to generate 366 kW 1,250,000 Btu/hr when burning [No. 2 fuel oil] [natural gas] [liquified petroleum gas]. Burners shall fire horizontally and tangentially into the pit from opposite sides to heat the refractory lined pit up to radiant temperature. Heat shall be transferred to the hopper car by radiation from hot refractory surfaces and by convection from exhaust gases and evaporated moisture to rail car bottom and sides. Construct pit outer shell of not less than 6 mm 1/4 inch thick corrosion resistant steel plate, with the end plates of 10 gage (3.42 mm 0.1345 inch) steel. Provide supporting flanges and handling loops on both ends and provide cap strips on top of both sides. Place cast iron heat deflecting plates with overlapping edges on pit sides and bottom supported off the ledge on the outer shell. Provide a minimum 25 mm one inch air space between plates and outer shell. Pit side walls and
bottom shall have a minimum 65 mm 2 1/2 inch thickness of standard firebrick with one course of standard end skew brick along the top of the side walls. Firebrick shall be easily replaceable. End section shall have not less than 114 mm 4 1/2 inch thick precast high temperature refractory panels. Provide burner refractory ignition tiles with steel jacket casings having mounting lugs for bolting to end plates of pit. Provide concrete railroad ties adjacent to each thawing pit. Deliver combustion air to burners by means of pressure blowers which take fresh air from outside thawing area. Factory wire and assemble heaters, control panels, blowers, and zone controls. Shop fabricate burner piping and control valve assemblies.

**************************************************************************
NOTE: Designer shall make selection here based on fuel to be used in thawing system.
**************************************************************************

b. Fuel System: [Provide complete fuel system for operation with, [natural] [liquified petroleum] gas including piping, regulators, low and high pressure limit switches interlocked with combustion controls, gages, solenoid valves, shutoff valves, and other accessories which may be required for each manufacturer's particular system.] [Provide complete fuel system for operation with duplex fuel oil pump set with [_____] liters gallon horizontal [below] [above] ground fuel tank and other accessories which may be required for each manufacturer's particular system. Provide fuel oil system in accordance with the requirements specified under the paragraph FUEL OIL SYSTEM this section.]

c. Burner controls shall meet Industrial Risk Insurers' (I.R.I., formerly F.I.A.) requirements. Connect fuel system piping to fuel supply piping as indicated. Burners shall be controlled (modulate) to regulate heat output to suit the operating requirements. Provide a manual light-off, low pressure [gas] [oil] pilot for automatic light-off of each thawing unit.

d. Air System: Provide complete air systems for operation with blowers, inlet silencers, gages, shutoff valves, low pressure limit switches interlocked with combustion controls, and other accessories which may be required for each manufacturer's particular system.

e. Control Panel: Provide centrally located control panel, with panel front consisting of a graphic display of the thawing system. Display shall be approximately to scale and coordinated with control and light indication for combustion air blowers and on-off control of convenient groups of heaters. Provide on-off control with indicating light for each thawing pit. Panel shall have a [NEMA 12] [NEMA 3R-8], dust-tight enclosure with internal equipment and wiring accessible from the panel front. Provide nameplates on panel front to designate function of switches and indicating lights. Controls shall be suitable for [_____] volt, [_____] phase, 60 Hz operation. Provide and mark terminals for connections with the exception of the neutral. Terminal blocks shall be 600 volt rated. Control relays shall have convertible contacts and shall have rating suitable for intended services but in any case, not less than 10 amp, 600 volt rating. Components shall be oiltight type. Connections to panel shall be watertight. Motor starters for combustion air blowers shall be installed in each respective blower cabinet.
2.9.1.2 Surface Mounted Enclosed Railroad Hopper Car Thawing System

a. Surface Mounted Enclosed Thawing Unit: Burner shall be of multiport cast iron construction and provide for even heating of radiant elements. Heater design shall be essentially the same for undercar and sidecar heaters, with heat transmitted to hopper car by both radiation and convection. Design burner and radiant element for radiation being the primary mode of heat transfer. Make radiant element over the burner of a heavy corrosion-resistant metal material. Design burner to operate on [No. 2 fuel oil] [natural gas] [liquefied petroleum gas], and such that open flame from combustion will not extend beyond the emitter surface either during normal operation or in the event of emitter deterioration or burnout. Provide shields where necessary to direct radiation and hot exhaust gases to hopper car surface. Provide means for shielding car air hoses, air brake equipment, and bearings from excessive heat. Provide each heater with individual heater control boxes constructed as to provide positive air pressure inside control box. Control boxes shall contain mixing valve for maintaining proper gas-air ratio for satisfactory combustion. Locate gas and air piping connections for easy removal of individual burners. Deliver combustion air to heaters by means of pressure blowers which take fresh air from outside thawing area to ensure continued satisfactory combustion of gaseous fuels. Factory wire and assemble thawing units, control panels, blowers, and zone controls. Fuel system and burner control for oil fired units shall be as specified under the paragraph PIT-TYPE RAILROAD HOPPER CAR THAWING SYSTEM above.

b. Burner Controls (for gas fired units): Burners shall be electrically ignited with controls meeting I.R.I. requirements. Provide a gas pressure regulator for serving not more than eight individual burners. Regulator shall reduce gas pressure in supply line to pressure required for burners. Provide each burner with an air regulating valve for fuel-air ratio adjustment. Regulating valve shall contain positive vibration-proof locking device for maintaining critical adjustment.

c. Control Panel: Provide centrally located control panel with panel front having a graphic display of the thawing system. Display shall be approximately to scale and coordinated with control and light indication for combustion air blowers and on-off control of individual heaters. Provide a modulating control for each heater to regulate heat output to suit the operating requirements. Panel shall be [NEMA 12] [NEMA 3R-8], dust-tight enclosure with internal equipment and wiring accessible from the panel front. Provide nameplates on panel front to designate function of switches and indicating lights. Controls shall be suitable for [_____] volt, [_____] phase, 60 Hz operation. Provide and mark terminals for connections, with the exception of the neutral. Terminal blocks shall be 600 volt rated. Control relays shall have convertible contacts and shall have rating suitable for intended service but not less than 10 amp, 600 volt rating. Components shall be an industrial design of the oiltight type. Connections to the panel shall be watertight. Motor starters for combustion air blowers shall be installed in each respective blower cabinet.

[ d. Thawing unit may be an electric radiant heat thawing unit which includes self-contained heater banks such as under-car outside the rail heater sections, lower side car heater sections and vertical side car heater sections, with reflectors, hinged cover, waterproof and weatherproof wired terminal blocks and zone controls for flexibility of operation.
2.9.1.3 Shed

**************************************************************************
NOTE: Shed should be used in the severe climate areas. Consult appropriate DM-2 series design manuals for design criteria for the shed.
**************************************************************************

Provide shed of pre-engineered metal space frame construction with corrugated siding as indicated. Provide ventilation with roof vents and openings along bottom of sides of shed.

2.9.2 Top-Mounted Railroad Hopper Car Shaker

**************************************************************************
NOTE: When noise is a major factor of concern, design a shaker enclosure with acoustical treatment which will be capable of reducing the noise to a tolerable level.
**************************************************************************

Provide top-mounted rail car shaker complete with shaker, frame, vibrator, motors, hoists, hoist frame, [enclosure], and controls. Design unit for operation under all weather conditions.

2.9.2.1 Shaker

Shaker shall operate with a nominal 4 mm 5/32 inch stroke at 1200 rpm. Stroke shall be generated by large eccentric SAE 1045 steel shaft mounted in high capacity, self-aligning, spherical roller bearings. Seal bearings with a double piston ring labyrinth seal and dust and water slinger to retain lubricant and prevent entry of contaminants. Shaker frame shall be stress-relieved, welded steel construction. Fabricate frame of heavy steel plate, with bearing housing seats machined after stress relieving. Provide four lifting eyebolts of heat-treated forged alloy steel for connecting to hoist chains.

Shaker Electric Motor and Drive: Motor shall be totally enclosed, fan cooled, 1,800 rpm, [_____] volt, three phase, 60 Hz, not less than 15 kW 20 hp, as specified under the paragraph MOTORS AND DRIVES in this section. Motor shall be mounted on heavy spring isolated supporting frame with adjustable motor base. Shaker shall be belt driven with special deep groove sheaves, taper locking type hubs, and constant belt tensioning spring.

2.9.2.2 Shaker Hoist

Hoist shall be twin hook type having a rated capacity exceeding the weight of the shaker unit. Hoist shall have a lift of not less than 7 1/2 meters 25 feet with a hoist speed of not less than 0.08 meter per second (m/s) 16 feet per minute (fpm). Hoist shall have not less than 460 mm 18 inch long sling chains for connecting hoist to shaker lifting eyes, and hooks shall have U-bolt safety latches. Hoist shall be mounted on an electrified trolley as specified in Section 41 22 13.14 BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING.

Shaker Hoist Electric Motor: Motor shall be totally enclosed, [fan cooled], [non ventilated], 1,800 rpm, [_____] volt, three phase, 60 Hz, not
less than 5 1/2 kW 7 1/2 hp as specified under the paragraph MOTORS AND DRIVES in this section. Motors shall be high slip type and shall with thermal overload protection embedded in the windings.

2.9.2.3 Controls

Provide [remote] [pendant] pushbutton station for both shaker and hoist operation. Provide automatic controls with upper and lower screw type limit switches to limit hook travel, slack cable limit switch to stop lowering of hooks when car shaker has been lowered on top of car, electrical interlock to prevent operation of car shaker motor until shaker is lowered on car, and electrical interlock to prevent operation of hoist motor while car shaker is running. Mount electrical equipment in NEMA 4 enclosures.

2.9.2.4 Frame [and Enclosure]

Provide frame [and enclosure] as indicated for support of hoist and shaker unit [and for attenuation of noise].

2.9.3 Car Pullers

2.9.3.1 Capstan Car Puller

******************************************************************************

NOTE: Choose this subparagraph or the subparagraph REVERSIBLE DRUM TYPE CAR PULLER.
******************************************************************************

Designed with capacity of not less than 4540 kg 10,000 pounds of starting pull and an average rope speed of approximately 0.23 m/s 45 fpm. Assembly shall be totally enclosed, weatherproof, and suitable for exterior installation with vertical capstan. Capstan shall be semisteel alloy construction designed for use with marlin-covered wire rope.

a. Accessories: Provide capstan complete with accessories, including controls, rope, rope storage reel, car hooks, sheaves, snatch blocks, anchors, and ratchet holdback.

b. Rope: Capstan rope shall be not less than 25 mm one inch outside diameter marlin clad wire rope with a breaking strength of not less than 13,620 kg 30,000 pounds.

c. Rope Storage Reel: Construct rope storage reel of metal, hand operated with the drum not less than 300 mm 12 inches in diameter and the reel faces not less than one meter 3 feet in diameter. Drum shall have not less than [_____] mm inches face width and store not less than [_____] meters feet of 25 mm 1 inch diameter marlin clad wire rope.

d. Electric Motor: [Totally enclosed], [fan cooled], high starting torque, reversing type, [_____] volt, three phase, 60 Hz, not less than 7 1/2 kW 10 hp as specified under the paragraph MOTORS AND DRIVES in this section.

2.9.3.2 Reversible Drum Type Car Puller

******************************************************************************

NOTE: Choose this subparagraph or the above subparagraph CAPSTAN CAR PULLER.
******************************************************************************
NOTE: Designer shall detail required footings and foundations based on the selected puller and soil conditions at each plant site.

[Single drum reversing] [Double drum] type designed with a capacity of not less than [_____] kg pounds of running rope pull. Starting pull capacity shall be not less than twice the running pull capacity. Provide assembly on one-piece heavy steel base with weatherproof motor and gear reducers suitable for exterior location.

a. Puller: Unit shall consist of a [_____] mm inch pitch diameter by [_____] mm inch face, spirally grooved for [_____] mm inch diameter wire rope with sealed anti-friction bearings, alloy steel ring mounted spur gear and SAE 1045 steel shaft. Provide an SAE 1045 steel countershaft with anti-friction pillow blocks and heat-treated alloy steel spur pinion roller chain drive with steel sprockets and enclosed guard. Speed shall be a minimum of [_____] m/s fpm.

   (1) Electric Motor: [Totally enclosed], [fan cooled], high starting torque, reversing type, [_____] volt, [_____] phase, 60 Hz, not less than [_____] kW hp, as specified under the paragraph MOTORS AND DRIVES in this section. Provide clutch for engaging and disengaging power to drum.

b. Accessories:

   (1) Rope Sheaves: Provide four stationary type, 762 mm 30 inch pitch diameter single sheaves and one 762 mm 30 inch take up sheave assembly. Sheave shall be cast steel, grooved for [_____] mm inch diameter rope and shall be oriented horizontally and mounted in a welded steel frame with self-lubricating bronze bushings. Provide removable steel rope guards over sheaves.

   (2) Wire Rope: Wire rope shall be not less than [_____] mm inch in diameter with a breaking strength of not less than [_____] kg pounds. Rope shall consist of six 19 wire strands of improved plow steel rope with hemp center.

   (3) Safety Warning System: Provide a safety warning system, including an audible horn and three flashing lights to indicate cars in motion. System shall activate 30 seconds before puller motor is energized and shall not deactivate until puller motor is de-energized. Provide a permanent warning sign at each light indicating "RAILCAR IN MOTION."

   (4) Miscellaneous: Provide reversing controls, car hooks, snatch blocks, and anchors.
2.9.4 Track Hopper

**************************************************************************
NOTE: Determine when a track hopper will be required.
**************************************************************************

Welded construction of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.1644 inch) 410 stainless steel] plate not less than 4 1/4 meters 14 feet wide and 8 1/2 meters 28 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.4.1 Track Girders

Two wide flanged beams designed for Cooper's E-[_____] loading with 50 percent impact allowance and sized at W [_____] by [_____]. Provide beams with cross struts for rigidity and bearing plates for mounting on pit wall as indicated.

2.9.4.2 Grating

Hopper grating between rails of [_____] by 10 mm 3/8 inch steel bars and [_____] by 10 mm 3/8 inch steel cross bars with openings [100] [150] by [100] [150] mm [4] [6] by [4] [6] inches. Grating outside rails shall have openings 100 by 100 mm 4 by 4 inches and be constructed of same size steel bars as specified above. Construct grating in removable panels and support from concrete pit walls and by steel angle supports resting on track girders.

2.9.4.3 Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Cover for portions of hopper outside rails shall be hinged with edges turned down. Construct cover between rails in easily removable sections with handles.

2.9.4.4 Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a water-collecting reclaim hopper type coal gate not less than [_____] by [_____] mm inches in size along with a dust tight metal slip joint, constructed of not less than 6 mm 1/4 inch thick [410 stainless steel] [structurally reinforced steel plate lined with 8 gage (4.18 mm 0.164 inch) 410 stainless steel] plate. Slip joint shall be of split construction to allow for disassembly and replacement. Design slip joint to allow for necessary flexibility to take care of deflection of hopper outlet due to varying coal loads and temperature variations without imposing load on feeder enclosure. Provide rope packing or other resilient gasket material to make the slip joint completely dust tight.

2.9.5 Truck Hopper

**************************************************************************
NOTE: Determine when a truck hopper will be required.
**************************************************************************
2.9.5.1 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 125 by 13 mm 5 by 1/2 inch steel bars and 25 by 10 mm one by 3/8 inch steel cross bars. Weld grating and make in sections for ease of removal. Provide two intermediate support beams sized not less than W8 by 31 arranged for a maximum grating span of 1016 mm 3 feet 4 inches.

2.9.5.2 Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a water-collecting reclaim hopper type coal gate not less than [_____] by [_____] mm inches size.

2.9.5.3 Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Construct cover in sections with handles for ease of removal.

2.9.6 Reclaim Hoppers

Welded construction of not less than 6 mm 1/4 inch thick structurally reinforced steel plate lined with 8 gage ( 4.18 mm 0.1644 inch) 410 stainless steel plate not less than 3 meters 10 feet wide and 3 meters 10 feet long. Side slopes not less than 60 degrees from horizontal. Interior bolts shall have flat heads. Support hopper from concrete pit walls as indicated.

2.9.6.1 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 125 by 13 mm 5 by 1/2 inch steel bars and 25 by 10 mm one by 3/8 inch steel cross bars. Weld grating and make in sections for ease of removal. Provide two intermediate support beams sized not less than W8 by 31 arranged for a maximum grating span of 1016 mm 3 feet 4 inches.

2.9.6.2 Hopper Outlet

Flanged not less than [_____] by [_____] mm inches. Outlet shall contain a special reclaim hopper gate not less than [_____] by [_____] mm inches.

2.9.6.3 Reclaim Hopper Cover

Structurally reinforced 5 mm 3/16 inch thick raised pattern floor plate. Construct cover in sections with handles for ease of removal.

2.9.7 Belt Feeder

Totally enclosed, dust tight, approximately [_____] meter feet between pulley centers, designed to operate at a speed not to exceed [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide belt feeder complete with continuous belt, shafts,
pulleys, idlers, belt cleaner, frame, enclosure, reduction gear, and drive motor.

2.9.7.1 Head and Foot Shafts

Cold rolled steel, not less than [___] mm inches and [___] mm inches in diameter respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than a [___] mm inch adjustment. Shafts shall fit tight in pulley hubs.

2.9.7.2 Pulleys

Welded steel type with detachable compression grip-type hubs, steel plate ends, and crown faces 50 mm 2 inches wider than the belt width. Provide an adjustable spring loaded or counter weighted type rubber bladed belt wiper beneath the head pulleys.

2.9.7.3 Belt

Mine Safety and Health Administration (MSHA) approved fire resistant construction, belt not less than [___] mm inches wide, [___] ply, [___] kg ounces per square meter foot, with 3 mm 1/8 inch thick oil and chemical resistant cover on carrying side 0.79 mm 1/32 inch thick oil and chemical resistant rubber cover on under side. Cover shall be fire resistant. Belt shall have a cover tensile strength of not less than [___] kPa psi and friction between plies of not less than [___] kPa psi. Belt shall have vulcanized splice.

2.9.7.4 Electric Motor

Totally enclosed, fan cooled, high torque, [___] volt, [___] phase, 60 Hz, not less than [___] kW hp as specified under the paragraph MOTORS AND DRIVES. Motor shall be direct connected by means of flexible coupling with guard to a reduction gear.

2.9.7.5 Reduction Gear

Alloy steel helical gear type enclosed in oiltight housing. Provide an adjustable base for motor and reducer unit. Drive from output shaft of the speed reducer to the conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.7.6 Backstop

Differential band brake type, cam type, or internal type to prevent reversal of belt.

2.9.7.7 Idlers

Flat type with 125 mm 5 inch diameter steel shells, malleable iron end brackets, grease sealed roller-type antifriction bearings, and self-cleaning angle bases. Idler spacing shall be not greater than 1372 mm 4 feet 6 inches. Return idler shall be of the flat single-pulley type having 125 mm 5 inch diameter steel shells, grease sealed roller-type antifriction bearings spaced on not more than [___] meter feet centers.
Provide self-aligning training type idlers, as required, to ensure proper training of the belt. Provide additional idlers, as required, beneath track or truck hopper for support of belt and coal and to properly protect belt from impact caused by the coal. Extend grease pipes to one side for four point lubrication from tunnel walkway.

2.9.7.8 Load Skirts

Steel plate 6.35 mm 1/4 inch thick supported by structural brackets from conveyor frame. Skirts shall have rubber strips along the bottom edge to seal belt. Strips shall be easily adjustable by means of a clamp bar arrangement not requiring slotted bolt holes.

2.9.7.9 Frame, Supports, and Enclosure

Construct frame of either structural steel channel side stringers properly tied and braced for support of head and foot shafts with 12 gage (2.66 mm 0.1046 inch) steel deck plate the full length of the feeder, or integrally formed plate conveyor and deck frame. Support idlers from conveyor frame. Support frame from floor of tunnel [by steel channel legs] [as indicated]. Completely enclose feeder in a dust-tight enclosure constructed of not less than 10 gage (3.42 mm 0.1345 inch) steel plate with easily removable gasketed side panels containing handles at each panel end.

2.9.7.10 Loading Hopper

Constructed of not less than 10 mm 3/8 inch thick steel plate connected to bottom flange of the track or truck hopper. Provide an adjustable regulating gate adjacent to loading hopper for regulating height of coal on the belt.

2.9.7.11 Vibrating Feeder

Flat pan type vibrating feeder to convey coal from the day hopper to the belt conveyor. Pan shall be [_____] mm inches wide by [_____] mm inches long, with 150 mm 6 inch sides, constructed of 6.35 mm 1/4 inch thick stainless steel. Provide feeder with integral electromechanical drive and a remote controller. Controller shall contain operating switches and rate of flow adjustment and the power source for the feeder drive. Controller shall be designed for 460 volt, 60 Hz supply voltage. Support feeder from the hopper.

2.9.8 Shallow-In-Built Bar Flight Feeder and Receiving Hopper

Bar flight feeder shall be totally enclosed, dusttight type with shallow-in-built [track] [truck] hopper. Bar flight feeder shall have a horizontal length of [_____] meter feet [_____] mm inches between sprocket centers, operate at not greater than [_____] m/s fpm, and have a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide feeder complete with continuous chains and attached bars, terminal sprockets, gears, shafts, bearings, troughs, enclosure, frames, [truck] [track] hopper, grating, regulating gate, hinged inspection doors, discharge chute, electric motor, reduction gear, and supports.

2.9.8.1 Head and Foot Shafts

Head and foot shafts shall be not less than [_____] mm inches and [_____] mm inches in diameter, respectively. Construct shafts of coal rolled steel and mount in antifriction roller bearings. Mount head shaft in fixed
pillow blocks and foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.9.8.2 Terminal Sprockets

Cast iron terminal sprockets with chilled rims not less than 380 mm 15 inches in diameter. Foot shaft sprockets shall be split type in two 180 degree sections to facilitate removal in shallow pit.

2.9.8.3 Chains and Flights

Chains shall be bar link type each having a pitch of not greater than 150 mm 6 inches and an ultimate strength of not less than 20,430 kg 45,000 pounds. Construct chain of heat treated carbon steel components with not less than a 22 by 38 mm 7/8 by 1 1/2 inch wide center link, 10 mm 3/8 inch wide by 38 mm 1 1/2 inch thick side bars, fastened with 18 mm 5/8 inch diameter pins. Construct bar flights of 10 mm 3/8 inch thick steel bars not less than 50 mm 2 inches high with flight width of not less than [_____] mm inches. Flight spacing shall be such that feeder shall move the required coal with a head shaft speed not greater than [_____] rpm.

2.9.8.4 Frame and Enclosure

Construct feeder frame of structural steel properly tied and braced, complete with guides and track for both the carrying and return runs, of not less than 80 by 80 by 10 mm 3 by 3 by 3/8 inch steel angles with not less than 6 mm 1/4 inch high renewable carbon steel wear bars. Enclosure shall be dusttight of not less than 10 gage (3.42 mm 0.1345 inch) commercial hot rolled steel plate. Enclosure shall be removable in sections. Top and side panels at head and foot sections shall be hinged and removable for access to chain sprockets.

2.9.8.5 Trough

Construct trough with flat bottom of not less than 10 mm 3/8 inch thick steel plate. Trough shall be removable and constructed with flanged discharge opening.

2.9.8.6 Hopper

Construct hopper not less than 2 1/2 meters 8 feet long and 3 meters 10 feet wide of structurally reinforced 10 mm 3/8 inch thick steel plate lined with 10 gage (3.42 mm 0.1345 inch) 410 stainless steel plate. Hopper sides shall not slope less than 55 degrees from the horizontal. Construct hopper with a shield over the return run so that coal is fed directly to the bottom conveying run.

2.9.8.7 Grating

Hopper grating shall have openings 90 by 90 mm 3 1/2 by 3 1/2 inches. Construct grating of 65 by 10 mm 2 1/2 by 3/8 inch steel bars and 20 mm 3/4 inch diameter steel rods. Weld grating and make in sections for ease of removal. Provide intermediate beams to support the grating.

2.9.8.8 Flight Feeder Drive

Flight feeder shall be driven by an electric motor direct connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight
housing. Provide an adjustable base for motor and gear. Drive from output speed shaft of the reduction gear to the conveyor head shaft shall be by means of standard finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100.

2.9.8.9 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

2.9.9 Bucket Elevator

Dusttight [centrifugal discharge] [continuous bucket] type having approximately [_____] meter feet [_____] mm inches sprocket centers, vertical chain and bucket, operating at a speed not to exceed [_____] m/s fpm, and having a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide bucket elevator complete with continuous double chains and attached buckets, upper and lower sprockets, gears, shafts, bearings, casing, top hood, discharge spout, bottom boot, access doors, electric motor drive, reduction gear, service platform, and accessories.

2.9.9.1 Head and Foot Shafts

Cold rolled steel not less than [_____] mm inches and [_____] mm inches in diameter, respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than a [_____] mm inch adjustment. Shafts shall fit tight in sprocket hubs.

2.9.9.2 Terminal Sprockets

Cast iron with chilled rims. Head sprockets shall be not less than [_____] mm inches in diameter and foot sprockets not less than [_____] mm inches in diameter.

2.9.9.3 Buckets and Chain

Construct buckets of [malleable iron] [not less than [_____] mm inch steel plate] not less than [_____] mm inches long, [_____] mm inches wide, and [_____] mm inches deep. Buckets shall be mounted by not less than four bolt attachments to double strand of steel bushed chain each having an ultimate strength of not less than [_____] kg pounds and pitch of [_____] mm inches. Bucket spacing shall not be greater than [_____] mm inches.

2.9.9.4 Backstop

Differential band brake type, cam type or internal type to prevent reversal of chain and buckets in case of power failure.

2.9.9.5 Elevator Casing

Not less than [_____] by [_____] mm inches inside of not less than [_____] [gage] [ mm inch thick] commercial hot rolled mild steel plate with 50 by 50 by 6 mm 2 by 2 by 1/4 inch corner angles for full height of elevator casing. Construct casing in standard sections from 3 to 3.66 meters 10 to 12 feet high with 50 by 50 by 6 mm 2 by 2 by 1/4 inch angle
flanges at the end of each section. Provide a hinged inspection door not less than 610 by 760 mm 24 by 30 inches in the section immediately above the boot section [and where indicated]. Casing and inspection doors shall be of dust-tight construction with flange angles continuously welded and gasketed. No makeshift repairs or field patching to overcome leakage shall be permitted. Casing interior shall be given a 1.60 mm 1/16 inch thick coating of coal tar primer and enamel in accordance with SSPC PS 11.01.

2.9.9.6 Head Section

Not less than [_____] mm inch thick commercial hot rolled mild steel plate in heavy angle frame with split, hinged, and removable top cover hood. Construct hood of not less than [_____] mm inch thick commercial hot rolled mild steel plate with flanged discharge throat built of not less than [_____] mm inch thick commercial hot rolled mild steel plate. Design head section to support the drive machinery and head bearings. Provide maintenance access ladder and platform conforming to applicable OSHA regulations [as indicated].

2.9.9.7 Boot Section

Not less than [_____] mm inch thick commercial hot rolled mild steel plate in heavy angle frame with curved and renewable bottom plate built of not less than [_____] mm inch thick commercial hot rolled mild steel plate, and flanged inlet. Take up and foot terminal bearing on one side of the boot shall be mounted in a bolted removable side panel so the foot shaft and [sprocket] [sprockets] may be removed through the side of the door. Bolt end panels so they are removable for cleanout and inspection.

2.9.9.8 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz not less than [_____] kW hp, as specified under the paragraph MOTORS AND DRIVES in this section. Motor shall be direct connected by means of flexible coupling to a reduction gear.

2.9.9.9 Reduction Gear

Alloy steel herringbone or helical gear type enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear unit. Drive from output shaft of reduction gear to elevator head shaft shall be by means of standard finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.9.10 Anchoring Brackets

Provide steel brackets at intervals [as indicated] at [not less than [_____] meters feet over centers] for anchoring elevator and to increase rigidity.

2.9.10 Rotary Vane Feeder

Provide a fully enclosed, dusttight, rotary vane feeder designed to feed [_____] size coal at a constant rate of not less than [_____] Mg tons per hour. Provide feeder complete with housing, feeder vanes, removable panels and inspection doors.
2.9.10.1 Body

Construct feeder body dusttight of not less than 12.7 mm 1/2 inch thick formed carbon steel plate with 19.05 mm 3/4 inch thick flanges. Continuously weld joints both inside and out. Top cover of feeder between inlet and outlet flanges shall be removable to allow access to interior of feeder. Provide hinged inspection doors in both sides of the outlet section.

2.9.10.2 Feeder Vanes

Feeder section shall consist of not less than four vanes, equally spaced, extending radially from drive shaft. Feeder section shall be not less than 457 mm 18 inches long and 457 mm 18 inches in diameter. Construct shaft of turned and polished cold rolled steel mounted in externally flanged babbitted type bearing blocks with forced lubrication type fittings. Protect bearings with felt seal between bearing blocks and feeder body.

2.9.10.3 Drive Sprocket

Provide cast iron drive sprocket with chilled rims. Coordinate diameter with drive motor and reduction gear for required feeder speed.

2.9.10.4 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section. Motor shall be directly connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear unit. Drive from output speed shaft of the reduction gear to the conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100.

2.9.11 Screw Conveyors

Provide each dusttight and furnished complete, with trough, screw, inlet and discharge spouts, discharge gates, bearings, bearing hangers, dust cover, electric motor, reduction gear, [service platform,] and supports.

2.9.11.1 Inlet and Discharge Spouts

Arrange as indicated. Spouts shall be flanged and square with opening dimensions equal to inside diameter of trough.

2.9.11.2 Screw Trough

Provide dusttight screw trough with trough covers. Support trough by 6 mm 1/4 inch thick steel plate feet at not less than 3 meters 10 foot intervals. Individual trough sections shall not be greater than 3 meters 10 foot long with steel angle end flanged connections.

2.9.11.3 Bearings and Hangers

Provide thrust bearings and trough end dust seals for both drive and tail bearings. Thrust bearings shall be bronze in antifriction pillow blocks.
Screw hanger bearings shall be rabitted-type, with cast iron hangers having removable bearing caps held in place by a U-bolt. Design hangers to fit inside the conveyor trough and equip bearing for grease lubrication with grease fittings penetrating the dust cover to allow bearings to be greased without removing dust cover. Hangers shall not be located at trough joints, feed, or discharge openings. Locate hangers at not less than [3.66 meter 12 foot intervals for screw diameters larger than 250 mm 10 inches] [and] [3 meters 10 foot intervals for screw diameters 250 mm 10 inches in diameter and smaller].

2.9.11.4 Conveyor Screws and Couplings

Construct conveyor screws of helicoid-type flights and connect with cold rolled steel couplings. Assemble conveyor screws so that at the hangers there is 180 degrees rotation between the flight ends of each adjacent screw section. Screw flight shall end over last discharge spout so bare pipe extends across this area to prevent material carry-over.

2.9.11.5 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section. Install motor at discharge end of conveyor. Motor shall be supported by a unit bracket attached to the screw conveyor trough end plate and shall be connected to reduction gear through a -belt drive. Reduction gear shall be shaft mounted, double reduction type mounted directly on conveyor shaft. Provide tie rods, when required, to prevent reduction gear rotation and for adjusting belt tension.

2.9.11.6 Service Platforms

Provide service platform conforming to OSHA regulations as indicated to properly maintain and service conveyor drive unit.

2.9.12 Belt Conveyor

Inclined and approximately [_____] meter feet between pulley centers, operated at a speed not to exceed [_____] m/s fpm, and have a capacity of not less than [_____] Mg tons per hour of [_____] size coal. Provide belt conveyor complete with continuous belt, shafts, pulleys, idlers, takeups, belt cleaner, frame with conveyor cover and walkway, transfer chute, hopper, emergency stop cord and switch, alignment switch, reduction gear, electric motor, bin high level limit switch and alarm.

2.9.12.1 Head and Foot Shafts

Construct shafts of turned and polished cold rolled steel not less than [_____] mm inches and [_____] mm inches in diameter, respectively. Mount shafts in antifriction roller bearings with forced lubricating type fittings. Mount head shaft in fixed pillow blocks. Foot shaft shall have screw-type takeups with not less than [_____] mm inches adjustment.

2.9.12.2 Takeups

[Three pulley guided vertical counter weighted type] [Screw type] to maintain proper belt tension. Shafts shall be as specified above and not less than [_____] mm inches in diameter. Provide a safety device to prevent free fall of take-up pulley. Takeups shall provide a minimum adjustment of 1.5 percent of total belt length.
2.9.12.3 Pulleys

Welded steel type with detachable compression grip-type hubs, steel plate ends, and crown faces 50 mm 2 inches wider than the belt width. Provide a multiple belt scraper at each head pulley.

2.9.12.4 Magnetic Pulley

Drive pulley of [_____] conveyor shall be a nonelectric permanent magnet type designed to remove tramp iron. Provide a removable pan to collect the tramp iron.

2.9.12.5 Belt

Synthetic fabric, not less than [_____] mm inches wide, a minimum of [_____] ply, with 3 mm 1/8 inch thick oil and chemical resistant cover on carrying side, [1.59] [0.79] mm [1/16] [1/32] inch thick oil and chemical resistant rubber cover on under side. Cover shall be fire resistant. Belt shall have a tension pull strength of not less than [_____] N per mm pounds per inch of belt width. Belt shall have vulcanized splice.

2.9.12.6 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60 Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section. Motor shall be direct connected by means of flexible coupling with guard to a reduction gear.

2.9.12.7 Reduction Gear

Alloy steel helical gear type enclosed in an oil tight housing. Provide an adjustable base for mounting motor and reducing unit. Drive from the output shaft of the speed reducer to the conveyor head shaft shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 and complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100. Provide means to properly tension drive chain.

2.9.12.8 Backstop

Differential band brake type, cam type, or internal type to prevent reversal of belt.

2.9.12.9 Emergency Stop Cord and Switch

Provide emergency stop cord the length of the conveyor to actuate a switch for stopping the conveyor. Switch shall have flag to indicate actuated switch and shall have positive safety lock that cannot be accidentally reset. Cord shall be not less than 2.38 mm 3/32 inch galvanized aircraft cable with a minimum 1.19 mm 3/64 inch vinyl or nylon protective coating. Provide sufficient number of switches to prevent cable weight from actuating switch.

2.9.12.10 Belt Alignment Switch

Provide on each side of belt mounted off conveyor frame or discharge chute to stop conveyor under belt misalignment or runoff conditions. Mount switches on breakaway mounts to prevent damage from runaway belt.
2.9.12.11 Idlers

Troughing idlers shall be the [20] [35] degree three-pulley type with 125 mm 5 inch diameter steel shells, malleable iron end brackets, grease sealed roller type antifriction bearings, and self-cleaning angle bases. Troughing idler spacing shall be not greater than 1.37 meters 4 feet 6 inches, with additional idlers at the loading point. Return idler shall be of the flat single-pulley type having 125 mm 5 inch diameter steel shells, grease sealed roller type antifriction bearings and spaced on not more than 3 meters 10 foot centers. Provide self-aligning training type trough and return idlers at not greater than 15.24 meters 50 foot intervals to ensure proper training of belt. Extend grease pipes to one side for four point lubrication from walkway.

2.9.12.12 Load Skirts

Not less than 6 mm 1/4 inch thick steel plate and supported by structural brackets from conveyor frame. Skirts shall have rubber strips along bottom edge to seal belt. Strips shall be easily adjustable by means of a clamp bar arrangement not requiring slotted bolt holes.

2.9.12.13 Frame, Supports, and Walkway

Frame shall be of the structural steel truss type with head and foot terminals framed of structural steel. Support frame from grade on structural A-frames set on concrete footings as indicated. Support idlers on not less than 150 mm 6 inch channel stringers braced and tied to structural steel truss frame. Provide a 12 gage (2.66 mm 0.1046 inch) steel deck plate for full length of conveyor. Provide a curved belt cover constructed of not less than 16 gage (1.52 mm 0.0598 inch) corrugated galvanized metal having removable panels on the walkway side for access to the idlers. Provide walkway not less than 914 mm 36 inches wide, supported from the structural steel framing for the entire length of the conveyor. Walkway shall be complete with handrails and metal nonslip grating meeting the requirements of 29 CFR 1910-SUBPART D.

2.9.12.14 Discharge Hopper

Construct discharge hopper of not less than 6 mm 1/4 inch thick steel plate to discharge on a discharge chute. Provide a discharge hood built of 10 gage (3.42 mm 0.1345 inch) steel plate enclosing the top, front, and sides above the discharge hopper.

2.9.13 Coal Scales

Stationary, automatic, dust-proof, belt-fed, batch type with rated capacity of not less than [_____] Mg tons per hour and a hopper capacity of 91 kg 200 pounds. Coal scales shall be complete units, including the body, belt feeder, feeder drive, bypass, weighing mechanism, weigh hopper, controls, counters, and other items required to make a completely automatic coal scale.
2.9.13.1 Body

Dusttight, of welded heavy steel plate construction with base angles not less than 6 mm 1/4 inch thick. Top plate, bypass plate, and reducer mounting plate shall be not less than 6 mm 1/4 inch thick, with other plates of not less than 11 gage (3.04 mm 0.1196 inch) steel plate. Provide large, gasketed, dusttight doors with adjustable pre-set compression type latches and forged steel hinges for inspection and maintenance purposes. Door openings shall be sufficient to allow removal of feeder and hopper without removal of screws or bolts.

2.9.13.2 Feeder

Feeder shall be a self-contained unit with an endless belt which shall be capable of being removed from one end or side. Construct feeder of heavy rigid steel frame with an 11 gage (3.04 mm 0.1196 inch) stainless steel plate to support the belt on the carrying run. Head and take-up shafts shall be cold rolled steel carried on self-aligning ball bearings equipped with dust seals and fitted for pressure lubrications. Bearings shall be capable of being lubricated during scale operation. Take-up shaft shall have screw-type take-up bearings and pulleys shall be crown faced steel for proper belt tracking.

2.9.13.3 Feed Belt

Channel type and of endless construction without splice. Belt shall be not less than 7.94 mm 5/16 inch thick of three ply heavy fabric core construction with chemical and abrasion resistant rubber coating. Feeder skirts and leveling plate shall be stainless steel and shall be arranged to provide a continuous stream of constant width and depth coal on the feed belt.

2.9.13.4 Electric Motor And Drive

Totally enclosed [_____] volt, [_____] phase, 60 Hz, with heavy duty reduction gear not less than 0.56 kW 3/4 hp as specified under the paragraph MOTORS AND DRIVES in this section. Scale shall be capable of bypassing coal without disconnection of the drive. Drive disconnection shall not be required for feeder removal unless special provisions are made for a quick and simple drive disconnection.

2.9.13.5 Coal Bypass

Provide a quick-operating coal bypass with an easily operable lever located on the outside of scale body. Operating lever operation shall instantly bypass coal around the feeder section and weighing mechanism without release of belt tension to prevent entry of coal between belt and pulley or support plates. Bypass construction shall not restrict inlet opening size for normal scale operation.

2.9.13.6 Weighing Mechanism

Enclose in a dusttight compartment. Construct weighing mechanism of cold rolled steel for minimum deflection, warp, and twist. Pivot points shall be self-aligning with hardened double bearing surfaces. Weighing mechanism shall be complete with weight lever, tare adjustment, and compensator, [with design subject to approval by the Contracting Officer], and scale shall be guaranteed to weigh coal accurately within 0.25 percent.
2.9.13.7 Scale Weigh Hopper

Construct scale weigh hopper and discharge gate of not less than 14 gage stainless steel plate, continuously welded and stiffened with angle irons. Weigh hopper shall be of such design and construction to ensure clean discharge.

2.9.13.8 Controls

Provide controls, except those required for weigh hopper discharge, prewired and located in a [NEMA 12] [NEMA 3] dusttight enclosure. Provide circuit breaker interlocked with the electrical panel door. Control circuits shall be two wire nominal 120 volt systems obtained by using an isolation transformer with one side grounded and shall be wired to a single terminal block which shall be included in the electrical panel. Segregate circuits of different voltage levels. Controls shall include large, oiltight, industrial type pushbuttons for use as "start-stop," "test," and "dump" switches mounted on the scale body adjacent to the electrical panel.

2.9.13.9 Counters

Mount a mechanical type coal counter on the scale body. Counter shall be rugged, reliable, with heavy duty register and designed so that double counting is impossible. A remote motor operated counter shall be furnished located on the coal handling control panel in the control room. Counter shall be designed so that double counting is impossible. Provide a contact closure for sending a pulse signal of each weigh hopper discharge to the operator control console, specified under Section 23 09 53.00 20 SPACE TEMPERATURE CONTROL SYSTEMS.

2.9.13.10 Scale Inlet

Scale inlet shall contain coal gate with opening not less than 457 by 457 mm or 406 by 508 mm 18 by 18 inches or 16 by 20 inches along with a dusttight metal slip joint constructed of not less than 4.76 mm 3/16 inch thick steel plate. Slip joint shall be of split construction to allow for installation after coal scale is in place. Design slip joint to allow the necessary flexibility to take care of deflection of the [bunker] [silo] outlet due to varying load and temperature variations without imposing load on the scale. Rope packing or other resilient gasket material shall be provided to make the slip joint completely dusttight.

2.9.13.11 Scale Outlet Hopper

Not less than 6 mm 1/4 inch thick 410 stainless steel plate of capacity not less than 227 kg 500 pounds and 13 mm 1/2 inch thick steel plate flanges.

2.9.14 Stoker Hopper Extension

Stoker hopper extensions shall be dusttight and bolted to hopper furnished with stokers. Construct hopper extensions approximately as indicated of 6 mm 1/4 inch thick 410 stainless steel plate with structural stiffeners. Hopper extension shall hold not less than [_____] Mg tons of coal at a density of 800 kg per cubic meter 50 pounds per cubic foot. Hopper extensions shall have bolted emergency firing doors of not less than 610 by 610 mm 24 by 24 inches which shall contain a 152 by 152 mm 6 by 6 inch glass observation window. Connections shall be dusttight.
2.9.15 Coal Valve

Dusttight and drip proof of the double ladder rack-and-pinion type sized as indicated for each valve. Valve shall be capable of closing through a standing coal column. Valve opening shall be full size with no bridges, internal braces, or other barriers.

2.9.15.1 Valve Body

Not less than 6 mm 1/4 inch thick formed 410 stainless steel with heavy 19 mm 3/4 inch thick flanges. Continuously weld joints in contact with coal both inside and out and grind smooth. Valve body shall have dusttight steel gate assembly cover with molded gasket for removal of gate without removing the coal valve. Provide a minimum of two dusttight poke holes with rigid covers and molded gaskets.

2.9.15.2 Valve Gate

Drip proof and siftproof of 10 mm 3/8 inch thick steel plate with an 11 gage (3.04 mm 0.1196 inch) 410 stainless steel liner. Support gate by ball bearing rollers with 16 gage (1.52 mm 0.0598 inch) stainless steel shells equipped with felt grease seals and stainless steel grease retainers. Provide rollers with grease fittings extended through the valve body for pressure lubrication. Design gate so that supporting rollers, racks, and pinions are located completely out of the coal stream. Racks shall be cold formed and self cleaning, with stainless steel self cleaning pinions located over racks for positive tooth engagement.

2.9.15.3 Operating Shaft

Mount operating shaft in ball bearings with felt seals, stainless steel shells, stainless steel grease retainers, and grease fittings. Provide handwheels with proper finger clearance or pocket sheaves with heavy hot-dipped galvanized chain and chain guard as indicated. Handwheels and sheaves shall be not less than 457 mm 18 inches in diameter. Provide valves with mechanical type position indicator consisting of large pointer and legend to indicate the position of the valve gate.

2.9.15.4 Electric Motor Operators

Provide motor operators where indicated and capable of remote operation from the coal handling control panel. Operator shall consist of totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz motor as specified under the paragraph MOTORS AND DRIVES in this section with reduction gear, clutch and limit switches. Motor horsepower shall be as recommended by the manufacturer. Provide motorized valves that have manual operators, with fail-safe interlocks that make manual operation impossible while motor is operating.

2.9.16 Track and Reclaim Hopper Valves

Dusttight, double rack and pinion type, with water collecting trough. Valve shall have inlet opening not less than [_____] by [_____] mm inches in the direction of gate travel with a larger outlet opening. Inlet and outlet shall be flanged and constructed of mild steel.

2.9.16.1 Valve Body

Not less than 10 mm 3/8 inch thick mild steel continuously welded both
internally and externally and lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate where body comes in direct contact with coal. Construct inlet skirt of not less than 6 mm 1/4 inch thick 410 stainless steel with outlet body plates constructed of 10 mm 3/8 inch thick mild steel lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate. Construct water collecting trough of not less than 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate and containing water sprays for flushing. Valve body shall have dust-tight steel gate assembly cover with molded gasket for removal of gate without removing the coal valve. Provide a hinged access panel not less than [_____] by [_____] mm inches in the direction of gate travel with compression-type latches over the water collecting trough for removing obstructions.

2.9.16.2 Valve Gate

Slope gate plate toward water collecting trough and mount it on large ball bearing rollers with 16 gage (1.52 mm 0.0598 inch) stainless steel shells equipped with felt grease seals and stainless steel grease retainers. Provide rollers with grease fittings extended through the valve body for pressure lubrication. Gate shall be U-shaped with ladder racks on both sides and shall be constructed of not less than 16 mm 5/8 inch thick mild steel lined with 11 gage (3.04 mm 0.1196 inch) 410 stainless steel plate. Gate design shall be such that supporting rollers, racks, and pinions are located completely out of the coal stream. Racks shall be cold formed and self-cleaning, with stainless steel, self cleaning pinions over racks.

2.9.16.3 Operating Shaft

Mount in ball bearings with felt seals, stainless steel shells, stainless steel grease retainers, and grease fittings. Mount a reduction gear on the gate shaft and provide an ample gate clearance pocket in the body to ensure ease of operation through a standing column of coal. Handwheel for operating the valve shall be not less than 457 mm 18 inches in diameter.

2.9.17 Chutes

Construct coal chutes dusttight as indicated of not less than 6 mm 1/4 inch thick 410 stainless steel plate. Weld chutes with flanges located as indicated to facilitate equipment and chute section removal. Flanges shall be not less than 10 mm 3/8 inch thick steel and gasketed to maintain dust-tight seal. Poke holes and access panels shall be provided where indicated.

2.9.18 Coal Presence Indicators and Equipment Response Switches

May be of the following types and shall be interlocked with the coal handling controls to indicate equipment failures, coal stoppages, and provide for a semi-automatic system. Enclosures for components shall meet the requirements of NEMA Type 7, Class I, Division I, Groups C and D, and NEMA Type 9, Class II, Division I, Groups E, F, and G.

2.9.18.1 Type A - Diaphragm Type Presence Indicator

Pressure-sensitive to presence of coal consisting of housing, diaphragm, limit switches, wiring, and mounting bracket flanges. Housing shall be either cast iron, stainless steel, or protected cast aluminum, with synthetic diaphragm as recommended for coarse slightly abrasive materials. Diaphragm deflection shall actuate a limit switch to indicate coal presence. Design unit so that maintenance, diaphragm replacement and
2.9.18.2 Type B - Paddle Type Presence Indicator

Paddle mounted on a counterweighted horizontal shaft so that deflection of the paddle rotates a cam which actuates a limit switch in a control box mounted on the shaft. Unit shall consist of paddle, shaft, enclosure, limit switches, wiring, and mounting brackets. Shaft shall be cold rolled steel and paddle shall be stainless steel with control enclosure of cast iron, stainless steel, or suitably protected cast aluminum. Type and number of contacts and voltages shall be as indicated on the control diagram. Mount shaft in ball bearings equipped with suitable dust seals and fittings for pressure grease lubrication.

2.9.18.3 Type C - Tilt Type Presence Indicator

Conical steel float that shall be tilted by presence of coal. Unit shall consist of housing, conical float, universal pivot-collar, pendant mechanism, dust seal, limit switches, wiring, and mounting brackets. Unit shall operate so that the tilting of the float actuates a limit switch in the enclosed housing above. Provide a hood constructed according to manufacturer's recommendations for the indicator's location of not less than 5 mm 3/16 inch thick steel plate. Provide access panel for servicing the unit. Tilt type indicator may be a totally enclosed type in which tilting causes a ball to roll off the center actuating a limit switch. Design unit to be cable hung and to tilt on the presence of coal. Type and number of contacts and voltages shall be as indicated on the control diagram.

2.9.18.4 Type D - Rotating Type Presence Indicator

Rotating paddle where presence of coal stalls motor and actuates a limit switch. Unit shall have either cast iron or cast aluminum housing, stainless steel paddle, couplings, and flexible shaft. Shaft seal shall be spring loaded and shall prevent the buildup of fines between shaft and hub. Operation shall be such that when paddle stalls, motor continues to operate until the limit switch is actuated, which in turn shuts off the current to the motor. Vane and baffle arrangements shall be according to manufacturer's recommendations for each indicator location. Type and number of contacts and voltages shall be as indicated on the control diagrams.

2.9.18.5 Type E - Vibrating Type Presence Indicator

Vibrating sensing rod so that the presence of coal dampens the vibrations actuating a control signal. Sensing rod shall be stainless steel not less than 10 mm 3/8 inch in diameter. Control unit shall be solid state, with type and number of contacts and voltages as indicated on the control diagrams.

2.9.18.6 Equipment Speed Response Switch

Actuates a control signal when preset abnormal equipment operating conditions are encountered. Switch shall be adjustable so that it may be used as an underspeed switch, overspeed switch, or zero speed switch. Switch shall consist of input shaft from which the equipment speed is measured and compared to a preset point. Enclosure shall be cast iron or suitably protected cast aluminum. Mount speed response switches as indicated on drawings. Type of switch adjustment, type and number of
contacts, and voltages shall be as indicated on the control diagrams.

2.9.18.7 Presence Indicators and Response Switches

Provide at hoppers and conveyor discharges located and protected according to manufacturer's recommendations to ensure safe and reliable operation. Mount presence indicators in such a manner that they will not be injured by occasional large lumps nor falsely operated by stray lumps or collected amounts of coal.

2.9.19 Control Panel and Controls

Provide a semi-automatic control system for the coal handling system as indicated. Control panel NEMA 12 construction, centrally located in the main plant control room. Panel front shall include a system graphic display as indicated. Display shall be approximately to scale and painted with an industrial acrylic enamel. Outline items with 3 mm 1/8 inch wide black lines. Lettering shall be on engraved plastic screwed to the front of the panel, with white letters on a black background. Provide controls for operation on [_____] volt, [_____] phase, 60 Hz a.c. Panel shall be complete with an annunciator and interlocks, relays, switches, running and safety lights, and auxiliary parts necessary to safely control and operate the system. Items located in the door shall be dust-tight and oil tight with push-to-test indicating lights being of the transformer type. Control relays shall be 10 amp, 600 volt class with convertible contacts. Provide and mark terminals for connections with the exception of the neutral. Panel shall contain [_____] percent spare terminals. Wiring shall be No. 14 AWG type THHN stranded. Neutral wire shall be white and other wiring of 120 volts or less shall be color coded and labeled. Provide a plastic wire duct of sufficient size to provide [_____] percent cross sectional spare. Wiring shall be in accordance with requirements of NFPA 70.

2.9.19.1 Panel Devices

Control panel shall include the following indicating lights and color:

2.9.19.2 Switches and Pushbuttons

Provide momentary contact pushbuttons or selector switches for the following:

a. System- START (3 required)
   - Rail unloading hopper to storage yard
   - Reclaim hopper to boiler plant
   - Bunker to boiler plant

b. System - STOP (red head)

c. Rail unloading hopper surfactant spray - START/STOP

d. Reclaim hopper surfactant spray - START/STOP

e. Alarm - ACKNOWLEDGE

2.9.19.3 Annunciator Panel

Annunciator panel shall include the following:

a. Bunker - HIGH LEVEL

b. Bunker - LOW LEVEL

c. Stoker surge hopper (one required for each hopper) - HIGH LEVEL
d. Stoker surge hopper (one required for each hopper) - LOW LEVEL

e. Stoker surge hopper (one required for each hopper) - LOW LOW LEVEL

f. EMERGENCY SHUTDOWN (Auxiliary contacts for remote alarm)

g. Blank (3 required)

2.9.19.4 Panel Size

Size panel to accommodate future addition of one stoker surge hopper and associated equipment.

2.9.19.5 Auxiliary Devices

Provide auxiliary devices required for the control functions indicated above.

2.9.19.6 Name Plates

Provide laminated plastic name plates for devices on panel face.

2.9.19.7 Control Sequence

To ensure that coal does not back up during system startup or shutdown, design the controls so that on startup, the last piece of equipment to handle coal starts first and on shutdown, stops last.

2.9.19.8 Additional Controls

Provide as shown. These controls include local START and STOP pushbuttons or three-position selector switches for the following:

a. Belt feeders

b. Rotary vane feeder

c. Belt conveyor (at head pulley)

d. Screw conveyors

e. Coal scale

f. EMERGENCY STOP pushbuttons which stop the entire system shall be provided where indicated.

2.9.20 Multiple Belt Scrapers

Equip conveyor belts at the head pulley, with multiple belt scrapers. Adequate room and service access shall be provided in the head chute design for multiple cleaners. Provide a doctor blade on the face of the head pulley to remove most of the carryback material and a torsion arm type multiple blade cleaner to scrape and remove material that bypasses the primary cleaner. Tail pulley takeups shall be provided with a plow to protect against material being carried back between the belt and the pulleys. Both cleaners and plows shall have features that enable the operator to safely inspect and adjust blades. Dribble chutes shall be designed to resist material buildup and shall be plastic lined. A convenient dust tight door for clean out and inspection purposes shall be
2.9.21 Steel Coal Bunker

Cylindrical shaped type having a storage capacity of not less than [_____] Mg tons of coal having a density of 800 kg per cubic meter 50 pounds per cubic foot.

2.9.21.1 Construction

Welded construction, not less than [_____] meters feet in diameter with a vertical cylindrical section [_____] meters feet [_____] mm inches high. Construct vertical cylindrical section of not less than 7.94 mm 5/16 inch thick steel plate. Slope bottom cone shaped hopper section at not less than 55 degrees and fabricate from not less than 10 mm 3/8 inch thick 410 stainless steel plate. Top of bunker shall be conical 35 degree sloped structurally reinforced 6 mm 1/4 inch thick steel plate. Provide ladder inside bunker and immediately above ladder the bunker top shall contain dusttight, weather tight access hatch of not less than 610 by 610 mm 24 by 24 inches. Shell and bottom plates shall be beveled for full butt weld on inside of bunker and a finish weld on outside of bunker. Provide bunker with flanged outlet drilled to match inlet of gate.

a. Responsibility: Contractor with whom contract is drawn shall assume full responsibility for the design and final details of construction of the steel coal bunker.

b. Supports: Bunker shall be self supporting from four steel columns which shall be supported from on top of a concrete foundation. Concrete work shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

c. Liner: Surface blast vertical inside surfaces of the bunker to a near white metal, and then coat with 6 mm 1/4 inch thick troweled-on heavy duty three compound corrosion resistant liner consisting of a resin, a hardener and graphite aggregate. Liner shall have an operating temperature limitation of not less than 66 degrees C 150 degrees F.

2.9.21.2 Accessories

a. Alarm Switches: Provide bunker with two automatic bin level indicators with neoprene rubber diaphragm and a single pole, double throw switch mounted in explosion proof aluminum housing to signal high and low level alarms. Provide mounting plates on bunker shell and holes for installation of indicator housing on outside of bunker. Wiring shall be as specified in 26 11 16 SECONDARY UNIT SUBSTATIONS.

b. Vibrators: Provide on the cone bottom of the coal bunker a heavy duty pulsating magnet electric vibrator, semi-noiseless type, complete with mounting plate. Provide one vibrator controller panel arranged for mounting in wall mounted control panel. Panel shall contain an "ON-OFF" switch, power control dial, fuses and rectifier. Power supply to panel shall be 460 volt, single phase, 60 Hz current.

2.9.22 Stoker Surge Hoppers

Construct stoker surge hoppers dusttight approximately as indicated of 6 mm 1/4 inch, 410 stainless steel plate with structural stiffeners, to hold not less than [_____] Mg tons of coal at a density of 800 kg per cubic meter 50 pounds per cubic foot.
pounds per cubic foot. Connection transition between surge hopper discharge chute and stoker hopper extension shall have bolted emergency firing door of not less than 610 by 457 mm 24 by 18 inches which shall contain a 150 by 150 mm 6 by 6 inch glass observation window. Connections shall be dusttight.

2.9.23 Coal Meter

Vane type, where a direct readout counter is directly connected by a flexible shaft to a vane projected into center of coal downspout.

2.9.23.1 Vane

Construct vane of stainless steel design so that each foot of coal travel in the downspout causes the vane to turn a definite amount.

2.9.23.2 Counter

Counter shall have not less than four 25 mm one inch high figures on translucent material, illuminated from within the counter. Counter shall record directly the number of pounds of coal passing through the downspout.

2.9.24 Stackout Tube

Provide a stackout type discharge tube not less than 10 mm 3/8 inch thick, reinforced, stainless steel plate for discharging coal from the stackout conveyor to the coal storage yard. Tube shall be 1220 mm 4 feet 0 inches in diameter, and shall be designed as the structural support for a portion of the stackout conveyor and support steel as indicated on the drawings. Tube shall be a window chute designed to discharge coal at not more than 1.83 meters 6 feet above coal pile.

2.10 FUEL OIL SYSTEM

******************************************************************************
NOTE: In reference to the following text, choose Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS if specifying below grade level fuel oil tanks. The rest of the system (including above ground tanks) shall be constructed to Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION).
******************************************************************************

The fuel oil system shall be designed and built in accordance with Section 33 52 10 FUEL SYSTEMS PIPING (SERVICE STATION)[.][, except when underground fuel oil tanks are specified. Below grade level fuel oil tanks shall be constructed in accordance with Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.]

2.11 ASH HANDLING SYSTEM (MECHANICAL)

******************************************************************************
NOTE: Choose this article and its paragraphs and subparagraphs or the following article ASH HANDLING SYSTEM (PNEUMATIC) and its paragraphs and subparagraphs.
******************************************************************************
2.11.1 General

2.11.1.1 System Requirements

Provide a complete integrated, mechanical, semi-automatic, ash handling system with chain drag conveyor, screw conveyors, bucket elevator, material intakes, rotary valves, [ash doors and enclosures,] silo vent filter, ash silo, rotary ash conditioner, and additional equipment required for a complete mechanical ash handling system. Provide related electrical work required to operate the ash handling system.

2.11.1.2 Routing

The system shall receive, and convey to the ash silo, ash from the stoker fired boiler ash storage pits, [economizer hoppers,] [baghouse hoppers,] and other pollution control equipment hoppers.

2.11.1.3 Discharge

Discharge ash into ash storage silo in a dry condition. Arrange silo equipment for disposal of conditioned ash to trucks. Operation shall be as dustless as possible.

2.11.1.4 Maximum Noise Level

Noise level of the operation shall not exceed 85 decibels sound pressure level 1.52 meters 5 feet from the equipment in any direction.

2.11.2 System Valving

2.11.2.1 Rotary Valves

Provide rotary valve feeders of carbon steel construction complete with drive, guard, motor mount and gaskets, carbon steel adjustable blade tips, adjustable shoe type air seal and right angle gearhead drive motor. Rotor blade tips and shoes shall have a minimum Brinnell hardness of 500. Valves requiring part of the housing to form an airlock seal are not acceptable.

Electric Motor: Totally enclosed, fan cooled, [_____] volt, [_____] phase, 60 Hz not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section.

2.11.2.2 Manual Valve Intakes for Bottom Ash

Provide in front of the stoker ash pit doors a 610 by 610 mm 24 by 24 inch cast iron grid and hopper with opening approximately sized for the conveyor. Provide intake with dusttight, removable 6 mm 1/4 inch thick checkered steel plate cover.

2.11.2.3 Silo Discharge Valve

Provide a rotary feeder for discharging bottom ash and fly ash from the ash silo. Feeders shall be of ductile iron or cast steel and shall be complete with motor, motor support, chain drive, and necessary guards. Chain shall be driven through a torque limiting clutch on the driven sprocket equipped with electric cutout switch and alarm. [Feeder shall have spring-loaded hinged bypass plate to permit passage of clinkers.] Inlet and outlet flanges shall be standard drilled pipe flange. Rotor blades and sealing arrangement shall be the manufacturer's standard for the intended
service. When rotors are equipped with adjustable tips, provide a service door in the body of the valve for tip adjustment. Shaft seals shall be of the packing gland type with suitable packing materials. Shaft bearings shall be outboard sealed ball bearings. Periphery seals shall be such that a complete seal is accomplished at a differential of \[____\] Pa inches of water static pressure.

2.11.3 Conveyors

2.11.3.1 Chain Drag Conveyor

Provide endless chain for dragging coal ashes from front of boilers along a recessed trough to the inlet chute of a bucket elevator. Conveyor shall have \[____\] meters feet sprocket centers, operate at speed not greater than \(35 \text{ mm per second} \times 7 \text{ feet per minute}\), and have a capacity of not less than \[____\] Mg per hour of 640 kg per cubic meter tons per hour of 40 pounds per cubic foot ash. Provide conveyor complete with continuous chain, drive, and take up terminals, gears, shafts, bearings, return rolls, hard white iron trough, ash intake gratings, floor plates, discharge chute, electric motor, reduction gear, and supports. [Chain drag conveyor shall be designed for future length of \[____\] meter feet.]

a. Head and Foot Shafts: Provide SAE 1045, steel head and foot shafts not less than \[____\] and \[____\] mm inches in diameter, respectively, mounted in anti-friction roller bearings in pillow blocks. Foot shaft shall have screw-type takeups with not less than \[____\] mm inches adjustment.

b. Terminal Sprockets: Terminal sprockets shall be gray iron chilled rim not less than \[____\] mm inches in diameter with solid web and not less than eight teeth each.

c. Chain: Combination drag type of riveted construction. Design chain symmetrically so that it can be turned over after one side is worn. Chain shall be \[____\] mm inches wide with a pitch not greater than 200 mm 8 inches and an ultimate strength of not less than \[187\] [249] kN [42,000] [56,000] pounds. Construct chain of promal, a pearlitic malleable iron, center links not less than \[____\] mm inches high, and heavy \[____\] mm inch thick heat treated carbon steel side bars. Steel pins shall be cold rolled steel not less than \[____\] mm inch in diameter, press-fitted into sidebars, and machined flat on one side to prevent rotation. Center section shall be rugged block type forming a rigid rectangle for maximum resistance to distortion with broad wearing shoes contoured to prevent snagging and damage to chain or trough. Barrels of center section shall be chambered to provide lubricant reservoir and still provide maximum bearing area for pins. Shape barrel with pushing surface on one side and for contact with sprocket on the other side.

d. Trough: Concrete lined with not less than \[____\] mm inch thick hard white iron approximately as indicated. Trough shall be \[____\] mm inches wide with hinged 6 mm 1/4 inch thick checkered steel plate covers. Covers shall be installed to be dusttight. Coordinate concrete work with conveyor manufacturer's requirements.

e. Return Rollers: Chilled rim, single flange, enclosed-oiling type on \[____\] mm inch diameter carbon steel shafts spaced at not more than 3 meters 10 feet apart.
f. Discharge Chute: Construct of not less than 10 mm 3/8 inch steel plate and slope at not less than 60 degrees.

g. Electric Motor and Drive: Totally enclosed, fan cooled, high torque, [_____] volt, [_____] phase, 60 Hz not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section, direct connected by means of flexible coupling to a reduction gear unit having alloy steel helical or herringbone gears and antifriction bearings enclosed in oiltight housing. Provide an adjustable base for motor and reduction gear. Drive from output shaft of the reduction gear shall be by means of finished steel roller chain conforming to ASME B29.100 running over cut tooth sprockets conforming to ASME B29.100 complete with steel plate chain guard. Roller chain attachments shall conform to ASME B29.100.

2.11.3.2 Screw Conveyors

Provide each screw conveyor dusttight and furnished complete, with trough, screw, inlet and discharge spouts, discharge gates, bearings, bearing hangers, dust cover, electric motor, reduction gear, [service platform,] and supports.

2.11.3.3 Inlet and Discharge Spouts

Arrange as indicated. Spouts shall be flanged and square with opening dimensions equal to the inside diameter of the trough.

2.11.3.4 Screw Trough

Provide dusttight screw trough with trough covers. Support trough by 6 mm 1/4 inch thick steel plate feet at not less than 3 meters 10 foot intervals. Individual trough sections shall not be greater than 3 meters 10 feet long with steel angle end flanged connections.

2.11.3.5 Bearings and Hangers

Provide thrust bearings and trough end dust seals for both drive and tail bearings. Thrust bearings shall be bronze in antifriction pillow blocks. Screw hanger bearings shall be babitted-type, with cast iron hangers having removable bearing caps held in place by a U-bolt. Design hangers to fit inside the conveyor trough and equip bearings for grease lubrication with grease fittings penetrating the dust cover to allow bearings to be greased without removing dust cover. Hangers shall not be located at trough joints, feed, or discharge openings. Locate hangers at not less than [3.66 meter 12 foot intervals for screw diameters larger than 250 mm 10 inches] [and] [3 meters 10 foot intervals for screw diameters 250 mm 10 inches in diameter and smaller].

2.11.3.6 Conveyor Screws and Couplings

Construct conveyor screws of helocold-type flights and connect with cold rolled steel couplings. Assemble conveyor screws so that at the hangers there is 180 degrees rotation between the flight ends of each adjacent screw section. Screw flight shall end over last discharge spout so bare pipe extends across this area to prevent material carry-over.

2.11.3.7 Electric Motor

Totally enclosed, fan cooled, high torque, [_____] volt, three phase, 60
Hz, not less than [_____] kW hp as specified under the paragraph MOTORS AND DRIVES in this section. Install motor at discharge end of the conveyor. Motor shall be supported by a unit bracket attached to the screw conveyor trough end plate and shall be connected to reduction gear through a V-belt drive. Reduction gear shall be shaft mounted, double reduction type mounted directly on the conveyor shaft. Provide tie rods, when required, to prevent reduction gear rotation and for adjusting belt tension.

2.11.3.8 Service Platforms

Provide service platform conforming to OSHA regulations as indicated to properly maintain and service conveyor drive unit.

2.11.4 Bucket Elevator
